UZBEKISTAN

### ABSTRACT

*This article covers the analysis of Islamic anthropology and the issue of religion Islam humanism. Also from the point of view of muslim philosophy the concept of perfect man and personality, its social essence is analyzed. In islamic anthropology, the phenomenon of personality, its content, specific features, structure, features of formation are revealed. In addition, in Muslim philosophy, an analysis of the processes associated with the independence of man and personality, as well as the views of Eastern scientists on man and personality is described.*

**KEYWORDS:** *Islam, Muslim Philosophy, Islamic Anthropology, Islamic Humanism, Perfect Man, Personality, Individ, Individuality, Man, Human, Society, Postmodern, Phenomenon, Mysticism, Muslim Personality, Destiny, East, Social Virtue, Science, Reason, Character, Conviction, Miracle, Freedom, Independent Person, Information.*

### INTRODUCTION

The problem of personality as the most pressing problem in the system of socio-humanities has been the constant focus of philosophical thought. Under the influence of serious changes in social development and positive and negative trends affecting it, "personality" was a specific problem in the attention of each historical period. This in turn became the basis for the formation of philosophical doctrines and directions that study the problem of person in human science from a socio-philosophical, religious-psychological point of view as a subject and object of social development. Therefore, initially, it would be worthwhile to focus on a comparative analysis of the concept of "person" and concomitant concepts to it.

Specialists of the present time use the concepts “individ”, “individuality”, “personality” to characterize a person as a specific phenomenon. The chain of these concepts creates the opportunity to analyze the interaction between man and society. Individ determines any representative belonging to the breed of man. In other words, if the concept of “man” expresses its biological essence, then “individ” characterizes a separate representative of the same breed, but the difference between people does not give an understanding of the individual characteristics of a person. He emphasizes his belonging to the so-called “man”, without including certain social qualities and qualities of man, no more. This concept expresses the richness of any person from genesis to social conditions.

Individuality is a concept that differs from other people, which is inherent only in the individual representative of a person, specifically, separately, used for the purpose of dividing and analyzing some sides. Individuality is a complex of all qualities, characteristics, caroms of a person, and not only his appearance, but also his own. In those who have developed individuality, a noble talent becomes wiser, with repeated rare talents. But individuality can also make a person noble or impoverished, in other words, imperceptible, meaningless personal social qualities. For the same reason, in Muslim philosophy, the concepts of “quality”, “peculiarity”, “miracle” are used with the aim of expressing the individual characteristics of highly capable, extremely talented persons.

One of the most talented manifestations of muslim philosophy, Najmiddin Kubro, was famous in the whole East for his miracle display character. Predict in advance the details of an happened or event that will occur with the help of a miracle display. With his sharp vision, he began to hum at the heart of his interlocutor. In one who has fallen in sight, the qualities of the Guardian have come into being.[1:25]

The historical experience of mankind has shown that the attitude to the phenomenon of man is different. There are certain essences in social thought and philosophy, in which the human essence is understood primarily in the biological context (racial theories) or in a purely social context - for example, in Soviet science there was a similar experience. In particular, at the center of muslim philosophy, there are different approaches to the problem of human personality.

The most important characteristic feature of muslim culture, it is characterized by its strong humanistic character, calling people to good deeds, friendliness, respect for knowledge, science, mind, spirituality, faith, honesty. More precisely, another of the peculiarities of medieval muslim culture, especially its philosophy, is that it is aimed at creating a system of criteria that characterize the humanity of a person, that is, its perfection.

Muslim philosophers also comprehensively analyzed the characteristics of man. The holy book of the religion of religion Islam in the Qur'an that man is a saint and dear, that God is affable within the creatures he created (Surah Isra, verse 70). It is also noted in the Qur'an that the mind is a great blessing, which determines the humanity of man (SurahBaqara, verse 76). Stupidity, mental weakness, condemned as a vice that absorbs the humanity of man. Those who are ignorant of reason are compared to those who are guided by Satan, and even to animals (Surah Anfal, verse 22, Surah Furqan, verse 34, Surah Mulk, verse 10). [2:12, 118, 259, 449]

Therefore, Islamic anthropology is aimed not at understanding and correcting the divine essence of man, but at the fulfillment of the task assigned to him by God. “What is his purpose man? it is not about answering the question”what should a person do and what should not do, what is good

and what is bad for him, what is his purpose in life, how should a person build his relationship with God, how to distinguish good from evil, and how to finally find salvation. In Islam, the main moral value is the activity of a person who understands the practice of serving Allah.

Islamic anthropology affirms practical, active humanism as the main way to serve Allah. He does not deny, on the contrary, accepts a constant conscious moral choice.[3:2]

In Hadis Sharif, which is considered one of the major sources of muslim philosophy, the pursuit of human perfection is glorified in every way. “As soon as Allah almighty created people, he made them happy with the mind. If people approach Allah with their piety, you should approach them with your own understanding.”; “Every believing servant is a mirror of his own. If he sees a fault in someone, he will fix it. You cannot be a perfect believer until you see your fellow man.”; “The best Muslim is those who have not seen offence neither by hand nor by language other than this.”;[4:29, 30]

In the philosophy of Farabi from medieval eastern scientists, the interpretation of man as a product of the development of the whole being is gaining weight. The thinker showed that all the noble qualities of a person are due to science, the meaning of a person’s life is to be happy and strive to be happy, and this can only be achieved through knowledge and enlightenment. Beruni and Ibn Sina looked at the proof that man is superior to other creatures because of intelligence and contemplation. Unlike, Abu Homid Ghazzali showed this superiority not in the mind but in the heart of man.[5]

As noted by Jalaliddin Rumi, man consists in the unity of the soul with the body. Also, in the opinion of the scientist, man is a talking animal. [6:57] Burhoniddin Marginani explained that power, which constantly feeds on human spirituality, is knowledge and enlightenment. Therefore, the responsibility for the spiritual perfection of society was entrusted to the people of science.

In the doctrine of mysticism, which tried to prove that the possibilities of reason were limited, the perfect man was one of the main ideas. These are those who have learned that perfection is manifested mainly in spiritual perfection, spiritual upliftment, the ability to handle physical desires. In Eastern philosophy, theories about man developed in an inextricably linked way with east mentality and lifestyle.

In the study of the structure of personality, the goals of human activity in the philosophy of mysticism developed in the East are analyzed and interpreted. Based on the religious experience, the influence of values and morality on human activity is also discussed. Especially in the philosophy of mysticism, which is a doctrine that studies various ideological-theoretical views, moral rules about the spiritual and spiritual perfection of man, these issues are reflected in an interesting idea, valuable thoughts about the spiritual and spiritual appearance of man are expressed.[7] According to one of the major manifestations of Sufism philosophy Ahmad Yassavi, Bahouddin Naqshband, Najmiddin Kubro and others, is a wise and moral purity that leads to spiritual perfection. [8]

Manifestations of the philosophy of mysticism recognize the most basic qualities of a person as erudition, kindness.[9: 39-44]

As Alisher Navoi pointed out, faithfulness is manifested first of all in kindness, in honesty. One of the qualities inherent in righteous, pious people is freedom. Faithfulness is a free, independent

thought-reasoning for a person, when we say otherwise, the freedom of mind and soul is higher than any reign, crown-throne.[10: 75-85]

In order for a person to have faith in his daily practical activity, that is, to strengthen his faith, one of the great poets of the East – as said by Sofi Olloyor, it is necessary to stand often in the conversation of educated, knowledgeable people. In other words, one of the first conditions for being an believer is to be in a conversation with an educated, knowledgeable person. A person in such conversations begins to take himself away from the circle of hypocrites, ignorant people. Scribes, a person who is in a conversation with good people, gradually begins to make a habit of doing good deeds. In particular, thirst gives water, asks the patient for a condition, shows compassion for the poor, begins to replace the respect of the parents, and others. A person with faith makes it his habit to follow all the good.[11:126]

Here in this place it is possible to see that social virtue, which is an important measure of the state in which a person is formed as an independent person, develops in a certain socio-historical context, the sum of the signs, that arise from his relations with people.

The opinion of Abu Mansur al-Motoridiy as Samarkandi (870-944) on the possibility of free choice in a person, what he does not do, what he will do voluntarily, and therefore his responsibility for every good and bad deed, action, intention is very valuable. This opinion sharply opposes any kind of unification, blind obedience to the will, word of someone, the imposition of a hand on the wrong, the transformation of a person into a fanatic. It is necessary to understand Motoridi's idea of fate and willpower as follows: in a person, fate is hidden as a responsibility and opportunity, he cannot change his destiny, but to a certain extent and to what extent a person reacts (in whole or in part) to his behavior. Therefore, freedom and responsibility in a person should grow and harmonize as one grows.[12: 141-142] Having fulfilled his duty, a person is able to choose and is responsible for it. Islam is even the most basic issue - the lack of coercion on the issue of religion is emphasized in the verses of the Qur'an. Conviction the issue also protects the freedom of choice. According to Islam, God created the world in such a way that a person should always choose between God and Satan, that is, evil with good. From a philosophical point of view, human life is a constant choice between reason and ignorance, laziness and diligence, happiness and generosity and others. According to Islam, a person must always make decisions independently of various options, make decisions depending on how quickly and reliably his personal well-being in the situations he needs, be obliged to understand that an active attitude to life is more important than ever, have self-confidence, strong and capable, know that he has the opportunity to change life for the better.

Abu Ali ibn Sina said that a mentally and morally mature person should have independent thinking skills. Anyone who wants to have an independent thinking skill-it is necessary to master the science of logic, that is, ingenuity. Abu Rayhon Beruni, a prominent muslim philosopher of the Middle Ages, who further developed Abu Ali ibn Sina's views on man, explained that although the external manifestations of people are diverse, their internal structure is common to all.[13]

According to Abu Rayhon Beruni, people are united into different communities in order to meet their daily needs (the need for protection from external enemies, the need to jointly perform various chores related to farming, crafting, livestock). To be more precise, a person is constantly in need of mutual association, unification, living in some kind of society. With the growing

number of people culturing and the emergence of ownership, such a need is becoming more and more developed.[13: 83-86] According to Beruni, man is fundamentally different from other creatures in the universe by his creativity. Such qualities as kindness, honesty, generosity, nobility, kindness, friendly togetherness further glorify a person. A person who embodies such qualities will benefit not only himself, but also the country. Such vices as deceit, evil, competition, extortion, drunkenness, rudeness, theft, slander, hypocrisy, putting a building on oneself, flattery, squabbling will make a person fall into shame. According to Abu Rayhon Beruni, man is glorious by his labor. With the help of Labor, a person saves his body from various vices, in particular laziness, lack of work. Man repeatedly states that he cannot achieve glory, no career without hard work.

Aziziddin Nasafi in his views on the perfect man, recognizes and analyzes many concrete qualities that make up such goodness as his subtle pursuits, tastes, morals, manners, responsibilities, land, faith. The perfect person of Nasafi is not a fully formed, consequently hardened person, summing up all the excellent qualities, but a person in constant movement, perfection, striving for the truth does not stop. The approach to man as a developing distinguishes Aziziddin Nasafi from all philosophers and religious thinkers of his time and brings him closer to modern views.[14] So an important measure of the state in which a person is formed as an independent person is social virtue. Social virtue is the sum of the signs, caused by a person's relations with people in a certain socio-historical context.

Even in the most terrible socio-political conditions, a person will be able to maintain his independence, that is, to remain faithful to the social prints he practices, moral norms (if it really is a principle). The great scholars of the East, Abu Ali Ibn Sina, Abu Rayhon Beruni, Baburahim Mashrab, who did not give up his chosen path despite the fact that he had suffered on his head, remained faithful to the principles he had practiced, are evidence of our thoughts of the path of life full of ill-will. Islamic humanism in general gives clear instructions to a person, emphasizing the need to improve morally. He also understood the need to improve the world, actively fight evil.

In the humanitarian features inherent in Islamic anthropology, of course, the Islamic religion and the factor of its customs, rituals also have its place. About this although in favor of an atheistic look, Y.Petrash, in religion Islam acknowledges universal ideas and says: "the mosque has an important moral and educational function and helps the community to maintain its moral health while urging muslims to adhere to simple and universal moral standards".[15]

The conclusion is that Islamic humanism in muslim culture is a powerful spiritual tool to combat the destructive, antigumanistic trends that are manifested in today's Postmodern society. Moral activity in the anthropology of Islam is an active service to Allah, personal responsibility or rejection of this service, that is, all areas of free moral activity of muslim. Hence, in order to study the social essence of muslim person, it is necessary to analyze the three main components of the relationship between him and Society:

- 1) which social group the person belongs to;
- 2) the sum of the social roles that he performs;
- 3) his needs, interests, knowledge, views, beliefs and convictions.

Even now, researchers are offering new approaches to the conceptual framework of the Islamic personality model. In the structure of the Islamic personality model proposed by some studies, the analysis of the characteristics of the Islamic Personality first, then the aspects of organizational commitment and job satisfaction, and finally job productivity, is described.[16]

In short, a muslim person is a product of socio-historical development, socio-historical activity, a subject of social relations, which as a product of history and society, as a result of education and upbringing acquired a social image. Its essence is formed by the richness of social relations, the scale of social activity and the volume of assimilated culture.

In the Postmodern society, it becomes clear that scientific and technical progress, information and communication technology, information attack and threat can bring a person to very difficult situation. Because in the Postmodern society, the individual is experiencing a truly ideological struggle.

In this situation, first of all, it is necessary to revise and improve the content of spiritual education, taking into account the modern requirements of methods and means, globalisation, information technology and mass culture, information attack, threats. Secondly, it is necessary to interpret the difference between true islamic humanism and vulgar anthroponcentrism, the unity of human land and responsibility, the importance of classical values, in a new way, linking them with the reality of the present time. Thirdly, it is a period of in-depth study of Islamic humanism, which is aimed at unifying people in society, allowing to express and form the consciousness of individuals in accordance with modern needs and demands.

### **ABSTRACT**

*The menopausal period is almost one third in the life of women, thanks to this fact, not only the health of the woman, but also her ability to work, the ability to perform various social functions that depend on the nature and course of this period. One of the complications of the postmenopausal period are metabolic disorders. In order to study the degree of metabolic disorders depending on the duration of menopause, 75 women were examined. A study of the genealogical history made it possible to find the main clinical signs pathognomonic for the metabolic syndrome (type 2 diabetes mellitus in 32% of cases, arterial hypertension in 52%,*

early coronary heart disease in 36%, found in close relatives). The longer the menopause, the more pronounced signs of obesity, impaired fat and carbohydrate metabolism (increased cholesterol, triglycerides, low density lipoproteins, decreased high density lipoproteins, the development of insulin resistance). An elevated level of C-reactive protein ( $4.3 \pm 0.6 \text{ mg/l}$ ) was found in women with a menopause of more than 5-7 years, which is a factor contributing to the development of vascular diseases. In 32% of patients with a menopause longer than 7 years, pronounced metabolic disorders such as type 2 diabetes mellitus were diagnosed, and in 48% of cases hypertension was diagnosed, therefore, timely diagnosis and metabolic correction will help reduce the risk of cardiovascular disease -vascular diseases and diabetes among women during menopause, as well as improving their quality of life.

**KEYWORDS:** *Postmenopause; Metabolic Disorders; Lipid Metabolism; Insulin Resistance.*

## INTRODUCTION

In recent years, much attention has been paid to women's health during the menopausal period, since this period makes up almost a third of a woman's life. In connection with this fact, not only the woman's health, but also her ability to work, the ability to perform various social functions depend on the nature and course of this period. Estrogen deficiency leads to the development of various complications, therefore, it is important to predict the likelihood of a functional disorder of various organs and systems during menopause, and to perform timely diagnosis and treatment. Metabolic disorders are some of the menopausal complications. Metabolic syndrome (MS) is a complex of interrelated disorders of carbohydrate and lipid metabolism, as well as mechanisms for regulating blood pressure (BP) and endothelial function, due to the reduced sensitivity of body tissues to insulin -insulin resistance (IR). Increased synthesis of free fatty acids in the liver proves that insulin resistance leads to increased synthesis of triglycerides (TG) and very low density lipoproteins (VLDL) in hepatocytes. In the case of insulin resistance, the activity of lipoprotein lipase, which is under the control of insulin, decreases. In this case, dyslipidemia associated with visceral obesity occurs: concentrations of VLDL and TG increase, high-density lipoproteins (HDL) decrease, and the number of low-density lipoproteins (LDL) increases. From this it follows that obesity and insulin resistance contribute to the development of lipid profile disorders, and together with hyperglycemia and hypertension they lead to early and rapid development of atherosclerosis in patients with impaired carbohydrate metabolism and visceral obesity. The effectiveness of the treatment of metabolic syndrome, as you know, depends on the duration of its development. The best treatment results can be obtained at the initial stage of the development of pathology, when excess weight is not considered an aesthetic problem, but serves as a signal for the start of certain actions. Therefore, timely diagnosis and correction of metabolic disorders will help prevent the development of cardiovascular diseases and diabetes.

## MATERIALS AND METHODS

The study involved 75 women aged 45 to 60 years, which were divided into groups depending on the duration of menopause. The first group consisted of 25 patients with menopause duration up to 2 years, the second - 25 patients with menopause duration from 2 to 7 years, the third group - 25 women with menopause more than 7 years. The control group included 20 women during the menopausal period with no signs of metabolic disorders. None of the women received

hormone replacement therapy. Obstetric-gynecological and hereditary history, age of onset of menopause, its duration and course of treatment were studied in all groups of patients. Using the anthropometric method, the following parameters were evaluated: body mass index (BMI), waist circumference (OT), ratio from OT to the circumference of the hips (OT / OB). Metabolic changes in lipids were evaluated on the basis of a biochemical study of total cholesterol (OX), TG, LDL, HDL, VLDL. Insulin resistance was assessed using the HOMA serum index (HOMA-IR - Homeostasis Model Assessment of Insulin Resistanc) - the ratio of glucose to insulin. An index is considered within the normal range, if it does not exceed 2.7 times the limit value. In addition, serum C-reactive protein levels were also evaluated, blood pressure monitored, and electrocardiogram (ECG) results recorded.

## RESULTS AND DISCUSSION

The examined groups did not statistically differ in age, time of the onset of menstruation, the number of births and abortions ( $p > 0.05$ ). Evaluation of the hereditary history revealed the main clinical signs pathognomonic for the metabolic syndrome in close relatives (type 2 diabetes mellitus in 32% of cases, arterial hypertension in 52%, and early coronary heart disease in 36%). In the control group, only 1 case (5%) revealed no arterial hypertension. The main complaints presented by the examined women quickly gained weight after the onset of menopause: hair growth in atypical places, high blood pressure, rough, hyperpigmented skin on the elbows, under the mammary glands, in the axillary areas (the so-called "black acanthosis") in 2 patients (8%) of the II group, in 10 patients (40%) - of the II group, and in the I and control groups these signs were not diagnosed. In women of group I, the average body weight increased by 2.8 kg, in group II - by 3.6 kg during the first two years of postmenopause. 7 years later, after menopause, the weight gain in group III was 7.6 kg, adipose tissue was mainly distributed in the waist area. In the control group, body weight became, on average, 2.2 kg more within 7 years after menopause. In patients from group I, during two years of menopause, OT increased, on average, by 5.6 cm, after five years (group II) - by 7.8 cm, after seven years (group III) - by 9.2 cm. The OT / OB index increased to 0.95 in 27 (36%) of the women examined, in 34 (45.32%) patients it was 1.01. At the same time, 60 (80%) women of reproductive age had a proportional figure in the female type and did not suffer from excess weight. Examination of patients revealed significant changes in the lipid spectrum in blood plasma, characterized by increased total cholesterol, TG, LDL, VLDL and a decrease in HDL. 66.7% of the examined patients showed a decrease in HDL below 1.29 mmol / L and a TG above 1.69 mmol / L. These changes were more pronounced in patients from group III, while in group I these values varied at the upper limit of the norm ( $p > 0.05$ ). Thus, the total cholesterol level rises with the duration of menopause: group I -  $4.7 \pm 0.5$  mmol / l, group II -  $6.2 \pm 0.5$  mmol / l, group II -  $7.2 \pm 0.2$  mmol / l The level of triglycerides also increases with the duration of menopause: group I -  $1.7 \pm 0.2$  mmol / l, group II -  $3.1 \pm 0.3$  mmol / l, group III -  $3.5 \pm 0.2$  mmol / l. Excessive synthesis of triglycerides is a violation of carbohydrate metabolism, together with gluconeogenesis, this process is a method of bioutilization of free fatty acids. Most scientists believe that the most typical sign of dyslipidemia associated with IR is an increase in TG and a decrease in HDL, and these changes are proposed to be used as markers. A fundamentally important pathogenic mechanism of IR is a violation of the regulation of lipid metabolism, as a means of increased release of free fatty acids into adipose tissue. IR in this category of women is confirmed by the value of the HOMA index (table).

**TABLE 1. NOMA INDEX DEPENDING ON THE DURATION OF MENOPAUSE**

Studied Groups	Normal Values	HOMA Index
Control group	20	20 $2.6 \pm 0.2$
I group	25	25 $2.7 \pm 0.2$
II group	25	25 $3.4 \pm 0.5$
III group	25	$3.8 \pm 0.5$

When examining 8 (32%) patients of group III, an increase in the basal level of C-reactive protein ( $4.3 \pm 0.6$  mg / l) was found, which is a risk factor for vascular complications. This indicator was higher in 4 (16%) women of group II and in 1 (2.5%) - group I ( $p < 0.05$ ). An elevated level of C-reactive backing was found in 80% of obese women.

This suggests a direct correlation between the obesity factor and elevated levels of C-reactive protein. In addition, after examination, type 2 diabetes mellitus was detected in 8 (32%) patients from group III. Fasting glucose was at the upper limit of normal among patients of groups II and I. Arterial hypertension was found in 24% of women of group II and 48% of group III. ECG results indicate characteristic signs of hypertrophy of the left cardiac cavities.

## CONCLUSION

1. Heredity plays a role in the development of metabolic disorders. 2. The longer the duration of menopause, the more pronounced signs of metabolic disorders are detected: obesity, increased levels of OX, TG, LDL and VLDL, decreased levels of HDL, insulin, the development of IR, vascular complications, diabetes. The prospect of further research, timely diagnosis and correction of metabolic disorders will help reduce the risk of cardiovascular disorders and diabetes in women during postmenopause and improve their quality of life.

### ABSTRACT

*The article deals with the problems of formation and development of innovative energy in the Republic of Uzbekistan and the role of innovative energy in the sustainable development of the fuel and energy complex. Data on the projected growth rates of the world economy, medium-developed countries and Uzbekistan, factors for ensuring growth are linked to the efficiency of using fuel and energy resources, as well as specific capital investments and the cost of electricity production using various types of renewable energy sources (RES) are shown. The article examines the prospects for the development of RES, as well as measures to involve RES in the energy balance of the Republic.*

**KEYWORDS:** *Fuel And Energy Complex, Sustainable Economic Development, Energy Balance, Energy Structure, Renewable Energy Sources, Innovative Energy, Energy Resources, Investment.*

### INTRODUCTION

In the context of global competition, the countries that have been able to create a developed infrastructure and institutions for the development, commercialization and implementation of innovations have an advantage. Now, when all countries, although to a different extent, are experiencing the consequences of the financial and economic crisis, it is clear that those countries that take timely measures to re-equip their production and develop new technologies will emerge from this situation with the least losses. One of the most important measures to overcome the consequences of the financial and economic crisis is the accelerated innovative development of the fuel and energy complex. This direction has been and remains a priority in the policy of the Republic of Uzbekistan.

An important result of the economic reforms implemented in Uzbekistan has been the technical and technological renewal of one of the key sectors of the real sector - the fuel and energy complex. With the measures taken by the country's leadership, Uzbekistan achieved oil and, in General, energy independence back in 1995. Currently, taking into account the self-sufficiency of the Republic, measures are being taken to meet its needs in the medium and long term with the necessary quality energy resources on the basis of sustainable innovative development of the industry.

The fuel and energy sector plays a key role in the development of Uzbekistan's economy: almost 50% of capital investment is directed to this sector, and it accounts for 7% of the total gross domestic product (GDP). Specific measures to improve the efficient use of capacity, lower specific power consumption, reducing the share of natural gas by increasing coal use in the process of energy production, based on modernization, technical and technological re-equipment of enterprises, introduction of resource-saving technologies, and as a result, ensuring reliable and quality supply of consumers with electric and thermal energy in the long term [1].

At the same time, in the context of globalization of the world economy, the growth of non-renewable energy resources, increased competition on world markets liquid hydrocarbons and solid fuels for sustainable economic development increasing importance is the modernization of existing and development and implementation of new technologies at the enterprises of fuel-energy complex of the Republic, and also search and involvement of new alternative energy sources in the energy balance of the country. Also, one of the main problems at present is that significant physical and moral deterioration of production capacity does not always allow to compete with foreign manufacturers, even in the domestic market. This problem is also true for enterprises of the fuel and energy complex. Hence, there is a need to develop and implement an effective innovation policy at the enterprises of the fuel and energy complex of the Republic of Uzbekistan, the main task of which is to create a system that will allow you to use the intellectual and scientific and technical potential of this industry in the shortest possible time.

Therefore, the main task for the period up to 2020-2030 is to ensure macroeconomic stability and stable high rates of economic growth, improving its quality parameters through further diversification of economic sectors. This direction is especially relevant for the energy sector, given its system-forming role in the economy of Uzbekistan.

Medium-term targets for the development of the national economy are determined by the need to solve the problem of maximizing the gap between the development of the economy of Uzbekistan and the average level of development of developing countries in the long term. The assessment of the development prospects of the countries included in the category of medium-developed countries of the world is made in conjunction with the development of the world economy as a whole. Forecast estimates showed that the growth of the world economy for the period up to 2015-2020 will be -3.8-4.1% on an average annual basis, followed by a reduction to 3.5% by the end of the forecast period. The growth rate of the countries included in the category of medium-developed countries of the world will be about 4%. However, Uzbekistan's economy is very energy-intensive by international standards. Uzbekistan is 4-5 times lower than the average in Western Europe, 3.5 times lower than the United States, and more than 4 times lower than Japan and Korea. In the group of CIS countries, Uzbekistan has the highest value for this

indicator. The energy intensity of Uzbekistan's GDP exceeds the current value of this indicator in Russia-by 80%, Kazakhstan-by 70%, and Ukraine-by 20%.

This is due to the use of technologically outdated equipment, a high share of fuel and energy resources in the country's exports, relatively low prices for electricity and certain types of fuel, an inadequate accounting system for the production and consumption of electricity and energy resources, etc.

Also, one of the most important factors for the sustainable development of the fuel and energy complex in the medium and long term is the successful solution of tasks for the development of innovative energy, or so-called "green" energy, which implies wide application.

Today, the development of renewable energy is one of the most important issues of national and global security. In recent decades, the negative impact on the environment from the extraction and use of gas, oil, and coal and the high price paid by society for their use (the so-called "external side" environmental costs) have become apparent. The earlier the full-scale transition to economically profitable and environmentally safe renewable energy begins, the lower the risk of an energy crisis and the greater the economic gain for the country.

The developed countries of the world are actively searching for effective technologies for the use of renewable energy and currently various types of renewable energy are used in more than 70 countries around the world. The volume of energy produced on the basis of RES exceeded 10% of the total global energy consumption, despite their inherent disadvantages: time and spatial variability and instability of energy production; low energy density; high cost of equipment and energy produced (except hydro); the need to reserve generating capacity for RES; reactive power consumption.

The competitiveness of electricity based on RES is also weakened by current electricity prices, which currently reflect only the cost of fuel, operation and maintenance of current generating capacities and do not take into account the cost of introducing new ones.

Today, the main obstacle hindering the widespread use of renewable energy is the high cost of equipment and the cost of energy production, which still remain higher than the cost of traditional sources of electricity using organic fuel.

Capacity in the Republic's energy sector, as well as determined by the steady growth rate of electricity demand:

- for several years, the demand for electricity in the Republic has practically not increased. In these conditions, it does not make sense to focus on increasing the demand for electricity by developing traditional energy with large power units. This can lead to reduced reliability of power supply, as well as create additional problems and inefficient use of capacity during peak loads. From the above, we can conclude that the Republic has received a certain "time-out" for the development of traditional energy (excluding issues of modernization of existing power plants). During this period:

- the development of traditional energy is not only inefficient, but also unsafe from the point of view of reliability of energy supply;

- in these conditions, the Republic gets a good chance to develop energy based on the use of RES; in turn, if traditional energy in the Republic certainly suggests the import of power

equipment, for which the Republic does not possess the necessary scientific, engineering and technical basis, the development of renewable energy, by contrast, can contribute to the development of the national industry for the production of components and equipment for individual areas of renewable energy. In particular, it can be hydro turbines of medium, small and micro power, wind and solar power plants, complexes, power plants.

The experience of European countries shows that, despite the fact that the primary objects for renewable energy are consumers located in areas with a complete lack of centralized electricity supply, the largest amounts of energy production from RES can be obtained only when they work on the common network. For example, large wind turbines require reactive energy for their operation, which they can consume from centralized power grids. Also, the stochastic nature of wind and solar energy requires the use of backup power supply, which causes the connection of such installations to centralized power supply networks [2].

## CONCLUSION

In general, there are all the necessary prerequisites for the development of renewable energy in the Republic: environmental, economic, social and energy. However, further development of innovative energy in the Republic requires the following measures:

- state subsidies (as a measure that cannot be avoided at the initial stage) for research on renewable energy, for the creation of pilot and demonstration projects on the use of renewable energy, for stimulating the attraction of private investment funds;
- creation of a special Fund for the development of renewable energy, combined with the Fund for saving fuel and energy resources;
- the inclusion of mandatory business plans for new investment projects - energy users, a separate section providing for the establishment of a local source for renewable energy that cover the needs of the consumer in energy in the amount of not less than 5% (and possibly more depending on the region) of the contracted capacity connection to Central or electric heating system (this system is offered in return for serving in other countries, establishing appropriate fees for connecting new plants to the power networks);
- introduction of a point system (LEED) that allows you to quickly evaluate buildings for compliance with requirements (recommendations, proposals) for energy conservation, develop appropriate measures for buildings with different scores to use renewable energy to partially cover their own energy needs.

Thus, the adoption of these measures should stimulate the accelerated development of innovative energy in the Republic of Uzbekistan, which in turn will contribute to the sustainable development of not only the fuel and energy complex of the Republic, but also the national economy as a whole.

### ABSTRACT

*The results of researches for the first time the developed effective compositions of the composite materials filled with the mechano activated natural sands and other ingredients allowing increase in strength properties, heat resistance, a stability shift and crack resistance and in general working capacity and durability of asphalt concrete composite coverings of roads, bridges and airfields are given in article.*

**KEYWORDS:** *Physic Mechanical Properties, Heat Resistance, Composition, Fillers, Mechanoactivation of Ingredients, Stability Shift, Crack Resistance, Working Capacity, Durability, Asphalt Concrete Compositions.*

### 1. INTRODUCTION

In the Republic of Uzbekistan great state, strategic and economic value is attached to technical condition of transport network. In the general transport system of the Republic of Uzbekistan the dominant position is allocated for highways on which about 90% of economic loads and up to 95% of passengers of all volume of the transportations made by all means of transport are transported. The network of highways of the republic, including bridges, makes more than 147 thousand km, of them 50,7 thousand km of the road with asphalt, concrete pavements and 96,3 thousand km with petromineral and crushed-stone coverings. Construction of the steel concrete roads more than 10000 km long passing through desert and mountain regions of the republic is in the long term planned. In the republic there are 11 airfields with a total area of 600 hectares covered with concrete and asphalt concrete.

Sharply continental climatic conditions of Central Asia essentially affect a state and terms of operation of asphalt concrete roads. The durability application of asphalt concrete and oil mineral coverings of roads in the conditions of Uzbekistan because of their insufficient stability shift at high summer positive, and crack resistance - at low negative winter temperatures usually doesn't exceed 2-3 years. [1]. In recent years creation and receiving highly effective composite asphalt concrete coverings of roads, bridges and airfields is of broad interest.

Researches of a number of scientists have created the road-building composite materials capable to be operated in the range of temperatures from - 300C to + 70-800C. However these compositions and mastics not completely meet the requirements of climatic conditions of the Republic of Uzbekistan and in general Central Asia because of the low temperature of fusion of bitumen, decrease in adhesive interactions in system mineral-bitumen, formations of edges and cracks on the surface of asphalt concrete and mastic.

In the world literature are extremely insufficiently lit and there are practically no data on a research of a possibility of increase in heat resistance, a stability shift and crack resistance and, respectively, durability of composite asphalt concrete coverings of roads, bridges and airfields. It, first of all, is caused by lack of evidence-based approach to creation thermo, frost, crack-proof compositions with the improved technological properties. The solution of this problem demands essentially new approach to selection of ingredients taking into account their polyfunctionality, by the preliminary mechanoactivation of their surface promoting improvement of superficial interaction between filler and the dispersive environment, leading to different formation of polystructures in bitumen - polymeric composition. [4-6].

In this regard carrying out researches on creation and receiving import-substituting and export-oriented highly effective, composite materials on the basis of the mechanoactivated and chemically modified ingredients from local and secondary raw material resources of organic and mineral origin for asphalt concrete coverings and the pressurizing mastics for filling of deformation seams concrete and cracks of asphalt concrete roads, bridges and airfields for the purpose of increase their warm and frost-resistant, the shift of steady both crack-proof properties and, respectively, increase in terms of operation in the range of temperatures from - 250C to + 1200C is very current problem.

## 2. Subject and Methods of Research

Creations of effective compositions of import-substituting and export-oriented composite materials with vyoky physic mechanical and operational properties for coverings of the asphalt concrete roads capable to be operated in a wide interval of temperatures from -25 to + 1200C, on the basis of local mineral and secondary raw material resources of organic and inorganic origin.

**Object and methods of researches.** Objects of a research are bitumens of the BN-90/10 (BNI-V) brands, BN-70/30 (BNI-IV), BND-60/90, a rubber crumb, gossypol pitch, hydrolytic lignin, secondary polyvinylchloride, extinguished lime, basalt fibrous filler and activated fine wollastonite, chinaz and

Chirchiq river, yazjyavan and yangiyerbarkhan sandsand compositions on their basis. [1-2].

Object of research was establishment of physical and chemical regularities of interaction of components of model mixes and multiphase compositions from the organic, modified and mechanoactivated mineral and secondary raw material resources; definition of themechanism of

mechanoactivation of mineral ingredients; a research of physicommechanical and operational characteristics of the developed composite materials for asphalt concrete coverings and sealing of their deformation seams and cracks.

### METHODS OF RESEARCHES

Physical and chemical properties are investigated by means of IK-spectroscope. Physicommechanical properties of composition: - temperature of softening is determined by the KiSh method; - fragility temperature by the Fraasu method; - extensibility in accordance with GOST 11056; - durability of coupling with concrete on Tsh RUZ 4/14/2004; - depth of penetration of a needle in accordance with GOST 11501, water absorption in accordance with GOST 26589. [1].

### Results of researches and their discussion

We will consider results of researches of physic mechanical and operational properties and development of effective structures of compositions for asphalt concrete coverings of roads with use of the organic, modified and activated inorganic ingredients on the basis of local and secondary raw materials.

On the basis of results of physical and chemical researches of the modified bitumen's and gossypol pitch for creation of compositions of asphalt concrete coverings of roads we have developed bituminous compositions which structure and properties it is shown in tables 1 and 2. [3].

**TABLE 1 THE DEVELOPED COMPOUNDING OF BITUMINOUS COMPOSITIONS ON THE BASIS OF INGREDIENTS FROM THE LOCALRAW MATERIAL RESOURCES RECOMMENDED FOR APPLICATION IN COVERINGS OF HIGHWAYS**

Name of ingredients	Maintenance
BN-60/90 bitumen	40, 40,40
Gossypol pitch	35, 35,35
Secondary polyvinylchloride	20,23
Secondary polyethylene	23
Hydrolytic lignin	5
hydrated lime	2, 2
in total	100,100,100

**TABLE 2 PHYSICS - MECHANICAL PROPERTIES OF THE DEVELOPED BITUMINOUS COMPOSITIONS ON THE BASIS OF LOCAL RAW MATERIALS AND TECHNOGENIC WASTE**

Name of ingredients	Values of an indicator
Softening temperature, With, isn't lower (GOST 11505-66)	82, 79, 81
Fragility temperature across Fraas, With, (GOST 11507-65)	-20, -22, -20
Extensibility at 25 C, cm, not lower (GOST 11505-65)	4,2,4,1, 4,0
Durability of coupling with concrete, MPa (GOST 11508-65)	0,29,0,79, 0,30
Penetration depth to a needle at 25 C, mm-1 (GOST 11501-65)	30,0,28,0,32,0
Water absorption in 24 hours, %	0,18,0,20, 0,21

Water absorption in 24 hours, % mechanical properties of asphalt concrete compositions, mainly, depend on particle size distribution, extent of mechanoactivation of the fillers and properties knitting.

Considering it, we have conducted researches of properties before mechanical activation of inorganic ingredients on various equipment.

The conducted researches on mechanical activation of barkhan and river sands have shown that the most effective equipment is the dismembrator activator. It is established that such parameters of a dismembrator as a gap between a rotor and the stator, extent of loading and especially speed of rotation of a rotor have significant effect on extent of crushing and mechanical activation of ingredients of mineral origin. Being based on set of the conducted researches of influence of speed of rotation of a rotor, gap between a rotor and the stator and also extents of loading of a dismembrator, at mechanoactivation of natural river and barkhan sands it is possible to take for optimum parameters: speed of rotation of a rotor of 1500 rpm; a gap between a rotor and the stator - 0,20 mm; extent of loading - 3 kg/min. at which the necessary dispersion and the corresponding specific surface of river and barkhan sands and which meet the requirements to raw materials when receiving asphalt concrete coverings is reached. The mechanoactivation mechanism when processing minerals and natural sands in dismembrator installation occurs as follows. At the shock using-up processing mode activation happens generally due to formation of new surfaces to minor change of particle size distribution, and when processing in with great dispatch - raskalyvayushche - the using-up mode activation happens both due to change of particle size distribution, and due to exposure of new surfaces. Researches of influence of mechanoactivation on properties of natural sands have shown what after mechanoactivation of both river, and barkhan sands considerably changes their physical properties and by that they significantly become more active.

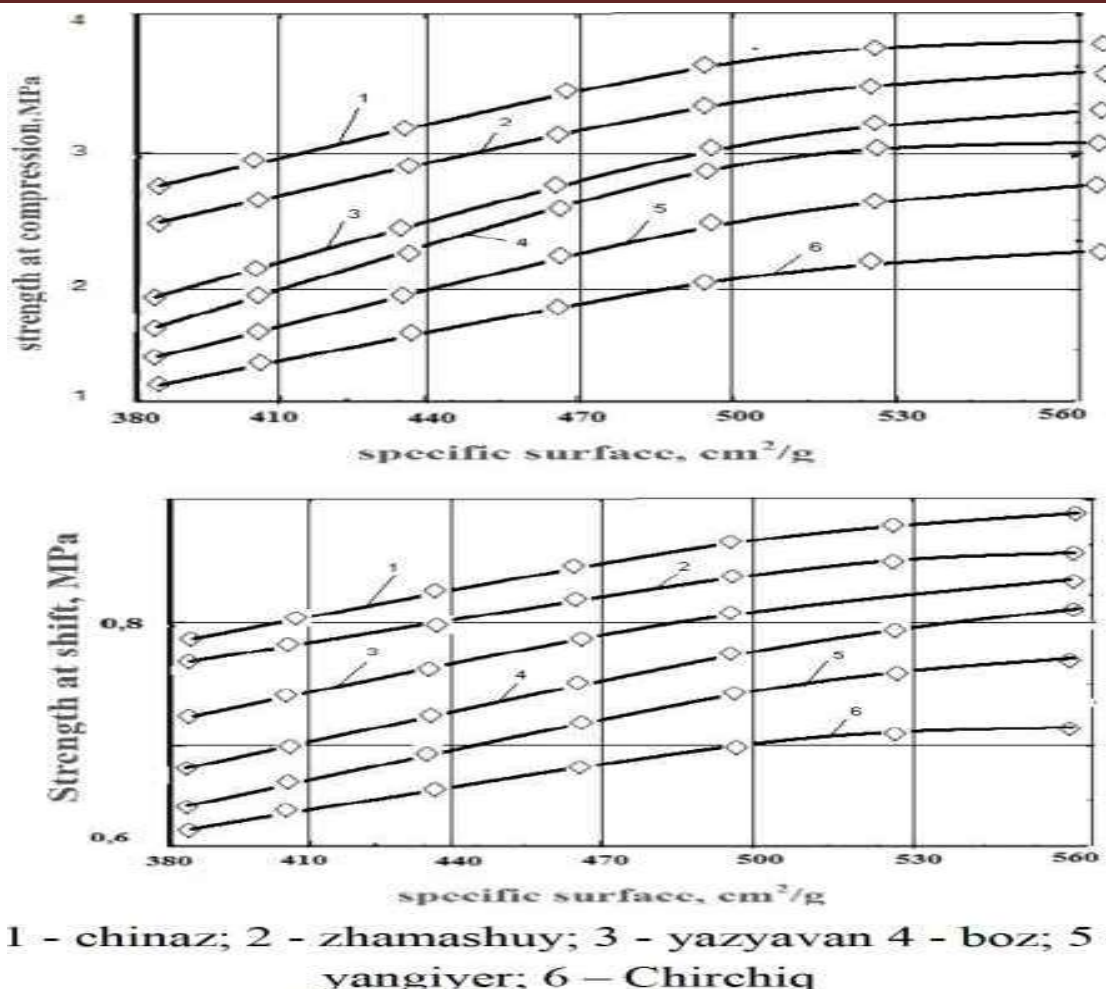

For development of the pressurizing mastics high-disperse particles with more developed specific surface are required. In this regard influence of speed of rotation of a rotor of a dismembrator on extent of crushing of a wollastonite concentrate has been studied. The obtained

data show that when processing a wollastonite concentrate on dismembrator installation with a speed of rotation of working bodies of 2900 rpm significant increase in its dispersion and, respectively, a specific surface is reached. It, in turn, leads to receiving the tonkoizmelchennymechanoactivatedwollastonite concentrate. So, if the initial wollastonite concentratecontains in the structure to 63,3% of particles fineness more than 200 microns, then at mechanoactivation with a speed of rotation of working bodies of 2900 rpm these particles are crushed to level below 200 microns and sharply the quantity of particles with sizes from 100 to 1 microns which 95,4% of the mass of an initial wollastonite concentrate are increases. In the course of mechanoactivation anisotropy coefficient thewollastonitekh of particles approaches unit, and indicators of oil-absorption power increase from 3 to 12 mg / 100 that demonstrates noticeable increase in a specific surface of a wollastonite concentrate after mechanoactivation in dismembrator installation. Therefore, that at mechanoactivation of natural sands on dismembrator installation under the influence of the shock splitting-using up effect there is an activation not only due to increase in a specific and adsorptive surface of the dispersed particles, but also due to formation of the reactive active centers, promoting improvement of interphase interaction which have significant effect on physicommechanical properties of compositions for asphalt concrete coverings of roads.

Proceeding from told and considering that the key indicators defining deformation shift stability coverings, are their durability at shift and compression, we have investigated influence of mechanoactivation on the specified strength indicators of asphalt concrete coverings. And strength properties of asphalt concrete composition, in turn, significantly depend on particle size distribution and, respectively, on the specific surface of mineral powder materials.

In this regard, dependences of strength at shift and compression from value of a specific surface of particles of sand at their mechanoactivation have been investigated and influence of mechanoactivation on durability of asphalt concrete coverings at shift.

Results of researches of durability at compression and shift of the asphalt concrete compositions received with the mechanoactivated natural sands are given in the figure 1 (and, b).

**Figure 1.** Dependence of strength at compression (a) and shift (b) of asphalt concrete composite materials from values of a specific surface of particles of themechanoactivated natural sands

Apparently from the course of curves of the figure 1 (and, b), when using at all mechanoactivated sands increase in durability at compression and shift of the asphalt pavements containing sands with increase in a specific surface of their particles is observed. The maximum increase in strength at compression and shift of asphalt concrete composition materials is observed at value of a specific surface of 550 cm<sup>2</sup>/g. At the same time strength increases from 1,3 to 3,9 MPas, and durability at shift increases from 0,6 to 1,0 MPas respectively.

Thus, introduction to structure of composition of mechanoactivatedsands, both river, and barkhan, allows to increase strength properties and, respectively, deformation shift stability the developed compositions for asphalt pavements of highways.

On the basis of complex researches and the revealed patterns of the received results the effective composition of composition materials with use of the mechanoactivated natural sands and organic ingredients is developed for asphalt pavements of highways, bridges and airfields.

Optimum structures of the developed compoundings of asphalt pavements are brought in tab. 3.

From data of table 4 it is visible that the compositions for asphalt concrete coverings received with use of the mechanoactivated sands modified by gossypol pitch in the place of mineral filler from BND 60/90 bitumen physic mechanical characteristics completely meet for all indicators the requirements of GOST 9128-97.

## CONCLUSION

Evidence-based approach to creation warm and frost-resistant, the shift of steady and crack-proof composite materials on the basis of local and secondary raw material resources for asphalt concrete coverings and sealing of deformation seams and cracks of concrete, asphalt concrete roads, bridges and airfields with the improved physic mechanical and operational properties, capable to be operated in extreme climatic conditions of the Republic of Uzbekistan is for the first time offered.

**TABLE. 3 COMPOUNDING OF COMPOSITIONS FOR ASPHALT CONCRETE COVERINGS**

Structure of an asphalt concrete covering	GOST 9128-97	The developed structures, an mass. %, with the content of sand			
		Chirchiq	Chinaz	Yazyavan	Yangiyer
BND 60-90 bitumen	6	-	-	-	-
BND 60-90 bitumen + Gossipolovaya smola 7% of bitumen weight)		6,042	6,042	6,042	6,042
road metal	45	45	45	45	45
The sand which isn't activated	41	41,058	41,058	41,058	41,058
mineral filler	8	-	-	-	-
The mechanoactivated sand	-	8	8	8	8
total	100	100	100	100	100
Brands developed compositions	-	БК-3-ЧчПП	БК-3-ЧзПП	БК-3-ЯзВП	БК-3-ЯнВП

Comparative characteristics of physicommechanical properties of the developed asphalt concrete coverings are provided in table 4.

The new effective way of increase in physic mechanical properties of asphalt concrete coverings by the introduction to their composition of the mechanoactivated mineral ingredients, in particular, natural river and barkhan sands based on with great dispatch the raskalyvayush which is using up, leading to formation of particles from the developed specific surface with the required geometrical and physical parameters due to polarization of particles at the molecular level, followed by emergence of the heterogeneous dipolar moments which promote improvement of adhesive properties with formation of hydrogen communications as with cationicly- active is developed, and it is anion - active agents what gossypol pitch and, eventually, to increase in interphase interaction between ingredients and bitumen is.

On the basis of the revealed regularities a number of brands of asphalt concrete composite materials is developed for a covering of roads - BK-Z-ChchRP, BK-3-ChzRP, BK-3-YazVP, BK-3-YanVP, the applied mechanoactivated sands differing from each other in the nature. For each specified brand of the developed composite materials the optimum technological modes of receiving their receiving (temperature of heating 150-1800C, mixture time 180 sec., mix temperature at release from the mixer within 120-1550C and temperature of mix by the beginning of laying 110-1200C) providing necessary physicomechanical and technical characteristics are defined.

**TABLE 4 COMPARATIVE CHARACTERISTICS OF PHYSICOMECHANICAL PROPERTIES OF THE DEVELOPED COMPOSITIONS FOR ASPHALT CONCRETE COVERINGS**

### ABSTRACT

*In this article, the unique qualities of the heroes of the epic poem "Alpomish" reflecting the centuries-old traditions of the Uzbek people and the richness of the oral creativity of the Uzbek people, their special aspects in the upbringing of children were studied.*

**KEYWORDS:** *People's Oral Creativity, Epic, "Alpomish" Epic Poem, Narrator, Spirituality, Morality, Upbringing, Courage, Friendship, Commitment To The Covenant.*

### INTRODUCTION

The education of representatives of the younger generation, who are considered to be future owners in a period of today's globalization, information flow has accelerated and again their negative effects, as young people who can compete with their peers around the world for the development of the country, society in every field, continue the centuries-old traditions of their people, making their ancestors. It can be said that the issue of upbringing, in turn, reflects such concepts as spirituality, enlightenment in its own time. President of the Republic of Uzbekistan Sh.Mirziyoyev in his address to the Oliy Majlis in 2020 put forward idea that "the greatest wealth is intelligence and science, the greatest legacy is good education, the greatest poverty is ignorance". In fact, knowledge, morality is absorbed into the veins of the Uzbek people.

Look, the issue of youth education is recognized as the most outstanding issue in the history of mankind as a whole, and even this is reflected in the pages of our ancient history. In the name of the Uzbek people as a single nation and as a single nation, there is a great and invaluable heritage of the so-called oral creativity of the people, which is in solidarity with it and serves to reveal the

distinctive aspects of the representatives of the people from other nations, through this resource the representatives of the people are after all, as the first president rightly pointed out, "The most ancient stones and inscriptions created with the vision and genius of our ancestors, from the samples of oral creativity of the people, thousands and thousands of manuscripts stored in the treasury of our libraries today, valuable works related to the history, literature, art, politics, morality, philosophy, medicine, mathematics, mineralogy, chemistry, astronomy, architecture, a nation with such a large heritage is rarely found in the world" [1].

The oral creativity of the people is the most viable, ancient, virtuous and always updated of our national values, bringing strength from the yellowing of the artistic thinking of each generation to the bleaching. Ancient examples of oral creativity were preserved in written sources, in particular in the huge memory – "Avesto", which was created in our country, as well as in the works of historians and adiblama, in rock paintings (such as paintings of Sarmishsoy, Zarautsoy), in archaeological and architectural monuments, in labor weapons and household items in a peculiar way. The oral artistic work of the Uzbek people was formed in accordance with the lifestyle, living conditions and level of social work of our compatriots, passed from father to son, from teacher to shogird, from father to generation, continuously polished, perfected, becoming more and more traditional, and finally gained professionalism (professionalism) and reached us through live performance.

One of the largest genres of Uzbek folklore is the epic poems. "Epic poem" refers to the story, adventure, meaning of description and praise and to the story of interesting events, the meaning of praise. The word epic is described in the explanatory dictionary of the Uzbek language as follows: "epic - story. An epic work of poetry and prose about the heroes of the people, known stories of famous adventures that pass from mouth to mouth, rumor definition-descriptions" [2]

M.Saidov noted that the saga is a complex work of art, in order for it to be an epic, it is necessary to have a literary text, music, carefully mastered the art of singing hafizlik and know how to play the sound. [3]

As a literary term, it refers to folk oral creativity and large-scale epic works in written literature. However, the epic poems in written and oral literature differ sharply from each other in their different aspects. The first are the epic poems, which have been sung verbally by narrators in the oral creativity of the people for centuries. The second is the epics, invented by poets in written form. "Alpomish", "The birth of Gurugli" in the category of Gurugli, "Malikai Ayyor", "Ravshan"; "Kuntugmish", "Rustamkhon" and etc. are examples of oral epics. The works of Yusuf Khos Hojib such as "Kutadgu bilig", "Gul va Navruz" of Haydar Khorezmi, "Hayrat-ul-abror", "Farhad va Shirin", "Leyli va Majnun" are written works and should be separated from their mouths.

Folklore scientist Muhammad Saidov noted that the epic poem to be a complex work of art, to be its epic, to be the following required:

- a) Known literary text,
- b) Music corresponding to the text,
- c) Be a singing evangelical singer,

d) The fact that the singer knows how to play one of the musical instruments - the instrument.[3] One of these recipes complements the other. Therefore, even the epic poems it is considered a syncretic - genre.

Educating young people in the spirit of courage, honesty, courage, spiritually pure and a unique pearl of the oral creativity of the people in adolescence competently the old friend of epic poem "Alpomish" teaches us the qualities of patriotism provides. To be just and truthful, to guard their land, family, stronghold, to be friendly, to be honest, to be honest, to be honest, to be honest with any of the holy shrines of our fathers. Teaches to keep from encroachments, to be morally clean. The epic poem "Alpomish" is a vivid example of our creative thinking, spiritual wealth how deep our historical roots are, in what environment our people are bright description of the formation, development, how to overcome difficulties provides. We are spiritually harmonious, morally clean, conscientious Uzbek on the example of Alpomish we see the appearance of their sons.

In the epic, each hero can become an example for today's youth with his beautiful qualities. As a proof of our word, it is described very beautifully that the father of Alpomish as a Boyburi heard the talk of his son zakot, even if he had his own state, that is, so that the Boysari would not go out to stingy, as zakot said in the epic poem, it is described very beautifully that only one "goatling" asks, an Alp young man with the tongue of the Uzbek woman Qaldig'och can move the Alpomish.

About this, the literary scientist Kazakboy Yuldoshev in his work "interpretations of the Alpomish" says: "the words of the Qaldirgoch, despite his young age, are not thoughtful mind, punctuality, "boiling" is not accidental. In general, in the life of the species, the mind of a woman is decisive. The power of the Uzbek woman is not in the wrist, waist, but in the language of the head-eyes. The Uzbek woman is strong in her weakness. She almost always keeps in touch with the fact that he does not quarrel with a man, he is content because he does not receive for his sake, he does not go against a man. [4] The Qaldirgoch told his brother:

*Aytgan so'zning poyomini bilsang-chi,*

*Ko'z kuyugi, ey narmoda, o'lsangchi.*

*Kecha-kunduz Haqqa fig'on etmagan,*

*Qilichiga qirmizi qon qotmagan,*

*O'z moliga o'zin vaji o'tmagan.*

*...Qultoyning do'qidan qaytib kelasan,*

*...Sen ham odamman deb qanday yurasan?..*

The above remarks once again prove that the original Uzbek aspects such as Uzbek shame, courage, solemnity are characteristic not only of the guys, but also of the Uzbek girls, and today the woman-daughters she calls her to seriousness, awareness, reminding them that together with chastity they carry the shame of her and other people. It remains to be said that the landscape of the Qaldirgoch watching the Alpomish is also beautifully depicted in the scene, which in reality is reflected high respect for his network, so eagerly with the aim of giving him moral support, saddling the horse of his liver, who is currently on the journey:

*...G'arib qulga Egam bo'lgay mehribon.*

*...Sog' borib salomat kelgin Alpinjon.*

*...El ko'chirib Olatovdan oshirdim,*

*Borgin, emikdoshim, Haqqa topshirdim.*

At first glance, the view that the Alpomish ate a bitch from a horse can not, because his pride is strong, his sister tried not to report to the Qaldirgoch, the landscape that he had side by side with the earth can lead a person to the wrong dream. At the same time, Alpomish, embodying a deep meaning in the phenomenon, did something original with his upbringing, typical of Uzbeks, although Qultoy was a slave, his grandfather. After all, in Uzbekistan slaves were not treated like other peoples. After all, in Uzbekistan slaves were not treated like other peoples. Because we Uzbek tradition "respect the adult-he, little self-esteem" and did not know as slave that Qultoy Alpomish, put his respect in place. The same lines can be seen in the treatment of the founder of the Uzbek novel, Abdulla Qadiri, who made his slave Hasanali of Otabek in the work "Utgan kunlar". The samples of oral creativity and the rules of etiquette inherent in the Uzbek people are common in the masterpieces of our written literature.

One of the main heroes of the epic poem, chastity to Uzbek girls - it is not exaggerating if we say that the image that can become an example of decency takes place in the hearts of the readers with its distinctive character and upbringing Barchinoy. As we read the epic poem, we are sure that in different difficult situations everyone can become an example for the youth of all times with a thoughtful mind, thoughtful mind. In particular, Qorajon, who conveyed that his Alpomish had come, "If it comes to Alpomish, although it has come. As the Alpomish came, will I keep up with the skirt of the Alpomish?" if we observe cases of loyalty to the promise inherent in the Uzbek people and courage when he says that he meets four conditions and fulfills four conditions, we can know the kindness of Uzbek girls towards his father when leaving his father in country Qalmoq through the following sentences spoken in his language.

*Otam deb qilarman bul zamon faryod*

*Buzilsin, yiqilsin ul charhi noshod*

*Dunyoning g'amidan bo'lmadi ozod*

*Qalmoqlardan qutulmadi salomat,*

*Otama bo'ldi vahmi qiyomat.*

In the epic poem, we can again see the image of a true friend on the example of a Qorajon. Their trust, loyalty and affection for each other are of paramount importance to today's youth as well.

In the epic poem, the issues of brothers, relatives, liver are described in such a wonderful way that we can see these landscapes in the way that the Boysari of the Boyburi, the Alpom of the Qaldirgoch, and again in the way that the qalmoqs' did to the Qorajon. You can learn from the following words, which the brothers of Qorajon, who accepted another religion, said in a high tone, which gives the landscape of the status of those who want to punish, but do not allow their conscience to do so.

*Yig'ilib qalmoqlar zo'rlik qiladi,*

*O'ldirmoqqa ko'zi qiymay turadi.*

As we read the epic poem, we can be sure that the spiritual state of the Surkhail old woman, her suffering, is described at an extremely thorough level. She also wants to see the fullness of her mother and children with a soulful tongue, but on this path she also goes to the level of seduction of Toychikon. It is known to all that no mother can admit who has touched her child, and this, of course, is due to her boundless love for her child. Therefore, today, when the Uzbek daughter, as an educator of the original continuation of our nation, was able to show her child the right way, starting from the mountain road, it is necessary to realize that she could be proud, first of all, before her conscience, and then showing her child with a bright face before country, that this is my child.

In addition, negative images are also given in the epic poem, through which the readers draw the necessary conclusions about what should not be done, as they say, "The mistress is sickle". In particular: the brother of the Kukaldos looks at the Qorajon:

*Menga dushman bo'lgan odam o'ladi,*

*Xotinimni qaytib o'zbak oladi.* to say that it was unfair to everyone who had someone else's daughter and who has not yet become a wife to Barchinoy.

In the epic, not only the intelligence of people, but also the kindness and specific stubbornness of animals to the owner, are also beautifully described, which is reflected in the example of Boychibor and Kukdunan in the epic poem. With Boychibor false racing, you really notice the race. Therefore, the soul does not sit down to lie. After all, as the epic poem says, "in the game win really digs".

The first president of our country, Islam Karimov, who knows that "the spiritual perfection and enlightenment of the nation and the people should be regarded as a universal public policy" in the work of "High spirituality – invincible power" -, "of course, it has always been of great importance for us to put kindness to the child, to idolize their blood, but to bring our children to adulthood on failure to pay attention to this issue can be seen in many life examples not only for some parents, but also for the whole society," [1] the head of our state, Shavkat Mirziyoyev, today, having come out on the field as a logical successor of these works, laid the foundation for honorable and responsible work, bringing up the children of our people with rich spirituality.

## CONCLUSION

In summary, each hero of the epic poems "Alpomish", which is considered a cultism of the epic poems of the Uzbeks and these epic poem, whether he is a positive or a negative hero, affects the education of the original Uzbek Youth, keeps the centuries - old traditions of our people in himself, does not miss the leadership in carrying out the function of the program of action. After all, about the main hero of the epic poem Alpomish, the First president of our country Islam Karimov said that "The invincible power of our people – in the image of the Alpomish, we see the spiritual image of today's alpomish - our sons who are able to protect our homeland from evil eyes and troubles, and who, if necessary, are ready to sacrifice their lives on this path. I am sure that every generation will cherish this heroic epic and bring it to the next generations. Singing

this heroic epic, no power can overcome the nation that made it to its heart and to its consciousness” he was right when he said.

### ABSTRACT

*This article provides details on the laminar and turbulent flow of liquid metal from alloy cast iron to the production of quality castings in sand-clay molds. It was also important to properly select the composition, ductility, penetration, furnace and casting system of the alloy to obtain a quality casting.*

**KEYWORDS:** *Chromium, Manganese, Molybdenum, Casting System, Alloy, Riser, Sand-Clay, Mold, Supplier, Casting Cup, Laminar, Turbulent, Bucket.*

### INTRODUCTION

Nowadays, one of the most important issues is to provide the production and processing industries with various details obtained by high-quality casting. Because in order to obtain a quality casting, it is necessary not only to have quality molds, but also: at what temperature and in what furnace to liquefy the alloy; correct selection of the injection system and the temperature of the liquid alloy poured into the mold; the fluidity, ductility and geometric shape and size of the cast alloy must be taken into account.

According to the statistics conducted by professors and teachers of the department "Casting Technology", at present in many enterprises of mining, metallurgy, chemical engineering and other similar abrasive operating conditions for the production of many parts from alloy cast iron.

The main brands of cast iron are ChX16, ChX16M2, ChX22, ChX22S, ChX28D2, ChX32, ICh290X12M, 280X29NL and others. In this case, according to the instructions of GOST 7769-82, cast iron may contain the following alloying elements after the letter Ch: X-chromium, S-silicon, G-manganese, N-nickel, D-copper, M-molybdenum, T-titanium, P-phosphorus, Yu - aluminum. Alloy castings are mainly made of parts that work in operating conditions with high aggressive environments and abrasive wear. Therefore, there is great interest in these cast iron in the production and processing of our country.

Although alloyed cast irons have high performance properties, obtaining quality castings from them will improve somewhat. Because cast iron is alloyed with various alloying elements, especially chromium, its alloying properties improve depending on the amount of chromium[1]. In addition, the abrasion resistance of alloy castings is very sensitive to the formation of its microstructure, that is, when obtaining alloy castings, it is necessary to ensure not only the quality of the casting, but also the formation of microstructure that provides corrosion resistance of cast iron.

The corrosion resistance of cast iron is mainly provided by carbides with a structure of  $(C, Fe, Mn)_7 C_3$ . The reason is that this carbide is 1,5-2,0 times harder than cementite carbide. Another complication associated with this  $(Cr, Fe, Mn)_7 C_3$  is that the amount of chromium in cast iron, which has 3% carbon for the formation of carbides in the system, is very high, ranging from 12 to 27%.

To determine the optimal composition of white cast irons was studied the effect of carbon and chromium on the casting properties of these alloys. The content of these elements varied within 1,53 - 4,15% for carbon and 12,84 - 31,5% for chromium with constant the content of the remaining elements 1,4 - 1,6% Mo, 0,4 - 0,7% Si and Mn (table 1). All heats were overheated to 1500° C, the samples were poured at temperature 100° C above the melting point casting alloy.

Figure 1 shows the effect of high chromium cast iron on ductility as carbon content increase.

**Fig. 1. The effect of changes in carbon content at 12 – 14 % Cr on chromium cast iron has been shown to affect ductility.**

**TABLE 1. THE EFFECT OF CARBON AND CHROMIUM ON THE CASTING PROPERTIES OF HIGH-CHROMIUM CAST IRONS**

**Fig. 2. Fluid flowcast iron (2.8–3.2% Carbon) incontent dependentchromium**

Increased chromium content also increases the fluidity of cast irons (see Fig. 2). Increase the chromium content in the range of 18-30% practically does not affect linear shrinkage of cast irons. Increase fluidity with increasing carbon and chromium content in these alloys, apparently due to the increase in their heat capacity.

**Fig. 3. The fluidity of cast irons depending on the pouring temperature:**

**1 - cast iron ICh290H12M; 2 - gray cast iron**

With an increase in cast iron pouring temperature (from 3% carbon and 12% chrome) their fluidity linearly increases and at 1500° C reaches 600 mm in the Keri spiral (Fig. 3).

The fluidity of cast iron ICh290X12M (2.8–3.2% carbon; 12–14% chrome; 1.4–1.6% molybdenum; 0.4–0.8% silicon and manganese) is linearly related to its overheating temperature (see Fig. 3) [2].

As can be seen from fig. 3, high-chromium cast irons (12–14% Cr) have high fluidity close to that of graycast iron. This means that we need to choose the right casting system to get a quality casting, taking into account the ductility of alloy castings.

### Essential features of gating systems

In the simplest of all gating systems the metal is poured down an open feeder head situated at the top or the side of the casting. This technique is often followed for small castings, in which the provision of an additional system of mould passages would greatly lower the yield of useful metal; at the same time the temperature distribution is favourable and the distance through which the liquid metal must fall is short.

In most cases, however, a separate gating system is used, the metal being distributed through passages into selected parts of the mould cavity. The essential features of a typical system are illustrated in Figure 4. The metal is poured into a bush or basin, whence a downrunner or sprue descends to the required level. From the base of the sprue further runners conduct the metal to the ingates, through which it enters the casting impression. Entry may be directly into the casting or into one or more feeder heads. The gating system may consist of a single passage or the metal stream may be subdivided and directed into the casting at widely dispersed points. For very large castings more than one sprue may be required, the individual sprues then being filled either from separate ladles or from a common tundish or launder. In addition to these basic features the gating system often incorporates devices for the separation of non-metallic inclusions [3].

**Fig. 4. Principal features of a gating system. (a) Bush or basin, (b) sprue or down runner, (c) runner, (d) ingates**

Before examining gating systems in more detail, consideration should be given to the general nature of metal flow in foundry moulds.

The mould erosion tendency during casting is accentuated by turbulent as distinct from smooth or laminar flow of the molten metal. In turbulent flow, although the mass of a liquid may have a resultant direction, there are wide local variations of direction and velocity within the stream. Laminar flow gives way to turbulence when the mean velocity reaches a critical value for the particular combination of metal properties and mould dimensions.

The balance of conditions determining the type of flow is represented in the Reynolds Number. [4].

$$(Re) = \frac{Vd}{\nu} \quad (1)$$

where:  $V$  = mean velocity,

$d$  = linear dimension of the mould channel section,

$\nu$  = kinematic viscosity of the liquid.

Turbulent flow is associated with high values of  $(Re)$  and therefore with high velocity, large flow channels and low kinematic viscosity. The value of  $(Re)$  at which flow becomes turbulent depends upon the geometry of the system but normally lies within the range 2000–4000. Turbulence will occur at lower values if smooth flow is disrupted by sudden changes in the dimensions and direction of the passages. Under most foundry conditions, given the minimum passage dimensions and flow velocities needed to avoid premature freezing, turbulent flow is encountered; a primary function of the gating system is to minimize its violence by shaping a smooth path for the liquid and by using the lowest flow rates compatible with mould filling. Streamlined passages are thus ideal.

### Design of gating systems

Most modern studies of gating systems have been based upon consideration of two laws of fluid dynamics. The first of these, the Equation of Continuity, states that the volume rate of flow is constant throughout a system and is expressed by:

$$Q = A_1 V_1 = A_2 V_2 \quad \text{B.X.} \quad (2)$$

where:  $Q$  = volume rate of flow,

$A$  = cross-sectional area of flow passage,

$V$  = linear velocity of flow.

The linear velocity of flow in a system is related to other factors in Bernoulli's Theorem, which states that the total energy of unit weight of fluid is constant throughout a system:

$$\frac{V_1^2}{2g} + h_1 + \frac{P_1}{\rho} = \frac{V_2^2}{2g} + h_2 + \frac{P_2}{\rho} \quad \text{B.X.} \quad (3)$$

where:  $V$  = linear velocity of flow,

$h$  = height above the datum plane,

$P$  = pressure,

$\rho$  = density.

The successive terms in the equation represent the kinetic, potential and pressure energies respectively. Flow calculations based upon these laws are subject to errors arising from friction, from sudden changes in cross-section, and from sharp changes in direction at bends and junctions. Corrections can, however, be applied using experimentally determined loss coefficients. Research has indicated that such losses are not so high as was at one time thought and that they are in many cases negligible [5].

These principles may be used to estimate the velocities of flow in individual systems. The behavior of metal in the down runner, for example, may be deduced from consideration of the linear velocity attained in a metal stream falling from an initial point of rest in the absence of frictional resistance. In this case, under atmospheric pressure, the potential energy at rest may be equated directly with the kinetic energy at any point in the moving stream. Thus, using the point in the stream as datum, the Bernoulli equation 3 becomes.

$$h = \frac{v^2}{2g} \quad (4)$$

Thus,  $V = (2gh)^{1/2}$  and the velocity is simply related to the distance offal from the initial point of rest.

In order to get a quality cast, we definitely need to take into account the ductility of the cast iron. Due to the high ductility of gray cast iron, the amount of chromium in it significantly affects the ductility of cast iron. Therefore, we need to pour the desired casting in the side casting system to get quality in the sand-clay mold.

**Fig. 5. Side gating**

The purpose of choosing a side casting system is to be able to fill the mold cavity evenly and to provide a good supply of metal in the castings to account for the ingress in the castings. Due to this, we can reduce the consumption of excess metal. It is also recommended that we use multi-branch suppliers when obtaining large castings [6].

**Fig. 6. Multiple ingate systems. (a) and (b) parallel finger ingates, (c) circumferentially placed ingates**

The reason is that our liquid metal needs to fill the mold cavity well in a short time. To do this, it is advisable to use the following multi-branch supply injection system. Through this casting system we will be able to get the quality casting we need.

### ABSTRACT

*Highlights the urgent problem today operational control cocoons in their initial processing. The analysis of the optical and radiation methods of control of process parameters cocoons. The block diagram and principle of operation of the optical device to control the density cocoon shell based on measurements of the luminescence emission intensity upon irradiation of UV radiation and device for studying the light transmission cocoon shell. The principle of operation of the photoelectric control unit density cocoon shell. The block diagram and principle of visual-optical and radiation methods and devices for monitoring cocoon shell. It is established that the optoelectronic methods and process parameters control devices cocoons is more promising.*

**KEYWORDS:** Cocoon, A Process Variable Output Of Raw Silk, The Degree Razmatyvaemost, Shelkonostnost, Stiffness, Thickness, Shell Linear Density. Emitting Diode, A Photo detector Device, The Light Transmission, Luminescence, Nymph, Scattering, Absorption.

### INTRODUCTION

Development of technical equipment and automation, determination of process parameters and their sorting is an actual scientific and technical problem, a solution that will ensure filature quality raw materials. Quality control of raw silk, at all stages of its production, is a necessary and indispensable, particularly on a primary treatment stage cocoons.

Improving the quality of cocoons largely determines the degree of razmatyvaemosti silk weight of their shells, the output of raw silk reeling performance of equipment and labor, and ultimately increase revenues and profitability silkworm industry. With the existing technique acceptance from silkworm live cocoons on their total weight and determining the quality of the cocoon raw organoleptic through the shell characteristic - it is difficult to fight against the collection and delivery of cocoons immature and low quality [1,2,3].

The technology of silk production the largest share of manual labor associated with the lack of an automatic non-destructive testing methods and means of sorting cocoons in various quality parameters and defects.

It should be noted that the cocoons of silkworm, which is produced from natural raw silk, is a product of living, body, whose characteristic depends on Rearing conditions. Therefore, even within one species differ in the gauges cocoons, stiffness, power, shell thickness, defects, etc. [4].

To obtain a high yield of raw silk and preservation process rhythmicity cocoons before unwinding grouped in production batches with approximately the same process parameters, which require the same cooking mode and unwinding [5,6,7].

Development of optoelectronics and its elemental base, creation of new efficient semiconductor sources and detectors of radiation in the infrared region of the spectrum create preconditions for solving the problem of recognition of cocoons of process parameters cocoon [8,9,10].

**Main part.** The main process parameters during the initial processing of the cocoon is parameters such as thickness, hardness, density, power and vnutripyatnistost membrane [4,6].

### 1. Methods and means of control and sorting cocoon shell of density.

Density - is the weight of the cocoon per unit volume and given by the expression [6]:

$$\gamma_0 = \frac{m_0}{S_l l} \quad (1)$$

Where:  $m_0$  - the mass of the shell;  $S_l$  - shell area;  $l$  - the shell thickness.

Hitherto envelope density is determined in vitro by measuring the volume and weight of the shell.

In [11], the authors conducted a study to identify luminescence method envelope density. A block diagram of the device for carrying out the method is shown in Fig. 1. It contains a mercury lamp RL, collecting lenses SL1 ÷ SL4, filter SF1 (PS-7), controlled QA cocoon prism RPP, filter SF2 (OS-I7), photomultiplier photomultiplier tube (PMT-17), an electronic amplifier and power plant ammeter ICA.

Fig.1. The apparatus of density determination method luminescent shell.

The apparatus operates as follows: UV radiation from the source is directed onto the surface of Controlled cocoon when exposed cocoon shell is excited and begin to emit luminescent radiation. Recently released via filter from the general background radiation and supplied to a light-sensitive area of the photoelectric multiplier, whose output is connected to an amplifier through an electronic micro ammeter. According to researchers, the intensity of the fluorescent radiation is proportional to the envelope of its density.

However, it should be noted that the luminescence of the inner layers of the shell can be absorbed subsequent layers towards the surface of the shell cocoon, which leads to a decrease in overall intensity of the luminescent cocoon radiation. In addition to the luminescence intensity significantly affects membrane contamination.

Thus, due to the high error and the unacceptability of this method is not widely used for automatic sorting of cocoons envelope density.

In [12] a light transmission cocoon shell studied and found that the degree of light transmission cocoon determines process parameters that directly affect the yield of raw silk.

A block diagram of devices for investigating the degree of light transmission cocoon shell is shown in Fig. 2.

The apparatus operates as follows: The test pod is cut by the equatorial cross section and half cocoon shell QoS is set between the slit and the monochromator SHM1 OM microscope lens.

Fig. 2. Device for the study of light transmission cocoon shell.

Next, the light from the source IP, passing through the pipe TM microscope strikes the surface of the controlled section KO investigated cocoon. The light flux passed through the shell hits the

entrance slit ShM1 monochromator, SHM2 outlet slit, which is installed photomultiplier PMT. The output of the latter is amplified by an amplifier and supplied to a recording device RP.

Before determining the flow of radiation through the shell all cocoons were divided into three classes.

The experimental results showed that the highest flux is absorbed in a cocoon shell of the first grade. Current corresponding to the intensity of flux passing through the cocoon is 29  $\mu\text{A}$ . Shell II-th grade stream is passed ahead I-th grade and less than III-th kind, a corresponding current flow rate is 41  $\mu\text{A}$ . Skins cocoons III-th grade passed stream is greater than the other grades and the corresponding current is 55  $\mu\text{A}$  microammeter.

This method is not acceptable for the automatic inspection and sorting of the cocoons. Since it is carried out destructive method.

Based on the optoelectronic method, first, we have developed a device for automatic and NDT sorting cocoons of shell density [13]. The principle of operation is based on measuring the weakening of the intensity of radiation transmitted through the sheath flow cocoon.

Past the radiation flux through the cocoon based on [14] is defined;

$$\hat{O}_\tau = \hat{O}_0 \exp(-\lambda_c / \gamma) \quad (2)$$

Where:  $\lambda_c = [P(\lambda) + \alpha(\lambda)](m / \Delta S)$  - spectral coefficient; (3)

$P(\lambda)$  - dissipation factor;  $\alpha(\lambda)$  - absorption coefficient cocoon shell;  $m$  - the mass of the shell;  $\Delta S$  - the area is illuminated by a shell portion;

$\gamma$  - density of the envelope.

Solving equation (2) yields:

$$\gamma = -\frac{\lambda_c}{\ln \frac{\hat{O}_\tau}{\hat{O}_0}} \quad (4)$$

The output voltage of the photodetector is defined as: [15]

$$U_\tau = \hat{E} \hat{O}_\tau \quad (5)$$

$$U_0 = \hat{E} \hat{O}_0 \quad (6)$$

where:  $K$  - conversion coefficient photodetector.

Then, the expression (4) with (5) and (6) has the form:

$$\gamma = -\frac{\lambda_c}{\ln \frac{U_\tau}{U_0}} \quad (7)$$

A block diagram of apparatus implementing the method is shown in Fig. 3.

The apparatus operates as follows: The master oscillator - MH generates a sequence of rectangular pulses which control the switch emitting diodes - and KID switch photodetectors CFP CFP and CDS switches serially connected to a power source opton pairs emitting diode and photodetector ID AF. Streams emitting diodes passing through controlled cocoon - QC on different parts of the shell are applied to photodetectors - OP1 ÷ FP7.

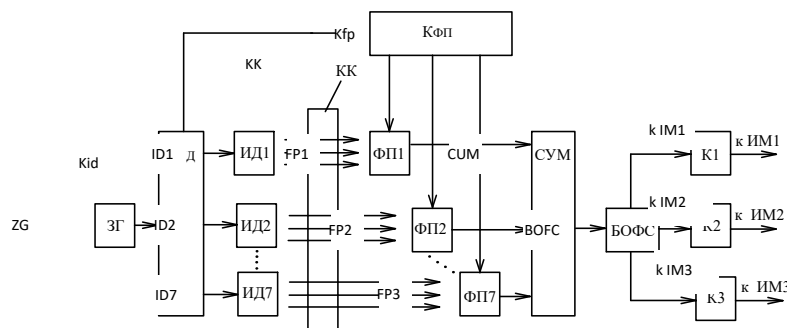

Fig. 3. The optoelectronic envelope density control device perimeter.

Photoelectric signals photodetectors are fed to the adder SUM, which is connected to the output of the photoelectric signal processing unit - BOFS. Appropriate control signals from the output BOFS served on electronic keys - KI ÷ Short circuit, which is controlled by three executive IM1 mechanisms ÷ IM3, are triggered depending on the shell density (minimum, average and maximum density).

A block diagram of a more advanced embodiment of the device shown in Fig. 4. It comprises a rectangular pulse generator - GOP pulse distributor - RI, pulse shapers - FI1 ÷ FI1, amplifiers - U1 ÷ U3 emitting diodes - ID1 ÷ ID3, control zones - QC, photodiodes - PD1 ÷ FD3 adder - MSA, the threshold device - SP, matching device - SU and electromagnets - EM.

The difference of this apparatus from the previous in that the photoelectric signal processing unit is designed as a threshold device connected in series and a matching device, and operating principle similar to the apparatus shown in Fig. 3.

Determination shell density cocoon listed devices are based on the expression (7).

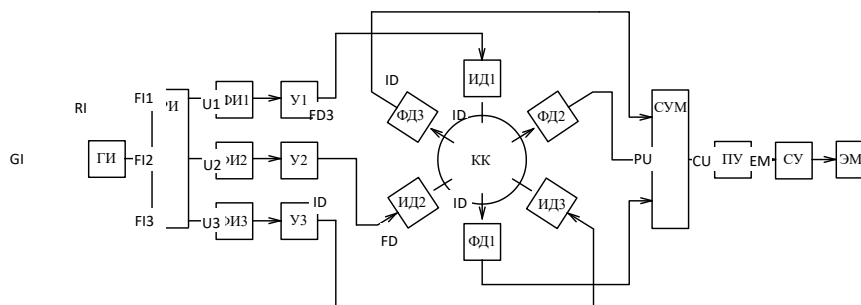

Fig. 4. Improved optoelectric density control device casing perimeter.

Further investigation of the above methods and tools showed that the use of the expression (7) to determine the density, leads to significant errors.

In expression (3) an integral part of the  $m / \Delta S$  - capacity (areal density) of the skin, and it is not constant and varies from 0.010 to 0.25 mg / mm<sup>2</sup>. Besides, the envelope density is insufficient

characterizes shelkonostnost, i.e. yield raw silk, i.e. two shells cocoon having the same density at various thickness can have varying degrees shelkonostnosti.

Thus, on the basis of the analysis and the expression (1) we can conclude that envelope power as compared with the density is more precise process parameter determining shelkonostnost.

## 2. Power Control Methods shell.

More accurate parameters shelkonostnosti, the output of raw silk and cocoon razmatyvaemosti length continuously, the power envelope is defined by the expression [16,17].

$$M = \frac{m_0}{S_l} \quad (8)$$

Where:  $m_0$  - the mass of the shell;  $S_l$  - membrane area.

From (8) we see that the power - it is the mass of the shell per unit surface area and in the physical sense reflects the areal density. Power envelope determined in practice only in laboratory conditions, weighing 5-7 mm diameter disk cut from the cocoon shell. Power cocoon shell can be determined with high precision optoelectronic monitoring method [12].

At the core of an optoelectronic power control method is based on the principle of measuring the proportion of radiation energy absorbed in the shell comprising a certain mass [11,12].

On the basis of [11] that has passed through the radiation flux cocoon can be described by the expression:

$$\hat{O}_\tau = \hat{O}_0 \hat{a}^{-m \hat{E}_\lambda} \quad (9)$$

Where:  $\hat{O}_0$  - the radiation flux incident on the surface of the cocoon shell;  $m$  - mass of the shell;  $\hat{E}_\lambda$  - shell of the absorption coefficient.

Solving the equation with respect to the mass of the shell, we obtain the expression:

$$m = -\frac{\ln \frac{\hat{O}_\tau}{\hat{O}_0}}{\hat{E}_\lambda} \quad (10)$$

Expression (10) through the envelope power based on (8)

It is described as:

$$M_l S_l = -\frac{\ln \frac{\hat{O}_\tau}{\hat{O}_0}}{\hat{E}_\lambda} \quad (\text{eleven})$$

it follows that:

$$M_l = -\frac{\ln \frac{\hat{O}_\tau}{\hat{O}_0}}{S_l \hat{E}_\lambda} \quad (12)$$

Where:  $S_l$  - the area of the irradiated portion of the shell.

If the irradiated area of the shell portion is constant, the following expression holds for the power;

$$M_l = -\frac{1}{\hat{E}} \ln \frac{\hat{O}_r}{\hat{O}_0} \quad (\text{thirteen})$$

Where:  $\hat{E} = S_l \hat{E}_\lambda$  - constant.

From the expression (13) shows that for a constant area irradiated portion of the radiation passed through the sheath flow characterizes its capacity.

### 3. Methods and means for monitoring vnutripyatnistosti shell.

The output of raw silk except shelkonostnosti also affects vnutripyatnistost shell [18,19,20]. Vnutripyatnistye cocoons is soiled silkworm body fluid, decomposed inside the cocoon. Cause of death is vnutripyatnistosti silkworm cocoon shell inside a cocoon stage larvae or pupal stage [21].

To determine vnutripyatnistosti shell used a variety of control methods, which are based on irradiation of the cocoon and the body is detected, created internal spots.

One method is the optical-visual method. On the basis of the method developed by the authors of [17] to determine the device vnutripyatnistosti shell, the operating principle of which is based on the irradiation luminous flux cocoon shell and inner spots visual detection method. A simplified block diagram of the device shown in Fig.6.

Fig. 6. An apparatus casing vnutripyatnistosti visual inspection.

QC controlled cocoon mounted on special cassettes SK. Streams F illuminator radiation irradiated OS controlled QC cocoon, and passed therethrough on the light fluxes OZ reflecting mirror projection spots formed inside the cocoons that are detected by visual means.

The main disadvantage of this device is unacceptable for automation cocoons sorting shell vnutripyatnistosti.

It is also known to determine the shell vnutripyatnistosti by irradiating X-rays and recording the transmitted radiation flux through the cocoon [22,23]. A block diagram of an apparatus realizing this method is shown in Fig. 7.

The apparatus operates as follows: X-ray emission from III source, passing through controlled cocoon CC and lead aperture diabetes, strikes the radiation receiver PI, the output of which a signal through the electronic power PP is supplied to a recording device RC.

Figure 7. Radiation monitoring device vnutripyatnistosti shell.

The disadvantage of this device is the low accuracy of measurement due to the influence of fluctuations in the controlled cocoon zone control and change the diameter of the largest casing for monitoring result.

In [24] a method of determining vnutripyatnistosti shell, which is based on luminescence analysis using an ultrahigh pressure discharge lamp.

Controlled cocoon irradiated with UV - radiation and luminescence radiation is determined vnutripyatnistost cocoon. In this case, if the cocoon shell has an internal stain on the background fluorescent light shadow will appear.

The disadvantage of this method is the low accuracy due to the influence of other types of membrane contamination and unacceptability of the process.

It is also known an apparatus for sorting Japanese cocoons of vnutripyatnistosti shell [17] that is based on a controlled irradiation cocoon  $\gamma$  - beam and comparing the shapes of the absorption of waves transmitted flux through the net and vnutripyatnistye cocoons.

The block diagram of the device shown in Fig. 8.

The device operates as follows: Controlled cocoon QC irradiated  $\gamma$  - rays AI source. Radiation passing through the cocoon flow through the lead aperture SD falls on the radiation receiver PI and converted into an electrical signal which, via a system unit SP is supplied to the air valve VC. Further cocoon by a conveyor T of the air valve reaches the area BK and BK is sorted into a special tank.

Fig. 8. Radiation sorting device through the shell vnutripyatnistosti cocoons.

The disadvantage of this device is the low accuracy due to the influence of fluctuations in the controlled cocoon during irradiation on the inspection result.

Analysis of the various methods and means for the control of process parameters cocoons shows that the promising control methods are optoelectronic.

## CONCLUSIONS

Analysis of the optical and radiation techniques and technological parameters control devices cocoons possible to establish:

- lyuminestsenty method of determining the density of a cocoon shell has a high accuracy due to the influence of contamination significantly shell on the luminescence intensity.
- on the basis of this analysis it can be concluded that the capacity of the shell as compared with the density is more precise process parameter determining shelkonostnost.
- the main drawback of fiber-optical and radiation control method vnutripyatnistosti shell cocoon is the unacceptability of these methods to automate cocoons sorting process parameter.
- Optoelectronic methods and automatic control devices of process parameters cocoon is more promising.

Analytic Hierarchy Process (AHP), IRAN

### **ABSTRACT**

*This is in question whether decentralized budget distribution among organizational subsidiaries and their distinctive activities are critically defendable or not? Undoubtedly, a series of varying discrete budget distribution procedures designed and modeled; in essence, budget distribution is based on Equal Distribution Patterns or Program Distribution Patterns which can be distributable as per of ratio each and every organizational units' past activities weight to cost centers. The purpose of this article is to present a model regarding a fair distribution of decentralized credit into each of ACECR's (Academic Center for Education, Culture and Research) affiliated units by using Analytic Hierarchy Process (AHP)<sup>1</sup>. This is a descriptive survey that is of respective statistical samples having ACECR's units and research centers. The importance of each contributor to budget distribution has been oriented by both group decision-making process and Analytic Hierarchy Process (pair-wise comparison matrix). The results indicate some meaningful relations concerning recruitment type, education level, members' activity area, the proportion of organizational positions occupied to adopted, the amount of fixed*

*assets and new investments and finally per capita revenue to subsidiaries' cost centers and units annual credit.*

**KEYWORDS:** *Budget, Credit Distribution, Analytic Hierarchy Process And Group Decision-Making Process.*

## INTRODUCTION:

Developments and complexities of the modern era highly require organizations to take an array of reasonable and particular measures including proceeding to proper planning, decision making and scientific management in terms of subsections requirements and subordinate units in organizations. Applying modern methods of credit distribution not only does prevent from slow pace of administrative units and waste of public funds, but it also is effective apropos socioeconomic ends advancements; in this way, organizations can fairly distribute their resources among the preferred targets. An economic development—in both part and regional facets—requires having a thought-out comprehensive pattern based on policy goals.

Obviously, budget is an essential tool in achieving the organization objectives. Division and equitable allocation of financial resources is one of the important management tools; furthermore, achieving a logical tactic for this purpose plays an important factor so as to avail organizations preset appropriate goals. Studies of credit distribution trend among departments and cost centers, especially in research centers, show that a majority of these centers do not take into account the proper criteria, indices, measurement tools and knowledge of fund allocation monitoring (Mehrabi, 2003)<sup>1</sup>.

Society progress associated with organizations development; consequently, it is entailed having efficient systems in resources allocation and also mechanism of controlling and planning will be posed. As a result, traditional budgeting methods go into advanced and modern science and research based methods (Namazi, 1999).

Current research aims at identifying and ranking effective contributors regarding decentralized credit into ACECR's (Academic Center for Education, Culture and Research) units and subsidiaries then. In this study, respectively, factors affecting the credit distribution are recognized based on experts' opinions; the importance of each and every factor – by decision-making methods – determined.

Therefore, division and allocation of budget resources, fairly and reasonably, will be extended to the ACECR's senior management; and it also provides homogeneous and consistent growth along with preset goals.

## Principles and Research Literature

### Studies reviews

Using a series of mathematical models, particularly by emergence of "Planning Programing budgeting System"(PPBS)<sup>2</sup> in 1965 and "Zero-Based Budgeting" (ZBB)<sup>3</sup> in 1973, were wildly spread (Seng Lee,1979)

It is worth mentioning that, between 1920 and 1935, cost monitoring was highly regarded; while, budgeting played just a controller. At this stage, budget was prepared on the basis of seasons, materials and costs (Azar, Seyed Isfahani, 1995).

In the last two decades, several mathematical models have been extended in regard with eco-financial budgeting and planning (Buddy and Morton, 2002), such as utopian economy model for Nigeria which was presented by "Y.A.H"<sup>4</sup>

(M & W, 1998)<sup>5</sup> conducted researches and questionnaires for different States of the U.S., in order to find out how they can make it possible to develop a utopian model for budget distribution based on operation and specific indices. Afterwards, their findings indicated that all wide nation but three states had owned their specific requirements in terms of budget distribution, moreover, a majority of these states enacted regulatory field since 1990's then.

(J & H, 1999)<sup>6</sup>, the state budgetary executive authorities' survey results implied that budgeting distribution is based on some incentive-effective operative indices.

(A.R 2004) <sup>7</sup>has shown that it is likely to maintain a fair budget distribution based on some operative indices in a number of the states of which authorities hold professional competences, in their domain, for those changes needed. (B & L, 2004)<sup>8</sup> found that using indices of effectiveness and efficiency rates slightly decreased in a span of ten years (1990-2000). They also found that in periods when levels of financial resources had changed, yet the stated indices were greatly improved. (B.E, 2011)<sup>9</sup> in her article "The budget for education-research centers; International experience and policy lessons", has answered three following questions:

1. What are the budgeting formulas differences among governmental education-research centers?
2. What are the indices in budgeting models?
3. What are the lessons due to the international experience & policy?

This research shows that in sample countries, education-research centers being financially granted in accordance with purposeful pattern in juxtaposition to current policies of higher education.

(D, ET all, 2011) <sup>10</sup>in his study "European universities budgeting and financial independence" addressed 200 active research-based universities in 33 European fields of research(Including: 27 member countries and Croatia, Iceland, Israel, Norway, Switzerland and Turkey); these countries, which had been being public financially resources paid, affecting under control of a specific framework. The results show that European higher education system has been undertaken an array of changes in less than ten years, which mostly ends with far independence. In other words, more independence of a university, in essence, brings about an ability to achieve its budget from distinctive resources such as competitive budgets, contracts with private companies and nongovernmental organizations' financial aids. In this case, research and educational institutes not only do less depend on a single stream of revenuebut they also are more prone to gain environmental consistency.

(Entezaari & Mahjoob, 2013) Iranian researchers in a study titled "a suitable mechanism and a proper method to allocate general resources in higher education" have investigated both desirable mechanism and system availability, and the question of what an appropriate mechanism for Iranian Higher Education System. To achieve this goal then they take some actions in sequence:

to begin with, different systems and mechanisms of financing beside their criteria are recognized by qualitative meta-analysis; in the following framed spectrum, often mechanisms are evaluated based on financing regulations. Analytic hierarchy process results–based on six contributors via process evaluation method– proclaim that the best financial resources allocation mechanism to higher education, in the world, can be income contingent loan for students surrounded by higher education services market.

"The introduction of template required financial resources assessment for macro goals of the Science, Research and Technology out of public resources", Gharoon (2013), in his article estimated the government sources needed to achieve a certain level of outputs by using the Neural Network Method. Statistical population consisted of the universities and the research centers affiliated but Azad Islamic University and non-governmental colleges. Results of the implementation model showed that networks, exchanges between educational and research activities with resource constraints in the existing system, and also indicated the existence of some economic scales at the micro level significantly; thus an appropriate framework for estimating the resources required without detailed descriptions and parametric relationships between inputs and outputs are created. "Examines how the allocation of budget credits using Fuzzy goal programming model" Mohammad Namazi (2002); Issued and studied preparing model for ideal distribution of budget in the industry and mining, agriculture, the private sector, cooperatives and government agencies based in the of Fars province. The aim of this study was to provide preparation and management of scientific model to determine the appropriate mechanism to determine the allocation of financial resources.

Jamshid Babaei (2006) in her graduate thesis dealt with entitled "Analysis of the structure and budgeting process in the Police systematic approach" and the general trend in the wake of research has confirmed the importance of scientific model of budget distribution.

Seyed Esmaeil Hashemi (2014) in their study provided a budget distribution model for administrative systems in Golestan Province; it has been the aim of this study to provide a suitable and efficient scientific budget distribution model in line with the needs of Golestan province executive agencies.

Therefore, in this study the principles of budget distribution collected and expressed its strengths and weaknesses conceptual model for the implementation of decentralized budget presented in ACECR.

### **Budget and the evolution**

Since the advent of budget terms, of numerous definitions have been conducted. According to the peoples' perception and attitude, the budget issue is different. In the beginning, the budget merely meant a budget computing. That is why the definition of the term is available, meaning budgeting associated in the minds (Yousefnejad, 2007). The concept and definition of the budget from both the perspectives of scientific and legal points of view can be considered.

Budget, from the viewpoint of customary and commonly, includes the definition that has been proposed by connoisseurs and experts of economics. For example, in the definition of the budget: to keep the budget income and expenditure account of a balance between income and expenditure to the budget deficit not arise (Babaei, 1381).

Legally in the matter of public accounting act first enacted in September of 1987 the budget has been defined as follows: "The entire of the country budget is the government's financial plan prepared for a financial year and contains forecasting revenues and other sources of funding and estimating costs for operations that lead to the achievement of policies and legal objectives, Of three parts are composed as follows " (Sheikh Wadud, 1382).

In general, before and during the rule of constitutional monarchy in Iran, monitoring of the budget was minimal and kings were in power, how to tax the people was done by them as well. With the advent of the constitutional revolution, legislation was introduced in the budget which was derived mainly from French laws. After the constitutional revolution in Iran, the first budget in new approach to directing in 1289 solar calendar carried out by Sani'odowleh, being prepared and submitted to parliament. This procedure continued until the year 1320 Hijri (1941) Likewise; the administration of the budget of the Ministry of Finance was responsible for. In the year of 1948, with the current budget, budget preparation and operation of state companies were submitted to Parliament. In 1340, all matters related to the development budget were assigned to the planning organization; in addition, all affairs relating to the regular budget were transferred to the finance ministry. The task of preparing, since 1967 then, operating budget and development were prepared separately at the headquarters of planning and budget organization was awarded to a new unit called "central office and budget plan". Fourth five-year plan was approved in 1968 and the Fifth five-year development plan was implemented in 1973 and continued until 1977 (Ahmadi, 2003).

From the 1979 to 1988, coincided with the revolution and the war, because of problems emerged, practically important event--in the process of preparation of the state budget--has not been forthcoming. In 1989, the first development plan approved by parliament after the Islamic revolution and continued until 1994. In a span of these years, budgetary purposes continued in a form of five-year programs; In 2005, the authorities was emphasized operational budget preparation method. The 1385-circular budget was prepared on the same basis and communicated to all the executive agencies and ultimately to Parliament and approved. Fortunately, since 2014 the country's budget bill has been on the agenda of the planning and budgeting organization despite changes and developments in recent years of the country budgeting system; "budgeting based on operations and determining criteria and triggers" (Kordbacheh, 1395).

### **Goals and benefits of budget distribution to cost centers**

Ensuring and strengthening accountability at various management levels, achieving output oriented approach, granting authority to managers in the selection of inputs needed to produce the desired output, underlying continuous performance appraisal of managers and performance results as one of the criteria for allocating funds and decision-making in evaluating managers' performance, producing transparent financial management information for decision making in relation to the increase, decrease budget allocation, escaping from routine life and achieving the long-term planning and spending on programs, enhancing the capability of managers in the management of financial resources, physical, human and information, reducing corruption and bribery at different levels of management and decision-making, providing a proper basis for making decisions about resource allocation, determining measurable results expected, decision-making process focusing on the most important problems and challenges which administration

faces with and creating a logical process for making decisions regarding budget which are directly related to the process of planning, implementation, monitoring, evaluation and reporting on performance, considered the most important goals and benefits of fair distribution of budget and credits among the cost centers.

### **Challenges in the budget distribution among cost centers**

The budget distribution among organizations and cost centers of which belong to administrative agencies subsets takes time and entails an effective- efficient leadership. Executive challenges of this system can be left behind, provided that these challenges are well understood and actively investigated and dealt with (Babaei, 1386). The most important of these challenges are as follows:

1. The difficulty of defining the indicators and activities.
2. The complexity of identifying the cost of activities.
3. Difficult to justify budget in each and every index and activities.
4. Resistance by managers of subsidiaries.
5. The complexity of improvement process in technology systems information.
6. Lack of coordination among the areas related to preparation and making the necessary preparations.
7. Not justified levels of planning and budgeting as well as managers and experts subsidiary.
8. Lack of hardware system and software programs along with experts in the field of finance.

### **ACECR budget<sup>11</sup>**

ACECR as one of the research centers with the aim of creating a bridge between academia and industry and services have been created, about twenty percent of its annual budget from credits approved in the budget law of the country is obtaining. The remaining eighty percent of its annual budget revenues from professional services and research, in technical fields - engineering, medicine, science, agriculture, humanities, etc. as well as long and short-term specialized training acquired. Public credit of this institution absorbed budget from legal validity of the rows which is divided into two categories:

#### **A: centralized budget:**

Part of the state budget during the year towards the various assistance programs and policies, domain or the organizational units assigned to their activities.

#### **B: decentralized budget:**

Part of the state budget to pay for personnel costs, staff and maintenance of equipment and buildings, the units assigned.

In this study, efforts have been made to identify indicators presented mathematical model based on distribution of the decentralized budget credits among affiliated units and centers to seem reasonable. Therefore, questionnaire has been adjusted in two stages for managers, research institutes, experts and informed people so as the proposed model has been developed based on these studies.

### Hypotheses development

Considering the fundamentals and peer-reviewed research literature, per capita income variables, Posts occupied in the proportion of positions adopted by the organization and communicated, the fixed assets and new investment, the quantity and quality of human resources, have influenced on the distribution of decentralized subordinate units and included in this study.

- Indicators of human resources: In order to meet part of the costs of staff members working in the unit is considered. This index is based on three main factors:

A: Activity (in ACECR, there are five areas of activity: research, education, culture, support and the presidency)

B: The level of education (education at five levels: diploma, associate degree, undergraduate, graduate and professional degree and Ph.D.)

C: The type of employment (type of employment manpower in ACECR is divided into three categories: formal, alliance and contract)

- The ratio of approved posts to occupied ones: Since the move in order to match the current organization with approved organizations including ACECR is one of the establishment objectives. Thus, in order to propel the current situation and research institute forming unit by forming approved, these indicators are considered.

- Fixed asset index: Fixed asset-specific rate of revenues as an indicator to determine the validity of decentralized units are considered. The first objective of the Index is to provide the cost of maintaining fixed assets and secondly, increasing motivation for the development of physical spaces and equipment.

-The amount of fixed assets includes: A) land and buildings B)Property, machinery and equipment C)Vehicles.

- Specific income per capita index: Considering the fact that about eighty percent of ACECR budget is provided by dedicated revenues, so in order to motivate the subordinate units to increase private incomes, these indicators have been considered. Also per capita income divided specific organizational unit of the special revenue into the number of workers considered in that unit. Thus implications of these research hypotheses are presented as follows.

### 3. Research hypotheses:

Hypothesis 1: The number of workforce (disaggregated by type of employment, education and activities) with decentralized credit relationship is established.

Hypothesis 2: a significant relationship is between the amounts of fixed assets with decentralized credit.

Hypothesis 3: There is a significant relationship between per capita incomes with decentralized credit.

Hypothesis 4: There is a significant relationship among the proportion of posts occupied positions adopted with decentralized credit.

Hypothesis 5: there is no significant difference between the ranking factors by hierarchical analysis and comparison means.

#### 4: RESEARCH METHODOLOGY:

The method used in this study is a descriptive study and the purpose of the study is applied, as is oriented towards practical application of knowledge.

According to the study, the population of this research consists of managers, administrators and experts within departments and ACECR research Institute affiliated. In this study, managers and specialized professionals with at least five years' work experience in the field of ACECR have been considered. In order to achieve the desired sample multi-stage sampling technique was used on three levels. At the first level, the units considering the extent of the record and development activities were divided. According to determined population size and by using the (Cochran formula) of success for society at large, the sample size was 96. Considering the 25 selected branches, on-probability sampling method of judgment for the selection of the sample (95% confidence level and error ( $\varepsilon = 5\%$ )) was used that 3 to 4 people in each unit and the Institute were selected. Of course, in the process of conducting research, based on data, 94 questionnaires completed was diagnosed valid and usable.

$$n = \frac{z^2 pq}{d^2} = \frac{(1.96)^2 (0.5)(0.5)}{(0.05)^2} \approx 96$$

In this study, from two questionnaires were used to collect data. The first questionnaire based on review of literature and considering the views of experts in the field of taxes and the plan was developed, includes 15 questions which identify important factors on the distribution of decentralization. As mentioned, these factors have been divided into four groups as follows: Human factors, factors relating to the structure, factors relating to the assets, and the factors related to per capita income. Scale used in the questionnaire is a five-point Likert scale.

Using data extracted from the first questionnaire and the related statistical analysis, the final factors affecting the distribution of decentralized recognized then the second type of the questionnaire was set on the first basis. In this questionnaire, respondents were asked to conduct paired comparison (two by two) according to the instructions given, human factors, together with its subsidiaries, factors related to the structure (the proportion of approved posts to occupied), Factors related to both fixed assets and per capita income to determine the order of importance of these factors.

For determination questionnaire validity, first the experts and tutors' opinions were used. The second component factors of the statistical analysis of the questionnaire obtained data then. Also The experts and financial experts and planning in terms of the development of this questionnaire, which confirms its validity. Reliability of the questionnaire was assessed by Cronbach's alpha test. The mean alpha spectra obtained for about 84 percent of all variables that showed high validity of the questionnaire.

#### Data analysis and hypothesis testing

For ranking 18-fold factors, from average comparison and AHP methods are used as a supplementary for first approach. In the wake of hypothesis, in order to analyze the data from different statistical methods are used, the results of which are presented below:

**Ranking factors: Hierarchical approach (AHP)**

The required data for the comparative test was conducted by hierarchical approach; priorities for each group of factors as well as factors were the higher level, the results obtained are the following tables

Relative Weight	Human Resources Factors	Rank
0/1500	Employment Type	1
0/5500	Education Level	2
0/3000	Activity Area	3

**TABLE1. RANKING FACTORS AFFECTING THE DISTRIBUTION OF MANPOWER  
(SOURCE: FINDINGS)**

Relative Weight	Human resource factors - Employment Type	Rank
0/1430	Official hiring	1
0/1570	Employment alliance	2
0/7000	contractual employment	3

Table1-1. Ranking factors affecting the distribution of Human resource by the type of employment (Source: Findings)

Relative Weight	Human resource factors - Education Level	Rank
0/1000	Diploma	1
0/1200	Associate Degree	2
0/2200	Bachelor	3
0/3000	Professional master's and Ph.D.	4
0/2600	Postdoc	5

**TABLE2-1. RATING BASED ON HUMAN RESOURCES FACTORS AFFECTING THE  
DISTRIBUTION OF EDUCATION LEVEL (SOURCE: FINDINGS)**

Relative Weight	Human resource Factors - Activity Area	Rank
0/3100	Research	1
0/2400	Cultural	2
0/2100	Educational	3
0/2400	Support	4

**TABLE 3-1. RANKING FACTORS AFFECTING THE DISTRIBUTION OF HUMAN  
RESOURCE TO SEPARATE ACTIVITY AREA (Source: Findings)**

Relative Weight	Structural Factors	Rank
0/1000	The Proportion of Approved Post to Filled Posts	1

**TABLE 2. RANKING FACTORS AFFECTING THE DISTRIBUTION THE PROPORTION OF POSTS APPROVED BY THE FILLED ON CREDIT (SOURCE: FINDINGS)**

Relative Weight	Factors Related to Fixed Assets	Rank
0/5000	Fixed assets (land, buildings, vehicles, property, machinery, etc.)	1
0/5000	The new investments during the fiscal period	2

**TABLE 3. RANKING FACTORS AFFECTING THE DISTRIBUTION OF CREDIT RELATED TO FIXED ASSETS (SOURCE: FINDINGS)**

Relative Weight	Factors Related to Specific Income per Capita	Rank
0/5500	Research	1
0/1500	Cultural	2
0/2500	Educational	3
0/5000	Support	4

**TABLE 4. PER CAPITA INCOME RANKING THE FACTORS AFFECTING THE DISTRIBUTION OF FUNDS DEDICATED TO THE SEPARATION OF ACTIVITY AREA (SOURCE: FINDINGS)**

The ranking and the weight of higher-level factors in Table (5) is shown.

Relative Weight	Factors	Rank
0/3000	Factors related to human resource	1
0/1000	Factors related to approved posts to filled	2
0/2000	Related to fixed assets	3
0/4000	Per capita income of dedicated	4

**TABLE 5: RANKING HIGHER LEVEL FACTORS AFFECTING THE DISTRIBUTION OF CREDIT DECENTRALIZED (SOURCE: FINDINGS)**

Finally, the contribution of each unit and the institute of the decentralized credit upon points scored of that unit and research institute the introduced indices are calculated acquired. Total

stipulation by which an organizational unit can obtain from criteria in four main sections are summarized as follows:

$N$  = Points per unit of human resource index.

$P$  = Score of each unit of the approved posts index.

$D$  = scores asset value per unit of the index.

$E$  = Points per unit of per capita indicators from dedicated income.

The total score for a unit equal to the sum of the scores in each of the above criteria and it is calculated by the following formula:

$$T = N + P + D + E$$

Since human resources index itself is influenced by several other factors, so as follows:

$$\text{Human resources index weight} \times N = (A + B + C)$$

$A$  = Total score of the Employment Type

$B$  = Score of the level of education

$C$  = Total score of activities area

The scores for each factor are calculated from the following formulas:

Formal, alliance and contract

$$\begin{aligned}
 A = & \left\{ \frac{\text{the number of unit formal members}}{\text{the total number of formals in ACECR}} \times \text{formal weight factor} + \frac{\text{the number of alliance staff in each unit}}{\text{the total number of alliance ones in ACECR}} \times \text{alliance weight factor} + \right. \\
 & \left. \frac{\text{the number of contracts in each unit}}{\text{the total number of contracts in ACECR}} \times \text{contract weight factor} \right\} \times \text{Operating weight, Employment Type} \\
 B = & \left\{ \frac{\text{the number of diploma holders in each unit}}{\text{the total number of diploma holders in}} \times \text{diploma weight factor} + \frac{\text{the number of associate holders in each unit}}{\text{the total number of associate in ACECR}} \times \text{associate weight factor} + \right.
 \end{aligned}$$

## ACECR

$$\begin{aligned}
 & \left( \frac{\text{the number of bachelors in each unit}}{\text{the total number of bachelors in ACECR}} \right) \times \text{bachel or weight factor} + \left( \frac{\text{the number of masters in each unit}}{\text{the total number of masters in ACECR}} \right) \times \text{master weight factor} + \\
 & \left( \frac{\text{the number of Ph.Ds. in each unit}}{\text{the total number of Ph.Ds. in ACECR}} \right) \times \left. \begin{array}{l} \text{The weight factor,} \\ \text{Ph.D.} \end{array} \right\} \times \left( \text{research weight factor} \right) \\
 & Q = \left\{ \left( \frac{\text{the number of research units}}{\text{the number of research personnel in each unit}} \right) \times \text{Research Weight Factor} + \left( \frac{\text{the number of culture staff in each unit}}{\text{the number of culture staff in each unit}} \right) \times \text{culture weight factor} + \right. \\
 & \left. \left( \frac{\text{the number of education staff in each unit}}{\text{the total number of ACECR's education staff}} \right) \times \text{educati on weight factor} + \left( \frac{\text{the number of support staff in each unit}}{\text{the total number of ACECR's support staff}} \right) \times \text{support weight factor} \times \left( \frac{\text{the weight of operating post areas}}{\text{the weight of operating post areas}} \right) \right\}
 \end{aligned}$$

Given the scores of each unit of human factors related to manpower index, so other scores of the units should be calculated from other indices.

Since other indices have acted independently and not be affected by other factors; thus, they will be more straightforward computation than manpower index, and each of the following equations is calculated:

$$N = (A+B+C) \times \text{manpower weight factor}$$

$$P = \frac{\text{The unit posts filled into the unit posts approved}}{\text{the total filled posts into approved posts}} \times \text{approved posts weight factor}$$

$$D = \frac{\text{the unit fixed assets}}{\text{the total fixed assets of ACECR}} \times \text{fixed asset weight factor}$$

$$E = \frac{\text{The special per capita revenue of unit}}{\text{the total special per capita revenue of ACECR's units}} \times \text{special revenue weight factor}$$

And thus the share of each unit and research center calculated from the total amount of ACECR decentralized credit.

### Measuring causal relationship hypotheses

In order to assess the causal relationship, which had been stated earlier in hypotheses, claims that if the amount of sig in the table of correlation coefficient among variables is less than 05/0, so the regression is deemed meaningful. The final results are in accordance with Table (6).

per capita income	Assets	Posts	Manpower	Decentralized Credit		
0/681** 0/000 94	0/732** 0/000 94	0/537** 0/000 94	0/341** 0/004 94	1 0 94	Pearson's correlation coefficient Significance level Sample size	Decentralized Credit
0/614** 0/000 94	0/201** 0/000 94	0/309** 0/000 94	1 0 94	0/641** 0/004 94	Pearson's correlation coefficient Significance level Sample size	Manpower
0/354** 0/000 94	0/202** 0/000 94	1 0 94	0/309** 0/000 94	0/198** 0/000 94	Pearson's correlation coefficient Significance level	Posts

					Sample size	
0/340 ** 0/000 94	1 0 94	0/418 ** 0/000 94	0/201 ** 0/000 94	0/732 ** 0/000 94	Pearson's correlation coefficient significance level Sample size	Assets
1 0 94	0/301 ** 0/000 94	0/225 ** 0/000 94	0/401 ** 0/000 94	0/581 ** 0/000 94	Pearson's correlation coefficient significance level Sample size	per capita income

**TABLE6. MATRIX OF CORRELATION COEFFICIENTS BETWEEN THE VARIABLES AFFECTING THE DISTRIBUTION OF DECENTRALIZED CREDIT OF ACECR (SOURCE: FINDINGS)**

The results of validity and appropriate fitness of criteria is reflected in table 6. These factors indicate that the dependent variable (decentralized funds) and the independent variables are statistically significant positive relationship with a confidence interval of 99 percent. That is to say that by increasing the level of each and every of the independent variables, the share of the decentralized budget increases as well. These findings may provide a descending perception. Due to the absolute value of the correlation coefficient, strength of these connections (Since the absolute value of the correlation coefficient is equal to 198/0, the strength of this relationship is at a medium level) except in the relationship between the posts and the decentralized budget is ranked high. So the hypotheses of the first, second, and third are approved.

So as to carry out the fifth hypothesis study, Friedman's analysis of variance is used. Since there was clear boundaries in the hypothesis of present study, the claimed hypothesis (both methods used to rank the factors are the same) in  $H_0$ , and its contradictory in  $H_1$  appeared. The calculated value obtained is 36.6512 that is larger than chi - square in table (26.2962). Therefore, assuming the claim was rejected (both methods used to rank the factors are the same).

In other words, there are significant differences, between the ranking of factors, by two methods of hierarchical approach and comparison of means.

## 6. DISCUSSION AND CONCLUSION

In this study, factors affecting the decentralized funds, by attitude and in particular on research units and centers in ACECR was conducted. According to the statistical analysis: There is a significant relationship between manpower factors, factors related to posts, factors related to fixed assets and factors related to per capita income with amount of the decentralized budget which shows the importance of these factors to strengthen the relationship between ACECR and its subordinate units.

Data analysis has showed that all factors affect amount of the decentralized budget. Exclusively, the effect of these factors is greatly different from one another. Generally the results of this study are described as follows:

A: According to a number of hypotheses related to manpower (first hypothesis), ACECR administrators are suggested that, given the effects of these factors on decentralized budget, In their policies, the degree of importance of these factors should be taken into their account and continue to take the necessary amendments and revisions.

(B) Based on the amount of hypothesis by the indices of fixed assets (second hypothesis), since the hardware is the part of top factors in distribution of decentralized funds, the physical environmental factors in ACECR should be taken into the managers' plans and strategies, then as tangible, the quality and quantity of supplies and equipment should be improved and also more maneuvers in a logical and effective investments related to the objectives of the development plan be put into practice.

A: According to the findings of the third hypothesis, per capita income will have a high impact on the quantity and quality of decentralized funds. Due to the synergistic effect of attention to these factors, ACECR is needed on long-term policies and programs, all aspects taken into consideration in order to be strengthened in competing with other research institutions. If the individual factors of rankings being considered then, factors of manpower number, amount of fixed assets, per capita incomes have earned high ratings; which shows the importance of these factors and their impact on the decentralized budget in ACECR units and research centers subsidiaries.

### ABSTRACT

*In this article the transportation of oil and oil products, the types of the transportation will be discussed. Besides, improved reliability of equipment which used in this process is also examined.*

**KEYWORDS:** *Oil, Oil Products, Water Transport, Rail Transport, Equipments.*

### INTRODUCTION

Various vehicles are used to transport oil and oil products. For example, rail transport, water transport plays an important role in the transportation of oil and oil products. Rail transport transports more than 40% of total oil and oil products. These products are mainly transported in wagon-cisterns, including about 2% in barrels and containers. The caravans have a carrying capacity of 25, 50, 60, 90 and 120 tons, the most common of which are the 60 and 90 ton tanks (Figure 27). The tank car is equipped with a universal pouring device, a safety spring valve, a hatch and a ladder. The safety valve is located at the top of the tank and regulates the pressure inside the tank. The hatch is also located at the top of the tank. It is used for repair, cleaning,

pouring and heating of products. The universal pouring device (d-200 mm) is located at the bottom of the tank through which the product is drained.

#### General drawing of a four-axle (60t) tank car

The built-in spinners come in a variety of designs, some of which are equipped with heaters. For example, the universal pouring machine (UTQ) is designed for pouring products without heating. Water vapor and electric heaters (UTQP and UTQPE) are used to heat the products. UTPQ - uses steam, UTQPE - uses electricity to heat the products in the tank. Currently, automated pouring devices ASN-7V6, ASN-8B6 and SPG-200 are used for unloading products from tank cars. ASN-7B is used for liquid, ASN-8B for thick and SNP-200 for high viscosity petroleum products. High-viscosity and high-temperature curing oil and oil products tank cars will be equipped with external heating "shirts" or internal heating devices. Heating of high-viscosity oil and oil products is carried out by injecting water vapor into the heating pipe sections installed inside the tank cars. The outer surface of the tank is covered with a thermal insulation coating to prevent the temperature from falling, and its surface is covered with a metal layer. Such tank cars are also called special "Hermos" tanks. In addition, the products inside the tank cars are heated using a steam "jacket" formed on their outer surface. The heating jacket is mounted on the bottom (half) of the tank and is supplied with water vapor (Figure 28). Heavy lubricating oils, lubricants with a carrying capacity of 2.5 and 5 tons. Heavy lubricants and lubricants are transported in 2.5- and 5-ton cisterns. They will also be equipped with a heating steam jacket. Packaged petroleum products (barrels, cans and various polyethylene containers) are transported in on-board wagons.

Heating the product inside the tank using a steam jacket:

- 1 - Petroleum product;
- 2- Cistern;
- 3 - Warming "shirt";
- 4 - Ingress of water vapor;
- 5- Water condensate outlet.

Oil, gas, and petroleum products are transported by water, rail, pipeline, road, and in some cases by air. The solution of the specific task of importing petroleum products, ie the choice of the mode of transport, the presence or absence of transport routes operating in the transport area, their employment rates play a major role. In addition, the choice of mode of transport is influenced to some extent by the volume of products transported and the distance of transportation, physical properties of petroleum products (liquefied gas, solids), reserves, prospects for the development of the oil industry in the regions.

**Rail transport.** Its main technical and economic advantages are: Universal transport; can transport all types of oil and its products in any volume. The presence of a railway network in densely populated industrial and agricultural areas allows products to be delivered directly to consumers. Transport Railway transport is more uniform and faster throughout the year than water transport. Disadvantages: Large capital investment in construction of new railways, repair of old ones; high operating costs compared to other oil transport vehicles; low efficiency of moving capacity (cisterns return empty); waste of oil and oil products; the need to set up special loading and unloading points and tank wagon cleaning points.

**Water transport.** This type of transport can transport a large number of products (carrying capacity: 5000-45000; 450000 and 1 million tons in tankers and barges) by water; about 70 percent of the total weight of transport is transported products. The opposite is true of rail transport. Disadvantages: seasonality; the inability to transport the product directly to any point, the need to create a large number of additional containers at the pouring points. Pipeline transport. The main advantages of this mode of transport over other modes of transport are: - it is the main means of transport for natural gas; - low cost of transportation; - specific capital costs

per unit of transported product are small and quickly recoup construction costs; - transportation is uninterrupted throughout the year, practically independent of any climatic conditions; - high labor productivity; - Loss of product while driving is very low; - several types of oil and oil products can be transported through one pipeline; - The capacity of the pipeline can be increased by building additional pumping stations, etc. Disadvantages: construction and commissioning requires a lot of capital and a lot of metal; must have a stable load for a long time; oil and oil products flow rate is not high (5-10 km / h); small quantities of products cannot be transported, etc. Motor transport. The technical and economic advantages of this mode of transport include: rapid transport of small batches of oil and oil products over various distances; it is possible to arrange scheduled transportation; fast completion. Disadvantages: high operating costs; the cost of transporting goods by road is 10-20 times higher than by rail; tank trucks have a small carrying capacity; depending on the availability and technical condition of the road. Growth capacity is not fully utilized (cisterns return empty in one direction, etc.)

In conclusion, Transport work is an integral part of oil and oil production, and the timely delivery of goods and materials is of great importance. In agricultural production, the transportation of goods amounts to billions of ton-kilometers. In this regard, oil product supply and environmental safety of these works are of great importance.

### ABSTRACT

*The article touches upon the problem of elaboration of the theory of tropes hyperbole, its antipode anti-hyperbole, litotes, and meiosis. It is dedicated to the linguo-conceptual field of anti-hyperbole and expressed with verbalizers that realize the field of "conceptual semantics of anti-hyperbole" compared in English and Uzbek languages. The distinctive features of anti-hyperbole, litotes, and meiosis are illustrated with examples, supported with the opinions of scholars' research work. The novelty of the article is the mixture of tropes gives new 'mixed (syncretic)' stylistic devices.*

**KEYWORDS:** *Hyperbole, Anti-Hyperbole, Verbalizers, Linguo-Conceptual Field, Litotes, Meiosis, Anti-Hyperlitotes, Anti- Hypermeiosis, Anti-Hypersimile.*

### 1. INTRODUCTION

It is well known that the formation and development of all beings in existence on the basis of contradictions is recognized as a philosophical law. In the same way, all linguistic phenomena revolve around similarities and differences, as noted by linguist F. de Saussure. In particular, the existence of the phenomenon of hyperbole in linguistics requires an anti-hyperbole, which is its opposite.

An anti-hyperbole is the opposite of hyperbole that is both a trope and a speech figure that serves to deliberately overemphasize certain realities (quality, degree, quantity) in objective reality. While hyperbole greatly exaggerates the reality of objective existence, anti-hyperbole diminishes or reduces it through extreme semantics. These concepts therefore represent a mutual contradiction.

In particular, anti-hyperboles expressed by expressions (phrases) have a unique structural-semantic nature, which, with their linguo- ethnoculturological features, occupy a special place in

the system of verbalizers, which characterizes the field of "conceptual semantics of anti-hyperbole." Therefore, it is not an exaggeration to call them "linguo-culturemes" [6; 36.35;], ie "linguo-ethnoculturemes".

The translation of the verbalizers that characterize the field of "conceptual semantics of anti-hyperbole" from one language to another is done strictly within the existing system of field members in each language.

Each language has its own system of verbalizers –antihyperbolemes in the field of "conceptual semantics of anti-hyperbole", which differ in quantity and quality. This indicates that the morphological and syntactic status and system of the members of the field of "conceptual semantics of anti-hyperbole" in languages are different. In Uzbek and English, "over-minimization" is realized through the following specific means - invariant types of verbalizers:

1) morphemes:

In English

in Uzbek

booklet

(бола)ча

girlie

(қиз)ча

weakest

энг кучсиз

2) lexemes:

In English

in Uzbek

Extremely, deadly (short)

ўта, роса, нихоятда бенихоя (қисқа )

3) phrases

In Uzbek:

*Биртомчиқони(м)дан кечмоқ*

*Бирогизсўзайтмоқ*

*Биртомчисувгазорбўлмоқ*

*Ўзингбирқаричсан-ку, лекинақлингхамманилолқолдиради.*

In English:

*A woman of pocket size. She is a woman of a pocket size, but her heart is strong.*

*Just a second*

*to have half a word with somebody*

4) taxonomies (monotaxes, polytaxes):

In Uzbek:

a) monotaxes

*Бирогизгапайтсамбўладими?*

*Бугапларунгазаррачатаъсирқилмади.*

b) polytaxes

*Сенингбуолаётганбилимингденгизданбиртомчихолос.*

*Агарижозатберсангиз, сизнингбирсониявақтингизниолсам.*

In English:

a) monotaxes

This is the tiniest creature

This is riot of handful of people

I can't say less

Can I have a word with you?

b) polytaxes:

If you allow me, I want to have a couple of words with you

Do I deserve the slightest respect when I am here?

5) phraseology:

In Uzbek:

*Биртомчиқонимданкечинг, шоҳим.*

*Упашаданфилясяпти.*

In English

*He is making a mountain out of a molehill.*

6) Texts:

In Uzbek:

Тоғниурсаталқонқиладиганйигитнингсичқонданқўрқиниқара!

Нима?Охиргинафасингниоляпсанми? Жонингчикибкетяптими?

In English:

Look at the man.He can face the devil, but he is afraid of a mouse. What? Are you taking your last breath?

All of the above mentioned verbal means show that there is a conceptual field in the languages being compared that is expressed by over-minimizing emotional-expressive coloring.

Anti-hyperbole, in turn, requires the exaggeration of small concepts [10]

Eg: *Wait just half a second.*

*Фақат ярим сония кутинг.*

*He will come in a moment.*

*У бир сонияда келади.*

*They will come in a little while!*

*Улар бироз вақт ичида келади!*

*A storm in a tea cup. (Proverb)*

*Чой пиёласидаги бўрон. (инглиз мақоли)*

*She wore a pink hat, the size of a button.[12.59]*

*У тугмача ўлчамидаги,пушти ишляна кийган.*

*An unfortunate man would be drowned in a tea cup. (Proverb)*

*Бахтсиз одам чой пиёласида чўкиб кетади. (инглиз мақоли)*

*I have not had a wink of sleep these last two nights.[14.187]*

*Сўнгги икки кечада мен заррача ҳам кўз юммадим.*

*He didn't even open his lips, though he was well aware of the mess.[14.211]*

*У хатто лабини очмади, гарчи у холатдан яхши хабардор бўлса ҳам.*

*Half a loaf is better than no bread.*

*Йўқ нондан кўра ярим нон яхшироқдир.*

In the example of "Wait just half a second", it can be notified that the speaker does not wait long, his request is fulfilled in a short time. In this regard, it is possible to give examples of "фақатгина бир сония", "just a moment", "бир лаҳза ичида", "in a little while". Admittedly, in real life, this kind of events can't happen so fast. In doing so, the speaker tries to reassure the listener, that is, to point out that it is not expected much.

Methodology includes stylistic devices such as litotes and meiosis, which are qualitatively close to anti-hyperbole, which also serve to ensure that the meaning is conveyed to the listener quickly, emotionally and expressively by exaggerating, reinforcing and softening the speaker's opinion during speech.

The characteristics of other tropes are also taken into account when systematizing hyperboles. In this context, it is necessary to mention the similarities of hyperbole and anti-hyperbole with litotes.

## 2. RESEARCH METHODOLOGY

The tropes aforementioned are structurally similar, but they have semantically distinct-contrasting properties. In particular, while hyperboles serve to exaggerate object-events, anti-hyperboles, on the contrary, provide exaggeration of expression by over-minimizing. Nowadays, many linguistic scholars have tried to define anti-hyperbole, in which more structural-semantic and stylistic aspects are taken as the basis. Accordingly, T.A. Dorogova, S.V. Lopatkina, X.B. Nurgalina, J. Koraboev, G. Satibaldieva were the first to apply the term anti-hyperbole in their scientific works. T.A. Dorogova, S.V. Lopatkina, and Kh.B. Nurgalina contrast the anti-hyperbole with the hyperbole and introduce the tropes that are closer to hyperbole: litotes and meiosis under its name. In contrast, Y.M. Skrebnev, S.E. Nikitina, N.V. Vasileva, T.S. Dronyaeva, N.I. Klushina noted that hyperbole is expressed through the semantics of over-exaggeration and that the stylistic means of expressing its contradiction are meiosis- over-minimizing and litotes- negation of the opposite. We try to shed light on the fact that the "extreme" semantics present in hyperbola do not occur in litotes and meiosis and that overstatement is the hyperbole, and its antipode understatement is anti-hyperbole, agreeing with the views of J. Korabaev and G. Satibaldieva in our research work.

Litotes - (gr. Litotes - from the word simplicity) - In fiction, the method of depicting something, an event or a character, diminishing and weakening. In ancient literature, litotes was considered as a state below moderation. The creator depicts an appropriate thing or an event in a way that is inferior to its glory and power. For example:

The implication of this word is so warm that,

The sun is like a little candle next to it. (Uygun)

Бу сўзнинг мазмуни шу қадар иссиқ,

Куёш бир кичик шам унинг ёнида.

(Уйғун)

In order to emphasize the importance of peace to humanity in the applied litotes, and even the fact that the meaning behind this word is hotter and more pleasant than the sun, the poet describes the giant cosmic -sun as a small candle. [7.166]

In "Encyclopedia Britannica" litotes was described as: "Litotes, a figure of speech, conscious understatement in which emphasis is achieved by negation... Litotes is a stylistic feature of Old English poetry and of the Icelandic sagas, and it is responsible for much of their characteristic stoical restraint..."

In "Oxford English Dictionary" "was depicted as "ironical understatement in which an affirmative is expressed by the negative of its contrary. (I shan't be sorry for I shall be glad)"

In "Collins English Dictionary" litotes was described "understatement for rhetorical effect, esp. when achieved by using negation with a term in place of using an antonym of that term, as in "She was not a little upset" for "She was extremely upset."

In the "Dictionary of Linguistic Terms" by O.S.Akhamanova there are two different interpretations of the litotes. In particular, litotes is defined as a stylistic tool used as a trope, a rhetorical appeal, often inverted by denying any description. Secondly, according to the author, litotes overlaps with meiosis. Therefore, the reason why litotes is sometimes interpreted as a "denial of opposition" is that there is a meaning of denial based on it: useless (фойдасиз), without saying a word (бир сўз айтмай).[1.213] On the one hand, the denial of denial is equivalent to affirmation, but on the other hand, according to Y.M. Skrebnev, the meaning of litotes is weaker than affirmative statements.

For example, litotes:

*notwithouthelp* - не без помощи - ёрдамисизбўлмайд

*do not consider useless* - не считать непригодным- фойдасиз деб хисобламаслик

In the affirmative meaning:

*withhelp*- с помощью - ёрдами билан -

*считать пригодным- фойдали деб хисоблаш* - *consideras useful*

it is clear from the above examples that the meaning of the phrases expressed by litotes is weaker than the affirmative meaning. [5.118]

The concept of understatement – anti-hyperbole is caused by the exaggeration of small concepts. This, in turn, indicates that the composition of the hyperbole and litotes opposite. Anti-hyperbole serves to over small concepts, while the composition of litotes is to minimize through negation. According to Y.M. Skrebnev, the technique of expression of hyperbole and litotes is different, it consists of a partial negation of one concept of litotes. It should be noted that the semantic mechanism of the anti-hyperbole overlaps with the semantic mechanism of the hyperbole. J.Koraboev, G.Satibaldieva also distinguished anti-hyperbole as the anti-pod of hyperbole. Moreover, litotes and meiosis are tropes close to anti-hyperbole.

There is also the term "meiosis" in linguistics. In accordance with J. Korabaev, the word form is significantly reduced, meaning that it is manifested in a relatively reduced form of quality or

degree, rather than in a severely reduced form. For example, “*Иноқ ўйнашяпти*” “*They are playing friendly*” instead of “*Яхши ўйнашяпти*”, “*They are playing peacefully*”, “*Ёмон танқид қиляпсан*”, “*Яхши танқид қиляпсан*” and so on. In these examples, there is no denial that must be used in the litotes, in which case “*Ёмон танқид қилмаяпсан*” “*you are not criticizing in a bad way*” would be in the form of “*Яхши танқид қиляпсан*” “*you are criticizing well*” instead of “*Ёмон ишламадик*”, “*We haven't done badly*”, it would be “*Яхши ишладик*”, “*We have done well*”. [10]

The examples show that in meiosis there is no “over-minimizing” or even anti-hyperbolic element, to be a form of opposition to hyperbole, even semantically, because hyperboles especially anti-hyperboles include exaggeration and diminution in relation to quality, quantity, degree, behavior, objects, individuals, animals, and other beings, which is not observed in meiosis and litotes. From this, we can see that the opinion of the researchers, who considered litotes and meiosis to be a manifestation of hyperbole, has not been proven, hyperbole and the stylistic figures mentioned above are different concepts when summed up, we can see that they are only partially close to each other from a stylistic point of view.

The relationship between anti-hyperbole and litotes on the one hand and anti-hyperbole and meiosis on the other is also noteworthy. It should be noted that in this respect the difference between the anti-hyperbole and the litotes is proportional to the difference found between the hyperbole and the litotes. That is, it is not a form of hyperbole, but a troop close to hyperbola and anti-hyperbole, in which there is no “extreme” semantics, and this distinctive feature also applies in part to meiosis. In meiosis, the word form occurs in a significantly reduced form, i.e., in a relatively reduced form of quality or degree, rather than in a very reduced form. Therefore, if we assume that there is a semantic contradiction between hyperbole and litotes (also meiosis), in the case of “over-magnification” - “over-minimizing”, in this case there is a partial semantic similarity between the anti-hyperbola and litotes (also meiosis), that is, they are forms of speech in which the quality and degree of the object of existence are greatly diminished (in anti-hyperbole) and only diminished (in meiosis and litotes). An important fundamental difference between anti-hyperbole and lithotomic (also meiosis) is that anti-hyperbole is characterized by the expression of the semantics of over-minimizing, but this is not characteristic of litotes and meiosis.

The stylistic description of other tropes is also taken into account when systematizing hyperboles. In this context, we will first try to consider hyperbole and anti-hyperbole, as well as their interactions with meiosis and litotes, which are similar to them.

1) Hyperbole is a means of exaggerating a certain description:

*Мен сенга уни қилма деб юз марта айтдим.*

*I told not to do it a hundred times.*

2) Anti-hyperbole is a means of over-minimizing and lessening a certain characteristic:

*Яримта сўз ҳам сизмайди!*

*Don't utter even half a word!*

3) Meiosis is a means of minimizing and reducing the particular characteristic with culturally, politely:

*Мен уни ақлли деб айта олмайман.*

*I can't say he is clever.*

4) Litotes is a type of expression in which any description is reduced or diminished, in which in most cases any description is interpreted inversely by negation.

5) *-У жуда бой одам.*

6) *He is a very rich person.*

7) *-Биз ҳам камбағал эмасмиз. (lithota)*

8) *-And we are not poor either.*

9) *Кўриниши ёмон эмас.*

10) *She is not bad looking.*

11) *У мен биладиган энг тоза одам эмас.*

12) *He is not the cleanest person I know.*

13) *Мен сизнинг нуқтаи назарингиз билан, норози бўла олмайман*

14) *I cannot disagree with your point of view.*

15) *Мишليون доллар кичкина миқдор эмас.*

16) *A million dollars is not a little amount.*

17) *Сизнинг хонадонингиз носарамжон эмас.*

18) *Your apartment is not unclean.*

19) *У чиройли малика эмас.*

20) *She is not a beauty queen.*

21) *I fear I am not in my perfect mind... (W.Shakespeare, King Lear)*

Anti-hyperbole is divided into structurally pure and mixed anti-hyperboles:

Pure anti-hyperboles, in turn, are words that have only an over-minimizing semantics:

*Бир оғиз зан.*

*Half a word*

*A woman of pocket size*

If the description of something by means of language is represented by meiosis and litotes by overminimizing or reduction, in which a mixture of meiosis and litotes is observed with anti-hyperbole. It is appropriate to call it "anti-hyper meiosis" or "Anti-hyper litotes".

*Мен бу ҳақда бир оғиз бир нарса дейишга ҳам истиҳола қиламан.*

*I will abstain from saying even just half a word about it. (anti-hyper meiosis)*

"Anti-hyperlitotes" can also be found on the language

*Not at all a drop in the ocean.*

*He is not at all a tiny creature.*

*She is not at all stupid in her manners.*

*Сизга бу нарсалар жуда ёқиб тушмаса керак.*

*It is not the tiniest creature I have ever seen. (anti-hyperlitotes)*

*They do not seem the happiest couple around. (anti-hyperlitotes)*

*The ice cream was not too bad.* (anti-hyperlitotes)

Also, anti-hyperbole can be mixed with metaphor, metonymy, synecdoche, oxymoron, antithesis, epithet and simile.

*Кўнглим сал тинчиди.* (anti-hyperbolicomparison)

*Кўнглимга қил ҳам сизмайди.*

*Кўнглига қўл солиб кўр.* (anti-hyperbolic synecdochal metaphor)[11.57]

*Кўнглимда заррача гумон йўқ.* (anti-hyperbolic synecdoche)

*Синчалак деган қушни биласизми, оёғи ундай.... Шу қуш “Осмон тушиб кетса ушлаб қоламан” дебоғини кўтариб ётар экан.* (anti-hypersimile)[11.45]

In this example, extreme reduction is used in conjunction with comparison. The thinness of the leg is reduced to a "thread" and, as a result, becomes an "anti-hypersimile" mixture.

### 3. CONCLUSION

Since hyperbole, anti-hyperbole, and meiosis are associated with enhancing (enlarging) or decreasing (lessening) the description of objects in life, their main difference is that while hyperbole and anti-hyperbole are always exaggerated, there is no “extreme” semantics in litotes and meiosis, but their mixture gives us ‘anti-hypermeiosis’ and ‘anti-hyperlitotes’, which are new ‘mixed (syncretic)’ stylistic devices. All of this suggests that hyperbola, litotes, and meiosis are not the same, that they are different stylistic forms, but that they are semantically partially close to each other.

## CRIMINAL LAW CHARACTERISTICS OF CRIMES IN THE FIELD OF FOREIGN ECONOMIC ACTIVITY

**Achilov Alisher Temirovich\***

\*Senior Lecturer,  
Department of Special Legal Disciplines,  
Customs Institute of the State Customs,  
Lieutenant Colonel of the Customs Service,  
Committee of the Republic of UZBEKISTAN

### ABSTRACT

*The article outlines the reforms carried out on the integration of the Republic of Uzbekistan into the world economic community, also analyzes the legal doctrine and legal norms that allow the concept of foreign economic crimes to be revealed. The author formulates the signs and definition of foreign economic crimes in the field of foreign economic activity. The formulated concept will provide competent qualification of crimes by the law enforcer.*

**KEYWORDS:** *Crime, Legislation, State, Republic Of Uzbekistan, Foreign Economic Activity, Customs Crimes, Customs Border, Customs Authorities.*

### INTRODUCTION

In the context of the formation of market relations, the issues of improving foreign trade activities in view of the globalization of the world economy are put to the fore. At the same time, the formation and development of its own management system for export-import relations, the development of principles for determining the ways of integration, is associated with the reduction of administrative barriers, the application of international legal acts and market instruments for regulating foreign trade in General. The solution of these issues involves the development of scientifically-based recommendations for the development of the functioning of the customs system that meets international norms, standards and rules. Formation against the background of major transformations in the Republic, as well as global, far-reaching changes in the world, emphasizes the need for scientific understanding of the nature, essence and prospects of the ongoing processes and trends in the state.

An increase in the flow of goods transported across the customs border of the Republic of Uzbekistan requires constant monitoring by the state in terms of ensuring the development of the economy and ensuring the safety of citizens and the state itself. The economic policy of the Republic of Uzbekistan includes many directions for the implementation of the main state tasks formulated in the Constitution of the Republic of Uzbekistan, legislative acts, international treaties and a number of other documents. The main law in this direction is the Law on Foreign Economic Activity.<sup>1</sup> For the implementation of foreign economic relations, the framework conditions for concluding international agreements in the field of foreign economic activity were created. The legislation of the Republic was enshrined execution and protection of economic interests of Republic, legal entities and citizens of Uzbekistan, to establish legal guarantees for activities of foreign investors on the territory of the Republic.

The democratization of foreign economic policy has made it possible for domestic entrepreneurs to establish relations with foreign contacts. However, changes in the economic life of the country have contributed to the emergence of foreign trade offenses that have negative consequences for the development of the Republic.

Economic security of the country is one of the most important national priorities in many countries of the world, as it is a guarantee of the country's sovereignty and a condition for stable and productive life of the population. The stability of the economy determines economic security. When conducting economic reforms, criminalization in the sphere of foreign economic activity is particularly difficult.

On the territory of our country, the State Customs Committee of the Republic of Uzbekistan and its territorial customs departments carry out targeted comprehensive measures to identify facts of violation of customs legislation. So, as a result of measures taken in this direction, according to official statistics, for the period of 2019, customs authorities revealed 16,433 (2018 - 12,836) offenses, with the seizure of goods worth 193.1 billion (145.1 billion) sums, among which 514 (452) criminal cases were instituted, and administrative cases were instituted on 15,266 (12,103) facts<sup>2</sup>.

Of these, 7,031 violations were detected in the sphere of foreign economic activity (4142 in 2018), and goods totaling 77.2 billion rubles were seized (detained). sum (60.2 billion), additional customs duties were charged in the amount of 198.2 billion rubles. in 2019, 91 (104) criminal cases were initiated against participants in foreign economic activity, and 6802 (3972) administrative cases were considered.

### Identified offenses in the field of FEA detected in 2019

In the current criminal legislation of the Republic of Uzbekistan, foreign economic activity is not accepted as a separate object of a crime, since the object is what the socially dangerous act of the subject is aimed at or what the crime is capable of causing harm, namely, “public relations protected by criminal law, which, as a result of criminal encroachment is harmed or a real threat is created”.<sup>3</sup>

On the basis of the generalization of the interests of the criminal law protection, the general, tribal, species and direct objects of crime are distinguished.<sup>4</sup>

A common object forms the totality of all socially significant social relations protected by criminal law. They are listed in part I of article 2 of the Criminal Code of the Republic of Uzbekistan.

The generic object of criminal encroachment refers to a group of homogeneous social relations, which are encroached upon by crimes provided for in articles included in the same section of the Special part of the criminal code, for example, section III “Crimes in the sphere of economy”.

The species object unites an even narrower and more similar in nature group of social relations, protected by a more specific (in comparison with the section) set of norms of the Special Part of the Criminal Code, which constitute a separate chapter, for example, included in Section III of Chapter 12 “Crimes against the Fundamentals of the Economy” (art. Art. 175-1852 of the Criminal Code of the Republic of Uzbekistan).

Finally, the immediate object is a type of social relationship that is violated as a result of a separate specific criminal assault. The specific features of each crime are determined primarily by the nature of the immediate object of the attack.

One of the elements of economic activity is foreign economic activity. Chapter 12 of the criminal code of the Republic of Uzbekistan provides for crimes related to foreign trade, investment and

other activities. In order to improve the criminal legislation in this area most effectively, we believe it is worth finding out what foreign economic crimes are and how they are characterized.

In legal doctrine and judicial investigative practice, there is no single position on resolving this issue. Also, unfortunately, Uzbek scientists as a separate object of scientific work on crimes in the field of foreign economic activity have not conducted research. According to some Russian legal experts, crimes in the field of foreign trade are not distinguished, these criminal infringements are customs<sup>5</sup>.

However, the doctrine and current legislation do not have a common understanding of customs crimes, which introduces some uncertainty in the concept of foreign economic crimes.

Of course, the system-forming group of crimes in the sphere of foreign economic activity is represented by acts that infringe on the established procedure for moving goods and other valuables across the customs border of the Republic of Uzbekistan (crimes in the field of customs control when moving goods and other valuables across the customs border).

In the content of the Criminal Code of the Republic of Uzbekistan, customs crimes are not separated into a separate group. At the same time, the substantive content of the relevant social relations, which are encroached upon by customs crimes, allows us to distinguish such norms of the Special part of the criminal code of the Republic of Uzbekistan as art. 182 ("violation of customs legislation"), 184 ("Evasion of taxes or other mandatory payments"), 246 ("Smuggling"), as well as, 130 ("Manufacture, import, distribution, advertising, demonstration of pornographic products"), 130<sup>1</sup> ("Manufacture, import, distribution, advertising, demonstration of products promoting the cult of violence or cruelty"), 244<sup>3</sup> ("Illegal manufacture, storage, import or distribution of religious materials"), 244<sup>4</sup> ("Illegal import, sale, acquisition, storage or the use of unmanned Aerial vehicles»), 246 ("Contraband") and 250<sup>1</sup> ("Illegal turnover of pyrotechnic products") in terms of violation of customs legislation. In addition to the Criminal code of the Republic of Uzbekistan the legal regulation of customs offences also has a number of laws and decrees of the President of the Republic of Uzbekistan, resolutions of the Government of the Republic of Uzbekistan and other regulations.

Other scientific concept is the identification of the customs offences and crimes in the sphere of foreign trade. There are also options for combining all the crimes considered by us as a whole crime in the field of foreign trade and customs control<sup>6</sup>.

A different position is held by legal experts who oppose the designation of foreign economic crimes as customs, arguing that the customs authorities are a kind of tool for the implementation of foreign economic policy of the state, which makes it difficult to recognize the activities of customs authorities as the object of the analyzed crimes, since their essence is aimed at higher - order public relations-relations in the sphere of foreign economic activity, which are a component of public relations in the sphere of economic activity<sup>7</sup>.

In essence, "foreign economic crimes" and "customs crimes" are completely different concepts and should not be identified, since customs crimes can be taken as one of the types of foreign trade crimes.

Despite the existence of various options for defining the concept we are interested in, we see the need to develop a definition that defines crimes in the field of foreign trade, based on the norms of legislation and the established legal doctrine.

In order to determine the meaning of crimes in the external economic sphere, first you need to know what is meant by the term "foreign economic activity". One of the official definitions of this activity is given in the Law of the Republic of Uzbekistan "on foreign economic activity" dated May 26, 2000, No. 77-11, in which the term "foreign economic activity" is defined as the activity of legal entities and individuals of the Republic of Uzbekistan aimed at establishing and developing mutually beneficial economic relations with legal entities and individuals of foreign States, as well as international organizations.

In-depth study of the law "on foreign economic activity", you can find the basic concepts that make up the essence of foreign economic activity. According to article 6 of this law, foreign economic activity may be carried out in relation to goods, works (services), any property, including securities, currency values, electric, thermal and other types of energy, vehicles, intellectual property objects that are objects of sale or exchange, except for those prohibited by law for use in foreign economic activity.

This law also defines the main directions of foreign economic activity in particular:

- International economic and financial cooperation;
- Trade activity;
- attracting foreign investment;
- Investment activities outside the Republic of Uzbekistan.

International economic and financial cooperation - the implementation of foreign economic activities aimed at establishing and expanding mutually beneficial relations of the subjects of foreign economic activity of the Republic of Uzbekistan by legal and natural persons of foreign States and international organizations in the field of production, Finance, banking and insurance activities, education and training, tourism, healthcare, scientific-technical, cultural, environmental, humanitarian and other spheres in the manner prescribed by law.

Foreign trade activity is business activity in the field of international trade in goods, works (services).

Foreign trade activities are carried out by exporting and importing goods, works (services).

Export of goods is the export of goods from the customs territory of the Republic of Uzbekistan without the obligation to re-import them, unless otherwise provided by law.

Import of goods is the import of goods into the customs territory of the Republic of Uzbekistan without the obligation to re-export them.

Export of works (services) is the performance (provision) of works (services) by a legal entity or individual of the Republic of Uzbekistan to a legal entity or individual of a foreign state, regardless of the place of their performance (provision).

Import of works (services) is the performance (rendering) of works (services) by a legal entity or individual of a foreign state to a legal entity or individual of the Republic of Uzbekistan, regardless of the place of their performance (rendering).

Foreign investment in the territory of the Republic of Uzbekistan is recognized as all types of tangible and intangible goods and rights to them, including intellectual property rights, as well as

any income from foreign investment invested by foreign investors in objects of business and other types of activities that are not prohibited by law. The forms and procedure for foreign investment in the territory of the Republic of Uzbekistan are determined by law.

Also, the law provides for investment activities outside the Republic of Uzbekistan, which is recognized as a set of actions of subjects of foreign economic activity related to the investment of tangible and intangible goods and rights to them in the objects of business and other activities outside the Republic of Uzbekistan.

Investment activities outside the Republic of Uzbekistan may be carried out in accordance with the procedure provided for by law by:

- Creation of legal entities or equity participation in authorized funds (capital), including through the acquisition of property and shares;
- Establishment of representative offices, branches and other separate divisions outside the Republic of Uzbekistan;
- Purchases of securities, including debt obligations issued by residents of foreign countries;
- Acquisition of concessions, including concessions for exploration, development, production or use of natural resources;
- Acquisition of property rights, as well as the right to own and use land and other natural resources.

Investment activities outside the Republic of Uzbekistan may also be carried out in other ways provided for by the legislation of a foreign state and the legislation of the Republic of Uzbekistan.

We find certain shortcomings that do not allow the full disclosure of the essence of foreign economic crimes, despite the variety of options for their formulation. Taking into account all the above, we will try to determine the main features inherent in crimes in the sphere of foreign economic activity:

- Signs stipulated in article 14 of the criminal code of the Republic of Uzbekistan, defining these acts as crimes;
- A special area of protected public relations, namely the procedure for foreign economic activity;
- A special way of doing;
- implementation of transactions in the field of import and export of goods, works (services), any property that is objects of sale or exchange, except for those prohibited by law for use;
- implementation of the above actions by directly crossing the customs border of the Republic of Uzbekistan, as well as using information and telecommunications technologies.

The form of guilt in the sphere of foreign economic activity, taking into account the characteristics of the objects of all crimes, refers to intentional acts.

Based on the above characteristics, it should be noted that foreign economic crimes are committed by directly crossing the customs border of the Republic of Uzbekistan, as well as

using information and telecommunications technologies, deliberate socially dangerous acts that infringe on the procedure for carrying out foreign economic activities.

Thus, we have considered the norms of international, criminal and civil legislation, as well as analyzed the doctrinal sources that together helped us achieve our goal - to understand the essence of foreign economic crimes and formulate a definition, which is a necessary condition for improving relations in this area.

### ABSTRACT

*Such stage-by-stage forms of work are improving the students' skills and abilities, solving problematic problems in literature, and analyzing specific situations. As the study showed, positive results in the implementation of the tasks were achieved by highlighting the communicative skills and abilities, and therefore, special attention was paid to ways of improving the culture of oral and written speech, the types of essays and assessment criteria. At the same time, the organization of systematic and focused work on improving the formation of key concepts and skills, such as building a definition in a given form, evaluating and maintaining one's own position, evaluating and fixing the position of the interlocutor, reaching a general conclusion remained as the most important reserve for the development and improvement of skills for analyzing literary text.*

**KEYWORDS:** *Method, The Process Of The Lessons, Literature, Specialist In Literature, Poetry, Character, Writing, Training, Extra Classes, Exhibition Corner.*

### INTRODUCTION

In the 21st century, in the fastest updating of information all over the world, it is extremely difficult and important to form moral and ethical qualities in the education and upbringing of students of secondary specialized and professional educational institutions of the Republic of Karakalpakstan.

That pays attention to such methodological problems as forms of teaching Karakalpak literature and curricula for teaching Karakalpak literature at academic lyceums. All teachers are required the legal organization of the educational process, to have a creative attitude to each lesson. In order to draw up a curriculum, literary programs, educational standards in accordance with the

requirements of the law, the main direction of the study was to achieve the improvement of the results and quality of education.

In pedagogy according to the teaching methodology, several scientific studies, educational and methodological textbooks have been published. Studies on the use of innovative technologies in teaching have been carried out by such scientists as, these include monographs, dissertations, methodological works of B.S.Blom[1], J.Bateson [2], *Eigler Pierre, Langeard Eric* [3], *Gronroos Christian* [4], P.Skarzynski and R.Gibson [5], Paul Trott. [6], Tidd J and J.Bessant[7] along with the traditions of education and upbringing, the organization of new educational forms, attention is also paid to pedagogical thoughts. At academic lyceums, basic concepts are studied according to the methodology of teaching Karakalpak literature, the relationship of programs with subjects, the principles of teaching, the organization and planning of classes, interactive methods, the analysis of works of art, the study of the writers' work, the conduct of extracurricular activities. It is important to study in a comparative way the point of view of scientists on current problems of teaching literature, to outline the development of the direction of methodological and theoretical opinions. The methodological studies indicate the opinions of S.Dalimov [8], S K.Yuldoshev [9], A.Pakhratdinov[10], K.Khusanbaeva [11], K.Yusupov [12] and others on the problems of teaching literature at schools.

Considering age and psychological features of students on the materials included in the program on Karakalpak literature, it is necessary to familiarize students with the best examples of Karakalpak literature, literature of related people and world literature, to instill a sense of love for the motherland in the hearts of young people, a national feeling, and also an awakening of a sense of respect for national values and the ability to express one's opinion by studying the poetic characteristics of fiction. It is also necessary to consider that the materials included in the literature program are selected literary works, and therefore it is necessary to take into account the peculiarity of the language, psychological and pedagogical requirements of students.

Analysis of works of art and requirements for them, discussion of the text, types of analysis and methods will be studied in the course of classes under the program intended for academic lyceums. By analyzing the works of art, the students are explained the educational, moral, aesthetic, spiritual tasks of upbringing, that each people is strong in its high culture and spirituality. These program materials will be studied with the help of new types of classes: seminar, game, competition, test, conference and discussion. Teachers will need pedagogical and methodological abilities while teaching Karakalpak literature. Each lesson in literature should be held in connection with philosophy, linguistics, literary criticism, history, aesthetics, pedagogy and psychology.

Attention is paid to the features of using the methods of pedagogical technology in various types of classes on Karakalpak literature at academic lyceums: a conference, a lesson to test the knowledge and desires of students, mixed, combined and new educational lessons, attention is paid to the relationship between teacher and student, the need to change their tasks, on pedagogical technologies, having expressed opinions about the technological features of the interactive method, attention is paid to the use of such interactive methods in the lessons of the Karakalpak literature as "Brainstorming", "Cluster", "Corners strategy", "Three-stage interview", "Round table", "Zig-Zag method", "Insert", etc. methods and games. In addition to

them, the purpose and principles of teaching in the analysis of works of art, scientific analysis, didactic analysis and the problems of using these types of analysis in practice are studied.

Also, during classes it is necessary to observe an individual approach with each student, it is necessary to conduct individual work with capable, talented and poorly performing students, it is necessary to instill the habit of independent work, to independently acquire knowledge, to develop the consciousness and ability of students.

Teaching Karakalpak literature with the help of new educational lessons, conferences, disputes are considered the most important methodological task. We considered it necessary to dwell on the methodology of the conference. The methodologists reasonably determined the purpose and objectives of the conference: "A lesson-conference is one of the types of classes in and out of the lesson. We study the materials of the lesson-conference for the following purposes. It's necessary to have a concept of the material being conducted, a deep knowledge of scientific and theoretical materials, and the development of an understanding of the topic being studied." There are few methodological opinions on this type of lesson. Therefore, attention is paid to the content of the lesson conference and the way they are taught, to the problem and the peculiarity of teaching the materials of the lesson conference presented in the program.

Conducting lessons increase interest in the lesson through the various types of activities given in the program. Also methodological suggestions and opinions on the conduct of the lesson are given, an exchange of views, the purpose and objectives of the lesson, the organization of the lesson, and ways to assess the knowledge of students in the lesson. Exchange of views lesson develops the ability of thinking, the opinions of students and increases interest in literature.

At secondary schools and academic lyceums there are features of the use of lesson forms. Firstly, at schools during the lesson it will be advisable to use such types of lessons as a blended lesson, a joint lesson, introducing students to a new educational lesson, an introduction lesson, a repetition lesson, and a game lesson. Secondly, you need to take under the guidance the age-specific features of students, the time of each lesson, and the principles of compiling materials from an easy level to a difficult one. Thirdly, at academic lyceums such types of lessons as a conference, an exchange of views lesson, a lecture, and a seminar increase the students' thinking ability and interest in the lesson. As a result, a spiritual, philosophical, aesthetic feeling and a sense of beauty are formed in the students' minds.

Explores the problems of using innovative technologies in teaching Karakalpak literature, introducing innovation into the educational system of the Republic of Uzbekistan, tasks based on the development of methods that give quick and good results in practice, new methods and ways of education that are consistent with world achievements. The use of interactive methods in the teaching of Karakalpak literature has its own goals and objectives. It is necessary to constantly pay attention to the issues of rules and regulations of interactive technologies used in classes on Karakalpak literature. In addition, students are given freedom of speech and the need to respect each other and ethics of communication are explained. When dividing into groups, it will be useful to give students the right to choose, and then apply the principle of random choice. Based on the results of interactive technologies in the classes on Karakalpak literature, the teacher of literature should take stock and give the participants of the groups appropriate marks.

Opinions are expressed on the methodological issues of using problematic, monographic, moving lectures in teaching Karakalpak literature at academic lyceums, and the methods of

organizing lecture classes are implemented on the basis of materials given in the program of teaching technologies. Through the use of interactive technologies when teaching on the material given in the program on Karakalpak literature, a sense of humanism, love for the homeland and mutual respect is formed in the students' minds.

On the analysis of a work of art and its tasks and role, gives philological and methodological opinions from scientific works of famous scientists such as A. Kankalik, V.I.Khazan, B.G. Tolybaev, D.Azizov, G.Usova, A.Lilov, K.Yuldoshev, S.Matzhanov, K.Khusanbaeva and others. In the methodology of teaching Karakalpak literature, there is a peculiar order of analysis of a work of art and work on it, by purpose, task. A study of the work of each writer is required in connection with peculiar features.

By analyzing works of art under this literature program, students can familiarize themselves with its ideological content, images, and genre qualities. Along with this, one must be guided by the main principles of the analysis of a work of art. Studying the topic, the idea of a work of art. The event described in it and what period they relate to, it is necessary to pay attention to the writer's view of the present. In the course of analysis of an artwork, students form such knowledge and skills as mastering the form and content of the work, determining the genre variety and the main problems posed in the work, knowledge of its plot, compositional elements, and world of images, artistic and ideological features.

Studying by students of such works given in the program as "Aral qushaginda" by O.Ayzhanov, "Akdarya" by K.Sultanov, "Amudarya boyinda" by J.Aymurzaev, "Dastan about Karakalpaks" by T.Kayipbergenov and Sh.Seyitov's novels are one of the necessary methodological tasks. Therefore, it is necessary to know the content and ideological orientation of the work, to determine its plot, to understand and fully reveal the characters of the heroes, to determine the portraits of the heroes, to know the landscape and art details, to determine the figurative world of the work of art, to reveal the composition of the work.

As a result of this, firstly, students of academic lyceums get a wide idea of works of art, their aesthetic level, and the depth of events in them, the epic presentation and their conditions, historical periods and images and psychology of heroes. Secondly, students will try to read prose works by certain authors. Images of heroes will have a positive impact on the upbringing of the younger generation. Thirdly, during the analysis of prose works according to the program of Karakalpak literature, students develop ideas about the plot and images of the heroes of the work. As a result, their interest in literature grows and their vocabulary is enriched, as well as the development of knowledge of folk history and their cultural and aesthetic level.

Studying the biography and work of the writer while teaching Karakalpak literature at academic lyceums is one of the important methodological problems. On this issue, methodological opinions are presented in the works of such scientists as N.Yu.Postalyuk, L.B. Khvan, F.Iskhokov, K.Yusupov, etc. According to the program on Karakalpak literature, a lot of material on the biography of the writer is given. It is advisable to study the biographies of writers according to the program from a methodological point of view sequentially.

The study of the biography of each writer is considered as a presentation and introduction of his works. Studying the biography of writers, students take an example from the deeds they have done for the good of the homeland and people, from their humanism and courage. Therefore, it is necessary to take into account the educational aspects when studying the biography of writers.

When explaining the biography of the writer, respectively, each lesson provides information about important moments in the life of the writer, about the truths of that time, about his attitude to the environment where he was born and raised.

When studying the biography of the writer at academic lyceums, methodological issues such as a brief definition from the biography of the writer, as well as stories and essays about the biography, are taken into account. At the same time, it occupies a special place to study the life and work of the writer, the disclosure of the ideological and artistic quality of works and historical and literary tasks. The effectiveness and quality of conducting a lesson related to the biography of a writer, first of all, depends on the teacher's preparedness, as well as on collecting material and drawing up a good lesson plan. Therefore, the teacher must use the writings of writers on the life and work of writers.

When teaching the writers' creativity in the classroom of Karakalpak literature, students have an interest in the fact that each writer is mysterious in his own way, his inner world, that psychological experiences in the creative process are completely different. This is also stated in the writings of such writers as Z.Kabdolov, K.Yuldashev, K.Mambetov, K.Kamalov, A.Pakhratdinov, K.Allambergenov, K.Orazymbetov and others. For example, the writer Z.Kabdolov cites many mysterious and interesting facts related to the letters of writers during their creative activities. If you pay attention to them, it is said that the famous writer Ernest Hemingway could not write without standing at the podium, and some wrote lying down, and some wrote while leaving home, traveling or in creative houses, and some could not create except at the desk of their house. It is interesting to talk about such things to students, interest depends on the experience of the teacher. As a result, students, studying writers according to the program of Karakalpak literature, form in their minds a sense of patriotism, humanism, honesty, hard work, conscience, overcoming difficulties and they will increase interest in fiction.

Methodological study was conducted on the organization and content of extracurricular activities in Karakalpak literature. It notes the need to study some literary materials in extracurricular activities due to the fact that studying the material in the program is not enough. On this issue, opinions are indicated on the methodological importance of the methods of organizing and conducting extracurricular activities to improve the knowledge and skills of students in the methodological studies and works of T.R.Niyazmatova, M. Mirkosimov, SafoOchil, A. Abdurazokkov, I.Kalmikov. Conducting extracurricular classes in literature makes it possible to consolidate the knowledge gained, to further develop the students' worldview. From this point of view, it will be correct to conduct extracurricular activities in accordance with the program, not limited to regular classes in literature. In terms of purpose and content, extracurricular work on Karakalpak literature is divided into several varieties. The necessity of paying special attention to extracurricular activities while improving students' knowledge, while educating them with worthy citizens of the homeland is noted. Extracurricular activities at academic lyceums: circles, organization of shows, literary travels, literary magazines and newspapers, literary conferences develop spiritual qualities and interest in each student. During extracurricular activities, students should study folklore materials, the history of Karakalpak literature of the ancient period, Karakalpak literature of the 18th, 19th, 20th, 21st centuries. One of the still unexplored varieties of extracurricular activities carried out in order to increase students' interest in literature is the corners of visualization.

The tasks completed by students then serve as visual aids for the teacher. In addition, this kind of extracurricular work leads not only to increasing student's interest, but also adorns the cabinet of literature and enriches it with visual aids. Therefore, it will be advisable if teachers - writers will carry out such work, not during, but after school hours. Wall newspapers and magazines published in academic lyceums are considered to be a creative center that provides information about news in the community, literary news, and articles written by students on various topics, stories and poems. [13]

If the organized corners of shows on Karakalpak literature increase the aesthetic feelings and research abilities of students, then wall newspapers and magazines form their ability to express their thoughts and creativity in writing. Defines the results of experimental and practical work on Karakalpak literature conducted at academic lyceums as follows: were studied the possibilities of organizing experimental work, their analysis, and indicators of the level of effectiveness of their results were examined. The organization of experimental work on the basis of a certain order and program ensured their effectiveness. The program of experimental work defines the criteria, indicators and development methods, the results of the study of fiction during the lesson.

Analysis of the research theory, as well as the results of experimental work, allowed us to draw the following conclusions: The current state of student learning at academic lyceums is determined not only by the specifics of the lyceum. But also with modern requirements for teaching students, which involves a review of teaching and upbringing methods. Increasing the level of knowledge requires the appropriate organization of not only classroom, but also extracurricular activities. To this end, we first determined the purpose and objectives of the lesson, the content of the material, and made an analysis of the specialized literature, which allowed us to single out the complex of extracurricular activities as a discussion. Literary travel, country study circle, independent work, etc., as well as a set of modern interactive methods that can be applied during extracurricular activities, such as brainstorming, cluster, insert, three-story interviews, round table discussions, zigzag, business games, disputes, discussion. The use of new pedagogical technologies in teaching helps create favorable conditions for interlocutors and facilitates the assimilation of extracurricular material. In this connection, the purpose and objectives of the lesson, the content of the material were studied. The basis for the formation of educational tasks is the question of the aesthetic and spiritual education of students on the basis of a reassessment of the values, traditions of the people, their culture and spiritual wealth, which require a systematic approach to highlight the ways and techniques of intellectual work.

### ABSTRACT

*Stability of the socio-economic conditions in the country, the rule of law, the size of the domestic market, rich natural resources, high intellectual potential, stability of the banking and financial system, development of infrastructure and logistics, flexibility of tax policy, participation of foreign investors in the privatization process, foreign capital privileges and preferences, such as the provision of additional facilities to the enterprises with the participation of foreign investors it serves as an important decision in favor of Development and strengthening of the banking system has always been in the focus of our attention, and this is giving its positive results. The country's banking system demonstrates stability and stability. This is explained by the high level of reliability of banks and the lack of reliance on foreign sources of financing, and the negative impact of external shocks. Investment activity of commercial banks is increasing. More than 75% of commercial banks' investments are long-term investment loans for over three years. In general, it should be noted that over the past ten years, lending by the banks to the real sector of the economy has increased 7 times. The unconventional approach to transfer the economically insolvent enterprises to the balance sheets of the banks has justified and proved effective. At present, out of 164 bankrupt enterprises transferred to the banks, 156 have fully restored their production activity, 110 have been sold to new investors. Commercial banks invested 275 billion soums in the technical re-equipment and modernization of such enterprises, resulting in over 22,000 jobs. The role of banks is particularly important in their investment policies for*

*modernization, technical and technological re-equipment of leading sectors of the economy, housing construction, transport and infrastructure communications development. In this regard, commercial banks of the country have problems with the mechanism of lending, monitoring and repayment of loans and the need to develop scientific proposals and practical recommendations aimed at solving these problems.*

Economic Relations Related To The Mechanism Of Lending By Commercial Banks Are Also Emerging In The Practice Of Increasing The Efficiency Of Monitoring. Research Methods. Systematic And Factor Analysis, Comparative And Structural Analysis, Statistical Grouping, Inductive And Deductive, Monographical Observation, Expert Evaluation, Abstract Thinking And Other Methods Were Used In The Study.*

## I. INTRODUCTION

Development and strengthening of the banking system has always been in the focus of our attention, and this is giving its positive results. The country's banking system demonstrates stability and stability. This is explained by the high level of reliability of banks and the lack of reliance on foreign sources of financing, and the negative impact of external shocks.

President of the Republic of Uzbekistan Sh.

For example, for the first time, world-renowned rating agencies Fitch Ratings and Standard & Poor's set the country's sovereign credit rating. These ratings have a "Stable" outlook, which means that this indicator is likely to decline over the next 12-18 months.

Commercial banks credit investments to reach 58 trln. As of January 1, 2018, the amount increased by 110.6 trillion soums, or by 110% (32% in 2016). and the share of credit investments in GDP increased up to 44.4% (26.4% in 2016). while the share of credit investments (net) in total assets increased from 61.9% to 65.1%.

**TABLE 1 CREDIT INVESTMENTS OF COMMERCIAL BANKS (IN PERCENT)**

Types of banking	2016		2017		2018	
	Total loans	From this in foreign currency	Total loans	From this in foreign currency	Total loans	From this in foreign currency
Banks with state share	84,2	94,7	88,4	94,3	88,0	—
banks with no state share capital	15,8	5,3	11,6	5,7	12,0	—

Source: Report of the Central Bank of the Republic of Uzbekistan, [www.cbu.uz](http://www.cbu.uz)

At the end of 2017, commercial banks accounted for 88.4% of total loan portfolio of commercial banks, which fell by 0.4 percentage points in 2018. At the same time, almost all (94.3%) foreign currency credit investments during the year 2017 were financed by state-owned commercial banks.

The rapid increase in consumer and investment demand in the economy in 2018 is also due to the significant increase in bank loans to the economy.

In particular, the total volume of loans to the economy in January-September 2018 increased by 1.8 times or 34.1 trillion soums compared to the same period of 2017. 69.9 trillion soums soums, and its share in GDP increased from 19.3% to 28.6%.

However, a sharp gap between the growth of loans and the growth of the money supply, and the high rate of change in the share of loans allotted to GDP, imply that part of the domestic demand created by these loans is covered by imports.

The banking system of the Republic of Uzbekistan is an important and dynamically developing sector of the country's economy. With particular emphasis on this area, it has been selected as one of the priority areas for the development of the national economy.

Dear President Shavkat Mirziyoyev in his Address to the Oliy Majlis:

“Today, the main problem in the banking system is that the majority of their capital, 83%, is state-owned. This, in turn, hinders healthy competition in the banking sector and adversely affects the quality of service.”

Analysis of the current state of the banking system of the Republic of Uzbekistan shows that during the past period commercial banks have achieved certain successes, which are a driving force in the development of the economy. At the same time, further development of the country's banking system will largely depend on the quality and variety of banking services provided.

## II. LITERATURE REVIEW

A number of legislative acts of our state are the laws of the Republic of Uzbekistan. Decrees and resolutions of the President of the Republic of Uzbekistan, resolutions of the Cabinet of Ministers strengthened the legal framework for the activities of commercial banks.

Financial and banking relations have been studied by a number of world scholars and experts, and a great contribution is made by foreign researchers, scientists of our country. Several on the study of bank concept and its theoretical aspects

Economists have been working for centuries. Examples include world scientists D.Polfremen, E.D. Dolon, J.Skinki, J.Matuk, D.Macnoton, K.Barltrop, I. Reed, and Philip Ford. Russian economists OI Lavrushin, Yu. Babicheva, Zharkovsky S. Efimova MR In Kovalev VV, Kolesnikov VI, A. Simanovsky, A. Vikulin, V. Usoskin, G. Tosunyan, G. Beloglazova, G. Panova, L. Lavrushin, B. Buhwald, E. J. Bregel, K. Gaval, The theoretical and practical issues of development of commercial banks activity by J. Stuffle, Tam and GG Korobova were thoroughly researched.

Among the economists of Uzbekistan engaged in banking are Sh. Sh.Z.Abdullaeva, Mullajonov F.M. Abdullaev YA, Bobokulov Abduganiev BA, A. Vakhobov, O.Iminov, N.Jumaev,

T.Koraliev, S.Norkobilov, U.Ortikov, D.Saidov Theoretical and practical aspects of development of commercial banks.<sup>1</sup>

### III. RESULTS

The President of the Republic of Uzbekistan signed a decree on 9 January 2018 on measures to radically improve the activity of the Central Bank of the Republic of Uzbekistan in order to facilitate the achievement of the goals through the full utilization of the monetary policy and banking regulations. Decree of the President of the Republic of Uzbekistan “On Measures for the Protection of Children” According to it, the strategic objectives of the Central Bank are: price stability; stability and development of the banking system; stability and development of the payment system.

However, to date, the banking and financial services and the interbank competition environment for customer engagement do not fully meet the requirements of the time. At the same time, the services sector in rural areas is still underdeveloped. A serious problem is that the management system in the economy is outdated and the effective mechanisms for supporting innovative ideas are not implemented in a timely manner.

On March 23, 2018, the President of the Republic of Uzbekistan Sh.Mirziyoev signed the Resolution “On Additional Measures to Increase Banking Accessibility”. It was noted that as a result of the ongoing reforms, the banking system has introduced the market mechanisms for the provision of services, expanding its range and increasing financial transparency for entrepreneurs and the public.

Organization of lending involves the combination of mutual obligations and interests of two subjects of credit relations - bank and borrower. The standard document of the banks' activity as a creditor is reflected in the credit policy. Commercial banks independently form a credit policy.

An important aspect of the bank's lending activity is the formation of a credit policy by each bank, taking into account its political, economic, organizational and other aspects. The credit policy of the commercial bank is the basis of credit management.

According to the Regulation of the Central Bank of the Republic of Uzbekistan dated March 2, 2000 "On the requirements of credit policy of commercial banks", the bank's credit policy is defined as follows: is a document that provides employees with guidance on how to effectively manage their loan portfolios. Credit policy should clearly state and specify the objectives of the bank's credit activities.

Credit policy of commercial banks is the basis for effective credit management. This policy defines objective standards and criteria for lending to bank employees and managing the bank's credit portfolio. Properly developing and pursuing a credit policy, a clear understanding of the purpose of this policy by all departments is the basis for proper management of credit standards, avoidance of high risks, and proper identification of banking opportunities.

A well-developed credit policy is a good way to manage and mitigate credit risk.

The need for a credit policy is that the bank should have a policy, whether large or small, with little or no employees. This policy ensures the implementation of the general rules and principles of credit, as well as the sequence of operations. The credit policy of the bank should be the same for all employees of the bank - from the junior staff or the chairman of the bank's management. That is why a set of credit policies is a set of rules and solutions.

Lending policy and its effectiveness can be successful if the right credit price is established.

In order to effectively pursue a credit policy, bank employees need to be well aware of who can use their bank clients' funds.

The bank has to decide what loans, how much, in what form, to whom and on what terms. There are such types of business that a bank may find it difficult to grant. Therefore, it is important to remember that each activity is at risk. The Bank's credit policy requires preventing possible hazards in its operations, by balancing the ratio of deposits and loans, the balance between bank liabilities and equity and other indicators. Rational credit policy improves the quality of loans. Therefore, the main purpose of credit policy should include such elements as management processes, adequacy of funds, quality risk categories, credit portfolio balance sheet, separation of liability components. As for banking policy, bank policy is a combination of bank deposit policy, credit policy, interest rate policy, currency policy, customer service policy and other banking services, bank liquidity policy, and personnel policy. Thus, the activity of banks consists of the following basic elements:

To find out more about the essence of the credit policy, let's look at what it is.

The content of the Bank's credit policy is as follows:

Issues related to the identification and formation of the Bank's loan portfolio (types of credit, terms of repayment, quantity and quality);

List of powers assigned to the Deputy Chairman of the Bank responsible for credit activities, Chairman of Credit Committee and Credit Inspector (maximum amount and types of credit);

Bank's lending rights and total commitment to provide information;

Description of credit check-in and decision-making system;

The list of required documents to be attached to the loan application and the list of documents that must be kept in the credit file (the borrower's financial statements, the credit agreement, the pledge agreement, the pledge agreement, etc.);

Detailed information about who is responsible for safeguarding and checking credit cases and when and under what circumstances;

Provision of the credit and the basic rules of its acceptance, evaluation and implementation;

The description of the norms defining the quality of all loans;

Determining and demonstrating the maximum credit concessions (ie the ratio of loan amounts and total assets of the bank);

Banking region, industry, sector or sector where the major part of credit investments is used; Structure and analysis of problem loans, showing how problems can be solved;

The rest of the documents describe the types of loans that are prohibited or unsuitable (borrowers who are questionable or who do not provide a complete list of documents).

Qualified credit policy is implemented at all levels, from the bank's head to the operator, which enables the bank's management to make the right decisions, to avoid excessive risks and to

properly evaluate bank loans. At the same time, credit policy should be more flexible, taking into account political, economic and legal conditions.

#### IV. DISCUSSION & CONCLUSION

Stable growth rates and quality of key indicators of the country's banking system, consistent implementation of monetary policy, lowering interest rates, increasing intellectual potential, improved access to banking services for the population and businesses, effective banking supervision, financial reporting based on international standards; targeted use of investments, minimization of investment risks are important factors of improvement of the investment climate in the system is calculated.

The Bank will need to systematize monitoring plans for all projects to ensure systematic monitoring and implementation of projects. At the same time, a project monitoring plan for the implementation of the project will be developed. Provided that credit protection is established, a monitoring plan is created for the entire credit period between the loan officers (experts) and the monitoring department specialists. At the same time, the monitoring plan envisages that a bank employee visits the inspection sites at least once every quarter.

Email id: xikmat.alimov@inbox.ru

### ABSTRACT

*The article sets out the result of a technical survey of unfinished four-story residential building. It developed a recommendation to strengthen individual load-bearing structures and indicated measures to further continue installation work on putting the facility into exploitation.*

**KEYWORDS:** *Technical Condition, Reinforcing, Technical Survey, Impact, Building Construction, Unfinished Building.*

### INTRODUCTION

In recent years, due to the rapid development of the construction industry, investors did not disregard unfinished construction projects (unfinished), frozen during the period of decline in industrial construction.

However, the necessary conservation of facilities during the suspension of construction in those days, as a rule, was not carried out.

Long-term environmental impact does not pass for structural elements of a building or structure without a trace. In this case, a number of factors play a negative role: natural - such as precipitation, temperature drops, etc., man-caused - for example, dynamic loads from rail traffic (nearby metro lines, tram, railways, etc.). In addition, during this time, changes in the geological and hydrogeological situation of the built-up area could occur.

Given this, even at the planning stage, the resumption of construction is necessary survey an existing building or structures, determine the current technical condition of structural elements, provide, if necessary, measures to restore or strengthen structures and give a forecast about the

possibility of further exploitation of a building or structure (sometimes it is not economically feasible to continue the construction of such objects).

A detailed engineering and technical survey of the unfinished building (structure) will answer the question about the possibility of its completion and safe further exploitation.

Identification of the technical condition of structural materials, supporting and enclosing structures of a building (construction), as a result of the survey, will help to make a concrete decision about the future fate of the object.

As a rule, if there is a long interruption in construction, the unfinished building or structure is adversely affected by the environment: excessive moisture, freezing or thawing, heating and cooling. Building structures that are not designed for such effects are subject to various damages and deformations.

In order to resume construction, it is required to conduct detailed surveys of existing structures, to identify and assess damage resulting from a break in their construction. According to the survey, measures are being developed to eliminate damage, to prevent defects that may appear as a result of construction and installation works. It is also necessary to conduct geological engineering studies, sometimes there is a need to develop new completion project object with the introduction of structural elements.

The periodic effect of precipitation and melt water on the soil of the base leads to excessive water logging (for example, sometimes water can stand for a long time in the pit), thereby reducing the bearing capacity of the soil. Most often this happens on clay soils. If construction resumes on frozen heaving soils, then at the beginning of the summer period, large non-uniform precipitation can be expected. In this case, you should wait for the thawing process and only then begin construction and installation works. Excessive soil moisture and freezing, backfilling of foundations is not carried out, there is no external layout, windows do not close in the basements, there is no heating system in the winter - all this can lead to the destruction of the whole building. Unfinished objects after a certain time begin to deform, the result is the appearance of cracks on the walls, foundations, slabs. These cracks increase in size after each freezing and thawing cycle, which renders a certain part of the building or structure unusable.

During a long interruption of construction and installation work, it is necessary to carefully assess the damage that was caused to building structures, a prerequisite is the assessment of reduced quality indicators of the soil base.

After the construction work resumes, it is necessary explore the properties of the soil base and then develop measures that will depend on existing soil conditions.

If a dug pit is open before the break, then when starting new construction and installation works, it is necessary to deepen to those soils that were not exposed to any factors.

In long breaks in construction work (in the event that the structures were not preserved), severe damage is primarily manifested in the brickwork of the walls, in floor slabs, concrete structures with existing defects, such as poros, mother-in-law, etc.

In cases where acidic gases are present in the air, then reinforced concrete building structures consisting of dense concrete and steel structures are also subjected to corrosion. There is a danger of rotting and warping of wooden structures.

Adverse effects of long interruptions in construction will affect the building or structure during excavation during construction of foundations.

It is imperative to develop measures to eliminate the consequences, and for this it is necessary to conduct high-quality examination or unfinished building structure.

### **Survey of the building, after a break in construction (unfinished).**

This survey necessary when resuming construction work at facilities whose construction or reconstruction was discontinued several years ago. During a long break in construction, unfinished buildings and structures are subject to constant adverse environmental effects: humidification, freezing and thawing, heating and cooling. Building structures not designed for such impacts receive various damages.

Main challenge inspection is to determine the possibility of further exploitation of materials and the use of individual structural elements as part of a single building structure. During the examination, if necessary:

- Identification of changes in the quality indicators of building structures;
- A thorough instrumental analysis of the physical and mechanical properties of materials with sampling in the laboratory;
- Probes are made to determine the condition of hidden structures and materials;
- a geodetic survey is being carried out to determine the deflections, movements of structures;
- a cartogram of defects is compiled, on the basis of which the defects are classified in accordance with the regulatory framework and verification calculations are performed to assess the bearing capacity of structural elements.

### **Description of the object**

The surveyed object is located at the address: Tashkent city, Sergeli district, Sputnik-2 massif, Davlatobod street.

### **Characteristic of the construction area**

Construction area - Tashkent city, seismicity - 8 points; the estimated seismicity of the site is estimated at 9 points, the capital of construction is II class, the durability class is II class, the degree of fire resistance is II class, non-stop soils with rated resistance  $R = 20$  kPa are accepted, soil category by seismic properties is II, groundwater is non-aggressive to concrete normal permeability in Portland cement, the standard depth of soil freezing is 0.68 m, the depth of seasonal soil freezing is 0.7 m, groundwater within the area is uncovered at a depth of 2.8 m from the ground.

### **Space-planning scheme and structural design of the building**

Object unfinished four-story brick building with basement. This building is “square” in plan and with axial dimensions of 30.9 m - 11.22 m. The height of the building is 3.00 m from floor to floor. The building under examination was launched in the early 1994s of the last century according to design estimates. However, at the time of the examination, these documents were not submitted by the customer, i.e. they are not preserved.

The surveyed building, over the past period a long time there was atmospheric precipitation (without a roof). Measured survey work showed that the building has the following structural solution.

Photo. 1. The appearance of the unfinished construction of a residential building

Photo. 2. Floor plan of a four-story residential building

## SURVEY METHODS

1.1. Technical inspection of building structures was carried out by the visual-instrumental method, in accordance with KMK 2.01.15-97 "Regulations for the technical examination of residential buildings", "Recommendations for the examination and assessment of the technical condition of large-panel and stone buildings. TSNIISK them. V.A. Kucherenko, Moscow, 1988" and other regulatory documents.

1.2. During the inspection, the actual dimensions between the center axes of the building, the spans and sections of the structures, as well as the defects of the elements and assemblies that were allowed during the design, manufacture, transportation, installation and appeared during exploitation, were determined.

### 1.3. Tools and instruments used in the examination:

- Plumb - to measure deviation or displacement from the vertical;
- metal roulettes 3 and 5 m long in accordance with GOST 7502-89 - for measuring linear dimensions;
- vernier caliper according to GOST 166-80 - for measuring linear dimensions;
- Probes - for measuring the size of gaps, depth and width of crack opening;
- Laser roulette BOSCH DLE 50, for measuring linear dimensions;
- Canon digital camera - for fixing defects in construction

### Constructions;

- ONIX-2.5 concrete strength meter for determining the grade and class of concrete.
- measuring concrete protective layer POISK-2,5
- Adhesive strength meter in masonry ONIKS-OS-2.

1.4. To determine the actual laying depth and the configuration of the foundations, a control passage of pits was made.

1.5. To establish the actual strength characteristics of the brickwork, laboratory tests of the masonry mortar and brick selected at the facility in the testing laboratory were performed.

1.6. A photograph was taken of the object with the fixation of individual structures, their elements, nodes and defects.

### The results of the survey.

Grounds and foundations. The foundations of the building are tape, reinforced concrete, monolithic. The width of the soles of the foundations of the longitudinal walls is 0.9 m, transverse -2.0 m. The depth of the sole is -3.32m from the floor level ( $\pm 0,000$ ) or from the ground level -1.20m. on reinforced concrete foundation pillows, foundation walls are constructed from prefabricated factory concrete blocks FBS 24.0x0.6x0.4. On the outside, the foundation walls have a bitumen coating. When digging a pit on October 4, 2014, the soils under the soles of the foundation are dry, compacted. During construction, they are soaked. Violations of the integrity of the foundations of the walls are not observed.

### The technical condition of the main building structures;

The foundations of the building are tape, monolithic, reinforced concrete and made of prefabricated concrete blocks of factory manufacture. The lower, monolithic part of the foundation is a reinforced concrete pillow with a width of 0.9 m (longitudinal) and 2.0 m (transverse bearing) and a height of 0.32 m. On a monolithic reinforced concrete foundation along the axes, FBS 24.0x0.6x0.4 with a width of 400 mm, external and 400 mm internal, longitudinal and transverse, are laid. All precast concrete blocks are laid on a cement-sand mortar, followed by reinforcement. Reinforced by reinforced mesh with cells 100mm x 100mm Ø6 VR.

The depth of foundation is -3.32 m from the level of the clean floor of the first floor (0.00) or -1.20 m from the natural level of the earth. Floor levels below 3.32m are reinforced concrete monolithic concrete pillow, concrete walls are laid down to the floors of the 1st floor, drawing No. 4. Concrete class of monolithic sections, i.e. walls B 20 (Table 1.). Blocks are not arranged around the perimeter of the building. Water under the foundations is not recommended. Waterproofing is done. Backfill made of construction debris and partially gravel.

At the time of the survey, soil deformations of the foundation or foundations are not observed. In constructions, damage or defects whose dimensions exceed those regulated by standards are not established.

The walls of the examined building with a thickness of 380 mm (1.5 bricks) along the perimeter of the buildings and 380 mm along the stairwell and 250 mm along the middle longitudinal axes of the buildings are laid from solid clay burnt brick on cement - lime-sand mortar. They are reinforced with masonry mesh 100x100mm - Ø5 VR. Partitions 120 mm thick are reinforced brick. The tests performed showed that the adhesion of the mortar to the brick is good. The normal adhesion of the mortar to the brick on non-tied seams averaged 1.2 kg / cm<sup>2</sup>. This value corresponds to the laying of category I (requirement of clause 3.5.4. Table No. 1 of KMK 2.01.03-96 "Construction in seismic areas").

On all longitudinal and transverse walls, masonry nets of Bp Ø5 were laid with cells 100mm x 100mm wide 30cm. They are stacked for every 40-50cm in height.

The step of the transverse walls at an 8-point zone according to table No. 3.1 KMK 2.01.03.-96 point No. 5 of the I-category of masonry should be no more than 12.0 m, but in fact they should be no more than 6 m and no reinforcement is required. On all perimeters, internal and external walls, strapping belts are arranged. Such buildings are complex construction. A technical examination revealed that when leveling, the horizontal deviation from the 1st axis to 7 axis 3cm. Verticality deviates up to 4cm.

Partitions are made of burnt clay brick 120 mm thick laid on cement - lime sand mortar. They are reinforced from wire rod BP Ø5 in one row on each 50-60 cm high. In many places, partitions and middle walls with a thickness of 250 mm are dismantled, these sections should be dismantled to the end and re-laid.

Reinforced concrete columns. At the corners of the balcony, reinforced concrete columns with dimensions of 300mm x 400mm were released from the foundation pillow. They are reinforced in the basement of 4 AIII Ø20 with clamps Ø6 AI and with clamps Ø6 AI with a pitch of no more than 25 cm, and from the first floor they are reinforced with 4 AIII Ø16 and clamps AI1 Ø6 with a pitch of no more than 25 cm. Concrete brand B25.

The lintels above the entrance doors are reinforced concrete, monolithic and they are reinforced with 6-AIII-Ø14 with clamps Ø6-A-1 with a pitch of 250 mm. Dimensions of jumpers 40cm x 40cm. The jumpers in the partitions and partly in the doorways are made of fittings, but they are currently dismantled. It is necessary to arrange jumpers in partitions and some doorways.

The reinforcing belt can be reinforced with 4 AIII-Ø14 and with clamps AI-Ø6 with a pitch of at least 250 mm. Concrete brand B20.

Reinforced concrete antiseismic belts 22 cm high are constructed along all longitudinal and transverse walls, meeting the requirements of current building codes. KMK 2.01.03.-96. Clause-3.5.10 and 3.5.11.

Reinforcement of seismic belts is made of 2Ø14A-III and clamps Ø6 A-1 with a pitch of 250 mm. Class of concrete in compressive strength B20 (table. 1.). reinforced concrete they are reinforced with 2 AIII-Ø14 and with clamps AI-Ø6 with a pitch of at least 250 mm. Concrete brand B20. At the edges of the transverse wall they are in the body of a brick and the width is not more than 14 cm. Antiseismic belts are not arranged along the length of the building, since the strapping belts work as antiseismic belts.

Overlapping reinforced concrete, prefabricated, hollow, factory-made. The average value of the strength of monolithic floors, determined by the non-destructive method ONIX-2.5 with a reliability of 92%, corresponds to the concrete class of compressive strength B 25. At the time of the examination, defects or damage, indicating a decrease in the bearing capacity of structures, have not been established. The design meets the requirements for stiffness and strength. Deflections of floor slabs within the limits allowed by building codes. The nodes supporting the floors correspond to the requirements of building codes, except along the transverse walls and stairwells and along the middle axes according to the drawings. They rely on this axis on 1 and 18 axes on a strapping belt and have an anti-seismic belt on a brick body 12 cm thick, and should be 25 cm, SNIP "Construction in seismic areas" KMK 2.01.03-96 paragraph 3.5.11. It is necessary to strengthen these sites according to the recommendations. In the stairwells, the same is also done. On the middle axes, the axis of these sections does not correspond to the standard length, since they should be 6.0 m and actually 7-10 cm more. But they rely on reinforced-concrete strapping belts with a brand of at least B 20 and work like reinforced-concrete crossbar in frame buildings and do not need reinforcement.

Stair flights and prefabricated platforms, reinforced concrete, factory-made. Two marching stairs.

### **Instrumental surveys results. Determination of concrete strength**

To determine the actual strength of concrete foundations, a shock-impulse meter ONIKS-2.53 was used. This device is designed to measure the strength of concrete and other composite materials by the shock pulse method according to GOST 22690-88 and PCT Uz 872-98 according to the non-destructive method. The device has a two-parameter method for determining the strength (shock + rebound) in the range and strength changes of 3-30 MPa and 10-100 MPa with a limit of permissible basic relative measurement error of not more than  $\pm 8\%$ .

The principle of exploitation of the device is based on the correlation dependence of the parameters of the shock pulse on the elastic-plastic properties of the controlled material. The device consists of a sclerometer and an electronic unit.

To carry out measurements of the strength of concrete foundations, the sclerometer identifier struck the measured surface. Upon impact, the converter generates a signal proportional to the surface hardness of the measurement object, which is recorded by the electronic unit and converted to the strength of the material. Measurements are made automatically when the sensor performs impacts and the display shows the results of single measurements and the final data: K-measured value of strength, V-coefficient of variation and W-span. The unit strength value of

concrete was taken as the average strength at the construction site, defined as the average value of 10 measurements.

**Determining the characteristics of masonry.** The masonry of the external and internal walls of the building under examination is made of burnt ceramic brick with dimensions of 250x120x65 mm in a cement-sand mortar.

For sampling in order to determine the strength characteristics, several brick samples were taken from accessible sections of the walls. The actual strength indicators of the masonry (brick grade, grade of masonry mortar, temporary resistance to axial tension along an unbound seam) were determined in accordance with the requirements of GOST 24922-81, GOST 8462-85.

**a) Determination of the brand of brick.** The brand of brick selected from the available sections of the masonry was determined using the ONIX-2.5 device. The results of determining the tensile strength of a brick under compression are shown in table No. 2

**b) Determination of the strength of the masonry mortar.** The strength of the mortar from the masonry joints was determined by compression tests of cubes with 3-4 cm ribs made of plates selected from horizontal masonry joints and glued using a layer of gypsum dough 2-5 mm thick. The plates were made in the form of a square, the side of which was 1.5 times the thickness of the plate, equal to the thickness of the seam. Samples were tested one day after their manufacture. Samples of cubes from the solution were tested according to paragraph 9.5 of the PCT Uz 691-96 "Building solutions. Test Methods. " The strength of the solution was calculated according to clause 9.6.1. PCT Uz 961-96 and was determined as the arithmetic average of the results of five samples.

To determine the actual strength of the solution in cubes with ribs of 3-4 cm, the test results of the cubic plates were multiplied by a reduced coefficient of 0.8 (see table A1 of Appendix A, PCT Uz 961-96). The test results are given in table No. 2. Determined using the ONYX 2.5 instrument.

**c) Determination of the adhesion of the masonry.** The determination of adhesion strength was carried out by axial tensile testing of the elements of masonry walls, selected under construction conditions. To conduct control tests on the adhesion of masonry from brick, accessible sections of the walls were selected. When testing the masonry for adhesion, the compressive strength of the solution was determined from the masonry seam according to the above procedure. The test of masonry for adhesion was carried out according to the scheme specified in GOST 24992-81 "Stone structures. Method for determining adhesion strength in masonry. " The test results are shown in table No. 3 and determined using the ONIX-2.53 device.

### The recommendation for eliminating partially saline walls is to carry out the following work:

1. Treat the walls with a special inhibitor. (Journal of Architecture and Construction of Uzbekistan No. 5 of 2008, pp. 40-41.
2. After the inhibitor dries up - plaster the walls with cement sand mortar, in the ceilings: apply krausite putty.

**Recommendation for the isolation of bare working reinforcement in girders and ceilings.**

1. Removes rust from working fittings with a wire brush.
2. Drawing a layer of krausit solution.
3. After the mortar has dried, the plaster is cement-sand mortar without adding gypsum, giving every day to dry the cement only in the basements.

**Recommendation for reinforcing reinforced concrete floors from the second floor along the ends and stairwells by arranging an anti-seismic belt.**

1. The device is an anti-seismic belt from corners No. 50 at the bottom and top of the wall with the use of Ø12 studs with a stud pitch of 500-600mm.
2. Punch a through hole on the walls Ø12 and along the transverse walls to pass corner number 50 on the inside, install plates 100mm x 100mm x 10mm and install them on the krausit solution, pull them into the "mixture". It is also similar in slabs with two plates to pull up to the "mixture". Connect the plates on the walls and on the slabs using a corner number 100 with a length of up to 100mm.
3. Tighten the metal corners parallel to the brick wall with Ø12 studs.
4. Setting the strip between the corners as vertical clamps from a 50mm x 5mm plate with a 30cm pitch.
5. Wrapping the structure with a galvanized mesh with 20mm x 20mm cells and cement plaster with sand mortar M100.

Attached is drawing No. 4 for strengthening the anti-seismic belt and overlap.

**CONCLUSION**

According to the results of a technical survey of building structures of a four-story brick residential building located in Tashkent, Sergeli district, Sputnik-2 massif, Davlatobod street.

1. The foundations of the building are tape, monolithic. The technical condition of the foundations is workable.
2. The walls of the surveyed building are made of solid burnt bricks. The walls at the time of the examination were in a limited working condition. The walls of the fourth floor were subjected to atmospheric precipitation for a long time (more than 20 years), they are destroyed. It is necessary at the beginning of construction to disassemble 60-80 masonry in height.
3. Harnesses and monolithic belts, at the time of the examination were in a limited working condition. It is necessary to isolate bare working fittings according to recommendations.
4. The antiseismic belts along the ends and along the stairwells must be strengthened according to the recommendations. They are in limited working condition.
5. Overlapping reinforced concrete, hollow, prefabricated prefabricated. The condition category of reinforced concrete floor slabs is assessed as exploitational.
6. Stairs - two marching, reinforced concrete teams, factory-made. They are generally in good condition.

7. The staircases are prefabricated reinforced concrete, factory-made. They are generally in good condition.
8. There is no roof, it is necessary to design.
9. Window blocks are missing. It is necessary to install new window units in accordance with modern requirements.
10. Door blocks are missing. It is necessary to install new door blocks in accordance with modern requirements.
11. No floors. It is necessary to design floors that meet environmental requirements.
12. No water-bearing communications; no heating systems in the building. It is necessary to perform the design and estimate documentation on all communications: heating systems, hot and cold water supply, sewage and gasification.
13. Interior finishing plaster must complete the finishing work.
14. Exterior finish is necessary to complete the finishing work.

Based on the results of the technical inspection of the building structures of the four-story three driveway brick residential building, we conclude: the examined object should be completed: After the appropriate measures to strengthen and restore the building structures are completed, the residential building will be earthquake-resistant and exploitation-reliable. It is necessary to carry out design estimates for specialized design organizations.

The survey forms a conclusion on the possibility of further exploitation of building elements, carrying out necessary works and measures to strengthen structures, eliminate defects caused by a long interruption in construction and the prevention of defects that may occur after the resumption of construction and installation works, the implementation of which will ensure the safety and reliability of the facility under construction. Possibilities of using materials in construction.

## **PECULIARITIES OF TREATMENT OF POST-TRAUMATIC PURULENT INFLAMMATORY COMPLICATIONS IN PATIENTS WITH Fractures OF THE LOWER JAW**

**Rakhimov Zokir Kayimovich\***

\*Candidate of Medical Sciences,  
Bukhara State Medical Institute,  
UZBEKISTAN

### **ABSTRACT**

*The purulent-inflammatory complications of fractures of the lower jaw represent a serious medical and social problem. Despite certain successes achieved in the prevention and control of purulent-inflammatory diseases after fractures of the lower jaw, a marked decrease in the proportion of complications is not observed. To a large extent, this is due, on the one hand, to the state of the immune system, liver, and kidneys, and, on the other hand, to difficulties in selecting pathogenetically substantiated therapy. Treatment of patients with fractures of the lower jaw remains one of the urgent problems of modern dentistry. In different age groups, the course and treatment of fractures of the lower jaw has its own peculiarities, therefore, improving the quality of treatment for victims largely depends on a differentiated approach to each specific case of injury, taking into account certain patterns characteristic of each patient.*

**KEYWORDS:** *Lower Jaw Fractures, Purulent-Inflammatory Complications, Treatment Methods, Treatment Objective, Improvement of Treatment Quality.*

### **INTRODUCTION**

In the course of the long development of reconstructive surgery, the maxillofacial region (MFR) formulated the basic principles for treating diseases, the most optimal methods for their reconstruction (plastic surgery with local tissues, flaps on the feeding leg from tissues close to the defect and distant parts of the body, free tissue transplantation) and therapeutic methods have been proposed to prevent postoperative inflammatory complications [15]. A common task in the treatment of patients with purulent-inflammatory processes of the lower jaw is the inclusion of a set of therapeutic measures aimed at both the patient's body and pathogens. [12, 37]. Treatment of purulent-inflammatory processes is based on the integrated conduct of surgical interventions

and conservative measures. Surgical intervention, which consists in the mandatory opening of a purulent focus and their rational [2, 19]. Autopsy of the abscesses is carried out by incisions over the affected foci, which provides a free outflow of pus and exudate, reduces pressure in the infiltrated tissues, normalizes microcirculation and early removal of necrotic tissues, and also helps to suppress microflora directly in the pathological focus and accelerates the regeneration process. After good drainage, the wound is repeatedly washed with solutions of antiseptics (furatsilin, potassium permanganate, dimexide, extericide, etc.) antibiotics, surfactants (chlorhexedine, rocal, etc.). One of the effective local methods of cleansing the wound from microbes and toxins, as well as tissue decay products, is wound dialysis, which actively influences healing processes, improves functional results and shortens the treatment time for patients [40]. In order to quickly cleanse the wound, dioxidine, dimethyl sulfoxide, oxacillin, chloroacetophos and levomecol ointments, proteolytic enzymes are used locally. A common drawback of various ointments used in the treatment of purulent-inflammatory diseases is that their basis is fat. In this regard, ointments do not mix with wound exudates and cannot absorb wound, which adversely affects the processes of cleansing and healing of the wound in the initial stages. Apparently, in the initial stages of the inflammatory process, it is better to use drugs in the form of solutions, and after cleansing the wound and in the absence of secretions from it, use ointment preparations [17.39.].

In recent years, a number of works have appeared on the successful use of a number of physical factors in local therapy, which helps to cleanse and heal wounds, and reduce the duration of treatment. In particular, in the literature there are works devoted to the use of ultrasonic cavitations of purulent wounds. According to these authors, when using ultrasonic cavitations, a complex of reflex reactions of a stress-adaptive and protective nature is developed in the body that improves homeostasis, adaptive and trophic functions ([25]. Many authors recommend the use of laser radiation only in the regenerative phase of the wound process, t. to. its use in the phase of purulent-necrotic states can exacerbate the inflammatory process. [31].

Apparently, at present, the situation is completely ripe when it is necessary to intensify the introduction of methods that do not inhibit or replace, but naturally stimulate the body's defense system (local, general and specific and non-specific). In addition, it is necessary to take into account the fact that, in response to a fracture, an increased yield of calcium and phosphorus from the bone is noted both locally and from distant parts of the skeleton. [19.29]. The presence of local acidosis caused by an acute inflammatory process, both in the lower jaw and in the surrounding tissues, contributes to a decrease in the mineral saturation of bone tissue in the area of the defect. All this against the background of bacterial aggression, metabolic and microcirculatory disorders in the damaged bone complicates the treatment of this pathology and lengthens the rehabilitation of patients and, most importantly, hinders its structural and functional recovery.

The use of one method does not always give the proper result, therefore, scientists have found application for new mutually complementary methods of treatment. These include electrophoresis and ultrasound treatment of wounds, with which drugs can be administered deeper [17.34]. The use of ultrasonic cavitation of purulent wounds is reflected in modern literature [5,13,27].

Hyperbaric oxygenation is increasingly used in the complex of therapeutic measures in the treatment of patients with purulent-inflammatory diseases, especially in the presence of anaerobic infection [7,26], the effectiveness of which is associated primarily with the acceleration of local and general hypoxia, as well as the creation of hyperoxia, which is detrimental on aerobes and a number of anaerobes, at the same time increases the activity of antibiotics [23]. The main component of the complex of general therapy is the use of antibacterial drugs. General therapy for purulent-inflammatory diseases of the MFR begins immediately after surgery with intramuscular or intravenous antibiotics. Rational antibiotic therapy is the use of antibiotics taking into account individual sensitivity or, in the absence of such an opportunity, broad-spectrum drugs are usually used [23,42]. The frequency of antibiotic administration depends on the severity of the patient's condition. In the event of severe complications, some authors suggest administering large doses of antibiotics, which often leads to the development of dysbiosis and even candidiasis [3, 36]. Antibacterial drugs, inherently sometimes replacing natural immunity and nonspecific body protection at the beginning of use, are highly effective. Their use on an increasing scale began to turn its opposite side, as many authors point out, they convince themselves that a natural load on the immune system is necessary. With purulent-inflammatory processes and traditional methods of administering antibiotics, due to insufficient therapeutic concentration in the lymph, they are not always able to exert an optimal bactericidal and bacteriostatic effect on pathogenic microorganisms in the lymphatic system, which indicates the need to develop more advanced methods of drug administration ([44, 45].

The lymphatic system is involved in various pathological processes: shock, inflammation, allergic, as well as adaptive restructuring of the body. Considering that at usual doses and routes of administration, medications do not always penetrate into the lymphatic system in sufficient doses, manifesting effective amounts, endolymphatic therapy has developed significantly. A number of authors have proved the advantage of the endolymphatic method of administering antibiotics (ampicillin, claforan, gentamicin injected into the lymphatic vessel once), which consisted in achieving a very high concentration of the drug in the lymph and maintaining the therapeutic concentration of the antibiotic in the body during the day, which cannot be achieved with traditional methods introduction [9,22, 28]. When conducting regional endolymphatic therapy, an antibiotic that has got into the lymph slowly moves along the lymphatic pathways, partially entering the bloodstream [41,45]. Most of it is delayed and held for a long time along the lymphatic capillaries, depending on the localization of the pathological focus, but as far as possible from the affected organ (skin, mucous membrane) with reduced protective properties.

Studies on indirect saturation of the lymphatic system with drugs were first conducted by B.V. Ognev (1971), who used high-molecular-weight drugs to administer, based on the fact that these substances are mainly absorbed from the tissue into the lymphatic system, however, due to the slow nature of this process, it was not possible to create the necessary therapeutic concentration of the drug in the lymphatic system in this way. The works of S.U. Dzhumabaeva learned that a local increase in venous pressure resulting from the application of a tourniquet to the limbs leads to a redistribution of tissue fluid movements towards the lymph node. Yu.M. When studying the effectiveness of lymphotropic therapy for purulent-inflammatory diseases of soft tissues of various etiologies and localizations, Levin revealed that with the lymphotropic administration of antibiotics 1-2 times a day, the patients' condition improves faster, the temperature and leukocyte

blood count normalize. Subsequently, this method was widely used in the treatment of purulent-inflammatory diseases, including in the treatment of fractures of the maxillofacial region.

In the search for new drugs, the authors drew attention to the complex preparation Collapan gel containing hydroxyapatite collagen, which is a solid gradually resorbable matrix, against the background of infected bone defects, its gradual destruction occurs with the simultaneous replacement of the newly formed bone. The preparation Kollapan-gel has antimicrobial osteoinductive and osteoconductive properties i.e. refers to biologically active materials. In addition to these properties, the drug can prevent complications due to the prolonged release of the antibiotics contained in it. High antimicrobial activity of the material lasts up to 20 days. Thus, the complex preparation Kollapan-gel allows affecting the main pathogenesis links in the inflammation zone, bacterial factor, microcirculation system, reparative osteogenesis and local immune status [16, 33].

Enzymotherapy is the treatment with the help of purposefully formulated mixtures of hydrolytic enzymes, the therapeutic effectiveness of which is based on the integrated effect on key processes in the body. Systemic enzyme therapy drugs are WobenzymFlogenzim and Wobe-Mulos E (MUCOS Pharma GmbH Co, Germany), which are a combination of natural, highly effective enzymes of plant and animal origin. Clinical trials have shown that Wobenzym and Wobe-mugos E satisfy the universal therapeutic principle: reliability and high efficiency with overall good tolerance, which determines the wide range of their clinical use [43]. Acting systemically, enzymes have an anti-inflammatory, immunomodulatory, antiaggregant, fibrinolytic, decongestion, and secondary analgesic effect. The drugs have a positive effect on the course of the inflammatory process, limits the pathological manifestation of autoimmune and immunocomplex processes, positively affect the immunological reactivity of the body. Systemic enzymes do not inhibit inflammation (since this is a natural reaction of the body to the disease), but optimize its course. Under the influence of proteolytic enzymes, the necessary catabolytic phase of inflammation is minimized and the regenerative phase is accelerated. If the disease is associated with an infection, then enzymes contribute to a normal immune response: detect, kill the pathogen and remove from the body. One of the properties of enzyme preparations is the ability to improve the effect of other drugs and reduce their side effects. Enzymes increase the concentration of antibiotics in the blood, facilitate their penetration into tissues and thereby increase the effectiveness of therapy. According to the results of the work of Guggendicher, Wobenzym is able to increase the penetration of antibiotics into staphylococcal abscesses. A number of works of recent years have also shown that Wobenzym potentiated the effectiveness of the use of antibiotics in the treatment of various purulent-septic processes. The clinical effectiveness of drugs that affect the processes of regeneration of the mandibular bones is also in the field of view of many scientists.

A number of articles have been devoted to bone metabolism in fractures under the influence of hormones. Calcitonin [14] and others were used as a stimulant for regeneration. The regeneration of the mandibular bone takes place in three stages: cell-fibrous 1 week after the fracture, chondroid 2 weeks later and primary - bone after 4 weeks. The authors prove how, under the influence of calcitonin, phosphorus-potassium metabolism improves, changes in the basic mineral elements of bone tissue in patients with fractures of the lower jaw and osteoporosis. The decrease in the content of Ca and P in the mandibular bone on the side of the fracture from the 7th to the 14th day is obviously due to the prevalence of the resorption of the mineral elements of

the bone over their restitution. At this time, the protein system is intensely formed, contributing to mineralization. This is, first of all, the morphogenetic protein of bone - collagen. By the 28th day, primary bone callus is formed and naturally by this time the entry of CA and P into the bone prevails over their exit from it. Surgical treatment of a purulent bone wound consists in creating the correct surgical situation, i.e. "Multi-chamber" wound space should be turned into a "single-chamber" with effective drainage. Treatment of overgrown fractures, defects of the bone and soft tissues is possible not only sequential, but also simultaneous. Non-free soft tissue and bone grafting can be performed under conditions of stable fixation of bone fragments of MFR. Scientists prove that the use of calcitonin in fractures of the lower jaw favorably affects the course of the regenerative process and the formation of apatite crystals. Dystrophic processes in bone tissue and the development of inflammatory complications depend on the violation of the trophic function of the lower alveolar nerve. It was shown that deafferentation of the lower jaw causes regular changes in mineral metabolism, as well as structural rearrangement of the bone in the dynamics of post-traumatic regeneration, which causes inhibition of the replacement of primary bone marrow by highly differentiated bone tissue (Eroshenko V.F. 1993).

The literature data on the treatment of patients with complicated fractures of the lower jaw indicate the advisability of including in the complex of therapeutic measures the method of intraosseous administration of drugs: dioxidine, dimexide, etc., which allows to achieve optimal conditions for splicing fragments [12, 37]. However, insufficient attention is paid to the normalization of metabolic processes in damaged bones. The inclusion of the method of intraosseous infusion of biologically active drugs in the complex of therapeutic measures at the early stage of treatment of fractures of the lower jaw, the authors consider it extremely advisable. This contributes to a faster adaptation of the body to injury, accelerating the normalization of metabolic and reparative processes in damaged bone tissue. The most common and serious complication of a local mandible fracture is traumatic osteomyelitis. According to various authors, its frequency reaches 30%. Currently, despite successes in the study of etiology and pathogenesis, the improvement of known methods and the development of new methods of treatment and prevention, a significant reduction in the frequency of its occurrence has not been achieved [12,37]. In the complex treatment and prevention of traumatic osteomyelitis with general antibiotic therapy and correction of hemostasis, the local effect on the infected bone wound is important. In this regard, studies of intraosseous infusions of antibacterial drugs are of particular interest [11, 37].

Recent studies have shown an increasing interest in the use of sodium hypochlorite solution, which has a detoxifying, antimicrobial, antibacterial and antiviral effect, in the treatment of purulent-septic conditions. Medicinal sodium hypochlorite solution is a powerful means of a multidirectional action of an oxidizing nature, an active oxygen donor, and is widely and successfully used in the treatment of endo- and exotoxicoes of various etiologies [6,35]. The authors prove that the inclusion of intra-infusion infusions of sodium hypochlorite solution in the complex therapy of patients with traumatic osteomyelitis of the lower jaw promotes not only activation of reparative osteogenesis, but also another favorable shift in metabolic processes in the body, which ultimately have a positive effect on the course of the postoperative period, which consists in in particular, in reducing the incidence of complications.

Currently, autologous bone, alloost, xenotissue, synthetic bone based on calcium and phosphorus are widely used in bone restoration operations. However, as many authors point out with bone

grafting, adequate osteogenesis is far from always created. Researchers indicate that the larger the bone defect, the more likely the formation of patches with the formation of only fibrous or non-mineralizing osteoid tissue [1,21, 38]. Even autobone is not always completely remodeled into mature bone tissue, and its full mineralization does not always occur. One of the attempts to improve osteogenesis was the use of a combination of autobone and allocost, allocost and xenotissue, all of these materials with synthetic bone. If small bone defects filled with biomaterials in different combinations gave good osteogenesis, in other cases the results were far from satisfactory [10,25,16].

To increase the effectiveness of osteogenesis of individual biomaterials and their combinations, a number of authors consider it necessary to prepare the bone. They noted more perfect osteogenesis with the introduction of biomaterial directly into the bone, i.e. in the spongy bone, or when the cortical plate is perforated and plastic material is laid on the jaw portion washed by the blood. Other researchers have obtained good results when mixing biomaterial with blood from a wound [34]. From these premises a new technology arose - the use of a patient's blood plasma enriched in platelets. Experimental studies have established the stimulation of osteogenesis under the influence of a number of factors emanating from platelets, the use of this technique allows you to increase bone mass by 30-40% [28,30].

In the West, in cranial-maxillofacial surgery, distraction osteogenesis is becoming increasingly popular, and the literature on the elimination of congenital deformities and defects of the facial skeleton, requiring a slight movement of the bones, predominates in the literature. Only rarely are publications devoted to the elimination of large defects of the lower jaw. Distraction osteogenesis significantly expanded the possibility of reconstructive craniofacial surgery. The apparatus designed by Shvyrkov M.B. it is successfully used in the primary surgical treatment of gunshot wounds, it was once the surgical treatment of gunshot wounds, he developed several models, and gunshot defects of the lower jaw, different in size and location, prompted the author to create more and more new options for osteoplasty of the lower jaw.

Particularly successfully used are two variants of the Shvyrkov apparatus: osteoplasty with local tissues and non-free osteoplasty of the lower jaw. Using external fixation devices of his own design, using compression and distraction technologies in conjunction with radical PChO wounds, he notes a 5-fold reduction in the number of complications in the form of gunshot osteomyelitis, an almost 4-fold decrease in the number of disabled people, and 93.1% of the wounded in Afghanistan were returned to service. war, which is 32% more than in the American army during the Vietnam War [8.34].

The scientist continues to improve his technique called "distraction" - or a metered stretching of the resulting callus. Shvyrkov M.B. published a whole series of articles in the journal "Dentistry", which describes the experience of bone marrow distraction for osteoplasty of the lower jaw with local tissues, non-free osteoplasty of the lower jaw through distraction osteogenesis. The experience of M.B. Shvyrkov, osteoplasty of the lower jaw with local tissues and distraction osteogenesis is almost bloodless operation and can be used not only in the treatment of jaw fractures or elimination of defects, but also to increase its size in the presence of congenital and acquired malformations [3,32, 38].

One of the most optimal methods for treating fractures of the lower jaw is a functionally stable osteogenesis with mini-plates with screws, the use of which allows achieving good anatomical

and functional results in the shortest possible time. However, as with any treatment method, the use of standard miniplates has certain limitations. In particular, osteosynthesis with miniplates is not indicated for fractures of the lower jaw, accompanied by significant defects in bone tissue (comminuted, complicated by traumatic osteomyelitis, etc.). In such cases, for the reposition and immobilization of fragments, it is most often recommended to use various kinds of bone devices and fill the bone defect either a bone graft, or osteotropic drugs mainly containing hydroxyapatite or its analogues [23,44]. However, as the authors note, this method of surgical treatment of this pathology has certain drawbacks: the bulkiness of the apparatus, the need to perform another operation to collect a bone graft, the probability of rejection of foreign material, the high cost of the apparatus, etc. In this situation, the authors recommend the introduction into clinical practice of treating fractures of the lower jaw with defects in bone tissue, a mesh plate implant made of titanium for craniofacial facial osteogenesis in combination with filling the bone cavity with osteotropic drugs.

The authors from Bishkek Yeshiev A.M. and Scheinman V.Yu. a method for treating fractures of the lower jaw using a modified Tigerstedt tire based on special couplings and struts is proposed. The proposed tire is new, improves the hygienic condition of the oral cavity, increases the effectiveness of splinting and reduces the number of complications of an inflammatory nature.

Currently, it is generally recognized that the most effective stimulator of osteoreparation is the demineralized bone matrix (DBM), while the osteogenic potential of other types of allografts is insignificant or absent [20].

One of the promising new directions in the correction of the regeneration process is the use of biological active polypeptide growth factors.

The material accumulated over recent years indicates that polypeptide growth factors regulate osteogenesis and bone resorption [36]. Currently, methods have been developed for the purification of polypeptide growth factors from animal tissues, as well as methods for producing recombinant analogues of these proteins. This makes it possible to create composite materials with osteoinductive properties for the treatment of bone injuries and other defects. One of the properties of demineralized bone tissue is its ability to induce osteogenesis with great constancy under unusual conditions for it and has a unique ability to replace bone structures in a purulent wound.

Saveliev V.I., Kravtsov V.A. In the experiment, we conducted a comparative study of the biologically active properties of demineralized, freshly frozen and formalized bone allo- and autografts and proved the superior osteoinductive property of demineralized bone tissue. It was established that in their osteogenic qualities formalized allografts are inferior to frozen and lyophilized ones, and those, in turn, are worse than demineralized bone tissue with osteoinductive ability. It is advisable to use it as an inducer of demineralized bone tissue in combination with other types of transplants and implants, which can bear the main mechanical load. There is no information in the literature on the use of demineralized bone tissue in reconstructive maxillofacial surgery. Information about their use by foreign authors is sporadic. For the first time, G.B. Troshkova, I.E. Kolukanov used an allogeneic demineralized bone graft to restore the integrity of the front wall of the maxillary sinus in an infected bed. Vinnikov I.N., Kuralesova A.I. conducted clinical and experimental work on the use of decalcified bone matrix to stimulate bone formation after removal of odontogenic cysts up to 6 cm in size. The

decalcified bone matrix was lyophilized. V.Yu. Nikolsky (2002) in the early stages (3-17 weeks after tooth extraction) used allogeneic demineralized and lyophilized bone, sterilized by gamma radiation, in the form of small shavings to fill the hole when installing both an instant dental implant and with the introduction of a titanium biphasic dental implant with simultaneous alveolar bone grafting. Successful osseointegration was achieved in 95.1% of cases [18,41].

The development of complications of bone fractures of the facial skeleton (the formation of a false joint, delayed consolidation and secondary displacement of fragments, failure of bone regenerate, improperly fused fracture) contribute not only to errors in treatment and associated inflammatory processes, but also to underestimation of somatic diseases, among which alcoholism plays an important role. This disease, primarily affecting the mental sphere, but also accompanying serious changes in the organs and tissues of the whole organism, including the skeletal system.

A number of researchers have proved that with chronic alcohol consumption, secondary-caused osteoporosis occurs, which is characterized by a decrease in the level of physiological, and therefore reparative bone regeneration. The development of osteoporosis is due to the toxic effect of ethanol and its products on bone cells and a violation of the formation of hormone-active forms of vitamin D. The possibility of a direct effect of alcohol on orthotropic cells and cells providing reparative processes is also not ruled out [4,43].

Injury to the facial skeleton and fractures of the lower jaw is most often domestic and usually occurs in a state of intoxication, when coordination of movements is impaired, muscle tone is reduced. In alcoholics, fractures are predisposed to increased fragility of bones associated with a change in their physical properties. During the treatment of fractures, this is of great importance, since a reduced regenerative ability, exacerbated by non-compliance with such treatment by such patients, is the basis for the development of complications. In patients with alcoholism, bone wound healing is slower due to a violation of the immune system. (Askolonov A.A. 1990). These authors prove that alcoholism slows the healing of bone wounds, prolongs the local post-traumatic tissue reaction, and impaired immunity, mainly at the cellular level, also inhibits the regeneration process, and contributes to the development of inflammatory complications [2].

## CONCLUSION

An analysis of the scientific works of domestic and foreign authors shows that the problem of treating patients with MFR fractures and the prevention of purulent-inflammatory complications of these patients remains relevant and one of the most difficult. There is no single approach to the choice of classical and new methods of plastics, individualization of the choice of donor zones for free flaps. The issues of planning and the sequence of therapeutic measures and the timing of treatment have not been sufficiently studied. The issues of choosing an autologous transplant for reconstruction of the lower jaw have been little studied, there are different opinions and the feasibility of using an autorebro with its extensive defects.

There is no systematization of early postoperative complications from the movement of tissues and soft-bone tissue grafts and methods for their correction. The literature does not adequately reflect the importance of the body's reactivity and the state of the immune status for the prevention of complications after reconstructive operations for extensive lesions of the MFR and the possibility of using physical immune correction methods. In the available literature there is no data on the effect of enzyme therapy in combination with magneto therapy on the clinical and

biochemical processes in patients with fractures of the maxillofacial lesions. There is no comparative socio-economic study of the methodological approaches of rehabilitation for this pathology. Unresolved issues of the urgent problem of providing specialized medical care to patients with various forms of pathology of the MFR served as the subject of this study in order to substantiate organizational and complex treatment measures aimed at optimizing the anatomical, functional and social rehabilitation of patients with fractures of the lower jaw.

## DENTAL PREVENTION OF MORBIDITY IN SILK-WELDING WORKERS

**Kurbonova N.I\***

\*Bukhara State Medical Institute,  
UZBEKISTAN

### ABSTRACT

*Analyzing the literature on the impact of occupational factors of various chemical industries on the formation of dental pathology, we can state that the prevalence of diseases of hard tissues of the teeth, periodontal tissues and oral mucosa in workers of these industries are more common than in the control group, where the effect of chemicals on oral organs missing. The bleeding index is  $2.02 \pm 0.24$  points. The examination showed that patients had periodontal tissue lesions corresponding to moderate periodontitis, clinically manifested by symptomatic gingivitis and bleeding phenomena.*

**KEYWORDS:** Occupational, Symptomatic, Periodontitis

### INTRODUCTION

#### Relevance of the topic

A study of the epidemiology of dental diseases conducted in many countries of the world shows significant differences in the prevalence and intensity of dental caries, periodontal and oral mucosa diseases, and the decisive role in the development of these processes of natural, social, domestic, cultural, as well as vocational factors .

Analyzing the literature on the impact of occupational factors of various chemical industries on the formation of dental pathology, we can state that the prevalence of diseases of hard tissues of the teeth, periodontal tissues and oral mucosa in workers of these industries are more common than in the control group, where the effect of chemicals on oral organs missing. However, there is no assessment of the impact of a complex of harmful substances in combination with unfavorable physical factors of the working environment on the state of hard tooth tissues, periodontal and oral mucosa. The study of the pathogenetic condition of dental diseases under

the influence of various industrial and production factors is one of the priority areas in dentistry and allows us to develop an effective prevention program.

Many scientists have proven that production factors have a negative effect not only on the hard tissues of the tooth, but also cause diseases of the oral mucosa. However, questions regarding the level and structure of the incidence of the oral mucosa under the influence of harmful factors among workers in chemical industries have not been fully studied; the mechanisms of the influence of harmful factors on the oral mucosa are not completely described.

An analysis of the literature indicates that in countries with developed industry, research is being carried out to study working conditions and morbidity of workers, ensure occupational safety, assess occupational risks and develop preventive measures aimed at protecting labor and health.

## **MATERIALS AND RESEARCH METHODS**

We conducted a comprehensive examination of 150 patients with chronic generalized periodontitis of moderate severity aged 35 to 50 years, as well as 10 volunteers (practically healthy people) with an intact periodontium aged 25–35 years, who made up the control group (CG). A study of the dental status of patients included a survey and examination. The following indices were determined during the survey: hygiene index according to Green - Vermillion (1964), PMA, PI according to A. Russel (1967), IR according to Muchlemann (1971). X-ray examination was carried out using orthopantomograms and targeted intraoral images.

## **Research results and discussion**

During the examination of patients, the following complaints were noted: bleeding gums during brushing and eating solid food, itching and discomfort in the gums, bad breath, discoloration of the gums, tooth mobility. On an objective examination, the gingival papillae and marginal gums were swollen, cyanotic, bleeding on probing. The depth of periodontal pockets reached 4–5 mm. Pathological mobility was determined within the I – II degree. In all patients, abundant supra- and sub gingival dental deposits were revealed. An X-ray examination in patients with moderate severity of CGP revealed a predominance of the vertical type of bone resorption, the absence of a compact plate and destruction of the interalveolar septum from 1/3 to 1/2 of the root length, which corresponds to the second degree of destruction of the bone tissue of the alveolar part of the jaw.

The hygiene index was very high, its average value was  $2.63 \pm 0.43$  points, which indicates poor oral hygiene. The RMA index was  $40.30 \pm 3.34\%$ , which indicates the presence of an inflammatory process in the periodontal complex in these groups of patients. The average PI value in group I was  $5.06 \pm 0.31$  points. The bleeding index is  $2.02 \pm 0.24$  points. The examination showed that patients had periodontal tissue lesions corresponding to moderate periodontitis, clinically manifested by symptomatic gingivitis and bleeding phenomena.

## **FINDINGS**

1. A direct dependence of the prevalence of keratoses of the oral mucosa on the conditions of silkworm production has been established, they can be attributed to occupational diseases
2. The influence of adverse production factors on the functional and radiological parameters of the oral cavity of the examined workers and the population has been established.

### ABSTRACT

*Goods and Services Tax (GST) is the biggest taxation reform since 1947. It is implemented in India from 1<sup>st</sup> July 1, 2017. The main purpose of GST is to sum up various types of indirect tax all together. This tax structure is designed to support and enhance the economic growth of the country. This is user friendly and would bring transparency in the taxation system of India. GST will be levied on manufacturer sale and consumption of goods and services. It is to overcome all the shortcomings of the existing taxation system. The paper is focused on meaning, concept and purpose of GST, all the changes amended by the government in the tax rates on goods and services and challenges faced by the stakeholders.*

**KEYWORDS:** GST, Indirect Tax, VAT, Indian economy

### INTRODUCTION

#### Objectives of the study

- To study the concept of GST
- To know the changes in the Taxation Structure
- To know the benefits and challenges faced by the stakeholders.

### RESEARCH METHODOLOGY

This paper is based on secondary data. The data was collected from the various published sources like reports, magazines, journals, newspapers etc.

### Concept of GST

The new indirect taxation system that is Goods and Services Tax (GST) is made to create a single tax system and single market. It will boost economic and development goals. This system is amended in India from 1<sup>st</sup> July 2017; it will throw up some surprises for consumers and businesses. First time the consumers get a measure of the total central and state taxes levied on a product. It will end the hidden taxes paid by them. People are concern about inflation. They expected to rise in price because of GST. But the government keen to ensure that GST is not inflationary, it's to prevent firms from passing on any reduction in tax burden to consumers. Consumers are likely to benefit from lower tax burden on some products and services. Lower indirect taxes will also address the regressive nature of this levy which affects the rich and poor alike, unlike taxes on income which is based on an assessee's ability to pay. For businesses elimination of multiple levies and creation of a single market with fewer tax rates and fewer tax exemptions will improve the ease of doing business and reduce avoidable litigation. A large part of the tax litigation in India is around tax exemption.

**Meaning of GST:** Goods and Services Tax is to eliminate inefficiencies in the tax system that results in "tax on tax. It is value added tax at each stage of the supply of goods and services precisely on the amount of value addition achieved. It is the tax based on consumption. It has three components CGST, SGST and IGST.

**GST is the sum of:** Import duty, service tax, excise duty, customs duty, central sales tax, taxes on advertisement, luxury tax, entertainment tax, taxes on betting and gambling, state cesses and surcharges on supply of goods and services.

### Other countries GST

Country	Rate of GST
Australia	10%
France	19.6%
Canada	5%
Germany	19%
Japan	5%
Singapore	7%
Sweden	25%
New Zealand	15%

There are 150 countries all over the world there is GST. In India GST rates are 5%, 12%, 18% and 28%.

- Zero rated items: Food grains used by common people
- 5% rate: items of mass consumption including essential commodities will have low tax incidence.
- 12% and 18%: Two standard rates have been finalized as 12% and 18%.
- 28% rate: White goods were taxed at 30-31% shall be now taxed at 28%.

### Products not part of GST

Education, health, local train, hotel up to 1000, Crude oil, petrol, diesel, natural gas, liquor, jet fuel, meat other than frozen and in unit container, fish fresh or chilled, dairy products, eggs, salt, human blood and components, contraceptives, fresh fruits and vegetables, non branded cereals

and flour, jiggery, non branded organic manure, judicial non judicial stamp paper, inland, post cards, non precious metal bangles and agricultural hand tools,

### Impact of GST

Product	Current Rates	GST Rates
Butter	5.66	12
Television	24.39	28
Footwear	14.41	18
Biscuits	16.09	18
Cornflakes	9.86	18
Wrist watch	20.64	28
Jam	5.66	18
Baby food	7.06	18
Small cars	26	28
Gold	2	3
Insurance	15	18
Banking charges	15	18
Telecom bills	15	18
Movie tickets	40	28
Medicines	5	12,18
Cab rides	6	5
Coal	11.69	5
Maintenance charges	15.55	18
Smartphones	5-15	12
Cement	31	28
Ayurveda	8-9	12
Readymade garments	18.16	12

These are for illustration purposes only. Not meant for direct implementation or reliance. The rates are based on submission as of the June 20<sup>th</sup>, 2017.

Under the present taxation system food articles and agriculture produce are not taxed. The same arrangement is likely to continue under GST. For the other about 5000 commodities and services, the nearest tax slab will be applied. The services cannot be taxed over 18% and 5% will be imposed on mass consumption like spices, salts etc. Food grains to remain untaxed under the GST. Most of the daily used items will be taxed at 12-13%. The current tax is over 20%. The white goods are currently being taxed around 30-31% will be bought to nearest slab of 28%. Luxury goods will attract 28% GST plus cess.

GST on hotels services are depend the kind of room you stay in. If the room tariff is less than Rs. 1000, your stay will be tax free. However, if the room tariff is between Rs. 1000- Rs.2500, you will tax 12%. If the tariff is between Rs. 2500 to Rs. 5000, the stay will be taxed at 18%. For luxury hotels, where the tariffs are more than Rs. 5000, GST rate will 28%.

GST on eating out has different tax slabs for restaurants depending on their turnover and whether they have AC or not. Restaurants with a turnover of less than Rs. 50 lakh will be levied a tax rate of 5%. Non AC restaurant will be charged 12% GST on food bill. Tax rate for AC restaurants and those with liquor license will be 18%, whereas restaurants in 5 star hotels will attract a GST rate of 28%. Eating out get costlier in cities like Mumbai where the existing tax rate is around 10.6%. Post GST, the customers will be taxed at 18% in AC restaurants. For a non AC restaurant in Mumbai where existing tax rate is at 6%. From July 1, 2017, small joints will be taxed at 12%.

All cars are fall in the 'luxury bracket' of GST. That means they will attract 28% tax. However, depending on their size, extra cess will be levied. Small cars or cars under four- metre length powered by a petrol engine not greater than 1.2 litre or a diesel engine not greater than 1.5 litre by displacement will be taxed at 28%. For petrol cars, the effective tax rate will be 29%. However, for diesel cars the effective tax rate will be 31%. For mid-size, luxury cars and SUVs the effective tax rate will be 43%. The price of SUVs is expected to come down as they are currently taxed at 48-55%. The government said it would tax hybrid vehicles at a rate as high as 43%. This would be significantly higher than the prevailing tax of about 29% on such cars.

Daily use items like sugar, tea, coffee and edible oil will attract the lowest tax rate of 5%, almost the same as under the current tax structure. Common use products like hair oil, soaps and toothpaste will be charged with a single national sales tax or GST of 18% instead of present 22-24%. The highest slab of 28% under GST has also been applied on chewing gums, white chocolate, and chocolates containing cocoa, wafers coated with chocolate, instant coffee, custard power, student's colors, paints, varnishes, perfumes, beauty products, sunscreen, shampoos, hair dyes, after-shave lotions and deodorants.

### **Benefits of GST**

It is a simple method. The tax rate will be same in the whole country it will not change rapidly. It will bring transparency in the indirect taxation system. GST will transparent the taxes levied on supply of goods and services. It will reduce tax burden. Business will be beneficial with the common market. No truck line will be at state border after GST. The imports will improve due to lower tax rates. The new tax system is expected to improve the tax compliance boost revenue receipts of central and state government. It will increase GDP by 1-2%. It results in reduction tax burden on many items.

### **Limitations of GST**

The GST is a very good type of tax. But there are few challenges that has to be face to implement GST in India. There are many tax slabs in GST this can reduce the benefits. There can be lots of conflicts in the classification. There should be separate registration for each state. It needs more time to satisfy everybody, the stated are confused whether the GST will hamper their revenue. But the government ensured that they will compensate the loss by GST. This is very difficult that the entire states implement GST together at the same rates, the centre have to coordinate with 29 states and 7 union territories to implement such tax regimes. People are unaware about the tax rates so it is important they should spread awareness. There are goods on which the tax rates have been increased. The proposed GST structure is likely to succeed only if the country has a strong IT networks.

---

## CONCLUSION

GST is the biggest step taken by the government in this year. There are 150 countries all over the world have implemented GST with success. This is user friendly and transparent taxation system. No doubt GST will give India a world class tax system by giving different treatment to manufacturer and service sectors. GST has a positive impact on various stakeholders like central government, state government and industry. It will impact the national economy, international trade, firms and consumers. Although GST is a good tax system but India has to face many challenges due to diversity in India and lack of awareness and IT sector.

## FORMATION OF THE CENTRAL ASIAN VECTOR IN THE FOREIGN POLICY OF THE FEDERAL REPUBLIC OF GERMANY

**Bituraev Uktamjon Bazarbaevich\***

\*Senior Lecturer,  
Department of "World Policy and International Relationships",  
Tashkent State University of Oriental Studie,  
UZBEKISTAN

### ABSTRACT

*This article is devoted to the formation of cooperation between the Federal Republic of Germany and the newly independent Central Asian states. As a result of the disintegration of the USSR in the 90s of the XX century, the Central Asian states gained independence. Initially, the main foreign policy issue for the countries of the region was to expand diplomatic relations and accelerate cooperation with the world's leading countries. In this context, the Federal Republic of Germany was one of the first Western European countries to establish embassies in all Central Asian countries. The article analyzes the factors influencing the formation of the Central Asian vector in German foreign policy. These include Germany's economic, political and cultural interests in Central Asia. In addition, in the 1990s, more than 300,000 ethnic Germans lived in Central Asia. The formation of the German Central Asian vector is taking place in two directions: as an independent state, Germany participates in its foreign policy and in the common Central Asian policy of the European Union. It also laid the groundwork for the EU's Central Asia strategy for the first time under the German presidency. This strategy was updated in 2015 and 2019. This shows that Germany's interest in Central Asia is growing.*

**KEYWORDS:** *Federal Republic of Germany, Central Asia, Economic and Political Interests, European Union, PCAs, TACIS, Ostpolitik, Green Central Asia Initiative*

### INTRODUCTION

In the emerging world order, Germany is seeking a geopolitical and geoeconomic place in accordance with its position at the regional (European) and global levels. In this context, Central Asia, with its favorable geostrategic and economic potential, is playing an important role in

German foreign policy strategy. Therefore, Germany's interests in Central Asia can be explained as follows:

- Maintaining its influence in different regions of the world as a means of strengthening and further enhancing its status as a leading state, increasing its ability to find its place in new regions;

- Find an alternative source of raw materials for German industry, which is the largest industrial producer in Europe, and ensure energy security; According to the data, in 2020-2030, the dependence of Western European countries on external energy resources will be as follows: gas - 70%, oil - 90%, coal - 100% [1]. At present, Turkmenistan, Uzbekistan and Kazakhstan have 4.3% of the world's gas reserves. The identified gas reserves are estimated at 7.76 trillion cubic meters. Oil reserves in these countries are estimated at 5.6 billion barrels. tons or 3.5% of world reserves[2].

- The need for a new market for growing German products and the restoration of the "Great Silk Road" as a strategic transport corridor in this case; "It should be noted that a large part of the EU's main trade turnover with the East is accounted for by Germany, in particular, Germany accounts for 40% of the EU's annual exports to China alone." [3] In this context, the formation of a single transport corridor is becoming an objective necessity.

The implementation of the above-mentioned tasks is closely linked with ensuring stability in Central Asia. The fact that Afghanistan, a neighbor of Central Asia, has become a center of global threats (international terrorism, drug cultivation, economic poverty, illegal arms trade, etc.) also has a negative impact on Germany. Therefore, raising the level of security in Europe by ensuring stability in Central Asia and neighboring regions can be said to be one of the priorities of German policy today.

In addition, the protection of the interests of the German population living in the territory of the former Soviet Union is also important in German foreign policy. According to 2008 data, Kazakhstan has a population of 230,000 Germans [4]. Although there are about 15,000 Germans left in Kyrgyzstan today, there were more than 100,000 in the 1990s. Therefore, the local German population can play a mediating role in German policy in Central Asia.

### **The main directions of German Central Asian policy**

Germany's policy on Central Asia has been developing steadily since the first chancellor of the United Germany, G. Kold, came to power. In particular, the government of Chancellor G. Kohl recognized the independence of all states in the region six days after Gorbachev's resignation as head of the Soviet Union on December 31, 1991 [5]. As a result, it has become the only EU member to have an embassy in all Central Asian states. Before coming to power in 1998, the Social Democrats drafted a document entitled "The Caspian Sea - the future of the region", which emphasizes the need to intensify policy in Central Asia and the Caspian region[6]. After coming to power, on November 8, 2001, former German Chancellor G. Schroeder demanded that the Bundestag conduct a wider European operation than in Central Asia [7].

At the same time, Germany, through the EU, seeks to advance its interests in various areas of cooperation with Central Asian countries. This can be explained mainly by the fact that Germany is the main donor to the EU budget.

So far, the EU's relations with Central Asia have been based on two principles:

1. Partnership and cooperation agreements (PCAs). These agreements, signed in 1999 with Kazakhstan, Kyrgyzstan and Uzbekistan, entered into force.
2. Technical assistance for the CIS countries (TACIS). In 1991, the European Commission launched the TACIS program, which covered 12 CIS countries and Macedonia.

Also, since the beginning of the XXI century, the EU has adopted a strategic program for Central Asia: "EU and Central Asia: a new strategy for cooperation (2007-2013)." This strategy was updated in 2015 and 2019 [8].

It can be seen that the EU's policy towards Central Asia reached a new level in 2007, during the German presidency of the EU. On 22 June 2007, the German presidency adopted a new EU Central Asia Strategy. According to the new strategy, 750 million soums will be allocated for various projects with Central Asian countries in 2007-2013. euro allocation is planned. The main task of this strategy is to ensure the traditional historical ties between Europe and Central Asia, mutual interests and stability in the region [9]. However, based on new political concepts, the humanitarian sector has been recognized as one of the most important areas of security in Central Asia.

Therefore, based on the EU-Central Asia: New Partnership Strategy, the EU's priorities in Central Asia are[10]:

1. Support for human rights, the rule of law, democratization;
2. Investment in the future: in the field of youth and education;
3. Promotion of economic development, trade and investment;
4. Strengthening energy and transport links;
5. Combating common threats and challenges;
6. In the field of environment and water resources;
7. Expansion of intercultural ties;

To this day, the EU's strategy towards Central Asia has traditionally continued today. At the same time, official Berlin is contributing to the European Union's strategy for Central Asia, adopted on June 17, 2019.

Currently, one of the priorities of German Central Asian policy is to improve the ecosystem in the region. It is known that this is called the "Berlin Process" and was launched by Germany in 2008. It is dedicated to strengthening regional cooperation on water issues and thus the sustainable management of water resources in the Aral Sea basin.

As part of this process, on January 28, 2020, Germany announced "the Green Central Asia Initiative". The Green Central Asia initiative, launched by Berlin, is aimed at reducing the negative effects of climate change and strengthening dialogue on the issue. This initiative is also a unique contribution to the implementation of the goals set out in the EU Strategy for Central Asia, adopted on June 17, 2019.

### Obstacles to German Central Asian Policy

Despite Germany's growing interest in Central Asia, the region is not a relatively priority in the EU's overall foreign policy:

- *The emergence of relative differences in US and EU policy in Central Asia.* According to A.Rar, a well-known German expert, at first Europe tried to follow the US "Great Game" in the region and supported the US approach. However, he noted that the differences between the interests of the alliance and the interests of the United States have intensified. The US attempt to gain a foothold in the region is seen as a threat to the EU's "geopolitical ambitions" in Central Asia and the Caucasus[7]. In this regard, Chinese researcher Yu Shao points out two main differences in EU and US Central Asian policy:

1. The United States has no interest in developing regional cooperation and only prioritizes the development of individual ties with the countries of the region. The EU, on the other hand, prioritizes regional integration over bilateral ties;

2. The issue of pipelines carrying energy resources to the world market. The U.S. is focusing on the trans-Caspian direction, while the EU is focusing on the trans-Caspian direction.[10].

– *Division within the EU on foreign policy.* This is mainly reflected in the fact that the leading states within the EU are trying to focus the Union's foreign policy on their spheres of influence, and in this way try to gain greater influence in the EU. In particular, the interest zones of Britain and France are located in the Middle East and North Africa, as well as in its efforts to bring EU policy to the region. There is competition for geopolitical construction in the European region - France and Germany, France is the initiator of the "Southern" direction - the Mediterranean Union, and Germany is the supporter of the "Eastern" direction [11]. In the first half of 2007, during Germany's presidency, Kempe described the EU's foreign policy in Central Asia and its efforts to strengthen ties with Eastern Europe as a new "Eastern policy" by Bertelsmann, an expert on political research. [12].

– *Despite the EU's growing dependence on energy resources, about 80% of the world's resources are located around the EU's borders.* The largest source among them is the Middle East and Russia. Analyzing the importance of energy sources and countries in their supply to provide Europe with sustainable energy sources and the expansion of the energy community, the author I.Pashkovskaya in her article published in January 2009 assessed them as follows:

1. Russia;
2. Norway and Algeria;
3. Turkey on energy supply;
4. Ukraine (transit);
5. Caspian and Central Asian region;
6. North Africa, the Middle East and the Persian Gulf [13].

- *Central Asia's entry into Russia's strategic sphere of influence and the sharp increase in the dependence of Eastern European countries on Russian energy resources.*

## CONCLUSION

In conclusion, the formation of Germany's Central Asian policy, its desire to bring it to the permanent agenda of EU foreign policy and ensure its interests in the region directly depend on Germany's relations with the three participants in this process:

- Germany-Central Asia;
- Germany-EU members;
- Germany - relations with leading countries.

Ensuring a balance in these areas can play a key role in determining the future of Germany's position in the Central Asian region, in determining the prospects for cooperation with the countries of the region.

## ANALYSIS OF THE RESEARCH ON TEACHING GEOGRAPHY TO BLIND STUDENTS

**Musaev Dilshod Askarjanovich\***

\*Independent Researcher,  
Tashkent State Pedagogical University,  
UZBEKISTAN

### ABSTRACT

*The article describes the pedagogical and psychological features of teaching blind students, in particular, the history and current trends in research in the teaching of geography.*

**KEYWORDS:** *Education, Geography, Blind Children, Visual Aids, Map, Research.*

### INTRODUCTION

The analysis and study of previous research in each scientific work allows using the achievements and drawing conclusions from the mistakes made. Many scholars from history have dealt with theoretical and practical issues of the science of typhlopedagogy. In particular, the peculiarities of the education of blind children, the first information about their physical development, the founder of medical science Hippocrates (about 460-370 BC) said that it is necessary to first abandon the circle of religious thought and make a rational diagnosis of diseases. He tried to explain and actively treat the causes of blindness, hearing loss.

According to Aristotle, the loss of one of the senses in a person with a visual impairment leads to the restriction of emotions and the loss of some knowledge. The philosopher pointed out that those who have lost the ability to see from the three basic senses (smell, hearing, and sight) are the most valuable for the needs of life. He warned that the blind were born with higher mental abilities than the deaf. Aristotle also confirmed that the ability of people with visual impairments to work is at the same level as normal people [1, 1976].

### THE MAIN FINDINGS AND RESULTS

#### *Methodology*

While many philosophers and naturalists in ancient times tried to explain the processes of knowing the world, they often gave a negative answer to the question of how blind people in

those times could understand the world. However, we can see that Aristotle's views on the subject were radically different, that is, positive.

It should be noted that Aristotle's opinion is fully confirmed by the fact that today not only scientists, but all mankind enjoys the scientific and literary heritage created by historically blind talents - Homer, Mosert, Ahmad Yugnaki, Beethoven. The first steps in the social rehabilitation of the visually impaired were taken by the Polish scientist J.A. Comenius (1592-1670), the French enlighteners J.J. Russo (1712-1778), K.A. Helvetius (1715-1771), Denis Diderot (1713-1784) began with new ideas introduced into pedagogy by scholars such as [6, 1939; 11, 1985; 12, 1973;].

He also stressed the need for education for all children with disabilities and stressed that no human being should be deprived of the opportunity to receive an education [7, 1996].

#### *Analysis of results*

For the development and formation of special education, the French philosophers and enlighteners J.J. Russo (1712-1778), K.A. Helvetius (1715-1771), d. The works of Diderot (1713-1784) were of great importance. It is noteworthy that in 1784 the first school for children with visual impairments was established in France. In his Study of the Visually Impaired (1749), Deni Diderot developed the ability of surviving analysts to argue that the visually impaired could understand the realities of the universe and that special conditions and teaching aids were needed. He proved that people with visual impairments can be as educated as healthy children if the necessary conditions are created for their education. The scientist also made a psychological analysis of the inner world of a person with a congenital visual defect, his feelings and experiences, and laid the groundwork for a number of special scientific studies in this regard. Diderot drew attention to the need to create conditions for the blind and to create a special education system for them [4, 1941].

Born in Copvre, France, in the family of a shoemaker, Louis Braille developed a six-dot embossed writing system in 1825. This method of writing is still used by the blind today.

ValentinGayui was the first person to put the system of teaching the blind into practice. In 1784, at his own expense, he founded the Institute of the Blind at his home in Paris and the first school for the blind in Russia (1807). He expressed the following views, taking into account the opportunity of the blind and the need for education:

1. It is necessary to save all blind people from idleness, to allow them to work.
2. The blind must engage individually or collectively in work that is beneficial to society and to them.
3. The blind must have access to a source of income that protects them from begging and poverty.
4. It is necessary to return to the community living at the expense of charitable funds - idle, but healthy hands.
5. The blind should be given the opportunity to engage in science, literature, and the arts. This goal is achieved through the use of special textbooks and exaggerated books.
6. It is necessary to ensure the use of any necessary means in the education of the blind.

7. The activities of the blind can be an example to those who are prone to laziness; they should be a competitive example for healthy young people.

V. Gayui believed that although advanced methods of teaching the blind had not yet been developed, it was possible to teach them and bring them to higher levels. He believed that those with visual impairments could join the community and find their place through their activities. V. Gayui draws the first embossed pictures of animals, and in the lesson those who had a defect in seeing the original of a natural object used them. With the establishment of the first school for the blind, the natural sciences course became one of the compulsory subjects in the program, but natural objects in the environment were taught directly using preserved analyzers.

The students were told about the geographical location and the human economy. The teaching of geography, including the natural sciences, was practiced until the early twentieth century by hearing or touching materials in a one-way street [9, 2006].

Special schools for children with visual impairments began to be established only in the early twentieth century. In 1908, the British ophthalmologist Garman opened “classes to protect the abilities of those with visual impairments”. In 1913, similar classes were opened in Boston (USA) by Dr. Allen. In them, the teaching of geographical materials to visually impaired schoolchildren was carried out using two different programs. The first is the use of the correctional method, this direction is developed during the formation and development of special schools, and the second is that only the image of the didactic material is magnified in accordance with the methods adopted in secondary schools.

L.S. Vygotsky was one of the first to say, “Blindness is not a defect, but a deficiency, an imperfection. It only becomes a defect under the influence of unfavorable social conditions for the blind. With the help of special education, the problem will be solved”. These views of LS Vygotsky were developed by V.A. Gander, P.Ya. Efremov, L.V. Zankov, D.I. Zorichev and G.A. Uspensky in 1928 in the first program and textbook for blind children of the former Soviet Union. formed the basis. Although this program and textbook have some shortcomings from a scientific point of view, it is still recognized as the basis of typhlopedagogy teaching programs. The main idea of this textbook is to raise the content of education in special schools for blind children to the level of secondary schools [2, 1955].

The electroforming method proposed by V.S. Sverlov and P.D. Krasnousov for the creation of embossed materials allowed to print a relief copy of the images on thick paper. Some geographical learning materials have also been created using this method, but the difficulty and complete incomprehensibility of these materials by the blind poses another problem. This work was continued by D.I. Zorichev. He developed the basic requirements for relief drawings, diagrams, schemes, tables and relief exhibitions. As a result of the scientist's work, in the 60s of the last century appeared visual weapons made of plastic, in which the embossed shapes are better described [8, 1960].

A well-known representative of typhlopedagogy, the Russian scientist DI Zorichev in his methodological manual “Geography of blind schools”, published in 1934 (reprinted in 1950), gave the necessary methodological recommendations for teaching geography to visually impaired or blind children. In particular, it should be noted that the scientist has developed a technology for the formation of curricula for visually impaired children and the organization of excursions in the teaching of geography [15, 2018]. It is also worth noting that the study of

spatial forms in geography, the development of scientific and methodological recommendations on the methodology of working with a special map [5, 1950].

The importance of making embossed visual aids in geography is that they can be used in the teaching of almost any subject. In addition, it is important to include in the teaching the specific stylistic features of the exhibitions, namely the relief image, the combination of relief, the introduction of explanatory texts in Braille.

Beginning in the 1930s, practical methods of teaching students in schools for the blind began to be introduced. From the simplest observations in nature, on the basis of a certain amount of accumulated experience, practical work in the field of geography gradually began to be applied to the educational process.

Since the late 1970s, the situation has improved somewhat, as the production of many visual aids in geography has been established. However, modern visual aids in geography are not enough for visually impaired and visually impaired students today. The existing ones do not meet the requirements of today's typhlopedagogy [14, 2020].

French scholar Stuart Snowdon has also conducted research on the teaching of geography in blind secondary schools. According to him, it is more difficult for the blind to master geography than to study other sciences. Because the science of geography needs to be more visual than other sciences. It is easy for healthy students to explain the environment and different countries through a map. For the blind, it is important to develop a special methodology and apply it in practice [16, 2020].

In his pamphlet, *Teaching Geography to Blind Students*, S. Snowdon made the following point: I am not opposed to blind students receiving the same education as healthy students. However, they should have their own methodology in teaching geography. For example, in this regard, it is advisable to exaggerate the objects on the map, diagrams and drawings in a way that can be felt by hand, and to describe the information about them in the same order. However, the information depicted on the map needs to be simplified a bit. This is because we have to admit that it is difficult for the blind to use the information provided for normal students to fully depict a special embossed map. That's why I'm in favor of identifying and mapping the most basic information that can be mapped to specific maps, he says. He also put forward the idea of making various teaching materials out of clay and applying them to the teaching process. He noted that the mastery of blind students increased when they created and applied to the learning process the creation of caves, shores, foothills, waterfalls, valleys, various landscape forms [17].

Russian scientist T. Alexander's scientific article "Vision and Geography" is devoted to the problems of teaching geography in students with different visual abilities. He points out that vision plays a key role in many ways in the acquisition of geographical knowledge. Visualization is important, first of all, in field observations and conducting field experiments and laboratories, conducting measurements, working with maps [13, 2020]. It should be noted that it is necessary to create special visual materials in this regard.

Russian scientist Boris Konstantinovich Tuponogov also conducted research on the teaching of natural sciences in schools for blind children. In particular, the topic of his dissertation for the degree of Doctor of Pedagogical Sciences is "Typhlopedagogical basis of correctional and developmental education (teaching biology and chemistry to blind and visually impaired

students”) (1996). As a result of his research, the foundations for teaching certain subjects in schools for blind children were developed. The means, form, method and content of special education have been improved on the basis of a systematic and comprehensive approach to this problem. At the same time, the specifics of the educational process in schools for blind children, the features of the use of general didactic and defectological principles were revealed, and typhlopedagogical requirements for teaching chemistry and biology were developed and tested [11, 1985].

R.Sh.Serodeeva from Russia in her dissertation “Requirements for the use of visual methods in the teaching of science to blind children” identified shortcomings and difficulties associated with visual impairment of children. He substantiated the typhopedagogical requirements for science lessons and visual aids, and provided guidelines for improving the knowledge and skills of visually impaired schoolchildren in the study of natural sciences [9, 2006].

It should be noted that in 2019, a special manual on creating geographical maps for visually impaired people in Russia was published. This book “Creation of tactile and typhoid maps” was written by Andrei Medvedev, head of the cartography laboratory of the Institute of Geography of the Russian Academy of Sciences.

“A blind or visually impaired person needs to be taught to understand and read a tactile map”. “It is very important to identify and understand the relief material, the symbols in the form of dots and lines, in the structure of the map and in the disclosure of the information shown in it”, said Andrei Medvedev. In his book, he explained the latest advances, basic principles, and methods for creating tactile and typhoid maps. Students who read this guide will be able to create tactile and typhoid maps independently. There are many pictures in the book - examples of tactile and typographic maps from different countries of the world [18, 2019].

This Institute of Geography is actively involved in the production of cartographic products for the blind. Also in 2015, with the financial support of the Russian Geographical Society, he published a geographical atlas of Moscow for the visually impaired, which included the most modern ecological and socio-economic state of nature.

## CONCLUSION

In general, it is very important to fill the gaps in the education of the blind and visually impaired, to help them in the process of education and development. The transfer of schools for the blind to a curriculum similar to the curriculum of secondary schools is considered a historic achievement of typhlopedagogy. It should be noted that the problem of using visual aids in teaching geography to visually impaired students is waiting to be solved. There is also insufficient scientific and practical research to improve the teaching of geography in blind children.

## THE ROLE OF SOCIAL AND HUMANITY SUBJECTS IN EDUCATION OF SPIRITUAL GENERATION

**Fazliddin Abdunaevich Abdurazaqov\***

1st Year Master's Degree in Pedagogy and Psychology,  
Termez State University, UZBEKISATN

### ABSTRACT

*This article focuses the spiritual problems, the effective system that needs to be established in the fight against popular culture, and the importance of the social sciences and humanities in this regard.*

**KEYWORDS:** *Popular Culture, Kitch Style, Ideology, Spirituality, Global Network, Global Issues, Threat Concept, Tolerance*

*The unimaginative man is a kind of observatory without a telescope (G. Biger).*

### INTRODUCTION

It is known that the role of the social sciences in protecting our youth today from external ideological influences and threats is also important. Because the forms of ideological threat are diverse, they often work behind the guise of attractive slogans and ideas, using a variety of methods. Such evil forces have enormous material, financial resources and opportunities at their disposal, that serve well-thought-out and long-term goals. The main goal of these actions are, first of all, to win the hearts of young people, to influence the minds of a people in a particular country or region, to subjugate them to their own worldview, to weaken and subordinate them ideologically.

However, in the context of the global coronavirus pandemic, the initiators of various alien ideas also had problems with propaganda. They can't put on a show right now, they can't get together. But that doesn't mean they stop. They are looking for new and effective ways to achieve their goals.

## RESULTS AND DISCUSSION

There is the most perfect universal definition of "Popular culture". In other words, "mass culture" is a set of attacks that come to us from abroad, which are completely alien to national values, and include moral and ethical vices.

What is popular culture? Bernard Rosenberg of the United States claims of 1965 about popular culture: "The main reason for 'popular culture' is modern technology. Neither the national character, nor the economic, nor the political system is crucial in this matter."<sup>1</sup>

George Friedman (Toronto) says: "By popular culture we mean a set of cultural consumption values that are communicated to the general public by the media in the context of technical civilization" (1962)<sup>2</sup>.

Popular culture and its values are aimed at the general public. They are distributed quickly, all at once, through mass technical propaganda. Popularized.

In the context of the corona virus pandemic in the world, despite the fact that students and educators are at home, education and upbringing is carried out systematically. The old methods have been abandoned and replaced by effective, useful methods.

What to pay attention to in the upbringing of a harmoniously developed generation at the same time sitting all at home, in fact. Which documents reflect the important aspects that we need to programmatically in this regard? Which way is "convenient" for us? ...

The effectiveness of education in the current era of globalization depends on the further inculcation in the minds of young people of the ideas of patriotism for the motherland and its people. Because any ideology also serves the task of creating a social environment in which certain ideas prevail in society. As the First President of the Republic of Uzbekistan Islam Karimov stated, "Ideology is necessary in the life of any society. Without ideology, a person, a society, a state will inevitably lose its way."<sup>3</sup>

Hence, the fight against ideological threats is effective through proper education and training.

Ideological threats are a deliberate attempt to poison the minds of our youth and to "create" the average person by secretly promoting ideas such as immorality, violence, and the pursuit of pleasure alone.

The main weapon of these threats is the media and the Internet, known as the World Wide Web. Due to the extremely wide range of ideological threats, they can be responded to through comprehensive, well-thought-out and ideological education.

Globalization is widely spreading "mass culture". It dusts the minds, music, tastes, dress, interactions, family relationships, dreams and even religion of young people.

In his claim to the OliyMajlis on January 24, 2020, President of the Republic of Uzbekistan Sh.M. Mirziyoev said that the program idea "From national revival to national uplift" is a very honorable task to educate young people in the spirit of devotion to the motherland, the formation of initiative, devotion and moral qualities.<sup>4</sup>

Today, Uzbekistan has an institutional system for the development of the national idea (the father of this direction is recognized as the Nobel Laureate Doglaz Norz), and its further effectiveness depends on how the social sciences are taught in schools, including higher

education. It is also important to pay attention to the training of specialists in the teaching of these subjects in the higher education system.

It would be expedient to pay more attention to the specialization of students in the creation of educational complexes in the social sciences and humanities. This is due to the fact that in the 2019-2020 academic year in Uzbekistan, undergraduate students who have graduated from the same direction as the master's degree have been admitted, and this process will continue systematically. In our opinion, there are some problems in teaching professors and teachers in different fields.

The most important of these is that all students have different basic knowledge in the field. In such a situation, it is possible to achieve the intended goal with sufficient knowledge and experience of professors and teachers. Because each subject is explained to the student through a familiar field, its effectiveness will increase even more.

Social sciences and humanities are one of the main links in the education system of our society. Improving, expanding and increasing their effectiveness is one of the most pressing issues of today.

Moreover, it is based on the generalization of the experience of advanced countries in the world, to help young people to form a new social culture, to determine the path based on the principles of development, not to repeat the mistakes of the past, to learn from them, to anticipate and eliminate the main threats. In harmony with their peoples, it will be possible to ensure peaceful coexistence.

In this regard, President Sh.M.Mirziyoev states: "We all understand that education is the most important priority that will solve not only today but also tomorrow of any state and society. That is why our country is focusing on this issue at the national level."<sup>5</sup>

The formation of worldviews and thinking in today's youth, as well as their ideological protection, imposes a huge responsibility on professors and teachers of social sciences and humanities.

This is because it is possible to create a strong core of civil society only by uniting and mobilizing young people for a specific goal of the country's development. At the same time, it will be necessary to unite professors and teachers, generalize the topics they like, develop mobile applications, create applications based on the age and worldview of the audience, generalize the experience of world scientists, apply them in practice.

The Resolution of the Cabinet of Ministers of the Republic of Uzbekistan dated December 31, 2019 "On approval of the concept of continuous spiritual education and measures for its implementation" summarizes the work of all, including teachers. It is also expected that this concept lead to a single system of spiritual and educational work in our country.

## CONCLUSION

In order to form the spirituality of young people in the concept, it is important to deeply integrate the principles of national ideas in the educational process in secondary schools, to fully explain to students the basics of national education, to organize the subject "Education" to convey the teachings of our ancestors. As a result, young people with sufficient knowledge come to higher education.<sup>6</sup>

At the time, when there is a coronavirus pandemic in the world, it is not possible for young people to be spectators on the sidelines. When popular culturists can't show their sharp performances, let young people take to the big stage and have their say. In sum up, with a great sense of responsibility, it is necessary to master the social sciences and humanities at home, to do independent research or works, to receive the necessary instructions and recommendations, to express their views with knowledge, practical results and to be worthy successors to teachers.

## MODERN EDUCATIONAL TECHNOLOGIES IN PRESCHOOL INSTITUTION

**Melibaeva Shokhista Muhiddinovna\***

\*Lecturer,  
Kokand State Pedagogical Institute,  
UZBEKISTAN

### ABSTRACT

*The article shows the role of didactic games and integration with computer technology, the use of computer games in a preschool institution, integration in the development of logical thinking, sense of proportion, orientation in the environment, feelings of the motherland in the education of preschool children in educational and educational classes, the Presidential Decree on fundamental changes in preschool education.*

**KEYWORDS:** *Preschool Institution, Education, Computer, Technology, Game, Speech Development, Feeling, Pupils, Integration Of Subjects, Relevance, Modern Pedagogy*

### INTRODUCTION

Ensuring the implementation of the Decree of the President of the Republic of Uzbekistan dated September 30, 2017 No PF-5198 "On measures to radically improve the management of preschool education" and the establishment of state and non-state networks of preschool education further expansion, creation of conditions for the formation of a healthy competitive environment between public and private preschools, the introduction of new forms of preschool education in the context of public-private partnership, as well as In order to ensure the effective organization of the Ministry of Preschool Education of the Republic of Uzbekistan, the Ministry of Preschool Education was established. The document says the number of public preschools in the country has shrunk by more than 45 percent over the past 20 years, while enrollment in preschools has risen by about 30 percent.[1]

In this regard, it is planned to retrain preschool teachers and teachers on the basis of modern technologies and methods and to create "appropriate conditions for the upbringing of children "In the next 4-5 years, all children of kindergarten age in Uzbekistan will be fully covered by preschool education, President ShavkatMirziyoyev said in his speech at the ceremony dedicated

to International Women's Day. "We have set a goal to fully cover all preschool children in our country in the next 4-5 years. This is our duty to our women, our children, if necessary, our sacred duty to the future, and we will definitely fulfill it," the President said.

According to him, there are currently 7,104 preschools in the country. Over the past two years, 2,211 new kindergartens have been established, with an additional 243,000 children enrolled.

"In other words, the coverage of preschool children in our country has increased by 12% over the past year and a half to 38%," said ShavkatMirziyoyev. [1]

### **Main part**

The main task facing the preschool education of the Republic is to bring up and bring up healthy, talented children who are fully developed, loyal to their Motherland and people. One of the current requirements of modern pedagogy is the fact that our educators teach in the classroom on the basis of the integration and interdependence of disciplines.

Modern pedagogical technologies in preschool education are aimed at the implementation of state standards of preschool education.

Today we will talk about pedagogical technologies and their effective use in a preschool institution. First, let's recall what the term "technology" itself means.

Technology is a set of techniques used in any business, skill, art (explanatory dictionary).

Pedagogical technology is a set of psychological and pedagogical attitudes that determine a special set and layout of forms, methods, methods, teaching methods, educational tools; it is the organizational and methodological toolkit of the pedagogical process (B.T. Likhachev).

Today, there are more than a hundred educational technologies.

Basic requirements (criteria) of pedagogical technology:

- Conceptual
- Systematic
- Manageability
- Efficiency
- Reproducibility

Conceptuality is the support of a certain scientific concept, including the philosophical, psychological, didactic and socio-pedagogical substantiation of the achievement of educational goals.

Consistency - technology must have all the features of a system:

- The logic of the process,
- The interconnection of its parts,
- Integrity.

Manageability - the possibility of diagnostic goal-setting, planning, designing the learning process, stage-by-stage diagnostics, varying means and methods in order to correct results.

Efficiency - modern pedagogical technologies that exist in specific conditions should be efficient in terms of results and cost-effective, to guarantee the achievement of a certain standard of training.

**Educational technology structure** The structure of educational technology consists of three parts: • The conceptual part is the scientific basis of technology, ie psychological and pedagogical ideas that are laid in its foundation. • The content part is the general, specific goals and content of the training material. • The procedural part - a set of forms and methods of educational activity of children, methods and forms of work of a teacher, activities of a teacher in managing the process of mastering the material, diagnostics of the learning process.

1. Modern educational technologies include:
2. • health-saving technologies;
3. • technology project activities
4. • research technology
5. • information and communication technologies;
6. • personality-oriented technologies;
7. • technology portfolio preschooler and educator
8. • gaming technology
9. • technology "TRIZ" and others.

I would like to consider information and communication technologies. The world in which the modern child develops is fundamentally different from the world in which his parents grew up. This makes qualitatively new demands on preschool education as the first link in lifelong education: education using modern information technologies (computer, interactive whiteboard, tablet, etc.).

Informatization of society poses the following tasks for preschool teachers:

- keep up with the times,
- become for the child a guide to the world of new technologies,
- a mentor in choosing computer programs,
- form the basis of the information culture of his personality,
- increase the professional level of teachers and the competence of parents.

The solution to these problems is not possible without updating and revising all areas of the kindergarten in the context of informatization.

**Requirements for computer programs DOE:**

- Research character
- Ease for independent studies of children
- Development of a wide range of skills and perceptions
- Age compliance
- Entertaining.

**Program Classification:**

- Development of imagination, thinking, memory
- Speaking dictionaries of foreign languages
- Simple graphical editors
- Travel Games
- Learning to read, math
- Use of multimedia presentations

Advantages of the computer:

- presenting information on a computer screen in a playful way is of great interest to children;
- carries a figurative type of information that is understandable to preschoolers;
- Movements, sound, animation for a long time attracts the attention of a child;
- has an incentive for cognitive activity of children;
- provides an opportunity to individualize training;
- in the course of his activities at the computer, the preschooler gains self-confidence;
- allows you to simulate life situations that cannot be seen in everyday life.

Errors in the use of information and communication technologies:

- Lack of teacher training
- Incorrect definition of the didactic role and place of ICT in the classroom
- Unplannedness, accidental use of ICT
- Congestion of demonstration.

ICT in the work of a modern teacher:

1. Selection of illustrative material for classes and for the design of stands, groups, classrooms (scanning, Internet, printer, presentation).
2. The selection of additional educational material for classes, familiarity with the scenarios of holidays and other events.
3. Exchange of experience, acquaintance with periodicals, developments of other educators in Russia and abroad.
4. Registration of group documentation, reports. The computer will allow you not to write reports and analyzes every time, but rather just type the circuit once and only make the necessary changes in the future.
5. Creation of presentations in the Power Point program to improve the effectiveness of educational activities with children and pedagogical competence of parents in the process of parenting.

Game technology

It is built as a holistic education, covering a certain part of the educational process and united by a common content, plot, character. It is included in series:

- Games and exercises that form the ability to highlight the main, characteristic features of objects, to compare, to compare them;
- Groups of games to generalize subjects according to certain criteria;
- Groups of games during which preschoolers develop the ability to distinguish real phenomena from unreal ones;
- Groups of games that educate the ability to control oneself, the speed of reaction to a word, phonemic hearing, ingenuity, etc.

Training in the form of a game can and should be interesting, entertaining, but not entertaining. To implement this approach, it is necessary that the educational technologies developed for teaching preschool children contain a clearly defined and step-by-step system of game assignments and various games so that, using this system, the teacher can be sure that as a result he will receive a guaranteed level of learning child of a particular subject matter. Of course, this level of achievement of the child should be diagnosed, and the technology used by the teacher should provide this diagnosis with appropriate materials. In the activity with the help of gaming technologies in children, mental processes develop. Game technologies are closely related to all aspects of the educational and educational work of the kindergarten and the solution of its main tasks. Some modern educational programs suggest using the folk game as a means of pedagogical correction of children's behavior.

## RESULTS AND DISCUSSIONS

Therefore, it should be noted that we suggest using computer and gaming technologies in integration. For example, such computer games for preschoolers:

For speech development.

This type of game is important in preparing the child for school, because now the child must not only be able to read and count, but also correctly pronounce all the sounds of speech. Here speech therapy games come to the rescue: Home logoped.

In this game there are many tongue twisters, proverbs, funny games and more than 350 exercises to study the pronunciation of certain sounds. A nice addition are colorful pictures.

"Games for the tiger".50 exercises, colorful and understandable drawings, volumetric images, sound accompaniment of the actions performed, the game form for the presentation of educational material and a cheerful presenter Tiger cub, which helps motivate children to attend classes.

There are also entire software and methodological complexes for studying letters and sounds, which are divided into difficulty levels, depending on the age of the child.

Developing online games

Developing games are divided into age categories and genres, but in any case, they are all educational. Here we "kill two birds with one stone": playing them, the child will receive new knowledge and pleasure. It is possible to enumerate the number and their types forever, but

nevertheless we will list the main ones: for the smallest common programs are “Find an Item”, “Guess Who”, “Collect an Item”, “Find the Differences” and many, many others.[6]

When choosing games for a child, remember that the main thing is not to harm. If possible, it is better to limit the time you use your computer. It is believed that a child aged about 5-6 years should spend at the computer no more than 15-20 minutes a day, and preferably not every day.

The game is one of the forms of practical thinking. In the game, the child operates with his knowledge, experience, impressions, displayed in the social form of game modes of action, game signs, which acquire significance in the semantic field of the game. The game, having features of intellectual activity in its motive and representing a peculiar practical form of the child's thoughts about the surrounding natural and social reality, allows him, figuratively speaking, to “spread the wings of his abilities”. In the game process of his thinking about the world, the child uses a sign (symbolic) system for displaying reality in the game. Iconic means of displaying reality in the game. The sign means of displaying reality by the child in the game have a hierarchical structure, which is crowned with the representation of the image of reality in an external sign - an object, image, symbol, including a word [7].

## CONCLUSION

The technological approach, that is, new pedagogical technologies guarantee the achievements of the preschooler and further guarantee their successful education in school.

Every teacher is the creator of technology, even if he deals with borrowing. Creating technology is impossible without creativity. For a teacher who has learned to work at a technological level, the cognitive process in its developing state will always be the main guideline. Everything is in our hands, so they cannot be omitted.

### ABSTRACT

*This article is devoted to the phenomenon of lacunarity in Chinese and Uzbek languages, in particular, the issue of verbal lacuna. The article provides analytical considerations based on the grammatical features of the verbs. In the following places, the lacunas occurring in verbs related to somas are analyzed between the two languages, and the classification of somatic verbal lacunas is given.*

**KEYWORDS:** *Lacuna, Lexical Gap, Phenomenon Of Lacunarity, Verbal Lacuna, Grammatical Categories Of The Verb, Somatic Verbal Lacuna.*

### INTRODUCTION

Lacuna (Latin lacuna "ditch, gap"; French lacune déficit, vide) - characteristic of the domestic, cultural, social and historical life of any nation and alien to another nation words and phrases that have no clear alternative in another language [1, 145]. I.A. Sternin, Z.D. Popova, M.A. Sternina, in their work, also distinguishes the type of lacuna called "word lacuna" [2, 208]. The problem of grammatical gaps in language comparison is poorly understood. In this regard, the study of the phenomenon of lacuna in the context of the grammar of Chinese and Uzbek languages is relevant.

In English language scientific works, the word "lacuna" is derived from "lexical hole", "lexical vacancy", and usually the term "lexical gap" is used in linguistics. The term "gap" in the word combining as a term for scientific discourse refers to different meanings of the lacunas such as "space", "hole". Combining with different definition words different types of lacunas are produced, for example, "semantic gap", "cultural gap". Thus, the word "gap" is used as a

synonym for "lacuna", and the word "gap" is used to describe a combination of lacunas (grammatical lacuna, cultural lacuna, etc.).

## RESULTS AND DISCUSSION

It is well known that verbs are very important in the construction of a text or speech. In this sense, there are a number of problems with the verb phrase in translation work. These problems, especially the peculiarities of these two languages, depend on the system of grammatical categories in them. An existing grammatical category in one language may not exist in another language or may be represented by other means. For example, in Uzbek, verbs include voices, moods, tenses, leading and auxiliary verbs. It is not present in the grammar of the Chinese language. This leads to grammatical gaps between the two languages. The voice category represents the relation of the action to the subject. This relationship emerges with a special grammatical form [3, 159]. The voice category represents the relation of the action to the subject (performer). This relationship emerges with a special grammatical form [3, 159]. The relative forms of the verb are formed in Uzbek with the help of suffixes, and in Chinese with the help of prepositions.

For example,

1. *U kiyimini kiydi.* (He put on his jacket) (active voice) 他穿衣服了。 *Ta chuan yifu le.*

2. *U bosh kiyimini kiydi.* (He put on his hat) (active voice) 他戴帽子了。 *Ta dai maozile.*

There is no lacuna in the grammar of Chinese and Uzbek languages. Speech order is proportional in both languages.

3. *Marasul ashula aytib asboblari yig'ishtiradi va kiyinadi.* (Marasul picks up her instruments and gets dressed). [4, 5] (active voice) Marasul 唱着歌收拾了东西, 就穿衣服了。 *Marasul changzhe ge shoushi le dongxi, jiu chuan yifu le.*

4. *Yur tezroq, kiyingin, qizim! Hurry up, get dressed, honey!* [4, 8] (active voice) 快点儿走啊, 穿衣服吧, 女儿! *Kuai dianr zou a, chuan yifu ba, nver!*

5. *Bolani kiyintiring!* (causative). 帮孩子穿衣服! *Bang haizi chuan yifu!*

6. *They got dressed.* 他们穿衣服了。 *Tamen chuan yifu le.*

Considering the above sentences, the verb proportions in sentences 1, 3, 4, 5, 6 are expressed differently in Uzbek and in Chinese with the same 穿衣服 *chuan yifu*.

Using suffixes such as *-in*, *-tir*, *-ish*, verbs that change in meaning and function do not find their full equivalent in Chinese, and see a grammatical gap in the middle. The verbs "to wear" in sentences 1 and 2 are translated into Chinese in two different ways. Because in Chinese, the verb "to wear" is used separately according to its object, such as 穿 *chuan* for "outer garment" and 戴 *dai* for "hat."

The word "undress" is also different in Chinese: 脱衣服 *tuo yifu* – to take off one's clothes, 摘帽子 *zhai maozi* – to take off one's hat. Although the Uzbek language has the concepts of "wearing a hat" or "wearing an outer garment", there are no separate lexemes to express these concepts.

This means that the concepts mentioned in the Uzbek language give rise to lexical lacuna. Below is another Chinese version of the word "dress".

7. *Nasiba.Kiyib ko 'ray-chi!Nasiba. Let me try it on!* [4, 14]Nasiba: 我试试看呢! *Wo shishi kan ne!*

The word "try on" in Uzbek is a completely different word from the Chinese word

“试试”*shishi*". As you can see, the verb "to wear" has several lacuna in Chinese.

In Chinese, passive voice is formed with the help of the 被 *bei*, 由 *you*, 让 *rang*, 叫 *jiao*, 使 *shi*, while in Uzbek it is formed by adding the suffixes - (i) *n*, - (i) *l* to the base of the verb. In Uzbek, the use of the auxiliary "by", which corresponds to the Chinese prefixes, is not used in the passive pronouns of the subject, so there is no lacuna between the two languages in the passive pronoun:

7) 他被老师批评了一顿。 *Ta bei laoshi piping le yi dun.* [5, 37] –*U o'qituvchi tomonidan tanqid qilindi. (She was criticized by her teacher).*

According to the linguist Sh.Usmanova, in the Uzbek language the head soma is more closely connected with the state verbs (confuse, hurt), the eye soma with the verbs (look, see), the foot soma with the action verbs (walk, go, press, pull). In addition, the pronoun comes together with gesture verbs such as shake, throw, shake, shake, raise the hand, shake, join, and forms a number of phraseological units, which serve to describe the action [6, 31].

O. Sukhanova distinguishes three types of verbal lacuna: generalizing, concretizing and generalizing-concretizing lacuna. According to him, the amount of concretizing verb lacuna is much greater than the rest of the verb lacuna. The degree of lacunarity of concretizing lacuna and concretizing-generalizing lacuna is the degree of concretization, which belongs to the lexical differentiation of the concept of species [7].

Specific lacuna in the Uzbek language on the Chinese background related to the soma of the mouth, eyes, hands and feet can be shown as follows:

a) Verbal lacunas associated with oral soma:

尝 *chang*- to eat, to taste

呓 *qiā*- to bite

咻 *xiū*- to make noise, to murmur

吭 *kēng*- to make a sound.

“专员——”她追上了下了车朝东院走去的蒋经国气咻咻喊道[8]。

“*Zhuānyuán ——*” *tā zhuī shàngle xiàle chē cháo dōng yuàn zǒu qù de jiǎngjīngguó qì xiūxiū hǎn dào.*

У “Комиссар ——” дея шовқин солиб аравадан тушиб шарқий ҳовли томон йўл олган Жиянг Жинггуога бақирди.

("Commissioner——" she cried Jiang Jingguo yelled after catching up with the car and walking towards the east courtyard).

b) the verballacunas associated with eye soma:

瞧 qiáo- to glance

眯 mī- to squint, to squint

瞟 piǎo- to look out of the corner of the eye, to look in secret

瞻 zhān- to look straight.

刘检察长瞟了赵金如问：“听清这两人是谁了吗？” [9]

*Liú jiǎnchá zhǎng piǎole zhào jīnrú wèn: "Tīng qīng zhè liǎng rén shì shéile ma?"*

*Прокурор Лю Жоэжинруга зимдан кўз таилаб: "Бу иккиси кимлигини аниқ эшитдингизми?" деб сўради.*

*(Prosecutor Liu Zhaojinru glanced at him and said, "Did you hear exactly who the two were?" he asked).*

c) the verballacunas related to hand soma:

带 dài- to carry with oneself;

掂 diān - to estimate the weight by hand;

钓 diào - fishing with a hook;

捧 pěng - to take with both hands (with respect).

领队者乃是死者的长子，他手捧着“先父之位”的灵牌，迈着沉重的脚步..... [10]

*Lǐngduì zhě nǎi shì sǐzhě de cháng zǐ, tā shǒu pěngzhe "xiān fǔ zhī wèi" de língpái, màizhe chénzhòng de jiǎobù....*

*Сардор марҳумнинг тўнғич ўғли эди. У "марҳум отаси"нинг исми ёзилган тахтачани икки қўллаб олиб, оғир қадам ташларди.*

*(The leader is the eldest son of the deceased. He is holding the spirit card of "the father's place" and taking a heavy step..).*

d) Chinese-Uzbek verballacunas related to foot soma:

跪 guì- to bend the knee;

踮 qiāng- to move in a rhythm;

蹑 niè- to walk on tiptoe.

忽然他灵机一动，蹑足走到通往楼梯的门旁，把门一开。 [11]

*Hūrán tā língjī yīdòng, nièzú zǒu dào tōng wǎng lóutī de mén páng, bǎmén yī kāi.*

*У бирдан ҳаракатга келиб, зинапоёга бошловчи эшик томонга оёқ учида юриб борди ва эшикни очди.*

*(Suddenly he moved, walked to the door leading to the stairs, and opened the door).*

Against the background of the Uzbek language, you can observe Chinese lacuna such as Gesture– 打手势叫 *dǎ shǒushì jiào*, shout loudly – 大声喊叫 *dàshēng hǎnjiào*.

## CONCLUSION

In conclusion, the problem of occurrence of grammatical lacunas between Chinese and Uzbek languages has not been investigated fully. The grammatical category specific to the Uzbek verb family may not exist in Chinese or may be expressed by other means. There are significant differences, especially in the relative categories of verbs in both languages.

Somatic verbal lacunas are lacunas in words that describe actions performed with the participation of body parts, and they occur mainly in concretizing verbs.

## EVALUATION IN 1960-1980 SCIENTIFIC RESEARCHES REGARDING THE EVENTS IN KHOREZM UNDER SOVIET UNION REPUBLIC

**Rakhimov Navruzбек Shokhnazarovich\***

\*Senior Lecturer,  
Department of "Socio-Humanitarian Sciences",  
Tashkent State University of Uzbek Language and Literature,  
UZBEKISTAN

### ABSTRACT

*In the period of Soviets, a lot of research was carried out on the liquidation of the Khiva Khanate and the history of the Khorezmpeople's Republic of Soviets. As a result of them, the data and archive documents on the subject are included in the scientific report. At the same time, this period was complicated, contradictory in the history of our statehood and ideological pressures in the scientific study of the problem prevailed. The article analyzes the scientific evaluations given in 1960 -1980s research on the processes in the Khorezmpeople's Republic of Soviets from the point of view of historiography.*

**KEYWORDS:** *Khorezm People's Soviet Republic (KSSR), Bukhara People's Soviet Republic, October Revolution, RSFSR, "Questions Of The History Of The CPSU", All-Russian Congress, Turkestan ASSR, Khiva Revolution.*

### INTRODUCTION

First of all, it should be noted that the scientific research of this period is inextricably linked with the domestic and foreign policy of the Soviet state, as evidenced by the example of the history of the Khorezm People's Soviet Republic. The team of scientists who survived the great difficulties of Stalinist politics in the 1950s and World War II finally had the opportunity to fully engage in science between the 1960s and 1980s. In general, this period did not differ much in the communist ideological life of the period, but after Stalin's death, N. Khrushchev's rise to power in the Soviet Union was reflected in scientific research, including historiography, except, until the years of perestroika, almost the same situation - a class approach in the communist spirit to historical realities prevailed.

---

## THE MAIN FINDINGS AND RESULTS

The period of stagnation of the Soviet state under L.I. Brezhnev, the rise of corruption in state and public organizations and in Soviet society in general, was reflected in almost all spheres of society, including science, in particular. At the same time, the principles of openness of N. Khrushchev's time, objective assessment of historical events, national history, values, and objective assessment of historical figures changed, and the propaganda apparatus of the first years of the Soviet government, especially under Stalin, was revived and the class approach to realities intensifies. The government took the path of misleading the public and creating a "Single Soviet Nation" by exploiting scientific research, especially in the field of history and literature, by denouncing or unilaterally interpreting national history.

This approach is especially evident in the scientific and popular literature on the history of the Khorezm People's Soviet Republic, which can be seen not only in the Center or in the republic, but also in regional publications. For example, in an article titled "Issues of the history of CPSU" in the Journal "Khorezm and Bukhara experience" – the movement of the 20th century during the transition period, it was shown that the workers and peasants class had a desire to develop anti - dictatorial revolutionary-democratic movements such as growth and increase in consciousness [6] - will be evaluated as.

Another feature of the research of this period is that the October coup was emphasized as a people's democratic revolution, as a result of the victory of the revolution, initially in the Khiva Khanate, and then in the emirate of Bukhara for the first time in history carried out the transition to socialism with the unselfish assistance of Russian and other peoples of – Soviet ideology was strongly influenced by the content of the Soviet republics, the generalization of their experience in the development of these republics, which has a significant theoretical and practical significance for all developing non-socialist countries that have achieved political independence.

The second period, the period from the mid-1950s to independence, is marked by a return to Soviet ideology and the strengthening of its influence in the literature and research of this period. However, from the mid-1980s to the 1990s, the years of reconstruction saw significant changes in this area.

B.N. Ponomarev, Secretary of the Central Committee of the CPSU, in his 1962 report "On the State of Historical Science and Measures to Improve the Training of Scientific and Pedagogical Personnel" drew the attention of Soviet historians to the need for in-depth study and generalization of the experience of Khorezm and Bukhara. For this experience to become the property of the peoples liberated from colonialism, it must be manifested in all clarity, not only the end result, but also the real course of the process" [2: p. 22].

In the 1960s, along with the publication of a number of scientific monographs on the history of the Khorezm People's Soviet Republic, the candidate's work was carried out. Among them is U. Tukhtakhanov's "Relations between the Russian Soviet Federative Socialist Republic and the Khorezm People's Republic, 1921-1924" (1961) [3], A. Satlikov's "History of the development of irrigation in Khorezm (1920-1941) (1967) [4], K.Abdullaev's "Komsomol and youth in the struggle to strengthen Soviet power in 1920-1924" (1969) [5] cases were defended. The fact that this and other researchers' scientific research has been published not only in scientific journals but also in the mass media, especially in newspapers [6] shows how masterfully the Soviet state used science, especially history.

We find that M. Dzhunusov's research on the Khorezm People's Soviet Republic, published in the late 1960s, was dominated by such approaches [7]. New research by a number of other authors has also emerged on the subject. In particular, in 1964-1965 in the pages of the journal "Issues of the history of the CPSU" published articles on the problems of the path of development of socialism [8: p. 61].

The work, created by L.M. Landa in 1970, is presented as a short but detailed literature on the history of the Khiva revolution and the Khorezm People's Republic [9: p. 74-78]. This study also continues the views expressed earlier in this regard, and it is clear that one-sided coverage of the events, based on the existing communist ideology, prevailed. For example, M.A. Akhmedova's research on the development of socialism. One of his books, *The Experience of the Soviet Eastern Republics on the Path to Socialism and Its Characteristics* (1967), and the other, *The Non-Capitalist Path: Some Problems of Theory and Practice* (1976), although these works are a generalized study, but there is a special section on the Turkestan Autonomous Soviet Socialist Republic, Bukhara and Khorezm [10].

M.A. Akhmedova's research concludes that the Soviet ideology played a key role in the development of backward peoples, including the peoples of Khorezm and Bukhara. The significance of this monograph is that it presents not only an analysis of the practical experience and features of the development of socialism in the Khorezm People's Soviet Republic and the Bukhara People's Soviet Republic, but also specific problems.

The works of G.M. Bilalov, I.A. Alimov, M.N. Mamadjanov [11] can be included in such researches. G.M. Bilalov's "From the history of culture and education of the Khorezm People's Soviet Republic. 1920-1924 years". The book is considered to be the first study aimed at studying the Khorezm Cultural Revolution.

An important step is also taken in the field of research on general theoretical issues of socialist-based economic development related to the Khorezm People's Soviet Republic and the Bukhara People's Soviet Republic, and this task was carried out in practice in the 60s and 70s. I.A. Alimov's research "Agricultural changes in Khorezm and Bukhara People's Soviet Republics" (1970) [12] "Education and activities of the Communist Party, 1920 - 1924" [13].

This work covers and summarizes all aspects of socio-economic development in the works of other authors. As a continuation of this study, the historical research of F. X. Kasimov summarizes all the issues that were written on the problem [14], reviews of different views of the authors. This monograph includes the period from the first half of the 50 - ies. In the 1980s .The second monograph of F. X. Kasimov is published, the work is devoted to the historiography of the pre-socialist period of the peoples of Central Asia. This monograph covers the literature created on the subject until the 1970s [15].

In 1976, a collection of documents entitled "History of the Khorezm People's Republic" was published in Russian, which includes materials from the archives of the Uzbek and Turkmen SSR, the Republic and the region [16]. These documents are presented on a periodic basis. In the same year, a number of studies on the history of Khorezm were published, which also focused on the history of the Khorezm People's Soviet Republic [17].

Soviet-era research evaluates the literature of foreign scholars on the abolition of the Khiva Khanate and the history of the Khorezm People's Soviet Republic as the work of bourgeois

authors who grossly falsified the events in Khorezm. In particular, F. X. Kasimov's monograph "Avoidance of Capitalism: Soviet Historiography of the Transition of the Peoples of Central Asia to Socialism" (1979) [18] has a special section – "Soviet historians struggle against bourgeois falsification of socialist construction in the Central Asian republics".

The book by American author Seymour Becker [19: P. 286-289], who studied at Moscow State University, covers the period from 1865 to 1924. According to the author, during this time there was no change in the life of Bukhara and Khiva. Many collections of documents on the history of the October Revolution and the Civil War have been published in Central Asia, but they contain only partial information about Khorezm. There are different memories on this topic. It is estimated that these memories should be explored as an important source in the creation of real history.

In the 1980s, a number of studies on the history of the Khorezm People's Soviet Republic were published. Only articles and monographs published in 1980 confirm this. During these years, along with scientific research, a number of journalistic articles on the history of the Khorezm People's Soviet Republic were published in the national and regional press. In particular, O. Sobirov's article "Culture since the Revolution (60 years since the victory of the Khorezm People's Revolution)" was published in the newspaper "Uzbekistan Madaniyati" (February 19, 1980), in the newspaper "KhorezmHaqiqati", the official publication of the Khorezm regional administration, O. Avazmuradov's "Last blow". A scene from history.

Research in the 1980s acknowledged the development of Soviet history in connection with the history of the Khorezm People's Soviet Republic. This is based on the achievements, the predominance of the identification and study, systematization and scientific description of new documents in many Central and local archives. This, in turn, is considered by historians to usher in a new era in the study of a number of topics, including the Khiva revolution and the history of the Khorezm People's Republic. In particular, the movement of the Khorezm People's Soviet Republic and the Bukhara People's Soviet Republic to independent activity was described as feudal eastern backwardness and became the center of revolutions against their movement [25: p. 230-231].

The end of the Khiva Khanate and the history of the Khorezm People's Republic are complex, sometimes full of contradictions, based not only on concrete achievements, but also on a number of serious mistakes. They can be described as follows:

- Assess the specific historical characteristics of the socio-economic development of Central Asia;
- In the post-October revolution period, the Soviet ideology, which was instilled in the peoples of Central Asia, prevailed;
- A number of historians have tried to study not only research, but also important legal literature from the point of view of historiography and source studies.
- In the first decades of the twentieth century, taking into account the peculiarities of the socio-economic and political structure of the Khiva Khanate, attention was paid to the conditions for the abolition of the Khiva Khanate, but the class approach to reality prevailed;

- The methods and tools used in the implementation of revolutionary-democratic changes in the Khorezm People's Republic have been analyzed, but in many cases the ideological approach has led to a departure from the coverage of the original situation.

At the same time, studies conducted over the years have comprehensively analyzed the influence of the Russian Soviet Federative Socialist Republic in the Khorezm People's Republic, the establishment of a socialist republic in Khorezm, but often exaggerated the activities of centralized forces and sometimes discriminated against locals. Also, the research of this period is dominated by the ideological approach to the history of the Khorezm People's Soviet Republic, the exaggeration of the class struggle and one-sided coverage. However, they are important for their richness of materials, coverage of almost all aspects of the history of the Khorezm People's Soviet Republic and consistent coverage of the issue, as well as their role as a source.

Certainly, we are far from discriminating against the research of this period. Most of the researchers who conducted scientific research during the Soviet era were well acquainted with the literature related to historical events and tried to make extensive use of the research created before them. They also sought to make extensive use of periodicals and archives that provided materials on the history of the Khorezm People's Soviet Republic to cover the issue in full. Highly appreciating the work of the researchers of this period, it should be noted that they served the ideological life of their time and were influenced by the ideas that had been ingrained in their minds for many years.

The ideological policy pursued in Soviet times for many years, educational institutions, propaganda bodies, radio-television, newspaper-magazine, Scientific and artistic literatures, which were the main means of its existence, gave the result of ideas that were inextricably integrated into the people's masses. On the one hand, this led to the fact that not only did it affect every researcher who conducted scientific research in those years, but also did not take into account some exceptions; many of them became the chief propagandists of Soviet ideology. On the second hand, the awareness of the researchers who had reached this period in contrast to the researchers in the 1950 - ies about the Real realities has been greatly reduced, almost depriving them of the opportunity to see the "second side of the coin", and the lack of access to research carried out abroad has led to the creation of scientific literature.

One of the characteristic features of the historiography of the Khorezm People's Soviet Republic at that time was to show the Khiva khanate only in black and arouse hatred against it, to evaluate the khanate as a structure that oppressed only the poor, and khans, officials and priests as representatives of the old regime. as well as the description of the construction of the Khorezm People's Soviet Republic as a stage in the centuries-old dream of the population.

Khorezm culture flourished during the Khiva khanate, such as state traditions, political and military achievements, creative work, architecture and music, education in Khiva madrassas, literature, history and translation during the khanate, national handicrafts and land cultivation, irrigation networks, etc. it has become a definite tradition in historiography of the 60s and 80s to give only a negative assessment of a flourishing period. A similar approach was taken against the Young Khiva people, who played an important role in the construction of the Khorezm People's Soviet Republic and were enlightened forces in the oasis, and continued to label progressive intellectuals as "nationalists", "counter-revolutionary forces" and "anti-communists".

## CONCLUSION

To conclude, although the influence of communist ideology is evident in Soviet-era research and published works on the history of the Khorezm People's Soviet Republic, a recognizable feature of this research is that it was created using primary sources and important historical archival documents.

Certainly, the research and literature of this period is an important source for creating real history. Therefore, one of the main tasks before us is to study the Soviet-era literature on the abolition of the Khiva Khanate and the history of the Khorezm People's Republic without ideology or in isolation.

## CONCEPTS OF PERSON AND RESPONSIBILITY IN ISLAM

**Mamadaliyeva Feruza Asrorovna\***

\*Lecturer,  
Department of Humanities,  
Tashkent State Agrarian University,  
UZBEKISTAN

### ABSTRACT

*Each person, undoubtedly, is a society part. The understanding of an Islamic way contains also understanding of the person, as especially important category for reflexions. Allah speaks to us: «Truly, Allah does not cancel favor which he rendered to people while they do not change that in their souls» (Koran, 8:53). Certainly, the idea of revival and justification after death is based on the concept of personal responsibility of the person. The same it is possible to tell and concerning the concept of creation of the world.*

**KEYWORDS:** *Concept, Personality, Social Group, Individual Properties Of The Person, Development Of The Person.*

### INTRODUCTION

The concept of the person is the most complicated in human knowledge. In the European languages the word "person" goes back to Latin concept "person" that meant a mask of the actor at theatre, a social role of the person as certain complete beings, especially in legal sense. The slave was not considered as the person. Expression «to lose the face» which is in many languages means loss of the place and the status in certain hierarchy<sup>1</sup>.

To begin studying of a problem of the person it is necessary from the individual - indivisible further a particle any whole. But this original social atom, the separate person, is considered not only as the individual representative of a human race, but also as a member of any social group. It is the most simple and abstract characteristic of the person saying only that it is separated (first of all corporally) from other individuals. Much more substantially other term – is the "individuality", designating uniqueness and originality of the person in all riches of its personal qualities and properties. Schematically it looks so: person acts at first as the individual, «casual individual», then as the social individual, the personified social group (class individual) and, at

last, as the person incorporating all variety of social communications and relations [Berkovis2001:86].

## THE MAIN FINDINGS AND RESULTS

Essence of "special person», is according to K.Marks, not his beard, his blood, not his abstract physical nature, but his social qualities. But properties of the person in any way do not reduce - with I to his specific features. The more considerably the person is, the more his individual refraction is presented in general, universal characteristics. Individual properties of the person are not the same, those personal properties of the individual, i.e. the properties characterizing it as the person [Berkovis2001:86].

### 2. Formation of the person and his form

To understand these questions, it is necessary to address to a problem of genesis, an origin of personal features of the person. First of all there is a question - when the person is born, what to it promotes or interferes? It is obvious, that to the newborn child the term "person" is inapplicable, though all people are born as individuals (except for so-called Siamese twins) and as individualities, i.e. in each newborn child the unique image embodies as in a genotype, and a phenotype all its background. It can concern to congenital features of biochemical reactions, physiological parameters, readiness of a brain for perception of an external world etc. At a birth all children are not only different, but also all unique for even monoovular twins differ on a number of essential signs. Reception of a genetic copy - the double of the person - basically is possible, but will cause weight of the most complicated ethical problems.

So, newborn is already individuality, and everyday lives increases its requirement for diverse reactions to world around. Crying and shout - are unique ways accessible to it to let know about the unsatisfied requirements. But already from first days of a life, from the first feedings, special style of behavior of the child is formed, so well recognized by mother and relatives. Individuality of the child accrues to 2 - to 3-year-old age. At this particular time the first lines of personal behavior in many respects caused by are shown that the child gets to a situation of a free choice. At this age all children are extraordinary talented and inquisitive, and if associates promote development of these qualities, formation of the person goes normally[Nuriev, Yakupov 2007:140].

The further development of the person is connected with passage of other age periods and with features of development of girls and boys, girls and young men. The age, sex, a trade, a circle of contacts, an epoch - all these can form personality. On a course of life launches (as a rule, in a youth and at the age of 30 - 40 years), and stagnation (25 - 30 years, 40 - 50 years) are inevitable also. Creation of own family, a birth of children etc. become boundaries in human life a separation from a parental family[Nuriev, Yakupov 2007:141].

Formation of the person occurs in the course of socialization, i.e. mastering of experience by it and valuable orientations of the given society. The person studies to carry out social roles (to behave according to a role of the child, the student serving, the spouse, the parent etc.) . All these social roles have the expressed cultural context and, in particular, strongly depend on a thinking stereotype. If to compare the European canon of the person, say, with Japanese essential distinctions are obvious. The person is understood by Europeans as certain value which operate with similar image in different situations, keeping leading "core". For Japanese the perception of

the person and his acts as sets of several «circles of duties» are characterized - in relation to the emperor, parents, friends etc. For each sphere there is "code" of behavior. The person here is not independent and not self valued, and is realized only in connection with any generality. The European appears as «firm person», reminding egg in a shell while the Japanese is more anxious by an establishment and maintenance of communications with associates.

Formation of the person has passed in the European tradition stages of comprehension of feeling of fear and shame (an antique society), love to the God, sinfulness of the person and corporate morals (feudal world), statement of self-value of human individuality and occurrence of a phenomenon of alienation (New time).

Let's stop on structure and components of the person. We already said that are not born persons, and become as a result of long process of maturing which has the critical periods. Moreover, at a certain stage of a course of life the person can partially or lose personal lines completely. It happens at chronic alcoholics, addicts, at a heavy pathology of a brain etc. the Person is characterized by a unique combination of natural properties of the individual and the social qualities formed in this or that society. In this sense the person represents synthesis sensual and super sensual, i.e. that is not fixed by sense organs, but very really influences behavior of the person[Lobkovich 1998: 23].

First of all are allocated physical person, or «physical I». This body, or the corporal organization of the person, the steadiest component of the person based on corporal properties and feelings. The clothes and "home" can be carried to the physical person also. It is known that, how much about the person is possible to tell on these components of his world. Same concerns products of manual or intellectual work of the person - to ornaments of his life, collections, manuscripts, letters etc. Protection of the body, the identity, the nearest environment is the most ancient personal qualities of the person both in society history, and in history of the individual.

The social person develops in dialogue of people, since primary forms of dialogue of mother with the child. As a matter of fact, he grows from system of social roles of the person in the different groups which opinion he values. All forms of self-affirmation in a trade, public work, friendship, love, rivalry etc. form social structure of the person.

The spiritual person - is a kernel of ours "I". These are the inwardnesses reflecting tendency to certain cultural wealth and ideals. They can and not be realized in all completeness, but anyhow the care of "shower" is quintessence of personal development. Sooner or later each person starts to think of sense of the existence and spiritual development. Spirituality of the person is not something external; it cannot be got by formation or imitation. Frequently it is not only "holds" the person, like a core, but also is the highest blessing, the Supreme value in which name even sacrifice life. Requirement for spiritual development of the person is nonsaturated that it is impossible to tell about physical and social requirements. The history gives weight of examples of, how the intensive spiritual life (wise men, scientific, figures of the literature and art, religious devotees) was pledge not only a physical survival, but also active longevity. The people keeping the inner world, as a rule, survived and in the conditions of penal servitudes and concentration camps that has once again confirmed bitter experience of XX century.

Allocation of the physical, social and spiritual person (as well as corresponding requirements) has conditional enough character. In the person all these parties of the person form the system, each of which elements can get dominating value at different stages of life. The periods of the

strengthened care of the body, its functions, stages of expansion of enrichment of social communications, peaks of spiritual activity are known, say. It often happens that any line accepts system formed character and in many respects defines essence of the person at the given stage of its development. The age, heavy tests, illnesses, etc. can change in many respects structure of the person, lead to its original splitting or degradation.

### 3. Social types of the person

Allocate some large types of the person which are traced on all historical way of development of mankind. The first type - are figures (hunters and fishers, soldiers and handicraftsmen, farmers and industrial workers, engineers and geologists, physicians and teachers, politicians and managers etc.). For them main is an active action, change of the world and other people, including and. These people are "burn" on work, finding in it the higher satisfaction even if his fruits and are not so appreciable. Rapid development of the western civilization has led cultivated to such person - active, knowing to himself the price possessing self-respect and realizing a measure of the responsibility for, the family, people. The requirement for such persons always was strict. Still the evangelist of Luka gave of a word of the Christ: «Much is Harvest, but is not enough makers» [Stolovich 1994: 87].

The second type - are thinkers. They are people who, according to Pifagor, come to the world not to compete and trade but to look and reflect. The image of a wise man, thinker personifying traditions of a sort and his historical memory (annals), always had huge authority. Many great wise men and prophets - Buddha and Zarathustra, Moisey and Pifagor, Solomon and Lao-tsz, Confusiy and Mahavira Gin, Christ and Mohammed - or were considered as envoys of gods, or were idolised. Thinkers have the unique weapon - is a word.

The third type - people of feelings and emotions who sharply feel how «world crack» passes through their hearts. They are figures of the literature and art, whose ingenious discernments frequently advance the most courageous scientific forecasts and predictions of wise men [Stolovich 1994: 87].

The fourth type - is the people who have made with business of the life mercy. Albert Schweitzer and Feodor Petrovich Gaaz, Anri Dyunan and mother Tereza, thousand their followers in history and the present - living examples of service to people, irrespective of their race, nation, an age, sex, a condition, creed and other signs. An evangelical precept - «Love near yours as yourself» - found in their activity by a direct embodiment. Such persons feel a sincere condition of other person, as though «feel» in it, facilitating its sufferings. Their force - is in belief in the mission, in love to people and all live.

Certainly, the majority of people is combined by signs of different types of persons, and sometimes there is also a change of leading installations. Thus it is important to understand one - a choice of a personal way and a sphere of action - is result of free of the person. Therefore the person is inconceivable out of freedom, and according to Hegel, the true nature of the person is «free spirituality».

### 4. Freedom

Freedom is an ability of the person to operate according to the interests and desires. In Russian the term "freedom" is used first of all in value «freedom from», i.e. absence of external compulsion, oppression, restrictions etc. Concept "will" has wider value which was issued

approximately in XV - XVI centuries in the Moscow state. On the one hand, «manumission» at all did not mean autonomy of the person, and opposite, replaced with its authority of group that is in a sense nonfree. On the other hand, in freedom is both the desire and command of the nature, steppe, have given, that so is characteristic for perception of the world (we will recollect a Gogol bird-three). The concept of freedom was fixed in Christianity as expression of idea of equality of people before the God and possibilities for the person of a free choice on a way to the God. However realization of this idea has appeared in the contradiction with equality and justice ideals.

To understand essence of a phenomenon of a personal freedom, it is necessary to understand contradictions of voluntarism and fatalism, to define borders of necessity (law) without which freedom realization is inconceivable [Rahmatullina, Yakupov 2004; 255].

The voluntarism considers will as a human life principle, belittling thus value of reason. These ideas have been developed in Schopenhauer's philosophy was extended in XX century to Operate in the spirit of voluntarism - means, not to reckon with objective conditions of life, with nature and society laws, giving out the arbitrariness for the higher wisdom. It is a lot of such examples, including in history of our society. Many revolutionaries tested original impatience, desire to "push" a course of history and to impose it the will. But the life showed sooner or later utopianism of such attempts, for which people paid off with blood, poverty, development delay.

Fatal predetermines all courses of human life and his acts. It speaks or destiny (in mythology and language), or will of the God (in Christianity and Islam), or a determinism of the closed system where each subsequent event is rigidly connected with previous (Gobbs, Spinoza's systems, Laplasa). Here, as a matter of fact, places for a free choice does not remain, for there are no alternatives. Rigid necessity and full predictability of the basic stages of human life following from here and the main events is characteristic for an astrology and other occult doctrines of the past and the present, and also for every possible social Utopias and the anti-Utopias reflected in products by A. Platonova, J. Oruella, O. Haksli, etc.

At the same time it is obvious, that necessity ignoring (natural, historical etc.) is fraught with an arbitrariness and permissiveness, anarchy and chaos, that in general excludes freedom. Hence, freedom is something more, than the account of objective necessity and elimination of external restrictions. Internal freedom, «freedom for», freedom in a choice of true, good and beauty is much more essential. In frameworks «freedom from» the formula is quite reasonable: «everything is authorised, that is not forbidden». But as a matter of fact it is logic of the slave which has remained without the supervisor [Rahmatullina, Yakupov 2004; 255].

Thus, freedom is the most complicated and deeply inconsistent phenomenon of human life and a society, having the greatest attractiveness and being at the same time heavy burden. Knowingly in western philosophical thoughts (E. From) the phenomenon «flight from freedom», especially was analyzed if freedom realization led to inequality and injustice growth. This problem - is how to correlate freedom and equality, not leading to suppression and equalizes, - faces to each society and state. Solving it, it is necessary to be guided by this or that system of values.

## 5. Values and their kinds

The concept of values reflects the importance of those or other objective phenomena for a life of people. The valuable relation is formed in the course of human activity where allocate three kinds of manufacture: people, things and ideas.

The first (and the basic) value is the person in all variety of his life and activity. This representation has arisen not at once, there was a result enough a long evolution of public consciousness. The belief, that each person is self estimated irrespective of an age, sex, race and the nation, an origin, etc., were arisen and become stronger or in comparison of the person with the higher value (the God, Spirit), or owing to action of the general laws of life of society. So, in the Buddhism equality of people and recognition of their value occurred because all born is doomed to suffering and should overcome it and find pleasure. In Christianity value of the person is seen in possibility of expiation of sinfulness and finding of an eternal life in the Christ, and in Islam value of the person - in return of to the Allah and execution of his will [Yakupov 2004: 340].

Concept of value of the person - is universal, and it is impossible to reduce concept of value of the person to "utility" of the person for a society. Attempts to divide people on "necessary" and "unnecessary" are vicious on the essence for their realization inevitably generates an arbitrariness conducting to degradation and the person, and societies. Value of the human person in a sense above all that does or is spoken were done by person. It cannot be reduced to work or creativity, to a recognition from a society or group of people. As objective criteria (work fruits, creativity certificates), and their value judgment from contemporaries sin is homogeneity. The history repeatedly proves that the true scale and an orientation of acts and thoughts of many persons become obvious after many years, and even centuries. Value of many works of historical figures as though continuously increases; at the same time it is a lot of examples when time discredits exaggerated authorities.

There was a whole galaxy of scientists, whose contribution to a scientific-theoretical substantiation of depth of philosophy and ethics of Islam was especially great.

I will name only several: they are - SaaduddinMasud Ibn Umar at-Taftazani (722-792), Abdulla Ibn Mubarrak al-Marvazi (740-803), Imam Ahmad Ibn HafsKabirBuhariHazrati (768-832), Ishak Ibn Rahvayh al-Marvazi (785-860), Ahmad Ibn Hanbal al-Marvazi (786-863), Abu Muhammad Abdulla Ibn Abdurahman Ad DorimiSamarkandi (803-877). The most well-known, affected all development of divinity, were Imam Abu Abdulla Muhammad Ibn Ismail al-Buhari and Muhammad Ibn Ali Hakim at-Tirmizi.

All of them were the largest experts on the Sacred Koran and Sunna Prophet, began the formation with these main sources of Islam. The huge scientific huge scientific, literary, cultural and spiritually-moral heritage didn't lose the importance up to our days to what huge circulations of their books testify, exit on screens and theatrical scenes of films and performances about a life and acts of great ancestors.

Other visible collector and the keeper of hadis became **Abu Iso Muhammad at-Termizi**. Known as **al-Hakim at-Tirmizi**. Written by **at-Tirmizi** the book of hadis is considered one of authoritative in the Islamic world. **At-Tirmizi** in the products popularly explains the essence of traditions, rituals, customs, ceremonies. In the sermons and compositions, such as «Ilal ash-

Sharia» and «Hatm al-Avlija», **at-Tirmizi** argued on sense of Muslim ceremonies, about «love to the God», about categories of mystics, about «press sacred», existing along with «the press of prophets

**Al-Buhari** has written more than 20 products. This original work has been made with classification of hadis on plots. For the past since then more than 12 centuries the collection of al-Buhari is for Moslems the theological work second for the importance after the Koran. It was republished time and again, and translated on many languages of the world[Uvatov 1998: 42].

Some words about **Hodzhe Ahmad Yasavi** - is one of the first sufiy mystics in turkik in the world. He wrote on hakani - the Turkic literary language, developed at a court yard of karahanid, and was the author of a cycle of verses «Divan of hikmat».

## CONCLUSION

Thus, it is possible to draw a conclusion, that the fertile earth Maverannahr gave to the world the whole galaxy of scientists and thinkers which the natural-science, logic, religious-philosophical researches and searches included big contribution to world civilization development. Practically all cities and villages of this edge became famous owing to the sons of Khoresm, Samarkand, Bukhara, Nasaf, Tashkent, Fergana, Margelan, Termez, Shahrisabz and other places. They caused stir in spheres of science, poetry and music, culture, theology, medicine, military science, architecture.

Thus, the concept of the person, freedom, values enriches and expands our representation about the person, his past, present and future.

### ABSTRACT

*The experiment was studied the antioxidant the activity of polyphenol Euforbin getesan in isolated mitochondria. Discovered getesan inhibitory effect on the  $Fe^{2+}$ /acrobate-dependent swelling of mitochondria and lipid per oxidation decrease on mitochondria. It was established getasan has antioxidant activity and has protective effect on mitochondrial membranes.*

### 1. INTRODUCTION

One of the current problems of today is the search for substances that have effective pharmacological activity on the basis of native plants that exhibit antioxidant, antihypoxanthic and antiradical properties [2;3]. Research to identify the medicinal properties of plant extracts and their application in clinical trials requires direct molecular research in tissue and cell physiology [3,4,5].

Recent research in the field of pharmacology has shown that polyphenols can effectively control tissue and cell dysfunction in various pathophysiological states, have different mechanisms of

action and have higher pharmacological activity than other plant biologically active substances (alkaloids, diterpenoids, flavonoids) [1; 2]. Studies have shown that polyphenols are natural substances with a wide range of membrane activity, antioxidant, antihypoxanthic, hepatoprotective, cardioprotective, immunomodulatory, and membranefree effects [2,3,4].

Polyphenols are involved in metabolic processes in the body, exhibit membrane activity and antioxidant properties at the expense of OH groups, and low levels of toxicity can lead to a number of problems in medicine, food, cosmetics, pharmaceuticals and manufacturing [2,4].

Therefore, it is necessary to study the mechanism of action of polyphenols at the tissue and cellular levels, and to determine their pharmacological properties, and the advances will help to keep the genome of the population healthy and healthy. The results will lead to promising advances in pharmacology, medicine, physiology, and biophysics [4,9,10].

**Purpose of the study:** Study and pharmacological evaluation of antioxidant and antiradically properties of Euforbin polyphenol in vitro experiments.

## METHODOLOGY

In carrying out this work, presented by the Institute of Bioorganic Chemistry of the Academy of Sciences of the Republic of Uzbekistan: *Euphorbia ferganensis* B. Fedtch (Drying) (1-O-galloil-2,4-valoneil-3,6-hygsahydroxydifenol- $\beta$ -D-glucose pharmacological properties of glucose) polyphenol have been investigated.

( $C_{20}H_{19}NO_5$ )

M.m = 1104

**Figure 1. Chemical structure formula of Euforbin polyphenol**

**The antioxidant activity of Euforbin polyphenol** was evaluated in the context of the effect of hepatic mitochondria on lipid peroxide oxidation process in non-white white rats with a body mass of 120–140 g. Mx was isolated from the liver of rats by differential centrifugation [15]. Dissociation medium (DM): 250 mM sucrose, 10 mM trisHCL, 1 mM EDTA, pH 7.4.

### Determination of lipid peroxide oxidation products in mitochondria

LPO products were studied in the presence of thiobarbiturate acid (TBA). The reaction was stopped by adding 0.220 ml of 70% trichloric acid to DM. After this phase, the mitochondria suspension was centrifuged at 4,000-minute intervals for 15 minutes. Then, 2 ml of precipitate was removed and 1 ml of 75% TBA was poured. 2 ml of H<sub>2</sub>O and 1 ml of TBA were added to the control test tube. The mixture was incubated for 30 minutes in a water bath. After cooling, a change in optical density at a wavelength of 540 nm was detected. In calculating MDA, extraction with the molar coefficient ( $\epsilon=1,56 \times 10^5 \text{ M}^{-1} \text{ cm}^{-1}$ ) was used:  $\text{nmol MDA} / \text{mg protein} = D / 1,56 \times 30$ .

The amount of protein in the mitochondria was calorimetrically determined by the Biuret method. Cattle whey album was used as the standard.

$\text{Fe}^{2+}$  / ascorbate system was also used to study the LPO process in the mitochondria membrane. Under the influence of this system, the mitochondrial membrane loses its barrier function, resulting in an increase in organelle volume and a loss of mitochondria. This volume change was determined by photometric change in optical density at 540 nm wavelength in 3 ml cells. DM: KCl - 125 mM, trisHCl - 10mM, (pH 7.4); Concentrations:  $\text{FeSO}_4$  - 10  $\mu\text{M}$ , ascorbate - 600  $\mu\text{M}$ ; the amount of mitochondria is 0.5 mg / ml [5].

**The antiradical anti-hypoxanthic activity of Euforbin polyphenol** have been investigated by the use of an antioxidant base as well as 2,2-diphenyl-1-picrylhydrazyl (DFPG) molecular regeneration.

### Statistical processing of the obtained results

Statistical processing of images and drawing was performed using OriginPro 7.0 (Microsoft, USA), computer programs. The experiments were performed as a calculation of the arithmetic mean of 3–8 different experiments of the liver. The difference between control and experiment values was calculated by t-test. Whereas  $P < 0.05$  and  $P < 0.01$  represent statistical reliability.

## RESULT AND DISCUSSION

The role of mitochondria in cell physiology is a specific “target” for the study of pharmacological agents that have antioxidant effects [8,9,10,11,12]. Dysfunctional changes in mitochondria are first observed in the etiology of various pathologies [12,13,14]. These changes are explained by the qualitative and quantitative changes of lipids in the structure of the membrane of the Mx, the disruption of the membrane permeability to the ions, and the permeabilization of the membrane [14,15]. Several external (pesticides, herbicides, alcohol, chemical reagents) [14,15] and the accumulation of internal (free radicals in the cell, high concentrations of H<sub>2</sub>O<sub>2</sub> and Ca<sup>2+</sup> ions in the mitochondrial matrix), which accelerates the process of peroxide oxidation of lipids in mitochondria and causes cellular antioxidant systems to degenerate [12,14,15]. Antioxidant drugs improve the physiological and functional system of the cell, increasing the stability of damaged cells and mitochondria membranes.

The antioxidant property of Euforbin polyphenol was assessed by investigating the process of peroxide oxidation of lipids resulting from the induction of rat liver mitochondria under the effect of  $\text{Fe}^{2+}$  / ascorbate [5].

In the experiments, the addition of 10  $\mu\text{M}$   $\text{FeSO}_4$  and 600  $\mu\text{M}$  ascorbate to the incubation medium had an inducible effect on the mitochondrial membrane structure, resulting in permeable membrane permeability. Under these conditions, membrane permeability increased by  $45.3 \pm 1.76\%$  as a result of structural disturbance of the Mx membrane. In the experiments, the Mx membrane permeability values were calculated and were 100%. Increased membrane permeability under  $\text{Fe}^{2+}$  / ascorbate evidence indicates that the LPO process is formed in Mx.

(Concentrations Euforbin)

1- control; 2-1  $\mu\text{M}$ , 3-3  $\mu\text{M}$ , 4-5  $\mu\text{M}$ ,  
5-6  $\mu\text{M}$ , 6-8  $\mu\text{M}$ , 7- 10  $\mu\text{M}$

**Figure 1. Effect of Euforbin polyphenol on the peroxide oxidation of lipids in mitochondria.**

Note: The research conditions are listed in the Materials and Methods section. The peroxide oxidation process of lipids in the mitochondria is expressed in% of the ordinate axis, and the absorption axis shows the concentrations of euphorbia polyphenols. (\* -  $P < 0.05$ ;  $n = 8$ ).

In subsequent experiments, the correction effect of Euforbin polyphenol on LPO was analyzed. Adding 1  $\mu\text{M}$  of Euforbin together with  $\text{Fe}^{2+}$  / ascorbate to the incubation medium reduced the peroxide oxidation process of lipids in Mx by  $2.0\% \pm 1.2$ . This is the first indication that Euforbin polyphenol has antioxidant properties.

The antioxidant effects of Euforbin have been studied in greater detail by increasing the concentrations added to the incubation medium. 3  $\mu\text{M}$  of Euforbin added to the medium inhibited the LPO process at Mx by  $20.6\% \pm 1.2$ , 5  $\mu\text{M}$  by  $63.6\% \pm 1.5$ , with 6  $\mu\text{M}$  by  $87.9\% \pm 0.5$ , and  $92.3\% \pm 0.5$  by 8  $\mu\text{M}$ . Euforbin at 10  $\mu\text{M}$  showed a high antioxidant property by inhibiting the LPO process in Mx to 100%. In the experiments, the half-maximum inhibitory concentration of Euforbin (IS<sub>50</sub>) was 3.72  $\mu\text{M}$ .

The study of the activity of the studied substance to determine the antioxidant effect is fully covered by the study of the amount of MDA produced by the LPO process. Because, under pathophysiological conditions, the main disorders in tissues and cellular antioxidant systems are the degree of qualitative and quantitative changes of lipids by the process of production of LPO products (MDA). In addition to enhancing the membrane stability of the anti-oxidant pharmacological agent Mx, it is also essential to prevent MDA secretion from the LPO process. Only then, the antioxidant activity of the investigated substance is fully covered [Oliveira et al., 2015, Nakagawa et al., 2000].

In our experiments, MDA release in the LPO induced by  $\text{Fe}^{2+}$  / ascorbate effect (control group) was  $3.52 \pm 0.18$  3.2 nmol / mg of protein (Tabl.1.).

$\text{Fe}^{2+}$ /asc. + Euforbin 20 µM	0,70±0,03***	
$\text{Fe}^{2+}$ /asc. + Euforbin 25 µM	0,46±0,03***	

(DM: KCl - 125 mM, trisHCl - 10mM, pH 7.4; Concentrations:  $\text{FeSO}_4$  - 10 µM, ascorbate - 600 µM; mitochondria protein 0.5mg / ml; control -  $\text{Fe}^{2+}$  / ascorbate;

\*\* R <0.01; \*\*\* P <0.001; n = 5).

Adding 1 µM and 5 µM concentration of Euforbin in the incubation medium did not significantly affect the accumulation of MDA in the membrane. The major quantitative change in the MDA decay occurred at a concentration of 20 µM of Euforbin. Under the effect of 5 µM of Euforbin, the MDA in the membrane was 2.98 nmol/ mg of protein, 2.1 nmol/mg of protein at 15 µM, and 1.8 and 0.7 nmol / mg of protein at 15 and 20 µM, respectively. In this experiment, the highest inhibitory concentration of Euforbin was 25 and the MDA content was 0.46 nmol/mg of protein (Tabl.1.).

The results of the experiments prove that Euforbin is a pharmacological agent with high antioxidant properties. MDA inhibited the decomposition process by preventing the increased LPO process induced by Euforbin  $\text{Fe}^{2+}$  / ascorbate action.

The literature also shows that antioxidants simultaneously exhibit anti-oxidant properties. The antiradical properties of antioxidants are characterized by their chelating of various metal ions and their free oxygen-absorbing properties. In our experiments, the antiradical effect of Euforbin was achieved by the application of 2,2-diphenyl-1-picrylhydrazyl (DFPG), an antioxidant-based molecule [4].

**Euforbin 10 мкМ**

**Figure 4. Effect of Euforbin polyphenol on free radicals.**

Note: The rate of reaction of Euforbin polyphenol with DPPH on the Ordinate axis, and the absorption axis time is -  $t_{50}$  .

The results of the kinetics of changing the optical density of the solution by adding Euforbin to the DPPH solution are shown in the figure below (Figure 2).

Continuation of the reaction process directly showed that the molecular deceleration process slowed down. The summarizing formula for the DPPH binding process of Euforbin polyphenol was calculated as follows:

$$-\frac{dC_{DPPH}}{dt} = k1_{eff} C_{DPPH} + k2_{eff} C_{DPPH}^2$$

The results obtained are based on the regression curves, and  $k1_{eff}$  and  $k2_{eff}$  are calculated as a result of the solution of the above formula. The accuracy of the results is  $10^{-4}$ , which allows comparing the antiradical properties of  $k1_{eff}$  and  $k2_{eff}$  Euforbin (Table 2).

**Table 2.**

**Expression of activity  $k1_{eff}$  and  $k2_{eff}$  constant calculated on the basis of regression curves**

The reaction constant of primary and secondary order	Euforbin
$k1_{eff} (\text{мин}^{-1}) 10^{-4}$	3,53
$k2_{eff} (\text{M}^{-1} \cdot \text{мин}^{-1})$	0.74

At the end of the study, we examined the correlation coefficients of the interaction of Euforbin polyphenol with antioxidant and antiradical properties. The results obtained and their statistical

treatment were consistent with the antioxidant and antioxidant properties of Euforbin, indicating that this ratio was equivalent to  $r = 0.82\%$  in the effect of Euforbin.

## CONCLUSION

The results of the study prove that Euforbin is a medicinal compound with high antioxidant, anti-radical and anti-hypoxic effects. The properties of Euforbin suggest that it is a highly pharmacological, effective drug such as quercetin. The obtained results can be used for the creation of a new generation of medicines with Euforbin based targeting membrane-containing, antioxidant, antioxidant properties, and indepth study of the mechanisms of sub molecular action of polyphenols compounds. The kinetic changes of the curves shown in the figures show that the DFPG molecules account for the first 5 minutes of the reaction process, with the bulk of.

### **ABSTRACTS**

*This study investigated how were correlates with the parental involvement and the achievement of students in the urban and semi-urban type 2 schools in mathematics and science. The descriptive survey research design was employed to carry out this study. One hundred and ninety two (192) students from 16 type 2 schools in Batticaloa educational zone, Sri Lanka were stratified randomly selected for this study. The type 2 school was selected for maintaining the homogenous values. From the results of this study, parental involvement accounts for 26.1 % of the total variance in mathematics achievement of secondary schools ( $R^2 = 0.261$ ;  $p < 0.05$ ) and 19.4 % of the total variance in science achievement of secondary schools ( $R^2 = 0.194$ ;  $p < 0.05$ ). These percentages are significant at 0.05 level of confidence. It shows that parental involvement is an important predictor of mathematics and science achievement. There exists a significant difference in the parental involvement of urban and semi-urban type 2 school students ( $t = -8.12$ ;  $p < 0.05$ ). Urban school students enjoy more parental involvement than their counterparts in the semi-urban school students. It shows that there is a correlation between parental involvement and male, female students in type 2 schools ( $t = -7.34$ ;  $p < 0.05$ ), and also there is a significant difference in the academic achievement of male and female students in mathematics and science ( $t = -0.432$  and,  $-0.512$  respectively ;  $p < 0.05$  ). It also shows the finding reports that, there is a significant difference in the academic achievement of mathematics and science with urban, semi-urban schools students ( $t = -9.142$  and,  $-8.314$  respectively;  $p < 0.05$ ). ## INTRODUCTION

The term 'Parental involvement' includes several different forms of participation in education and with schools. Parents can support their children's schooling by attending school functions and responding to school obligations like parent-teacher conferences. They can become more involved in helping their children improve their schoolwork by providing encouragement, arranging for appropriate study time and space, modeling desired behavior (such as reading for pleasure), monitoring homework and activity tutoring their children at home. Outside the home, parents can serve as advocates for the school. They can volunteer to help out with school activities or work in the classroom or they can take an active role in governance and decision-making necessary for planning, developing and providing an education for the community's children.

Alebiosu saw science education as the tool used to achieve scientific literacy which is the gateway to achieve scientific and technological advancement and economic survival. She further pointed out that the place of science in the improvement of the social, economic and political life of mankind justified its inclusion in the curricula of schools. Mathematics in itself is identified as a specialized language in which knowledge of the physical world has been recorded; a language in which idea originating in the minds of scientists can be encoded, transmitted to others and decoded with a much exact method and much less error (Oyedeji, 1999). Olutusin described mathematics as an instrument to ease or facilitate the learning of other subjects and that today, the importance of mathematics permeate all aspects of human endeavour.

## REVIEW OF LITERATURE

Parental Influence can make a substantial difference in encouraging or discouraging young women to pursue mathematics related majors and careers. Studying factors that influence the selection of quantitative fields, Ethington and Wolfr (1987) found that while parents encouraged academic performance in general, they tended to discourage daughters from entering quantitative majors in college. Luchins (1979) reported that more women mathematicians recalled being discouraged by family and friends. However, high mathematics achieving women and women who chose non stereotyped careers were strongly influenced by parental, teacher, and counselor support and encouragement (Franklin and Wong, 1987; Kingdon and Sedlacek. 1982). Differential treatment by parents in their children's enrollment in advanced mathematics courses can also be found in children from underrepresented groups. Parental education level in and attitude towards mathematics could also be reasons for the racial difference in enrollment in mathematics courses and performance on mathematics tasks.

Parsons et al.(1982) studied whether parents had sex-differentiated perceptions of their children's mathematics aptitudes. The results revealed that both mothers and fathers held sex-differentiated perceptions of their children's mathematics aptitude despite the similarity of actual mathematics performance of boys and girls. Parents' perceptions of mathematics ability favored sons rather

than the daughters; similar finding were also reported by Andrews (1989). Researchers found that parents could engage in their children's education in various ways (Eccles and Harold, 1993; Edwards and Young 1992). Ho and Willms (1996) used eighth-grade student data from the NELS to investigate the effects of parental influence on eighth-grade achievement. By controlling for the family structure variables, the authors concluded that "it was involvement at home; particularity in discussing school activities and helping students plan their programme, that had the strongest relationship to academic achievement".

In Ho's and Willms'(1996) study of the effects of parental influence on eighth grade achievement, it was found that parents' participation in school events had a moderate relationship with students' reading achievement but a negligible relationship with science achievement. Ma's study (1999) indicated that this type of parental influence, especially volunteer work for school, had sustaining and important effects on student achievement through early grades(eight to ten) of high school. Ascher (1988) stated, "the more parents participate in a sustained way at every level in advocacy, decision making and oversight roles, as fund raisers and boosters, as volunteers and paraprofessionals, and as home tutors the better for student achievement". A number of researchers also emphasized the positive effects of parental supervision at home on a range of educational outcomes (Astone and McLanahan, 1991; Fehrmann, Keith and Reimers, 1987). Home supervision includes such things as parents' structuring children's time for homework, modeling children's learning, encouraging children to read at home, and limiting the time children watch television (Christenson et al., 1992). Edwards and Young (1992) summarized various studies on parental involvement and concluded that students achieved higher when parents monitored children's homework.

Epstein(1995) and Gianzero(2001) reported that family practices of involvement are as or more important than family background variables in determining whether and how students' progress and succeed in school. Henderson and Beria (1997) and Gianzero (2001) asserted that when schools work together with families to support learning, children tend to succeed not just in school, but throughout life. Research shows that parental involvement in their children's learning positively affects the child's academic performance (Fan and Chen, 2001). Olatoye and Ogunkola (2008) reported there is no significant difference between how parents are involved in their sons' and daughters' academic progress. There is also a strong positive relationship between parental involvement and academic achievement.

Experts in the field agree about the importance of linkages between families and schools, however, researchers in developed countries should now begin to emphasize the need for more rigorous study to help educators predict the precise outcomes of implementing particular strategies for involving families in children's education. In developing countries, studies on parental involvement are few; many research reports on this area continue to come from developed countries(Jeynes, 2005) argued that there are still questions that the individual studies on parental involvement cannot answer because of narrow focus that they had addressed. This study therefore attempted to examine the probable influence of parental involvement on students' achievement especially in mathematics and science in the secondary schools in Batticaloa educational zone, Sri Lanka.

### **Research Hypothesis**

Thus, the study was guided by the following research hypotheses;

1.  $H_0$ : Parental involvement will not significantly influence students' achievement in mathematics.
2.  $H_0$ : Parental involvement will not significantly influence students' achievement in science.
3.  $H_0$ : There is no significant difference in the parental involvement of students in urban and semi-urban school.
4.  $H_0$ : There is no significant difference in the parental involvement of students of male and female students.
5.  $H_0$ : There is no significant difference in the academic achievement of male and female students in mathematics.
6.  $H_0$ : There is no significant difference in the academic achievement of male and female students in science.
7.  $H_0$ : There is no significant difference in urban and semi-urban school students' achievement in mathematics.
8.  $H_0$ : There is no significant difference in urban and semi-urban school students' achievement in science.

## METHODOLOGY

The descriptive survey research design was employed to carry out this study. Since the aim of the investigators was to record, analyze and interpret the existing conditions between the non-manipulated variables, hence the choice of the research design. This design also accommodates generalization of the findings of the study upon the whole population from which only a representative portion was actually studied.

The target population for the study comprised all the students in junior secondary students in grade 9 in Batticaloa educational zone. This zone is one of the 14 zones in eastern province in Sri Lanka. It has cultural and educational similarities with the other zone in the eastern province of Sri Lanka. The school in Batticaloa zone was stratified into urban and semi-urban schools. A stratified random sample of 192 students from 16 type 2 schools (8 urban and 8 semi-urban schools were used) was selected for this study. A random sample procedure was used to select urban and semi-urban type 2 school from the list of schools in the Batticaloa zone. Equal number of urban and semi-urban schools was chosen. From each of these selected schools, 12 students were randomly selected to make a total of 192 respondents that constituted the sample for this study. The average age of the students is 14.2. (Early adolescent). The schools situated in area served by urban and town councils were considered urban school while those situated in area served by Piradesasaba were considered semi-urban school.

Two instruments were used to collect data for this study,

- i. Self-designed questionnaire named Parental Involvement Questionnaire (PIQ) – It was made up of two sections, with section A comprising of 08 items designed to find out some personal information such as sex and school type while section B comprised of 12 items based on the issues raised in the background to the study. The respondents are to choose either Yes or No on each items. This was considered appropriate because of the age, level of education and maturity of the respondents, being junior secondary school students. The investigator and his assistant helped the respondents in interpreting the items and ticking their chosen responses.
- ii. Achievement Performance Test (APT) - The investigator take junior secondary level for find out the achievement of mathematics and science subject. In this study focus on achievement

of mathematics and science subject in secondary school students. The achievement of students was assessed on the subject by they obtained at the mid-year examination marks held in July 2012.

The content validity of the questionnaire and performance tests was ensured through experts' suggestions and guidance. Experts in questionnaire construction and mathematics and science teachers assisted in critiquing the items on the instruments. Correction was made on the items of the instruments based on suggestions of experts. The test-retest reliability yielded 0.78 and 0.71 coefficient of correlation (R) for PIQ and APT respectively.

### Data Analysis, Results and Discussion

The data collected with the above described instruments were analyzed using Regression, t-test and Pearson Product Moment Correlation statistics. All null hypotheses were tested at 0.05 level of confidence using a two-tailed test.

**1. Research Hypothesis  $H_0$  – Parental involvement will not significantly influence students' achievement in mathematics:** Table 1 shows that parental involvement accounts for 26.1% of the total variance in mathematics achievement of secondary school students ( $R^2 = 0.261$ ;  $p < 0.05$ ). This percentage is significant at 0.05 level of confidence. It shows that parental involvement is an important predictor of mathematics achievement. However, the results also reveal the fact that there are other factors contributing to students' mathematics achievement other than parental involvement which may account for the remaining variance in science achievement.

**TABLE 1: INFLUENCE ON PARENTAL INVOLVEMENT ON MATHEMATICS ACHIEVEMENT OF SECONDARY SCHOOL STUDENTS.**

R= 0.511 ; $R^2 = 0.261$						
	Sum of squares	Df	Mean square	F	Significant	Remarks
Regression	198.125	1	198.127			Significant ( $p < 0.05$ )
Residual	4126.329	190	12.457	24.456	0.000	
Total	4896.126	191				

**2. Research Hypothesis  $H_0$  – Parental involvement will not significantly influence students' achievement in science:** Table 2 shows parental involvement account for 19.4 % of the total variance in students' achievement in science ( $R^2 = 0.194$ ;  $p < 0.05$ ). This percentage is statistically significant. Although it is obvious from these results that there exist other factors that determine achievement in science apart from parental involvement. Nevertheless, parental involvement is an important predictor of achievement in science, according to the findings of this study. Thus, to enhance achievement in science, greater parental involvement in their children's' academic activities should be encouraged.

**TABLE 2: INFLUENCE OF PARENTAL INVOLVEMENT ON SCIENCE ACHIEVEMENT OF SECONDARY SCHOOL STUDENTS**

R =0.441 ; $R^2 = 0.194$						
	Sum of square	Df	Mean square	F	Significant	Remarks
Regression	186.415	1	186.415			Significant ( $p < 0.05$ )
Residual	2428.314	190	9.458	22.159	0.000	
Total	2841.984	191				

**3. Research Hypothesis  $H_0$  – There is no significant difference in the parental involvement of students in urban and semi-urban schools :** The results presented in Table 3 shows that there exist a significant difference in the parental involvement of urban and semi-urban secondary school students (  $t = - 8.12$  ;  $p < 0.05$  ). This suggests that urban school students enjoy more parental involvement than their counterparts in the semi-urban schools. Therefore, the null hypothesis that there is no significant difference in the parental involvement of urban and semi-urban school students is rejected.

**TABLE 3: COMPARISON OF URBAN AND SEMI-URBAN SCHOOL STUDENTS' PARENTAL INVOLVEMENT**

School Type	N	Mean	Standard deviation	Df	t	significant	Remarks
Urban	96	7.458	2.384	190	- 8.12	0.000	Significant ( $p < 0.05$ )
Semi-urban	96	8.346	3.436				

**4. Research Hypothesis  $H_0$  – There is no significant difference in the parental involvement of male and female students:** There is a significant difference in the parental involvement of male and female students (  $t = - 7.34$  ;  $p < 0.05$  ). Male students seemed to be enjoying greater parental involvement in their academic activities than their female counterparts. The null hypothesis is therefore rejected in Table 4.

**TABLE 4 : COMPARISON OF MALE AND FEMALE STUDENTS' PARENTAL INVOLVEMENT**

Gender	N	Mean	Standard deviation	Df	t	significant	Remarks
Male	96	8.345	3.456	190	- 7.34	0.000	Significant ( $p < 0.05$ )
Female	96	9.489	2.945				

**5. Research Hypothesis  $H_0$  – There is no significant difference in the academic achievement of male and female secondary school students in mathematics:** The results in the Table 5 indicate that there is no significant difference in the achievement of male and female secondary school students in mathematics (  $t = - 0.432$  ;  $p < 0.05$  ). The hypothesis is therefore not rejected.

**TABLE 5 : COMPARISON OF MALE AND FEMALE STUDENTS' ACHIEVEMENT IN MATHEMATICS**

Gender	N	Mean	Standard deviation	Df	t	significant	Remarks
Male	96	6.321	3.145	190	-0.432	0.651	Not Significant ( $p < 0.05$ )
Female	96	7.452	4.239				

**6. Research Hypothesis  $H_0$  - There is no significant difference in the academic achievement of male and female students in science :** From the results presented in Table 6, it can be deducted that there is no significant difference in the academic achievement of male and female secondary school students in science (  $t = 0.512$  ;  $p < 0.05$  ). The hypothesis is therefore not rejected.

**TABLE 6 : COMPARISON OF MALE AND FEMALE STUDENTS' ACHIEVEMENT IN SCIENCE**

Gender	N	Mean	Standard deviation	Df	t	significant	Remarks
Male	96	6.321	3.241	190	-0.512	0.514	Not Significant ( p < 0.05)
Female	96	7.459	4.012				

**7. Research Hypothesis  $H_0$  - There is no significant difference in the performance of students in urban and semi-urban secondary schools in mathematics :** From the results of the hypothesis 7 presented in Table 7, it was revealed that there exist a significant difference in the mathematics achievement of urban and semi-urban secondary school students (  $t = -9.142$  ;  $p < 0.05$  ). Urban school students performed better than their semi-urban school counterpart in mathematics. The hypothesis that there is no difference in the achievement of urban and semi-urban school students in mathematics is therefore rejected.

**TABLE 7 : COMPARISON OF URBAN AND SEMI-URBAN STUDENTS' ACHIEVEMENT IN MATHEMATICS**

Gender	N	Mean	Standard deviation	Df	t	significant	Remarks
Urban	96	6.412	3.214	190	-9.142	0.000	Significant ( p < 0.05)
Semi-urban	96	9.314	5.172				

**8. Research Hypothesis  $H_0$  - There is no significant difference in the performance of students in urban and semi-urban secondary schools in science :** The results of the test made in hypothesis 8 as presented in Table 8 shows that there is a significant difference in the performance of urban and semi-urban school students in science (  $t = -8.314$  ;  $p < 0.05$  ). Urban school student performed better than their semi-urban school counterpart in science. The hypothesis that there is no significant difference is therefore rejected.

**TABLE 8 : COMPARISON OF URBAN AND SEMI-URBAN STUDENTS' ACHIEVEMENT IN SCIENCE**

Gender	N	Mean	Standard deviation	Df	t	significant	Remarks
Urban	96	4.841	2.912	190	-8.314	0.000	Significant ( p < 0.05)
Semi-urban	96	6.319	3.148				

Cotton and Wiklund (1989) asked the question; “Does parent involvement have positive effects on students’ achievement?” In answer to that question they found that all the research documents they selected to reflect on the effects of parental involvement on students’ academic achievement and other student outcomes overwhelmingly demonstrate that parents’ involvement in children’s learning is positively related to achievement in all subjects and for all types and ages of students. The findings in this study agree with Cotton and Wiklund that parental involvement significantly influences mathematics achievement of secondary school students. The shows that if parents can be involved more with their wards’ academic activities especially in mathematics

and science, the ordeal of mass failure in mathematics will become a thing of the past as the interest of the students may be awakened in the subject through motivation and encouragement by their own parents.

It was also discovered in this study that parental involvement is an important predictor of students' achievement in science. This coincides with the finding of Olatoye and Ogunkola (2008) that parental involvements have significant influence on science achievement which invariably indicates that parental involvement is an important predictor of science achievement. Also, according to Olatoye and Ogunkola, this finding corroborated many research studies such as Hixon (2006) and Epstein (1995) who also found that parental involvement could help improve student achievement in school. Cotton and Wikelund (1989) found that the more active forms of parent involvement produce greater achievement benefits than the mere passive ones, that is, if parents receive phone call, read and sign written communications from the school and perhaps attend and listen during parent-teacher meeting, greater achievement benefits accrue than would be the case with no parent involvement at all. They continued that considerably greater achievement benefits are noted when parent involvement is active. When parents work with their children at home, attend and activity support school activities or even help out in classroom or field trips and so on.

Parental involvement when correlated with students' in mathematics and science yield positive and significant correlation revealing how important parental involvement is to achievement of students in these core school subjects. It was discovered in this study that parental involvement in urban and semi-urban schools varies and parents of students in semi-urban schools are more involved in their ward's schooling than parents of students in urban schools. This is probably due to variations in the facilities committed to children's learning since semi-urban schools are difficult while urban school is about good facilities compared with the semi-urban schools. The variations may also be explained by the likely differences in parent educational qualifications or socio-economic status. The difference may also be in the level or types of parental involvement, whichever the case; urban school students' parents should be more alive to their responsibilities.

Parental involvements of male and female students were compared and it was discovered that male students enjoy more of parental involvement than the female students. Conway (2008) on the other hand concluded that parents are more involved with their daughter than sons. This finding contradicted that of Olatoye and Ogunkola (2008) who found that parental involvement for male and female students does not differ in anyway, but in agreement with that of Paulson (1994) who reported that parental involvement predicted academic achievement for boys not for girls.

However, gender was found to have no impact at all on mathematics achievement as both male and female students performed well alike in mathematics and science. Olatoye and Ogunkola (2008) also found no significant in male and female students achievement in science. This opposes the findings of Gorman (2006) that there is a significant difference in favor of male students. This suggests that if care is taken to make the home environment conducive for learning, both male and female students will overcome the scholastic malfunction of this present age. It was discovered that urban school students were lagging behind in their performance in mathematics and science when they were compared with those in semi-urban schools. This finding is supported by Olatoye (2002) and Ogbonna (2007).

## CONCLUSION AND RECOMMENDATION

Overtime, educators have frequently pointed out the critical role of the home and family environment in determining school success and that earlier in a child's educational process parental involvement begins, the more powerful the effects will be. Parents and other sibling in the family should seize and harness the influence of involvement to set their wards in motion in order to facilitate better and higher achievement in their school subjects. No one is more than parents in sending signals to their ward on the importance of reading and education through their own examples, assistance and involvement. Parents should not just send their wards to school as a way of getting them free from their aprons for the period while they are away, rather they should see going to school as a way of building the lives of the children and their future too.

Parents should therefore devise means by which they would be involved in the academic activities of their children. There are different types and levels of parental involvement, individual parents and families should start from somewhere and get involved. End should come to era where all a parent does is to supply the needs to keep their children in school, parents should visit schools, involve themselves with school (as much as they can afford) then identity with their young lads as early as possible in their studies.

The schools should also organize orientation and training programmes for parents as such could open their eyes and minds as to how they can be involved, some may possibly be ignorant of just how to help or be involved with their children's studies. An array of programmes should be offered by the schools so that parents no matter their degree of willingness, available time, ability and social economic status will be able to participate in academic activities of their children.

Teachers can specifically pinpoints areas of needs, weakness or strength of students to the parents so that they can work on it as a way of getting them acquainted to how to help the child. This suggests that parents and teachers are to work in collaboration in order to bring the best out of every student, as much as possible.

Parents, teachers and the school at large should overcome the age-long gender bias and come to grip with the truth that if all mediating variables are taken care of, boys and girls will both perform well alike and so should start to encourage both male and female students to be at their best that gender is not a barrier in mathematics and science achievement.

### ABSTRACT

*Comprehensive study of Alisher Navoi's works is one of the most important tasks facing today's literary critics and linguists. This article discusses the linguo-poetic features of the antonyms used in the work "Lisonut-tayr" by the poet AlisherNavoi, the sultan of the word property. The power of the thinker, the importance of the word for man, his views on the types of words is illustrated by examples from his work. Many aspects of Navoi's work have been studied by our researchers. The goal of every researcher is to reveal to readers the essence of Navoi's works and to bring them to the level of immortal masterpieces. In particular, this article promotes the same idea.*

**KEYWORDS:** *Literary Text, Antonyms, Nouns, Adjectives, Adverbs, Verbs, Analysis, Contradictions, Antonyms.*

### INTRODUCTION

The fourth section of the Decree of the President of the Republic of Uzbekistan ShavkatMiromonovichMirziyoyev "On the Strategy of Actions for the Further Development of the Republic of Uzbekistan" is devoted to the development of the social sphere and the state youth policy, and special attention and emphasis are placed on improvement. Therefore, in today's process of globalization, the study of the works of our classical poets is very effective in strengthening ideological immunity and educating the younger generation to be perfect human

beings. This is clearly seen in the rubai of our classic poets AlisherNavoi and Zahiriddin Muhammad Babur.<sup>1</sup>

Undoubtedly, the ability of a literary work to rise to the level of an eternal work depends on its linguistic structure and the age of the author's artistic expression. Therefore, in order to evaluate the essence of any literary work objectively, first of all, it is necessary to analyze the specificity of its linguistic structure. Just as it is necessary and important to study AlisherNavoi from the point of view of creative literature, so it is necessary and important to study his language, his great contribution to the creation of the Uzbek literary language and his linguistic activity from the point of view of linguistics.

## MAIN PART

The language of fiction opens up new horizons in the field of literary expression in the process of development of the national literary language on the basis of a creative approach, study and mastery of the national language, and the history of the national literary language. The language of the work of art also reflects the subtleties of speech, ways of expression, artistic, stylistic, expressive, emotionally expressive ways of expressing words.<sup>2</sup> In the process of linguistic analysis of a literary text, it is necessary to identify lexical units in which the semantic-expressive expressions of emotional-expressive expression, reflecting the writer's skill in language use, and to consider to what extent they served the writer's artistic and aesthetic purpose. For this purpose, semantic, figurative, contradictory, ambiguous, historical and archaic words, new constructions, dialectal words, foreign and vulgar words in the language of the work of art are distinguished and what is added to the work, and explained that it was brought in on purpose.

From the second half of the twentieth century, the interest in the phenomenon of antonyms increased, and special research on this topic began to emerge. Over time, the phenomenon of antonyms was initially interpreted on the basis of different opinions in some articles, textbooks and scientific works. In particular,

S. Mutallibov's article "Antonyms" is one of the first works on the study of antonyms in the Uzbek language.<sup>3</sup>

Contradiction is one of the main criteria of existence. The role of the category of contradiction in the understanding of the universe is incomparable. For example, in Ethics, B. Spinoza makes effective use of contrast in revealing the nature of emotions and explains their expression by contrasting words. The philosopher argues that he approaches events on the basis of contrast: "Definition means opposition".<sup>4</sup>

Another important aspect in defining the category of contradiction is its psycholinguistic aspect. Psychologists argue that the formation of any concept, distinguishing the features of different objects and phenomena and comparing them with each other, the identification of commonalities takes place on the basis of perceptions in our thinking.

Antonyms (derived from the Greek anti- and onomanom) are words with opposite meanings, one denying the other, but this denial is associated with a new concept. This notion, on the other hand, reflects the natural negatives and positives of events, the existence of parties, and their relative interrelationships. For example: there is a small for a large being, there is a narrow for a

large being, there is a day for a night, there is a bad for a good being, so the antonym is two opposite poles.

The methodological features of antonyms are as follows:

- a) Summarizes (in pairs) things, it is absolutely impossible to convey the content-concept expressed by this pair in another word, phrase, sentence. Large and small gathered at the meeting. It is through this generalization that thought is expressed in a powerful, influential, and figurative way;
- b) Using an antonymic pair, the meaning of one is reinforced, emphasized, influenced by the listener. Strengthening is often relative to the next: your heart is soft, your will is strong;
- c) Serves as a descriptive representation of real reality.
- g) Exaggerates the meaning, indicates that the situation is at the last limit-opportunity level. It is necessary to use antonyms thoughtfully and appropriately in speech, otherwise there will be mental confusion<sup>5</sup>.

The presence of contradictory words in the language is one of the most convenient ways to ensure the expressiveness of artistic speech, and one is "tazod". This art is also called "mutabaqa, tibak, applied, muttazad, ittizad, takofu". In this art, according to art critics, the opposite is used".<sup>6</sup>

Abu Abdullah al-Khwarizmi, in his book Mafatih al-Ulum, which deals with the study of the terminology of the science of art, explains the term "mutabaqa" as follows: "The word "mutabaqa" is derived from the verb "tabaqa", which means followed in the footsteps of his forelegs.

In the European philological tradition, this art is called "antithesis". In the works on the language of the work of art, the terms of opposition are used. Concepts, signs, situations, images are contradicted by the use of opposite words side by side. There is usually a difference between linguistic and contextual or spoken words.<sup>7</sup>

The antonyms of cognate words are formed mainly by means of adverbs that form opposite words: watery-waterless, informed-ignorant. In the play we can also find such antonyms:

Chun *hunar***varuz**rachiqdib*ehunar*,

Tozdinqoldiquyiroqtojvar.

Chun went out on a limb,

The lower crown remained dusty. (30-b)

Antonyms, which consist of different root words, are in the original form:

O'tkaribmenurni**vayronada**,

Boshimayemrulgudek**koshonada**.

I've ruined my life,

My head hurts. (75-p)

Antonyms are often used in speech to denote a feature, quantity, place, and are less common in lexical units that express a specific concept. This indicates that antonyms appear mainly on the basis of character; attribute (quality and form). From the point of view of antonyms, we can divide them into groups according to their occurrence in the following categories:

1. Noun antonyms:

a) Time nouns:

He made the sky dark. (7 p.)

He also fixed the evening with a difficult dress. (8-p)

b) Place names:

Every strange thing, spread across the desert,

Then cross the river. (8-p)

There is a danger of death in Furqat,

Eight flights and seven hells will sink. (36 p.)

The word fly means heaven, where the number eight is part of heaven and the number seven is part of hell.

c) activity-process names:

Better a poor horse than no horse at all.

Surdin mourns a hundred times better. (187-p)

In the above verse, antonymic pairs such as “aysh”-sin, “sur”-mourning are used, in which the lexeme of “sur” is the wedding lexeme, is contrasted with the lexeme of mourning.

O’rnig’aonirasulaylabimom,  
Oybo’lib**xurshidg**’aqoimmaqom.

Instead, the imam became the imam,

The position of the moon is as a hurricane. (P. 21)

d) Personal nouns: In this work, which is one of Navoi's rare works, the number of personal names is significant, especially the number of personal names with opposite meanings. In the play, the words "king" and "gado" are used interchangeably. In addition, the names of historical figures are mentioned, contrasted with each other, and word art is created.

Bermadimhargiz**gadolg**’abirdiram,  
To o’zimniko’rmadim**sohibkaram**.

I never paid a penny,

I didn't see myself as an entrepreneur. (13-p)

In the following verse, the words king and lover are conditionally contrasted, that is, they are textual antonyms.

**Shohg**’akomiltavajjuhdu ravish,  
Bo’yla**oshiqqaqachonbo**’lg’ayulish.

With full respect for the king,

That's the decent thing to do, and it should end there. (58-p)

In the following legacies, the words believer and disbeliever are contrasted from a religious point of view.

Mehnatiding'oyibuhozirg'arahm,  
Shiddatidin**mo'minukofirg'**arahm.

Mercy for the lost and the present,

Have mercy on the believer and the disbeliever. (102-p)

Through these verses, the poet was able to illustrate the phenomenon of stratification of people or confrontation based on their position.

Garchiitlarga**mulozimbo'**lmisham,  
Lekulxayluzrah**hokimbo'**lmisham

Although I've been a dog handler,

But I am the ruler of that dream. (202-p.)

*e) Abstract nouns:*

Ko'zgaavvalko'rguzub**mehrimunir**,  
Yoshurub, **g'amshomig'**aqildingasir.

Show kindness first,

You hid and grieved in captivity. (97-p)

Doimog'**ambirlaeltibmenbasar**,  
**Shodlig'**idinmendayo'qemishasar.

I'm always sad,

I'm glad I didn't have to. (164-p)

The words "yusrvausr" in the following byte are historical words and mean ease.

Solg'oningdinbo'yunungg'atasbehi**yusr**,  
Tilgaoningvasfidayuzlandi**usr**.

The rosary on your neck,

Face with her to be eased.(45-p)

Because Navoi'sLisonut-tayr was written in a mystical spirit, and because it was based on conversations between birds, the birds there were placed in opposition to each other.

With desire they have composed a novel for,

Crow's foreign trade is endless. (254-b)

Animals and plants are also contrasted in the text.

All poetry at birth,

The fly will stop hunting elephants. (212-p)

In the above verse, the poem with the ant, as well as the elephant and the fly are in conflict with each other in terms of form and power and opposed to each other.

In addition, plants and flowers are used as antonyms in the play.

## 2. Quality antonyms:

### a) Dimensional quality:

Who is here in the progressive recession. (207-b)

In the above verse, it means a part, a piece, a gray-large.

### b) color quality:

He also fixed the evening with a difficult dress. (8-b)

The word camphor is white and musk is black. Black and white antonyms are used.

### c) Feature quality:

His faithful companion,

For better or for worse for him. (P. 20)

The word good or bad is the same for everyone.

## 3. Verb antonyms:

### a) Action verb:

I thought, I complained - know how I am,

Kill or have mercy, if you know. (P. 105)

The name of the action is contradicted in the following bytes.

Every species of bird in the world,

How many days will it take to fly or land? (P. 37)

### b) Case verb:

Keep my situation a secret or reveal it,

Say the word or you will not be able to stand alone. (P. 230)

## 4. Adverbial antonyms:

### a) Time format:

If you die a thousand years ago,

Whoever does not suffer death in the end (p. 161)

### c) In the form of quantity and (late) time:

If it's too late, it's too late.

Not at all. (P. 167)

### d) Location:

The sheikh looked at this time,

In the future, every new group.

Many roads go up and down,

Except for self-identification. (P. 240)

## CONCLUSION

Navoi is an incomparable master of words who can effectively use the word tool. It is not difficult to learn this from the above verses. Each of the contradictory words in the work is used

appropriately, and serves to reveal the essence of the work. He was able to express to the reader what is good and what is bad, that the world is made up of two poles, and that he does not value the good without seeing the bad by contrasting the two words.

## THE DEVELOPMENT OF STUDENTS' MEMORY SKILLS WHEN LEARNING A FOREIGN LANGUAGE

**Ikromov Oybek Ibragimovich\***

\*Lecturer,

Department of Pedagogy and Psychology,  
Navoi State Pedagogical Institute  
Faculty of Art History, UZBEKISTAN

### ABSTRACT

*Memory is one of the essential parts of human mind. The good memory is particularly indispensable for the foreign languages learning, as it is one of the conditions for the new communication skills obtaining. Also the well-developed memory is a prerequisite for both high-quality translation and interpretation. In order to keep memory sharp it should be regularly trained. In this article we have considered the most widespread and efficient aural and visual memory enhancing techniques, since these types are the most involved into the translating, interpreting and foreign languages learning activities.*

**KEYWORDS:** *Memory Development, Translation, Operative Memory, Aural Memory, Visual Memory, Foreign Languages.*

### INTRODUCTION

Human memory is a necessary mechanism that can store huge volumes of all kinds of information and instantly find the necessary information. However, sometimes it fails, confusing or losing some data. We often complain about a bad memory or that it is full of insignificant trifles, but the really important one is erased. Nevertheless, even in ancient times, scientists found that memory needs constant training, and over the centuries of the development of science, many methods and methods have been developed to maintain its sharpness until the end of life.

The first attempts to study the nature of human memory and find a way to improve it are attributed to the ancient Greek thinkers Parmenides, Diogenes, Plato. Philosopher Aristotle in the 4th century BC e. introduced a system of scientific terminology to describe mental processes. He linked the work of memory with the movement of blood in the body. The development of the theory of psychoanalysis at the end of the 19th century, as well as the development of new

scientific ideas in the second half of the 20th century, had a significant impact on the modern understanding of the work of memory. G. Ebbinghaus in his works studied the processes of memorization and forgetting. O. Hayden determined the dependence of memory on the amount of RNA in the body. Surgeon W. Penfield researched direct stimulation of the brain and found that its various parts are responsible for different types of memory. He also suggested that a person's memory retains everything he has ever paid attention to.

According to modern scientific ideas, according to the storage time of information, memory is divided into instantaneous (sensory), short-term and long-term. Unlike long-term, short-term memory is not aimed at accumulating information, but at its direct processing and application. It holds information for a short period of time, on average up to 20 seconds [1]. The short-term subtype is the operative (working) memory required to carry out current actions. The processed data disappears from it as the final result is achieved. The main feature of this type of memory is the presence of operational units; their number, which a person is able to accurately reproduce a few seconds after a single perception, determines the amount of information held, as well as the quality of its storage. Researchers found that, on average, RAM stores 5-7 such units, but they can be increased to 8-9. They consist of separate semantic compounds, the size of which depends on the degree of development of a particular topic and training attention. The operational units of memory in learning to read are letters or syllables, but later they expand to letter combinations, words, phrases, sentences, and even complex syntactic constructions. Thus, the volume of operational units, along with their number, determines the amount of RAM in general.

When teaching students interpretation and translation, much attention is paid to the development of memory, since in this professional activity it is the main tool for finding language matches. In order to perform the task at a high level, the translator must constantly increase the volume of his working memory, expanding the boundaries of its individual operational units. No less important is a trained memory for people who study foreign languages, even if they are not related to translation activities.

There are a variety of techniques and methods for improving memory. We examined exercises to increase the volume of auditory and visual memory, since it is these types that are most involved in the development of language skills.

**Auditory memory.** This type is more involved than others in simultaneous and consecutive translation, it also plays an important role in oral communication and understanding of foreign speech.

The first exercise is recommended before bedtime. When you lay down, you need to listen to the surrounding sounds. They are present, even if it seems that you are in complete silence. Try to isolate individual noises from the general background, for example, a clockwise knock, your own heartbeat, or wind noise. This exercise will significantly improve your attention; increase your sensitivity to the right sounds [2]. For maximum effect, it should be repeated daily.

The second exercise is the reproduction of what you hear about yourself. Being in a quiet place completely relax and focus on any sounds heard by you earlier. Try to hear them in your mind, then change the volume, key, duration. Such an exercise must be done for five minutes daily. Make sure that you can perfectly clearly reproduce any sound internally and easily change its parameters.

The third exercise is performed using musical works. After choosing a well-known melody, listen to its beginning and press the pause. Now try to mentally continue the music. The exercise will be mastered when you can mentally turn on the work, interrupt it and continue again. Over time, you should increase the length of the listening passage. Remember to compare our composite on with the original.

Reading out loud. Reading aloud is certainly one of the most effective exercises for developing auditory memory when learning a foreign language. It is this that helps to increase the working vocabulary, improve diction, intonation and brightness of speech. Reading aloud is necessary in a hurry, expressing words clearly and clearly. Such 10-15-minute daily activities will significantly develop both auditory memory and eloquence.

Eavesdropping. Walking along the street or in a public place, try to hear and keep in mind a passage of conversation of strangers. Then reproduce to yourself what you heard with the right intonation, and also mentally imagine the faces of the speakers. Such an exercise will allow you to learn how to easily perceive the text by ear, and also develop attention and sensitivity to the tone of speech.

Visual memory. When learning a foreign language, equally important is the ability to quickly remember unfamiliar words, most of which we perceive visually, reading literature or making notes. Such abilities can also be developed with the help of special exercises.

A toy. Pick up a small toy or any other small item. Stroke, smell, feel with your fingers all the small details of the thing, squeeze it in your hands, feel its weight and elasticity of the material from which it is made, look at it. Then put it aside, close your eyes and imagine all the little things that you are familiar with. Feel the object in your hands, remember its smell. Open your eyes and check yourself. This exercise will benefit your tactile memory, and also allow you to develop a coherence of feelings-perceptions, which are the basis for photographic memory.

Aivazovsky method. For 5 minutes, carefully look at the subject, part of the landscape or at the person. Close your eyes and mentally restore the color image of the subject as clearly as possible. According to your desire, images can be recreated not only in the head, but also drawn on paper, this will increase the effectiveness of the training. The regular implementation of this exercise will facilitate the mastery of foreign spelling and vocabulary [3].

The game of matches. Throw 5 matches on the table, and within a few seconds, remember their location. After that, turn away and try using the other 5 matches to recreate the picture on another surface. If you couldn't remember everything, then look at the matches again and reflect the image more precisely. As soon as you feel that it's easy for you to do this exercise, observation time. This technique also effectively develops photographic memory.

Lifestyle. In addition to exercises, the lifestyle of a person is extremely influenced by a person's memory. The negative effects of bad habits (alcohol, smoking, chronic lack of sleep) on brain activity and memory were identified in a study conducted at the Kazakh National Medical University. According to a study by researchers at Harvard Medical School and the Brigham Women's Hospital in Boston, eating a lot of foods rich in saturated fats (red meat and butter (palm and coconut oil, dairy products) and trans-fats (confectionery, chips, popcorn, convenience foods, meatballs, fish fingers) also leads to memory impairment.

1. The development of memory is a priority when mastering any foreign language and developing the skills of interpretation and translation.
2. In simultaneous and sequential translation, in addition to auditory, operative memory is involved, the size of which is determined by the volume and number of operational memory units.
3. Using exercises for auditory and visual memory, it is possible to increase the amount of RAM, as well as significantly improve attention.

## THE PHILOSOPHY OF INDEPENDENCE IS THE IDEOLOGICAL BASIS FOR RAISING THE COUNTRY'S NATIONAL DEVELOPMENT TO A HIGHER LEVEL

**Karimova Ra'noMalikovna\***

\*Senior Lecturer,  
Department of National Ideology,  
Fundamentals of Spirituality and Jurisprudence,  
History Department, Navoi State Pedagogical Institute,  
UZBKISTAN

### ABSTRACT

*The content of the national idea is significantly influenced by the views of the greatest representatives of the social thought of the East and West, which have not lost their value. The true meaning of the expression "Knowledge is power" lies precisely in this. Along with the aforementioned, such qualities as faith and conviction, honesty and conscientiousness, mercy and generosity, honesty and favor, shame and shyness are inherent in our people. Its formation, in particular, is influenced by theories about the origin of the world and man, about the development of society, the ideas of goodness, justice, nobility, moral and physical perfection of the individual. Of course, this feeling acquires positive significance only if a certain measure is observed. If it passes the measure, then it pushes the people to swagger, aggressiveness; and if it does not reach a measure, it leads to national pessimism.*

**KEYWORDS:** *Aforementioned, Representatives, Conscientiousness,*

### INTRODUCTION

One of the foundations that determines the content and meaning of the ideology of national independence is the ancient and rich history of our region. History is a great teacher. She gives people not only role models, but sometimes she also presents bitter lessons. Created in the native land many centuries ago, still ancient admirable monuments of culture and art, testify to the high skill of our people, the glorious history of our country, awaken a sense of pride in the soul of every citizen.

Sources that nourish the national idea are such pearls of spiritual heritage as Alpomysh, Shashmak, as well as the life and works of great ancestors - Spitamen, Jaloliddin Manguberda, Amir Temur and others. The philosophical foundation of our national idea is, first of all, the best examples of national spiritual heritage, scientific, religious and secular views of great ancestors and pearls of world philosophy. Its formation, in particular, is influenced by theories about the origin of the world and man, about the development of society, the ideas of goodness, justice, nobility, moral and physical perfection of the individual. These are the freedom-loving ideas of great thinkers, the world discoveries of Al-Khwarizmi, Al-Beeruni, Ulugbek and others, the concept of a just society of Al-Farabi, the philosophical views of Ibn Sino, Alisher Navoi's views on the problem of human perfection, as well as the activities of the enlightenment democrats of the late 19th – early XX centuries.

The content of the national idea is significantly influenced by the views of the greatest representatives of the social thought of the East and West, which have not lost their value. The philosophical wisdom of Confucius, Plato's doctrine of the world of ideas, Hegel's dialectic, humanistic philosophical traditions and currents of modern philosophy are all universal human foundations of the national idea. Thus, the national idea of Uzbekistan is based essentially on the whole philosophical experience of human civilization - antiquity, antiquity, the Middle Ages, modern times and modern times.

In the world there are a lot of nations, peoples and states. Each of them has its own specific interests, goals and aspirations, dreams and hopes. There are also ideas expressing these hopes, dreams and goals, mobilizing people for their realization. Today, an idea is being formed in Uzbekistan, embodying the fundamental interests, dreams and aspirations, noble goals of representatives of all nations and nationalities living in the country.

The national idea of Uzbekistan is, in its essence, a system of ideas expressing the main goals of our people, linking its past and future, serving the achievement of its centuries-old aspirations and aspirations. Protecting and strengthening the independence that people have dreamed of for centuries is the sacred duty of every citizen. For this, we all must actively act, closely uniting, feeling the interests of the motherland. This is due to the awareness of the idea that embodies the interests of our people, the understanding that the well-being of the people is the prosperity of the motherland. Only that country will live in material and spiritual prosperity, in which rich citizens. The national idea of Uzbekistan is a spiritual criterion that determines the activity of each person in society, the degree of awareness and fulfillment of his duty and responsibility to the country, nation, himself and his family. The national idea of Uzbekistan should:

- be based on the Constitution of the Republic of Uzbekistan, national and universal values, principles of democracy;
- absorb for centuries the high spirituality of the people, its traditions and customs, the immortal heritage of our great ancestors;
- Express the ideas of goodness, justice, freedom and independence, beliefs and faith of the people;
- serve the prosperity of the motherland, ensure peace in the Fatherland, increase the welfare of people

- mobilize all members of society, all sectors of the population to achieve the great future of Uzbekistan;
- To educate in every citizen, regardless of nationality, language and religion, a sense of pride and dignity, love of the motherland, mutual respect, devotion to the ideas of independence and democracy;
- To form public consciousness through enlightenment, relying on pluralism of opinions and freedom of conscience. If an idea is a mobilizing thought, then ideology is a system that combines such ideas into a single force. Its content and meaning are covered in detail in the Basic Law, where it is determined that social life develops on the basis of a variety of political institutions, ideologies and opinions. No ideology should rise to the level of state ideology.

The national idea of Uzbekistan serves the socio-political progress of Uzbekistan, expresses the interests of the whole people, all political parties, groups and movements.

Ideology is a force that stimulates national identity. The main reference point of the national idea of Uzbekistan lies precisely in this. In other words, as long as the nation does not recognize itself as a single "organism", it cannot take care of its honor, its dignity, authority, and cannot feel its national pride. Awareness of their identity is a force that encourages people, leading them to social cohesion. It is based on a sense of shared ownership, expressed by the concept of "this is ours."

Of course, this feeling acquires positive significance only if a certain measure is observed. If it passes the measure, then it pushes the people to swagger, aggressiveness; and if it does not reach a measure, it leads to national pessimism. The awakening of a sense of self-awareness in the East and the West, in the life of the peoples of Asia and Europe, led them to flourish, to unite, and was the impetus for a healthy "competition" with other peoples. And we have the feeling "Uzbekistan is a united Motherland" is being formed at a high level. From time immemorial, representatives of various civilizations have lived side by side on the land of Uzbekistan, diverse beliefs and worldviews have mutually enriched.

The national idea of Uzbekistan has the following basic principles:

- Assistance in maintaining and strengthening the independence of the country, ensuring territorial integrity, inviolability of its borders;
- ensuring peace in the Fatherland, protecting the state from military, economic, environmental, information and other threats;
- Approval of the country's civil and interethnic harmony, an atmosphere of social stability;
- The achievement of well-being in every family and all people;
- Implementation in society of the idea of justice, the principles of democracy and self-government. Uzbekistan is a long-lived and sacred home where our ancestors lived. He is one of the ancient centers of human thinking, science and culture. The roots of a great civilization appeared on this earth, significant values and traditions were formed. G

Heraclitus, the philosopher of the ancient world, called this land "the cradle of philosophical thinking." For centuries, civilization in our country contained a specific style of thinking, a way of life. Tolerance, humanism, modesty, the coexistence of various ideas and diverse points of

view and the complementarity of ideological trends - all these were the features of this civilization. For this reason, in our country, as a rule, there could exist side by side, different nations and religious beliefs, and representatives of Zoroastrianism and Buddhism, Judaism, Christianity and Islam lived in peace and mutual consent. In our country, representatives of various religions could hold discussions among themselves, being in the same house of worship; however, they did not insult each other's human dignity.

In such discussions, representatives of different religions learned from each other good manners, applied positive customs to religious rites and rituals. Humane religious and secular traditions and rites were introduced into the actions and soul of our people.

In the philosophical views of the great thinkers of our region, universal ideas were priority. And in our daily lives, we must be guided by these views. They serve as the spiritual foundation of peace, harmony, stability and progress in our country.

The national idea of Uzbekistan is characterized by the following national characteristics:

- The priority in the minds of the people of the principle of "living in friendship and good neighborliness, peace and harmony, close cooperation";
- giving a sacred meaning to the concepts of "family", "mahalla", "Homeland";
- Respectful attitude to parents, others and respect for elders, care for the younger generation;
- Love for the native language as a life-giving source of spirituality of the nation;
- Veneration of women - the personification of motherhood, love, beauty and tenderness, a symbol of eternity of life;
- Patience, mercy and hard work;
- Honesty.

Thanks to the above characteristics, the ideology of national independence enables a person to realize who he is, what he is capable of, what achievements he has and what disadvantages, which way he should go. This contributes to the fact that the national idea serves to unlock the potential of man and to realize the fidelity of the path chosen by our people; will be a spiritual bridge connecting the past with the future; contributes to the fact that each of us has the right to own the spiritual wealth created by our people in the past through the deep-rooted oriental way of thinking, which helps to understand the essence of today's events.

National ideology is the ideological pillar of creating a great future, of course, based on rich historical experience. The national idea of Uzbekistan, being a social phenomenon, a nationwide phenomenon, becomes the leading one regarding the ideologies of various political parties and public groups. It does not elevate any idea into an absolute, and it does not turn into a political weapon in order to strengthen the existing government. This ideology, which has a universal content, serves the socio-political progress of all; expresses the fundamental interests of all political parties, nations and nationalities, social groups and strata.

The ideology of independence is based on the following universal values and feeds on them:

- Law supremacy;
- ensuring fundamental human rights and freedoms;

- Respect for representatives of various nationalities, their culture and national values;
- Religious tolerance;
- The desire for secular knowledge, enlightenment;
- The study and application of the best practices of various peoples in the construction of society, the achievements of universal culture, etc.

The national idea of Uzbekistan indicates the most acceptable road, allowing to realize the innermost hopes of each person. It is a force uniting the people and the state, a source of high faith and belief. It equally belongs to all nations, nationalities, representatives of social groups and various religions living in Uzbekistan. It absorbs advanced ideas and rejects inhumane views, it is considered a relevant and creative theory that quickly adapts to a new environment.

Our national ideology is not confined to the narrow, limited interests of individual political forces and parties; not a short-term campaign product. Acting as a criterion for awakening historical memory, drawing lessons from past phenomena and awareness of identity, it fulfills the task of expressing the fundamental goals of our people and an ideological banner uniting members of society. Through this ideology, people draw conclusions from their past, determine the need to go to a specific goal and on a specific path, and, on this basis, determine the future.

Our wise people say that "Who has a strong hand wins one, whose knowledge is strong - thousands wins." The true meaning of the expression "Knowledge is power" lies precisely in this. Along with the aforementioned, such qualities as faith and conviction, honesty and conscientiousness, mercy and generosity, honesty and favor, shame and shyness are inherent in our people. And developing the best qualities of each person, giving them due attention and respect, it is necessary to raise them to the level of universal values, to widely promote them.

You should use the exemplary 89 aspects of such customs and traditions as hospitality, the culture of housekeeping, a sincere relationship in the family, among relatives, friends. Representatives of more than one hundred nations and nationalities live in such a multinational country like Uzbekistan. The successes of the implementation of the national idea and the fruits of the prosperity of our Motherland belong equally to all citizens living on this earth. Therefore, it is important to educate in the heart of every citizen a sense of master of his country, pride in the success of his land, the formation of all people, regardless of nationality and religiosity, the natural concept of "Uzbekistan - a single homeland." Only in this case will the feeling of the active creator of the future Motherland, the feeling of patriotism, devotion to the country and people, courage and readiness for the feat become even more desirable for the hearts of all citizens.

## MODERN METHODOLOGICAL BASES OF FOREIGN LANGUAGE TEACHING IN PRIMARY SCHOOL

**Sultonova Sevara Baxtiyor qizi\***

\* 3rd year Student of English Language and Literature,  
Faculty of Foreign Languages,  
Navoi State Pedagogical Institute,  
UZBEKISTAN

### ABSTRACT

*At present, it is generally recognized that a foreign language must be taught already in elementary school. About what, as well as relying on what principles to learn English in elementary school, and now we will talk. This task is directly related to the problem of mutual understanding of people, the search for common ways of making progress. One of the solutions to this problem may be, according to Z.N. Nikitenko, the humanization of education, that is, introducing students to the cultural heritage and spiritual values of their people and other peoples of the world.*

**KEYWORDS:** *humanization, heritage, Pedagogical, Contradictory*

### INTRODUCTION

The social transformations taking place in our country have created certain conditions for the restructuring processes in the education system. Russian primary education is developing. But, despite the fact that the term “developmental education” is actively used in psychological, pedagogical and methodological literature, the content of this concept remains not quite clear, and the answers to the question of what developmental education is are quite contradictory.

Education in a modern school is aimed at solving two main problems. First, the school should equip students with solid and in-depth knowledge of the fundamentals of science; secondly, it is obliged to prepare its graduates “for life”, to form in them the most important skills necessary for inclusion in various spheres of society. The developing effect of training, subordinate to the task of assimilating knowledge, abilities and skills, can become a “by-product” result, an “unplanned” product of such training.

The development of business and personal contacts, the expansion and strengthening of economic and cultural ties between nations highlight the task of educating a person before the school, the main asset of which is universal culture and universal values. This task is directly related to the problem of mutual understanding of people, the search for common ways of making progress.

One of the solutions to this problem may be, according to Z.N. Nikitenko, the humanization of education, that is, introducing students to the cultural heritage and spiritual values of their people and other peoples of the world. A special role in this belongs to the foreign language, with the help of which "a direct and indirect dialogue of cultures - foreign and native, - has become one of the main provisions of the modern concept of education."

The specificity of a foreign language as an educational discipline is determined by the fact that it, characterized by the features inherent in the language as a sign system in general, at the same time has a number of distinctive features of mastering and possession of it, distinct from the native language. At the same time, for a number of characteristics, it differs significantly from any other school subject. English as a subject is characterized by:

- interdisciplinary (the content of speech in a foreign language can be information from different fields of knowledge, for example, literature, art, history, geography, mathematics, etc.);
- Multi-level (on the one hand, it is necessary to master various linguistic means that are related to aspects of the language: lexical, grammatical, phonetic, and on the other, skills in four types of speech activity);
- multifunctionality (can act as the goal of training and as a means of acquiring knowledge in various fields).

Being an essential element of the culture of a people - native speaker of a given language and a means of transmitting it to others, a foreign language contributes to the formation of a holistic picture of the world among schoolchildren. Proficiency in a foreign language contributes to the formation of personality and its social adaptation to the conditions of an ever-changing multicultural, multilingual world.

A foreign language broadens the linguistic horizons of students, promotes the formation of a culture of communication, and promotes overall speech development. This shows the interaction of all language educational subjects that contribute to the formation of the foundations of philological education of schoolchildren.

At primary school age, the child continues social and personal development. This age period is characterized by the appearance of a fairly conscious system of ideas about people around you, about yourself, about moral and ethical standards, on the basis of which relationships with peers and adults, relatives and strangers are built. The level of formation of all personality manifestations fully depends on the orientation of the educational process on the organization of various practical activities of schoolchildren (cognitive, labor, artistic, etc.). This determined the need to highlight not only the content of knowledge that should be presented to the student and formed at him, but also the content of practical activity, which includes specific skills of students, the possibility of creative application of knowledge, elementary skills of self-education.

Learning a foreign language starts from the 2nd grade. Students of this age are characterized by a high susceptibility to learning, which allows them to master the basics of communication in a new language for them with less time and effort than students in other age groups.

In turn, the study of a foreign language contributes to the development of communicative abilities of younger students, which positively affects the development of students' speech; the formation of their cognitive abilities; the formation of general educational skills.

The active nature of the subject "Foreign Language" corresponds to the nature of the younger student, perceiving the world holistically, emotionally and actively. This allows you to include foreign language speech activity in other activities characteristic of a child of a given age (play, aesthetic, etc.) and makes it possible to carry out a variety of intersubject communications.

The main purpose of a foreign language is to form a communicative competence, i.e. ability and willingness to carry out foreign language interpersonal and intercultural communication with native speakers.

In sample English programs, the following goals for teaching English in primary school are distinguished:

- the formation of communication skills in English, taking into account the speech capabilities and needs of younger students; elementary communicative skills in speaking, listening, reading and writing;
- Development of personality, speech abilities, attention, thinking, memory and imagination of a primary school student; the formation of motivation for further mastery of the English language;
- ensuring the communicative and psychological adaptation of younger students to the new language world in order to overcome the psychological barrier in the future and use the English language as a means of communication;
- mastering elementary linguistic representations accessible to primary school students and necessary for mastering oral and written speech in English;
- introducing children to a new social experience using the English language: introducing younger schoolchildren to the world of foreign peers, foreign children's folklore and accessible samples of fiction; fostering friendly relations with representatives of other countries;
- The formation of speech, intellectual and cognitive abilities of younger students, as well as their general educational skills.

As can be seen from the above goals, training should be developmental in nature and implement the basic principles of developing, competency-based approaches.

The introduction of a foreign language from the second grade caused a large number of difficulties for teachers. Teachers who worked in secondary and high school had to face new difficulties - how to start teaching English to children of seven years old? What to rely on? What to consider? What are the features of teaching a foreign language in primary school? First of all, you need to understand what principles of teaching foreign languages at the initial stage should be based on.

Principles are the initial, basic principles in which the most essential aspects of theoretical and practical activity are reflected and generalized.

The principles of training are understood as the initial provisions that determine the goals, content, technology of training and are manifested in their interconnection and interdependence. According to the methodologists, the principles are designed to determine the strategy and tactics of teaching English at the initial stage at almost every point in the educational process. It follows that the teacher needs to be guided by them in organizing and conducting the educational process on the subject.

An analysis of the literature, which examines the principles of learning, shows that there are different approaches to the allocation of principles and the disclosure of their content.

The basis of teaching any subject at school, including a foreign language, is based on didactic principles, first formulated by the great teacher Jan Amos Komensky in the book "Great Didactics". For centuries, these principles have maintained and still retain their strength, but, of course, they were refined, received, on the basis of changing conditions, an appropriate interpretation in a given period. These principles are: scientific, accessible and feasible, visual in training, an individual approach to the student in a collective work with the class, etc.

In modern didactics, the following teaching principles are distinguished:

1. Focus on the decision in the interconnection of the goals of education, training and the general development of students;
2. Science, the relationship of learning with life;
3. Systematic and consistent; availability;
4. Visibility; consciousness and activity of students with the leadership role of a teacher; a combination of various methods, as well as training tools, depending on the tasks and content of the training;
5. The combination of various forms of training depending on the tasks, content and teaching methods;
6. Creation of necessary conditions for training;
7. Strength, awareness and effectiveness of the results of education, training and development.

It should be noted that there are general methodological principles (universal, which apply to all subjects) and specific principles - those that are characteristic for teaching a particular subject.

The principles of training allowed us to solve a number of didactic and methodological problems:

- The formation of language skills and speech skills both collectively and differentially;
- Organization of the learning process in accordance with the principle of communicative orientation;
- Formation of a holistic view of the culture and people of the country of the language being studied;
- avoiding the construction of false stereotypes and generalizations about representatives of the studied cultures;
- Selection of thematic content for cultural enrichment by means of IN;

- Co-study of the cultures of the countries of the native and foreign languages with the aim of forming global planetary thinking;
- the formation of socio cultural strategies that allow students to use the experience of communication in new situations of intercultural communication with representatives of other countries and cultures, as well as allowing students to resolve the inevitable cultural conflicts that arise during intercultural communication;
- the use of IN as one of the many tools of sociocultural education.

It seems to us that these specific principles of teaching foreign languages reflect the essence of this subject and distinguish it from others.

## INTERACTIVE METHODS FOR TEACHING RUSSIAN

**Batiraliyeva Shaxnoza Pulatovna\***

\*Lecturer,

Department of Russian Language and Literature,  
Navoi State Pedagogical Institute. UZBEKISTAN

### ABSTRACT

*Modernization of education requires not only the active saturation of educational institutions with technology, but also fundamentally changes educational priorities, changes approaches to building a paradigm in general, and building individual educational trajectories, in particular. Significant changes in education are associated with the active introduction of interactive teaching methods in the educational process.*

**KEYWORDS:** *Fundamentally, Individualization, Trajectories,*

### INREODUCTION

In our opinion, the necessary potential is largely possessed by training aids and methods using information and communication technologies. They will be able to ensure individualization of training, adaptability to the abilities, opportunities and interests of students, the development of their independence and creative abilities, access to new sources of educational information, the use of information modeling of the studied processes and objects, etc. In fact, today we are talking about creating a new learning environment based on information technology, aimed at independent learning activities, the development of the abilities and personality of students. In this regard, university teachers should be aware that a modern education model based on a competency-based educational paradigm should be aimed at creating a motivated personality capable of:

- \* quickly navigate in a dynamically developing and updating information space;
- \* receive, use and create a variety of information;
- \* make informed decisions and solve life problems on the basis of acquired knowledge, skills.

This can be achieved only by changing the organization of cognitive activity of students from a simple relay of knowledge to the development of their creative abilities, the disclosure of their capabilities, preparation for life in modern conditions on the basis of a system-activity approach.

Considering the fact that the modern lesson in the Russian language requires special preparation and conducting it requires a large amount of creative effort from the teacher. The introduction of information and communication technologies can improve the effectiveness of the teacher, as well as make this activity more diverse. Information and communication technologies not only give students the opportunity to keep up with the times, but also make the learning process more interesting.

Today, ICT occupies an important place in the educational work of all levels of education. Most educational institutions with computer classes implement a program for the study of academic disciplines by using all the technical innovations available to the user: various presentations, documentaries and on-line archives of the world's leading libraries. And also modern information and communication technologies implement the most important didactic principle - the principle of visibility. The objects represented by information and communication technologies are more informative, colorful and allow you to consider the processes from a wide range of perspectives, and the proximity of knowledge to real life makes this knowledge more understandable. In addition, information and computer technology can make learning problematic, creative, and focused on research activity.

The introduction of information technology solves issues related to the development of the personality of the student, the formation of his emotional and cognitive-cognitive sphere. Teachers consider the problem of motivation in the context of personality-oriented learning, study the didactic possibilities of using ICT in the educational process, individual ICT software tools in terms of their impact on the motivation of educational activities. As a result of this, students form a value attitude to information and communication technologies as an effective means of increasing their level of knowledge. In the learning process, various methods are used, each of which has its own advantages and disadvantages and is typical for a particular type of activity (whether it is a lesson-repetition, lesson-review of new material or lesson-presentation). Here, a lot depends on the personality of the teacher himself, his professional competence in the field of subject and ICT.

ICT programs in the Russian language contribute to the growth of motivation in relation to this subject, the development of the correct speaking, writing, etc. skills, as well as students' control and self-control skills. As a result, the use of information technology in the educational process significantly increases the effectiveness of students learning. Also, the use of information technologies allows students to discover the possibilities of creating serious research, design work with multimedia presentations, etc. For example, the use of an interactive whiteboard in combination with audio means allows you to implement the principles of visibility, accessibility and systematic presentation of the material.

Moreover, these opportunities are realized not only in the viewing mode, as it was when using presentations in the classroom, but, using a special marker and other features of the board, we can combine proven methods and techniques of working with a regular board, and a set of interactive and multimedia features .

The use of information and communication technologies in the Russian language classes is quite relevant for the development of the personality of the learner and the formation of the following competencies among students: the ability to compare the advantages and disadvantages of various sources of information, choose the appropriate technology for its search, create and use adequate models, procedures for studying information processing, etc. .d.

Based on the foregoing, the planning of classes in the Russian language using ICT can be divided into stages, which we will consider in more detail.

At the conceptual stage, the didactic goal is determined with the focus on achieving the following results:

- the formation, consolidation, generalization or improvement of knowledge;
- development of skills;
- assimilation control, etc.

Based on the objectives of the lesson and its pedagogical tasks, the necessity of using ICT tools in the educational process is argued. In this regard, it is necessary to choose educational electronic resources of a particular methodological purpose: training, information retrieval, imitation, demonstration, modeling, controlling, educational and game, etc.

The technological stage allows you to formulate requirements for didactic goals and methodological purpose, to conduct their multivariate analysis and selection. At this stage, the form of the lesson is also chosen: presentation, research, virtual tour, workshop, thematic project, training lesson, etc.

In addition, a more detailed analysis is being carried out, including refinement or modernization of the electronic resource. It is at this stage that the teacher determines the necessary hardware and software (multimedia computer, software).

At the operational stage, the basic structural elements of the lesson are distinguished, the methods for the interaction of various components (teacher - student - educational material) and their functional relationships are selected.

Here it is observed how the detailing of the functions assigned to ICT tools and the ways of their implementation is carried out, as well as the choice of ways the student interacts with the electronic resource and the teacher.

The phased planning of the lesson is carried out, for each of its stages the purpose, duration, form of organization of student activity, the functions of the teacher and its main activities, the form of intermediate control, etc. are determined, on the basis of which the technological map is filled.

Every year, information and communication technologies are increasingly used in the learning process. Programs for teaching the Russian language are increasingly used in the organization of the educational process in educational institutions.

The effectiveness of the use of ICT in the lessons of the Russian language is as follows:

- 1) a large information capacity of educational material;
- 2) the intensification of the independent work of each student;

3) the creation of a communicative situation through the development of communication skills in the main types of speech activity: listening, reading, speaking, writing;

4) mastery of various language models and structures;

5) increasing the cognitive activity of the student, as well as strengthening the motivation of learning.

Non-traditional forms of classes in the Russian language are realized, as a rule, after studying a topic, performing the functions of educational control, and are carried out with the mandatory participation of all students.

In such classes, it is possible to achieve a variety of goals of a methodological, pedagogical and psychological nature, which can be summarized as follows:

- \* control of knowledge, skills and abilities of students on a specific topic;

- \* provides a business, working atmosphere, a serious attitude of students to the lesson;

- \* Provides for minimal participation in the lesson of the teacher.

Integrated classes in the form of games, discussions, tests and many other forms are methodically highly effective, implementing non-traditional forms of training, development and education of students.

M.M. Potashnik in his book "Management of the quality of education" noted that in the 21st century it is unacceptable to use inefficient, outdated teaching technologies that exhaust both the student and the teacher. New information technologies for seekers and those who like to learn new things, for those who are not indifferent to the level of their professional competence, who are concerned about how much he is, the teacher meets the requirements of the century to come.

The nature of comprehensive integrated training is strongly dictated by the use of modern developing technologies, a combination of theoretical and practical exercises. Among them:

- travel classes, interactive classes ("activity sheets", "workbooks", specialized guides, museum newspapers and magazines, catalogs, slides, video programs, museum program brochures, museum events calendars and special guides aimed at self-study of the exposition on a particular topic),

- design and research activities with media presentations;

- master classes;

- socio-gaming technologies (press conferences, art therapy);

- exhibitions of creative works (essays, expositions, essays, reviews, annotations);

- theatrical contests, role-playing games;

- meeting-conversations with the intelligentsia and creative youth;

- presentation programs on the basis of expositions (thematic evenings, holidays, fairs).

- holding seminars, conferences;

- organization of exhibitions, video presentations;

- creation of expositions, thematic and anniversary exhibitions;
- cultural and educational programs involving multidisciplinary specialists - engineers, irrigators, land reclamators, psychologists, art therapists;
- excursion and tourist programs (walking and bus excursions, weekend itineraries, family excursions);
- museum-pedagogical events (museum lessons, role-playing games, master classes);
- creation of thematic educational films, teaching aids;
- Interactive programs of historical, musical and artistic cycles.

You can also use the following interactive techniques and methods:

- 1) reception "What do I know?"
- 2) Reception "Association"
- 3) Reception "Mutual Question"
- 4) reception "Letter"
- 5) methods: "Phone", "Alphabet", "Snowball", "Figure on the wall" and various language simulators.

When using the above and other methods and techniques for using ICT, depending on the students' language preparedness, the teacher can make appropriate changes, and use some game techniques at all stages of the training session, gradually complicating the phonetic material. It is necessary to organize independent work of students in teaching cross-cutting topics using various interactive techniques. For example, you can distribute tables to students and ask them to prepare for reading after a certain time or tasks like "Test yourself!", Which give them the opportunity to independently test their knowledge, and to the teacher - the level of students' knowledge.

One of the interactive techniques is the case method. This is a teaching method in which students and teachers participate in a direct discussion of business situations and tasks. They are invited to analyze the real situation, the description of which simultaneously reflects not only some practical problem, but also actualizes a certain set of knowledge that is necessary to solve this situation. Case study training helps to develop the ability to solve practical problems taking into account specific conditions, makes it possible to formulate such qualification characteristics as the ability to analyze, the ability to clearly formulate and express one's position.

The case method is a description of a real situation, like a "piece" of real life, events that actually happened and described by the authors in order to provoke a discussion in the classroom. This is not just a true description of events, but a single information complex that allows you to understand the situation. A well-made case provokes a discussion, linking students to real facts, allows you to simulate a real problem, which in the future will have to face in practice.

Case may be

- \* personal, when there are specific individuals, managers, politicians, leaders;
- \* organizational and institutional, when there are organizations, enterprises, firms, communities;

\* multi-subject, if it includes several actors.

The main function of the case method is to teach students to solve complex unstructured problems that cannot be solved analytically. He activates, develops analytical and communicative abilities, leaves trainees face to face with real situations.

The case will correspond to the clearly set goal of creation; have an appropriate level of difficulty; illustrate several aspects of the situation; be relevant today; illustrate typical situations; develop analytical thinking; provoke a discussion and have several solutions.

Another interactive technique is the SWOT analysis method in strategic planning, which consists in dividing factors and phenomena into four categories: strengths, weaknesses, opportunities and threats. Here, a teacher of the Russian language can implement a concept that involves the need to provide students with solid knowledge of the material of the program with the simultaneous implementation of different aspects of development and personality formation of each student, taking into account his individual abilities and capabilities. The ways and means of implementing these principles should be significantly creative and at the same time effective.

For non-philologists, the Russian language is not only the purpose of learning, but also a means of achieving the goal - participation in educational and professional communication. As many years of experience at the university show, the lack of understanding of the mechanisms of understanding, memorizing, designing, the ability to reproduce and transform statements, synthesize them with others, and generate new ones leads to the fact that when learning the Russian language, more interactive methods should be used that will allow students to have an adequate level intellectual development.

Thus, the use of information and communication technologies makes learning fun, allows you to more interestingly and graphically present educational material in the Russian language, as well as motivating students to independently study additional material in order to increase the level of knowledge in this academic discipline.

### **INTRODUCTION**

The current stage of development of the world community is characterized by rapidly unfolding innovation processes, and innovation is increasingly acquiring the status of a general indicator of cultural development. The condition for progress is the readiness of public and individual consciousness for positive changes in all areas of society. This trend is observed in many countries of the world, since the reform of the educational system has become an urgent problem for mankind. In this process, the role of pedagogy as a science of upbringing, education and training of the younger generation is great.

It is pedagogy that possesses the art of influencing the educator on the pupil with the aim of forming his worldview, thinking, and consciousness. Therefore, it is called the science of harmonious education of a person.

The task of pedagogical science today is to help the student become perfect through the system of educational institutions. To do this, first of all, you need to learn to learn thoroughly, quickly, economically, and also to learn to think and act professionally.

Pedagogical science as a priority area of science in the Republic of Uzbekistan is focused on increasing the effectiveness of training on the basis of armament with educational models and technologies that have arisen on the basis of new pedagogical theories, improving the system of lifelong education that contributes to the progress of the state and society in independent Uzbekistan.

At the current stage of development of pedagogical science, all financial, economic, political, social and other systems are becoming global. Therefore, it is necessary to arrange them so that they can interact. Only under this condition, in the opinion of well-known teachers, psychologists, politicians, philosophers, economists, it is possible to solve problems in education. It is necessary to theoretically study the formation, directions of development of the education system, its influence on other systems. Because pedagogical science, thanks to its practical integrative function, occupies a special place in the enrichment of pedagogy of different nations. As for Uzbekistan, today it is a multinational republic, where representatives of 136 nations and nationalities live. Over 140 national cultural centers operate here, which is a vivid manifestation of the attention and care of the country's leadership to strengthen interethnic relations and ensure the stability of the social sphere in the republic. Interethnic and interfaith tolerance is a characteristic feature of the historical development of our country, and is considered in the republic as one of the fundamental goals of state policy and social development. "The polyethnism of Uzbekistan is our wealth, the subject of our pride" [1], "emphasizes the President of Uzbekistan Islam Karimov.

The education of a tolerant person who knows how to work, communicate and collaborate with representatives of various nationalities is the basis of the educational activities of teachers, including teachers of secondary schools. But in today's conditions, it is still necessary to study and disseminate the positive features of foreign education systems in this area, theoretically substantiate the positive experience of Uzbekistan in the system of continuing education.

These are the developed charters of educational institutions; provisions and documents that determine the direction of management of institutions of general secondary education and higher educational institutions, as well as documents on the methodological work of heads of preschool educational institutions, directors of secondary schools, academic lyceums, professional colleges, university rectors, heads of district, regional, republican educational institutions, organization retraining and advanced training systems for teaching staff and its management. As for the comprehensive school, here special attention is paid to the principles and directions of the organization of the school principal; goals, objectives and content of the work of the Deputy Director for Academic Affairs; ways and means of work of the school administration with the teaching staff; the theoretical foundations of the scientific organization of teachers' pedagogical activity; pedagogical conditions for creating a spiritual and psychological environment in a comprehensive school.

Pedagogical science, based on the laws of the comprehensive development of the individual, determines the minimum and maximum, creative and heuristic levels of the foundations of the content of education, as well as the results of mastering and mastering education at one or another level, within the framework of state educational standards.

At the current stage of socio-economic development, research in the field of pedagogical psychology involves the search for promising areas. Here it is imperative to ensure the continuity

of pedagogical views of the past and modern pedagogical theories, because these sources require that in each person, in which the frame of reference serving the formation of a perfect person is found, universal, national, moral, entrepreneurial qualities and such features as steadfastness, education were raised in the educational process to the level of spiritual culture.

For these purposes, one must rely both on the spiritual and cultural heritage created in the past, and on the achievements of world civilization today. To ensure the continuity and consistency between modern pedagogical thinking and the views of the past, it is necessary to study the problems of pedagogical philosophy, which is considered the leading foundation of pedagogy. Moreover, the categories of freedom and freedom of thought should form the basis of the content of education and upbringing.

In this case, it becomes necessary to use in practice, first of all, the possibilities of pedagogical science that have not been realized until today. At this stage, pedagogical science has information about the ways of educating the personality, its worldview, its place in society, about the personality and interpersonal relationships, about the individual and the state, the relationship between the individual and society, the duty and duties of the individual, feelings of duty and conscience in a developing personality. Only when conducting scientific research on the philosophical problems of pedagogy as a basic part of pedagogical science, this science will be able to effectively manage the process of education and upbringing. Therefore, pedagogical science, in accordance with the requirements of the time, should theoretically study the activities of educational institutions and develop means for the practical use of the results. It is designed to develop and implement educational institutions principles of leadership of educational institutions. And also to create and theoretically substantiate educational models that ensure the sequence of the main stages of lifelong education and thereby implement the formation of mutually enriching knowledge, skills.

Along with this, pedagogical science should develop its statistical and social components. In determining the goals and objectives of the content of education and upbringing, pedagogical science strives, first of all, to raise the issue of personality development, combining its interests with the interests of the state and society, the activities and worldview of the individual to the level of a factor that develops the state and society.

Given the intensive development of society, the ever-expanding needs and opportunities for its progress, the acceleration of various social, political, economic, scientific, technical, information flows, pedagogical science should take on the task of creating a mechanism for using new forms and means of pedagogical forecasting. Pedagogical science should keep in mind the development and presentation of ways and means to increase the pedagogical activity of a teacher to the level of tolerance, patterns and content of secondary and higher pedagogical education, its new models.

Public organizations and the mahalla occupy a special place in the system of education of students in secondary schools. It is especially important today to create a mechanism for determining and putting into practice pedagogical directions in the management of educational institutions.

The integrative system of pedagogical science also includes the tasks of organizing internal control in an educational institution, combining control with practical assistance to school teachers; creation of scientific and pedagogical foundations for compiling activities for the

development of an educational institution. In addition, a process continues in the continuing education system aimed at educating a person with global thinking, able to actively participate in the socio-cultural process, changing for the better himself and the surrounding reality.

Such a person should be formed taking into account specific features in the field of knowledge, skills and relationships. He must know local / global relationships and dependencies; links between areas of knowledge; common human needs; yourself as a holistic person (your own views, values and worldview, strengths, weaknesses, potential); problematic issues at the interpersonal and global levels.

To see systems and connections, interpersonal relationships, to be able to cooperate, to analyze trends in education; have an individual personal judgment and be able to make decisions; have creative thinking and a comprehensive approach to the issue; be able to solve problems; ensure your individual growth (emotional, intellectual, spiritual, physical).

In addition, have the flexibility to adapt to change; desire to learn and teach others; be able to work in a team; have a sense of solidarity with other people; curiosity about questions, trends, and circumstances; show respect for other people and cultures; Believe in your own abilities and potential; recognize lifelong learning; be sincere, be able to take responsibility.

Thus, the key to solving global problems is the integrative function of pedagogical science, which helps transform education into a leading factor in economic growth. At the same time, education forms the investment attractiveness of countries and provides a technological breakthrough. To do this, flexible and accurate adaptation of education to current and future needs of the labor market, the formation of the ability of students to productive and creative work and social partnership is carried out.

It is education that sets the dynamics of the qualitative development of society and is one of the effective fields of national harmony, social integration, a unifying social factor capable of forming tolerance among a growing generation.

Navoi State Pedagogical Institute, UZBEKISTAN

### ABSTRACT

*A modern person needs such qualities as: the ability to work effectively with information, be able to work in collaboration, have communication skills, and be responsible for his own education. The essence of personality-oriented pedagogy is to recognize the student as the main acting figure of the entire educational process. An equal student with a teacher is a partner in educational activities. Here, the teacher does not force the student to study the required material, but creates the best (optimal) conditions for the student's self-development. In the traditional educational system, the main guideline was the transfer of ready-made knowledge, which encouraged the mechanical memorization of theoretical material and did not provide an opportunity for students to fulfill themselves.*

**KEYWORDS:** *Personality-Oriented, Effectively, Encouraged*

### INTRODUCTION

In modern conditions of reforming the education system, increasing the requirements for the level of professionalism of a teacher and his personal responsibility for the effectiveness of his work, the problem of improving pedagogical skills appears not only as an objective social need, but also as a subjective need for the teacher himself.

Pedagogical excellence is the art of training and education, requiring constant improvement. This is a professional ability to direct all types of educational work on the comprehensive development of the student, including his worldview and abilities.

In the educational system at all levels, intensive innovative work is being carried out, which is becoming more and more relevant and promising. According to the President of the Association

of Independent Schools of the Southeast United States S. Robinson, first of all, the process of the need to change the learning process is due to economic needs [1].

Accelerated globalization affects not only the availability of jobs, but also the type of available work and, therefore, the knowledge and skills needed to get a job. In the current era of globalization, the need has arisen for high-quality education. A modern teacher should be a teacher-trainer of student learning activities.

The main skills of a 21st century student should be: ability to collaborate, critical thinking, communicative, initiative, ability to solve problems, etc. From the point of view of the constructivist theory of teaching, the purpose of teaching should be oriented toward the achievement by the student of a more thorough understanding of the subject, ensuring the use and application of knowledge in situations outside the classroom. A student of a new generation should be self-regulatory, able to independently acquire the necessary knowledge. "Teachers should be competent not only in the development of students' knowledge and skills, but also in their personal development, taking into account the importance of individualization of education and the formation of students' meta-consciousness - teaching skills on how to learn" [2, 104]. Therefore, in the education system, a transition to the position of personality-oriented pedagogy is necessary. The essence of personality-oriented pedagogy is to recognize the student as the main acting figure of the entire educational process. An equal student with a teacher is a partner in educational activities. Here, the teacher does not force the student to study the required material, but creates the best (optimal) conditions for the student's self-development.

One of the tasks of a modern school is to unleash the potential of all participants in the pedagogical process, providing them with opportunities for the manifestation of creative abilities. The solution to these problems is impossible without changing the teacher's attitude to his activities and a look at teaching and how to teach. Teacher training courses in the framework of retraining and advanced training of pedagogical personnel of the republic have become a big impetus in the system of domestic education in recent years, which made it possible to realize creative potential on the platform of ideas.

In the traditional educational system, the main guideline was the transfer of ready-made knowledge, which encouraged the mechanical memorization of theoretical material and did not provide an opportunity for students to fulfill themselves. Now education is more and more focused on the creation of such technologies and ways of influencing the personality, which provide a balance between social and individual needs and which, by launching the mechanism of self-development, self-improvement, self-education, ensure the individual's readiness to realize his own individuality and changes in society. A modern student from a socially passive becomes active, independently acquiring knowledge. If a student previously broadcast ready-made knowledge in the lessons, now it is a reflective person who can evaluate his actions.

By conducting research in action as part of the school, the quality of instruction can be improved. This process is not so much "in" and "about" education as it is "for" it and helps to analyze, reflect and solve school problems. Research in action is the practice of change or the so-called change-based learning. It should be said that research in action is not a method, it is a strategy consisting of different methods and techniques. I conducted a study in action on the topic "How teaching critical thinking improves the teaching process". To combine the existing experience and new scientific concepts into a single system, to increase the effectiveness of the lesson and

the quality of assimilation of knowledge, to increase the professionalism of teachers, the need arose to introduce this particular aspect into school practice. The purpose of the study in action was to improve the skills of teachers to effectively use the methods and techniques of developing critical thinking.

In order to achieve the highest results, the necessary methods and techniques were used. In an age of competitiveness and demand, having received initial ideas about the ideas of seven modules, teachers began to independently introduce the methods and strategies of innovative methods into the learning process. Coaches helped their colleagues in choosing the direction of work and ways of actively using new approaches in training to improve relevant and necessary skills. To enhance professionalism, "coaching is a promising area for the development of education" [3, 75].

To achieve significant dynamics in the student in improving knowledge, thinking, the effectiveness of practical actions, for the professional formation of the personality of the teacher, mentoring plays a big role. In this process, the mentor offers solutions to complex problems and professional support for students. It contributes to the formation of less qualified teachers' readiness to help themselves, to find their own solutions to problems. The emphasis is on the career and personal development of the student.

To enhance professionalism, achieve success and further improve, coaching and mentoring are effective ways to help teachers. These processes are aimed at analysis, reflection and subsequent actions that will allow the teacher to achieve success in their work.

During practice, teachers need to constantly reflect in order to learn from their experiences. At the moment, every teacher working in a new format is reflective, i.e. a teacher who thinks, analyzes, and studies his experience. Reflection is the key to the teacher's self-development, this is an appeal to the activity with the goal of its further purposeful improvement, which involves the teacher's awareness of his inner world, of his actions. It is in reflection that the results of one's work are comprehended. The teacher sees that through practice, their students comprehend the theory. According to the American philosopher John Dewey, "reflection flips the subject from different angles and with different lighting, so that nothing substantial goes unnoticed ...".

Using modern teaching technologies, teachers are happy to use everything that is new, interesting and useful. They see their task not in teaching the student exact knowledge, but rather in navigating in the vast world of information, choosing the main thing, knowing and understanding the relationships and reasons. Therefore, search and research methods of work are often used, work with additional sources of knowledge, encyclopedias, etc. They use group forms of work with elements of search and research activity, where not only educational, but also educational tasks are solved in the lessons. The lessons taught instill an interest in learning, increase student motivation. In order for children to be interested in learning, it is not at all necessary to make each lesson entertaining. The secret of interest is not at all interesting, but in the successes of children, in their sense of growth, movement, achievement of work. Yesterday I did not understand - today I understood. That's where the joy is! Yesterday I didn't know how - today I learned. That is what happiness is! It turns out that children should study well, it is necessary that they ... study well "[4]. To do this, you need to make out in time and try to develop each child's particular abilities. And how to develop or maintain the diligence and

interest of the child is the teacher's talent, his desire for a situation of success, his kind word, his support, praise and cooperation.

Teachers use the formed conceptual understanding of the theoretical foundations not only in lessons, but also in the educational process. With the introduction of innovative processes in teaching and learning, there has been a positive increase in the quality of knowledge, the dynamics of the activity of students and parents of the school, their interest in those transformations that are taking place in the educational institution. The ongoing parent-teacher meetings and extra-curricular activities in a new format are evidence of this. Parents, interested in school problems, are active in the life of a comprehensive school, create favorable conditions for improving their personality.

Teachers who use strategies and techniques for teaching critical thinking notice that this kind of thinking allows a person to make sound judgments about their actions and the actions of other people, reasonably reason, act logically and consistently, accept the point of view of other people, and acknowledge their mistakes. A person is capable of "... comprehending, analyzing, synthesizing and evaluating information obtained through observation, experience, reflection and reasoning, which in the future may serve as the basis for action." All these transformations are aimed at the formation of independent, motivated, enthusiastic, confident personalities with developed critical thinking.

A modern person needs such qualities as: the ability to work effectively with information, be able to work in collaboration, have communication skills, and be responsible for his own education. We must educate a person who is trained throughout life. To achieve this goal, we must work in collaboration. The famous American industrialist G. Ford said: "Teamwork consists in the ability to work together on a common vision, in the ability to direct individual achievements towards the goals of the organization. This is a stimulant that allows ordinary people to achieve unusual results. " By introducing modern innovations into school practice, teachers have moved away from the traditional form of conducting lessons.

### ABSTRACT

*Leadership is considered as an integration function of divided (collective) subject. Activity approach suggests that action object wholly determines the psychological peculiarities of action subject, including collective subject. This rule has been discovered when comparing the leadership in the teams of two power plant shops which have sharply different labor object' structures.*

**KEYWORDS:** *Leadership, Sheared Leadership, Collective Team, Activity Approach*

### INTRODUCTION

In modern conditions, interest in the problem of leadership has grown significantly. Scientific studies of the late 20th and early 21st centuries in the field of management indicate the formation of a new managerial paradigm - leadership, which is manifested through the approval of new organizational structures, procedures, behaviors, values and principles as the basis of managerial activity. This is due to the fact that leadership is the key to achieving the effective activities of organizations: planning, regulation, formation of employee motivation, monitoring their activities and other functions that a leader, leader or manager should perform.

The problem of leadership has been of interest to people since ancient times. However, so far no full agreement has been reached on the concept of leadership and the methods of its formation. A systematic, focused study of leadership has been started since the time of Friedrich Taylor.

Systematizing theoretical and experimental foreign studies of leadership, the scientists identified the following main areas: theories of leadership traits (F. Galton, C. Byrd, S. Smith, D. Kruger), situational theories (J. Schneider, L. Carter, P. Pigors ), the theory of “expectations of interaction” (S. Djibb), etc. The problem of leadership as a socio-psychological phenomenon was investigated by K. Levin, R. Wood, S. A. Gib, T. Mitchell, R. Stogdill and others. R. Stogdill, in his book *Leadership Handbook* [1], grouped the basic ideas of scientists on leadership in accordance with eleven key ideas that reflect different approaches to understanding and exploring this phenomenon throughout the 20th century. R.L. Krichevsky supplemented this classification with later, including modern, formulations of Western scientists. In abbreviated form, it looks as follows:

1. Leadership as the center of group interests, when the leader is considered as the spiritual and emotional center of the group, determining its structure, atmosphere, ideology and group processes. In this case, the leader is seen as a central figure, an integrator of group processes and relationships. A similar idea of leadership is contained in the earliest definitions of S. Cooley, E. Mumford, L. Bernard and other authors.

2. Leadership as a characteristic of the personality and the effects generated by it. This understanding of leadership has dominated literature from the 1920s through the 1930s. It is typical for him to consider leadership as a manifestation of the strength of the individual, as a combination of traits that give the individual the ability to motivate others to perform the task, and a leader as possessing the largest, compared with other members of the group, set of desirable personality and character traits. According to R. Stogdill, in the interpretation under discussion, leadership actually acts as an expression of the unidirectional influence of the leader on followers (the latter are usually referred to in the literature as members of the group led by the leader). Moreover, R.L. Krichevsky notes that the approach to leadership as a kind of personal quality or a set of traits and skills, often criticized by academic psychologists, is very popular these days among domestic and foreign practitioners dealing with the selection, certification and training of managerial staff.

3. Leadership as the art of reaching agreement or submission refers to the process or ability of a leader to organize people for effective cooperation, during which he uses mainly various indirect ways of influencing people to encourage them to act in the right direction. In particular, B. Moore defined leadership as an individual's ability to influence followers and achieve obedience, loyalty, respect and cooperation on their part. Similar definitions of leadership are found in F. Philips, W. Bennis, F. Allport and others.

Leadership as action and behavior. The focus here is on the behavioral aspects of leadership, in particular the actions that a leader takes to manage and coordinate the work of a group. According to one of the leading experts in the field under discussion, F. Fiedler, leadership behavior is usually understood as specific actions taken by the leader in the course of managing and coordinating the work of members of his group.

5. Leadership as a tool to achieve a goal or desired result. These concepts recognize the instrumental value of leadership as a means of integrating group members and shaping the coherence of their actions to obtain the desired result. According to R. Kettel, leadership can be determined on the basis of the individual's effective influence on the actions of followers to

achieve the group's common goal. C. Davis presented leadership as a human (subjective) factor that unites a group and motivates it to achieve a certain result.

6. Leadership as an interaction in which people voluntarily unite around a more successful person, feeling a personal interest in him and recognizing that he is an important carrier of the goals, programs and methods of action, as well as the values and norms of the group. According to this approach, the necessary condition for effective leadership is awareness and support from the members of the group. According to P. Drucker, as a result of the leader gaining confidence in other members of the group, they become his followers, and his success determines the willingness of followers to follow him. According to S. Brown, there can be no leader without followers, so the leadership process cannot be separated from the needs and goals of the followers.

7. Leadership as the ability to convince. The distinction between leadership and management is emphasized here. If the latter is the art of forcing and using the power of power or the threat of its use in order to force people to follow a certain direction, then the leader controls with the help of persuasion, encouragement and motivation to action. Such a leader's behavior is characteristic of many political and public, most often informal organizations. Therefore, the definition of leadership as a form of persuasion is more characteristic of authors studying political leadership and social movements. They view beliefs as an important tool to influence people's expectations and beliefs in the social, political, and religious spheres of society. 8. Leadership as the exercise of influence.

In this concept, leadership is considered as a process of influencing the activities of the group as a whole and individual followers in particular. So, according to the definition of R. Stogdill, leadership is the process of influencing the activities of a group to achieve a common goal. According to F. Hayman, leadership is a process of direct interaction, as a result of which the individual influences the behavior of others, prompting them to achieve a certain result. Moreover, not only the leader affects the followers, but he himself experiences their influence. This is written by E. Hollander in the third American edition of the fundamental guide to social psychology, analyzing various definitions of leadership. M. Chemers in the four-volume reference book on social psychology published in Europe, referring to the variety of interpretations of leadership, refers to leadership as the most widespread view of leadership as a process of influence through which a person enlisted the support of others and directed their efforts towards achieving group goals.

9. Leadership as a power relationship. Leaders use power in their actions, in connection with which some authors consider leadership relations, primarily as imperious. In their opinion, the main task of the leader is to make others obey and act in the direction desired by him or the organization. Moreover, the leader, being the initiator of interaction, stimulates followers and establishes control over them, changing their initial intentions. Some leaders, more than others, seek to transform any leadership opportunity into explicit power relationships. Ultimately, this leads to authoritarian trends in leadership. Such definitions, according to O.V. Evtikhova, more applicable to political and organizational leadership.

10. Leadership as a result of role differentiation. According to this concept, leadership can be considered as role differentiation, which is based on the process of interaction and mutual influence. M. and K. Sheriff understood the leadership assigned to one of the group members as

a special role within the system of relationships, which is determined by the mutual expectations of the leader and followers. A similar point of view was later developed by S. Gibb, who argued that leadership is one of the aspects of the role differentiation process and, like any other role behavior, acts as a function of the dynamic interaction of personal properties and the social system.

The above classification of various approaches to the study of leadership shows how broad and diverse the views of researchers on the nature and nature of leadership. Each of the above models reveals only one of the facets of the nature of this phenomenon.

There are also many definitions of leadership as the degree of the leader's leading influence on the group in order to optimize the solution of the task. Leadership is also considered as managerial status, a social position related to decision-making in a managerial position.

Such an interpretation of leadership proceeds from a structurally functional approach, which provides for the consideration of the group as a complex, hierarchically organized system of social positions and roles. The occupation of positions in it related to the performance of managerial functions and gives a person the status of a leader. Moreover, leadership is considered as:

- Influence on a group of people, which contributes to their achievement of common ideas;
- Interpersonal communication, manifested through the communicative process and aimed at achieving the goal;
- The ability to influence individuals and groups to make them work together;
- The main process of organizing group decision-making, the historically formed social need of people to organize the process of their activities.

Leadership is also one of the processes of organizing and managing a small social group, which contributes to the achievement of group goals on time and with optimal effect. It is characterized by relations of domination and submission, power and influence in the system of interpersonal communication in a group. This process is largely determined by the existing social relations in society. From the above functions it follows that leadership is a process of influence on people generated by the system of informal relations itself, and management presupposes the presence of clearly structured formal relations through which it is realized.

Leader (from the English leader - leading, first, leading the way) - a person in a group who enjoys a large, recognized authority, has influence, which manifests itself as controlling actions. At the same time, the group recognizes its right to make responsible decisions in situations significant for it. This is the most authoritative person, really occupying a central role in organizing joint activities and regulating relationships in a group. A leader is a person whose opinion is heard, who can lead people, who have learned to control, motivate and guide himself and others to achieve his goals and solve assigned tasks. The influence of a leader usually has two sources:

- Credibility (members of the group recognize the leader by position, experience, professionalism, education, etc.);
- Charismatic personality traits (humanity, morality, etc.).

An initial understanding of business leadership meant being ahead or first: occupying a high position, first place.

But in the 21st century, leadership began to be viewed from a different angle. It involves not so much managing material resources as managing time, knowledge, and trust of group members. Leadership does not exist in isolation from the successes of those people on whom the achievement of the desired result depends, it is also associated with the satisfaction received from work. Scientists interpret modern business leadership in two ways.

First, all leadership is inseparable from those who constitute a group of followers. The key to leadership here is the acquisition of as many followers from among the employees as possible. This is what most business leaders do.

Secondly, self-confident and visionary leaders turn followers into new leaders and, thus, a group of followers becomes a team of leaders. This approach allows you to replicate the business, increases the market activity of the enterprise and the level of its success, which is determined by the capabilities of his team. Therefore, the effectiveness of leadership depends on the ability of the leader to provide the opportunity for the development of those who are next to him in the same team, which strengthens the organization's potential.

So, leadership competency is most clearly manifested in the ability to create a team of leaders. The installation of great business leaders is a positive interaction with the group. In this case, the leader takes a position of interdependence with other leaders and maintains relations with them that encourage cooperation rather than rivalry. Success is achieved by the skill of the whole group, and not just the skill of the leader. To increase group effectiveness, it is necessary to learn not only how to train leaders most productively, but also to create an organizational environment in which a leader can work well. In this case, leadership is seen as a process of organizing interpersonal relationships in a group, and a leader as a subject of control of this process. The possibility of leadership training is allowed, as the experience of leadership behavior can be formed, including in simulated situations, thereby developing appropriate leadership qualities relevant in modern conditions. An effective leader can successfully use all types of communications, all communication channels: verbal, book, multimedia and others. For the formation of an effective leader, it is necessary that the social subject be a "communicative personality", which helps to influence the followers, this resource of influence has a pronounced personality component. Currently, the concepts of "leader" and "success" have become synonymous. A leader must be successful. The only way to transform a person into a leader is to, as himself, begin to act using all his abilities, skills, abilities, energy, which are either given by nature, or those that they have already developed. Leaders are not born, they become! Leader functions arise from two controversial aspects of group life. In relation to the external goal related to the business sphere of the group's life, one can distinguish such functions as:

- ☐ Awareness of the group goal;
- ☐ Analysis and control of the external environment;
- ☐ Development of a plan to achieve the goal;
- ☐ Distribution of responsibilities of group members and organization of their interaction;

□ ensuring the external security of the group, maintaining contacts and interaction with other groups;

In relation to the internal life of the group, the leader has the following functions:

- ensuring the inclusion of group members in joint activities;
- ensuring the independence of group members and their individuality;
- ensuring the efficiency of the group structure, the influence of some members of the group on others, necessary to achieve the group goal;
- ensuring control, distribution of responsibility and power in the group in an optimal way;
- Maximum use of the capabilities and abilities of group members to achieve success.

A dynamic leader is a stabilizer of group interaction, but he is also a destroyer of stability, as he is forced to do this, directing the group to achieve an external goal. So the function of a leader is twofold, and he himself is an embodied contradiction. And only harmoniously combining these opposites, can he take place as a leader. After all, a group, like any dynamic system, develops in the unity of opposites, the resolution of conflicts between which is the source of movement. Under these conditions, the function of a leader is to stabilize this movement, keep it within the boundaries of the measure, and compensate for shortcomings. This is where the compensatory or complementary function of the leader in the group is manifested. According to scientists, the leader's strength consists of personal qualities and experience, vision of the future and self-confidence, knowledge of their strengths and weaknesses. It is due to the presence of the leader's potential, its disclosure, development and successful self-realization. There are many definitions of the qualities of an effective leader. At the same time, there is no such list of qualities the possession of which would guarantee leadership itself. Situations and tasks are no less important, and the group in which leadership takes place is not only an environment, but also an element of this leadership, often more important than others. Leaders not only indicate the direction, but also show their followers how to achieve their goals, awaken their business activity and responsibility. A leader can understand the importance of others to achieve overall success. He is obliged and able to see the prospects of employees, employers, customers and 17 colleagues.

Vision of the future favorably distinguishes the leader along with a real assessment of the current situation. Thus, the role of a leader is crucial in organizing the joint activities of the group and ensuring the effectiveness of its work. The personality of the leader and the style of his behavior as a dominant person largely determine the fate of each participant and the whole group as a whole. In other words, leaders influence the socialization of individuals. How diverse are people and groups, just as diverse are leaders and their behavior. But in all cases one regularity can be traced: the leader and the style of his behavior reflect the circumstances, the essence of the group, as well as the personality traits of not only the leader himself, but also his followers.

### ABSTRACT

*The main environmental problems that pose a real threat to the sustainable socio-economic development of the Republic of Uzbekistan are global, regional and national in nature. The strategy for ensuring the environmental safety of the Republic of Uzbekistan proceeds from the vital interests of the individual, society and the state in the environmental sphere. The article provides information on environmental safety issues in the Republic of Uzbekistan, in particular, on reforms in the field of environmental protection at the present, new stage of development of the Republic of Uzbekistan.*

**KEYWORDS:** *Strategy, Environment, Ecology, Safety, Legislation, Cooperation.*

### INTRODUCTION

The environmental degradation of our planet, especially air, water, and soil pollution from toxic chemicals, hazardous waste, and other factors, is a global concern. The modern concept of socio-economic development of society, based on meeting the ever-growing needs of human-being, has encountered many contradictions.

In the region of Central Asia, one of the most dangerous zones of environmental disaster has formed, becoming a tragedy for the lives of many people. Severe shortage and pollution of water resources, air pollution, desertification, qualitative deterioration of land resources, drying of the Aral Sea are the means of the threat to the sustainable development of the region. According to its environmental and socio-economic impact, the Aral Sea problem, according to the UN experts, is one of the greatest disasters of the twentieth century.

The main environmental problems that pose a real threat to the sustainable socio-economic development of the Republic of Uzbekistan are global, regional and national in nature.

Global problems: The Republic of Uzbekistan is part of a worldwide movement to mitigate and weaken modern environmental challenges, such as the destruction of the ozone layer, climate change, and the prevention of desertification and land degradation.

**Regional and national issues:**

The resource intensity and raw materials orientation of the economies of the countries of the region, an inefficient management system and intensive nature management have led to the formation of a number of common environmental problems in the territory of Central Asian countries.

Unsustainable use of the region's natural resources, including water-land, fuel and energy, biological, deserves special attention, without taking into account further development prospects.

The Strategy for ensuring environmental safety of the Republic of Uzbekistan proceeds from the vital interests of the individual, society and the state in the environmental sphere, as defined by the Concept of National Security and the Constitution of the Republic of Uzbekistan.

The vital interests of the individual include: ensuring optimal environmental conditions for human life, protecting people's health.

The vital interests of the state include:

- Sustainable development, stability of the environmental situation in the region, the formation of a healthy lifestyle;
- ensuring a high level of scientific and technological development in priority sectors of the economy;
- Creation of an effective system of national security, ensuring the organic inclusion of Uzbekistan in the regional and global systems of collective security and cooperation and their structures.

During the years of independence, Uzbekistan became a full-fledged subject international environmental political relations, strengthened strategic directions and legal foundations of their policies. A fundamental regulatory framework has been created in the country, about 30 laws and more than 150 regulatory documents governing environmental protection and nature management have been adopted and are in force. It provides for the formation and improvement of an effective legal mechanism for ensuring public participation in this process, the consistent implementation of the environmental control system.

The environmental policy of the Republic of Uzbekistan is carried out on the basis of the Constitution, legislation, the National Security Concept of the Republic of Uzbekistan, the principles of the Rio de Janeiro and Johannesburg Declarations on the Environment and

Sustainable Development, taking into account the obligations of the republic arising from international conventions and agreements, as well as legislative experience of leading states.

Since, the Republic of Uzbekistan is a party to a number of international environmental treaties and regional agreements. The country is a party to three Rio conventions: the Climate Change Convention, the Convention on Biological Diversity and the Convention to Combat Desertification. In addition to them, the country signed and ratified the following treaties: Basel Convention on the Control of Transboundary Movements of Hazardous Wastes and their Disposal (12.22.1995); Convention for the Protection of the World Cultural and Natural Heritage (12.22.1995); Convention on International Trade in Endangered Species of Wild Fauna and Flora (07.01.1997); Bonn Convention on the Conservation of Migratory Species of Wild Animals (05.01.1998); Stockholm Convention on Persistent Organic Pollutants (05.22.2001), Paris Agreement (02.10.2018), International Plant Protection Convention (12.23.2019).

## **MATERIALS AND DISCUSSION**

The adoption and implementation of the Strategy of Action in five prior initiatives of the country's development in 2017-2021 became the basis for the beginning of a new stage in the development of the Republic of Uzbekistan, characterized by deep and large-scale transformations in all spheres of life and activities of the state.

In order to ensure environmental safety, the development of social infrastructure that improves the living conditions of the population and other tasks stipulated in the Action Strategy for the five priority initiatives of development of the Republic of Uzbekistan in 2017-2021, the Decree of the President of the Republic of Uzbekistan "On improving the public administration system in the field of ecology and environmental protection", the resolution of the President of the Republic of Uzbekistan "On measures to ensure the organization of activities of the State Committee of the Republic of Uzbekistan on Ecology and Environmental Protection and "On measures to radically improve and develop the waste management system for the period of 2017-2021".

In accordance with the decree of the President of the Republic of Uzbekistan dated April 21, 2017, the transformed State Committee of the Republic of Uzbekistan on ecology and environmental protection was entrusted with broad tasks to improve the environmental situation, collect, store, transport, recycle and process household waste.

On February 2, 2018, the meeting was held under the chairmanship of the President of the Republic of Uzbekistan Shavkat Mirziyoyev, dedicated to the analysis of ongoing work to improve the ecological situation and environmental protection, and to identify urgent tasks in this area.

The meeting noted the need to strengthen state supervision in the field of pollution prevention. For example, in such industrial cities as Andijan, Angren, Bukhara, Navoi, Fergana, Almalyk, Bekabad, Chirchik, Tashkent and Nukus, the level of air dust exceeds sanitary standards by an average of 2.7 times.

In connection with this and other factors, the decision-makers of the State Committee for Ecology and Environmental Protection were entrusted with the task of developing, based on international experience, the National Concept for Environmental Protection.

In order to identify priority areas of state policy in the field of environmental protection, introduce effective mechanisms for the prevention, detection and suppression of violations of environmental laws, strengthen the personal responsibility of heads of state bodies and business entities, citizens for the sanitary and environmental condition of settlements of the republic, as well as ensure the achievement of National goals and objectives in the field of sustainable development for the period up to 2030 by Presidential Decree Republic of Uzbekistan dated October 30, 2019 No. UP-5863 dated October 30, 2019, the Concept of Environmental Protection of the Republic of Uzbekistan until 2030 was approved, providing for measures to:

- Preservation and quality assurance of environmental objects (atmospheric air, water, land, soil, subsoil, biodiversity, protected natural areas) from anthropogenic impact and other negative factors;
- The prior usage of materials, products, industrial and other facilities that pose the least environmental hazard;
- expansion of protected natural areas;
- ensuring the environmentally sound use of toxic chemical and radioactive substances;
- Improving the environmentally sound waste management system;
- the formation of an ecological culture of the population, increasing the level of transparency of the activities of state bodies in the field of environmental protection and strengthening the role of civil society.

On October 4, 2019, the Presidential Decree approved the Strategy for the transition of the Republic of Uzbekistan to the green economy for the period of 2019-2030. The main objectives of the strategy:

- improving the energy efficiency of the economy and the rational consumption of natural resources;
- Inclusion of green criteria in priority areas of state investments and expenditures;
- Government incentives for projects to implement the principles of a green economy;
- Training for the green economy;
- Strengthening international cooperation in the field of "green" economy and others.

For the conditions of Uzbekistan, renewable energy sources such as solar, wind, small hydropower, biomass and geothermal energy are relevant. According to expert estimates, the potential of renewable energy in our country is equivalent to the use of 51 billion tons of oil. The technologies existing today make it possible to obtain energy equivalent to 179 million tons of oil, which is three times higher than the volume of fuel extracted in the republic, and also to prevent the emissions of millions of tons of carbon dioxide, various sulfur compounds, nitric oxide and other pollutants.

The Ecological Party of Uzbekistan was established at the Constituent Congress on January 8, 2019. The creation of the Ecoparty is a special page in the history of Uzbekistan, a strategic

direction in the development of the state. This has become a kind of brand of modern Uzbekistan, indicating a prior attention to environmental problems.

Acting under the motto “We are responsible for the future!”, The party considers its main mission to ensure the rights of present and future generations to live in a favorable environment, to consolidate the efforts of all social groups to achieve environmental sustainability and improve public health indicators.

At the initiative of the Ecological Party of Uzbekistan, a decision was made that concerned the public and caused widespread debate on social networks about the falling of trees. At the party's proposal, the Concept of Environmental Protection of the Republic of Uzbekistan until 2030, approved by the Decree of the President of the country of October 30, 2019, declared a moratorium on falling of valuable tree species from November 1, 2019 to December 31, 2020.

In general, the party's priorities are as follows:

- to ensure that the task of achieving environmental safety becomes a priority of state policy;
- the search and elimination of the causes of environmental, socio-economic and other problems, and not the fight against their consequences;
- the unification of efforts of all citizens aimed at protecting the environment and the formation of an environmentally sustainable society.

## CONCLUSION

Over the years of independence, the republic has created a modern, fundamental regulatory framework to ensure environmental protection and rational use of natural resources.

Uzbekistan fulfills its obligations to achieve the UN Sustainable Development Goals, recognizing their importance and relevance in the context of national sustainable development.

To achieve these goals in our country only in recent years, a number of strategic documents have been adopted: an Action Strategy for the five priority areas for the development of Uzbekistan in 2017-2021, a Strategy for the transition to a green economy, a Strategy for the further development and reform of the electric power industry of the Republic of Uzbekistan, The concept of environmental protection of the Republic of Uzbekistan until 2030 and others.

On January 8, 2019, the Ecological Party of Uzbekistan was formed. Its main goals are to ensure the implementation of state policy aimed at achieving sustainable development, environmental safety, creating a favorable environment, preserving natural resources for present and future generations, and helping to ensure that environmental protection and the conservation of natural resources become the business of the state, and society, and every citizen of the country. The implementation of these measures in our country will ensure the sustainable development of the social, economic and environmental spheres, the essence of which is to establish the principles of the right of every citizen to a favorable environment, to meet social needs without harming future generations, and wise use of natural resources.

Signing and subsequent ratification of the Paris Climate Agreement, which has become the most important document of the world community in recent years, was important for Uzbekistan. In

order to fulfill the country's obligations under the Paris Agreement, a Strategy was developed and approved on October 4, 2019 by the President's Decree on the transition of the Republic of Uzbekistan to the green economy for the period 2019-2030, aimed at the consistent modernization of industry, improving energy efficiency and energy saving in key sectors of the economy, which will stabilize greenhouse gas emissions.

The country is conducting consistent work in the field of environmental protection, the rational use of natural resources, and the improvement of sanitary and environmental conditions.

In the past two years, Uzbekistan has taken unprecedented measures to mitigate the socio-economic and environmental consequences of the Aral Sea disaster. 461 thousand hectares were sown on seeds on a dry sea bottom, and furrows were prepared for planting seedlings of salt tolerant plants on an area of 1.1 million hectares. These and other measures are aimed at counteracting the removal of dust and salt from the dried seabed, mitigating the impact of climate warming in the region on the environment and public health.

A state system for monitoring the state of the environment has been created and operates in the republic, which covers all objects of nature conservation. Certain experience has been accumulated, appropriate methods and databases have been created. At the same time, a unified monitoring system requires improvement using the latest world technologies.

One of the urgent tasks to improve the ecological situation and protect the environment remains the systemic processing and disposal of household waste with the widespread introduction of the experience of leading foreign countries.

### **ABSTRACT**

*This article gives some definitions of e-learning given by scientists and also discusses the pedagogical features of e-learning.*

**KEYWORDS:** *E-Learning, Internet Education, Pedagogical Technologies, Traditional Education, Pedagogical Principles, Virtual Sphere.*

### **INTRODUCTION**

In this article, we will look at e-learning and its pedagogical features. On this basis, we use telecommunication networks and technologies that provide information stored in the database as e-learning and used in the preparation of educational programs, its processing technologies, tools and broadcasts on these information lines. We understand the organization of the learning process that ensures the interaction of all participants in the learning process. (used by Бубнов В.А. [1]). We will also look at some of the definitions given to e-learning by other scholars.

University of Melbourne professors M.S. Bowles described e-learning as "the use of the Internet as an educational tool has led to tremendous change in society." (used by Bowles, M.S. [2]). But to date, no agreement has been reached on the main content of e-learning. Gerhard Casper, a former president of Stanford University at the time, said, "I don't really know how e-learning will develop. But I can say for sure that in the next few decades, we will see a transition from full-time education to online education." (used by Muller, H. [3]).

The term "e-learning" is widely used to refer to "computing and communication technologies for teaching and learning. Some of them are used effectively, and some do not work well." (used by

Allen, M. [4]). M.Allen described e-learning as the delivery of well-designed curricula using computer technology.

E-learning can be defined through teaching and learning based on pedagogical technologies.Chin Paul describes it as “e-learning is not a means of transmitting content, but an interactive process between teacher and student”. (used by Chin, H. [6]). M. Sloman describes e-learning as teaching using electronic means, i.e. the Internet, intranet or extranet (used by Sloman, M. [7]).

Shank and Sitze argue that “e-learning involves the use of network technologies such as the Internet and business networks to provide, apply and evaluate formal and informal learning”. (used by Shank, P. & Sitze, A. [6]). They also stressed that online education doesn't just have to be online.The use of technology in education is the foundation of extracurricular education.

Based on the above definitions, we consider the role of e-learning in pedagogy.Modern technology has entered traditional education in a way that has updated and preserved some aspects.The most important of these is the e-textbook, which allows students to use once-created multimedia educational content multiple times in an interactive mode.In this way, students not only follow the process of creating content, but also create it themselves.E-learning shapes the content of social networks, forums, conversations.Wiki and Internet forums are creating new forms of communication. In addition, they allow the development of a dynamic model of improving the content of the site, the formation of educational materials.Modern technologies ensure the popularity and speed of the communication process.

In the traditional education system, textbooks are updated every 3-4 years, but e-learning materials are updated daily.This shows how important modern technologies are in the educational process.It should be noted that e-learning allows the transition to another source through a hyperlink in an optional e-learning resource while retaining traditional learning features.

Today, the teacher must learn to communicate remotely.On this basis, it can perform tasks such as creating, supplementing, editing training materials.The lectures used in traditional education are not organized here.In traditional education, students are given previously unknown information. In the process of e-learning, all learning materials are delivered to students in various formats of information in an organized manner. So now the teacher takes a creative approach to the lecture, provides the sources of information used in the lecture to prepare the students independently, or the students themselves look for additional sources of information on the lecture. Then, on the basis of this, the report will be discussed in the form of questions and answers.During the discussion, students 'opinions on the report are considered and a general conclusion is reached.

The use of pedagogical technologies in e-learning should be adapted to the level of pedagogical processes.The use of modern technological tools (e-textbooks, forum LMS, automated search in databases) in the implementation of reproductive education leads e-learning to traditional software education.

Modern e-learning allows to implement open learning methods in the field of public education:

- no time limit;
- learner, listener - is a subject in the case of alternative learning opportunities, in which he must make an important decision;
- goal - the subjectivity and originality of the person in active work..

The study of the course in the virtual field requires the construction of the learning process on the principle of openness, such as the implementation of the pedagogical process in a subject-oriented form, and provides the following:

- content (educational material using multimedia);
- competence of the student;
- study guide to help students work on the course;
- Syllabus;
- the tutor function of the teacher.

This is another demonstration of how important the e-learning system is today.

### ABSTRACT

*In this paper we discuss the continuation polyharmonic function its values and the values of its normal derivative on the smooth side of  $S$  the boundary of the infinite  $D$ . Using this integral representation, we obtain some properties of the polyharmonic functions of this class.*

**KEYWORDS:** *Cauchy Problem, Carleman Function, Polyharmonic Functions, Partial Derivatives, Normal Derivatives.*

### INTRODUCTION

The paper proposes an explicit continuation formula for solving the Cauchy problem for the polyharmonic equation in the statement of M.M. Lavrentieva. The continuation formulas found here are complete analogues of the classical Riemann, Voltaire and Hadamard formulas that they constructed to solve the Cauchy problem in the theory of linear equations of the second order. Sh. Yarmukhamedov in 2003 in the article "The Cauchy Problem for the Polyharmonic Equation" having solved the problem, obtained the result when the region is simply connected with the boundary  $-\partial D_\rho$ , consisting of a cone surface. Juraeva N.Yu. 2004 in the article "The

Cauchy Problem for Polyharmonic Functions" [3], proved some theorems when  $D$  - unlimited area lying in the layer  $\{y: y = (y_1, y_2, \dots, y_m), (y_1, y_2, \dots, y_m) \in R^m, 0 < y_m < h\}$  with border  $\partial D = L \cup S$ ,  $L = \{y: y_m = 0\}$ ,  $S = \{y: y_m = f(y_1, \dots, y_{m-1})\}$  Where  $f(y_1, \dots, y_{m-1})$  has first-order bounded partial derivatives.

In this paper, similar results are obtained in the case when the region has the following form:

Let be  $R^m$  -  $m$ - dimensional real Euclidean space,  
 $x = (x_1, x_2, x_3, \dots, x_m)$ ,  $y = (y_1, y_2, y_3, \dots, y_m)$ ,  $x \in R^m, y \in R^m$

$$x' = (0, x_2, \dots, x_m), y' = (0, y_2, \dots, y_m), r^2 = |x - y|, s = |x' - y'|^2, h = \frac{\pi}{\rho}, \rho > 0, \alpha^2 = s$$

$D$  - unlimited area lying in the layer  $\{y: y = (y_1, y_2, \dots, y_m) \in R, 0 < y_m < h\}$  with border  $\partial D = \{y: y = (y_1, y_2, \dots, y_m), y_1 = 0\} \cup S$ ,  $S = \{y: y = (y_1, \dots, y_m), y_m = f(y_1, \dots, y_{m-1})\}$

где  $f(y_1, \dots, y_{m-1})$  the function satisfies the Lyapunov condition with a fixed constant.

The following problem is solved (Cauchy problem). Let me  $u \in C^{2n}(D)$  и  $\Delta^n u(y) = 0, y \in D$  (1)

$$u(y) = F_0(y), \Delta u(y) = F_1(y), \dots, \Delta^{n-1} u(y) = F_{n-1}(y), y \in S$$

$$\frac{du(y)}{d\bar{n}} = G_0(y), \frac{d\Delta u(y)}{d\bar{n}} = G_1(y), \dots, \frac{d\Delta^{n-1} u(y)}{d\bar{n}} = G_{n-1}(y), y \in S, \quad (2)$$

where  $F_i(y), G_i(y)$  given on  $\partial D$  continuous functions,  $\bar{n}$  - external normal to  $\partial D$ . Restore required  $u(y)$  в  $D$ .

We assume that the solution  $u(y)$  tasks (1)–(2) exists and is continuously differentiable,  $2n - 1$  times up to the end points of the boundary and satisfies a certain growth condition (correctness class), which ensures the uniqueness of the solution. Then an explicit continuation formula is established, which is a multidimensional analogue of the classical Carleman formula from the theory of analytic functions.

Functions  $\varphi_\sigma(y, x)$  и  $\Phi_\sigma(y, x)$  at  $s > 0, \sigma \geq 0$  we define the following equalities: if

$$m = 2k, k = 2, 3, \dots \text{to } (-1)^{k-1} (k-2)! \varphi_\sigma(y, x) K(x_m) = \frac{d^{k-2}}{ds^{k-2}} \operatorname{Im} \left[ \frac{K(\omega)}{\sqrt{s}(\omega - x_1)} \right], \quad \omega = i\sqrt{s} + y_1$$

if  $m = 2k + 1, k = 2, 3, \dots \text{to}$

$$(-1)^{k-1} 2^{-k} (k-2)! \varphi_\sigma(y, x) K(x_m) = \frac{d^{k-1}}{ds^{k-1}} \operatorname{Im} \int_0^\infty \left[ \frac{K(\omega)}{\omega - x_1} \right] \frac{du}{\sqrt{u^2 + s}}, \quad \omega = i\sqrt{s + u^2} + y_1$$

With all the odd  $m \geq 3$ , as well as even  $m$  condition  $2n < m$ , we believe

$$\Phi_\sigma(y, x) = C_{n,m} r^{2(n-1)} \varphi_\sigma(y, x), \quad C_{n,m} = (-1)^{n-1} \left( \Gamma\left(\frac{m}{2} - n\right) 2^{2n} \pi^{\frac{m}{2}} \Gamma(n) \right)^{-1}$$

For all even  $m, m = 2k, k = 1, 2, \dots$  with the condition  $2n \geq m$  we believe

$$\Phi_\sigma(y, x) = C_{n,m} \int_0^\infty \operatorname{Im} \left[ \frac{K(\omega)}{\omega - x_1} \right] (u^2 - s)^{n-k} du \quad \omega = iu + y_1 \text{ where}$$

$C_{n,m} = (-1)^{\frac{m}{2}-1} \left( \Gamma(n) \Gamma\left(n - \frac{m}{2} + 1\right) 2^{2n} \pi^{\frac{m}{2}} \Gamma(n) \right)^{-1}$  and function  $K(\omega)$  has the form

$$K(\omega) = \frac{\exp(\sigma\omega - a \operatorname{chi} \rho_1(\omega - h/2))}{(\omega + x_m + 3h)^{n+1}} \quad m = 2n + 1, n \geq 1 \quad K(\omega) = \frac{\exp(\sigma\omega - a \operatorname{chi} \rho_1(\omega - h/2))}{(\omega + x_m + 3h)^n}$$

$m = 2n, n \geq 2,$

**Theorem 1.** For function  $\varphi_\sigma(y, x)$  occurs inequality

$$|\varphi_\sigma(y, x)| \leq \begin{cases} C \sigma^{n-2} \alpha^{-m} \exp(\sigma y_m - a \cos \rho_1 y_m \operatorname{chi} \rho_1 \alpha), & \alpha \geq 1 \\ C \sigma^{n-2} (r^{-m+2} + \alpha^{-1} r^{-m+3} + \sum_{p=1}^{n-2} \alpha^{-2p} r^{-2(n-p-1)}) \exp(\sigma y_m - a \cos \rho_1 y_m \operatorname{chi} \rho_1 \alpha), & 0 < \alpha \leq 1 \end{cases}$$

**Lemma -1.** If  $\varphi_\sigma(y, x)$  harmonic function в  $R^m$  by variable  $x$  including point  $y$ , then

$$\Delta r^k \varphi_\sigma(y, x) = r^{k-2} \varphi_{\sigma,1}(y, x),$$

equality is true where

$$\varphi_{\sigma,1}(y, x) = \sum_{j=1}^n (x_j - y_j) \frac{\partial \varphi_\sigma(y, x)}{\partial x_j} + \varphi_\sigma(y, x)$$

function is also a harmonic function в  $R^m$  by variable  $x$  including point  $y$ .

$$\frac{\partial r^k \varphi_\sigma(y, x)}{\partial x_j} = \frac{\partial r^k}{\partial x_j} \varphi_\sigma(y, x) + r^k \frac{\partial \varphi_\sigma(y, x)}{\partial x_j} = k(x_j - y_j) r^{k-2} \varphi_\sigma(y, x) + r^k \frac{\partial \varphi_\sigma(y, x)}{\partial x_j}.$$

**Evidence:** 
$$\frac{\partial^2 r^k \varphi_\sigma(y, x)}{\partial x_j^2} = k r^{k-2} \varphi_\sigma(y, x) + k(x_j - y_j) \frac{\partial r^{k-2}}{\partial x_j} \varphi_\sigma(y, x) + k(x_j - y_j) r^{k-2} \frac{\partial \varphi_\sigma(y, x)}{\partial x_j} + \frac{\partial r^k}{\partial x_j} \frac{\partial \varphi_\sigma(y, x)}{\partial x_j} + r^k \frac{\partial^2 \varphi_\sigma(y, x)}{\partial x_j^2}.$$

There fore

$$\begin{aligned} \sum_{j=1}^n \frac{\partial^2 r^k \varphi_\sigma(y, x)}{\partial x_j^2} &= \Delta r^k \varphi_\sigma(y, x) = k n r^{k-2} \varphi_\sigma(y, x) + \sum_{j=1}^n k(x_j - y_j) \left( \frac{\partial r^{k-2}}{\partial x_j} \right) \varphi_\sigma(y, x) \\ &+ 2k \sum_{j=1}^n (x_j - y_j) r^{k-2} \frac{\partial \varphi_\sigma(y, x)}{\partial x_j} + \sum_{j=1}^n r^k \frac{\partial^2 \varphi_\sigma(y, x)}{\partial x_j^2} \end{aligned}$$

as  $\varphi_\sigma(y, x)$  harmonic function в  $R^m$  by variable  $x$  including point  $y$

$$k \sum_{j=1}^n (x_j - y_j) \frac{\partial r^{k-2}}{\partial y_j} \varphi_{\sigma}(y, x) = k \sum_{j=1}^n (k-2)(x_j - y_j)^2 r^{k-4} \varphi_{\sigma}(y, x) =$$

$$= k(k-2) \sum_{j=1}^n (x_j - y_j)^2 r^{k-4} \varphi_{\sigma}(y, x) = k(k-2) r^{k-2} \varphi_{\sigma}(y, x)$$

$$\Delta r^k \varphi_{\sigma}(y, x) = (kn + k(k-2)) r^{k-2} \varphi_{\sigma}(y, x) + 2k r^{k-2} \sum_{j=1}^n (x_j - y_j) \frac{\partial \varphi_{\sigma}(y, x)}{\partial x_j}$$

$$\text{If } \varphi_{\sigma,1}(y, x) = (kn + k(k-2)) \varphi_{\sigma}(y, x) + 2k \sum_{j=1}^n (x_j - y_j) \frac{\partial \varphi_{\sigma}(y, x)}{\partial x_j}$$

Marking,  $c = (kn + k(k-2)) = k(n + k - 2)$ , we have

$$\frac{\partial \varphi_{\sigma,1}(y, x)}{\partial x_i} = c \frac{\partial}{\partial x_i} \varphi_{\sigma}(y, x) + 2k \left( (x_1 - y_1) \frac{\partial^2 \varphi_{\sigma}(y, x)}{\partial x_1 \partial x_i} + \dots + (x_{i-1} - y_{i-1}) \frac{\partial^2 \varphi_{\sigma}(y, x)}{\partial x_{i-1} \partial x_i} \right) +$$

$$+ 2k \left( \frac{\partial \varphi_{\sigma}(y, x)}{\partial x_i} + (x_i - y_i) \frac{\partial^2 \varphi_{\sigma}(y, x)}{\partial x_i^2} + \dots + (x_n - y_n) \frac{\partial^2 \varphi_{\sigma}(y, x)}{\partial x_n \partial x_i} \right)$$

In addition, for a second-order partial derivative

$$\frac{\partial^2 \varphi_{\sigma,1}(y, x)}{\partial x_i^2} = \frac{\partial}{\partial x_i} \left( c \frac{\partial}{\partial x_i} \varphi_{\sigma}(y, x) + 2k \frac{\partial}{\partial x_i} \sum_{j=1}^n (x_j - y_j) \frac{\partial \varphi_{\sigma}(y, x)}{\partial x_j} \right) =$$

$$= c \frac{\partial^2 \varphi_{\sigma}(y, x)}{\partial x_i^2} + 2k \left( (x_1 - y_1) \frac{\partial^3 \varphi_{\sigma}(y, x)}{\partial x_1 \partial x_i^2} + \dots + (x_{i-1} - y_{i-1}) \frac{\partial^3 \varphi_{\sigma}(y, x)}{\partial x_{i-1} \partial x_i^2} \right) +$$

$$+ 2k \left( 2 \frac{\partial^2 \varphi_{\sigma}(y, x)}{\partial x_i^2} + (x_i - y_i) \frac{\partial^3 \varphi_{\sigma}(y, x)}{\partial x_i^3} + \dots + (x_n - y_n) \frac{\partial^2 \varphi_{\sigma}(y, x)}{\partial x_n \partial x_i^2} \right)$$

since the harmonic function in a variable including the point

$$\Delta \varphi_{\sigma,1}(y, x) = \sum_{j=1}^n \frac{\partial^2 \varphi_{\sigma,1}(y, x)}{\partial x_j^2} = 2 \sum_{j=1}^n \frac{\partial^2 \varphi_{\sigma}(y, x)}{\partial x_j^2} + \sum_{j=1}^n (x_j - y_j) \frac{\partial \Delta \varphi_{\sigma}(y, x)}{\partial x_j}$$

this implies the assertion of the lemma.

**Consequence 1.** For function  $\Phi_{\sigma}(y, x)$  fair estimate

$$|\Phi_{\sigma}(y, x)| \leq Cr^{2n-2} \alpha^{-m} \exp(\sigma y_m - a \cos \rho_1 \beta_2 ch \rho_1 \alpha), \quad \alpha \geq 1$$

$$|\Phi_{\sigma}(y, x)| \leq C \sigma^{n-2} (r^{2n-m} + \alpha^{-1} r^{2n-m+1} + \sum_{p=1}^{n-2} \alpha^{-2p} r^{2(p+2)}) \exp(\sigma y_m - a \cos \rho_1 \beta_2 ch \rho_1 \alpha), \quad 0 < \alpha \leq 1$$

**Theorem 2.** For function  $\varphi_{\sigma}(y, x)$  there is an inequality

$$\left| \frac{\partial}{\partial n} \varphi_{\sigma}(y, x) \right| \leq \begin{cases} C \sigma^{n-1} \alpha^{-m} \exp(\sigma y_m - a \cos \rho_1 \beta_2 ch \rho_1 \alpha), \alpha \geq 1 \\ C \sigma^{n-1} \left( \frac{|\cos \theta| + r}{r^{m-1}} + \sum_{p=1}^{n-2} \alpha^{-2p-1} r^{-2(n-p-1)-1} \right) \exp(\sigma y_m - a \cos \rho_1 \beta_2 ch \rho_1 \alpha), 0 < \alpha \leq 1 \end{cases}$$

$\alpha_i$  - guide cosines of the normal vector. We denote by the space of polyharmonic functions defined in the order, having continuous partial derivatives of the order up to the end points of the boundary and satisfying the condition:

$$\sum_{k=0}^{n-1} \left( \left| \Delta^k u(y) \right| + \left| \text{grad} \Delta^{n-k-1} u(y) \right| \right) \leq C \exp(\exp \rho_2(y')). \quad (3)$$

**Theorem -3.** Function,  $\Phi_{\sigma}(y, x)$  fixed  $x \in D$  function  $\Phi_{\sigma}(y, x)$  satisfies

$$\sum_{k=0}^{n-1} \int_{\partial D \setminus S} \left[ \left| \Delta^k \Phi_{\sigma}(y, x) \right| - \left| \frac{\partial \Delta^k \Phi_{\sigma}(y, x)}{\partial \bar{n}} \right| \right] ds_y \leq C(x) \varepsilon(\sigma),$$

where the constant depends on  $x$  and is the external normal to, when  $\sigma \rightarrow \infty$ .

We denote by the space of polyharmonic functions defined in  $D$  of order  $n$ , having continuous partial derivatives of order  $2n-1$  up to the end points of the boundary and satisfying the condition:  $\sum_{k=0}^{n-1} \left( \left| \Delta^k u(y) \right| + \left| \text{grad} \Delta^{n-k-1} u(y) \right| \right) \leq C \exp(\exp \rho_2(y'))$ .

**Theorem - 4.** Let for the function  $u \in B_{\rho_2}(D)$  at any point the inequality

$$\sum_{k=0}^{n-1} \left| \Delta^k u(y) \right| + \left| \frac{\partial \Delta^{n-1-k} u(y)}{\partial \bar{n}} \right| \leq C \exp \left( a \cos \rho_3 \left( y_1 - \frac{h}{2} \right) \exp \rho_3 |y'| \right) \quad (6)$$

where  $\rho_1 < \rho_2 < \rho_3 < \rho$ . Then for any point  $x_0 \in D$  equality holds

$$u(x_0) = \sum_{k=0}^{n-1} \int_{\partial D} \left[ \Delta^k \Phi(y, x_0) \frac{\partial \Delta^{n-1-k} u(y)}{\partial \bar{n}} - \Delta^{n-1-k} u(y) \frac{\partial \Delta^k \Phi(y, x_0)}{\partial \bar{n}} \right] ds.$$

Note that for arbitrary  $F_i(y)$ ,  $G_i(y)$  task (1)–(2) insoluble.

### **ABSTRACT**

*The given article is about Mukhammad Riza Erniyazbek's son Agakhi's activity as a master. On the basis of works created about Agakhi in belles-lettres, the symbol of Agakhi as a master has been analyzed. This literary truth has been proved comparing straightly to the historic facts.*

**KEYWORDS:** *Literary Fact, Spirit Positively, Belles-Lettres, Statesman.*

### **INTRODUCTION**

Mukhammad Riza Erniyazbek's son Agakhi is an outstanding representative of classical literature in the XIXth century. He is an intellectual image who submitted changes to not only in the literature of his age but also in his life period as an intercessor of socio-political and cultural affairs. His poems, historic and translation works which made his name immortal, influenced not only to XIXth century, but also nowadays spirit positively. A lot of work have been carried out as an acknowledgement to our ancestor. For instance, six-volume of his works were published, his divan "Taviz ul-oshiqin" was printed two times, the republican scientific-theoretical forum was held devoted to his 210th anniversary called "Agakhi-a poet, a historian, a translator". Also in novel, drama and other genres of our modern literature, several works are created about our historic image. In these works, as a literary image Agakhi is seen as a poet, a statesman, a master, a father and a beloved. As we know, the historic facts in belles-lettres differ from the real ones. Because each literary fact has some changes accordingly to authors' imagination. But the author's approach should suit the historic fact and image observing the measures when putting the historic fact into belles-lettres.

"Death does not create anything, but it reveals the ready and hidden truth. If life is fully submitted into literary work, it loses its reality and cannot be even a literary fact..." The writer

who addresses to the real fact should synthesize the reality in his fantasy, it means that he ought to enrich it with his own imagination, choosing the characteristically important facts and create the literary fact. So, as Abdulla Kahharones said, "real fact appears when you feel it through the prism of your soul, when it absorbs your thoughts, and when you express it adding your desires and ideals". As we mentioned above Mukhammad RizaErniyazbek's son Agakhiy was a versatile person. In nowadays literary works, he is characterized as either a beloved or a master and a statesman. Some literary works are mainly based on his one feature and his other characteristics are partially lightened up. We would like to And we are going to look into the attitude of Agakhi as a master to his apprentices in the literary works via the given article. It is Important to mention that, relation between master and apprentice is a specific tradition among the eastern people. Also a lot of proverbs, sayings and fairy-tales were created about relationship between master and apprentice in Uzbek folklore. Especially, the uzbek proverb "Master is as great as father" ("Ustozotangdekulug") shows the complete respect to the master. These phrases were proved in the life and working activity of Agakhi. Mukhammad RizaErniyazbek's son Agakhiy was the master of many young apprentices. Among his apprentices there was even the Khan of Khiva Khanate Feruz. Being the master of the head of a big state, shows how great Agakhi's status was. Whatever literary work was created, in each of them it was mentioned of Agakhi's being the master of a khan. It is considered to be a great historic event that can't be forgotten. Very few writers could gain such honour and recognition. Such case can also be seen in the life of the king of poetry and gazal Alisher Navoi, which is out of Agakhi's life. These two outstanding creators used to be both masters and friends with the kings. And this shows how their working activities were honored.

In the novel by ErkinSamandar "The traces of whirlwind or Agakhi" which is about the life and working activity of Agakhi, the relationship between master and apprentice is reflected very brightly. Exactly by these kind of works can we be the witness to the selflessness of Agakhi in educating the successors of the XIX th century classical literature. In the work Agakhi's model as a master is seen like father and friend syncretically. The model of Agakhi as a master is revealed by relating to patriotism, which should be mentioned as the achievement of the author. The work deals with the relationship between Agakhi and Feruz, Agakhi and Abdumalik Tora, Agakhi and Yakubdjan.

So many characters in the work are given as Agakhi's enemies. Exactly via those characters Agakhi's prestige of being a master is shown. The way of brightening up one image's positive specific features contrasting it to another opposite one shows how proficient the author is. These descriptions didn't affect the historic fact. Contrarily, they increased Agakhi's effective characteristics. In its turn the following words uttered by M. Gorki to a poetess G. Serebryakova can be proof to our idea: "... in a historic prose the events and conditions should be exact and true to life describing daily details". "If the reader begins doubting a little, they won't believe the writer."

Chapter I starts with the description of Master Agakhi's beautiful garden and suddenly shifts to apolitical process. Then another image of a king Abdumalik Tora, who considered Agakhi as his distant master, appears. In the following discussion in the stronghold the khan Feruz and Abdumalik Tora are contrasted to each other, but the fact that both of them were ticklish tasted poets and considered Agakhi as their master shows their general features between each other. The point of showing the general features of those two is to implicit the signal of being able to

unite the two states into one and resist the enemy. And then the image appears under the character of “steppe spider(qoraqurt)”. Just when two heads of states come to compromise, the agreement fails because of Malangkhanardar’s swords “Father and son are enemies”.

In its turn the fact that Agakhi is a specific figure is shown via his own thoughts and decisions. Agakhi had felt that Malangkhan intentionally spreads dissent in order to make the meeting intense. In the following chapters the opinion of master Agakhi is confirmed. Abdumaliktorahad also no idea about it. Then it turns out that the only reason to these events is trait which proved master Agakhi’s thoughts.

In just the same politically difficult situation, the relationship between Agakhi and the khan of Feruz is expressed accordingly to those events of that period. Feruzkhan considered Agakhi as his master not only in creative sphere but also in state affairs. Feruz used to follow Agakhi’s advice in solving any political issue. The khan even visited Agakhi’s house when the master was ill in bed. Or just consulted with Agakhi through a letter. And this shows how great Agakhi’s prestige was in the political sphere of the state.

Agakhi’s love as a master turns into love of a father in the process of the work. It can be seen with the examples of the fate of children which caused Russian Empire fight against the Khiva khanate. In fact the fate of those children which led to the war wasn’t so important to the “yellow rooks(soriqargalar)”. In its turn the destiny of twenty one children as slaves is revealed through the images of Bobokul and Sotlik bola(child) in contrast to each other.. Sotlik bola(child) is the image under the character “karakurt”(steppespider) who suffered from tyrant Shamuradinak. Inak tortured Sotlik bola(his real name was Serafim) who was only seven years old. The following extract shows how it was influential. “Inak wounded him. Inverted the ground under his feet. It seemed like the stones and rocks moved around and fell on the head of Serafim, threshed and injured him. His sensitive part of his body was cut down ...”. And the image Babakul(real name Borya) was brought up by his boss mirab(water-supervisor) and the neighbor of that mirab Agakhi. He was circumcised at the age of five and learned how to pray namaz from Yakubdjan. From the words of the author, that boy if not to take into account the fact that he was fair-haired, the boy looked like a typical Khorezmian. These contrasts are solved at the end of the work. Mainly, one day Serafim puts out Shamurad’s eyes. And Babakul who was educated by Agakhi, served the master like his son. Agakhi gave the boy who had been brought as a slave, a great blessing: a family. The role of the family in every person’s life is incomparable. “... According to the results in pedagogical and socio-psychological researches, the role of the family in bringing up the children spiritually, emotionally and morally, is proved to be incomparable”

The follower, apprentice and a person whom Agakhi considered like his own son, was Yakubdjan. Agakhi was more like a father than a master to the character of Yakubdjan. Master Agakhi adopted him(Yakubdjan) in his early childhood. Agakhi taught him all secrets of poetry and brought him up treating him like a father. The character of Yakubdjan is embodied as an honest person who was taught by Agakhi in the writings. “Once told to answer unjustly to the complaint letter, he couldn’t help being exasperated, he bursted. Having told his own opinion, he left snapping the door”. Agakhi’s syncretism love as a master and a father is brightened up via the character of Yakubdjan. On the one hand Agakhi remarks Yakubdjan as a master, on the other hand Agakhi worries about him like a father. Yakubdjan who was the victim of pure love,

intensifies the dramatic effect of the work. Agakhi's writings where he wrote about his suffering from being childless are expressed effectively. In its turn, it is important to point out that the model of a father is also has its contrasting side. Here the characters of the father of Abdumaliktoranir Muzaffar and Agakhi who treated his apprentices like a father are contrasted to each other. Emir Muzaffar treated his child like his enemy while Agakhi considered his apprentices like their father.

The relationship between Abdumaliktoranir and Agakhi as a master and an apprentice, is also brightened up without repeating the above mentioned facts. So many writers considered Agakhi, who was famous of his time as a distant master. Even though they never saw Agakhi, they used Agakhi's works and style as a model for themselves. Abdumaliktoranir was one of them. He had never seen Agakhi, but they could build a master-apprentice relationship in a very short time. The harmonious similarity between Agakhi and the prince Abdumaliktoranir in the way of their outlook and making decisions with a deep reflection attracts Agakhi's attention, and they make a relationship as a master and apprentice in a short period of time. One thing ought to be remarked that this is the second time Agakhi had been acknowledged as a master by the kings. Via their conversations mainly the opinions about Agakhi's human qualities can be understood. For instance, the viewpoints of two sides about outcome, kindness and evil deed are set forth. Especially, Abdumalik who suffered from betrayal, makes the conversation serious by his opinions on people who don't deserve kindness. In its turn Agakhi's viewpoint about this situation is reflected in the following couplet.

Parvarishilatikan gul bo'lmas, (A thorn doesn't turn into a flower with care)

Ham tarbiyatilazog' bulbul bo'lmas. (And neither does cuckoo into a nightingale with care)

Asliyomongayaxshilikmingqilsang, (If you do so much good to an evil)

Yaxshilikoningniyatibilkulbo'lmas. (You can't make him wish good)

The event of Bukhara emirate being occupied is submitted in the work intentionally. This was like a warning to the leaders of the Khiva khanate. Abdumaliktoranir dreams about while sleeping after the conversation with Agakhi. Kulpashsha's sorrowful situation is brightened up so expressively via the dream. Abdumaliktoranir's dialogue with his father Muzaffar in his dream can be an example to this fact. Here Emir Muzaffar's condition at Kulpashsha is described as following. "He was tired and hasty. He looked like a helpless king as if he kept his throne by losing his will. Neither a king, nor a citizen". The whole view is formed by Abdumaliktoranir's phrase "Is there a way out to the helplessness?". Also in Abdumalik's speech embodies a patriot who considers to fight up to death for their motherland than living and serving to the enemy. "Government with no right. Government which makes the people kneel before the enemy and follows the rules of the enemy. It is better to shepherd in the desert".

The author tries to express the spirit of Agakhi in every detail of the work. This can be seen in the description of the landscape. Every description of the scenery changes correspondently to the events of the work. The author tries to brighten it up referring to the experiences of Agakhi. For instance, the descriptions of the sceneries of Agakhi's garden in chapter one and chapter five are also contrasted. For example, in chapter one the beauty of Agakhi's garden is described brightly, and in chapter five when the enemy's attack was inevitable, the garden is described as the following. "Although the flowers were full in bloom, the diverse colours on the leaves were fewer

than before, although the mulberry ripened, but it has fewer fruit, the streams were passive, with no bright waves as it was before. The nightingales which used to sing every year, disappeared, only several of them are there and they don't sing they mourn, just mourn".

Agakhi, with his works filled with moral ideas, is the edifying light not only of his epoch, but also for the people of nowadays. The literary heritage of Agakhi has been a school for the writers and poets for so many centuries. They respect Agakhi, considering him as their master. It is for sure that we should be proud of the fact that we have such a wonderful genius master. And Agakhi deserves this respect and love.

## THE STATE OF THROMBOCYTIC LINK OF HEMOSTASIS IN CASE OF INSULIN RESISTANCE SYNDROME

**Ismatova Mehriniso Nasritdinovna\***; **Shadjanova Nigora Saidjanovna\*\***

<sup>1,2</sup>Bukhara state medical Institute,  
Bukhara, UZBEKISTAN

### ABSTRACT

*The significance of insulin resistance syndrome in the formation of platelet pathology of hemostasis was studied. The object of the study was 110 patients with metabolic syndrome. As comparison groups, 2 groups were identified (one - individuals without insulin resistance syndrome, the second group - patients with type 2 diabetes). The introduction into the diagnostic methods of hemostasis in the case of insulin resistance syndrome reduces the risk of the formation of cardiovascular diseases and the associated increased mortality of the population. The functional activity of platelets in violation of the sympathoadrenal and vaginal phases of the glycemic curve was studied.*

**KEYWORDS:** *Insulin Resistance, Diabetes Mellitus, Hemostasis, Glycemic Curve, Myocardial Infarction.*

### INTRODUCTION

In recent years, much attention has been paid to metabolic syndrome (MS), which is based on insulin resistance [1,5]. This syndrome includes a number of risk factors (RF): arterial hypertension (AH), impaired glucose tolerance (IGT), dyslipoproteinemia (DLP), obesity, hyperuremia and other risk factors. It should be noted that in individual studies, the number of components included in the MS varies [2,4]. However, hypertension, body mass index (BMI), hyperlipidemia and hyperinsulinemia remain the main components of MS.

The metabolic syndrome, being a clinical example of comorbidity, refers to clusters of risk factors for cardiovascular countervailing [3, 6]. Insulin resistance, arterial hypertension, dyslipidemia, hyperglycemia, united by the framework of the metabolic syndrome, lead to the development of atherosclerotic changes in blood vessels and are accompanied by a change in hemostasis. Among the mechanisms involved in the processes of atherothrombosis, platelet hyperactivity is of the greatest importance, and the close relationship between the processes of

atherogenesis and thrombosis in conditions of hyperglycemia, dyslipidemia, and arterial hypertension pathogenetically justifies long-term antiplatelet therapy [5,7,8].

The role of MS in the development of cardiovascular diseases and high mortality from them can be considered proven. However, the specific mechanisms of the formation of cardiovascular diseases in the case of insulin resistance syndrome require much further study. One of the main risk factors for the formation and death of a number of cardiovascular and endocrine diseases are disorders in the hemostatic system. However, studies of recent decades have shown the important role of insulin resistance syndrome in the formation, more severe course and increased mortality in the metabolic syndrome [2,7].

Unfortunately, to date, questions about the role of insulin resistance in the formation of hemostatic disorders have not been studied. Meanwhile, the development of technologies for evaluating the hemostasis system, as well as methods for correcting disorders in the coagulation and anticoagulation systems of the blood, may be an important prerequisite for reducing morbidity and mortality [3,8].

The role of MS in relation to other internal diseases still needs to be studied. To date, there is convincing evidence of the important role of diabetes in the formation of hemostatic disorders. However, in the literature there is practically no information about the role of IGT in this process. Meanwhile, IGT, in a certain sense, can serve as a marker of insulin resistance (meaning impaired glucose tolerance 2 hours after glucose loading). In some cases, IGT can be considered as a pre-stage of diabetes mellitus. Therefore, clarification of the role of IGT in the formation of hemostasis disorders, as well as the development of methods for its treatment with IGT, can play a decisive role in the primary and secondary prevention of increased thrombosis and, as a result, a decrease in cardiovascular risk [4,6].

Purpose of work. To study the significance of insulin resistance syndrome in the formation of platelet pathology of hemostasis.

## **MATERIALS AND METHODS**

The object of the study are 110 patients with metabolic syndrome. As comparison groups, 2 groups will be determined (one - individuals without insulin resistance syndrome, the second group - patients with type 2 diabetes).

All 2 groups were randomized according to the main demographic and clinical indicators.

The survey included the following methods: interrogation, biochemical instrumental.

Interview Methods:

- a standard WHO questionnaire for detecting angina pectoris (the presence of pain or other unpleasant sensations localized behind the sternum and / or / in the left half of the chest and left arm, appearing during physical activity and ceasing after a decrease in intensity or cessation of physical activity);
- a standard WHO questionnaire to identify possible myocardial infarction (history of severe pain piercing the front of the chest and lasting 30 minutes or more, in the absence of cicatricial changes on the ECG).

### **Instrumental methods:**

- The ECG was recorded on a 6-NEK electrocardiograph at rest in 12 generally accepted leads. Analysis of IHD data was carried out according to the Minnesota code according to the

following criteria: a certain myocardial infarction - the presence of cicatricial changes on the ECG (categories 1-1.2 minnesota code MC); angina pectoris - the presence of a pain syndrome that meets the criteria of the WHO questionnaire, in the absence of categories 1-1.2 MC; painless coronary heart disease - in the presence of ischemic changes on the ECG (categories 4-1.2 and 5-1.2 MC) in the absence of left ventricular hypertrophy, angina pectoris and categories 1-1.2 MC; a possible history of myocardial infarction (according to the WHO questionnaire) - in the absence of cicatricial and ischemic changes on the ECG, as well as angina pectoris; possible coronary heart disease, including possible cicatricial changes in the myocardium by ECG (categories 1-2-8 and 1-3 MC), possible myocardial ischemia (categories 4-3, 5-3 MC), arrhythmic form (categories 6-1.2; 7 -1 and 8-3 MC), myocardial ischemia in the presence of left ventricular hypertrophy (categories 4-1.2 and 5-1.2 in the presence of 3-1.3 MC).

**Results.** When assessing blood pressure (BP), the average values of 2 measurements taken at intervals of at least 2 minutes were taken into account. The following values were taken for AH (in mmHg): systolic blood pressure (SBP) > 140 and / or / diastolic blood pressure (DBP) ≥ 90. According to the current classification (WHO, 1999), the following categories are distinguished (in mm. Hg): optimal blood pressure (SBP < 120; DBP < 80); normal blood pressure (SBP < 130; DBP < 85); high normal blood pressure (SBP 130-139; DBP 85-89); 1 degree of hypertension (SAD 140-159; DBP 90-99); Grade 2 AH (GARDEN 160-179; DBP 100-109); Grade 3 hypertension (SBP > 180; DBP > 110). However, given the fact that in this study, hypertension was considered only as one of the components of MS, these categories were grouped as follows: normal blood pressure: SBP ≤ 139; DBP ≤ 89, AG - SBP ≥ 140; DBP ≥ 90. However, hypertension was recorded regardless of blood pressure if the patient took antihypertensive drugs within 2 weeks prior to the examination.

- overweight, according to the recommendations of the International Group on Obesity (1997), is fixed at the Kettle index (KI) calculated by the formula: weight (kg) / height (m)<sup>2</sup>, ≥ 25, and KI levels ≥ 30 are taken as obesity. However, in population studies for BMI it is recommended to take KI values > 29 (Rose G.A., Blackburn H., 1968). Therefore, in this work, KI ≥ 30 indicators were taken as the BMI criteria, since this KI level differs little from the BMI criteria recommended for population studies and, at the same time, meets the obesity criteria recommended by the International Obesity Group.

### Biochemical studies:

- the lipid content in venous blood was determined during initial screening on an AA-2 autoanalyzer from Technicon, and upon repeated examination on an Hospitex analyzer. We studied the levels of cholesterol (cholesterol), triglycerides (TG) and β-lipoproteins (β-LP). The values of cholesterol > 260 mg% were taken for hypercholesterolemia (HC), the level of TG > 180 mg% for hypertriglyceridemia (GTG), and the level of β-LIP > 55 opt.ed for hyperbetalipoproteinemia (HβLP). (upon repeated examination, the concentration of β-LP was determined by the calculation method). For a comparative study of the criteria for assessing lipid parameters, the work also used the criteria of the European Society of Cardiology, the European Society of Atherosclerosis, the European Society of Hypertension and the criteria of the US National Cholesterol Education Program.

- the state of glucose tolerance was evaluated on the basis of indicators of the standard glucose tolerance test (SGTT) with the determination of fasting glycemia, as well as 1 and 2 hours after

taking the subject 75 g. glucose. Evaluation of the data was carried out according to the following criteria (in mg%): normal glucose tolerance: with fasting glycemia <100, 1 hour after glucose loading <160 and 2 hours <100; impaired glucose tolerance: fasting glycemia <100; 1 hour after glucose loading > 160 and / or 2 hours > 100; diabetes mellitus: fasting glycemia > 100, 1 hour after glucose loading > 180, 2 hours > 130. At the same time, the modern WHO recommendations (WHO, 1996) were used in the work, according to which cases of glycemia after 2 hours are accepted after glucose loading  $\geq 140$  mg% with normal fasting glycemia (<100 mg%).

## CONCLUSIONS

The introduction into the diagnostic methods of hemostasis in the case of insulin resistance syndrome reduces the risk of the formation of cardiovascular diseases and the associated increased mortality of the population. The functional activity of platelets in violation of the sympathoadrenal and vaginal phases of the glycemic curve was studied. New methods for the prevention and treatment of platelet hemostasis disorders have been developed which allow achieving economic efficiency by reducing hospital stays, as well as medical efficiency due to minimal morbidity, disability and mortality.

### ABSTRACT

*The given article highlights briefly the issues related to the translation of phraseological units like idioms and phrasal verbs, effectively usage of them while translating, at the same time looks through and learns the meanings of phrasal verbs and idioms in the translation of the novel by Carol Ermakova.*

**KEYWORDS:** *Phraseological Unit, Phrasal Verb, Idiom, Translation, From Head To Toe, Go By Name, Meaning, Different Combinability Of Words, A Specific National Feature, Hold Up, Stylistic-Expressive Component In Meaning.*

### INTRODUCTION

For the next decades, as in all countries, translation theory have been consistently developing in our country. The quality of translation is gradually improving as well. "Days Gone By" is well-known for its historical writing style including in great deal of phrasal verbs, proverbs and sayings in it. "Days Gone By", has been widely studied in the fields of literature, linguistics, translation and interpretation and other issues of translation worldwide. It was translated into English several times.

"Regrettably, Abdulla Qadiri's work is not well known abroad. For this reason, we have decided to publish *Days Gone By* in English, and release a new edition in Uzbek using the Latin alphabet our young people are more familiar with nowadays. For the English –speaking readers, we have included brief footnotes explaining some quintessential aspects of the Uzbek culture so vividly portrayed here, as well as to give a little back-ground to historical events referred to in the novel.

The new edition contains artwork by one of the best representatives of Uzbek contemporary art, BoburIsmailov.

We hope that this new publication will play a significant role in bringing Uzbekistan's rich literary heritage to a worldwide audience, and are delighted to present one of its brightest lights, Abdulla Qadiri."

In 2018, "Days Gone By" was translated into English by Carol Ermakova. The first example of the Uzbek literature was also published in Nouveau Mond, the French publishing house in 2019. She first visited Russia as a student in the turbulent Perestroika years, later returning to live and work in St. Petersburg, and then Moscow. Ms.Ermakova has travelled widely throughout the former Soviet Union, including several visits to Central Asia, most notably Tashkent, Bukhara and Samarkand. She now lives in the North Pennines, working as a freelance translator specializing in contemporary Russian literature.

Translating a phraseological unit is not an easy matter as it depends on several factors: different combinability of words, homonymy, synonymy, polysemy of phraseological units and presence of falsely identical units, which makes it necessary to take into account of the context. Besides, a large number of phraseological units have a stylistic-expressive component in meaning, which usually has a specific national feature. The afore-cited determines the necessity to get acquainted with the main principles of the general theory of phraseology.

The following types of phraseological units may be observed: phrasemes and idioms. A unit of constant context, consisting of a dependent and a constant indicators may be called a phraseme. An idiom is a unit of constant context which is characterized by an integral meaning of the whole and by weakened meanings of the components, and in which the dependent and the indicating elements are identical and equal to the whole lexical structure of the phrase.

In this article we analyse the use and meaning, translation of the phrasal verbs and idioms which are used in the novel "Days Gone By", the first novel written by Abdulla Qadiri (1894-1938), has been read and loved by many generations of Uzbeks. His first novel, Days Gone By (O'tkankunlar) was first published in 1922 when the author was just 28 years old, and was one of the most influential Uzbek writers of the twentieth century. Born into a modest family, he developed an interest in literature while working as a book copier and was soon writing short stories, plays and newspaper articles of his own, and he won the hearts of his people with its simple yet evocative prose and gripping storyline. To quote the critics: "Abdulla Qadiri burst into Uzbek literature like a peal of thunder. Bright as a flash of lightning, he caught the attention of all."

Other works include the novel The Scorpion from the Altar (Mehrobdanchayon) and acclaimed satires KalvakMahzumningxotiradaftaridan (From Mahzum the Simpleton's Diary) and Toshpo'lattajangnimadeydi? (What Does Irritated Toshpo'lat Say?), published in Uzbek and Russian.

Qadiri was working on a third novel when his creativity was cut short; in 1937 he was arrested, and subsequently executed at the age of just forty-four.

## MATERIALS AND METHODS

Translation problems of classical work “Days Gone By” are the main issues in interpretation of the literary text today including revealing the use and meaning of the phrasal verbs and its’ cognitive-conceptual analysis where some phrasal verbs have different definitions in the dictionaries.

Using phrasal verbs and idioms appropriately while translating is not an easy work. A phrasal verb depends on the different particles which come after the verbs and identify the meaning of the phrasal verbs. While translating “Days Gone By” from Uzbek into English translator came across to the translation problems, and one of the most difficult of them is using phrasal verbs and idioms in the translation. Firstly, we should give the definition of phrasal verb. What is a phrasal verb? Does Uzbek language also have a phrasal verb?

A phrasal verb is a verb formed from two (or sometimes three) parts: a verb and an adverb or preposition. These adverbs and prepositions are often called particles when they are used in a phrasal verb.

Most phrasal verbs are formed from a small number of verbs (for example, get, go, come, put and set) and a small number of particles (for example, away, out, off, up and in).

Phrasal verbs sometimes have meanings that you can easily guess (for example, sit down or look for). However in most cases their meanings are quite different from the meanings of the verb they are formed from. For example, “hold up” can mean “to cause a delay” or “to try to rob someone”. The original meaning of hold (for example, to hold something in your hands) no longer applies.

Uzbek language doesn’t have phrasal verbs. There are only verbs that denote action and statives. And while translating a translator uses phrasal verbs instead of the above mentioned action verbs and statives. Here some sentences from the book “Days Gone By” in which used phrasal verbs and idioms effectively and appropriately while translating into English. There is a definition of each phrasal verb and an idiom before the sentences to clarify the meanings of it.

### Used phrasal verbs:

1. The definition of *sit down*- “to be in a position in which the lower part of your body rests on a seat or on the ground, while the upper part of your body is upright/to lower your body into a sitting position.”

Uzbek: Бирок Отабек тўшаги ёнига ўлтурдида, яна ўйлаб қолди...(p: 9)

English: However, having *sat down*, Atabek remained motionless, lost in thought... (p: 25)

Uzbek: Qizining yonig’ao ‘*lturibso*’ zlasho’rniga yum-yum yig’lay boshladi. (p:115)

English: *Sitting down* beside her, instead of broaching the subject, Oftobayim began crying bitterly. (p:197)

2. The definition of *go on*- to continue happening or doing something as before.

Uzbek: - Манимча, уйланишдек нозик бир иш дунёда йўқдир, ғ деди Раҳмат ва Отабекка юз ўғирди. - Уйлангач, хотининг таъинига мувофиқ келса бу жуда яхши; йўқса, мунчалик оғир гап дунёда бўлмас.(p:3)

English: Turning to Atabek, he *went on*: “Once married, it is of the utmost importance that the wife should suit the husband’s nature. Otherwise, there is no more troublesome task in the whole wide world.” (p:15)

3. The definition of *look in* – to visit someone for a short time on your way to another place, especially if they are ill or may need help.

Uzbek: Кутидор билан бек ялт этиб Кумушка қарадилар. (p: 55)

English: Kutidor and Atabek swiftly *looked in* her direction.(p: 101)

4. The definition of *look into something* – to try to discover the facts about something such as a problem or a crime.

Uzbek: Хотинҳамичкаригакиргач, Офтобойимэшиқниқиябеклади-да, қайғулиқбирбоқишбиланхотингақаради. – Негақайғулиққўринасан, Офтоб?

English: “Why are you so sad, Oftob?” asked the woman, *looking into her friend’s doleful eyes*. (p: 54)

5. The definition of *look at someone/something* – to direct your eyes towards someone or something so that you can see them:

Uzbek: Отабек Раҳматнинг сўзини ихлос билан эшитди ва “сен нима дейсан?” дегандек қилиб Ҳомидга қаради. (p:4)

English: After listening to Rakhmat with sympathy and attention, Atabek *looked at Hamid*; what would he say to this? (p: 15)

6. The definition of *come over someone*– if a feeling comes over you, it suddenly affects you in a strong way:

Uzbek: Отабек қизиқ ҳолатда қолди: бир турлик титраб кетди, кўзлари қинидан чиқар даражага етди. (p: 25)

English: Something strange *came over Atabek*: he shuddered, his eyes goggled, all but popping from their sockets.(p: 51)

7. The definition of *prepare for* – to make food ready to be cooked or eaten, for example by cleaning or cutting it.

English: Their day’s business done, the lodgers now made their way back to the shelter of the caravanserai, where many of the residents were already bustling about, *preparing for* the evening meal.

Uzbek: Саройаҳликундузгиишқучлариданбўшабхужраларигақайтқанлар, кўбхужраларкечликошпиширишиламашгул, шунингучункундузгигақарағандасаройжонлиқ: кишиларнингшақиллабсўзлашишлари, хоҳолабулишишларисаройникўккакўтаргудек.

8. The definition of *agree with* – to have the same opinion with somebody else.

Uzbek: “Хомушлигим сизга ҳам сезилдими, билмадим ... Марғилон ҳавоси мижозимга тўғри келмаганга ўхшайдир...” (p: 11)

English: “You have noticed my despondency ... In truth, I am in a quandary...Evidently this Margilan climate *does not agree with me*.” (p: 28)

9. The definition of *give over to something* – to allow (oneself) to be fully affected by, controlled by, or involved in (something); dedicate, devote.

Uzbek: Кўб ўйласа ҳам бир қарорга кела олмади. Аммо эртага бекнинг ўзини синаб кўрмакчи бўлиб кўзи уйкуга кетди. (p: 11)

English: Finally, he determined to winkle everything from Atabek the very next day. Relieved, he *gave himself over to sleep*. (p: 27)

10. The definition of *drift off* – start to fall asleep.

Uzbek: Тун тонг отарга яқинлашган, унинг уйкулик мияси ҳеч бир турлик бу муаммони еша билмас эди.(p: 11)

English: Night retreated softly, giving way to approaching dawn and, wearied by his futile efforts to solve this mystery, Khasanali began *to drift off*. (p: 27)

11. The definition of *hang over someone*– if something hangs over you, you worry about it or feel upset about it.

Uzbek: “Бир неча кундан бери хомушроқ кўринасизми?” (p: 11)

English: “For how many days now, has this sorrow been *hanging over* my bek?” (p: 28)

Idioms are expressions whose meaning cannot be completely understood from the meanings of the component parts. According to the classification of phraseological units by N.Amosova phrasemes and idioms are subdivided into movable and immovable. These qualities depend upon the structure of the unit. A phrase is called movable when one of its elements may vary. For example, *the apple of one's eye* means somebody dear for a person. In other words, this phrase refers in English today to something or someone that one cherishes above all others. Originally, the phrase was simply an idiom referring to the pupil of the eye:

Uzbek: Меналбаттакўзингизнинг оқуқорасибўлган ёлғиз қизингизни ярамас, бўлмағур кишига тутиб берарсиз, деб билмайман. (p: 23)

English: Of course, I would never even entertain the thought you might wish to give our beloved daughter, the apple of our eye, to a bad or unsuitable person. (p: 49)

### Used idioms:

1. *To be out of earshot* – too far away to hear somebody/something or to be heard.

Uzbek: Отабек Раҳматнинг саволига жавоб бермай эшикка қаради. Ҳасаналини хужрадан узоқлатиб сўнгра жавоб берди. (p: 2)

English: Atabek fell silent for a while, then glanced at the door. Only when he was satisfied the old man *was out of earshot* did he reply. (p: 13.)

2. *To be at a loss for words* – having nothing to say; stunned to the point of speechlessness.

Uzbek: Масаланинг бу янглиғ бошланишига ва бунинг устига эрининг мойилланишига Офтобойим нима дейишни билмай қолди.(p: 23)

English: Oftobayim was at a loss for words, seeing her husband clearly tending towards accepting the proposal. (p: 48)

3. *To be in one's hands* – in someone's possession or under their control.

Uzbek: -Чункинима бўлганда ҳам сизнинг оталиқ исмингиз бор, ҳам кўброқ ихтиёр сизнинг кўлингиздадир. (p: 23)

English: “You are her father, after all. *Everything is in your hands*”. (p: 48)

4. *from head to toe* – completely covering your body; over the entire body, in its entirety.

Uzbek: Ҳасанали бошдан-оёқ бекни кузатди, оталиқ муҳаббати билан бекнинг орқасини силади ва ёшли кўзлари билан дуо қилиб унга рухсат берди. (p: 31)

English: Khasanali eyed Atabek fondly *from head to toe*, patted him on the back in a fatherly manner and blessed him, with tears in his eyes. (p: 61)

5. *Can't believe one's eyes* – was totally shocked or surprised.

Uzbek: Отабек кўргучи кўзларига ишонмагандек: (p: 55)

English: Atabek *could not believe his eyes*. (p: 100)

6. *Keep an eye on* – keep a watch on something or someone closely; watch carefully; give attention to.

Uzbek: Ҳасанали шаъмни олиб, ўз хужрасига чиқди. Унинг хужраси Отабекнинг билан бир қаторда бўлиб, газмол, пояфзал ва шунинг сингари моллар ила тўлган ва Отабекдан бошқа, алоҳида хужрада туриши ҳам шу молларни сақлаб ётиш учун эди. (p:10)

English: Khasanali took the candle and went to his own chamber located beside Atabek's, it was piled high with fabrics, footwear and other goods. And indeed, that is why Khasanali had taken this room for himself, *to keep an eye on the stock*. (p:25)

7. *To be all ears* – means to be listening closely; to be eager to hear something; to pay close attention when being told something or to be willing to pay close attention; very eager to listen to what someone is going to say

Uzbek: - А - а – а, - деди Ҳасанали ва қайтадан қулоғини тирқишга олиб борди. Энди унинг бутун борлиғи қулоқ бўлиб айланган, ўзини унутиб барча диққати хужра ичига оқган эди. (p: 11)

English: “Aha!” said Khasanali, pressing his ear to the crack in the door once again. Now he pulled himself together, *he was all ears*, his attention fixed on Atabek's chamber. (p: 27)

8. *To raise eyebrows* – means to cause other people to react with surprise or mild disapproval. To raise an/your eyebrow means to move your eyebrows up in a way that shows surprise or mild disapproval. Both of these phrases are often used figuratively.

Uzbek: Ҳасанали тусини бузмади. (p: 12)

English: Khasanali did not so much as *raise an eyebrow*: ... (p: 29)

9. *Don't take on so* - means “no need to upset yourself”. Become very upset, especially needlessly.

Uzbek: Мен бундай йиғлоқ қизларнинг кўпини кўрдим, шундай қизларнинг уялмай-суялмай чимилдиқда ҳатто йигитдан ҳам ортдириб ҳаракат қилганларини ҳам кўрдим, сенинг қизинг ҳам шуларнинг биттаси, қайғирма Офтоб. (p: 27)

English: “I have seen many a maiden weep, but in the wedding bed they are friskier than the groom himself! Your daughter, no doubt, is one of them. *Do not take on so, Oftob.*” (p: 55)

10. *Know no bounds* – a feeling or quality that knows no bounds is very strong and seems to have no limits.

Uzbek: -“Қизиқ гаплар сўзлайсиз”,- деди Отабек, таажжуби ортқан эди.(p: 12)

English: “Your words are shocking!” Atabek’s amazement *knew no bounds.*(p:29)

## RESULTS AND DISCUSSIONS

“Qadiri’s language is simple and unpretentious, his use of metaphor subtle and harmonious. His treatment of his heroine, Kumush, is exquisite. With a few select adjectives and descriptive phrases, this youthful beauty comes to life, winning the reader’s heart. Her name, Kumush – “silver” – resonates with purity and preciousness, a cold yet beautiful light, like moonlight on water. Her face is round and pale as the moon; in Eastern literature, this epithet is often found in poetry, a symbol of unassailable, sacral purity, and sublime beauty. Yet the moon – especially the full moon – is also associated with cold, with dark nights, the drama of human life, and predetermined fate”.

In discussion, I want to analyse the meanings of some sentences that have different meanings in the dictionaries. The first phrasal verb is “go by the name of something”. It means “to use a particular name, especially when it is not your real name” in Macmillan English Dictionary. But in Cobuild Advanced English Dictionary, it is used “when you are saying what someone is called”. And in Merriam-Webster Dictionary, the definition of “by the name of” is “to indicate the name that is used for someone or something”.

The phrasal verb “go by name” is used in the translation of “Days Gone By” several times. In the following sentences translator used this phrasal verb while naming the heroes:

English: The young man, presently engrossed in thoughts privy to none but himself, *went by the name of Atabek.*(p:11)

Uzbek: Қандоғдир бир ҳаёл ичида ўлтурғучи бу йигит Тошканднинг машҳур аъёнларидан бўлган Юсуфбек ҳожининг ўғли - *Отабек.*(p:2)

Uzbek: Бу икки кишининг биттаси гавдага кичик, юзга тўла, озроқкина соқол- муртлик, йигирма беш ёшлар чамалиқ бир йигит бўлиб, Марғилоннинг бойларидан Зиё шоҳичи деганнинг *Раҳмат отлиқ* ўғлидир, ... (p: 2)

English: One of them – a young man, about twenty-five years old, shortish, round-faced, with a sparse beard and moustache – was the son of Ziya-shakhichi, a very well-to-do man from Margilan. He *went by the name Rakhmat.*(p:12)

In the following sentence translator used the name of our main hero “Atabek”, instead of the word “bek” that was origin in Uzbek version of the book.

Uzbek: Кутидор билан бек ялт этиб Кумушка қарадилар. (p: 55)

English: Kutidor and Atabek swiftly looked in her direction.(p: 101)

The same translation in the following sentence. The possessive pronoun “her” is used instead of the name of our heroine. Translator avoided repeating the words here.

Uzbek: Кутидор билан бек ялт этиб *Кумушка* қарадилар. (p: 55)

English: Kutidor and Atabek swiftly looked in *her* direction.(p: 101)

Now pay attention to the use of the phrasal verb “feel something for someone” in translation. The definition for this phrasal verb is “to sympathize with someone”. Here we can see that the translator is a master of her profession!

Uzbek: Ҳасанали бекнинг ҳар бир сирига ўзини маҳкам деб ҳисоблаганликдан, дарҳақиқат, Отабекка *махрам бўлишга лойиқ бир меҳрибончиликқа эга бўлганликдан* хўжазодаси билан очиқ сўзлашиш фикрига келди.(p: 11)

English: But he *felt a sense of responsibility* for Atabek’s state. Overcome with fatherly concern, the loyal servant settled on a candid conversation with his young master. (p: 28)

The next phrasal verb is “*take to one’s bed*” that means “to go to bed and stay there because of illness”. This phrasal verb is used in the translation of the sentence “менҳамишдан чиқади рғанўхшайман...”.

Uzbek: “Марғилоннинг ҳавоси бузиқ экан, бир-икки кундан бери маним ҳам аҳволим ўзгариб бошлади. Марғилондан тез жўнамасақ мен ҳам *ишдан чиқади рған ўхшайман...*” (p: 11)

English: “The weather here in Margilan is miserable. I have been feeling unwell myself for two days now. It would be wise to leave as soon as possible, before I must *take to my bed.*” (p: 28)

## CONCLUSION

The creative legacy of Abdulla Qodiri is, unfortunately, not well-known for foreign readers and they have not received enough information. Therefore, these translations of the work, along with acquaintance with the writer’s works, give foreign readers information about the period, the unique national values and traditions of the Uzbek nation. The Days Gone By is the main play of Abdulla Qodiri. The reason of calling “The Days Gone By” is that the author aimed to demonstrate the original spiritual life of the Uzbek people on the basis of expressing “black days” of nation’s history. The writer tried to describe beautiful decorum, great respect to other people, great spirituality in communication of people with each other, different systems of lifestyle of nation at that period.

In conclusion, I want to mention about the word translator. “A translator” is a person who translates from one language into another, especially as a profession. Translators deal with a lot of challenges. Apart from making sure that text is grammatically correct and uses appropriate tone, they must also decide when and how to translate certain cultural aspects and linguistic nuances. This includes translating phrasal verbs and idioms. In my research, I tried to analyse phraseological features of the translation of “Days Gone By”. We can find that translator used phrasal verbs and idioms effectively and appropriately while translating. And, I am so thankful sincerely to Lola Karimova-Tillyaeva who gave an opportunity to translate and publish “Days Gone By” in English, and release a new edition in Uzbek using the Latin alphabet that our young

people are more familiar with nowadays. I also want to express my gratitude to Carol Ermakova that she gave us such a great chance as to work on the book of our nation!

## ANOMALIES IN THE DENTITION OF CHILDREN IN THE BUKHARA REGION

**G.T. Eshonqulov\***

\*Bukhara State Medical Institute,  
UZBEKISTAN

### ABSTRACT

*Prevention of dentoalveolar anomalies is one of the most important tasks of orthodontics. It is a complex of medical, hygienic and social measures, the main task of which is to prevent pathogenic and etiological factors contributing to the occurrence.*

**KEYWORDS:** *Dentition Anomalies, Prophylaxis Of Dentition Anomalies, Risk Factors, Orthodontia, Children Of School Age.*

### INTRODUCTION

Maxillofacial abnormalities are the presence of deviations from the norm in the development of dentitions, their ratios in different planes and bone tissues of the jaws. They can have both congenital and acquired character. The study of the frequency and structure of anomalies of the dentition is due to the widespread prevalence of this pathology among children of all age groups. Analysis of publications by domestic authors on the epidemiology of dental diseases over the past 30 years indicate a high level of pathologies of the development of the dentition. I. G. Nizamov et al. (2003) analyzed the prevalence of dentoalveolar anomalies in various regions of our country and abroad, according to the literature from 1966 to 2002, and found that the prevalence of this pathology is 25-75%. In the structure of the prevalence of dental diseases in children, dentofacial anomalies take third place after caries and periodontal diseases and, according to the WHO, make up an average of 50% [A. V. Anokhina et al., 2003].

The prevalence of dentoalveolar anomalies and deformities in various regions of Russia, according to researchers, ranges from 30.9% to 76.5% (A.G. Korneev, 2005; I.M. Teperina, 2004; E.A. Vakushina, 1999). An analysis of the literature data indicates that there is no tendency to decrease this pathology over the past years (A.B. Anokhina, 2003; A.B. Alimsky, 1999). Moreover, the incidence over the past 5 years has increased by 1.5 times.

A certain dependence is observed - the older the age group, the greater the number of children in need of therapeutic orthodontic measures and the lesser in preventive. (FL. Khoroshilkina, 1999;

Jl.C. Persia, 2003; Gherunpong S., 2006), therefore, the greatest attention should be paid to identifying the most effective methods of treatment and prevention at the stages of temporary and shift bite in children; since pathology, which is not eliminated at the stage of its formation, retains its significance, acquiring over time more severe and severe forms (O.I. Arsenina, 1998)

**Purpose of the study.** In this work, we set the following goals: Studying the prevalence and changing the structure of dentofacial anomalies. And among schoolchildren, there was a study of the prevalence of dentofacial anomalies and an increase in the level of orthodontic care for the children based on the choice of optimal terms and the most rational methods of treatment.

## CHECKING METHODS AND MATERIALS

This article presents the results of a comprehensive medical and social study conducted in the period 2017-2018.

86 schoolchildren of a secondary school in the city of Bukhara aged 6 to 12 years were examined (of which 34 were girls, 52 were boys). All children were examined by a doctor orthodontist.

The research program included traditional methods of clinical and dental examination, such as clinical and dental research methods, the study of functional occlusion and the assessment of occlusive relationships, a biometric study of diagnostic models of the jaw and the study of facial proportions.

All information about the patient, including passport data, complaints, anamnesis, objective diagnostic indicators and diagnosis in a special patient examination card is formed by us.

The data obtained was processed by the method of variation statistics using special computer programs.

## Research objectives

1. To study the prevalence of dentition and anomalies in children 6 and 12 years old.
2. To identify the frequency of occurrence of individual dentofacial anomalies and deformations.
3. To evaluate the effect of early tooth extraction on the formation of deformities of the dental arch.

## CONCLUSION

Our research results may differ from data from other authors. However, it is important to note that the availability of such data for various regions, cities and other settlements will play an important role in creating the database.

## WHITE TREATMENT OF WHITE SPOT CARIES IN THE APPLICATION OF MODERN MEDICINE

**O'.A.Fozilov\***

\*Bukhara State Medical Institute,  
UZBEKISTAN

### ABSTRACT

*Poor oral hygiene attaches cariesogenic microorganisms firmly to the dentition and creates tooth decay. Adhesives accumulate at the retention points of the teeth when consumed, (fissures, cavities, contact surfaces, fillings, dentures), resulting in the process of decay and decay. As a result, caries develops on the tooth enamel surface.*

**KEYWORDS:** *Orthodontic Appliances, Tooth Enamel Surface, Caries, Demineralization Foci, ICON-0.4 Tool.*

### INTRODUCTION

The development of excellent treatments for the prevention of caries is one of the achievements of dentistry. He considered dental caries as a disease of polyetiological origin. AI Rybakov fully describes the endogenous and exogenous factors that contribute to the development of caries during the development of each person. Hereditary factors are of great importance.

Diseases experienced by the mother in the formation of organs and systems of the fetus; In diseases of the thyroid gland, metabolic disorders, pregnancy toxicosis and drug overdose, chronic maternal infections and allergic diseases, mental trauma and extreme conditions have a great impact on the fetus. All these diseases affect the dental system and hard tissue of the teeth. The period from 6 months to 6 years. This period pays great attention to natural nutrition, chronic and infectious diseases. Exogenous factors are considered by the author to be non-compliance with the rules of oral hygiene, deformity and trauma of the bite, impaired salivation, changes in intraoral pH. Childhood and adolescence from 6 to 20 years. Exogenous and endogenous causes of dental caries distinguishes factors. Endogenous factors include diseases (somatic), excessive consumption of carbohydrates, puberty, high levels of metabolism, micronutrient deficiencies, liver dysfunction, malnutrition. Decreased immunity of dental tissue, fluoride deficiency, changes in dental pulp. Exogenous factors include poor oral hygiene, pricus

deformity, injury, impaired salivation, intraoral pH, difficulty in extracting some teeth, tooth depulstation, and diseases of the dental jaw system. 20 years is the period up to 40 years.

The endogenous factors that cause caries at this age are diseases of the gastrointestinal tract, liver, endocrine system disorders, diseases of the cardiovascular system. Exogenous factors are diseases of the dental system, lack of oral hygiene, impaired salivation. 40 postpartum period. According to the author, it represents the interrelationship between the presence of plaque and diseases of internal organs and systems. The correlation of these factors is the primary mechanism in the caries process. Since 2000, microinvasive treatment of proximal surface caries has been achieved. This method was developed by Professor H. Meyer-Luckell and Dr. S. Paris. The method of treatment is carried out by demineralization at the level of tooth enamel using a deep fluoridation tool ICON 0.4.

**The purpose of the topic:** Improving the effectiveness of the use of ICON 0.4 in the elimination of demineralization foci on the damaged surfaces of the tooth enamel surface when using orthodontic appliances.

**Materials and methods:** The Bukhara Children's Dental Clinic received 56 orthodontic appliances for 11-13-year-old children with primary white spot caries.

**Results and analysis:** Fifty-six pediatric patients were studied in two groups using ICON 0.4 in children who had been placed with orthodontic appliances and treated with primary white spot caries.

A first group of 38 patients was administered to children with primary white spot caries before using ICON 0.4. When applied, the surface of the tooth is removed from the saliva of the oral fluid. Then dried and ICON 0.4 is applied. Sick children are advised not to eat for 2 hours, not to chew solid foods for 2-3 days, and to pay attention to the effectiveness of chewing. The course of treatment is prescribed once a month. This treatment condition is repeated for 3 months. When the analysis and results were examined, foci of demineralization were eliminated and treatment of moderate to deep caries was achieved. Patient children were given the opportunity to treat dental-jaw system abnormalities using orthodontic devices after treatment with ICON 0.4.

The second group V was performed by deep fluoridation using ICON 0.4 in the treatment of primary white spot caries that occurred after the use of orthodontic appliances in 18 patients. Examination of the results revealed that secondary dentin was formed instead of demineralization foci and that there were no complaints after treatment in sick children and no inconvenience in the use of orthodontic appliances.

## CONCLUSION

Deep fluoridation of foci of demineralization using the tool ICON 0.4 has shown good results in the treatment of primary white spot, moderate, deep caries in both groups of sick children. In our scientific studies, it was found that the use of ICON 0.4 in deep caries forms secondary dentin and protects the pulp roof from exogenous and endogenous influences. In

the treatment of primary white spot caries, elimination of foci of demineralization at the tooth enamel level was achieved.

## METHODS OF APPLICATION OF AUTOTROMBOTSITAR MASS IN PARADONTIC DISEASES

Turaeva F.A\*

\*Department of Pediatric Dentistry,  
Bukhara State Medical Institute,  
UZBEKISTAN

### ABSTRACT

*Studies on the etiology of periodontal diseases and their treatment are carried out in our country, as well as in foreign countries. Currently, researchers are focusing on the use of a mass of autothrombocytes for the effective treatment of periodontal disease. The article notes the effectiveness and advantages of treatment when using this method.*

**KEYWORDS:** *Chronic Periodontitis, Autoimmune Mass, Periodontal Index, Hygienic Effectiveness, Tissues, Men, Women.*

### INTRODUCTION

The sharp increase in periodontal inflammatory diseases in the mature and middle-aged population has become a serious problem of modern dentistry. (Blashkova S. L., 2016; Durnovo E. A., 2013). In recent years, there has been a high incidence of acute and recurrent periodontal disease. (Bulkina N. V., 2012; Grudyanov A. I., 2017).

There are several advantages of using autothrombocyte mass in therapeutic practice: simplicity of use; absence of postoperative rehabilitation period; naturalness; availability of other types of drugs; the exception of the risk of infectious diseases (Akhmerov R.R., 2007; 2011; Ivanov P.Yu., 2012; Gfatter R., 2000; Marx R.E., 2004).

Unless traditional methods of treatment of periodontal inflammatory diseases increase the resistance of the periodontium to pathogenic risk factors, the use of autoimmune mass in chronic forms of the disease is relevant.

**The aim of the study:** To increase the effectiveness of treatment of periodontal inflammatory diseases using autothrombocyte mass.

**Research methods and materials:** The clinical study was conducted in the dental office of the Bukhara Regional Multidisciplinary Medical Center.

In total, 240 patients were examined. Of these, 160 (66.7%) were patients diagnosed with general periodontitis between the ages of 35 and 65, including 78 (48.8%) men and 82 (51.2%) women. The mean age of the patients was  $42.9 \pm 7.5$  years. Also, 20 healthy non-gender-related periodontal control groups were isolated (of which only gums were examined). Selected for the study, 160 patients with common periodontitis were divided into two groups.

The first, core group consisted of 80 people, of whom 42 (52.5%) were men and 38 (47.5%) were women. The first group of patients underwent complex treatment with autothrombocyte mass.

In the second, control group, there were 80 patients, of whom 47 (58.8%) were women and 33 (41.2%) were men. In the complex treatment of patients in the control group, the traditional method of treatment of general periodontitis was used. The standard method of periodontist admission was used in the examination of patients.

At the initial examination, patients' complaints were as follows:

- bad breath;
- bleeding gums when eating solid food and brushing teeth;
- discoloration of property;
- the presence of dental caries (tartar);
- opening of the neck of the tooth;
- periodontal pockets and gums;

Based on clinical data, the diagnosis of "Chronic generalized periodontitis" was made.

The main complaints of patients with general periodontitis: bleeding gums (83.1%) and pain in them (26.2%), bad breath (23.1%), purulent discharge from the periodontal pocket (PK) (16.9%), loosening of teeth (13.8%), neck opening of the teeth (18.5%) and sensitivity in them (20%).

We assessed the general condition of the patients according to their words before starting treatment. From the collected anamnesis data, it was found that 72 patients (44.6%) considered themselves practically healthy, while the remaining 88 (55.4%) patients had a history of some disease or allergic reactions.

In most cases, 21.5% of patients reported having gastrointestinal disease, 16.9% of patients with ENT disease, and 12.3% of patients with cardiovascular disease.

According to the anamnesis of patients, 137 (85.6%) of them were diagnosed with periodontitis for the first time at the time of their visit to the dental office of the Bukhara Regional Medical Association. The remaining 23 (14.4%) patients knew they had periodontal inflammatory disease but did not receive specialized care from a specialist.

When examining the oral cavity, we focused on anatomical functional disorders. Because this process has a pathogenetic role in the development of periodontal inflammatory diseases. Gingival ischemia was observed in the frontal teeth of the lower jaw in 25.4% of patients, 22.4%

- small oral cavity, 23.8% - pathology of the sublingual girdle, 21% - traumatic effects, 77.8% of patients with pathological pricus, 11.5% % of fractures, 44.4% of partial defects of dentition, 32.1% of gingival recession, 17.9% of enamel eruption or complete absence, 41.8% of orthopedic devices, 71.2% of dental caries . Periodontal analysis revealed gingival bleeding in 100% of patients, gingival hyperemia in 95.6%, significant swelling in 51.2%, pain on palpation of the gums in 47.1%, purulent discharge in the periodontal pocket, 74.1% in which the movement of the teeth was recorded.

### Research results.

In the initial phase of treatment, an index assessment was performed in all patients in the two study groups. This procedure was repeated 3 days, 7 days, one month, 6 months, and one year after treatment.

On the first day of treatment, patients complained of bleeding gums when brushing teeth, swelling in the gums, pain, bad breath from the mouth, gnashing of teeth, and impaired chewing. Some patients also complained of worsening of the general condition: general weakness, irritability, loss of appetite.

On objective examination: hyperemia in the gums on the 1st flight, swelling, swollen consistency of the gums, PCh depth average  $5.8 \pm 1.2$  mm, purulent serous exudate separation and granulation in some places began to appear. In some patients, tooth movement reached grade II-III. Milk bleeding averaged  $2.91 \pm 0.11$  according to the Muhlemann index. Significant amounts of dental caries and tartar were found in the teeth. Oral hygiene was assessed as follows: tooth aproximal surface view index API  $77.61 \pm 7.37\%$ ; A PHP of  $2.41 \pm 0.25$  indicates that insufficient attention has been paid to oral hygiene.

### CONCLUSION

The disappearance of clinical signs of inflammation during the observation period, compliance of API and PHP indices with the normooptimal hygienic level of the oral cavity, reduction of PCh depth to an average of  $1.2 \pm 0.5$  mm confirm the use of autothrombocyte mass in the complex treatment of chronic generalized periodontitis.

## DEFINITIONS THE DIVISION FACTOR AT PURIFICATION OF OIL SLIME OF MECHANICAL IMPURITY

Hurmamatov A.M\*; Hametov Z.M\*\*

<sup>1,2</sup>Institute of the General and Inorganic,  
Chemistry AN Of RUZ, Tashkent  
Fergana Polytechnical Institute, Fergana, UZBEKISTAN

### ABSTRACT

*In this article are given results of definition of a factor of division at purification of oil slime of mechanical impurity in centrifugal field and also the sizes and mass of firm particles as a part of oil slime from 10 microns to 500 microns are determined.*

**KEYWORDS:** *The Mass of Particles, Oil Slime, Mechanical Impurity, Centrifugal Fields, A Division Factor, Gravitational Weeding.*

### INTRODUCTION

Oils, accumulated on the sewage facilities of the refinery, can be divided into two main groups: dropping directly on the sewage treatment plants and accumulated over a number of years stored in the slurry accumulators. The oilshlam consists mainly of solid sandy, clay particles, industrial dust, coke and soot, corrosion products, suspensions of hydroxide metals, alkaline-land carbonates, carbonates Oils as a certain dispersed system of coagulation structure has the properties of thixotropy, i.e. After the mechanical effect (dilution of water and intensive mixing) is restored over time. Oils Used to obtain claying in the production of which to reduce the volumetric density of clays use various organic additives, including polyglycols, sulphide yeast bard, diesel fuel, fuel oil, kerosene, piol For most centrifuges, the fraction of the separation F does not exceed 3500 and is an average of 500-1000 [2,3]. The greater the separation factor, the higher the separating ability of the centrifuge. The separation factor can be increased by increasing the radius of the drum and to an even greater extent - increasing the number of revolutions. ( $\omega^2 = \frac{\pi^2 n^2}{900}$ ), Since the value of F is proportional to the square of the number of revolutions [4]. To determine the division factor, we conducted a series of experiments in the gravitational and centrifugal fields, also theoretically calculated to determine the precipitation rate of solid particles of mechanical impurities in various fields. In order to determine the rate of

free precipitation of solid particles in the gravitational field, the Stokes formulas were used, in m / s (for Re (0.2) [5]:

$$\omega_{oc} = \frac{d^2 g (\rho_r - \rho_c)}{18\mu}, \quad (1)$$

where: DE is an equivalent particle diameter, m; g - acceleration of free fall,  $G = 9.81 \text{ m / s}^2$ ; (- particle density,  $\text{kg / m}^3$ ; (- dynamic viscosity of the medium,  $\text{PA} \cdot \text{s}$  with. The determination of the precipitation rate of a spherical single particle in a fixed unlimited medium was determined using the Archimedescript:

$$Ar = Ga \frac{\Delta\rho}{\rho_c} = \frac{Re^2}{Fr} \frac{\rho - \rho_c}{\rho_c} = \frac{d^3 (\rho - \rho_c) \rho_c g}{\mu^2}, \quad (2)$$

где  $Ga = Re^2 / Fr$  –

Galilean's criterion. The frude criterion was calculated by the following formula:

$$Fr_y = n^2 d / g, \quad (3)$$

where the N-frequency of the flux rotation, C-1; D-diameter of hydrocyclone, m;  $G = 9.81 \text{ m / s}^2$

Acceleration of free fall. Reynolds criterion determined:  $Re = \frac{\omega d \rho}{\mu}$ ,

where (- flow rate,  $\text{m / s}$ ; d - hydrocyclone diameter, m; (- density medium,  $\text{kg / m}^3$ ; (- dynamic environmental viscosity coefficient,  $\text{PA} \cdot \text{s}$ . Based on the calculations, hydrodynamic mode inside the hydrochlor

$$Ly = \frac{Re^3}{Ar} \frac{Re Fr \rho_c}{\rho - \rho_c} = \frac{\omega_{oc}^3 \rho_c^2}{\mu_c (\rho - \rho_c) g}. \quad (4)$$

Centrifugal force (in H), acting on a particle, is:

$$C = mn^2 / R = m\omega^2 R, \quad (5)$$

where: m - the mass of the particles, kg; (- the angular speed of rotation of the particle, C-1; N is the circumferential speed of rotation of the particle, C-1; R- Radius of the rotation of the particle, m. The power of gravity:

$$P = mg. \quad (6)$$

Solving equations (1) and (5), we get:

$$K_p = \frac{C}{P} = \frac{m\omega^2 R}{mg} = \frac{\omega^2 R}{g}, \quad (7)$$

Where: CR - separation factor. To determine the precipitation rate of solid particles of mechanical impurities, various particles (stone, sand, earth) of various sizes were taken (stone, sand, earth), i.e. from  $10 \mu\text{m}$  to  $500 \mu\text{m}$ . The sedimentation diameter of solid particles (in  $\mu\text{m}$ ) was calculated by the following formula:

$$d_s = \sqrt{1810^7 \mu H / (\rho_1 - \rho_2) g \tau}, \quad (8)$$

where, the dynamic viscosity of the medium, Pa · C; (1 - the density of the solid particle, g / cm<sup>3</sup>; (2 - the density of the medium, g / cm<sup>3</sup>; H is the height of the particle sedimentation, cm; G - acceleration of gravity, m / s<sup>2</sup>;

$$d_s = \sqrt[3]{\frac{6V}{\pi}} = 1,24 \sqrt[3]{\frac{M}{\rho}}, \quad (9)$$

where V is the volume of the particle, M<sup>3</sup>. As part of the captured mass contain various impurities (sand, earth, stones) with various sizes (within 10 ÷ 500 microns). To determine the size and mass of the particles, we conducted a series of experiments. Before determining the sizes of caught solid particles of mechanical impurities, they were dried into the furnace of the brand - Snol 1,6.2,5.1 / 11-II2 for 1-2 hours at a temperature of 100-150 (s. The mass of solid particles of mechanical impurities weighed with

**TABLE 1 SIZES AND WEIGHT OF SOLID PARTICLES IN THE STRUCTURE OF THE CAPTURED MASS**

Name of solid particles	Particle size, $\mu m$							
	500	400	325	270	200	100	50	10
	Mass of particles, g							
A rock	0,0045	0,0017	0,00067	0,00030	0,00027	0,00016	0,00011	0,000097
Land	0,00175	0,00170	0,00021	0,00007	0,00005	0,00001	0,000009	0,000006
Sand	0,0030	0,0023	0,0015	0,0004	0,0003	0,0001	0,000087	0,000054

Table 1 shows that the oil sludge contains various solid impurities, such as stone, earth, sand, etc. The mass of fine solid particles of the stone in the composition of the oil sludge with a size of 10  $\mu m$  to 500  $\mu m$  will change in the range of 0.0045 ÷ 0.000097 g, and the Earth is in the range of 0.00175 ÷ 0.000006 g

### Figure 1. Determination of solid particles depending on their size

Figure 1 shows that with an increase in the size of solid particles of mechanical impurities, their mass also increases, i.e. The mass of 10  $\mu\text{m}$  particles is 0.000097 g, the mass of 50  $\mu\text{m}$  particle is 0.00011. With a further increase in the size of solid particles up to 500  $\mu\text{m}$ , their mass was 0.0045, after determining the size and mass of solid particles The results of the studies on the definition of the value of the separation factor are shown in Table 2.

**TABLE2 THE VALUES OF THE RATE OF FREE DEPOSITION OF SINGLE SOLIDS IN CENTRIFUGAL AND GRAVITATIONAL FIELDS**

Particle size, m $\times 10^6$	Free deposition rate in gravitats.phol, m / s	The rate of deposition in the centrifugis. Field, m / s	Separation factor, cr	The values of the rate of free deposition of single solids in centrifugal and gravitational field Arkhimed
10	0,00095	1,55	1630,98	18,1
50	0,001	1,76	1630,98	20,1
100	0,0015	2,56	1630,98	29,5
200	0,0026	4,32	1630,98	50,22
270	0,0029	4,80	1630,98	56,09
325	0,0065	10,72	1630,98	98,1
400	0,016	27,20	1630	269,1
500	0,044	72	1636	784,8

From Table 2, it can be seen that 10  $\mu\text{m}$  of particles in the gravitational field is deposited in 0.00095 m / s, and in the centrifugal field is 1.55 m / s, the rate of deposition of 50  $\mu\text{m}$  particles in the gravitational field is 0.00 The sections of the Criminal Procedure for such particles is almost the same, i.e. This indicator is an average of 1631,485. The results of the studies are also illustrated in Fig.2.

Figure 2. Change the criterion of the Archimedes depending on the rate of precipitation of solids in the centrifugal field

Fig. 2 shows that the criterion of Archimede AR also varies depending on the mass of the particle within  $18.1 \div 784.8$ . This is due to the fact that with an increase in the mass of solid particles of mechanical impurities, their deposition speed is also accelerated in gravitational and centrifugal fields. At the same time, the sections of the Kyrgyz Republic remains almost unchanged, and the criterion of Archimede AR varies depending on the mass of solid particles. Thus, studies indicate that the separation factor for cleaning the oil sludge from mechanical impurities was an average of 1631.485 in various sizes of solid particles from 10  $\mu\text{m}$  to 500 microns, and the criterion of Archimede This is explained by the fact that in the centrifugal field at high speed of the liquid flow of resistance of the medium (the force of Archimede Ar) on the separation of solids is almost impermanent, i.e. It is advisable to use the hydrocyclone when cleaning the diluted oil sludge.

## ANALYTICAL INDICATOR OF SALIVA IN CHILDREN WITH CEREBRAL PALSY

Yo.Q.Eronov\*; A.A.Rajabov\*\*

<sup>1,2</sup>Bukhara State Medical Institute,  
UZBEKISTAN

### ABSTRACT

*Dental diseases are among the most common diseases among other diseases, among which caries and its complications in cerebral palsy at the age of children take the leading place. In children, tserebral paralysis is determined by the disability of 3-5 patients of 1000 born babies. According to the results of dental examinations, the prevalence of dental caries and its complications in children with cerebral palsy varies from 80% to 85%.*

**KEYWORDS:** *Cerebral Palsy, Saliva, Oral Cavity, Morphological Structure.*

### INTRODUCTION

Today, the problem of obtaining and treating dental diseases in children with cerebral palsy is especially relevant. Renowned it is important to develop special treatment measures in children with pathology. Despite the active work of various specialists, medical specialists and parents, unfortunately, the number of patients diagnosed with cerebral palsy increases year by year.

Among children with cerebral pathology, there is a wide prevalence of dental diseases, including isolyanin (2005), the average age of a child diagnosed with cerebral palsy is 11,5 years. Permanent tooth decay in them begins at the age of 12 years, and given the low level of oral hygiene in these children, it is very important to take measures to prevent and treat diseases of their oral cavity.

Children can not intelligently drain the oral cavity, some children do not have the ability to self-care. All this is accompanied by a lack of attention of parents. The state of teeth in such children is often aggravated. This means that children have a sharp need for dental care, and this is the prevention and treatment of dental diseases in children. Due to the somatic pathology present in patients with cerebral palsy, it is difficult to use a traditional treatment regimen in certain oral diseases, which necessitates the need for new approaches izlash to address this problem.

The saliva of different glands is different in consistency: the submandibular and tongue oscillate glands and secrete glue and darker saliva than the ear Aldi gland. This difference in saliva consistency is due to the protein substance in it — mucin. Musin makes the saliva more specific mucus and slippery, it is thanks to this that it is easier to swallow food that is digested with saliva.

In addition to Musin, in the saliva there are lean protein — globulin, amino acids, creatinine, uric acid, mochevina, as well as inorganic salts. All these substances form a solid residue of saliva (0,5—1,5%). Its 2/3 part corresponds to organic substances, and the rest to mineral salts. Salpal salpal is alkaline-reactive.

Depending on the type of food a person eats, the amount of saliva separated per day varies; it is equal to 1000-1200 ML on the average.

Salivary enzymes. Carbohydrates in human saliva grape sugar there are gillolytic ferments that decompose. Lizosimfsrmenti (salivary uncle lazasi) starch to dextrins, while dskstrins maltose becomes a disaccharide calledtiradi. The second fer in saliva- maltose at the action of Menth — maltase two pieces of granulated grape sugar-piss off.

Even if the saliva enzymes are highly active, the starch at their exposure does not decompose, since the food does not stay in the oral cavity for long. Ptialin and maltase have an optimal effect in alkaline conditions. The concentration of 0,01% of hydrochloric acid slows down the action of salivary enzymes, while the high concentration slows down the action of salivary enzymes and decomposes them, so the gastric juice stops the action of salivary enzymes. Since the bite of the food does not absorb the gastric juice at once, the effect of saliva enzymes on carbohydrates can last some time, even in the stomach. The secretion of the salivary glands is provoked by the reflex pathway. Food substances or rejection substances that affect the receptors in the oral cavity cause unconditional salivary cleavage reflexes in the body.

If the effect is strong enough, then after 1-3 seconds the saliva is separated. This period, which passes from the moment of exposure to the separation of saliva, is called latent, or latent, period. If the potency is low, the latent period reaches 20-30 seconds. In the period when the exposure continues, the saliva divides, as soon as the exposure stops, the output of the saliva also stops. It is worth noting that in children with cerebral palsy, oral fluid is observed more than the norm of saliva in science it is called hypersalivation. Such a disease occurs as a result of an involuntary state of various features in the brain of the head in children, as well as the saliva itself becomes very detached. This causes the absorption of tooth enamel to develop caries and its complications.

**The purpose of the topic:** To determine the chemical composition of saliva in oral fluid in children with cerebral palsy and prevention of dental diseases.

**Materials and methods:** The composition and environment of the saliva of 52 boys and girls aged 11-13 studying in the special boarding school No. 27 in Bukhara were determined.

**Conclusions and analyzes:** In conducting scientific studies, hypersalivation was studied in two groups depending on the amount. The first group of 28 sick children was divided according to the spontaneous course of salivation. The remaining second group was identified in 24 sick children based on the movement of the oral cavity organs. In addition to mucin, saliva contains a small amount of protein - globulin, amino acids, creatinine, uric acid, urea, as well as inorganic

salts. All of these substances form a solid residue of saliva (0.5-1.5%). 2/3 of it is organic matter and the rest is mineral salts.

The first group consisted of 28 patients with 3.4% solid saliva residue when the salivary fluid component was examined, which is a 98.7% developmental marker in the occurrence of tooth enamel erosion and caries complications.

In the second group of 24 sick children, when the saliva fluid component was examined, the solid residue of saliva was 2.2%, indicating a 68.7% development in the decay of tooth enamel and the occurrence of caries complications.

## CONCLUSION

In children with cerebral palsy, salivation is consistently high. This appearance of hypersalivation leads to tooth enamel erosion and the development of caries complications. In addition, an increase in solid residue in saliva (protein - globulin, amino acids, creatinine, uric acid, urea, inorganic salts) causes gingivitis of the upper and lower gums. As a result, the development of a tumor form of hypertrophic gingivitis can be observed in sick children of this age.

### ABSTRACT

*Results of a research on preparation of oil slime for processing are given in article, for dilution of oil slime different types thinners in various ratios are chosen (light and heavy naphtha, puфopmam, gasoline and hydrocarbon solvent). For the purpose of purification of oil slime of mechanical impurity it is used centrifugal cleaning which flow rate is varied within 10÷20 of m/s.*

**KEYWORDS:** Oil, Oil Slime, Flow Rate, Hydroclone, Mix, Gasoline, Centrifugal Cleaning

### INTRODUCTION

During the extraction, transportation and refining of oil, formation and accumulation of oil sludge occurs [1]. In general terms, all oil sludge can be divided into three main groups in accordance with the conditions of their formation: soil, bottom and tank type. The former are formed as a result of spills of oil products into the soil during production operations, or in emergency situations. Bottom sludge is formed due to subsidence of oil spills at the bottom of reservoirs, and tank-type sludge is formed during storage and transportation of oil products in containers of different designs [2,3,4].

The ratio of petroleum products, water and mechanical impurities (particles of sand, clay, rust, etc.) varies in a very wide range: hydrocarbons make up 5-90%, water 1-52%, solid impurities 0.8-65%. Such a significant change in the composition of oil sludge, the range of changes in their physico-chemical characteristics is also very wide. The density of oil sludge ranges from 830-1700 kg / m<sup>3</sup>, the pour point is from -3 ° C to + 50 ° C. The flash point lies in the range from 35 to 120 ° C [5,6,7].

During long-term storage, oil sludge with time is divided into several layers, with properties characteristic of each of them.

The top layer is a watered petroleum product with up to 5% fine particulate matter and belongs to the class of water-in-oil emulsions. The composition of this layer includes 70-80% oils, 6-25% asphaltenes, 7-20% resins, 1-4% paraffins. The water content does not exceed 5-8%. Quite often, the organic part of the freshly formed upper layer of oil sludge is close in composition and properties to the original oil product; the middle, relatively small volume layer is an oil-in-water emulsion. This layer contains 70-80% water and 1.5-15% mechanical impurities; the next layer consists entirely of settled mineralized water with a density of 1.01-1.19 g / cm<sup>3</sup>; finally, the bottom layer (bottom sludge) is usually a solid phase comprising up to 45% organics, 52-88% solids, including iron oxides. Since bottom sludge is presented in the form of a hydrated mass, the water content in it can reach up to 25%. In the process of processing sludge, various technological methods can be applied depending on their physical and mechanical characteristics. The collected oil sludge of a liquid-viscous consistency is subjected to separation into oil product, water and solid solids. This phase of refining has its purpose - the extraction of oil products with initial properties from the sludge and their use for its intended purpose. There are two main methods of phase separation of liquid-viscous oil sludge - mechanical and chemical. For deeper refining of petroleum products, they sometimes resort to complex technology. The destruction of stable water-oil emulsions by mechanical means is based on technological methods of artificially changing the concentration of the dispersed phase of the emulsion, followed by coalescence of small drops of this phase. To carry out the operation of interphase separation of liquid-viscous oil sludge, a large number of technological devices have been developed at present, including separators, centrifuges, and hydrocyclones of various designs [8, 9, 10].

Based on the foregoing, we have assembled an experimental laboratory technological line consisting of a two-stage hydrocyclone installation for cleaning oil sludge from mechanical impurities (Fig. 1). The production line consists of: a tank for supplying oil sludge 1, a tank for supplying a diluting agent 2, a collector for mixing the diluent with oil sludge 3, hydrocyclones for separating solids 4,5, silos for trapped mass 10 after cleaning the oil sludge from solids, pumps for injection of flow 12, valves for regulating the flow inside the pipes 15. Tank 3 is filled with oil sludge through pump 12, diluent is poured from tank 2 into tank 3 to dissolve the oil sludge in various proportions, then mixed for 30 ÷ 60 min. The temperature of the process is in the range of 60–70 ° C, after which, in order to clean oil sludge from mechanical impurities using pump 12, the diluted fraction was supplied in two-stage hydrocyclones 4 and 5 at a speed of 20 m / s. Formed during the process, the purified phase is discharged into the bunkers 10. Moreover, the flow rate of the feedstock is measured using a flow meter, and the hydraulic resistance of the hydrocyclone and the hydraulic pressure of the liquid in it is determined by a pressure gauge 14.

Fig. 1. Purification of oil sludge from mechanical impurities: 1- capacity for oil sludge supply; 2- capacity for supplying a diluting agent; 3.16-capacity with a stirrer; 4,5-hydrocyclones; 6- cylindrical part of the hydrocyclone; 7 - a supply pipe of a hydrocyclone; 8 - conical part; 9- lock gate; 10- hopper for trapped mass; 11 - drain pipe; 12 - pumps; 13- manometers and thermometers; 14- flowmeters; 15 - gate valves.

The geometric dimensions of the tank with a stirrer: height - 400 mm; diameter - 300 mm; stirrer rotation frequency - 300 rpm. The dimensions of the laboratory hydrocyclone are as follows: the diameter of the cylindrical part  $D$  is 10 mm, the height of the cylindrical part is 10 mm, the height of the conical part  $H$  is 30 mm, the diameter of the inlet (supply) pipe for the suspension  $d_{bx}$  is 15 mm, and the diameter of the drain pipe for the purified raw material  $d_{bb}$  is 15 mm

To determine the effect of the diluted liquid flow rate on the efficiency of cleaning oil sludge from mechanical impurities, we conducted a series of experiments. The experiments were

carried out in a hydrocyclone, i.e. in a centrifugal field (Fig. 1). In the course of the experiments, the flow velocity in the hydrocyclone was varied within 10–20 m / s. The results of the experiments are shown in table 1.

**TABLE 1 THE RESULTS OF OIL SLUDGE TREATMENT DEPENDING ON THE FLOW RATE (INITIAL CONCENTRATION OF MECHANICAL IMPURITY 25%)**

№	Diluted oil sludge speed, m / s	Light naphtha	Hydrocarbon solvent	Heavy naphtha	Reformat	Petrol
		<i>Residual concentration of particulate matter%</i>				
1.	10	7,18	1,91	4,03	2,96	5,14
2.	11	7,01	1,84	3,88	2,74	4,81
3.	12	6,82	1,77	3,72	2,59	4,39
4.	13	6,56	1,48	3,48	2,37	4,23
5.	14	6,24	1,21	3,12	2,11	3,93
6.	15	5,16	0,92	2,93	1,98	3,52
7.	16	4,62	0,21	2,18	1,86	3,21
8.	17	3,91	0,19	1,92	1,72	2,95
9.	18	3,01	0,16	1,74	1,66	2,57
10.	19	2,87	0,11	1,56	1,59	2,44
11.	20	2,04	0,02	1,43	1,22	2,31

With an increase in the rate of diluted oil sludge in a hydrocyclone from 10 m / s to 20 m / s, the residual concentration of solids of mechanical impurities also varies between  $7.18 \div 0.02\%$ , and the type of diluent also affects the separation of solid particles from diluted oil sludge. (light naphtha, heavy naphtha, reformat, hydrocarbon solvent and gasoline).

Fig. 2. The change in the residual concentration of solid particles depending on the flow rate.

It can be seen from Fig. 2 that at a speed of 10 m / s of a diluted liquid flow with light naphtha, the residual concentration of solid particles of mechanical impurities in the composition of the diluted mixture is 7.18%, and at 11 m / s this figure was 7.01 %, with a further increase in flow velocity to 20 m / s, the concentration of solid particles was 2.04%. At a speed of 10 m / s diluted with heavy naphtha, the concentration of solid particles was 4.03%, at 15 m / s diluted with this solvent, the residual concentration was 2.93%, and at 20 m / s, the concentration of solid particles was 1, 43% In the course of experiments on the purification of oil sludge from mechanical impurities, it was revealed that a hydrocarbon solvent was chosen to dilute the oil sludge in order to clean it from mechanical impurities, i.e. at a speed of 10 m / s of the liquid stream of the diluted hydrocarbon solvent, the residual concentration of solid particles was 1.91%, and with an increase in the flow rate of 11 m / s, the concentration of solid particles was 1.84%, and with a further increase in the flow rate to 20 m / s, the residual concentration of solid particles in the composition of the diluted mixture was 0.02%. This is because for the dilution of oil sludge in order to easily separate solid particles of mechanical impurities from the composition of the oil sludge, a hydrocarbon solvent is selected.

Further experiments on the purification of oil sludge from mechanical impurities with different diluent ratios of oil sludge were carried out in a centrifugal field at a liquid flow rate of 20 m / s, the concentration of solid particles of mechanical impurities in the initial and purified oil sludge were determined in a Soxhlet flask under laboratory conditions. The results of the experiments are shown in table.2.

**TABLE 2 RESULTS OF CLEANING OIL SLUDGE FROM SOLIDS WITH VARIOUS SOLVENTS (INITIAL CONCENTRATION OF SOLIDS 25%)**

№	Ratitions of raw materials,% (solvent / oil lodge)	Light naphtha	Hydrocarbon solvent	Heavy naphtha	Reformat	Petrol
1.	30/70	4,62	0,21	2,18	1,86	3,21
2.	40/60	3,91	0,19	1,92	1,72	2,95
3.	50/50	3,01	0,16	1,74	1,66	2,57
4.	60/40	2,87	0,11	1,56	1,59	2,44
5.	70/30	2,04	0,02	1,43	1,22	2,31

From Table 2 it can be seen that with a change in the type of solvent, the concentration of solid particles of mechanical impurities in the composition of the dilute mixture also changes, i.e. When diluting a light naphtha at a ratio of 30/70, the residual concentration of solid particles is 4.62%, and at 40/60, the concentration of solid particles was 3.91%, with a 50/50 ratio, residual concentration With a change in the solvent on heavy naphtha at a ratio of 30/70, this indicator was 2.17%, with the ratio of this diluent 70/30, this figure was 1.43%. The experiments on the purification of oilshlam are also illustrated below.

**Figure 3. Changing the concentration of solid particles in the composition of the oil sludge, depending on the ratio of the solvent**

With a change in the diluent for diluting the oil sludge on a hydrocarbon solvent (Fig. 3) with a ratio of 30/70, the residual concentration of solid particles of mechanical impurities in the dilute mixture was 0.21%. With a further change in the ratio of the diluent to 70/30, the residual concentration of solid particles of mechanical impurities in the structure of the dilute oil sludge is also reduced to 0.02%. This is due to the fact that with an increase in the diluent ratio with the oil sludge, the concentration of solid fine particles of mechanical impurities is also reduced, as well as for the purpose of light separation of solid mechanical impurities from the composition. Thus, for cleaning the dilute oil sludge in the centrifugal field, the optimal liquid flow rate of 20 m / s is selected. The experiments on the preparation of the oil sludge to process indicate that a hydrocarbon solvent is chosen to dilute the oil sludge, while the residual concentration of solid particles in the composition of the dilute mixture was

### ABSTRACT

*The article deals with the protection of the young generation of bliss-tive effect of different ideas and ideologies, analyzed the psychological problems of security of the person in the process of globalization and the ideological influence processes on a national idea.*

**KEYWORDS:** *Globalization, Idea, Spirituality, National Idea, The Ideological Processes, Information, Internet, Modern Technology, The Moral Threat, Mass Culture.*

### INTRODUCTION

The modern stage of human history is characterized by the intensity and integration of international relations in all areas of social, political, economic, spiritual, cultural life. In particular, due to the development of a means of communication and improvement of technical and technological means of the space and television radio systems of communication, computer, e-mail and the Internet, ideological processes have become global and the possibilities for ideological influence have expanded. The ideologies that have arisen in a certain territory or in a certain country are spreading rapidly around the world.

According to experts, today mankind is experiencing a new information revolution, and this is not the first revolution in the history of human society. If the formation of speech expanded the possibilities of transmitting information, the emergence of writing opened the way for its preservation for a long time and the transmission of information over great distances, even after a time, separately from its creator. The publication of newspapers and magazines has further strengthened the responsiveness and scale of the transmission of written information. And radio

and television, providing the transmission of information through sound and image, raised it to a new qualitative level. The level of media coverage, in other words, the implementation of activities on a local, national, regional or international (global) scale has further expanded its range of impact. The Internet has become an important link in today's information abode.

In the development of human society, serious changes have occurred in the national and spiritual life of man and society in a new quality. The pace of the cultural development of mankind is also increasing. Namely, the rapid growth of scientific inventions, the amount of information and people employed in the field of science, is clearly shown in doubling the volume of scientific activity every 10-15 years. Despite this, it is impossible to imagine the development of spirituality and culture of mankind as an even process.

But there are still peoples and regions lagging behind today's gains of humanity. No nationality, region could exist absolutely separately from its spirituality, culture. In the process of mutual influence between cultures, elements of another culture enter each national culture. Such a process of mutual influence and enrichment grows with the strengthening of the development of society, corresponding to it. Especially, the great changes that took place in the 20th century in industry, transport, and progress in the means of communication accelerated this process even more and covered almost all spheres of culture. However, time has also shown the inconsistency of these processes. A very complicated and contradictory historical path, rich in ups and downs, has entered a new millennium.

The future of mankind, its face in the new millennium, is also largely determined by modern features of development. From this point of view, speaking about the peculiarities of the progress of today's national idea, it is necessary to note the occurrence of negative phenomena, such as the widespread dissemination of elements of culturelessness, the manifestation of aggression in culture in a new form. Including, the cases leading to the destruction of the values that have been formed over the centuries of traditional societies, relying on ideological pressure, organizational foundations and material and financial resources, are trying to inculcate under the guise of universalism and globalism, a model and a standard. At the same time, it should be noted that under the influence of the general strengthening of the national spirit, which takes place in different parts of the world, there is an increase in the desire to restore national values and preserve the identity of the national culture. In the globalization of ideological processes, two completely different directions and trends are outlined:

- 1) Internationalization and universalization of universal values that arose in a certain place, spiritual and enlightening benefits, going beyond the historical framework.
- 2) The absolutization of ethnic, cultural, religious, class, racial, territorial, regional identities at the level of social, economic, political, spiritual and educational development leads to the ideological globalization of negative events that seriously threaten humanity.

“The mutual struggle of various old and new ideologies takes on a swift hue as never before. Frictions between different, sometimes conflicting worldviews, political, national, religious movements, sects become the causes of bloody clashes, mass extermination”[1]. In the same way, ideological globalization paves the way for the widespread dissemination of “works of art,” propagating baseness, villainy, and immorality. Young people show high communicative activity due to their desire for new and the availability of free time. Such features of them can lead to negative consequences, it is natural. This is determined by the existing danger of them falling

into the influence of aggressive ideologies in various forms and “beautiful” forms, combining “from easy erotica” to “open pornography”, from violence to open cruelty, which have a strong effect on human consciousness. Of course, such cases can lead to serious negative consequences in the upbringing of comprehensively developed highly spiritual personalities, which are the basis of the progress of the national idea. “If we successively consider the history of mankind, the development of its thinking, we will see the long-standing and still ongoing struggle between good ideologies and teachings that call a person to high goals, perfection and cruel and harmful ideologies” [2].

The globalization of ideological processes gives rise to the danger of weakening the identity of the national idea and the penetration of the “mass culture” that is forming in the community of highly developed countries. Globalization, being the fruit of the intellectual potential and selfless labor of mankind, cannot prevent it from spiritual impoverishment and national spiritual decay. Humanity, not wanting it, becomes the cause of the negative consequences [3]. In the process of globalization, such concepts as “my nation”, “my people”, “my country” disappear, and concepts appear, in the words of A. Toynbee, “common home”, “common destiny” and “common concerns” and as a result any nation can turn any nation into a mass herd, destroying its identity. And as a result, people may lose their national idea and history.

The civilization of the 21st century has turned the tendency to conquer the world with reason into a peculiar tendency of modern progress, a priority feature of mastering geopolitical statuses. And therefore, the power of the state, the potential of the country, today is measured not by nuclear test sites, but by the potential of ideological, ideological training grounds. It is well known that political forces striving to expand the scope of their influence carry out their ideological violent activities that threaten the security of citizens and society, aimed at weakening and destroying the constitutional and political system, against the stability and tranquility of a particular state, society, nation through various ideological means. To achieve their goals, they first seek to subordinate the consciousness of the population of the countries they want to conquer, to take control. In general, the main goal of ideological propaganda and agitation, distributed through various means in the process of ideological globalization, is the struggle for mastering the human consciousness. Because any idea, after being accepted by a person, will have the status of a practical life program that will set in motion a specific goal. Therefore, today the main goal of ideological warfare is the mastery of the consciousness, soul of the individual. The biggest danger now is the endless ideological struggle for the mastery of the human mind and soul. Evil forces, making every effort to master, will try to skillfully use telecommunications, modern technology, as well as religious, national feelings, social and economic difficulties in life to achieve their vile goals. “We should not forget that paying special attention to this issue, it would seem that small insignificant information directed against human enlightenment, intensified due to globalization in the information world, can cause invisible but irreparable enormous damage [4].”

Known for his propaganda of immoral ideas, the French writer Marquis de Sade wrote about the conquest of countries with the help of ideology:

“For us to conquer the whole world, it is not at all necessary to participate in major battles, to fight, spilling the blood of French soldiers in distant lands, it is not at all necessary to rot them and their boots. If we can spread our morality (that is, immorality) by my and similar books and

in other ways in other countries, in particular in the East, to make this a way of life of this people, the whole world will be at our feet, we will be able to master the souls of all mankind. ...”The above thought of the French writer, famous for his books promoting immorality, found its proof in history. When we read the work of Uzbek writer Pirimkul Kadyrov “Humoyun and Akbar”, we become witnesses of clashes of ideologies. At the time of Akbarshah, during the fierce struggle between the philanthropic, universal ideology, free religion and the destructive ideology of national incitement, religious friction, the French intelligence officer Albert Preiro, under the guise of allegedly teaching the son of Akbar Salim the French language, maritime affairs and navigation, began to impose hiding his immoral ideology, hiding from his father immoral photographs of women, slowly undermining father’s relations with his son, as a result, ruined their relationship and hit the root of this dynasty with an ax. As a result of this, many difficulties arose in Akbar’s policy, in the development of the country, in reaching agreement between different nationalities and religions. In the emergence of these difficulties, a great role was played by the son of Akbar - Salim, whose mind was poisoned by a destructive ideology. This shows that for the subjugation of human souls and thinking, it is not necessary to fight with weapons, ideological influence can be used for this.

Today, ideological processes in the world have their positive and negative effects, so they can be divided into the following groups:

Group I covers creative ideologies: peace, stability and progress, national harmony, religious tolerance, human freedom and personal excellence, the priority of universal values.

Group II embraces reactionary ideologies: war, weapons, terrorism and extremism, racial intransigence and nationalism, religious fanaticism, totalitarianism, selfishness, the priority of narrow interests

Complex processes arising on a global scale, an increase in racial intolerance in one country or another, fanatical crimes, young people who use drugs, inattention to spiritual and educational issues show the possibility of danger and as a result lead to a crisis of society. It should be noted that globalization is characterized by the ideologization of a new form of sociopolitical life; there is an inoculation in all spheres of a new way of life, a “new teaching”. And the role of the “new teaching” is played by Western liberalism.

Ideologies that continue the ideas of communism, with the same intensity and consistency, are trying to implement new models and solutions. So, the liberal “international forces” are under the interests of a certain state, as before the interests of a certain state were behind communism.

The globalization of ideological processes, accelerating the increase in people’s material and moral needs, has changed their traditional mentality. In view of the fact that changes in the national mentality of people today are taking place under the influence of the emerging “mass culture”, they do not develop positive qualities, but negative features such as individualism, desire for fame, accumulation of wealth by any means, neglect of others greed, cruelty, estrangement from each other. The direction of the globalization process in the formation of universal spirituality, which plays a large role in preventing negative qualities in people, has become the most important task for today’s civilization.

The construction of a legal democratic state, civil society in Uzbekistan, based on a market economy, is associated with participation in universal processes taking place in the world today.

Therefore, the analysis of the content and meaning of globalization of ideological processes in the world and the features of their influence on the life and development of our people is very important. Today, the globalization of ideological processes, covering all countries and regions on earth, shows the following features:

Firstly, integration on a global scale, covering all areas of socio-economic, political and spiritual life, makes national boundaries conditional.

Secondly, being an objective process, a feature of globalization of socio-political relations now is characterized by the influence on all spheres of society, without exception.

Thirdly, the general laws of the development of society, expressing the processes of differentiation in models of national development, specify at the national level the general laws in the development of mankind.

Fourth, it is characterized by the intensity of ideological relations as a result of the development of communications, technical and technological, intellectual foundations, international social, economic, political, spiritual and cultural relations.

In the implementation of the priority ideologies of national development, the socio-political situation within the country and beyond is important. Each ideology expresses desires, public opinion, a certain political benefit of a social group, as the embodiment of political consciousness and serves as a guarantor, the basis of socio-political sustainable development.

Each ideology as a political mind, combining certain political interests of a social group in society, expressing the wishes and thoughts of the public, corresponds to the spirit of the people, and also serves as the moral basis, the guarantor of social and political sustainable development in society.

Each society and state has independent development models, although they differ from each other in form, content, do not exclude the general laws of development. That is, on the one hand, it protects the interests of the unification of mankind for good purposes. On the other hand, the identity in national development is formed under the influence of the ideological environment, cultural life, social life, political system of a particular state. [5] "Simply put, each stage of development of a particular society and state requires taking into account the requirements and conditions provided by life itself. We can say that each stage of development is new problems and new tasks on the way to their elimination. This is the law of life, we cannot ignore it, and we have no right to ignore it."

So, times are passing and changing. Only the worldview of the people, the spiritual person, the meaning and content of the nation, passing from generation to generation, continue in new colors. This eternal and continuous process as a national phenomenon expresses in itself feelings, worldviews and attitudes, the spiritual world of a citizen.

If the idea of national independence during the globalization of ideological processes takes into account the spirituality of the people, this duration, continuity and inalienability in the cultural development of the nation, is based on it, combines the national spirit and national mood, will be tenacious and influential. When national state issues, the intended goals of society turn into the dreams of ordinary people, the socio-political processes will become irreversible. And this trend

calls on members of society to build a life based on healthy thinking, live their own minds, and stand on their own.

## INFORMATION TECHNOLOGY MODEL IN EDUCATION

**Yuldoshev Akhmadjon Tulkinovich \***

\*Researcher,  
UZBEKISTAN

### ABSTRACT

*The article talks about the urgent need for the transition of the education system from the traditional teaching model, which is based on the classroom lesson scheme for the organization of the educational process, to the information technology model. The proposed new training model is based on the systematic use of information and communication technologies in solving didactic tasks and educational process management tasks. The model provides a combination of the compulsory assimilation by all students of the established minimum of educational information on the discipline, on the one hand, and the achievement of maximum individual learning outcomes, on the other.*

**KEYWORDS:** *Education In The Information Society, Training Model, Information And Technology Training Model.*

### INTRODUCTION

The global task of the education system at all its levels is to prepare a person for life in society. At the present stage (as, indeed, during the periods of the existence of previous social formations), it should possess qualities that allow, on the one hand, to ensure the progress of society, and on the other hand, to feel comfortable (without conflict) as a member of this society, sharing its basic ideals and established hostel rules. An analysis of the demands of the labor market, directions and rates of social development shows that at present, the following set of qualities should be formed for a graduate of any state educational institution:

- Criticality and independence of thinking;
- High qualification, horizons in their field of activity;
- Fluency in technologies for searching, processing and using the necessary information;
- Discipline, accuracy and accuracy in the work;

- Willingness to bear responsibility for the result of their activities;
- Ability to self-education and the presence of internal motivation for this.

As you can see, this list has much in common with the solution of those pressing problems that are a consequence of the spread of information and communication technologies. A logical question arises: to what extent is the Russian education system adequate to the needs of society and can it ensure the formation of the listed qualities?

In one of his recent articles, academician V.I. Zagvyazinsky, reflecting on the features of the functioning of the domestic educational system, identified a number of factors that determine its shortcomings and difficulties: the lack of strategic development guidelines, the formalism of assessing learning outcomes through the USE, the principle of per capita financing, low pay the work of teachers, the aging of teaching staff, the attitude to education as a service sector, etc. [1]. One cannot disagree with the author, however, it should be noted that all this: insufficient public funding, and costs of management schemes, and the lack of mechanisms for the influence of social order on the content of education (as a result, the formation of content occurs in the bowels of the system itself, which, of course, is wrong) - external causes that impede the development of the education system, and not internal factors.

It is known that education is the process of transferring the knowledge accumulated by previous generations, methods of activity, moral values, and behavioral rules to subsequent generations. The statement that this transfer occurs through the exchange of information (in one form or another of its presentation) is trivial enough. In this regard, the search for answers to questions is important:

- Meaningful - what to teach?
- Methodological - how to teach?
- Psycho physiological - to what extent can one focus on the student?
- Evaluative - what are the criteria for the effectiveness of the educational process?

Actually, these issues always faced education, but while the substantive changes concerned mainly ideology, and the teacher (teacher) was the source of educational information and the organizer of the learning process, the procedures and results of graduate training responded to slowly changing technologies and there were no radical changes in the education system. required.

The formation of the information society with new specific requirements for its members has fundamentally changed the situation: since information has become the main value for humanity, and the ability to find, process and use it as basic skills, it is obvious that the content, organization of education and its management should reflect data changes. Another feature of recent times has become the urgent need for a significant number of adults to receive continuing education, regular professional retraining, which, with existing organizational and educational resources (training rooms, the contingent of teachers, educational and methodological support, financing), remains an insoluble task.

Modern information technologies (multimedia, virtual reality, the Internet, cloud technologies, etc.), which graduates of the education system have to deal with, as a rule, were created and

developed not to solve educational problems. However, their didactic abilities quickly revealed, and rapid technological improvement made them quite accessible, including for solving educational problems. Currently, there is a huge number of studies and descriptions of practical experience in the application of information technology as a means of training and educational process management. Indeed, modern information and communication technologies (ICT) can significantly change the presentation of information, its search, delivery, processing, use. There are many works that contain recommendations on the use of ICT in the educational process. Without diminishing their value and practical significance, I would like to draw attention to the following circumstances:

- firstly, in these works the didactic goal of using one or another technological tool is not always clearly described both from the point of view of mastering the discipline, and from the standpoint of forming the student's qualities of the modern person indicated above;
- Secondly, the work is phenomenological in nature without scientific justification at the psychological and physiological level of the appropriateness and admissibility of the proposed techniques;
- thirdly, as a rule, the emphasis is on the technical and technological aspects of training; Significantly less attention is paid to the methodology of organizing training sessions with the use of ICT, to the methods of pedagogical interaction between the teacher and the students.

V. I. Zagvyazinsky also draws attention to the risk of students developing "clip thinking", "button technologies" to search for ready-made solutions and answers that do not ensure the development of creative thinking, imagination, intuition, creativity [1, p. 12].

Our initial position, which determines the logic of subsequent constructions, is that the technology involved should be secondary to the didactic task and the individual cognitive characteristics of the student. The choice of a teaching method involving the use of one or another information technology should be commensurate with its pedagogical justification and personal value for the student; in this case, the method should have some advantages over traditional (non-computer) training, proven experimentally, and not only major statements of the developer (such as "... the use of this technology should allow ..." or "... students like it." )

About what qualities a graduate of a state educational institution should possess, about generalized educational goals that should be achieved, it is said in the Law "On Education", in state educational standards, and in the programs of individual educational disciplines. Unfortunately, these instructions are largely declarative in nature, since

- the content and teaching methods at all levels of education are based on outdated traditions, the list of disciplines to be studied, their volume and methods of learning are not justified and are not associated with the requirements of further professional activity;
- in secondary education there is practically no differentiation according to the level (depth) of mastering the discipline, as a result of which all students work according to the same curriculum without taking into account their cognitive interests and inclinations to one or another type of activity;
- the regulatory documents do not describe the mechanisms for achieving the set generalized goals; the curricula are built on a disciplinary principle, which makes the formation of specific

knowledge (competencies) a priority in the goal of studying the discipline and “erodes” responsibility and control for achieving common goals;

- The criteria for achieving educational goals related to the development of a specific academic discipline are very vague and ambiguous, and meters are not technologically advanced; methods of final control are formal and not focused on the identification and assessment of the above qualities.

Undoubtedly, the need has ripened and the time has come to eliminate these shortcomings. However, one must be aware that such a reform cannot be carried out quickly: even if a decision is made to start it, it will take several decades. Does this mean that when organizing the educational process, educational institutions and individual teachers are doomed to use the traditional teaching model? Such an opinion would be equivalent to postponing indefinitely the use of modern educational models and technologies, the need for which is felt more and more.

A compromise seems to be the case in which the goals and content of education will meet established standards, but the learning model will gradually change so that it maximally uses the capabilities of modern technologies of transportation, processing and presentation of information and takes into account the interests of the student. We will call such a model an information technology and will continue to use the notation IT training model.

The principles of building the educational process in the IT training model

In the IT model, we can distinguish the general and most significant requirements for the learning outcomes of any theoretical discipline:

- complete assimilation of the required minimum by all trainees;
- Development of independence, the intensification of educational and cognitive activities, the development of research and creative abilities of students;
- Maximum individual learning outcomes for given conditions;
- Extremely comfortable from a psychological and physiological point of view training conditions.

These requirements determine the principles for the implementation of the educational process based on the IT model.

1. Complete assimilation of basic educational information (the cognitive component of the state educational standard (GOS)), which means:

- Introduction of the concept of basic educational information (basic minimum - BM) in the discipline, which must be mastered completely by all students in a time not exceeding the established curriculum;
- The volume and content of BM is determined by the teacher or (which is preferable) by an assessment of the student's real workload according to the scheme of the European credit transfer and accumulation system (ECTA) 1;
- BM development is recorded according to the dichotomous scale “acquired” - “not acquired”, without gradations of success (degree) of assimilation;

- complete mastery by each student of the basic minimum, which is a condition for his further education on an individual trajectory.

## 2. Individualization of training

- Variability of the forms of presentation of information in order to take into account the psycho physiological characteristics and capabilities of the student

1 This article will be devoted to the next article of the author in the journal Education and Science.

- Individual development time of the base part;
- Individual learning paths after mastering the basic part (individual content);
- Use of blended learning organizational schemes;
- ensuring the educational activity of each student.

## 3. The temporary effectiveness of training:

- Minimization of BM assimilation time;
- The use of generalized techniques for working with information in the presentation and training;
- Completeness of educational and methodological support for the development of BM;
- Priority of visual presentation of educational information in relation to verbal.

## 4. Persistence of learning management:

- Continuity of measuring the success of the development of educational information for each student (continuous monitoring);
- prompt feedback of the teacher and students in the process of classroom and independent work;
- Completeness of management methods (distance, full-time);
- A priori developed management methods appropriate to the pedagogical situation.

The initial principles on which the educational process is built in the IT model are valid for any level, form or type of education. However, at various educational levels, taking into account their specifics, their priorities should be indicated and a more detailed content of certain provisions should be formulated. Distinctive features of secondary and higher education, essential for the implementation of the IT model, are presented in the table.

A comparison of the specifics of different levels of education allows us to determine priorities in the selection of content and preference for organizational forms of the educational process based on the IT model:

- in high school - individualization of instruction, increasing motivation and cognitive interest, mastering self-education methods;
- in higher education - providing access to a variety of information resources and efficient communication of subjects of the educational process, development of independence and creativity of future specialists, the formation of professional qualities.

Comparison of the specifics of secondary and higher education in the implementation of the IT model

Category High School High School

Learning objectives Learning the basics of science and practice, professional orientation, personal development Professional training of a specialist who is competent in a certain field of knowledge (activity)

Skills of independent work with information (search, processing, assimilation) Initially absent, formed in the learning process Formed at a level sufficient to study at a higher school

Motivation for learning. Mostly external (teachers, parents); internal is possible to separate disciplines Internal - is connected with the student's desire to get a certain profession at a good level

Conditions for the implementation and management of the educational process Significant regulation of organizational forms (mainly in the framework of the classroom lesson scheme), content, methods of activity of the teacher and students, management of the learning process Relative freedom of the teacher and student in choosing the form and teaching methods; lack of restrictions on subject matter outside educational standards, significant freedom in the choice of methods for managing the educational process by the teacher

Adaptation of the learning process to the individual characteristics of the student. External - the teacher identifies the level of training and especially the development of the discipline for students, selects and recommends educational tasks, exercises control and takes corrective measures. To a large extent, internal - the student can independently choose the most convenient content and form for the presentation of educational information

To the above, it is necessary to make a number of clarifications:

- firstly, the model involves the integrated use of information technologies in the process of training and learning management, that is, situations of fragmented use of ICTs for solving individual (private) didactic tasks (training, simulator, control, etc.) remain outside the scope of the review;
- secondly, the model covers only the technological and organizational aspects of the educational process - this shows its certain limitations, since the most important factors in increasing the effectiveness and quality of education are the optimization of its goals and content; the model does not provide an assessment of the appropriateness of including a particular discipline in the curriculum, its content and volume - it is for this reason that the basic minimum of mastering the discipline is associated with the requirements of the state educational standard or curriculum programs, however, when any other approaches to the formation of goals appear and content of education, the principle of allocation of basic content remains unchanged;
- thirdly, without affecting the content, the model, at the same time, provides for significant changes in teaching methods and educational process management (compared with those adopted in the traditional scheme), in particular, their use should be evaluated in terms of compliance with the requirements of cognitive psychology and results learning;

- fourthly, due to the difference in learning priorities and the cognitive abilities of trainees, teaching methods in secondary and higher education should be different;
- Fifth, ensuring that all students achieve the basic minimum level in mastering the discipline means that only those that provide the technological level for solving didactic tasks are acceptable schemes for organizing the educational process;
- Sixth, the disciplinary orientation of the IT model allows it to be used in teaching a particular discipline (cycle of disciplines), regardless of how others are taught;
- Seventh, based, in essence, on the full assimilation of knowledge, the IT model does not provide for rigid administration by the teacher of the student's educational work (as is done in "computer-free" implementations - dividing the material into modules, mandatory input control and monitoring of module development etc.), training tasks are issued in the formulation adopted in this discipline, and control is carried out, first of all, according to reports on the completion of tasks.

Next, we will consider the option of building an IT model of training at a university, since the presence of much greater academic freedom than in the system of secondary general education makes it possible to more fully and effectively implement the proposed model even though the content and set of subjects studied are poorly defined (from a scientific point of view and labor market needs) by state educational standards.

#### Organization of training in the framework of a university IT model

Since, as has been repeatedly pointed out, the curriculum for training a specialist at a university is drawn up on a disciplinary basis, it seems more correct to talk about an IT model of training for a particular discipline. In this case, the objectives of its application are:

- Full assimilation by all students of the basic content of the discipline;
- Individualization of training:
  - In terms of the volume and content of an individual educational trajectory after mastering the basic content;
  - choosing a blended learning model;
  - The desired level of discipline;
- The formation and development of professional qualities;
- Development of self-education abilities.

The educational process is built in accordance with the following provisions.

1. The basic content of the discipline, which all students are required to master, is determined by the teacher on the basis of the requirements of the CRP for the disciplines of the federal component; for other disciplines - the curriculum. Criteria are established for a student to achieve a basic minimum (BM), as well as methods and means of control that allow him to unambiguously verify his compliance with the criteria.

2. Joint (synchronous) training related to the development of BM takes only part of the semester's study time (50-60%). The form of training - full-time (classroom), distance, mixed - is

chosen by the student, and the volume of BM and the criteria for its development do not depend on the form of training.

3. For the development of BM, the student is provided with educational materials (in electronic formats with quick access to them), covering all types of educational activities and invariant with respect to the chosen form of training.

4. In the process of mastering BM, regular monitoring and self-monitoring of the success of the current training tasks are carried out; the number of “points” of the current control should be large enough (8-15 per semester) so that statistical patterns of the work of each student can be identified.

5. Assessment of educational activities is carried out according to the additive scheme; compulsory points associated with the assimilation of BM and points for mastering individual content are allocated from the maximum number of evaluation points.

6. The final control measure provided by the curriculum (test, exam) is carried out within the framework of BM.

7. If the student’s total amount of points is equal to or exceeds the level of BM, the student receives a minimum positive rating of “satisfactory”, regardless of how much the actual amount is higher than the level of BM.

8. After reaching the level of BM, the student, if desired, can continue to master the discipline along an individual trajectory; individual content is determined in conjunction with the teacher and involves the satisfaction of the student’s cognitive interests regarding the subject under study. Grades “good” and “excellent” are given by the teacher for the quality of mastering the individual content; at the same time, assessment criteria should be established and communicated to students in advance. The student finds the information materials for carrying out an individual task mainly on his own (teacher's recommendations are possible).

9. Students who have not mastered the BM continue to independently carry out current and additional training tasks, repeat the final control event — the cycle continues until the BM is mastered. The number of student attempts to deliver BM is limited only by the deadline for the semester.

10. Actions of the teacher: at the stage of mastering BM - conducting interactive training sessions, managing the development process; after completion of the joint training phase and the final control event, individual consultations on BM (for those who did not pass) and on the implementation of individual tasks for those who have overcome the BM level.

So, the full realization of ideas and the productive use of computer didactics are impossible in the conditions of classical classroom instruction. A logical question arises: what conditions are needed so that the educational process could be organized as an information technology?

Based on the learning objectives in the IT model, the above principles, as well as foreign and domestic experience in the use of ICT tools in the learning process, several groups of such conditions can be distinguished.

Technological:

- Availability of information educational environment (IOS);

- Free access for students and teachers to information resources and communication services of IOS, resources and Internet services;
- Automation of control, training;
- Students' access to specialized software environments necessary for studying the discipline.

**Didactic:**

- The availability of complete information support for all types of educational activities in the discipline in the volume of BM for any form of training chosen by the student;
- The possibility of adapting training materials in the form of their presentation to the individual characteristics of the student; visual form priority;
- Availability of information resources with records of interactive training sessions (lectures, seminars);
- the availability of resources (means) of assistance - guides, samples of solutions (tasks), answers to frequently asked questions, etc.

**Methodical:**

- Technological level of achievement of learning goals;
- focus on teaching methods that activate independent and research educational activities;
- The use of current performance assessment schemes that stimulate learning activities.

**Organizational:**

- Availability of a learning process management system (LMS - Learning Management System);
- A strict and unambiguous description of the content of the mandatory minimum and the conditions for its achievement;
- Freedom of choice for the learner at the level of mastering the discipline (in addition to BM) and the optimal form of training for him;
- The ability to build an individual learning path after reaching a set minimum;
- The presence of a clear schedule of the educational process indicating the time and form of control points;
- The freedom of the teacher in the choice of teaching methods (while ensuring the convenience of the learner and effectiveness in accordance with the criteria for full mastery);
- The teacher's willingness to implement the IT model in teaching his subject.

It is important that these conditions are fulfilled comprehensively: partial or selective compliance with them will not provide the possibility of implementing the described IT model.

In conclusion, we emphasize the most important features of the IT learning model:

- it affects only the organization and teaching methods, as well as methods of managing the educational process; the goals and content of the training are external to the model;

- It is called upon to ensure a combination of general and individual learning: mastering by all trainees the established minimum of educational information and at the same time satisfying their personal cognitive interests;
- has a disciplinary basis, and, therefore, its application is possible in the study of individual training courses, regardless of the methods used in the development of other disciplines;
- can be realized only if there is an information educational environment, full content on the discipline, the availability of means of operational communication of the subjects of the educational process; however, generally speaking, specialized training and methodological support is not required - electronic textbooks, computer simulators, etc .; only the requirements for the completeness and accessibility of training materials are mandatory (these may be, for example, electronic copies of ordinary textbooks and manuals).

Undoubtedly, the proposed scheme for organizing the educational process does not comply with some of the provisions and standards adopted in higher education.

## DEVELOPMENT OF READING CULTURE IN STUDENTS AND ITS IMPACT ON ACADEMIC LEARNING

**D.M. Malikova\***

\*Doctoral,  
Candidate of UzPFITI, UZBEKISTAN

### ABSTRACT

*This article deals with the development of reading culture in students and its impact on academic mastery, the development of intercultural, self-development and communicative competencies of students in reading books. Also, it has been suggested that regular reading can be a powerful tool for students to reach great heights in their future lives.*

**KEYWORDS:** *Reading Culture, Academic Mastery, Book Reading, General Cultural Competencies, Self-Development Competence, Communicative Competencies, Academic Mastery, Collaboration, New Technology, Reading technique, Audiobook, Worldview.*

### INTRODUCTION

Every nation in the world has contributed to the priceless treasure of world culture. In particular, the contribution of the peoples of Central Asia in this regard is unique. "... the land of ancient Uzbekistan has been a center of science and enlightenment, one of the centers of world civilization for many centuries, and the pursuit of science and enlightenment has become an integral part of the mentality of our people. Muhammad Kharezmi, Abu Rayhan Beruni, Abu Ali ibn Sino, Mirza Ulughbek and many other great ancestors, known in the West as Avicenna, became famous all over the world for their unparalleled discoveries in mathematics, astronomy, geodesy, mineralogy, pharmacology and medicine "[1; 10-p.] In fact, our ancestors from ancient times were interested not only in folklore, but also in the study of natural and astronomical sciences. In this regard, we can cite as a vivid example of the fact that they studied the flooding or lowering of rivers, the change of seasons at certain times, and the discovery of natural minerals underground.

Written literature has emerged that people are spending more time reading and reading. In particular, they were not satisfied with just one field, but studied perfectly many aspects of science and made unprecedented discoveries in this regard, which became their real goal. Only

Farabi (873-950) could speak more than 70 languages, which allowed him to use written literature in as many languages. According to sources, the encyclopedic scholar Abu RayhanBeruni was also saved from the wrath of Mahmud Ghaznavi by his knowledge. It is clear that reading a book is a prelude to the success that people have achieved. Therefore, we also need to make our children interested in reading from an early age, realizing that our first task is to form a perfect person with a bright future, because thinking and consciousness are formed and nurtured at an early age. It is no coincidence that our people say, "Knowledge given in youth is like a pattern carved in stone".

Getting used to reading is a regular reading of a topic according to a pre-determined plan. The habit of reading has a great influence on the academic development of the student. Reading and academic success are closely intertwined. All students have different growing conditions and living quarters, so it is natural that their level of education will also vary. Some students engage in regular reading, while others do not. Academic success shows how much knowledge everyone has acquired during school. Of particular importance in this regard is the Decree of the President of the Republic of Uzbekistan dated January 12, 2017 № PF-4789 "On improving the system of printing and distribution of books, the establishment of a commission to promote and promote the culture of reading and reading".

To be creative and pragmatic, everyone needs to be explored independently. A person engaged in independent research must be able to think and analyze. In order to learn, everyone needs to be able to read independently, at their own discretion, and turn it into a skill. In the process of learning through reading, the information is better understood, and in this case the student learns from his own experience, his worldview expands.

According to a study by foreign scholars, "it is good that the habit of reading begins in the primary grades of school, when the child has a high level of acceptance. Then reading becomes a lifelong habit".[4; 32-p.]

To achieve reading and academic achievement, researchers and educators need to know that every child, regardless of his or her social background, ability to learn and master, should be educated according to their level of acceptance. If this student has a well-developed reading habit, his academic development will always have a better performance. The knowledge that students want or need to learn can only be acquired through reading. Regular reading serves as a powerful tool in conquering high peaks in a student's future life.

According to Palani, a foreign scholar, the habit of reading is a necessary factor in building an enlightened society. The habit of reading shapes a person's personality and creates in them a right way of thinking; new ideas emerge from it. The media can also influence a person's interest (newspapers, magazines, and other printed products). Reading is also important for effective mastery of lessons, and reading is directly related to the learning process in school. For this reason, reading skills must be formed in order to achieve good results in school. Reading is about recognizing these symbols and understanding the meaning of these symbols. Readers should have the skills to identify and understand. By understanding, the reader is able to correctly understand the meaning of words and the content of the text. Before the invention of television,

young and old always set aside time to read. In addition to teachers, other professionals spent their free time reading literature. In schools, materials for additional reading to students have always been given as a task. But all this, unfortunately, has remained in the past. [5; 91-p.] Palani also points out that the habit of reading has lost its value nowadays as it is stuck in the big and small TVs. In educational institutions, they are limited to reading only the materials required for exams. [5; 91-p.]

Many researchers, including Bhanva Gupta, have conducted research on reading, especially among students, on the effect of reading on academic outcomes. [6; 1-9-p.] However, much of this work has been done by the international community. Some scientific work has been done in Canada, but they have been limited to a certain extent. [7]

Scientific research on these issues has also been conducted in Uzbekistan: A.A.Umarov "The role of reading in ensuring socio-cultural development and the formation of a full-fledged personality" [8], A.H.Abdulazizova, a sociological analysis of the process of forming a culture of reading in academic lyceums and professional colleges. [9]

The low level of academic performance among many students can be explained by the fact that they do not have a sufficiently formed reading culture. In order to achieve excellent results, it is necessary to form a culture of reading in the student. [10; 1-5-p.]

Nowadays, under the influence of the media, people have very little interest in reading, such as art books, magazines and other educational materials. The poor performance of academic exams can also be explained by the low level of students' attention to reading. In addition, the popularity of new technology products is leading to a decline in interest in reading among students.

At the same time, students watch movies, listen to music, and participate in online shows using a variety of technical means. Many parents and teachers are concerned that the culture of reading has not developed in today's younger generation. As a result, students' exam scores are declining. The reason why young people do not develop reading skills is not because students do not know how to read, but because of a lack of interest in reading.

Teaching students to read books is one of the important tasks of educators today. In this area, the teacher should first establish a partnership with the school library and parents. Teachers need to introduce students to the book, acquaint them with the world of books, and give them the opportunity to enjoy reading in order to develop reading culture skills in them. It is important to accustom students to search for the necessary information in the book.

At the same time, teachers and parents should regularly study students' interests, needs, and aspirations for books. Students are encouraged to read the book as the content of the learning process changes each year. In the first year of primary education, students develop reading technique skills. Students first begin reading the textbooks. They understand the texts read by the teacher better than they read. Because they do not have enough reading skills, they do not fully understand the content of the text. The illustrations in the books make them more appealing.

Even if they don't realize their connection to the text, they watch the pictures with great interest. That is why teachers need to encourage students to read aloud more in the primary grades.

Book discussion is an important pedagogical tool that encourages students to read carefully and think deeply. This will be the basis for the increased interest of students in reading books. They gradually become accustomed to expressing their opinions. At the same time, in the process of reading a book, students develop general cultural, self-development and communicative competencies. Group conversations lead students into debating situations, resulting in them becoming more prone to exploration. Teachers, on the other hand, should be able to organize heuristic lessons using such situations effectively. In such classes, students carry out research to determine the true nature of the work of art, the views, goals, thoughts of the protagonists. Adolescent students in particular are prone to such research.

We offer the following to solve the problem:

- 1) Re-read the read text within the specified time. In this case, the reader reads the given text aloud again and again. As a result of such an exercise, the student acquires words, pronunciation and intonation correctly and completely. A student who is able to read a text completely and correctly within a given time will then move on to reading a more complex text.
- 2) The child reads a book he likes. Parents and teachers should have books that children enjoy. This can require the child to read this book from time to time. The reader's propensity to read such a text will be high and inspiring for the child. The result will be positive and the child will enjoy reading the text.
- 3) Teaching simple phonetics. Regardless of age, every child should be taught phonetics carefully and with special attention. The child is taught to spell and pronounce each word correctly. Through this exercise, the child learns words better and reads and understands them correctly as he reads.
- 4) Deal with each child individually. Teachers should assign a portion of the text to each child at the beginning of the school year. Each child learns a text that is assigned to him or her and through this can identify children who are well mastered and struggling. As a result, the teacher can engage more with children who are struggling.
- 5) Reading books to children. Parents should read stories and eras to their children aloud and pronounce the words clearly and correctly. If you do not have time to sit down and read a book, you can listen to audio CDs. In doing so, children should not only listen, but also follow the text verbatim at the same time.
- 6) Staging the read text. With the help of poetry, speech and manuscripts, a child can become interested in reading. Teach the child a specific part of the work and act out the text being read. In this case, the child plays the role of the protagonist of the work, through which the child better understands the text and may be interested in it.
- 7) Tell the child the level of learning. Students want to know what their level of knowledge is. To demonstrate this, give the child to read a specific text and determine the number of words in the text. The reader reads aloud. Each time the text is read, mark the time spent on it and show it to the child through a graph. After reading it a few times, the child can see through this chart that his or her speed is increasing, which inspires him or her and inspires him or her to read more.

In conclusion, if we accompany our children to books from the earliest years, the quality of their reading will increase, their scientific outlook will be formed, and their artistic taste will increase. In this regard, various electronic and audio libraries on the Internet, which are gaining popularity today, can also serve as a valuable help. Let's give our kids good age-appropriate books that will raise their level, not different district toys. Only then will it be clear that our children will achieve the results we expect in the future.

### **ABSTRACT**

*In this article we are talking about family education as the main factor in social development and the education of a perfect developed generation. The pedagogical opportunities of the family are highlighted.*

**KEYWORDS:** *Family, Family Upbringing, Socio Cultural Phenomenon, Purpose And Tasks Of Family Upbringing, Principles And Methods Of Family Upbringing, Civilization.*

### **INTRODUCTION**

One of the main factors in the development of a child is his environment, and therefore his family, the atmosphere in it. The role of the family, the duty of parents consists, first of all, in combining their requirements with the requirements of society in the development and education of children. Today, a variety of factors and phenomena pose a spiritual threat: intensive social processes, uncritical borrowing from the outside and the forcible introduction of economic and political models, the destruction of the basic values accumulated by society.

At the heart of the new philosophy of interaction between the family and the educational institution is the idea that parents are responsible for the upbringing of young people, and all other social institutions are designed to help, support, guide, complement their educational activities.

The most difficult thing in introducing the principle of anticipatory impact in the field of moral education in the family is to teach parents to analyze changes in the child, stimulate their development, and not restrain, as is often the case with adolescents. It is necessary to instill in parents the skills of a humane attitude to their children, respectful and trustful dialogue (rather

than edification, shouting) in communication, to overcome the inertia of past views ("this was what my parents did, and I bring them up with life-tested methods") unconditionally, difficulties in solving this problem are many. Indifference of parents to children makes them feel lonely, and children begin to look for attachment on the side, in a variety of activities, in the company.

However, both parents and teachers experience the greatest difficulties precisely when solving ethical issues. It is especially difficult to engage in moral education in conditions when the country is in an economic, political spiritual crisis. In this regard, the process of moral education of children in the family and school institutions has become much more complicated.

The family is a small social group based on marriage, consanguinity, whose members are connected by common life, mutual moral and material responsibility. In sociology, the family is considered as: a) the primary social group in which the person's social life practically begins and flows and which is one of the main factors of socialization; b) a social institution that regulates and controls various aspects of life on the basis of principles, norms, rules and attitudes adopted in society; c) a social system in which all its members have certain statuses and roles [1].

The family is the most important source of social and economic development of a society. It produces the main social wealth - man. Not a single nation, not a single civilized society could do without a family. For each person, the family is the beginning of the beginning.

Scientists of our republic also attached great importance to the problems of family and education. Scientists Yusupov E., Shaikhova H., Kholmatova M., Nazarov K., Saydalieva N., Tillaeva G., - investigated the philosophical aspects of the family; Otakhajev F., - investigated the legal aspects of the family, etc.

Thinkers of the East paid particular attention to the issue of family, education, and training.

Yusuf Khos Khojib, a prominent poet and thinker of the 11th century, gives a large place to family and marriage issues, the upbringing of the younger generation, and parent-child relationships. The poet says that high moral values are inculcated by a good upbringing. "If a child grows inept, capricious, pampered, then his parents are to blame. Children are the joy of the family, without them there is no happiness," the thinker believes [2]. They must be brought up from an early age, taught craft, the acquisition of skills of exemplary behavior, the ability to respect elders and cherish the honor of family and parents.

The scholar - encyclopedist Ahmad Donish in his works gives advice to his sons about family and marriage. He claims that everyone should learn some knowledge and learn some kind of craft. In his opinion, the guy, first of all, should choose a smart, well-mannered and healthy girl if he thinks about his future. Secondly, he must have a permanent job, and thirdly, he must have a permanent certain place for further residence. And the girl, in turn, must be well-brought up, must respect her husband and be able to hide family secrets.

The upbringing of the young generation depends on the family, since upbringing begins there. According to Ahmad Donish, a healthy lifestyle depends on family members, on their upbringing. If a person knows his measure in everything, then he can live long and long. A measure determines a person's place in society, as it manifests itself in food, in leisure, in work, and in human terms. He discusses marriages between close relatives. In his opinion, such marriages prevented the birth of a healthy generation.

The great scientist - the encyclopedist of the medieval East, Abu Ali Ibn Sino, conducted an interesting experiment. He placed two lambs in absolutely identical cages, fed them and looked after them in exactly the same way. And now the first lamb grew frail, timid, depressed, and the second developed quite healthy, had a great appetite. What's the matter? And the thing is that the first lamb from his cage was always visible to the wolf sitting in the next cage, and the other lamb did not see this.

Fear has never been an assistant in the good family education of the younger generation.

Family education can be considered as social and cultural continuity, transmitted from generation to generation of parents, educators, teachers. Succession is broadcast in the form of traditions, customs, rites, the cult of ancestors, sacred covenants, commandments.

We consider it necessary to consider family education as a pedagogical, sociocultural, folk, religious phenomenon. Traditions as a phenomenon of being reveal the essential characteristics of family education. These include pedagogical, sociocultural, folk, religious traditions of family education.

Family upbringing is a system of upbringing and education, taking shape in a particular family by the efforts of parents and relatives.

The purpose of family education is the formation of personality traits that will help to adequately overcome the difficulties and obstacles encountered in life. The development of intelligence and creative abilities, primary work experience, moral and aesthetic formation, emotional culture and physical health of children, their happiness, all this depends on the family, on parents, and all this is the task of family education. It is the parents, the first educators, who have the strongest influence on the children. Even J. Zh. Rousseau argued that each subsequent teacher has less influence on the child than the previous one.

The success of the family in carrying out the leading function in raising children, their comprehensive development and preparation for socially useful work largely depends on the educational potential of the family. It represents a complex of conditions and means, which together constitute the pedagogical capabilities of the family.

This should include: material and living conditions, the size and structure of the family; its ideological, moral and emotional-psychological climate; level of development of the family team; the nature of the relationship between its members; family work atmosphere; life experience and cultural and educational level of adult family members; the availability of free time and the nature of the organization of family leisure; personal example of parents; the ability to use the media and culture; the system and nature of family communication and family communication with the environment; the level of pedagogical culture of adult family members, the distribution of pedagogical forces in the family; family traditions.

Customs and traditions always consolidate what has been achieved in public and personal life; they are powerful social means of stabilizing established social relations. They also play the role of social mechanisms for transferring accumulated social experience to new generations.

An increase in the role and importance of the family in the further development of the spiritual foundations of society, the preservation and strengthening of primordial national values, the widespread establishment of an atmosphere of high morality in society, and the opposition to

various harmful influences that are intensifying and absolutely foreign to the national mentality. Strengthening the role of the family in the education of a physically healthy, spiritually mature and harmoniously developed generation, and for these purposes, strengthening the mechanism of practical interaction of the family institution with educational and educational institutions, ensuring their close and effective cooperation.

In order to further form a physically healthy, spiritually mature and harmoniously developed younger generation with independent thinking, developed intellectual potential, deep knowledge and a modern worldview, capable of taking responsibility for the fate and future of the country.

Improving the legislative and regulatory framework, developing new provisions and norms aimed at creating favorable organizational and legal conditions for the formation of a healthy, harmoniously developed generation.

Increasing the role and responsibility of the healthcare system and medical workers in the formation of a healthy child, giving birth to children without pathologies, further strengthening the material and technical base and human resources of the healthcare system, and regularly conducting large-scale outreach to improve the medical culture of the population.

Strengthening the role of the education and sports system in shaping a healthy child, expanding the network of pre-school educational institutions with staffing with highly qualified, experienced teachers, dramatically improving the level of preparation of children for school, ensuring high quality primary education, widespread introduction of advanced pedagogical and information and communication technologies, implementation of specific measures to widely promote a healthy lifestyle, instilling in children, especially girls, a love of physical education and sports.

Strengthening assistance and support from the state and society in the formation of a healthy and harmoniously developed generation, creating conditions that meet modern requirements in healthcare, education, culture and social welfare institutions responsible for these processes, increasing the efficiency of the use of funds allocated for their development, wide study and the introduction of international best practices in raising a healthy child.

Increasing the role, empowerment of the mahalla and other social structures in raising a healthy child, especially girls, assisting them in mastering modern knowledge and professions, getting involved in various circles, developing entrepreneurship, strengthening the responsibility of the mahalla and other public structures for strengthening families and a society of mutual understanding, peace and tranquility, timely and targeted provision of material and moral assistance to low-income families;

Today in our country, the role of the family in shaping the spiritual image of youth on the basis of the idea of national independence, universal values and centuries-old traditions is priceless.

It should be noted that the noble idea “A healthy mother and child is the foundation of a happy family, a happy family is the foundation of a prosperous society” has deeply established itself in our lives and its implementation has become a sacred duty for each of us.

## **TOLERANT SCHOOLCHILDREN - THE FUTURE OF PROMISING UZBEKISTAN**

**Kushakova Gulnora Egamkulovna\***

\*Senior Lecturer,

Department of Preschool Education Methodology,  
Ph.D. Jizzakh State Pedagogical Institute, UZBEKISTAN

### **ABSTRACT**

*The article is devoted to the issues of formation and development of tolerance among pupils of general education schools. It touches upon the problems of introducing innovations in the education system. The policy of the republic of Uzbekistan actively integrating into the world community is aimed at the formation of a purposeful and responsible person able to successfully fulfill various life roles in a pluralistic changing world.*

**KEYWORDS:** *Pupil, General Education School, Tolerance, Mutual Understanding, Cooperation, Purposefulness, Ability.*

### **INTRODUCTION**

In the twenty-first century, the century of the intellectual generation, education is the key to solving global problems. It is the educational sphere that turns into a leading factor in the economic growth of states, forms their investment attractiveness and provides a technological breakthrough into the future. The introduction of innovations ensures high-quality growth in the field of lifelong education, in the steady progress of the country, the competitiveness of the republic in the world, increases the intellectual contribution to the economy due to the widespread introduction of technologies and scientific achievements [1]. That is why the policy of the Republic of Uzbekistan, which is actively integrating into the world community, is aimed at the formation of a purposeful and responsible person, capable of successfully fulfilling various life roles in society. For this, a flexible and accurate adaptation of the system of general secondary education to the current and future needs of the labor market is carried out, which is carried out through the formation of students' abilities for productive and creative activity and social interaction. The national tradition of a general secondary school reflects the result of the enormous changes that have occurred in the educational system in recent years, which helps to

draw the attention of students to active educational activities. But today, in order to improve the education system, modernize textbooks and update the content of the educational process, measures have been taken to increase the availability of educational services. To this end, modern teaching methods based on innovative approaches are being introduced and an effective mechanism for improving the quality of education has been developed. They are clearly indicated in the Decree of the President of the Republic of Uzbekistan Sh.M. Mirziyoyev "On measures to radically improve the system of general secondary, secondary specialized and vocational education" dated January 26, 2018 [2].

The gradation of problems and the solution of the tasks set by the state to the system of general secondary education are aimed at implementing a set of measures to take systemic measures to provide targeted support to talented students, strengthen modernization and update the content of the educational process. In order to improve the current state of secondary education, fundamental reforms have been carried out in the republic. First of all, this is the introduction of 10 classes into the system of a comprehensive school since 2017, and secondly, the opportunity for students to study once a week in their future or close specialty in educational complexes and at the end of a general secondary educational institution together with certificate of maturity to receive a certificate of qualification.

But there are issues that need to be addressed immediately. This applies to the existing practice of forming the material and technical base of professional colleges, where 10th grade students study once a week in vocational education, which led to the creation of training workshops that do not meet the areas of study, as well as the lack of components for the implementation of full-fledged education [2]. This means that the priority today is to improve the condition of training workshops equipped with modern spare parts and necessary equipment. Since only with practice-oriented learning can students improve their knowledge. Student youth should develop their understanding of the world, the structure of the universe, seek information on a matter of interest to them. Find and study everything that is possible in the area in which they want to become professionals and this will help the younger generation become leading specialists in their future professional activities. Similarly, it is necessary to act in every area of life in which they want to become better: in health, career, hobbies, etc. To do this, one should begin to adopt the experience of other people, become personalities and then they will be able to qualitatively change their life. It is necessary to read, develop and remember that one can change one's life for the better only by changing one's inner state. That is why in secondary schools, teachers today focus on the individual characteristics and abilities of students so that their profession chosen in the future would be interesting and loved. This means that today it is necessary to educate a person who would be trained throughout his life, had ample opportunities for realizing his creative potential, and had confidence in himself and his knowledge. To achieve this goal, teachers need to work in collaboration. Let us recall the words of the famous American industrialist G. Ford that "teamwork consists in the ability to work together on a common vision, in the ability to direct individual achievements towards the goals of the organization. This is a stimulant that allows ordinary people to achieve unusual results. " They aim both teachers and students to work in a team, respecting each other, and this is a tolerant relationship that is very important today, because based on mutual understanding and mutual respect, you can achieve the desired results.

For this, it is also important to unleash the potential of all participants in the pedagogical process, provide them with opportunities for the manifestation of creative abilities. The solution to these problems is impossible without changing the teacher's attitude to his activities and a look at teaching and how to teach. A great impetus in the education system in recent years has been the ability of teachers to realize their creative potential on the platform of ideas. In the traditional educational system, the main guideline was the transfer of ready-made knowledge, which encouraged the mechanical memorization of theoretical material and did not provide an opportunity for students to fulfill themselves. Now education is more and more focused on the creation of such technologies and ways of influencing the personality, which provide a balance between social and individual needs and which, by launching the mechanism of self-development, self-improvement, self-education, ensure the individual's readiness to realize his own individuality and changes in society. With this approach, a modern student from a socially passive becomes active, independently acquiring knowledge. If a student previously broadcast ready-made knowledge in lessons, now it is a reflecting personality who can evaluate his actions. Time requires a different approach to teaching students.

The attention given by the country's leadership to teachers inspires them to search for non-standard forms of teaching the lesson, and students to conquer new heights and personal development. Therefore, introducing modern innovations in school practice, teachers began to conduct lessons more effectively taking into account the individual characteristics of each student, to pay great attention to educating students in a tolerant worldview, a tolerant attitude towards all people, regardless of national, religious, social and property status.

The essence of personality-oriented pedagogy is to recognize the student as the main acting figure in the entire educational process. The student is an equal partner with the teacher in educational activities. Here, the teacher does not force him to study the compulsory material, but creates the best, optimal conditions for self-development and self-realization of the student. This will allow you to acquire personality traits such as the ability to effectively work with information, have communication skills, and be responsible for your own education, when the student can live a full, eventful life in which he can satisfy his spiritual and intellectual needs and find himself. Therefore, in secondary schools, opportunities are provided for obtaining a full-fledged education, ensuring social activity, developing creative abilities, increasing the intellectual and physical potential of students.

Therefore, the main skills of the student of this century should be: the ability to cooperate, developed critical thinking, communicativeness, initiative, the ability to solve their problems, etc.

From the point of view of the constructivist theory of teaching, the purpose of teaching should be oriented toward the achievement by the student of a more thorough understanding of the subject, ensuring the use and application of knowledge in situations outside the classroom. A student of a new generation should be self-regulatory, able to independently acquire the necessary knowledge. Teachers should be competent not only in the development of their knowledge and skills, but also in their personal development, taking into account the importance of individualization of education and the formation of their meta-consciousness, i.e. learning skills on how to learn. Humanitarian subjects form in the minds of the younger generation such unshakable concepts as the national idea, patriotism, respect for the traditions and culture of the

Uzbek people, which have developed over many years. They teach a careful attitude to material and spiritual values accumulated by ancestors, contribute to the growth of legal literacy and consciousness. Much in his future life depends on the discipline of the student, his well-read. Since the great teacher Abdullah Avloni was right when he said: "Man is like a gem. If he received a good upbringing, avoids evil deeds, has excellent manners, then everyone who is next to him experiences happiness. " That is why it should be remembered that our great ancestors bequeathed to us the creation of life, the love of knowledge, tolerance, respect for elders and the observance of moral and ethical standards, the ability to look to the future and take care of our future.

Improving the work on the formation of tolerance among schoolchildren is possible by studying the history, culture and traditions of the people of Uzbekistan, their knowledge of their rights, freedoms and duties. This is especially important in modern conditions, when, along with other global problems of mankind, extremism and terrorism have acquired an international character.

The large-scale reforms carried out in the republic laid a solid foundation for national statehood and sovereignty, ensuring security and the rule of law, inviolability of state borders, the rule of law, human rights and freedoms, interethnic harmony, religious tolerance in society, and also created decent living conditions for the population and the realization of creative potential citizens, especially the younger generation.

## COMEDY IN UZBEK CHILDREN'S LITERATURE IN INDEPENDENCE PERIOD

**Jurayeva Gulnoza Axmatovna\***

\*Associate Professor,  
Tashkent State Uzbek Language and Literature University,  
UZBEKISTAN

### ABSTRACT

*The article discusses the role of comedy in Uzbek children's literature during the independence period, the study and teaching of satirical and humorous works created during this period. It analyzes the poems of poets of this period and reveals poetic images. The extent to which the humorous poems written during the independence period meet the requirements of today's harsh times and their impact on developing children's thinking and strengthening their memory will be discussed in detail. In particular, Anvar Abidjan and Dilshod Rajab's examples of humorous poems written during the period of independence are studied, and it is important for students to read their deep meaning and understand their meaning. The role of this article in the development of a mature, well-rounded specialist today is invaluable. In this sense, it is necessary to move the science of Uzbek children's literature to systematic periods, to ensure its structure and continuity.*

**KEYWORDS:** Comedy, Satire, Humor, Contemplation, Comic, Image, Subject, Event, Figurative, Symbolic, Character, Idea, Cheerful.

### INTRODUCTION

In both satire and humor, laughter has vital roots. Comic things can be expressed in a work of art in a humorous way or in a satirical way with the help of laughter, depending on their character, content and essence. Appearances and forms of comedy in life determine the nature and variety of satire and humor. In both satire and humor, the trigger for laughter is born of the contradiction between form and content. Because at the heart of something funny there is always inconsistency, contradiction, between idea and form or form and idea [1, 238].<sup>1</sup> But when each of them is considered separately, it does not cause laughter in its own right. The poems analyzed in the last chapter are, of course, a shining proof of this idea.

Particular attention was paid to the creation of a figurative image in children's poetry during the independence period. Poets used all sorts of metaphors and poetic devices to create a humorous image, as well as a satirical image. However, in the creation of satirical images, as can be seen, the creators use the image of such animals as wolves, foxes, rats, crows, sparrows, birds and beasts, which have risen to the level of satirical symbols in the stories. In their metaphorical humorous imagery, great emphasis is placed on poetic movement, figurative and symbolic imagery.

### THE MAIN PART

In particular, U. Shukurov's research of such poets as Anvar Obidjon, Dilshod Rajab, Abdurahmon Akbar, Rustam Nazar, in this regard, deserve appreciation. Anvar Obidjon's collection of poems "A very interesting story" consists of humorous poems of this type from beginning to end. The poet himself admits in the preface of the book: "From the author": "... I tried to speak as cheerfully as possible about the world of children, the breath of mother nature, the mysterious world of various objects and creatures." You can feel it when you read the poem "News Seller" in the collection. This poem is written in the style of folklore, in

particular, in the style of folk songs, the songs of actors who travel around the city and sell a variety of goods, and it is rich in cheerful humor.

Yangi gaplar sotaman,

Eski gaplar ham.

Bolajonlar kep qoling,

Qoldi juda kam.

Surishtirmang narxini,

Shardan ham arzon.

Xo'rozqandga – rost xabar,

Pishloqqa yolg'on. [2, 45]

I	sell	new	words,
Old		sayings,	too.
Stay		tuned	guys
Very		little	left.
Do	not	ask	the price,
Cheaper	than	a	balloon.

True news to Khorozkand,

For Cheese -lies. [2, 3]

Thus, in the poem, which begins with joy, "old-new" stories about various animals - birds, beasts - are sold in "cheap prices" in vivid scenes. From "exchanging" the

"new story" for him without the bran, to "exchanging" the old for the barren nut

soap, to eating the eagle in the pigeon's dream, to the fox holding a rooster to the wolf, to the wolf eating the rooster and then the fox himself until a donkey that has been in the same class for

three years insults a bear as “illiterate,” so we see imaGES of many figurative characters running with a variety of humorous spirits. In short lines, the poet was able to create the unique character of each figurative image through cheerful laughter. In particular, while creating the image of the Rabbit, he depicts his image as a coward among the people in a form consistent with folk tones.

Quyong Yo‘lbars terisin

Yopinib yurib.

Xushdan ketdi, ko‘zguda

O‘z aksin ko‘rib.

(“Juda qiziq voqea”)

Putting on the tiger’s skin  
 Rabbit was walking around.  
 He fainted, in the mirror  
 Seeing the opposite in terror.  
 (“Very interesting story”)

This collection of poems includes several series. The first series, entitled "From the fields to children", consists of humorous poems about the plant world. The category includes poems about many melons and fruits such as wheat, cotton, carrots, watermelon, grapes, apricots, turnips, figs, onions, peppers, handalak (a kind of melon).

It is known that in the history of Uzbek children's poetry a number of verses were created in this form. For instance, a vivid example of this kind of poems is "Alphabet of Nature" by Quddus Muhammadi which belongs to the series such as about trees, plants, fruits, and natural phenomena. In his poems of this type, the poet conveys a great artistic-aesthetic and enlightenment meaning through the description of the peculiarities of each plant or fruit, giant tree, that is, its color, taste, structure and shape.

M. Qo‘shjonov writes: "The leading poet of children, is faithful to his general traditions when describing natural phenomena. He also seeks meaning from objects and animals in nature that are appropriate to the level of consciousness of children. Not only that, it finds a way to express the mystery of natural phenomena in accordance with the consciousness and level of children. Here, too, the tone and criteria of the folklore of Quddus Muhammadi come in handy" [3, 23-24] Anvar Obidjon, who successfully continued the creative traditions of Quddus Muhammadi, is also unique in that he draws the nature of children from the image of the world around us, and, most importantly, creates poetic content in the style of folk melodies which are very close to the hearts of children.

Anvar Obidjon's poetic skill is that as he recreates every image created by Quddus Muhammadi, he can elevate his new image, rich in new, original, cheerful humor, to the level of a short, concise, poetic metaphorical figure. For example, in the poem "Carrot" his poetic image is as follows.

Yupqagina

Po'stim bor,  
Dalada ko'p  
Do'stim bor.  
Maqolda ham  
Yoziqman.  
O'sha

“Oltin qoziq”man.

Yotsam

Erga qapishib,  
Dumginamdan

Tortishib,

Tashladilar o'raga...  
Salom  
Palov to'raga!

(“Juda qiziq voqea”) (Lotinga aylantiring)

	Athin	skin	I	have,
	Lots	of	friendsI	have
	In		the	field
	I am written			
Also	in	the		proverb
	I'm that gold pile			
	That's			it
When I lie	I	am	a	"golden pile".
	Stuck	in	the	ground,
	From		my	tale
	Arguably	they	pulled	off...
	and put in tasty palow			
	Like	Rice		pudding!
	All			know!
	("Very interesting story")			

The poet effectively uses unique imagery and rhyming art to bring the image of carrots to life in the imagination of readers. When children remember its appearance by recalling a folk proverb, they achieve the expressiveness and cheerfulness of the artistic tone through rhymes such as "my skin", "my friend", "summer", "peg". Especially at the end of the poem, when he causes humorous laughter like "I'm lying on the ground, pulling me off by my tail", "Hello, Palov toraga!" his poems bring him closer to real life, bringing a peculiar warmth to child's spirit.

In the poetic series, the poet animated various animals, creatures, clothes, objects and created their figurative image. The mastery of the poet is reflected in the fact that each image is created by means of artistic details, questions and answers, dialogic speech, which are cleverly found in its specificity, character, color, taste structure or other aspects. This allows children to quickly imagine by comparing the images of objects written in the poem.

For example, in the poem "Boshma-bosh" the children see the scene "Shara bar-a" through the figurative image of a goat. The goat's neck-stretching, "Shara bar-a" scream is a masterly poetic image. The animation created a humorous image of a goat and increased the artistic and aesthetic value of the poem. After all, Anvar Abidjan's uniqueness is reflected in the fact that he portrays a very serious situation in a funny and at the same time, realistic and original way. That is why Anvar Abidjan's social poems are multi-layered. They are read with interest by both children and adults, and the spiritual meanings are imprinted on the heart through their own observations. In his poems, such as "Sigir qo'shig'i", "Parvarda", and "Yirtqich", the poet reflects the process of children's desire to understand the world. For example, children's collisions with adults, parents and children sometimes misunderstand each other, and the dramatic situations that result from various misunderstandings are ridiculous" [4].

Dilshod Rajab is a humorous poet by nature. He reveals the essence of things with unexpected, extraordinary ingenuity in short lines. His humorous poems, such as "Poezdning bolasi", "To'yda", "Childirma", "Uchqunbekning savollari", "Hirmon", testify to the poet's ingenuity.

It should be noted that in Dilshod Rajab's poems, not only laughter is created from word play, but also each poem is rich in poetic content.

Masalan, "To'yda" she'rida:

Qo'sh kaltakka chiday olmay,  
Dod-voy solar Nog'ora.  
Parvo qilmas odamlar,  
O'yin bilan ovora

**Meaning:** For example, in the poem "At the wedding":

Can't stand double beat,  
Screaming the drum.  
People who do not care,  
Concerned neo-hippies

("Endi zerikmayman" (I'm not bored anymore), 41) [5]

“Childirma” she’rida:

Qichqirib aytar gapi  
 Faqat: “bak-bak-umbang”.  
 Suni ham aytmas, uni  
 Tarsakilab turmasang.

**Meaning:** In the poem "Childirma":

He would shout  
 Just: "bak-bak-umbang."  
 Not to mention, him  
 If you don't clap.

(“Endi zerikmayman”, (I'm not bored anymore) 44)

As can be seen from the examples, the poet is able to pay attention not only to the external signs of objects, but also to the deep artistic content associated with human behavior in the essence of the description of these signs.

## CONCLUSION

The following conclusions can be drawn from the above observations:  
 - In the creation of humorous images in children's poetry during the independence period, there are two main directions. The first direction consists of poems that directly create a humorous image of children. In the poems of this type, the poets expose to joyful laughter some and cause the merriment and playfulness, laziness, and tumultuous habits, which are found in the nature of children.

The second direction consists of figurative poems. It is possible to observe the creation of figurative humorous images of various trees, objects, animals, beasts, birds and mammals.

## OPPORTUNITIES AND TASKS OF DEVELOPING THE NOOSPHERE CONCEPT

**Tangirov Nizom Abdurahmonovich\***

\*Independent Researcher,  
Tashkent State Pedagogical University,  
UZBEKISTAN

### ABSTRACT

*This article covers views on the opportunities and tasks of developing the doctrine of the Noosphere. The scientific and theoretical approaches to the concept and role of the cogitation of the noosphere as a theory and abstraction in the development of scientific knowledge have been analysed from a philosophical and methodological point of view.*

**KEYWORDS:** *Noosphere, Biosphere, Concept, Paradigm, Philosophy, Science, Development.*

### INTRODUCTION

Modern integration, transformation processes, the development of scientific technologies in the world have contributed a special field of study, which is 'Noosphereology', studying the features and capabilities of the human mind. The tasks of philosophy and science in the development of the doctrine of the noosphere make it necessary, first of all, to study in detail the important methodological role of the concept of the noosphere as a theory and concept in the development of scientific knowledge.

Consequently, the harmony of the co-evolution of nature and society as a rational view of the universe has the character of a scientific and philosophical worldview in revealing the laws and content of the universe.

Concept (from Latin word 'conceptio' – 'complex', 'system') is a set of views, systems of principles, a specific way of understanding, comprehending and interpreting facts and events, a basic point of view [1, 23]. Within the framework of the concepts of interactions and relations between mankind and nature, the main features of the concept of noosphere as a separate branch of science must be paid special attention: 1) noosphere is the science of the field of mind; 2) noosphere is the limit of the human mind's influence on environment; 3) noosphere is a philosophical approach to the integrity of the development of nature, society and space.

---

## RESULTS AND DISCUSSION

According to Professor *S. Mamashokirov*, 'the noosphere is not limited to the scope of human conscious activity, but also includes nature, which means socialisation of biosphere and the universe.' [2, 58] Actually, the rational nature of the noosphere is closely linked not only to the social conditioning of man, but also to the essence of his creativity and ingenuity. Indeed, the possibilities and means of developing the concept of noosphere are determined by the important methodological function and importance of the concept of noosphere, the level and possibilities of organising active noosphere-environmental activities.

The dynamics of the development of science, the categorical apparatus of science triggers to the systematisation of conceptual schemes, the expansion of heuristic-epistemological functions of science. In turn, that actualises the role and status of science as a social institution. Science, as a special form of human activity, seeks to reconnect with the direct subject of this activity that is human. This is an important issue facing the scientific community. Science, in contrast to social alienation, must be linked to 'human-measurable', that is, human qualities, needs, and interests [3, 5]. Science also has a functional connection with the fact that it is socially based on the demands and needs of society and serves to enrich human spirituality. Science based on human thinking, human interest, can lead society to be demolished.

That is why, the objective and subjective factors of biosphere development are important. The laws of nature play an important role in this. Indeed, law means the relationship between different things and events, processes and events in the material world [4, 103]. In this regard, the common law that applies in different systems in our perception of natural phenomena is characterised as a necessary stage in the development of the universe.

The common laws of nature include universality in nature, integrity, systematicity, the law of evolutionary development, stability and variability, the laws of conservation of matter and energy, and the transfer of energy from one species to another, and so on [5, 17]. As a result, the future of mankind as a whole social-ecosystem in which 'nature-society' is connected, the necessary stage of development of the biosphere is the need for the noosphere. According to researcher *M.Yu. Shishin*, the noosphere as a synthetic concept embodies the results of human activity, including material and spiritual achievements. Furthermore, this concept also represents the system of human-environmental relations not only at the planetary level but also at the cosmic one. Therefore, in our view, it is expedient that the idea of noosphere must be at the centre of the emerging new scientific-philosophical paradigm [6, 3].

It is both theoretical and practical important that the analysis of the content and definition of the structure of noosphere-ecological activity, expressed in the framework of the concept of noosphere.

Initially, the noosphere as a theory is the most advanced form of scientific knowledge, reflecting in a holistic way the legitimate and important connection of the facets of existence. The noosphere as a concept represents the direction and purpose of the development of noosphere knowledge. In the theoretical and methodological analysis of the concept of the noosphere, the theoretical and fundamental foundations, theoretical concepts and principles, as well as ontological, epistemological and logical aspects of this concept are important.

Noosphere-genesis in philosophy and science encompasses the objective and subjective ontology of the concept of the noosphere. In this sense, the basis of non-spherical objective reality also includes the scope of ecology and related approaches. For instance, the understanding of the essence of such concepts as tolerance, correlation, transformation, noosphere, rationality enriches knowledge in the field of ecology. Philosophical analysis of biodiversity helps to understand and solve environmental matters [7].

The balance of sociogenic and technogeneous functions in the socio-historical development of human society depends in many respects on environmental factors. The pessimistic view that the computer revolution and the transition of human society to the stage of information civilization, the sociogenic function of technology deepens environmental problems, has a negative impact on social development was widespread in the 80s and 90s of the last century. In this regard, the deepening of the environmental crisis inevitably shows that the world community must radically change the principles of interaction with the natural environment by strengthening all efforts and taking practical measures to ensure global, sustainable eco-development [8, 5]. An anti-scientific view of the social consequences of the scientific and technological revolution is an example of this. The following formula is based on the conditions of sustainable development of the UN [9, 5-6]. An example is the idea of 'social development + economic growth + environmental security = sustainable development.' However, we believe that this formula does not fully cover the full socio-natural reality. That is, social development, economic growth, environmental security could not be the literal basis of sustainable development. There can be no talk of sustainable development unless the criterion of noosphere-spiritual growth in society is decided. Therefore, in our research, we introduce the idea 'social development + economic growth + environmental security + noosphere-spiritual growth = sustainable development'.

The essence of the anthropocentric paradigm of noosphere-ecological education is that man is recognised as the highest value, and nature is his personal property, man and nature are opposed, and man's influence on nature is only pragmatic.

The study of the concept of the noosphere, its formation plays an important role among the main directions of modern science and culture. The gradual implementation of the biosphere into the Noosphere, with its advent, the development of science and technology in society is of paramount importance. Comprehending the laws of the state, the functioning and development of the noosphere, its place in the dynamics is one of the conditions of human existence and living conditions today, thereby gaining a strong worldview [10, 3].

In the analysis of the tasks of philosophy and science in the development of the doctrine of the noosphere 'man – mental activity – innovation – sustainable development', the internal mechanisms of the model of the noosphere: needs, goals, activities, infrastructure are important. In this sense, the need that was the basis for the formation of the noosphere created human thinking as a cultural force. Noosphere can be approached bilaterally based on the analysis in terms of social need. *Firstly*, the noosphere is a product of mental activity. Through this form of activity, ecological harmony in the system of nature and society is formed. *Secondly*, the noosphere encompasses the logic of activities as a result. In this respect, the logic of the activities of the noosphere shows that the noosphere is based on ecological laws.

The current situation has raised the issue of philosophical analysis of the theoretical foundations of the harmonization of socio-natural interactions, including the importance of the doctrine of the noosphere as an ideal project of harmonization of these interactions.

Academician *V.I. Vernadsky* predicted the coming of a new geological era in human history. According to him, 'the surface of our planet – the biosphere – is undergoing drastic chemical changes by man, consciously and mostly unconsciously. Man is changing the physical and chemical air crust of the land, all its natural waters. ... Now we are experiencing new geological evolutionary changes in the biosphere.' [11, 186-187] The new phase of the biosphere is the noosphere phase, which is associated with the geological power of the human mind of a planetary nature.

As the French philosopher *Pierre Teilhard de Chardin* points out in his 'The Human Phenomenon', the formation of the Noosphere was first introduced by *Homo sapiens* (Conscious Man), that is, from the time of their first socialization. Thus, it is reasonable to assume that the Noosphere (Greek 'noos' – 'mind', and 'sphaira' – 'sphere', – 'Sphere of Mind') is a socialised stage of biosphere development. This is not, of course, to put the Noosphere above the biosphere or to separate it as a holistic phenomenon [12, 30]. However, there is now talk of no doubt about the dominance of the mind. Connecting the noosphere with terms such as 'socio-sphere', 'anthroposphere', 'techno-sphere' means its real content and breadth.

As we find the noosphere (the sphere of mind) out, we can approach it from two different aspects.

According to the first view, showing its positive aspects, the noosphere stage in the development of society can be interpreted as an absolutely positive (progressive phenomenon). As a result of the accumulation of potential knowledge of the millennium, the will of the people, the formation of a social structure, the structure of traditional society was completely renewed, and a new cultural life has been created [13, 136]. The invention of the writing machine, the invention of the printing press, the Great Geographical Discoveries, the Scientific and Technological Development and the Scientific and Technological Revolution, radio and television, mobile communications, spacecraft, the creation of the Satellite and the International Internet have set up a new age. Now the Mind has fully demonstrated its potential at the time frame. Mankind has achieved a comfortable environment such as micro and mega cities. At the same time, a person's real work rate (access to food, education, work, leisure, television, radio and other means of communication) is not limited. So conveniently, the power of the Noosphere has been able to create a new world image at a small point in the Universe called the Earth.

According to the second view, the negative (regressive) phenomenon of the Noosphere can also be seen as having a sharp and dangerous impact on the life of nature and human society.

A significant issue facing humanity at the current stage of development of society includes interrelated issues such as maintaining the natural environment in a normal state, laying the foundations of the economy, changing people's lifestyles, creating appropriate living conditions for them. Other types of global problems are related to these problems in one way or another.

In this sense, the experience of post-industrial and environmentally sustainable developed countries in the world shows that it is expedient to transfer the function of organizing, managing

and controlling the activities of nature protection institutions at the national, regional and global levels to state and international organizations [14, 13].

Nowadays, one of the most important problems facing humanity is to change people, that is, to bring up people who have a new way of thinking, worldview, activity. As an internal component of the development of the noosphere system, man forms a new dialogue with the biosphere and universe.

Modern post-classical science recognises the paradigm of the integrity of the universe, in which the universe, biosphere, noosphere, society, people form a single integrated whole system. In the manifestation of this wholeness lies the appearance of man as part of the whole, not outside the object of study, and as a result of such an approach we see the convergence of the natural and social sciences, in which the ideas and principles of modern natural science are widely applied to the mankind [15, 55].

Actually, in support of the above-mentioned ideas, the concept of the noosphere, formed as a new scientific paradigm in modern science, is manifested as the mutual integration of scientific knowledge, the convergence between the natural and social sciences. The integrative function of the concept of the noosphere in the epistemological sense is primarily associated with the active dialogue of the convergence between the social, natural and technical sciences, as well as the creation of an interconnected common language.

The concept of the Noosphere is therefore an absolute manifestation of the universal mind, in which interdisciplinary knowledge and experience are studied on a general basis and applied as theory and practice.

## CONCLUSION

To sum up, the concept of the noosphere implies the establishment and regulation of certain prohibitions on human activity. In this regard, there is a need for an 'environmental imperative' that sets certain limits on the interaction and behaviour of people. In general, the noosphere as a field of reason implies both a new, rational morality and the reconstruction of the whole being on the basis of the ideals of coevolutionary development without contradictions. In this regard, the concept of the noosphere includes the following tasks:

*Initially*, the study of the fundamental concepts and principles of the concept of the Noosphere is of great methodological importance to philosophy and science;

*Secondly*, it is important to define an abstract model of the Noosphere concept as an idealised object (e.g., 'Noosphere Stage', 'Noosphere Development');

*Thirdly*, the fact that the concept of the Noosphere focuses upon the research of the degree of change in human knowledge and the structure of scientific knowledge is at the heart of the matter;

*Finally*, the concept of the noosphere includes the objective and subjective features of natural and social laws and serves to be perfectly aware of the essence of this concept.

## STATE POLICY IN WORKING WITH TALENTED YOUTH IN UZBEKISTAN

**Khalimmetova Rokhatoy Davlatboevna\***

\*Senior Lecturer,

Department of Theory of Democratic Society Building in Uzbekistan,  
Faculty of History Tashkent State Pedagogical University,  
UZBEKISTAN

### ABSTRACT

*In this article, the author analyzes the reforms in the field of education in the Republic of Uzbekistan and tries to draw conclusions. The article examines the legal framework adopted in the field of education in the Republic of Uzbekistan.*

**KEYWORDS:** Education, Reform, State, Standard, Teaching, University.

### INTRODUCTION

Resolution of the President of the Republic of Uzbekistan dated July 20, 2018 "On measures to further increase the salaries of workers in science and higher education, state support for the implementation of the results of scientific and scientific-technical activities" the amount of basic salaries of teaching staff has been increased by an average of 25 percent since September 1, 2018, stratified. (People's Word, July 21, 2018)

### THE MAIN PART

South Korea, Japan, China, Malaysia, the United Kingdom, Russia, and QS (Quasquarelli Symonds), ARWV (Academic Ranking of World Universities), THE (The R&D of the World Universities) in the study of international experience in determining the ranking of educational institutions by the State Inspectorate for Education Quality Control under the Cabinet of Ministers. The style of large rating agencies such as Hihger Education) was compared with the rankings of higher education institutions in Uzbekistan. 10 of the indicators used by international rating agencies (percentage of PhD students in prestigious foreign universities, citations, scientific articles, funds, publications, defenses, exchange programs, foreign teachers and students, surveys, employment) are in our list of national rating indicators. 18 completely new indicators in the rating system of the University of South Korea, 5 indicators related to the level of quality of education, 3 indicators related to research activities, 4 indicators related to students'

contribution to the country's development and achievements, and 6 indicators related to public opinion polls. proposals were developed. In accordance with the "Regulations on the procedure for determining the rating of higher education institutions", approved by the joint decision of the State Inspectorate for Quality Control in Education and the Ministry of Higher and Secondary Special Education on March 7, 2018, 3 rating indicators were introduced. The activities of 57 higher education institutions in 2017 were analyzed by experts [-1.] With the help of these indicators, for the first time, the ranking of higher education institutions in the country was determined

According to the general results, the leading places in the rating are UzMU, TDSH, TIQXMMI, TTESI, SamSU, TDSI, UzSWLU, TTYTMI, TUIT. The last ten were occupied by NMTU, NDPI, QMI, QarSU, JPI, SDAQI, UzDSMI, MRDI, Jizzakh, Kokand state pedagogical institutes.

In general, in the period of reforms of Uzbekistan at the new stage, important aspects of training a competitive national, new generation of personnel; Based on international experience and global indices, the following conclusions can be drawn:

1. Ensuring the convenience of preschool education, improving the quality of general secondary education, secondary special and higher education in the fourth direction of the Action Strategy on 5 priority areas of development of the Republic of Uzbekistan for 2017-2021, identified today by the President of Uzbekistan Shavkat Mirziyoyev. Measures to improve and develop them are being implemented in public life.
2. Nowadays, "the fierce competition is intensifying around the world. In such a complex environment, we must work tirelessly to widely introduce the achievements of modern science and innovation [-2. -24 p].
3. Improving state and society building, ensuring the rule of law, further reforming the judiciary, further development and liberalization of the economy, development of the social sphere, security, interethnic harmony and religious tolerance, competitive foreign policy in a well-thought-out, mutually beneficial and practical spirit The cultivation and training of the next generation is a topical issue.
4. Therefore, "... one of our important tasks is to educate and train professionals who have the potential to effectively perform the tasks assigned to them, as well as high moral and ethical qualities and responsibilities" [-3.-211 p].

At a time when the requirements for the quality of the new generation of personnel are growing due to radical changes in our society, it is natural that the personnel policy inherited from the recent past by the mid-90s of the twentieth century did not meet modern requirements. Therefore, the essence, specificity and uniqueness of the Law "On Education", the "National Training Program" is that, as in previous documents, it is an important participant in the training of a new generation of personnel, their effective use by individuals, state and public institutions, industry, did not neglect areas such as science. Introduced to ensure the implementation of the national model of training, the "National Training Program" is the legal basis for major changes, defining the priorities, goals and objectives, as well as prospects for the development of the education system.

The "National Training Program" is a document protected by law to achieve the dream of our ancestors to organize the education and upbringing of a harmoniously developed generation. In this program, history is combined with modernity, humanity with nationalism. This program has a deep philosophical significance in terms of potential and importance, as evidenced by its international recognition. In particular, the 1998 International Conference on Education in the 21st Century in the Asia-Pacific Region, dedicated to the prospects of youth education in Australia in 1998, noted that only two countries, the United States and Uzbekistan, have a special state program for education development.

The announcement of Tashkent as the "Capital of Islamic Culture" in 2007 by the International Islamic Organization for Education, Science and Culture (ISESCO) is another international recognition of the good deeds aimed at restoring and preserving Islamic culture, spiritual values in our country. President Islam Karimov, in response to a question from a correspondent of the non-governmental news agency Turkiston-Press, described the event as "a high recognition of the invaluable contribution of the Uzbek people to the development of Islamic culture"[-4. -P. -211.-222].

In order to build and develop a system of training a new generation of bachelors and masters in building a democratic, legal state and civil society the principles of creating the necessary conditions serve as the basis.

The national program aimed at implementing the state's personnel policy is aimed at radically reforming the education system and providing for the training of a new generation of modern, highly qualified personnel on the basis of world requirements in the developing democratic process. Today, the fact that personnel policy is a priority of public policy shows that it is a strategic task.

The reason why Uzbekistan attaches great importance to education reform, training of bachelors and masters, as a nationwide work, is not only because of the country's unique labor potential. In this case, the state implies a unique philosophy of the whole society, as well as individual traditions. President Islam Karimov's approach to this problem is bound to inspire respect. Only through the implementation of the national education system, the training of mature modern personnel, it is possible to achieve positive results in "strengthening democratic values in the minds of the people, increasing their political and civic activism, expanding and deepening democratic change in the country" [-5.-182 p]. After all, "education reform is an internal force that boldly leads us on the path of democratic change, building a new society, moving us all ... Without changing the system of education and upbringing, it is impossible to radically change people's consciousness and, consequently, their way of life"[-6.-161 p].

Scientific analysis shows that the emergence of President Islam Karimov's political and enlightenment teachings in the field of training a new generation of personnel in the process of building a democratic society, the theoretical and practical development of which is reflected in the following stages.

The first stage is related to the Law on Education, adopted in 1992 at the initiative and under the leadership of President Islam Karimov, and its implementation. The law defines a new, political, legal, spiritual and educational path of independent Uzbekistan. This law is logically the beginning of a radical change in the system of public education, education is aimed at the

application of completely new national, ideological values, ideological foundations in the practical process.

## CONCLUSION

The head of our state foresaw that the education system inherited from the former totalitarian world could not fully serve the interests and prospects of independence. As a result, it was recommended to develop a new national training program. In preparing the program, it was emphasized that, **first of all**, it is necessary to bring up not a school graduate, but a free, perfect person who has mastered the rich material and spiritual values accumulated by mankind, able to think independently and make independent decisions.

## COVERAGE OF POLITICAL, JUDICIAL AND LEGAL PROCESSES IN THE TURKESTAN ASSR IN SOVIET-ERA RESEARCH

**Abdulxay Gulchexra Urazaliyevna\***

\*PhD Student,  
Institute of History of the Academy,  
Sciences of the Republic of Uzbekistan,  
Tashkent, UZBEKISTAN

### ABSTRACT

*The political processes that took place in the Turkestan ASSR are widely studied in the Soviet literature. It is also shown that the published works, defended dissertations, scientific articles reflect the political reforms in the Turkestan ASSR in 1918-1924, the activities of the judiciary and law enforcement agencies.*

**KEYWORDS:** *Turkestan ASSR, Soviet Union, Judicial And Legal Processes*

### INTRODUCTION

On April 20, 1918, the V Congress of Soviets of Turkestan region was opened. One of the peculiarities of this congress was that about half of the delegates, that is, the representatives of the indigenous people, numbered 120 people. The main task of the Congress was to declare Turkestan Soviet autonomy. The political and legal processes that took place in Turkestan during 1918-1924 left a special mark on the history of Uzbekistan in the Soviet period. With the establishment of Bolshevik rule, a great deal of scientific research was carried out on the basis of the theories of Lenin and Stalin. Nevertheless, significant work has been done to study the problem. Various periods in the history of Uzbekistan, including the history of the Turkestan ASSR, have been reflected in many monographs, dissertations, pamphlets and articles. Given their large number, it is expedient to analyze the literature on the judiciary and law, political life in the Turkestan ASSR in chronological terms (1925-1990) and in problematic terms.

### MAIN RESULTS AND FINDINGS

The Soviet government pursued a policy of "socialist construction" in the country through power structures and a single party. The literature published [1] in the second half of the 1920s provided an overview of the activities of the Soviet government and the governing bodies

established in the country. In particular, T. Risqulov called the Turkestan Bureau (TurkBureau), established in 1920, "... not an organ of internal party struggle, but one of the powerful apparatuses of communist propaganda. Musbyuro was also known as such an apparatus in Turkestan and neighboring countries. Although MusBureau operated within the party, all of this was the nature of internal party life [2. 5.] writes.

According to Adhamov and S. Muravevsky, NN Popov, who carried out the Soviet government's first "measures" in the interests of the workers, described the center's policy in the country as follows: "The Soviet government has been purged in Turkestan. The Communists began their policy of renewal among the local people." [3]

The literature of the 1930s consisted of books [4] on the Communist Party of Turkestan, under Lenin's leadership, with brief views and conclusions on the governance of the country in the construction of the "proletarian state." Manjara's pamphlets published in recent years provide an overview of Lenin's role in the creation of the "dictatorship of the proletariat" of the Turkestan ASSR, and of the governing bodies. The collection of programs and regulations of the Communist Party published in 1934 states: "The involvement of specialists from the old school, the involvement of the most educated class of city workers in the military led to a partial cessation of bureaucracy in the formation of the Proletarian Revolutionary State" [5. 23.]. Туркистонда Совет ҳокимиятини ўрнатишнинг "асосий вазифалари" ни К.Житов, In a book written by V. Nepomnins in 1939, it was stated: "The main conditions for the strengthening of Soviet power in Turkestan: colonialism, the struggle against local nationalism, ... was to build this autonomy on the basis of local soviets. ... The realization of the Soviet autonomy of Turkestan united the local working people with the Soviet authorities" [6. 52-57.].

Publications [7] published since the mid-1940s are mainly translated from Russian into Uzbek. They also contain general considerations typical of the literature of the 20's and 30's in the description of the subject. For example, A.Ya. Vishinsky in the country: "One of the factors that contributed to the success of the creation and development of the Soviet state was the Bolshevik policy" [8. 34.]. Kalishnikov writes: "The Soviet people, the Bolshevik Party, under the leadership of the great Stalin, built socialism in the country" [9. 4.].

One of the distinctive features of Soviet historiography in the 1950's was the emergence of works by legal scholars directly related to the subject of research [10]. The first doctoral dissertation defended by H.S. Sulaymonova was especially important. In the case of the ban, the author put into scientific circulation historical facts in the coverage of the history of the formation of the judicial system in the country. Also, H.S. Sulaymonova Turkestan ASSR "Soviet court as a body of Soviet government served the interests of the formation of a completely new socialist system. ... the struggle against old views and habits" [11. 136.].

It should be noted that during these years, the candidacy of historians and also emerged [12]. In these studies, the political process led to the emergence of a single party and constitution in the country, the policies of the Turkestan Central Executive Committee (CEC), the Council of People's Commissars (CCC), the Turkic Commission, MusBureau "against oppression and foreign intervention" and their "national state delimitation". was related to their work. Also, in the literature, the phrase "the population of the region gained a number of political rights only through the Soviets and bodies formed after the October Revolution and the establishment of" Soviet autonomy "was widely used as the main content of political processes. Z. Inomjanov,

H.T.Tursunov, A.A.Gordienko connect the activity of the Soviet power in Turkestan with the first 3 important political events: 1. Declaration of autonomy in Turkestan and approval of the Regulations on creation of the Turkestan Soviet Autonomous Republic; 2. Holding a conference of the Communist Party of Turkestan; 3. Turkestan was defined by the promulgation of the first Constitution of the ASSR [13].

The Turkestan ASSR was declared a legislative and executive body in 1918, and in October the first constitution was drafted. This is stated in almost all Soviet literature. In particular, Z.Inomjanov, H.T.Tursunov in their research work, according to the Regulations adopted at the V Congress in April 1918, "... the supreme legislative body - the Central Executive Committee was established in the country. It consisted of six sections. ... The executive function and management of the country were entrusted to the Council of People's Commissars. The Council of People's Commissars was formed consisting of 14 commissariats. ... The adoption of the Constitution is at the height of the war against the White Guards and the British intervention, the first significant political victory "[14. 19-21.]. In his research, Gordienko states that the Constitution proclaimed in the Turkestan ASSR in 1918 was "... the first stage of the policy pursued by the Soviet government in Turkestan." He also noted that Turkestan was one of the attempts to build and shape the Soviet statehood in the ASSR, and it was completed [15. 143.].

In the works of E.Voskoboynikov, A.Zevelev, H.T.Tursunov the structure, tasks, activities of the Turkic Commission and the TurkBureau and the single party, which are the structures of power established by the center in the country, are described [16]. For example, H.T. Tursunov wrote a number of mistakes in the policies of the Turkestan Communist Party: "In March-April 1919, the Muslim Bureau (Musbyuro) was established as an auxiliary body under the Provincial Committee of the Turkestan Communist Party. He was to carry out political work among the workers of the indigenous peoples, assist the party in the organizations, and educate the local communists in the Bolshevik spirit. But under Musbyuro's leadership, separatist, factional tendencies prevailed, and he began to place himself against the Provincial Committee of the Turkestan Communist Party. T. Ryskulov, who was the head of the MusBureau, allowed the Turkestan ASSR to be "nationalist and deviant because it made decisions that were contrary to the project of reorganization of the Turkish Soviet Republic and the decisions of the party" [17. 35-40.]. It should be noted that the second volume of the two-volume book "History of the Uzbek SSR", published in 1958, positively assessed the activities of the Muslim Bureau and its local branches: "has done important work in between. Cultural and educational work has also been launched. The best representatives of the indigenous peoples were involved in the ranks of the Communist Party"[18. 55.]. At the same time, the play states that in the autumn of 1924, the process of national-territorial delimitation in the country took place in two main ways: "... political, mass explanatory and agitational work was carried out. At the same time, the most important organizational and economic measures were taken". (Defining the boundaries of the newly established republics and regions, economic boundaries, etc.). [17. 241]. H.T. Tursunov noted that many difficulties and contradictions arose in Turkestan during the period of national delimitation: "Although A. Rakhimbaev was a supporter of the national delimitation of Turkestan, he opposed the annexation of the Kazakh regions of Turkestan to the Kazakh ASSR, which had existed since the 1920s. To prove his point, he cited the fact that the Ettisuv and Syrdarya regions of Turkestan had been merged with the Kazakh ASSR as evidence that the Kazakhs "would become very large in territory." It was a completely wrong idea. Khojanov,

Paskutsky, and others also said that national borders should not be crossed, but that "Central Asia should be politically united by three Soviet republics." [17. 113].

In the 1960s, the study of the political history of the Turkestan ASSR was carried out intensively. The doctoral and master's dissertations [19] and monographs [20] that emerged on the subject during this period were studied as a separate topic or paragraph of political processes.

The peculiarity of this Soviet-era literature on the problem is that the authors, who cover the history of the current political situation in the country, study the factual material and conclude that the political process was uneven and carried out through propaganda and "cleansing". In particular, M. Vahobov connects the successful implementation of all political measures in the country with the "political activism of local workers" [22. 288]. In addition, the author analyzes through historical facts the emergence of a "nationalist current" within the TKP, the shortcomings in the implementation of "national policy". "At the VIII Regional Congress of Soviets, Risqulov amended the decision to merge the post of chairman of the Central Executive Committee of Turkestan and the Council of People's Commissars and completely abolished the Council of People's Commissars. Its functions were delegated to three councils established under the Central Executive Committee. It was a gross violation of the principle of the Soviet state" [22]. Against this and other "political movements" in the Turkestan ASSR in 1922 a resolution was signed "On the cleansing of public administration in the center and in the field." Researchers point out that the decision was "relied on by local workers and communists" [23].

The researcher Sh.Z.Urazaev, who made a legal analysis of the history of the Turkestan ASSR, describes the Constitution of the region in 1918 from the point of view of Soviet ideology. In particular, he concludes that the Constitution of the Turkestan ASSR is the result of the heroic struggle of the Turkestan people, the establishment and consolidation of Soviet power under the leadership of the Communist Party [24. 274.] However, in his work "V.I. Lenin and the Construction of the Soviet State in Turkestan" one can find the following objective opinion: "... the Constitution did not include the basic rights and obligations of citizens" [25. 433]. In doing so, the author presented conflicting views.

In general, the existing works show that the political life in the Turkestan ASSR was complicated and full of struggles. The authors state in their research that the activities of the Bolsheviks were to strengthen the political position of the working class and to ensure their broad participation in public administration.

In the 1970s, research in the Turkestan ASSR intensified. They were dissertations based on Marxist-Leninist theories up to the volume of scientific articles [26] and monographs [27]. In these years, the participation of lawyers in the reference to the historical processes of the region is observed [28]. The research, written by lawyers, legally describes the legislation, the activities of judges, the formation of the Turkestan Prosecutor's Office, and others. For example, I.Abidova writes that the activity of judges in the country has stopped spontaneously, and the Soviet courts, acting in the interests of workers, have justified the trust of the local people. The reason for this is: "The formation of socialist relations in the Turkestan ASSR" [29. 39-40]. The author also points out that the activity of judges in the Turkestan ASSR consists of two stages: "The first stage is the abolition of kadijudges without taking into account the legal consciousness of the broad masses of the Uzbek people; The second stage was the legalization of kadijudges' courts in 1922, while retaining the right of waqf" [29. 162.].

In their articles on the 70th anniversary of the Soviet Prosecutor's Office and Advocacy, V.A. Zotov and G.P. Sargsyan described the work done in Turkestan on the implementation of the Law "On the Prosecutor's Office" adopted in 1922. The article states that "the Soviet prosecutor's office and the bar played an important role in defending the interests of socialism" [30].

In this regard, the works of historians contain recurring facts in the literature created in the 50-60s [31]. For example, H.Sh.Inoyatov noted that the activity of the Turkbureau was dominated by "nationalism", "nationalist", and that Lenin's "national policy" was correct in the construction of the Soviet state [32. 55, 59]. Published in 1974, "Essays on the History of the Communist Party of Uzbekistan. The monograph "Tashkent: Uzbekistan" describes the activities of "anti-party" groups [33. 76-77].

## CONCLUSION

The measures taken by the center in the political-judicial and legal system of the Turkestan ASSR in 1918-1924 are reflected in the scientific research of the Soviet period, the October Revolution, the class struggle and the struggle against the great state chauvinism. In this direction, not only the research of historians but also the research of lawyers can be seen. Their research covers the history of political processes in Turkestan mainly on a political basis.

### ABSTRACT

*The article presents the results of laboratory experiments to determine the productivity and some other parameters of the disk working body, working with the scheduler bucket in order to improve the process of leveling fields that meet the agrotechnical requirements of pre-sowing background.*

**KEYWORDS:** *Productivity, Disk, Bucket Filling Coefficient, Disk Diameter, Drawing Prism.*

### INTRODUCTION

The Resolution of the Cabinet of Ministers of the Republic of Uzbekistan dated February 24 , 2014 No. 39 “On additional measures to ensure the unconditional implementation of the State Program for the improvement of the ameliorative state of irrigated land and rational use of water resources for 2013-2017” was adopted [1]. One of the technologies used to enforce this solution, i.e. crop irrigation, efficient use of water resources, is a smooth surface. It can be concluded that the area of machine-tractor units is even, if the landing area is above the plane of the surface.

Accurate and reliable aggregate performance will improve their business efficiency and quality of work. In order to increase the leveling efficiency of the land based on its underwire buckets,

spherical disks are installed in order to analyze optimal size models and laboratory experiments. We have developed disk drives of the following diameters: 150 mm, 120 mm, for experiments in a soil channel with a workstation from a recycled disk. The experiments were performed in triplicate and at three speeds (0.25 m / s, 0.58 m / s, 0.80 m / s).

We have developed disk drives of the following diameters: 150 mm, 120 mm, for experiments in a soil channel with a workstation from a recycled disk. The experiments were performed in triplicate and at three speeds (0.25 m / s, 0.58 m / s, 0.80 m / s).

In order to identify the optimal variant of the disk disassembly scheme, vertical and horizontal slots (grooves) were made on the sides of the pile.

According to the results of the experiment, the dependence of the soft disk device model on the diameter and speed of the disk was investigated. Laboratory studies also show that increasing the layout increases with increasing diameter, distance and speed of the disks in the model. Studies have shown that the process of forming a ground coating on a dirt channel occurs several times slower than in field conditions. There was no destruction of the disk between the disks by increasing the speed of movement of the base device to the base station of the ground channel by 0.80 m / s, on the contrary, the level of crushing increased. In addition, if the height of the ground cellar exceeds 5 cm, the smooth movement of the hard disk to the ground leveling plane will deteriorate. At the same time, part of the soil inside the puddle falls from the side and rear walls, which reduces the quality of the drift plane in the soil channel. Analysis of the research results showed that several effective disk characteristics were found with a diameter of  $D_d = 150$  mm.

Laboratory results also show that the efficient operation of model workstations of a disk device, which softens the base plate, is associated with the optimum displacement of disks. We changed the disk space by tilting it. Optimized disks in disks are the displacement of disks with soil, minimization of the walls of the side and rear sides, as well as the smooth displacement of the soil in the heap. studying the soil coagulation process based on the speed of the drive model and analyzing photos taken with a fast merging photo demonstrated that the discriminating organization works more efficiently ... When the distance is 20%, the distance between the disks should be  $L \leq (2 \dots 3) D_d$

The angle of inclination of the disk space is of great importance for the horizontal plane. This is due to the fact that the inclination of the disk on which the disk was rolled should be flattened and crushed. According to the literature, the natural angle of soil inclination [4] should be from 40 to 50, based on the physical and mechanical properties of the soil. However, observations have shown that the length of the slope of mountaineering in motion is less than the length of the slope of the stop line. Thus, the slope of the leveling of the soil is much greater than when driving. Given the above analysis, we assume that the slope of the motion of the soil is 55.... 65 . The corner of the slope depends on the physical and mechanical properties of the soil and the moisture content. This corresponds to the results of experiments conducted on the soil channel. As can be seen, the inclination of the disk surface should correspond to the straight line of the soil coil and should be not less than 50 ... 100 mm below the center of the soil. These indicators depend on the speed and humidity of the pile (speed  $y = 0.25 \dots 0.80$  m / s, humidity  $W = 14 \dots 20\%$ ). If this speed and humidity exceed working quality, the soil will not even soften between the discs.

**Picture-1. A mockup of a data table model that simplifies alignment on land.**

Soil moisture, its hardness, weight and composition of soil aggregate were determined by three layers at a depth of 10 cm before and after crossing the groundwater channel of the disk device, which softens to the ground plane. The following tables show the measurement results . (Tables 1, 2 ,3)

**THE CHANGE IN THE HARDNESS OF THE SOIL DEPENDING ON THE SPEED OF MOVEMENT OF THEWORKING BODY ON THE DISK OF THE DEVICE SOFTENS TO THE BASE OF THE PLATEAU.**

**TABLE-1**

Horizontes,sm	Soil moisture, percentage calculation	hardness of the soil, kg/cm <sup>2</sup>			
		Until the passage of aggregate	Speed moving of aggregate after the passing m/s.		
			0.25	0.58	0.80
Getting cut the height of soil					
0...5	16,48	3,35	6,40	6,42	6,0
5...10	17,62	5,05	8,30	8,50	6,3
Feeling the depth					
0...5	16,48	3,5	3.0	2,5	3,2
5...10	17,62	5,6	4.5	3,3	3,9

**DEPENDING ON THE VELOCITY OF THE MOVING BODY OF THE WORKING BODY, THE DISK DEVICETHAT SOFTENS THE BASE PLATE TO CHANGE THE WEIGHT OF THE SOIL. TABLE -2**

Horizons, sm	The weight of the soil, g / cm <sup>3</sup>			
	Until the passage of aggregate	Speed moving of aggregate after the passing m/s.		
		0.25	0.58	0.80
0...5	1,41	1,42	1,41	1,40
5...10	1,43	1,43	1.42	1.41

**THE CHANGE OF THE COMPOSITION OF THE SOIL AGGREGATE, DEPENDING ON THE SPEED OF MOVEMENT OF THE WORKING ORGAN ON THE DISK DEVICE SOFTENING TO THE BASE PLATEAU.**

TABLE-3

Movement speed, m / s	Amount of Fractions,%		
	$\varnothing$ 10...5mm	$\varnothing$ 5... 0,25mm	$\varnothing$ < 0,25mm
Untill the passing of aggregate			
	59,1	28,89	11,19
After the passing og aggregate			
0,25	57,8	29,72	12,06
0,58	56,91	33,26	9,72
0,80	54,23	36,67	8,71

**CHANGE OF LEVELING PROFILE OF THE LONGITUDINAL PROFILE, DEPENDING ON THE VELOCITY OF MOVEMENT OF THE WORKING BODY BY THE DISK DEVICE SOFTENING TO THE BASE PLATEAU.**

TABLE-4

Tendency Indicator	Movement speed, m / s		
	0,25	0,58	0,80
$\sigma_{\partial}$	9,91	11,05	10,80
$\sigma_{\Pi}$	8,6	9,37	9,02
K (%)	13,21	15,2	16,48

As can be seen from the table, soil hardness, volume and aggregate content will vary at a rate of 0.25 ... 0.80 m / s and a relatively small amount of moisture content. This change corresponds to the agrotechnical requirements before planting. Table 4 shows that aggregate velocity increased from 0.25 m / s to 0.80 m / s, whereas the level of longitudinal profile of the ground canal increased by 19.84%. This change confirms the theoretical results. A smooth disc leveling device based on the slope, the slope of the soil heap from the soil surface should be parallel to the line and the middle of the pile should be placed at least 50 ... 100 mm. These indicators depend on the speed and humidity of the pile (speed  $y = 0.25 \dots 0.80$  m / s, humidity  $W = 14 \dots 20\%$ ). This speed is reduced, and the humidity improves the quality of work, and the soil is blocked on the surface of the disks. In summary, we can say that the above points and analyzes show that the qualitative leveling of land in improving land reclamation is of utmost importance.

### ABSTRACT

*This article provides information about catalysts and classification of catalysts, using catalysts in petrochemical industry. This article also discusses the scientific significance of using of catalysts in petrochemical industry.*

**KEYWORDS:** *Catalysts, Petrochemicals, Oil, Gas, Biochemical, Scientific Significance.*

### INTRODUCTION

The level of development of the world, oil, gas, chemical, oil refining, petrochemical and biochemical industries is increasing annually so that the incredible variety of production of all kinds of synthetic materials surrounding modern man is lost to ability to surprise. Increasing the coefficient of selection of oil from oil reservoirs using catalysts, production of various compounds from natural gas are new directions in the development of new catalysts and processes based on them. In the refining industry, new catalysts and processes are also continuously applied, for example, the introduction of microsecond cracking, fluidized bed reforming, and others appear on the basis of creating new types of catalysts and catalytic reactors. In the petrochemistry of heavy-duty plastics, anti-reflective coatings, water-repellent

surfaces are also based on the use of new catalysts in the form of nanosystems, which have a significant effect on the daily life and development of society. The basis of the majority of chemical-technological processes are catalytic conversions of organic and inorganic compounds. The volumes of production of the target product, the process conditions, its hardware design and technology features as a whole directly depend on the catalysts. Rarely even the economy of production is determined, namely, by the cost of the catalyst and the cost of its maintenance. In this situation, one of the priority directions in the development of applied chemistry is the development of the scientific foundations of the search for the most optimal catalysts for existing industrial reactions, or, conversely, the selection of a reaction catalyst that has already been developed. As a result of which this or that target product of the oil refining and petrochemical industry is formed with a significant yield and selectivity. Obviously, a researcher who sets himself a similar task in one of its variants will be forced to look at the mechanisms of elementary stages of catalytic (chemical) processes, as well as the properties and structure of such a complex system, that is, catalysts and reagents. Successful work in this direction may be assisted not only by empirical studies, and theories of catalysis and catalysts, but also by the methods of formal kinetics and thermodynamics and other methods, including the apparatus of quantum chemistry, constantly improved by the leading world scientists since the 30s XX century. Of particular importance is the involvement of theoretical foundations of catalysis for solving theoretical and practical problems, especially the theory of catalysis by polyhedra. Modern information technologies, which have undergone even more rapid development recently, are widely used for the oil, gas, chemical, petrochemical, oil refining and biochemical industries and open up wide horizons for specialists in the field of modeling of physical and chemical (catalytic) processes. In the market of software products for studying catalytic systems by quantum chemical methods, there are already various applied software packages (for example, CambridgeSoftChemOffice, MORAS and others) that allow performing the necessary thermodynamic calculations of catalysts and reagents, to carry out calculations of the composition and energy of transition states, the geometry of molecules and clusters, and calculations of other parameters of molecules and complex catalytic complexes based on methods of molecular mechanics and quantum chemistry. These methods are based on the solution of the Schrödinger equation and, when solving applied problems with their help, they have rather high accuracy and require relatively insignificant hardware resources (computers) and time required to obtain the parameters by the calculation method molecular and catalytic systems under study. The interested reader with calculation methods for studying molecular catalytic systems will find information for them in the books of V.A. Lyubimenko et al. The classification of catalysts and catalytic processes is one of the most important directions in understanding the features of the structure, state, and chemical composition of catalysts, the relationship of composition and structure with the activity and selectivity of the catalyst and with operating conditions (time their work without reducing activity and selectivity, productivity, resistance to high temperatures and etc) catalysts, mathematical description of catalysts and catalytic processes. Catalytic processes are distinguished by their mechanisms of occurrence, state of aggregation, methods of redistribution of electrons and bonds in molecules, and they, in turn, are taken into account in the mechanism of catalytic processes and, based on them, create mathematical modes. Based on the classification of catalysts according to different signs, conditions for their synthesis are more reasonably selected, the mechanisms of action of catalysts on reagent molecules and a sequence of elementary stages of catalytic processes are

formulated. Classification is also important in the creation of new types of catalysts and the selection of catalysts for chemical processes, as well as the optimization of the chemical composition of catalysts and the polyhedral structure of a crystalline or amorphous lattice bodies and the selection of other parameters for the catalyst and catalytic processes. Classification of catalysts and catalysis phenomena can be done when the main features of the catalysts themselves are distinguished, as well as catalytic processes. We can distinguish the following main features for catalysts and catalytic processes:

- Aggregate states of catalysts and reagents (classification of systems by phase state),
- General and acid-base catalysis,
- A method for separating electrons between catalysts and reagents (homolytic and heterolytic catalysis ),
- nanocatalysis,
- pico- and femtocatalysis,
- the chemical nature of the catalysts and the crystal chemical structure,
- catalyst supports
- the texture of solid catalysts
- biocatalysts (catalysis by enzymes),
- microheterogeneous catalysis (catalysis in colloidal systems),
- catalysis by metals and insulators,
- interphase catalysis,
- autocatalysis,
- coordination catalysis (catalysis by complex compounds),
- catalysis by polyhedrons,
- catalysis by ionic liquids,
- astrocatalysis,
- photocatalysis,
- cooperative catalysis.

Classification of catalysts by their state of aggregation. Catalytic processes are divided according to the mechanisms of their occurrence and their influence on the mechanism of the process of the nature of the catalyst and reagent molecules, as well as the state of the catalytic system (homogeneous or heterogeneous system). The classification of catalytic systems can be carried out first by the state of aggregation of the catalysts and reacting substances. By the aggregate type, the catalysts and reagents can be in a gaseous, liquid, and solid state. If the catalysts and reagents are in the same aggregate state (gas mixtures, true solutions of liquids and solids), then such systems are homogeneous and catalysis belong to a homogeneous type. If the catalyst and reagents are in different aggregate states, then such systems are called heterogeneous

and catalysis is called heterogeneous. In heterogeneous catalytic systems, at least 8 systems with different aggregate combinations can be distinguished. For heterogeneous catalytic systems, when a pair of aggregate states of the catalyst and a reagent are combined in three phases (g, g, and t), we obtain  $2^3 = 8$  systems.

All in all to conclude, Catalysis is a change in the rate of a chemical reaction by a substance called a catalyst. Unlike the reagents involved in the reaction, the catalyst does not react. Catalysts that accelerate the reaction are called positive catalysts, while those that slow down are called inhibitors. Catalyst enhancers are called promoters, and reducing agents are called catalytic poisons.

## INTRODUCTION

Gradual transition to market relations, achievement of sustainable development of agriculture and water resources of the Republic of Uzbekistan in the period of development through interconnection with the world community on the basis of common economic policy, improvement of rational use of water resources, working out of modern technological processes as well as automated working equipment and at the expense of introduction into production by using water and land which is directly related to perspective ways of transition to new forms for agricultural production.

Today, the issue of rational use of water resources is one of the most important issues for specialists in agriculture and water resources. The demand for agricultural crops of irrigation water in vegetation period is not always provided. In addition, the achievement of high-quality and high-yield irrigation technology depends on the reclamation of cultivated lands. To do this, agro technical treatment of irrigated land will need to be implemented by using modern technologies.

All kinds of measures are taken to prevent inefficient water supply to agricultural crops. Enterprises specializing in amelioration and water management work to expand and improve the capacity of water supply facilities. Legal norms and privileges established by the Government play an important role in this work. Decree of the President of the Republic of Uzbekistan Sh.Mirziyoev, dated November 27, 2017, PQ-3405 "On the State Program for the Development of Irrigation and Improvement of Irrigated Lands for 2018-2019", which will be an important factor in improving the efficiency of such works.

As a result of implementation of these decrees, ground water levels on more than 260,000 hectares of irrigated land have been reduced, average and severe salinization has been reduced on almost 32,000 hectares, and land-reclamation status of 182,000 hectares has been improved [1]. One of the technologies used to enforce this solution, i.e. crop irrigation, efficient use of water resources, is a smooth surface. It can be concluded that the area of machine-tractor units is even, if the landing area is above the plane of the surface. This is article based on importance of something the land and done it in the given time according to agro techniques demands the number of grader in something irrigated lands of Bukhara province is also based on given formulas. There are also given advice in using efficiently something aggregates. Something irrigated land makes condition of increasing fruit fullness of agriculture crops, not much work during irrigating the land and saving water, polishing quality row spaces and gathering crop quality with machines. Polishing soil several time make land uneven when irrigate the land, in other word while tilling long furrow and after irrigating high – lowland and last year uneven will be formed. There are also observed some part of the field after irrigating several time. It may also achieved in good or quality something by long grader machines two or three times but it can't be smoothed by hanging grader machines. Smoothing the land in agro techniques time ameliorate the land.

Smoothing aggregate should be provided enough for usefully and smoothed the land in agro technique time on conclusion of several scientist general smoothing land consist of 35 .. 40%

in our republic According to the observation in Vobkent , and G'ijduvon , region of Bukhara irrigating furrow cotton land in not smoothing fields moisture consists of in deep part of the land 8.....12% in high part 10...15% that's why we can't achieve moisture in all part of crop it increased salt. This make a result of decreasing crop [2,3].

## II. THEORETICAL RESEARCH

Spherical discs have found wide application in various agricultural tools for surface treatment. For example, there are disc ploughs, harrows, cucumbers, where a spherical disc serves as a working device. In disc ploughs and harrows, a spherical disc is the main working device that affects the soil. The decisive requirement for discs is a reduction in traction resistance, if the main purpose of cultivation is fulfilled satisfactorily [10,12].

In our researches the spherical disk worked as a plough-hole in the soil prepared for sowing, which was in loose condition, was sunk to the depth of 5-7 centimeters. Traction resistance is not of main importance due to under loading of tilled tractor type TTZ-80.10 during sowing. It is important to know the trajectory of flight of particles, thrown by disc, the distance of their throwing. In the theoretical determination of the trajectory of particles on the spherical surface, a significant role in determining the moment of particle velocity failure is played by the angular velocity of the spherical surface of the disk. In order to determine the influence, causes affecting the angular velocity, we have conducted research [14,11]. The spherical disk, buried in loose soil, comes into interaction with it and moves with certain angular velocity  $W$ . The soil particles enter the inner cavity of the sphere, then come off the disc and fall down at a certain distance.

The angular velocity of  $W$  is influenced:

1. The ratio of disc inertia moments to soil
2. Bearing friction
3. Resistance to cutting into the front edge of the sphere and release of the rear edge from the soil
4. Angle of attack.

The moment of inertia of the disk relative to the axis of rotation  $Z$  (Fig.1) is:

$$J_z = \frac{MR}{2}, \quad (1)$$

Where:

$M$  is disk weight ;

$R$  is radius of disk ;

To determine the angular velocity  $W$ , we apply the theorem of change relative to the rotation axis  $Z$  of the kinetic moment of the system consisting of soil and disc. For this purpose, we depict the system "disk-soil" and the external forces acting on the system (Fig. 1) [16].

This system is affected by only one external force applied to the spherical disc from the moving soil.

Let's make an equation of moments:

$$L_z - L_{oz} = \sum M_z [S^e] \quad (2)$$

Where:

$L_{oz}$ -kinetic torque relative to the axis of rotation of the disc of the soil-disc system until it touches. For simplicity of solving the problem, let's assume the disk standing in place at an angle and the soil layer moving progressively.

Then

$$L_{oz} = m g \rho \cdot \cos \alpha, \quad (3)$$

where m second - the mass of the formation is determined by the equation

$$m = \frac{s \cdot g \cdot \gamma}{g},$$

S-area in cross-section, normal to trajectory, dm<sup>2</sup>

$g$  -progressive movement speed .m/sec:

$g$  -acceleration, m/sec<sup>2</sup>;

$\cos \alpha$ , is a coefficient that takes into account the amount of movement per disc rotation;

- Distance between the axis of rotation of the disc and the center of gravity of a segment of disc buried in the soil;

$L_{oz}$  - the kinetic moment in relation to the rotational axis after contact.

After touching the disc will have angular speed  $W$  and the soil layer will move together with the disc because of soil looseness.

Consequently,

$$L_1 = L_{1z} + L_{2z} \quad (4)$$

But  $L_{1z} = L_{1z} \cdot W$  - disc kinetic moment,  $L_{2z} = L_{2z} \cdot W$  - the kinetic moment of the formation,

Where

$W$ -angle disc speed, l/s.

Considering expression (I), we shall result the equation

$$L_{1z} = \frac{MR^2}{2} \cdot W, \quad (5)$$

$a \sum M|S^e| = 0$  – the sum of external force moments relative to the z-axis because the system's kinematic torque is maintained.

The moment of inertia of the moving part of the layer with respect to the z-axis will be:

$$J_{2z} = m\rho^2 \quad (6)$$

That way;

$$L_z = \left[ \frac{MR^2}{2} + m\rho^2 \right] W \quad (7)$$

After substitution of the found values in the equation [2] we obtain.

**Figure. 1.** Spherical disc, sunk into the soil.

**Figure. 2.** To determine the angular speed of the disc standing at an angle  $\alpha$  to the trajectory

**Figure. 3.** Experimental angular (solid line) and calculated (dashed line) by

$$\text{formula } w = \frac{g \cdot \cos \alpha}{R}$$

Disk Speed  $W_{cp}$  : I-in  $V_1=613,8$  m/s,  $2-V_2=808,3$ , 3-  $V_2=1330,5$  and  $4=V_4=1672,2$  m/s.

$$\left[ \frac{MR^2}{2} + MP^2 \right] W - m \cdot g \cdot p \cdot \cos \alpha = 0.$$

Or

$$W = \frac{m \cdot v \cdot p \cdot \cos \alpha}{\frac{MR^2}{2} + mp^2}. \quad (8)$$

After dividing the numerator and denominator by mp we will finally get:

$$W = \frac{v \cdot \cos \alpha}{P + \frac{MR^2}{2mp}}. \quad (8a)$$

Besides, there's a dependency

$$\mathcal{G} = WR_{nep} \quad (9)$$

In which,

$R_{nep}$  - rolling radius.

Comparing formulas (8a) and (9), we can see that:

$$P + \frac{MR^2}{2mp} = R_{ntp} \quad (10)$$

But we do not take into account the friction torque in the bearing, the cutting resistance of the front of the disc, or the bulging of the rear [15,16]. Obviously, in reality, these factors increase rolling radius by a value oscillating within small limits which depends on bearing design, curvature of sphere, coefficient of soil friction against disk.

$$R_{nep} = R_{nep} + \Delta R \quad (11)$$

Now let us determine the change of angular speed depending on the angle of disk installation - angle of attack (Fig. 2).

Spherical disc, moving together with the tractor and having the forward speed of the tractor when moving in a straight line makes a complex movement. It simultaneously participates in movement of pure rolling and pure sliding at moving on a straight line from position 1 to position II. The speed of this movement can be expressed in equality

$$\mathcal{G}_{mp} = \mathcal{G}_{ck} + \mathcal{G}_{\omega} \quad (12)$$

Where:

$\mathcal{G}_{ck}$  - tractor speed:

$\mathcal{G}_{\omega}$  - pure sliding speed :

$\mathcal{G}_{mp}$  - pure rolling speed:

From a triangle I II II ' we have :

$$\mathcal{G}_{\omega} = \mathcal{G}_{mp} \cdot \cos \alpha \quad (13)$$

Considering the expression we will write down:

$$W = \frac{v_{mp} \cdot \cos \alpha}{R_{nep}} \quad (14)$$

By substituting from equations (10) and (11) into expression (14) the value  $R_{nep}$ , we obtain :

$$W = \frac{g_{mp} \cdot \cos \alpha}{\left( \rho + \frac{MR^2}{2mp} + \Delta R \right)} \quad (15)$$

For definition of actual rolling radius  $R_{nep}$  and also angular speed of a spherical disk, we have made spherical disks with various radiuses of curvature  $R_{крив}$  at various thickness  $t$  ( $\phi=300$  mm).

$R_{крив}$ ,	500	700	900	Flat	mm
$t$ ,mm	3	3	3	5	8 12

The rolling radius of the spherical disk is calculated as follows . On an optional device, which was manufactured at SAIME, the number of revolutions of the spherical disc, as well as parts of the revolutions up to  $I^0$ , is determined, the stopwatch time is counted to 0.01 . The device was strengthened on the running trolley of the soil channel that allowed fixing the spherical disk on the required angle of attack to the trajectory of movement in the range from 20 to 700 in 100 steps.

The trolley of the soil channel moved with four different speeds .

During the experiment, the number of disk revolutions  $N$  and time of movement  $t$  were calculated, and the number of revolutions  $N$  consisted of the whole number of revolutions  $n$  and the honor of revolutions.

Thatis

$$N = n + \Delta n$$

Experiments were conducted in the calculated area  $Z$ , the rolling radius is defined as

$$R_{nep}^1 = \frac{Z}{2\pi N}$$

The experiments were carried out in 4-fold repetition in each version.

Spherical discs with different moments of inertia and curvature radiuses were deepened to a depth of 30 : 60 : 90 : 120 mm and moved at different speeds [6,7].

After processing of experimental data it was found out that curvature of spherical surface, moment of inertia as well as burial of disk in soil practically does not influence on angular speed. Approximately the same data was obtained at other angles of attack.

The main factor influencing the rolling radius and accordingly the angular velocity was the angle of attack.

Calculation of rolling radius according to the above formula showed that rolling radius  $R_{nep}$  in all cases is close to  $R$  value (Fig. 1) .

Experiments have shown that the formula (15) can be simplified to the form :

$$W = \frac{g_{mp} \cdot \cos \alpha}{R} \quad (16)$$

In fig. 3 given the dependencies of angular velocity  $W$  on the angle of installation. a. Here is shown the value of angular velocity of the spherical disk, calculated by the formula (16) and experimental data[3]. The angular velocity depends only on the setting angle of the disc to the trajectory, the velocity of movement and can be calculated using formula (16).

### III. CONCLUSIONS

The angular speed of the spherical disc that moves in the soil prepared for sowing is independent of the disc curvature, the size of the burial, and the moment of inertia of the disc.

## CURRENT ISSUES OF YOUTH COVERAGE IN THE THEATER

**Rakhmonova Kamolakhon Amanullayevna\***

\*Doctoral Student,  
Institute of Art History of the Academy of Sciences,  
the Republic of UZBEKISTAN

### ABSTRACT

*The article discusses the importance of the study of youth in the field of theater. Issues related to the expression of the theme of youth in Uzbek drama and theater are analyzed. It describes in detail the specifics of staging the topic of youth in the modern process, the problems that arise in this process. There were also comments and suggestions on how to increase the role of theater in educating young people.*

**KEYWORDS:** Theater, Youth Theme, Performance, Artistic Form, Artistic Image, Solution, Playwright, Director, Acting Skills, Moral-Educational Function.

### INTRODUCTION

The focus on young people is an important step for the future. At the same time, young people are the most vulnerable group in society. When Uzbekistan gained independence, the basics of state youth policy were developed and the first adopted law was the Law on Youth in 1991.

It is no secret that the problems of young people today are gaining globalization and are considered a very serious issue. The study of youth abroad in various fields of science has long been established. "The special study of young people in the socio-political sciences as an independent stratum began in the 1920s and 1930s. Youth issues and various destructive moods among young people have been scientifically studied, primarily in the field of pedagogy and critical pedagogy.

The study of state policy and problems concerning youth has led to its inclusion in the classification of modern new sciences in the last century. The first complex works on youth were studied in G. Stanley Hall's book "Youth" and "Problems of Education", S. Buhler's "Spiritual Life of Youth", E. Spranger's "Psychology of Youth" and others. However, a narrow range of specialized research was introduced in the 1970s after the student uprisings of the 1960s,

resulting in the science and theory of juvenile science. The science of studying youth began to be called "juvenile" or "juventology" (Latin: Juvenilis - youth, logos - study). The topic of youth was first studied extensively in the fields of pedagogy and psychology, but later began to be studied in other social sciences and humanities. The topic of youth in the field of theater abroad is one of the current topics that requires in-depth study[1].

In particular, Peter Martin Gydborg's dissertation "Proud theater: A Queer performance model" is one of the major studies on this topic. The issue is being considered as a theatrical model by the US Proud Theater. It analyzes the main factors of the model of performances for young people, along with the role of theater in the art economy.

V.V. Pavlovsky is one of the scientists who conducted extensive research on youth in Russia. The book "Juventology: the formation of science and youth" provides a comprehensive analysis of the origin and study of this topic.

Kokhanaya Olga's doctoral dissertation "Sociocultural functions of children's and youth theater" also reveals the socio-political role of children's and youth theaters in the lives of young people. The author argues that children's and youth theaters should be studied as a special socio-cultural institution. The researcher focuses on the project "On the way to the audience: partnership program", launched in 2008 in Russia by the Experimental Center for Audience Work of the Russian Academic Youth Theater.

The project is implemented under the auspices of the President of Russia in support of children's and youth theaters for 2008-2010. In the article by AV Eterskova "Features of the interaction of the theater with the youth auditorium (at the first Legendary Alexandrinsky Theater)" it can be said that the above issues have found their logical continuation. Among the plans for future creative work in this theater is the creation of performances for young people, for which a plan (program) "Cultural life of the theater and the formation of an audience of young audiences" has been developed.

Veronica Kozel's dissertation "Young problems in the theatrical art of Belarus in the 70-80s" focuses on the theme of youth in the theaters of Belarus in the 70s and 80s, the relationship of the policy of that period to the theme of theater and youth. During his research, the dissertation said, "Active study of the problem of youth in theaters can greatly contribute to its development. It gives theaters the opportunity to interact with the audience, to experiment, to use the synthesis of art[2]". In the territory of Uzbekistan during the period of independence, the subject of youth has been studied in various fields of social sciences, including history, psychology, sociology, philosophy and political science.

The special study of the subject of youth in the field of art and theater is a scientific novelty. To date, there are two research studies on youth theaters in Uzbekistan, which provide only a partial analysis of youth-themed performances. However, the object of analysis of scientific works is not the subject of youth, but opinions are given on a general basis.

In particular, H. Ikramov's dissertation "Uzbek State Republican Theater of Young Viewers named after Yuldasha Akhunbabaeva" covers the stages of formation and development of the

theater until the 80s, and deeply analyzed the theater's repertoire and performances. Among the performances analyzed were youth-themed performances. However, in the period taken for the dissertation, mainly performances for children were staged. In all of the performances analyzed as works for young people, we cannot say that the theme of youth is the main theme. It was also found that these performances were not analyzed in terms of their impact on young people.

M.Akhmetjanova's dissertation for the degree of Candidate of Arts in "Youth Theaters of Uzbekistan in the period of independence (new era and its stage solution)" The repertoire of the Youth Theater of Uzbekistan, the Republican Theater of Young Spectators, Andijan Youth and Children's Theater named after Abbos Bakirov in 1991-2007 The dissertation is devoted to the analysis of performances for children. In this regard, it is difficult to say that this research work was prepared on the topic of youth. However, in the concluding part of the dissertation, the researcher focused on the issue of "Youth Theater" and a special theater for young people. raises the problem that it is gradually changing its direction and becoming an academic theater[3]. For example, the Young Guard Theater, which was opened specifically for young people in 1968, changed its direction in the 1980s after the resignation of its director E. Masafaev. As a solution to the problem, it is suggested that "theaters with the status of youth theaters should be equal, and all of them should be a place of sophistication and enlightenment that will serve young audiences, teenagers and young people alike."

From the above research, it can be concluded that in the modern Uzbek theater, the topic of youth as a whole, a special study is relevant. In the Uzbek theater of the twentieth century and the period of independence, the approaches to the theme of youth, their levels of interpretation varied. This promotes a comprehensive study of the interpretation of the theme of youth in the repertoire of modern Uzbek theater on the basis of its historical and theoretical features.

The birth, formation and development of the new Uzbek theatrical art took place over a century under three different social systems - the oppression of Russian tsarism, Soviet rule and, finally, independence. This in itself led to the development of theatrical art under the influence of various ideological currents - Jadidism, Bolshevism and the ideology of national independence.

In the history of Uzbek theater, the theme of youth has played an important role in the development of the theater and its growth in the aesthetic taste, culture, consciousness and upbringing of the people, especially the young audience[4].

In the last century, Uzbek theaters have successfully staged many performances on the theme of youth. At the Uzbek National Academic Drama Theater, the process of mastering the theme has begun with the play "Padarkush" ("The condition of an uneducated child"). He continued with such works as "Wedding", "Unhappy Groom", "Advocacy is easy", "Poisonous life", "Servant with the rich", "Halima", "Lion", "Mushtumzor". Later, the topics were "Chimildiq", "Qalliq uyin", "Dadajon demayman", "Bir kanotlilar", "Tortadurman jabrini", "Senga bir gap aytaman" found its place in the repertoire. The Uzbek State Musical Drama Theater named after Muqimi has repeatedly addressed the theme of youth: "Gulsara", "Tahir and Zuhra", "Nurkhan", "Fatima and Zuhra", "Jaydari kelin", "Olifita", "Tashkent's beautiful queen" issues related to youth in the performances resonated in musical tones. The Uzbek State Drama Theater began its

work as the first state theater to represent the life of young people - the Young Guard Theater. "Victims of Love", "Thirty Years Old", "Secrets of the Paranj", "Diydor", "My Eighteen Years", "Spring Will Not Return", "Father's Daughter", "Youthlessness". In particular, the work "The first kiss" caused a great stir.

The focus on youth in the Uzbek theater of the new era is connected with the launch of the 2005 Debut Festival. Aimed at discovering young talents (theater directors, playwrights, actors, artists), providing them with material and spiritual support, as well as providing theaters with young staff, the festival has a wide range of contemporary themes, especially youth. Raising moral issues related to young people, such as "Poisonous drops" staged by director B. Pozilov on the stage of the Republican Theater of Young Spectators, "Tortadurman jabrini" (Dilbar and Tilab Mahmudovs) of the Uzbek National Academic Drama Theater, "They are lost" (T. Muhiddin) of the Republican Satire Theater outgoing performances were staged.

In order to fulfill the tasks set by the head of government at the opening of the new building of the Bukhara Musical Drama Theater to create the image of a "modern hero" the 2011 festival "We sing you contemporary" began its work. This is a new step in increasing the number and quality of youth-themed performances

The fact that the performances on the theme of youth presented at the festival have been successfully staged in the theaters of the republic for many years shows the artistic and ideological significance of the plays. Performances can be divided into two types in terms of the theme and idea put forward, the problem raised:

1. Spiritual and moral problems among young people (including parental upbringing caused by internal influences, family conditions, feelings and aspirations of adolescents and young people, performances that embody the direct and indirect impact of ethnic customs on young people;
2. Performances that reflect the problems of young people that have arisen as a result of socio-political problems (on the basis of external influences, ie the situation of Uzbek youth in the throes of globalization).

A separate review of the works on dramaturgy and directing, the correct identification of the current situation and the problem, will help to develop clear conclusions and proposals on them.

These two types have generalizing and specific features, and the analysis clearly shows the problem in relation to the general to the specific.

The common feature of the works is that they are dominated by the drama genre. In terms of themes, they are complementary. In particular, "Disco" (Sh. Rizaev), "Hedgehogs without thorns" (Sh. Boshbekov), "Poisonous drops" (T. Malik), "Children of the state" (R. Muhammadjanov), "Autumn letters" (O. Umarbekov), "Formula of Life" (A. Yuldashev), "The Beware of People", "Courage" (U. Azim), while the educational shortcomings of young people due to the carelessness and negligence of their parents have found their artistic solution. In such performances as "Aydin" (R. Muhammadjanov), "Gumroh" (S. Hamroev), "Toda" (N. Kobilov,

B.Lutfullaev) the problems related to youth in the process of globalization, such as human trafficking, drug addiction, crime are almost the same. found its solution in an artistic form. The fact that the moral and educational function of the theater plays a key role in them proves the power of the theater's influence on the young audience.

However, from the point of view of the impact of the most artistically recognized performances on the youth theme listed above on the audience, there are aspects that require attention. In general, given that the images in a play may be involuntarily imitated by a young audience, the psychological states in the young audience's mind must be taken into account before staging. Discipline does not always work. After all, the spiritual needs of modern youth are not fully satisfied by didactic works, but it is likely to distance them from the theater. Most of the works dedicated to the lives of young people, especially those that raise issues of global significance, are of a didactic nature.

For example, in the play "Poison Drops" based on Tahir Malik's "Goodbye Childhood", the spirit of a teacher who died as a result of youth bullying is visible to children, admonishing them and guiding them to the right path. Young people understand their mistakes and will be punished according to their actions. It is known that the image of the soul in world drama played an important role in the sharpening and development of events. Shakespeare in particular made extensive use of this path. In Hamlet, for example, all the events were connected with the appearance of the soul to Hamlet and the evidence he told him. However, the conditions in the play are placed so correctly that they motivate the protagonist to move forward towards truth and justice.

That's why the "trap" scene served. The necessary action and character traits in Tahir Malik's "Goodbye Childhood" are not included in the staging of "Poison Drops". As a result, the work lost its artistic impact. This shortcoming can be found in the play "Autumn Letters" based on the works of Olmas Umarbekov "Letters to my daughter" and "The first day of autumn." The soul of the author is introduced in the reworked pesa. Olmas Umarbekov's advice to his daughter in "Letters to My Daughter" is addressed to the audience as if the author's comments on the upbringing of young people.

But did this "news" justify itself? The role of the immortal Umarbekov in the work, does he have a clear mission? In a dramatic play, each character and his actions must be positioned in such a way that the removal of a single character or a related event has a direct effect on the subject and idea of the work. The removal of the author's image in The Fall Letters has no effect on the chain of events.

Sh. Rizaev's poem "Disco" reflects the ideological struggle between the two worldviews, based on the views and debates of adults and young people. "While the media focuses on what makes young people think, what their goals are and what can hinder them from achieving this, it is important to show how today's youth are different from yesterday's peers." The protagonist, Oybek, wants to go to another region and open a disco club during the conversation. However, his father is against it. Oybek struggles to achieve his goal and gets his father's approval. However, the author's purpose in this regard is unclear. Young people could meet not in a disco,

but in a library, on the street, in the park, or even in a cafe. The protagonist could also aim to set up a library, a training course, or some other production facility, which would be much more useful not only for the disco but also for himself and others. Maybe the author meant that all the young people who go to the disco are not misbehaving? Based on the principles of vitality and honesty, the characteristics of the national mentality, the disco works very late, and the child of an educated Uzbek family, of course, does not go to such places, and parents who follow the rules of ethics do not allow teenagers to go to the disco. The play depicts the young hero's dream of opening a disco "to keep young people in the village."

The director (O. Salimov) tried to use new art forms in staging the disco. In order to make the poem short, succinct, and staged, the necessary events related to the young protagonist are highlighted. As a result, the author's idea of the work is the events and dialogues that serve to reveal the character of the characters (opinions of other characters about Oybek, superstitions in modern life, ideas about traditions, the conflict of European and Eastern views between parents and youth, the shortcomings of the market economy, reading a book, a drastic change in the generational exchange of ideas about the modern hero). Such dramatic and directing shortcomings can be found in U.Azim's poem "Kurshov".

In the play, the author tries to justify each action from a logical point of view, as a result of which the process of events slows down a bit. However, it takes the collaboration of a director and a playwright to skillfully bring it to the stage. Not every author can write a poem based on the rules of the scene. He imagines himself. The director, on the other hand, will have to be able to choose the right words and scenes and make it sound logical on stage.

The director of the play (M.Rajabov) dropped some scenes and characters in the play. Due to the director's abbreviations and additions, U.Azim's drama "Kurshov" will become a publicist play about traditional patriotism "Matonat". According to the director's approach, all the emphasis is placed on the protagonist Ravshan, the most necessary events and actions related to the secondary hero - an ordinary soldier Karim are removed, and the plot events that reveal Ravshan's heroism are shortened. The same is true of the realities of the other side of the conflict - the terrorists. As a result, no character is fully revealed. After all, "Any break in the chain of dramatic action can not but negatively affect the direction of the flow of events, the activities of the protagonists. Because each chain is inextricably linked with the components of the plot.

While the figurative-expressive analysis of works on the theme of modern youth, in recent directing approaches, the main focus is on external artistic forms, and the problem is that internal artistic criteria remain in the background. "Aydin" (R.Muhammadjanov), "Beware people" (U.Azim) (directed by V.Umarov); In performances such as "Gumroh", this issue is clearly visible. In their directing and acting work, the decoration, external effects, plastic actions, excessive pathos hindered the discovery of the inner character of the characters, weakened the idea, lost the integrity, completeness, perfect image, lost the natural atmosphere.

The lack of dramatic spirit in the works of the drama genre is due to the fact that the authors do not "live" the idea and theme, the movement of the characters, but try to subdue each reality and express their attitude to the plot. The "classical method" that Shakespeare used in his time is

being forgotten in modern Uzbek drama. What made Shakespeare a genius was when he was able to turn social problems into universal, living issues. The opposite is observed in modern Uzbek theater. In other words, universal ideas are becoming everyday, outdated, works of the same stamp. All of the works listed above face this problem. From the analysis, it is clear that the common problems of performances that raise youth issues are equally relevant to the playwright, director and actor.

After all, "a theater built on the process of action is a theater of living, experience." Today's audience is well aware of what is happening around them. He sees the changes, news, problems and threats in the world and in our country every day, every hour, through social networks. Young people in particular are among those details. So we can't treat them like young children. In addition to these events, dramaturgy must be an artistic expression of aspects of life that others ignore. This requires the playwright, along with his writing skills, to have a better understanding of the philosophy of life than others and to be able to express it in a true artistic way. After all, our modern young heroes "... move less, think less, our perception of his worldview is very limited: he does not live as a big life person in the eyes of the auditorium."

So, in general, today in the creation of performances related to young people, it is important to create a perfect artistic work, a stage atmosphere based on ideas and themes, the effective use of acting skills, to focus on issues of artistic integrity. The predominance of subjectivity in directing and acting is evident in the performances. The events are very vivid, the purpose and the idea are reflected in a simple way, the essence of the issue, the reasons why young people choose this path remain unclear. In particular, "The director is a person responsible for the ideological, artistic and aesthetic aspects of the play, the relevance, modernity and ideology of the subject. Therefore, a creative director is required to have a well-developed artistic taste, a well-formed worldview, a familiarity with domestic and foreign policy, and a deep understanding of life. "

Directors are divided into three categories: a director who can convey the author's idea by understanding the purpose and function of the work, a director who promotes an idea in the work that the author may not have imagined, and a director who stage the play at his own level without understanding the poem. . In order for a director not to remain at the level of an amateur and craftsman like an actor, it is necessary to have the ability to choose a work, to cooperate with the playwright in staging a play.

It would be useful to take into account the following suggestions when bringing issues related to youth to the stage:

- to pay attention to the correct choice of external and internal artistic form in dramaturgy, to stage works with a complex plot, sharp twists and conflicts;
- adherence to the principles of vitality and authenticity in dramatic works;
- Development of a director's plan for the staging of the play;
- Bringing up the most sensitive issues of social life, such as expanding the scope of the problem (for example, unemployment, the fate of young people raised in orphanages, alcoholism, drug trafficking, hooliganism, crime, important steps in the realization of youth aspirations);
- to set up the process of the actor's work on himself;
- creation of aesthetic ideals for young people on the basis of universal values and views;

- Cooperation of the director with the author in staging the work.

Taking into account the above suggestions, ensuring that performances on the theme of youth are viewed in a youth audience can help them find solutions to some of the problems and issues they face.

## THE NOTION OF FEMINISM IN THE WORKS OF CHARLOTTE BRONTE

**Darvishova Gulchehra Kenjabayevna\***

\*Teacher,

Department Foreign Languages Military,  
Technical Institute of National Guard Republic of UZBEKISTAN  
Email id: gulchehrad75@mail.ru

### ABSTRACT

*It aims at casting light on Charlotte Bronte as one of the most prominent female novelist in the nineteenth century. It also traces Charlotte Bronte as a subjective novelist is concerned to convey a subjective impression. The study provides a historical and critical background of her age in which she matured and originated the main literary tendencies which affected and swayed her and decided the expression and manner of her writings. The study concludes, Charlotte Bronte sets up moral, spiritual and social problems such as the position of women, but evades a solution to the complications by dropping the problem and substituting the conventional solution of love and marriage.*

**KEYWORDS:** *Prominent, Revolutionary, Substituting, Originated*

### INTRODUCTION

Feminism also emerged as an important aspect of this age. A number of women including Tennyson's wife started writing for the rights of women in the male-dominated society. However, their battle was not successful as society preferred male-written works and women and their works were disregarded male-written works and women and their works were disregarded by society. As a result, many female writers published their works with male pseudonym in order to achieve fame. Charlotte Bronte was one of the founders of feminism in the Victorian Age. She was the revolutionary icon of the age. She broke a number of conventions that prevailed before and during her time.

She wrote eponymous novels (the title of which is the name of the protagonist) like Jane Eyre. Being well aware of the status of women in the society she published her first novel assuming male pseudonym "Currer Bell".

**MAIN PART**

Charlotte Bronte is perhaps one of the most prominent female novelist in the nineteenth century. But she is in some ways even more typical. Of course, she is not so great a novelist as Dickens; apart from anything else she had a narrower range. Her range is confined to the inner life, the private passion. Indeed, Charlotte has stood the test of time and her works are still fascinating enough to attract readers and scholars of our time despite of her narrower range. Her imagination is stimulated to create by certain aspects of man's inner life as that of Dickens or Thackeray by certain aspects of his external life. As Thackeray was the first English writer to make the novel the vehicle of a conscious criticism of life, so she is the first to make it the vehicle of personal revelation. She is the first subjective novelist, the ancestor of Proust and Mr. James Joyce and all the rest of the historians of the private consciousness. And like them her range is limited to those aspect of experience which stimulate to significance and activity the private consciousness of their various heroes and heroines.

**According to Gaskell:**

*The life of Charlotte Bronte is very substance of her novels; three times she summarized what she had imagined, seen or felt. In Jane Eyre she depicted her imaginative life; in Villette, her true moral life; in Shirley, coming out of herself a little- though very little in fact- and standing as it were at the window of her soul, she depicted the corner of Yorkshire where she lived and what little she had seen of human society.[1]*

Each of her books has therefore a very marked character in the first, Jane Eyre, Villette, the best parts of Shirley, are not exercises of the mind, but cries of the heart; not a deliberate self-diagnosis, but an involuntary self-revelation. Fundamentally, her principal characters are all the same person; and that is Charlotte Bronte. Her range is confined, not only to a direct expression of an individuals' emotions and impression, but to a direct expression of Charlotte Bronte's emotions and impressions. In this, her final limitations, we come indeed to the distinguishing fact of her character as a novelist. The world she creates is the world of her own inner life; she is her own subject. This does not mean, of course, that she never writes about anything about her own character. She is a story-teller, and a story shows character in action, character, that is, as it appears in contact with the world of external event and personality. Only the relation of Charlotte Bronte's imagination to this world is different from that of most novelist.. In this context Gaskell points out that;

*Charlotte Bronte has struck only one cord of the human heart, the most powerful it is true. In Shirley, the imagination alone speaks and when imagination is sole master one can be sure that it will run to strange, fiery passions, difficult of interpretations.[1]*

Theirs, inspired as it is by some aspect of human life outside their own, works, as it were objectively. Charlotte Bronte as a subjective novelist is concerned to convey a subjective impression. Her picture of the external world is a picture of her own reaction to the external world. But she did not write novels in order to illustrate a particular moral precept. such an obvious procedure is deliberately rejected at the end of Shirley:

*I think I now see then judicious reader putting on his spectacles to look for the moral. It would be an insult to his sagacity to offer direction. I only say God speed him in the quest.*

Every page of Charlotte Bronte's novels burns and breathes with vitality. Out of her improbabilities and her absurdities, she constructed an original vision of life; from the scattered, distorted fragments of experience which managed to penetrate her huge self-absorption, she created a world. The present study aims at exploring the portrayal of women in Charlotte Bronte's Shirley. It also tries to give a historical and critical background of her age in which she matured and originated the main literary tendencies which affected and swayed her and decided the expression and manner of her writings which are necessary at the outset.

Charlotte Bronte admits the restrictions imposed upon women writers yet denies her suffering from them, or at least their hindering influence on her. At the same time, she denies the masculine gender of the pen name with which she signed her works and insists on its general neutrality. She can debate the gender of the name, but fails to offer an explanation why she, if she is such a daring woman, dares not write under her original name. Charlotte Bronte was more introvert by her nature and in her writing because of the partly voluntary seclusion of her family and also of the romantic era, which affected the cultural atmosphere of the time by emphasizing the exploration of nature and emotion.

Charlotte was much more in the world than her other contemporary writers, and her increasing contact with it on a variety of planets is revealed in her interest such as charity schools and their abuses, and the position of governess and teachers, is the work still of an individual not aware of herself or of these issues as part of a wider society. Hence it is the individual and isolated passion of Jane that is central; her anger at injustice, her temptation to forget the world and religion for individual happiness, her seeking for a fit and independent mode of existence. The Universe of Jane Eyre approaches that of Wuthering Height in the exploring of an individual's reaction to its own moral ambience and emotional universe. But this was not solely Charlotte's sphere for she was not the isolated spirit family was. The position of women, the fear of being an old maid, the struggle for independence on the world's terms, not by retreat to the spiritual, make Shirley and Villette novels based more firmly in a recognized society. They deal with problems of the individual seen more and more in relation to society, while still revealing an individual vision. Charlotte Bronte's writing is a powerful agent in her effect. The scenes in her novels, indeed, are the peak of Charlotte Bronte's achievements; for in them, as in no others, her imagination finds the perfect fields for its expression. Her pictures of love and character, though they reveal her powers, and it offers equal scope to her intensity and more on her she cannot satisfy. No power of psychological penetration or accurate observation is needed to communicate the impression of the senses in an abnormal nervous state; while to be dreamlike and unrestrained is characteristic of such impressions. For once Charlotte Bronte is true not only to imagination, but to fact.

Charlotte Bronte was a genius. She had, that is, that creative imagination which is the distinguishing quality of the artist, in the very highest intensity. In spite of the frustration that the women probably felt as surplus women, Charlotte had very realistic attitudes towards marriage for herself and she decided that mere respect without affection was not enough, although marriage would have made them independent from the charity of others. In Charlotte's work she relied on the same principle and married their heroines to men they loved but also sure that happy couples were well off. However, Charlotte, in later life gave up her principle by marrying Mr. Nicholls, a man she respected but was not sure if she would love. Naturally Charlotte was too much of a Victorian and too much of a Puritan to do more than hint at its animal side. But her hints are quite enough to prevent the emotion seeming disembodied and unreal. Even Caroline

Helstone, that blameless dummy, comes to life when alone in her room she abandons herself to her yearning for Robert Moore. Here is a frustrated love. And writing as she does of the emotion of her own unsatisfied heart, Charlotte Bronte is most characteristically concerned to describe a frustrated love: Jane Eyre's love for Rochester, so hopelessly, as it would seem, out of her reach; Lucy Snowe's for Dr. John, absorbed already in Ginevra Fanshawe. But the fact that it is frustrated does not make the love of Charlotte Bronte's heroines less intense. Indeed it makes it more of an obsession. Moreover, Charlotte Bronte can describe happy love equally well, if her story gives her a chance, As a matter of fact love is the occasion of her few successful flights of humor. Jane Eyre teasing Rochseter, Lucy Snowe sparring with Paul Emanuel, in these she achieves real comedy. It is a little stiff shy; it is also enchantingly demure and delicate; a sort of Puritan comedy of the sexes, unlike anything else in English literature. In addition to love' gaieties she can describe love's ecstasy.

Like most of the other novelist of her school, Charlotte Bronte is a poet; and her poetry is the pure lyrical poetry of passion. It connects itself with her sensibility to landscape. The special emotion of her love-scenes swells to assimilate to itself the emotional quality of the scenery amid which they take place. In language of stilted compliment Mr. Rochester converse with Jae Eyre in his garden, and then he says "listen to the nightingales,". And the four simple words, like the note of a violin, quicken the scene to a lyric rhapsody, in which the scent of the jasmine flowers, the chestnut in the distant sky, join to convey and symbolize the passion that animate the two beings who move among them. In this sort of effect she has no predecessor in English, and no successors till Meredith.

The plot is a complicate one, since it consists of a number of parallel stories. Although the novel takes its title from one of the characters, that character cannot be said to be the sole protagonist. The novel begins with a not very flattering picture of the curates of the area, and an attack on the new machinery for the mill. It ends in the Victorian welter of marriages and reconciliations. Caroline Helstone's parents separated soon after her birth and she lives with her uncle, the Reverend Helstone, rector of Briar -field. She is in love with Robert Moore, who is of Flemish and English extraction, and whose father was distantly related to Caroline's mother. Robert's whole concern in life is the success of Hollow's –mill and he is determined to install machinery there to ensure this success. Early in the story an argument between Helstone and Moore results in Caroline being forbidden to visit Hollow's cottage, though even before this she has come to doubt Robert's love for her. Miss Shirley Keeledar, heiress, landowner in the district and landlord of the mill, arrive with her governess, Mrs. Pryor, to stay for a while at her house, Fieldhead, since she has come of age. A strong friendship springs up between the two girls. Together they witness the attempt by the workers on Hollow's mill, together they take walks, together they take part in the annual Sunday-school walk and tea-drinking. Caroline falls into a decline, and is nursed to health by Mrs. Pryor, who turns out to be her long-lost mother. Shirley is visited by her uncle, Mr. Sympton, his family and his son' tutor. Moore who wants to marry her for her fortune, Shirley at length confess to her love for the tutor, Louis Moore, brother of Robert, whom she has loved since she lived with the Sympton family as a girl . Robert Moore, shot by a leader of the workman, is nursed to health by his friends, The Yorkers, repents his general harshness, and marries Caroline.

Charlotte Bronte ends the story with the following;

*The story is told. I think I now see the judicious reader putting on his spectacles to look for the moral. It would be an insult to his sagacity to offer directions. I only say, God speed him in the quest.*

Despite the obvious irony of the above-mentioned passage- in its reference to a male reader in particular, really, there is a 'moral' in Charlotte Bronte's Shirley, especially for the woman reader. The 'moral' that comes to the fore in my reading of Shirley would seem to be the contemporary society depicted in the novel does not yet allow women to be fully liberated and the social equals of men. Shirley is corrected by her 'mirror image', and shown the proper behavioral patterns for young women in the early nineteenth century.

Through the novel, Charlotte Bronte shows how the patterns of women's lives (and those of the workers) are shaped by social attitudes and forces over which they have no control. That the woman question is one of the main themes of the novel is recognized by both readers and the critics of the time. Although a concern with the position of women in society and the kinds of lives they lead is implicit in her other novel, it is only in Shirley that it becomes a predominant theme centering on the lives of the two heroines Caroline and Shirley. On this context we can quote Bellringer:

*In Shirley, Charlotte Bronte is also concerned with the opposition between the more general behavior of both protagonists, and she links this with the contrast between the opposite traits of passionate feeling and excitement, of individual freedom and fulfillment, and those of self-transcending or self-denying duty and moral responsibility. Rather than presenting this kind of divided approach in one character, as she does in Jane Eyre, she splits the behavior into two parts, assigning that the timid and dutiful young girl to Caroline, and that of the tougher and more independent women to Shirley.[2]*

Caroline's lack of character, her long, brooding inactivity in the novel, her seriousness, are as much the result of the weariness of life without purpose of an unmarried woman as of the sorrowing and decline of the girl crossed in love. Shirley is, of course, shown to have much to occupy her, but even so, a comparison of the occupations. Shirley's pursuits are quite as trivial in some ways as those of Caroline. Fundamentally, it is Shirley's nature which enables her to find such restrictions of activity not irksome.

In the novel also, Shirley is portrayed as an intelligent woman, observes men's treatment of women and recognizes the perception that underlines it. When Robert Moore does not inform her of the attack on the mill, even though he owns it, she marks that men tell women nothing and keep them completely in the dark about subjects which involve danger. She comes to the conclusion that they perceive women to have as much capacity for thought as children, and clearly that she thinks this wrong: In any case, Charlotte Bronte offers no solution to the feminist problem in this novel. Shirley, the landowner, farmer, mill owner and heiress, abdicates wealth, position and power in favor of her husband; Caroline marries Robert Moore and the problems of unmarried life are removed from her. But a third attitude to the feminine dilemma is suggested by the young girl, Rose Yorke, in her determination to use the talents God gave her and bury them in a life of domesticity.

---

## CONCLUSION

Love, indeed, is the central theme of Charlotte Bronte's novels: for it was inevitably the main preoccupation of so passionate a temperament. Her power to describe it is of course, conditioned by the nature of her genius. She cannot dissect the workings of passion, nor can she illuminate its effect on character. What she can do is to convey its actual present throb. And this she does as it had never been done before in English fiction. Finding love and getting married seem to be two of the most important themes in Charlotte Bronte's *Shirley*. The novel is filled with unhappy marriages- marriages in which it is the woman who comes off worst- and this is closely related to the feminine theme, both involving a man's view of woman.

*Shirley* gives her opinion as to how one may judge the right mate, by observing his behavior with others, with those weaker and more helpless than himself, by observing his attitude to women. But this a minority view in face of all the opinions raised against marriage in the novel.

Set against the men are the women, seen as old maids, young girls with their sights set on marriage, housewives, either married or single. Of these, the latter are in some ways most content- Mrs. Yorke and Hortense Moore have their household duties to occupy them. Miss Mann and Miss Ainley find their satisfaction in good works of a charitable kind, but under the dominance of male direction Young girls lead idle existences hoping to marry eventually.

*Shirley* is an attempt on a woman's part to straddle the two groupings. She is a woman who, through birth and position, occupies many of the posts normally filled by men; she refers to herself as Captain Keeldar. But it is noticeable that she is a figure-head in her position as landowner. She has more authority, more intimacy with business concerns than Caroline, but at crucial moments in political events she must retain the passive role of a woman. *Shirley* is intended to have greater insight into what is going on than everyone else, but since she does not reveal her insights until a situation has been revealed to her, she is unconvincing. The attempt to portray the Charlotte- heroine in fortunate circumstances as well as the attempt to analyze the situation of the unmarried woman is unsuccessful because both, by their nature, are dogged by lack of appropriate action.

Finally, Charlotte Bronte's picture of love and marriage reveal her power. But solitary obsession, while it offers equal scope to her intensity and more to her imaginative strangeness, makes no demands on her she cannot satisfy. No power of psychological penetration or accurate observation is needed to communicate the impressions of the senses in an abnormal nervous state; while to be dreamlike and unrestrained is characteristic of such impressions.[3]

## THERAPEUTIC AND PREVENTIVE MEASURES OF DENTAL DISEASES IN CHILDREN WITH DIABETES

**F.R. Kamalova\***

\*Bukhara State Medical Institute,  
UZBEKISTAN

### ABSTRACT

*The frequency of diabetes mellitus, endocrine disorders, and thyroid disease in children in the Bukhara endocrinological clinic in the children's department in the period 2017-2019 was studied. The Healthy Tooth program was developed according to the following parameters: anamnesis of life, periodontal condition, condition of the oral mucosa, intensity of caries spread, occlusion state, oral hygiene state, and tongue condition.*

**KEYWORDS:** *Endocrine Disorders, Diabetes Mellitus, Disability, Caries, Periodontium, Occlusion, Tooth, Prevention.*

### INTRODUCTION

Prevention of dental diseases is a national task and is carried out as an integral part of a comprehensive program of improving the population. Each dentist should carry out primary prevention in the form of planned activities. Initial measures for the prevention of dental diseases are based on modern ideas about the etiology and causes of this disease.

Common methods of prevention are systemic and local use of fluorides, restriction of sugar in the diet and systematic brushing of teeth with fluoride-containing toothpastes from an early childhood.

Common diseases of the child's body as diseases of the central nervous system, diabetes mellitus and other endocrinological disorders can affect the dental tissue, disrupting the function of the salivary glands, changing the composition of body fluids. Studies of the biochemical composition and physiological characteristics of tooth enamel have shown that some of the properties go beyond the parameters characteristic of biological tissues. The tooth enamel is permeable in the centripetal direction not only for substances that are not part of the tooth, but also for some substances that are not components of saliva.

The high prevalence of childhood disability and its steady growth create great difficulties in the medical care of this contingent. The practical work of the dentist with children with disabilities is associated with the expressed difficulties of conducting medical and preventive procedures. (N.V. Shovkun, A.V. Fomina).

Today, the issue of prevention of various diseases in children with disabilities is especially relevant throughout the world.

Currently, there is practically no information in the literature about large-scale programs of dental prophylaxis for children with disabilities.

Dental morbidity of children, including persons with disabilities, remains one of the most acute and urgent problems in the CIS countries.

V.V. Korchagina, having examined children with defects of the central nervous system and musculoskeletal system, revealed a high prevalence of dental diseases: multiple malformations of the hard tissues of the teeth, various dentoalveolar anomalies, periodontal inflammation due to poor oral hygiene. The author points out the difficulties of diagnosis and treatment of dental pathology in this category of patients.

E.V. Mikhailova evaluated the organization of dental care for children with disabilities 2-18 years old. The prevalence of caries in preschool children was 87.5%, with an average intensity according to the KP-3.2 index; in school-age children 74.4%; maxillofacial anomalies in schoolchildren were diagnosed in 80.1% of cases, the prevalence of periodontal tissue diseases was 100%; with an oral hygiene index of 2.3. The quality of dental care, estimated by the index "level of dental care", was 9% for preschool children, 21% for schoolchildren, which corresponded to a poor and insufficient level of dental care.

A.K. Iordanishvili, L.N. Soldatova, evaluating the dental status of children with diabetes, evaluated somatic pathology for the state of hard tissues of teeth, periodontal and the level of individual hygiene. Children were watched for a year. It has been established that children with type I diabetes mellitus are more likely than healthy children to suffer from periodontal inflammatory pathology, and their dental caries is more intense than in children without somatic diseases.

Diabetes mellitus is one of the progressive diseases worldwide leading to a large number of complications in various systems of the body, including dentofacial. The data of the WHO expert committee indicates an increase in the number of patients with diabetes mellitus worldwide, by 5-10% annually, and in the Russian Federation over the past 5 years there has been an increase in incidence from 10.4 to 13.4 cases per 100,000 children (N.V. Belyaev, T.V. Skochilova, 2006).

Childhood diabetes is a serious problem. In this regard, this disease is among the first priority national health programs of all countries of the world. (I.I.Dedov, 2007).

Periodontal treatment in childhood is one of the most important and complex problems of dentistry. Its relevance is characterized by a high frequency of occurrence of periodontal inflammatory diseases, the occurrence of chronic infections in the body, the incomplete development of the immune system in childhood, and the difficulty in stabilizing the mental state in abdominal pain. (1).

In diabetes mellitus, changes in the oral mucosa occur. The epithelial layer becomes thinner, the size of cellular elements decreases, and elastic fibers thicken. With this disease, salivation is disturbed, the quantity and quality are reduced, which prevents the development of pathology of the mucous membrane.

**Purpose of work:** To study the features of the dental status in children with diabetes mellitus and improve the condition of periodontal tissues. Improving the effectiveness of primary prevention of major dental diseases in children with diabetes who are under clinical supervision in an endocrinological clinic in Bukhara.

**Tasks:** To determine the prevalence and intensity of dental caries, dentofacial anomalies, the prevalence of periodontal tissue diseases. To develop "Healthy Tooth" lessons for children and adolescents with varying degrees of endocrinological diseases and introduce them into the educational process.

**Materials and methods:** Clinical studies were conducted in the regional endocrinological clinic, in the children's department. Observations were conducted for children aged 6 to 18 years. In 2017, the number of general patients was 420, of which 121, disabled children received social benefits from the state.

During the observation among endocrinological diseases, the total number of children with diabetes is 350, of which 21 were newly diagnosed.

In 2018, the number of general patients was 470, of which 173 children received social benefits. Among all endocrinological diseases, diabetes mellitus-368 gives a high rate, of which 23 were first detected.

In 2019 (over 8 months), the number of patients was 296, of which 88 were children receiving social benefits.

The analysis showed that diabetes is often found among children in hospital care.

A comprehensive study of the oral cavity included the identification of complaints of patients, history taking, visual examination, an index assessment of the state of hard tissues of teeth and periodontal tissues.

In the course of the study, we developed the Healthy Tooth program, which included the following parameters:

- Anamnesis of life;
- Bleeding gums - a periodontal condition;
- The condition of the oral mucosa;
- The prevalence of caries;
- bite condition;
- The state of oral hygiene;
- State of the language.

**The number of patients under clinical supervision in the regional endocrinological clinic in the children's department**

№	Disease	Are common	Girls
1	Endocrine disorders	5029	2772
2	Thyroid disease	3000	1892
3	Diffuse goiter	2822	1764
4	Congenital hypothyroidism	14	10
5	Nodular goiter	62	47
6	Thyrotoxicosis	23	22
7	Diabetes	159	111
8	Pituitary Disease	76	28
9	Pituitary hypofunction	76	28
10	Itsenko-Cushing	1	-
11	Reproductive system	291	46
12	Turner Syndrome	11	11

**The number of patients with newly diagnosed diseases in the regional endocrinological clinic in the children's department**

Disease	2017	2018	2019 (до сентября)
Diabetes	21	23	20
Diabetes insipidus	22	18	15
Hypothyroidism	6	2	1
Diffuse goiter	4	2	3
Syndrome Shershevsky Turner	2	4	1
Nodular goiter	4	3	3
Congenital hypothyroidism	11	12	2
Hypovizar dwarfism	8	9	5
Itsenko-Cushing	1	1	1
Obesity	1	1	1

**The number of patients in the regional endocrinological clinic in the children's department for the period 2017-2019**

№	Disease	
1	Endocrine disorders	5036
2	Thyroid disease	4708
3	Endemic goiter	4703
4	Nodular goiter	4
5	Reproductive system	34
6	Cryptorchidism	25
7	Obesity	52

**Results and discussion:** Analyzing the history of the life and illness of children suffering from type I diabetes, we found that in 38% of cases they had a hereditary predisposition to this pathology, in 10% of cases it was provoked by a stressful situation, 11% of patients noted the first symptoms after transferred viral infection. 41% of the observed children and their parents did not associate the onset of the disease with any factor.

According to the parents, it was found that a change in the general condition of the initial period of the disease was noted in 89.2% of children, and only 10.8% of cases the patients did not present characteristic complaints, and the diagnosis was established by additional laboratory tests of blood serum.

88% of children were bothered by gum bleeding when brushing their teeth and eating. At the same time, these changes in periodontal tissues often appeared 1.5-2 years before diagnosis. There was gingival hyperemia, gum bleeding. When examining the appearance of the red border and lips of 57% of children, a change in the oral cavity was observed with type 1 diabetes mellitus, children did not always complain of hyposalivation. When examining the oral cavity, a decrease in the humidity of the oral mucosa was observed. According to the results of the CPU, we noted a high intensity of caries in children with this pathology.

The intensity of caries was determined using the indicator KPU + kpu according to Yu.A. Fedorov, V.V.

During the study, the condition of the tongue of patients with type I diabetes mellitus, we observed a slight pathology of the tongue - slightly overlaid, and the papilla of the tongue tended to change color and size.

We conducted a lesson "Healthy tooth" I once a week in an endocrinology clinic for children with diabetes. Under this program, we have developed the following parameters for the prevention of dental diseases:

- Oral hygiene;
- Teeth cleaning;
- Selection of brushes and pastes;
- Selection of hygiene products;
- Means for rinsing;
- Proper nutrition.

In the course of preventive measures, we closely communicated with the parents of children with diabetes, who were shown an individual approach when choosing hygiene products, the choice of brushes, pastes, therapeutic rinses and gels. Equally important is the role of good nutrition in the prevention of oral diseases. Parents were advised to visit the dentist every three months, diabetes control, compliance with simple hygiene rules, in order to avoid the occurrence of dangerous diseases of the oral cavity caused by the underlying disease of diabetes.

As a result of a serious condition with this pathology, an unsatisfactory hygienic condition of the oral cavity was observed, which prevents full-fledged individual oral hygiene. The low level of oral hygiene has contributed to the development of inflammatory diseases of periodontal tissues such as catarrhal and hypertrophic gingivitis and periodontitis.

**CONCLUSION:** It was found that diabetes in children among endocrinological diseases is more common. The study of the dental status during the examination in children with diabetes mellitus showed that carrying out preventive work with parents to increase the level of knowledge about the care of the teeth and oral cavity of their children gives a significant effect and optimal dental health outcome.

When examining children, the dentist should pay attention to the presence of changes in the oral mucosa and the red border of the lips. When informing parents about the heredity of diabetes, the dentist must collect a thorough history of the child.

Pedagogical Sciences Karakalpak State University,  
UZBEKISTAN

### ABSTRACT

*This article is devoted to the problem of studying the evolution of musical pedagogy of the Karakalpak people of the historian - theoretical aspects. The art of human development is measured in a number of periods. And the heyday of ancient civilization refers to ancient Egypt, ancient Rome, ancient China, ancient India, ancient Babylon, ancient Khorezm. Monuments, cities, temples, and material culture as a whole have been preserved from these civilizations. This civilization has a beginning and an end. But there is another civilization that has come down to our days from the depths of centuries. This is a Karakalpak narrative art. This culture of Karakalpaks was highly developed precisely in the Middle Ages, the so-called time of the existence of the Golden Horde Empire. Such outstanding storytellers among Kazakhs, Karakalpaks entered the arena of the 12-14th century. They saved SapyorZhyrau, ShalkizZhyrau, DospambetZhyrau, KaztuganZhyrau. In the narrative art of zhyrau, the main musical instrument was kobyz. The first musical instrument - kobyz, is of Turkic origin. And the first to call this instrument kobyz was the storyteller Korkytata, whose unique guttural voice, thundered throughout the entire universe, was carefully conveyed to our days by the Karakalpakzhyrau.*

**KEYWORDS:** Music, Pedagogy, Karakalpak Folk Music, History.

### INTRODUCTION

Music is a reflection of the soul of the people. It combines its history and traditions. It reflects the characteristics of the ethnos, its characteristic distinguishing features. In the musical culture of the Karakalpaks, the history of the people is most clearly reflected. All Karakalpak epics are imbued with the spirit of patriotism and pride in their country.

It should be noted that Karakalpak music is closely related to folklore. Numerous legends and folk epics were shifted to music. Karakalpak music and folklore carry features of both Turkic peoples and Iranian ones.

Among the Karakalpaks, the singers of Zhyrau and Bakhshi predominate. These are folk singers who, playing national musical instruments, perform their works in a special melodious manner. Bakhshi singers are also found among Khorezmians, which indicates the proximity of two cultures.

The throat singing of zhyrau became widespread at the end of the 18th century, when, in fact, the development of Karakalpak literature and musical art began. Such famous Karakalpak music poets Jien-zhyrau (1730-1784), Kunhodzhi (1799-1880) lived and worked during this period. They were outstanding representatives of the musical and literary art of the Karakalpaks. They told their works to the piercing trills of music, which gave the poems and epics a unique, tragic sound in their own way, since many of these poems narrated about the heavy share of Karakalpaks who were forced to leave their native lands.

The art of human development is measured in a number of periods. And the heyday of ancient civilizations refers to ancient Egypt, ancient Rome, ancient China, ancient India, ancient Babylon, ancient Khorezm. Monuments, cities, temples, and material culture as a whole have been preserved from these civilizations. This civilization has a beginning and an end. But there is another civilization that has come down to our days from the depths of centuries. This is a Karakalpak narrative art. This culture of Karakalpaks was highly developed precisely in the Middle Ages, the so-called during the existence of the Golden Horde Empire. Such outstanding storytellers among Kazakhs, Karakalpaks, Soppasly Sypyr Zhyrau, Shalkiz Zhyrau, Dospambet Zhyrau, Kaztugan Zhyrau entered the arena of the 12th and 14th centuries. In zhyrau narrative art, the main musical instrument was kobyz. The first musical instrument - kobyz, is of Turkic origin. And the first to call this instrument kobyz was the storyteller Korkytata, whose unique guttural voice, thundered throughout the entire universe, was carefully conveyed to our days by the Karakalpak zhyrau.

The time of the appearance of the kobyz, the fact that it is the most ancient musical instrument, is recognized by all. In the oldest written monument of Turkic peoples, the book "Kitabi Dedem Korkut" says that the creator and first performer on the kobyz Korkutata, taking his instrument in his hands, traveled to cities and villages, sang the thoughts and tea of ordinary people, was a seer, the most revered person. He was always among the people of the afflicted, giving them advice, singing the deeds of the batyrs, and bringing peace to the souls of people.

In the book of the XI century scientist Mahmoud Kashgari, "Devon Lugat-it Turk", kobyz is commented on as a musical instrument of Turkic tribes. Information about Kobyz and Zhyrau are found in the works of Rashid-ad-din, Lutfiy (XV century), Navoi (XV century), Khorezmiy (XV century). Kobyz is the first musical instrument invented by man; all other musical instruments appeared on its basis. The kobyz melodies symbolize the time when there were still few people on earth, when Cosmos ruled, when a person proclaimed with all his voice: "I am the master of the Universe!" This symbol was conveyed in a special hoarse, guttural voice. This voice itself is a monument, similar to the monument of ancient Rome. The words "kobyz" ("kob" - many kind words, a long-lasting event, "yz" - a melody) means the transmission through a melody of a story about amazing heroes, historical events. As the most ancient musical

instrument, kobyz influenced musical instruments of other nations. So, the storyteller of the poem “The Word about Igor's Regiment” Boyan (“bayanlaush” - storyteller) in our language also means storyteller. And the Ukrainian word “kobzar” came from the word “kobyz”. Kobyz influenced all peoples having a musical instrument like him. Almost all Turkic-speaking peoples had Kobyz and Zhyrau. Over time, other types of storytellers began to appear in the changing political eras, and other types of musical instruments began to take the place of kobyz. For example, in the 20th century among Kazakhs, zhyrshy-akyns came to the forefront, performing epics accompanied by dombra, and the kobzar remained only a fact of Ukrainian folk history. Only the Karakalpak people conveyed to our days the kobyz in that ancient form in which Korkutata made it, as well as that manner of performance.

Zhyrau among the Karakalpak people enjoys special respect and love. Talent zhyrau is regarded as a magical property, bestowing from above. It is known that in a dream all the famous zhirau were visited and blessed by a dervish sent by Allah. After that, they became true storytellers. Such information is carried out in the biographies of NurabylZhyrau, EsemuratZhyrau, KurbanbaiZhyrau, ErpolatZhyrau. As history testifies, in ancient and Middle Ages, among the Turkic-speaking peoples, the Zhyrau lived in the palaces of the Padishahs, were their confidants. They performed works that have a society - political, national significance.

Altaians, Shors, Khakasses, Dolgans, telewits, telenguts of storytellers are called “kaichi”. The word “kai” comes from the word “kyu” (“kayak”, “kai”) and means a musical instrument, and the word “kaichi” (“kyuchi”) - performers on it. Among Tatars, the storytellers were called “zhyrshy”, Bashkirs - “sesen”, Turks - “asyk”, “dastanchiasyk”, Turkmen - “bakhshi”, Uzbeks - “bakhshi”, “fats”, Yakuts - “olonkhosut”. Thus, all the Turkic-speaking peoples of the storytellers were designated by a word originating from the same root-kyu, zhyr-yr, sasen-sheshen, asyk, bakhshi, olonkho-deer, olonkhosut.

Among different peoples, storytellers played a different social role in society. Altaians, Yakuts, Shors, Dolgans, Teleuit, Telenguts, Gagauz narration was not the main profession. The Karakalpakzhyrau were professionals, they improved their art in the famous storytelling schools, were masters of their craft.

Karakalpakzhyrau performed accompanied by a kobyz heroic dastans about the exploits of the batyrs. The lyrical dastans were performed by bakhs accompanied by the dutar in a completely different manner. The art of zhirau and bakhs was done only by professionals. In the history of Karakalpak folklore, there are no facts when Zhyrau was simultaneously Bakhs or vice versa.

The study of Zhyrau's creativity is the study of amazing folk art, which has conveyed to our days through the centuries the civilization of ancient eras. The study of a living epic tradition, its styles of execution, the field of distribution has always been the focus of world folklore.

It should be noted that the epic storytellers were also agents of the politics of the kings. They were advisers to the kings, along with this, during the battles of hostilities they were ahead of the troops and inspired the soldiers with their poetic words, even led them. For example, SoppaslySypyrzhyrau was an adviser to the padishah, and Kaztuganzhyrau (XVI century) and Dospambetzhyrau (XV century) - generals. One of the European travelers to Central Asia, Marco Polo notes the public role of the narrator in the 13th century. According to him, the storyteller usually sat next to the padishah, poured him various drinks, he ate food along with the lord, was a free man in his actions. The meaning of the word “zhyrau” in some Turkic-speaking peoples is

conveyed as “bakhy, bakhshi, bakhshy”. In Karakalpaks, Bakhs is a performer of lyrical dastans accompanied by a dutar. Among Kazakhs and Kyrgyz, the word “Bakhs” is used to refer to healers, people who drive out evil spirits.

Indeed, one of the most ancient properties of bakhsa is the treatment of people with a word. V.V. Bartold notes that the word “bhisshu” in Sanskrit means a Buddhist monk, a clergyman. Among the Mongols, this word was called a doctor, surgeon, among the Kalmyks, Manchurians - high-ranking servants of religion, enumerators, among the Uighurs - also enumerators, among the Chagatai, Zolotoordynsky, Kazan, Crimean khans - secretaries of military records, among the Turkmens - ancestral elders. Therefore, “bakhsi” (“bakhshi”) is a Turkic-Mongolian word for military accountants, secretaries, courtiers and, along with this, singers, people who sing out evil spirits by song. The word “bakhshi” was used in the meaning of “narrator” among the Turkmens and Uzbeks, and “sorcerer” was used by the Kazakhs and Kyrgyz.

The origin of the word “zhyrau” has been sufficiently studied in science. Zhyrau is a performer of the epic, taking origin from the most ancient historical times. The art of storytelling was especially pronounced among the Turkic-speaking peoples.

The performing traditions of the epic narrator are fully preserved among the Altai, Yakut, Kazakh, Uzbek, Turkmen, Kyrgyz, Karakalpak, Azerbaijan, Turkish, Khakass peoples. An epic storyteller-talent who keeps in memory several epics, several thousand poetic lines and can reproduce them.

The basis of Zhirau’s life is made up of narrative schools, or the science of this art, its methodology and experience. A storytelling school is similar to a university where bachelors and masters are trained. The high intelligence of the performer largely depended on whose pupil he was.

N. Davkaraev [4], K. Aimbetov [1], T. Adambaev [2] classifies the Karakalpakzhyrau into two schools - the storytelling school of SoppaslySypyrzhyrau, or the XIV century - the period of development of storytelling art, as well as the storytelling school of Zhiyenzhyrau, or the eighteenth century is the heyday of storytelling. In the development of the narrative school of SoppaslySypyrzhyrau, Kaztuganzhyrau, Dospambetzhhyrau, Shalkiyizzhyrau played a large role. Their repertoire consisted of dastans to “Edige”, “YerShor”, “Alpamys”, “Maspatsha”, “YerSayyin”, “Sharyar”.

Thus, by the end of the 18th - beginning of the 19th centuries, due to well-known historical events, the storytellers are also divided into the “upper”, concentrated in the vicinity of Bukhara, Zarafshan, Samarkand (the storytellers Shankai, Kazakhbai, Halmurat), and the “lower” Karakalpaks — Aituar, Kabyl, Zhiyemurat, Nurabylla, Yesemurat, etc. The tales of the “upper” KarakalpaksShankai, Kazakhbai, Halmurat, Bekmurat were considered more powerful. The storytellers of the “lower” Karakalpaks often went to their colleagues to hone their performing skills. IN AND. Zhirmunsky classifies Uzbek bakhshis into the Nurata and Bulungur schools, notes FazylYuldash (1873 - 1953) and ErgashZhumanbulbul (1870 - 1938) as their largest representatives. The Karakalpakzhyrau more often came into contact with the zhyrau and bakhshi of the Bulungurschool. If in the Nurataschool more often performed romanicedastans, then in the Bulungur school - heroic dastans.

Recent studies have noted the presence among Turkic-speaking peoples. Central Asia Oguz and Kypchak storytelling schools. The Oguz storytelling school prevailed in cities with highly developed trade (Uyghur, Turkmen, Azerbaijani, Turkish, Uzbek) and the Kypchak storytelling school, or the finger (barmak) system, was among the population with a nomadic way of life, mainly livestock breeders. In the Kipchakschool, preference was given to the dostans “Alpamys”, “Koblan”, “Edige”, “YerTargyn”, and in the Oguz school, dastans “Yusuf-Agmed”, “Gorogly”, “Garip-Sanem”, “Tahir-Zuhra”, in which the Persian-Arab book tradition dominated.

From the position of a common Turkic narrative school, Karakalpak storytellers have their roots closer to Kypchak traditions. Along with this, among the Karakalpaks, book dastans built on novel plots, i.e. related to the Oguzschool.

Bukhara Regional Center for Retraining and  
Advanced Training of public Educators, UZBEKISTAN

### **ABSTRACT**

*The concept of advanced training is considered in the article, and the issue of advanced training of teachers is also considered. The essence of the modernization of the contents of the courses of advanced training and retraining of personnel in the system of higher education is disclosed. The article describes the conditions of a socially-oriented economy of modern policy and strategy of the state in the development of the national education system. As well as the compendium for the development of the higher education system is given.*

**KEYWORDS:** *Advanced Training, Teacher, Advanced Training Course, Advanced Training Of Teachers, Knowledge, Advanced Training Course For Teachers, Professional Level, Professional Skills, Pedagogical Activity, And Advanced Training Course For Educators.*

### **INTRODUCTION**

Creating an effective structure of methodological work in order to improve the quality of education. "The teacher lives as long as he studies. As soon as he stops learning, the teacher dies in him." (KD Ushinsky) The social transformations taking place in our country have created the conditions for the restructuring processes in the field of education - this is the creation of new

types of schools, the active introduction of various pedagogical innovations, copyright programs and textbooks in practice. The changing situation in the general education system forms the new educational needs of teachers. Any teacher wants to become a significant figure. A significant teacher today is both a professional and a personality. In order to become significant, today it is necessary to practically master those types of pedagogical culture for which the teacher is most often prepared only theoretically. The teacher is constantly between practice and theory, building up his experience mainly with practical skills. Any pedagogical work is a practical activity. Graduates of pedagogical universities and experienced teachers know that pedagogical culture is the totality of the teacher's skills to show examples of personal-value attitudes towards students, taught disciplines, and children's creativity. It often happens that a serious gap continues between theoretical knowledge and practical skills. Bridging this gap in modern schools can be through professional retraining, which is commonly called methodological culture. But this becomes possible only when the main reasons that gave rise to the lag of practice from theory are comprehended.

The first reason: the desire to master private methods, honing techniques for teaching certain topics, parts of the lesson, is understood as a methodological culture as a whole. This desire overshadows the need to master the pedagogical culture, where the methodological culture is only part of the pedagogical culture.

The second reason: in the absence of deep knowledge about the modern meanings of education, the information culture, which is one of the goals of the methodological association of teachers, is formed based on the priority of the amount of information about the latest technologies. With the new goals of education, it is necessary to relate to the organization of methodological work in the school.

Traditional methodological work involves increasing the professional level of a teacher by increasing the amount of knowledge about new methods, techniques, technologies and skills by copying them in their activities. It should be noted that this is how the methodological work at school was built and this state of affairs, to some extent, suited us. But, taking into account the new values of education and methodological work in general, we determined new goals, and we came to the conclusion that a new network model of the methodological service was created.

The structure of the forming model:

- Networking with educational institutions of the village on the implementation of educational projects, to address the main problems of educational institutions;
- the work of the district school of a young specialist for the entire district;
- Intra-school methodological work is implemented on the basis of several significant projects (groups formed by interests in these projects) and at the same time coordination of work as subject matter through the leaders of subject associations.

The relevance of our chosen direction of improving the methodological work of the school is explained by the fact that only educators with high professionalism can educate a person with modern thinking, able to successfully fulfill their potential in life. Moreover, the concept of "professionalism" includes not only subject, didactic, methodological, psychological and pedagogical knowledge and skills, but also the personal potential of the teacher, which includes the system of his professional values, his beliefs, and attitudes. In the course of this activity, the

teacher becomes an active subject of the improvement process. This requires an integrated approach to multifaceted methodological work.

Further training helps the teacher to get rid of outdated views, makes him more susceptible to external changes, which ultimately increases his competitiveness. Methodical work stimulates the professional development of the teacher, contributes to his self-realization, 3 solving professional and personal problems, allows you to get more satisfaction from work.

The quality of teaching is critical to the development of the entire education system. Today, a teacher is extremely in demand, whose personal and professional qualities would be at the level of complexity of the tasks facing society. Such requirements should be supported by appropriate conditions, because without high-quality training of a teacher, without his social protection, without providing him with necessary working conditions, without motivation for his success, a high quality education cannot be achieved.

Hypothesis: The network interaction model performs a number of important functions. First of all, the functions of adaptation and socialization. Participating in the work of problem groups and networks, each teacher solves the problems of professional growth, develops the style of his pedagogical thinking, such features as systematic, comprehensive, concrete, flexible, mobile. In the course of this activity, the teacher gets rid of outdated views, becomes more susceptible to external changes. Object of study: improving the methodological level of teachers.

Subject of research: The structure of the methodological service of the school, ensuring the formation of a teacher as a subject of self-improvement. Theme of methodical work: Creating an effective structure of methodological work in order to improve the quality of education.

Purpose: organization of conditions for advanced training and staffing of the pedagogical potential of the school, training of the teacher as a subject of professional activity, social life, a subject of personal self-realization, self-actualization and self-organization.

Tasks:

- Improvement of methodological work, rational use of opportunities for improving the qualifications of teaching staff in the conditions of network interaction of educational institutions of the village;
- Motivation for the success of teachers to ensure strategic influence on the results of work;
- Solving issues of material incentives for teachers who improve their qualifications, achieve high quality of students' knowledge and growth of achievements, both of their own and those of schoolchildren, assessing the capabilities of the team;
- Improvement of certification measures as a means of improving the qualifications of teachers and managers;
- The development of innovative behavior of teachers and their new pedagogical thinking;
- Development and improvement of the research and methodological culture of teachers;
- modeling of professional activities of teachers on the basis of psychological and pedagogical diagnostics, development of timely corrective measures based on the results of activities, analysis of the causes of deviations;

- improving the control system, creating flexible mechanisms for managing the results of teachers' activities;
- Creation of monitoring and diagnostic programs in educational institutions aimed at an objective assessment of the work of teachers;
- Social protection of teachers and resource support for their professional activities;
- raising the status of teachers and the prestige of the teaching profession

Theoretical significance: This model of the school's MS is more flexible and adapted for solving non-standard tasks and working in unstable conditions.

Practical relevance: The proposed methodological service model will work effectively and efficiently both within the community with the teaching staff of 25 people, and with other educational institutions of the village.

Possible difficulties in the implementation of the structure:

1. in the internal structure: fuzzy leadership and distribution of functions by project teams and coordinators of subject associations. Lack of motivation for teachers to innovate
2. In the external structure: the lack of motivation of teachers to participate in activities unfamiliar to them (conservatism, aging staff). Unity coordination

The main directions of modernization of the methodological service of the school:

The first area: Formation of the mechanisms of personal self-development of teachers, such as pedagogical knowledge, communication, adaptation, activity, relaxation, reflection, etc. This work is aimed at the formation of the main components of the formation of an individual style of pedagogical activity: cognitive, motivational, reflective and operational. The performance is captured through the teacher's personal creative plan.

The second direction Improving the pedagogical culture of teachers is seen as ensuring the formation of reference levels for the development of pedagogical culture, as the integration of pedagogical experience, the implementation of all types of teaching activities in all aspects of education: training, education and development. In this regard, we determine the main groups of skills relevant for this professional activity: subject skills, gnostic skills, design skills, adaptive skills, organizational skills, communication skills, motivational skills, control and analytical skills.

Third direction: Information and analytical. Improving the professional qualities of teachers should be based on information obtained as a result of methodological monitoring. Practiced methods such as research, questionnaires, testing, interviews, observation and analysis of the practical activities of teachers and its results. As a result, a number of problems are identified that are brought up for discussion by the methodological council, and taking into account the recommendations received, workshops, courses, seminars, round tables and other methodological events are planned. Based on the diagnostics, an individual educational route for the teacher is formed, which will serve as the basis for taking advanced training courses and working out "falling" topics. One of the main components of this direction is the formation of an information and methodological bank, designed to provide a holistic vision of the activities of teachers engaged in practical activities, effective systems and 6 technologies for training and

education. Using the questionnaire, diagnostic maps of work experience are compiled, i.e. addresses of pedagogical experience in any direction are determined.

Widespread should be the growth map of pedagogical excellence and the sheet of pedagogical career. It is also necessary to introduce a map of the effectiveness of the teacher in terms of health-saving technologies. This will make it possible to determine the effectiveness of pedagogical technologies, and identify the experience of the best work.

Monitoring studies allow us to create a model for the formation of key competencies.

The fourth direction. Targeted methodological support of educational programs through the creation of a network of methodological services, ensuring the continuous development of professional culture, cooperation with other organizations.

The fifth direction. Activities to refine the "open" model of the methodological service of the school. Effective social positioning of the school in a wider and generally significant context of the development of the educational system of the village. A very effective step on this path is the creation of various forms of partnership: practical seminars, pedagogical councils, scientific and practical conferences, a school for a young specialist, network problem groups. Combining the efforts of other educational institutions that have joined the project will allow lobbying of the interests of education in the village successfully. When the zone of influence of the school on the continuing education system expands, then the effect of a qualitative shift in public opinion occurs: as a result, the "shares" of education in the village increase

"Presentation of success" - presentation of achievements to society, the public, parents, round tables, the website of the educational institution, etc. The content of work in this direction will include the publication of newsletters, prospectuses, informing the work of an educational institution through the media. The users of this information will be not only teachers and school leaders, but also students and their parents. This work will continue with informational and methodological assistance to the innovative development of the educational process of schools at the modernization stage, by presenting a package of effective teaching technologies and

Expected results:

- advanced training and capacity building in the school;
- a positive change in the quality indicators of the work of teachers and the activities of the school as a whole;
- consolidation and successful activity of young teachers;
- creating conditions for changing the status of a teacher, transferring him from the position of a "lessor" to the position of a teacher-methodologist, teacher-researcher and experimenter.

### ABSTRACT

*In gestalt psychology (M. Wertheimer, KDunker, K. Levin and others), the main ability for creativity is considered intuition, which along with holistic perception is the basis of creative thinking. In psychology in recent decades, the psycho physiological direction has become dominant in the study of the problem of abilities. Accordingly, researchers working in line with this approach have obtained the most significant results concerning, first of all, the connection between the basic properties of the nervous system (inclinations) and the general mental abilities of a person. In interpreting the totality of phases, the main difficulties were usually associated with unconscious work. Some researchers attributed the work of the subconscious to the number of "world riddles", others gave it fantastic or mythological nuances, while others removed this problem altogether, rejecting the general existence of the fact of unconscious work. One of the many secrets in this process is why other individuals who are in a similar stimulus environment (and in many cases deprivation) fail to gain recognition of their creative talent. Plato suggested that creativity could be the work of much more irresistible forces than the forces of the environment.*

## INTRODUCTION

Attempts to explain the mystery of human creativity have been made since ancient times. Plato and Aristotle (4th century BC) explained creativity as a gift from the gods. For centuries, this explanatory principle has remained the only one applied to creativity.

The natural inclinations of creative abilities are inherent in every person. But in order to reveal them and fully develop them, certain objective and subjective conditions are needed: early and skillful training, creative climate, strong-willed personality traits (perseverance, hard work, courage, etc.). [1]

One of the first researchers of creativity F. Galton claimed the predominant role of heredity and racial factors in the possibility of creative manifestations of people.

In further studies, creativity was developed from the standpoint of various psychological theories. So, for example, representatives of psychoanalysis (Z. Freud, E. Fromm, C.G. Jung, etc.) creatively associated manifestations with children's experiences of complexes, with sublimation of mental energy into creativity (Z. Freud), overcoming the deficiency complex ("inferiority") (A. Adler), by the action of the archetypes of the collective unconscious. [2]

In gestalt psychology (M. Wertheimer, KDunker, K. Levin and others), the main ability for creativity is considered intuition, which along with holistic perception is the basis of creative thinking. Gestalt psychology has a tradition of studying creativity as productive thinking, the process of solving problem problems (O. Zelts). Studies in the field of thinking (V. Keller, O. Dunker) made a significant contribution to the development of the psychology of creativity and were developed in heuristics (B. M. Velichkovsky, A. Newel, V. N. Pushkin, G. Simon, etc.) and the algorithmic approach (L.N. Landa).

The range of creative tasks is unusually wide in complexity - from solving a puzzle to a scientific discovery, but there is only one. When solving these creative tasks, new ways are found, inevitably something new is created, i.e. an act of creativity occurs. It is here that special qualities and creative abilities are required.

Vigilance in search of problems. The ability to see that which does not fit into the framework of what has been learned before is more than just observation. This freshness of view, a person sees with the help of the brain.

The ability to curtail mental operations (replacing several concepts with one, to use more capacious informational relations of symbols).

The economical symbolic designation of concepts and the relations between them is the most important condition for productive thinking. (Luke A.N., 1979).

The ability to apply the skill acquired in solving one problem to the solution of another, i.e. the ability to separate a specific "grain" of a problem from a non-specific one, which can be transferred to other areas (development of generalizing strategies).

Widely distributed attention increases the chances of solving a problem. By analogy with lateral vision, the English doctor E. De Bono called lateral thinking the ability to see the path to a solution using "extraneous" information. "To create, you need to think about" (E. Bono).

Readiness of memory. Memory includes the ability to remember, recognize, reproduce immediately or with a delay. When a person solves a problem, he can only rely on the information that he currently perceives and which he will be able to extract from memory.

The ability to perceive reality as a whole without crushing it (as opposed to perception by small independent portions). This ability was pointed out by I.P. Pavlov, identifying two main types of higher cortical activity - artistic and mental [3].

Flexibility of thinking, i.e. the ability to quickly and easily switch from one class of phenomena to another, distant in content. We can say that flexibility is a well-developed skill of transference, transposition. The absence of such a position is called inertia, rigidity, and even stuck or stagnant thinking, in fact, functional fixation [4].

Courage in creativity is the ability to make decisions in a situation of uncertainty, not to be afraid of their own conclusions and bring them to the end, risking personal success and their own reputation [5].

The ability to "grip" and "anti-grip." The ability to combine newly perceived information with what was previously known, to include it, and existing knowledge systems, to group data in one way or another in the process of perception is a condition and prerequisite for the ability to generate ideas [6].

Originality and ease of generating ideas. A thought or idea is not just an associative combination of two or more concepts. The combination of concepts should be substantively justified, reflect the objective relationship of the phenomena behind these concepts [7].

Another criterion is the breadth of the idea, embracing a large number of diverse facts. The most fruitful ideas include (predict) new, not yet discovered phenomena [8].

Fantasy - the ability to create something new, unusual is laid in childhood through the development of higher mental functions: thinking and imagination or fantasy.

Imagination is an inherent only to man possibility of creating new images (representations) by processing previous experience. There are three types of imagination: 1) logical - derives the future from the present with the help of logical transformations; 2) critical - looking for what is in the surrounding world that is imperfect and needs to be changed; 3) creative - gives rise to fundamentally new ideas, ideas that do not have prototypes in the real world, although based on elements of real reality [9].

Fluency. Creative thinking is mobile: it is not difficult for him to move from one aspect of the problem to another, not limited to one single point of view. Fluency of thought is determined by the number of ideas that arise per unit of time.

The ability to refine parts, to painful, painstaking fine-tuning, to improve the original plan. In a first approximation, three main lines of research on creativity can be distinguished. Firstly, creativity is studied from the perspective of ability, giftedness, talent, including specifically cognitive, intellectual processes, such as intelligence, divergent thinking, creating new things, solving problems - all these approaches in this context can be combined into one group, although Of course, they can be considered much more differentiated (Epiphany, 2002).

Secondly, creativity is considered as a characteristic of a personality, the question of a creative personality is raised.

In modern psychology of creativity, two main directions are traced: analytical and synthetic. The first continuation and development of the study of areas of knowledge that explored one of the aspects of creativity. The second is a synthetic approach to the study of creativity.

Almost all psychology textbooks included the definition of abilities given by B.M. Teplov and later almost completely accepted by N.S. Leutes. They define abilities as individual personality traits that are a condition for the successful implementation of one or more types of activity [10].

B.M. Teplov paid special attention to the inclusion of three mandatory attributes of abilities: by abilities are meant individual psychological characteristics that distinguish one person from another; abilities are not called any individual characteristics in general, but only those that are relevant to the success of any activity or many activities; the concept of “ability” does not boil down to the knowledge, skills, or abilities that a person has already developed.

And B.M. Teplov defended two more positions: “only anatomical and physiological features can be innate, i.e. the makings that underlie the development of abilities, the abilities themselves are always the result of development”, abilities are “created” in the activity. “This is not the point,” he writes, “that abilities are manifested in activity, but that they are created in this activity” [11].

In psychology in recent decades, the psycho physiological direction has become dominant in the study of the problem of abilities. Accordingly, researchers working in line with this approach have obtained the most significant results concerning, first of all, the connection between the basic properties of the nervous system (inclinations) and the general mental abilities of a person. Abilities are not given to a person from birth in a finished form. They are not innate human properties, are not inherited. Of great importance are the features of the structure of the brain. These features influence the development of other inclinations and further on the development of abilities for any type of activity, in the inclinations it is necessary to discern the psycho physiological properties, and especially those that appear in a person at the very beginning of mastering any activity. A particularly important role is played by the speed of formation and stability of conditioned reflexes, the speed of the formation process, and the stability of the inhibition reaction.

There are several ways to study this process. You should start with the main path, with the main methodological approach. This, of course, includes the application of a systematic approach, which is universal and is at the center of modern research in all areas of science. A systematic approach opens up the possibility of reconstructing a holistic picture of the processes of creativity, their research in a certain hierarchy of levels.

The first level is the study of the process of creating a single work from a point of view that reveals the purposefulness of the process to “focus”, to a specific goal, to resolve a problem situation, which is the basis of creative design.

The next level is the study of the process of creating works by this author in their unity. This opens up the opportunity to judge the nature of the creative process of a particular artist as a whole.

A higher level (in terms of systemic methodology) of the level of this hierarchy is a comparative analysis of the creative processes of various artists according to certain criteria, i.e. analysis of the typology of the creative process, for these processes, with all their individualization, can have

common features. The problem of the typology of creative processes is relatively new and very promising for the psychology of creativity.

Creativity processes are studied in dynamics, starting from the first phase (the emergence of objective and subjective impulses, the emergence of ideas and images and their crystallization) to the intermediate and final phases.

The core of creativity, the peak of the creative act is “insight”, in other words, insight. This is when a new idea penetrates into consciousness, is generated (generated). It can be scientific, philosophical, technical or artistic. But this often leads to a long way of preliminary work, a lot of work, during which the prerequisites for the birth of a new one are created.

Returning to the stages of the creative process, one should give due attention to one of the researchers of creativity Wallace (Wallas, 1926), because many years ago he described four successive stages of the creative process: 1) Preparation: Formulation of the problem and initial attempts to solve it. 2) Incubation: Distraction from the task and switching to another subject. 3) Enlightenment. Intuitive insight. 4) Verification: Testing and / or implementation of the solution.

The central specific moment was considered to be insight - an intuitive grasp of the desired result. Briefly about each of the stages.

1. Preparation. The preparatory period can last either a month or six months, more than a year. It all depends on how close the research area is, identifying possible solutions to the problem, with what intensity the search for the desired solution is manifested, identifying the optimal way to achieve the intended result. In other words, the preparatory phase can last from zero to infinity. A common theme in the biographies of many famous people is that even in early childhood they developed ideas, acquired knowledge and tried to develop their thoughts in a specific direction. Under the influence of such early ideas, the most distant fate of a creative person is often formed. One of the many secrets in this process is why other individuals who are in a similar stimulus environment (and in many cases deprivation) fail to gain recognition of their creative talent. Plato suggested that creativity could be the work of much more irresistible forces than the forces of the environment. Maybe it would be worth paying attention to the genetic basis of creativity [13].

2. Incubation. This is one of the mysterious periods of the creative process. The leading question has been and remains why it turns out that a creative breakthrough often follows a period during which the ground for solving the problem may remain completely unprepared? That is, looking, looking, it seems that you are approaching the cherished decision and it turns out that something is missing, some kind of dominant.

Perhaps this can be explained most simply, this explanation is that a significant part of our lives we relax, travel, walk in any free time, play sports, visit museums or just watch what is happening around. And this is all instead of stubbornly reflecting on any problem requiring a creative solution. So creative acts often follow periods of sleep or idleness, most likely simply because these periods take a lot of time.

There are many examples of enlightenment in the history of creative breakthroughs. The discovery of the structure of the DNA molecule, the discovery of the benzene ring, the invention of the telephone, the completion of the symphony, the plot for a painting or graphic canvas - all

these are examples of how, at the moment of enlightenment, a creative solution to the old annoying task comes to mind.

Enlightenment is a moment that either comes or does not. At the sensory level, enlightenment is characterized as a moment of maximum arousal. But after the joyful excitement that sometimes accompanies a discerning discovery, it is time to test a new idea.

4. Verification. Verification can be characterized as the process of cleaning the resulting creative product when it is checked for its degree of completeness. After a long and thorough study of the solution, which is a creative discovery, it turns out to be an individual product of intelligence, which is very valuable. This stage can be quite short, as in the case of rechecking calculations or a test run of a new design; however, in some cases, verifying an idea may require a lifetime of research, testing, and cross-checking.

In the above stages of the creative process are reflected in the scientific works of Ya.A. Ponomareva. He considered stages as phases: conscious work - preparation; unconscious work - maturation; the transition of the unconscious into consciousness - inspiration; conscious work - the development of an idea, its finalization and verification.

In interpreting the totality of phases, the main difficulties were usually associated with unconscious work. Some researchers attributed the work of the subconscious to the number of "world riddles", others gave it fantastic or mythological nuances, while others removed this problem altogether, rejecting the general existence of the fact of unconscious work.

The basis for the allocation of phases by Ya.A. Ponomarev was based on: 1) the fact of the transition from consciously organized, logically substantiated searches to an intuitive solution, the method of which is not initially understood, and the content seems in no way related to the content of previous searches; 2) the subsequent evolution of the intuitively found solution into a logically complete one. [11]

From the foregoing, it becomes apparent that the characteristics of the creative process are one of the forms for describing the dialectic of development. The solution of creative tasks is always carried out through the struggle of opposites, acting in the form of a dialectical relationship of the structural levels of the organization of the decision system. The solution to these problems, the future of our education.

## PROBLEMS OF TEACHING MATHEMATICS IN PRIMARY SCHOOL AND SOME WAYS TO SOLVE THEM

**Ruziyeva Zulaykho Samadovna\***

\*Lecturer,

Department of the Preschool and Primary Education,  
Bukhara State University, Bukhara city,  
The Republic of UZBEKISTAN

### ABSTRACT

*This material addresses some of the problems of teaching mathematics and how to solve them. Mathematics as an educational subject contains the necessary prerequisites for the development of cognitive abilities of students, it forms and corrects such forms of thinking as synthesis, comparison, analysis, develops the ability to generalize to concretization, creates conditions for the correction of memory, attention and other mental functions. Recently, the use of modeling methods has been increasingly seen. Teaching mathematics in secondary schools, including in the elementary grades, contributes to the formation of personality traits such as accuracy, punctuality, perseverance and strong will. Although mathematics is an exact science, nevertheless, teachers can experiment, apply, various manuals, music, movement, all that can show children all the beauty and power, as well as the importance of this discipline in everyday life.*

**KEYWORDS:** *Primary Classes, Mathematics, Teacher, Students, Method, Method, Psychology, Tasks, Education.*

### INTRODUCTION

Mathematics is one of the most significant disciplines, which can be very necessary in the life of every person. It is impossible to do without mathematics in principle, given the time in which we all live. Mathematics as an educational subject contains the necessary prerequisites for the development of cognitive abilities of students, it forms and corrects such forms of thinking as synthesis, comparison, analysis, develops the ability to generalize to concretization, creates conditions for the correction of memory, attention and other mental functions.

In this process, the development of children's speech is observed, it is enriched with special mathematical terms and expressions. When explaining the solution of a particular problem, the student acquires the skills of rational explanation of his actions, to do it accurately and concisely, without adding extra words or expressions.

The math classes in elementary grades are dramatically different from those in the older grades. A mathematics teacher in primary school should, like other teachers at this stage, possess the skills of a psychologist and educator in addition to his main responsibilities. Because training in this period involves not only the presentation of knowledge in various academic disciplines, but also its upbringing in psychological and personal terms.

Like other subjects, mathematics involves mastering the following knowledge and skills:

- a) Gives the concept of a natural number, zero, a natural series of numbers, their properties, the concept of ordinary decimal fractions;
- b) Forms in students' minds clear ideas about the basic quantities (length of a segment, cost, mass of objects, area of various geometric shapes, capacity and volume of bodies, time), measurement units, various quantities and their ratios;
- c) gives the concept of a metric system of measures, measures of time;
- d) The ability to carry out four basic arithmetic operations (addition, subtraction, multiplication and division) with multi-valued numbers and fractions;
- e) Develops in students the ability to solve simple and compound tasks.

To achieve the above goals in mathematics, various methods are used that are aimed at the most complete transfer of educational material to students.

The teaching methodology is a way of joint activity of a teacher and students, with the help of which a teacher transfers knowledge and skills by a teacher to a student. Such methods have many varieties.

The teacher chooses which one is appropriate to apply at this particular stage of training. Some of them are creative, others are called traditional. If new teaching methods have not yet been mastered by many teachers, traditional methods have long been used in the classroom and managed to show their effectiveness. More often in other primary classes, when explaining materials in various academic disciplines, including mathematics, the storytelling method is used; it is referred to as the method of exposing knowledge in mathematics. Along with him use the method of conversation.

During the conversation, the teacher sets the students tasks in which the latter will have to use existing knowledge. The methodology of teaching mathematics is closely connected with other sciences, primarily with pedagogy, developmental psychology, ethics, the native language and literature.

Recently, the use of modeling methods has been increasingly seen. Teaching mathematics in secondary schools, including in the elementary grades, contributes to the formation of personality traits such as accuracy, punctuality, perseverance and strong will. Also, mathematics can help with educational purposes. This subject teaches students rational thinking. If the lessons of the native language and literature help to reveal the creative abilities of the child, give him a

field for improvisation, mathematics teaches you to firmly assess a particular situation, draw the right conclusions and make the most correct decision in this situation.

Mathematics forms in students such forms of thinking as a comparison analysis, and the ability to generalize conclusions. Also, solving a mathematical problem, the student gets the opportunity to strengthen correct memory, sharpen skills of concentration, develop observation. In the elementary grades of secondary school, children very often perceive mathematics as a boring and monotonous subject, perceiving classes in this discipline as the most monotonous.

The guilty in this state of affairs can be called the teachers themselves, who for the most part do not seek to bring something new to the lesson process, they are not interested in how interesting their teaching abilities students consider.

It is important to remember that a teacher, whose teaching methods are considered interesting for students to perceive, is winning among them. Unquestioned authority and, as a result, at the lessons of such a teacher, they are engaged more diligently trying to get his praise. It is easier for such a teacher to convey to the students the training material provided for this particular lesson. Why do some teachers manage to gain confidence in children, while others, with all his undoubted pedagogical knowledge, fail? Because, as noted above, they must first be psychologists, which implies the ability to find an approach to each child.

It is very easy to work with children who have the ability to mathematics — they grasp the teacher's explanation on the fly, easily perform mathematical operations and solve problems of different difficulty levels. But, as a rule, there are few such children in primary school.

In the course of research, it was found that a child who had difficulties with addition and subtraction in preschool age also has them in primary school, which certainly prevents him from learning mathematical material. Since math problems become more complex over time, the problems of these children are exacerbated. It is all the more important that the teacher can figure out the number of such children in this particular class and build a lesson plan based on this detail. Primary school teachers solve this problem in different ways. Some practice dividing children into groups depending on their level of knowledge and ability to math.

In such cases, stronger or slightly weaker groups are formed. The teacher gives these groups tasks based on their abilities - a strong group solves more complex problems; a weak one is not so difficult.

The teacher gradually complicates the tasks of the lagging group, step by step bringing these students closer to the level of children from a strong group. It should be noted that this method has several advantages, but it is also not without drawbacks. It can be considered its advantage that children in lagging groups have the opportunity to catch up with their classmates from a strong group, to strengthen their skills in solving problems to eliminate their shortcomings. But you need to consider that this method can lead to the stratification of students, their separation into leaders and outsiders. Since children in the elementary grades are still not very confident in themselves and in their abilities, such a separation can hurt his pride, and especially for impressionable children, they can even hurt the psyche.

Therefore, the teacher who decided to use this method should be as attentive to the psychological climate of the class as possible, not to allow the arrogant attitude of students from a strong group towards children from the group weaker.

Another way of teaching mathematics is also known - for the lesson, a teacher transfers a strong student in mathematics to a weak student, giving them one task for two. In such cases, small teams are created from the students, which for two carry out a common task. This way of learning to teach children to work in a team, a lagging child, who is often timid in relations with a teacher, next to his peer feels more relaxed and can see how problems are solved by a living example, a classmate can use his language to uncover the essence of the problem of a given task and explain the ways to solve it.

But this method gives the result only if friendship is established between two such students. Otherwise, such work can turn into torture for both sides and can cause nothing but mutual irritation. And this again means that the teacher must be a subtle psychologist and an expert on children's characters.

Because in such teams there is always a leader and a follower. If a leading student learns well-guided, he can improve his problem-solving skills; he will really learn how to solve arithmetic examples. But if the leader in terms of character is stronger, but learns worse, this method will not do anything good since he will dominate the couple and all the work will be done for him by a strong student, but a weak character student.

In such cases, the lagging student will not learn anything, all his activities in the team will only lead to the writing off of the tasks solved by the other student.

As you can see, the teaching of mathematics can be carried out using various methods and methods in order to use the time allotted to the lesson in the most rational way, in terms of conveying educational material to the students' consciousness. Although mathematics is an exact science, nevertheless, teachers can experiment, apply, various manuals, music, movement, all that can show children all the beauty and power, as well as the importance of this discipline in everyday life.

**“CLINICAL-RESEARCH BASED AND MORPHOLOGICAL EVIDENCE OF FEATURES OF THE COURSE AND TREATMENT EFFECTIVENESS OF PERIODONTAL TISSUES AND ORAL MUCOSA IN ANIMALS UNDER THE IMPACT OF SODIUM HYPOCHLORITE”**

**F.I. Ibrahimova\***

\*Bukhara State Medical Institute  
UZBEKISTAN

**ABSTRACT**

*The aim is to substantiate the clinical course and pathogenesis of lesions of periodontal tissues, oral mucosa and liver in animals with sodium hypochlorite in experimental conditions and to evaluate the effectiveness of our developed methods of treatment. **Material and methods.** The study was performed on 60 white male mongrel rats weighing from 120 to 170 g. The animals were repeatedly exposed to sodium hypochlorite (SHC) at a dose of 1/20 LD50 (225 mg/kg intragastric), approximating the actual intake of this drug in real conditions. **Results.** Experimental studies indicate that during the 90-day priming in the blood of animals, in the studied tissues increases the amount of lactic, pyruvic acids, glucose (in the blood), there is a decrease in glycogen levels and reduced activity of enzymes dehydrogenase (GDH, SDH, MDH), which confirms the activation of glycolysis and inhibition of the potential of redox processes in the tissues of the body of animals. **Summary.** It was found that after the toxic effects of SHC on the general body and organs of animals PR is significantly reduced if in the conditions of priming animals specified harmful substance simultaneously carried out a set of recommended therapeutic and preventive measures.*

**INTRODUCTION**

It is reported that the most prevalent part of the household items made of surfactants is obtained by modern synthetic detergents (MSD) and synthetic cleansing agents (SCA) which have been displacing the non-synthetic cleansing agents. According to the specialists, further growth of the production of household chemicals is expected which requires reliable criteria of usage safety to

be developed for humanity and environment. The MSD and SCA are manufactured in the form of powder, pills, liquids, paste, gel, aerosol or sprays (Potemkina O.L., 2005).

The recent data shows that the poisoning caused by the household chemical agents including MSD and SCA makes up nearly 14% and tends to grow further, especially among children (Liushina A.B and co-authors, 2008).

High chemical input in the environment resulted in the emergence of new hazardous factor in houses: objects of household chemical agents affecting organisms with the compound and complex effect. After dishes have been cleansed with use of the MSD and SCA, on their surface remnants of the detergents can be detected (0,03-0,06 ml/l) as a result of flushing film formation.

Per oral intake of MSD and SCA in human organism is possible with water or food in the form of remnants left after cleansing, as well as incorrect storage and spontaneous intake occurs. The origins of contamination of drinking water are typically its insufficient refinement of washing and cleansing agents. With food MSD and SCA enters as a result of their accumulation in the outer layer of soil and migration into the green mass and fruits of plants. Each path is considered to be the main route of input into organism for MAS and SCA in life. Apart from the direct contact of MSD and SCA with the skin, one of the causes of skin irritation in people is the prolonged contact with the texture processed with the washing agents. Based on the research, safe levels of percutaneous pressure to an organism for anion-active PAV-0,55 mg/kg, for non-ionogen PAV-0,01 mg/kg are recommended. The marginal level of PAV remnant substances in texture equals to 5,0 mkg/sm<sup>2</sup> [1,3,4].

Research of atmosphere in the territory of "Organika" factory, where numerous types of MSD and SCA are manufactured, has detected the presence of substances like NO<sub>2</sub>, NO<sub>3</sub>, HCN, Ce<sub>2</sub>, CH<sub>3</sub>OH, CO, CH<sub>2</sub>COO, acetone, ammonium and the concentration of the latter with the sodium hypochlorite and CO exceeded PDK 1.5-2 times. The atmosphere in the different areas of the factory where workers are present most of the time is exceeded PDK NO<sub>2</sub>, NH<sub>3</sub>, CO – in some instances 1.2-1.3 times more [5].

While the research was carried out, the study of effects of MSD and SCA on periodontal tissues and oral mucosa of the workers in the republic had not been conducted, which in turn has defined the importance and relevance of the given problem.

**Objective.** In experimental conditions to explain the clinical features and pathogenesis of lesions of periodontal tissue, oral mucosa and liver in animals SHC and to evaluate the effectiveness of the treatment methods we developed.

### Tools and methods

With the aim of proving toxic effects of SHC on an organism kept in laboratory (white rats) experimental studies has been carried out (In the laboratory Sanitation, Hygiene and Occupational Diseases Research Institute under supervision DSc Askarov A.U.). The latter has undergone numerous impacts of sodium hypochlorite (SHC) with the dose 1/20 ЛД (225 mg/kg into stomach). Each group of animals were worked out in accordance the goal and preset aims of study. The first group of animals received SHC, the second – SHC and concurrently treatment was carried out, and the third group was for monitoring and received an ordinary water into stomach.

As treatment and preventive care agents, we used potions made of regional plants-rosehip fruits, licorice root, mint leaves, strawflower and daisy flowers.

During the experiment process the examination of oral mucosa of animals, observation of animal behavior and their weight, the biochemical analysis of blood serum, liver and oral mucosa was carried out. Meanwhile the generic protein, carbamide, cholesterol, glucose, ALT, AST, amylase and alkaline phosphatase were defined since these indicators are very sensitive to hazardous effects of industrial factors on an organism.

The study was carried out in 15<sup>th</sup>, 30<sup>th</sup>, 45<sup>th</sup>, 60<sup>th</sup> and 90<sup>th</sup> days of the experiment and after the experiment was finished with the duration of 90 days, the rats were decapitated. For morphological studies samples of gingiva, buccal mucosa and liver which had been submerged into the 12% solution of neutral formaldehyde. After the proper wiring and pouring, the slices with the thickness of 4-5 mk were stained with hematoxylin and eosin by Van-Hizon and were examined and photographed under MBI-15 microscope.

Statistical results of the experimental studies were carried out by the traditional methods with the implementation of application programs, by means of Microsoft Excel 2007.

## RESULTS AND DISCUSSION

The animals have undergone chronical poisoning with SHC with the dosage LD50 1/20 225mg/kg (1<sup>st</sup> group). 30 rats into stomach of which an ordinary water was inserted, were used for monitoring. (2<sup>nd</sup> group).

In the process of study, with the exception of the oral mucosa examination, the behavior and the body weight were observed. Alterations in the behavior of the poisoned animals (1<sup>st</sup> group) has not been detected. Visually they differed with hyper-saliva secretion from the monitoring group. In many animals, fungal lesions were detected. The 1<sup>st</sup> group of animals fell behind in body weight compared to that of the monitoring group (table 1.1).

**TABLE 1.1. COMPARATIVE DATA OF THE DYNAMICS OF THE MASS OF THE ANIMALS UNDER THE IMPACT OF SODIUM HYPOCHLORITE (SHC)**

Group of animals	Substance	Prior to poisoning	Days				
			15	30	45	60	90
1	SHC	121±3,5	124± 4,6	129± 5,7	134± 5,3	139± 5,4	140± 6,7
2	Monitoring	120±3,7	127± 3,7	138± 3,8	146± 3,4	158± 3,5	170± 4,3

Examination of oral cavity of the poisoned rats has shown that from 15-30<sup>th</sup> days of study, the oral mucosa alterations with the prevalence of inflammation progressed. So, in many rats (23 from 30) hyperemia and edema of oral mucosa have been observed.

In some animals, gingival papilla hypertrophy and its bleeding have been detected. Others had lingual desquamation in some spots.

When poisoning animals with SHC were kept on, starting from 70-80<sup>th</sup> days of study, dystrophic, atrophic and sclerotic changes of oral mucosa occurred. So, on day 90 of the experiment the animals had cyanotic oral mucous membrane, thinning, pathological periodontal pockets,

containing food debris and purulent exudate, formed. Gingival papillae are flattened and atrophied in places. On the tongue, cheeks and palate, bright red hyperemia, dotted white rashes, raids resembling curd masses, or whitish-gray films are found. They were removed with difficulty, and after removal formed an erosive bleeding surface. In some animals there was exposure of the neck of the teeth. In some cases, there were zones of bifurcation of the roots of the teeth and an increase in the mobility of the teeth. In some animals, by the 90th day of the experiment, changes in the hard tissues of the teeth were detected in the form of dullness of the enamel, its yellow pigmentation, abrasion of the cutting edges of the teeth and their carious lesion. As a result of exposure to the body of rats, diseases of the oral cavity such as gingivitis, periodontitis and stomatitis developed. In this regard, the study of the protective effect of herbal infusions was carried out under experimental conditions.

The analysis of the experimental data showed that during the whole experiment the death of animals and visible changes in the overall state of 2 groups of animals were not observed. There is a significant increase in the body weight of animals, resulting in both SHC and complexes of therapeutic and preventive measures in comparison with untreated animals (table 1.2).

**TABLE 1.2. THE DYNAMICS OF THE BODY MASS CHANGES UNDER THE INFLUENCE OF SODIUM HYPOCHLORITE AND AMID THE COMPLEX OF THERAPEUTIC AND PREVENTIVE MEASURES (M<sub>±</sub>M, GR)**

Groups	Type of study	Prior to poisoning	Days of study		
			30	60	90
1	SHC (without treatment)	129 $\pm$ 5,7	134 $\pm$ 5,3	139 $\pm$ 5,2	139 $\pm$ 5,4
2	SHC (with treatment)	133 $\pm$ 3,6	149 $\pm$ 3,7	146 $\pm$ 3,6	166 $\pm$ 3,9

Examination of the oral cavity of group 2 animals on day 90 of the experiment revealed some changes in oral mucosa in the form of redness and swelling with a cyanotic tinge. These changes were less pronounced and manifested later than in a similar group of animals, but without treatment (group 1). Next, we studied the effect of SHC on some functionally active groups (protein, cholesterol, urea, ALT, AST, alkaline phosphatase, amylase and others) of blood, liver and gums of experimental animals (table 1.3).

**Influence of sodium hypochlorite on the content of biochemical parameters in the biological environment of white rats and treatment with plant preparations**

Our studies have shown that in chronic poisoning with SHC on 15, 30, 45, 60 and 90 days of the experiment, an increase in the content of blood urea was noted and, respectively, amounted to 5.50+ and 5.7+; 5.69+ and 5.95+ mmol / l. In control was 5.02 mmol/l. With the introduction of medicinal plants, the amount of urea in the blood of the experimental animals decreased by 0.2 mmol/l compared to rats that did not receive treatment.

With repeated administration of the chemical for 90 days at a dose of 225 mg/kg, an increase in the concentration of cholesterol to 108.6-11.0% was noted. The treatment with plants for 30 days, on the 15th day of the experience revealed no therapeutic effect and the amount of cholesterol remained unchanged. On the 30th day of the experiment, the cholesterol level decreased by 105.5%. Consequently, in chronic poisoning of animals with SHC, a slight increase in serum cholesterol and urea was observed. The introduction of herbal preparations has almost no therapeutic effect. Administration of SHC to rats reduces the concentration of total protein in serum and liver tissue. The concentration of protein in the blood serum in all the study periods is reduced by 2.8-13 g/l In the liver tissue in chronic poisoning with protein levels of 15, 30, 45, 60 and 90 days decreased to 84.1-71,4%. On the gum tissue with mucous membrane the protein content remained essentially unchanged. Consequently, in chronic poisoning for 90 days, the level of protein in the serum and liver tissue is slightly reduced and in the gums with co ITS level remains unchanged. In table 1.3 changes in the activity of the enzymes alanine and asparagine-aminotransaminase in serum, liver and gums with repeated administration of the chemical SHC at a dose of 225 mg/kg and treatment with herbal preparations are presented.

In table 1.4 it is seen that the intensity of the conversion between alanine and  $\alpha$ -ketoglutaric acid in the serum of poisoned animals in all studied periods increases to 117.2-134.5% in relation to animals that do not receive poison (control). In the liver and mouth, tissue enzyme activity is reduced to 89.0-77.8%, and in the gums and oral mucosa is also reduced to 86-91%. Therefore, in chronic poisoning with SHC, alanine aminotransferase in the serum of the blood is increased, and intensity of re-aminization in tissues is reduced, which suggests impaired permeability of cell membranes and the passage of the enzyme in cytoplasmic fluid and increased concentration of ALT in blood leads to increase.

Similar changes in the studied activity asparaginamide - transferase in the blood serum, which accounted for 15-90 day study 123-110% relative to the monitoring group. Especially, large changes in aspartic acid transamination activity in liver are observed. Activity decreased in the study period of experiments to 82.7-58.8%. The activity of the enzyme in the gums and CO under the action of the studied chemical does not change significantly and remains within the physiological fluctuations. The use of herbal preparations on poisoned animals on the activity of transaminases alanine and serum asparagine has no effect. On the liver tissue has a positive effect, the intensity of their re-aminization is normal. Thus, the use of herbal medicines has an impact on liver tissue: restored hepatocytes when exposed to SHC. We found that with repeated administration of 1/20 LD50 SHC in animals with chronic poisoning, there is a different direction of changes in the activity of amylase and alkaline phosphatase in serum, liver and gums (table 1.5).

**The activity of amylase and alkaline phosphatase in serum and liver oral mucosa with repeated administration of sodium hypochlorite**

At the same time, the activity of blood amylase in the studied terms decreases 73.7-78.9%. In the liver tissue, the activity of amylase on day 15 increases to 121.6%, in the other periods of research, a downward trend was noted.

To identify the early signs of intoxication of the body with SHC of great interest are studies of the activity of alkaline phosphatase, deciding the question of in what biological media, first of all, there are changes in the amount of the enzyme. Our studies have shown that the most pronounced shifts in enzyme activity are observed in serum and liver tissue. Thus, the activity of alkaline phosphatase in the blood serum in all stages of poisoning is increased and totaled 1,66±0,2; 1,48±0,10; 1,42±0,07; 1,57±0,04; and 1,56±0,07 mmol/L. h, respectively, 15, 30, 45, 60 and 90 days of the decoctions (table 1.5).

In the liver tissue, the activity of alkaline phosphatase with multiple chemical poisoning is reduced to 70.0-88.7%, and in the gingiva and mucosa, enzyme activity at the beginning of the experiment 15 days increased (to 118.6%) and, starting from day 30, decreased from 79.8 to 86.7%.

Consequently, the introduction of SHC in the studied doses leads to a marked decrease in the activity of aminase in the liver and gingival tissue of the poisoned animals throughout the

experiments. The only thing that could be noted was that the activity of amylase in the blood serum of the poisoned animals is at the level of control.

The detected increase in the activity of alkaline phosphatase in serum with a decrease in the studied tissues, indicate a violation of the functional state of cell membranes and enhanced enzyme output in the cytoplasmic fluid.

After the end of poisoning, morphological studies of the mucous membranes of the cheek, gingiva and liver were carried out in the dead white rats.

When describing the results of morphological studies, we found it possible to give the pictures of only those changes that were recorded when animals were exposed with a mixture of high concentrations of SHC (5 MPC) of the studied mixture of harmful substances.

When priming with a mixture of SHC, several morphological changes in the cheeks, gums and the liver occurred. The condition of the buccal mucosa is mostly heterogeneous, the epithelium is thinned for a long time and is represented by 4-5 rows of cells with a thin stratum corneum. In some areas, the stratum corneum is detached or completely absent, and the basal membrane is thin, very slightly convoluted Fig 1.1.

**Fig 1.1**

**Figs 1.2**

Spiny cells are differentiated poorly, their nuclei are slightly elongated horizontally, and the granular layer is thin with fairly distinct keratogialin granules.

Basal cell is clearly identified, visible mitotic figures, and dystrophic modified forms, sometimes **discomplexation**. The connective tissue stroma under the thinned epithelium is characterized by pronounced edema, more coarsened and the presence of large blood vessels, some of which are in a state of stasis is noted. The most characteristic feature is the presence a large number of fat cells in these places, glands are located between the muscle bundles and sharply edematous

connective tissue stroma, and the collagen fibers are coarse, randomly located, enlarged, some of them hardened. (Fig. 1.1).

When priming with a mixture of SHC, the gum epithelium in all investigated cases is inhomogeneous in thickness, and more over it is atrophied with flattened papillary layer, smooth, poorly marked basal membrane, which are separate areas forms a weakly sinuous line. Epithelium is represented by 4-5 rows of cells. The stratum corneum is thin, sometimes rejected, sometimes layers are visible on its surface. Cells of the spiny layer without clearly defined cell boundaries, some of them swollen with homogenized cytoplasm without distinctly detected intercellular bridges, others-vacuolated. The granular layer is poorly expressed, represented by elongated cells with a small content of poorly contoured keratogialin granules. The nuclei are mainly hypochromic, some of them are in a state of karyopyknosis and the basal layer is poorly expressed. In some places its cells are destructively changed, the cytoplasm of some of them is vacuolated. In some fragments the figures of mitosis can be seen. Basal and spiny cells of the lower rows are disoriented in places. (Fig. 1.2).

The stroma around the vessels is loosened with pronounced edema between coarsened bundles of differently oriented collagen fibers (Fig. 1.2).Gingival mucosa in the presence of small areas of hypertrophied epithelium, its atrophy was mainly revealed.

In the connective tissue, compared with the monitoring group, there is an increase in inflammatory phenomena in the form of pronounced edema in the underlying and deeper located connective tissue stroma, its loosening and collagenization of fibers.

Morphological changes in the liver when inserted a mixture of SHC is manifested in reversible changes in hepatocytes in the form of granular and atomized fatty degeneration, the appearance of the 2-core and polyploid forms, and the development of dyscirculatory changes in the stroma with symptoms of congestive plethora. This causes the development in the liver of deeper dystrophic changes in hepatocytes in the form of fat, vacuole, their dystrophy, pronounced dyscirculatory and inflammatory changes with the presence of perivascular infiltrates.

**Fig. 1.3**

The lobular and beam structure of the liver is not preserved completely, sinusoidal capillaries are narrow, only at the periphery of the lobules are somewhat expanded, the boundaries of hepatocytes are clearly revealed, possibly as a result of pericellular fibrosis. There are areas with large hyperchromatic polyploid nuclei, hepatocytes increased in size, some of them in a state of granular dystrophy. There are groups of large hepatocytes with the phenomenon of vacuole and fatty dystrophy on the periphery of the lobules. In conclusion, we can say, the studied substances in the liver, in addition to the presence of fat and vacuole dystrophy, leads to deeper dyscirculatory and inflammatory disorders, such as congestive full blood vessels with their perivascular infiltration, as well as the appearance of signs of pericellular fibrosis.

Thus, the results of experimental studies have shown that the toxic effect of SHC on the overall body and organs of animals is significantly reduced IF, the conditions of priming animals specified harmful substance simultaneously carried out a set of recommended therapeutic and preventive measures.

This is expressed in the normalization of the general condition and body weight of animals, the clinical state of PR, as well as the regulation of biochemical parameters in the blood, liver and gums.

Thus, with repeated exposure to SHC for 90 days at a dose of 1/20 LD50 (225 mg / kg), a different reaction of biochemical parameters of carbohydrate energy, protein metabolism, the intensity of enzymes of these exchanges in the liver, gingiva and oral mucosa, as well as in the blood.

In biochemical experiments under the influence of SHC revealed significant changes in carbohydrate metabolism, energy-indicators: glycogen and end products of anaerobic glycolysis of lactic and pyruvic acids, the activity of redox enzymes: glutamate, succinate, malate dehydrogenase, amylase. In protein metabolism: total protein content, the intensity of transamination of amino acids alanine, aspartic acid between  $\alpha$ -ketoglutaric acid, urea - cholesterol, alkaline phosphatase enzyme activity in liver tissues, gums and oral mucosa. These changes are not the same when exposed to xenobiotics. Thus, in chronic poisoning in the blood, liver and gums, the greatest changes in carbohydrate and energy metabolism are observed-the activity of alkaline phosphatase. Experimental studies indicate that during the 90-day priming in the blood of animals, in the studied tissues increases the amount of lactic, pyruvic acids, glucose (in the blood), there is a decrease in glycogen levels and reduced activity of enzymes dehydrogenase (GDH, SDH, MDH), which confirms the activation of glycolysis and inhibition of the potential of redox processes in the tissues of the body of animals.

A special place among the functional groups of chemical compounds is occupied by protein metabolism due to their important ration ability. Thus, the activity of alanine aminotransaminase, asparaginates-amines in serum significantly activates, and tissue activity decreases and there is increase of urea in the blood serum.

Consequently, the data obtained indicate the selective action of SHC under repeated exposure to the activity of various enzyme systems. These data also allow us to conclude about the effect on the activity of enzymes phosphorylase-alkaline phosphatase, transaminases ALT, AST, which are increased in serum. In tissues reduced redox mitochondrial enzymes are inhibited in the studied biological media: serum, liver and gums.

Thus, from the data presented by us it can be seen that as early signs of intoxication of animals with SHC, the determination of the content of lactic, pyruvic acids and the activity of alkaline phosphatase, GDG, SDG and MDG in serum can be used.

Based on the results obtained, we assume that with respect to the mechanism of action of the chemical SHC:

First, the introduction of xenobiotics, obviously, the primary receptors of metabolites of carbohydrate-energy metabolism: changes the intensity of glycolysis and activity of redox enzymes tricarboxylic acid cycle.

Secondly, the action of SHC is based on the types of their influence on intracellular mechanisms of membrane regulation and related energy processes.

Third, the nature of the action SHC for these biochemical reactions are different, which is probably due to the specificity of the examined tissues; and; systemic toxicity mixture HHN it was found that its concentration higher than the MPC had a polytropic action, mostly breaking the functions of the liver, Central nervous system and irritating oral mucosa.

With the introduction of drugs during the 30 days, the poisoned animals were observed approaching the standards of the metabolites of carbohydrate, energy, protein metabolism in blood, liver and gums with the oral mucous membrane.

### ABSTRACT

*Studying the flora of the territory of the Republic of Karakalpakstan, especially, Japanese sophora and catalpa, which are introduced type in today's sharp ecological condition. Quantity and quality of greening is increasing in Uzbekistan, there are appeared terms as landscape projecting, landscape design in the list of greening in people living places.*

**KEYWORDS:** *Forests, Tree, Ecology, Nature, Greening, Japanese Sophora, Catalpa, Decorative, Sprout, Seed, Soil, Moisture, Sun, Wood.*

### INTRODUCTION

Researching strength to create forests households of the Republic started to carry out planting types of wood-bush plants in farms, which are suggested by the conference among the Republic and using them in the actions of greening city and villages.

It is obvious that forests are the strongest weapons in keeping ecological balance in biosphere. The role of forests in creating comfortable environment for human living is important not only in the places where they grow, but also in heartening nearest cities and human living places. Tree branches catch the main part of sun light, acquire it and does the task "umbrella" - saves human from sun radiation. In parks, where big trees and sprouts grow is cooler in summer, because trees and the process of transpiration increases air moisture and makes comfort for human living. Being in connection with nature destroys tiredness of human and calms down nerves. For this reason, construction scale is increasing, the cities are widening in our country. Therefore, it is very important to create comfortable conditions for people to live and rest, protecting environment, especially widening the works of greening people living places. The goal of the field greening is to provide each people of the city with 30 m<sup>2</sup> wood. For achieving this aim we need to increase the size of green zones near cities, to create additional parks, alleys, boulevards.

Japanese sophora - *Sophorajaronisa* L. Fabaceae - is one of the leguminous crops, height is 15-20 cm, wood. In our condition it can reach to 10 m. It has a crown like a sphere. Grows many years, wood crust is dark black - grey, it has cracks. Young branches are green, without thorns. Leaves are complicated, like one feather located on branches one after another, the length is 10-25 cm, leaf string has strands. Leaf has sharp head, 25-29 cm, like lengthened ellipse or wide lancet, 9-17 cm. Surface is dark green and underside is grey.

This type of tree is catalpa decorative tree, which is being used for greening in our Republic. Leaves go down from this tree, native countries are North America and China, there it is widely used for greening. It is a perfected type for greening city and villages of Uzbekistan.

We should pay a good attention to agrotechnics of growing sophora and catalpa trees' sprouts in the condition of saline soil of the Republic of Karakalpakstan, these catalpa and sophora trees certainly grow well from their seed. Japanese sophora - when it ripens it is brown-reddish, yellow-brown, its fruit ripens in September and October, seed is black, like a bud, as a bean. It is hanged on a branch during the winter. There are 45 kinds of sophora family. Mainly grows in Europe, North Asia, mountains of Pacific ocean, Australia and North America. The kind Japanese sophora mainly spread widely in China, Japan and Korea. It was cultivated from 1747. This plant is one of the symbols of China. In 1814 it was planted to botanic garden named after Nikitinskiy in Caucasus, Crimea. Then widely spread to Crimea, regions of Krasnodar, Kherson and Odessa. It is used in phytomeliorative and decorative aim in Crimea.

It is steady for dry and shade but not steady for freezing. Japanese sophora is one of the plants which are decorative, herbs and gives honey. Buds (*lat. AlabastraSophoraejaponicae*) and fruits (*FructusSophoraejaponicae*) are used as a raw medical element. Buds are collected when the weather is dry, at the end of becoming buds and fruits are collected before they ripen. There are flavonoids and mainly rut in the structure. "Rut" specimen is taken from its buds, it is used in treating and preventing hypo avitaminosis, when capillaries are destroyed. First it was known as a plant from which colour can be taken in its native country. Buds which are used as colour are called "Chinese yellow fruit" for many years.

The main five direction of developing decorative gardening in Uzbekistan is choosing local-tree bushes. Now there are appeared conditions for making precious, different types of trees. Catalpa is a new decorative in the condition of Uzbekistan and its morphology, biology was not studied deeply. For this, studying the peculiarities of this plant and the technology of manifolding its sprouts is being done for the first time in climate and soil conditions of our republic. Catalpa grows fast and beautiful in Uzbekistan than its native country and we should widely use it for creating beautiful landscapes as a beautiful tree in the list of greening. The paleography of catalpa types was studied well by A.N.Krishtofovich [20]. In author's opinion catalpa was met in ancient lands of the third period flora of Cheni in China. In scientific resource "Synopsis of the genus Catalpa (Bignoniaceae) [45-46] which was written by J.Paclt, there are given 31 taxonomic types of it, 11 of them are new types, 2 are hybrids, 5 are forms between kinds and 13 are natural and cultural forms. Author suggests to divide Catalpa type into 2 sections; (real catalpas and big catalpas).

The section of eucatalpa

1. *C. tibetica*-tibet catalpa

2. *C. ovata*-catalpa which has leaves like an egg

3. *C. bungei*-bunge catalpa

4. *C. fargesii*-fargesii catalpa

5. *C. bignonioides*-bignonia catalpa

6. *C. speciosa*-beautiful catalpa

The section of macrocatalpa

1. *C. logeissima*

*Catalpa* is a big tree which height reaches to 30 m, diameter is 1,5 m. Mainly grows well in forests, which has alluvial soil, lands which has productive soil. Branches are wide, diameter is 5-6 m. Mainly, the trunk is 50 cm, crust is grey. Crust of young trees is light brown. Leaves are 15-20 cm wide, like an egg or heart. Flowers are big, two gendered, they have white, yellow stripes and reddish, brown spots, they are collected to 15-30 flowers selection. Fruit is dry, seed is cylinder, the length is 25-40 cm and the wideness is 1,5 cm. *Catalpa* manifolds by its seed easy, is planted to soil to 3 cm depth. Seeds grow after 4-5 days. It was observed that new seeds grow best, the growth of the second year seeds is lower. Seeds which are kept 3 years do not grow. 2-3 years' seed sprouts are planted to one place. It blossoms in the 3-4 years for the first time. Seed length is 2,5 cm, it is spread at the two coasts of Mississippi, joining place of the rivers Missouri and Ohio, from the states Illinois and Indiana to Tennessee and North Arkansas. Trunk of beautiful catalpa is light colour, not heavy but very strong and does not rotten. Railway tie and telegraph pillars are made from catalpa wood in North America. Apart from this it is planted in parks and street sides.

*Catalpa bignonioides* is one type of catalpa, the height is 15-20 m and diameter is 1,5 m. Branches are like sphere, they are located on short trunk and create decorative view. Leaves are like whorl, oval formed, wide, the length is 20 cm, the basis is like a heart, if you rub leaves it makes unpleasant smell. Leaf handle is long from 6 to 10 cm. Flowers are 3-4 cm wide, white, 2 yellow and reddish spots are located in two sides. Fruit is 40 cm length, 8 mm thickness, thin, walls are dry. The length of seed is 25 mm, striped. This type is mainly spread in the lower part of Mississippi river in North America, in the states of Mississippi, Alabama and Georgia. Wood is light but strong and steady to rotting, for this reason telegraph pillars are made from it. Leaves fully or partly fall from all types of catalpa. All of them are big trees but only *C. tibetica* grows as a bush. Among the types of catalpa the highest is beautiful catalpa, it grows up to 30 m height naturally. Other types of catalpa is about 15-20 m. In China the type *C. bungei* sometimes grows up to 30 m. Crust of catalpa is light brown and grey, young sprouts are green. By growing crust of tree becomes reddish, then becomes light brown and strands fall down. Sometimes, on sprouts crusts cleave after many years. Branches are like sphere or pyramid. Leaves are long, located on handle, leaf plate is in different forms. The length of leaf plate is up to 20 cm, width is 18 cm, lower part is sharp. The basis of leaf plate is like a heart or round, green colour. Roots of catalpa leaves are like a feather, spread from the center, root of leaves are twisted before reaching to leaf sides. *Catalpa* is a hermaphrodite plant, flowers are two gendered. Fruits are like cylinder and long, dry seed. Root system of catalpas is formed like following: in the first year one arrow root grows on the length of 80 cm on vertical.

Spreading catalpa in Uzbekistan started in 1875 by introducing exotic plants to Zarafshan region of Turkistan according to the information of N.I.Sherbakov [33]. In 1872-1883, types of catalpa was introduced and planted the same as ailanthus, gledichiya, elm and etc. According to the information of O.G.Ottendorf [23] types of catalpa were spread in Ferghana region in XIX century. In 1885, forest sprout growing place was organized in Margilan and catalpa sprout was grown in it. In this period catalpa types were brought to Tashkent. N.I.Sherbakov [33] says that actions of creating forest sprouts started again in Central Asia and people started to plant widely catalpa types for greening. A.V.Gurskiy [13] mentioned that people started to plant widely the type *C.speciosa* from 1930 and the type *C.bignoniodes* from 1940 in cities and villages. S.Muxamadxonov, F.Jongurazov [22] say that simple catalpa was widely spread in ancient times and mainly it was manifolded from seed and sprouts, and planted as decorative plant in parks. I.Kuzmichev, V.Pechenichin [21] assess types of catalpa as fast growing tree, according to their opinion catalpa is a tree steady for hot and dry weather, also gas and smoke in the condition of Tashkent. Authors consider that it is easy to manifold catalpa from seed, for this we need to pick them in autumn and plant in spring. 1 year seed sprouts are moved into caring part and are grown for 3-4 years till they become sprouts, they like being moved to another place and grows well. A.Xonazarov and others consider that it is necessary to use widely types of catalpa as decorative plants in greening. This type is steady to dryness but if there is not enough moisture on soil its growth decreases and it can get dry. It is mainly suggested to plant it separately or in groups in creating alleys, its form like powder (it has white small spots on leaves) - *Catalpa speciosa*, *C. bignoniodes* is widely planted in greening. I.I.Galaktinov and others [12] give full botanic and ecological information about tekoma liana (*Tesoma radicans*), bignonia or lilac leaf catalpa (*Catalpa bignoniodes*), beautiful catalpa (*Catalpa speciosa*) which belong to the family of Bignonia. According to their opinion it is suitable to plant hybrid catalpa (*C.hybrida*) (got as a result of hybridizing bignonia and catalpa like and egg) for greening. This hybrid is a decorative tree with its dark green leaves and yellow-white, smelling flowers. V.P.Pechenichin and others [24] suggest to plant beautiful catalpa more in the condition of Tashkent as a steady tree. K.D. Vil'danova [43] gives information about xilocatalpa which was got as a result of hybridizing *Xilonsis* and catalpa. Apart from these oval leaf catalpa type was also introduced. The following interesting types were also included in the family apart from catalpas.

Chilopsis or desert willow (*Chilopsis linearis* (Gav.) Sweet.) is a bush or a small tree, the height reaches to 10 m. Leaves are like lapcet, the height is 15-20 cm, without strands, usually with clue, short handled. Flowers create collection of flowers, collection of flowers are located on the edge of straw, cup is with strands, flower crown is red or white, height and width are up to 3,5 cm, fruit is not wide, height is 30 cm, width is 6 mm. Chilopsis is manifolded by its seed. It grows well in the conditions of Tashkent, but in winter branches are damaged by cold then grows again. It is spread in South America, North California and Mexico. It is very important in selection and greening.

Tecoma or flower like tube (*Tecoma Campsis radicans* Lam) is a bush which grows twisted, the height is up to 10 m. Roots grow to the ground from thick straws and with the help of them it grows by sticking to rough and crack places. Leaves are like a feather, it has 9-11 small leaves. They are like ellipse, egg, the height is 6 cm, sharp, sides are toothed, handle is short. Outside flowers are white-yellow, inside are red, height is 9 cm, width is 5 cm. Seed is like cylinder, long, height is 12 cm, with wings. Seed is with wings, sprawl, brown, height is 12 mm. Tecoma

makes sprouts from root and manifolds from seed. It is steady to dry and hot weather. It is spread in South America. It was brought to Uzbekistan 100 years ago. It is suggested to plant for greening.

Bignonia (*Bignonia cepreolata* L.) grows by twisting to big trees with the help of handles, it can grow up to 20 m. Leaves have thick crusts, oval-long, like lacet, height is up to 15 cm, like a heart, complete, green. Flowers' umbrella is like a tube, handle is short. They are located on flower handle by five, height is 4 cm, flower crown is red, height is up to 5 cm, parts are round, shorter to four times than a tube. The height of fruit is 17 cm, sides are squeezed, width is 2 cm. This plant is spread in North America, Virginia, South Illinois, Florida states, it grows in moistured forests of these regions.

### ABSTRACT

*The article studies the socio-psychological characteristics of the individual, the committed act of suicide. Theoretical and practical problems of psycho prophylaxis of suicide are analyzed. Adolescent maximalist, feelings of loneliness in old age, special effects of the Internet aimed at human behavior, passion and worship of people for wealth, commodity fetishism are studied as factors of suicidal mood. Suicide and attempted suicide are studied from the point of view of existentialism, and Logo therapy, founded by Viktor Frankl, is proposed as their prevention.*

*There are many ways to leave life and die. The best of them is to continue to live.*

### INTRODUCTION

In the 21st century, the phenomenology of suicide attempts has undergone certain changes and has begun to change qualitatively. We now have the notion of a "death stimulus" introduced into science by modern Russian researcher Sabina Spielrain, and it is one of the least studied mental phenomena.

According to Zebiniso Ahmedova, a well-known psychologist in the country, instead of the concepts of suicide, suicide and suicide, it is time to call these terms "renunciation of the future

(action, behavior, act)." This facilitates psychological work as a fact that is somewhat more easily accepted by experts and the general public. However, the terms "genocide" and "suicide" should be left as an imaginary category.

### **Methodological basis**

Uzbek and foreign researchers describe behaviors that lead to suicidal behavior in adolescents and young adults, but the type of "suicidal behavior in adolescents and young adults" is not justified by its stable personality traits. In this regard, Russian researchers Sokolova ET, Nikolaeva NN, 1995; Sokolova E.T., Sotnikova Yu.A., 2006; Moxovikov A.N., Donets O.Yu., 2013; Schneidman E., 2013; Blatt S. J., Blass R. B., 1996; The work of Paris J., 2007 can be cited. A number of modern researchers study the above problem in terms of the existential crisis in adolescence. About this L. V. Senkevich writes about the difficulty of overcoming the age crisis due to the increase in the frequency of individual crises (Senkevich L.V., 2011, 2012, 2013). Thus, the individual characteristics of the person exacerbate the age crisis in unfavorable socio-psychological conditions, and this period leads to a negative course. This puts every suicide incident in a situation that is unlike any other and cannot be prevented.

Edwin Schneidman's research in modern foreign research provides a good analysis of the socio-psychological factors of the problem. According to him, the purpose of any suicide is to find a solution to a problem that is constantly tormenting a person. E.. According to Schneidman, a person who commits suicide tends to avoid unbearable mental suffering (Schneidman E., 2013; Erickson E., 1999; Blatt S. J., Blass R. B., 1996; Paris J., 2007). Schneidman refers to suicide as an affective narrowing of the mind that narrows its intellectual capacity, and calls it the "tunnel state of the mind". [2. 66-67]

Experts have done a lot of research on the first feature of giving up one's life. First and foremost, it is the suicide of children and adolescents. As for children, a number of experts agree that the main reasons for this are related to the crisis of the family institution. It means the dissolution of the marriage and the divorce of one or both parents who are still "one in the same" with the child. The second negative factor is the drastic reduction in the amount of time parents spend with young children, distracting the child with questionable electronic entertainment and inanimate gadgets instead of parental love and attention. An additional factor is that the child, who has been the focus of the parent until now, may feel unnecessary and less affectionate with the appearance of the sibling.

Such behavior in adolescence and youth is explained by the maximalism of adolescence, the logical decline and complexity of school education, the crisis of ideals and the lack of ideology, more precisely the system of modernity. Society is in a state of deep cognitive illness, because a large part of society, including its youth (2000s), has character traits that are clearly incompatible with the modern model of spiritual and socio-economic relations. It will be recalled that the famous philosopher Nikolai Berdyaev once described the crisis of ideals as a temporary insanity.

Another category is extreme conditioning syndrome. For example, young people who are involved in car racing or accidents during extreme sports. In fact, these are also unfinished suicide options.

In 2010, hashtags of "death groups" appeared on social media, bringing to the attention of experts a point in their lives. In November 2016, one of the most well-known organizers of such

groups, Philip Budeykin (Blue Whale), was arrested on charges of inciting teenagers to commit suicide. In an interview with the newspaper, he answered the question of whether he encouraged teenagers to commit suicide: "Yes. I really did. But, they died happily. I gave them something that was not in real life: warmth, understanding, communication." [4.12 ] In general, mental crisis is caused by a lack of certain emotions. First of all, mutual understanding, the warmth of interpersonal relationships is formed only in a normal family.

It is known from the history of psychiatry that unhealthy and socially dangerous people (maniacs) give a lot of evidence that they tend to preach their savage and inhumane ideas with sincerity and extreme sincerity, sometimes they succeed, i.e. they can convince mentally retarded young people.

People with such mania can now affect everyone, rich and poor alike. Modern preschoolers are playing with inanimate gadgets, not social story-based role-playing games. This creates a huge gap in the process of socialization and self-awareness of the individual.

As a result, the computer becomes a favorite object that meets the child's need for communication. While the previous generation tried to show obedience to win the affection of their parents, gadgets are now perceived as an almost living being who believes infinitely, is attached to it, and wants to burn. We ignore this close relationship between children and computers. The creators of death groups use this to try to have a strong psychological impact on the target audience. Basically, when influencing teenagers who are introverts and children with a sense of loneliness, they often use phrases like, "It's for someone who doesn't understand, has their own opinion, and wants to hear it ..." and so on.

Here it is necessary to emphasize another peculiarity. In the pre-Internet era, the motive for suicide was personally emotional, naturally egocentric, selfish, focused on others in the struggle for inheritance, love, social or material status, and so on. In the present case, however, the only reason for boys and girls to commit suicide seems to be to satisfy their pathological desires as domination over their lives and destiny, and it is done anonymously, without giving a reason.

It should be noted that the specific form of suicide in society is not always evaluated uniformly. The suicide category should include the movement of rufflers and the like; the passion of successful people for extreme sports also belongs to this risk group. Tattoos are also one of the manifestations of the tendency to commit suicide (torture).

It should also be noted that, in contrast to the World Health Organization (2011) definition that "suicide is the result of conscious actions by a particular person" [3.35], and, at the same time, youth suicide it can be added that in many cases it occurs for absolutely spontaneous, emotional, affective, and unconscious reasons.

It is typical for sick seniors to have "altruistic suicides". Their main goal is the desire to save themselves and their relatives from unnecessary suffering. In other cases, such "altruistic suicide" may be the result of avoiding an embarrassing situation. For example, patients with AIDS. But when it comes to seniors committing suicide, factors such as hopeless poverty, neglect and abandonment of the elderly should not be overlooked. This situation is not typical for our country, but for megacities.

Another case is the competitive motive. In the early twentieth century, this motive was analyzed in the study of cases of student suicide at the universities of Vienna. It was led by young people

in creative professions - musicians and artists. The reason is that this state of mind, described as the "Salieri complex" (i.e., "I am not as talented as Mozart"), is self-evident.

In the past, suicide has been described as a tragedy, a special case involving a person and the people around him. However, the hundreds of events that have taken place so far show that suicide has changed qualitatively. That is, a situation in which a suicide bomber causes the death of many along with himself. Examples include hijacking planes, comedy, shooting people in the face, and then shooting themselves. It is a qualitatively new manifestation of human aggression and its distinctive manifestation. It is a suicide in the form of hatred for humanity and has not yet been sufficiently studied.

The psyche is a dynamic system: if everything was fine in the human psyche yesterday, today a mental disorder can also be observed. Therefore, it is necessary to support the development of psychodiagnostic methods that can conduct high-tech dynamic psychological and psychiatric examination, rather than an annual commission with the participation of a psychiatrist and psychologist in the assessment of human psyche. Of course, this is a complex task at the moment. The shortage of such specialists has not yet been resolved in our country. Private psychotherapeutic centers partially cover the situation, but they cannot provide mass free assistance to the population. The opening of scientific and psychological laboratories and psychotherapeutic clinics in Uzbekistan dealing with these problems is an urgent problem of education, personnel and science. Another problem is that today the science of psychology is moving away from medicine and physiology and closer to the socio-philosophical direction.

Returning to the subject of suicidal terrorists, the reason for such criminal actions is primarily related to the pathological thirst for recognition of the person by others, the narcissistic reassessment of one's own personality (i.e., people seem to appreciate it after death). They thus gain fame. Of course, these cases are being studied by various experts.

This was done in 2011 by American psychologist prof. James Fox explains, "In American society, some people are angry with the world around them, frustrated with it altogether, ruined their lives, and don't want to live anymore. These people are not emotionally supported by family and friends and they think they are responsible for their failures. and seek revenge on those who do not give them a chance to overcome the problems of life. Suicide and terrorism (genocide) carried out under the guise of psychosis are usually one and the same thing. also the demand of the study period.

## CONCLUSION

In the 1960s, Victor Frankl noted the loss of meaning in life for large sections of the population. According to his statistics, the risk of depression, addiction, alcoholism and aggression, car accidents is increasing. The notions of spirituality and ideology have lost their power, and some even believe they no longer exist. Of course not.

What is the role of ideology in solving this problem? First, any ideology has two main functions: 1) it must have an explanatory system aimed at eliminating contradictions; 2) it should give meaning to daily life and unite all citizens of the country around these meanings, as well as describe a positive image of the future. The ideology of our society is young and our people have suffered a strong national psychological trauma because it has been believing in a false ideology for so long. It was a loss of meaning, a loss of trust. After 1992, there was a peak in the number

of suicides in our country and in neighboring countries - 46.1 per 100,000 people (and more than 60 in some regions), which gradually decreased to 22.4 by 2012. There are many studies that analyze the relationship between suicide rates and environmental and economic factors, national traditions and characteristics, but they have long been ignored on political platforms.

As noted by modern sociologists and politicians, there is now a worldwide tradition of material status, consumer sentiment, brand fetishism (i.e. devotion to wealth). This is contrary to the ideology of humanity. The great enlighteners understood the roots of this problem many centuries ago and expressed their thoughts and ideas. It is a dangerous tradition to view suicide as a psychological or medical problem, which is more of a social problem. The bottom line is that suicide is directly proportional to the spiritual crisis of society and the individual.

One of the methods we now have for psychoprophylaxis of this unpleasant condition is Victor Frankl's logotherapy. As existential psychology emphasizes, the search for meaning in life and finding it is the most effective way in this direction.

### ABSTRACT

*In context of forming the foundations of civil society in Uzbekistan, the development the political culture of youth on the basis of creative approach is an important social process, serves to cultivate in our youth the skills as independent thinking, cognizing and a conscious attitude to objective events, moreover it helps to research and solve the existing issues on accordance of socio-political points of views.*

**KEYWORDS:** *Political Culture, Creative Approach, Ideological Processes, Ideological And Political Education, Political Literacy.*

### INTRODUCTION AND ACTUALITY

Nowadays, the struggle for the human heart and consciousness is becoming more intense than ever it has been. Examples include the changing ideological landscape of the world, harmonization of geopolitical goals and ideological policies, growing importance of ideological principles in post-independence countries, ideological processes and the level of political culture of young people in this regard. Therefore, it is important to ensure the effectiveness of the formation of political culture of young people in the world, for studying the forms and methods of effective mechanisms to increase their awareness of political processes. It is especially important to increase the level of influence of young people in socio-political life, to develop their political culture on the basis of a creative approach. Today, more than 60% of the country's population is under 30 years old. This is two and a half times more than in other countries. Forty percent of Uzbekistan's population is under 18 years old. Due to the growing attention in our country to the youth and their development activities, the head of our state Sh.M.Mirziyoev specially pays attention and said: "It is known that the upbringing of the young generation has always been important and relevant. However, in XXI century which we live, this issue is really becoming a matter of life and death[1]". Therefore, "education of independent-minded,

enterprising, courageous young people who are able to take responsibility for the future of our country" [2] has been identified as one of the priorities in the development of the social sphere in our country.

After reaching independence, one of the most important tasks of our time remains to grow up a new generation of thinkers who will adapt to these processes. Particular attention is paid to the implementation of state youth policy and the development of their political culture on the basis of a creative approach, and a number of targeted measures are being implemented. It is known that the improvement of the education system is important in the development of our society. Social factors, including the principles of democracy and humanity, have encouraged members of society to be spiritual nourishment, spiritual support in all countries and at all times. If deep insights into the essence of these principles and values are formed in the family, there is no doubt that they will make a significant positive change in the minds, upbringing, worldview and lifestyle of young people. In addition, a creative approach to improving the system of formation of ideological and political culture of young people is gaining important social significance in the spiritual and moral, educational development of society. In the speech of the President of the Republic of Uzbekistan Shavkat Mirziyoyev at the solemn ceremony which dedicated to the 24th anniversary of the adoption of the Constitution of the Republic of Uzbekistan said: "... the greatest dreams and vital interests of every single person and every family in our country are manifested and realized in the image of his children"[3]. The Presidents such opinions requires to be responsible and indifferent to the upbringing of the younger generation more than ever.

## METHODS AND STUDYING LEVEL

Problems related to the political culture of the individual were analyzed in detail at the end of the last century. A number of philosophers reflected on the problems of ideological and political education in the conditions of the socialist system. Also, in the articles of A.Azizkhodjaev, N.Berdaliev, F.Boboev, A.Jalolov, N.Juraev, M.Zaripov, U.Idirov, D.Nazarov, G.Yusupova and others, important elements of Eastern democracy, special characteristics of the democratization of society in Uzbekistan, issues related to the specific features, the role of democracy in shaping the political image of the individual are showed[4].

In the nineties, Uzbek scientists began to study not only the impact of political processes on the political image of the individual, but also the impact of the individual on public policy. They emphasize the importance of the role of the individual in government, the role of the political leader in the implementation of large-scale reforms.

A. Choriev also makes a structural analysis of the category of "political culture", while E. Bobomurodov thinks about the peculiarities of political thinking[5].

In addition, during the years of independence, the political processes in the country, the problems of forming the political culture of citizens have been studied to some extent in the scientific research of M. Ahmedova, B. Tuychiev, R. Jumaev, I. Ergashev, N. Khakimov and S. Juraev.

## RESULTS OF THE EXPERIMENT

Nowadays, the activity aimed at creating creativity, innovation is understood as a creative activity. Derived from the word creativity (English "create" - creativity, make something new that is not exist), which characterizes the ability of the individual to be creative, the level of creative talent, the individual's readiness to create fundamentally new ideas, far from traditional

or habitual thinking patterns, as well as unique solutions are creative abilities that are perceived as an independent factor of talent.

American scientist D. Vexler describes "creative thinking as a type of thinking that requires a person to come up with multiple solutions to a problem or issue at once, and helps to understand the uniqueness of the nature of things and events, as opposed to stereotyped, boring thinking." Being a creative person, and in our example, to be a creative student, is to have an advantage in today's world, for example, to stand out among other students, to be more interesting than others, to come out of life's challenges in an unusual way. Applying creative skills is not only to create new ideas, but also to improve the lifestyle, or aspects taken separately, and plays an important role in the development of the inner world of the individual.

Specific aspects of the formation and development of political culture in young people based on a creative approach to the formation of political culture in young people, researching it allows us to assess and imagine the level of knowledge of the future political situation in our society.

The use of the following resources to form a political culture among young people is very effective. These are:

- Teachings, ideas and works of great Scientists;
- Constitution and laws of the Republic of Uzbekistan;
- Works, speeches and lectures of the President of the Republic of Uzbekistan;
- International conventions ratified by the Republic of Uzbekistan;
- Science textbooks, literature.

Knowledge of the norms, legal principles, state organizations and functioning of government agencies, including law enforcement agencies, is a necessary condition for the formation of political culture among young people. Successful implementation of the state policy of the Republic of Uzbekistan "National Program for Raising Legal Culture in Society" on the formation of legal culture of the population, on the one hand, to create the necessary conditions for each member of society to acquire a certain level of legal knowledge, on the one hand, to create the necessary conditions for each member of society to acquire a certain level of legal knowledge; provides for the stratification of legal education. In addition, the study of political culture highlights the need for in-depth scientific research and consideration of the specifics of different social groups in society, and encourages it.

The new world outlook formed implies devotion to the Motherland, love for national values and traditions, kindness to one's relatives, loyalty to one's chosen path, profession, profession and faith during the years of independence. The builders of the civil society being built today must have a political culture, for which they must have political knowledge, of course. Because only a person who has political knowledge and reflects them in his behavior is considered politically cultured. It is well known that political culture is an integral part of a person's overall culture. To be civilized, one must be able to follow the law, act in accordance with the law, and analyze the political processes taking place in the country.

The role of political consciousness is important in having a political culture. Political consciousness is one of the forms of social consciousness, that is, it is a set of views and ideas of

people, which represent the political process in society and its relationship to law and the rules. This means that a person should feel justice and hate crimes and illegal acts. What does political culture consist of? Like any home, a building of political culture rests on a foundation. The foundations of political culture include:

- socio-political processes;
- Moral and spiritual views;
- creeds and beliefs.

Depending on the level of development of political culture in society, it is possible to know information about the state of values in public life, such as governance and the rule of law, the rule of law, the development of the system of separation of powers. In a people, nation, society, state with a highly developed political culture, the system of governance will be in a democratic form. In a state where the political culture of citizens is not well developed, the system of government is governed in an authoritarian manner. That is why the level of development of political culture is important.

We know that political culture is not a process that occurs suddenly in a person. For political culture to form, we first need to know what political culture is. In the encyclopedic dictionary of philosophy in the Uzbek language, political culture is described as follows. "Political culture is a unity of political consciousness and political activity, and reflects the attitude of an individual, social group or society as a whole to the social system, government, domestic and foreign policy of the state. It is a holistic system that combines many components and elements. Political culture consists of three aspects: cognition, evaluation, behavior, and manifestation in action. Each of them consists of several components. While the cognitive aspect includes components such as political knowledge, political thinking, political awareness, political consciousness, the evaluative aspect consists of political considerations, political moods, political values, political norms. Behavioral aspects include such components as activism, patriotism, nationalism, inter-ethnicity, which are carried out on the basis of socio-political programs. The basis of political culture is political belief. Political culture manifests itself in different forms and levels. "Political culture can be considered at the level of society (study of the conditions that create the basis for improving the political culture of citizens), at the level of a social group by analyzing the participation of this group in society, at the level of the individual"[6]. Why is it necessary to raise the political culture of young people? The question can be answered as follows, it is necessary to solve the socio-political problems accumulated in society by raising the political culture of young people, to democratize the life of the state, the state and society, and to carry out reforms. In order to develop political culture among young people, it is necessary to conduct legal education and upbringing together dialectically. We cannot pass without recognizing the role of legal culture in the development of political culture. Through legal education, it is possible to study legal factors such as law, law, legal culture, civil society. We know that there are many types of political culture. We need to teach young people an active political culture.

In an active political culture, citizens actively participate in the political life of society. This participation is based on the confidence of citizens to be able to influence themselves through political literacy and political decision-making.

The following issues should be considered in the development of youth political culture. In the early years of independence, Doctor of Philosophy Yuldashev Muhamadilhom Mamayusupovich in his doctoral dissertation posed the following problems and made suggestions to solve these problems:

- Achieving more national content in the political culture of youth, taking into account the national values and traditions of the Uzbek people;
- Using the full use of the rich spiritual heritage, reflecting the political culture of our ancestors in the formation of the political world outlook of young people;
- Broad involvement of young people in the management of state and public affairs, the creation of all necessary conditions for this;
- Formation of their political culture on the basis of moral values;
- Achieving the full enjoyment of the exercise of the constitutional rights and freedoms of young people;
- Supporting multiparty system and ensuring freedom of opinion as an important factor in the formation of political culture;
- Raising the political awareness of young people through the widespread dissemination of political knowledge;
- Formation of youth's inclination to the political values of independent Uzbekistan;
- To raise their scientific and spiritual potential to the level of the potential of the youth of the developed countries of the world. [7]

Political culture plays an important role in the way of life, traditional culture, national outlook and ideology of our people. It is necessary to rely on our national, spiritual, religious, moral, legal and historical heritage, the ideas of our ideology in the complete decision-making of political culture among young people. Therefore, the education of students and youth should be based on universal values, traditions, views of Central Asian thinkers. The ideas put forward in the works of the Qur'an and Hadith, Farabi, Biruni, Avicenna, Alisher Navai, Babur, Nakshband, Ahmad Yassavi, al-Bukhari, al-Termizi, Margilani and other famous scientists, which are the basis of Islam, humanism, honesty, purity, nationhood. Such ideas as love, pride in the Motherland, diligence, and kindness should be inculcated in the minds of young people. Our great ancestors considered the issue of child education to be a priority, regardless of the political, economic and spiritual foundations of the social system of their time. For example, according to the great scholar Abu Nasr al-Farabi, man, by his nature, is a perfect human being in the process of socialization, that is, in society, in the process of interaction and mutual assistance. According to Farabi, educating a person can be done in two different ways. The trainee must voluntarily direct the necessary, mental and moral qualities to be knowledgeable and at the same time to have high moral qualities such as honesty, love of truth, courage, loyalty to friends. For nurturing someone with such human qualities, there must be a team that leads to happiness. Consistent work is needed to raise a person to be a member of a happy community. Education should be aimed at preparing a person to be a mature, perfect person, both mentally and morally. So, the only task of education is to prepare an ideal person who can fully meet the needs of society and serve to maintain it in its integrity, peace and prosperity.

First of all, it is necessary to work consistently to bring up a person as a member of a happy community. Education should be aimed at preparing a person to be a mature, perfect person, both mentally and morally. Therefore, the only task of education is to prepare an ideal person who can fully meet the needs of society and serve to maintain it in its integrity, peace and prosperity[8]. To form a political culture, it is necessary to increase literacy. In order to increase political literacy among young people, it is necessary to do the following.

First of all, young people increase their level of knowledge by participating in different areas of education. They become more aware of the sciences that provide political knowledge, as well as knowledge in various fields of science. The knowledge imparted in educational institutions plays an important role in the development of the political culture of the youth of our country. As the number of students studying political science grows from year to year, so does the level of political culture of the population in our country.

Second of all, political literacy is the direct participation of young people in the political activities and political life of society. Each student expresses his / her views on political relations, conversations on political topics, meetings, events. Such communication and relations affect the individual's consciousness and create favorable conditions for the formation of political culture[9].

Based on the above considerations, by shaping the political culture of young people in the education system:

first, the political foundations of a democratic political state will be strengthened in our country;

secondly, the practice of applying political knowledge in our daily life will be improved in our youth;

third, the political consciousness and culture of the youth will be further enhanced. It is important to constantly enrich the political culture, to carry out consistent political work.

## CONCLUSION

In short, a creative approach to the system of shaping the political culture of young people in the family is an important social process. It serves to cultivate a conscious attitude to objective events and happenings, independent thinking, thinking in our youth. At the same it helps to increase the time management of a person's political principles, political considerations, or inclinations, bypassing destructive, destructive ideas, having a social character, having a strong influence on the human psyche, leading them to the goal, embracing the moral and spiritual obligations of society, to the general happiness of man its focused activities include the development of a society that serves justice and freedom, the achievements in social and spiritual life, and the preservation and preservation of our national and spiritual values. Growing young generation can be ensured only if family upbringing is inextricably linked with social upbringing. The absence of this or that has a negative impact on the educational process.

The formation of the political culture of young people in the family, increasing the effectiveness of education depends in many ways on the ability of our parents to correctly apply the methods and techniques of the educational process. In this case, first of all, it is important to rely on experience, to choose the most effective ways to achieve the goal, to apply the methods tested in practice. Professionalism in the educational process is characterized by the fact that in the family,

our parents or the older generation relies not only on their own experience or on the experience of others, but also on scientific knowledge that reveals the specifics of the educational process. However, given that social life is changeable and multifaceted, focusing only on past experiences will inevitably narrow the process of effective parenting.

Especially, in today's context of radical reforms, when the values, moods, aspirations, interests of young people are changing, a creative approach to the system of formation of ideological and political culture is especially relevant. A creative approach to the formation of the ideological and political culture of young people in the family as an important social issue plays an important role in the implementation of the following tasks:

1. Strengthening cooperation between political parties in order to increase the ideological and political culture of young people and their active participation in the political life of society.
2. Organizing actions, forums and marathons against various alien ideas.
3. Achieving the improvement of the system of raising the ideological and political culture of youth through the quartet "Family-school-neighborhood-party".
4. Holding a scientific-practical conference on "Pedagogical conditions for the formation of ideological and political culture of youth in the family" in cooperation with the Republican Center for Spirituality and Enlightenment, the Ministry of Family and Mahalla Support, higher education institutions.
5. Demonstration of videos in the media aimed at the formation and strengthening of the ideological and political culture of young people in the family, increasing the political awareness of young people, political culture.
6. Establishment of a Youth Club to instill a sense of patriotism in young people, devotion to the motherland and the promotion of creative ideas.

Nowadays, Uzbekistan carries out the main tasks of state and society building on the path of renewal and reform of our lives based on the experience gained in the path of independent development. The methods and tools used by our people for many centuries to prepare the younger generation for life, their unique customs and traditions, ideas and life experiences of education, examples of oral and written creativity, are vividly expressed in their works. These thoughts and ideas are rooted in the historical and social conditions, have acquired a universal character, have been gradually developed, and have become an expression of the noble aspirations of the people.

### ABSTRACT

*This article is devoted to the study of the terms "Hard skills" and "Soft skills" the history of origin, the importance of these skills in the preparation of future teachers The article also suggests the importance of skills by the help of different situations and questions.*

**KEYWORDS:** *Hard Skills, Soft Skills, Professional Skills, Communication, Emotional Intelligence, Adaptivity.*

### INTRODUCTION

Nowadays, in various pedagogical trainings and articles the new English terms "hard skills" and "soft skills" are used, but most people do not know about these terms and their meaning, significance and differences.

"Hard skills" are professional skills that can be taught and determined. An English teacher needs sufficient knowledge and methodology in this subject to conduct lessons. To form these skills following instructions and the acquisition of knowledge is required, the quality of education can be checked through an exam. Professional skills include: computer typing, driving, reading, math, knowledge of foreign languages, use of computer programs.

"Soft skills" - universal competencies, sometimes called personal qualities and attributes, which depend on human behavior and are acquired through personal experience, can not be measured by any indicators. Communicative, social, intellectual and volitional competencies such as teamwork, creativity, punctuality, hard work are examples of universal competencies.

The term was originally used in the military during the development of the program, the researchers identified the importance of hard skills for servicemen, as well as universal skills that cannot be taught with planned training.

The differences between these two skills are defined in 1968 in Military Doctrine Design Systems : hard skills are techniques, machines, and soft skills are people and documents. After the military and psychology, these terms began to be used freely in business. At present, they are used in pedagogy and methodology without translation.

While intellect (left hemisphere, intellectual coefficient, logic) is important for successful acquisition of professional skills, emotionality (right hemisphere, EQ - emotional intelligence, empathy) is important for the development of universal competencies.

Professional skills can be acquired in different educational institutions (schools, universities, additional courses). Usually, these skills are formed gradually from easy to difficult. For example, learning English is organized at different stages depending on the level of knowledge: Elementary, Pre-intermediate, Intermediate, Upper-intermediate, Advanced Levels are determined by examination.

Personal qualities (universal competence) are formed and slowly acquired in a person as a result of various mistakes and experiences during birth or life activities.

Professional competencies can be defined by a diploma or certificate, but universal competencies cannot be defined in this way. Personal qualities such as the ability to communicate in teaching, emotional intelligence, effective problem solving, critical thinking help students to communicate and organize their activities. Sometimes there are cases when a linguist's red diploma and high level of knowledge of the language is not enough to communicate with students and effectively organize lessons, the teacher must also have personal qualities. Therefore, in the training of future teachers we need to focus special attention to the formation of universal competencies.

The following situations and questions will allow each teacher to learn about the importance of personal qualities in teaching and whether or not they have these skills:

1. Effective communication. You will meet with the students' parents , the purpose of the meeting is clearly defined. Then you will provide all the necessary information, listen carefully to the parents to determine their views and formulate responses accordingly. It is important to understand their opinion from their facial expression. If you notice that the teacher does not understand something from the parents' facial expressions, they are reluctant to ask, you will repeat this information again.

To find out how you developed these qualities, answer the following question and find out how difficult it was to answer.

You need to explain to your 80-year-old grandmother how online classes are organized! How difficult is that for you?

2. Collaboration or teamwork. You are participating in a competition. Candidates are divided into groups. In this case, the roles should be distributed equally and correctly among all participants. When conflicts arise, you should try to resolve them.

Question:

The team is doing badly because the members are not able to fulfill their roles. How would you deal with this situation?

3. Evaluation and analysis of information. This is the ability to choose quickly and accurately what you need to make decisions.

You have been given a new group to teach, in the first lesson you have learned the level of knowledge and interests, goals of students. By analyzing the collected information, you identify common interests and try to make the lesson interesting for everyone. While explaining a topic to students, you plan in advance how to assign strong students.

**Question:**

You had to fix the problem, but you didn't have the information you needed. What did you do?

4. Creativity is about making non-standard decisions, implementing unusual ideas and taking a creative approach to routine tasks. You need to teach a student who is not good at grammar "The Present Simple Tense". You anticipate the difficulties that may arise and explain the topic using the student's favorite character (from a cartoon or book) so that the topic is easy to remember.

Q: If your life had been a book, what would you call it?

5. Emotional intelligence or empathy is the ability to identify and control the feelings of oneself and others. A student in the class does not pay attention to the lesson because he is not in a good mood. The teacher asks the student how he feels. In this way the teacher can bring him/her back to class by listening to it carefully.

Q: A close friend needs your support, how can you help him?

Your partner in front of you is trying to hide that he is disappointed with you, how do you know that?

You are very upset with the students who did not do their homework. How do you behave?

6. Adaptability is one of the most important skills in problem solving and adaptation to change. You are ready for all your lessons. But in the morning you were told that another teacher was sick and you had to organize his lessons together. You work in different programs, but quickly review the situation and change the lesson plan in a way that is beneficial to all.

Q: Do you remember the most difficult change you faced during your career and how you overcame it?

7. Efficient use of time.

Do you have time to do all the things you have planned for the day?

Do coincidences affect your schedule?

8. Self-control, self-improvement is a conscious attitude to one's life and development.

Nowadays, these personal qualities are important for all teachers, because our attitude to the profession is changing. In the past, the teacher was the only source of knowledge, and a new topic could be learned only from the teacher through a textbook. But now the situation is different. A lot of information can be openly used on the Internet. The teacher guides and teaches

students to think critically as a guide and assistant in the independent study of the material. Teachers who fail to adequately assess the importance of skills cannot teach effectively.

### ABSTRACT

*This article discusses the emergence of the press in Uzbekistan, its causes, needs, historical formation, its role in society, its stages of development. The press is based on the fact that during the Tsarist colonial and Soviet eras, the system became a tool of political propaganda.*

**KEYWORDS:** Writing, Periodicals, Pictograms, Ideograms (Logograms), Messenger, Writer, Carpenter, Historian,

### INTRODUCTION

Periodicals have a special place in the deep and scientific analysis of the history of Uzbekistan. Each historical period is studied by contemporaries and the events that took place in the press are sealed. Regardless of the political perspective of the information in the pages of periodicals, their critical study and scientific coverage are important in illuminating the unread pages of history. In particular, the history of the Soviet period is relevant to the situation we have mentioned above. One of the main hallmarks of civilization is writing [Childe, P.9-16; Gulyaev, 1979. P.19], and the first element of the press is writing [Abduazimov, 2007]. As the relations in the society became more active, as people's experience and knowledge increased, there was a need to receive, remember and pass on information to others. In modern parlance, the problem of storing and transmitting information has arisen. This will trigger the appearance of the record.

In science, there are sources and ideas about the "homeland" of writing, its stages of development. According to the scientist VS Drachuk, the stage of development of writing is as follows: pictogram - ideogram (logogram) - syllable-letter. [Drachuk, 1980. P.27]

Although there is an opinion that Central Asia does not belong to the region of inscription [Rtveladze, Saidov, Abdullaev 2000], taking into account the pictographic inscription of symbols

in Sopollitepa pottery [Choriev, Shaydullaev, Annaev, 2007. P.26], the inscription was discovered during the Sopolli culture [Choriev, Shaydullaev, Annaev, 2007. P.64]. Also, Jarqo'ton, Goose inscriptions, the discovery of an Aramaic letter from Katta Oybuyirqala [Mambetullaev, 1979.] in the ancient lands here ... , 1989. B.11] we witness.

In general, in Central Asia, before the Arabic script, the ancient Bactrian, Khorezmian, Sogdian scripts were formed on the basis of the Greek, Aramaic scripts, and the Uyghur alphabet was formed on their basis [Sodikov, 1997. B.3.]. which was. In the early Middle Ages, Turkish script, Arabic language and alphabet, and later Uzbek became the language of communication and administration. The history of the Uzbek language is divided into three periods: Ancient Turkic language (period up to XIV century AD); Old Uzbek language (the period from the XIV century AD to the October Socialist Revolution); Modern Uzbek literary language (from the revolution to the present day) [Abdurahmanov, 1989. P.9-10].

Thus, although language is the most important means of human communication in society, it is gradually evolving in accordance with the development of society as a product of the times. In the East, the roots of journalism go back to the works of medieval scholars [Fixtelius, 2002. B.12], and they can be called the first appearance of the press. In human society, there were special professions that were engaged in collecting and disseminating information, writing messages and informing people and rulers. People in such positions are writers of events in the state of Amir Temur [reporter] [Amir Temur, 2013. P.139; Amir Temur Koragon, 2000. P.285]. Favorable conditions have been created for the rapid transmission of information collected by reporters, the communication system is perfectly set up. The messengers had the right to take the horse of anyone, even a prince or queen, if necessary on the way. [Klavixo, 2019. B.96; Clavijo, 2010. P.127-128] The kingdom also created the legal basis for the profession of "habarnavis". In particular, the transmitter must pay attention to the accuracy, precision, delivery of information without regard to personal interests, otherwise it will be severely punished. [Amir Temur, 2013. P.139] The position of this professional was highly valued, his duties and responsibilities, the information they conveyed were extremely important in governing the state and society. In a sense, this can be seen as the first form of the social media industry. At different times, such professions were dabir (secretary) [Saalibi, 1976. P.11-15; Abdullaev, 1992. P.29-30], writer [Bakiev, Yuldasheva, 2017. P.149; Bakiev, Yuldasheva, 2019. p. 137-143; Voxidov, 2006. p. 56-92; Samarkand, Volume 2, Part 1. 2008. B. 317; Fozilov, Tom. 1. 1983. B.299.], Bitukchi [Bakiev, Yuldasheva, 2019. S.299; Fozilov, Tom. 4. 1983. B.629, 631], leafmaker, leafler [Bakiev, Yuldasheva, 2019. S.300; Fozilov, Tom. 1. 1983. P.145], numerator, numerator [Bakiev, Yuldasheva, 2019, p. 305; Fozilov, Tom. 2. 1983. B.614.], Roqim [Bakiev, Yuldasheva, 2019. S.306; Fozilov, Tom. 2. 4. 1983. b. 530, 631/2; 619/4.], Homazan [Fozilov, Tom. 4. 1983. B.411; 629], darakchi [Samarkandiy, Volume 2, Part 1. 2008. P.277], editor [Samarkandiy, Volume 2, Part 1.2008. B. 69-70], correspondent [Bakiev, Yuldasheva, 2017. B. 82; Xavafi, 1980. S.129; Samarkand, Volume 2, Part 1. 2008. B. 111, 299; Samarkand, Volume 2, Part 2. 2008. B. 422, 540; Shamiy, 1996. B.96, 215], barid-messenger, messenger [Shamiy, 1996. B. 348, 329], Informant [Samarkand, Volume 2, Part 2. 2008. B.597; Shamiy. 1996. B. 85], secretary [Bakiev, Yuldasheva, 2017. P.212-213; Bobur, 2008. B. 129, 179, 190-191, 232], muarrix [Bahodirxon, 1990. B.11; Shamiy, 1996. P.284; Fozilov, Tom. 1. 1983. b. 401, 245/16], storyteller [Natanziy, 2011. p. 47], news (a) [Fozilov, Tom. 1. 1983. b. 67] and is also referred to by other names. These professionals later served as a positive impetus for the emergence,

formation and development of the press in Uzbekistan. The role of the press in reforming society [Trufanov, 1972. p.42; Xmara, 1974. S.188; Afanasev, 1981. S.383; Prokhorov, 1980. p. 50] Jadid representatives, realizing its extreme importance, pay special attention to it. Although the newspaper and magazine-type publications appeared in Turkestan in the second half of the 19th century, the history of the national press began on June 27, 1906. [Dostmuhammad, 2007. P.103; Boboxonov, 2002.] We can read in N.Abdualazizova's researches that Turkestanskies Vedomosti and Turkiston viloyatinin Gazeti were the first publications in Turkestan that were not popular enough among the masses and even among the intelligentsia [Dostmuhammad, 2007. P.102]. [Abduazizova, 2000. B.6.] After that, a number of press releases were published. According to research on the publication of magazines in Turkestan [Abduazizova, 1997. P.252] Before the October Revolution of 1917, the first magazine in Turkestan was Sredne-Aziatskiy Vestnik (March 1896), in the early twentieth century Turkestanskoe selskoe khozyaystvo (1906-1918). ), "For the People" (1907), "Turkestanskiy skorpion" (1907-1910), "Srednyaya Aziya" (1910-1911), "Turkestanskiy kara-kurt" (1911), "Oyina" ( 1913-1915), "Al-Islah" (1915-1918), "Al-Izoh" (1917-1918, Turkestan is terminated by Resolution No. 243 of the Soviet Socialist Republic of Turkestan for non-compliance with the interests of workers) [Sayfullayev, 2019. P.59] magazines, the almanac "Stepnye mirage" (1914) and others were published and they mainly served the interests of the official circles, the local bourgeoisie. During this period, unofficial periodicals also operated in Turkestan. [Shadmanova, 2011. B.5; Dobrosmyslov, 1910. P.145-152] The work of Ziya Said (Soli Kasimov) is a unique bibliography of periodicals published during this period [Rakhmonov, 2009. P.5; Ziya Said, 1927], MP Avsharov's bibliographic index contains information published in Russian in Turkestan and not found in other sources on the history of periodicals [Shadmanova, 2011. P.12; Avsharova, 1960. S.198]. It is noted that 10 magazines were published in Turkestan before 1917 [Abduazizova, 2002. B.11], Avloni testified that 22 newspapers and 8 magazines were published in 1905-1917. Most of them were issued by Jadid progressives who believed that the only way to get rid of the troubles that befell Turkestan was through education [Mahmud, 1924]. These periodicals did not last long because they did not serve the interests of tsarist Russia, but instead worked to increase the national consciousness, social, economic and cultural level of the Uzbek people. [Hasanov, 2015. B.3]. During the period from February to October 1917 in Turkestan the newspapers "Najot", "Shorai Islam", "Turon", "Turk eli", "Ulug Turkiston", "El bayragi", "Ravnaq ul-Islam", "Ozod", "Al- Reforms ", "Izhor ul-haq ", "Bayon ul-haq ", "Yurt ", "Kengash ", "Ishchilar dunyosi ", "Chayon "magazines were published [Abduazizova, 2012. p. 198-202]. These newspapers and magazines published more articles based on the ideas put forward by the Jadids. After 1917, a multi-sectoral system of political party-Soviet press was established in Uzbekistan. The process of formation and development of this press was carried out under the absolute control of the Communist Party. The form and direction of the press were determined on the instructions of the "leaders" of the ruling party. In Soviet times, there was no law regulating the activities of the press, but the form and direction of the press were determined by government decisions, instructions of the "leaders" of the ruling party [Bahriev, 2000. P.5]. Russian-language newspapers Znamya Svobody, Kokandskaya Pravda, Shchit Naroda, Ishtirokiyun, Voice of Workers, Information of the Fergana Workers 'and Peasants' and Red Army Council, published in the national language since 1918, Workers' Shield ", " People's Newspaper ", " New East ", " Dawn ", " Freedom ", " Sun of the Revolution ", " Bukhara News ", " Salvation "and other newspapers published articles promoting the ideas of the system, [Ernazarov, 1962 , B. 15-16]

Newspapers such as the Red Banner did not give an objective assessment of the independence movement, but instead published articles that blamed the independence movement for all social problems [Khamaev, 2018. P.48]. A number of studies have been conducted on the history of the press during the Soviet period [Ernazarov, 1962. p. 221; Rastsvet narodnoy pechati in Uzbekistan. 1983; Shogulomov, Pidaev, 1965. B. 86; Yusupov, 1974. S. 85; Ernazarov, Akbarov, 1976. p. 288; Ernazarov, Akbarov, 1977. p. 310; Yusupov, 1977; Boboxonov, 1979. B. 149; Axmedova, 1983; Atamirzaev, 1983. S.184; Mamatova, 1994]. These studies exaggerate the role of the Soviet press in society and focus on its role. At the beginning of the twentieth century, newspapers and magazines began to be published not only in Uzbek and Russian, but also in Tajik, Kazakh, Kyrgyz, Turkmen and other languages living in Uzbekistan. [Abduazizova, 2008. P.384] In particular, in the Tajik language "Bukhara Sharif", [Rahimkulov, 2017. B. 13-14] "Ovozi tajik kambagal", "Roshnoi" in Jewish, "Bayroqi mekhnat", "Kutulish" in Uyghur, and later "Sharq Haqiqati" newspapers were published. [Ernazarov, 1962. B. 68-72; Azimov, 1994. p. 8-10] These publications in Uzbek and other languages made full use of the style of Pravda, the organ of the Communist Party [Ernazarov, 1962. P.132], published party resolutions and appeals, and paid great attention to the propaganda work of the regime. After the formation of the Uzbek SSR, by the 1930s, the press had become a full-fledged herald of Stalinism. 26 newspapers in Uzbekistan in 1925, [Ernazarov, 1962. P.22] 26 in 1926, [Aduazizova, 2002. P.36-37] 27 in 1927, 25 in 1928 [Ernazarov, 1962. P.22] newspaper, 24 journals, [Abdullaeva, 2010. P.17] In 1933, 54 journals and periodicals of the journal type were published, and by 1937 their number had risen to 57. [Aduazizova, 2002. B. 36-37] On all issues, these publications express not only the official guidelines and views of the party leadership, but also created an ideological basis for the general repression that took place throughout the country during these years. After the formation of the Uzbek SSR, by the 1930s, the press had become a full-fledged herald of Stalinism. 26 newspapers in Uzbekistan in 1925, [Ernazarov, 1962. P.22] 26 in 1926, [Aduazizova, 2002. P.36-37] 27 in 1927, 25 in 1928 [Ernazarov, 1962. P.22] newspaper, 24 journals, [Abdullaeva, 2010. P.17] In 1933, 54 journals and periodicals of the journal type were published, and by 1937 their number had risen to 57. [Aduazizova, 2002. B. 36-37] On all issues, these publications express not only the official guidelines and views of the party leadership, but also created an ideological basis for the general repression that took place throughout the country during these years. Between 1946 and 1990, the press expanded in number and paid great attention to the ideological and political "education" of all people. We can see from the researches of B. Yusupov [Yusupov, 1977] that the press is completely subordinated to the interests of the party and its control is strengthened. The resolution of the Central Committee of the CPSU set the task of increasing the role of the press and raising the ideological level of newspapers and magazines, their use in solving the most urgent tasks of communist construction. [Red Uzbekistan, 1960. 9] By the second half of the 1980s, the so-called "reconstruction" period began to see the effects of freedom of speech and transparency in the press. According to H. Dostmuhammad, the critical spirit was on the rise. The notion of impartiality and impartiality was mixed with the notion of the interests of certain groups in the interests of the people. Corruption and chaos reigned in the society and in the press. [Dostmuhammad, 2007. b. 126-127]

## CONCLUSION

The weakening of the former Soviet power, the collapse of the economy, the various problems in society were encouraging people to look at life with a realistic view. Although the periodical press operated under the control of the Communist Party, it also began to publish articles exposing the problems of the period, imbued with ideas of national self-awareness. Although the cracked ruling party tried to exert its pressure on such changes in the press through various means, it could not stop the growing force. In conclusion, until 1917, the issues of self-awareness, education, and independence were on the agenda of the national intelligentsia - the Jadids. expressed the will of the Communist Party, serving the purposes of the totalitarian regime, which consisted of mobilizing for the struggle for independence. During this period, the press was in need of radical reform due to its complete subordination to party interests, lack of democratic legal framework, lack of press freedom, lack of self-government, lack of a healthy competitive environment, and censorship. As a result of these problems, the press has become a powerful ideological and organizational tool to achieve the goals of the system. Many articles were published on their pages, which falsified the history of the people, undermined national values, widely supported the policy of monopoly in the country, and promoted atheism.

### ABSTRACT:

*This article discusses the physico-mechanical properties, curing period and heat release of construction gypsum grades G5 and G6.*

**KEYWORDS:** *Construction, Gypsum Board, Gypsum, Heat Release, Hardening Of Gypsum, Physical And Mechanical Properties.*

### INTRODUCTION

In the Resolution of the President of the Republic of Uzbekistan dated May 23, 2019 No PD-4335 “On additional measures for the accelerated development of the construction materials industry”. At a meeting with industry experts, the President instructed to reduce costs through the introduction of energy-saving technologies in the construction materials industry.

Building materials played a huge role in the development of culture and technique. Without them it is impossible to climb buildings and structures. In the construction materials occupy the first places the connecting substances. When the binder is mixed with water, it begins to thicken as a result of physico-chemical processes, its excitability decreases. This is called the period of the beginning of the thickening of the binding substance, and the last period after the complete destruction of the excitability (hardening).

## THE MAIN FINDINGS AND RESULTS

The basis of modern construction is fasteners. They are widely used in the preparation of plaster mixtures and various types of concrete.

Approximately in 3-4 thousand years BC, binder substances appeared to be obtained as a result of artificial burns. The first of them was obtained as a result of burning a gypsum stone - it was a building plaster. Gypsum Stone is considered a traditional mineral binder of substances obtained as a result of the burning of rocks and has been known to mankind for several thousand years.

Gypsum binders are widely used not only in plastering, but also in obtaining bulk building materials. When obtaining a binding substance, raw materials are natural mountain ash (gypsum Stone rocks, anhydrite).

In the world, a total of 35-40 million tons of gypsum binders are produced, of which 90% are used in construction work. The USA, France, England, Spain are the countries that produce the most amount of gypsum binders. The production of gypsum binders in Uzbekistan is well developed in Bukhara and Fergana regions. Much work is being done on the production of gypsum using the production wastes in Tashkent, Fergana, Samarkand regions.

Gypsum binders are a powdery mineral that is mainly a product of the dehydration of calcium by aqueous sulfate. Natural gypsum stone  $\text{CaCO}_4 \cdot 2\text{H}_2\text{O}$  and natural anhydrite  $\text{CaCO}_4$ , gilgips, as well as various wastes of the chemical industry, consisting mainly of calcium sulfate, as well as phosphorus gypsum, borogips, serve as raw materials for the production of gypsum substances.

Two molecules of aqueous gypsum are light minerals. It has a hardness of 2 on the SRHM scale, a density of  $2.2-2.4 \text{ g / cm}^3$ , and anhydrite of  $2.9-3.1 \text{ g / cm}^3$ . The composition of pure two-molecule aqueous gypsum consists of 32,56% CaO, 46,51%  $\text{CO}_3$ , 20,83%  $\text{H}_2\text{O}$ .

The density of gypsum binders is  $2.6-2.75 \text{ g / cm}^3$ , the average bulk density is  $800-1100 \text{ kg / m}^3$  and  $1250-1450 \text{ kg / m}^3$  in the compacted state. Its normal density is represented by 50-70% water consumption; the degree of fineness depends on the amount of impurities. Due to the fact that gypsum is an air binder, its strength is reduced in wet conditions. To increase its resistance to moisture, cement, puttsolan minerals and blast furnace slag powder, water-resistant polymers are added or the surface of the gypsum product is covered with varnish - paints and films.

According to the hardening properties, gypsum binders are divided into two types: fast-setting gypsum binder construction, ultra-strong, mold and medical gypsum, slow-setting anhydrite cement and high-strength gypsum gypsum binders.

The biting and hardening times of gypsum depend on the nature of the raw material, its preparation conditions, shelf life and conditions, the amount of water added, the ratio of gypsum to water - S / G, binder and water temperature, mixing conditions and the presence of any additives.

This condition causes a number of inconveniences, as the mixed plaster must be applied before it bites. If the biting process is disrupted, the crystalline tumors that form will disintegrate and their strength will decrease dramatically. It is therefore possible to finish using the plaster before biting or to mix it in small amounts or to add substances to the plaster that attenuate the biting process.

Special diluents are added to the plaster to prolong its bite time. Colloidal solution-forming, semi-aqueous gypsum (density 2500... 2800 kg / m<sup>3</sup>, bulk density 800 ... 1100 kg / m<sup>3</sup>, bulk density 1250 ... 1450 kg / m<sup>3</sup> in compaction) attenuates the melting rate and, as a result, two Examples of materials that delay the crystallization of molecular aqueous gypsum are bone glue, casein, gelatin, glycerin, magnesium, calcium salts. Water heated to 60 ° C can also be used to prolong the biting time of gypsum.

Enterprises are required to accelerate the biting of construction gypsum in order to make gypsum building materials and harden them in the cold. In the implementation of this, two aqueous gypsum, table salt, potassium sulfate, sulfuric acid, alkalis, potassium silicon fluoride and many other substances are added to the construction gypsum.

When construction gypsum looks more, very soft and quick-biting molded gypsum is formed. Construction gypsum is divided into two grades according to its quality. The tensile strength of gypsum is determined in samples prepared by casting in a mold measuring 40x40x160 mm. To prepare a gypsum mixture that meets the requirements of GOST 23789-2018, great attention should be paid to the amount of water.

In the laboratory, construction plaster G5 and G6 of the scientific production and commercial firm “Imorat-ADA” of Jizzakh region was selected. Normal thickness of construction gypsum, tensile life, flexural and compressive strength was considered as physical and mechanical properties. Samples of 40x40x160 cm were prepared in the laboratory. The test results are given in Table 1 below. The strength is given by evaluating the hydraulic press performance by dividing the surface area of the cube side.

The test time of the samples was set at 2 hours, during which the samples were tested for bending and compression in accordance with Interstate Standard 23789-2018 using a hydraulic press, and the results of testing the samples were determined.

Figure 1. Determination of bending and compressive strength of gypsum; a) bending, b) compression

**TABLE 1 BITING TIMES OF CONSTRUCTION GYPSUM, (MINUTE-SECOND)  
OBSERVATION**

№	Gypsum type	Normal density, cm	Bite times, minutes-seconds		Bending strength MPa	Compressive strength MPa
			Start time	End time	2 hour	2 hour
1	Г5	17,5	1-40	17-55	5,42	5,49
2	Г6	18,0	2-13	18-15	5,62	6,05

During the hardening process of gypsum, its volume expands by about 1%. This makes it easy to use gypsum in the manufacture of architectural items, to close cracks and for other purposes. According to Interstate Standard, the beginning of construction gypsum biting should be after 4 minutes, and the end should last from 6 to 30 minutes. Hence, construction gypsum is a fast-binding and quick-setting binder.

The results showed that the curing period of G5 grade construction gypsum lasted up to 17.55 minutes and the curing period of G6 grade construction gypsum lasted up to 18.15 minutes.

The use of gypsum binder is highly dependent on its crystallization rate. Water accumulation of gypsum binder is an exothermic (heat release) process.

*Figure 2. Determination of heat release of gypsum of G5 and G6 brands; a) G5 and b) G6*

Heat dissipation diagrams of our samples taken in the laboratory, G5 and G6 grades of construction gypsum are given.

Figure 3. Diagram of the process of thermal separation of construction gypsum grade G5.

During the gypsum test of the G5 device, the room temperature was 22 ° C. From the 1st minute heat dissipation, the temperature began to rise from 23.2 ° C and after 30 minutes the construction gypsum reached a maximum of 39.9 ° C and started back again.

Figure 4. Diagram of the process of thermal separation of construction gypsum grade G6.

The gypsum test of the G6 device was carried out at a room temperature of 22.3 ° C. From the 1st minute the heat dissipation, the temperature began to raise from 24.7 ° C and after 30 minutes the construction gypsum reached a maximum of 45.2 ° C and started back again.

## CONCLUSION

To conclude, the physical and mechanical properties of gypsum grades G5 and G6 and its thermal conductivity were observed. The normal thickness of G5 construction gypsum is 17.5 cm, the curing period starts from 1.40 minutes and ends in 17.55 minutes. Heat dissipation reached a maximum of 39.9 ° C in 30 minutes. The normal thickness of G6 construction gypsum is 18 cm, the curing period starts at 2.15 minutes and ends at 18.55 minutes. Heat dissipation reached a maximum of 45.5 ° C in 30 minutes.

### **ABSTRACT**

*The article discusses the role of pencil drawing in the formation of the creative competence of a future teacher of fine arts, the methods and techniques of using geometric shapes in drawing. The article also shows a step-by-step geometric representation of David's face in depicting the shape of a human head.*

**KEYWORDS:** *Fine Arts, Penmanship, Professional Competence, Geometric Representation, Methodological Consistency, Creativity.*

### **INTRODUCTION**

Decree of the President of the Republic of Uzbekistan dated April 29, 2019 No PD-5712 "On approval of the Concept of development of the public education system of the Republic of Uzbekistan until 2030", improvement of teaching methods, development of practical scientific research aimed at studying alternative approaches and scientific substantiation ". This shows that one of the most important tasks is to improve the creative competence of the future student of fine arts in the specialty [1, 2019].

### THE MAIN FINDINGS AND RESULTS

In higher pedagogical education, the subject of penmanship, along with all other disciplines, plays an important role in the professional training and formation of creative competencies of future teachers of fine arts. Pen is the leading science in all educational institutions specializing in fine arts. All in the category of fine arts, which provides professional training of future teachers of fine arts in higher education: "Plastic anatomy", "Painting", "Composition", "Technology of fine arts and printing" and "decay" is the theoretical basis and foundation of such disciplines. The great Michelangelo Buonarroti, a Renaissance painter, sculptor, and fine art theorist, made the following point. "Pencil drawing, in

other words, the art of drawing, painting, sculpture, the pinnacle of architecture, is the root and source of all science" [4, 1984].

Indeed, penmanship is a key discipline in the training of future teachers of fine arts and design in higher education. That is why the professional training of future art teachers is one of the most important tasks today.

The results of many years of practice show that in the fine arts it is not difficult to build a perspective image of a simple geometric object, but it is much more difficult to create a perspective effect of a portrait, human figure and other similar complex shapes. Therefore, based on the pedagogical principle of education - from simple to complex, from general to specific, Renaissance artists used the simplest geometric shapes in their teaching to depict complex shapes. They were taught to see and imagine the shapes as a whole, as well as each part of it on a geometric basis. Following this principle, the painter had to sculpt the shape like a sculptor and imagine its generalized appearance.

This is illustrated by A. Dürer (Figure 1). This technique has been used by many artists to analyze and construct images of the human head. An example of this is the paintings by Golby and Sean, two of the oldest painters. Practice has shown that the cross-sectional method makes it much easier to master the principle of perspective construction of the image. Since the Renaissance, and even to this day, this style has been used by educators.

Later, the great Russian artist-pedagogue D. Kardovsky spoke about the principles of drawing and teaching methods; *"So what is form? - These include geometric objects; cube, sphere, cylinder, and so on. They are objects of one character or another. Of course, the shapes of living things cannot be exact geometric shapes, but in fact they are close to these geometric shapes"* [2, 2006].

The subject of penmanship is the basis of all special disciplines taught in art faculties and provides a direct link between them. Without sufficient knowledge and skills in painting, a student will not be able to master composition, painting, sculpture, folk arts and other specialties at a high level.

At present, the most pressing issues in pedagogical universities and institutes are the development of theoretical and methodological bases for the teaching of specialty subjects, including pencil drawing, and the development of new scientifically based ways, forms, content and methods. They are:

- To determine the current state of teaching fine arts to young people on the basis of state standards of fine arts education and to develop its future directions for the coming years;
- Scientific and methodological analysis of the activities of institutions that train specialists in the field of fine arts;
- Ensuring the development of young people as highly qualified professionals by expanding the use of local resources in the training of teachers of fine arts and the development of highly talented, loyal to the Fatherland, fluent in the art of national and world peoples. to ensure that they grow up to be people who can love and appreciate our culture.
- Training of highly qualified teachers for secondary special vocational colleges, secondary schools with a high level of theoretical and practical knowledge of penmanship, equipped with modern information technology.

This means that in order for a student to do his or her homework properly, he or she must first and foremost follow the laws and regulations that apply to the visual arts. Through them, he must exaggerate the primary objects in the image in the course of performing academic tasks, accurately describe the characteristics of the form, and make the secondary objects less general and simple to the eye.

The laws and regulations in the field of fine arts, especially in the field of educational writing, are based on the laws of nature. These laws influence the development of the visual arts. The laws of illustration increase the competence and skills of students in drawing, develop their creative abilities, and thoroughly prepare them for future pedagogical activities. In order to develop students' drawing skills based on geometric shapes, we will get acquainted with the basic laws of construction of the nose shape from parts of the head shape (David's head sculpture) Figure 2. A plaster cast of David's head is recommended for the study of skulls in art schools of all types and stages.

When drawing a picture of the nose, the methodological sequence of image construction is followed - from simplicity to complexity, from general to specific. First of all, it is necessary to determine the prismatic shape of the nasal plaster specimen; we determine its position and proportions in width (according to the laws of perspective). The location and orientation of the nasal prism (anterior, inferior, and, if visible, the two lateral surfaces) are then determined. If the nasal prism is frontal towards us, then the anterior surface is well visible, and the rest is in perspective contraction; if we look down at the nasal prism, the lower surface of the nose is spread out and well visible, while the anterior and lateral surfaces are in perspective contraction.

Prism - If the structure of the nose is in four or three turns or in a profile, the side surface of the nose prism facing us is better, and the rest of the surface is in perspective contraction. Therefore, first of all, we need to correctly determine the general shape of the prism-nose in the image, to determine whether its position is correct according to the laws of linear perspective in latitude, and to check its proportions. This will open the structure of the form according to our scheme.

When drawing the lips, carefully observe the nose-lip shape plastic in front of the corners of the lips. The upper and lower surfaces of the lips are pulled in as they approach the corners, and the protruding part of the cheeks (nose and lips) seems to close to them. In most students, on the contrary, the lip arrows protrude forward; they are spread out on the pattern, so the plasticity of the entire lower part of the face is broken.

Students usually make their reflexes very bright. Use the following method to test your reflex strength; look at nature and close your eyes a bit while seeing the reflex - if the reflex disappears, it should disappear in the picture as well. If the reflex is too bright, it should be slightly lowered. To see the integrity of the shape in the picture, move it further away from you.

As you master the material, make sure that the pictures you draw at the same time are expressive. To this end, it is important to copy the classic manual. In this process, the student learns not only the form, but also the material properties of the forms.

Copying helps you control the pen and see the expressiveness of the graphics. These exercises also help to reveal the expression of color and shape.

To better understand the laws of lip construction, you need to draw a series of pictures of living nature (as a nature, your own image in front of a mirror also works).

In the implementation of this, the student draws himself with the help of a mirror, in the process of which he can try to express not only the plastic characteristics of the lips, but also his emotional state. Lips are very expressive, and a person can express his mood with his lips. The person raises the corners of the lips in a good, cheerful mood (i.e. laughs); when he is sad or crying, on the contrary, he lowers the corners of his lips. You need to lighten your lips in different emotional states and observe how the edges of the upper and lower lips change character, what the line of the lip line looks like. The shape of the lips varies from person to person (pay special attention to the appearance of the lips).

The expressiveness and character of the shape of the lips also depends on the thickness of the lips. The light spreads over the head, allowing the artist to see its plasticity. Initially, a person perceives the shape of the head very quickly in a generalized way; the head looks like a ball, the neck looks like a cylinder, the nose looks like a prism, and the eyes look like a spherical shell. Only by looking closely can the artist begin to grasp the subtleties of the plastic description of both the head and its parts.

From a psychological point of view, a person first begins to perceive the general form of an object, and only then its parts. The results of scientific research provide a basis for distinguishing five main stages of the cognitive process:

1. Distinguish between the spatial position of an object and the approximate estimate of its overall proportions:
2. The form stands in the raccoon:
3. Distinguish changes in perspectives:
4. Perceive the form in the same general way when its details are given indistinguishable:
5. Display the shape exactly to its details.

In case of compliance with the laws of visual perception, it is necessary that the drawing depicts, first of all, the general appearance of the head, indicating its shape-windy features.

Artists have been emphasizing this need since the Renaissance. For example, Alberti wrote in his book "Three books about painting". "When we look at something, we see that it occupies a certain place in space. Later, when we look deeper into this body, we see that all its many parts have come together"[3, 2017].

Artists and educators of the XII-XIX centuries also derived from the simplest geometric shapes in the depiction of complex shapes (Karrachi, Preisler, Losenko, Shebuyev, Sapojnikov, Dupuis, Chistyakov, Ashbe and many others). For example, Anton Ashbe, a Yugoslav art educator, used the "ball principle" and color modeling as the basis for his system of teaching to draw a sketch. The artist and educator D. Kardovsky believed that the first stage of painting is the use of the method of "cut" drawing. It should be noted that almost all artists from different schools and disciplines have come to the same conclusion; In describing the structure of the head, it is necessary to start large by exaggerating the appearance of the overall volume, and then move on to the smaller parts [3, 2017].

## CONCLUSION

To conclude, the use of geometric methods of drawing in the organization of pencil lessons to form the creative competencies of a future teacher of fine arts should take into account the following main aspects:

1. Observation of existence, analysis of everything on the basis of elementary rules.
2. Draw simple things with a pencil, identify shadows and lights;
3. Draw and show the volume using the principle of comparison with geometric objects in the description of both simple and complex shapes.
4. Theoretical analysis of the shadows formed in the forms, their relationship.

### ABSTRACT

*The following article is dedicated to Alisher Navoi's work "Khamsa", and artists over the centuries by various cases of clear prose. It is also drawn attention to adjust the interpretation of the works of changes in attitude to the works of art, the analysis of the level of understanding of the classical works of the reader. The characteristic features of that period, according to the needs of readers reviews were transformed into prose, carried out by analyzing changes in the first prose description of "Nasri Xamsai unique" case-lit. There were analyzed the original interpretation of the work, which shows the mistakes and flaws. English literature, research and analysis to new resources, "Nasri Xamsai unique" are presented as the comparative analysis of the case.*

**KEYWORDS:** Alisher Navoi, Hamsa, Poetry, Prose, Period, Reader, Publisher, Prosaic Statement, Stone Press.

### INTRODUCTION:

During the history of human civilization, there have been artistic treasures, all the spiritual descendants of the fullness of time, have been reading their influence steadily. Great Uzbek poet Alisher Navoi, which consists of five poems "Hamsa" (the fifth) is one of such works. For centuries, "Hamsa" was part of the poem, artists and calligraphers copied them in order to convey to the public the content of the work illustrated with miniatures. However, according to the requirements of each time it is not kept to its brahma uniform. Sometimes scribes to copy them to change the name of poems, through its innovative products, enter a brief part of the book "Amazed Abror" epic omitted from some of the narrations of the five integrity.

**MATERIALS:**

As you know, from the end of XIX century to the beginning of XX century the literature lovers of original stories of "Hamsa" were kept reading among intellectuals and common people and work in the style of the book of prose poem options was wide spread. Folklore "Hamsa" will continue in the direction of the intrigue of stories "Farhad and Shirin", "Layla and Majnun", "Bahram and Dilorom", "Iskandarnoma", "Amazed Abror" philosophical poem, which was not only a subject line, such as the creation of the common options. Natural writer Nosirxoja Vala Mansurxoja "Layla and Majnun", by poet grieve, "Farhad and Shirin stories," Mirza Secretary Alexander Namangani a great adventure novel "Iskandarnoma" s prose. Tashkent State Institute of Oriental Studies at the Center of Oriental Manuscripts named after Abu Rayhan Biruni many other prosaic stories of the same name created by the presence of the people, "Hamsa" poems written literature and folklore has served as an inexhaustible ideological source. In general, Alisher Navoiy the next phase of creative works devoted to the school as an example inspires them.

At the beginning of the eighteenth and early nineteenth century poet, who lived on behalf of Omar Baki Khan of Khiva Avazbiy Anakin "Khamasa" poem, "Farhad and Shirin", "Layla and Majnun" of creative, independent prosaic statement. Turkish Literature Khan of Khiva Avazbiy work, "Hamsa" to create a prose description of the cargo Omar ever undertake course, refers to a specific destination. The palace environment Navoiy understand the essence of the poem, and read the content of the original, deeply educated people capable of understanding a lot, but the masses of ordinary people can enjoy even more important to isolate. Academic A.Kayumov Ogahy carried out by the Khorezm order Muhammad Rakhimkhan Firuz Khan Nizami novels, "Haft Pike" free prose translation of the poem analysis, explains the goals set in its translation: "the initiator of the translations increase orders and supplier of Khorezm Muhammad Khan Rahimxon Feruz. He is the head of state. So, East masterpieces of classical literature to the public of the state policy in the field of education and culture event. This is the general public in the event that works and stick to familiarize the public with the effects to show, educate society, would continue to benefit from the ideas and works of service " [Kayumov, 2009, p. 28].

Thus, the Khan of Khiva Avazbiy Anakin socio-political, cultural and educational purposes Navoiy for the public to understand the purpose of the creation of a simplified version of the poem, I knew that. Prose descriptions Navoiy through deep humanistic ideas, creative minds of the people in mind. Umar talented artists ever work carried out by their results soon. Prose descriptions Navoi become one of the most beloved works of the night and spread across the entire region. The first of the lithographic printing according to the needs of self-publishers, readers will be published repeatedly.

**DISCUSSION:**

In fact, the promotion of the works of Alisher Navoiy say a little inappropriate. Not because of her work since the creation of the entire Turkic literature, the reader is not heard. But until the remains of the classic poem, increase again. Accelerate the popularization of the works of the creator of the saga.

Among the people due to particularly strong interest in the romantic-adventure books, "Farhad and Shirin", "Layla and Majnun" poem, prose versions of options and more creativity. As you know, Alisher Navoiy, "Farhad and Shirin" at the ancient eastern portions of the literature on the

part of the tradition gives praise to Allah and the Prophet. After Nizami Ganjavi teachers, Xisrav Dahlawo, Rahman Jami, who praised his friend Hussein Boyqaroni Bethel lights. People form of prose description of the creation of creative options in this section of the book are omitted.

Omar ever Navoiy more creative approach to the text of the legends, folk narratives, like any other major events in a statement, according to traditional prose sentence poem (Chapter 11) and the conclusion (Chapter 2) describes the prose plans. The main events Farhodov were born, and ended with the death of lovers. This is the original text and creative memory does not relate to the sensitivity of the genre taken into account.

This explains the choice of this particular study, the scientists N.Mallaev statement: "This, of course, Umar lasting Navoiy" preamble "and" Memory", but not indifferent form to a specific request, the method and style of expression," he said , and these sections Omar enduring great enlightenment, spiritual, aesthetic, and highlights the creative inspiration [Mallaev, 1973, p. 135]. Omar is eternal poem, traditions of the people of that time, the shape and direction of the story.

During this period, even translators, DTP publishers, book reader works in accordance with the level of simple, tried to. "Some of his works were translated into composite parts, reducing translators. Most of this reduction of the start of a part of the work, dedication and traditional praise" [Komilov, 1976, p.16].

Lithographic printing publishers, who worked in the early period of the twentieth century works of classic literature as active promoters of the process closer to the people, seeking to publish and distribute multiple copies. The situation in revenues, readership now in various development options, "created by Alisher Navoiy and allow her to enter deeper into the understanding of the validity of the original copy, and so the key will be to review the need for suspect " (Salomov, 1983, p. 149). Navoiy description of the first prose poem "Nasri Xamsai a unique" natural needs, the result of a creative process. Prose description created by the publisher Mir bin Shohyunus Mahdum Tashkent and Ghulam Hassan Orifjonov the year 1908, published in the Arabic alphabet print.

"Hamsa" Description of the first prose poem "Nasri Xamsai outstanding" at a certain file, there are many quotations. Edri original text has some way to reduce the omission in the evacuation, works of prose period, according to the requirements of the authors describe some of the clips are omitted from the description.

## FINDINGS:

Spoiling the inscription, "Hamsa" as a unique, unique and invaluable work indicates that the expression of a work of prose, the statement "Nasri Xamsai unique" names. In turn change the name of the poems and folklore storytelling tradition "of Farhad and Shirin", "The story is Layla and Majnun", "Narrative landscape Bahram week", "Iskandarnoma" style names. The ancient stories, "stories of King Jamshid", "Hasan and Husayn stories" and "The stories she Dilorom" story called simultaneously, such as that represented genres. Mir is the traditional way to attract the attention of readers have named Mahdum.

"Khamsa" poem in the traditional procedure, have a strong sense duration of sentence they are placed as follows:

Iskandarnoma

Narrative landscape Bahram week

Layla and Majnun stories

Farhad and Shirin stories

As is known, "Saddi Iskandari", which represents the views of Navoi latest saga. This will take place depending on the nature of the publisher poems, because "Saddi Iskandari" great epic philosophical and educational work, Navoi it a great quality of life, community, reflected in the attitude of the people. "Hamsa" is the largest of the epic legends; subject to the complexity of the composition in terms of approach him with a great sense of responsibility, political and social importance as a masterpiece. - Alexander, Bahram symbol of society, that seeks to influence people. Poem, rising by Mir Mahdum good ideas of their own, which directs the interpretation of the period.

Q. Ergashev, "Nasri Xamsai outstanding" poems that this position explains the procedure: "Mir Mahdum" Hamsa "lies in giving priority to the social content and in prose poem, and his place in accordance with these views. Indeed, the social content and ideas, "Hamsa" There are all legends. But "Saddi Iskandari" at the image of Alexander the idea of the Incarnation of the righteous king, the enlightened ruler expressed through the image of a very good" [Ergashev, 2009, p. 4].

Mir Mahdum one more reason to stop these two epic priority statement, first of all, it is the publisher of literature, science, education promoter, light to reveal the human person. As a result, the works of literary-aesthetic, educational exposure takes into account the strength of the report of the socio-political nature of this poem in the first place, and aims to bring people through the work of Navoiy spiritual Naf'ul. In addition to these ideas, the author of two poems after a small deviation from the people and the rulers of justice, generosity, mercy will be part of the story was that a few of the book. Professor M.Muhiddinov "Seven planets" plot of a number of works in the analysis of the content of this book "of landscape Bahram week," explains the different stops, and a number of conclusions: "The works of the publisher Navoiy a better understanding of the importance of education in his day. It knows that he is calling the rulers giving Adlung gain. Therefore, as an example of Alexander the Great and the kings of the humane justice, "according to the publisher and justice, devotion to promoting the works should be spread among the people, he says [Muhiddinov, 2007, p. 86].

Poems considered "Amazed Abror" does not have the whole story. "Amazed Abror" is not clear prose descriptions from destruction in the next few years, "Amazed Abror" relatively prosaic explained later. When the author explains abbreviations full prose poem, which is unusual artistic statement. However, we think, the publisher according to the purpose of the set period, depending on demand and opportunities.

"Hamsa" in the Preamble chapters, instead of the traditional praise and Mullah Mirza Xomushiy "praise" Turkey is "Shohnoma" and separate, shorter ("Shohnoma Turkey" the first edition of the publisher's). This praise and served as the beginning of the period to stay in shape. Was published in 1908, "the king of storytelling Jamshid", "murderer a hero of the stories," such as the outbreak of the text of such works.

After the traditional praise and who intended to report and how to interpret the potential to do this: "book "Hamsa" Navoiy travel Rahmatullah gardens and multicolor gathered to hear prose poetryю "Hamsa" I loved every single soul in poetry and Navoi Lazio, openhearted people and wise and spiritually enlightened people. But the wisdom of the people and the story is the story of the love and of a sound mind. But this is the time most people only literates can not balance and grant enjoy poetic prose gradually, I patiently explain anything goes, so pardon error" [Mir Mahdum, 1908, p. 3].

Thus, the publisher of his day poem, simpler case, that it is necessary to provide for the common people think. Only created great masterpieces of poetry readers think, needs to turn a prose work as a result of natural highlights. In fact, people are fascinated by the beauty of his poetry, poetic weight. Prose description paving the way towards the understanding of its essence.

### RESULT:

Omar ever as he went the way of rounding, the content of the pages and reduces the number of events completed in the next chapter "in general", "Chun", "but" had contact with on a regular basis. In turn, changes in the structure of the chapters. As it is known, Navoi areas presentation of the descriptive part of the image and lyrical input" set up. Mir Mahdum introduction of the (al Rawi say), description and image storage, lyrical prose can not be relied upon your conclusion, this is a conscious being. According to the plan, because the tab after the sections are combined under a single big sections should be the overall total. This is the essence of epic poems during the four losses, the structure went out of four. Lyrical memory "Saddi Iskandari" at the first 7-8 chapters of a house, then 6 bytes in a row. "Farhad and Shirin" at 3 bytes, "Layla and Majnun" is 2 bytes. Prose memory bytes will not be displayed next chapter will be linked to the events. "Seven planets", which will be given upon arrival at the Lyric, resulted in the original text. In this case relate to events in the adaptation of the genre is very easy to connect to one another.

Mir Mahdum prose coincides with the original text for clear-cuts, if slightly positive approach. In particular, the "Seven Planets" at Navoi in the memory of a dream Bahrom remain motivated. In addition to the text of the work, "Saddi Iskandari" and "Seven planets" after a small description and the ideas they expressed intention to withdraw approval for the expansion of their riches and blessings of the kingdom, which reflect the fair makes a nice story, and the following objectives expresses: "Alexander has been Bahram King narratives mentioned above, together with Real, but other King stories. Hamas should make the ADL and cabbage, and compliance with the Shariah and the pardons with the higher ranks. Other people, even if these qualities Musavvad, honor and respect in the middle of the crowd. So, I'm writing a little preserve old died and cabbage, and should make clear pardon" [Mir Mahdum, 1906, p. 3].

Author "Amazed abror" story from the four and a common story among the people - a total of eight prose place as described in the story. This time the author of prose describes two functions: "Hamsa" portions of the poems were the main events in a simple, common style, along with prose to make clear to the opportunity to carry out his creative plan. Do not affect the content of the poems in the book "Saddi Iskandari", "Seven planets" ideological content of this part of the story, and it describes the synchronization of a specific innovation.

Among the poems "Saddi Iskandari" a complex subject, the composition of the device, which is able to work, "Alexander has been a part of the story after the events of the world, is the study of the philosophical views expressed in the life of society chapter. ... After his story that points to

prove after the conclusion of wisdom are" [Kayumov, 1975, p. 21]. The saga of the structure of any such complexity into trouble. For this reason, the publisher of the work of prose reflect deep on the left and down into chapters, they do not affect the basic plot level, the majority of the life of Alexander the prose sections. Navoi philosophical and ethical ideas of the chapters in this instance, narrations and opinions expressed by Aristotle, Alexander's plan while the minimum amount of questions and answers. However, the epic stories and wisdom of each specific role. They are "working directly with leading content access, he explains, is completed, the evidence is much brighter, and the opening of the validity of the idea." Brought a great responsibility in this chapter Nasr, of course, reduces the value of a work of art. There are specific reasons for it. Meanwhile, Mir Mahdum according to their level of business opportunities must be taken into account. Philosophical prose section, retractable great work, perseverance is required. His main aim to bring readers interesting plots. In addition, the book also takes into account the size of the whole of the poem, prose to describe his work, and therefore a plus for the philosophical and ethical chapter is a tool to get to know the original student.

1939-1940 Latin alphabet in a statement published prose to prevent cuts. But "Khamsa" poem, and in recent years most prosaic statement omitted from the preamble and memory prosaic statement. However, the statement made cuts in the same context, can not be overestimated. Literary scholar A.Erkinov version has two phases: the first stage - "Eastern way of thinking and living is still preserve the innocence" of the period; During the second stage of the western way of thinking increased interpretations created [Erkinov, 1998, p. 63]. "Nasri Xamsai unique" Oriental Uzbek people still keep thinking of the period. In recent years, the statement was a result of political, ideological constraints created in praise of the departments descriptions are omitted. Prosaic statement made a special study of literary A.Hayitov and stunted Reductions in fact change, but also the requirements of the dominant ideology during the recession, he continued: "That is the view of religious, philosophical and mystic poet be free of them tends to be construed as secular works for the same period was caused by a common cause" [Hayitov, 2000, p. 85].

## CONCLUSION:

Prose created during the period described above, there was no such restrictions. Taking into account the needs of the interests of publishers and readers demand, which necessitated a period of adaptation statement. So, Navoiy poem, prose versions of each period defined by the literary process, created to meet the needs of the broad masses of readers, and this process continues. Every one of them an important place in literature of the period, with their functions.

## SOME COMMENTS ON THE HISTORY OF THE PENETRATION OF THE CHIGIL TRIBE INTO MOWAROUNNAHR

**S.M. Kuldashev\***

\*Intern Researcher,  
Institute of History of the Russian Academy of Sciences,  
UZBEKISTAN

### ABSTRACT

*This article summarizes the historical and ethnographic information about the Chigils, one of the Uzbek tribes. It also analyzes the areas inhabited by the seeds of chigil and traces the history of their entry into the Mowarounnahr region.*

**KEYWORDS:** *Chiyaal, Chigil, Jigidil.*

### INTRODUCTION

Chigils played a key role in the formation of the Karakhanid state. They are also one of the ninety-two clans that played an important role in the ethnic history of the Uzbek people. Chigils originally lived in the south of Zhetysu and Issyk-Kul.

There is a large village called Chiyaal in Chirakchi district of Kashkadarya region. Chiyaal village is famous not only in our republic but also abroad. So why is the name of Chiyaal village famous and the history of the village, what does the toponym Chiyaal mean? According to historical records, the name of the village of Chiyaal is associated with the Chigil tribe, one of the Uzbek tribes [1.209].

Chigil, also known as Jigil, Jikil, Chiyaal, has been mentioned in historical sources since the 4th century AD.

According to the narrations, the name of one of the sons of Turk ibn Yafas ibn Nuh was also Chigil [2.24]. Khiva khan Abulgazi Bahodirkhan in his work repeats the information that the name of the third son of Japheth was Chigil [3.5]. The Chigils are also mentioned in Firdausi's Shahnameh as the ruler of Turan [4.89].

## THE MAIN FINDINGS AND RESULTS

Mahmud Kashgari described the Chigils as follows: When Alexander the Great reached the city of Argu on the Syrdarya, it rained and the whole place became muddy. So what kind of mud was Alexander the Great's "In chi gilast" in Persian? He said how we can get rid of it. He builds a castle here. After that, the name Chigil began to be given to those who lived in this place [5.374].

The name Chigil is called Chuyue in Chinese sources and means "the place of the moon" [6.250]. A. Khodjaev writes that in the process of studying Chinese sources, the Chinese called the Turkic tribes Tele, Cheli [7.9].

In Persian sources, they mean "forty". In the Majmua at-Tawarikh of Gardizi, Chigil states that it originated from the name of the chief of this tribe [8.200].

Abu Dulaf, who made a long journey from Bukhara to Ching during the reign of the Samanid ruler Nasr II, presents the Turkic tribes along the paths he traveled. In it, Abu Dulaf mentions that on the twenty-first day of his journey he went to an area inhabited by squirrels [9.145].

Where did Chigils live?

If we look at the historical literature, we can see that the Chigils originally lived around Lake Issyk-Kul and on the banks of the Ili River.

Mahmud Qashqari writes that the Chigils live in areas from Jaihun to the upper Qing (China) [2.487]. This information was mistaken in the translation of "DīwānLughāt al-Turk" by SalihMusalibov. In fact, the Chigil tribes were nomads and lived in different places during the reign of Mahmud Kashgari in the Talos Valley, Fergana Valley, East Turkestan and the Kashkadarya oasis, around Samarkand.

Mahmud Kashgari also mentions that the nomadic tribes living in the city of Kuyas near the city of Barsagan were also called Chigil [2.374]. Muqaddas cites in his century as a residential area consisting of a mosque where the name of Juma is recited near the city of ChigilTarozi [8.200]. In fact, the city was located near Tarozi. The city is named after Chigil. This city was formed during the settlement of the Chigils, and the bulk of its population was also Chigils. Some of these were nomadic pastoralists who lived around Tarozi (Torozi) [10.206].

"Hududul-Alam" also mentions that Chigillarni wore a felt hat and migrated to large areas on the shores of lake Issyk-Kul and the Ili River, grazing sheep and cattle [11.271].

According to K. Shoniyazov, one of the largest seeds in the snowdrops, Chigils lived on the banks of the Jugoriya and Irtysh rivers before they came to Zhetysu[12.158].

G. Babayorov stated that he lived northeast of the town of Beshbalik of the Chigals and west of Barqul [13.38].

There are also different views on the arrival of the Chigil tribes in Mowarounnahr.

Mowarounnahr and adjacent areas were inhabited by local Sogdian and Turkic peoples. In the VI-VIII centuries, along with the seeds of argun, yagmo, duglat, qarluq, halach, turkash, kangli, kipchak, oguz and others, chigils also came and settled. Most of them settled in the areas of Central Asia up to the Amu Darya and mixed with the local population [14.260].

K. Shoniyazov writes that Chigils migrated to Tokharistan along with the descendants of Qarluq and Khalaj in the late 6th and early 8th centuries during the Turkish Khanate. During this period, the rulers of Tokharistan were called yabgu [12.146]. In the VI-VIII centuries the Oghuz, Qarluq, Chigil, Khalach, Yagmo tribes settled in the middle and lower reaches of the Syrdarya and in the Tashkent oasis [15.37].

The Chigils, along with the Qarluqs, took part in the battle against the Chinese by the Arabs in 751 near Talos [16.38]. This indicates that in the VIII century, the Chigils migrated to Central Asia.

Another researcher converted the Chigil and Yagma tribes to Bukhara and Samarkand in the 10th century during the Samanid period and converted to Islam. However, the large urban population and their interference led to a loss of identity [17.349]. This is not true. Because even during the Samanid period, the Turkic tribes made up the majority of the population, and the population also spoke the Turkic language. Only state affairs were conducted in Persian. In addition, the highest position of the Samanids was that most of the pilgrims were Turks [18.110-111].

According to "Ibn al-'Asir", when the Qarakhanids attacked Samarkand, most of their soldiers were Chigils [19.226]. After that, the Chigils moved around Samarkand.

Another source states that the Chigils entered Movorounnahr in the 11th century under the rule of the Qarakhanids [20.114]. This is also not true until this period.

According to AsrorQayumov, before the Mongol invasion, ancient Turkic ethnic groups such as Chigil, Yagma, Usun, Tuxsi, Khalachi and others came to Central Asia and settled there [21.38].

The political life of the Karakhanid state was led by people from the Chigils. According to researcher O. Pritsak, the lion was the totem of this chigil seed. The rulers of Western Karakhanids were also called Asrlonkhans [22.24].

The famous scholar Yusuf Khas Hajib was also a Chigil. Because he wrote many poems in Chigil language. Also at that time the majority of the population was chigils [23.79].

Also known as Aynud-Davla, the deputy of the Qarakhanids in Samarkand was one of the Chigils and at the same time the leader of the Chigil soldiers [19.226]. Aynud-Davla also played an important role in the political relations between the Qarakhanids and the Seljuks [24.295].

Many of the settlements mentioned in medieval sources have names derived from the ethnonym chigil. In the Tashkent oasis, Chatkal also originated in the Middle Ages. At that time, there was a city called Jidgil in this area [25.203]. The city associated with the name Chigil also existed in the Fergana Valley in the IX-X centuries, and the name of this city was also called Jigdil [12.191]. In the Middle Ages, in the city called Yar on the southern shore of Lake Issyk-Kul, there was the residence of the chief of the Jikil (i.e. Chigil) tribe [26.92]. The city still retains its name in the form of Chal. In addition, the names Chigilkent and Chigil-balyk in Xinjiang (China), Chigil in Zhetysu (Kazakhstan) and Chingeldi in Tashkent region [26.42] are also derived from Chigil. This chigil toponym occurs in various forms, such as "shiyen", "shal", "chal" and "chiyal" (i.e. Chigil) [26.146]. Villages associated with the name Chigil have also been preserved in the Sivas region of Asia Minor, Beyshehri, Kastomonu districts [27.103-106].

## CONCLUSION

Thus, the Chchigil tribe has been living in the Issyk-Kul and Talos valleys of East Turkestan since BC. From the beginning of the twentieth century, a part of the Chigil tribes slowly entered the territory of Uzbekistan, first as part of the Khionis, Kidaris, and Eftals, and mixed with the local population. During the Turkish dynasty, however, its entry was felt a little. When the Arabs came, many Turkic tribes lived in these areas. In the X-XI centuries, the Chigils played an important role in the formation of the Karakhanid state, and it was this process that led to the emergence of the Chigils on the stage of history. Information about the Chigils was recorded by Arab historians such as Al-Muqaddas, Al-Gardizi, Ibn Hawqal, Ibn Istakhri, IbnKhurdodbek.

Today, in addition to the above-mentioned settlements of the Chigil ethnos, it is found in Asia Minor, Azerbaijan, the Volga region, the Xinjiang Uyghur Autonomous Region of China, Siberia and other regions. This suggests that the Chigils were involved in the ethnic history of the population living in large areas.

### ABSTRACT

*This paper clarifies the political development and socio-political modification in Uzbeks in modern times. The political advancement of Uzbeks and its connection with the particular social-political arrangements, as well as the effect of the Soviet guideline on those structures are analyzed. In addition, the paper examines the development of an Uzbek political character and its impact on post-Soviet autonomous Uzbekistan. The fundamental argument is the Uzbek experience in the Soviet rule has transformed the Uzbek society and made relative progress in changing the conventional structures into apparently modern ones. However, regardless of the practical political modernization in the Soviet period, the particular socio-political association, tribes, and family relationship structures intrinsic in the Uzbek society succeeded, adjusting and even changing current organizations and structures forced by the Soviets. These customary informal structures have developed as stable organizations in the post-autonomy time.*

**KEYWORDS:** Political Improvement, Uzbekistan, Informal Politics, Administration.

### INTRODUCTION:

The fundamental point of the paper is to examine the Western view on the bases and outcomes of development in Central Asia and Uzbekistan dependent on the modern conceptualizations and attempt to offer an increasingly centered methodology on the socio-political framework and the change occurring in Uzbekistan. These conceptualizations revealed a Western-arranged method that appeared to ignore other experiences, for example, those in Central Asia with totally different social-historical structures and skills. In this paper, real purposes of discussion give a premise of research on the political change of Uzbekistan. The predominant methodology on post-Soviet Central Asian nations would expect that the recently made states, similar to

Uzbekistan, would follow the western model into the post-socialist political frameworks and would build up modern types of vote based systems and liberal economies. The move of political identities from modern socio-political association to colonial characters, from Sovietisation to new national identities in the post-Soviet freedom period, establishes a fundamental issue for current Uzbek politics, for example, for the national identity-making, during the modification frame. The philosophy of the country state pushes the old, conventional, and pre-current types of social associations. It replaces them with the modern standards of social-political organizations, law, and financial matters. Governments in the modification are relied upon the change politically, legitimize, bureaucratize, and make the practical arrangement of political foundations in which the legislative power legally utilized. The legitimization of politics, economy, and lawful framework are the primary determinants as advanced by this Western-one-sided approach.

In addition, the most pivotal point in analyzing the subject of inquiry, to be specific the role of curious socio-political structures, of casual governmental issues and factions as the operator of occasional legislative issues in Uzbek political modernization must genuinely be considered. Uzbekistan is the most strong communities for Islamic development in nations of Central Asia, the place that is known for contemporary Uzbekistan situated at the focal point of Central Asian civilization. The impact of the Oasis (Bacon, Elizabeth E. 1980) culture is altogether observable in these grounds, with a more decentralized populace of mixed origins, in contrast with the itinerant societies of the east. Uzbekistan can depict as one of the most 'conventional' social orders in Central Asia, which makes it a different case for an examination of modernization.

### **METHODOLOGY:**

So as to break down the political modernization in Uzbekistan, this paper will use theoretical ways to deal with modernization in a more broad sense by alluding to standard scholars and discussions on political modernization. Likewise, an authentic record of the rise of the Uzbek will be made by utilizing the material from the scholars on the Central Asian region, to find and characterize the idea of current Uzbek society. The common socio-political framework, just as part of religious identity will be analyzed. The paper will use secondary material on the pre-modern development of Uzbek society, for the most part, dependent on the Western history specialists'.

### **Political Upgrading in Central Asia:**

On account of Central Asia, it is difficult to make a distinct meaning of the modernizing society, because political modernization itself requires the existence of a modernizing ability and society with the adequate power and assets to assemble modernization venture. The case is firmly related to being a newbie into the modernization process. And still, Central Asia does not appear to move towards a natural modernization process. However, it is remotely constrained to adopt an institutional, social, and political requirement of modernization introduced by the Soviets. Because of the Russian Revolution, Turkistan turned into a Soviet Socialist State (1918), and Khiva and Bukhara both turned into People's States (1920). During that time, there had been no viable and clear political development option to displace the Soviets in Turkistan. With an end goal to conquer the desires of both the Muslim Socialists, aim at setting up a free Turkic state and the container Islamic powers behind the Basmachi revolutions, Moscow, along these lines

split Central Asia into five the Soviet Communist States, each one overwhelming ethnic gatherings in the territory.

The early periods of Soviet ruling in Turkistan has encountered state-building just as country building tasks to assemble agreement for the new ideological and political system. Even though this paper manages the political part of modernization, it is clear that on account of Central Asia, financial, social, and political modernization was anticipated all the while, yet with the utilization of various techniques and intentions. In Central Asia, while the tsarist principle was concerned more with monetary advancement, which they projected to achieve political and social change, the Soviets gave much accentuation on self-assurance rights and relative decolonization in earlier eras advancing political modernization. Yet, the new Soviet system was upset by a civil conflict, which profoundly felt in Central Asia. Then again, legitimizing agree to the Soviet government was not all that simple. At the same time, the customary structures were kept alive or even advanced in the early period of the Soviet principle. It has various reasons; Soviets put themselves contrary to the Tsarist colonialism, which was a foundation of Turkistan as per the radical targets. Accordingly, the Soviet revolution abandons any colonialist right on Turkistan or needed to appear forsaking. Relative self-governance of the social orders in Central Asia did not represent a risk, in short, keep running for the combining Moscow-based Soviet system (Sengupta, Anita, 2003: 83).

After the Civil War and Revolution tailing it, the urgency for stability and control in Central Asia made Soviets forsake any self-governance for the regional elites. Any conventional association viewed as a risk to Soviet power in Turkistan. The modern and controllable structures must change the traditional structures. Soviets attempted to set up the ideal control instruments by means of the development of another ideological identity, in particular, the Soviet character.

The political change that Soviets expected to control and to balance out Turkistan meant to change customary identities, limit and merge them, or swap the conventional identities and loyalties with fake ones so as to prepare social orders as per Soviet political and ideological targets. The infusion of another Soviet-type training and culture intended to make monetary functionalism, centralization, the bureaucratization of political power, and the procedure of imposition of the formation of new regional elites, including Korenizatsia. In that manner, the conventional social and political association would supplant the sub-national and religious identities with functional and assimilated characters. Soviet upgrading of Turkistan along these lines attempted to get control of any probability of contention as a response to Soviet change. They understood that political modernization had turned into an essential element for their crucial point of controlling Turkistan and changing the region into a proficient and functional monetary factory regardless of whether there existed no genuine political risk. This required production of political interest structures, in particular, bureaucratization to bring together control, which is the straightforward component of whether confrontation or development will be the response to Soviet control.

Obviously, in the period of modernization, activation of assets and individuals through identity turns out to be especially significant. The social orders of Central Asia and Uzbeks specifically did not have a typical character that is brought together by a state and which can control people. The two mobilizing elements, to be specific Islam and Turkic genealogical administration, had restricted impacts for the Central Asian social orders to react to the difficulties raised by the

Soviets and the Russians. Other possible mobilizing sub-national characters, for example, alliance with the family, clan, or connection, had likewise been dividing instead of joining together. Political administration was overwhelmingly local and concerned more with steadiness than change. Soviets required a change, in any case, to control and fuse Central Asia. Tribe, clan, and territorial identities so much divided that it was difficult to mobilize Central Asians.

Regarding the Uzbek situation, political modernization started when Uzbeks went under the Soviets, and their legislative frameworks were hindered by the Russian elites to reshape the political structure of the region. The control was applied by means of the bureaucratization, strengthening, and centralization of the administration. Even though the tsarist system did whatever it takes not to change the ethnic synthesis, it somewhat attempted to order it, since "achieving much information as could reasonably be expected on the recently consolidated subjects would improve potential outcomes for control (Haugen, Arne, 2003). "Soviets neglected to keep up the set-up framework, which was weakened by various elements, most significant of which is the integration of customary structures into the new institutional arrangements. Russification and Sovietization, all together for the foundation of political control and modernization, attempted to make an elective identity for such extensive, however disintegrative characters.

### **Results of Modern Period for Uzbekistan:**

The Soviet goals of building up political and strategic control in Central Asia by delimitating the people groups made relative progress. During the Soviet time, Uzbek political modernization advanced around the creation of local elites, expanding the number of Communist Party enrolment, escalation of Soviet-sort of instruction (Tomiak, J.J. 1972: 11) together with the Russification, demolition of the vast majority of the conventional social and political structures, for example, those concerning agriculture, the bureaucratization of the local people and the formation of a cotton monoculture system. Uzbek customary socio-political association, which depended on the local, neighborhood, and connection ties as opposed to the modern Uzbek ethnic, has changed to follow the advanced structures forced by the Soviets, to be specific family structures and religious ceremonies (Sengupta, Anita, 2003: 83).

One of the approaches to undermine and build up a reaction to the Soviet principle firmly identified with administration and power associations in the Soviet framework. It contended that the local elites had discovered methods for subverting the nomenklatura arrangement in the oblasts, starting with the de-Stalinization phase. Hence Moscow's endeavor to re-impose control was a partial achievement (Rywkin, Michael, 1985: 41). One of the real outcomes of Soviet period modernization in Central Asia has not been the absorption of the customary political structures into current organizations, yet the other way around, in particular, the appropriation of traditional political loyalties to the difficulties of modernization. Soviets controlled almost all the political choices and establishments in Uzbekistan, while civic associations in the community couldn't be entered. It achieved a versatile and adaptable political structure. The political leading structure proceeded with their web of associations in the modern institutional arrangements. They were merged into the Soviet foundations, not as their customary identities, however, with the expectation that this sort of joining would loosen their faithfulness to the conventional connections.

Another purpose of the adjustment was the moving of loyalties in structure, while the substance of the power legislative issues continued as before. Donald Carlisle gives a point by examination of local commitments in Soviet Uzbekistan somewhere in the range of 1938 and 1983. He contends that "it is the legislator's local loyalties, for example, to Tashkent, or Samarkand, that might be the way to their direction and viewpoints. He further proposes the term "group legislative issues" as a critical idea for understanding Uzbek governmental issues (Donald Carlisle, 1986: 91). The significant division here is the Central Asian versus European division. Yet, such loyalties to the region have two elements: first, the common governmental issues and the strategic significance given to one area over the other. Olivier Roy clarifies how the Soviet system prohibited Bukharan Jadids, specifically Khojaev and his supporters from the political organizations, and infused those numbers of Ferghana origin. At the point when the cotton scandal happened (1983), Soviets attempted to conquer this ethnic political structure, this time trying to infuse new Slavic frameworks rather than the local elites, which anyway made colossal restriction. The rise of Islam Karimov in 1989 was an endeavor to reinstitute the regional balance for the Samarkand-Jizzak group (Roy, Olivier, 2000: 159).

The common hidden types of political association survived and demonstrated to be fit for being changed by the impact of Soviet suppression into a progressively standardized structure. Collins gives two types of adjustment to Soviet establishments that the conventional social structures had the option to make due through 1. Most local towns and settlements stayed in place, by a modification to kolkhoz and sovkhoz, 2. These two organizations were changed into clan and tribe (Collins, Kathleen, 2006: 21).

A similar association of the organizations along tribal and clan lines was genuine likewise for the Communist Party frameworks. The Communist Party units and power positions, explicitly three most high positions, and the sharing of the locales in these three positions characterized the political balance in the significant clans of the republic as the characterizing component of stability. Uzbek SSR's heads were picked among the two clans, in particular, Ferghana and Tashkent.

Falsely made countries bit by bit progressed toward becoming a part of the fact during the Soviet period, despite the way that they come up short on a powerful modern political conversation, which expected to change them into an appropriate state in the freedom time. Religious and local divisions have made systematized positions in the structure. Uzbekistan rose from the Soviet control as one of the most segregated and centralized governments in Central Asia, swaying between genuine governmental issues and the political change implemented by external pressures. Tradition in Uzbekistan couldn't represent a danger for Soviet-arranged modernization, but instead of that became incorporated into the framework, making its specific socio-political association with relative integration as often as possible Soviets had additionally advanced the casual socio-political structures in the Soviet frame (Critchlow, James, 1991).

### **Clan Politics:**

The most urgent matter for the country-building procedure was the foundation of authenticity among the natives of an autonomous nation. Karimov's government attempted to overrun the transformative conventional political structures, which don't represent a danger to political modernization, however, present continuous flexibility, which brought the customary arrangements re-imagined as reactionary or radicalized in conflict with the counterfeit and non-

modern procedures of control and centralization. So as to dissect this encounter, it is essential to take a look at the embodiment of political improvement, where the power situated in this advancement and the players who govern it in the Uzbek society. The primary issue is the avoidance and concealment of the customary political structures from the portion of intensity in the state structure. Karimov government attacks to tribe and family relationship links, while he is reliant on them. As the hypothesis expects, strife, and conflict, whenever introduced inclination towards change, may create progress in the general public. However, on account of Uzbekistan, the concealment by the Karimov government counteracts dynamic political improvement and rivalry. The fundamental reason is hence the utilization of state regulation to build up authority and control to avoid restriction, which anyway bars the conventional and participative political structures from the basic leadership and asset allotment, making major provincial and neighborhood clashes.

At that point, where is the whole power set, and how the Karimov government neglects to keep the balance among the power-centers? Rather than government modification studies and accepting modernization hypothesis on account of Uzbekistan, the absolute power legislative issues are implemented not through the constitutional structures. Which the new period powers upon the countries of the recently rising nations, yet on the tribe governmental issues, to be specific the casual political systems. These informal political systems are not primordial and conventional bottlenecks for modernization, yet have further socio-political significance, which has legitimized through the development of legislative issues during the Soviet period. There have not been new state foundations or national identities in Central Asia with legal and bureaucratic structures working, until the Soviet mastery and vital delimitation approaches.

Additionally, the point of political modernization by the Soviet government has not been the advancement or justification of governmental issues through improvement, yet rather expected to re-establish Authoritative Soviet control by dissolving the pre-frontier, socio-political, and conventional structures prominent in Central Asian social orders. These vital points, anyway, are affected by political modernization (Central Asia), which uncovered during Glasnost time before the finish of the Soviet government and during the freedom time. New types of organization, bureaucratization, and monetary projections occurred in the Central Asian political division. These progressions, anyway, couldn't overcome the casual and traditionalized political structures, which were adjusted and kept on adjusting to the modern nation and financial matters.

What has been persevering even when political modernization was not the customary structures, however, the "modernized tradition (Lloyd Rudolph and Susanne Rudolph 1967: 13)," which uncovered an inappropriate presumption that the modern and customary structures oppositely restricted to one another. Clan links in Uzbekistan introduced a massive case of this interrelation and mere presence between the two. Thinking about the duality of modernization and tradition, the predominant worldview of modernization displayed a two-overlap improvement cycle through which political modernization happens. 1) The conflict is inescapable as in the conventional structures, casual governmental issues, and financial association would challenge the prerequisites of modernization. 2) It would bring about the change of the general public to wind up modern, balanced, bureaucratized, developing, and liberalized.

Since the conventional constantly located as steady and static, the space between the late-modernizer and the advanced Western couldn't overcome. Huntington focusing on the

difficulties of the clan and religious loyalties contended that modernizing national approaches would move "loyalties from town, and clan to country (Huntington 1968: 140)." Therefore, the final point of political modernization depicted as a move of loyalties to modern frames from customary and casual associations. Be that as it may, clan governmental issues demonstrated to be prevailing the advanced structures, changing them, and organizing control by adjusting them.

Clan legislative issues rely upon a reasonably characterized network connection, which organizes family relationships and deep imaginary family relationships attach among the individuals to the clan (Philip Khoury and Joseph Kostiner, 1990: 334). The modernized connection oversaw through the advancement of tribe individuals, subsequently making reliance networks and focusing riches and influence in their gathering (Daniel Vaisman, 1995: 109). During the Soviet period, these family systems figured out the way to utilize the framework to their advantage, to set up their customary casual strategies and systems, which allowed them to beat the Soviet barricade and to control their assets. Deniz Kandiyoti breaks down how these systems "created casual techniques and procedures of adapting, particularly when different roads for investment have all the earmarks of being blocked (Deniz Kandiyoti, 1998: 576)." Therefore, both the Soviet frameworks played a harsh, however valuable job that improved the rising of casual systems. In contrast, the discernment of these systems gave an adaptable and versatile character to these systems to endure, and even to change the progress/change happening in Uzbekistan and Central Asia.

Then again, what makes them so incredible throughout the political change in Uzbekistan are the bonds that contain the identity and obligations of socio-political association in the general public. The deep fictive connection that the tribe systems clutch goes past the genuine blood bonds while speaking to the subjective feeling of recognizable proof, so these relations encourage individuals to utilize the standards of family relationship and safeguard its individuals, advance them in the political and social levels. Like ethnic identities, clans give vertical and flat relations, breaking points of which not fixed and perpetual but somewhat hard to penetrate.

Perceptibly, families establish systems which are ground-breaking and discerning enough to undermine government solidification, while making government changes and ideological disintegrations moderately shallow. The families do not form the results, yet they can shape and compel the inclinations and choices of individual players of the government changes. Thinking about the Uzbek autonomy, families assumed an extremely versatile job in government change, comprising the balanced arrangement of the new free government and characterizing its new regimes' earlier inclinations of political change. Concerning the political change in the autonomy period, families had the option to obstruct across the country's development and financial means of the individual natives. Or maybe the family assumed a distributive job, which is played by the nation in modern Western nations. Along these lines, instead of the nation-building projection of the unavoidable modernization of the autonomy time, clans assumed a deciding job in the course of characterizing the players of state assembling, their political inclinations, and decisions concerning the government change. The modernization or democratization endeavors with respect to the new government are effectively undermined by the incredible clan links, since "at both world-class and mass level, clans' links hinder both post-transition government and state combination and longer-term feasibility (Collins, Kathleen, 2006: 21)."

Uzbekistan is today depicted as one of the most controlling governments in Central Asia. Political modernization, which viewed as an inescapable result of government change in post-Soviet, does not appear to bring anticipated outcomes. While Karimov governments kept on smothering decentralization endeavors in the nation and still overwhelm contemporary legislative issues in Uzbekistan. This Western- arranged methodology fails to get the genuine idea of Uzbek governmental issues and its legacy of political modernization and misjudge casual socio-political structures clearing approach to centralize power in the hands of a couple of tribes elites, who at that point collide with one another to accomplish control. The subsequent political circumstance has been the nation's restraint of these casual groups by the Karimov government in Uzbekistan. The Western-arranged methodology naming the government in Uzbekistan as totalitarian is deluding not in the sense that the government isn't harsh; however, the conditions that make ready for the attestation of expanding state control misjudged to mark it strict. The state suppression, at last, stifles the natural and progressive development of the framework, causing strife between the nation and the families.

The impact of tribe legislative issues is enormous in that failure to change, not because the clan links took a static and constant demeanor to evolving conditions. Yet, the government stayed static under the influence of Karimov's strategies. After the Soviet breakdown, Karimov depended massively on the tribes that brought him the situation as a dealer of family interests. The Rashidov and Jurabekov groups of Samarkand, the Sultanov family of Tashkent, and the Azimov family of Ferghana, which involved the most dominant families of Soviet Uzbekistan in the start of the post-autonomy period, all supported Karimov for the presidency and thusly profited (Khaknazarov, Usman, 2003). Karimov's this reliance on tribes anyway returned out to have obliging impacts for Karimov rule. Henceforth, while attempting to take these tribes' control, he additionally needed to manage and assuage them.

#### **The eventual fate of Political framework in Uzbekistan (Anthony Clive Bowyer, 2019: 89):**

The different projects proposed by the new President and currently under operation hold the guarantee of reshaping the residential political scene, changing the essential connection between the native and nation, and rebalancing the geopolitical direction in an area since quite a while ago consigned as the space of extraordinary outside forces. In 2016 Presidential elections, Mirziyoyev promise on the standard of a legislature with a more prominent level of receptiveness and straightforwardness serving the individuals – a curiosity in the experience of autonomous Uzbekistan and other post-Soviet nations. To propel this motivation, President Mirziyoyev published three key things: A Plan to Reform the Judicial System; an Action Scheme on Five Important Areas of the Nation's Improvement for 2017-2021; and an "Idea" of Governmental Reform.

The Action Strategy, which threw light on guaranteeing the standard of law, changing the legal framework, advancing monetary progression, and the improvement of the social circle, contains various sub-destinations which, if completely actualized, will on basic level change the connection between Uzbekistan's administration and its citizens, and lift autonomous community support associations and casual establishments, for example, Mahallas, to the status of accomplices of the legislature. The Perception for Governmental Reform expects to bring about a compelling and straightforward arrangement of public administration capable of securing the privileges of natives and reinforcing Uzbekistan's monetary intensity globally. It characterized

six critical zones, among which are; "the development of the institutional, authoritative, and legitimate structure of the official specialist's exercises" and "the development of a viable arrangement of expert civil administration, and the acquaintance of powerful instruments to battle corruption in the arrangement of official specialists."

In the coming years, one can anticipate that further practical changes should be done to the territorial government, with the probability of numerous new faces in places of power, every one of them famously chose without precedent for Uzbekistan's free statehood. The new heads should be intently watched to decide if they are following up for the benefit of natives or are stepped over into territorial or local faithfulness systems. At last, elections are an essential yet not adequate condition for advancement: the elections additionally should be expertly and decently managed at all levels – especially the Precinct Election Commissions. Moreover, they should be investigated by dynamic, free NGO monitors.

The President likewise approached the parliament to be substantially more dynamic in the enactment. He pushed parliamentarians out of their workplaces and travel around the nation to meet individuals, particularly the young, hear their worries and returns with a proposition on the most proficient method to determine the issues distinguished by residents. He encouraged them to dissect proposed enactment and propose upgrades. The President likewise recommended that political groups associate with foreign partners, which had been the standard until the mid- the 1990s; however, in later years, it had been found in a progressively negative light.

It brought outcomes: parliamentarians presently visit provincial regions, where they have shown up in live programs, utilized internet based life, took an interest in different gatherings and attempted to turn out to be increasingly associated with their constituents. However, there is as yet far to go so as to accomplish a solid, multiparty framework that acknowledges and empowers an assorted variety of stages and programs and does not see contradicting arrangements as anathema to the nation. Mirziyoyev's changes have likewise had significant ramifications for the collective society. As opposed to an enemy, the administration currently looks to see cooperative society as a partner in its change motivation. It was shown in various authoritative revisions and activities to facilitate the capacity of NGOs to work in the nation. Since Mirziyoyev got to work as Interim President (2016), 685 advocacy associations have effectively enlisted with the Ministry of Justice in excess of an 8 percent expansion. A larger objective of the President's Action Strategy is to find inefficiency and corruption at the national levels.

## CONCLUSION:

The social-political structures that implied to bring the conflict in Central Asia, to be specific religious and ethnic clashes, rising fundamentalism, corruption, and monetary underdevelopment are not the main issues, however just results of political modernization. The political on account of Central Asia is beyond the regular classifications concerning the pith of contention in Uzbekistan. The odd conventional structures of political association in Uzbekistan are the versatility and adaptability of clan governmental issues that are capable of on-going in the limits of the modern structures, its dissemination of monetary riches, its diverting of political parity and social order. Besides, the conventional and in-formalized tribe governmental issues do not make a clash with the political modernization, which is outside or inside forced on the general public. Casual governmental issues are transformative, yet just when the framework finds a channel to coordinate its assets, to receive and adopt the upper organized modern structures. The casual

governmental issues are banished from the continuous political context, as in Uzbekistan (Karimov time), at that point, conflict is possible, which makes further pressure among the structure. The tyranny of the state is a result of its powerlessness to oversee inner political balance. At the same time, Islam-based restriction to the government is a constrained reaction of the individuals who can't influence the political field of Uzbek legislative issues.

There is a connection between history change and conflict, to give a general comprehension of the modernization hypothesis, the spot of belief in it, its Western-based belief system, and issues with this methodology. Hence, three essential highlights of modernization that are explicitly related to the Uzbek case.

I. Modernization is seen to be a Westernization procedure. Formalization of legislative issues, the foundation of ideological groups, and the accentuation on the national character in Uzbekistan are viewed as an endeavor towards Westernization, which anyway comes up short. In contrast, Karimov saw as a tyrant who neglected to start a fruitful change.

II. It makes an unclosing space and, in this manner, authority between the modernizing/conventional and the modern. Western nations are progressively attempting to build up relations with Uzbekistan, particularly after the German Presidency and the presentation of a Central Asia Strategy. In any case, events, for example, Andijan, keeps the West reluctant towards Uzbekistan, as the US, UN, and EU organizations categorize Uzbekistan as an unsuccessful nation like Afghanistan and Iraq.

III. The conventional stays in reverse and usually needs to be developed by the inconvenience of establishments, legal framework, monetary principles, and political mind-set. This paper expected to demonstrate that the complexity between the conventional structures and the modern isn't so distinct.

The customary political structures in Uzbekistan demonstrated a versatile and adaptable character in the aspect of political change experienced in Soviet rule and the freedom following the Soviet period. Accordingly, the paper presumes that the general observation that the shift would pursue a way-reliant change, which is pointed towards advancement and is a misguided judgment since the connection between the modern and the conventional does not appear to be advanced enough. This issue is firmly related to the oppressive utilization of modernity to characterize tradition for its key and authoritative mastery over the emerging world. Be that as it may, as the instance of casual legislative issues dependent on clan structures proposes, customary arrangements are more adaptable and versatile than the Western logical methodology recommends. The job of religion or ethnicity is constrained, while other political loyalties have a more grounded impact on preparing and propelling individuals in Uzbekistan, even changing the advanced foundations, arrangements, and philosophy.

### ABSTRACT

*This article is partly dedicated to "The Kuraisi Dictionary", created by 60 collectives of linguists led by Professor T. Kuraisi, a Japanese linguist-sinologist and chairman of the Chinese Language Society. It is well-known that in general linguistics the method of studying homonyms, which is based on dictionaries, is widely used. The research material of quantitative composition and character of homonyms was taken from "IvanamiTu: gokuoziten" – the phonetic Chinese-Japanese dictionary, released by the Ivanami Publishing House in Tokio in 1972, with the overall quantity of 37 thousand words. The article gives a broad overview of the definitions provided in the dictionary, given a semantic field of numbers from one to nine in Chinese, which can be used as a material for various studies of Chinese words, thanks to the listed grammatical information.*

**KEYWORDS:** Japan, China, T. Kuraisi, Dictionary, Numbers, Homonymy, Lexics, Phonetics, Tone, Hieroglyph, Sound.

### INTRODUCTION

Chinese words and hieroglyphic writing began to penetrate Japan in the 4<sup>th</sup> and 5<sup>th</sup> centuries. Hieroglyphic texts were difficult to read because the Chinese and Japanese languages differed in their methodological structure. Nevertheless, the first Japanese written work - "Kodziki" (a collection of myths and legends, 712y) was written on the basis of Chinese hieroglyphs and Chinese grammar. In addition to the hieroglyphics, their Chinese reading of the word "on" was assimilated with certain phonetic changes. After that a meaningful Japanese form of reading the word "kun" appeared. The phonetic use of hieroglyphs made it possible to have a national writing. The rise of the Chinese-Japanese vocabulary as a result of progress has had a profound

impact on lexicography of the two languages. This effect does not bypass the issue of homonyms.

The issue of homonyms is not only an important theoretical issue related to defining the boundaries of the word, the main unit of the language, but also one of the most complex issues of applied lexicography.

There are different points of view about the importance, position and role of the homonymy phenomenon in the language. Some linguists believe that the formation of homonymy is the enrichment of the language vocabulary, while others regard it as "a fatal wound" of the language. A. A. Reformaty, A. N. Gvozdev and a number of other linguists view homonymy as a negative phenomenon, "a barrier to understanding", "a language defect." Other scholars, e.g. L.A. Bulakhowski, O. S. Akhmanova, R. A. Budagovs, do not consider this phenomenon to be "abnormal", although they may in some cases find homonymy difficult to understand the speech and the text. In exploring the issue of homonymy, researchers refer to both native language materials and foreign languages.

In general linguistics, there are four approaches to the question of the phenomenon of homonymy, and there are four basic points of view on the concept of "homonym".

At first sight, homonyms are the words that have the same phonetic shape but have different meanings regardless of their graphic writing. A large group of local and foreign linguists, including, V.V. Vinogradov, O. S. Akhmanova, L. A. Bulakhowski, E. M. Galkina-Fedoruk, S. I. Kanonich, B. Trika, Sh. Bally, L. Blumfield and others agree with this view<sup>1</sup>.

By the opinion of the second group of linguists, homonyms must have the same spelling, although they have the same pronunciation and different meanings (V. V. Brown, I. V. Arnold, N. M. Shansky, M.X. Akhtyamov).

A number of other scholars include homonyms in the list of words that have the same pronunciation, but with different meanings and spelling: H. Ogata and R. Inglott.

The view, contrary to these three notions of the term "homonym", is reflected in Skit's "The Etymological Dictionary," where he describes the homonym not on the principle of the sound, but on the principle of graphic similarity. We agree with the first group of scholars that the words under the term "homonym" are the same words (pronounced). Thus, in the present research, the word "homonym" means the words that have the same sound but different meanings.

It is well known that in Chinese linguistics there are different approaches to the notion of homonym. Up to the present day, Chinese scholars have not yet come to an agreement about the phenomenon of homonym, as well as the exact definition of the term "homonym". According to one comment, Chinese means the words that have the same pronunciation and different meanings, irrespective of the sounds. Depending on this notion, the words that are distinguished by their tone are called "homonyms":

1. 妈 mā - mother; 2. 麻 má - kenaf (canop);

3. 马 mǎ - horse; 4. 骂 mà - to fight, to swear;

However, such a view is not entirely justified because A. A. Dragunov and E. I. Dragunova note that "... the minimal phonetic unit that can be expressed as part of a word (morpheme) is understood as a syllable, not a tone (phoneme), but a tone syllable<sup>2</sup>. In Chinese, a tone (tune) is an integral part of the phonetic crust (upper cover) of a word or morpheme, and plays a distinctive role. That is why the word "homonym" means the words that match each other in terms of pronunciation and tone (supporters of this view are Chinese linguists Zhou Tsumo, Liu Shusin and others<sup>3</sup>).

It is known that in modern Chinese hieroglyphic writing, each symbol - a hieroglyphic word or part of it with a minimal meaning - serves to represent a morpheme in writing. Therefore, in the study of the phenomenon of homonymy, according to N. I. Feldman, a Chinese word, despite its hieroglyphic writing, should be treated as in any other language<sup>4</sup>. Thus, Chinese homonyms can be described as the words that have the same tune (including a tone) but have different meanings regardless of their hieroglyphic writing. For example, the following pairs of words include:

1. 花 huā - flower; 2. 吉利 jílì - happy, lucky;
3. 花 huā - spend; 4. 极力 jílì - with all its might

It is known that scholars propose a number of norms to differentiate between homonyms and polysemantic words, including different word-formation strings, paradigms, links with other lexical groups (sorting of synonyms and antonyms), syntactic relationships (distributive methods) and differences in management (verbs).

The "homonym" phenomenon of the Chinese language and typology, its similarity to or difference from all other languages, has attracted the attention of linguists-sinologists and other language specialists.

As you may know, in Chinese linguistics, special attention was paid to the issue of replacing the Chinese hieroglyphic writing by phonetic writing in the early 1950s. According to Chinese scholars, such a transition was a major challenge, one of which aspects was related to homonymy. At that time, in China, the issue of homonymy was widely covered in the press, and linguists, such as Zhou Yuguan, Bo Han, Zhou Yaoen, To Mu, Tsao Denfan and Zhang Shilu, actively participated in the discussions.

During the discussions, the following issues were raised:

- define the essence of the term "homonymy";
- determine the boundary between homonymy and polysemy;
- classify homonyms;
- determine the sources of homonymy;
- find the ways to eliminate homonyms;
- reform homonymy of names and geographical names.

Many of the issues raised there are still unsolved and retain their relevance. In contrast to grammatical homonymy in the Chinese language (research works by S. Yankiver and V. Gorelov), lexical homonymy is still not studied as an independent research object<sup>5</sup>.

In general linguistics, the methodology of studying homonymy based on dictionaries is widely used. To investigate the composition and specificity of modern Chinese homonymy, a 37,000-word “IvanamiTyu:gokugodziten” - the Chinese-Japanese phonetic dictionary, printed by the Ivanami Publishing House in Tokyo in 1972 (the first edition in 1963) serves as the research material. This dictionary is the collective work of 60 linguists under the guidance of the leading Japanese linguist-sinologist T. Kuraisi, Chairman of the Chinese Society for the Study of the Chinese language.

The Kuraisi dictionary (the dictionary was called so later on) consists of 10 sections: 1) Introduction, 2) Preamble, 3) Glossary, 4) Chinese and non-Chinese Nouns, 5) Hieroglyphic Index, 6) Semantic Index, 7) Relationship Tables, 8) Scale and Weight Charts, 9) Tables of Chinese language syllables, 10) Conclusion.

In the introduction, the authors point out the essence of the dictionary and its sources. Specifically, the following sources were taken: Lu Zhuivey's “北京话单音词词汇” “The Single-word Dictionary of Beijing Dialects”, “汉语拼音词汇” (the Chinese Phonetic Dictionary) published by the Lexicology Group under the Chinese Committee on Writing Reform. In addition to compiling this dictionary, some of the works by Lao Shee, a contemporary Chinese writer, as well as the materials on oral vocabulary collected by Lee Bao, a lecturer of the University of Tokyo.

In the introduction, the authors also provide information on phonetics, grammar and vocabulary of modern Chinese.

In the “Phonetics” section, the words included in the dictionary are characterized. This section focuses on the grammatical nature of a Chinese word, as well as on the problem of separation of its components, that is, the distinction between words and morphemes, words and phrases.

In addition, this section gives information on some of the features of the words that fall into the 11 categories of words that have been identified by the authors. On the other hand, the authors comment on the distribution of words in 11 different directions.

The “Grammar” section provides a brief overview of Chinese syntax. Here, the ways, in which the words in the Chinese sentence are interconnected, are indicated and the sentences are described. It also provides a classification of modularity and structure of sentences.

It is not accidental that this dictionary has been selected as a research material. First, it is a phonetic dictionary, where the words are arranged in alphabetical order in China, and are followed by tone indexes. All of this makes it easier to find and identify homonyms.

Second, this dictionary contains only words from the modern Chinese vocabulary. S. X. Ioffe says that “... this is the most perfect and interesting dictionary in Chinese lexicography at the moment”, because, in the first place, “not the whole Chinese language (from the earliest written works to the present day) but the modern Chinese language has been chosen as the object of research.”

Third, due to the ancient Chinese lexicographic tradition, it was based on words and morphemes, but not on hieroglyphics. The selection of the word as a main dictionary unit in the dictionary,

according to S. X. Ioffe's opinion, indicates a certain grammatical tendency (direction) that is manifested in Chinese lexicography.

The "grammaticalization" of this dictionary (a term proposed by S.X. Ioffe) is related to the grammatical information on the word, as well as its inclusion in a particular category<sup>6</sup>.

When it comes to grammatical approaches to the word in the dictionary, or in general to the grammaticalization of the dictionary, it is important to note that the process is determined not by the inclusion of a word in a particular category, but by the boundaries and the nature of the word.

Another feature of the dictionary is directly related to the problem of determining the boundaries of words, that is, the grammatical characterization of words. The authors of the dictionary describe Chinese as a polysyllabic language at the outset, emphasizing the superiority of the two compound words while emphasizing the monosyllabic tone of the ancient Chinese language. The definition of the word in ancient and modern Chinese is of great importance in the separation of 11 lexical layers in the present-day Chinese vocabulary.

-The vocabulary of ancient classical works, which is found in the present oral language and sometimes used in quotations (excerpts from the works).

-The vocabulary of ancient classical works, which is widely used in modern Chinese.

- Scientific and special terms that are not widely used.

- Literary lexicon.

-The vocabulary used on the radio, television and public appearances.

-The neutral vocabulary -a common oral vocabulary. (Here, the authors include the putunhua - the modern literary language lexics).

-The simple speech language lexicon (the authors include "Bezzinhua," the words used in the Beijing language).

-Beijing dialects, slang, etc.

- Taboo, words used as a ban.

-Swear (slandorous) words.

- Words in other dialects that came into Putunhua and are rarely used.

The study of these lexical layers suggests that a number of them correspond to the functional methods laid down by modern linguists. However, another layer of vocabulary arranged in the dictionary cannot be included in the functional style layers. For example, O. S. Akhmanova's "The Dictionary of Linguistic Terms" contains the following selection of functional methods: scientific, daily-domestic, daily- business, official-documentary, journalistic, and artistic-novelistic.

This distribution of lexical layers in a given dictionary is of great importance in analyzing the unity of the Chinese word, and in particular the phenomenon of homonymy. Each word is highlighted in the dictionary to indicate the appropriate style, and each particular word should be studied only within the framework of that style. Except for the style specified, this unit may not be the word. We should take into consideration this originality of the Chinese language when

analyzing the phenomenon of homonymy. It is also important to take into account the methods used to determine the prevalence of homonymy.

Some information on grammatical features of the Chinese language is provided, along with definitions of the concept of the Chinese word. For example, the introduction says that the dictionary is composed of (a) modern words and (b) understandable words upon hearing. Besides that it was also noted that if any lexical unit used in the sentence is written in Latin letters, it is recognized as a detached word in the dictionary.

Based on the information presented above, the authors describe the unit defined as a word by two criteria: the clarity of the word upon hearing and its "continuity" (integrity) in the recording.

As it was emphasized above, all words in the dictionary are organized according to word categories. Each word has a specific lexical meaning and a specific function in the sentence, so the following categories of words are defined in the dictionary: 1) 指示词 zhǐshìcí - demonstrative words; 2) 数次 shùcì- numbers; 3) 量词 liàngcí- account-related words; 4) 名词 míngcí - nouns; 5) 动词 dòngcí- verbs; 6) 形容词 xíngróngcí - adjectives; 7) 副词 fùcí- adverbs; 8) 介词 jiècí - prepositions (front auxiliaries); 9) 助词 zhùcí - modal words and particles;

10) 接词 jiēcí- conjunctions; 11) 问投词 wèntóucí- appeals.

In this classification, the units called speech parts and particles in the European tradition are listed as separate word categories.

In general, the classification of independent words in the dictionary corresponds to the classification of words in Chinese studies(sinology). The main differences lie in the classification of auxiliary words. For example, the pronouns were included in the list of demonstrative words. A. A. Dragunov called the pronouns as word-substitutes and included them in a separate general lexical-grammatical category (peer group), independent parts of speech. In this dictionary, the calculation words are also classified into the group of words with independent meaning. The words contained in this category are considered to be auxiliary words by the following authors: V.I. Gorelov, Li Jinsy, Zhao Yuandjen, and also the authors of the Chinese Language Review. In A. A. Dragunov's case, account words are studied as a separate lexical-grammatical category in nouns.

Another advantage of the dictionary is its structure based on dictionary articles. The Kuraisi dictionary contains grammar materials or grammatical description of a word in each dictionary article.

The dictionary article has the following structure: first, the Latin word transcript is followed by its hieroglyphic writing. The dictionary uses 517 simplified hieroglyphs, as well as their complete spelling in brackets. The dictionary also provides a variety of hieroglyphic inscriptions, with a special designation. After the hieroglyphic spelling, a part of speech's symbol is noted in brackets, for example, 动 dòng - (verb), 名 míng - (noun), etc., and behind the brackets the number of the corresponding lexical layer is indicated. Further, the translation of the word into Japanese is followed by confirming examples, because using them, it will be possible to check

the information in the dictionary. Such examples are found in about 25 percent of words, mostly composed of single words.

The dictionary also contains words that are related to the numeric category, with several meanings of the numbers and other words used in the same tone. In the article we found it necessary to review numbers from one to nine. For example, the number "one" is called "yī" in Chinese, and it has 11 different meanings as "one", "head", "same", "only". Here is an example of the homonym words yī: - one, 衣 yī- clothes, 医 yī- "he" (in Russian), 医 yī - nurse and so on.

The number "two" is translated into the Chinese language as "二 èr" and has its accompanying words. For example, 二 èr – two, 而 èr- even then.

The number "three" is called "三 sān" and has melodious words. For example: 三 sān –yч, 髫 Sān- hairy, woolly.

The number "four" is translated as "四 sì-four" in Chinese, and it gives the following meanings: 寺 sì- Buddhist temple, 似 sì- exact, 祀 sì – to sacrifice, 饲 sì - fodder, 嗣 sì- afterwards and etc.

The number "five" is translated as "五 wǔ" and has similar homonym words. For example: 午 wǔ -afternoon, 武 wǔ - military, 舞 wǔ- dancing, 捂 wǔ-closing and other words.

The number "six" is translated as "六 liù" and has such homonym words as, 溜 liù - stream, 溜 liù –heating, 溜 liù –walking, 鸱 liù – skate.

The number "seven" is called "七 qī" in Chinese. Like many others, it has a lot of melodious words. In Chinese, there are more than a dozen similar words, such as; 期 qī –period, 栖 qī - sitting, wintering, 戚 qī- relatives, 欺 qī – to lie.

The number "eight" is called 八 bā. It has the following melodious words: 巴 bā- to be thirsty, 把 bā –holding, 疤 bā-scar, 笆 bā-pack, texture.

The number "nine" is interpreted as 九 jiǔ, and there is a list of homonym words: 久 jiǔ – old, ancient, 灸 jiǔ- burning, 酒 jiǔ - wine, or 韭 jiǔ-onion.

The articles on multidisciplinary words cover all the meanings of these words as lexical units. Opposite each meaning there is a symbol of the part of speech, as well as a reference to a particular lexical layer of the word in this meaning, followed by a Japanese translation, whereupon an example of the word use in one or another meaning is given<sup>7</sup>.

The dictionary includes different meanings under the single word symbol, as well as different meanings of the multivariate words that refer to different categories of words. Opposite various meanings, not only the signs pointing to different categories of words can be indicated but also different signs of lexical layers.

When two or more meanings of a word belonging to the same category defined, the dictionary studies them as a single lexical unit. When multiple meanings of a word are defined by different categories of words, the dictionary treats them as the meanings of various words formed by conversion.

The authors of the dictionary place different grammatical meanings of the word 讨论 tāolùn – (to discuss, discussion) in a single dictionary article and refer to these as the root meanings of a single word. These two meanings of different word categories are studied by the authors as a language condition rather than as a condition of speech. The authors distinguish the cases in which the word can be changed. For words that appear in the function of a different word series in the archetype, a special "+" character is inserted before the example and indicates that the word is used in a non-specific function. For example, such kind of dictionary articles containing the words in the form of 讨论 tāolùn are, are fundamentally different from the ones mentioned above. For instance: Compare 报告 bàogào (动) with (我把这件事报告给他 wǒ bǎ zhè jiàn shì bàogào gěi tā (I informed him about this case), 作了报告 (lecture, made a speech).

From the statement mentioned above, we can conclude that thanks to the grammar information provided there, this dictionary can be used as a valuable material in all kinds of research on Chinese words and numbers.

## **CIVIL SERVICE PROFESSIONALIZATION: PROBLEMATIC ASPECTS AND WAYS TO ACHIEVE SUCCESS (RUSSIAN EXPERIENCE)**

**Yuldashev Anvar Ergashevich\***

\*Associate Professor,  
Professor of Department of "ICT in Management",  
Doctor of Historical Sciences,  
Academy of Public Administration Under,  
The President of the Republic of Uzbekistan,  
Tashkent, UZBEKISTAN

### **ABSTRACT**

*The article focuses on the current aspects of the problem of professional development of civil servants. It pays special attention to the essence and interdependence of such concepts as "civil service", "civil servant", "qualification requirements", "competence", "employee training", "professional development", "professionalization". Taking into account the results of public opinion polls on this activity, the issue of scientific review of the process of professionalization of the civil service is raised. It was noted that the main problem in the field of governance today is the growing contradictions between the stereotypes of traditional management activities and the requirements of the current stage of development. The author substantiates a new approach to the content of professional development of civil servants, given that the civil service is a multifaceted and complex activity. The proposed measures raise the issue of developing a professiogram - a document containing a list of requirements and standards created for public civil service, aimed at professionalizing the service in the public system and improving its*

*quality. It is also proposed to develop a new scientific field (for us) that studies the problems of the profession - a special branch of professionalism, sociology.*

**KEYWORDS:** *Civil Service, Professionalization, Professional Activity Of Civil Servants, Professional Development Of Civil Servants, Professionogram, Professionalism.*

## INTRODUCTION

According to Russian legislation, the Civil Service means the service of citizens of the Russian Federation in professional positions in the civil service. This service is an activity related to the powers exercised by the federal state bodies and organizations of the Russian Federation, the structural units of the Russian Federation (subjects of the federation) and their deputies [1].

This activity is social in nature and is conducted in a formal, transparent (open) manner. Professional development of civil servants can be achieved only if a number of necessary conditions are met:

- the social need for this type of activity and the availability of specially trained people who meet this need;
- sustainable organized cooperation that promotes the formation of corporate culture of the subjects on the basis of unity of social interests;
- a certain professional environment - a set of conditions and means of organizing professional activities that provide it.

A civil servant with appropriate qualifications must perform his or her job at a high level of professionalism in accordance with established norms and rules, which in turn is a key factor in the effective functioning of a public body.

Thus, the civil service places high demands on civil servants in terms of professionalism in their field, availability of general professional skills, and general culture.

## The main results and findings

The term “professionalism” itself (Lat. Profession) has a broad meaning and can be interpreted in several contexts. It also includes high skills and ability to perform their duties wisely, ability to achieve high performance, professional performance results and so on. This term includes many characteristics, such as values, professional knowledge and skills, professional thinking, professional experience, duty, skill, professional creativity, professional creativity and so on. Professional skills are manifested in certain qualities. E. Durkheim emphasizes that professionalization leads to social change and contributes to the development of society.

E. Durkheim emphasizes that placing specialization and division of labor at the center of the theoretical basis of development as necessary parameters for the development of society, emphasizes that a professional group can be one of the institutions that maintain social order [2].

A.Flexner, who studied the problem of professional competence, emphasized that a civil servant should have special knowledge acquired during the training process and certified by the required certificate, as well as special technologies and professional ethics [3].

B.Barber dwells on professional creativity and professional experience as the main quality attributes of professionalism, having a high level of knowledge and skills, focusing on the public interest, “self-governance through high ethical requirements”. In his opinion, these features form the basis of professionalism [4].

M. Weber considers professions as a social institution, and professionalism as an indicator of value, efficiency of activity. According to Weber, the main characteristics of professionalism are rationality (ie, activities based on scientific knowledge and professional skills). The bureaucracy, in Weber's view, requires strict adherence to formal rules. In this case, the government official must stay out of politics.

In the Russian Federation, the powers of a modern civil servant are enshrined in the Law on Civil Service. Service of the Russian Federation (Article 17). These include strict adherence to the law, high level of professionalism, modernity, protection of citizens' rights and freedoms, political neutrality, impartiality, proper treatment of citizens in solving problems, prevention of conflict situations, conscientious performance of official duties, observance of statutory restrictions make and so on.

Given the nature of the responsibilities set out, the skills required for specialization, training areas, and civil service positions are detailed in the manual prepared by the Ministry of Labor and Social Development. It contains requirements, specialization and other skills, as well as requirements for jurisprudence, which include the basic professional and functional skills established for holding positions in specific government agencies.

The main requirements include the candidate's education, general education, work experience, knowledge of the state language (Russian), the basics of the Russian Constitution, as well as knowledge and skills in the field of information and communication technologies. In addition, general and managerial skills are taken into account.

General skills (for all categories and groups of civil service positions) include:

- ability to think systematically (strategically);
- ability to plan work time, use it wisely and achieve results;
- culture of communication;
- ability to manage change.

Management skills (for “managers” and “managerial assistants (advisors)” categories of civil service positions include senior specialists (as well as for key, managerial, and senior group positions) with the following functions:

- ability to manage subordinates, effective planning;
- Ability to quickly make and implement management decisions [6].

Functional qualification requirements are regulated by job responsibilities in accordance with the functional powers of a civil servant. In June 2019, Russian President V.V. Putin signed a decree

"On the main directions of development of the civil service of the Russian Federation for 2019-2021" [7]. This decree improves the procedure for appointment to civil positions in the Russian Federation, encourages civil servants, provides them with legal and social protection to improve the effectiveness of their professional services, develops a system of guarantees, introduces new forms of professional activity, including the use of information and communication technologies issues were raised.

Based on the President's decision, the Russian government approved a "road map" for the development of the civil service. This document provides for the improvement of the system of recruitment, remuneration and incentives for civil servants. The task was also set to improve the system of advanced training of civil servants. Today, civil servants must have a high level of consciousness, high education, solid skills and professionalism. Unfortunately, modern state civil service personnel cannot meet these requirements.

Professional development should be carried out regularly, throughout the life of the civil service. Its results should be taken into account during the certification, in appointments to other positions, at the service level.

Professional growth includes:

- 1) general education in the form of additional professional knowledge and skills (seminars, trainings, master classes, lessons aimed at the formation of new knowledge and skills;
- 2) Conference and hands-on experience that provides reading and best practice sharing;
- 3) self-education using special information;
- 4) training courses.

However, in this case, the question arises, what kind of knowledge do civil servants currently lack to perform their duties professionally? According to their answers, they lack management skills, legal knowledge, skills to work with citizens, communication culture [9, 10].

According to experts, the lack of qualified lawyers in the civil service, modern management, personnel, information management specialists, psychologists and sociologists, as well as the lack of sense of responsibility for the staff he recommended for public service positions.

This is certainly not a coincidence. Because the decline in professionalism in the civil service is due to several reasons. Among them, recruitment to the civil service on the basis of acquaintance, promotion to leadership positions is not due to professional qualities, but on the basis of personal devotion, due to such shortcomings as the decline of moral and spiritual qualities of civil servants. In this case, the staffing of the civil service is associated with a clear social demand. After all, the effectiveness of the activities of an official has a direct impact on the development of the state and the well-being of the people.

The achievement of a civil servant, the high level of professionalism is not only his personal wealth - he also has social significance. Therefore, professionalism, professionalism should be free from vices such as formality, bureaucracy, indifference, dry administration or improvisation of active activity.

Success is usually accompanied by civil servants who understand the nature of the processes taking place, are able to act in non-standard situations, and are able to critically evaluate the

actions of themselves and their colleagues. The main problem of the current situation is the sharpening of the contradictions between the stereotypes of management activity and modern requirements for management.

The results of a survey conducted by the Levada Center in January 2019 showed that the majority of Russian citizens have low confidence in officials. Two-thirds of the respondents (78%) said that officials hide the truth about their work situation and avoid solving current problems [11].

However, professionalism involves looking for ways to solve a problem in society. According to Weber, civil servants usually serve the interests of the organization they serve, their bosses, or worse, instead of fulfilling their professional duties.

As noted above, the normative legal acts will set out the criteria for improving the professional skills of civil servants, their level of professionalism. In this regard, there are normative documents stating the qualification requirements for candidates seeking to enter the civil service. They contain the basic qualification requirements for civil servants (level of professional education, work experience, knowledge of the state language (Russian), the basics of the Constitution, office work, documentation, knowledge and skills in information and communication technologies).

Functional qualification requirements are also formed. They are related to experience in a particular specialty, area of teaching, knowledge and skills required to perform in a professional setting.

Taking into account the professional requirements for civil servants, it is also necessary to define their forms of self-training, to form a practice-adapted production of self-education methods that take into account the specifics of the employee's activity. This leads to the assessment of professional self-development in its own way, the improvement of methodological tools and technologies for effective development. The process of acquiring competencies within the framework of additional vocational education programs should be ensured in accordance with the competency model of the position of this civil servant, which depends on the competence.

Speaking of changing the policy of civil service training, we believe that based on the strategic guidelines of the new public paradigm, it is desirable to introduce more active management, ie training of civil servants using mixed learning technologies - audience and distance learning-interactive methods, including project activities. In addition, learning outcomes should be linked to the motivation of the civil servant for professional growth and effective performance.

Referring to foreign experience in improving the skills of civil servants is useful in the study of its practical direction. For example, in Europe, the training of such specialists is carried out mainly in practice, the acquired knowledge and skills are immediately applied in practice, that is, the knowledge in practical activities aimed at professional development is closely linked with change management. In Russia, on the other hand, vocational training is still based on more theoretical knowledge, not always related to real life.

In the civil service system, a coaching school can become an effective tool for professional development. This system provides an effective exchange of management experience, provides the transfer of knowledge, professional skills, training of personnel, strengthens team spirit. The urgency of coaching schools is evident in today's new environment, which is essential for new

employees in the civil service, and is increasingly needed to adapt them to new positions in government agencies without delay. Of course, coaches themselves must be highly qualified professionals, respected by their colleagues and staff.

The establishment of coaching institutes, the appointment of coaches excludes the use of a single prescription. It is necessary to develop a well-thought-out plan and roadmap, including various incentives. Coaches and trainees need to be based on mutual interests to achieve goals. Well-known expert in the field of management D. According to Meister, only as a result of a high corporate approach can the coaching school be seen as an investment in long-term development [12].

Given the growing qualification requirements for civil servants, there is a need to reconsider the powers of public service personnel, increase their responsibility in the selection of personnel and the rational use of best practices in management. To do this, it is necessary to create a reliable mechanism to protect the professionalism of civil servants from serving the interests of some high-ranking officials. In our opinion, in the eyes of the personnel service should be all the tasks of personnel management.

## CONCLUSION

The process of professionalization of the civil service requires scientific study as a management activity. Management activities should be supplemented with new scientific terms, concepts related to professional activities, including professional growth, professional skills, professional knowledge, professional service, professional interest, professional development, professional experience, professional responsibility and so on.

We also need to think about the development of a professionogram - a document that includes a system of signs describing the specific features of the civil service, a list of requirements for civil servants. A professionogram is a document that meets the requirements of the law, i.e. high qualification requirements, and should be based on ethical and psychological qualities.

As a branch of sociology that conducts research related to the study of problems of professional growth, as well as the study of management activities - the inclusion of the science of professionalism in the list of sciences is a topical issue today. Advanced foreign countries have this science. The subject studies the problems of improving modern policy in management, the correct organization of public policy in the civil service, the evaluation of the effectiveness of management, their improvement and so on. All this serves as a basis for a healthy workforce.

Undoubtedly, the professionalization of management activities will be the basis for improving the skills of civil servants, their service efficiency, improving the level of scientific validity of these processes will affect all aspects of public administration and ensure its efficiency.

#### ABSTRACT

*In this article, in order to increase environmental sustainability in the desert and oasis zones of Uzbekistan, the creation of planned multifunctional landscape areas in public buildings, the appropriate use of landscape design components to improve the microclimate of the region, increase the impact of their artistic and aesthetic appearance, important strategic issues related to increasing the role of public buildings in socio-economic life have been studied in detail.*

**KEYWORDS:** *Urbanization; Landscape Design; Hot And Dry Climate; Landscape Design Elements; Construction - Climatic Zoning;*

#### INTRODUCTION

Nowadays, the problem of increasing the harmful effects on the environment as a result of the

rapid development of the urbanization process is being raised all over the world and is causing a heated debate. *Replacement of natural surfaces like soil and vegetation cover by various urban surfaces – bricks, paving, asphalt, concrete surfaces, glass and iron started modifying urban atmospheric environment at different levels above ground in local geographic scale[1].*

*Thermal comfort and air quality are major concerns for people living in urban areas. Currently, due to the influence of factors such as building density, building materials and anthropogenic heat emission in residential areas, high temperatures may frequently occur in hot summers and may negatively affect residential life. Moreover, traffic-induced emissions are one of the major contributors of air pollution in urban built-up areas, emitting several harmful pollutants in the form of particulate matters[2]*

However, we can also describe urbanization as a factor in preventing desertification. It is known that Arid zones are one of the important resources for the location and development of settlements in the future. This requires improving the natural and climatic environment of the desert and oasis zones of the country, which have a wide economic and social potential. A large area of the Republic of Uzbekistan is highly exposed to solar radiation, combined with high summer temperatures, low air mobility and low humidity. These conditions cause significant thermal stress on the human body and a significant decrease in its performance in residential and public buildings, leading to overheating of their area.

*Air Temperature is the most common indicator of human thermal comfort. Nevertheless, air temperature alone is not an accurate indicator of thermal comfort. There are other environmental and personal parameters must be taken into account.[3]. According to ASHRAE Standard 55-2010, environmental parameters are air temperature, mean radiant temperature, wind speed and relative humidity. Personal parameters are activity level and clothing insulation. In general, outdoor thermal comfort is much more complex than indoor comfort. For example, the spatial and temporal microclimatic variations of meteorological variables are often very large. Other reasons for the difficulty include lack of climate control in outdoor spaces[4].*

In complex natural and climatic conditions, it is important to create a favorable thermal (thermal comfort) environment to improve the conditions of social and practical activities of people, increase well-being, living standards and quality indicators.

*Green infrastructure, such as urban parks, community gardens, green buildings, and green roofs, represents a network of human-managed and natural ecosystems that together enhance ecosystem health and climate change resilience, contribute to biodiversity, and benefit human populations through the maintenance and enhancement of ecosystem services.[5].*

Improving the ecological and hygienic condition of public buildings and planting trees, parks and alleys, even if they are small in cities, will help to keep the microclimate, air temperature and humidity moderate. Not only landscaping around the city recreation areas, but also in the areas of public buildings, which are not a small part of the city, a "small corner of nature", the effective use of landscape solutions, natural conditions for work and study, leisure and strengthens the role of man in the development of society. It strengthens the connection of human activity with the environment and increases its role in social life.

*Urban Green Infrastructures (UGI) have been recently defined as sets of man-made elements that can provide a range of environmental benefits at buildings and urban scales.[6]UGI*

*comprise urban forests, street trees, parks, turf-grass, private gardens, green roofs and green walls. They play an important role in contributing to a range of ecosystem services such as improving aesthetically the environment to live and work, removing airborne pollutants and improving air quality, improving the habitat for invertebrates, birds, weeds and plants and promoting and increasing biodiversity, providing sound insulation and noise absorption, enhancing of storm-water management and water run-off quality[7].*

In recent years, much attention has been paid to the issues of construction and landscaping in hot climates. The design of the exterior of the building, its surface coating has a great impact on the heating, cooling and lighting of the building. In this regard, the landscape design and landscaping around the building play an important role in heating, cooling and lighting the building. However, in many cases, the specific climatic conditions of the region are not fully taken into account. In landscaping, regardless of the climatic conditions of the region, the use of landscape design components only as a decorative ornament, nature does not solve the problem of improving the environment, but also has a negative impact on them.

*Although plants are very popular, they are usually used for their aesthetic rather than functional benefits. Ideally, along with their decorative function they could act as windbreaks in the winter, as shading devices and evaporative coolers in the summer, and as lightfilters all yearlong. Plants can also reduce erosion, noise, dust and other air pollution, the level of carbon dioxide, and increase the level of oxygen in the local air[8].* Especially in dry climates, by creating a pleasant microclimate by landscaping public buildings, not only provide people with work, education, cultural and educational recreation, but also to identify and develop principles for improving its artistic and aesthetic appearance. output problems are emerging transversely.

## **MATERIALS AND METHODS**

### ***I. Regional climate.***

Climate is one of the most basic factors of life in the universe around us, and man is in constant contact with it, i.e. man is always under its influence. Climate affects the lifestyle of the population, influences the organization of activities, recreation. Therefore, it is necessary to take into account the correct and comprehensive climatic factors in the design and construction work. The task of designers is not to passively adapt to local climatic conditions, but to develop effective measures to eliminate or completely eliminate the shortcomings of the natural environment, to maximize the benefits of climate.

As 2000 ago, Vitruvius said, "*The damage caused by nature must be remedied through art.*" In addition, we can say that landscape design is able to change the natural environment based on human needs. The main feature of landscape design in desert and oasis zones with dry and hot climates is the inclusion of landscape components (green vegetation and water basins) to create a comfortable living environment. This will help to create a favorable climate and reduce the harmful effects of the climate.

As with all areas of architecture and construction, one of the most important and decisive factors in the design of landscape design is to take into account the natural, geographical and climatic characteristics of the area. Designers are well aware of the negative effects of hot climates on human life activities. The diversity of natural and climatic conditions in the world, in each case, requires the creation of a detailed climate zone and the establishment of design rules in places

where the city originated or developed. The diversity of natural and climatic conditions on Earth requires detailed microclimatic zoning of the area for construction and urban planning purposes. When dividing the area into different climatic zones, the elements of climate that affect the design of the building, as well as the elements that need to be taken into account in construction and operation, are analyzed. Large areas of the country are studied and divided into regions with similar climatic parameters. The laws of the climatic zone are formed, and on this basis the typological requirements of buildings intended for different purposes are formed.

## *II. Climatic zoning of the territory of Uzbekistan.*

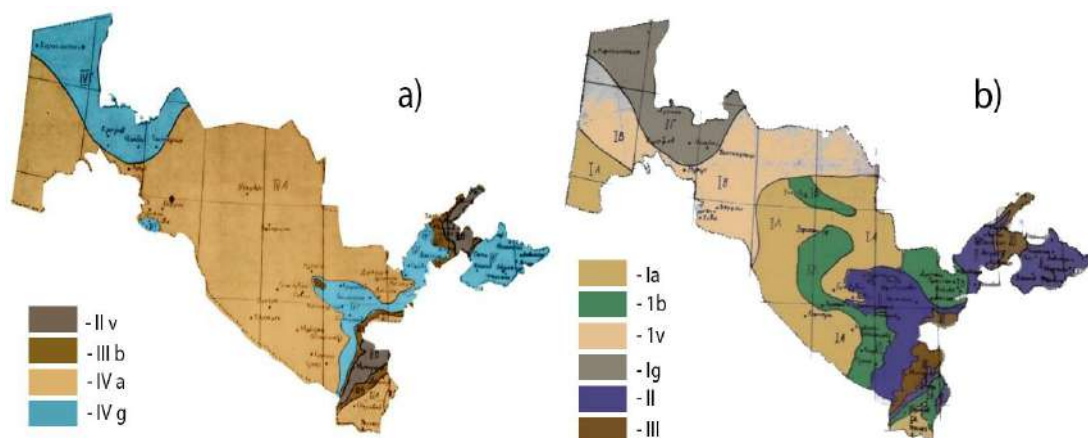

The natural and climatic conditions of individual construction sites are a vital factors in shaping the architecture of buildings and structures. The term “*natural-climatic conditions*” refers primarily to natural landscape, insulation, solar radiation, temperature, humidity and wind conditions. With the similarity of these factors, the entire territory of the USSR was divided into four construction and climatic zones. Each of them has its own temperature-humidity and wind regime characteristics and construction conditions.

*Fig 1. SNiP 2.01.01-82. Schematic map of climate zoning of the former USSR territory for construction . Central Asian part*

According to the climatic zoning adopted in 1982 (Fig 1), the regions of Uzbekistan were divided into **zones II-III-IV**, which were divided into **climate subareas IIv, IIIb, IVa, IVg**. The hottest period of summer is July, when the average monthly temperature is  $+12^{\circ}\text{C}$  to  $+21^{\circ}\text{C}$  in **zone IIv**,  $+21^{\circ}\text{C}$  to  $+25^{\circ}\text{C}$  in **zone IIIb**,  $+28^{\circ}\text{C}$  and more in **zone IVa**. And in **zone IVg** the temperature was obtained from  $+25^{\circ}\text{C}$  to  $+28^{\circ}\text{C}$  degrees. The winter months are January  $-14^{\circ}\text{C}$  to  $-3^{\circ}\text{C}$  in **zone IIv**,  $-5^{\circ}\text{C}$  to  $+2^{\circ}\text{C}$  in **zone IIIb**,  $-10^{\circ}\text{C}$  to  $+4^{\circ}\text{C}$  in **zone IVa** and  $-15^{\circ}\text{C}$  to  $0^{\circ}\text{C}$  in **zone IVg** average temperature was obtained.

During the years of independence, a number of measures have been taken to divide the territory of Uzbekistan into construction and climatic zones. Construction and climatic zones of the Republic of Uzbekistan are issued on the basis of 2 schematic maps according to KMK 2.01.01-94 (Figure 2).

a) Map of Construction and climate zoning similar to that adopted in SNiP 2.01.01-82.

b) Map of Construction and climate zoning for urban planning purposes

**Fig 2.** Schematic map of Construction and climate zoning of the Republic of Uzbekistan KMK 2.01.01-94

First, construction-climatic map is similar to the climatic zoning map adopted in 1982, in which the territory of Uzbekistan is divided into three climatic-construction zones **II**, **III**, **IV** and four climate subareas **II v**, **III b**, **IV a**, **IV g**, taking into account the average monthly temperature in July and January (Figure 2a).

**Table 1 .** Map of Construction and climate zoning. Similar to that adopted in SNiP 2.01.01-82. Calculated indicators

Climatic regions	Climate subareas	The average monthly air temperature in July, ° C	The average monthly air temperature in January, ° C
<b>II</b>	II v	From +12°C to +21°C	From -14°C to -3°C
<b>III</b>	III b	From +21°C to +25°C	From -5°C to +2°C
<b>IV</b>	IV a	+28°C and more	From -10°C to +4°C
	IV g	From +25°C to +28°C	From -15 to 0°C

As can be seen from Table 1, in the **II v** zone, the average monthly temperature in July ranged from +12°C to +21°C, and the average monthly temperature in January ranged from -14°C to -3°C, including the mountainous regions of the country. **Zone III b** can be called foothills, **zone IV a** can be called a desert zone with its hottest days in July, and **zone IV d** can be called oasis zone (Table 1).

We can see from the map and temperature indicators that cities such as Nukus, Urgench, Uchkuduk, Zarafshan, Navoi, Bukhara, Shakhrisabz, Karshi, Termez are included in the high-temperature and dry climate-desert zone, Samarkand, Tashkent and Fergana can be entered into the oasis zone with a relatively moderate air temperature.

**Fig 3.** The average indicators monthly air temperature in July and January of Construction and climate zoning

The second “*Construction for Urban Planning - Climatic Zoning Map*” issued in KMK 2.01.01-94 is structured taking into account more climatic factors and provides more information (Figure 2b).

We can see that **zone IV a**, which was separated on map 1 and given in general, is now divided into 4 zones. It can be seen from this graph that the abundance of sunny days in zones **Ia and Ib** and the lack of winter cold period in itself indicate its hot zone, while the duration of hot and cold days in zones **Iv and Ig** is relatively moderate. The part of the country divided into **zones III** differs from other regions by the fact that there are a few cold days and no hot days.

From all the above data, we can say that one of the reasons for the peculiar formation of the climate of Uzbekistan is its geographical location and related solar radiation; atmospheric circulation; relief: the condition of the earth's surface (what the earth's surface is covered with), anthropogenic factors, and its distance from the oceans and seas.

**TABLE 2. KMK 2.01.01-94. CALCULATED INDICATORS OF CONSTRUCTION AND CLIMATE ZONING MAP FOR URBAN PLANNING PURPOSES**

Climatic regions	Climate subareas	The number of dusty days in a year	Continuation of scorching hot days	Continuation of the heating season
<b>I</b>	1a	More than 20	More than 60	Less than 160
	1b	Less than 20	More than 60	Less than 160
	1v	More than 20/5	40-60	Less than 160
	1g	Less than 20/5	40-60	More than 160
<b>II</b>	-	Less than 20	40-60	More than 160
<b>III</b>	-	Less than 20	0-60	More than 160

*In the denominator of the fraction is the dusty days of the Aral zone*

Under the influence of anthropogenic factors, oases have formed in parts of the barren, arid climatic plains. This has led to a change in the microclimate. Many cities of Uzbekistan were built within these oases.

## Results

In the desert and oasis zones with hot and dry climates, it is necessary to create shade areas, cool the air temperature, organize light breezes, provide relative humidity. In this case, the role of landscape design elements is great. In this sense, plants, water, wind, shade, geothermal energy have a positive effect on the microclimate of the region, evoke a pleasant feeling of warmth, improve the condition of the person, a great hygienic and psychological impact on him. When these mechanisms are combined with each other, it is possible to design heat-friendly open spaces that can be used throughout the year. They control the heating regime of the area, have a positive effect on the composition and cleanliness of the air, are used in the fight against noise and air pollution, create the landscape attractiveness of the city.

### Microclimate control by shading

Solutions for shading in the open should include a combination of natural (trees, creeping plants growing on the pergola) and shade-protective structures (such as pergolas, fences, solid cubes).

*Fig 4. Microclimate control by shading*

### Microclimate control by geothermal energy

At depth, the indoor microclimate is cooler in summer and warmer in winter than the outdoor temperature, ensuring a stable, ie comfortable, heat regime throughout the year.

*Fig 5. Microclimate control by geothermal energy*

### Microclimate control by water

Due to the fact that water absorbs heat from the sun, they serve as natural conditioners in the open. Proper introduction of open water systems in the landscape improves the microclimate conditions and, consequently, the heating regime during the hot periods of the year. Microclimate conditions are favorable for humans at a relative humidity of 30-70%. Research in medical science has shown that an environment with an air temperature of 18-22 C and a relative humidity of 50-60% is comfortable for a human being. In dry weather (low relative humidity) cold air temperatures (-42) are more easily tolerated than in cold latitudes - 25 C0 cold. Plants have a large evaporative property, have a significant effect on humidity and air temperature, evoke a positive feeling of warmth. On the one hand, plants provide protection from sunlight with their shade, on the other hand, the transpiration of plants significantly reduces the outside air temperature.

**Fig 6. Microclimate control by water**

Micronebulization is a method of cooling the air through water evaporation mechanisms that facilitate the climate in certain areas of the garden. Micronebulization systems create a mist with very small water droplets; The smaller these droplets are, the faster they absorb energy and evaporate, and the air temperature immediately drops. Many factors affect evaporative cooling, such as the effectiveness of the refreshing effect, the amount of air, the movement of air and air renewal, and the presence of shade in the area. Water evaporation systems are more effective in enclosed, air-guaranteed areas protected by shady structures.

#### **Microclimate control by wind / wind flow.**

Air movement is the most important factor determining the microclimate of an urban area, which has a significant impact on a person's perception of heat, especially in the summer when the environment is overheated. The wind regime that is comfortable for humans is calculated from 0.5m / s to 3m / s. Using trees and shrubs, it is possible to improve the ventilation of the entire city area or its individual parts, protect city buildings from unpleasant winds, regulate air movement - reduce and increase its speed of movement, change the direction of its flow. The exchange of green and open areas affects the speed and direction of the wind, increasing the air circulation of the area and creating a positive microclimate, which is especially important for cities located in southern climatic zones. Biological processes in plants have a significant effect on the cooling of the air, which occurs as a result of the exchange of the hot air layer below with the cooled air. As a result of differences in air temperature, there is a horizontal migration of air masses from the green massifs to the environment between green and open or indoor areas, i.e.

the heated air in the open areas tends upwards, resulting in its replacement by green massifs fills the colder air.

*Fig 7. Microclimate control by wind*

## CONCLUSION

In the normative and legal acts of urban planning and other normative documents developed for the territory of the Republic, in public buildings of desert and oasis zones with hot and dry climates, which occupy the main part of the country, the measures to be taken to reduce the negative effects of climate, methodological recommendations on issues such as landscaping, how to organize the area in a planned manner have not been given and are not adequately covered. In the current KMK 2.01.01-94, the regions are divided into construction-climatic zones only in terms of annual precipitation and annual high and low temperatures, the annual amount of winds. Analysis of the history of architecture and urban planning has shown that regional and national architectural styles and images, the appearance of solutions of objects (buildings) are formed under the influence of climatic factors of the region. Ancient architects, based on many experiences and mistakes, minimized the impact of adverse weather factors and at the same time developed constructive and methodological solutions using favorable climatic factors. The impact of climate design and building on human Although the production of special climatic norms for the construction industry began in the late nineteenth and early twentieth centuries.

In historical periods, the process of developing new lands in desert areas developed in other regions, sometimes at the same time. This is evidenced by the numerous monuments of ancient culture, archeological excavations, traces of ancient settlements, irrigation systems. Remains of ancient cities and castles abound in the south of Karakalpakstan, in the Kashkadarya and Surkhandarya regions. is of great interest to local and international tourism representatives. Ancient cities such as Bukhara, Khiva, Beruni appeared in the desert and continue to live.

Common problems are common to all desert cities: lack of water resources, unfavorable climatic conditions, and so on. A city without greenery in the desert, fresh water sources, the breadth of sand massifs and the same appearance, create unfavorable conditions for the life of the population. The oasis zones of Uzbekistan differ from the adjacent deserts by all components of nature.

Complex-planned organization of landscape design solutions in the areas of public buildings located in the hot and dry climates of deserts and oases, combining our national traditions on the basis of modern experience not only stabilizes the ecological environment of the city or improves the artistic and aesthetic image of the city, but also plays an important role in the rapid and balanced development of the economy of any country, in radically improving the living standards and quality of life of the urban population, as well as in the development of tourism.

## Review Process

Each research paper/article submitted to the journal is subject to the following reviewing process:

1. Each research paper/article will be initially evaluated by the editor to check the quality of the research article for the journal. The editor may make use of iThenticate/Viper software to examine the originality of research articles received.
2. The articles passed through screening at this level will be forwarded to two referees for blind peer review.
3. At this stage, two referees will carefully review the research article, each of whom will make a recommendation to publish the article in its present form/modify/reject.
4. The review process may take one/two months.
5. In case of acceptance of the article, journal reserves the right of making amendments in the final draft of the research paper to suit the journal's standard and requirement.
