### ABSTRACT

*In our research, we have reflected agro industrialized small city's self-peculiarities, which positive sides to being reflecting developed rural agriculture for servicing to increase people's living conditions. Agro industrialized small cities advanced modern directions have looked in this research. Have been analyzed, have been specialized most important methods and trends. In this condition have learned agro industrialized small city's self-peculiarities, then will be given concerning conclusions. At the first complex, invitations have been found about agro industrialized small city projecting trends in Uzbekistan's watering earthly territory.*

**KEYWORDS:** Agriculture, Town – Planning, Agro Industrialized Small Cities, Designing Agro Industrialized Small Cities

### INTRODUCTION

“The modernization of agriculture and its development” is the third task of the “Most priorities of liberalization and development of the economy”. “Most priorities of liberalization and development of the economy” is the third direction in “The strategy of tactics in development of Uzbekistan during 2017-2021 on five main directions” adopted by Shavkat Mirziyoyev, the President of Republic of Uzbekistan on February 7, 2017 [1]. To organize agro industrialized small cities make service be peculiar implement to developing agriculture.

Republic of Uzbekistan's President Shavkat Miromonovich Mirziyoyev said his selfly speech in Higher meeting chambers' jointly meeting in was being devoted solemn ceremony to entering the position Republic of Uzbekistan's President:

“We must increase 2 together with our country's entirely insidely products till 2030. Renovating agriculture, bring up food products are a very important problem for us. At first, to significance, to developing farmer households. Because farmer households are the moving strength agricultural complex.

One of our important problem - supporting small business and discretion. Grow up our country's economical powers, strengthening countries peace, social friendly. Discrete gives products selfing family and country. I say again, if people rich, the country is rich” [2].

Agriculture reform and development of the first task - the development of diversified farming, the farm economy, economic efficiency and financial stability. This issue, we believe that the key to the country's food safety. Our President Sh. Mirziyoyev has done extremely high important works to supply people with houses in rural places. Correspond to time's demands of today, cheap costly houses give beauty to our rural. October 21, 2016, the President of the Republic of Uzbekistan "model projects in rural areas in 2017-2021 updated on affordable housing construction program" On the decision. Each one will think positive about the happiness of their children, family, build a comfortable house to live in you. Human happiness for their hardly critical to prosperity and stability. In this sense, the Program is national architectural traditions and modern trends in architecture and construction, bravery, Uzbek rural's provides the continuity of the work to create a modern image of the service [3].

A new type of model houses all modern requirements gives. The best primarily characterized by the efficient use of land. Agroindustrialized small cities project in the same houses uses. Earth is one of the most important factors in ‘people’s life and activity. People live differently territory in the world. Every country differently using earth according to selfly possibilities and intended people's abundance. Our Republic of Uzbekistan has done many weighty works this matter, attach importance separate important matter what cleverly using watering earthly territory. Because watering earthly territory is a very necessary factor for effectively activity agriculture. Agriculture is importantly implementing to satisfy people's very necessary cares. Nature's all things for people. People must use things economically. That time we obtain what our first President Islam Karimov said in “Conception deepen democratic reforms more and developing citizenship's society” “People's abundance” [4].

## **MATERIALS AND METHODS**

“It is known that 60 per cent of people live in rural areas. That is why we want to build a comfortable life for as long as we the people must be taken in order to improve the lives of our economic reform, particularly in agriculture, as well as the need to start” [5].

“First of all, providing jobs in rural areas, those who are unemployed and effectively employed happened sector involvement, their social protection. This solution chosen should remain the same: people working in agriculture production, and the rest in other sectors - industry, the services sector should be involved “[6].

You should bring to the village for the development of the rural industry. Therefore, the land at the expense of labor is empty of people employed in the industrial, construction and service

sectors, creating the foundation for the further development of the activities of the farmers. "To do this, first of all, the formation of market relations in agriculture. This task, which is agricultural wider market introduction of the "sustainable use of the Earth, its performance and to implement a science-based crop rotation (que) should help scientists closer to them" [7]. Agroindustrialized small cities - agriculture-related activities intended small city. If these towns, townships, and agriculture-related activities. Here, more than the work of agricultural machinery is used. Agricultural products grown, processed, and presented to the public, part of the increase in consumption will be exported. Today, the global market for our fruit and vegetables taking into account the high level of demand, the need to increase exports of agricultural products as much as possible. (Figure 1)

**Figure 1. Agroindustry complex**

Part of the agro industrialized small city of agriculture and primary processing enterprises, networks and facilities.

District planning structures and projects in the agro - small city-regional and district lines are considered. The lower the regional level, the agro industrialized small cities structure will be much simpler. Administrative district to the district planning project will only complex of the district and the district's joint elements:

- Agriculture (farms of all categories, to help enterprises in the industrial economy, private economy, collective gardens and vegetable plots);
- Agriculture service provider networks (agricultural engineering, agricultural chemical, agricultural, construction, transport, etc.);
- Agriculture products processing and storage activating networks;
- Agro industrialized small cities in rural areas and social infrastructure sectors (cultural and community services and housing construction).

Agriculture, the agro industrialized small city is one of the most important parts of the rural economy, so all production of goods on the main set, designed by the organization of the territory and land owned by the district to ensure the efficient and effective use of planning structures and projects one of the tasks.

The formation of agro industrialized small city residential, small city of production as a form of the progressive development of their production regions of the functional adherence to the principles envisages the use of which will be allocated as follows:

- Manufacturing plants, warehouses and auxiliary economy;
- Municipal facilities, transportation facilities, administrative, cultural and community services and other facilities;
- Sanitary protection areas and reserves.

Agroindustrialized small city, primarily in the real owners of the land, making the life of farmers, as well as entrepreneurs, owners and the combination of characteristics. Farmers, entrepreneurs, owners of their business processes closely with the organization worthy of support. This town of farmers, entrepreneurs, owners and their workers and their families live and work effectively with the activity of form.

Particular attention should be paid to the next most important priority is aimed at radically improving the living standards, and a long-term closely associated with one of the large-scale implementations of measures to improve the social and accelerate the development infrastructure, manufacturing, entrepreneurship and small business owner review the status, role and importance of farms, the development of all-round support.

These priority areas for the implementation of the program, future prospects important is considered the head of this word is very significant:

According to the structure of the agro industrialized small cities and performs the function directly above the guidelines of the program is to provide a combination of expression and the development of these directions.

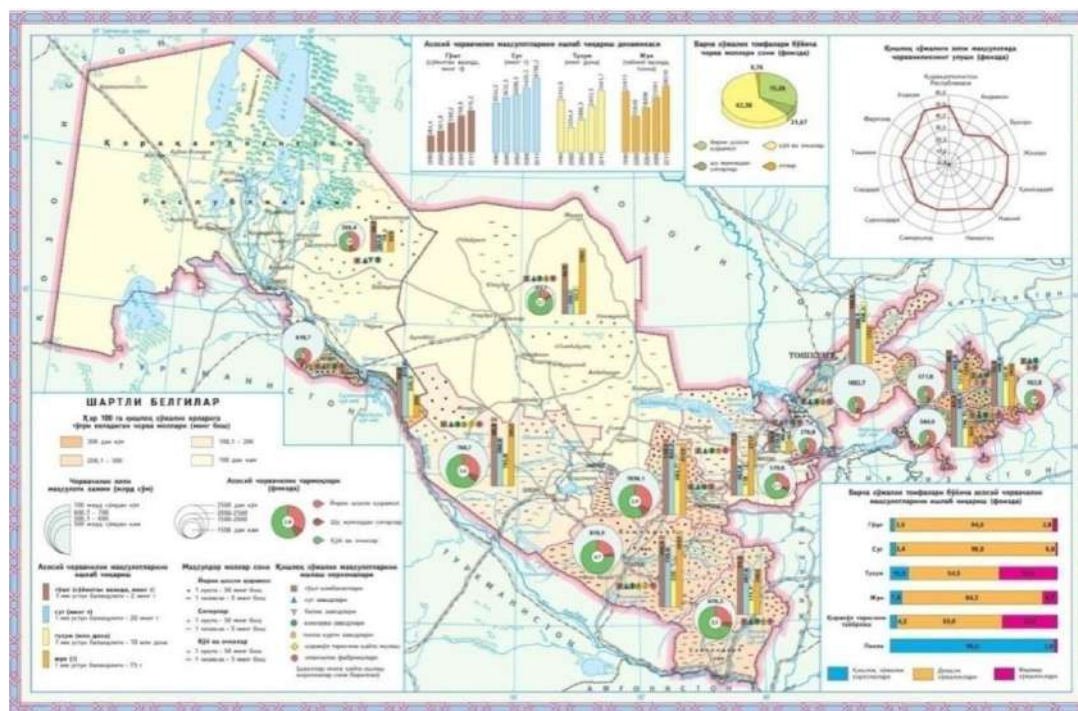

Agriculture to a new level, the flip cotton fields to reduce the size of the increase at the expense of food production, farms, processing optimization of the existing reserves held that it was important. In general, demand in the domestic and foreign markets, which stressed the need for the production of products with a higher value [8].

Modern agro industrialized small city planning and construction of the project and description of the scale and the economic development of the place of residence of the population of the town is connected with the development of the district's total.

The residence of the population of the town planning zones in the structure, function and construction, architectural - planning structure of the population, cultural and community service systems, industrial facilities and complexes to be resolved: the establishment of communications, engineering equipment, wide and improvement of the system is charged. Also, the project with social, economic, architectural, artistic or other issues is resolved.

Planning and spatial structure refer to the place of residence of the population, in all its parts and elements accordingly unit, they understood the principles and laws of the organization. (Figure 2)

**Figure 2. Cattle - raising agroindustry complex**

The following parts of the city - is subdivided into zones:

- Residential zone - where housing, public buildings and institutions, streets and squares, gardens, parks, sports grounds and stadiums;
- Industry zone - where production includes agriculture, energy, transport, utilities and other facilities are located.

Building elements of its functional areas, other elements of his compositions of the community centre, and the main street. The importance of the public centre of town with all areas of the city and its structural elements depends on favorable terms. Advanced planning factors include the following elements of the structure of natural water bodies, clearly an element of relief.

The basis of the structure of the town planning of its territory to separate functional zones. These functional areas of mutual regulation, including inserting a convenient pedestrian and transportation provided.

Economically, bars, residential and industrial areas, including the establishment of friendly relations is desirable.

Located in the zone of the population, which is easy to the health of people, the natural conditions are good, the relief and the flow of the river, which is located on higher agricultural production facilities on the territory of the wind blowing recommended. Population located in the zone of production and storage area with a slice of sanitary protection. The size of the sanitary protection zone on the regulatory documents. This zone is desirable for plantly zones and improvement.

Proximity zone browns ventilation in the production of transport is linked closely with the local roads, and farms situated in areas linked with land use [9].

The use of regional zones is not correct to use other types of settlements, cemeteries, Les burial places, household removed from the waste dump and other facilities for special purpose zones. At the age of technology revolution in reverse, namely, conservation, restoration and improvement of the human need for life.

Agroindustrialized small city planning projects and enterprises of the town to determine the costs of all aspects of the impact of factors and conditions, which must be assessed. In addition, population and labour resources, water, land, fuel - energy, transport, building a database, which can be the effect of sintering and others. Agroindustrialized small city is several different microclimates with a full assessment of the conditions required. Working factor requirement of the population and labour growth estimates should take into account, such as the availability of qualified personnel.

High demand solutions, agreed on the construction of centralized engineering facilities with limited or all of the recommended or permitted by the rules of state enterprises, companies, private companies and other private entities and citizens of certain objects projected by the order applied. [10]

Agricultural enterprises of the Republic of the historical district in accordance with the drawings of plans and projects, as well as the design based on the location of the sectors of the economy and the prospects for development without depending on the design [11; 12].

Agricultural enterprises and private ownership of the following:

1. the livestock, poultry, animal and worm farms;
2. veterinary treatment;
3. Greenhouse and greenhouse economy;
4. Food manufacturing companies;
5. primary processing of agricultural products and processing plants - plants, canned milk, sausages, wine shops, factories, sugar production plants and others;
1. Specialized in agricultural products, filing and storage companies;
2. Agriculture Machinery Repair and store base (agriculture);
3. Construction materials and structures manufacturing facility;
4. economic yards, construction, manufacturing and agricultural centres

Area-wide service on its classification (Classification) divided the territory of the activity and location. Plants, depending on the position of the city in the outskirts of the city, in front of public buildings and buildings, structures or recreational areas may be. Depending on the activities of the plants is subdivided into the following groups:

1. All people use plants, national parks, leisure parks (parks), city, and neighbourhood parks, squares Square, in front of the houses in the way of plants and the streets of the between the cities (boulevard), shore's pedestrian alleys around passage plants.

2. Restricted people use plants. Nursery school, school children, the Technical High academy, cultural and consumer services, health care organizations, sanatory, industrial warehouses and other plants in the yard.
3. Special-purpose plants around the main street and road use, for the protection of water for curtailing the wind to sever the city, cemetery and also between the industrial enterprises of the city with smoke, dust, gas and noise protection is intended for the plants

## CONCLUSION

1. The production of the formation of the agro industrialized small city residential small city to use as a form of the progressive development of their production regions of the functional envisage the adherence to the principles of which will be allocated as follows:
  - Manufacturing plants, warehouses and auxiliary economy;
  - municipal facilities, transportation facilities, administrative, cultural and community services and other facilities;
  - Sanitary protection areas and reserves.
2. The future development of the rural areas of the Republic of Uzbekistan to bind production. Uzbekistan has a variety of small cities, depending on the climatic zone was designed. Regional projects - taking into account the capacity of the region, taking into account the future of the region, referring to the development of futural designed.
3. Everyone in the project before going to work in areas engineering improvement work is carried out.
4. At the time of our life in the future for use to watering areas of construction, houses a small design, the expansion of residential areas would not be supplied without planning compactly. If we don't keep us to watering earth today, lest the lands face enormous challenges in the future. In some countries like soggy land to build housing, growing in faith.
5. Projects of agro industrialized small cities of the rural settlements should be linked with the development of future production. Uzbekistan has a variety of small cities, depending on the climatic zone was designed. Regional projects - taking into account the capacity of the region, taking into account the future of the region, the projects envisaged for the development of the future.

## **DIGITAL CONTROLLED SYNCHRONOUS ELECTRIC DRIVES**

**Sultonov Ro'zimat Anvarjon o'g'li\*; O'rmonov Sanjarbek Raxmonjon o'g'li \*\***

**\*/\*\*Lecturer,**

Department Of Electric Engineering,  
Electric Mechanics and Electric Technologies,  
Fergana Polytechnic Institute, UZBEKISTAN

### **ABSTRACT**

*The article focuses on improving the performance of chemical enterprises with the use of electric drives with mental potential. This allows the system to be controlled and monitored by replacing existing electrical drives in chemical plants with new digital controllable intelligent electrical drives. Unlike other systems, which have the ability to view and change parameters using the installed control device, and reflect high energy efficiency.*

**KEYWORDS:** *Electric Drive, Inverter, Microprocessor, Voltage Frequency, Spatial Vector, Mathematical Model, Rotation Frequency, Signal Filter And Sensitivity Field.*

### **INTRODUCTION**

In recent years, the chemical industry has had electric drives that are coordinated by frequency of use, but consumer demand cannot ensure the smooth operation of the system. On the basis of new elements of mental electric drives IGBT - transistors are installed, and in power models IPM and control-systems of microcontrollers with digital vision. Frequency-lubricated electric guides will not see an excessively high dynamic state, so the range indicator will not exceed 50/1.[1] At present, a small proportion of electric drives, which are part of the energy demand of the chemical industry, have been developed in our country by "hand tools," which are "unknown" software.

All versions of converters are implemented on a single hardware platform in terms of power and control and differ from each other in software, as well as in hardware and software complex of interface functions and modes of operation.

## MATERIALS AND METHODS

One of the current trends in the development of converter equipment for controlled smart drives is the constant expansion of its functionality, modes of operation and intellectual features. Modes such as Auto Adjustment of Electric Brake with Synchronous Frequency Control, Energy Saving Mode, Spinning Part with Acceleration, Motor Start, Constant Braking, Auto Brake Out and Real Time Cyclogram Monitoring can be considered.[2] A number of inverters are equipped with a computer interface, exchange contacts with different angular displacement sensors, user programming functions, standard communication channels and microprocessor-based devices. In this case, it will work in two different modes: mode "self-support" and mode "synchronization".

Homing mode ensures that the drive will operate in the event of a brief drop or power failure. The implementation of the mode is based on the kinetic energy stored by the moving mechanical weights of the load and returned to the inverter during the frequency braking.[3; 9] One of the ways to implement this mode is to control the input voltage of external motion, and the control of internal active components is to transfer looped electrical movements into the control structure.

This concept mainly applies to vector motion control systems in which control schemes of active and reactive components of a flow are included in the basic structure of speed control. When switching to "homing" mode instead of speed control, the inverter input voltage is adjusted. When the power is restored, the speed control is reversed. The adjustment of the proportional integral voltage is set symmetrically to the optimum one. The main advantages of the considered "homing" mode are high dynamic and static voltage control accuracy, no low-frequency voltage and current fluctuations, the motor operation mode is characterized by proximity to the fault and low energy loss.[4]

In frequency control systems without the considered speed control sensor in the "self-sustainment" mode, the problem of "soft" transition between structures arises without an active current regulator in its main structures. The solution to the problem is to create a frequency counter for "self-sustainment" when returning to the main control structure or developing a "self-disconnect" option (smooth start in a rotating engine with quick search function).[5; 6; 10] However, algorithms for implementing "self-sustainment" in a frequency control system are more complex and require more change in the underlying software than in vector systems. Another method of implementing the "stand-alone power supply" mode is to construct a relay circuit for controlling the external voltage of an inverter in a rate (frequency) control circuit. In this mode, the operation algorithm of the device is implemented as follows.

1. The activation of the mode is performed when the "self-control" option is set and the condition  $U_{\pi} < U_{\pi 0}$  is fulfilled. It starts to slow down the movement with a certain intensity.
2. The braking of the motion stops in the positions  $(U_{\pi} > U_{\pi 1})$  or  $(U_{\pi} < -U_{\pi 0})$  and continues in the states  $(U_{\pi} < U_{\pi 0})$  and  $(I_{\pi} > 0)$ .

where  $U_{\pi 0}$ ,  $U_{\pi 1}$ ,  $U_{\pi 0}$  - programmable values of the input voltage and current of the inverter;  $I_{\pi}$  is the inverter input current calculated by phase current and voltage. In an uncontrolled orthogonal coordinate system (x, y), the inverter input current is expressed as follows:

$$U_o = (3/2) [(U_x I_x + U_y I_y) / U_o] (4)$$

3. When braking stops, the set speed (frequency) for engine failure is adjusted according to the actual value.

Providing "off-line power supply" mode with "poor network" parameters and automatic restart significantly increases stability of movement under conditions of low voltage quality.

In "Synchronization" mode, smooth switching of motor between networks is performed by synchronizing output voltage of inverter with voltage of network and generation of control signals for contactors that connect motor to network and inverter.[7; 8] This allows the inverter to operate in parallel for a short time in parallel with the network. Synchronization is performed by monitoring instantaneous values of the network phase voltages using sensors installed on the eC4 expansion board installed on the converter. Based on the data obtained from the sensors, frequency, amplitude and phase angle of rotation of the network voltage vector are calculated. These values are used as a function to generate the output voltage of the inverter. The control system is consistent with frequency, amplitude and phase voltage.

## CONCLUSION

Logic signals from their unit contacts are transmitted to the converter to prevent occurrence of emergency situations due to mismatch between actual state of KM1 contactors and KM2 specified by the converter and electrical contacts. The use of these signals made it possible to implement a control algorithm that was not proportional to contactor response time, and to minimize switching time.

The conductivity current is limited by the active state of the contactor between the inverter output and the network due to the 50 Hz drop in the nominal voltage of the network by 5... 9% in a 3-phase excitation reactor.

## **NEGATIVE IMPACT OF THE TAX SYSTEM ON POLITICAL LIFE - ON THE EXAMPLE OF THE HISTORY OF THE KOKAND KHANATE (1850-1865)**

**Burkhonov Ilyoskhon Muhiddinovich\***

\*Lecturer,  
Department of the "History of Uzbekistan",  
Ferghana Polytechnic Institute, Ferghana,  
UZBEKISTAN

### **ABSTRACT**

*The article covers information about the history of the Kokand Khanate, what scientists can study in their research, and what taxes formed the basis of the administrative management system in the Khanate, and that they were raised at the request of the head of state, which, in turn, had a negative impact on the life of the country's population, resulting in revolts against the tax policy of the Khan in various regions.*

**KEYWORDS:** *Historical Literature, Taxes, Khudoyorkhon, Rebellion, Sarkor, Khokim, Social, Political.*

### **INTRODUCTION**

In the long history of Uzbekistan, the Kokand Khanate was considered a state of special importance. If you look at the history of the Khanate, you can see that from the time the Khanate was founded until the last days, complex political processes and acute social and economic situations reigned. Nevertheless, the Khanate was considered a state with special authority and strategic position in relation to other khanates of Central Asia.

In the 50-60s of the XIX century, a difficult political situation developed in the Kokand Khanate. This political tension had a huge impact on the economic life of the Khanate, especially on its domestic and foreign policy. In the 1950s, the Kipchak uprising and their massacre, the uprisings in different parts of the Khanate against rising taxes and fees, caused by various reasons, and their violent suppression, especially in the palace, led to increased tension in political life.

## MATERIALS AND METHODS

We can find valuable information on the history of the Kokand khanate from books, research sources and articles of our historians, such as S.Nurken, V.Grigorev, A.Kun, A. Xoroshxin, A. Geyns, N. Pantusov, A. Middendorf, V. Nalivkin, A. Zimin, N. Ostroumov, S. Abdugaffarov, V. Nalivkin, A. Juvonmardiev, A. A. Troitskaya, R. N. Nabiev, A. P. Qayumov, F. G'afforov, E. Xurshut, H. N. Bobobekov, A. Xasanov, Sh. Vohidov, Sh. Yusupov, G.Agzamova, D.Sangirova, V.Ishquvvatov, Z. Ilhomov, B. Tursunov, Muhammad Yahyoxon, Sh. Makhmudov. In addition, scientists from Kazakhstan, Kyrgyzstan and Russia - S. Sudanbekov, T. Beisembiev, Yu. Lunev, N. Terletsky, Japanese researcher Yaoyi Kawahara, also conducted research on the history of the Khanate. One of them is T. Beisembiev, who published the facsimile "The Stories of Alikuli Amirlashkar" by Muhammad Yunus Taib in English in London. We see that the information about the tax system of the Khanate was partially covered in the research of scientists such as M. Zhuvonmardiyev, R. Nabiyeu, A. Krinboyev, K. Bobobekov, Sh. Makhmudov. [1, p. 75]

The 50 years of the 19th century marked the most violent processes of domestic political upheaval for the Kokand Khanate. First, Sayyid Muhammad Khudoyerhan could not fully take power in his own hands, even though he had been heir to the throne since 1844. But to say that Khudoyarhan was an unworthy Khan will be wrong. While in the early years the strong influence of Muslim thousands and Kipchak officials in the palace prevented him from ruling the throne on his own, in later years strife and growing general discontent led to the destruction of these opportunities. This circumstance could also be observed in the revolts, protests that took place in different years of his reign in different parts of the Khanate. [2, p. 42]

Secondly, by the 50s of the XIX century, insufficient attention was paid to the struggle of the Russian Empire against attacks on the Khanate, and political and military weakness led to expansion and serious obstacles to the invasion, which eventually led to the destruction of the Khanate. Since the Russian Empire focused on conquering Central Asia and turning it into a colony, in submission to the Kokand Khanate, which has become a great obstacle and a serious opponent in the full conquest of the territories of today's Kazakhstan. However, the economic situation was aggravated, on the one hand, by the internal wars in the Khanate and, on the other hand, by the military invasions of Tsarist Russia with a colonial purpose, which led, first of all, to the strengthening of general discontent of Khudoyar Khan as head of state and ruler. If a Khanate citizen was dissatisfied with the excessive increase in taxes in the following years, the representatives of the upper classes of nobility and the palace were dissatisfied with the fact that Khudojerkhan could not fully take the political situation into his own hands. Assessing the political situation in the Kokand Khanate in 40-60 - years of XIX century, N. Ziyoyev emphasizes - "quot;... As a result of continuous internecine wars and sitting on the throne of noblemen, the Khanate was experiencing a deep crisis in all respects.

People's uprisings against the difficult situation have risen." [3, p. 33]

By the 1950s, taxes were increased in nomadic Kazakh areas of Kokand Khanate, as well as in Turkistan, Shymkent and other localities. For example, Z. Hatamova studied the tax system and types of taxes in Kokand Khanate as follows: "The types of taxes levied on the population in Kokand Khanate can be divided into official and special types of taxes. There were official taxes such as rent, sunset, sales tax, animal tax, balance tax, river crossing tax, the salt tax, tithe tax. Tanobona, wedding taxes, inheritance taxes are special taxes... Due to the fact that the Kokand

Khanate was separated from the Bukhara Khanate, the tax system and types of taxes were formed on the basis of the tax system of the Bukhara Khanate. However, in recent years many changes have been made to the tax system during the Khudoyorhan 's rule, "he said. [1, pp. 75-84]

One of the protests against the tax policy of the Khanate took place in 1858 on the territory of the Tashkent Bekt. In the Kokand Khanate, the Hakims of the province also have the right to levy taxes on Hiraj and Tanabon. [1, p. 78]

During the period of Khudoyarkhan's reign (1865-1875), every year the governors were paid taxes to the Khan's treasury for the amount of 150000 rubles. In common people's language, the taxpayer was called tanabchi (land measurer and taxpayer from each land), the officials collecting Zakatka tax were called zakats. When Tashkent's Hakim Mirzo Ahmad Kushbegi said that everyone except residents of Chimkent, Turkestan and sacred areas is taxed on livestock, and a tax of one tilla(gold coin) was introduced for each married girl, a disgruntled crowd uprising ensued. In addition, according to the sources, Mirzo Ahmed Kushbegi, who is the Hakim of Tashkent, actually runs his own government, suffering cruelty and violence.

It's especially brutal in tax policy. Even those who cannot pay taxes when collecting small taxes, such as bird money, blue money, force their young son or daughter to pay as tax.

Despite the fact that taxes were to be collected strictly in due time and on time, at the discretion of the khan and officials all this changed. During the war, in particular, the types and amounts of taxes were increased. [1, p. 82]

This, as noted above, led to an increase in General discontent not only on the part of Mirzo Ahmed Kushbegi but also on the part of Khudoyarkhan, as the head of state. The reasons for this uprising, the historian Muhammad Yunus Tuib points out that the people patiently followed the policy of the authorities, in particular, the brutality of Muhammad parvonachi and Mirzo Ahmad kushbegi, as well as the neglect of Khudoerkhan and disregard for citizens. [7, pp. 110-111] Abu Ubaydullo Toshkandi, a historian and government official, writes that people's discontent is growing every day as a result of numerous taxes and excessive harassment by Mirzo Ahmad Kushbegi. Even the taxmen went out with an army to collect zakat and girozh. In 1857, Abu Ubaydullah himself participated in the collection of taxes from the population living in the vicinity of Avliot. This revolt was led by Ibn Khudoybergan Bayit Bakhodur. [4, p. 261] "The steppe Kipchak," writes Muhammad Salih, " the tribes and tribes living in different regions United and declared their withdrawal from the subordination of the Kokand khanate and at the same time the Tashkent Khanate. They didn't pay the tax authorities any dirhams or fulus. On the contrary, the territories of the Steppe Kipchak before Turkestan remained on the verge of revolts and riots. "[5, p. 202] About the reasons for this situation in other sources there is information in a completely different interpretation. For example, L. Sobolev points out that after Okmach was released, Khudoyarkhan introduced separate administration in the Northern regions of the khanate and appointed one of his closest officials, Mirzo Ahmed Kushbegi, as Governor. When presenting him with power, God specifically assigns "robberies and murders of all nomads under the influence and power of the Russians". As a result, "all the Northern regions of the khanate were left in ruins of revolts".[6, p. 152]

Mirza Ahmad's cousin stopped in Alma-Ata with his army to suppress the uprising, at which time he sent an army under the command of Besh Ponsot against Sufitoy Biya, one of the great

rebels standing in Pishpak. However, the sent army was defeated. Encouraged by the victory, the rebels imprisoned and besieged Mirza Ahmad, who had returned to his Holy Father at the time. The siege includes an argument, duglat, barlos, bell, pentathlon, fork, earring, black hat and other seeds. The army, led by Mirzabi, Minister of the Tashkent Government, was sent to the outskirts of Shymkent to collect the sunset and was defeated by earrings, bells and other seeds. Mirzabi himself and his close officials were killed in the clashes. [2, p. 58]

The situation in the northern parts of the Khanate was such that no general wanted to come here. Khudojorhan immediately sent an army led by commander Shodmonhoja and his brother Mallabek to suppress the uprising and save Mirza Ahmad, who had been imprisoned by the rebels in Avliat. The uprising was suppressed as a result of Mallabek's entrepreneurial behaviour, that is, his commitment to meeting the conditions set by the rebels, and peace was restored in the country. The commander of Shodmonkhoja will be appointed governor of Tashkent. [3, p. 212]

After the above events, mistrust of Khudojorkhan and his government will increase. At this time, the Emir of Bukhara besieged Nasrullo Uratapa, smashed the Kokands and moved towards Khojand. However, Mayor Yakubbek Badavlat stopped the Emir's march and the Emir was forced to retreat. After these events, Brother Mallabek Khan, one of the most influential officials, Mirzo Ahmad Koshbegi and Dostmuhammad, considered tablecloths the main culprits of Khudoyarkhan's ignorance and ignorance towards the country and its citizens and tried to execute them. However, after the intervention of other officials, he changed his mind and went from Kokand with his men to Andijan. [8, p. 55]

The Mallabek ' s case sparked protests in Khudoyorhan, and he was sentenced to death by the intervention of the Prime Minister. It is for this reason that senior government officials and a number of Kyrgyz-Kypchak communities and tribal leaders have increased their sympathy for Mallabek. In Andijan, a group led by Mallabek overthrew Khudoyorhan and embarked on a plan to capture the throne. From here Mallabek comes to Osh on the advice of Mullo Alikuli, who became one of his most trusted people. He says he intends to make an alliance with Olimbek Dodhoch, Saidbek Dodhoch and other influential people in Osh to seize power and restore order in the country. After receiving several colleagues here, Mallabek returned to Andijan, in the district of Toshlock, where he rose to the rank of khan in the yard of Alikuli. They stand here and begin to prepare for the seizure of power. The Mallahan movement can be seen as a political crime against the state or a political conspiracy incompatible with Islam and the law and not permitted by Sharia, but the above information shows that Mallahan is trying to bring order to the country, put an end to the riots in the palace, and put an end to the plots. Fought for power to prevent an invasion of the growing Russian Empire. His goal was supported by many officials and statesmen, as well as religious leaders. However, it would be wrong to assume that Mallahan's struggle for the throne and his accession to the throne were based on the goals of the Kyrgyz-Kypchak aristocracy, which had previously been in power and had a huge influence on the political governance of the state. [9, 10, 11, 12]

Although the Kyrgyz-Kypchak aristocracy, which had great military power and standing, provided close assistance to Mallahan, this struggle was marked by clashes between forces seeking power in the palace, conspiracy, disobedience to the throne and the inability of Khudoyorhan to pursue policies for the benefit of all segments of the population. It should also be assumed that this was based on the personal interests of Mallahan, who was trying to capture.

In 1858, with the help of Mallabek Alikuli, he took advantage of the absence of Sufibek and Shah Murad, who was now fighting against the Emir of Bukhara and captured Andijan and Margilan, who were under their rule. Subsequent marches will focus on the conquest of Kokand, and the battle between the brothers will take place in the Samonchi area. Mallahan wins this battle and after several days of siege takes over Kokand. Mallahan's victory and accession to the throne were congratulated by the Governor of Tashkent, Sultan Murodbek, a cousin of Otambaya, Sufibek, the Governor of Andijan and the kuramals, who recognized his legitimate ownership of the throne and declared their loyalty to Mallahan. Khudoyorhan, on the other hand, sought refuge from the Bukhara's emir due to lack of support.

When Mallahan ascended to the throne, he first proceeded to establish order in the Khanate and to strengthen Khan's power. Such measures are taken by Mallahan, as well as his domestic policy actions, subsequently do not justify themselves and lead to a crisis of Mallahan rule.

## CONCLUSION

Summing up the above, it can be said that in the 1950s-1960s a difficult political situation arose in Kokand Khanate. These political tensions have had a huge negative impact on the economic life of the Khanate, especially its domestic and foreign policy. The Kipchak rebellion and its destruction in the Khanate in the 1950s for various reasons, the rebellion in various parts of the Khanate against raising taxes and fees and their violent suppression, especially the rise of chaos and intrigues in the palace, caused tensions in political life. As a result of the plots of the inner palace Khudoyorhan was overthrown, Mallakhon and Shohmurodhan were killed, disobedience to the central government and increased partisanship. This political situation created conditions for the emergence of military power, not the power of the Han dynasty. As a result of the struggle of such domestic political forces, Aliguli took the reins as patron of Sultan Said Khan. Nevertheless, the Alikuli government should not be seen as a government that puts Kipchaks in high office. Based on the course of events, it can be concluded that Alikuli came to power not to restore the position of the Kyrgyz-Kipchak aristocracy in the palace, but in the process of the political situation created by internal riots and conspiracy in the palace.

### ABSTRACT

*Solar energy (or solar technology) is rapidly occupying the global energy market as an environmentally friendly type of energy. Along with low-power 0.1-10 kW solar devices for providing energy to local objects, solar power plants are being formed that are connected to industrial power networks with a capacity of 1 MW or more. The article discusses the issues of increasing the efficiency of using devices using non-traditional types of energy, in particular low-power solar power plants, where the results are presented on providing constant high powers in four-stroke lifting wide pulses solar power plants of low power. In the course of the work, the types and elements of low power, solar power stations were analyzed. Based on these data, computer and mathematical models have been developed. The results of changes in the output voltage of the solar power plant depending on the position of the sun, the current-voltage characteristic of the solar module of the MCW series with a power of 120 watts are presented. Some results of experiments and calculations are given in graphical and tabular forms.*

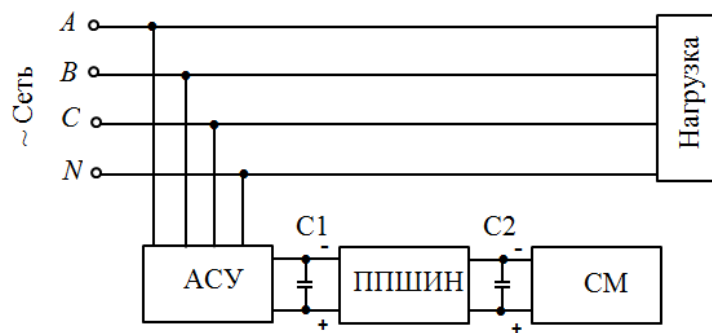

**KEYWORDS:** *Solar energy, low-power solar devices, energy supply, local objects, increased efficiency, low-power solar power plants, computer model, mathematical model, the position of the sun, experimental results.*

## INTRODUCTION

Due to the low energy density of solar radiation, it is desirable to use an optical concentrator of solar radiation in almost many types of solar installations. Possibilities of solar radiation concentration are caused by features of the Sun, as a source of radiation - a small angular radius, which determines the possibility of obtaining high concentrations. Now the problem of application of concentrators consists of the decision of problems of increase of their optical efficiency and maintenance of economic profitability in operation. One of the technical tasks with the use of hubs is to ensure its rotation following the visible movement of the Sun during the day, continuously or discretely. The difficulty of solving the problem is due to the fact that due to the low energy density of solar radiation near the Earth to obtain any noticeable power requires a significant area of solar installations, including concentrators, whose size is proportional to the power of the solar plant. The above-mentioned leads to the necessity to solve complex technical problems of the creation of large-size concentrators, creation for concentrators of bearing and turning devices and control systems providing movement of such objects following the visible movement of the Sun. Research on concentrator tracking and control systems has been underway since the beginning of concentrator development. In this regard, as well as the objectives of increasing the efficiency of existing concentrators and heliostats, this article contains aspects of increasing tracking systems, in particular, a mathematical model of a solar element taking into account the dependence of natural illumination characteristics has been developed, a model - Matlab of the system of electric supply of a local object containing an active load and lift wide pulses of the solar station has been built. The reduction of traditional fuel reserves and the pollution of the environment during their combustion are considered to be the main disadvantages of traditional energy sources. In this regard, energy programs aimed at alternative energy development have been developed in recent decades. Solar energy (or solar engineering) is rapidly occupying the global energy market as an ecological clean type of energy. Along with low-power 0.1-10 kW Helio devices to provide power to local objects, solar electric stations are currently being formed connected to industrial electricity networks with a capacity of 1MW or more [1].

## MATERIALS AND METHODS

Special converter devices are needed to ensure the overall operation of the solar power plant and industrial electrical networks. In many cases, such devices use actively controlled converters. The output characteristics of such converters for the quality of electric energy should comply with modern standards. Actively controlled rectifiers are made according to three-phase bridge circuit of IGBT transistors with reverse diodes. The voltage from solar cells is supplied to its input from the DC voltage converter of lift wide pulses. (Fig. 1).

**Figure 1.** Circuit of actively controlled rectifier

A solar power station block diagram having a DC voltage converter of lift wide pulses and an actively controlled rectifier.

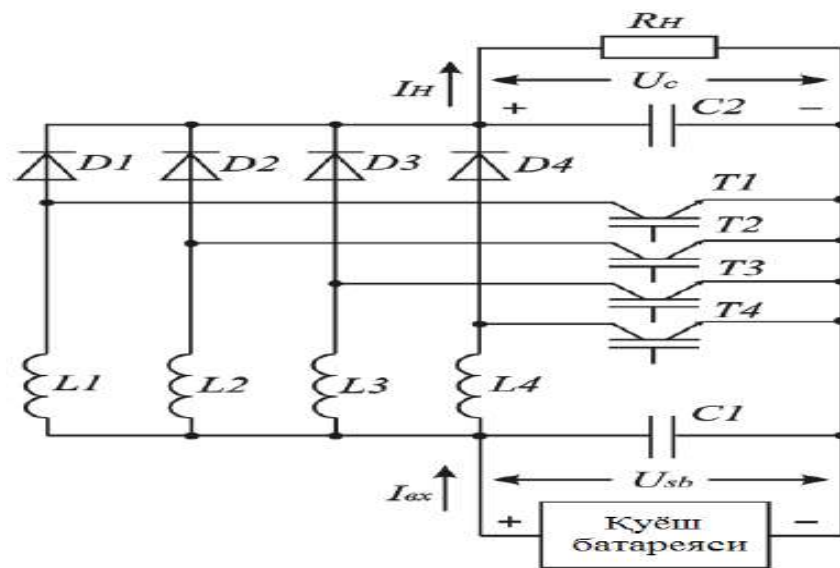

Capacitors with low  $C1$  capacity are connected to the solar battery output. Connected capacitor  $C2$  is selected for the input of actively controlled rectifier by the high voltage of amplitude values of supply line voltage.

$$U_c > kU_{am} \quad (1)$$

Where  $k=1.25 \div 1.5$ .

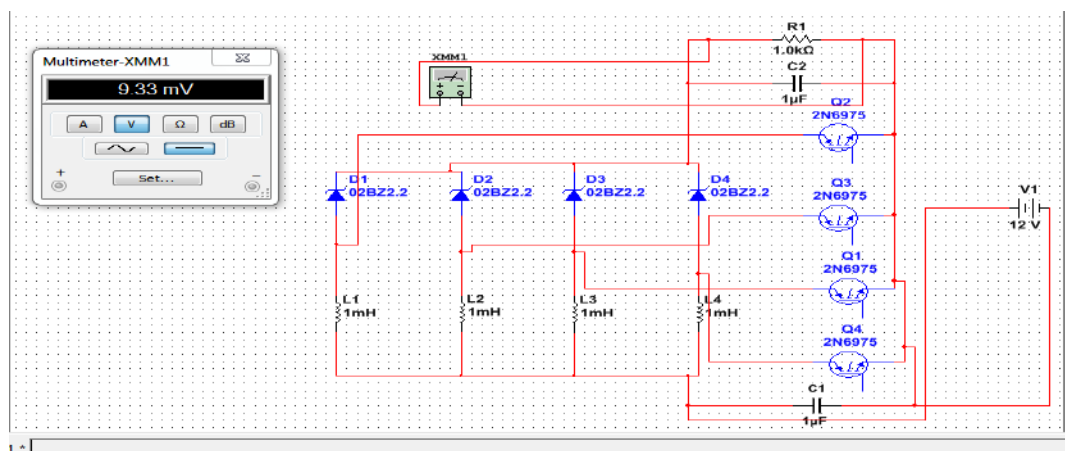

For stable operation of the converter, it is necessary that  $C2 \gg C1$ .

In a 100 kW solar power station, the use of a lift-wide DC voltage pulse converter makes it possible to reduce the number of solar cells connected in series, and as a result, the overall efficiency of the solar power station is increased. The diagram of the connection of the converter of lifting wide pulses of DC voltage to the output of the solar battery is shown in Figure 2.

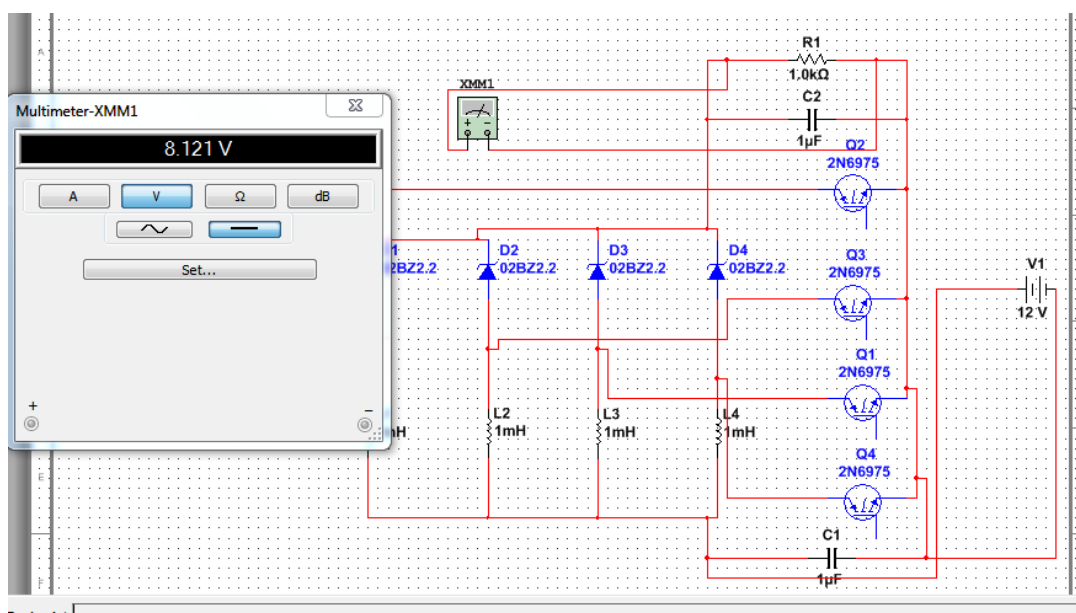

**Figure2.** Diagram of connection of PPSHIN to solar battery output [2]

The PPSHIN model shown in Figure 3 is constructed as Figure 3:

**Figure. 3.** PPSHIN model.

Here, during sunrise, the multimeter shows 9.33 mV. Accordingly, the angle of the lift will change as the sun changes position. In the model below, you can see an increase in voltage due to a change in the angle of the PPSHIN. It follows that with the change in the angular value of the PPSHIN depending on the position of the sun, the value of the stress will change accordingly.

**Figure. 4.** Change the output voltage PPSHIN depending on the sun position

The output voltage PPSHIN will be greater than the input voltage. This is achieved by separating from each other in time the processes of energy transfer to the capacity in the output and the process of energy accumulation in inductive cells [3] For example, the results of changing the position of the solar module power 120 W relative to the sun are given in Table 1.

**TABLE 1. RESULTS OF THE CHANGE OF POSITION OF THE SOLAR MODULE WITH A POWER OF 120 W RELATIVE TO THE SUN.**

V	A	V	A	V	A	V	A	V	A	V	A	V	A	V	A	V	A

21.1	0.54	20.7	0.34	20.3	0.49	19.9	1.12	20	0.92	20.2	0.53	20.1	0.96	19.8	0.54	20	0.63
21.3	0.38	20.8	0.28	20.4	0.43	20.4	0.35	20.4	0.45	20.2	0.45	20.2	0.47	20.1	0.32	20	0.43
800		900		1000		1100		1200		1300		1400		1500		1600	

The lifting converter is four-stroke, that is, four single-stroke wide pulse converters are connected in parallel and operate by moving in time equal to  $T/4$ , here  $T$  - a period of wide pulse modulator.

#### Solar Cell Mathematical Model

The equivalent active load solar cell diagram is shown in Figure 5. By viewing the currents resulting from the internal photo effect, it is possible to estimate the maximum power of the solar battery [4]. Under the influence of light of wavelength  $\gamma = 0.2-2 \mu\text{m}$  the solar cell is irradiated and its p-n transition current appears (Fig.5.)

**Figure 5.** Solar Cell Equivalent Diagram

$$I = I_s \left[ e^{\frac{qU}{kt}} - 1 \right] - I_\phi \quad (2)$$

Where:  $I_s$  - current of non-basic carriers (current of development);  $I_{\text{sexp}} (qU/(kT))$  - main carrier current;  $I_f$  is the primary photocurrent;  $Q$  - electron charge, modulo;  $U$  is the shift of transition in the right direction;  $T$  – temperature. The volt-amp characteristic of an ideal solar cell is characterized by the ratio (2). [4. 6]

Volt-ampere characteristic of MCW series solar module with the power of 120 W and voltage of 12 V (curve I) and graph of voltage dependence on dissipation power in the load at the illumination of solar element  $E = 1050 \text{ W/m}^2$  (curve -  $P/10$ ) are shown in Figure 4. The maximum power supplied from the solar cell corresponds to the BAX point an ( $I_p = 7.06 \text{ A}$ ;  $U_p = 17 \text{ V}$ ). If the operating point of the control system algorithm is constructed according to the BAX point the output power of the BUS will depend only on two parameters - primary photocurrent and load resistance. In turn, the photocurrent ( $I_f$ ) depends on the illumination of the solar cell ( $E$ ).

$$I_{\phi} = \frac{E}{\alpha} \quad (3)$$

Where  $\alpha$  is the percentage of proportionally depending on the kind of solar cell

**Figure 6.** Characteristics of the solar module (a-CAB, b-dependence of power dissipated in the load from illumination) [5]

The maximum possible solar cell power (fig. 6) and corresponding to expressions (2), (3), can be determined by examining:

$$\frac{dP}{dU} = I_s \left[ e^{\frac{qU_p}{kT} * \left[ \frac{qU_p}{kT} + 1 \right]} - 1 \right] - \frac{E}{\alpha} = 0 \quad (4)$$

Where -  $U_r$  - output power of the module

To obtain the relationship between power and illumination and expressions (4), define  $U_p$  and insert into expression (2).

The link between lighting and maximum power for solar module MCW12060-12 is shown in Figure 6 b.

---

## CONCLUSION

In this regard, the objective of this article to study and provide constant high power when using solar cells through the use of four-stroke lift wide pulses in solar cells is relevant and of scientific and practical interest.

UZBEKISTAN

### ABSTRACT

*In the article, it is informed about sources of learning tax system the khanate of Kokand which had a significant role in Central Asia from 1709 to 1920. The author describes the peculiarities of studying the system of taxation in Kokand Khanate. This information is very important for researchers and a wide range of interests about the tax system in Kokand Khanate.*

**KEYWORDS:** *Kokand Khanate, Finance, Tax, Administrative Development, Source, Social-Political.*

### INTRODUCTION

29 years have passed since Uzbekistan gained independence, and during this time the study of the history of Uzbek national statehood was formed based on new innovative projects. It is necessary to deeply study our national history, not to mention the fact that we have achieved the goal, but to study the field of history in order to form in the minds of the younger generation respect for domestic history and traditions, devotion to the motherland, respect for the memory of our ancestors. In his book “Yuksak ma'naviyat – yengilmas kuch”, the first President of the Republic of Uzbekistan I. A. Karimov focused on the issue of educating young people spiritually mature and not influenced by foreign ideas in the process of globalization. Young people who know their history well have a strong sense of pride and patriotism and are not influenced by any foreign ideas.[1]

### MATERIALS AND METHODS

Among the Central Asian Khanates, the Kokand Khanate was formed with some features in political, social and cultural life, and the system of taxation, types of taxes and the way taxes

were collected, which were of great importance in its administration, also developed slightly differently. The tax system is the source of the state treasury, the basis of the budget, and it is difficult to imagine the stage of development of states without this system. In studying the history of the tax system of the Kokand Khanate, it would probably be a mistake to analyze sources in the field of taxation and to highlight sources related to the political, administrative and social spheres of the Khanate. Let's look at sources on the history of the Kokand Khanate, based on the conclusion that when studying each source you can find something new related to the subject.

The works of the Russian orientalist V. Nalivkin, who researched the history of the Kokand khanate in the second half of the 19th century, are of great importance. The scientist, who wrote the "Brief History of the Kokand Khanate" based on the works of local historians, expressed important views on some aspects of the problem under study. In particular, he gives very clear information about the administrative division of the khanate. [4. 12]]

It is noteworthy that among the studies created during this period, A. Kuhn and A. Khoroshkin provided accurate information about the financial and tax system, which plays an important role in the administrative management of the state in the khanate. [7.13] However, it should be noted that there are sharp differences between these authors in the views on taxes in the works of local historians. In particular, A. Khoroshkin wrote in the 1870s that "the population was subject to incredible taxes," while 19th-century historian Mohammed Aziz Margilani noted that taxes only increased after the Russians invaded the khanate. [8, p. 89]

One of the studies of the tax system, which is an integral part of the system of administrative management ensuring the financial condition of the state, was carried out by the orientalist N. Pantusov. It is important that the author created his scientific studies "Податные сборы в Коканде" and "Сборники и пошлины в бывшем Кокандском ханстве" on the basis of local tax documents.

In the 60-80s of the XX century, such scientists as A.Djuvonmardiev, A.A. Troitskaya, R.N. Nabiev, F. Gafforov, E. Khurshut, T.K. Beisembiev, H.N. Bobobekov, based on written sources, researched various issues of the history of the Kokand Khanate.

The studies of these scholars also provide some information about the administrative system of the khanate. In particular, the work of A. Djuvonmardiev is different in that it contains information specifying the types of taxes in the khanate and state measures in the field of social protection. [2, p.p. 70-71]

It should be noted that one of the researchers who studied in detail the history of the Kokand Khanate was A.A. Troitskaya [6, p.p. 120-129]

The scientist who compiled the catalogue of archives of the Kokand khans and created articles and works on the basis of the documents included in this catalogue contains valuable information about the financial system of the Khanate, the tax sphere, as well as information about the activities of commanders and leaders.

In studying the history of the Kokand Khanate in the 1950s and 70s, R.N. Nabiyeu 's works also play an important role. [5, p.p. 147-203]

In his work, the author focuses on the feudal economy of the last ruler of Kokand, Khudoyorhan, and shows the economic power of the supreme ruler, its sources based on documentary materials, written sources. In his work, he described not only the political processes that took place during the reign of Khudoyorhan, but also Sheralihan (1842-1845), Mallakhon (1858-1862), Sultan Sayidhan (1863-1865), but also one of the important features of the administrative system of the khanate in the 1950s-1970s. He also detailed the essence of the Sarkar Institute.

After the independence of the Republic of Uzbekistan among various problems of historical science, special attention was paid to the issues of the history of Uzbek statehood and it began to be studied on the basis of new approaches and modern requirements. During this period, a millennial history of Uzbek statehood was founded on a theoretical and scientific basis. Such works as “Essays on the History of Statehood of Uzbekistan”, “Abstract of the Bibliography (1991-2001)” and “History of Uzbek Statehood”, prepared by the Institute of History of the Academy of Sciences of the Republic of Uzbekistan, are published. Also, scientific conferences were held on the activities of political figures who played an important role in the development of Uzbek statehood - Amir Temur, Mirzo Ulugbek, Jaloliddin Manguberdi, prominent figures of the Islamic world - Imam Bukhari, Burkhoniddin Margilani, Imam Moturudi, Bakhovuddin Naqshrabandi, an important role in the political, socio-economic and cultural life of the state of the Timurids - Khodja Ahror Vali, conducted research and primary sources related to the period of their life and published. During the years of independence, various periods of the history of Uzbekistan, in particular the history of the Khanate, began to be studied on the basis of new approaches. The Institute of History of the Academy of Sciences of the Republic of Uzbekistan published "History of Uzbekistan" (third volume) on the history of this period. The works and articles of Kh. Ziovuiddinov, X. Bobobekov, Sh. Vohidov, Sh. Yusupov, G. Agzamova, D. Sangirova, V. Ishkuvvatov, Z. Ilkhomov, B. Tursunov, Muxammad Yayokhon, Sh. Makhmudov were published on some aspects political, socio-economic and cultural processes that took place in the Kokand Khanate, an integral part of national statehood, formed and developing in Uzbekistan since ancient times. [7, p. 275.] They cover various issues of the history of the Khanate, including the struggle of the peoples of Turkestan against Russian aggression and domination, popular movements in the Kokand Khanate and their socio-political foundations, the role of various historical figures, including Alikuli Amirlashkar, in the political life of the country. Some problems of the administrative system, issues of source studies of the Kokand Khanate were raised and found their scientific interpretation. At the same time, the authors of these works cite some ideas that shed light on some issues of statehood in the khanate.

For example, in his work on the occupation of the Kokand Khanate by the Russian Empire, H. Zieev not only highlights important aspects of this process but also draws attention to some aspects of the khanate.

The great expert on the history of the Kokand Khanate, Kh. N. Bobobekov, in his work “The History of Kokand” published during this period, analyzes many problems of the history of the Khanate, provides information on some positions in the Khanate and the tax system. [7, p.p. 275-276.]

Sh. Vokhidov, who conducted the source study of the history of the Khanate created by representatives of the Kokand historiographic school, in his studies cites historical facts that allow scientific analysis of the state of Uzbek statehood during the Kokand khanate. His

pamphlet "Titles and Positions in the Kokand Khanate and the Bukhara Emirate" is especially important when studying the subject. In addition, G. Agzamova's research on the history of the khanates of Central Asia, in particular, the Kokand khanate, gives certain ideas about the life of cities, their existing administrative system and the activities of officials occupying various parts of this system, in particular the chairman (mukhtasib). During the years of independence, a number of dissertations on some issues of the history of Kokand were prepared and defended. They include the doctoral dissertation of Sh. Vokhidov, the candidate dissertations of D. Sangirova, O. Masalieva, V. Ishkuvatov, Z. Ilkhomov and Sh. Makhmudov. These studies are mainly devoted to some issues of the history of the Khanate, such as historiography, source studies, the role of some historical figures in the political life of the country. In particular, Sh. Vokhidov's doctoral dissertation is devoted to the development of historiography in the Kokand khanate in the 19th and early 20th centuries, which widely analyzes the stages of development, representatives of the Kokand school of historiography and their scientific views.

The study of O. Masalieva is devoted to the history of the Bukhara, Khiva and Kokand khanates in the 20th century Anglo-American historiography. In it, the author also quotes the views of English-speaking scholars on public administration in the Kokand Khanate. V. Ishkuvatov's dissertation analyzes the study of Kokand-Russian diplomatic relations in the historiography of the second half of the 20th century. In the dissertation, D. Sangirova analyzes an important source on the history of Kokand - "Tarihi Aziziy" from the point of view of source studies, and the study of Z. Ilkhomov analyzes the role of Khan Alikili Amirlashkar in the political history of the Kokand Khanate from 1863 to 1865. B. Tursunov's dissertation is devoted to the state of the army and military activity in the Kokand khanate. In the scientific research of Sh. Makhmudov, the positions in the administrative department of the khanate, tax system employees, and social protection of the population are analyzed.

During this period, Kazakhstani, Kyrgyz and Russian scientists - S. Sudanbekov, T. Beisembiev, Yu. Lunev, N. Terletsky - also conducted research on the history of the Khanate. [7, p.p. 274-277.]

S. Sudanbekov and Yu. Lunev used in their research only the work of Russian researchers and did not pay attention to the information in the work of local historians. In our opinion, studying the history of the khanate without the work of local historians, it is impossible to give an objective assessment of the historical processes that took place during this period. This situation often leads to erroneous scientific conclusions. In particular, the Kyrgyz scientist S. Sudanbekov, writing about the Supreme Council of the Kokand Khanate, admits that this important central government body was created during the reign of Umar Khan (1810 - 1822). In the writings of local historians, there is information about the activities of the Council under the first rulers of Kokand. It should be noted that in the republics of Central Asia there are scientists who are actively engaged in the study of medieval history on the basis of primary sources, the introduction of new sources in scientific circulation. One of them was T. Beysembiev, who published a facsimile of the story "The History of Alikuli Amirlashkar" by Muhammad Yunus Taib in English in London. He also commented on the positions available in the Khanate, based on the information presented in the work. Foreign researchers also contributed, although in part, to the study of the history of the Kokand khanate.

They include English, Japanese, and Turkish scientists. Their work contains information that sheds light on certain aspects of the subject. Special attention should be paid to the work of Yaoi Kawahara, a Japanese researcher of the history of the Kokand khanate. In his work, the researcher pays special attention to the analysis of the life and activities of the rulers of Kokand and Khojas and their role in the internal and foreign policy of the khanate. The works on the history of Kokand, published in English by A. Holdsworth and B. Mance, reflect the political, socio-economic life of the khanate, the administrative system and try to draw appropriate conclusions. However, their comments on this topic are not without some drawbacks. In particular, M. Holdsworth mistakenly believes that the Kokand khanate was in the hands of the khans of the "Ming dynasty" only from 1798 to 1876 and that the khanate included the Margilan, Kokand and Namangan regions. [7, p. 275.]

B. Mans repeats the same mistake in his work. Some English language researchers, including Yu. Bregel and E. Allworth paid close attention to this problem and tried to correctly analyze historical processes. In particular, these researchers, in contrast to M. Holdsworth and B. Man, correctly indicate that the formation of the khanate occurred in 1710.

Turkish scientists have also made a great contribution to the study of the history of the khanate. In particular, the Turkish historian M. Rabots of the Palace is devoted to relations between the rulers of the Kokand Khanate and Turkish Sultans, in particular, political, socio-economic, diplomatic relations, in which manuscripts and archives stored in Turkey, unavailable in Central Asia, play an important role. In this regard, the work of the Turkish scientist is important. However, in this work, the tax system, which occupied a special place in economic life and administrative-management system of Kokand Khanate, was not considered as the object of research. From scientific data of A. A. Semenova, M. Yuldasheva, M. Abduraimov, Yu Bregel, Anke von Kügelgen, R. Holikov, S. Saburov and I. Avezova it is better to use it in comparative analysis with activity

## CONCLUSION

In conclusion, studying the above sources, young historians pay attention not only to the sources of the tax system of the Kokand Khanate but also to the sphere of management, agriculture and social life of the population.

### ABSTRACT

*The article describes a method for determining various chemical additives are widely used in modern concrete technology. They allow us to direct the formation of the cement composition and improve concrete technologies at all stages of the production of concrete and reinforced concrete products and structures. Chemical additives are obtained from additional products or are specially designed synthesized substances.*

**KEYWORDS:** Concrete, Modifier, Testing, Dry Hot Climate, Concrete Solution, Frost Resistance, Corrosion Resistance, Insufficient Weather Resistance.

### INTRODUCTION

Despite the economy of pozzolanic and slag-Portland cement, they are characterized by a number of disadvantages which reduce the efficiency of their practical application. Such characteristic disadvantages as delayed initial hardening, relatively high capillary suction water demand, unstable frost resistance, corrosion resistance, insufficient atmospheric resistance, increased shrinkage and creep, relatively high cement consumption to obtain a marking strength comparable to Portland cement in a significant sea can be eliminated by the use of chemical additives surfactants (CHAS). [2,3,4,5]

### MATERIALS AND METHODS

One of the most effective ways of intensification of manufacture, improvement of quality, decrease in the cost price and material consumption of ferroconcrete designs - application of chemical additives for concrete mixes. In modern concrete technology, various types of chemical additives are widely used.[1,6,7,8] They allow directional adjustment of structure formation of cement compositions and improvement of concrete technology at all stages of production of

concrete and reinforced concrete products and structures. Chemical additives are derived from by-products or are specially synthesized substances for their intended use. They are used as intensifiers of grinding and giving special properties to cement, for obtaining activated mineral aggregates, for surface treatment of aggregates, organic components of polymer cement concrete and as additives to concrete mixtures. According to the basic concrete admixtures, the concrete mixture is divided into 9 classes: on regulators of rheological properties of concrete mixtures (plasticizers), plasticizers, air-reflecting, gas-forming, sealing, setting retarders, curing accelerators, antifreeze, steel corrosion inhibitors, additives for special concretes and cement retarders. [3,4,9,10]

The following additives are recommended for the preparation of lightweight concrete: plasticizing, ducting, foaming, gas-forming and curing accelerators. Depending on individual qualities, additives are used from a thousandth to 1-2% of cement mass in terms of dry matter and their dosage is specified based on specific requirements, the type of binder, the composition of the concrete mixture, the quality of aggregates and curing conditions. The main class of additives that increase the efficiency of production of reinforced concrete products and structures are plasticizers. Fundamental works of scientists promoted the open mechanism of action of additives on processes of hydration and hardening of cement, and also on structural formation of solutions and concretes. Technical calcium lignosulfonates (LST) are the most widely used plasticizer for concrete. Aqueous solutions or LST concentrates are large tonnage waste from pulp and paper mills. [2,11,12].

The plasticizing effect of unmodified LST additives is expressed in the reduction of water consumption of concrete mixture at normal temperature by 5-10%.

When the temperature of the ambient air and concrete mixture increases, the plasticizing effect of LST decreases sharply. Deceleration of cement hydration in the presence of LST additives leads to a decrease in the strength of cement stone in the initial curing time. At the same time, the stabilizing effect of the additive promotes the formation of a finer dispersion crystal structure, resulting in an intensive increase in strength at a later stage of curing.

A significant factor that increases the strength of concrete in the late curing period is the reduced water consumption of cement. In concretes on dense aggregates hardening effect from the introduction of LST in an amount of 0.1-0.15% is 15-20% or is expressed by saving cement by 5-10%. [2,3,13,14,15]

Recently there have been intensive developments in the field of modification of lignosulphonate additives for concrete. The use of concrete fillers is dictated by theoretical prerequisites and practical necessity. Theoretical prerequisites for filling a cement test are based on providing incomplete hydration of clinker minerals and long-term preservation of the remaining cement grain nuclei (30 % and above) in the cement stone, acting as fillers as a result.

This makes it advisable to replace clinker fillers with cheaper and less.

On the basis of the performed studies on LST modification, additives are developed: UBB, NSDB, CDSC = 1, M = 4, NL = 10, NL = 20, NL = 21, etc., the use of which in the amount of 0.2-0.7% increases the plasticizing effect of the additive without reducing concrete strength and allows saving cement consumption up to 10%. [2,3,16]

Hydrophobizing surfactants are characterized by polyfunctional action of plasticizing concrete mixtures with simultaneous volume hydrophobization of the material, which increases water resistance and frost resistance of concrete. Hydrophobizing surfactants are divided into single-component and complex surfactants. The single components include additives obtained from natural raw materials, petrochemical raw materials and shallow oil processing and modified substances [2, 3].

Single-component hydrophilizing surfactants are characterized by low plasticizing capacity, and some of them are also insoluble in water, which complicates their direct use for the concrete mixture.

Therefore, complex additives prepared from hydrophobizing and hydrophilizing components are considered more promising, which also complicates their practical use.

Concrete hardening accelerators not only reduce the duration or temperature of isothermal heating during heat treatment of articles by 20-30% but also positively affect the dispersion of cement stone hydration products and its pore structure, strength and frost resistance of concrete.

The range of chemical additives in concrete technology is constantly expanding. Recently, new varieties of chemical additives of various effects have been proposed. Individual and complex additives based on scrubber paste of synthetic detergents and one-off post-yeast mash (UPB) can reduce the water demand of the concrete mixture to 10%, involve an additional 3-4% of air, increase the total porosity by 1.5-2 times, shorten the heat treatment cycle by 20-25%, increase frost resistance by 2-2.5 times. A number of proposed new additives exhibit the same plasticizing effect as SDB, but at the same time, they do not inhibit the hardening of concrete.

## CONCLUSION

So, the addition of SPD in an amount of 0.005-0.02% helps to increase the air content in the concrete mixture by 3-6%, which leads to an increase in workability, frost resistance and water resistance by 1.5-2.0 times, reduces cement consumption by 1 m<sup>3</sup> concrete on average 10-15 kg. The plasticizing additive P = 1 by-product of caprolactam production provides concrete with water resistance B6-BIO and frost resistance of MPC 200 and higher, with a reduction of cement consumption by 15-20 kg, per 1 m<sup>3</sup> of concrete.

### ABSTRACT

*This project gives the effects of karuvelam at Attayampatti village situated in Salem District, TamilNadu. A bio economic model is used to eradicate the Karuvelam trees. This model is divided into two components as ecology and economics. Numerical simulation and scenario analysis are obtained to eradicate them and finally a simple fuzzy logic based Mamdani model is used to view the proportionality between the growth of karuvelam trees and the ground water level.*

**KEYWORDS:** *Mathematical Modelling, Numerical Simulation, Scenario analysis, Fuzzy Logic, Fuzzy Rules.*

### 1. INTRODUCTION

The Karuvelam tree, or *Prosopis juliflora* as it is known biologically, is a species native to West Africa and was brought to TamilNadu in 1960s as fuel wood. Slowly, these started drifting into dams and rivers, causing problems. Karuvelam is a major threat to water conservation. The ground water level has depleted since the Karuvelam trees rapidly absorb the ground water

thereby causing ground water scarcity. Here, our aim is to control its growth and increase the ground water level.

Vikram Dayal [11] studied the effect of *Prosopis juliflora* an exotic tree on diverse agents in Ranthambore National Park, situated in Rajasthan, India using Lotka-Volterra Equations. The effects of *Prosopis juliflora* on the users has been modelled by drawing on mathematical ecology by Gurney and Nisbet [3]. The bio economic model that studies the economics of developing country protected areas and the usage of different modelling approaches was studied by Chopra and Adhikari [2]. The most common fuzzy methodology is Mamdani's fuzzy inference method which was built using fuzzy set theory. This method was proposed in 1975 by Ebrahim Mamdani [9] as an attempt to control a steam engine and boiler combination. Fuzzy Mamdani Model on Air Pollution was studied by Amudhambigai and Neeraja [1]. After getting various details, Fuzzy Mamdani model is used to find the conclusion.

The area taken for study is Attayampatti town panchayat, Salem. Attayampatti is the town panchayat, with population of about 14 thousand. It is the second most populous town panchayat in Salem district. There are 3649 households. Total geographical area of Attayampatti town panchayat is 2.4 km<sup>2</sup>. Out of 240 hectares, 4.36 hectares are under karuvelam.

People planted karuvelam for fuel wood. Apart from the purpose of planting them for fuel wood, they served the additional purpose of protecting the agricultural lands from goats. Now this shrub has proliferated like a virus in Attayampatti.

## 2. Preliminaries

### Definition 2.1 [4]

**Carrying capacity** is defined as the environment's maximal load. Carrying capacity was originally used to determine the number of animals that could graze on a segment of land without destroying it.

### Definition 2.2 [5]

A **functional response** in ecology is the intake rate of a consumer as a function of food density. It is associated with the numerical response, which is the reproduction rate of a consumer as a function of food density. Functional responses are generally classified into three types, which are called **Holling's type I, II, and III**.

### Definition 2.3 [5]

**Holling's Type II** functional response is characterized by a decelerating intake rate, which follows from the assumption that the consumer is limited by its capacity to process food. Type II functional response is often modelled by a rectangular hyperbola.

### Definition 2.4 [10]

A function that occurs as the result of the division of two exponential functions is called a **logistic function**. Logistic function is also known as the logistic curve.

### Definition 2.5 [6]

The **Lotka-Volterra equations**, also known as the predator-prey equations are a pair of first-order, nonlinear, differential equations frequently used to describe the dynamics of biological systems in which two species interact, one as a predator and the other as prey. The populations change through time according to the pair of equations.

$$\frac{dx}{dt} = \alpha x - \beta xy \quad ; \quad \frac{dy}{dt} = \delta xy - \gamma y$$

where,  $x$  is the number of prey;  $y$  is the number of some predator;  $\frac{dx}{dt}$  and  $\frac{dy}{dt}$  represents the growth rates of the two populations over time;  $t$  represents time and  $\alpha, \beta, \gamma, \delta$  are positive real parameters describing the interaction of the two species.

**Definition 2.6 [12]**

A fuzzy set is a pair  $(U, m)$  where  $U$  is a set and  $m: U \rightarrow [0, 1]$ .

**Definition 2.7 [12]**

A membership function (MF) for a fuzzy set  $A$  on the universe of discourse  $X$  is defined as  $\mu_A: X \rightarrow [0,1]$ . This value, quantifies the grade of membership of the element in  $X$  to the fuzzy set  $A$ .

**Definition 2.8 [7]**

A fuzzy number  $A=(a, b,c)$  is said to be a triangular fuzzy number if its membership function is given by

$$\mu_A(x) = \begin{cases} 0 & x \leq a \\ \frac{x-a}{b-a} & a \leq x \leq b \\ \frac{c-x}{c-b} & b \leq x \leq c \\ 0 & c \leq x \end{cases}$$

### 3. Eradication of Karuvelam Using a Bio - Economic Model

In this section, a bioeconomic model is used to eradicate the growth of the Karuvelam trees. Numerical simulation is obtained to eradicate the Karuvelam trees. Since there is considerable uncertainty about the ecology-economy interactions, alternative scenarios are also examined.

#### 3.1 Model Overview and Equations

The study was undertaken at Attayampatti village situated in Salem District, TamilNadu, India. The entire area is divided as the area covered by 'Karuvelam' and remaining areas. If land under Karuvelam can be cleared, then the area moves into the category 'other area' (Area without Karuvelam). It is observed that out of 40 trees in an area one is Karuvelam.

Both 'Karuvelam' and trees on 'other area' produce wood. In addition, Karuvelam also produces pods, which are eaten by goats. Cattle compete for grass that grows in 'other area'. Cattle and goats are assumed to follow a logistic growth function, with carrying capacity determined by the availability of feed.

We can divide the model into two components, ecology and economics. The ecology component of the model is discussed now.

#### 3.2 Ecology

The effect of Karuvelam on the users of village, lake and river has been modelled by drawing on mathematical ecology. To study the effect of Karuvelam on Attayampatti, a weed control model is used.

**TABLE 1-KARUVELAM AND ATTAYAMPATTI AREA COMPOSITION**

Variable	Symbol	Values (Attayampatti)
Total Area	A	240 ha
Area under Karuvelam	$A_K$	4.36364 ha
Rate of growth of Karuvelam per unit area	$r_K$	1.85657
Cost of Nutrients	CNu	Rs. 50,000 (app)
Cost for maintaining the ground water	CG <sub>W</sub>	Rs. 1,00,000(app)
Rate of pod growth per unit area	$g_K$	700-1000
Stock of goats surviving on Karuvelam	X	250
Parameters for estimating goat and cattle carrying capacity	K	0.34
Initial carrying cost	$K_K$	Rs. 5,00,000(app)
Fraction of area under karuvelam	$f_{KC}$	0.004/4.36364
Number of factors	N	4
Goats that browse in land has not been invaded by karuvelam	$X_4$	150
Goats that browse in land that has been invaded by karuvelam	$X_5$	250
Number of cattle	M	60
Price of cattle	$p_C$	Rs. 25,000
Price of milk	$p_M$	Rs. 34
Price of wood	$p_W$	Rs. 15
Production of wood in Karuvelam area	$w_K$	120 kg
Production of wood in other area	w	80 kg
Fraction of cattle that were milk bearing	$m_F$	30/60 (total cattle = 60)
Milk yield per milk bearing cattle	$m_C$	8 litres
Price of goat	$p_G$	Rs. 5000
Cattle removal fraction	$O_C$	20/60
Goat removal fraction	$O_G$	200/250(total cattle =250)

The area of Attayampatti ( $A_A$ ) consists of area under Karuvelam ( $A_K$ ), and the other area (A) as given in (3.1)

$$A_A = A_K + A \quad (3.1)$$

The characteristics of Karuvelam in terms of spread, effects and control are discussed. This influenced the assumptions used in the following equations related to it. The spread of

Karuvelam is assumed to follow a logistic function. When Karuvelam is cleared in the land, it moves from the category  $A_K$  to the category A.

However, this is only partially successful as the tree will again grow back. Hence, we use the following formula (3.2) to reduce the growth of Karuvelam with respect to the various parameters:  $ir_K$  -the intrinsic rate of growth of Karuvelam;  $A_k$ -area under Karuvelam; N-the cost of nutrients;  $k_K$  -the initial carrying cost of land;  $f_{kc}$  -the fraction of area under Karuvelam is cleared; t- time and G-the cost of maintaining ground water level.

$$\frac{dA_k}{dt} = ir_K A_k \left[ 1 - \frac{A_k}{k_K - (C_{Nu} + C_{G_w})} \right] - 0.9 A_k f_{kc} \quad (3.2)$$

where,  $ir_K A_K$  is the rate of growth of Karuvelam for the total land  $A_K$  ;

$k_K - (C_{Nu} + C_{G_w})$  is the carrying cost of area occupied by Karuvelamat a point in time.

The intrinsic rate of growth of Karuvelam  $ir_K$  given in (3.3) is equal to a base rate of growth and an additional rate of growth that depends on the abundance of goats surviving in the Karuvelam area.

$$ir_K = 0.025 + (0.025 \times X / A_K g_K k) \quad (3.3)$$

where, X is the stock of goats surviving on Karuvelam area;  $g_K$  is the rate of growth per unit area; k is the parameters for estimating goat and cattle carrying capacity;  $A_K g_K k$  is the carrying capacity of goats surviving on karuvelam.

For Attayampatti village,

$$ir_K = 0.025 + (0.025 \times 250 / (4.36364)(800)(0.34)) = 0.0303$$

$$\frac{dA_K}{dt} = ir_K A_k \left[ 1 - \frac{A_k}{K_k - (N + C_{G_w})} \right] - 0.9 A_k f_{kc}$$

Thus we have from Table 1

$$\frac{dA_K}{dt} = (0.0303)(4.36364) \left[ 1 - \frac{4.36364}{5,00,000 - 1,50,000} \right] - (0.9)(4.36364) \left( \frac{0.04}{4.36364} \right)$$

and hence

$$\frac{dA_K}{dt} = 0.0950 \quad (3.4)$$

Equation (3.4) gives the rate of change in the growth of Karuvelam trees in the area taken for study. It can be seen that, there is a significant decrease in the growth rate of Karuvelam. This was accomplished due to the significant increase in the growth of pods and increase in the number of cattles that feed on Karuvelam. Thus, larger the rate of growth of pods per unit area and larger the number of cattles in the area covered by Karuvelam, lesser the growth of Karuvelam in that area. This rate of growth can be calculated using the Lotka – Volterra Model.

### 3.3 The Effects of the Growth of Karuvelam

It is stated in the report of the newspaper “The Hindu” that cattle tied to the Karuvelam trees suffer from problems such as infertility and giving birth to offspring with physical deformities.

**I. Hence the increase in the number of cattle, number of birds and the amount of ground water level interrupted by the growth of Karuvelam trees is as follows:**

$$\frac{dC}{dt} = nA_k; \frac{dB}{dt} = nA_k; \frac{dG_w}{dt} = nA_k \quad (3.5)$$

where, C refers Cattle, B refers Birds and  $G_w$  refers Ground Water Level and n is the number of parameters which causes the reduction in the amount of Cattle, Birds and Ground Water Level by the Karuvelam trees.

### **3.3.1 The effect of Karuvelam on the growth of other trees:**

The differential equation (3.6) shows how the growth of other trees is affected by the growth of Karuvelam.

$$\frac{dY}{dt} = \text{growth of other trees} - \text{death of other trees} = [R_k R_T Y] - [U Y] \quad (3.6)$$

Where,  $R_k$  is the number of Karuvelam trees removed;  $R_T$  is the coefficient of rate of rainfall; Y is the number of other trees; U is the number of other trees grazed by animals. There are six categories of ingestion that causes the death of trees in an area:  $X_1$  - herbivores that graze the other trees;  $X_2$  - wild herbivores that browse the other trees;  $X_3$  - cattle;  $X_4$  - Goats that browse in land that has not been invaded by Karuvelam;  $X_5$  - Goats that browse in land that has been invaded by Karuvelam.

The destruction of other trees is high, availability of nutrients and other basic essential needs are low, which is directly proportional to its abundance. Hence no other plants or shrubs would grow next to the Karuvelam trees.

### **3.3.2 Effects of Karuvelam in Lakes and River**

The availability of water in lakes, ponds and river is proportional to the difference between the amount of rainfall and the growth of Karuvelam in that area as shown in (3.8)

$$\begin{aligned} \frac{dW}{dt} &= \text{standard water level} - \text{scarcity of water level} \\ &= [W R_1 Y] - [R_2 W] \end{aligned} \quad (3.8)$$

Where, W is the standard water level in lakes and ponds;  $R_1$  is the coefficient of removal of Karuvelam trees;  $R_2$  is the coefficient of growth of Karuvelam trees; Y is the number of other trees. Thus, the Karuvelam trees are harmful to the ecology as they turn the land dry by sucking too much of ground water besides poisoning them.

## **3.4 Economics**

The benefits of the categories of villagers over the period of time simulated is given by

$$\int B_i e^{-\rho t} dt, i=C, G, W \text{ and } \rho \text{ is the discount rate}$$

The cattle owner gets benefits from selling (1) the cattle offtake (removal of cattle from stock for sale) and (2) milk from the cattle.

**I.** The benefits to the cattle owner,  $B_C$ , are given by:

$$\int B_C e^{-\rho t} dt; \text{ where } B_C = p_M m_F m_c m + P_C O_C m$$

Here  $p_M$  is the price of milk;  $m$  is the number of cattle;  $m_F$  is the fraction of cattle that are milk bearing;  $m_c$  is the milk yield per milk-bearing cattle;  $P_C$  is the price of cattle &  $O_C$  is the off take fraction of cattle. From Table 1,

$$p_M = \text{Rs. } 34, m_F = \frac{30}{60}, m = 60, m_c = 8 \text{ litres}, p_C = \text{Rs. } 25,000, O_C = \frac{20}{60}, \rho = 12\%$$

$$B_C = (34) \left( \frac{30}{60} \right) (60) (8) + (25,000) \left( \frac{20}{60} \right) (60) = 5,08,160$$

$$\int B_C e^{-\rho t} dt = 508160 \int e^{-12t} dt$$

Hence depending on various time factors the cattle owner is benefited by removing the Karuvelam trees.

**II.** The goat owner gets benefits from selling goats. Revenues from selling goats are taken as a measure of benefits to the goat owner as shown in (3.9)

$$B_G = P_G O_G (X_4 + X_5) \quad (3.9)$$

Where,  $O_G$  is the goat removal fraction;  $P_G$  is the price of goat;  $X_4$  is goats that browse in land has not been invaded by Karuvelam &  $X_5$  is goats that browse in land has been invaded by Karuvelam

From the data table 1,

$$P_G = \text{Rs. } 5000, O_G = \frac{200}{250}, X_4 = 150, X_5 = 250$$

$$B_G = 16,00,000, \rho = 30\%$$

$$\int B_G e^{-\rho t} dt = 160000 \int e^{-30t} dt$$

**III.** The wood gatherer is assumed to gather wood equal to the growth of wood stock. The model abstracts from the possibility that too much extraction could affect the stock of wood. Revenues from sale of this wood are taken as a measure of the benefits to the wood gatherer and it is given in (3.10)

$$B_W = P_W (wA + w_K A_K) \quad (3.10)$$

Where,  $w$  and  $w_K$  are the productivity of wood in land under non-Karuvelam and Karuvelam.

From the data table 1

$$P_W = \text{Rs. } 15, w = 80 \text{ kg}, w_K = 120 \text{ kg}; B_W = 290618.17 \text{ and } \rho = 1\%$$

$$\int B_W e^{-\rho t} dt = 290618.17 \int e^{-t} dt$$

Thus, the increase in the profit on the removal of Karuvelam trees for cattle owners proves the need for eradication of the trees.

#### 4. Application of Various Scenarios in Fuzzy Mamdani Model

In this section four scenarios are given to show the depletion of water in the study area by applying the Fuzzy Mamdani model. Thus, after giving the rules in the rule editor if the number of trees in an area is entered in the input, the level of water and the amount of nitrogen is given

as output based on the data given. In this model, the antecedent (if – part of the rule) and the consequent (then-part of the rule) are fuzzy propositions:

$R_i$  : if  $x$  is  $A_i$  then  $y$  is  $B_i$ ,  $i = 1, 2, \dots, K$ .

Here  $A_i$  and  $B_i$  are linguistic terms represented by fuzzy sets and  $K$  denotes the number of rules in the model.

#### 4.1 Scenarios:

**Scenario 1:** If Karuvelam trees are removed then water level in lakes, tanks and ponds will be increased.

**Scenario 2:** If Karuvelam trees are not removed then the benefits of cattle and goat owner will be maximized

**Scenario 3:** If Karuvelam trees are not removed then water level will be decreased.

**Scenario 4:** If Karuvelam trees are removed then the benefits of cattle and goat owner will be minimized.

Fuzzy Mamdani model is applied to all the scenarios as follows:

The membership function is given based on the number of trees and the level of water in tanks and ponds and the amount of Nitrogen in the soil. Though there are many nutrients, Nitrogen is a Macronutrient and plays a vital role in enriching the soil. The membership function for these factors is given below.

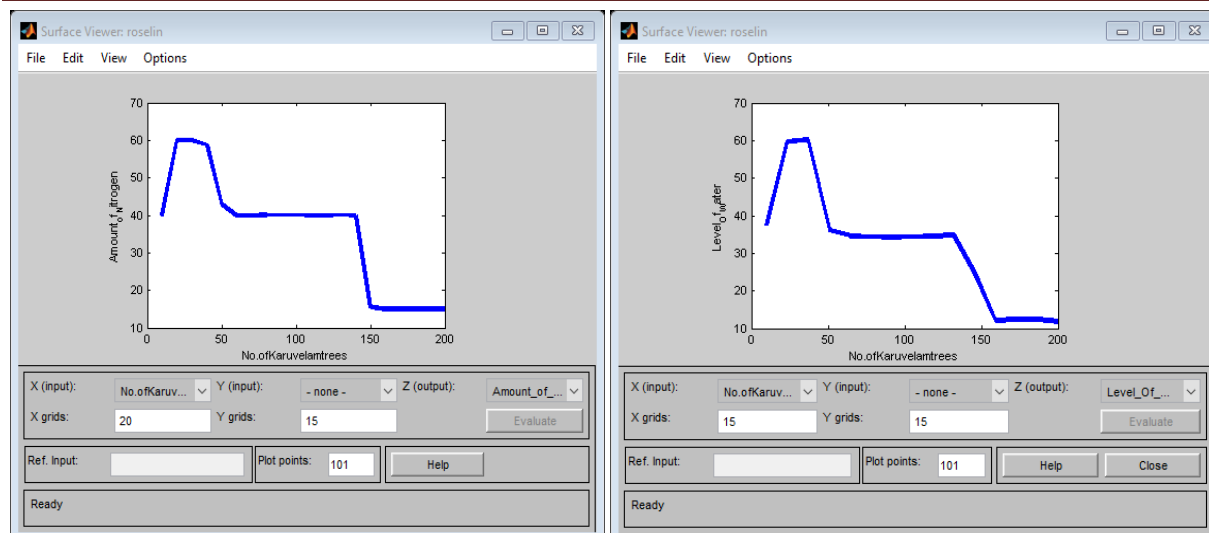

**TABLE 2: RANGE OF EACH FACTORS**

Range	No. of Karuvelam Trees	Level of Water (tmc)	Amount of Nitrogen(mg)
Low	0-50	0-20	0-25
Medium	50-150	20-50	25-50
High	>150	>50	50-75

#### Fuzzy Rules:

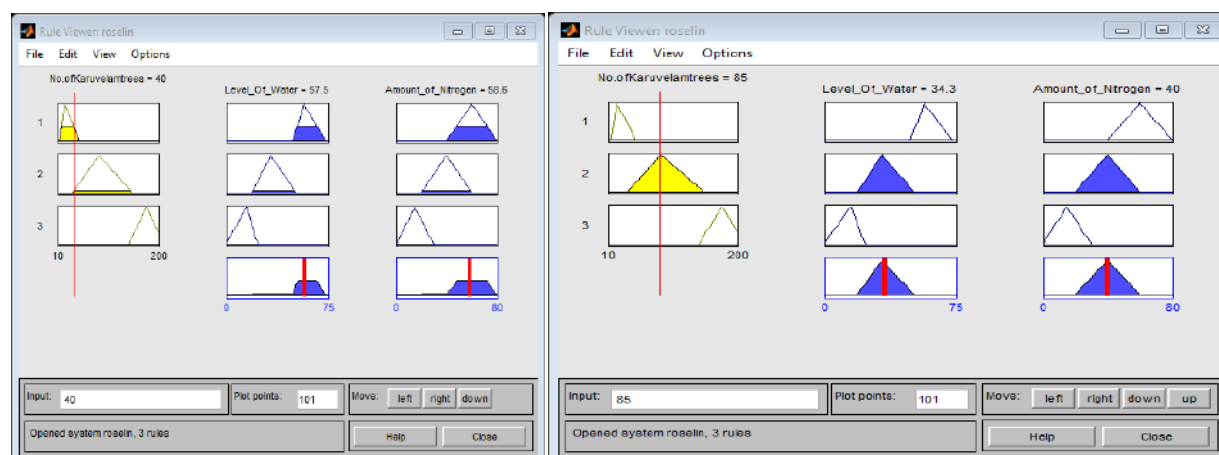

The fuzzy rules are

- 1) If (No. of Karuvelam trees is Low) then (Level of Water is High) and (Amount of Nitrogen is High).
- 2) If (No. of Karuvelam Trees is Medium) then (Level of Water is Medium) and (Amount of Nitrogen is Medium).
- 3) If (No. of Karuvelam Trees is High) then (Level of Water is Low) and (Amount of Nitrogen is Low). The FIS editor for the input and output variables are given below:

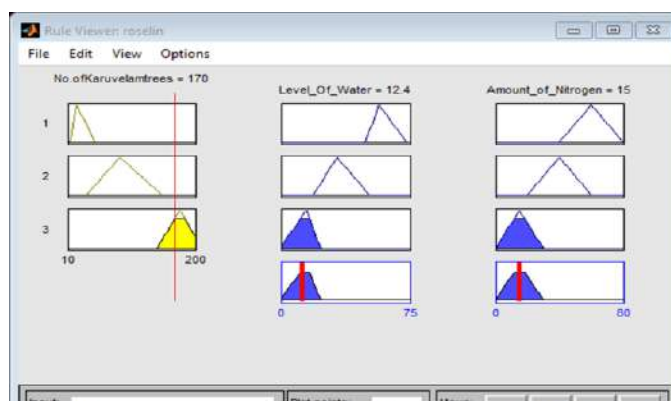

water and the amount of Nitrogen based on the data given as shown below:

**Range: Low, No. of Karuvelam – 45** **Range: Medium, No. of Karuvelam –**

**Range: High, No. of Karuvelam - 170**

Thus, if the Number of Karuvelam trees are entered in the input column, the water level and the amount of Nitrogen can be found out using the Fuzzy editor.

## 5. CONCLUSION

The government must take necessary steps in the eradication of seemai karuvelam. So far only 15% of the trees had been removed and they are still abundant in number. Eradication can be done under natural resource management programme of PWD.

The rapid invasion of karuvelam trees in Attayampatti village has depleted the level of water in lakes and river and also the ground water level. Earth can be protected only if these trees are destroyed forever. Hence the only lasting solution is to dig out the trees and roots entirely, using machines. There are biological as well as chemical methods to destroy the tree. The Agriculture and Horticulture departments are taking several measures to identify trees that harm the ecosystem and destroy them. Also, it is the responsibility of every citizen to destroy atleast one Karuvelam, thereby preventing the earth from many hazardous effects.

### **ABSTRACT**

*In the article, the idea is to create a moderate amount of air in the house by installing solar panels in the home using natural solar energy.*

**KEYWORDS:** *Solar Collector, Windows, Cold Air, Reconstruction, Air Conditioning.*

### **INTRODUCTION**

Since the formation of the earth, people have used sunlight. Archaeological evidence shows that people decided to live in the sun, protected from the cold, cold winds and sunlight. Myths about the sun were fabricated, and they were a goddess. In ancient Egypt, Ra was the god of the sun.

The first known solar system is the 15th century BC. Amenhotep III. The air and water chambers inside the sculpture acted as a musical instrument, hidden under the influence of sunlight. In ancient Greece, Helios was worshipped. This name is based on many terms related to solar energy today. Among the ancient Slavs, Doydbog is a divine source of sun, heat and light. In the past, there were such mysterious structures that now we can assume that they were used as solar collectors [1].

Central Asia, in particular, the beginning of the architectural architecture of Uzbekistan, dates back to the third century AD. Many buildings and structures built in the IX-X centuries and preserved to this day are rightly considered the culmination of building art. indoor and outdoor environment, taking into account the harmony of form and spatial composition, climatic and urban conditions [4].

---

## MATERIALS AND METHODS

It is known that when converting fuel to energy, more or less harmful emissions are harmful to the environment. Intensive use of land, extraction of raw materials, reduction of agricultural land, reduction of the natural environment for human survival. It is known that 90% of primary energy is lost during the extraction, production, transportation, storage and consumption of energy resources [4].

It is known that when converting fuel to energy, more or less harmful emissions are harmful to the environment. Intensive use of land, extraction of raw materials, reduction of agricultural land, reduction of the natural environment for human survival. It is known that 90% of primary energy is lost during the extraction, production, transportation, storage and consumption of energy resources.

The light emitted by the sun is great, and its energy is 100% (340 watts per 1 kWh). Currently, the problem is how much solar energy is utilized for human needs. and radiation (each heated surface radiates heat). Each of these three situations depends on the surface temperature, as well as on the temperature of the surface and the environment, which is taken into account when climate changes. The results of many studies show that by 2020, fossil fuels will partially meet global energy demand.

The rest of the energy demand is met through the use of alternative and other renewable energy sources. Other renewable energy sources are energy flows that are constantly present or occur in the environment. The difference is that a newly created force is not a product of human activity.

Nuclear fuel, coal, oil and gas are examples of such energy sources. Unlike newly formed sources, unproductive energy sources are interconnected in nature and are separated by human intervention. The equipment is similar to window air conditioning. A high level of adjustment is achieved when cold air is supplied from one window to the collector and transferred to the second window with hot air. As a result of the economic difficulties of the 1990s, the development of unconventional forms of energy in our country was stopped [3].

The environmental situation requires architects and builders to think again: modern energy is becoming more traditional and has a negative impact on the environment in the energy supply of buildings and cities in general. As you know, solar energy is mainly used by low-power communal water heaters and heaters. The production of thermal energy in the world in the near future will be  $5 \cdot 10^6$  Gcal.

Photoelectric devices have a total capacity of 500 MW. The conclusion is that collectors can be placed in separate structures outside the building. Cold air in the house is supplied from the bottom of the window to the solar collector, back to the room through the top of the window, usually, it looks like a window air conditioner. When restoring existing buildings, it is possible to quickly and relatively cheaply install simple airborne solar collectors in a window.

Figure 1 shows the design of Buck Rogers from Embdu, New Mexico, USA. The cold air in the room is absorbed into the collector by hot air, and the collector returns to the room with warm air. The search results return to the room with warm air. .[1]

**Figure 1.** In the courtyard, a portable solar collector of air type is installed.

In recent decades, the most relevant concept has become - the energy efficiency of buildings, which is directly related to increasing the energy efficiency of buildings. Development in this area was started back in the 70s of the last century, the impetus for this was the energy crisis that swept most of Europe. From that moment on, more and more stringent requirements began to apply to heat-insulating materials. The heat permeability parameters also increase every day, and in general, buildings and structures are evaluated quite strictly by the thermal insulation parameter.

The energy efficiency of buildings includes such a thing as thermal insulation, which implies an overall improvement in the quality of life of people and at the same time a reduction in energy costs. It is important to consider not only the quality of thermal insulation materials but also to develop new engineering solutions, as well as approaches to creating energy-efficient buildings.

In order to increase the energy efficiency of buildings, it is necessary to use the experience of already commissioned structures. Thus, by trial and error, the most effective methods of energy conservation can be distinguished. It is very important to use integrated approaches in this matter, since losses, for example, of heat by 40 per cent occur through walls, by 18% through the roof and windows, by 14% due to improper ventilation in the house, and 10% insufficient insulation of basements.

Modern insulation systems require comprehensive thermal insulation protection since local insulation does not have sufficient efficiency. It is important to install protection on the so-called "cold bridges". As a rule, this is the place of contact of the plates with the walls, the places where the internal walls adjoin the external, subsidence of poor-quality heat-insulating material.

Reducing heat loss can also be achieved by reducing the area of windows, but not always installing small windows is an ideal solution. Since it can significantly worsen the indoor climate. The most acceptable option, in this case, is the installation of three-layer double-glazed windows, the heat loss through which is minimal. It is also important to use intelligent heating systems, implying the rational use of heat in the building. Typically, such systems can increase and decrease the amount of heat depending on the situation.

## CONCLUSION

Improving the energy efficiency of buildings has become an urgent issue around the world, especially the achievements of Scandinavia and Western Europe, where heat savings in new buildings range from 50% to 70%. The savings made fully cover the costs of developing and installing energy-saving technologies.

At present, Russian companies have also come to the decision on the need for savings, so every year several new buildings with a modern energy-saving system appear in different regions of Russia.

## POSSESSIVE PRONOUNS IN INDONESIAN LANGUAGE

**Sariyeva Zamira\***

\*TerSU,

UZBEKISTAN

Email id: sariyeva.zamira@gmail.com

### ABSTRACT

*Indonesian, which is called bahasa Indonesia by its speakers, is classified as a Malayic language of Malayo-Polynesian branch of Austronesian language family [2]. It is spoken mainly in the Republic of Indonesia, as the sole official and national language and as the common language for hundreds of ethnic groups living there. In Indonesia 22.8 million people speak Indonesian as their first language, while more than 140 million speak it as their second language. It is over 80% cognate with Standard Malay, which is spoken in Malaysia, Brunei, and Singapore[2]. Indonesian is an agglutinative language with a rich affixation system, including a variety of prefixes, suffixes, circumfixes, and reduplication. In general, grammatical relations are only distinguished in terms of word order. Indonesian is a diglossic language. The high variety of Indonesian, also called bahasa resmi 'official language' or bahasa baku 'standard language'. This work will analyse examples in these two types of language forms. This article analyse the means of denoting possessiveness and possessive pronouns in Indonesian language.*

**KEYWORDS:** Possessive Form, Formal, Informal, Affixation, Possessive Pronouns

### INTRODUCTION

There are several ways of expressing possessiveness in Indonesian language. This work will analyse these means.

In order to form possessive form in Indonesian language we can use personal pronouns by replacing them after the noun. For example :

Buku **saya**. / My book/

Buku kamu / Your book/

Buku dia /his; her; its book/

Buku kita / Our book/

From above mentioned examples it is possible to conclude that indicating possession pronouns must follow a noun.

There is another way of denoting possessive form, by using affixation (-ku, -mu, -nya ) after the noun. Here, "-ku" is used for first person singular, "-mu" is used for the second person singular and "-nya" is used for the third person singular. For example:

Ini rumahku. / This is my house/

Itu rumahmu. /That is your house /

Dia ingin jual bukunya / He /She wants to sell his/her book/

The suffix "-nya" has several functions within the noun phrase. It can function as a third person possessive pronoun or as a ligature before a possessive noun. This suffix can also denote third person singular "it". Here, this suffix has some feature to be different from "itu" (that). These examples will be used to analyse the difference:

Ibu sudah memasak roti. Roti itu di lemari.

/ Mother has cooked a bread. It is in the pantry./

Kalau mau makan, rotinya di lemari.

/If you want to eat, the rice is in the pantry/

In the first sentence above nasi itu 'that rice' refers to the rice already mentioned.

As nasi is not mentioned previously in the second example, itu is not possible. However, when reference is made to eating in Indonesia rice is understood, and thus -nya can occur.

In the following examples pelayanya 'the waiter' and airnya 'the water' are possible because waiters are assumed in the context of a restaurants and water is necessary for bathing:

Ia menilai pelayanan di rumah makan cukup baik.

"Begitu dibel, pelayanya langsung datang", katanya.

/He regards service in the restaurant is very good./

/ "No sooner she called than the waiter immediately comes," he said./

Saya ingin mandi, tetapi airnya tidak ada.

/ I wanted to have a bath but there wasn't any water./

Saya mau ke rumah sakit tapi tidak tahu jalannya.

/ I want to go to the hospital but I don't know the way./

Use of -nya in this way is optional; it tends to be used by Indonesians whose regional language has a similar construction.

The bound form -nya can refer to non-human animate and inanimate nouns, both single and plural:

Apa/siapa namanya?

/What's its name?/What are their names?/

Saya sudah membacanya.

/I've read it/them./

In contexts where -nya cannot occur there is usually nothing corresponding to English 'it'. This is further discussed in section . In the translations of the following examples 'it' is placed in square brackets where there is no equivalent in Indonesian:

Hebat, bukan?

/It's amazing, isn't it?/

Dia meminyaki rambutnya, supaya mengkilat

/ She oiled her hair so that [it] shone/

As it was mentioned above indicating possession pronouns must follow a noun.

Phrasal forms corresponding to 'mine', 'his', and so on, do not occur. This may require repetition of a noun:

Mobil ini mobil saya.

/This car is mine./

To avoid repetition the first occurrence of the noun is usually omitted. Alternatively the possessive pronoun may be attached to a form like 'kepunyaan' or 'punya' 'possession', milik 'property':

Ini mobil saya.

This is my car.

Mobil ini kepunyaan saya.

Mobil ini milik saya.

Mobil ini milikku. (more informal)

This car is **mine** (my possession).

Dia **memiliki** lima tas baru.

/ She/he has five new bags/

Dia **mempunyai** banyak buku

/She/ he has many books/

This example compares the usage of 'punya' which can be considered as informal form of "kepunyaan".

Saya punya mobil

I have a car.

## CONCLUSION

Possessive form in Indonesian can be denoted by using possessive pronouns and affixation. This article has described the signs and constructions used to express possession and in Indonesian language. The language has many constructions in to express possession. Frequently, there is almost no obvious distinction between attributive and predicative possession in Indonesian language, making possible several different interpretations. Pointing is used to identify both the possessor and the possessed item in a possessive relationship, and occurs in both attributive and predicative possession. Moreover, Indonesian language uses several different 'have'-like constructions to relate a possessor to its possessum. The example including 'mempunya', 'punya' (informal form). "memilik" or "milik" (more informal) are used to denote possessiveness. From the examples that were given above it is obvious that unlike English language structure possessive pronoun + noun, Indonesian language structure noun + possessive.

For example: My book /English language/

Buku saya

BOOK 1SG (I).

/My book/

## ENGLISH AND UZBEK MEAT IDIOMS REFLECTED BY CULTURE AND HISTORY

**Saidakbarova Saodat Parhadjanovna\***

\*Researcher and an English Language Teacher,  
Tashkent State University of Oriental Studies,  
UZBEKISTAN  
Email id: saodat.83@list.ru

### ABSTRACT

*Over the years, research has shown that language and culture are interrelated, and that linguistics is highly relevant in language studies and reflects the notion of national character. The phraseological Foundation of the Language is one of the linguo-cultural units and is a valuable source of folk culture and mentality. Our study shows that gastronomic phrases reflect the customs, customs and traditions of a particular nation.*

**KEYWORDS:** *Linguo-Culture, Phraseology, Culture, Tradition, Etymology, Meat.*

*“We find the way to talk about things that would otherwise be unexpressed in language. The horrors of war, the ultimate alienation of death and the great ecstasy of love would remain vague phenomena if we could not discuss them in terms of easily understood happenings in our daily life<sup>1</sup>”*

Robert Di Pierro

### INTRODUCTION

Phraseology covers all spheres of life. They emerge in the field of sailors, cooks, merchants, curses, tourists, etc. and are created by representatives of the sphere. Over time, these phrases come into the literary language, which is considered the most influential, that is, they move from its narrow meaning to its broad meaning. For example, the English idiom *fat in the fire* appeared in the speech of cooks in the kitchen, which later began to be used in other areas.

Lucien Lévy-Bruhl attributed the formation of expressions with the development of primitive thinking. This progress has gone through two stages connected to each other. The first – prologue (until the emergence of logic) contemplation. This stage people came up with stagnant

expressions caused by the desire to use some concepts and existing words in a completely different sense (taboo and euphemism), to name something and phenomena that are equally imagined for the seed weed within the framework of different magic-related imaginations and superstition. The second is the stage of logical thinking, in which primitive people deliberately took things and events under the influence of natural or linguistic impulses, or formed proverbial phraseological units by using completely different words in relation to them in a portable sense. (Lévy-Bruhl, 1930)

One of the components that are actively used in the formation of gastronomic phraseology is "meat". Meat and meat products are also one of the profound factors that play an important role in human life and in the culture of nutrition. In English culture, the idiom used with components of meat products is associated with the ancient history of England. For example, it can be seen that the origin of the words pork, beef, mutton, was formed from the "Battle" of languages during the period of communication with the Saxons and Normans, in which the second ones were defeated. The process of gradual relocation of French and English languages lasted three to four centuries. The French language was considered the language of the nobility for many years, and in English it was spoken by illiterate people of the lower class. On the table of the Normans were drawn beef, pork and mutton, and in itself the Old English name of these products was changed to the French Alternative:

English	French
pig (old English picga)	pork (old French porc)
ox (old English oxa)	beef (old French boef)
sheep (old English sce-ap)	mutton (old French moton)
calf (old English cealf)	veal (old French veel, later veau)

In the process of the study, twenty two gastronomic phraseological units with the components of meat products in English were identified.

English gastronomic idioms formed with the meat component and their Uzbek equivalents:

To be meat and drink	жонудили
One's meat is another man's poison	кимгасавоб, кимгахаром
After meat mustard	Ғишт қолибдан кўчди
Strong meat	дахшат
Meat and potatoes	мухимомил
Dead meat	мурда (пуписа килмоқ)

English gastronomic idioms formed with the mutton component and their Uzbek equivalents:

To eat one's mutton with smb	Тушлик қилиш
Mutton dressed (up) as a lamb	Кампирлар киз бўламан дейди
Returns to one's mutton	эски ашуласини бошламоқ карам шурвасини бошламоқ

English gastronomic idioms formed with the chicken component and their Uzbek equivalents:

Chicken	кўрқок
Don't count chickens before they are hatched	санамай саккиз дема
Spring chicken	ўнг гулидан бир гули очилмаган, ёш
Like headless chicken	пала- партиш,
Chicken feed	арзимас пул

English gastronomic idioms formed with the turkey component and their Uzbek equivalents:

Red as a turkey	уятдан қизариб кетмоқ
Talk turkey to	масалага ойдинлик киритиш мақсадида суҳбатлашиш

English gastronomic idioms formed with the components of bacon, ham, pork and their Uzbek equivalents:

To bring home the bacon	Оиланибокмоқ
Pork barrel	-
Ham	Кимнингдиркарамогидабулмоқ

English gastronomic idioms formed with the lamb component and their Uzbek equivalents:

Smell of the lamb	Ёзувчилар уз асарлари устида жуда куп вақт утказганларида кулланиладиган ибора
Mutton dressed (up) as a lamb	Хозирги замон кампирлари киз буламан дейди

English gastronomic idioms formed with the fish component and their Uzbek equivalents:

Bigger fish to fry	Мухим вазифа
--------------------	--------------

We have analyzed all these idioms from linguo-cultural perspectives and tried to find a link between present and past.

The word “meat” refers to such concepts as: *meat and potatoes, one man’s meat is another man’s poison, dead meat*.(phrases.org.uk)

The majority of gastronomic phraseological units in the composition of the Uzbek linguistics, in which meat is involved, represent a negative meaning. For example: the idioms *гўштини бурда-бурда қилмоқ* (to cut someone’s meat into pieces), *гўштини емоқ* (I’ll eat your meat) are used in the sense of a threat, in the sense of “fight, quarrel”. The English idiom *dead meat* is close to the meaning of this group

Along with the above, it can be seen that gastronomic phraseologic units, expressed in English, with the words meat, mutton, pork, beef, and turkey are also widely used. For example:

*To eat one’s mutton with smb – бирга танаввул қилмоқ.*

*Will you eat your mutton with me today, Palmer?* (Ch. Reade, “It is Never Too Late to Mend”, ch. XII).

*Бугун бирга танаввул қиламизми, Палмер?*

*Mutton dressed (up) as lamb – кампир қиз бўламан дейди.*

*They are popular in the neighborhood, I gather.* ‘Some of the old cats don’t like ‘em,’ said General Grant. ‘A good deal of **mutton dressed as a lamb** round here’ (A. Christie, “The Labours of Hercules”, “The Horses of Diomedes”).

*Фикримча, улар маҳалламизнинг кўзга кўринган қизларидан. Фақат кампирлар эмас – деди Генерал Грант. – Ўзимизда ҳам қиз бўламан деган кампирларимиз талайгина.*

The phrase Return to one's muttons (start cabbage soup) came from French *revenons a nos moutons* which is used as a joke. It was used in relation to people who repeatedly spoke one sentence in order to please their opinion.

*Mr. Cox seemed to lost interest in a conversation which had regrettably drifted away from the topic of himself. He turned his back on us rather abruptly, and **returned to his titled muttons**.* (R. Aldington, "Soft Answers", "Nobody's Baby").

The idioms with the component "pork" are also used in modern English. For example, *pork barrel* refers to the amount of money given by the state to some kind of program or projects. (Hornby, 2005) Pork barrel is a metaphor (Wikipedia), the history of its origin is connected with the story of Edward Everett Hale, which was published in 1863 year, titled "The Children of the Public". In the story, this metaphorical phrase was used to express the funds that were given to citizens. Later, after the war of American citizens, this metaphorical expression began to be used in the literal sense. At the beginning of the XIX century, pork was stored in large containers. Those who need it were also able to monetize the meat in the contender. From this arose the meaning of pork barrel's figurative "cash refrain". By the twentieth century, the population began to collect money for the purpose of prosperity of its territory and spend it on several federal projects. Currently, this metaphorical phrase is used in relation to the amount of money allocated by the state for political elections. For example:

*But hey, don't worry, the Democrats have already put this into their \$45 billion infrastructure pork barrel so that we taxpayers get pay for it.* (chicagotribune.com, Talk of the Country: Civil War Days talk is political correctness run amok, 17 June 2019).

The idiom *to talk turkey* means "talk seriously about business". This expression was widely used in the US in 1824 year. During the American colonization, Pilgrim Fathers were in great demand for turkey meat while trading with Indians. Naturally, the first question of the Indians was: "You come to talk to turkey?" According to Nigel Rees, this idiom is taken from the famous story about Americans and Indians. During the colonial period, there was an agreement between the White Hunter and the Indians, according to which everything they hunted was equally divided between the White Hunter and the Indian Hunter. When the time of Sunset came to sum up, there were three crows that were hunted and two turkeys that had to be divided equally between the hunters. The White Hunter first gave the crow to the Indian, and the Indian itself gave the Turkey to the White Hunter, and then the white one handed the second crow to the Indian, and the Indian the second turkey. So the Indians took only the Crow, and the whites-the turkeys. The Indians who were angrily surprised and asked: you took all turkeys and the crows to us? (Rees, Croydon)

K. Watson wrote, "studying another culture means knowing the most beautiful and genuine expressions of this people, as well as everyday lifestyle." (Watson, 1974) Here we can see the importance of the culture in communication of the representatives of two different cultures." K. Watson's research has shown how expressions are significant to know another culture. He believes, if you want to be received by an unfamiliar society, you are obliged to study the phraseological units, which are the value, dignity of this society, and which can manifest its culture.

According to Sh. Usmanova, the semantics of phraseology reflect a long process of development of folk culture. In the phraseology of each language, the events of social history, which belong to the life of the people, are reflected in moral and spiritual-cultural norms, religious outlines, national traditions and customs, cultural stereotypes and archetypes, which are transmitted from the courtyard to the generation. (Usmanova, 2015)

## CONCLUSION

An idiom breaks the normal rules, then, in that it does not mean what you would expect. In fact the idiom is a new linguistic entity with a sense attached to it that may be quite remote from the senses of the individual words that form it. Although it is in form a phrase, it has many of the characteristics of a single word.

All these analysis reveal that English and Uzbek idioms with meat units have almost the same equivalent. However, in some cases they have no one. Of course, history, culture and habitant of target society play a significant role in formation of figurative languages. In spite of the fact that English and Uzbek nations have a great deal of contradictions some idioms have very similar meanings and their explanation and origin can surprise with its identity.

## PROFESSIONAL TEACHING OF PHYSICS IN ACADEMIC LYCEUMS IN MEDICAL DIRECTION

**Khodjayeva Diyora Zuhridinovna\***

\*Tashkent State Dental Institute,  
Republic of UZBEKISTAN

### ABSTRACT

*This article aims to enhance interest in science established in the vocational education of physics students who study at medical academic lyceums, it recommends being able to acquire the knowledge which they need to gain from other subjects under the state educational standards.*

**KEYWORDS:** *Vocational Training, Integrative Education, Improving Education Quality, Interest In Science.*

### INTRODUCTION

In recent years, we have seen that among students intending to enter to the higher education, subjects are divided into two categories: "necessary" and "unnecessary". That is, the student places the subject in which he / she is selected for admission at the university of his / her choice as "necessary" or "unnecessary" subjects. As a result, students do not master the subjects they need to know based on state educational standards.

Currently, there are several ways to solve problems that arise in the educational process in order to increase the interest of students in science, and have been introduced into the educational process. For example, the introduction of information technology in the educational process, the wide use of various audio and video materials, the introduction of modern teaching methods in the education system, and so on. Unfortunately, in most cases, students who want to go to a higher education institution, their views remain the same. Students attend in classes which they consider unnecessary only for attendance, keeping their preparations. There are also cases of missing out on extracurricular activities and courses. This, in turn, can not only absorb the knowledge that the learner should have in accordance with the state educational standards, but also cause the attendance of high school students and of course the lack of interest in the subject remains.

## THE MAIN PART

Today, there is a need to address the above disadvantages, to study the current state of the problem, to analyze and draw the necessary conclusions, as well as to develop practical and methodological recommendations.

The natural question arises: What is the main driving force for students to acquire the knowledge they need to master in the state educational standards? How can these problems be overcome?

It is known that when a learner experiences such qualities as interest, demand, commitment, commitment, he or she can accept and remember the content of the lesson. Properly organized teaching will stimulate students' interest in science and this knowledge will be remembered. Of course, it is up to the teacher to attract students to the basics of science and to provide various scientific knowledge on the subject.

We think it is important to do the following in order not to categorize students and to master all the disciplines of the sample work programs.

To avoid confusion and make sure the solution is not just general terms, we will look at the problem solely in medical lyceums and high school physics.

Obviously, a number of students who intend to enter a higher education medical school begin their academic studies at academic lyceums in medicine. Up to now, the entrance exams in medical universities are biology, chemistry, native language and literature, so the high schools in this area are focusing on teaching the same subjects. At the same time, physics is becoming a "secondary" subject. However, in the age of technology, physics plays an important role not only in technical education, but also in medicine. At the same time, it is difficult to make the right diagnosis and treatment without modern medical equipment. In a word, without modern medical devices, it is impossible to imagine the development of medicine. In order to use such equipment properly and properly, it is necessary to know the physics and understanding of physics. Not only medical equipment but also a number of diseases in the human body are subject to physical laws. This means that if a student fails to master physics well, he or she will have difficulty in acquiring the profession in the future. The teacher should be able to explain it to the students, which in turn will involve the learner in the subject and the student will be able to understand the importance of science to the learner. After all, the student should attend the lesson, not because of a commitment, but because of the role that science has in his or her profession. Only then can the student find a clear answer to the question, "Does this subject matter to my chosen profession?" To reveal the essence of the subject and to stimulate the student's interest in learning the subject. Clearly, the learner must be well-versed in his or her knowledge of the subject, as well as the interdisciplinary and interdisciplinary integration of science.

In the system of secondary special education, academic lyceums, which are not specialized in the curriculum and programs of the academic lyceum, are distributed in the same lyceum with the same hours and chapters. This means that for undergraduates who do not have a degree in physics, the direction of the lyceum is different, but the subject matter is the same. So the teacher might also ask, "Can I get out of the program?" However, the development of working curricula for science based on the percentage of changes that can be made to the model curriculum will be assigned to the most qualified personnel in each institution. This is no

accident. Using this, professional education is one of the key to finding a solution to the problem, without altering the content of the sections of the standard education. As we have already mentioned, this solution can appeal to every student, regardless of the direction of the teacher.

Below we consider the content of teaching related to medicine in the distribution of physics subjects in academic lyceums in the field of medicine.

№	Topics	Medical knowledge
1	Introduction. The role of physics in the study of nature. Tasks of kinematics.	The role of physics in medicine. Medical metrology.
2	Mechanics of liquids and gases. Bernoullie's equation	Movement of blood in blood vessels. Occurrence of laminar and turbulent flow in blood vessels. Gas embolism. Effects of changes in blood viscosity on the human body.
3	Dynamics of a rotating solid. The rule of moments.	Biomechanical processes in the musculoskeletal system. Joints and ligaments in the musculoskeletal system. Degrees of freedom.
4	Impulse of body and power. The law of conservation of momentum.	The mechanical work of man. Ergometry.
5	Mechanical vibration action. Forced oscillations. Resonance.	Kinetic and potential energy of oscillating motion. The role of resonance in the human body.
6	Mechanical waves. Sound waves. Sound speed.	Bioacoustics. Characteristics of auditory perception. Clinical sound diagnosis.
7	The concept of ultrasound.	The use of ultrasound in medicine.
8	The basic equation of the molecular kinetic theory of an ideal gas. Measuring the velocity of gas molecules.	Measure body temperature. The organism as an open system.
9	Fluid properties. Surface tension force and surface energy. Humidity.	The use of capillaries in medicine. The importance of surface tension in medicine. The effect of humidity on the human body
10	Structure of solids. Mechanical properties of solids.	Muscle deformation. Mechanical properties of biological tissues.
11	Thermal expansion of solids. Melting and solidification of solids.	Heat treatment. Taking medications.
12	Laws of thermodynamics.	Energy exchange processes in the body. The importance of thermodynamic quantities in the human body.
13	Heat machines and the principle of their operation	Cardiac biomechanics.
14	Current strength and density. Conditions for the availability of electricity.	The effect of current on the human body.
15	Ohm's law for a complete chain. Ammeter	Resistance in the human body. Impedance.

	and voltmeter.	
16	Conductors, dielectrics and semiconductors.	Basics of electrocardiography (ECG). Working with medical devices.
17	Application of electrolysis in engineering and medicine.	Electrophoresis. Enhancement.
18	The magnetic field of the current.	Treatment with current area
19	Electromagnetic field. Electromagnetic waves.	Effects of electromagnetic waves on living organisms.
20	Optics.	Eye-optical system.
21	X-rays and their application.	The use of X-rays in medicine.
22	Quantum light sources are lasers.	The use of lasers in medicine.
23	Nuclear reactions. Radioactive cycles.	The principle of operation of magnetic resonance imaging (MRI)

The table shows that a teacher who is well aware of the interdisciplinary, interdisciplinary integration of his subject can keep the student interested in his subject. In doing so, the student thinks about the content of each subject, realizes the importance of understanding the content of the subject, and, of course, avoids categorizing the subjects.

In order to get a positive result, the teacher must follow the following didactic requirements:

1. The material in question is general and specific to physics should not negatively affect the performance of their duties, and physics should not become a medicine.
2. Misinterpretation without thorough knowledge of medicine should not.
3. The given material helps students to master physics in depth, should help him to remember.

## CONCLUSION

While teaching has a scientific basis, it is pedagogical, psychological, didactic plans may vary. With this in mind, the proper organization of teaching depends on each teacher. In this way, a creative approach to science, the acquisition of theoretical knowledge and laws, the acquisition of knowledge in a spirit that can be confident that in the future they will be able to become experts in their chosen profession, without becoming slaves to common ideas and unreasonable approval of their opinions is needed. Career-oriented teaching in the specific sciences is a clear example of this.

### ABSTRACT

*This article analyzes the work of Abdulhamid Cholpon in the context of world literary and aesthetic thinking on the example of his work in the field of literary translation. Attention is drawn to the fact that he had a direct connection with the literary movements in Russia, Turkey, Great Britain, Germany and a number of other countries. Based on the analysis of the translation of Shakespeare's tragedy "Hamlet", it is proved that the poet studied the traditions of European literature and was able to synthesize the achievements of world literature in his works.*

**KEYWORDS:** *Poetic Content, Literary Process, Translation, Interpreter, Drama, Artistic Interpretation, World Literature, Literary-Aesthetic Thinking.*

### INTRODUCTION

The relationship between the creative and the socio-literary environment, capable of updating the poetic content, is an important literary-aesthetic factor that determines the level of development of a particular national literature. There are issues that need special attention in the process of studying this scientific problem in literature. This, of course, implies issues related to the scope and boundaries of the socio-literary environment. The point is that it is not expedient to limit the sphere of influence of the work of advanced reformers only to the time in which he lived, the

space in which he stepped, as well as the intelligibility factors of language. In the second half of the XIX century - the beginning of the XX century there was such a literary upsurge in the world that it is expedient to look for the reasons in mutual literary influences.

## MAIN RESULTS AND FINDINGS

In the early twentieth century, the Irish writer and poet James O'Connell (1882 - 1942), the Spanish poet and playwright Federico Garcia Lorca (1883 - 1936), the German writer Franz Kafka (1883 - 1924), the Russian poet Alexander Alexandrovich Blok (1880 - 1921), Sergei Alexandrovich Yesenin (1895 - 1925), Chinese writer Lu Xin (Zhou Shujun) (1881 - 1936), Indian writer and poet Rabindranath Tagore (1861 - 1941), a number of French writers, including Henry Barbusse (1873 - 1935), Turkish artists, including Riza Tawfiq, Yahya Kemal, Hussein Rahmi Gurepinar (1864 - 1944) and many other famous artists of the world can not be glazed. It is also true that the work of the same writers determined the level of world artistic thinking in the early twentieth century. Every artist who considers himself a national devotee, who aims to bring his people to the world stage by raising the level of national literature, must adapt the level of artistic thinking to the most advanced trends of his time. This, of course, requires him to make effective use of the achievements and experiences of world writers who lived and worked at the same time as him, and, if necessary, to enter into mutual discussions with them. Cholpon, the son of Abdulhamid Sulaymon, was able to bring Uzbek literature to such a level in the early twentieth century, along with Abdullah Qodiri and Abdurauf Fitrat. In this sense, the study of Cholpon's work in the context of world literature would, in our view, be the most appropriate path. However, it should be borne in mind that "the process of literary influence or comparative studies is reflected in the context of each national literature." [3. 234-235].

The socio-literary environment of Cholpon should not be limited to Uzbekistan or Central Asia. It is well known that he was directly acquainted with the literary movements in Russia, Turkey, Great Britain, Germany and a number of other countries, and had a peculiar connection. After all, the ideological basis of the poet's work was the Jadid movement, the idea of national awakening, which was initiated by Ismail Gaspirinsky, aimed at overcoming the centuries-old national crisis of the Turkic peoples and bringing them to the advanced nations of the world. It is well known that Jadidism and Jadid literature are based on the idea of developing national enlightenment in harmony with world science and art.

Undoubtedly, the education and upbringing he received as a child play an important role in the development of Cholpon's talent. His father, Suleiman Bazzoz, was a prominent merchant and businessman of his time, as well as a poet from Andijan who wrote poems under the pseudonyms Rasvo and Volai Rasvo. Naturally, he was seriously engaged in the education of his son. Academician Naim Karimov writes that Suleiman was "one of the most progressive people of his time, so he subscribed to several foreign newspapers in order to keep abreast of developments in other countries, in particular trade in those countries. Abdulhamid's vision and knowledge of the world and the peoples of the East and the West were formed with the help of these publications" [4. 6]. At the age of 15, in 1913, he wrote a letter to a famous man like Ismail Gaspirinsky, in which he was well acquainted with the materials of the newspapers "Shalola", "Turk Yurdi", "Shahbal", "Vaqt", "Iqbol" and "Tarjumon". indicates that he is enlightened.

The bourgeois uprising and coup d'etat that took place in Russia in February 1917 seemed to give him the hope, albeit a weak one, of a short-lived hope of freedom in the subordinate and

colonial lands. A new independent state was declared in Kokand, and thousands of intellectuals were involved in its construction. Cholpon, who was not yet twenty, wrote the Anthem of the new state. It was not a coincidence. As early as 1914, the young Abdulhamid began to gain the recognition of the nation's educated patriots. On April 18 of the same year, the newspaper Sadoi Turkiston wrote the following lines before the poem "To our Turkestan brothers": their heroes are the cause. Their young hearts dream of conquering everything and destroying the forts of ignorance and ignorance by force. And some of them will succeed in their dreams and become the leaders of an entire nation's age, old age, husband and wife alone. With their young hearts they begin the light of light and knowledge, the light of enlightenment. Such young people exist in every country, more or less, in their own way. Alhamdulillah, such young people and young like-minded children are starting to appear among our Turkestan Turks. For proof, he will show 12-year-old M. Sanjarbek from Osh and 15-year-old Abdulhamid from Andijan" [5. 330].

According to Academician Naim Karimov, Cholpon's poem "To our Turkestan brothers" published in 1914 in the newspaper "Sadoi Turkiston", stories "Victim of ignorance", "Doctor Muhammadiyor", journalistic article "School", "What is literature?", "Dear literary writers" his "creative program was reflected" [4. 7]. Such an enthusiastic creative activity, the creation of works worthy of great recognition at the age of 16, and, most importantly, the possession of a creative program, turned the hope in him into confidence. When an author was chosen for the new National Anthem, it was difficult to find another worthy one.

But it was not about the Anthem, but the emergence of a new autonomy that was in line with Cholpon's patriotic ideas. That is why the poet was ready to give him his existence. Unfortunately, he was crushed in a short time and his activists were persecuted. Until the Turkestan Autonomy was forgotten, the poet who wrote its Anthem could only survive if it was out of sight. Realizing this, Zaki Validi takes Cholpon to Orenburg. Here he took part in the formation of the Autonomous Government of Bashkortostan. All these processes nurtured in the poet the idea of the freedom of the country and formed his political views on the basis of the ideas of a renewed homeland, a rising nation. Naturally, these ideas required innovations in creativity as well. Therefore, in the opinion of Professor Nurboy Jabborov [2. 45]. This was based, firstly, on the achievements of world literature and, secondly, on the scale of individual poetic thinking.

As a child, Cholpon was educated in a madrasah and studied Arabic and Persian well, and in a sense became acquainted with the literature in these languages. Later, the poet got acquainted with the Russian language and literature in the Russian-language school at the level of school education, within the framework of the ideology of tsarism in relation to indigenous peoples. But when Jadidism began to get acquainted with the works of the representatives of the political-enlightenment movement of the national awakening, the level of awareness of Russian literature no doubt did not satisfy him. Because the traditional features of these literatures were in a sense obsolete in the face of updates in Russian, Turkish and Tatar literature. Perhaps this is why Cholpon, in his poems, along with the old styles and traditions, boldly begins to apply the innovations he has learned through these languages to national standards. We will try to explain them with some examples.

***Mastering Shakespeare's poetic skills through the translation of Hamlet.*** It is known that at the beginning of the XX century in Turkestan there was a renewal in all spheres of culture. Here the

rise of theatrical art began to be realized, first of all, by the efforts of serious intellectuals. In particular, Cholpon's translations of world classic dramas have made a worthy contribution to the development of Uzbek theater. On the other hand, these translations also served as a great school in the growth of the poet's artistic skills. This is clearly shown in the translation of the tragedy "Hamlet" by W. Shakespeare. The translator translated this work, presumably, on the recommendation of M. Uyghur. In the poem "The first symbol of art, comrade Uyghur", there are references to this: You would say. Or: "How it shone to the delight of the people, the greatest work of W. Shakespeare."

It is known that Shakespeare's tragedy "Hamlet" was written in a poetic way, like many other tragedies. Some of the translations into Russian before Cholpon (there are about 20 of them) were done in a poetic and some in a prose way. For example, the translations of Nikolai Ketcher, A.M. Danilevsky, Pavel Kanshin, etc., were prose, while Peter Gnedich, Dmitry Averkiev, Nikolai Rossov, Mikhail Lozinsky, Anna Radlova, and Boris Pasternak performed translations in the path of poetry or prose. From our brief observation, it is clear that Cholpon was acquainted with all of them. It is based on a prose translation by P. Kanshin on the advice of Shakespearean Eugene Lan. At the same time, with the help of E. Lan, he is studying this translation in comparison with the English original. " (4. 538). The prose translation of the work must have taken into account the taste and level of the Uzbek audience at that time.

Although Cholpon's translation is prose, it reads like a poem. There are so many imagery in the sentences that they are no different from poetic verses. An example of this can be found anywhere in the work. An excerpt from the fourth scene of the third act of the translation, we observe the debate of Hamlet and his mother, the Queen:

***Translate in to Uzbek:***

*Qirolicha: Oh, basqil, Hamlet! Senmenio 'zko' nglimning chuqurjoy larigako'z tash lashgamaj burqilding vamenund as hunday qoradog'larniko'rayotirmanki, dunyod ahechnars abilanularniyuibbo'lmaydi!*

*Hamlet: Shudog'larniko'ribturi bhamjir kanog'I ldayashab, if losyo to qningsassi qbo'ylarinihidl abvabiraravago'ngustidamuhabbatnash'alarinisurishdadavometmak. Hamda...*

*Qirolicha: Bas, endibirog'izhamgapirma! So'zlaringqulog'imgaxuddixanjardaybotmoqda. Basendi, sevimliHamlet!*

*Hamlet:* (davomettirib)

*Hamdaburungieringningbirharomtukigaarzimaydiganqotilvayirtqichbirmaxluqningqo'ynida!*

*Qirolningemas, odambolasiningnuqulaybiniko'rsatadiganbirmasxarabozqo'ynida!*

*Podshohliqnivahukumatnikasbqilibolgan,*

*tokchadagiqimmatbahotoshnio'g'irlabcho'ntagigaberkitgankissavurqo'ynida...*

*Qirolicha: Bas!*

*Hamlet: (davometib) Qiyqimlardanvalatta-puttalardanyasolg'anqirolqo'ynida!..*

The same passage was translated into Russian by B. Pasternak as follows:

***Королева***

*Гамлет, перестань!*

*Ты повернул глаза зрачками в душу,  
А там повсюду пятна черноты,  
И их ничем не смыть!*

**Гамлет**

*Валяться в сале  
Продавленной кровати, утопать  
В испарине порока, любоваться  
Своим паденьем...*

**Королева**

*Гамлет, пощади!  
Твои слова – как острия кинжалов  
И режут слух.*

**Гамлет**

*... с убийцей и скотом,  
Не стоящим одной двухсотой доли  
Того, что тот. С петрушкой в королях.  
С карманником на царстве. Он завидел  
Венец на полке, взял исподтишка  
И вынес под полою.*

**Королева**

*Гамлет, сжалься!*

**Гамлет**

*С святошной игрушкою...*

**In English, this passage is as follows:**

**Queen Gertrude**

O Hamlet, speak no more:

Thou turn'st mine eyes into my very soul;  
And there I see such black and grained spots  
As will not leave their tinct.

**Hamlet**

Nay, but to live  
In the rank sweat of an enseamed bed,

Stew'd in corruption, honeying and making love

Over the nasty sty, -

**Queen Gertrude**

O, to me speak no more;

These words, like daggers, enter mine ears;

No more, sweet Hamlet!

**Hamlet**

A murderer and a villain;

A slave that is not twentieth part the tithe

Of your precedent lord; a vice of kings;

A cutpurse of the empire and the rule,

That from a shelf the precious diadem stole,

And put it in his pocket!

**Queen Gertrude**

No more!

**Hamlet**

A king of shreds and patches... (Shakspeare homepage. Shakspeare.mit.edu)

This passage looks like this in a poetic translation by Maqsud Shaykhzoda after Cholpon:

**Malika**

Basqil, Hamlet! Senmeningko'zimnihozir

Vijdonimgaqarashgamajburaylading.

Undako'rganimnuqulqoradog'lardir,

Udog'larnihechnarsayuvibketgizmas.

**Hamlet**

Baribir, sizyog'bosganyotoqdamudom

Nafsingizningkayfidannash'alartopib

Shahvatningxumoridaag'nayotirsiz.

**Malika**

Hamlet, rahmet! So'zlaringxanjarsingari

Qulog'imnitilmoqda.

**Hamlet**

Sizgahamyosti qbo'lgan qotil vahayvon

Marhumning bittaharom tukichaemas.

Sizni qo'yniga olganshohemas – ayyor,

Utaxtuz rao'tirgan bittakisabur,

Tokchadatoj niko'ri bo'g'irlagan pes.

### Malika

Hamlet, rahmet!

### Hamlet

Yoringiz birmas xaraboz...

As can be seen, despite being written in prose, Cholpon's translation has a peculiar perfection in poetic terms. Therefore, it can be called a mansur translation. It is also clear that Maqsud Shaykhzoda learned from Cholpon during the translation process. This is confirmed by the use of the phrase "*not worth a single dirty hair*" - "*not a single dirty hair*". Here we are not thinking about the skill of translation, but about the background of the emergence of the common form of Mansura poetry in Uzbek poetry through the poetry of Cholpon. Initially, this situation was widely reflected in the poet's poetry. It is known that the poet used this method even before the translation of "Hamlet". In particular, he used it in his poems "That's how we end up," "Hey, hungry Poor." and in the embrace of "Nature", "Nature's answer". Probably because he liked it more, the translation was done in this way.

It should also be noted that Cholpon's creative way of thinking is close in nature to Shakespeare's thinking. It is no coincidence that in the poem "Cholpon is Cholpon" Ahmad Shukri compared the poet to Shakespeare. "Shakespeare's spirit is visible as soon as the Cholpon horse enters my ears," the author wrote. - No matter how much I tried to distinguish between Shakespeare's lyricism and Cholpon's poetry, I could not find her. I have read "Awakening" many times. I read Shakespeare. Finally I came to the conclusion that Shakespeare is Cholpon or Cholpon is Shakespeare.

### CONCLUSION

The breadth of the poet's worldview is seen when he deeply analyzes the events taking place in the world and finds many motives for freedom in them. Ancient Egypt, from the events cited in ancient Greek sources to the political attitudes of Great Britain, France, Germany, Italy, the Arab world, Iran, India, China and other countries in the twentieth century, is not left out of the poet's view. Fresh emotions from them are appetizing, influenced by the unusual manifestations of oppression and violence. It captures them in a variety of ways, similar to the Soviet policy that enslaved a number of republics. Sometimes when he is confronted with exposing this attitude, with works that are appropriate to the oppression of the oppressed peoples, he translates it, whether it is a poem or a dramatic work. Sometimes he also translates works in harmony with his dreams, some of which take the form of a series. A deeper and more detailed study of the poet's translation work is one of the tasks ahead.

## **DISEASE-RELATED EUPHEMISMS IN CHINESE AND UZBEK LINGUOCULTURE**

**Shokhistakhon Kudratullaevna Shamsieva\***

\*Researcher,  
Tashkent State University of Oriental Studies,  
UZBEKISTAN

### **ABSTRACT**

*This article is devoted to linguistic research of euphemisms associated with diseases in Chinese and Uzbek languages, the general and specific features of the euphemisms that characterize diseases are covered in the course of their propagation, indicating their role in language and culture. In both folk speech it was found that such cognitive signs as eastern embarrassment, shame, chastity are reflected in euphemisms. The study of euphemisms provides an opportunity to penetrate deeply into the mentality of the people, to have a complete idea of its national culture, values, customs, moral norms, national character of the owner of the language, as well as the interaction of language and culture.*

**KEYWORDS:** *Mental Illness, Gonorrhoea, Linguoculture, Physiological Defect, Chill.*

### **INTRODUCTION**

One of the reasons that make people vulnerable is because of these diseases and illness-related topics. A person who is depressed, both physically and mentally, first of all tries to find a way out of depression in order to get rid of this helpless situation. Because, by mentioning the name of the disease, the disease seems to have intensified. Therefore, in the fight against the disease, it is necessary to change the interpretation of the disease in the first place. This leads to a positive change in the psyche of the person himself and his loved ones. People resort to various euphemistic expressions to dispel the misery and sorrow caused by the disease. Relieving this disease is the best, tried and tested way to overcome it.

The disease endangers human health and life. That's why the Chinese often use the saying, "Don't get sick no matter what." According to ancient traditions, sickness and injury are punishments inflicted on a person, and this punishment occurs through divinity or as a result of

encountering the wrath of divine beings. Therefore, avoid using words related to the disease and try to use softer expressions instead.

## THE MAIN FINDINGS AND RESULTS

In Chinese, the disease is called 疾恙 jíyàng, and the disease is often perceived as “feeling uncomfortable”. This is why many euphemistic means are used instead of the word disease in Chinese. For example: 不适 bùshì – “there is a slight pain in the body”, 略感不适 lüègǎnbúshì – “a little discomfort” (a little, a little, taste loss), 微恙 wēi yàng – “no taste” (usually used as a response when others ask about the situation), 微 wēi – “a little pain”, 偶染微恙 ǒurǎnwēiyàng – to take action, to run away from time to time”, 欠安 qiàn’ān – “not to taste (a little, a little)”, “to be uncomfortable”, 欠安 qiànān – “not in good condition”, 失调 shītiáo – “to have pain all over his body”, 虚弱 xūruò – “to be sick and weak”, 症候 zhènghòu – “Symptoms of the disease observed in the patient”, 沉痾 chéngē – “chronic disease, serious illness”, 苛疾 kē jí – “rare disease” (“ke”, ie severe, irritating), 内伤 nèi shāng – ararlanishi “外伤 wài shāng – “external damage”, 感觉差 gǎnjué chà – “status of the members of the body, she felt bad and not good”, 有麻烦 yǒu máfan – “Check to be in a critical condition”, 采新之忧 cǎi xīn zhī yōu – “due to the illness of occurrence of inconvenience, “低于常态 dī yú cháng tài – “is not in good standing”.

In Uzbek linguistics, the word sick means sick, ill, sick; to be ill, to be ill, to be ill; euphemisms such as bad taste, bad taste, bad taste, bad taste, bad taste, bad taste, bad taste, bad taste, bad taste, bad taste, bad taste, bad taste, bad taste, bad taste, bad taste, bad taste, bad taste applied. For example: My uncle's seriously ill wife was lying in this house (A. Qahhor, vol. 3, p. 205); *Hamroqul, the packer, escaped* (A. Qahhor, Tomoshabog, 279). *Sultankhan's mother became ill. Only the fly moans, the patient revolves* (A. Qahhor, “Bemor”, 8); *The old man was in pain, apparently, holding his back* (N. Aminov, “Elvizak”, p. 49); *If it doesn't taste good, why does it go out and not lie down?* (“Mushtum”, 1996, №1, p. 8); *“Bahodir, why didn't you go to school yesterday?” - Mazam escaped* (“Mushtum”, 1996, №1, p. 9); *Sotiboldi's wife fell ill* (A. Qahhor. vol. 1, p. 289); - *Allo, Mukarramkhan, ... please tell the chief that I am not healthy, I can't go to the meeting* (“Oil avaj Jamiyat, 1999, April 21); - *If he is in poor health, he should go home and sit, but not look bad in everyone's eyes* (“SurkhanTongi”, December 12, 1997); *She needs to be spoken to with caution, she is not in good health* (N.A., “QitigiO’ImaganQiz,” p. 83); I'm sorry, I have a cold. - Now is the time (Sozlashuvdan); Dress thicker and you will catch a cold, my child (E. Turan, “Bu toglarlugtoglar”, p. 81).

Along with the above-mentioned, the Uzbek language also uses the euphemic expressions of being perfect in the sense of “going away from power and becoming a weak” and “becoming overweight and lying in front of death”. For example: -- while Gafforjonsufbadal was studying at the jadid school opened in eshon's room, his father did not send him to school after his mother was paralyzed, his mother remembered the school as an old woman (A. Qahhor vol. 3, 215).

In Chinese and Uzbek linguistics, disease-related euphemisms can be divided into thematic groups such as “euphemisms for dangerous diseases”, “euphemisms for mental illnesses”, “euphemisms for skin and genital diseases” and “euphemisms for internal diseases”.

### Euphemisms representing dangerous diseases

People especially hate incurable diseases and are terrified of them. In medicine, the names of many dangerous diseases are tabooed. In ancient times, people called rash “flower”, “bloom”, plague “chronic disease”. The reason was the high mortality rate from these two diseases at that time. That is why people were very afraid of dying from these diseases. But to date, due to the development of medicine, many diseases have been overcome. Rash, plague, and plague no longer frightened people. Therefore, the naming of such diseases as euphemisms in everyday treatment decreased, and they began to be referred to directly.

In Chinese linguistics, cancer is often interpreted as “swelling,” “new cell,” or “something has grown”. For example, 生长物 shēng cháng wù – “suffering from swelling of the body, the appearance of tumors”; Mild expression of 大写字母 C - dàxiě zìmǔ – cancers, S.A. the abbreviation of the word cancer in the West; 最后一场疾病 zuìhòu yī chǎng jíbing – (analogy) is a euphemistic expression of incurable diseases.

Cancer, cancer, tumor in science instead of cancer in Uzbek; a bad patient in speech, a dangerous patient, such a patient, without treatment; instead of plague, euphemistic means such as moonshine, chronic diseases are used. Experiments have shown that cobra venom can even stop cancer from growing (“Science and Life”).

AIDS, which appeared in the West in the middle of the twentieth century, is one of the most difficult global diseases to treat. In recent years, the disease has become a major concern of eastern communities as well. Its euphemistic synonyms began to be used in order to alleviate the depressed mood in people with the disease, to lift their spirits, to encourage them to overcome the disease, to encourage and sympathize with them. In this sense, the term “social disease” appeared in English, and it appeared in the dictionary of most languages. In Chinese, 社会病 shèhuì bìng euphemistic expressions are used instead of AIDS.

COVID - the 19-coronavirus (coronavirus), which has become a global pandemic around the world today, has caused a great deal of confusion. Even in some countries, the name of the coronavirus has become taboo.

### Euphemisms for mental illness

A group of diseases that result from a disorder of brain activity, ranging from a functional change in mental activity to a complete breakdown of it, is called a mental illness. It is well known that euphemisms arise mainly as a result of mental fear. Below we consider euphemisms related to mental illness in Chinese and Uzbek linguocultures.

In Chinese linguoculture, mental illness is expressed by the following euphemistic expressions: 弯轴断裂 wān zhóu duànliè – “mental illness”; 螺丝松了 luósī sōngle – “depression, insanity”; 心智不健全 xīnzhì bù jiànquán – “mental disorder” and so on.

In Uzbek linguoculture, the concept of “crazy // stupid” in the literary language is unhealthy, mentally ill, mentally handicapped, mentally retarded; in speech, “coming in and out”, “ninety-nine”, “one less face”, lacking, deaf, dementia, stupid; as before, the roof is represented by euphemistic means, such as: Do you hear that every year six thousand mentally retarded babies are born (A. Jumakul, “Yurakgasig’ masgaplar”; “O’ylamasdanso’ ylaganodamni no sog’ deydilar

“Song”. *It is called a person who speaks nonchalantly*”; Who knows, maybe everyone knew that Nargis's body was “**unhealthy**” (O. Hoshimov, “Twice two-five”, 179); What a pity, I say that this girl is less sane, - thought Juraboy (N. Ergashev, “Uzanbiyavlodlari”, 19).

In most linguocultures, the concept of “crazy” is sometimes expressed in a nonverbal way. For example, in Uzbek linguistics, the sign of turning the index finger on the temple is “stupid”, “crazy?”, “Are you crazy?” meanings. In Chinese linguistics, this meaning is expressed by tapping a finger on the forehead or head.

#### Euphemisms for skin and genital diseases

Sexually transmitted diseases are called mitochondrial diseases. The word “tanosil” (from the Arabic language) means “reproduction, multiplication, reproduction.” In Chinese linguistics, 花柳病 huāliǔbīng euphemistic expressions are used to mean “skin and genital diseases”, “syphilis”. The 爱神之痒 ai shén zhī yǎng euphemisms are also used in the mild expression of sexually transmitted disease.

Syphilis is an infectious, chronic sexually transmitted disease called zahm in Uzbek. Tuberculosis, syphilis and cancer poison the vocal cords and change the sound (N. Ismailov, “Care of diseases”).

Gonorrhea is an infectious venereal disease, mainly caused by casual sex, with inflammation of the urinary tract and genitals, which is expressed in Chinese by the 微妙的污点 wéimiào de wūdiǎn euphemistic means. In Uzbek, this disease is expressed verbally. As the word is contagious, it is necessary to consult a venereologist as soon as symptoms appear (“National Encyclopedia of Uzbekistan”).

“Xez, Xezalak” words are replaced by euphemisms such as sexual weakness, temperament weakness, constipation, parentheses, and urinary incontinence. For example: Don't be shy. If I am not ashamed ... my temperament is weak ... said Otabek (A. Qodiriy, “Days Gone By”, 78).

Skin diseases are a type of illness that causes a person to be depressed, especially because they have a negative effect on a person's appearance. Therefore, euphemisms are used more often than other diseases in the expression of skin diseases. Including white, spot, dry in place of leprosy; instead of measles, softened euphemistic means such as flowers, smallpox are used.

*Yana echkingizniemsam, esbo'liy - dedixiqillab. - To'g'riayt! -Aytdim-ku ... esbo'liy (pes so'ziniaytishdanes deb talaffuzqilinmoqda)* (N. A. “Qitig'io'lmaganqiz”, 95). *Sizgao'zog'zimbilaniqrorgilishgauyalaman. Xotiningizdanuyalasizmi? Oqdomlapeshonasi, ko'zostlari, birchekkasivabutunbo'ynioppoq pes, biroqnafasidan jinni shifotopadiganbo'lganiuchunxalq Pes domladeganiog'zibormay, oqdomladerkan*(A. Qahhor, 3-t., 212). Bolagagultoshdi (so'zlashuvdan).

An allergic reaction is a disease characterized by severe itching, rash on the skin, sometimes large and small blisters on the mucous membranes. The disease is called in Uzbek donkey, donkey metaphorical euphemism. In Uzbek culture, it is customary to feed a donkey at the foot to cure a patient with hives. *I went to one and a half of my cousins, wondering if I had a donkey, and rented a man's donkey for an hour* (G. Gulom, “Noughty Boy”).

In Uzbek tradition, good wishes are expressed in order to cheer up the sick person and his relatives, to comfort and encourage them. Typically, the patient: "Be healed," "Be healed," "You will still be like a horse," "You will be like you have never seen before," "May this be what you have seen and experienced," "May God heal you," and "He will heal you."

## CONCLUSION

To sum up, an illness is a phenomenon that leaves a person helpless and helpless. Therefore, various euphemistic expressions are used in order to avoid this unpleasant situation, to encourage the patient and his relatives, to have a positive effect on their depressed mood. Instead of being sick, euphemisms such as "there is a little pain in the body", "a little discomfort", "no taste", "a little sick", "to be uncomfortable", "to escape the disease", "to be like this", "to be awake" expressions are used.

## LINGUOCULTURAL APPROACH IN THE STUDY OF SURKHANDARYA'S DIALECTS AND ETHNOGRAPHIES

**Botir Rakhmonov\***

\*Researcher,

Termez State University, Termiz, UZBEKISTAN

Email id: b-rahmonov@list.ru

### ABSTRACT

*This article discusses the collection and study of dialects and ethnographisms in the territory of Surkhandarya, as well as the collection of dialectic proverbs and sayings in the speech of our ancestors and their study in the linguo-culturology, aspect.*

**KEYWORDS:** *Dialect, Ethnography, Proverb, Proverb, Linguo- Culturology, Animal Husbandry.*

### INTRODUCTION

In Uzbek linguistics, in the 30s and 80s of the last century, a lot of scientific research was conducted on the study of Uzbek dialects. These studies are one-sided and do not focus on the ethnolinguistic and linguocultural aspects of dialects. Scientists attribute this to the existing system of the time. The communist ideology was not interested in the study and research of the national history, customs, values, ethnography, national culture of the peoples. At this point, let us pay attention to the views of some linguists.

“There are objective and subjective reasons why professional speech in Uzbek linguistics is not studied in general linguistics. Subjective reason: in 20-30 years, as if to “improve” the Uzbek language - to put it in the form of a literary language, first of all, to clean it from dialect, religious, outdated words (archaism, historism), the struggle for “pure literary language” is characterized by the influence of vulgar sociological, purist ideas” [4,2].

Many scientists were not indifferent to this process at the time. For example, academician V.V Vinogradov assessed the processes of synthesis of social dialects (poludialekt, interdialekt - koyne) with the literary language, the role in the formation of oral and written forms of literary language. In particular, he stressed that professional lexicon in dialects, first of all, the

manifestation of folk speech (speech), ethnography, therefore, their study is an urgent issue [1,27].

The objective and subjective causes of the problem were also explained by other scholars in the 1970s. In particular, the achievements of Professor S. Ibragimov in the field of science and technology have radically changed the method of production, mechanization and improvement of many industries (textiles, blacksmithing, carpentry, ceramics, jewelry, handicrafts) based on handicrafts and simple production left over from the past. therefore, some professions (such as saddle, shoemaker, machinist) are facing a crisis. He stressed that the language tools used for them - professional vocabulary - are gradually being forgotten - are becoming a passive dialectal layer, and now it is urgent to study and preserve it [2,121]. Academician Sh. Shoabdurahmanov also praised the importance of dialect and the means considered as a passive, dialectal layer of speech in the development of literary language. He stressed the danger of losing them if they were not collected immediately [6,16].

“Unfortunately, our modern Uzbek literary language,” writes Bosim Tuychiev, “has bypassed many words related to animal husbandry, such as o'tov (pasture), qishlov (winter), yaylov (grass), keraga. Just as there is a great barrier between our modern literary language and our classical language, such barriers have been made very insignificant between the literary language and the vernacular, as well as the language of examples of folklore. As a result, our literary language has lost many of them” [5,68]. The author also mentions the modern Uzbek literary language in three sources: 1) **classical language**; 2) **the common language**; 3) It is also rightly stated that **folklore** should be based on the language of riddles, proverbs, sayings, fairy tales and epics.

Based on the views of scientists in the field, it is necessary to determine the differences between the living spoken language, dialect and ethnography in the territory of our country. Their study on a large scale, in the linguocultural aspect, is one of the long-standing issues facing linguists. In addition, for some reason, terms, words and phrases, proverbs, sayings related to changes in the times, socio-political factors, technical progress, etc., which are out of our speech today or forgotten, not even found in dictionaries, preserved only in the language of the elderly, proverbs, parables, riddles, weddings, mourning songs and sayings, writing, studying, creating dictionaries, in particular, the return of ethnocultural masterpieces to the owners of the treasury - the people.

For this reason, in recent years, our research, as well as dialectological practices organized by students in remote villages of the region, have paid special attention to the immediate collection of rare dialects (words and sayings) and ethnographies that are in danger of extinction in the coming years. Hundreds of dialectal and ethnographic materials were collected from the speech of the local population (mainly the speech of the elderly) during the research. For example like that words: *jarchi, qo'noq, ovul, sipoh, navkar, qozi, baharjurt, chillasuv, biy, paranji, o'mgan, oymaq, qalmoq, qo'ton, po'stak, janda, changak, chobag'an, suruv, biya, baytal, to'qol, to'biq, shishak, tuvcha, mulla, eshon, qushnach*. Many of these ethnocultural proverbs and sayings are specific to the speech of the people of the oasis and are not found in popular proverbs. At the same time, these proverbs and sayings are very ancient and reflect the ethnocultural way of life of the people of the region. This can be seen in the fact that most of the collected materials are related to animal husbandry, agriculture, hunting, harvesting, weaving,

ceremonies, kinship. Below, we focus on dialectal-ethnographic proverbs and sayings taken from the speech of the older generation living in different parts of Surkhandarya region.

Chillasichiroqko'rmaganning,

Sochitaroqko'rmas.

(If you do not see the forty days lamp,

Sochi does not see a comb) (Kokildor ota mahalla of Termez district).

(meaning: *stingy, stingy, jealous*) [3,8].

Jemiyman-jemiymandegankelin,

Jengsadayhasipjepti

(The bride, who said she would not eat, ate the sausage like a big shoulder)(meaning: *cunning*).

Qutli qunoq kelsa qo'y egiz tuvar,

Qutsiz qunoq kelsa qo'yga qashqir. ("Khojamqon" mahalla of Angor district). (When a blessed sheep comes, twins are born, and when a unblessed sheep comes, it feeds the wolf. Meaning: *luck doesn't always come. It is also a reference to people with good and bad intentions*) [3,10].

To'qolsiyir – suzog'ich,

Oqsaqbiyatepog'ich (meaning: *a flaw in every shed*).

To'qol (kalqiz)dingbaxtiochilsa, jordayboybichajorilibo'lar. (meaning: *envy, greed, jealousy*).

Kovrak, o'zingrovasan,

Mingbirdardgadovasan (Novshahar mahalla of Angor district).(meaning: *belief in the blessings of nature, devotion*) [3,24].

Qiyshiq-shiyshiqbo'sayamqiy (qo'yaxlati) shipiribkeladi,

Joman-jumanbo'sayamjoppa (tappi,tezak) teribkeladi (meaning: *contentment, sufficiency; bless you*).

Qudag'ayimqurovuz,

Jegannonibirovuz. (My mother-in-law 's mouth is dry, the bread he eats is a mouthful. Meaning: *in the sense of a woman who talks a lot and can't hold a sieve in her mouth*)

Qizkattarsaqozibo'lar,

Ketarigarozibo'lar. (meaning: *every job has a time*)

Mengaso'yilgankalulaq,

Sengayamso'yiladishu(l) ulaq. (meaning: *all are equal, the same person, the same fate*)

O'tinningyaxshisi – jontaq,

Xotinningyaxshisi – qalmoq (Alisher Navoi mahalla of Jarqurghon district) [3,39].

Ostidag'iolaboytaldioityorag'an. (axtargan) (meaning: *a careless man who does not climb on his heels when the world is flooded*).

Ovuloymag'ibilan,

Bo'tatoylag'ibilan.

Sipohtingboshiko'prikbo'sayam

Bosibo'tma. (Kumkurgan mahalla of Kumkurgan district), (meaning: *appreciation of sacred and holy things*) [3,40].

Tonimasangtog'angdi,

Jirtayinmajog'angdi?!(Will I tear your jaw because you don't know your uncle. Meaning: *self-awareness*).

Egachim yergatiydi,

Yeskisimengatiydi.

Chobag'an (chavandoz) otiniqaritmaydi,

Yoxshi yer (er) xotinini (Meaning: *a man who knows the eye of the work, a master, a resourceful, skillful man*).

Xotinio'lganqizliovulgaqarabjilar (The dead man cries towards the village where his daughters are. Meaning: *vital need, pointing to necessities*). (Rabot village of Boysun district) [3,48].

Joladaottanlama,

Hayitdaqiz (Don't choose a horse if you go on the road, don't choose a girl on holiday. Meaning: *a sign of not making a decision when the nerve is disturbed, or in a hurry*).

Omochtingqiynalg'anini,

Tirkishqayoqdanbilsin. (Let the hole know where the hammer is tormented. Meaning: *everyone knows what happened*) [3,52].

At the same time, a number of unique words and phrases related to animal husbandry are used in the dialects of the oasis. It should be noted that most of the following dialects and ethnographies related to the horse and its equipment are not found in the explanatory dictionary of the Uzbek language or are given a common name.

**Jerchil**– agile, a left-handed rider who quickly lifts off the ground and does not easily tear the kid off.

**Kurmov, ilmak, chiymoq**– rope tying methods.

**Nurmantog'a** – an eight-figure iron fixture made of metal that connects the rope to the horse point.

**Beldachiq**– a device that can be pulled at the horse's waist while tied. A small horse harness with a reed 20 to 40 cm long and sewn on a hard cloth.

**Qo'm** – the size of the belt.

**Jugan**– a device that is attached to the horse's head, to control the horse.

**Suvliq**– part of the jugan, a metal tool in the horse's mouth.

**Bostirma**- a horse's winter harness (protective clothing) sewn from a hard cloth over felt.

**Terilik** –a thin, wind-blown device that pulls from the bottom of the saddle and absorbs the skin when the horse sweats.

**Jahannik** – a bag-like device that is placed under the saddle, specially sewn from a hard cloth over the felt.

**Digdika** – a large ornate, embroidered horse harness that covers over all the harnesses of the horse.

**Otto`rba**– designed to feed, is a specially sewn device that fits almost the entire head of a horse, and is one of the devices that protects the horse from the cold when it is transported to the barn by car.

**Tonglay qi(l)moq** – If the horse is not fed on time, the reflex of feeding time formed in the horse is disturbed and damage to the palate occurs in the throat (this term is used in similar cases).

**Nohina**–(name of the disease) A horse that is overheated in the cold is left in a cold place, in the wind, in the rain, as well as as a result of the horse being left in the cold too much, the respiratory tract is damaged. If the disease is not prevented and treated in time, it can also lead to the death of the horse.

**Ballaqam** – a wild, “hard-skinned” horse that is not even affected by a whip.

## CONCLUSION

The results of extensive research of Surkhandarya dialects and ethnographies give the following conclusions:

1. It is necessary to master thousands of dialects and ethnographies, which are not included in the explanatory dictionary of the Uzbek language and still remain lacunae in the Uzbek literary language.
2. Dialects and ethnographies mainly reflect the way of life, customs and traditions, ethnographic traditions, religious ceremonies, values of the population living in a particular area. Therefore, it is expedient to study dialects and ethnographies from the linguocultural aspect.
3. Given that most of the dialectal-ethnographic materials are now preserved in remote areas, in the speech of the older generation, their immediate collection and creation of dictionaries allows for a more extensive study of the spoken language.
4. Scientific works, dictionaries created on the basis of the study of dialectal-ethnographic proverbs, sayings and sayings serve as an important program and guide for the growing field of ethnotourism in our country.

### ABSTRACT

*Since ancient times, the territory of Central Asia, particularly Uzbekistan, has become an abode for representatives of various nations and nationalities, which lived under the same sky and have become an integral part of our homeland. Among them should be noted the Jewish community. The article is devoted to analysis of views on the appearance of Jews in the Central Asia, formation, characteristics and social life of Jewish communities. Also are disclosed relationships of the Jews with local people (Persians, Tajiks, Uzbeks, and others.), customs, and rites, the similarities and differences in the costumes.*

**KEYWORDS:** Bukharan Jews, Central Asian Jews, Kosher, Assimilation, Wedding Ceremonies And Burials, Kalima, Nadzhama, Jazz, Rites "Yeti" (Seven), "O'ttiz" (Thirty), "Yil" (Anniversary).

### INTRODUCTION

Central Asia has long been one of the regions where people of various nationalities lived. It is known from history that here they lived a peaceful life, preserving their culture and traditions. Among them, in particular, in Uzbekistan and Tajikistan, the Jews of Bukhara, an ethno-confessional community that has its place in socio-cultural processes as part of the Jewish nation, are should be mentioned.

The issue of first Jewish settlements in Central Asia, development of local communities and their socio-cultural life has always been of big interest among historians. Most famous of them are M.Zand<sup>1</sup>, S.Gitlin<sup>2</sup>, Z.L.Amitin-Shapiro<sup>3</sup> (12: P. 124-127).

Despite the abovementioned fact, the question about exact time of first Jewish settlements in Central Asia remains open. Dozens of books dedicated to the issue are overfilled with contradicting information and hypotheses.

There is no exact information about the appearance of Jews in the Central Asia in sources. It is worthy to state that although many books were written and researches were carried out on this problem, all of them give contradictory information about it.

Baseless information was spread in last century that Jewish diaspora has been formed since “Captivity of Babylon”. In addition, it is scientifically baseless to compare Hever (mentioned in the book of the reign) with Bukhara by scholars of the medieval centuries, although the territory of modern Uzbekistan is not included into the territory of the reign of Babylon” (15: P. 93-94).

Every person who studies the history of Jews in the Central Asia and, at least, is interested in it, may have some questions like “When and from where Jews come to this region?”. It is necessary to state that some views that far from a scientific character are also observed when we try to find answers to this question from sources. For example, it may be given a supposition that Jews of Bukhara are considered as “indigene” – native people.

When we talk about Jews of the Central Asia and their role in the social-cultural life of the region, it is useful to emphasize a method of our research. It is advantageous to use a method of a transition from abstract to exactness in the study of the history of Jews in the region. Because, it is impossible to include all characters and shapes of a complicated, many-sided, differential and changeable subject in the study and explanation of it. In addition, some characters of this subject are not important or others are obstacle in the comprehension of it. That is why it is not necessary to take all of them into account. It is very important to distinguish all essential aspects in the correct comprehension of the subject of the research. It has more complicated and many-sided form in this abstract situation.

The second problem is a changeableness of the subject in its appearance and its mutual influence on the permanent change of results. In brief, we have to choose the true essence of the subject and to analyze it separately from other essences at the same time. Then we study it considering its other essences as well. A conclusion, obtained in a result of it, expresses a meaning and matter of the truth in the abstract case, which is free from various situations. Now, considering all shapes of appearance of the subject into account, we will have an opinion, which expresses a meaning and matter of the truth on the condition of accepting a concrete conclusion – all existed situations (26: P. 49-50).

It is advantageous to use the above-mentioned method for a subject of our research – Jewish communities of the Central Asia or Bukhara.

Analyzing all information, we found out that most historians incline that first Jews came to Central Asia 2 000 – 2 500 years ago. The reason of such vagueness is lack of sources giving information about that time. According to most scientists, the III-IV centuries are least studied ages of Central Asian history. Only sources regarding that time belong to Arab writers and mostly consist of history of ‘*arab futuhat*’ (conquests) of VII-VIII centuries. We can see little information about events of II-IV centuries in later sources (21: P. 749).

Historians agree that Central Asian Jewish communities came there from Israel (9: P. 39.). Their settlement in these lands are closely related with their exile from Israel after collapse of Israel

Kingdom in I century BC and destruction of The Temple in Jerusalem. In 586 BC, far earlier from destruction of the Temple in Jerusalem and Babylonian captivity first Jewish diasporas spread to Egypt and Mesopotamia, in the beginning of new era to eastern coasts of Mediterranean Sea, Persia and other lands (9: P. 39.). Life of Jews in Persia was complex. We can see many data in historical documents regarding discrimination of Jews there. Researchers parallel this with aggravation of political and especially religious conditions (9: P. 39.). After enthronement of Yazdegerd II (438-459) and his son Piruz (460-484) oppressions toward Jewish people strengthened. During the rule of Piruz we can even see the genocide of Jews. For instance, historical documents state that in 468 (in some sources 472) Piruz killed half of Jewish population in Isfahan accusing them of killing two Zoroastrian *mobads* (priests). Another example of Piruz's severe attitude towards Jews was killing the leader of Babylonian Jewish community Hun Marin (18: P. 65-67.).

Intransigent policy of Yazdegerd II and Piruz towards Jews resulted mass migration of Jewish people from Persian kingdom. Migrated people settled in Byzantium, Crimea, India and China, where Zoroastrianism did not have much influence.

Most researchers agree in the point that Jews migrated and settled in Central Asia during the rule of Ahamanide dynasty (after 559 BC) (9: P. 39.). As a proof they cite book of Esther from Old Testament, written in 78-77 BC, where it is said "...jews spread in all territories of Persia" (19: P. 6). First reliable information on the settlement of Jews in Central Asia shows that Jewish people emerged in Balkh, Merv and Khorezm in VIII-IX centuries AC. In contrary to this, according to M.Zand immigration of Jews to Central Asia falls on IV century (25: P. 531-533). To prove this he adduces Babylonian Talmud, where it is written that member Babylonian Amoraim (Institute for Jewish legislature) Samuel Bar Biseni (Pumbedata<sup>4</sup>) travelled to Merv. Visiting his brothers in faith abstains from drinking wine. Stressing on this fact, M.Zand says that Jews, after several centuries' life in Merv, have forgotten religious rituals of preparing the wine. That is why Samuel did not drink their wine (25: P. 531-533).

All researchers, including M.Zand, attribute the migration of Jews to Central Asia with their silk trade activity through The Great Silk road (25: P. 531-533). But, it would be unreasonable to link this only with Silk Road. It is known that repressions of Jews by the Romans during the rule of Marcus Aurelius, forced the Jewish people to migrate to other lands, including Central Asia (19: P. 8).

According to Jacob Neusner<sup>5</sup>, in first centuries AC Jews played important role in socio-economic life of Parthian Empire. Most of them were engaged in Roman-Chinese trade (17: P. 910).

In the beginning of new era Dura-Europos became a big Jewish center<sup>6</sup>. Archeological excavations detected there remainings of ancient synagogue (19: P. 9). Dura-Europos bordered with Khadra (arabic – al-khadhr)<sup>7</sup>, Khamadan, Parthia, Marghiyana and Baktria. E.Rtveladze, a famous scholar on history and traditions of Central Asian Jews states that Jews migrated to Central Asia from these territories (19: P. 9).

Undoubtedly, it was Merv where most Jews of Central Asia lived. During the archeological excavations in 1954-1956 were found ossuaries with rectangular Hebrew inscriptions on it dating VI-VII centuries. Later information about those findings was published by A.Kelvan (13: P. 91-92).

According to E.Rtveladze, jews later spread from Merv to Baktriya, Tokharistan, Soghd and Khorezm. The main reason of it, he states, was policy of Babylonian Jew academy, starting from 6<sup>th</sup> century, towards spreading Judaism across South Iran, Khorasan and other neighbouring territories (19: P. 9).

Some researchers stress that Jews lived in Balkh till 709, when the city was conquered by Arabs. According to such sources as “Fadhail al-Balkh” and “Bakhr al-asrar” one of the gates of Balkh was called “Yahudiyyah” (Jewish), also in the outskirts of Balkh there was residential area called “Yehudanak” (Little home of Jews) (25: P. 531-533.).

Historical sources evidence that in the Juzhjan province, north-west of Balkh, there was a town called Yahudiyyah. In the period between 988-1031 it was renamed as Maymanah. This fact corroborates that the town was founded by Jews or was reconstructed by them in early medievals. Furthermore, many graveyards of Jews with gravestones with written epitaphs in Persian and jewish language were found in Herat and other cities of Afghanistan (10: P. 335-342).

It is difficult to find written sources about life of Jews in Bukhara and Samarkand in early medieval. Famous historian Narshakhi in his “History of Bukhara” quoting from Nishapuris “Khazain al-ulum” (Treasury of sciences) states that territory of Bukhara was covered with riparian forests and only in 6<sup>th</sup> century after settlement of people from other territories of Central Asia it became a city. Researcher P.Is’hakov relies on these sources and in his “History of Bukhara-Jewish ethnos” supposes that since Bukhara city did not exist until the end of 6<sup>th</sup> century, then till that time there lived neither jews nor other nations (9: P. 43.).

E.Rtveladze in his article “Jews in pre-Islamic Central Asia” quotes a narration from Nasafi’s “Kandiyyah”. According to this, before the Arab conquest there was a well called Juyi Arziz, and this well was dug up by Jewish man (19: P. 9). Another orientalist O.N.Logofet suggests that Jews came to Central Asia, particularly to Bukhara together with Arab conquerors.

Sources witness that settlement of Jews to Khorezm was much earlier from arab futuhāt (conquests). In the historical treatise called “Shakhrestani- Iranshakhr” written in Pakhlavi language it is said that the founder of Kat, the capital of ancient Khorezm Narse (Narshakh) was a son of a Jew (25: P. 531). According to the myth given in medieval historical sources, another city of ancient Khorezm – Khiva was founded by Sam, the son of prophet Noah. Of course those myths may seem far from reality. But there may be a part of the truth. Because, Tabari in his famous “Tarikh” (History) states that before the conquest of Kat by arabs in 712, among advisers of the Kharezmshakh were people called akhbars (27). It is known that the term akhbar was used by arabs for representatives of other religions, especially Jewish priests (rabbis). Later, through Soghd, Chach and Ferghana Jews reached Eastern Turkistan. An ancient document of Jewish merchants dating 8<sup>th</sup> century AC, found in Dandan-Uylak<sup>8</sup> is written in jewish-persian language using abramic scripts. This evidences that those merchants who wrote this document were from Central Asia or Iran (27).

The information given above shows that there are many hypotheses about migration and settlement of Jews in the lands of Central Asia, and all of them pretend to be truth. It is known that some associate emergence of Jews in this region with biblical traditions. But we must not forget that there is difference between emergence, spreading and settlement. We cannot ignore that individual Jews existed in Soghd from ancient times. But this fact is not supported by

historical sources. For instance, near the Onega Lake was found a graveyard dating the Neolithic Period. Among hundreds of skeletons was found skeleton of a human from Negroid race. However, despite this well-known fact, no one from researchers said that Negroids were widely spread in Northern Europe in Neolithic Period (6: P. 3).

Most researchers are sure in one point – Jews came to Central Asia through Afghanistan and other frontiers of the region. It is considered as undoubted reality. Cultural monuments of the region show that direct relations between Jews and people of Iran and Central Asia have at least four thousand year history.

It is important to stress that migration and settlement of Jews in Central Asia did not occur at the same time, but it was slow process, which lasted for hundred years, stage by stage.

The delta of Amudarya River is considered as historical and geographic center of Central Asia. Nowadays, much part of this region goes to the territory of modern Uzbekistan. Other smaller parts of it go to modern Turkmenistan, Kazakhstan (Chimkent region), Kirgizstan (Osh, Jalalabad), Tajikistan (Khojand, Khisar and head of Amudarya) and Afghanistan (left Coast of Amudarya River). Central regions of Central Asia are much fertile. Nearly all ancient cities of sub region as Samarkand, Merv, Bukhara, Khiva and little independent states are situated in this region (14: P. 24-25).

Jews massively settled in Central Asia coming from Afghanistan, Iran and even Iraq. But, historians do not rule out the possibility of individual settlement of Jews in Bukhara in earlier periods. Relying on M.Zand we can conclude that migration and settlement of Jews to the region is closely associated with The Great Silk Road, which was founded in early 1<sup>st</sup> century AC (9: P. 45). Besides, according to Chinese Jews their coreligionists came to China in first century during the rule of Han dynasty. At this period there was a road linking Manchjuriya, Eastern Turkestan with Central Asia. Historians believe that migration of Jews to China was via this road (11: P. 5-7).

After the Jews settled in the region, for years, a separate diaspora has formed as a community of Bukharan Jews. Science questions such as, "Was Jews from Iraq, Afghanistan and other regions considered as 'Bukharan Jews' from the beginning?" or "Did it form under the influence of other cultures over time?" This can be answered only by examining Jewish history in the region and their social life. In fact, the Jewish community in this region was not formed in a single shell (vacuum). On the contrary, in the Central Asian region, their formation as a sub-ethnic community can be seen in Jewish migrations which happened many times and at different times as well as in the situation of the ethnically complex population of the region.

It should be noted that the relations between different peoples leave a certain mark on them: most of them are assimilated and some of them "die" as a result of their full acceptance of the language and culture of the majority. It is worth noting the following words of archaeologist G.Ya.Dresvyanskaya: "Historically, migration of various peoples to Central Asia was related to the name of Amir Temur. Among them were Persian Jews who, in the 14th century, had almost forgotten their native language. For centuries, they have become ethnicized as a result of being far from their historical cultural centers" (4: P. 22). It is noteworthy that the Russian, Chinese, European prisoners of war or other emigrating people associated with the Amir Temur epoch retained their identity only in the names of their places. For example: Uruskishlak, Khitay,

Baghdad, Damascus and so on. In contrast, the Jews still hold the name “Bukharian” in relation to the region where they still live (9: P. 95).

Central Asian Jews can entirely be seen as a section that preserved their unity and cohesion. It is true that here was a struggle to survive. At the same time, people of majority were also influenced by the people around them (9: P. 95).

Jews lived as a particular category of civilized society in Central Asia. In this layer, the temporal transformations took place and had an impact on the formation of ethnic groups. However, for all the people united under the name of the Turks, the common features of dress, house design and mentality were common to all. The material culture, customs and folk art of the people of this country were inseparable. The ancient, often medieval history of these people, including the Central Asian Jews is close and in many cases the same. The main reason is that their development emerged in one region.

Central Asian Jews have adopted many features of the local population (Persian, Tajik, Uzbek, etc.) and to a lesser extent they still retain them as their subcultures. The changes in the Jewish life occurred mainly in their lives, which reflected a major part of human life. It is well-known that this can be seen in everyday affairs, lifestyle, character similarities, customs and values, as a result of interethnic relationships (9: P. 95).

The life lasted centuries based on community neighborliness have led to the interplay of culture, language, everyday life and economy. As a result, the characteristics of the Tajiks and Uzbeks in dress, food, home arrangements, customs, music and everyday life were also reflected in the lives of Central Asian Jews. This is especially true in the tradition of cooking, serving meals and welcoming guests. It is worth noting that since many Central Asian Jews follow Kosher (foods that may be consumed according to Halakha law) there are certain characteristics in cooking and serving. In particular, milk and meat products are not served at the same time. Sabbath observance is also reflected in the preparation of dishes in advance (8: P. 172).

Speaking of the clothing of Central Asian Jews, traveler Franz von Schwartz wrote in the 19th century that: “...the situation had reached the point where Jews preferred to dress like Uzbeks and Tajiks” (7: P. 87). For example, suits, especially men's outerwear, were practically the same as those of Uzbeks. Their national elements were mainly shirts, belts, hats and skullcaps. It can be said that skullcaps differed in shape, color and pattern, depending on the particular ethnic group. Also, some details in clothes depended on social status. Male Jewish shoes were identical to those of Muslims. Their boots with flat heels were made from leather (20: P. 344; 1: P. 40). Scientists are currently conducting a number of studies in this area. In particular, it is worth mentioning T.G.Yemelyanenko, a leading researcher of the Russian Ethnography Museum, Department “Ethnography of the peoples of the Caucasus, Central Asia and Kazakhstan”. In her monograph titled “Traditional suit of Bukharian Jews”, she discusses the clothing of Bukharian Jews. In his opinion, the clothes of Bukharan Jews who lived among Muslims were similar, but insisted that they had some uniqueness (23: P. 3-45).

Along with the above mentioned facts, it can be seen that assimilation processes were also reflected in other areas of Central Asian Jewish life. For instance, the Jews accepted some characteristics of Muslims in their marriage ceremonies. Examples of this situation include marriage registration, couples' meeting, their relationship till the marriage, marriage contract and so on (9: P. 96). Z.Amitin-Shapiro notes: “Looking at the material aspects of the marriage

process in Central Asian Jews, it was not different from other Central Asian nations. For example, kalima (money given the bride's family), najama (bridal gifts), and jazi (father's gifts such as home appliances, clothes, jewelry for his daughter) were the same (1: 45; 2: 40).

This is also reflected in the selection of bride. According to this, only the female relatives of the bridegroom were allowed to see the girl. The bride and groom had not met each other until the marriage was announced. All issues were agreed by the old as in local families. The bride and groom could see each other during the marriage ceremony. As is customary in the local tradition (mainly in Samarkand and Bukhara), the bridegroom stayed in the bride's house on the first night of marriage and the second day he solemnly took the bride away from her parents' house in the cab (9: P. 96).

In another case, a Jewish woman did not call her husband by his name, as in local families. This was considered a violation of the dignity of the man. The woman usually addressed to her spouse saying the words which mean "father of my children" and then called him with the name of their first child (3: P. 31-37).

Another tradition that has been preserved for centuries is related to the death ceremonials. After the funeral, relatives of the deceased had to organize "seven", "thirty" and "year" ceremonies to commemorate the dead. Semen Gitlin says on this issue: "Rituals like the "seven" or "thirty" are not mentioned in the Torah or the Talmud. So in this case, these ceremonies might be adopted from Muslim traditions" (9: P. 97). However, it is surprising that by which source the scholar expressed this view. Because, there are references of such ceremonies in the Jewish legislation (Halakha) and it is remarked that these dates are based on the sacred sources of Judaism. For example, the mourning on the seventh day is found in the book of Genesis of The Torah, chapter 50, paragraph 10, which states: "Joseph mourned for his father seven days". This is why Jewish religious scholars have accepted the first week of mourning when one's loved dies. In addition, the ceremonies of the "year" (Yahrzeit) and laying stones on the tomb have also been found in the Jews and this has also become customary to the local Muslims and still exists today (22: P. 264-275).

**Conclusions:** From the above, we can conclude that the study of history of Jews in Central Asia is based on written sources, archeological and ethnographic researches. Summarizing results of these studies and researches, it will be appropriate to date the first emergence of Jews in Central Asia as 1500 - 2000 years BC.

Also, since Central Asian Jews have been living among the different nations in the same territory for centuries, they have evolved in similarity in many ways. At the same time, there was a danger that Central Asian Jews would be completely assimilated. Only time would tell if one of the ancient networks of the Jewish nation will disappear or be retained on the ethnic map of the world. The words of Joseph Maimon to E.K. Meiendorf, a Russian diplomat who visited Bukhara in the late eighteenth century, make this conclusion: "I saw my fellow believers in the depths of ignorance. Only some of them knew reading. They have only two copies of The Holy Book, with only the first three books of the Torah manuscript" (16: P. 95). Commenting on these words, R.Rabic concludes: "Taking into account the low religious knowledge of the Bukharan Jews, they can be barely regarded as Jewish. If two or three generations lived like this, the Jewish community would have been united with the Muslim population" (24: P. 94). However, it did not happen.

## CONCLUSION

Some scholars have concluded that the dominance of Islam in the region has led to the adaptation of Central Asian Jews to Muslim culture and the acceptance of some of the Muslim rituals. However, it would be a mistake on the other hand to define this state only with the hegemony of religion. Because, it is important to remember that these nations have lived side by side for centuries. As we have seen in the aforementioned examples, not only did the Jews accept the Muslim traditions, but also Muslims adopted the traditions of the Jews. It is not an exaggeration to say that Jews, with their national character, history, and lifestyle, have become integral parts of the lives of other Central Asian people, like Tajiks and Uzbeks. The rituals of daily life have united this nation of different race, culture, language for many years. Scholar Dresvyanskaya said: "The Jews of Bukhara had close ties to many people in the process of adaptation in Persia and later in Central Asia. During this time, they learned some aspects of the life, customs and ceremonies of the native peoples. However, they maintained their ethnic identity first of all because of Judaism" (5: P. 3). Consequently, it was the religion that served to preserve Jewish nationality. It is because Judaism has ethnical and confessional character. According to the traditional view, the conversion of a Jew to a different religion is equivalent to the conversion to another nation. The Jewish theologian Lewis Jacoby describes this concept as follows: "The history of Judaism and Judaism itself is so intertwined that it is impossible to imagine them apart. Godless Judaism is not Judaism. Judaism without the Torah is not Judaism. Judaism without the Jews is not Judaism".

## SYMBOLIC LANGUAGE OF NUMBERS IN MUSLIM ARCHITECTURE

**Matluba Sadullaeva Akhrorovna\***

UZBEKISTAN

Email id: matlyuba2002@yahoo.com

### ABSTRACT

*Numerology is a way to assess the real prospects for the development of various events and factors in your life. What events have numerical codes and rhythms? Well, almost in all. This paper interprets the symbolic significance of numbers in Islamic culture, especially in Islamic architecture using examples of architectural monuments and historical objects. The patterns' shapes and existence are analyzed according to the Islamic belief and Quran interpretation. Abjad- the alphabetical science of numbers has been used to elucidate some data related to numerology. This science concerns itself not only with the numerological aspect of letters but also with the study of the shapes of letters and their cosmological significance. The true essence of numbers have been revealed in the means of architecture. According to the great thinkers such as Seyyed Hussein Naser the origin of Islamic art is in the esoteric dimension of Islam. The results also suggested that Symbolism is a factor which transfers the meanings of upper-world to the material-world.*

**KEYWORDS:** Muslim Architecture, Pythagoras, Abjad Numbers, Numerology, Alhambra, Mihrab.

### INTRODUCTION

Numerology uses numeric symbols and geometric shapes as the “main toolkit” to search for patterns. However, numerology is not mathematics - they have different methods of “miscalculating” rhythmically repeated life phenomena: numbers in mathematics are used to calculate quantitative or volume indicators, and numerology uses numbers as a philosophical and statistical criterion. Numbers in numerology usually symbolize the different properties of phenomena and objects and have a philosophical (qualitative, not quantitative, as in mathematicians) interpretation.

Persians, Sumerians, Egyptians, Japanese, Chinese, Hindi, Greek, Christians, Buddhists, Muslims, Hebrew, and many other ancient nations and religions have had symbolic behavior with numbers. The symbol is simply defined as mysterious substitute of a concept or image perceived unconsciously. Jan Shuvalieh, the mythologists, has extensively discussed about the meaning of symbol. He thinks that symbol is more than one simple sign. Symbol is beyond the meaning and has its own particular interpretation which it requires sort of talent. The symbol is full of effectiveness and dynamism. Numbers have had different symbolic meaning in different nations. However, all of them include metaphysical, mental, abstract, and mysterious concepts. The numbers of zero, one, two, three, five, seven, nine, twelve, thirteen, forty, seventy, hundred, and one thousand have always had various degrees of validity and particular symbolic load among various nations. The science of number governs nature. Numbers themselves are the first effusion of soul on ego and it is the basis of creatures and source of all sciences. Each number has inside value that distinguishes it with other numbers. This inner value is embodiment of unity links the number continuously to its source[10, 2014: 3].

Muslim architecture is the most amazing and visible art form related to the culture of Islam. It includes not only religious, but also secular buildings and structures. The main religious building in Islam is a mosque. The mosque in Arabic means a place of worship. Over time, such types of Muslim architecture developed as a madrasah (educational institution), khanaka (Sufi monastery), zawiya (cell), mausoleum, maristan (military hospital). In accordance with Muslim ideas about the world, the principle of “hidden architecture” was developed in Islamic architecture: the dull facades that hide variously decorated rooms open to the courtyard with a fountain and reservoir with blooming greenery.[1, 1990: 190]

The creations of Muslim architects occupy no less honorable place in the history of world architecture than the celebrated achievements of architects of Christian Europe or Buddhist Asia. Muslim religious buildings, caravanserais, covered markets, public baths, gardens and parks, palaces, castles, and citadels, founded in the Middle Ages, invariably admire the high level of amenities, simplicity, and ease of layout, ingenious engineering solutions. Muslim architects have developed flexible layout schemes and universal construction methods applicable to the construction of both powerful fortresses and light palace pavilions. Excellent mathematicians invented ways to transform elementary geometric shapes (square, triangle, circle) into complex architectural structures and jewelry is woven ornaments, using simple and cheap clay, brick, natural stone, knock or gypsum, concrete. Artfully combining carving, polishing, painting, mosaic, they turned wood, marble, glass, glazed ceramics into precious finishing materials. Guided by the principles of geometric correspondence and harmony of numbers, similarity, and symmetry, they created unusually effective compositions from combinations of simple elements [2, 2012].

Mystical and cosmological symbolism, whether found in literature, art, or architecture, created a context for understanding and attuning oneself to the spiritual world. As the example of Muslim architecture the Alhambra palace in Spain is taken as an example. It is often cited by art historians as an example of Islamic architectural symbolism because of the cosmological references evident in the ceiling of the Hall of the Ambassadors. It has been very credibly demonstrated that this ceiling depicts the cosmological hierarchy of the Throne of Allah set

above the seven heavens of the created world [6, 2004]. The impact of the room's proportions, lighting and surface detail allow one to viscerally experience the message illustrated in the vaulted ceiling. One feels at once dwarfed, awed and protected under this walled heavenly dome. It is easy to imagine divine authority acting through the sultan whose throne once sat under this representation of the cosmic hierarchy[5, 67:3].

A good deal of debate has taken place concerning the symbolism of this and other structures at the Alhambra. Yet the treasure trove of mystical symbolism and allusion hidden throughout these palaces has scarcely been tapped. The symbolic language must be known before the communication can be understood. One of the symbolic languages of the Sufis is a form of numerology generally called Abjad in the Islamic world. Each letter of the alphabet is assigned a number, allowing words to have specific numerical assignments through the addition of their letter-numbers. In this manner, words and concepts with the same number totals can be identified with each other. The fundamentals of this system, far from being esoteric, are to be found in any Arabic dictionary or grammar book [7, 1994:245].

Before continuing the idea about the symbolic essence of numbers in Islamic world, let's look back to the history of numbers.

Pales believed that water is the basis of everything, and Pythagoras thought- it was a number, so the basis of the Pythagorean teaching is the science of numbers, in which they correspond not only with geometric figures, but with all things existing in the world. Here is how he formulates these relationships in his notes: "The beginning of everything is one; the unit as the cause is subject as an indefinite duality substance; numbers come from a unit and an indefinite double; from numbers - points; from points - lines; of them are flat figures; from flat - volumetric figures; of them are sensory-perceived bodies, in which there are four foundations - fire, water, earth and air; moving and turning as a whole, they give rise to the world - animate, intelligent, spherical, in the middle of which is the earth; and the earth is also spherical and populated on all sides. " All things are similar to number - so Pythagoras said. For example, a unit, two, three and four in geometric interpretation correspond to a point, line, square and cube. The sum of these numbers gives the number ten, which the Pythagoreans revered as the ideal number expressing the Divine essence... Each number for Pythagoras denoted opposites, on the harmonious relationship of which the ordered Cosmos is held: 1 (limit — unlimited), 2 (odd-even), 3 (single — many), 4 (right-left), 5 (male-female), 6 (piece — movement), 7 (straight — crooked), 8 (light — darkness), 9 (good-evil), 10 (square — rectangle) [3, 2018].

The Islamic world was heir to the alphabetical numerology already used for centuries throughout the Near East. In this system, each letter of the alphabet also represents a number. A system of alphabetical numbering of things was the common practice in Arabia prior to the introduction of Indian numerals. We now call them Arabic numerals, but they were not commonly used in Arabia prior to the 9th century. Alphabetical numbers were used instead. Arabs were raised reading letters as numbers and would, as a matter of course, see words simultaneously as a collection of numbers. Numbers had to be colored or overlined to distinguish them from words. Given these facts, it is easy to imagine the development of a sophisticated usage of alphabetical numerology in Arabic [4, 2018].

Aesthetic use of numerology in a prayer rug from the late 19<sup>th</sup> or early 20<sup>th</sup> century can be another example to the article. Textile experts were curious about the asymmetry evident in the *mihrab* design. While studying the piece Dr. Haydar made the following discoveries. The asymmetry results from eleven leaves or palm fronds of different colors that form the arch of the *mihrab* in the rug.

The borders are particularly interesting. The border of the inner field is a line of sixty-six identical flowers broken by one anomalous sprout. Sixty-six, as you may recall, is the abjad number of Allah. The single sprout would seem to represent the principle of unity. At the spot where the worshipper's head touches the rug during prostration, a sentence has been stitched. The sentence is the liturgical '*subhana rabbi al-'ala*', "Praise to my Lord, most Sublime." The cartouche surrounding this phrase is made up of 130 tiny flowers. This is the abjad number for the word *qul*, the command to 'say.' Now if we gather together the several meanings already discovered, we find the reference to the *Surah al-Ikhlās*, the Surah of Sincerity or Unity which is often called by its first line, *QulHuwaLlahuAhad*, "Say that Allah is One." All of these words have numerological symbols within the *mihrab* field upon which the worshipper stands, bows, and prostrates.

There are quite a few more abjad meanings in the prayer rug which together with the ones I've already mentioned in the field, convince me that these were conscious choices made by the rug designer. The two perimeter borders contain a total of 329 identical small flowers. You may recall that this is the abjad for both *ar-Rahman* and *as-Sabur*. Within these borders is a wider band that holds fan-shaped flowers. There are three of the same floral shapes at the top of the rug. Together these total 44 which is the abjad number for *al-Ahad*, the One [6, 2004].

This is the applications of the octagon based on eight pointed patterns in architecture. “And the angels will be on its sides, and eight will, that Day, bear the throne of thy Lord above them”[8, 69:17].

Wooden panel at a Minbar  
at a book art (Quran)

Wooden panel on a door

Two frontispieces

Applications of a five-to-tenfold pattern based on the golden mean proportion.

The *IkhwanAl-Safa*(the Brothers of Purity) stressed the important symbolism of number six, regarding number 6 as a perfect number. The number 6 consists of 1 2 3; at the same time also  $1+2+3$ . Any number with this quality is considered a perfect number. Also, it was on the sixth day of the Creation that God created man. There are six directions of space as well. The six-sided hexagon is therefore a symbol of the universal man [4, 2018].

## CONCLUSION

These are the mere examples of sacred numerology in Islamic world. Numbers are one of the cores of human being. Every single thing in life even, a drop of water includes numbers in itself. There is a proportion in life, everywhere which contains numbers as well. The mysticism of numbers, in my belief, lies in the root of Islam, in recognition of Allah and His Prophets, Books and Religion. Like number 1 represents the uniqueness of Allah, the rest numbers symbolizes other beliefs either.

The number in its Pythagorean sense to highlight certain forms of visible world and the forms through the essence disposed within the integrated unity [12, 2013: 1]. Seyyed Hossein Nasr says

that the source of Islamic art is the inner dimensions of Islam religion. The source of Islamic art should be sought in the inner facts of Quran that is the main facts of world and divine revelation. To design the spaces Islam-rich concepts should be extracted from Quran and present them in the architecture form. With gradual introduction of the concepts to field of architecture, special form of architecture was shaped that was known as Islamic architecture. These concepts were gradually developed in the Islamic architecture and they enriched this type of architecture and by increasing the culture level of people and perspective of Muslims and increasing the progress and understanding of Muslims from religion, Islamic architecture has been developed toward meaning –oriented course [11, 2013: 9]. Formation of symbols is not a conscious process, but it is produces and emitted by revelation or intuition from unconscious heart. Symbols have a special importance and a special place in human life, and they have been used in different ways and different interpretations since old days till now [13 2013: 16].

## THE USING MODELS OF 去[QÙ]AND EQUIVALENTS IN UZBEK LANGUAGE

**Mukhamedjanova Shahbora Kamolovna\***

\*PhD Student,  
Faculty of Chinese Studies,  
Tashkent State University of Oriental Studies,  
UZBEKISTAN

### ABSTRACT

*The verb plays a major role in any grammar. The verb is the name of the action. Therefore, it is more difficult to describe the verb semantics. Verbs are categorized according to the direction of the interrelated meaning and the presence of objects and objects to which they relate. Chinese language researchers distinguish movement verbs within a group of action verbs. Movement verbs are polyphonic in nature and form joint (complex) verbs together with other verbs in the sentence as an independent verb, as well as in the function of auxiliary verbs. Such complex verbs can be used not only as independent verbs, but also to combine with other verbs to express direction. All Chinese researchers include verbs 来(to come) and 去(to depart) in the direction verbs group. In their view, these are basic verbs of action, as they form joint verbs with the meaning of direction. In this article, we present the leading and moving meanings of the verb 去 [qù] in the main action verb, as well as the orientation of this verb in Lyu Shusyang's book 现代汉语八百词. 吕叔湘 (800 Chinese words) models and their analysis.*

**KEYWORDS:** Action Verb, Joint Verb, Complex Verb, Modifier, Simple Modifier, Complex Modifier, Predicate, Additional Grammatical Meaning, Leading Meaning, Portable Meaning, Meaning Of Direction, Movement Towards Orientation.

### INTRODUCTION

As it is known, there is a lexical-semantic group of action verbs in all languages. Also, the meaning and function of the verbs are very versatile. An example of this can be seen in Chinese grammar. In Chinese, verbs can serve not only as a predetermined function, but also to have

additional grammatical meanings, that is to say, an auxiliary verb function. Also, verbs that do not have action meanings refer to the action verbs in the auxiliary verb.

(想出来 [xiǎng chū lái] to think, to find out) this can represent the meaning of results. In the Uzbek language, auxiliary verbs come with a leading verb, which also adds additional meaning. In addition, this additional meaning may indicate the direction, speed, duration, and so on.

## THE MAIN PART

In Chinese and Uzbek, the direction from the direction of action is expressed by the verb 去 [qù], that is, the direction of departure, to depart. The verb to depart in Uzbek means direction of action. Also, the use of the verb 'to go' in verbs of action that have directional meanings (to go, to come out, to get out, to fall, to pass, to turn). In this article, the verb of 去 [qù] is translated as "to go".

In Chinese and Uzbek, the verbs of 去 [qù] "to go", "to depart" differ from those of verbs, which form a group of directional verbs.

To leave the verb in the Uzbek language, the verb means "to move away from", and "to move away from it" (O'TIL, 2008: 2- j. 359-360). To find out the meanings of the verbs with the highest frequency of usage, we will look at the "Explanatory Dictionary of the Uzbek Language". It contains six behavioral meanings of the verb to go: a) move away from the speaker or observer's location, move away, move to the destination; b) to reach a destination; v) to drive across the vehicle; g) to be somewhere; d) to move in one direction, move forward; e) to go on, to attend (O'TIL, 2006; 1- j. 316-317).

By examining the similarities and differences in the meanings of 去 [qù] and the verbs of departure, we seek to determine the Uzbek equivalents of 去 [qù]

As we have said, the direction of the action is taken by the subject in the sentence (the direction in which the action is directed is not clearly defined, so the position of the speaker is taken as the place of the speaker or some other place [2]), As well as the object (the location of the sentence is clearly specified and serves as the reference point for the action to be performed "). Based on this, we analyze the following:

### 1- case.

The movement direction is represented by the object (which contains the action direction in the sentence) and the spoken position as an external observer. In this case, the move toward the semantics of the Chinese verbs 去 [qù] means "to go" in Uzbek verbs, for example:

常常雨过三天了，地上已经干燥，那石凹里水儿还有，鸡儿便去那里渴饮 [Chángcháng yǔguò sān tiānle, dìshàng yǐjīng gānzào, nà shí āo lǐ shuǐ er hái yǒu, jī er biàn qù nàlǐ kě yǐn] [4].

*It has been three days since heavy rains, the ground is already dry, but there is still water on the pavement and the chickens are going to drink it.*

In the example given, the direction of the movement is clearly indicated on the roof of the object, that is, 那里 [nàlǐ] (there, in front of the stone).

**2- case.**

The direction of the movement is determined by the subject (the direction of the speech is not specified; the position of the speaker corresponds to the orientation). In this case, the speaker becomes a participant of the situation, not an external observer, for example:

唉！对了，刚才爸爸又给你买来巧克力，你快去，要不都叫妈妈吃了[Āi! Duìle, gāngcái bàba yòu gěi nǐ mǎi lái qiǎokèlì, nǐ kuài qù, yào bù dōu jiào māma chīle] [5]. *Yes! In fact, your dad has just bought you some chocolate, and you can go soon, or your mother will eat it.*

In the example given, the direction of the action is determined by the subjective “I”. In this case the movement is directed from the direction, ie from the speaker's position.

**3- case.** The direction of action is set by the subject (not specified in the direction of the action), in which case the speaker becomes the action rather than the external observer, for example:

我三天去了[Wǒ sān tiān qùle]. *It's been three days since I left (literally: It's been three days since I left).*

In the aforementioned situations, the Chinese verb 去 [qù] and the verbs of “to go” and “to depart” in the Uzbek language have similar directions. Based on the results of the analysis, it is possible to say that in both languages, the behavior of the speaker (speaker - external observer, speaker - participant in the movement condition) and different features of the action orientation influence the semantics of the verb.

As can be seen from the examples, in case 1, the speaker of the situation, where the action orientation in the sentence is expressed by a specific object, the 去 [qù] and the semantics of the verb “to go”, correspond to the orientation.

**2- case.** The speaker becomes a participant in the movement condition, where the position corresponds to the direction of the movement, the direction of the movement determined by the subject (the speaker). In this case, both 去 [qù] and the verb of “to go” represent the direction from the verbs' direction (from where the speaker is) and are semantically interconnected.

**3- case.** The speaker is also a participant in the speech situation, but differs from the case in the case of the speaker. In this case, the verb that is conjugated also has similar meanings. That is, both verbs 去 [qù] and the verb of “to go” indicate the direction from the starting point of the movement. In turn, this starting point serves as an action orientation.

**Parabolical meaning.** Apart from the action of the Chinese verb 去 [qù], it also has parabolical meanings in terms of time. The verb of 去 [qù] has the meaning of “to pass” (term, moment), instead of the verb in Uzbek, it is appropriate to use the word “to pass”. After all, in Uzbek, verbs of action that have directional meanings (to go, to come, to come out, to go down, to pass, to turn, to swing).

大势已去[Dàshìyǐqù] [6]. *The severe crisis (critical situation) is behind (passed).*

去冬今春[Qù dōng jīnchūn]. *Winter passed, and spring arrived.*

This means that there are cases when the verb 去 [qù] can be translated into Uzbek not only with the verb to go, but also with another verb.

The verb 去 [qù] does not have the same meaning in Uzbek as “to go”, “to leave”, “to return”.

去东北上北京来 [Qù dōngběi shàng běijīng lái].

*To go (to leave) from Dunbey to Beijing.*

他的父亲去世了 [Tā de fùqīn qùshìle]

His father died (passed away) (literally: his father left the world).

去路不好走 [Qùlù bù hǎo zǒu]. *Walking way is not easy.*

The figurative meaning of the verb 去 [qù] “to fall”, “to spill” is not expressed in the Uzbek verb “to go”. For example:

此老人已八十多岁，齿发已去 [Cǐ lǎorén yǐ bāshí duō suì, chǐ fā yǐ qù]. *The old man is over 80 and has already lost his teeth and hair.*

The 去 [qù] verb “to play” or “to perform” does not mean to go in Uzbek. For example:

梅兰芳去白娘子 [Méi lán fāng qù bái niángzǐ].

*Mae Lan-Fan plays the role of maid (... in the role).*

The meanings of the verbs in 去 [qù] also have the meaning of utility.

For example, the words “to send off” in 去 [qù], “to send on a business trip”, or “to send” something are also used in Uzbek with other verbs:

给他去信 [Gěi tā qù xìn] [7] *To send him a letter.*

This example is more specific to oral speech. The reason is that the meaning of sending a letter is mainly expressed by the verb 寄 [jì].

去 [qù] verb “to throw”, “to throw away”, “to clean”; The meanings for “to clean” are expressed in the following verbs in Uzbek:

这句话，去了几个字，就更明显了 [Zhè jù huà, qùle jǐ gè zì, jiù gèng míngxiǎnle]. *If we remove a few hieroglyphs from this phrase, it becomes clearer.*

去皮 [Qù pí]. “To clean the skin” “to scrub” (“to remove”).

去 [qù] means “to reduce”, “to minimize”

把这条线再去一寸 [Bǎ zhè tiáo xiàn zài qù yīcùn].

*This thread should be shortened to another sun (unit of measure).*

The verb 去 [qù] means “to refuse”, “to push away”; The meaning of “to abandon” in Uzbek is as follows:

人所畔者，天所去也 [Rén suǒ pàn zhě, tiān suǒ qù yě].

*Heaven (God) will drive away those who turn away from Him.*

As can be seen from the above examples, these figurative meanings of the verb 去 [qù] are given by other verbs, because its original meaning in Uzbek does not express its figurative meaning in Chinese.

In our article, we also review the use of 去 [qù] in Lyu Shusyang's book “现代汉语八百词. 吕叔湘” (800 words in modern Chinese) [8].

### 1. The use of 去 [qù] in the verb function

In this case, 去 [qù] means the movement from one position to the other; 了 [le] and 过 [guo] can be used with attachments. In Uzbek it is expressed by the verbs “to go”. For example:

他已经去了 [Tā yǐjīng qù le] *He's already gone.*

去过好几趟，都没碰到他 [Qù guò hǎojǐ tàng, dōu méi pèng dào tā]

*I went there several times and never met her.*

你去得不是时候 [Nìqù dé bùshì shíhòu] *It is not the time you go.*

**Noun (place, time)+ 去 [qù] + noun (subject of action).** In this model, words that belong to a number group are used in front of the next noun. In Uzbek, it is given by the verbs “to go”, for example:

昨天已经去了三个人 [Zuótiān yǐjīng qù le sān gèrén]

*Three people went and came back yesterday.*

刚去了一辆车运行李 [Gāng qù le yī liàng chē yùn xínglǐ] *Just recently a car went to the luggage.*

**a) Noun (subject of action) + 去 [qù] + Noun (action object).** The model also uses the number of words in the last name of the next noun. It is translated into Uzbek based on the verb “to send”, for example:

我给他去过两封信 [Wǒ gěi tā qù guò liǎng fēng xìn]

*I have sent two letters to him.*

我们只去了个代表 (=派去一个代表) [Wǒmen zhǐ qù le gè dàibiǎo (=pài qù yīgè dàibiǎo)]

*We have sent only one representative.*

**b) Noun (subject of action)+ 去 qù + noun (place)** The verb 去 qù of in the mode is translated into Uzbek with the verb “to go”:

我去车站接人 [Wǒ qù chēzhàn jiē rén]

*I go to the station to meet the [man].*

他想去一趟长春 [Tā xiǎng qù yī tàng Chángchūn]

*He wants to go to Changchun.*

**2. 去 qù** The verb 去 qù may be used before or after another verb. In these cases, it means:

**a) 去 [qù] + fe'l.** It expresses a desire to do something. But even when 去 [qù] is not used, the meaning is practically unchanged.

这件事我去办吧 [Zhè jiàn shì wǒ qù bàn ba] *I'll do it.*

你们去研究研究，耆该怎么解决 [Nǐmen qù yánjiū yánjiū, qí gāi zěnmē jiějué]

*You go there and learn how to deal with it.*

**b) fe'l + 去 [qù].** Here the verb expresses its purpose “to go”.

咱们看电影去 [Zánmen kàn diànyǐng qù] *We're going to the movies.*

他上街买东西去了 [Tā shàng jiē mǎi dōngxī qù le]

*He went out to buy things on the street.*

**\去 [qù] // 成 [chéng].** Modal Meaning: To be able to do something:

他去中国去成了吗? [Tā qù zhōngguó qù chéngle ma?]

*Can he go to China?*

飞机票不好买，恐怕去不成 [Fēijī piào bù hǎo mǎi, kǒngpà qù bùchéng] *Buying air tickets is not easy, I am afraid I will not go.*

今天有事，去不了你那儿了 [Jīntiān yǒushì, qù bùliǎo nǐ nà'ěrle] *There are things to do today, I can't come to you.*

Although in these examples, the 去 [qù] verb comes with the 成 [chéng] verb, and the modal meaning and the direction meaning are preserved.

### 去[qù]'s meaning of the direction

**1. Verb+ 去 qù [+Noun(action object)].** Usually not used with “得”[de] and “不”[bù]. The verb 去[qù] that follows the leading verb represents the direction of the leading verb. It has the following features:

a) it means that the person or subject may leave the speaker after a certain action. It is usually translated into Uzbek with the verb to leave. Occasionally other verbs based on the leading verb may also be used, such as:

车队向远方开去 [Chēduì xiàng yuǎnfāng kāi qù]

*The team started to walk long distances.*

一群孩子向河边跑去 [Yīqún háizi xiàng hé biān pǎo qù]

*A group of kids ran to the river.*

谁把我的笔拿去了？ [Shéi bǎ wǒ de bǐ ná qù le?] *Who took my pen?*

刚派去一个人 [Gāng pài qù yīgè rén]

*We just sent one person.*

我们给图书馆送去不少新书 [Wǒmen gěi túshū guǎn sòng qù bù shǎo xīnshū] *We have donated many new books to the library.*

In the above sentence, a different verb is used. It is also important to note that in addition to 去 [qù], the prefix 给 [gěi] also indicates direction of action.

他从我这儿借了几本书去 [Tā cóng wǒ zhè'ér jiè le jǐ běn shū qù]

*He took some books from me.*

我们给幼儿园送了不少玩具去 [Wǒmen gěi yòu'ér yīn sòng liǎo bù shǎo wánjù qù] *We donated a lot of toys to the kindergarten.* In the above examples, we can observe another aspect, that is, between the leading verb and the modifier verb. Such cases are common in Chinese. However, whether or not the complement is between a leading and a modifier is based on certain rules. For example, when a simple modifier expresses the directional meaning, if a simple modifier is represented by “来/去”, the complement is used before “来/去”:

太晚了，我要回家去 [9] [Tài wǎnle, wǒ yào huí jiā qù]

*It's late, and I have to go home.*

If the complement indicates the name of the person or subject, the complement may be used before or after the modifier. For example:

睡觉前, 妈妈给我端来一碗汤, 一定叫我喝了 [Shuìjiào qián, māmā gěi wǒ duān lái yī wǎn tāng, yīdìng jiào wǒ hēle]

睡觉前, 妈妈给我端一碗汤来, 一定叫我喝了 [10][Shuìjiào qián, māmā gěi wǒ duān yī wǎn tāng lái, yīdìng jiào wǒ hēle]

Before she goes to bed, my mother brings me a bowl of soup, of course she invites me to drink.

Also, when a compound modifier represents the direction of the complement, the complement name is placed in the middle of the compound modifier. For example:

我们很高兴地走上楼去 [Wǒmen hěn gāoxìng de zǒu shàng lóu qù] *We went to upstairs with being happy.*

他明天就要飞回国去了 [Tā míngtiān jiù yào fēi huíguó qùle]

He must return home tomorrow. Hence, the use of a complement in such a form is a common occurrence of action verbs and modifiers.

b) a person or subject is left behind after a certain action, which sometimes means death, translated into Uzbek with the words “to die” and “to leave”.

For example:

那一年, 他父母都相继死去 [Nà yī nián, tā fùmǔ dōu xiāngjì sǐ qù] *His parents passed away one after the other in that year.*

疾病夺去了他的生命 [Jíbìng duó qù le tā de shēngmìng]

*The disease took him away from this life.*

他从设计室拿去了三份图纸 [Tā cóng shèjì shì ná qù le sān fèn túzhǐ] *He took three drawings from the design studio.*

他把多余的枝叶剪去 [Tā bǎ duōyú de zhīyè jiǎn qù]

*She cut off unnecessary leaves.*

**2. Verb + 去 qù + Noun (action object, number).** It means “to finish”, “to lose”. 用[Yòng], 占[zhàn], 吃[chī], 花[huā] are used in such constructions.

这些琐碎事情占去了他不少时间 [Zhèxiē suǒsuì shìqíng zhàn qù le tā bù shǎo shíjiān] *These unimportant things took too long.*

已经用去了好几吨水泥 [Yǐ jīng yòng qù le hǎojǐ dūn shuǐní] *A few tons of cement have already been used.*

In the above examples, although the meaning of the verb 去 [qù] is not to go away, or to lose, in these portable meanings of the verb 去 [qù] we can observe the partial presence of the verb.

**3. 随 suí (让 ràng) + 小句 xiǎo jù a small sentence + 去 qù.** Trust means to act on someone you trust. For example:

随他说去, 别理他 [Suí tā shuō qù, bié lǐ tā]

*Do what he says, don't ignore him.*

**4. “看去 kàn qù, 听去 tīng qù”** refers to the assumption or emphasis of a particular aspect, comes at the outset, is often used in literary language (often used in ‘看上去[kàn shàngqù], 听上去[tīng shàngqù]’. For example:

他看去还是一久不到二十岁的青年 [Tā kàn qù háishì yǐjiǔ bù dào èrshí suì de qīngnián] *He looks like a teenager in his early 20's.*

这声音听去像是有人走动 [Zhè shēngyīn tīng qù xiàng shì yǒurén zǒudòng] *When you hear this sound, it seems as if someone is walking [11].*

## CONCLUSION

The results of the article's analysis lead to the following conclusions:

- The verb 去 [qù] in Chinese verb meaning in direction of movement (in the place aspect) and the Uzbek meaning of the verbs of going, directing, in a sense are mutually compatible;
- The verb 去 [qù] in Chinese has broad semantics. Its meaning is expressed in the words “to go”, “to leave”, “to send”, “to pass” (in the time aspect) in Uzbek language;
- however, the verb 去 [qù] does not have its own meaning in the Uzbek language, such as “leave”, “send”, “leave”, “to go back”. It is used with other verbs;
- the verb 去 [qù] means “to collide”, “to drop (e.g., tooth)”; “perform on stage”; “send someone”; “To remove”, “to clear”; “Shrink”, “reduce”; It has the same meanings as “to give up”, “to push away”. These meanings are expressed in Uzbek with various verbs;
- Verbal verbs and modifiers are often used to fill in the modifier's phrases, either before or after the modifier; in the middle; In the case of a compound modifier, it is used in the middle of a complex modifier.

At the end of the conclusion, when expressing the direction from the orientation (in the spatial aspect), the Chinese verb 去 [qù] and the meaning of the direction in the Uzbek language are intertwined, however, the portable meanings of the verb 去 [qù] are not mentioned in Uzbek at all. This indicates the broader meaning of the verb, and it shows that how and why it is to be studied in the Uzbek language.

### ABSTRACT

*Football is a real athletic game that helps to develop qualities such as speed, agility, endurance, strength and jumping. During the game, the player performs work at a very high load, which, in turn, increases the level of functional capabilities of the person and cultivates mental-volitional qualities. In Uzbekistan, football is popular as a means of physical education. Football is practiced in schools, special schools specializing in football, colleges, institutes, production organizations and the army. In the football process, speed and endurance are very important.*

## INTRODUCTION

The problem of cultivating resilience in schoolchildren has been studied by a number of specialized scientists as a subject of scientific research in our country and abroad. They described the quality of this movement as endurance, "the body's ability to fight fatigue, that is, to continue to work in opposition to the appearance of factors that delay the onset of fatigue or cause the process of fatigue." In recent times, the concept of resilience has expanded somewhat. This was due to the stability of the movement of external and internal negative factors. Speed is recommended as the degree of resistance to the duration of the body's ability to maintain the cocktail capacity and its ability to withstand the effects of fatigue or adverse factors of the external environment (high or low temperature, low atmospheric pressure).

## MAIN RESULTS AND FINDINGS

The endurance of the players is the ability to continue the game activity from the beginning to the end of the game without ever letting go. In general, endurance can also be said to be the ability to resist fatigue again. Fatigue in sports practice can be divided into 4 types: mental, sensory, emotional, physical fatigue. These four fatigue are common to all players. Naturally, the weight of physical fatigue is greater among these. In order to properly approach the method of training speed in players, it is necessary to take into account the nature of the game activity of athletes and the load they will have during the game [1, 45].

It is well known that the activities of players take place in conflicting zones; on the one hand a short time, the maximum running time is 5-8 seconds (fast running, wrestling, jumping, wrestling, etc.), on the other hand the game time lasts 90 minutes, which is a characteristic feature of the average work [1, 47]. If we take into account that a moderate workout has a negative impact on maximum work, then it becomes clear that the issue of speed in football is a very serious issue. That's why speed experts say that speed is needed during the most responsible period of the race, and endurance is needed during the whole distance when the athlete is most tired. Of course, this is also typical for young players, but the psychological readiness of players of this age has been noted.

In determining the methods of speed training in young players, it is necessary to distinguish between general and specific speed in them. The overall speed of a player is usually understood as the ability to perform tasks that are even significantly different from each other, at a moderate level or without exceeding a long watt [2, 65].

The special speed is reflected in the ability of the players to keep the required image until the end of the game.

Athletes who specialize in running 800, 1000, 1500, and 2000 meters may not be as fast and must be very, very resilient at the same time [2, 69].

Exercises involving long movements are commonly used to develop overall speed.

Fast walking 800-2000 m, running 3-5 km, skiing, long-distance swimming, climbing 10-30 times on tourniquets and so on. These exercises are usually performed when idle athletes are in the early stages of the training period when they are not yet ready for the hard work [3, 36].

The player will cover a distance of 5.5 to 10.5 km, depending on his position in the team. In this case, intense movements (running fast, accelerating, running fast) take 5 minutes. During this

time period, players run from 1,500 to 2,000 meters quickly, but briefly, from 7,15.25 meters in length. In the meantime, they take 25 to 35 minutes to run slower and 45 to 57 minutes to walk. On the surface, it seems like more time is spent on non-violent running for players. But that's actually the time it takes to accelerate the movement in 5 minutes to cover the huge amount of energy that is spent on running fast and fighting for the ball. If we define speed in terms of physiological and biochemical expert scientists, running requires a certain amount of energy expenditure, like any other form of muscle activity, i.e. the body receives energy for chemical change from chemical changes. Respiratory processes are involved in the presence of oxygen in the air, in which nutrients (mainly carbohydrates and fats) are oxidized to carbon dioxide and water [2, 70-71].

At the initial stage of training with young players, it is advisable to use a set of tools aimed at their comprehensive physical training, strengthening and balanced development of health, acquisition of various skills and abilities, learning the basics of football techniques and tactics.

The task of physical training at this time is primarily to shape the movement functions of young players (strength, speed, endurance, agility and dexterity), as well as the ability to control their movements over time (air and muscle strength are key components of movement function). Great attention should be paid to cultivating the speed of action. Because in childhood and adolescence there are ample opportunities to cultivate this most important physical quality [3, 63].

It should be noted that in the stages of initial training and primary sports specialization, agility is nurtured in a strong connection with agility, which provides the necessary basis for successful mastery of the rational technique of shifting (moving from one place to another). A significant increase in maximum speed in running between the ages of 8-12 is associated with a natural increase in movement speed [1, 32]. At the age of 12-14, however, speed increases mainly due to an increase in speed-strength qualities and muscle strength.

Therefore, in the development of speed, it is necessary to try to maximize the frequency of movements that require running speed and great muscle strength. It is necessary to give more space to natural movements. Games, sports games and action games in the form of competitions, exercises can also be of great help.

Performing game exercises forces young players to exert maximum effort to win. Game material should take up 50% of the total training time. Each exercise is performed in a short series (10-15 seconds) in several series, with a rest interval of 10-15 m. It is important to run again at maximum speed, which is done in the relay method at a distance of up to 20 m. In addition to relays, it is recommended to include control exercises for running 10-15 m. To develop a complex movement reaction and frequency of movements, it is necessary to make extensive use of speed exercises that run from different sports positions. These exercises are performed by changing the direction of running according to different visual signals. This allows you to react to each of the signals with response actions, modeling the complex situations that arise during the game [4, 42-43].

In the primary sports specialization phase, a wide range of games can be used, in addition to the use of game exercises, basic physical training exercise complexes. This creates favorable conditions for creating a solid base of all-round physical training. Complexes aimed at developing more speed should be applied at the beginning of the main part of the lesson, followed by the use of games that help to improve this quality. Much less time is spent on a set

of appropriate games and game exercises that require strength, as well as a set of games that require endurance. They are held in the middle and at the end of the lesson, respectively.

The variety of tools, including games and special training exercises, helps to better improve the general physical fitness of children and adolescents and, in particular, to develop their basic physical qualities specifically [4, 51].

In the phase of serious training and improvement, great attention is paid to the development of speed, because increasing speed is a much more complex task. In addition to repetitive running at maximum speed, a wide use of speed-strength, individual strength training, i.e., increasing running speed, mainly at the expense of dynamic force, is necessary to get rid of premature stabilization of speed at the achieved level. It is advisable to use the method of dynamic exertion in cultivating the ability to demonstrate strength quickly. This is achieved by moving the light load to another location at maximum speed.

Exercise that is done very intensively is a powerful tool. Therefore, exercises aimed at developing maximum speed should be performed more frequently, but on a smaller scale. It is necessary to correctly determine the norm of exercises aimed at increasing the speed of movements, to take into account how many times the exercises are repeated without slowing down, as well as how long the continuous training work is performed without lowering the speed limit. Exercises aimed at developing speed are stopped when a young player's subjective sensations, external signs of fatigue, or stopwatch readings indicate a decrease in movement speed. This decrease serves as the first signal ("sufficient criterion") [5, 64-65] to stop the work on speed development in this exercise.

Exercises that can be done at maximum speed are used as a means of developing speed. First of all, three groups of exercises are used: general developmental (focused on speed development), special exercises in their own sports, and exercises in other sports. At least three requirements must be taken into account:

1. Exercises should be performed at the last speed.
2. The exercises should be mastered so well by the trainees that during the movement, the emphasis should be placed on the speed of the movement, rather than on the method of performing the movement.
3. The duration of the exercise (or the length of the distance) should be such that by the end of the exercise the speed does not decrease as a result of fatigue [5, 62].

If we take into account the fact that the player's activity is in a state of strong mental tension and a huge emotional excitement, it does not take much effort. However, an analysis of game activity shows that they have enough time to recover from the general initial state during breaks that occur after vigorous activity. Therefore, players need to be prepared for the same type of activity. Sometimes it determines its quality depending on the amount of work in the classroom, which is completely wrong. Execution of a large load should not be the goal in itself and should not be seen as a primary means of cultivating agility [6, 56-57].

Football is a non-cyclical sport in which the duration of the movement is constantly changing, so it requires proper training. An activity that changes rapidly in intensity requires more effort than an activity that is performed at a steady pace. This is something to keep in mind when training

speed in players. It is important to remember that breathing, which is a legitimate task, adapts to the form and nature of the movement you are performing. In this case, breathing and exhalation are integral to the act of movement.

The breathing of the players is different from the breathing of a skier or staer (long-distance runners) [6, 37].

Willpower is also at the forefront of speed training. Regular long-term work requires athletes to overcome internal and external challenges with a strong, determined, strong will, that is, a “stable will quality”. While performing work of a non-cyclical nature, the athlete experiences difficulty in a relatively short period of time, but intense repetitive strain. Players are well aware of how difficult it is to force oneself to do so when the air temperature is high, on top of doing any more strenuous movement activity against the backdrop of intense fatigue after repeated rapid runs due to the demands of the situation in the game. In the training of endurance of players, a great deal of attention is paid to the explosive short-term work of the body, mainly in the absence of oxygen. During the breaks between intensive work, the player is given as much oxygen (debt) as possible. Tasks specific to special functional training are solved more effectively during the performance of game exercises. In terms of their character and emotionality, they are much more suited to the game. However, it is necessary to combine game exercises with exercises without balls [7, 64-65].

Speed training should be conducted in accordance with the five signs of the load; a-run time, b-work complexity, c-rest time, g-rest character, d-number of repetitions [7, 82].

Given the rapid and variable nature of external signals, football places high demands on a player's psyche.

Hence, a good adaptation of the psyche to the various influences of the external environment; the ability to move on the basis of anticipating the actions of an opponent or partner and the ability to implement game skills in a creative approach. Football requires creative tactical thinking, the ability to play a combination game, as well as teamwork, discipline and self-control.

There are great demands on the nature of football players, their willpower, goal-orientation, fighting spirit, perseverance and aspiration to victory. The player's organism forms an integral complex, so it is not possible to study the physical and psychological aspects of the organism separately, just as it is not possible to separate the individual parts of the exercise. Based on this, it can be concluded that:

- Development of the player's personality in terms of the requirements of modern football;
- Development of the ability to compete in complex conditions of play activities;
- It is necessary to manage changes in the psychological state of the player in the game activities [5, 73].

With the help of pedagogical control of the competitive activity of players it is possible to estimate different levels of development of individual and collective technical and tactical actions.

## CONCLUSION

Football is one of the most beloved and popular sports on earth. The simplicity and convenience of the game, the skill and speed of the players still attract all the fans.

So does this sport have an impact on student health and development? As it turns out, the impact is huge. If you play football regularly, you will develop speed, agility, endurance and goal-orientation. During the game, a large load is placed on the player, which serves to cultivate the willpower in him, increasing the overall endurance of all members. Because football is mainly played outdoors, it leads, firstly, to physical training, and secondly, it increases the resistance of body parts of players to the effects of the environment.

In football, two teams compete with each other. Striving to win encourages players to act in unison and fosters a sense of camaraderie, mutual support. The mass interest of students in football academies in this game is causing them to study in special schools, work on themselves and become fast and resilient players. Speed and agility are very important in the game process. That is, it is very important to cultivate the quality of speed in the process of transitioning to a quick counter-attack or defense during the game.

Email id: ganesh@ncc.edu.np

### **ABSTRACT**

*This study has examined the direct and interactive effects of performance appraisal satisfaction and intrinsic motivation on affective organizational commitment. Self-reported perceptual cross-sectional data obtained from 358 employees working in the Nepalese insurance industry have been analysed quantitatively. Direct effects of performance appraisal satisfaction on intrinsic motivation as well as on affective organizational commitment were significant. Intrinsic motivation antagonistically moderated the relationship of performance appraisal satisfaction with affective organizational commitment. Where, relatively negative strong prediction of performance appraisal satisfaction on affective organizational commitment was for those employees who had a high level of intrinsic motivation and vice versa. Likewise, the intrinsic motivation mediated the relationship between performance appraisal satisfaction to affective organizational commitment. Out of total mediated effected size of performance appraisal satisfaction to affective organizational commitment, 38% effect size went through intrinsic motivation.*

**KEYWORDS:** *Performance Appraisal Satisfaction, Intrinsic Motivation, Affective Organizational Commitment*

---

## INTRODUCTION

### Background of the Study

Performance appraisal (PA) is the measurement of work and its results by using the scale and index with the freedom of personal judgments and vague criteria of evaluation (Ali et al. 2012). PA has been increasingly becoming the part of a strategic approach to integrate human resource activities and business policies. PA pervades all types of organizations and the results are very important for employees and the organizations (Jawahar, 2010). PA continues to be a very essential topic in these days for both practitioner and researchers because organizations attempt to use the formal appraisal process as a critical human resource management tool. Rapid changes in environment, increasing communication, technology, and development of knowledge management have made the existence of an effective organizational PA system inevitable (Ali et al., 2012). However, the implementation of PA has been challenging for developing countries, due to the problems of capacity and institutional constraints (Liu & Dong, 2012).

Tziner et al. (2000) have suggested two broad uses of PA result in organizations. First, it serves administrative purposes in the areas like reward allocation (increases in salary, bonuses, etc.) and assignment decisions (promotions, transfers, demotions etc.). Second, it contributes to employee development by making it possible to identify their strengths and weaknesses with up to date performance feedback from supervisors. Directly and indirectly, employee's developmental activities are related to the successful life of both the employee as well as organization. Therefore stakeholders, especially employees, should be comfortable and satisfied with developmental aspects of the PA mechanism. This study concentrates to the employees' perceptions of developmental aspects of the PA, which has been defined as the perceived clarity, relevance, recognition and understanding with regard to the goal setting through feedback activities involved in the appraisal procedure. More specifically, developmental goal setting refers to the degree in which employees perceive through PA feedback that the goals are attainable, clear, relevant, and understandable. For the purpose of the study, hereafter, PA denotes the developmental aspects of the PA.

Motivation is a multidimensional construct; one well-established way to think about the dimensions of motivation is according to the origins of individual motivation i.e. intrinsic and extrinsic. The intrinsic arises from the task itself, while the extrinsic comes from expectations of external rewards (Cho & Perry, 2012). In contrast to rewards and punishment based extrinsic motivation (which are controlled by the organization), intrinsic motivation is based on positively valued experiences that a person gets directly from their works. These positive experiences serve to get an individual excited, involved, committed, and energized in their works. Thomas and Velthouse (1990) have argued that intrinsic motivation is the key psychological component of employees' empowerment and it enables them to become self-managing or self-leading. Among various types of motivation, intrinsic motivation has been noted as having a large effect on employees' attitudes and performance (Deci & Ryan, 2008). Benabou and Tirole (2003) stated there is no doubt that the benefits (piece-rate systems or pay-for-performance incentive devices) can be considerably compromised when the systems undermine workers' intrinsic motivation. Here this study concentrates on intrinsic motivation with a belief that this is a necessary consequence of an individual's subjective sense of the developmental PA mechanism.

Employees' affective organizational commitment is the employee's emotional attachment to his or her organization being the member of that organization. Meyer and Allen (1991) have identified three distinct themes in defining commitment as affective, continuance, and normative. However, this study concentrates on affective organizational commitment of the employees in order to achieve the intended objectives of this study. In the view of Allen et al. (2003) affective organizational commitment refers to the emotional attachment to the organization based on feelings of loyalty toward the employer. Employees who are affectively committed are seen as having a sense of identification and belonging which increases their serious involvement in the organization's activities, willingness to pursue the organizational objectives, and desire to remain with the organization for a long-time (Meyer & Allen, 1991). The field of industrial and organizational psychology provides ample researches that affective commitment in the workplace has demonstrated an improvement in employees' performance and ultimately the performance of the overall organization (Sandra et al., 2008). However, lower levels of affective organizational commitment exist in most industries (Sandra et al., 2008).

PA satisfaction, intrinsic motivation, and affective organizational commitment are the subjective construct in the field of management of human resources. Studies of direct or indirect association of these variables are very important for practitioners as well as theoreticians for the betterment of both employees as well as organizations. So, the role of intrinsic motivation cannot be ignored in the relationship between PA satisfaction and affective organizational commitment. Research on the effect of intrinsic motivation has been considered moderating and mediating influences (Cho & Perry, 2012) in the relationships of cause and effect variables that have been related to employees. Among the several possible pathways from PA satisfaction to employee outcomes, intrinsic motivation could be a key mediating variable (Hackman & Oldham, 1976). About the moderation, it can't be expected that all employees will react in the same way to PA (Fletcher, 2001), and intrinsic motivation has a global or dispositional component that may partly explain individual differences in how employees are affected by the PA. Researchers like Piccolo and Colquitt (2006) agreed that there are very few empirical testing and it requires further testing to measure these relationships. In this context, the study has been dedicated to examine a new perspective in PA satisfaction- affective organizational commitment relationship with moderating and mediating role of intrinsic motivation in the context of the Nepalese insurance industry.

### **Statement of the Problems**

Managers are lacking generalized, latest, and home-ground generated theoretical knowledge to improve their employee's affective organizational commitment through the proper mechanism of the PA and intrinsic motivation. Most of the organizations are facing employees' problems regarding less attachment with organization and leaving the organization. In such context, managers are investing a lot of money and efforts to improve their situations. But they are careless on the importance of PA satisfaction and intrinsic motivation which improve employee affective organizational commitment without the additional financial burden to the organization. Employees as a dominating source of competitive advantage, most of the organizations are interested to solve these problems.

Jawahar (2010) stated that although PA feedback is advocated as a means for influencing performance via intrinsic motivation, empirical investigations indicate that the effect of feedback

on performance is not uniformly positive. Likewise, Fletcher (2001) mentions performance evaluation systems are not successful in creating intrinsic motivation and improvement of employees' performance. But Ali et al. (2012) and Kuvaas (2007) state successful PA feedbacks significantly improve the employee's intrinsic motivation and employee outcomes. Such contradicting findings regarding the impact of PA feedback on employee's intrinsic motivation and employee outcome (here affective organizational commitment) has been first gap to be fulfilled.

Scientific inquiries and technological advancement make knowledge obsolete, which were developed in the very beginning. Obsolete knowledge creates a dilemma about the applicability of the theories and models to solve the current problems (Dissanayake, 2013). The latest theories are compulsory to solve the current problems. Therefore, obsolescence of knowledge has been the next gap to be fulfilled in this study.

Self-determination theory suggests that the social and environmental forces influence intrinsic motivation (Grouzet et al. 2004). If intrinsic motivation is influenced by environment, its antecedent (here, PA satisfaction) and consequences (here, affective organizational commitment) are not free from the social and environmental influences. So, the findings from the western context may not be generalized. Context representing the insurance industry and Nepalese cultural phenomena has been another gap that is desired to fulfil in this study.

Considering these gaps a study to examine the role of intrinsic motivation in the relationship between PA satisfaction and affective organizational commitment in the Nepali insurance industry has been felt necessary.

In this context, the following research issues are worth examining:

- i) Are there significant relationships between: a) PA satisfaction with affective organizational commitment b) Intrinsic motivation with affective organizational commitment?
- ii) Does intrinsic motivation moderate and mediate the relationship of PA satisfaction to affective organizational commitment?

In order to address the above issues, this study seeks to answer the following fundamental research question.

In what way PA satisfaction is associated with affective commitment in the Nepali insurance industry? Does intrinsic motivation moderate and mediate these associations?

### **PA Satisfaction and Affective Organizational Commitment**

Impacts of the developmental PA satisfaction on affective organizational commitment can be highlighted from the following three ways. First, through communicating organizational strategies, goals and vision to the employees while conducting a performance interview. Kuvaas (2006b) mentioned 'to the extent that PA is able to communicate subordinate strategies, goals and vision; employees should experience a higher level of commitment to subordinate organizational goals and, therefore, become more affectively committed to their organization.

Second, increasing employees' perception of being valued and being part of an organizational team; PA contributes to increase employees' understanding of the sense of being valuable and know themselves as a part of the organizational team that is the main understanding for being committed to the organization. Levy and Williams (2004) stated that developmental PA is also

about increasing employees' perceptions of being valued and being part of an organizational team. Such perceptions are central to the affective commitment.

Third, increasing perception of organizational investment for employees' career development; if reflections that have been obtained from PA satisfaction are being invested in developing employees, then probably employees will compensate it through increasing of affective commitment in the organization. Lee and Bruvold (2003) stated that PA satisfaction reflects perceived investment in employee career development; employees will probably reciprocate by the way of higher affective commitment to the organization.

Roberts and Reed (1996) noted that PA satisfaction may be positively related to affective commitment due to the enhanced employee participation and perceived clarity of goals within the PA process. Kuvaas (2006b) concluded after analysing the data from Norwegian banking employees that PA satisfaction positively influences employees affective organizational commitment. Similar findings have been revealed from the other studies from Malaysia (Vignaswaran, 2008) and Iran (Fakharyan et al., 2012). On the basis of preceding arguments and research evidences; it can be hypothesized that:

Hypothesis 1: There is a positive relationship between PA satisfaction and affective organizational commitment.

### **PA Satisfaction and Intrinsic Motivation**

One function of PA systems is to arouse motivation in the employees (Ali et al., 2012). The systematic practice of giving feedback to employees will have a great impact on the intrinsic motivation of employees (Wang & Guthrie, 2004). Pettijoh et al. (2001) stated that by reducing ambiguity through feedback and discussion, PA may positively affect the resulting levels of motivation exhibited by the employee.

PA is one such technique to provide feedback that can affect intrinsic motivation (Oh & Lewis, 2009). They indicated that an employee's intrinsic motivation depends on meaningful feedback about his performance and perception of his self-control over setting his own goals and over defining the paths to these goals. Procedural fairness of an appraisal, such as opportunities to participate in setting goals, would positively affect intrinsic motivation of the employees because they are self-involved for their interesting and attainable goal setting. PA system that is perceived to be fair and acceptable in terms of distributive, procedural, and interactional aspects would positively affect intrinsic motivation (Kim & Rubianty, 2011). Similarly, Studies conducted by Kuvaas (2006b), Vignaswaran (2008) and Fakharyan et al. (2012) remarked that PA satisfaction positively impacts employees' intrinsic motivation. Therefore, on the basis of the preceding arguments and related research evidence, it has been hypothesized that:

Hypothesis 2: There is a positive relationship between PA satisfaction and intrinsic motivation.

### **Intrinsic Motivation and Affective Organizational Commitment**

Innate satisfaction of the intrinsically motivated people contributes to the affective commitment of the employees, they are enjoying with their jobs and overall working environment. Empirical study carried out by Ganesan and Weitz (1996) found a positive relationship between intrinsic motivation and affective organizational commitment, suggesting that some of the benefits associated with a challenging and interesting job are attributed to the organization. Results from the study conducted by Karatepe and Tekinkus (2006) demonstrated that high levels of intrinsic

motivation resulted in high level of affective commitment to the organization among the front-line banking employees in Turkey. Likewise, studies conducted by Kuvass (2006b), Vignaswaran (2008), and Fakharyan et al. (2012) remarked that intrinsic motivation positively impacts on employees affective organizational commitment. Therefore, on the basis of the preceding arguments and related research evidence, it has been hypothesized that:

Hypothesis 3: There is a positive relationship between intrinsic motivation and affective organizational commitment.

### **Intrinsic Motivation as a Moderator**

By nature individuals are different and their level of motivation is different, even they are working under the same context. If individuals are reviewed from a psychological perspective, their level of intrinsic motivation from PA satisfaction can be different. Ryan and Deci (2000) stated that people are intrinsically motivated for some activities and not others, and not everyone is intrinsically motivated for any particular task. Individuals with high intrinsic motivation will become more self-learning and self-correcting in response to changing demands of the environment, without waiting for formal training and development for the organization (Vignaswaran, 2008). Fletcher (2001) claimed that if all appraises are going to react the same way to PA, it may be very unsafe to the organization. Furthermore, individual differences play a substantial role in how people interpret appraisal feedback and how they respond to these interpretations (Ilgen et al., 1979). If it is agreed that individual differences cause to create different level of intrinsic motivation from the PA feedback mechanism, there is no doubt that individual's different level of intrinsic motivation cause to different level of employees affective organizational commitment. Therefore, individual's intrinsic motivation plays vital role in the direct relationship between PA satisfactions to employee affective organizational commitment. According to Kluger and DeNisi (1996), compared to employees with lower intrinsic motivation, those with higher intrinsic motivation should, to a greater extent, view feedback as task oriented, which in turn should enhance self-learning and performance associated with PA satisfaction. Therefore, on the basis of the preceding arguments and related research evidence, it has been hypothesized that:

Hypothesis 4: The relationship between PA satisfaction and affective organizational commitment is moderated by intrinsic motivation.

### **Intrinsic Motivation as a Mediator**

It is simple to state that, feedback received from PA activity impacts on intrinsic motivation and intrinsically motivated employees will increase their affective commitment. Jawahar (2010) tested a model and concluded that ratees' reactions (e.g. perceived accuracy, perceived utility, and satisfaction with feedback) mediates the relationship between feedback related characteristics (e.g. rater's job knowledge, criticism by rater, opportunity to participate in feedback, job relatedness of criteria, goal setting, and suggesting ways to improve performance) and ratees' performance. In this model, ratees' reactions with feedback related characteristics somehow related to intrinsic motivation and feedback related characteristics are related to the PA satisfaction. So, it was expected that the relationship between PA satisfaction and affective organizational commitment can be mediated by intrinsic motivation. Results from a survey carried out by Vignaswaran (2008) in Malaysia showed that the relationship between PA satisfaction and affective organizational commitment was mediated by employees' intrinsic

motivation. Another study conducted by Fakharyan et al. (2012) in Iran concluded that intrinsic motivation as a mediator has affected in the relationship between PA satisfactions with affective organizational commitment. Therefore, it has been hypothesized that:

Hypothesis 5: The relationship of PA satisfaction to affective organizational commitment is mediated by intrinsic motivation.

### Research Design

Quantitative research design has been followed to analyze the cross sectional data. Richard (2009) stated that quantitative research is typically considered to be the more scientific approach to do social science research. Indeed, the ability to make correct predictions are one of the most outstanding characteristics of quantitative methodology and it may be valuable for evaluating theory and testing whether the theory holds up under a variety of circumstances and instances. Platt (2012) expressed that Britain's Economic and Social Research Council has striven to increase the level of quantitative work in British social science. In the context of America, Freese (2007) has stated that it is the policy of the American Economic Review to publish papers only if the data used in the analysis are clearly and precisely documented and are readily available to any researcher for the purposes of replication. The credibility of quantitative social science benefits from policies that increase confidence that the results reported by one researcher can be verified by others. Regarding the verification and replication of research methodology Duvendack and Palmer-Jones (2013) stated that there is a growing demand for replications of authoritative works in development studies, which reflects recent trends in other social sciences.

### Measures

All multi-item scales used in this research were adopted from prior research work.

Except demographic variables, responses to all the items have been measured at a 5-point Likert type scale where 1 = strongly disagree, 2 = disagree, 3 = neither agree nor disagree, 4 = agree, and 5 = strongly agree. Measures of this study were as follows: *PA satisfaction* was assessed by using an instrument developed by Meyer and Smith (2000). They have used these items to measure the satisfaction from developmental PA. It has included seven items concerning the overall satisfaction with PA activities in the organization. This instrument has been used by many researchers (e.g. Kuvaas, 2006b; Vignaswaran, 2008) with coefficient alpha ranging from .86 to .93. *Intrinsic motivation* was assessed by six items developed by Cameron and Pierce (1994). This instrument has been used by many researchers like Kuvaas (2006b, 2009), Vignaswaran, (2008), and Hsu (2012) with coefficient alpha ranging from .82 to .90. *Affective organizational commitment* was measured by the six-item scale used by Meyer and Allen (1997). This instrument has been used by many researchers like Kuvaas (2006a, 2006b, 2007) and Vignaswaran, (2008) with coefficient alpha ranging from .77 to .88.

### Reliability and Validity

Explorative Factor Analysis (EFA) has been computed for each instrument to check whether the constructs used in this study fit the same factor structures or not. Reliability of the measurement scales has been assessed by calculating Cronbach coefficient alpha after EFA. According Knies and Leisink (2014) Cronbach's alpha should be at least .70 for acceptable reliability. The computed Cronbach's alpha (reliability values) of the constructs in this study are; PA satisfaction = .83, intrinsic motivation = .71, and affective organizational commitment = .70. Peterson and

Kim (2013) stated that Cronbach's coefficient alpha is the most widely used estimator of the reliability of tests and scales.

The internal validity of this research has been ensured through measuring different constructs using prior validated measures. Hypotheses were formulated based on the comprehensive review of the empirical evidence from the different context. The normality of the data were tested by plotting Histogram and Normal Q-Q plot and found normally distributed. Likewise, the interactive effect of independent and moderating variables with dependent variables were measured after centring interactive variables. Variance Inflating Factor (VIF) was tested and found less than 10 which are not problematic (Adnan et al., 2006). The findings were calculated from well-known statistical tools.

### Sample and Sampling Design

Through quota (stratified and non-random) sampling method, 15 insurance companies (4 life insurance, 10 non-life insurance, and 1 both life and non-life insurance), out of 25, were selected from the Nepali insurance industry. To select the sample companies, strata have been categorized into two stages. Firstly, according to nature of the business (e.g. life insurance, non-life insurance, and both); secondly, life insurance and non-life insurance companies were categorized into 3 strata based on the volume of business (e.g. high, medium, and low level of premium collecting companies). Within the selected strata, companies were selected as the convenience of the researcher. From the sample selected companies 358 respondents have been surveyed, as convenience, as a sample for 3200 population size. Demographic composition of the sample is presented in Table 1.

**TABLE 1 DEMOGRAPHIC COMPOSITION OF THE SAMPLE**

	Group	N	Percentage
Sex	Male	208	58.10
	Female	150	41.90
Age	Below 30 Years	125	34.92
	30 to 50 Years	210	58.66
	More than 50 Years	23	6.42
Education	Under-Graduation	64	17.88
	Graduation	170	47.49
	Post-Graduation	124	34.64
Experience	Less than 5 Years	143	39.94
	5 to 10 Years	96	26.82

### Common Method Variance

Self-rating made it possible to assess individual perceptions that are not easily measured by objective measures (Hasson et al. 2013). However, self-ratings also have some disadvantages such as social desirability (giving the answer one believes is the desirable one) and negative affectivity (a general tendency to perceive things negatively). These problems are particularly pronounced when all variables are measured using self-ratings, as they may lead to spurious relationships (Hasson et al. 2013). Collecting data at one point in time and using self-reported data would be prone to common method bias, and it would be a serious threat to the magnitudes of the relationships among the study variables (Karatepe, 2012). Podsakoff et al. (2003) identified four potential sources of Common Method Variance (CMV), namely, self-report data, item characteristics, item context, and measurement context, but concerns about CMV are almost exclusively limited to the use of self-report surveys (Spector & Brannick, 2010). Therefore, common method bias should be controlled via the relevant procedural remedies.

Two common strategies to circumvent the problem of self-reported data at a point of time include the collection of data from multiple sources and temporal spacing of variables. However, the use of multiple sources is not always applicable because many important variables, i.e. personality, attitudes, cognitions, and values, are primarily measured by self-report and hard to be observed by others (Lai et al., 2013). These variables often occupy key roles in theoretical models, functioning as independent variables, moderators, mediators, and dependent variables. The remedy of temporal spacing of measures may not be feasible in some research contexts, and the time gap involved may introduce other types of biases, like the non-equivalence of contextual characteristics across the two waves of measurement (Lai et al., 2013).

Consistent with the suggestions made by Podsakoff et al. (2003), this study used two procedural remedies for controlling common method bias. Firstly, around 33% questionnaire were reverse scored to reduce the potential effects of response pattern biases, by incorporating negatively worded items in the questionnaire. Secondly, questions measuring different variables (e.g. independent, moderating and mediating, and dependent) were counterbalanced in order, so that respondents could not recognize the corresponding constructs of the items.

However, to know the degree of common method bias, this study has tested the Harman's one-factor test, which implements principal component factor analysis of all the variables in the model. According to Podsakoff et al. (2003), one of the most widely used techniques that has been used by researchers to measure the problem of CMV is Harman's one-factor (or single-factor) test. One concludes that the bias is serious when the analysis (from Harman's one-factor test) retains only one factor or a single factor explains most covariance (Podsakoff, et al., 2003). In this study, the analysis revealed that three factors were retained, and the first factor explained only 27.62 % of the variance. If the first factor explains less than 50% of the variance, then result shows that the bias is not so serious as to make analysis invalid even though it may still slightly inflate regression coefficients (Cho & Lee, 2012).

### Administration of the Questionnaire

The questionnaire comprises of 18 items including seven demographic details. A questionnaire has been prepared in English language with translation in Nepali language in order to ease the participants. Concretely, the translation was performed by researcher and edited by two other researchers whose native language is Nepali. Five employees comparable to the respondents of

this research also checked the language, simplicity, and clarity of the questionnaire. For the administration of questionnaires, chief executive officers of each and every sample selected companies were requested to make participation their employees in the survey. In each company, on the request of the researcher, a referral person was assigned by CEO to facilitate the distribution and collection of questionnaires. With the help of reference person, altogether 550 questionnaires were distributed to each respondent individually. Out of the 550 distributed questionnaires 417 were filled up and returned back. But only 358 (65%) questionnaires were found ready to use for the study purpose.

### **Data Analysis**

The data collected for this study were analysed in various phases. First, to determine the item retention in the context of this study, factor analysis (principal component analysis with varimax rotation) was computed on all multiple scale items. In order to avoid confounded measures of closely related constructs, the following three strict rules-of-thumb (Dysvik & Kuvaas, 2013) have been applied. The Items were retained only; i) with a strong loading of .50 or higher, ii) a cross-loading of less than .35 on other included factors, and iii) a differential of .20 or higher between included factors. Whenever construct measuring items are translated from English to local language, there are practice of choosing an exploratory factor analysis rather than confirmatory factor analysis (e.g. Karatepe, 2012; Dysvik & Kuvaas, 2013). All the items used in this study were prepared in English with translation into Nepali that is why exploratory factor analysis has been adopted rather than confirmatory factor analysis.

Histogram and Normal Q-Q plot have been plotted to test normality of the residual. Multicollinearity diagnostic have been tested ( by VIFs) to measure the multicollinearity among the independent variables and moderating variables while measuring the interactive effect of independent variables and moderating variables on the dependent variable.

Multiple Regression Models (MRM) have been calculated to measure significant of direct association of independent variable and moderating/and mediating variable with dependent variable after controlling the effect of demographic variables. Hierarchical Regression Model (HRM), as the guidelines provided by Baron and Kenny (1986), has been calculated to measure interactive (moderating) effects. F- test have been computed to measure the significance of the model, t-test has been computed to measure the significance of association of single variable, and change in  $R^2$  has been used to measure the significance of adding another variable in the model.

According to Baron and Kenny (1986) the following three conditions must be met to support a mediating relationship. First, the independent variable must be significantly associated with the mediator in the first equation. Second, the independent variable must be significantly associated with the dependent variable in the second equation. Finally, after the mediator is entered in the regression model, the relationship between the independent and dependent variables should either disappear (full mediation) or significantly diminish (partial mediation). Sobel test (Preacher & Leonardelli, 2001) was used to measure the significance of reduction of the relationship between independent variable and dependent variable due to entering the mediating variable.

### **Results**

As shown in Annex I, the principal component analysis revealed that two of the PA satisfaction items loaded in another factor and another one item loaded with less than the threshold value .50. One of the intrinsic motivation items crosses loaded with value .43 and another one loaded in

other factor. Two of the affective organizational commitment items loaded in another factor and one factor loaded with less than the threshold value .50. All these items (which were not properly loaded) were removed from the analysis before computing scales by averaging of the items. Details of principal component analysis have been presented in Annex I.

As depicted in Table 2, there were no strong correlation coefficients (all are less than .50) between predictor variables, therefore the issue of multicollinearity need not be addressed.

**TABLE 2**

	PAS	IM	AOC
PA Satisfaction (PAS)	-		
Intrinsic Motivation (IM)	.35***	-	
Affective Organizational Commitment (AOC)	.34***	.44***	-

However, VIFs (variance-inflating factors) have been calculated to measure the presence (or not) of the multicollinearity while calculating the interactive effect of independent and moderating variable on the dependent variables (i.e. calculating hierarchical moderating regression). In this study, VIFs have been found less than 10 except interactive variables. According to Adnan et al. (2006), the multicollinearity would not be problematic if VIF is less than 10. **Even VIFs are more than 10 and it is caused by the inclusion of powers or products of other variables, there would not be a problem of the multicollinearity (Paul, 2012).**

**TABLE 3**  
**REGRESSION RESULT TESTING DIRECT, MEDIATION AND MODERATION MODELS**

Independent Variables	Dependent Variable: Affective Organizational Commitment			
	Model 1 ( $\beta$ )	Model 2 ( $\beta$ )	Model 3 ( $\beta$ )	Model 4 ( $\beta$ )

Table 3, model 3, has also been used to measure the direct association of intrinsic motivation with affective organizational commitment after controlling the effect of the demographic variables and PA satisfaction. As shown in this model, to predict the affective organizational commitment, coefficient of intrinsic motivation was statistically significant ( $\beta = .34$ ,  $p < .001$ ).

Table 3, model 4, has been used to measure the moderating role of intrinsic motivation in the direct relationship between PA satisfaction and affective organizational commitment. As shown in this model moderating role of intrinsic motivation in the relationship between PA satisfaction and affective organizational commitment was statistically significant ( $\beta = -.10$ ,  $\Delta R^2 = .01$ ,  $p < .05$ ).

Significance of change in  $R^2$  was used to measure the moderating effect of intrinsic motivation in the direct relationships of PA satisfaction with affective organizational commitment. The statistical significance of the change in  $R^2$  due to the addition of the interaction term is typically used as the criterion to measure the effect size of the interaction. However, researchers Witt et al. (2000) have argued that the change in  $R^2$  does not adequately reflect the magnitude of the impact of the moderator variable. A limitation of using the change in  $R^2$  as the only estimate of the effect size of the interaction is that it provides a conservative estimate; as it reflects the average effect of a moderator across the entire range of values of a predictor. To address this issue, three levels (high = mean value plus 1SD, medium = mean value, and low = mean value minus 1SD) of criterion effect identified by Aiken and West (1991) have been applied. In this study, to measure the three levels of criterion effect, interactive regression models were introduced in graph as advocated by Jose (2008) who clarifies the forms of moderation. Figure 1 displays the statistical interaction of PA satisfaction, affective organizational commitment and intrinsic motivation as dependent, independent and moderating variables respectively. According to Jose (2008) statistically significant interactions occur when the three lines representing high, medium and low value of moderating variable (here, intrinsic motivation) are not parallel.

Graphic presentation of interactive effects of PA satisfaction and intrinsic motivation to predict the affective organizational commitment has been shown in Figure 1. As shown in Figure 1, graphs representing the high, medium, and low level of intrinsic motivation are not parallel and sloped negatively. Negative sloped graph mean there is antagonistic (where moderator reverses the original effect of the predictor on the outcome) moderating role of intrinsic motivation in the relationship between PA satisfaction with affective organizational commitment.

Figure 1

*Moderation by IM in the Relationship between PAS and AOC*

Graph representing high-value of intrinsic motivation was comparatively steeper than both mid-value and low-value representing graphs. This indicates that there was a relatively strong negative prediction of PA satisfaction on affective organizational commitment for those employees who had a high level of intrinsic motivation and vice versa.

Three criteria developed by Baron and Kenny (1986) that need to be satisfied in order to determine the mediator relationship were adopted. Table 4, model 2, depicts the first criterion that the independent variable (PA satisfaction) must be associated with the mediating variable (intrinsic motivation) which was met ( $\beta = .35, p < .001$ ). The second criterion, independent variable must be related to the dependent variables before the mediator is entered. This relationship was measured in Table 3 - model 2. The second criterion was met for the association of PA satisfaction with affective organizational commitment (Table 3, model 2,  $\beta = .34, p < .001$ ). Third criterion, after the mediator is entered in the regression model; the relationship between the independent and dependent variable should either disappear (full mediation) or significantly diminish (partial mediation). The third criterion was measured in Table 3 - model 3. Coefficient of PA satisfaction to predict affective organizational commitment has diminished from .34 ( $\beta = .34$ , coefficient of PA satisfaction before entering intrinsic motivation) to .22 ( $\beta = .22$ , coefficient of PA satisfaction after entering the intrinsic motivation). Then, next step was to test whether these diminished coefficients of PA satisfaction were statistically significant or not; for this purpose, Sobel test (Preacher & Leonardelli, 2001) has been applied. Sobel test revealed that diminished PA satisfaction coefficients, after entering intrinsic motivation, to predict affective organizational commitment ( $z = 5.13, p < .001$ ) was statistically significant.

In addition to measuring the significance of diminished coefficients of the independent variable on the dependent variable after entering the mediating variable; it was interesting to know the effects size of the independent variable on dependent variables before and after entering the mediating variable. As shown in Table 5, the total effect of PA satisfaction on affective organizational commitment was .34. Out of this effect; direct effect of PA satisfaction on affective organizational commitment was .21, and indirect effect of PA satisfaction on affective organizational commitment through intrinsic motivation was .13. Indirect to total ratio was .38 which means 38% effect of PA satisfaction on affective organizational commitment goes through the mediating variable intrinsic motivation.

**TABLE 5**  
**DIRECT AND INDIRECT EFFECT SIZE (COEFFICIENTS) OF THE PAS ON AOC AND TI**

Effects Size	Dependent Variables
	AOC
Total effect of PA Satisfaction on AOC	.34
Direct effect of PAS on AOC	.21
Indirect effect of PAS on AOC via IM	.13
Indirect to Total ratio	.38

Independent Variable = PAS, Mediating Variable = IM

## DISCUSSION

This study found that there was direct impact of PA satisfaction on affective organizational commitment. This finding is consistent with different prior studies, like Fakharyan et al. (2012), Vignaswaran (2008), and Kuvaas (2006b). In the case of direct relationship between PA satisfaction and intrinsic motivation, this study found the positive and significant relationship. Theoretically, Pettijoh et al. (2001) have stated that by reducing ambiguity through feedback and discussion, PA satisfaction may positively affect the resulting level of motivation exhibited by employees. Likewise, Kim and Rubianty (2011) have stated a PA system that is perceived to be fair and acceptable in terms of distributive, procedural, and interactional aspects would positively affect intrinsic motivation. Similarly, the findings of this research consist with Fakharyan et al. (2012), Vignaswaran (2008), and Kuvaas (2006b). Likewise, this study found that there exists a positive direct impact of intrinsic motivation on affective organizational commitment, which shows similarity with numbers of prior studies like Fakharyan et al. (2012), Vignaswaran (2008), Karatepe and Tekinkus (2006), Kuvass (2006b), and Ganesan and Weitz (1996). Such similarities of findings with theoretical expectations as well as empirical findings indicate that established theories are strong and they are not affected by the contexts.

As expected, this study found that intrinsic motivation has moderated the relationship between PA satisfaction and affective organizational commitment. But moderation of intrinsic motivation was antagonistic. Introduction of a moderating variable changes the direction or magnitude of the relationship between independent and dependent variable. A moderation effect could be (a) enhancing, where increasing the moderator would increase the effect of the predictor on the outcome; (b) buffering, where increasing the moderator would decrease the effect of the predictor on the outcome; or (c) antagonistic, where increasing the moderator would reverse the effect of the predictor on the outcome.

Regarding antagonistic moderation, perhaps one of the novel findings, this study indicated that PA satisfaction comparatively strong but negatively impacts on affective organizational commitment for those employees who have a high level of intrinsic motivation and vice versa. Whether high, or medium or low level of intrinsic motivation exist in the relationship between PA satisfaction and affective organizational commitment; it applies the antagonistic moderation. Possible causes can be that intrinsically motivated people are self-managed and self-controlled; they do not like comments from supervisor either it is about their strength or weakness. Due to their intrinsic motivation, they are already excited, involved, committed, energized, and psychologically empowered. Comments about their career development, work- life, roles and responsibilities in organization, personal goals etc. from supervisor (or others) may threat their self-esteem. If, intrinsically motivated people feel PA activities are threatening their self-esteem and development, then it may lead negative impact on affective organizational commitment.

Out of different PA methods, a particular method can be the best suitable for the particular context. For example Management by Objective methods can be more effective than the Graphic Rating Scale method for managerial and professional employee rating. Moreover, performance appraisal systems are not generic or easily passable from one organization to another or one designation to another. Their design and administration must be tailor-made to match with a particular employee and organizational characteristics. Therefore, the application of the generic performance appraisal method for all types of employee might be the other possible causes of an antagonistic moderating effect of intrinsic motivation in the relationship between PA satisfaction and affective organizational commitment. Because, if intrinsically

motivated people felt they are not assessed as what they are and rated in predetermined standard format. Then, they do not feel their own compatibility with current organization which may leads to negative affective organizational commitment.

Though, to the best of literature reviewed in the study, there were few empirical evidences regarding moderating role of intrinsic motivation between PA satisfaction and affective organizational commitment. Finding of this study did not show similarity with the findings of a prior study carried out by Kuvaas (2006b) in Norwegian banking context who reported that there was no moderation of intrinsic motivation in the relationship between PA satisfactions and affective organizational commitment. Intrinsic motivation depends not only on innate qualities common to all people, but also on socialization aspects of corporate culture that support proactive work behavior (Peterson & Ruiz-Quintanilla, 2003). So, logic for such inconsistent findings can be the adaptation or not the particular culture (e.g. collaborative and cooperative) in the organization.

This study found that intrinsic motivation mediates the relationship of PA satisfaction to affective organizational commitment. This finding is consistent with the prior study of Fakharyan et al. (2012) and Vignaswaran (2008) but not with the study of Kuvaas (2006b). Such inconsistencies indicate that theoretical proposition; intrinsic motivation mediates the relationship of PA satisfaction to affective organizational commitment are also context dependent and requires further empirical testing. Another important and novel finding of this study is a measurement of the effect size of PA satisfaction to affective organizational commitment that goes directly and indirectly via intrinsic motivation. Apart from the total effect size; only 38% effect of PA satisfaction on affective organizational commitment goes through intrinsic motivation.

### **Practical implication**

Employee's affective organizational commitment was positively affected by both PA satisfaction and intrinsic motivation; which means organizations can increase employee's affective commitment by increasing PA satisfaction and intrinsic motivation. Intrinsic motivation has antagonistically moderated the relationship between PA satisfaction and affective organizational commitment. Here, the organization should consider the level of employee's intrinsic motivation while increasing affective organizational commitment by increasing PA satisfaction. There was a relatively negative strong prediction of PA satisfaction on affective organizational commitment for those employees who had a high level of intrinsic motivation and vice versa. The organization can focus to increase affective organizational commitment by enhancing PA satisfaction for those employees who have low level (or zero level) of intrinsic motivation. So that, relatively, the marginal decrease of PA satisfaction on affective organizational commitment becomes lower. Relationship of PA satisfaction to affective organizational commitment has been mediated by intrinsic motivation. Being affective organizational commitment is positively affected directly by PA satisfaction as well as indirectly via intrinsic motivation; the organization can increase affective organizational commitment by increasing PA satisfaction in a way that increased PA satisfaction should cause to increase in intrinsic motivation. So that organization can be benefited to increase affective organizational commitment directly by increasing PA satisfaction (i.e. .21, direct relationship) and indirectly through intrinsic motivation (i.e. .13, indirect relationship)

**Theoretical implication**

Novel theoretical contributions of this study are; firstly, the intervention of intrinsic motivation in the relationship between PA satisfaction and affective organizational commitment is negative; means original positive association of PA satisfaction with affective organizational commitment becomes negative when it is interacted with intrinsic motivation. A marginal decrease on employees' affective organizational commitment due to PA satisfaction is lower for those employees who possess low level of intrinsic motivation and vice versa. This finding can be a base for further study and analysis in the literature of intervention of intrinsic motivation in the relationship of PA satisfaction to affective organizational commitment. Secondly, out of the total effect of PA satisfaction on affective organizational commitment; 38% effect size goes through the mediating variable intrinsic motivation. These findings can be interesting issues to theoretician for further discussion and testing in the literature of the mediating role of intrinsic motivation in the relationship of PA satisfaction to affective organizational commitment. The direct impact of PA satisfaction on affective organizational commitment and intrinsic motivation on affective organizational commitment are consistent with prior number of studies (e.g. Fakharyan et al., 2012; Kuvaas, 2006b & Vignaswaran, 2008). Such consistencies of findings in different contexts reveal that the theory can be generalized.

**Critiques of the Study**

Despite Common Method Variance (CMV) is widely regarded as a serious threat to the validity of findings based on self-reports, there is insufficient research on its confounding influence (Lai et al. 2013). However, Podsakoff et al. (2003) have suggested different procedural remedies for controlling findings that may deviate due to common method bias (more discussed in the methodology section). Out of their suggested remedies; one technique (i.e. obtaining measures of the predictor and criterion variables from different sources) was not considered in this study. It is one of the issues to be addressed in obtaining self-reported perceptual data. Because one of the major causes of CMV is obtaining the measures of both predictor and criterion variables from the same rater or source, one way of controlling for it is to collect the measures of these variables from different sources. But all the measures in this study were obtained from the same sources at a time. Moreover, Harman's single-factor test that implements principal component factor analysis of all the variables in the model showed that first factor explained 27.62 % of the variance. One concludes that the common method bias is serious when the analysis retains only one factor or a single factor explains the most variance (Podsakoff, et al., 2003). Though, this result does not show the serious problems of common method bias, there is room to improve it because 27.62 % of the variance was explained by first one factor out of the five factors in Harman's single-factor test.

PA satisfaction is the predictor variable in this study. There are different methods of performance evaluation with own rating scale format. A wide range of rating scale formats can be used for PA. It is arguable that differences in rating scale formats could have influence on its dependent variables. So, the rating scale format cannot be ignored to determine the level of satisfaction with PA. Tziner et al. (2000) have concluded that ratees' satisfaction with PA was highest and their perceptions of performance goals were more favourable when using BOS (Behavioral Observation Scale- which asks raters to report the frequency of specific job-related behaviours). Trainer and associates further added that different behavioural-oriented rating

formats can enhance or inhibit the developmental applications of PA. But this study has not considered the rating scale format which can be one of the important facets of PA satisfaction and that can cause its moderating, mediating and dependent variables.

Different controlling variables are whether controlled or not while measuring predictor variable (here, PA satisfaction) significantly impact on its explained variable (here, affective organizational commitment). Ratees' perception of perspective use of PA result can be one of the controllable variables to determine the employee's PA satisfaction level. So, perceptions of PA use can be one of the important factors to be considered while measuring PA satisfaction, as they affect both rater and ratee attitudes and behaviours. Boswell and Boudreau (2000) concluded that the perceived developmental PA use positively associated with both PA satisfaction and satisfaction with the appraiser, but the effect of perceived PA use for evaluation was non-significant. Boswell and Boudreau added if an organization states that the PA is used for a certain purpose (for example, individual development) but the employees do not feel it is actually for that purpose, attitudes may be more negative in comparison to when an organization succeeds in matching perceptions of use as stated. Actually, this study has not considered the employees' perception of perspective use of PA, though PA satisfaction measuring items were only about the developmental use of PA. Organizations should perhaps make the developmental aspect of the PA process clear so that employees understand and believe that a primary purpose of their PA is for job and career development. Having said this, organizations should be careful to match perceptions to reality, so that employees perceive development feedbacks are important components of the appraisal process and react favourably.

Likewise, gap between employees' PA event and measuring its response is another factor to be considered while measuring PA satisfaction. It is common in PA practice that many organizations conduct the PA on an employee's anniversary date. But it is possible that survey responses can be influenced by the most recent experiences. So investigating employees' reactions immediate after PA reveals more realistic information. But this study has not considered such factor.

Another factor can be considered while measuring PA satisfaction is the role of Core Self-Evaluation (CSE) of an individual that may cause differences in responses regarding feedback from the PA. Individual CSE represents a stable personality trait which encompasses an individual's subconscious, fundamental evaluations about themselves, their own abilities and their own control. According to Judge et al. (1997), CSE is a broader, higher order trait consisting of four evaluations-focused and fundamental personality traits. They are : (1) self-esteem – i.e. the favourable or unfavourable attitude toward the self (Rosenberg, 1965), (2) generalized self-efficacy – i.e. the evaluation of one's capability to mobilize motivation, cognitive resources, and courses of action needed to exercise general control over many events (Judge et al., 1997) (3) emotional stability - i.e. the tendency to be emotionally stable and steadfast as opposed to insecure, guilty, and timid (Costa & McCrae, 1988), and (4) locus of control- i.e. the degree to which people believe they can control events and outcomes in their lives (Rotter, 1966).

From the definition it can simply be argued that individuals who have high core self-evaluations will think positively themselves and be confident in their own abilities. Conversely, individuals with low core self-evaluations will have a negative appraisal of themselves and will lack confidence. Empirical evidences show that higher CSE were positively associated with both higher satisfaction and goal commitment following the PA discussion. Kamen and Annen (2010) tested that individuals with high CSE were more satisfied and motivated because they were more likely to experience having a voice (their own opinion) during the appraisal process. Satisfaction and goal commitment following the PA discussion are related to PA satisfaction. Meta-analytic results, carried out by Chang et al. (2010) support the relation of CSE with various outcome variables, including job and life satisfaction, in-role and extra-role job performance, and perceptions of the work environment (e.g., job characteristics and fairness). Therefore, consideration of control of CSE while measuring predictor construct (PA satisfaction) seems meaningful, but it is not regarded in this study.

As discussed in the previous paragraphs, numbers of issues to be addressed for refinement of the findings are raised as the critique of this study. Further study's findings will be more generalizable if it is carried out addressing these issues, like: common method bias, performance rating scale format, ratee's perception of perspective use of PA, timing of PA event and measuring its response, corporate culture (e.g. cooperative culture, innovative culture, and supportive culture), employee's core self-evaluation etc.

## THE PROBLEMS OF PEOPLE'S RESETTLEMENT POLICY IN THE BUKHARA REGION IN 1950-60s

**Rizayev Baxtiyor Nazarbayevich\***

\*Senior lecturer of the chair of "World.  
History", Bukhara State University,  
UZBELISTAN

### ABSTRACT

*In the following article the issues of the people's resettlement policy on the basis of planning in the region of Bukhara, result of resettlement measures, the essential issues related with the co-operation between the government of Uzbekistan SSR and regional authorities are revealed in the framework of archive sources.*

**KEYWORDS:** *Resettlement, Plan, New Land, Households, Decision, Privilege, Propaganda, Housing, Social Facilities.*

### Introduction

During the Soviet government's resettlement policy, it faced financial, logistical, housing, social facilities, and a number of other problems. The central government has developed a number of measures aimed at solving these problems and put them into practice. However, it took a long time for a mechanism to fully address the problems of resettlement policy to be formed. The plans designed to solve the problems did not take into account the stereotypes and mental characteristics of the republics of the union and the peoples living in them. Republican governments would often have to deal independently with problems that arose during the resettlement policy process. However, the normative and legal documents set by the center limited the independence of the allied republics. In this case, it is possible to witness that the process of timely and positive solution of problems has become incredibly protracted.

During the resettlement policy implemented in Uzbekistan in 1950-1980, there were unspeakable problems. In particular, the planning of resettlement activities, the involvement of migrants in the resettlement process, registration of their documents, transfer from one place to another, relocation of households, freedom and privileges for migrants (providing them with loans, livestock, land for private farming, tax exemptions, housing, etc.) the organization of economic life for new settlers and the mass return of migrants are include such as issues.

---

## LITERATURE REVIEW

In 1950, a plan to relocate 1,100 households in Bukhara region was approved from above and submitted to the regional administration for implementation. Under the pressure of the center, the plan approved by the Government of the Republic did not take into account the internal potential of the region. By August 1950, the republican administration realized that it had made a mistake in developing a plan to relocate the households. On August 28, 1950, by the decision of the Council of Ministers of Uzbekistan No. 1539, the resettlement plan of the region was reduced to 500 households [3.P.278]. Despite the reduction of the resettlement plan for the province, it was intended to maintain the overall volume set by the center. That is, the relocation of 16,000 households indicated by the Center for 1950 [5.P.33] while maintaining the plan, a total of 1,100 households in the country were reduced, while 1,100 households were added to Tashkent region [3.P.278]. It is necessary to emphasize that in the years when Stalin ruled the state, the decisions taken in the center would reach regional executive power in a week or two. Although resettlement measures in the Central Asian republics were much slower than in the central regions of the USSR, very deliberately short deadlines were set for the implementation of the decisions. When a comparative analysis of the resettlement plan and the housing plan for mobile farms is made, the discrepancy in this regard becomes apparent. For example, the relocation plan was adopted on January 28, 1950, while the housing plan was adopted on August 28, 1950 [3.P.299]. As a result of the irrationality, the displaced population was accommodated in temporary and abandoned buildings. This led to a mass return of migrants. For example, in Bukhara region this year, 21 of the farms relocated due to housing problems decided to return to their former places of residence [3.P.299]. In this case, of course, the regional administration has made a “worthy contribution” to making the resettlement policy more complex. In other words, the propaganda aimed at attracting migrants from the areas where the resettlement is planned, the explanatory work on the benefits for farms, was completed in a timely manner in the Kazakhs.

### Main part

The issue of selection of relocated households was even more tragic, as the issue was resolved in the cabinet by mutual agreement of the inspector of the regional relocation department, the district party committee and the representatives of the agriculture department. The importance of explanatory and propaganda activities was highly valued by Soviet government officials. For this reason, clear mechanisms have been developed to carry out explanatory work in the areas where resettlement is planned and intended. In the process of attracting and selecting migrants, the resettlement authorities were expected to make effective use of the media: (handouts (leaflet), posters, brochures, photovoltaics, etc.) newspapers, radio, movies, various publications. In the Uzbek SSR, the publication of material on resettlement in the official publications of the central, regional newspapers or district committees was very limited. But in other regions of the Soviet Union, the situation was different. In 1952, for example, an average of eight volunteer organizers worked in each of the Kirov Oblast's resettlement districts in the Russian Federation. There were also three and four radio sessions in each district. In the absence of a radio line, special telephones were connected to the broadcast, and at least 40-50 individuals organized advocacy activities at the meetings [11.P.131]. In the analysis of the reports of the General Directorate of Resettlement, it was noted that public awareness campaigns on relocated farms in Uzbekistan will be organized with the participation of a representative of the regional resettlement department and 15 (non-state) organizers [2.P.42]. But representatives of the Bukhara regional

executive branch and the party body could not secure the participation of the representative of the directly responsible person (representative of the regional resettlement department) in the meetings, imposing public explanatory work on the kolkhozs farms. As a result, the selected households for relocation could not meet the requirements of the government. For example, the official letter sent by the chairman of the Gijduvan district party committee to Nabiev by the Kagan district executive committee is the basis for our opinion. In it: “Khalikov Shirin, a member of the Lenin kolkhoz in the Gijduvan district executive committee of your kolkhoz council, moved to a mobile farm on the Akhunboboev kolkhoz in the Uba desert village council of the Kagan district. Shirinova Orzi, the wife of Khalikov Shirin, and her daughters Shirinova Olima and Munavvara are still working on the Lenin collective farm in your village council. We ask you to instruct the chairman of the kolkhoz to transfer the comrades named in the farm of Khalilov Shirin to the kolkhoz named after Akhunboboev in the village council of Uba Choli, Kagan district [7.P.88]” - said in the archive materials. We can witness that many mistakes were made during the organizational selection process during the entire relocation period. We can witness that many mistakes were made during the organizational selection process during the entire relocation period. For example, in the 1970s, volunteers from Namangan region moved to the 29<sup>th</sup> state farm named after Murodov in the Bahoristan district of Kashkadarya region. For example, in the 1970s, volunteers from Namangan region moved to the 29<sup>th</sup> soviet farm named after Murodov in the Bahoristan district of Kashkadarya region. They were welcomed, provided with jobs, housing, and a decent salary. However, some of the migrants are dissatisfied with the work after working for several weeks and demand to be paid more than their labor, allocating a few hectares of land for the land. When they learned that the state farm did not have this opportunity, they decided to go back. Apparently, in the Namagan region, the selection of volunteers was done irresponsibly, and those who were trying to earn a living did not notice in time” [10.P.56-58], - said one of the sources. The issue of selection is an important component of resettlement policy, which determines the order of selection of migrants, depending on the type of farm established on the new land. Great attention is paid to the selection of exemplary and hard-working population with experience in cotton growing in agriculture. However, mistakes and shortcomings in the organization of advocacy events had a negative impact on the organizational selection process. A 1957 report by the “General Directorate of Resettlement” focused on the issue of organizational selection, saying: “Of the 304 households selected by the Verkhne-Volinsky District Executive Committee for resettlement, 87 were former mobile households, locals, or other collective farms in the district. Those who were transferred to the kolkhozes-B.R) were composed of settlers [2.P.51]. As a result of monitoring the situation in the main resettlement centers, the Resettlement Department was able to identify a number of shortcomings. As a result of monitoring the situation in the main resettlement centers, “The Resettlement Department” was able to identify a number of shortcomings. If the resettlement measures taken in the Republic were analyzed, it was natural that the scale of the problems would increase. Of the 233 households selected for relocation by the Bekabad District Executive Committee, 80 were from the Dzerzhinsky collective farm, specifically the former relocated ones. Similar cases were reported in the collective farms of Mirzachul, Syrdarya and Kuyi-Chirchik districts [2.P.21].

Upon completion of registration and clearance for resettlement, the delivery of vehicles (trains, trucks, buses, etc.) directly to the designated address by the state would begin. The Council of Ministers of the Uzbek SSR entrusted the regional executive committee with the task of

relocating the inter-district farms to a new location. Various organizations in the region have been involved [4,334] in order to transport migrants to their destination. Various organizations in the region have been involved [4,334] in order to transport migrants to their destination. Various organizations in the region have been involved [4,334] (Regional Department of Agricultural Machinery, Department of Agriculture, Department of Agriculture, State Farms, various trusts) in order to transport migrants to their destination.

But there were unexpected problems when the convoys mobilized for the evacuation arrived at the destination.

**Firstly**, the number of migrants turned out to be lower than expected.

**Secondly**, there was a problem with the fact that the property of the farms, whose relocation was envisaged, was not clearly allocated.

**Thirdly**, instead of the households that applied for emigration, those who did not participate in the competition, those households that were not formalized, gathered in the Centers of relocation.

Realizing that the brick had moved from the mold, the district executive committee and the supervisor of the regional relocation department decided to relocate any farm that had gathered by mutual agreement and expressed a desire to relocate. As a result, unexpected problems began to arise. In particular, on June 3, 1950, the chairman of the Executive Committee of Kagan district, Comrade Isabaev, was sent a message by the chairman of the Executive Committee of Gijduvan district, Nabiev. In particular, "I would like to inform you that the Executive Committee of Gijduvan district has sent a letter to you that Turaev Egam, a member of the Lenin collective farm of Gavshun village council in our district, has moved to your district on a mobile farm. Among the things that took the above-mentioned comrade with him was the belongings of Karimov Tokhtani, a member of the same collective farm. That is why the district executive committee asks Karimov to bring Tukhta's belongings from Turayev Egam"[8.56]. From this point of view, it will be possible to draw such a conclusion- that it was not possible to collect settlers in specially allocated areas, as a result of which the technicians went inside the addresses where they live and loaded with direct loads. Otherwise, there would be no cases of taking away something related to the neighbor. It was also questionable whether Uzbekistan adhered to the principle of voluntariness set out in the decision of the Council of Ministers [5.P.112].

The provincial administration has managed to relocate the households, albeit with great difficulty. The next problems are their placement, organization of economic life, allocation of benefits and housing, etc. Mistakes made during the selection and relocation of migrants also had a negative impact on placement. The success of the resettlement policy was assessed by the fact that the resettled population settled permanently in these areas. The resettlement of people living in the same area, ie relatives, neighbors and neighborhoods, is explained by the guarantee of their permanent residence in the new land. This practice has been tested in other regions of the country and has yielded positive results. During the construction of the South Surkhan Reservoir in the 1950s, 8 villages were relocated to the Oguz massif, while during the construction of the Tupolang Reservoir, 1 village was relocated en masse [12.P.107]. However, the provincial administration took a different approach, selecting 3 to 10 households from each collective farm to relocate. We can see an even more complicated situation when thinking about placement (Appendix 1).

Plan for the selection and placement of the population to be resettled in Bukhara region in 1950-1952 [9. 4, 16, 30, 313, 127]

### Results

The disparity of resettlement and placement plans is evident in the table. In 1950, 1,000 households in the province were relocated, but by June, 45 households had applied for relocation and were housed in the district archives. Apparently, it would not have been as if he had also volunteered work on formalization. In addition, the relocation of one, two or three households

from each village may have had a negative impact on the process of adaptation of settlers, and as soon as the relocation measures were taken, there were cases of returning of household. The procedure of registration of the resettled population was introduced in cooperation with the district executive committees and the resettlement department of the regional executive committee. However, a number of problems arise in this regard due to the fact that the normative and legal documents related to the registration do not reach the region in a timely manner, and the documents submitted to the executive committees are not fully understood by officials. The district executive committees are obliged to submit a written report to the region every 10 days on the progress of the resettlement activities and to submit their list the day after the resettlement [4.P.135]. The exact timing of the resettlement was set out in government decisions. However, shortcomings in the planning and selection process also had a negative impact on the implementation of regulations. In particular, 24 hours for the resettlement of the displaced population, 3 days for the allocation of land to the farmland, 10 days for the issuance of loans to low-income Farms, 1 month period for the purchase of cattle, 6 months for the construction and repair of houses were determined. However, it was not possible to complete the census in the region within the specified timeframes. Reporting forms developed by the General Directorate of Resettlement for the registration of mobile farms (Form 636 registration of mobile households), placement (preparation of reports in Form 37) were not submitted to the regional resettlement department in a timely manner. As a result, the Council of Ministers of the Uzbek SSR limited itself to reporting to the General Directorate of Resettlement on the activities of relocated farms by the district executive committees (Figure 4) [1.P.21]. New problems began to arise under the influence of mistakes made in the process of registration of migrants. These include timely provision of housing, credit allocation, use of benefits, tax exemptions, etc. For example, in one of the two letters sent by the Executive Committee of the Bukhara Regional Soviet of Workers' Deputies to the Executive Committee of the Kagan District on April 22, 1952, to Comrade Isabaev: "The resettlement department of the Bukhara regional executive committee asks you to collect and prepare all the tickets for mobile households in the district executive committee for registration. Keep in mind that if the tickets of mobile households are not issued in time, they will definitely be subject to agricultural tax. When all the tickets have been collected, the district executive committee should inform the department"[6.P.18].

## CONCLUSION

Unfortunately, it was practically impossible to organize the work within the time frames specified in the regulations. As a result, the allocation of existing freedoms and privileges, which had been promised to resettled households and should be the basis for them to live in the new land, has been delayed. In the 1950s and 1960s, planned relocation measures at the regional level did not justify themselves.

### ABSTRACT

*In this article, the life and teachings of Bahauddin Naqshband as a holy text were set forth. The aspects of studying the teaching of Bahauddin Naqshband as a Tatar saint in higher education are highlighted.*

**KEYWORDS:** Weaving, Teaching, Kimhob, Bahauddin Naqshband, Time, Soul, Definition, Shokh Naqshband, Pattern, Dhikr.

### INTRODUCTION

As a result of reforms in the field of education after the independence of our country, it became possible to study the teachings of our ancestors and apply some of them in higher education. This article discusses the teachings of Bahauddin Naqshband and provides information on the life, teachings and creative activities of Bahauddin Naqshband as a weaver in technology and equipment for higher education 5321600-Light industry.

Bahauddin Naqshband was born in the month of Muharram 718 of the Hijra, which coincides in time from approximately March 5 to April 3, 1318 A.D. The deposit of Bahauddin is the village of Kasri Hinduwon near the city of Bukhara. At present, this place is located in the Kagan district of the Bukhara region. After the birth of Bahauddin Naqshband, this village became known as Kasri Orifon and is still known to pilgrims.

The real name of Bahauddin Naqshband is Muhammad. "Bahauddin" is a nickname for his status, achievement and greatness.

“Baho” is an Arabic word meaning: “price”, “beauty”, “light”, “accuracy”, “impeccability”. Muhammad ibn Muhammad al-Bukhoriy has reached such heights that, looking at it, one can see the light, price and beauty of the true faith of Islam, illuminating the thoughts and hearts of those who believe in human God.

The name Shokh Naqshband (ruler of carvers of patterns) was obtained by knitting and drawing patterns on matter - kimkhob (brocade), together with his father. In fact, Naqshband means interweaving a thin thread of patterns of faith, truth and truth, which formed the basis of his teachings, as well as Allah in his heart, and, therefore, the ability to bind the souls of people.

Bahauddin preached: “Naksh gang, badil gang” (whip pattern, pattern in the heart). The true meaning of the name Bahauddin Naqshband was revealed by Alisher Navai in his work “Hamsa”, in the first book “Hairatul Abror”.

Muhammad Porso, in RisolaiQudsia (Treatise on Holiness), wrote the following lines about the excellent qualities of Bahauddin:

He is a light of holiness, a mirror image,  
Answers to questions he is a spring.  
Out of difficulties, he will indicate the ideal  
Clear verb, as if crystal waters  
The flow of poetic speeches and his words.

The father of Bahauddin Naqshband Sayyid Muhammad Bukhoriy ibn Sayyid Zhaloliddin was a craftsman weaver of cloth kimkhob (brocade). Bibi Orif's mother was from the Khojai Khizr clan.

Another three-day-old baby, Bahouddin Naqshband, is brought up by Muhammad Boboi Samosiy and remains his spiritual mentor until the end of his life. Bahauddin Naqshband said: "We received moral education and teaching from Sheikh Muhammad Boboi Samosiy."

Naqshband reached the level of uvais due to spiritual training Abdulhalik Gizhduvoni - KhojaiJahon (died in 1220), the teachings of which were based on the tariqa hodjagon. “This vision became his “second initiation” because Gijduvani ordered Bahauddin to perform a “silent” dhikr, as opposed to a “loud” one, which he held to the end of his life. At the behest of Adbulhalik, Gijduvoni Naqshband meets Amir Kulol (died 1370) and learns from him.

While Naqshband studied the basics of Khojagon with Khoja Amir Kulol, he dreamed of one of the feasts of the Yassaviya teachings of Hakim - Suleiman Bokirgoniy, who sent him to study with the Turkic sheikh Halil. Around the fall of 1336, Naqshband met with Khalilin Bukhara and became his murid. He has been studying with him for 12 years. Bahauddin six years - from 1336 to 1341. serves Khalil. JS Trimmingham writes: "Khalil was the son of Yasavurov of one of the Chigatay khans and from 1341 to 1347 was the Sultan."

In 1341, Khalil became Sultan Khalil and was called Gozonkhan. During his reign, Bahauddin Naqshband continues to serve him and learn from him. After the collapse of the Gozonkhan sultanate, 29-year-old Bahauddin settled in the village of Revartun and devoted the rest of his life to Sufism.

After Khalil - Sultan Khalil, Bahauddin Naqshband studied for seven years (1347-1354) under Amir Kulol, from 1354 to 1360. Serves with Orif Deggaroniy and 3 months studies with Sheikh Kusam. In 1361, he began to create an independent teaching of Naqshbandi.

Bahauddin studied with such well-known sheikhs of the Hodjagontariqah – Abdulholik Gizhduvoni, Hazrat Azizon, Muhammad Boboi Samosiy, Hazrat Amir Kulol and Orif Deggaroniy. He also studied at the feasts of the Yasaviya tarikat - Khalil and Sheikh Kusam, from whom he studied the most advanced thoughts of achieving perfection of a person, on the basis of which he began to develop a new doctrine of improvement - Naqshbandiya. After the death of Amir Kulol in 1370, he independently organizes a new teaching in the tariqa. This doctrine of tariqa, which originates in Bukhara, is called “Naqshbandiya”, after which it becomes the world famous course of the doctrine of tariqa.

The sources cite facts that Bahauddin Naqshband for 22 years was spiritually trained by Hakim Termiziy. In particular, Naqshband received spiritual knowledge from Uvais Karaniy, Mansur Hallodge, Boyazid Bistomy and Zhunaida Bagdodiy.

At the heart of the Nakshbandi tariqah are 11 principles. The 8 principles of the Khojagon teaching were taken in the Naqshbandi teaching and 3 new principles were added to them, which can lead people who do not understand the true purpose of man out of oblivion and darkness, and direct them to the true path, the path of faith in Allah.

Naqshband for the improvement of humanity introduces three new principles:

- “Vukufi zamoni” (awareness of time) - to keep abreast of time and keep up to date;
- “Vukufi adadi” (quantitative awareness) - awareness of the laws of life;
- “Vukufi kalbi” (awareness of the heart) - look into your heart and act as Allah commands the heart, to be able to hear the call of the heart and the voice of the mind.

Naqshband enriched the concepts of tasawwuf about the heart, time and number, discovered new traits and was one of the first to introduce these concepts to perfect a person. The doctrine founded by Bahauddin Naqshband “Naqshbandiya” has global significance. Alouddin Attor, Muhammad Porso, Alouddin Gijduvoni, Yakubi Charkhiy improved this teaching, Khoja Ahror Valiy spread this teaching throughout the world. In the modern world, Naqshbandiya is distributed under the names "Naqshbandiya - Muzhaddidiya", "Naqshbandiya - Holiday".

Bahauddin Naqshband died on Monday night of the third day of the month of Robbiul Aval in the year 791 of the hijra, i.e. March 2, 1389. His grave is located in the village of Kasri Orifon, near Bukhara.

Bahauddin Naqshband knew Arabic, Turkic and Persian. He is considered the pillar of his time, who studied the Koran and hadith, the holiest man and righteous man who received the name of His Holiness Shokh Naqshband during his lifetime. This holy man left the doctrine of Naqshbandi, the work "Avrod" and wise sayings as a legacy.

In St. Petersburg, we were lucky to find and translate a copy of the work "Avrod". And also we managed to learn about four comments on this work. The writings of Bahauddin Naqshband have been preserved in the writings of Muhammad Porso “Risolaikudsiya” and Yakub Charkhiy “Risolaiyusiya”. The quatrains of Bahauddin Naqshband also survived. When asked why he did

not hire servants, he replied: "Slavery and slavery are incompatible things!" The following two bates belonging to him are given in the sources:

"I don't have a carpet, and there is no servant,  
There is no Turk in slavery and no squire.  
I lay in the night, as it should, like a dog,  
Moaning quietly, resting her head on her tail. "

These two bates are also his:

"Nobody we need us anything,  
Suffering for the missing is nothing for us  
Rags on the shoulders, our home is the grave,  
Since rock will overtake us - and mourning is useless to us".

One of his first students, Alouddin Attor, says about the path of Bahauddin Naqshbanda tarikata (the path): "The path of our Khoja was the path of the Fakra, renunciation of earthly goods for the benefit of mankind, loneliness in the name of Allah. His sacred words were filled with philanthropy. His virtue was immeasurable. A hadeeth was often sounded in his speeches: "Ibadat (Divine Service) consists of ten parts, nine of which are the desire for purity, and only one part is prayer."

Therefore, the motto of this teaching is "Dast ba koru, Dilba Yor" (hand in work, and the soul and thoughts about the Lord), "Dast ba koru, tan dar don Bosor" (hand in work, and the body in the market), "Dastba Koru, Madad Az Parvardigor" (hand in work, hope in God). Throughout his life, Bahauddin Naqshband always ate only "halal" food and bequeathed it to his students. The life path and teachings of Naqshband corresponded to the life path of the holiest of the holy people to the Prophet Muhammad (pbuh) and coincides with his moralizing. Therefore, Abdurahman Jamiy wrote the following lines about BahauddinNaqshband:

Mecca and Medina are sealed with holiness,  
Including Bukhara.  
Not All Given the Seal of Holiness  
Holiness became grace for Naqshband.  
You can't meet such a pearl everywhere  
The deposit of this pearl is Bukhara.

In 1993, the 675th anniversary of Bahauddin Naqshband was widely celebrated. In 2017, Decree of the President of the Republic of Uzbekistan No. F-4988 of July 11, 2017 on the 700th anniversary of Bahauddin Naqshband was adopted. From the foregoing, the following conclusions can be drawn: –Bahauddin Naqshband lived in the 14th century in Bukhara, he was educated, cognized the essence of being and the seventh feast (holiest) of Bukhara.

– Bahauddin Naqshband is the largest representative of the tasawwuf teachings and the founder of the Naqshband teachings.

- The work "Avrod" dedicated to the educational and spiritual education of man and his wise sayings have been preserved.
- On the basis of the teachings created by Bahauddin Naqshband, the ideas of industriousness, humanism, enlightenment, and the desire to know life that have not lost relevance in the modern world are promoted.

### CONCLUSION

- In conclusion, we can say that in the process of studying the teachings of Bahauddin Naqshband, the results of the work of a student engaged in his craft will increase by 2 times if he performs his profession with an understanding of the value of time, purity of soul, and laws of life. A person who knows the value of time does everything by planning and doing his job. Where there is a person who understands the purity of the soul, gossip is kept aloof.

A person receiving a message from the laws of life develops the ability to see uniqueness in the plural.

## INNOVATIVE CHANGE IN THE NATIONAL ECONOMY IS THE KEY TO INNOVATION IN ALL AREAS

**Djumaeva Mekhribon Abduvokhitovna\***; **Imomov Bekhruz Marat ugli\*\***

\*Basic Doctoral Student,  
Department "Pedagogy" of Bukhara State University,  
UZBEKISTAN

\*\*Master's Student,  
University of Cassino and Southern Lazio, ITALY

### ABSTRACT

*The article discusses such issues as innovative changes in the national economy, innovative activities, the role of innovative strategies in the socio-economic development of the country, the importance of choosing and implementing a long-term strategy for innovative updating of the economy.*

**KEYWORDS:** *National Economy, Strategy, Economic Strategy, Innovation, Social Sphere, Industry, Science And Technology, Scientific Work.*

### INTRODUCTION

One of the priorities of the transition to a market economy is innovative reforms in the economy, the modernization of radical innovations, which are based on ensuring macroeconomic stability, equipping enterprises with new technologies and equipment, and increasing the share of the private sector in the economy. This process, of course, implies the effective use of the country's innovative, economic potential, while at the same time increasing it.

The current state of the country's economy requires accelerating the pace of innovative changes in the national economy.

The experience of developed economies shows that the implementation of a deep, effective innovation strategy can be achieved only through the rational use of economic and natural factors of the country. In the transition to a market economy, the innovative formation of the economy is primarily due to sectors that ensure economic growth, which in turn leads to a reduction in the export of raw materials, the development of its processing, the preservation of foreign currency, and an increase in employment.

These factors, in turn, lead to the strengthening of our country's position in the world community through the implementation of innovative strategies and innovative activities in all areas.

Indeed, the country's active integration into the world economic system, the expansion and liberalization of the economy, and modernization based on innovation require special attention to the problems of ensuring sustainable economic growth in Uzbekistan.

The most general description of our century can be summarized in a nutshell - this is a period of innovation, changes in the life of society as a whole, which will determine the development of human destiny for the next two centuries. It was in this era of radical change that humanity entered the threshold of the third millennium. All the usual aspects of everyday life and the dynamics of society are changing.

The world is changing beyond recognition and requires a new understanding from scientists, long-term strategies of state and political representatives, that is, different thinking from the whole generation. The selection and implementation of a long-term strategy of innovative economic renewal plays an important role in the further development of the Republic of Uzbekistan.

Innovation is the introduction of innovations in any field of activity.

Another important factor in industrial production, such as labor, capital, natural resources and entrepreneurship, is the emergence of innovative resources, but there are some problems with the commercialization of scientific and technical projects, that is, their use for profit in market competition.

Innovation is the introduction of scientific innovations in any field of activity (scientific discoveries, innovations, scientific inventions, constructive projects, and so on), in particular:

- These scientific and technical innovations in the field of science and technology - computer, laser, microwave semiconductor technologies, integrated lines of communication and satellite communications, robotics, providing the operation of global networks of e-mail, mobile communications and the internet;
- In the energy sector - nuclear energy, synthetic fuel and food;
- In medicine, genetic engineering (DNA).

Numerous empirical evidence suggests that technological progress is the main driver of economic growth. In a market economy, small business and entrepreneurship play a central role in the innovation process, and innovation is the main competitive tool in industries with high rates of technological progress.

These observations are not new. In his book *The Wealth of Nations*, Adam Smith emphasizes institutions that support technological progress and economic development. Among economists of the first half of the twentieth century, Joseph Alois Schumpeter (1883-1950) occupies a special place. Its influence on modern economic thinking is no less than on the neoclassical school. It was this scientist who described the mechanism of competition, which stimulates innovation and is the main source of income in excess of the norm.

Schumpeter incorporated the strategic advantages and achievements gained through continuous improvement of the organization, product or production process into the concept of innovation or “introducing new combinations”. He indicated the following five cases:

- 1) preparing a new blessing;
- 2) introduction of a new production method;
- 3) the development of a new market;
- 4) the availability of a new source of raw materials or semi-finished products;
- 5) appropriate reorganization, for example, ensuring a monopoly position.

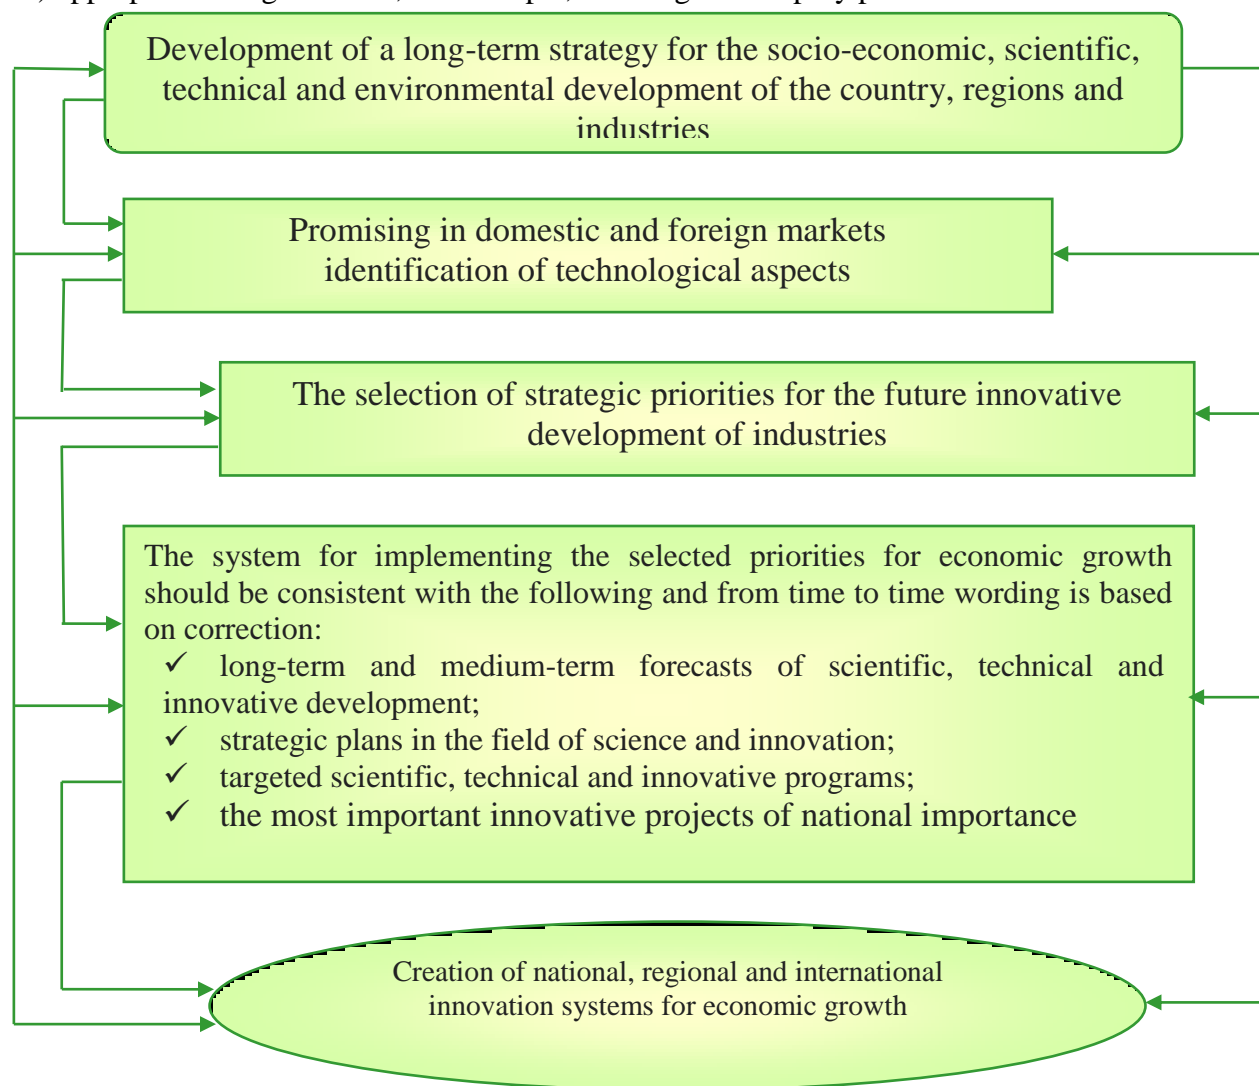

Figure 1. The mechanism and structure of the implementation of innovative growth strategies in achieving economic growth of industries.

It should be noted that the full provision of resources for the implementation of the selected priorities of economic growth is carried out on a multichannel basis:

- 
- budget financing for the development of innovative projects and programs in the non-productive sphere, as well as the most important innovative projects, targeted programs, strategic plans and forecasts, the distribution of budget funds for the entire period of the implementation of programs and projects;
  - providing tax and customs benefits for innovative programs and projects focused on individual priority sectors;
  - creating conditions for attracting private and foreign investment in such programs and projects;
  - organization of innovative and technological expertise of investment programs and projects in industries to give innovative content to investments.
  - In addition, the formation of innovative infrastructure should be focused on the implementation of selected priorities:
  - budget support for the development and expansion of the Central Bank to more actively support innovative projects;
  - the creation of the Republican Innovation Fund and local regional funds to support targeted priority programs and projects of an innovative nature, as well as state insurance companies for priority innovative projects;
  - the use of part of the reserve fund of the Central Bank of the Republic of Uzbekistan in one form or another to support large-scale innovative projects of a priority nature;
  - scientific expansion of scientific, technical and innovative infrastructure through the creation of technology transfer centers, innovative business incubators, innovation centers and so on;
  - creation of multinational companies and strategic alliances on an international basis based on the basic technologies and priorities that Uzbekistan can lead and successfully operate in the global market;
  - involvement of non-governmental organizations, academies of sciences, scientists, engineers, designers and managers in the implementation and promotion of innovative programs and projects in industry;
  - Creation of national, regional and international innovation systems focused on innovation and technological growth to achieve economic growth.

The formation of an effective mechanism of innovative growth in achieving economic growth of industries will allow in practice to realize the strategic and innovative function of the state in a market economy.

A feature of the intensive type of economic growth is that the expansion of production is achieved through a qualitative improvement in growth factors, in particular, the use of advanced technologies and the use of highly qualified and highly productive labor. In this case, the growth rate of the real volume of production will be higher than the rate of change in the total costs of its production.

In the early stages of the development of productive forces, economic growth occurs mainly on an extensive basis. The role of intensive growth factors in saturating production with machines and highly qualified personnel is increasing.

It should also be noted that the type of economic growth can be determined conditionally, since in real economic practice it does not occur in a “pure” form. Intensification is not just a feature of our time.

Intensive economic growth occurs after extensive growth, followed each time by the technological method of production - a method of the relationship of productive forces and qualitative changes in these components.

A number of arguments in favor of a positive future scenario. First, historical experience. Over ten thousand years of history, society repeatedly fell into the abyss, and each time it found the strength and mind in itself to get out of this situation, to step to higher peaks of development.

Secondly, the instinct of self-preservation and reproduction, the desire of each generation to enrich the inheritance left to it and provide it in the best possible way to the next generation, meeting the requirements of the time. This requires a correct understanding of the scale and structure of these requirements and problems, as well as the development and implementation of appropriate response strategies in every country, in every civilization and on a global scale.

Thirdly, the transition to a knowledge society and the formation of the noosphere also contribute to this.

In fact, it is a question of forming a global innovation system that responds to the innovative renewal of society that is taking place in the world.

Thus, at the crossroads of centuries and millennia, humanity is faced with a new theory of foresight, a strategic planning methodology and the need to assess the nature and consequences of basic (and sometimes periodic) innovation clusters in addition to a radically changed worldview (post-industrial scientific paradigm). Thus, the participation of civil society and its institutions - scientific, technical and engineering societies, inventors' unions, professional associations - is also important in the process of innovative creativity. Civil society should influence representatives of the central and local authorities elected by it in order to create favorable conditions for innovation.

## METHODS OF APPLICATION OF INFORMATION AND COMMUNICATION TECHNOLOGIES IN EDUCATION AND PROBLEMS...

**G.A. Ablizova\*; G.I. Aripova\*\***

\*Senior Teachers of Modern,  
Information Technologies Department,  
Uzbek State World Languages University,  
UZBEKISTAN

### ABSTRACT

*The organization of lessons using ICT in the educational process is the most effective tool in educating students. If each lesson is organized because of ICT using unique pedagogical technologies, this topic will be the most memorable for the student. This article examines the most efficient ways of teaching through the information and communication technologies.*

**KEYWORDS:** *Information Technology, ICT Tools, Interactions And Collaborations, Cooperation, E-Learning Platforms, Infrastructure, Teachers' Policies, Digital Content. ICT in the field of education*

### INTRODUCTION

Schools use a variety of ICT tools to share, create, distribute, store, and manage information. In some contexts, ICT has also become an integral part of educational communication through approaches such as the replacement of whiteboards with interactive whiteboards. The so-called “broken classroom” model is when students use their smartphones or other devices during the lesson and students watch lessons at home on a computer and use the class time for more interactive lessons. When teachers are trained in digital literacy and the use of ICT, these approaches lead to higher order thinking skills, provide students with creative and individual choices to express their understanding, and keep students in the community and in the workplace, which allows them to be prepared for the technological changes that are taking place. ICT planners should include followings: taking into account the overall cost balance, providing the necessary infrastructure and maintenance, coordinating investments with teacher support and other policies aimed at the effective use of ICT.

**Problems and discussion**

Digital Culture and Digital Literacy: Computer technology and other aspects of digital culture have influenced the construction and spread of knowledge and power around the world by changing the way people live, work, play and learn. Moreover, digital culture is increasingly harming the national and global economy. Digital literacy - the ability to search for information, view and produce information, as well as the critical use of new media for full participation in society - has become important for curricula. In many countries, digital literacy is being created through the introduction of information and communication technologies (ICT) in schools. Some common ICT curricula include one laptop per child: Cheaper laptops are designed for 1:1 use in school, with lower power consumption, lower cost operating system, and special software and network functions. However, delivering one laptop per child can be very costly for some developing countries. Tablets: Tablets are small PCs with a touch screen that allow access without a keyboard and mouse. Cheap training programs ("apps") can be downloaded to tablets, making them a versatile learning tool. The most effective applications develop high-level thinking skills and provide creative and individual choices for students to express their understanding. Interactive whiteboards or smart boards: Interactive whiteboards allow you to display, manage, drag, click, or copy projected computer images. Simultaneous handwritten notes can be taken to the board and saved for later use. Interactive whiteboards are associated with teaching throughout the classroom, not with student-centered activities. Typically, if ICT is available for students to use throughout the class, the level of student engagement will be higher. There can be hundreds of books in digital form and they are increasingly being used in the delivery of learning materials. Students - both educated and unwilling readers - have responded positively to the use of e-learning tools for independent reading. Features that can contribute to the positive use of e-learning tools include their portability and long battery life, the ability to respond to text and identify unfamiliar words. In addition, many classic books, the names are provided free of charge in the form of an e-book. Classrooms: A selective classroom model that includes lectures and hands-on activities through home-based computer-based learning and interactive learning can create an expanded opportunity and curriculum. There is little information about the results of teaching students in the classrooms where they study. Students' opinions about the classrooms they teach are mixed, but generally positive, as they prefer joint learning in class to lecture.

**ICT and teacher training**

Teachers need clear opportunities for professional development to assess the formation of teacher training, individual learning, access to Internet resources, and the ability to use ICT to develop student interactions and collaborations. It affects the general attitude of teachers towards ICT in the classroom, but it should provide clear guidelines on ICT teaching and learning in each subject. Without such support, teachers use ICT in skill-based programs that limit students' academic thinking. They are also needed by education managers, leaders, educators, and decision makers to support teachers as they change their subjects. .

**Ensuring the benefits of ICT investment**

Additional conditions must be met to ensure investment in ICT students. School policy should include minimum optimal infrastructure for ICT, including security measures such as stable and affordable Internet access and blocking of filters and sites. Teachers' policies should focus on

ICT literacy, the use of ICT in a pedagogical setting, and disciplinary skills. Successful introduction of ICT requires the introduction of ICT in the curriculum. Finally, digital content should be developed in local languages and reflect local culture. Ongoing technical, human and organizational support for all of these issues is essential for the use and effective use of ICT. Resource-limited contexts: The overall value of having ICT is enormous: teacher and administrator training, connectivity, technical support, and software, among others. In engaging ICT in classrooms, policy should take a growing path, creating and leading infrastructure. In some countries, instead of providing such tools to all students, schools have begun to allow students to bring their mobile technology (e.g. laptop, tablet, or smartphone) into the classroom. Own device. However, not all families have access to tools or service plans for their children. Schools must ensure that all students have equal access to ICT devices for learning. ICT in education includes the basic concepts and skills needed to initiate the pedagogically effective use of ICT to support and improve classroom learning, teaching and assessment.

Technology has many benefits for education, but it must be used wisely. Teachers need to use their experience as educators to make informed decisions about how to integrate technology.

### **General information about the course**

The use of information and communication technologies (ICT) can make a significant contribution to improving the quality of education and its effectiveness. This course is designed for teachers of all subjects who want to increase their knowledge of the use of technology in the classroom. It is important to learn how to use open learning resources, acquire new skills, create model lessons, and be aware of the potential weaknesses of ICT in education.

### **Lesson methodology**

Each module covers different aspects of the use of ICT in education. The course work incorporates your existing knowledge and experience and provides a useful learning environment with a good combination of theoretical and practical knowledge. Cooperation with ICT in the context of exhibitions and international groups will share the importance of cooperation and experience in the use of ICT in education.

### **Learning Outcomes**

Gain the skills and knowledge needed to create and implement e-learning platforms and incorporate digital technologies into the curriculum, depending on the interdisciplinary approach. You need to be prepared to use materials, practical ideas, and available online programs to support the development of your school or organization. Introduction of information and communication technologies, support of universal access to education. Supporting Open Learning Resources (OER) and an open learning environment, fostering collaboration between the education sectors, including students with disabilities. Develop key competencies such as critical thinking through the media and digital literacy, and the use of ICT. the quality and relevance of general education at all levels. It is necessary to review and develop personal and professional competencies, increase confidence in promoting the use of ICT in education, and support innovative and active pedagogies that respond to social and cultural diversity. A broader understanding of practices, policies, and systems is possible. Having a diverse education is about access to countries, mutual respect, the development of intercultural consciousness and the inculcation of common educational values. Colleagues from different nationalities within the

EU will share their experiences of intercultural learning, exchange views and build a network for future international cooperation. Knowledge of foreign languages, expansion of professional vocabulary and development of a wide range of language diversity in the EU.

### ABSTRACT

*The article analyzes the role of Puppet Theater, artistic traditions, as well as compliance of the ancient and modern styles in the Bukhara folk festivals. The information, given in historical sources, on nationality and the fascination of Bukhara puppetry and folk rope-walking is studied in comparative typological plan.*

**KEYWORDS:** *Traditional Performances, Puppet Theaters, National Culture, Seasonal Rites, Holiday Of Mehrzhon (Mehrzon), Holiday Of Navruz.*

### INTRODUCTION

During the years of independence, as in all spheres of social life, there have been radical changes in cultural life. Extensive opportunities have been created for the revival and development of national cultural traditions.

First of all, this was evident in the development of theatrical art, new theaters were built and put into operation. In 1991, state puppet theaters opened in Fergana, in 1993 in Khiva, and in 1994 puppet groups were opened in Kashkadarya and Namangan regional theaters. The Youth Theater in Andijan was transformed into the Andijan Youth and Children's Theater named after Abbos Bakirov in 1994. In August 1993, the Turkiston Palace was opened in Tashkent [4; 528]. In 2014, the 100th anniversary of the theater was widely celebrated in Uzbekistan.

Bukhara's ancient national cultural traditions, folk festivals and celebrations, theatrical performances and puppet theater reflect the social life of the people.

Bukhara has an integrated traditional system of celebrations and performances, with festivals and ceremonies taking place throughout the year, even a month. We classify the seasonal ceremonies of Bukhara people into the following categories:

- 1) winter rumors;
- 2) spring ceremonies - Navruz, shohmoylar (double issue), tulip or red flower festival, mud holding, "Sust Khotin";
- 3) melon festival from summer ceremonies, "Tea momo", etc .;
- 4) Autumn ceremonies - "Oblobaraka", "Yo Haydar" wind-calling ceremony, grape festival, etc. associated with the harvest. These performances are mostly theatrical.

### **Main part**

Navruz is a New Year's holiday celebrated at the beginning of the year, at the same time of day. It is based on the mythological views of the peoples of Central Asia that the ceremony can have a positive effect on productivity [2, 127-128]. These days, the seven sacred foods that adorn the festive table, including sumalak, halim, goja, the cooking of various dishes from spring greens, the special attention of the rulers to the farmers, the beginning of spring field work - all testify to the organic connection of Navruz with farming culture. The holiday of Navruz was associated with the religion of fire-worship, so in the early Middle Ages, Navruz and its associated rituals, games and performances were held in Zoroastrian temples. On the eve of spring, in the last month of winter, ceremonies were held to encourage the heat of the sun, and the Feast of Tabernacles was celebrated. "On this day, people lit big bonfires in their homes, sat around them, ate and had fun. Such a ceremony was held in connection with the supposed end of the winter cold "[6; 99-b.]. Information about such holidays can be found in Narshahi's book "History of Bukhara".

During the reign of Amir Muzaffar, Navruz was officially celebrated for almost two months. Shirbudin Park in the eastern part of Bukhara hosted festivals, various performances, national wrestling competitions. During the reign of Amir Abdullah Khan, Navruz festivals were reduced to one month Sadridin Ayni's memoirs provide detailed information about another ten-day campaign [1; 198-p.].

In Bukhara, the holiday of red (red rose) is widely celebrated: "In the shrine of the most holy place Hoja Bahaiddin were held great feasts, entertainment, celebrations" [3; 39-p.]. The celebration lasted a month. "From morning till evening people sang, danced and played musical instruments" [8; P. 32]. During the holiday, performances of puppets and clowns were staged, puppet theaters were staged, sales and fairs were held, and so on.

Among the autumn holidays, Mehrjon (Mehrgon) is celebrated especially solemnly. Undoubtedly, all the festivities were theatrical, with entertainment, ceremonies, performances, spectacles, and folk festivals combined with dance. City squares and out-of-town special areas have been set aside for the celebration of national holidays, mainly in Shirbudin Park. In addition to musicians and singers, drummers, clowns and rompers also performed at the festivities. All performances by musicians, singers and artists were organized and directed by celebrities and bakvuls who preserve traditions.

Bukhara's puppet theater and folk art have captured the hearts of people with their natural magic and charm. Bukhara's theatrical art flourished in the V-VII centuries.

Cultural ties between Turan and China were strengthened in Budapest, and theater troupes were sent to China from Turan, including Bukhara. According to Chinese chroniclers, the Chinese Imperial Palace housed several groups of singers and musicians from Bukhara (Ango), Samarkand (Qanga). There were many women among them. They played on nine musical instruments. To this day, "masi" is a type of dance [7; 121-b.].

Among the musicians and artists of Bukhara, the great poet, musician, composer Mavlonov Najmiddin Kavkabi had a great reputation. He dedicated his treatise on music to Ubaydullah, the khan of Bukhara in 1702–1711 [2; P. 128]. He founded his own puppet theater and music school.

According to sources, the Bukhara musician and other performers have traveled not only throughout Central Asia and India, but also in large and small cities in Russia. For example, in 1784–1785, Orifdorboz from Bukhara exhibited his art in Moscow.

The Moskovskie Vedomosti newspaper regularly reported on his performances in the square in front of the Kremlin. In 1796, a performance was staged in Moscow with trained elephants moaning in Bukhara.

In the XIX century in other cities of the Bukhara emirate there was a revival in the art of puppet theater and folk performances. In the first half of the XIX century, about forty families of artists lived in the Darvozai Oglon district of Bukhara. There were not only musicians, but also puppets, clowns, dancers. Demezov, the head of Alexander's mission in Bukhara, wrote in October 1834 about their way of life: Talented representatives of the puppet theater served in the Ark, the winter palace of the Emirate of Bukhara. They played music on the drum at the top of the Ark Gate during an event of national importance or on holidays. The musicians there consisted of eight drummers and eight trumpeters [5; 137-b.].

There was a group of clowns in the palace of the Emir of Bukhara. They combined puppet theater with their performances. The clown troupe was first led by Sayfullo Mashara (1797-1867) and then Full Mashara (1842-1916). The full troupe includes Ergash, Sa'di, Khaliq, Murad ink, Abdurauf aksakal, Abdurasul korfarmon, Said mirzaboshi, Kili Abbas, Hamro garmon, Ota Ashraf mavrigi, Usto Qudrat, Sharif bozinger, Egamberdi chotboz. They are all genuinely talented and have been able to skillfully combine puppet theater performances with music and play [2; P. 134]. The puppet theater troupe showed their art to foreign guests at the Emir's palace and took part in feasts and celebratory programs of great officials. Normally, each group worked independently, but their joint efforts were not expected. For example, on March 4, 1879, the Russian ambassador IL Yarovsky was shown a five-hour theatrical program. The basis of the program was a puppet theater [9; 330-b.].

The Russian ambassadors, led by VV Krestovsky, were shown a program consisting of two parts: one was the clowns; in the second, the puppets performed. In this way, he was able to attract a number of musicians, two clowns, five puppets and two puppets. The clowns performed a number of pantomimes, imitations, as well as comedies such as "Eshakavdosi" and "Dalollik". "It should be noted that, - says VV Krestovsky, - all the jokes of clowns, dancers did not go beyond the bounds of etiquette out of respect for the place of performance, in some games they were limited to a slight gesture [2; 136-p.].

Palace gangs (rickshaws) sometimes performed at Registan Square near the Ark. Such demonstrations, which attract thousands of spectators, have been dubbed chavkiide. Often dancers, clowns, gatekeepers performed. They were guarded by soldiers. In one of such performances, Mahmoud Dorboz-led Dorboz, Jora and Abdukholik clowns, and dancers holding sticks performed their art, attracting about fifty thousand spectators.

In the twentieth century, the most stable in the traditional performing arts of Bukhara are dances, circus performances, celebrations associated with family celebrations and theatrical ceremonies. At this time, performers were divided into three categories:

- 1) artists who served and created in the palace;
- 2) artists who lived and worked among the people;
- 3) Sufism - artists associated with the Naqshbandi sect.

With the help of Fayzulla Khodjaev, a European-level theater was established in Bukhara in 1922. This theater includes all areas of the industry. Artist and director Mannon Majidov - Uyghur was invited from Tashkent. The foundation of the Bukhara Puppet Theater was formed by graduates of the 2nd Moscow studio: P.Rakhmonova, H.Khojaeva, O.Hasanov, M.Musaev, B.Khojaev, A.Olimova, B.Jamolov, J.Kuldashev. In 1931–1932, the theater troupe was headed by director Ya. Bobojonov.

For many years, the creative team of the theater named after S. Ayni has been mastering the artistic traditions of Bukhara theatrical art, constantly looking for ways to combine old traditional and new, modern, artistic styles. The best performances of the theater continue the traditions of maqom, dance and puppetry.

After the independence of Uzbekistan, Bukhara is in the process of reviving national traditions in life, customs and culture. The state theaters and dorboz groups operating here successfully continue the traditional art of Bukhara, regularly updating their repertoire with folk works. We have the opportunity to summarize this scientific article on the peculiarities of the development of traditional folk art in the land of Bukhara as follows.

During the reign of the Shaybanids and Ashtarkhanids, Bukhara was one of the main centers of the art of high master music. It is here that due to the favorable historical conditions, the interaction of spiritual cultures not only of the Central Asian region, but of the Middle East in general was observed. A great example of this is the magnificent series of maqoms in Bukhara at the end of the XVIII century - "Shashmaqom". This process is reflected in many pamphlets, literary and poetic texts in the field of music, which have survived to our days.

"Shashmaqom" (six maqoms) is a collection of more than 250 classical examples of musical instruments and songs. Bukhara maqoms, a complex creative product of many generations of composers, reflect the genetic and typological commonality of sister cultures. At the same time, they reflect the local features of Bukhara music in great depth and detail. It is no coincidence that I. Rajabov, a major researcher of Uzbek maqom, called this huge series "the musical encyclopedia of the Uzbek and Tajik peoples."

Bukhara Shashmaqom includes such positions as Buzruk, Rost, Navo, Dugoh, Segoh, Iraq. Each of them, in turn, consists of sections "instrument" - "difficulty" and song - "prose", and the sections, in turn, are divided into relatively complete parts in terms of form and content. Status is

the main unifying key factor of the overall composition, while the metrorhythmic organizational dynamics of the components create an astonishing variety. The philosophical, poetic, didactic, Sufi lyricism of Persian and Turkish classical poets such as Rudaki, Ibn Sino, Jami, Navoi, Fuzuli, Bedil, Babur, Nodira, Mashrab was used as the poetic text of the samples of songs.

Famous Bukhara scientist, thinker, playwright, statesman A. Fitrat (1886-1967) made a great contribution to the study and popularization of "Shashmaqom" in the new socio-political conditions. His works on national and spiritual heritage, in particular, "Uzbek classical music and its history", published in 1927 in the old Uzbek alphabet, contributed to the formation of the Bukhara School of Maqomology. Thanks to the efforts of A. Fitrat, the text of the musical performance of "Shashmaqom" was recorded for the first time in the history of pan-European music by VA Uspensky, who visited Bukhara in the early 20s of the XX century. Bukhara "Shashmaqom" was recorded for the first time in Europe. It was a really good job

This record, performed by elderly maqom singers Ota JalolNosirov and tanbur player Ota Giyas, Abdugani, was published in 1924 by the Ministry of Education in Bukhara. In particular, A. Fitrat's book "Uzbek classical music and its history" describes the theory, history and stages of development of national music. In recent decades, academician YunusRajabi (1897-1976) was engaged in collecting samples of maqom and improving their notation. . The result of his many years of work in this field was the publication of the series "Shashmaqom" in 1966-1975 in six books, each of which was dedicated to a separate status. In 1959, Yu. Rajabi formed an ensemble of maqom players under the auspices of the Republican Radio. In the performance of this creative team since the 60s, many copies of the gramophone record "Shashmaqom" were released. Various interpretations of "Shashmaqom" in solo and ensemble performances have appeared, and the Bukhara style, which is distinguished by its original mastery and strict academic style, is still considered a classic. Domullo Halim Ibodov and Levi Bobojonov are the great representatives of this school.

- For the people of Bukhara since ancient times, culture, in particular, art has been an integral part of their way of life;

- It was found that the musical world of Bukhara has its own traditions, both theoretically and practically;

- It turned out that the spiritual world of Bukhara is the reason for the unique originality of folklore and music;

## CONCLUSION

In the land of old and young Bukhara, a huge reserve of traditional folk art is still hidden. The history of Bukhara is very ancient. In this region, which has undergone such a long historical development, various aspects of the traditional art of a very rich people are concentrated. The study of local features of traditional folk art will always remain relevant.

### ABSTRACT

*The article presents the ideas that contributed to the formation of the science of landscape science and landscape theory, as well as some comments on the life and scientific work of scientists who developed it.*

**KEYWORDS:** I.V.Vernadsky, V.R.Williams, G.N.Visotsky, B.F.Dobrinin, L.N.Babushkin, N.A.Kogay, P.Gulamov, M .Umarov, Yu.Sultonov, A.Abdulkosimov, L.Alibekov, A.Rafikov, Sh.S.Zokirov, O.Rahmatullaev, S.Abbosov, P.Baratov, H.Vahobov, A.Nigmatov, I.K.Nazarov , N.Sabitova, Biogeography, Soil Science, Landscape Science, Landscape Education.

### INTRODUCTION

Landscape studies the natural geographical complexes that exist objectively on the Earth's surface. Its emergence as a science is inextricably linked with the creation of landscape doctrine. Hence, the development of science and the doctrine on which it is based covers long historical periods. In short, a number of natural sciences and their teachings have played a key role in landscape and landscape teaching.

To date, scientists of our country have studied, described and written many works and articles on landscape and landscape doctrine. In particular, the well-known landscape scientist Yu.Sultanov noted the importance of biogeography and soil science for landscape science, and climatology and geomorphology for landscape education.

**Main part.** In the following pages Yu.Sultanov discusses the development of landscape in Uzbekistan VMChetirkin, LNBabushkin, NAKogay, P.Baratov, A.Saidov, L.Alibekov,

M.Umarov, P.Gulamov, S.Nishanov, Scientists such as A.Abdulkasimov, M.Kuzibaev, T.Jumaboev noted their contribution [4].

The same ideas and comments can be read in the textbook "Landscape" prepared by Sh. Zokirov and H.R. Toshov [1, pp. 49-50].

Of course, in the history of landscape science LN Babushkin, NA Kogay, P. Gulomov, M. Umarov, Yu. Sultanov, A. Abdulqosimov, L. Alibekov, A. Rafikov, Sh.S. Zokirov, O. Rahmatullaev, S.Abbosov, P.Baratov, H.Vahobov, A.Nigmatov, I.Q.Nazarov, N.Sabitova, more than a dozen scientists have written scientific works and most of them continue their scientific research today.

Also, geographers of higher educational institutions of our country, such as the National University of Uzbekistan (Sh. Sharipov, R. Ibragimova), Tashkent State Pedagogical University named after Nizami (N. Alimkulov, I. Abdullayev), Bukhara State University (H.R. Toshov) it is worth noting that research is ongoing.

It is very important to study the lives and scientific heritage of the above-mentioned landscape and the representatives of science, who played an important role in the formation of the doctrine of landscape in it. Of these, the life and scientific heritage of IV Vernadsky, VR Williams, GN Vysotsky, AI Voeykov, BF Dobrinin play an important role in the fate of landscape and landscape teaching.

Vernadsky Vladimir Ivanovich (1863 - 1945) - a great naturalist, mineralogist [2, p. 185]. Founder of modern geochemistry and biogeochemistry. VI Vernadsky studied at St. Petersburg University and listened to lectures by Mendeleev, VV Dokuchaev, AI Voekov and PA Kostichev. He worked as an associate professor and professor at Moscow University until 1911. He is a full member of the Academy of Sciences. VI Vernadsky was actively involved in the establishment of several scientific institutions, such as the Meteorite Committee, the Russian Commission for the Study of Natural Productive Forces, and was recognized as their organizer.

He was the founder of the Ukrainian Academy of Sciences and the first president from 1919 to 1921. VI Vernadsky enriched and extensively studied the teachings of the natural sciences. His biosphere theory is close in content to the concept of landscape or the term geographical crust. VI Vernadsky was the first to discover the unique geochemical role of living organisms in the development of life on Earth. According to VI Vernadsky, the biosphere gradually passes into a new stage of development - the noosphere, as a result of active human activity. VI Vernadsky's idea of the geochemical interactions and interconnectedness of organisms in the environment developed the doctrine of landscape geochemistry. He inherited great scientific works from the great scientist. They have been reprinted several times. The following works are especially popular among readers.

"Discovery of a naturalist" ("Naturalist's observation") from 2 books "Space and time in the inanimate and living nature" M., 1975., ("Existence and time in inanimate and animate nature"), "Scientific Thinking as a Planetary Phenomenon".

Williams Vasily Robertovich (1863 - 1939) - a well-known soil scientist, a senior specialist in meadows. Many years of scientific and pedagogical activity of VR Williams are connected with the Petrovsk Academy (now the Agricultural Academy named after KA Timiryazev). He has been a full member of the Academy of Sciences since 1931. The doctrine of the unity of soil-

forming processes belongs to V.R. Williams. The appearance of soil zones and types is a statistical condition of the unit of dynamics of the process of soil formation according to V.R. Williams. V.R. Williams has shown that landscape development occurs after freezing due to internal causes (soil and plant development) regardless of external causes such as climate change. That is: tundra - forest - swamp - steppe - desert.

One of his great services was that of V.R. Williams, as a pastoralist, devoted his main activity to the study of the landscapes of Cairo.

Visotsky Georgiy Nikolaevich (1865 - 1940) - geobotanist, soil scientist, hydrologist and natural geographer. GN Vysotsky graduated from the Petrovsk (K.A. Timiryazev) Agricultural Academy. At the invitation of VV Dokuchaev, in 1892-1897 he took part in "separate" expeditions to study forests and water resources in the steppes of Russia. He is a scholar of steppe nature.

G Vysotsky showed that the reduction of forest area in the steppes depends on the zoning, but here the sharp magnitude of the eruption from the amount of precipitation is the main factor. He wrote a natural geographical monograph on adolescence. In the field of landscape theory, GN Visotsky was one of the first to note the need to create typological maps (phytotopological). Fanga introduced the terms placard, gley, microrelief.

The following works are popular.

O karte tipov mestoproizrastaniya // Sb. Sovremennyye voprosy russkogo selskogo khozyaystva. SPb., 1904.

About fitotopologicheskix kartax, sposobax ix sostavleniya i ix prakticheskom znachenie // Pochvovedenie. 1909. № 2.

Ergenya // Tr. Bureau of Applied Botany, 1915. T.8.

Voeykov Alexander Ivanovich (1842 - 1916) - climatologist and geographer. He studied at the University of St. Petersburg and listened to lectures in Heidelberg and Göttingen.

AI Voeykov's 50 years of scientific and social activity are inextricably linked with the Russian Geographical Society. He set up a meteorological commission in front of the community. At the initiative of AI Voeykov in 1891 the journal "Meteorological Information" ("Meteorological Bulletin") was founded. He also worked at the University of St. Petersburg. AI Voeykov made many trips throughout Russia and to Western Europe, America, Old Asia, South and Southeast Asia. He was well acquainted with the basic landscapes of the earth's surface. He has authored more than 1,700 books and articles on a variety of topics in natural geography and economic geography.

He wrote the monograph "Climates of the Earth, a feature of Russia" (1884), which formed the basis of modern climatology. He pointed out that the geographical environment is integral and indivisible, emphasizing that climate is an integral part of it.

AI Voeykov introduced the "method of ratios" ("ratio of humidity in ice, atmosphere, etc.") in geography. AI Voeykov's contribution to the creation of the doctrine of snow cover and the development of agricultural meteorology was great.

Boris Fedorovich Dobrinin (1885 - 1951) - geomorphologist, geographer-geographer, student of

DN Anuchin. He studied at Moscow University. BF Dobrinin was a professor at Moscow, Tbilisi and Kiev universities. The scientist worked as an editor in the natural-geography section of the Great Atlas (1st edition), as an editor-consultant in the natural geography of the Great Encyclopedia (1st edition). BF Dobrin traveled to the Russian Plain, Crimea, the Caucasus and a number of foreign countries (Italy, Spain, France, Switzerland, Mexico). He wrote textbooks on natural geography. B.F. Dobrinin's works on landscape ("Landshafty Dagestana". 1924. Kn.1-2.) Are also known.

## CONCLUSION

The idea of geochemical interactions and interrelationships of organisms in landscape evolution (VI Vernadsky), the doctrine of the unity of soil-forming processes (VR Williams), the idea of creating typological maps (phytotopological) (GN Vysotsky), the geographical environment the idea of integrity and indivisibility and that climate is an integral part of it (A.I. Voeykov) was of great importance. Works on landscape (B.F. Dobrinin) played an important role in the further development of science.

### ABSTRACT

*This article discusses the fact that cochlear implantation is the most effective means of social rehabilitation of children and adults with hearing impairment, medical-pedagogical-psychological prospects for the restoration of their ability to hear and understand speech.*

**KEYWORDS:** Cochlear, Implant, Deafness, Hearing Loss, Integration, Localization, Rehabilitation.

### INTRODUCTION

The very rapid development of technology in the world today opens the door to many opportunities for people with disabilities as well. The formation of the cochlear implant system for those with a single hearing impairment has given many people the opportunity to use their hearing as well as healthy people and the happiness of speaking through speech. It is not a spontaneous system. First of all, it is necessary to look at the theoretical basis of this process.

It is known from the science of deaf pedagogy that today the main criterion is to integrate deaf and hard of hearing children into the society of healthy and hearing people on the basis of education. In Uzbekistan, most children with hearing impairments are enrolled in special education institutions. Today's scientific and technological progress also creates opportunities for them to study in general secondary education. The formation of a cochlear implantation installation system is one such possibility. The analysis of this process reveals the following on the basis of the installation of cochlear implantation:

- speech comprehensibility increases by 10-12% even in noisy conditions;
- the localization of the sound source in space is improved;
- in the context of reverberation, the comprehensibility and separation of speech increases when talking to several speakers at the same time;
- Children quickly learn to hear and distinguish different sounds, accumulate vocabulary faster;
- sound and speech sound more natural;
- Children perceive sounds from different angles, not from one side;
- listening process requires less effort and less fatigue.

Studies today show that the earlier cochlear implantation is done, the better the results can be observed. According to IV Korolyova, it is advisable to perform the operation as soon as the child reaches the age of 2-3 years, from the day when he notices that his hearing is reduced and the hearing aid does not help him. The earlier the child is operated on, the sooner the problems in his speech development will be eliminated. [1.38]

The term "cochlear implant" is a scientific and methodological term used for preoperative screening, client preparation, surgery, postoperative rehabilitation and cochlear implantation. Once the technology is installed in the human body, electrical impulses come to the external microphone, the nervous system receives these signals. (An implant body is placed under the skin; an electrode goes to the shell; an external speech processor transmits the sound coming through the microphone to the audio processor). [5.64]

In sensory deafness, healthy hair that transmits sound is rare or the cochlear implant is completely injured. Therefore, the sound vibrates and does not reach the nerve impulse. When hearing is reduced due to a decrease in the number of healthy hairs, special hearing aids show positive results, i.e. it does not matter that there is no reduction in healthy hair tissue at all when installing a cochlear implant.

In this regard, in the 60s of the twentieth century it became possible to implement the idea of solving the problem of neurosensory deafness. The transmission of sound through electrical signals passes directly to the auditory nerve and to the damaged or dead hair tissue. [6.45]

Early diagnosis of abnormalities in a child's development before cochlear implantation is important.

One month after cochlear implant surgery, the processor begins to adjust and turn on (external part) after the stitches are finished. But this period can be delayed for some time. This is determined by the work plan of the cochlear implant adjuster and the degree of closure of the sutures. The cochlear implant does not allow full reception of sounds. In this case, the electrodes coming to the auditory nerve through the implant pass through a very small amount of hair that vibrates into a normally functioning shell. Sounds to a child with a cochlear implant are heard slightly differently from the sounds that healthy hearing children are accustomed to in the early stages. When a cochlear implant is used systemically, it takes time to learn to hear the sounds and speech of others. The rehabilitation period, which is conducted through a special program, will be continuous. However, it allows the surrounding sounds to be heard after the cochlear implant is opened. It is of interest to the development of cochlear implants in children.

Often, experts recommend wearing a speech processor and a hearing aid to the operated ear and adjusting both the same. But implanted children do not want to wear a hearing aid after the speech processor is turned on. In such cases, experts do not force the child and his parents to wear hearing aids. [2.10]

First of all, the cochlear implant is adjusted by specialists. First, a cochlear implant processor is connected to a computer with special devices. The child is given a cochlear implant. The transmitting device is placed on the implant. They program the processor. Second, a signal is given to the processor at the lowest level and the signal is gradually amplified. When the alarm starts to sound, the alarm limit is set and programmed. The cochlear implant canal in each ear should be programmed separately because the auditory impulse is different in the left and right ears. Third, the signals to the processor are fed alternately to the other electrodes. The main goal is to have the same level of impact on all electrodes based on the signal height differentiation. Fourth, the normal hardware operating mode is turned on and the operation of the programs is checked. If necessary, it is raised or the implant is lowered. Fifth, if the result is not positive, the setting is reset. There will be no painful situations during the adjustment. The tuning duration is designed for about an hour a day and lasts for several days. (It is not possible to adjust at once. The brain must learn a new incoming method. Each adjustment expands the volume and range of sounds.) The next adjustment time is done in agreement with the adjuster. This depends on the individual characteristics and adaptability of people who have received a cochlear implant. [4.33]

When a child with a cochlear implant learns to speak, at what age he underwent surgery, how well he develops speech, and whether the rehabilitation period is active, depends on what parents are doing during this period. Healthy children begin to speak at the age of two if they have the opportunity to hear the sounds around them, and if they hear voices and speech from birth. Children with hearing impairment develop speech in the same pattern (sound, word, phrase, sentence) after cochlear implant surgery. In this process, the speech therapist and the deaf pedagogue work together. The deaf educator develops listening skills: working on oral speech formation, speech comprehension, and written speech. A speech therapist uses methods to correct speech defects. Every specialist should pay attention to the correctional work and materials carried out by a colleague. The postoperative training period for a child with a cochlear implant can be one to five years or more. Training depends on the age at which hearing is lost, the timing of cochlear implant placement, the development of preoperative speech, individual characteristics, and parents. [3.21]

With children and adults after cochlear implant surgery several different specialists carry out habilitation and rehabilitation work (Audiologist (adjusts the speech processor), deaf pedagogue, speech therapist, psychologist).

Rehabilitation of children with cochlear implants in many countries (Europe, America, Austria) is carried out in specialized centers. Rehabilitation centers also study the causes of hearing loss (hereditary, meningitis, pneumonia, genetic diseases).

Specialists of such a rehabilitation center also identify cases that are not possible for a cochlear implant:

- if the hairy tissue is damaged as a result of deafness or the tissue in the shell is dead, the auditory nerve is damaged, the central parts of the auditory analyzer are damaged, the hearing loss is after a neuritis complication of the auditory nerve;

-calcification and ossification of the shell. In this case, there is a lack of calcium salts or bone growth, which prevents the electrodes from passing into the shell. There may also be a chance that the operation will fail;

In sensory deafness, people have lived in "silence" for years, have not used hearing aids at all, and have worn less even after the appearance of these hearing aids. In this case, the branches of the auditory nerve are damaged or die.

Therefore, children with hearing impairment are thoroughly analyzed before cochlear implant surgery, and this process includes:

- Audiological examination of the child before cochlear implantation;
- tonal audiometry (checking for hearing loss of sounds of different frequencies);
- acoustic impedancemetry (examination of tympayumetry);
- electrocochlography;
- promontorial test-examination of the condition of the auditory nerve;
- vestibulometry examination of the patient's somatic condition, mental development, health and speech;
- check speech discrimination.

There are even probable cases that can occur after surgery, and they can be as follows:

- paralysis of the facial nerve after surgery;
- disorders of taste;
- vestibular disorders (dizziness, nausea, vomiting, headache)
- increased noise in the ear;
- condition of ossification (process of bone formation) and calcification (accumulation of calcium salts in soft tissues or organs) of the shell together with implantation. [5.53]

**In conclusion,** today the development of science and technology is leading to the improvement of the use of modern instrumental diagnostic methods in the preparation of children with hearing impairment for cochlear implant surgery. Also in the field of medicine the use of technical means such as computer and magnetic resonance imaging, electroencephalography, rheoencephalography is gaining popularity. In general, cochlear implantation is the most effective means of rehabilitating hearing and speech formation in children and adults with hearing impairment, and of course, everyone has the right to enjoy universal human rights and technological advances while alive.

### ABSTRACT

*The shortage of water resources in the irrigated agriculture of Uzbekistan is equally related not only to the unilateral interest of neighboring countries, but also to the extent to which it is used effectively at the national level. Water distribution between water users and farms is based on systematic and commercial water use plans. Their theoretical basis was first developed by academician A.N. Formed by Kostyakov.*

**KEYWORDS:** *Irrigated Agriculture, SIU, Irrigation Norm, Decade, Water Use Plan.*

## INTRODUCTION

The internal economic plan of water use of farms is an integral part of the business plan. Therefore, the correctness of the water use plan of the farm depends on the efficient use of land and water resources, labor resources, material, technical, financial and other resources. In addition, the quality structure and implementation of the water use plan will depend on the reclamation, ecological, sanitary-epidemiological and social conditions of the farm. The internal economic plan of water use is the basis of the systematic plan. Therefore, it is necessary to carefully study the natural-economic conditions for the current year when considering the internal economic plan of water use of farmers and other farms. In our and foreign countries' economic experiences, we can see that the domestic economic plan for water use is applied for the growing season and the calendar year. There are also long-term water use plans for farms for the next 3 or 5 years.

This method of the scientist is still used today in the development of water use plans for farms, including SIUs. Professor N.A. Yanishevsky proposes the following formula:

$$m\omega_{дек} = Q_{дек} t_{дек}; \quad (1)$$

Here:  $m$  - irrigation rate of the crop,  $m^3 / ha$ ;  $t_{дек}$  - duration of irrigation of the crop in one decade (ten days),  $\omega$  - area of the crop in question, which is planned to be irrigated in the period of  $t_{дек}$ ;  $Q_{дек}$  is the planned consumption of water net,  $l / s$ , which is transmitted to the crop for a period of  $t_{дек}$ . The formula follows:

$$Q_{дек} = \frac{m\omega_{дек}}{t_{дек}}; \quad (2)$$

$\omega_{дек} = \frac{\Omega}{T}$  Given that, we pour into the above formula and characterize the following We do:

$$Q_{дек} = \frac{m\Omega t_{дек}}{T t_{дек}}; \quad (3)$$

or 
$$Q_{дек} = \frac{m\Omega}{T}, l / s; \quad (4)$$

Planned decade (ten-day) consumption and gross water volume (taken from the irrigation system control channel) are calculated from the following formula:

$$Q_{дек.бр.} = \frac{Q_{дек}}{\eta_{сист}}, l / s; \quad (5)$$

Here  $\bar{\eta}_{сист}$  - is the efficiency of the water user's irrigation network, which starts at the main gate of the irrigation system control channel and ends at the irrigation area,

$$\eta_{сист} = \eta_{хк} \eta_{вхр} \eta_{ферм} \eta_{вр.ор.}; \quad (6)$$

Here  $\bar{e}xk$ ,  $\bar{e}vvr$ ,  $\bar{e}ferm$ ,  $\bar{e}vr.or$  - FIK ti of the farm, domestic and farm channel.

$$W_{\text{дек.бр.}} = Q_{\text{дек.бр.}} \cdot t_{\text{дек.}}, \text{ m}^3; \quad (7)$$

The limit water consumption per decade allocated to the SIU is calculated on the basis of the limit coefficients set by the Irrigation Department:

$$Q_{\text{дек.лим.}} = K_{\text{л}} Q_{\text{дек.бр.}}, \text{ l / s}; \quad (8)$$

The duration of the water cycle is equal to  $t_v = 10-15$  days. Professor X.A. According to Akhmedov, if irrigation is delayed for 5-7 days during the period of cotton seed formation, the loss of seed elements and a decrease in yield will reach 10-30%. If we take this figure in relation to the total irrigated area, on the average cotton yield of the republic (which is 1.5.mln and 20ts / ha), then it will not be difficult to calculate the damage. This is about 3 million tons of cotton or about a million tons of cotton fiber. Market price of cotton fiber, in the USA 1 kg If we take into account that the losses of Uzbekistan are 15-20 million dollars. USD.

In irrigated farms, crop rotation areas receive irrigation water at a constant rate in accordance with the water use plan. The sequence of irrigation is carried out between alternating planting areas. Water circulation takes place between a single water user.

Scientific research institutions are engaged in the study of optimal regimes of irrigation of agricultural crops. These regimes are now obsolete in many irrigation systems due to water scarcity and the reason for the prospects for the expansion of irrigated lands.

It is necessary to set such irrigation standards that, taking into account the entire water-land balance, it is necessary to find a cost-effective hydromodule, in other words, which will allow to produce the maximum product per unit volume of water.

Statement of KPZ value for decades of growing season of agricultural crops on the example of Oltinkuz farm of Bukhara region.

The size of the irrigated area of agricultural crops over the decades of the growing season is determined as follows:

$$F_{\text{дек}} = K_{\text{нз}} F_{\text{нет}}, \text{ га}; \quad (9)$$

Here,  $F_{\text{нет}}$  is the area under agricultural crops of a given farm and is defined as follows:

$$F_{\text{нет}} = F_{\text{хл}}^{\text{нет}} + F_{\text{пшеницы}}^{\text{нет}}, \text{ га}; \quad (10)$$

Here  $F_{\text{хл}}^{\text{нет}}$  - area under cotton, ha;  $F_{\text{пшеницы}}^{\text{нет}}$  - area under wheat, ha; Irrigation of cotton fields in the given decade is carried out in the following form:

$$F_{\text{хл}}^{\text{дек}} = K_{\text{нз}}^{\text{хл}(\partial)} F_{\text{хл}}^{\text{нет}}, \text{ га}; \quad (11)$$

Here,  $K_{\text{нз}}^{\text{хл}(\partial)}$  - cotton irrigation coefficient.

Similarly, the value of the coefficients of irrigation assignments for the remaining agricultural crops is also determined. According to the results of the calculation, the statement of irrigated

areas of agricultural crops is made in decades of the growing season and the schedule of irrigated area. The amount of irrigation water transferred to each crop over the decades of the growing season is determined. It depends on the size of the irrigation area and the irrigation norm.

### CONCLUSION

As a result of the research, our conclusion is that the magnitudes of irrigation norms should be considered as constant and as variables of irrigated lands. The efficiency of irrigation water increases due to the economically coordinated sequence of irrigation of crops, which determines the emergency period of irrigation of the irrigation source, and then differs according to water consumption. According to the scientist's proposal, first of all, it is necessary to stop the supply of water to relatively low-value crops.

Under Namangan Engineering,  
Technology Institute, UZBEKISTAN

### ABSTRACT

*This article analyzes Khabib Sadulla's poetry and his scope of the theme, particularly, ideas of patriotism. Besides, poet's poems and lyric features of his works are studied and conclusions are drawn. A work of art can rise to the level of a work of art only if it combines the spiritual, psychological and philosophical synthesis of socio-political reality, the development of the period and the fate of man and the people.*

**KEYWORDS:** Poetry, Lyro-Epic Genre, Musical Drama, Figurativeness, Nature, Motherland, National Character, Spirituality.

### INTRODUCTION

For a long time, the land of Namangan has always been the land of great poets and thinkers such as Zakhiriddin Mukhammad Babur, Mashrab, Fazliy, Nodim Namangoni, Is'hakhan Ibrat, Sufizoda, Usman Nasir, Nabikhan Chustiy. The talented, skillful folk poet Khabib Sa'dulla became a worthy successor of these great creators. His name is well-known among the people, and he is a poet who has further enriched Uzbek poetry, prose and drama with his masterpieces.

Khabib Sadulla was born on April 5, 1942 in the city of Namangan. His first collection of poems, "Okeandan shabada" (Breeze from the ocean), was published in 1969. After that the followings were published: "Bahor bilan suhbat" ("Conversation with Spring") (1975), "Muloqot" ("Dialogue") (1979), "Yana ostonangda" ("On the Threshold Again") (1982), "Ehtirom" ("Respect") (1984), "Nur qadri" ("The Value of Light") (1988), "Ko'chamdan jonon o'tganda" ("When the pretty passed by my street") (1992), "Usmonatlas" (1984), "Bog'lar yurtin bolasimiz" (1988), "U poroga tvoego" (in Russian). The poet's two-volume "Selected Works" (2002) was published. Contemporary issues are reflected in the short stories and journalistic

articles in the collection “Tong musaffo bo’lsa” (“If the morning is clear”). His ideologically and artistically well-written epics such as “Tug’ilgan yilim” (“My Year of Birth”), “Onaizor”, “Tirik qurbonlar” (“Living Victims”), “Zamin sadosi” (“Earth's Voice”), “Yettinci qit’a” (“Seventh Continent”), “E’tiqod” (“Faith”), “Chust rivoyati” (“Chust Narrative”), “Jarohat” (“Injury”), “Adib taqdiri” (“The Fate of the Writer”), “Usmonatlas” made an important contribution to the development of the lyro-epic genre in Uzbek literature.

Khabib Sadulla was able to demonstrate his dramatic skills by composing the musical drama “Yusuf va Zulayho” (“Yusuf and Zulayho”), the plays “Mehr Quyoshi” (“Sun of Affection”), “Rahmat, ig’vogar” (“Thank you, provocateur”).

The poet’s poetry is extremely diverse in terms of subject matter. The most important aspects of the poet’s lyrics are the boundless love for the motherland, the glorification of independence, the glorification of human freedom, the promotion of human qualities, the image of nature, responsiveness to current issues, a creative approach to classical traditions.

In Khabib Sadulla’s works, the theme of homeland has a special place. After all, the theme of the Homeland in poetry is as old as life and as young as life; it is constantly growing. At a glance, its boundaries, its history, change places; in such places you see the spirit of the period, of social progress, of the life and destiny of the people. At such times, you can be sure that in each period, poets will open the horizons and edges of this theme, will contribute to a certain degree of poetic experience in the interpretation of the theme of the Motherland. Khabib Sadulla also brings to his poems the boundless respect and attention to our great ancestors, and to the essence of his poems he instills feelings of motherland, national pride, love for his language and history. There are the followings in the poem “Ona tilim” (“My native language”):

*Сенинг нафосатинг кўрсин, деб олам -*

*Навоий сарф этди бутун умрини.*

*Буюк Ҳиндистонда шоҳ бўлганда ҳам,*

*Бобур сенда битди дардли шеърини(1,47).*

*(Navoi spent all his life to demonstrate your beauty to the world*

*Although Babur was a ruler in India, he wrote his poem)*

Thinking about our native language, Navoi spent his whole life singing to the world about the infinity of the subtleties of our language, which fascinates people so much that Babur, who established a great kingdom in India, wrote his poem in this language. In the poem, respect for our mother tongue is mixed with a sense of love for the Motherland. Indeed, the concepts of the language of the homeland and the nation are inextricably linked.

A work of art can rise to the level of a work of art only if it combines the spiritual, psychological and philosophical synthesis of socio-political reality, the development of the period and the fate of man and the people. It is natural that the synthesis of thoughts and feelings in the lyrics is manifested in a unique way. This is manifested in the poet’s ability to come to deep philosophical generalizations from the essence of ordinary life events, to see and find the signs of the future in our present reality, to generalize them. In this sense, I can say that in the lyrics of Khabib Sadulla, a bright future is placed side by side with the image of a perfect man:

*Ўт қўймоқ бўлдилар муқаддас туйғу -*

*Буюк келажакка, комил ишончга.*

*Бақавли сўндирмоқ бўлдилар мангу*

*Тош отиб кўкдаги боқий қуёшга(378).*

The poet's lyrical protagonist believes in the future of his homeland, the eternity of his independence, and compares it to the sun. It indicates that malicious enemies cannot achieve their intentions. The Motherland will never forgive such people:

*Она оқ қилганга ер чидар балки,*

*Ота оқ қилганни кўтарар замин.*

*Кимники оқ қилса Ватани, халқи,*

*Уни ўз бағридан итарар замин(1,379).*

This, firstly, shows that the poet's attitude to the socio-philosophical, spiritual and moral issues of the time has deepened in recent years, and secondly, it shows that it is becoming more diverse today.

In poetry, "avoiding" complex imagery does not mean an absolute abandonment of figurativeness. Khabib Sadulla manages to vividly portray aspects of life that others may not have noticed, through simple and attractive, but beautiful figurative expressions and images of a "finding" nature. In this sense, it can be said that the poet's lyrics differ sharply from the poems of other creators in that they are free from complex imagery. But the gloom of the intense tones, which are reflected in the depth of his dark thoughts, his reflections, represents the radiance of colors, which, in turn, provides a deep imagery in the poet's poems.

Khabib Sa'dulla creates a series of magicians and poems from a set of unique imagery, dark metaphor, colorful adjectives, simple and straightforward but resonant words for his lyrics. Simple and straightforward in his lyrics, the words familiar to every reader attract your attention as a vivid image of human spiritual experiences.

In Khabib Sa'dulla's lyrics, poems about the homeland have a significant place. This is determined by the nature of the lyrical hero, as mentioned above. Khabib Sa'dulla's lyrical protagonist is characterized by a restless and anxious heart that burns, worries about the fate of humanity and the globe, the present and future of his homeland. The poet creates images that interpret the bright future of the Motherland and the people in harmony with the past and the present.

In the 70s and 80s of the twentieth century, a number of books by the author were published. His collections such as "Dialogue" (1979), "On the Threshold" (1982), "Respect" (1984) were published. They contain the best poems and ghazals, and epics of Habib Sa'dulla. These books are a reflection of the poet's genuine growth and development in the field of literature, his enthusiasm, skill and courage.

In the development of society, each generation is more or less different from the previous generation in certain respects. But the sense of homeland, truth, goodness, beauty, which is the most sacred for mankind, is always passed down from generation to generation as a sacred

tradition. In every age, every generation remains faithful to these sacred traditions with their deeds, words, beliefs and thoughts. Today is history for the future. Powerful and magical word art gives eternity to our days, moments, and times. As a result of the power of the poetic word, future generations will be aware of the socio-political realities of each epoch, the life and destiny of the people, their personal worries and thoughts, their joys. In the series of life of generations he sees the points of connection between his life, destiny and interests, and his research.

Someone imagines the image of the homeland in the sunlight, someone in the tree, someone in the image of the earth. When you see human footprints on the ground, buried graves, you think about the meaning of life, transience and eternity. It becomes more sacred, more revered. After all, human skin and human blood have been shed on this soil, and both hot and cold breaths of people have joined it. In a word, man has taken root in this soil. The root of cotton growing from this soil is the root of Uzbek life, the whiteness of cotton is the face of Uzbek. After all, it is also the steamy faces that give color to the soil. It is from these soil images that the image of the glorious Motherland grows in the poet's poem:

*Умрини ўтказиб баҳона билан,  
Кузакда лаб тишлаб турса бўйни хам.  
Қадрин ўлчамаса хирмони билан,  
Пахтакор саналмас унақа одам(262).*

In some of the poet's poems, reason prevails over emotion, and in some of his poems, life is portrayed as an exhortation, in which case, often, the image, the symbol, is pushed aside.

*Бас, эркак бахтига излама мезон,  
Ҳақиқатдай жўндир эркакнинг бахти.  
У - губор қўнмаган покиза виждон.  
У - бош омонлиги, билак қуввати(1,301).*

It can be said that the images and concepts of the images in today's lyrics about the Motherland are extremely rich in modern scientific and technical innovations, and are gaining momentum due to the concepts of time and the fate of the world. New words are being absorbed into the layer of poems. Khabib Sadulla skillfully uses the modern word "idora"(office) in the following poem "Dehqonga ta'zim"("Bow to the Farmer"), which does not cause discomfort in the reading and meaning of the poem:

*Идоранинг тор хонасин тарк этиб гоҳо  
Бағри осмон далаларга кетгим келади.  
Даласидай кўнгли ҳам кенг деҳқонлар аро  
Юракдаги дардларимни айтгим келади(1,337).*

Emotions, scenes of feelings, deep thoughts and observations imbibe their philosophical and spiritual essence in the verses. After all, the filling of tulips burning like coals on the first spring holiday is not just a jolt in the wind - it is a song in the wind of the motherland; in the care of cotton, in the work of cotton, a drop of coral spilled from the forehead of a hardworking farmer

is not sweat - it is a verse of life, of destiny; his body is not an ordinary figure, the face of Alpomish, the work he does is not for himself, but for the future of the motherland. In the lyrics of Khabib Sadulla, the images of Uzbekistan - Motherland - people - nature appear in front of our eyes as an open book in general harmony. The main theme of Khabib Sadulla's poems is the motherland, Uzbekistan. In fact, the Motherland, the people, the nature - these are the concepts that originated in one land. Loving the Motherland alone is impossible without loving the people and nature. On the ground of love for the motherland, the cotton fields, the grandfather farmer, the village where he was born and grew up, the beautiful and charming corners, the great and powerful concept and love of the Motherland are manifested:

*Хузурингга талпинаман азамат деҳқон,  
Ўргангали сендан Меҳнат, Поклик, Ҳимматни.  
Алтомишдай келбатингда кўраман аён,  
Ўзбекистон - келажаги буюк давлатни(1,338).*

In the poet's thoughts, not only the past and history, but also the future is connected with the Motherland, with the lives of future generations. It is impossible for a person in his maturity not to think about who will be in charge of this world after him, what will happen to future generations in the future. These melodies are full of the meaning of mourning for the Motherland, the destiny of humanity.

In creating the image of the homeland, Khabib Sadulla often focuses on the principles of addressing the history of our people, striving to understand the basics of national character, reviving, restoring childhood memories, appealing to nature, aesthetic approach to the landscapes of the homeland. In the poems of the poet, the image of the Homeland, with its inner and outer essence, in particular, flows from the virgin memories of childhood imaginations and provides the basis of lyrical character, the vitality of feeling and perception of the world:

*Шу боис ёшлигим қўмсаганим пайт,  
Мен азим Тошкентни тавоф этаман.  
Бундан Дўстлик, Поклик, Вафо, Садоқат,  
Ёшлик сабогини олиб кетаман(14).*

Khabib Sadulla, public writer of Uzbekistan and the hero of Uzbekistan, died in 2005. The poet's fiery poems and epics, journalistic short stories and articles have made a worthy contribution to the treasury of Uzbek literature. Undoubtedly, his creative work, especially in the spirit of love for the Motherland, plays an important role in educating a spiritually mature generation.

### **ABSTRACT**

*The main objective of this study is to measure the level of Assertiveness, Self-esteem, Stress, and Academic achievement among adolescents of Kashmir division of Jammu and Kashmir State. The sample of the study comprised of 120 high school students divided equally into two groups, i.e. 60 male students and 60 female students within the age range of 12 to 19 years. They were administered by Rathus assertiveness schedule (RAS), Rosenberg self-esteem (RSE), perceived stress scale (PSS), and academic achievement scale. The data was collected with the help of questionnaire and analysed with the help of statistical tools such as mean, Standard Deviation ( $\sigma$ ), and student's 't'-test, computed with the help of SPSS. The results of the study confirmed the expectation that there is significant difference in the level of assertiveness among students. The findings also revealed that there is a significant difference in self-esteem and in the levels of stress among students. In addition to that results reflected no significant difference in academic achievement among students. From the findings of the study, it is concluded by the researcher that some intervention techniques should be used in future researches for such adolescents to increase the level of assertiveness among them. So that it helps them not only in becoming assertive but also in increasing their self-esteem, academic achievement and reducing their stress level.*

## INTRODUCTION

According to the UNICEF report (2011), 1.2 billion adolescence stands at the crossroads between childhood and the adulthood world and around 234 million of them live in India. About one-quarter of India's population is adolescence. The word adolescence is derived from the Latin verb 'adolescere' that means "to grow into maturity". Peterson, 1988 has defined adolescence as a phase of life beginning in biology and ending in society. This means that it cut across every phase of life and thus become very important. So it is the fact that this stage is considered very important because many significant changes happen during this period of time.

As we know it is the time when adolescents have to establish their social positions and are exposed to a wide range of new social situations. They came into contact not only with friends, but also with other persons to learn and develop new social roles without the direction of their parents (Ingles et al., 2005). It is a crucial period of life span which has not been fully understood by the parents, teachers and the society as a whole. It is the time when individuals face new challenges and new opportunities. While some adolescents do not negotiate these challenges positively and develop personal and social problems which lead towards their maladjustment. The increase in attention towards adolescents is due to the recognition of this group as a significant proportion of the total population and also as the future leaders and guardians of the nation's development.

The problems during adolescence have a great impact on self esteem as it is the period during which a new identity is formed. It plays an important role in one's psychosocial development. Hence, this age is considered very important, because several significant changes take place during this period of time. It is characterized by rapid physical growth, significant emotional, psychological and spiritual change and it is the wonder years in human life because they are the future source of any development nation. Infact, it is the most sensitive critical periods of life for development of lifelong perceptions, beliefs, values, and practices. The adolescent struggles with the developmental tasks of establishing an identity, becoming a contributing member of society, and selecting a vocation (Ansari & Stock, 2010).

Before adulthood, it is important to develop a healthy self-esteem among adolescents because during this stage they feel lot of pressure to fulfill their goals in education (Ansari & Stock, 2010). Infact it is the crucial part of life where they have to build their career and to maintain challenges of shifting from adolescence to adulthood and to deal with various tasks of academic life (Colic, Baric, & Satalic, Lukesic, 2003). He has to adjust himself with varying and sometimes conflicting demands from his parents, teachers, playmates and the community. He is told to take the responsibilities, to show some judgment and to take decisions and then he is treated as a child and is expected to be submissive and obedient to his parents and teachers. It is rightly said by (Hall, 1904) that adolescence is a period of 'stress and strain'. If the personality development at various stages has progressed fairly well, adjustments are not then difficult. Otherwise, many persons enter this period as shy, nervous and timid individuals. So in helping them to reduce such shy behavior in adolescents it is important to shape their behavior.

Therefore, it becomes necessary to study & understand it not only in terms of a boy or a girl but in terms of all adolescents and in what respect they are alike or different. And it also becomes

important to know what kind of changes occurs in this period physiologically, psychologically & socially.

### **Aim of the Study**

The present investigation was undertaken with an aim to study the level of assertiveness, self-esteem, stress and academic achievement among the Adolescents of Kashmir.

### **Objectives of the Study**

- ✓ To measure the level of Assertiveness and Self-Esteem among the Adolescents of Kashmir.
- ✓ To measure the level of Stress and Academic achievement among the Adolescents of Kashmir.
- ✓ To measure the level of Assertiveness, Self-esteem, Stress and Academic achievement among Kashmiri urban and rural adolescents.

### **Hypotheses of the Study**

- ✓ There is no significant difference in the level of Assertiveness and Self-esteem among the Adolescents of Kashmir.
- ✓ There is no significant difference in the level of Stress and Academic achievement among the Adolescents of Kashmir.
- ✓ There is no significant difference in the level of Assertiveness, Self-esteem, Stress and Academic achievement among urban and rural Adolescents of Kashmir.

## **RESEARCH METHODOLOGY**

The research design for present study is qualitative in nature. Purposive sampling technique was used for data collection.

### **Participants**

In this study 120 students were selected, divided into two groups i.e. 60 male students, and 60 female students. From 120 students 30 boys students and 30 girls students belongs to rural areas and remaining 60 students (30 boys and 30 girls) belongs to urban areas of Kashmir. The age range of the participants was 12-19 years.

### **Measures**

Following measures were used in the study;

**The Rathus Assertiveness Schedule (1978)** used to study the assertiveness of adolescents. It is a standardized tool comprising 30 situational statements for which the subject is asked to rank the degree to which each statement is characteristic and descriptive of his/her behaviour ( -3 to +3) yielding a total assertiveness score between -90 (least assertive) and + 90 (most assertive). The tool was administered individually to each student and care was taken to see that the adolescents filled the questionnaire without discussing. There was no time limit for completion of the scale.

**The Rosenberg Self-Esteem Scale (RSES)** developed by Rosenberg (1965). It is a 10- item self report measure of self-esteem based upon satisfaction of one's self and life. The scale consists of five positive items and five negative items and need to be scored accordingly by reversing the

value of either the positive or negative item responses. Typically, each item is answered on a four point Likert scale ranging from "strongly disagree" to "strongly agree. The internal Consistency ranges from .77 to .88 with test retest reliability ranges from 0.82 to 0.85. The scale ranges from 0-30. (0<15 low self esteem), (15: 25 within normal range of self- esteem), (+25 high self esteem).

**Perceived Stress Scale – 10 item version** developed by Cohen et al., (1983). It is a self-report scale designed to measure the perception of stress. The scale consists of 10-items; each item is answered on 5-point scale. In each item, students will be asked to indicate by circling how often you felt or thought a certain way. (Response values: 0=never, 1=almost never, 2=sometimes, 3=fairly often; 4=very often). To score this measure, reverse the scores for the positively stated items (items 4, 5, 7, and 8), such that a score of 4 will become a score of 0, a score of 3 will become a score of 1, and so on. Next, sum the reverse-scored items with the remaining 6 items. Scores range from 0 to 40. The Reliability of PSS was .78-.86. This scale has no diagnostic cut-offs. Higher scores correspond to a higher level of perceived stress.

**Academic Achievement:** This scale developed by Anderson et al., 2016, measures academic adjustment of the student. This scale represents three components/ three dimensional construct of academic adjustment which is academic life style, academic achievement and academic motivation and it comprises 9 items. Responses are elicited on 5point scale. The test-r test reliability of the academic adjustment is .84. With regard to the study, the researcher will apply the academic achievement dimension of the above said scale.

#### Statistical Techniques Used:

In the present study the Researcher used the following statistical techniques:

1. Descriptive Analysis (Mean, Standard Deviation)
2. Differential Analysis (t-value, F-ratio)

#### Data Analysis

**TABLE 1 DESCRIPTIVE AND DIFFERENTIAL ANALYSIS OF MALE AND FEMALE STUDENTS ON ASSERTIVENESS AND SELF-ESTEEM**

Variable	Gender	N	Mean	Std.deviation	t	Sig.
Assertiveness	Male	60	13.60	14.67	<b>2.07*</b>	<b>0.05</b>
	Female	60	6.60	21.61		
Self-esteem	Male	60	19.60	3.86	<b>3.81*</b>	<b>0.05</b>
	Female	60	17.60	3.60		

The above table indicates that the mean score regarding assertiveness of male students (13.60) is high in comparison to the mean value of female students (6.60). The t-value is found to be 2.07, which is significant at 0.05 level. The above table also depicted higher mean value (19.60) of male students as compared to mean value (17.60) of female students. The t-value is found to be 3.81 which is also significant at 0.05 level.

**TABLE 2 DESCRIPTIVE AND DIFFERENTIAL ANALYSIS OF MALE AND FEMALE STUDENTS ON STRESS AND ACADEMIC ACHIEVEMENT**

Variable	Gender		N	Mean	Std.deviation	t	Sig.
Stress	Male	Female	60	20.46	4.27	4.52*	0.05
			60	23.48	2.90		
Academic achievement	Male	Female	60	11.95	2.27	1.01	
			60	11.53	2.23		

Table 2 reveals that the mean value regarding stress of girls (23.48) is high in comparison to the mean value of boys (20.46). The t-value is found to be 4.52, which is significant at 0.05 level. Moreover above table also depicted that mean value of academic achievement among female students is (11.53) and male students (11.95) which is not significant at 0.05 level.

**TABLE 3 DESCRIPTIVE AND DIFFERENTIAL ANALYSIS OF URBAN AND RURAL STUDENTS ON ASSERTIVENESS AND SELF-ESTEEM**

Variable	Residence	N	Mean	Std.deviation	t	Sig.
Assertiveness	Urban Rural	60	12.98	17.25	1.70*	0.05
		60	7.21	19.81		
Self-esteem	Urban Rural	60	17.46	03.58	2.36*	
		60	19.13	04.13		

It is evident from the table 3 that the mean score of urban students (12.98) on assertiveness is more than the mean score of rural students (7.21). The t-value is 1.70, which is significant at 0.05 level. In addition, above findings also depicted higher mean score (19.13) of rural students on self-esteem as compared to the mean score (17.46) of urban students.

**TABLE 4 DESCRIPTIVE AND DIFFERENTIAL ANALYSIS OF URBAN AND RURAL STUDENTS ON STRESS AND ACADEMIC ACHIEVEMENT**

Variable	Residence	N	Mean	Std.deviation	t	Sig.
Stress	Urban Rural	60	21.11	04.43	<b>2.43*</b>	<b>0.05</b>
		60	22.83	03.17		
Academic achievement	Urban Rural	60	12.16	02.00	<b>2.09*</b>	
		60	11.31	02.41		

Table 4 presenting the mean, SD, and t-value of urban and rural students on stress and academic achievement. According to the findings, significant differences found on the scale of stress among urban and rural students (urban mean= 21.11, rural mean= 22.83, t= 2.43). While the

mean score of urban students on academic achievement is more than the mean score of rural students (urban mean=12.16, rural mean= 11.31,  $t= 2.09$ ), which is significant at 0.05 level. Hence our hypothesis is rejected.

## DISCUSSION

Present research was done to explore the level of assertiveness, self-esteem, stress and academic achievement among Kashmiri adolescents. During the analysis on the basis of gender, it was retrieved that male adolescents had higher assertiveness score as compared with female adolescents as shown in Table 1. In the literature there are studies that have similar results like Chandler, Cook & Dugovics (1978) and Adejumo (1981) who found men to be more assertive than women. But Parray & Kumar, (2016) and Rathee, (2015) reported no significant difference in assertiveness with respect to gender. As for as self-esteem score the findings revealed that male participants had higher self-esteem as compared with female participants. These findings are consistent with (Ozsaker, 2012 and Gull et al., 2012) who reported that male participant had higher self-esteem as compared with female participants. The findings of the table 2 reveal that there is significant difference between male and female students in their level of stress as findings depicted that female students had higher stress as compared to male students. In addition to that the findings also revealed that there is no significant difference between male and female students in their academic achievement.

While discussing the findings between urban and rural students in their assertiveness and self-esteem with respect to residence it is depicted from the findings that urban students had higher assertiveness as compared to rural students. The findings of this study are in consistent with previous studies (Prakash & Devi, 2012 and Parray & Kumar, 2016) who reported urban students are more assertive than rural students. Moreover the findings also revealed that rural students had higher self-esteem as compared to urban students.

During the analysis it was also ascertained by the researcher that the rural students scored higher stress as compared to the urban students. Moreover regarding academic achievement there is a significant difference between urban and rural students. As findings depicted that urban students are better in their academic achievement as compared to rural students.

## CONCLUSION

From the above discussion the researcher concludes that there is greater need of prevention for adolescents of Kashmir especially rural adolescents. The findings suggested that the students of Kashmir are facing problems especially in rural areas. There is lack of assertiveness, academic achievement along with high stress level among rural adolescents and also a very less opportunities, carrier options and other facilities as compared to their urban areas.

Finally it can be concluded that there should be some intervention techniques (assertiveness training) which will help the adolescents of Kashmir especially rural ones to become assertive and to express themselves and it will help them to increase their self-esteem, academic achievement and reduce their stress level to a great extent.

## Suggestions and recommendations

The present study gives some suggestions for the future researchers, who are interested to conduct researches in the same area. The sample size of the present study is limited to only 120

students taken from only two schools. In future researches the sample size should be large and should be taken from different districts of Kashmir so that we should better understand the problems of the adolescents of Kashmir. In addition to that some demographic variables e.g. socio economic status, parent's education, parents job should be included in future studies. As we know there are several studies in this area but there is dearth of studies from the conflict zone especially in Kashmir. So there should be more studies on this topic in future.

### Acknowledgement

I am thankful to Doctor Harisingh Gour Central University Sagar for giving me consent to collect data from Kashmir. I place my deep debt of gratitude to the principal of Govt. High School Sopore and to the chairman Mr. Farooq Ahmad Bhat of Gousia High School for helping in my research and especially students of the school who joined the study for their close attention and serious participation.

## ANALYSIS OF PROVERBS AND APHORISMS IN “KUTADGU BILIG”

**Bozorova Sabokhat\***

\*Tashkent state university of Uzbek Language and Literature,  
UZBEKISTAN

Email id: sabokatbozorova@gmail.com

### ABSTRACT

*“Kutadgu Bilig”, one of the most important works of post-Islamic Turkic Literature written by Yusuf Has Hacib in 1069, has a great distance between today. Nevertheless, most of the ideas about the main purposes of the work, manners, labels, education, and the relationships between the various social classes still apply today. In the study, the positions of the postas in Kutadgu Bilig in reflecting the educational content of the work, ideological-scientific value, cultural linguistic features, educational importance in society and public life are in question. The importance of the meanings in the text of the phrase, the educational-spiritual value, the psychological and genetic principles of the content of the meanings are interpreted. Special emphasis was given to researching aspects of aphorisms related to folk literature, especially proverbs used in “Kutadgu Bilig”, and the common features of sums and proverbs were examined. The purpose of this research is Kutadgu Bilig in the context of phrases and proverbs Evaluate. In this context, the examples of aphorisms and proverbs in Kutadgu Bilig have been determined and these couplets It was evaluated as a source. Ethnography and phenomenology methods were used in this work.*

**KEYWORDS:** *Kutadgu Bilig, Didactic Works, Folk Literature, Aphorism, Proverb, Uzbek Proverbs, Turkish Proverbs, Metaphors.*

### LITERATURE REVIEW

“Kutadgu Bilig” written by Yusuf Khas Hajib is the first literary epic written in Turkish. The work is an invaluable treasure that, with its deep meaning that has lived on for centuries, serves to pass on spiritual values to future generations. Scientists around the world have done a lot of research on this work. The first study of the semantics of words used in “Kutadgu bilig” was made in 1820 by Yu. Klaprot. In 1823, J. Amadee published a part of the manuscript in the “Journal Asiatique”, giving information about the Viennese version of the “Kutadgu bilig”. In

1870, H. Vamberi published parts of the epic. V.Radlov, S.Malov, A.Samoylovich, S.Ivanov, A.Kononov researched the work. R.R. Arat was one of the first to create a critical text and index of the work. G.Blagova compared the materials of "Kutadgu bilig" with "Boburnoma" and analyzed its morphological features. R.Arziev defended his dissertation on the lexical and stylistic features of "Kutadgu bilig". Turkologists such as E.Bertels, A.Valitova, A.Bombachi, Li Chi, B.Sultanov, A.Kasieva conducted scientific research on the work. Scholars such as G.Abdurahmanov, K.Karimov, H.Nematov, H.Dadaboev studied the lexical-semantic, syntactic features of the work. B.Tukhliev, H.Abdullaev, S.Ibotov, Z.Sodikov, D.Tashpulatova studied the epic from the literary point of view. Ahmad Zaki Validi and Abdurauf Fitrat, orientalists, should be mentioned in popularizing "Kutadgu Bilig". In Uzbek linguistics, Q. Karimov's contribution to the linguistic study of "Kutadgu Bilig" is significant. Scientists such as E.Fozilov, E. Umarov, O. Jo'raev, H. Boltaboev also conducted scientific research on the work "Kutadgu bilig". Kutadgu Bilig is an important work on which a lot of research has been done. The aphorisms and proverbs in the book have also been studied by many researchers. However, the forms of aphorisms and proverbs in modern Uzbek and Turkish have not been studied comparatively. The relevance of the study is thus determined. In the study comparative, comparative-historical methods were used.

## METHODOLOGY

Qualitative research is a type of research in which qualitative data collection methods such as observation, interview and document analysis are used, perceived, and a process for realizing events in a realistic and holistic manner is followed. (Yıldırım & Şimşek, 2006) In our study, information was collected using ethnography and phenomenology methods of qualitative research and interpreted as relevant. The sources that will shape the research are generally qualitative works. Therefore, a theoretical way of working was generally adopted. Therefore, preferred works as sources in the literature written about proverbs and sayings were examined. Couplets containing aphorisms and proverbs in "Kutadgu Bilig". The value of these couplets, which have been identified, has been revealed for today as well as for the period they were written. It is important to state that our main goal is to benefit from the magnificent works of our peoples, to know the meanings of the aphorisms and proverbs, to remember the advice of our ancestors and our personality.

## RESULTS

The didactic content of Yusuf Khas Hajib's "Kutadgu Bilig" is determined by its aphorisms. Aforizmlar taniqli ijodkorlar, mutafakkirlar tomonidan yaratilgan hikmatlar bo'lib, ularning negizida xalq donishmandligi yotadi. Aphorisms are proverbs which were told by famous writers, poets and thinkers. They are based on the wisdom of the nation. In general, proverbs and aphorisms are often difficult to identify. It is clear that folk proverbs are formed, first of all, in the form of aphorisms. Folk proverbs are also realized through the speech of some folk sage. That is the reason why we feel common in folk proverbs and aphorisms. "Kutadgu Bilig" contains aphorisms that are in line with the content of popular Turkish proverbs. These proverbs are still important. A number of aphorisms in the work reflect proverbs based on life experience. In such aphorisms, the conclusion is referred directly to the judgment of the listener. In this study, the aphorisms in the "Kutadgu bilig" are classified into seven groups.

## INTRODUCTION

It is important to research the text of ancient literary works in terms of philology, language and speech, thoughts of speech culture, examples of folk literature, and to educate the youth in all respects as mature, highly intelligent. The “Kutadgu Bilig”, written by Yusuf Has Hacib, is one of the educational works that serve to raise the personal spirituality of our literature, reflecting Eastern-style worldviews. There are also many proverbs and aphorisms in the work. In fact, it is a little difficult to distinguish proverbs and sayings. Proverbs are spoken by wisdom among the people and first they are shaped in the style of aphorisms. Therefore, there are many similarities between proverbs and aphorisms. Proverbs are used both in basic and side meanings, and meanings are used only in the basic sense.

In “Kutadgu Bilig”, there are meanings that are meaningfully close to proverbs used by Turkic people. The results on the basis of life experiences are expressed in these meanings.

Many features of the “Kutadgu Bilig” such as its importance in Turkic people’s culture, literature, the significance of this being as a common literary work for Turkic nations, the educational role in the history of world nations, linguistic features and the author’s talent attracts attention. The significant role of the aphorisms in reflecting the educational content of this work, its ideological-artistic value, lingvopoetic features and its role in society and public life, the thematic classification of the aphorisms, its literary features, the expressing degree of the characteristic properties, the linguistic value of words which express cultural and national meanings in the aphorisms are also very important.

## APHORISMS IN “KUTADGU BILIG”

Special emphasis should be given to aspects of aphorisms used in “Kutadgu Bilig” related to Turkic folk literature, especially proverbs, and the common features of words and proverbs. Attention should also be paid to the literary symbols in the work, the features which show the skills of Yusuf Has Hacib, examples of metaphors, metonymy and other literary arts, semantic features of the character describing human character and other features, and the degree of influence. Today's importance, educational-spiritual value, psychological and genetic principles of the content of the postans are very important in terms of linguistics. We can classify the aphorisms in the work in terms of meaning:

1. Aphorisms about genetics.
2. Aphorisms about human psychology .
3. Aphorisms about the education and etiquette.
4. Aphorisms about human character.
5. Aphorisms about speech culture.
6. Aphorisms about science and scientists.
7. Aphorisms about social relations.

### *1- Aphorisms about Genetics*

Some aphorisms in “Kutadgu bilig” are related to genetics, that is lineage. For instance, Örüñ süt birlä kirsä ed’gü qılıq, ölüm tutmağınça ewürmäs yoriq (Yaxshi qiliq oq sut bilan kirsä,

O'lim kelib tutmaguncha o'z tarzini o'zgartirmaydi) [If good habit is taken through the mother's milk, it will not change until the Death comes]. The main meaning of this is actively being used today as "Sut bilan kirgan jon bilan chiqar". It is in the same sense with the proverb (If something is taken through the mother's milk it comes out only if the death comes). This psychological, genetic basis is related to the character and psychology of human beings. *Huy canin altındadır* (The temperament is under life), *Güzele kırk günde doyulur, iyi huyluya kırk yılda doyulmaz* (You can be fed up with a beautiful person in forty days, whereas you will not fed up with a good behaved person in forty years), *Huylu huyundan vazgeçmez* (A person will never give up his character), *Sütle giren huy, canla çıkar* (If something is taken through the mother's milk it comes out only if the death comes), *Yüz güzelliği hamamdan eve, huy güzelliği Urum'dan Şam'a* (The external beauty will be known only by the family, a beautiful temper will be seen from Urum to Damascus), *Yüzü güzel olanın huyu (da) güzel olur* (The face of the person, whose character is also beautiful, will also be beautiful). The same meaning is expressed in the proverbs mentioned above. The inner world of man is endless emotions, the sum of experiences, many of which are genetic. For this reason, the character of man creates natural, unchanging habits as well as features that will affect the social environment. The word "Sut" (milk) units with the words like "tug'ilish" (born) and "jon" (life) and "o'lim" and creates logical opposition in relation to (death) thoughts and increases the degree of influence.

## 2-Aphorisms about Human Psychology

Some aphorisms in the "Kutadgu Bilig" are related to personal psychology:

Buşaqlıq bilä erkä öwkä yawuz, bu ikki bilä tutçı emgär et öz (Anger and wrath are enemies of man, because of these two people are always tormented (9, 326). Buşaqlıq (buşaq+lıq) – öwkä the use of words in the sense of anger and wrath is related to the peoples' ideas about the occurrence of anger in the lung. For this reason, it would be appropriate to accept these words as linguistics with cultural knowledge. Kaşgarlı Mahmut noted that the word *kisskä* was used in the sense of anger. (3, 148). This aphorism's meaning is close to the proverbs of Uzbeks "Jahl chiqsa(kelsa) – aql ketadi", and Turks *Öfkeyle kalkan zararlar oturur* (If the person stands angrily, he sits with harm), *Öfkede akıl olmaz* (There is no mind in anger), *Keskin sirke kabına (küpiñe) zarar(-dır)* (Sharp vinegar damages own container) . If it was emphasized in the aphorism that anger was an enemy to man, it was stated in the proverbs that the angry person could not control himself and hurt himself. *Sabr tubi – sariq oltin /Sabrning tagi sariq oltin*, *Sabr qilsang, go'radin halvo bitar* The patience, which is meaningfully close to the proverbs [The end of the patience is yellow gold], is also related to the psychological state of man:

*Qachon qahring kelsa, o'zingni tut, sabrli bo'l, Sabrli kishining sevinchi oldida* [Try to keep calm when you get angry and be patient as the happiness of the patient is ahead.] [9,1304.beyit] The impaired man's degraded work is getting better. Patience is what one wants. If there is any problem, anxiety in human life, then these torments come with joy and happiness. Patience is the ornament of man. Patiently, the human finds his way to the sky. When he is angry, the human loses his mind. A person who can control himself when he gets angry is considered willed. It is recommended to be patient in Turkish folklore through these proverbs *Allah sabırlı kulunu sever* (Allah loves his patient servant), *Sabır acıdır, (acı ise de) meyvesi tatlıdır* (Patience is bitter, (despite its bitterness) its fruit is sweet), *Sabırla koruk helva olur, dut yaprağı atlas* (The leaf of mulberry is silk), *Sabreden derviş, muradına ermiş* (Patient dervish became happy), *Sabreyle*

*ishine, hayır gelsin başına* (If you want to have goodness be patient), *Sabrin sonu selamettir* (The end of the patience is goodness). The proverb “Eve kirme ishke sabr qil serin, Eve qilmish ishlar o’kunchi yarin” resembles the proverbs of Uzbek “O’ylamay qilingan ish, Boshga keltirar tashvish”, (The work done without thinking well will bring trouble), *Shoshmasang tez yetasan, Shoshgandan o’zib ketasan* (If you are not in hurry you will reach fast, you will outstrip the man who are in hurry). The proverbs in “Kutadgu Bilig” such as “Qamug’ ishte evme serin o’z baqa, Serimlug kishiler tegir arzuqa”, “Serinse kishi o’z tilikin tapar, Serib turdachi er o’run qush tutar” are close meaningfully close to the Uzbek proverbs to the Uzbek proverbs “Sabrning tagi – sariq oltin” (The end of the patience is golden), “Sabr etgan yetar murodga, Besabr qolar uyatga” (The man who is patient will be happy whereas the man without patience will be embarrassed).

### 3- Aphorisms about the education and etiquette

The aphorisms in “Kutadgu Bilig” are also related to the character and manners of human beings. “Körü barsa dunya kölikä sanı, yeðärsä qaçar qačsa eðrär seni”. [If you pay attention, the world is like a shadow, if you follow your foot, you run, if you run, it will follow your foot.] (9, 3488). This is equivalent to the proverb of Uzbeks “Sen boylikni quvlama, boylik seni quvlasin” [You should not pursue the wealth, it should pursue you]. In aphorism, the world (wealth) is likened to shadow. According to the analogy, the meanings of instability, mortality and disloyalty in wealth are expressed by “Kölikä säni”.

“Rizqli, mard kishi uchun mol-dunyo (hech) kamaymaydi, Tug’ilgan [ya’ni bunyod bo’lgan] oqqush uchun don (hech) kamaymaydi” [For wealthy and brave man, wealth never decreases. “For the swan which was born” (that was, created), grain never decreases.] [9,2020.beyit]. These aphorisms are meaningfully close to these actively used proverbs “Har kim o’z rizqi bilan tug’iladi” [Her insan rızkıyla doğar] [Everyone borns with own sustenance]; “Har kimning o’z rizqi bor” [Everyone has their own sustenance]; Tishni bergan Xudo rizqini ham beradi [God who gives the tooth also gives a sustenance]. There is a lot of wisdom about the birth of everybody in their own culture in the eastern culture, in every child, in every family, in the creation of each person with his own will. It was stated in this aphorism that a person cannot enjoy the pleasure of someone else, and that every person can have the amount of blessing that God gives. “Og’ilxonada buzoq tug’ilsa, ariq bo’yida o’ti unadi” [If the calf is born in a shed, the grass will grow near to him.] *Ağilda oğlak doğsa, Yaylada otu biter* [If the calf is born in a shed, the grass will grow in the pasture.] In the aphorism and proverbs, Eastern ideas are expressed about the spreading of the sustenance of the baby from the time the baby was born, collecting this sustenance throughout the life of the human, and the inability of someone else to receive the sustenance given by Allah to another. “Tarīylay erür dunya elig qutī, tarīsa orar er tirilgū otī ” [Happy ruler, this world is a field, if plants grow, everyone will harvest own food] [9, 1378]. In the couplet, the world is likened to the field, and it is emphasized that everyone will reap what they sow and eat their own sustenance.

### 4- Aphorisms about human character

In the poses of Kutadgu Bilig, it is not only contented to express precious ideas based on life experience, but also it is recommended to pay attention to the result, and advises the reader: *Qoraga yaqinlashma, ey asli oq, Oqqa qora tez yuqadi, ko’ring* [Do not close to the black as you are originally white because the black infects the white fast] [9,4136.beyit]. “Yomonga yaqinlashsang, balosi yuqar, Qozonga yaqinlashsang – qorasi” It is close to the essence of the

proverb [If you close to the bad their bad deeds infects you, if you get closer to the pot with its black you can get dirty]. Yaxshi bilan yurding – yetding murodga, yomon bilan yurding – qolding uyatga It is reminiscent of the proverb [If you are a companion of a good person you become happy, If your companion is bad you can be embarrassed]. The inner world of those who are friends with good people, and who are in good people's conversations also turns towards goodness. If a good person becomes a friend of a bad person, he can start doing bad things soon. Do'sting kimligini aytsang, men sening kimligingni aytaman Proverb [If you tell me who your friend is, I will tell you who you are] is common.

The proverb “Yaxshi yeydi oshini, yomon yeydi boshini “ [The good one eats a meal while the bad one eats his own head] is close to the essence of the proverb “Yaši qisqa esiz ökünçün qarir, uzun yašliy eđgü ökünçsüz yorir [It is stated that the age of the evil is short, he ages with regret, whereas the life of the good is long, he lives without regret] [9, 342]. If the young, strong person is bad, he will age with regret, no matter how old the good person will live without regret. The semantic contrast constitute with words *goodand bad* in the proverb and “ökünçlög – ökünçsüz” in the aphorism.

“Etiglig az eđgü üküštä kökü, telim tüšti artaq üküš sü” [Disciplined minority is better than undisciplined majority, There is a lot of confusion with many soldiers] (9,2304.) The use of the words *az-ükuš* in the meanings of few and many served to emphasize the idea: “Disciplined minority is better than undisciplined majority.” [Ахмедов Б. 2007: 3] This idea is close to the opinion of Amir Temur “A single person who knows his job well, is brave and diligent, decisive, enterprising and vigilant is better than thousands of careless people”. [Ahmedov B. 2007: 3] This conforms to the proverb of the Uzbek “Oz bo'lsin-u, soz bo'lsin” [Can be less but should be good]. “Dushman birgina bo'lsa ham zarari ming-mingdir, Minglab do'sting bo'lsa ham ozligi birga tengdir[ya'ni bir kabi ozdir]” (Even if there is one enemy, its harm is thousands, even if there are thousands of friends, they are equal to one (that is, as little as one). (4087)Do'sting mingta bo'lsa ham oz, dushmaning bitta bo'lsa ham ko'p [Even if you have a thousand friends it is still less, even if you have one enemy it is more .] This proverb and aphorism encourages you to be careful in social relations, to be friends with people.

### 5- Aphorisms about speech culture

Some aphorisms are related to the culture of speech: Uquşqa biligkä bu tılmaç tıl, yaruttaçı erni yoriq tilni know [Know that the interpreter for education and science is a language, the fluent language makes people happy] (QBN, 158; 13a7). The person is developed and become valuable thanks to his language. The word in couplets “tılmaç” formed the metaphor. Aphorism Boshga balo tildan kelar It is close to the proverb [the trouble comes from tangle ].

*Yaxshi so'zga ilon inidan chiqar, yomon so'zga pichoq qinidan chiqar* [with sweet words the snake comes out from the hole, with bad words the knife is taken from the sheath] this proverb is reflected in these aphorisms: “Ayızdın ara ot ara suw čiqar, birisi yapuylı birisi yıqar – Sometimes the water, sometimes the fire comes out of the mouth, one of them treats, the second one breaks down (9, 2646.beyit)”. There wonderful metaphor is used. The word that comes out of the mouth is expressed with the features of fire and water. As emphasized in the work, the bad word always destroys crops like fire, that is, it breaks people. The good word is like clear water. Where the water is, various blessings are there. The good word spreads goodness seeds to people's hearts. The contrast in the thoughts of water constitutes the metaphor.

Aqar suw teg ul bu tilin eḡgü söz, qayuqa bu aqsa čečäk ündi tüz [The beautiful word that comes out of the mouth is like flowing water, wherever this water flows, flowers bloom there.] [9, 2648.beyit]. The word combination “eḡgü söz” is compared to “aqar suwa”. The blossoming flowers near to the flowing water, filling the realm with goodness, has been compared with the words of the beautiful word.

The beautiful meaningful, deep ideas in “Kutadgu Bilig” were written thanks to hadiths. In the couplets we have examined, we have seen that wise people are compared to the land which is with water, and wise words are compared to life-giving water. In the hadiths about science learning, science is compared to rainwater, and those who learn science are compared to the ground. It is stated in the hadith that rainwater is life-giving.

Süčig sözlük (sweet language) envoys are considered to have the virtues: Sözi bolsa yumşaq šakar-teg süčig, süčig sözkä yumşar uluy ham kičig [If the word is sweet, like sugar, it softens everyone.] [9, 2626.beyit]. Here süčig (sweet) used the word metaphorically, süčig söz (sweet words) šakar (sugar) is compared to “The painful (bad) word removes the man from his religion (with the sweet word snake comes out of his hole) while sweet words makes the snake come out from his hole”. Kaltak yarasi bitadi, tez esdan chiqadi, Til bilan so‘ksa bitmaydi, zahri abadiy qoladi [The wound which is made by stick will be treated and it will be forgotten quickly, if it is wounded from the tongue, its poison will remain eternal] [9,2541.beyit]. “Tig‘ jarohati bitar, til jarohati bitmas” [the wound made by knife will be cured, whereas the wound made by the tongue will never be healed] is appropriate to the proverb above. Warnings like this encourage every person to be very careful, because that is the goal. “Proverbs are the common property of a nation. A nation made the lessons learned from the rich life experience proverb, so that it wanted to inform, warn and criticize people. [Aksoy, Ömer Asım, 1988:10]

### **6- Aphorisms about science and scientists**

The period in which Yusuf Has Hacib lived was the flourishing period of the Karakhanid denasty. In this period, much attention was paid to learning science, and scientists were also respected. It was recommended by the author to learn science, to be patient in every job, not to rush. In many places of “Kutadgu Bilig”, the importance of science in human and social life has been mentioned and the words of knowledgeable people have been compared to water: “Bilimlining so‘zlari yer uchun suv kabidir, Suvni oqizilsa, yerda anvoyi ne‘matlar unadi” [The words of the knowledgeable are like water for the ground. Many plants grow as water flows.] [9,958.beyit]

Water are the source of life for nature, human and all living things. Smart people are necessary for society and the state as much as water and air. One wise and an intelligent person is better than thousands of mindless people. The mindless person is very dangerous for society. Because he has no mind. Therefore, malevolent people can easily get what they want. The smart and wise man is determined. No power can turn him down in his own way. The language of the scholar must be free to speak. The fame of the wisdom person will never decrease like the water of the flowing water. Knowledgeable human is like a place where plants grow. Wherever foot is placed on this place, water comes out of it. The heart of the ignorant is like a desert. Even if the river

water flows there, it does not fill. This is close to this proverb Bilimli ming yashar, bilimsiz bir yashar [the smart ones live thousand years, while the ignorant ones live a year].

“Zakovat ko‘rki tildir, bu tilning ko‘rki so‘zdir, Kishining ko‘rki yuzdir, bu yuzning ko‘rki ko‘zdir” [The ornament of intelligence is language, the ornament of this language is the word, the ornament of the person is the face, the ornament of the face is the eyes.] [9,271.beyit]. According to what people say, it is possible to understand his science and his worldview. The ornament of the mind is the word, the ornament of the person is the face and the ornament of the face is his eyes. If his word is good, he will be respected. This posy reminds one of the proverb of Uzbek folk literature “So‘z ko‘rki – maqol, yigit ko‘rki – soqol” [The ornament of the word is a proverb, the ornament of the man is his beard].

### 7- Aphorisms about social relations

In “Kutadgu Bilig” Yusuf Has Hacib also paid attention to neighbors and neighborhoods. It is stated that the person who wants to buy a house should learn who the neighbors are first, because if the neighbor is bad, there is no peace in life. A good neighbor becomes better than a relative. A close idea can be seen in these Turkish proverbs: *Ev alma, komşu al* (Do not buy a house, buy a neighbor), *Hayırlı komşu, hayırsız akrabadan iyidir* (A good neighbor is better than a unthankful relative), *Kem dileme komşuna, kem iş gelir başına* (Do not wish bad things to your neighbor, they come to your own head), *Komşu ekmeği komşuya borçtur* (The neighbor's bread is a debt to the neighbor), *Komşu hakkı, Tanrı hakkı(-dır)* (Neighbor's right, is God's right), *Komşu komşunun külüne (tütününe) muhtaçtır* (Neighbor is in need to the neighbor's ash), *Komşuda pişer, bize de düşer* (Cooked meals in the neighbor's house, comes to us as well), *Komşun kör ise sen kıpa bak* (If your neighbor is blind you should also adapt to this), *Komşunu iki inekli (öküzlü) iste ki kendin bir inekli (öküzlü) olasın* (Wish to your neighbor two cows, if you want to have a cow), *Sırça köşkte (evde) oturan, komşusuna taş atmamalı* (The person who lives in glass castles should not throw a stone at his neighbor), *Yaman komşu, yaman avrat, yaman at; birinden göç, birin boşa, birin sat* atasözleri boşuna söylenmemiştir (A bad neighbor, a bad wife and a bad horse: leave from one of them, break up with her, sell the last one). As “Each proverb is a treasure in which the culture of society is hidden and a guide that guides people. The societies' lifestyles, customs and traditions, perspectives on life, value judgments and cultural structures have been included in proverbs in the form of experiences and transferred to future generations as advice.” [Aynur Öz Özcan, 2009:1]

“Uy olmoqni istasang, qo‘shnilarini surishtir, Yer olmoqni istasang, suvini surishtir” [If you want to buy a house inquire about your neighbors, If you want to get a place, inquire about the water of this place ] [9,4444.beyit]. In Uzbek folklore has proverbs like “Bir qizga yetti qo‘shni ota-ona” [Seven neighbors are regarded as parents of a girl], *Hovli olma, qo‘shni ol* [You should not buy yard but you should buy neighbors], “Yon qo‘shni – jon qo‘shni [A close neighbor is a life neighbor], “Yomon qo‘shni yovdan yomon” [A bad neighbor is worse than an enemy] [10,126]. This means that neighbors, neighboring issues were of great importance in the lives of our people.

### CONCLUSION

As we can see, proverbs and aphorisms in “Kutadgu Bilig” have not lost their importance today. We can explain the importance of the aphorism in the work as follows:

- Aphorisms are similar to proverbs in that they are based on a certain experience, related to events in social life. They are distinguished from proverbs with the author's own approach;
- There are words reflecting to the culture of the people and the thoughts of the worldview. For this reason, aphorisms are significant in expressing national values and cultural relations;
- Aphorisms have linguistic units that reflect the development periods of a particular language;
- Written statements make it possible to express thoughts, ideas, and reach future generations through proverbs.

Researching proverbs and aphorisms in “Kutadgu Bilig” is also very important in terms of our people's worldview, understanding their spiritual values, and examining the changes in our vocabulary.

As you can see, proverbs and aphorisms in Kutadgu Bilig have not lost their significance till nowadays. “Kutadgu Bilig”, which is regarded as one of the most valuable works of Turkic literature in the period of Islam and has been translated into many languages of the world, has an extremely important place in the world culture and literature. For this reason, the 950th anniversary of the writing of Kutadgu Bilig by Yusuf Has Hacib was included in the 2019 UNESCO Memorial and Celebration Anniversaries program.

### ABSTRACT

*In this article, speech goes on health, which is the World Health Organization (WHO) defines as a state of complete physical, spiritual and social well-being, and not just the absence of an illness or physical defect. Moreover, some signs of health, such as (balance with the environment, breadth of adaptive capabilities, functional reserves, level of working capacity) are quantified, others (degree of physical, social, spiritual well-being) are discussed.*

**KEYWORDS:** *Sport, Health, Exercises, Lifestyle.*

### INTRODUCTION

Health is defined as the ability to self-preservation, self-development and self-improvement. Health is the ability to:

- ❖ resist external and internal influences, diseases, damage, aging and other forms of degradation;
- ❖ adapt to the environment and their own capabilities;
- ❖ increase the duration of life;
- ❖ produce and grow full-fledged offspring;
- ❖ improve the capabilities, properties and abilities of your body, as well as the quality of life and the environment.

Most often in the definitions of health there are several signs:

1. The absence of disease;
2. The normal function of the body at all levels of its organization;
3. The ability to fully perform basic social functions;
4. Complete physical, mental and social well-being, harmonious development of the physical and spiritual forces of the body;
5. The dynamic balance of the body, its functions and environmental factors;
6. The ability to adapt to constantly changing living conditions in the environment (adaptation).

Some signs of health, such as (balance with the environment, breadth of adaptive capabilities, functional reserves, level of working capacity) are quantified; others (degree of physical, social, spiritual well-being) are descriptive. Scientific and technical, social progress brings not only goodness, but also leads to environmental pollution, increases the requirements for stress resistance, necessitates the assimilation of a large information flow, reduces the amount of physical activity of a person (lack of exercise), which together leads to poor health.

There are several gradations of health:

1. **Absolutely healthy** - all organs and systems function in accordance with the environment, there are no painful manifestations in them.
2. **Almost healthy** - the observed some deviations in the state of health do not significantly affect well-being and performance.

More than 1000 years ago, Avicenna identified 5 degrees of health and illness:

- 1) The body is healthy to the limit;
- 2) The body is healthy, but not to the limit;
- 3) The body is not healthy, but not sick;
- 4) The body is in good condition, quickly perceiving health;
- 5) The body is sick to the limit.

Along with "static health", "dynamic health" is becoming increasingly important. "Healthy" - one who has good "dynamic health" and is able to perform certain physical activities.

In the system of state educational institutions, pupils, learners and students by health level are divided into basic, preparatory and special medical groups.

Many scientists consider the most common components of health. Traditionally, following the WHO definition, in most cases, the following are distinguished:

The components of health are physical, mental, and social.

**Physical health**, which provides power relationships with the outside world, is a person's ability to use his physical body, his organs and systems for self-preservation.

**Mental health** determines a person's ability to use the image of the outside world, control their emotions and behavior, cope with stress and use them to improve health.

**Social health** consists in the ability to form and use for self-preservation the subjective ideas of other people about the outside world and their role in it. This component reflects social ties, resources, ability to communicate and its quality.

Biological, social, and natural factors influence human health. Of great importance is heredity - the ability of the body to preserve and transmit to posterity the characteristic features, structural features, functioning and individual development. The concept of "health" includes a person's ability to adapt, i.e. adequate changes in functional parameters, ensuring the preservation of performance in new conditions. Compensatory reactions are aimed at maintaining homeostasis and is defined as:

- 1) Health is the state of the body,
- 2) Health is determined by internal and external factors, especially social,
- 3) Health - a state of equilibrium with the environment and has a quantitative and qualitative degree.

A person's attitude to health is manifested in the actions, deeds, experiences, judgments of people regarding factors that affect their physical and mental well-being.

The forms of manifestation of the attitude to health can be adequate (reasonable) and inadequate (unreasonable, careless), but since in real life such a polar alternative is practically excluded, we should talk about the degree of adequacy of the attitude to health.

The criterion for a measure of the adequacy of attitude to health can be the degree to which a person's actions comply with the requirements of a healthy lifestyle, as well as the normatively prescribed requirements of medicine, sanitation and hygiene, and whether the individual's self-esteem matches the physical and mental health status.

**Health as a need for a cultured person.** The need for health, given to us at a biogenic level in the form of the need for self-preservation, transforming as a person socializes, develops and becomes a need for health as a means of fulfilling other life needs (in material well-being, achieving other goals, etc.).

As the individual develops culturally and spiritually, the need for health becomes an independent value. The stronger spiritual needs, the higher the person's responsibility for their physical ability to realize them.

There is a group of needs that are themselves, to one degree or another, met in the process of fitness classes. This may include the need for outdoor activities, restoration of working capacity and health, communication and collective activity, moral and aesthetic development, recognition by other people and self-affirmation, etc. The more developed these needs are, the greater will be the need for physical education and sports.

**Student's lifestyle and its impact on health.** Physical culture acts as a necessary part of students' lifestyles, because it is an integral part of universal human culture, the area of satisfying vital needs in physical activity, solves the problem of physical perfection, and solves the problems of rational use of free time.

Everyday academic work, test-examination sessions (2 times a year), training practices - all this requires a student to be very diligent, good health, positive psychophysical preparedness. The

volume of students' workload in faculties and courses, as well as in specialization, varies considerably. It is determined by the complexity of the studied disciplines, the level of preliminary preparedness of the student and his attitude to study. Sociological studies show that 6-8 hours per day are given for training sessions. Self-training requires from 3 to 5 hours, and during the examination session - 8-9 hours a day. Thus, the total study time of students is 9-12 hours a day. This is a rather large psychophysical load on the body of a young man. The volume of physical activity in students of the Faculty of Physical Culture, in the process of daily practical exercises, in total significantly exceeds the physical load in comparison with students of other faculties.

A significant part of students with insufficient theoretical training in healthy lifestyle issues often rely on a fairly quick natural recovery of the young body. Most students have this feature, but you need to know the elementary patterns about the consequences of the endless exploitation of the young body, violating the elementary rules of the study and rest regime. According to research materials, up to 60% of students are self-taught in the late hours and, as a result, many have a sleep disorder that has been observed for all years of study at the university. In 87% of students living in dormitories, going to bed is delayed until late at night. Hence the extremely insufficient duration of night sleep occurs. Sleep normally should last from 7 to 8 hours, which is observed only in 15% of students. There is a complete disregard for the diet, when up to 21%, students go to classes without breakfast, with irregular intake of hot food. The calorie content of food, its volume and quality are not regulated at all.

Great overloads and a "barbaric" attitude towards your body sooner or later make themselves felt. They are manifested in reduced working capacity already at the end of the semester, when the greatest mobilization of forces is necessary for the successful development of all the training material for the test-examination session. The exam period is not just a test of knowledge, it is a test of the health of the whole organism of a young man.

For example, special observations showed that during the exam session, the heart rate of students steadily rises to 80–92 beats / min, at a rate of 68–72 during normal training sessions. On the day of exams, before entering the audience where the exam takes place, the heart rate increases to significant levels, reaching 144 beats / min, blood pressure rises, breathing becomes uneven and, therefore, oxygen saturation decreases. It would seem that it was during this period that it is necessary to pay special attention to the correct mode of work and rest, to the use of active recreation, compensating for low physical activity and great mental fatigue.

In practice, during the examination sessions, about 90% of students become violators of elementary patterns. Dramatically limited students stay outdoors. There is a systematic lack of sleep, a rare and irregular meal and as a result, after the session, some students have colds and other deviations in their health status. All these "ordinary" diseases (flu, tonsillitis, acute respiratory infections, etc.) are the result of a decrease in the body's protective capabilities due to overstrain during the session, the result of significant violations of the proper mode of academic work and life, as well as a consequence of a general lack of physical activity (physical inactivity).

At the same time, students who regularly go in for sports and do not interrupt their studies even during the exam period, more safely pass through these difficulties of their student lives.

Students involved in systematic physical education and sports and exhibiting quite high activity in them develop a certain stereotype of the daily regimen, increase confidence in behavior, observe the development of prestigious attitudes, and high vitality. They are more sociable, express readiness for commonwealth, rejoice in social recognition, are less afraid of criticism. They have higher emotional stability, endurance, they are more prone to optimism, energy, among them there are more persistent, decisive people. This group of students is more inherent in a sense of duty, integrity, self-discipline. They successfully interact in work that requires constancy, tension, more freely enter into contacts, are more resourceful and sociable, leaders are more common among them, they are more able to self-control.

These data emphasize the solid positive impact of systematic physical education and sports on the character logical characteristics of students' personalities.

Educational and free time is an inextricable whole. It is no coincidence that they say: "As you rest, you will work!" Students' free time is about 2-3 hours per day. Of course, the conditions in which they live, study and relax, have a significant impact not only on the structure of free time, but also on their performance, health status.

Sociological studies have revealed that students of special educational institutions use their free time in different ways. Comparing the budget for free time of student athletes and students who are not involved in sports, we clearly see the greater clarity of the regime of work and rest in the former.

Students-athletes, whom the very essence of sports training forces to constantly monitor their health, already put themselves in relatively better conditions. By consciously following the rules of a healthy lifestyle, athletes are less likely to violate sleep, nutrition, more often are in the air, so they have a great harmony between mental and physical stress. They do not need to be convinced of the dangers of smoking and alcohol, since they know very well how this can affect their well-being and performance. As a result, they are less likely to get sick, switch more easily from one type of activity to another and, despite the additional time spent on sports training, have higher resistance to various stressful situations, as well as increased overall performance during the school year.

Calculations of the impact of risk factor groups on health have shown that 50–52% are related to lifestyle, 18–20% are heredity, 20% are environmental and environmental effects, 10–12% are health-dependent factors.

It is established that the influence of the individual components of the student's lifestyle, taken as 100%, is very significant. So, sleep mode accounts for 24-30%, diet mode - 10-16%, motor activity mode - 15-30%. Accumulating during the school year, the negative consequences of such an organization of life are most pronounced by the time it ends.

Unfortunately, not all students have the right idea of a healthy lifestyle. Many believe that for this it is enough to abandon bad habits. Some students express doubts about the justification and the ability to play sports and study well. In this matter, you must first decide which athletes to talk about. Candidate students for masters of sports spend more than 20 hours a week on training and competitions and, in addition, go to sports competitions and training camps for more than 1.5–2 months during the year. The total time volume of work in this case is approximately equal to or slightly exceeds the established weekly volume of classroom studies of students at the

university. And when you consider that athletes of this level conduct 2-3 trainings a day, you still need time to travel to the place of training and recovery procedures. Thus, the total time spent by athletes increases significantly. Therefore, we can say that the most significant minus in the attempt to combine the active functioning of a student in sports and his professional development as a specialist in a particular profession is based on a catastrophic lack of time for successfully solving these two independent tasks within the established periods of study at the university. Almost one or the other task will not be completed, and possibly both.

A different picture is noted among representatives of mass sport. These students study in their educational institutions, compete for their faculty, university, national team of the city, region. These students have the priority of mastering their chosen profession over sports success. Sport in this case is an assistant in becoming a professional employee.

Specifically conducted studies indicate that student athletes of the II — III grades, who spend 6–12 hours a week on training, study better than students who are not involved in sports; student athletes of I category and candidates for master of sports, training for 12-20 hours per week, study in the same way as non-athlete students. Only student candidates for master of sports study worse than the average university student. But the worst performance, the most missed classes, frequent departures on academic leave and a high frequency of cases of expulsion from the institute are among students of a special medical group and exempted from practical classes in physical education.

One of the factors that significantly reduces the adaptive abilities of students is physical inactivity. If earlier physical inactivity, physical weakness was noted in middle-aged and older people, then at present it is observed quite often among young people, students, and schoolchildren. The main reason is low motor activity. 20-30% of students entering the institute cannot swim. Over 25-35% of university students are weakened by their health and poor physical fitness. In extracurricular activities, students' physical-sports activity is low.

## **PATRIOTISM AS A MEANS OF DEVELOPING HARMONIOUSLY DEVELOPED YOUNG GENERATION IN THE MILITARY SYSTEM**

**Saidov Hakim Gofurovich\***

\*Lecturer,

Urgench State University, UZBEKISTAN

Email id: volidaravshan@gmail.com

---

### **ABSTRACT**

*In this article patriotism is discussed as a citizen's spiritual heritage, the most important element of social consciousness, the foundation of social and state systems, the foundation for strengthening the unity of a federal state. Patriotism is one of the main signs of national harmony in society, and a sense of patriotism has always been a necessary component of the educational process. For any country at all times, bursts and downturns of national unity were characteristic, and the strength of the country was to a very large extent determined by the sense of patriotism of its people.*

**KEYWORDS:** *Patriotism, Statehood, Military System, Education, Secondary Schools*

---

### **INTRODUCTION**

At present, in Uzbek society, feelings of spiritual unity and patriotism have again become really in demand. Therefore, the relevance of this article we see in the analysis of the strengths and weaknesses of the military - patriotic work carried out in individual regions relatively recently, so that this experience of educating pre-conscription youth helped to develop measures to restore and strengthen the spiritual foundations expressing the common interests of all layers and groups in Uzbekistan, strengthened the credibility of the central authorities, local authorities, and, ultimately, would facilitate the approval and support of young people both native and foreign policy of our state.

The revival of Uzbek statehood on the basis of Uzbek national-spiritual identification, the recognition of the country's national interests, required the restoration of a system of patriotic and military-patriotic education on completely new foundations. The peculiarity of the current state of affairs has put on the agenda the creation of a system of patriotic and military-patriotic

education on the basis of previously practically tested and understandable common spiritual values.

The problem of modernizing the entire system of military-patriotic education in the educational system is associated with the identification and preservation of the best traditions of patriotic education accumulated by pre-revolutionary and Uzbek schools, updating its content, designing new technologies with justification of organizational and pedagogical conditions for increasing the effectiveness of patriotic education in educational systems.

The most significant achievements of patriotic upbringing experience accumulated by the pedagogical school for modern times are reflected in the writings of A.L. Aronova, V.A. Rodrodny, B.C. Ilyina, N.M. Konzhieva, I.F. Vydrina. Problems of military-patriotic education, training of a soldier-internationalist are considered in the works of A.G. Bazanova, A.V. Drumshchikova, G.V. Sredina, A.N. Vyrshchikova, A.A. Cherkasova and others.

However, in the works of these authors, the dependence of the content of military-patriotic education, its forms and methods on the results of the process of diversification of education, the existence of various types of organizations engaged in military-patriotic education using regional characteristics are not fully shown. Analyzing the scientific literature on this topic, a number of dissertation studies based on the modern experience of organizing military-patriotic education, it is difficult not to notice a number of contradictions:

- between the needs of society, the state in the personality of a citizen-patriot, as a bearer of national cultural and historical traditions, and the process of predominant orientation of young people to other moral and material, sometimes artificially implanted, values;
- Between the desire to form democratic ideals, ideals of the rule of law in the socio-political consciousness and the inadequate level of patriotic and civic consciousness of a significant part of the population, including pre-conscription youth;
- Between the needs of high school students in knowing the historical truth about their Motherland and the content of the curriculum of the main humanitarian disciplines, sometimes insufficiently truthfully and objectively reflecting the past and present;
- Between the desires of pre-conscripts to take part in socially significant activities and the real possibilities for involving students in military-patriotic activities;
- Between the pace of improvement, the introduction of new educational technologies and the ability of state institutions, public organizations to introduce new technologies in the field of military-patriotic education.

A natural question arises: how should approaches to the design, content, organization of military-patriotic education be changed in order to increase its practical orientation and effectiveness? The search for an answer to it was the topic of our article.

Our purpose is the assessment, generalization and scientific and pedagogical understanding of the experience of military-patriotic education of preprincipled youth in the state institutions and public organizations.

The organizational and pedagogical experience of military-patriotic education of high school students and pre-conscripts will be more positive if we:

- show the importance of the patriotic moods of Uzbek society for strengthening the country's defense capabilities, as well as factors affecting its condition;
- reveal the content and features of military-patriotic education in modern conditions as part of the system of patriotic education;
- analyze the basic concepts of patriotism that have developed in modern Uzbekistan, as well as explore the possibilities of their use in military-patriotic education of pre-conscription youth;
- To investigate the attitude of pre-conscripts and high school students to the activities of military-patriotic education conducted with them;
- to reveal the orientation and effectiveness of military-patriotic education of pre-conscription youth carried out by state institutions and public organizations.

To solve the tasks, a complex of theoretical and empirical methods was used: analysis of scientific literature, documents, pedagogical experience; questioning, testing, ranking, studying the results of activity, stating and formulating an experiment; systematization and qualitative analysis of experimental data, their graphical interpretation. The study was carried out in three stages.

The first stage was associated with a theoretical analysis of philosophical, historical, sociological, psychological and pedagogical, regional studies literature, the development of research programs, and the definition of a conceptual apparatus.

The second stage- conducting the study itself on the basis of assessing the degree of effectiveness of work on military-patriotic education conducted by state institutions and public organizations (associations) of its role in shaping the patriotic consciousness of pre-conscripts.

The third stage - completion of the research work, analysis of the data obtained, generalization of the results obtained, preparation of the article.

In conclusion, the study of literature on patriotic education, a comparative analysis of the state and prospects of ethnic self-preservation of the diaspora showed:

1. The education of students in the spirit of patriotism and friendship of peoples in the diaspora is an urgent psychological and pedagogical problem of modern pedagogical theory and practice of education.
2. The problem of educating young people in the spirit of patriotism and friendship of peoples in the diaspora has not been studied enough and requires scientific understanding, theoretical, and methodological development.
3. In the education of youth in the spirit of patriotism and friendship of peoples in the conditions of life of the diaspora, it is necessary to take into account the psychological and pedagogical features of family education.
4. The national school plays a decisive role.
5. The national diaspora is a phenomenon of the spiritual and moral life of society.
6. The implementation of the theoretical foundations of the education of patriotism and friendship of peoples among students in the diaspora is possible when developing a model of the pedagogical system and introducing an approximate methodology for solving this problem based

on the above logic of constructing the educational process, which in turn requires the implementation of an experimental test.

### ABSTRACT

*Ogahi lived during the Russian occupation period. The article analyzes Ogahi's depictions of the struggle against the invaders in contemporary art. Battle scenes are rare in the play. But through the spiritual resistance of Ogahi against a whole war, the psyche of the people was revealed. The article tries to explain this situation.*

**KEYWORDS:** *Historical Novel, Historical Personality, Generalized Image, Specific Features Of Images, Image Psyche And War, Symbolic Images, Khiva Khanate, Russian Invasion, Patriotism And Betrayal.*

### INTRODUCTION

In the 19th century, the son of the great historian, poet, scientist, translator and statesman Erniyozbek, Muhammad Riza, nicknamed Ogahi, grew up in Khorezm, a center of high culture and cultivating a pleiad of great scholars. Ogahi is the second most prolific writer in the history of our literature after Alisher Navoi.

The work "Traces of a hurricane or Ogahiy" consists of two parts. The first part describes the causes of the war, the individual characteristics of each image, their specific features. The second part of the novel describes the war processes, the siege and occupation of the Khiva khanate, and describes the tragic situation of the Khiva khanate after the war in harmony with the Ogahi psyche. "During this period, the people of Khorezm were oppressed by the local rich and the Russian invaders. Nevertheless, cultural and educational work developed in the khanate. Ogahi's enlightenment contributed greatly to this. Ogahi's political lessons to Feruz are still relevant today."

The work begins with an image of spring. But these are not the traditional beautiful spring lines. This symbolic image of spring seems to be a sign of the future catastrophe of the Russian state

for our people. For example, in the first days of spring, Khorezm was invaded by a group of birds of prey. This bird says, "It cannot stand alone, it does not hesitate to eat what it sees in its eyes, it does not get enough of what it eats, it bites what it does not touch, it pollutes its destination, no one has seen it before, no one knows its name, it is yellow. The reader is able to see the image behind the symbolic symbol through these symbols.

Especially with the yellow color of this bird, we understand that the oil is meant by the Russian invaders. Another disaster in the image of spring is the symbolic image of the "blackbird". This image has generalized a number of images through its specific features. That is, the calamities that traitors bring to their people are revealed through this symbol of the "blackbird". For example, we can see this in the following passage. "It came from the cemetery inside the castle," he said. He began to gnaw at the stone walls, the columns of text below. Apart from the old courtyards, the new courtyards also started to be comfortable. Only after he collapsed did the blackbirds enter the houses and find out which roof had pierced which wall. There was no way to prevent the disaster or do anything about it. "It is important that the blackbird came out of the castle. In this way, the author is referring to traitors from within the country. Because with this sign his other signs become clear. Based on these signs, we see the images hidden behind it, the traitors. The "Soriqarga" symbolizes the leaders of the Russian invasion, while the "Karakurt" symbolizes Malanghan, Shomurod Inoq, Amir Tora, Kara Sardor, the poet Zamoniyy and Otajon Tora as traitors who destroy the country. The images of Ogahi and his entourage, King Feruz, Abdumalik Tora, Yaqubjon, Boboqul, and Siddiq, are portrayed as brave patriots who sacrificed their lives for the country.

## MATERIALS AND METHODS

At a time when the Russian army was in danger, Prince Abdumalik of Bukhara was pleased with Tora's visit to Khiva. Because he was well aware that the purpose of this visit was an alliance. With the Emirate of Bukhara under Russian occupation, there was no other reason for the visit. The phrase "His body is as light as a bird" is also used for this visit. The reason is that Ogahi, who correctly assessed the strength of the Russian army, was worried that one day the fate of Bukhara would fall on Khiva. However, due to Malanghan, the commander of Abdumalik Tora, the alliance agreement was annulled. It is emphasized that Ogahi is a strong politician. He is the first to notice that Malanghan has betrayed him. The reason for this betrayal was that von Kaufmann had thrown a large bone in front of Malanghan. Von Kaufmann focused on finding traitors, including Saidazamboy, one of Tashkent's richest men, and several castle governors, who carried out their plans with their own hands. It should be noted that the author created the image of Malanghan with complexity.

The reader finds it difficult to understand the true intent of this image. It seems that the author justifies this image in some ways. In particular, he seems to be still fighting for his country throughout the play. This can be explained by the process after Malanghan's interview with General Maneev, a representative of von Koufman. For example, he thinks he can help his people by overthrowing Amir Muzaffar, who is now an enemy to his people. In the current situation, fighting Russia is tantamount to self-immolation. But in any case, he left his comrade halfway. There is no excuse for betrayal.

The author has shown great skill in contrasting images of patriots and traitors. He contrasts the image of a slave boy, Boboqul, who was brought from another country in his youth, with traitors,

to the images of those who sold their homeland. Babakul's sister Anna will not leave her beloved homeland and return to her homeland with her sister. He says he is now in his homeland, in the arms of his family. This, in turn, reflects the image of Boboqul as an example of traitors under the guise of "blackbirds".

## RESULT AND DISCUSSION

The second part of the work describes the siege of Khiva. Each event is described in the same way as Ogahi's mental state. OgahiPahlavon thinks about Mahmoud Puryoivali's footsteps. "Did he get hurt? If a brick moves, people think it's a sign of decline. Let not the pillars of faith be broken, nor let the tower of faith be broken "(p. 107). We know that Pahlavon Mahmud was a great man. He is the teacher of all wrestlers. That begs the question. Why does Ogahi think of Pahlavon Mahmud's footsteps instead of caring for his people, innocent people? Because it is of special importance to the people. If a calamity befalls him by the enemy, the spirit of the people will be broken. In other words, Pahlavon Mahmud was a pir for the fighters along with the fighters. And for those who are defending their homeland during this war, it is one of the pillars of our great past. Literary critic P. Shermammedov in his article gives the following opinion about Pahlavon Mahmud. "It's very legal," he said. Because the vices of Pahlavon Mahmud, such as arrogance and lowliness, ignorance and ignorance, stupidity and envy, are very alive. The fight against these evils has not stopped.

"By this time, Ogahi had been repeatedly told that he was getting older and that his health was deteriorating. This is in conflict with Ogahi's actions during the siege and the war. Ogahi will fight the enemy to the last breath, even if he loses his strength and health. When Khiva khan Feruzkhan was betrayed by his uncle and brother and did not open the gate, Ogahi went on a hunger strike. When Sheikh-ul-Islam and Qaziqalan, who acknowledged Ogahi's courage, came to see him, the reason for Ogahi's hunger was reflected in his speech. "First of all, it is necessary to head to the fortress," said Mawlana. (p. 121). Apparently, Ogahi was crushed for internal turmoil. This is how he fought against those who betrayed the khan by claiming the throne.

This rebellion of Ogahi, who is revered by all and considered a master by kings, certainly does not leave anyone indifferent. Even General Kaufman, the leader of the Russian army. In his conversation with Commander Maneev, the following sentences are important. "If he was really on a hunger strike," he said. "It's called Ogahi." He is a true patriot if you know. He dared to slap us in the face. Do we have such a brave poet, I mean Russia? "(P. 148). Kaufman's claim that there are no such patriotic poets in Russia is a recognition of Ogahi's courage in the homeland. King Feruzkhan also says the following about Ogahi's courage. "MawlanaOgahi is an inexhaustible genius who knows the sorrow of the hand as his own sorrow. The fact that he did not taste the salt from the beginning to the end of the siege was not just a simple rebellion, but an obvious curse on those who came naked to the cursed ones with a sword, if I had the courage and heroism. , so be it "(p. 164).

Ogahi experiences such thoughts about the pain of addiction. "If you eat bad food, it will pass with medicine, and if you pass it, you will vomit." But you can't get rid of the whey of addiction. The world is full of comfort, but there is no cure for addiction. On the contrary, the more comfort, the greater the pain "(p. 160). Reflecting on freedom, Ogahi said, "Thank you for the wind that blows under your feet. How many are stuck in bed? " That is, it is a great thing that the wind blows under your feet, but if the Freedom of Man is violated, the wind will not taste.

Through von Kaufmann, Emperor Alexander had heard a great deal about Ogahi's poems and works on history. Therefore, the emperor invited Ogahi to St. Petersburg to see him. Ogahi tells Maneev, who brought the news, that he can only go on one condition. "... The books are our eyes, the pure blood that flows from our veins..., I am ready to go to St. Petersburg if necessary, but not to see our property, no, if I want to bring them, I will go, I will go "(p. 212). It is clear that Ogahi puts spiritual wealth ahead of material wealth. That is, the people believe that the state needs spiritual wealth first of all.

Ogahi, who witnessed so many trials and the conquest of Khiva, is confused. He thinks that every tragedy is the result of the actions of bad people. "The deficit of the wicked can strike at anything" (p. 230). Ogahi encounters a potter on his way to St. Petersburg. Kalandar tells Ogahi that he has been searching for the "Land of Flying Horses" for twenty years and tells the story of the horses. This story makes Ogahi think. He seems to have found the answer to the question, "Why were the invaders punished and the horses punished?" "This means that the wheel will continue to rotate until the invaders turn to stone," he concluded.

During the trip, Ogahi encounters rabbits. After talking to the mysterious potters, Mawlana says that there is a more horrible rabbit than these rabbits. And this well is inside man. It is concluded that neither the earth nor the sky can withstand the torment of slavery caused by the enslavement of one person to another, especially the enslavement of a free people. In the following verses, however, Ogahi sounds as if he has once again brought up the people left behind.

Vayronko'ngullarnikaramganjiilaobodqil, Gar istasanghaqlutfidinbo'lg'aysangama'murganj.

## CONCLUSION

At the end of the work, the great thinker Muhammad Reza Ogahi's deeds for the people are listed one by one, and he is sent on his last journey by the people who love and respect him.

## LINGUISTIC METHODS IN SENTENCE ANALYSIS

**Boltakulova Gulnoza Farruxovna\***

\*Doctor of Philosophy in Philology,  
Samarkand State Institute of Foreign Languages,  
Samarkand, UZBEKISTAN  
Email id: gulnoz05@yandex.ru

### ABSTRACT

*The present article is devoted to an actual theme of modern linguistics –linguistic methods in sentence analysis. More attention is paid to the linguistic methods in syntactic analysis of a sentence, the basic principles of comparative study of languages at the syntactic level and linguistic methods used in the analysis of tenses. Theoretical parts of the article is proved by examples.*

**KEYWORDS:** *Method, Sentence, Syntactic Units, Subject, Predicate, Syntactical Unit, Component, Linguistic, Speech Components, Analyze.*

### INTRODUCTION

It is well known that in the development of modern linguistics, there is a growing interest in the problems associated with the comparative analysis of language material. It is known that the correct use of specific linguistic methods in the study of any level of language and their application in comparative-functional research requires special attention from the researcher. If we focus on the processes of syntactic analysis of speech, in general linguistics, there are cases when the problems of syntactic content are derived from word forms, lexical meanings, and the opinions of linguists are contradictory. While some researchers recognize lexical meaning as the basis of grammar, others deny it; third groups of linguists do not recognize lexical meaning as a linguistic category.

### MATERIALS AND METHODS

In Roman linguistics, the syntactic analysis of a sentence is approached differently. In particular, in the analysis of a particular syntactic view, the component-by-component analysis itself has several views. For example, A. A. Hill is based on the principle that the definition of tag memes, the division of a sentence into tag memes into minimal functional segments, involves the

division of the sentence into parts [3, p.285]. Z.S. Harris, on the other hand, prefers the use of chain analysis, that is, the method of dividing the sentence into elementary parts and dividing it into adjuncts based on distribution [4, p.302], R.E.Longacre performs chain analysis by analyzing it directly into participants [8, p.165]. Due to the ideas of transformational grammar in linguistics, methods of segmentation and distribution analysis have emerged and developed. N. Chomsky (1997) in the development of the mentioned linguistic analysis methods; R. E. Lees (1960); P. Roberts (1964); E. Bach (1964); A. Hathaway (1967); The efforts of scholars such as P. S. Rosenbaum (1967) had a significant impact.

Today, there are distributive analysis, direct participant separation method, several types of transformation, substitution, derivation, component and syntax separation methods in small syntax analysis, and analysis of them into components and syntaxes is common to our research goal. Distinguishing language layers from each other, the correct and effective use of analytical methods in determining their relationship will be important. For example, when using the distributive method, linguists focus on three aspects of it:

- a) Additional or complementary distribution;
- b) Distribution of comparative contrast
- c) Free exchange distribution [8, p.172].

The distributive method was mostly used at the morphological (additional, contrast) level of the language, while the free substitution distribution was used only in word combinations. When the indirect division method is used, this method is mainly analyzed by modeling the morphological expression of those participants at the syntactic level by first dividing the speech device into the largest participants (Np + Vp) and then dividing them into smaller participants. This is just a synthesis of the external device of speech at the morphological level. This linguistic method returns speech analysis from the syntactic level to the morphological level of the language.

It is well known that in the development of modern linguistics, there is a growing interest in the problems associated with the comparative analysis of language material. In this case, the researcher's focus is on general linguistic research methods in the comparative analysis of the system of related and non-related languages. E.A. Shchebetenko argues that "... the method of linguistic analysis should theoretically be able to justify the commonalities and differences in languages when comparing the general and subsystems or microsystems of specific languages" [9, p.18]. Q. Yusupov clearly outlined the sections of comparative linguistics (comparative-historical, typology, comparative linguistics and comparative typology) and defined their main tasks. [12, p.115].

In our research, we replace the term transformation with the experimental method, because the linguistic experiment allows us to reveal the cases of relevance (proportionality) of the syntactic units in the sentences being analyzed.

#### **For example:**

All the time we heard the cattle in the woods [5, p.15];

I didn't think a long time about it [5, p.18].

How long did we hear the cattle in the woods? We heard  $\Rightarrow$  the cattle long in the woods;

I didn't think a long time about it I didn't  $\Rightarrow$  think then about it When didn't I  $\Rightarrow$  think about it?  $\Rightarrow$  How long didn't I think about it?  $\Rightarrow$  I didn't think long about it;

When the sentences are analyzed on the basis of the experimental method, it appears that the action represented by the syntactic units at the cut-off point has been continuous for a certain period of time.

Differential syntactic features of syntactic units are distinguished on the basis of defined syntactic relations, and their morphological expression is visually described in component models. This method allows to analyze the syntactic relations of units representing the state of time, as well as their component composition, without going beyond certain limits in clarifying the deictic states of temporality in the microtext.

**Compare:** He read the book for hours. [10, p.25];

He read the book occasionally. [10, p.28].

He read the book for hours He read the book then;

He read the book for hours When did he read the book?

In this syntactic unit, the elements long or how long can be used instead of the element for hours:

He read the book for hours He read  $\Rightarrow$  book long How long did he  $\Rightarrow$  the book?

He read the book occasionally by replacing the occasionally syntactic unit in the sentence with, sometimes from time to time, day after day, etc., or by questioning,

He read the book occasionally  $\Rightarrow$  He read the book sometimes;

He read the book occasionally  $\Rightarrow$  How often did he read the book?

When these sentences are compared with the sentence He read the book throughout the night, it is clear that there is both temporality and continuity in the content of the compound throughout the night. In experiment method syntax in this syntactic unit throughout the night combination **when?** By putting an interrogative pronoun or replacing this compound with an adverbial element **then**:

He read the book throughout the night  $\Rightarrow$  When did he read the book? He read the  $\Rightarrow$  book then.

In order to determine the continuum syntax, the long or how long compounds replace the out through the night combination:

He read the book throughout the night  $\Rightarrow$  He read the book long  $\Rightarrow$  How long did he read the book?

Linguists focus on only three aspects of the method of distributive analysis:

1. The addition distribution,
2. The contrast distribution,
3. The free exchange distribution.

However, if suffixes and contrast distributions are widely used at the morphological level of any language, that is, if the lexical units in a sentence are limited to comparing the meanings of form-

forming suffixes, free-exchange distributions are the same in meaning or content, different in form. At the syntactic level, distribution is determined by the syntactic position of the syntactic units representing the object selected for research in the sentence structure based on the defined syntactic relationships, and the languages are compared according to the same syntactic position in the sentence structure. That is, the differential syntactic features of syntactic units and their morphological features are determined using the method of modeling, as well as differential syntactic-semantic features of components, which opens a wide way to distinguish isomorphic and allomorphic cases in their system relations and their comparative-functional study.

## CONCLUSION

We all know that the linguistic methods used in the analysis of sentences in modern linguistics are of great importance. In the process of analyzing sentences in the system of related and non-related languages, we analyzed them using several different linguistic methods. Today, there are distributive analysis, direct participant separation method, several types of transformation, substitution, derivation, component and syntax separation methods in small syntax analysis, and analysis of them into components and syntaxes is common to our research goal. Distinguishing language layers from each other, the correct and effective use of analytical methods in determining their relationship will be important.

It is well known that in the development of modern linguistics, there is a growing interest in the problems associated with the comparative analysis of language material. In this case, the researcher's focus is on general linguistic research methods in the comparative analysis of the system of related and non-related languages.

### ABSTRACT

*The present article is devoted to linguistic investigation of metaphor formation process of the concept “coronavirus” in the English, Spanish and Uzbek publicistic discourse. The authors give examples of metaphors in the analyzed languages, which characterize this infection, dangerous for the whole world.*

**KEYWORDS:** *Coronavirus, Pandemia, Infection, Metaphor, Concept, Publicistic Text, Social Network, Global problem.*

### INTRODUCTION

Undoubtedly, the lexeme “coronavirus” has lately turned into one of the most frequently used words in mass media. The authors make an attempt of description of the conceptual metaphors representing coronavirus in English, Spanish and Uzbek publicistic discourse. The material for the research was taken from the channels of the social networks such as Telegram «Coronavirus España», “Koronavirusinfouz”, Kun.uz, from the websites [hbr.org/2020/03/understanding-the-](https://hbr.org/2020/03/understanding-the-)

economic-shock-of-coronavirus, pub.med.gov serving for publishing the news from the official sources.

First of all, we'll examine the structure of the notion "concept" for the realization of such a research. It is well known than the structuring and representation of knowledge are the result of concepts which aren't close units [1, p. 287]. The concepts constantly interact with each other, reflecting the dynamics of processes occurred in the modern world on the whole and in the separate socio cultural spheres [5, c. 53]. We can observe the same thing in the concept "coronavirus". The concept forms groups around the point of consciousness, on the base of which the associations are formed. Obviously, on this occasion, it causes negative, horrifying associations connected with this word.

The concept is a certain semantic formation of our consciousness which functions as an effective unit in mental process and points at the results of cognitive activity as quanta of knowledge. It is realized by the verbal means which serve as the markers of mentality and are characterized by national and ethno-cultural peculiarities [2, c. 15]. However, the concept "coronavirus" as though "overstepped the limits" and raised to the global level. So, this definition of concept is not very perfect for the object of the present research.

Summarizing the expressed standpoints about the definition of the notion of "concept", we'll dwell on the generalization of M.R.Galieva which certifies that the concept is:

- a difficult, multidimensional, many-sided, at the least, three-components mental formation which includes the conceptual, figurative, value, emotional-evaluative, associative, connotative features;
- An abstract, cognitive processed idea which is marked by national-cultural specificity;
- An unit of conceptual picture of the world, a product of human cognitive consciousness, the mean of the perception of outward things;
- a fundamental cell, a peculiar concentrate, gene, the "clot" of culture in human mental world, a human cultural and etymological memory which is the keeper and transmission medium of cultural information [3, c. 10].

The word "coronavirus" researched in this article completes the conceptualization process by means of metaphoric recomprehension. As a consequence, there appear the conceptual metaphors which form new senses reflecting the great threat of this infection. Along with it we should note that metaphors play a significant role in the formation of concepts. The production of metaphors is more than just a linguistic phenomenon, it is also a deep cognitive process with a constructive nature [4, c. 88-89].

It is the opinion of Ortega-y-Gasset that the metaphor is practically unique way for detecting and substantially determining the objects with high level of abstraction. He wrote: "Our conception of the world depends on our notions about consciousness and predetermines our morals, our politics, our art. It turns out that all the knowledge of Universe filled with life rests upon a tiny, light body of metaphor" [5, p.77]

In opinion of G.Lakoff and M.Johnson, metaphors run through all our life not only in language, but also in thought and in action. Our ordinary conceptual system in the context of which we reason and act, is essentially metaphorical (Lakoff, Johnson, 1980:3). They choose in English the

systems of metaphors based on points of view accepted in English-speaking countries to certain objects of designation and called such metaphors conceptual.

The term “conceptual metaphor” in the interpretation of G.Lakoff and M.Johnson allows to share the language means of expression and cognitive process on their base, namely the comprehension of one phenomenon in the terms of other phenomenon. G.Lakoff and M.Johnson emphasized three models of concepts based on metaphors: 1) structural metaphors describing one phenomenon metaphorically regulated by way of other phenomenon, as TIME IS MONEY or IDEAS ARE PLANTS; 2) orientational metaphors constructing the concepts through the spatial notions and relations as inside – outside, deep – shallow, central – peripheral; 3) ontological metaphors introducing abstract phenomena (emotions, ideas) and actions as a material substance, for example, “I’m slowly getting into shape” (Lakoff, Johnson, 7-32).

The metaphors of concept “coronavirus” founded by us in publicistic discourse of different languages belongs to the model of structural metaphors.

Coronavirus is described in the press of all the countries in all the world. So, for example, Spain which is nowadays on the second place of the total number of coronavirus-infected (180 659 on 16.04.2020), is no exception. In Spanish press the lexeme “coronavirus” has a big possibilities of metaphorization. We discovered the following conceptual metaphors of researched concept:

1. CORONAVIRUS – A DESTRUCTIVE POWER, paralyzing each activity and work, pursuing the humans everywhere, causing a fear: “Los autónomos cobrarán este viernes 17 de abril “el paro” por cese de actividad debido del coronavirus” (eldiario.es, 13.04.2020). “Todo lo que hacemos mal en el supermercado sin darnos cuenta de que acecha el coronavirus” (El Diario, 5.04.2020); “El coronavirus acecha a las farmacias” (El país, 1.04.2020). This metaphor arises from the fact that the coronavirus caused a significant damage to all the spheres of society life in all countries of the world. “La crisis del coronavirus golpea los negocios” (ABC, 7.04.2020); «Así ataca el coronavirus en los casos más letales” (El país, 11.04.2020). The lexemes “golpear”, “atacar” – to beat, to attack emphasizes the application of power by coronavirus. In the next example the abilities of coronavirus for overcoming of many obstacles are shown. «El mismo día del Brexit, el coronavirus ya ha superado al SARS (www.eldiario.es, 08.04.2020)». A large quantity of people died of this illness turned into the victims of coronavirus independently of their nationality. “Muere víctima del coronavirus, el actor de doblaje Salvador Vives” (www.huffingtonpost.es, 30.03.2020). In this connection coronavirus is a reason of fear and panic by all the humanity: “El pánico al coronavirus agita la xenofobia contra los franceses en Alemania” (La Vanguardia, 12.04.2020).

2. CORONAVIRUS - THREAT. The concept coronavirus is compared with a check in chess, in other words represents a threat for the whole world: «Coronavirus, jaque al mundo globalizado” (Vocable español, 807, 2020). The comparison with a trip emphasizes the unexpectedness of appearance and expansion of coronavirus threat: ¿Será el coronavirus la zancadilla que haga tropezar a una economía mundial? (Vocable español, 807, 2020).

3. CORONAVIRUS – LIVING CREATURE. There is a variety of this metaphor such as CORONAVIRUS – INFANT being in cradle. «Miles de personas salieron el miércoles a Wuhan tras el levantamiento de las medidas de cuarentena que han mantenido la ciudad, cuna del coronavirus” (ABC, 13.04.2020). As it is well known, coronavirus appeared for the first time in Chinese city Wuhan named in the press language “cradle of coronavirus”. This metaphor

emphasizes that coronavirus as each living creature came into the world in tiny size and its size increased considerably in the process of its growth and development.

4. CORONAVIRUS – WATER. This metaphor includes such varieties as CORONAVIRUS – STREAM: “La riada del coronavirus va a poner en su sitio algunos sueldos mastodónticos de algunas estrellas” (Merca2, 4.04.2020). The coronavirus is compared with an avalanche, stream in this example. Initially the lexeme “riada” in Spanish is connected with water and means “water rise, high water” causing destructions. The appearance of this metaphor is connected with the fact that the impetuous water stream can penetrate without hindrance into all the places with destructive consequences, as a coronavirus. The metaphor CORONAVIRUS – WAVE is also included here. Pies de plomo en China: preocupación ante una 2ª oleada de contagios de coronavirus (www.elconfidencial.com, 31.03.2020). These both varieties of metaphor “CORONAVIRUS – WATER” have negative destructive features.

5. CORONAVIRUS - LIGHTNING. The flash-like, high speed of coronavirus expansion promoted the comparison of coronavirus with a lightning. “España pierde empleo ... a la misma velocidad con la que se propaga el coronavirus, como un rayo” (ABC, 7.04.2020).

6. CORONAVIRUS - ENEMY. Undoubtedly, the damage and negative consequences of coronavirus entailed its perception in human consciousness as an enemy, and it is essential to defeat and conquer him. “...aumento significativo de ataques virtuales contra organizaciones que combaten el coronavirus” (www.publico.es, 04.04.2020); “El CEO de Twitter donará 1.000 millones de dólares a la lucha contra el coronavirus” (www.eleconomista.es, 08.04.2020).

Now we'll examine the conceptual metaphorization of coronavirus in English publicistic discourse:

1. CORONAVIRUS - EVIL: “Coronavirus is evil...”. (hbr.org/2020/03/understanding-the-economic-shock-of-coronavirus).

2. CORONAVIRUS – CRISIS AND THREAT for all the humanity: “... a new public health crises threatening the world with the emergence and spread... (pub.med.gov.).

3. CORONAVIRUS – MARCH AROUND THE WORLD: “The coronavirus continues its march around the world...” (hbr.org/2020/03/understanding-the-economic-shock-of-coronavirus). This metaphor evolved from the expansion of coronavirus in all the world.

4. CORONAVIRUS – TROUBLING STORY FOR PEOPLE: “troubling story for people” (hbr.org/2020/03/understanding-the-economic-shock-of-coronavirus). Analyzing this metaphor, we can say that all what is going on at present seems not real, as if it happens in a story written in a book or shown in a movie. Because of it coronavirus is perceived by people as a troubling story.

The problem of coronavirus in all the world is also widely covered in the mass-media of Uzbekistan. The lexeme “coronavirus” has also great metaphor-forming possibilities in publicistic discourse and is metaphorized in the following way:

1. CORONAVIRUS - TRIAL. The coronavirus is compared in Uzbek press mostly with a trial send down from heaven for all the humanity. This trial will show as far the nation can overcome this trial being united and solidary: “Koronavirus pandemiyasi butun insoniyat uchun Yaratganning bergan bir sinov” (The President of the Republic Uzbekistan Sh.M.Mirziyoyev),

“Dunyo – sinov. Virus ham sinov”, “Virus xalqning qay darajada XALQ bo’la olganini ko’rsatadi” (kun.uz, 12.04.2020); «Aytildan gaplarga quloq solsak, tartibni buzmasak, koronavirusni osonlikcha engib o’tamiz” (qalampir.uz, Zafarbek Solijonov). For overcoming of this trial it is necessary the unity not only of one nation, but also of all the world: «Virus nafaqat o’zbek xalqi, balki butun dunyo xalqlarni yanada jipslashtirayotgandek” (kun.uz, 04.04.2020). The valuable experience for the future will be acquired in the process of this trial: «Koronavirus davri shu jihatdan, juda sodda va aniq tajriba bo’lib, hatto jamiyatshunoslikda amaliy dars sifatida o’rgatiladigan ob’ektga aylanmoqda” (kun.uz, 05.04.2020).

2. CORONAVIRUS - THREAT. Undoubtedly, coronavirus is an immediate threat and danger for the life and health of person. Koronavirus: Janubiy Osiyo tahlika ostida (kun.uz, 12.04.2020); O’zbekistonga koronavirus kirib kelishi odamlarda ozmi-ko’pmi vahima hissini uyg’otdi (kun.uz, 31.03.2020).

3. CORONAVIRUS – DISASTER appeared spontaneously and suddenly. “Yaratganning o’zi xalqimizni va butun insoniyatni bu ofatdan tezroq ozod qilsin” (The President of the Republic Uzbekistan Sh.M.Mirziyoyev).

4. CORONAVIRUS – LIVING CREATURE having a destructive aims and feeling emotions such as a joy and sadness: «Virus, bu – ongli mavjudot. Vauningmaqsadi – xalqlarnizabtetish. Onglimavjudotningesaxursandqiladiganvaunixafaqiladigannarsalaribo’ladi.

Bundavirusningyo’linito’suvchinarsauniranjitadi, ungayo’lochuvchiomilesa – xursandqiladi” (kun.uz, 12.04.2020).It is interesting to observe the animalistic conceptual metaphor CORONAVIRUS – HORSE, because the Uzbek lexeme jilovlamoq – to bridle, to curb is used with respect to virus. Koronavirus epidemiyasini jilovlaganlar: Tayvan, Kanada va Janubiy Koreya tajribasi (kun.uz, 04.04.2020)

5. CORONAVIRUS – MIRROR reflecting the togetherness of society, the ability of resisting this negative phenomenon. “Virus – jamiyat yuziga tutilgan oyna” (kun.uz, 12.04.2020).

6. CORONAVIRUS - CHAIN. The gradual expansion of virus infection, when the contagion of one person is interrelated with the contagion of several persons, is a reason of the perception of coronavirus illness as a chain. “..uyda qolish orgali Siz kasallik tarqalish zanjirini uzishingiz, demakki kimningdir hayotini saqlab qolishingiz mumkin” (kun.uz).

7. CORONAVIRUS – ENEMY, INVADER, and it is necessary to defeat him. The reason of appearance of this metaphor is the expansion of coronavirus in all the world.Koronavirus nafaqat Xitoyini, balki butun dunyoni egallashini kutganmidingiz (kun.uz, 13.04.2020); Koronavirus ustidan g’alaba qozonayotgan shifokorlarimiz sharafiga (kun.uz, 31.03.2020).

8. CORONAVIRUS - OBSTACLE: «Agar virus kirib kelmaganida edi...” – koronavirus orzungizga to’siq bo’la oladimi?” (kun.uz, 30.03.2020).

Our modest linguistic research showed that coronavirus in the shortest possible time turned into a whole concept. The threat and harm of coronavirus is transmitted in the language with the help of vivid and uncommon metaphors. As our Respected President Shavkat Miromonovich Mirziyoyev pointed, we’ll overcome this illness.

### ABSTRACT

*This article analyzes the works of Ogahiy, a representative of the classical literature of the XIX century, which are covered in modern fiction. Komil Avaz's drama "Ogahiy" is a scientific study of the character traits, universal thoughts and spiritual experiences of the Ogahiy character.*

**KEYWORD:** *Muhammad Erniyozbek O'G'Li Ogahiy, Khiva Khanate, Russian Invasion, Historical Drama, Historical Image, Conflict, Dramatic Character.*

### INTRODUCTION

Ogahiy is a brilliant representative of the classical literature of the XIX century, with his historical, artistic and translated works sheds an indelible light on the spirituality of the Uzbek nation. Ogahiy was born in 1809 in the village of Qiyot near Khiva to a "mirab" (mirob – water supervisor) family. The author himself wrote: "We are the descendants of Amir Eshimbi, one of the hundred tribes living in Khiva."

Ogahiy had lived and worked during the reigns of 8 khans of Khiva: Muhammad Rahimkhan I (1806-1825), Allakulikhon (1825-1843), Rahimqulikhan (1843-1845), Muhammad Aminkhan (1845-1855), Abdullaxon (1855-1855), Sayyid Muhammadkhan (1855-1864), Muhammad Rahimkhan II (1864-1874) Kutlug Murodkhan (1855-1855).

His nickname is Ogahiy, which literally means "alert" ( uzb: ogoh-sergak). Ogahiy created a school of translation studies by translating more than 20 works of world literature and culture into Uzbek. Ogahiy is the author of 5 historical works.

"As a historian, he wrote poems dedicated to Khiva khans and great historical figures. The poet's poem "Qasidai nasihat" is a clear example of this. The work is dedicated to Feruz. In his sermons, Ogahiy provides guidance on how to govern the kingdom, and how to govern the

country and the people with justice. This poem is written in the genre of masnavi and vividly expresses the poet's political and enlightenment views.

According to the poet, any head of state should have all the positive qualities to strengthen power. The king must be generous, courageous, just, zealous, generous, imaginative, pure-minded, cultured, considerate of the poor. The ruler argues that if he possesses these qualities, his power will be perfect and his country will be prosperous. According to the poet, the king should stay away from lust, conspiracy and gossip, ignorance, laziness, oppression, slander and materialism. The khan of Khiva listened to Feruz Ogahiy's advice on governing the state, wrote his wise verses on marble stones and placed them in his petitions, and did many good deeds.

Among the scholars V.Zakhidov's "History of Uzbek literature" (Uzb: O'zbek adabiyoti tarixidan) in 1961, K.Munirov's "Ogahiy - scientific-literary activity"(Uzb: Ogahiy – ilmiy – adabiy faoliyati) in 1959, and "Historical works of Munis, Ogahiy, Bayani"(Uzb: Munis, Ogahiy, Bayoniyning tarixiy asarlari) in 1960, R.Majidi's 1963 A number of scientific works, such as "Ogahiy's Lyrics" (Uzb: Ogahiy lirikasi) were published. The list goes on and on. Because there is a lot of scientific research on Ogahiy's work. Ogahiy's work has been studied not only in Uzbekistan, but also in Azerbaijan, Turkey, the United States, Russia and many other countries.

Kamil Avaz has also done a lot of research and art on Ogahiy's work. In particular, in the drama "Ogahiy" he covered the life and creative processes of Ogahiy. The drama consists of two parts. The first part describes Ogahiy's youth, his romantic experiences, and his encounters with rivals who did not see him. The second part of the drama depicts his courage in the face of the Russian invasion in his old age. Drama differs from other literary genres and genres in that it depicts the image much more vividly.

If this image is a historical figure, it adds a lot of responsibility. Because the more or less the reader knows about historical figures, the more he or she will form an idea about them. Indeed, "Literary character is not a copy of real human life, but a relatively broad concept of character in fiction, which embodies both real life and the imagination of the artist, the ideal, and can express reality through the creative character".

The drama depicts the events of 1839-1840 and 1873. About thirty characters took part in the play. They are united by the main idea of the century - the defense of the homeland. The events and plots revolve around the main characters. The main characters in the drama are Ogahiy, Feruz and Sanamjon. The author tried to give a certain idea in the image of these images. In particular, the image of Sanamjon reflects the ideas of pure sincere love and devotion to the land. Feruz has always been a symbol of courage and bravery. And in the image of Ogahiy, we see that it embodies all the qualities put forward in the drama. Because at the center of the work is the image of Ogahiy, all the lines are connected with this image.

The work begins with a dialogue between the characters in opposition to Ogahiy. The author was able to create a special conflict by seeing Ogahiy as an enemy and gossiping about him. As a result of their conversation, it was revealed that Ogahiy had a high reputation and status among the people, in the presence of the king. This process continues until the end of the drama. Every character who sees Ogahiy as an enemy not only opposes him, but also acknowledges his courage. Because "the force that holds the work from beginning to end is necessary for the dynamics of the conflict, which is the mainstay, especially for the development of dramatic works".

Images in conflict with Ogahiy can be conditionally divided into the following types: 1. The conflict between Ogahiy and Sowirboy, or the struggle between honor and humiliation. 2. Conflict between Ogahiy and Hajiniyaz, Atamurod, or the conflict of faith and hypocrisy. 3. Conflict between the savages and the traitors, the Russian invaders, or the struggle between good and evil.

The second scene of the drama depicts Ogahiy's role as a mirage. It reveals Ogahiy's business acumen and concern for the people. We know from history that Ogahiy fell from a horse and was severely injured in the line of duty. As the author points out, it describes how difficult the task of mirab is. This is reflected in the following passage:

“ -Hoziq: Look, the ancestors were well aware of the flood. No river is as stubborn as Jeyhun.

Ogahiy: That's why we fight the stubbornness of the river day and night for 12 months of the year. Sometimes we win, sometimes he beats us. That's why we're restless. We rebuilt the stone, the escapees. We bring stones from Yumortov and strengthen the river bank. There is so much to do, as you say, which one will you list? ”(P. 105). As Ogahiy said this, he read one of his poems about the hard work of a farmer in managing water. At this point, the author skillfully moves from Ogahiy's role as a mirage to the world of creation. The images around him also speak directly to creation. Through their conversation, Ogahiy is applauded.

Throughout the drama, Ogahiy is vividly portrayed as not afraid of anyone or anything in the struggle for truth. The author reveals his courage in a way that creates tense situations. That is, "a logically based description of a writer's historical protagonist's character, character, behavior, external and internal world, interactions with people, and so on, in accordance with his creative intent".

The third scene depicts Ogahiy's romantic experiences. Ogahiy's love affair with a girl named Sanamjon is also mentioned in historical documents. In a drama, these two lovers can't be together. Because in the play, Ogahiy is given as a married and old man. Sanamjon is a teenage girl. In the 19th century, polygamy was allowed both in religion and in the socio-political structure of the state. From this point of view, it would be a logical mistake in the drama if only Ogahiy's marriage was the main obstacle in the way of the two lovers. With this in mind, the author gives many reasons why Ogahiy and Sanamjon cannot be together. First of all, Ogahiy is loyal to his family. Second, there has always been a strong disagreement between Ogahiy and the girl's father. Third, there is a big age difference between Ogahiy and Sanamjon. The following words of Ogahiy prove his perfection as a human being. "Understand, my dear, for you are an unopened flower, a stagnant variety, a crystal-clear waterfall. Don't set yourself on fire. After all, I am the owner of the apartment. I have no right to break the faithful picture. But in the end, I will keep your sincerity and love for me for the rest of my life. ... do not spoil the flower of youth. All your air is fleeting ”(p. 117).

When Ogahiy tells Sanamjon these words, he is not aware that he is not indifferent to the girl. Ogahiy also loves the girl, but this love makes her feel forbidden. "He wrote a letter with the intention of meeting, so it's a serious matter," he said. What's the matter? I'm sorry, why am I so upset? What kind of trade is this, every second that burns my heart and my body ?! Vodarig! What a waste! No! Give him strength, O God, not to fall into his trap! ” (P. 116).

The drama depicts Ogahiy sharply criticizing people who are not suitable for the people, who spread various *fisq-u fasots* in the palace. The following statements made by Khiva khan Allakulikhon at the Ogahiy Palace in front of everyone are an example of our opinion:

“Ogahiy: (calmly) Your Majesty, it is true that I have written a poem about corrupt officials. It's impossible for anyone to take them. ”

The drama also points out that Ogahiy is a good politician. The King of England sends Abbot as ambassador to make a treaty with Allahu Akbar. The aim was to stop Britain's Russian invasion of Khiva. Because otherwise their rule in India could also be in jeopardy. This has caused a great deal of controversy among palace officials. Allakulikhan then asked Ogahiy for his opinion on the matter:

"Allakulikhan: Do you mean to accept the British demand?"

Ogahiy: Absolutely not! If the Russians or the British take India, Khorezm will be under a guzar. I do not want to interfere in the affairs of the kingdom, but I would like it to be in a state of peace and decency, not in a hostile, violent state”(p. 124).

The second part of the work describes the events of 1873, the events of the Russian invasion. The drama does not provide details of the Russian invasion or battle scenes. The situation is described directly after the Russian invasion. It mainly reflects the mental state of Khiva khan Muhammad Rahimkhan II - Feruz, the actions of Ogahiy, who sought to lift the spirits of the depressed people. The work ends with Ogahiy's *gazel* about freedom.

## THE IMPORTANCE OF MATHEMATICAL TALES IN ELEMENTARY SCHOOL MATH CLASSES

**Shoira Rakhimova Adilbekovna\***

\*Teacher,  
Faculty of Pedagogy,  
Urgench, Uzbekistan. UrSU, UZBEKISTAN

### ABSTRACT

*This article discusses the importance of using mathematical tales in math classes in elementary school and how to use them effectively. The article analyzes the importance of using mathematical tales in the mathematics lessons of primary school students and their effective application, as well as methods for creating some mathematical tales. One may find that it is more difficult to understand the world of ideal dreams in a person who has not been brought up in fairy tales. Thanks to fairy tales, the child begins to distinguish between real and unreal things. If in the past the game was a prerequisite for attracting students to learning, then you can implement the game for the entire learning process, mastering the elements of educational activity in the gaming environment. , That is, a game based on the learning process becomes in essence a didactic tool.*

**KEYWORDS:** *Creative Thinking, Mathematical Understanding, Mathematical Fairy Tale, Didactic Game, Cognition, Imagination, Mathematical Knowledge, Ability.*

### INTRODUCTION

It is known that in the modern educational policy of the republic it is very important to increase students' interest in mathematics from elementary school, to use modern innovative technologies in mathematics lessons. The science of mathematics, the foundation of which was laid by our great ancestors, like Muhammad al-Khorezmi, Ahmad Ferghani, Abu RayhanBeruni, Mirzo Ulugbek, is becoming increasingly important in connection with the rapid development of modern branches of science and technology. Its role has increased in the field of information and communication technologies, medicine, biology, the digital economy and many other fields.

Large-scale, well-focused measures have been taken in order to bring up a healthy and harmoniously developed generation in our country, to create the necessary conditions and opportunities for young people to realize their creative and intellectual potential, to bring up young generation of our country as fully developed individuals who fully meet the requirements of the XXI century.

The Decree of the President of the Republic of Uzbekistan “On reforming the system of education and training, education of a harmoniously developed generation” and “National program of Personnel Training”<sup>1</sup> indicate different issues with the aim of improving the quality of teaching mathematics, the formation of personal qualities, mathematical literacy and the development of creative abilities.

Using a variety of methods in the classroom, including fairy tales, helps motivate students, increases their interest in science, literature, fairy tales, develops skills that help others, and increases the ability to interact with adults and peers. Mathematics is more complex than other subjects, and some students have difficulty mastering it. The use of mathematical tales in the teaching of this science is very effective.

The article analyzes the importance of using mathematical tales in the mathematics lessons of primary school students and their effective application, as well as methods for creating some mathematical tales. Mathematics is a real magical world. Shapes, geometric shapes can turn into amazing fairy-tale characters, if you want it. The child learns the first mathematical concepts from fairy tales: 1) numbers (Snow White and the Seven Dwarfs, three little pigs); 2) calculation; 3) comparison (three bears, 7 Dwarfs); 4) Concepts, including ideas such as geometric shapes, increase the wealth of mathematical knowledge in elementary school students and increase their interest in science. Here are some thoughts on the science of mathematics: mathematics finds the unknown, mathematics gives us the joy of feelings, mathematics is an art, mathematics is the world of arithmetic. In mathematics, too, thanks to fairy tales, we can instill in students an interest in this science, a desire to study it.

We are used to meeting fairy tales in literature lessons. Tales are adventures, we do not take them seriously. Mathematics is the queen of all sciences. From elementary school, we teach students to be polite, hardworking and serious. In our country, mathematics is colorless and not always interesting science, and we are used to talking formulas, equations, considerations, proofs, graphs in our native language. But this does not mean that the words "Tale" and "Mathematics" cannot stand side by side. Of course it is possible!

Using fairy tales for the interests of children in math classes in the first grades is very effective. If you ask the children if they like fairy tales, everyone will answer “yes”. Fairy tales always bring joy to children to understand their attention and interest.

One may find that it is more difficult to understand the world of ideal dreams in a person who has not been brought up in fairy tales. Thanks to fairy tales, the child begins to distinguish between real and unreal things. Bypassing a fairy tale, it is necessary to use not only imagination, but also to reveal the necessary information for decision-making, thinking about the proposed situation, which requires not only imagination, but also the basic skills of critical geometric materials, imagination and ability.

There is a good mood in the lessons where fairy tales are used, and this is the key to effective work. The fairy tale gives you access to humor, creativity classes, and most importantly, teaches children to be kind and fair. In the study of mathematics, fairy tales can be used as follows: the heroes of fairy tales face difficulties.

Children try to help them, they are corrected on the way, overcoming the most unexpected obstacles. They do math tasks, riddles, proverbs. Together with the heroes of fairy tales they help to overcome educational barriers. This improves the mastery of both mathematical and literary materials.

When the bell rings, the teacher says that it is not a simple math lesson today. All students go to the magical world of the fairy tale "Swans". The teacher tells a story: Do you remember when the swans took the girl's brother? The girl ran to look for her brother and asked for the stove, the apple tree and the river. But before helping the girl, the stove, the apple tree and the rivers ask her to fulfill their wishes. The girl, without a doubt, is worried. It will be very difficult for her to complete the tasks alone and there a lot of students in our class and together we will help her. The girl throws herself to meet the swans and runs, runs.

The girl sees a standing stove. Stove, stove, tell me? where did the geese swans fly? The stove answered her. I will tell you if you solve my task. Help me once. I'm in a hurry. Let the children help the girl so that the stove does not get angry with her. Children turn over the cards with the task: show a number greater than 2 less than 4, a number greater than 4, but less than 6. Give one number from 1 to 10. The girl ran forward, there is an apple tree. Apple tree, apple tree, where did geese and swans fly? Guess what number is not here, I'll tell you. Milk River, the shores of the Aral Sea, tell me, where did the geese and swans go? Multiply each number 13, 4, 7, 16 in the balloon by 3 and name the smallest, I will say. "I'm afraid I don't have time," she said and continued. Can the children do the job? The girl turned away from the chicken coop around the window. She found her friend in the hut, took his daughter in her arms and ran. The girl returned to the river with milk and asked: Mother river, hide us from them. I am hiding the answer. Which of the two terms can be divided into 8 and 7? The number that comes after the number 9 is the number that comes before the number 7 during the calculation.

The girl replied: (observes the answers of the students) The river took her and her brother to the shore. The girl and her brother ran again and saw that the geese and swans had flown away. There is an apple tree. The girl turns to the apple tree and quickly solves the problem. (3 apples under the apple tree. 4 more apples fall from the tree. How many apples under the apple tree?) The apple tree covered them with branches. Swans will never see them again and fly past them. The girl ran to the stove, mother stove, hide me! I hide the answer to the questions, find: which number is greater than 1 to 4 and less than 7 to 2? What number in the calculation goes after 8 and before 10? Which number is greater than 4? What are the numbers from 7 to 1? The girl answered quickly. Children encouraged the girl and hid her brother.

Lessons organized in this way make children active and contribute to their work. Education is formed as a result of many educational tasks. Didactic games in the form of entertainment lose their role as students acquire learning skills. If in the past the game was a prerequisite for attracting students to learning, then you can implement the game for the entire learning process, mastering the elements of educational activity in the gaming environment. , That is, a game based on the learning process becomes in essence a didactic tool.

So, thanks to the math lessons we want to teach, math stories are very important in the early math classes.

Organizing the learning activities of primary school students in a harmonious way through the activities of mathematical fairy tales gives good results in achieving the purpose of the lesson, motivating them, educating and developing the individual.

Surkhandarya Regional Centre for Retraining and,  
Advanced Training of Public Educators, UZBEKISTAN

### **ABSTRACT**

*This article provides concepts and Government decisions on informatization, computerization of the Republic of Uzbekistan, as well as information on the work done on the computerization of secondary schools in the country. The meeting focused on the development of the information sphere, increasing the speed of the Internet, further development of the e-government system and the development of other information technologies.*

**KEYWORDS:** *Computer, Education, Continuing Education, Information, Informatization.*

### **INTRODUCTION**

Today, our society, our entire way of life, is developing and accelerating so much that it can even be seen as an invisible phenomenon. The role of information and communication technologies, which are rapidly entering our lives, is gaining ground not only in industry or other areas, including the education system.

As the first President of our country IA Karimov said, “Today, the actions in the modern information space are so intense, so fast, now, as before, yes, this event took place far away from us, it cannot be ignored that it has nothing to do with us. It is inevitable that a people or a nation given such a mood will lag behind in development for hundreds of years”.

We can see that modern information technologies and software products are becoming one of the most important sectors in the development of the state economy as one of the most profitable sectors.

In his Address to the Oliy Majlis of January 24, 2020, the President of the Republic of Uzbekistan stressed the urgency of the development of information and digital technologies,

saying: “It is necessary and necessary to acquire digital knowledge and modern information technologies to achieve development. This allows us to take the shortest path to the ascent. After all, today in the world, information technology is penetrating deep into all areas. Digital technologies not only improve the quality of products and services, they reduce unnecessary costs. We all need to understand this”.

It is also necessary to launch the project “1 million programmers” with foreign partners to train highly qualified specialists for the industry, to introduce information technology that fully meets international standards at all levels of education, to provide all villages and neighborhoods with high-speed Internet in 2 years. The tasks of necessity have been identified.

## **MATERIALS AND METHODS**

If we look at the history of the legislation adopted by our Government on the development of the informatization of our country. With the adoption of our country's independence, great attention has been paid to the development of this area. In particular, the Resolution of the Cabinet of Ministers of the Republic of Uzbekistan dated April 22, 1999 No. 199 “On the program of modernization and development of the national data transmission network of the Republic of Uzbekistan for 1999-2003”, Resolution of the First President of the Republic of Uzbekistan No. PF-3080 of May 30, 2002 “On further development of computerization and introduction of information and communication technologies”, Resolution of the Cabinet of Ministers of the Republic of Uzbekistan dated May 27, 2002 No. 137 “On approval of the Regulation on Internet distribution”. Resolution No. 336 of September 10, 2002 “On Further Improvement of Activities in the Field of Information and Communication Technologies”, Resolution of the Government of the Republic of Uzbekistan No. 352 of October 10, 2002 “On Decentralization of the Use of International Computer Networks”; Resolution of the President of the Republic of Uzbekistan No. PP-191 “On the establishment of the public educational information network of the Republic of Uzbekistan”, Cabinet of Ministers of the Republic of Uzbekistan dated December 17, 2007 No. 269 “On measures to further develop the Government Portal of the Republic of Uzbekistan on the Internet”, “On approval of the Model Regulations on the electronic library and the plan for the creation of a full-text electronic information and library resources in information-library and information-resource centers and libraries” No. 198, February 1, 2012 “Further development of computerization and information and communication technologies in the field” Resolution of the First President of the Republic of Uzbekistan dated March 21, 2012 No. PP-1730 “On measures to create conditions for the introduction and further development of modern information and communication technologies” dated April 16, 2012 “On measures to create conditions for Republic of Uzbekistan “On measures to implement the investment project” Creation of the national system of “e-learning”” PP-1740, Resolutions No. PP-989 of June 27, 2013 “On measures to further develop the National Information and Communication System of the Republic of Uzbekistan”, PP-2042 of September 20, 2013 “On measures to further strengthen the incentives for software developers of the country”, PF-5099 of the President of the Republic of Uzbekistan dated June 30, 2017 “On measures to radically improve the conditions for the development of information technology in the country”, PF-5349 dated February 19, 2018 “On measures to further improve the information technology and communications” Decree of the President of the Republic of Uzbekistan dated February 19, 2018 No PP-3549 “On the organization of the Ministry of Information Technologies and Communications of the Republic of Uzbekistan”, the Cabinet of Ministers of the Republic of Uzbekistan dated September 5, 2018

“Information threat on the World Wide Web” On measures to further improve the quality of education No. 707, June 11, 2019 “On measures to introduce advanced information and pedagogical technologies in preschool education” No. 487, July 15, 2019 “On the organization of the Technological Park of software products and information technology Resolution No. 589 of November 28, 2019 “On measures to improve the quality of life of the population”, Resolution No. 955 of November 28, 2019 “On approval of the Regulation on the Unified Register of information resources of the network” ZIYONET”.

Given the importance of regulation of the informatization sector and the need to accelerate this process in the country, in accordance with the Resolution of the Cabinet of Ministers under the President of the Republic of Uzbekistan dated August 3, 1992 No 360 “On improving the structure and activities of the State Committee for Science and Technology” The General Directorate of Informatization has been established under the FTDQ. Within the framework of the main tasks and areas of activity set out in this resolution, a number of laws aimed at developing the information process were adopted at the initiative of the FSB of the Republic of Uzbekistan. Resolution of the Supreme Council of the Republic of Uzbekistan No. 869-XII of May 7, 1993 “On the implementation of the Law of the Republic of Uzbekistan” On Informatization”, May 6, 1994 “On legal protection of programs and databases created for computers” Laws 1060-XII are among them.

Following the provisions of the Law of the Republic of Uzbekistan on Informatization, in December 1994, the Cabinet of Ministers approved the concept of informatization of the Republic of Uzbekistan. The main purpose of this Concept and the issues raised in it are as follows: creation of a national information and computer network; maintaining economic, legal and regulatory documents on the approach to information as a commodity; compliance with international standards of information processing; integration and development of the information industry; encourage and support fundamental research in the field of information technology; coordination of the system of training computer users.

The “Informatization Program of the Republic of Uzbekistan” was developed, taking into account the main provisions of the concept. It includes three target programs:

- a) National information and computer network;
- b) Computer mathematical and software;
- c) Personal computer.

The program includes the creation of ministerial and judicial information networks, the National Information and Computing Network, the organization of production of computers and computer equipment, improving training in the field of new information technologies, the creation of regulatory and legal framework for documentation and others.

Uzbekistan has a lot of intellectual potential and information resources for the implementation and development of information technology. The Academy of Sciences, higher and secondary special educational institutions, manufacturing and companies have qualified staff in computer technology, communications, software and information, information systems.

On January 9, 2018, a meeting chaired by the President of the Republic of Uzbekistan ShavkatMirziyoyev was held on the effectiveness of measures taken to further develop information and communication technologies and ensure security.

The meeting focused on the development of the information sphere, increasing the speed of the Internet, further development of the e-government system and the development of other information technologies. Relevant instructions were given to the representatives of the industry on the issues considered.

The Ministry of Public Education its work in 2010 to increase the literacy of teachers in information and communication technologies. In particular, the Resolution of the Board of the Ministry of Public Education of the Republic of Uzbekistan dated July 1, 2010 No 5/1 “On further improvement of the system of retraining and advanced training of teachers” and January 3, 2012 No 1 “On approval of training programs” Basically, 8 (eight) hours – “Information technology and their use” and 12 (twelve) hours – “Information technology in science teaching” training courses for all categories of students on the use of information and communication technologies in education.

## RESULT AND DISCUSSION

The main purpose of this is to increase the competence of teachers in information and communication technologies and the effective conduct of distance learning in the future. This is because the main stages of the distance learning process are planned to be conducted on the Internet with the help of a computer.

Adoption of the Resolution of the Cabinet of Ministers of the Republic of Uzbekistan No. 92 of February 19, 2003 “On measures to implement the Education Sector Development Program with the participation of the Asian Development Bank” is the main basis for providing the education system with information and communication technologies In the Decree of the First President of the Republic of Uzbekistan PF-3431 “On the National State Program for the Development of School Education for 2004-2009” dated May 21, 2004, the issue of providing schools with educated and qualified personnel, creating a new, effective system of teacher retraining and advanced training set as a separate line.

One of the effective, convenient, popular solutions to this problem is the large-scale introduction of distance learning technology in the public education system.

Resolution of the First President of the Republic of Uzbekistan dated June 2, 2005 No pq-91 “On improving the system of training in the field of information technology”, instructions on improving the system of training specialists in information and computer technology, further expanding the application of information and communication technologies in education given.

A lot of work is being done in public education on the introduction of information technology and capacity building in this area. In particular, the order of the Ministry of Public Education dated August 3, 2006 No. 6/5-HB “On naming the 2006-2007 academic year as the academic year of capacity building of teachers in the use of information and communication technologies” to accelerate the introduction of information and communication technologies in education and ensuring computer literacy of all teaching staff was identified as the primary goal.

According to the order of the Ministry of Public Education of the Republic of Uzbekistan from December 20, 2007 of No. 329 “About approval of plans of retraining and advanced training of heads and teachers of public educational institutions for 2008” the Ministry of Public Education, Labor and social protection Joint orders of the Ministry of Higher and Secondary Special Education No. 542, 40 and 277 of September 5, 2008 and the Ministry of Public Education No. 153 of May 24, 2008 “On measures to improve the theoretical and practical knowledge of teachers on advanced pedagogical and information technologies” On the basis of the order of the Ministry of Education and Science of the Republic of Uzbekistan for 18 hours of training module “Information technology and their use” for each subject was introduced, which provides students with skills in the use of information and communication technologies and Internet services.

In addition, through the distance learning system, listeners will have access to the most necessary reading materials of the virtual library via the Internet. It should be noted that the virtual environment has the ability to provide listeners with much more visual information (text, illustration, video, audio) than in the form of full-time reading. The Internet Web-node consists of a unique classroom for listeners, which is accessible at any time of the day and on any day of the week, from any place (university, faculty, residence, office) with a computer connected to the Internet. In addition, the Internet consists of a Web-node - a room for rest, a post office, a bulletin board for hanging a table and a place for testing and partial examinations. The Internet Web-node provides listeners with information about the Internet's learning and information materials, in other words, it is a window into the global information network's educational space. Communication between the tutor, teachers and listeners is done through e-mail, discussion forums and chat systems in the learning environment created on the site. The interactive capabilities of the Internet provide a collective approach to education. The trainee can send information to colleagues through an electronic forum or a list of referrals, or use the tools of teamwork done on a training project. Once listeners are exempted from compulsory attendance, they can exchange information or interactive discussions from different geographical areas.

As noted in the Decree of the President of the Republic of Uzbekistan dated April 7, 2017 “Action Strategy for the five priority areas of development of Uzbekistan in 2017-2021” – “... new information and communication technologies in the education system, including the process of professional development of educational institutions It plays an important role in the formation of modern electronic information resources and portals, as well as in the further informatization of the education system. Today, the organization of the system of professional development of educational institutions in the country to a higher level on the basis of new information technologies such as computers, multimedia electronic manuals, Internet, electronic databases, distance learning, as well as teaching, learning, modeling, practical, informational and other programs. A number of measures are being taken for its widespread use”.

Resolution of the Cabinet of Ministers of the Republic of Uzbekistan ID-2110 on measures to provide secondary schools in the country with computers and the introduction of information systems and databases in public education in 2019-2020. The resolution of the Ministry of Public Education of the Republic of Uzbekistan on equipping educational institutions with modern information and communication technologies and the introduction of information systems and databases in public education in 2019-2020 and the program “Information systems in public education and Database Introduction Program”.

**CONCLUSION**

In conclusion, it should be noted that the rational use of opportunities provided by the period is one of the cornerstones of the country's development, not only in society, but also in the system of public education, which is a leading link in the development of society.

## PROBLEMS OF USING INFORMATION RESOURCE EDUCATIONAL TECHNOLOGIES FROM DIDACTIC SOURCES OF DRAWING

**Latipov Rustam Atakhanovich\***

\*Independent Researcher,  
Department Of Fine Arts and Engineering Graphics,  
Urgench State University, Urgench, UZBEKISTAN  
Email id: rustlatipov1980@gmail.com

### ABSTRACT

*In the article, the current state of engineering graphic science is analyzed in general schools. In the course of the educational process, it was proposed to develop electronic teaching literature in the use of information technology.*

**KEYWORDS:** *News, Reproductive Method, Graphic Assignment Computer Technology, Electronic Educational Literature.*

### INTRODUCTION

Modern society is living in an era of unprecedented growth of information flows, both in the economy and in the social sphere. The use of information in various spheres of human activity, the widespread introduction into practice of modern means of their transmission has launched a new stage in the development of society - the era of information.

People's lives and activities take place in the world of many types of information in the form of audio, text, digital, video.

Reproductive methods of teaching, which do not develop students' creative abilities, do not help them to work with information and identify, analyze and systematize the main content, are often used in the teaching of drawing in general secondary schools. The modern specialist is required not only to be knowledgeable in his field and to have information in this area, but also to be able to use them appropriately in various professional situations. Along with labor education classes in secondary schools, the subject of drawing also has great potential in the vocational guidance of students and the formation and development of their polytechnic knowledge. In order to make effective use of these opportunities in drawing lessons, it is necessary to pay special attention to the fact that the content of the subject is structured in a way that is interesting for them, taking

into account the age characteristics of students. However, the information in the textbooks that have been published so far does not go beyond the summary of the information in the Unified System of Design Documents (ESKD) and the description of simple methods of drawing.

## **MATERIAL AND METHODS**

The history of the development of drawing, as well as the unique achievements in the field of drawing in the territory of Uzbekistan (especially in the example of applied art) are ignored by the authors of textbooks, both in current and previous textbooks. In this regard, the inclusion in the educational process of creative tasks aimed at meeting modern requirements is not reflected in the textbooks. As a result, in most schools, drawing is viewed as a secondary subject, and students' knowledge of drawing does not meet the requirements.

In the process of studying and analyzing the teaching of drawing in general secondary schools and their content, we have identified a number of factors that negatively affect the mastery of the subject by schoolchildren. These include:

- Low interest in the school drawing course by the majority of students in secondary schools;
- In some cases, non-specialist teachers teach drawing lessons in schools for various reasons;
- Lack of seriousness on the part of school administration and teachers, as well as students;
- The study of drawing requires students to acquire special abilities and skills (spatial imagination, creative approach to problem solving, independent work skills, analytical skills, etc.). If a science teacher has not mastered the methods of shaping them (a non-specialist teacher), teaching students simple methods of drawing becomes a big problem in itself.

## **Results**

All of the above arguments are fully applicable to the subject of drawing in schools as well. The content of the science of drawing, the different changes in the study hours allocated to it, the variety of topics covered in the textbooks and programs of different authors confirm that there is no clear approach to solving the problem.

The content of the school drawing course and the problems in its teaching confirm the relevance of the topic.

Student engagement and independent thinking problems are one of the didactic roots of the practice. If students are not active and cannot imagine the space, the teacher's activity will not be meaningful. The development of teaching methods should primarily focus on students thinking independently and being active. Computer technology can effectively help students develop free thinking and spatial imagination.

## **DISCUSSION**

The task of scientific research is to create a new theoretical database on the subject of drawing, to develop samples of new types of exercises and graphic assignments of practical importance, taking into account the interests and age characteristics of students, lesson plans using modern pedagogical, information and computer technologies is calculated.

Course development using modern information and computer technologies, e-learning literature should have the following features:

- Ensuring fast communication in the educational process;
- Possibility of individualization of educational process;
- increasing the visibility of the educational process;
- the ability to search for information from various sources;
- the possibility of modeling the process or event being studied;
- It can be used in team and individual training;
- The breadth of opportunities to test students in education;
- availability of interactive methods and techniques of education;
- high quality training;
- creation of opportunities for students to generate knowledge and self-assessment;
- Ensuring the interconnectedness of lessons;
- Transmission of information in a new form through multimedia.

E-learning literature should not become an absolute source of information. E-learning literature should be designed taking into account the mental activity of the learner, his abilities, in particular, the ability to see, hear, especially imagine, and to facilitate the memorization of knowledge and concepts to a high degree.

## CONCLUSIONS

It is necessary to create a methodological support for the subject of drawing in secondary schools, taking into account the possibilities of using information, computer technology, computer graphics, taking into account the modern requirements of the education system.

## Acknowledgements

In summary, the application of computer technology in the teaching of drawing science enhances students' cognitive abilities, motivation to learn, develops their spatial imagination and creative thinking skills.

## ROLE OF ATTITUDE AND PRACTICES ABOUT PRE-CONCEPTUAL NUTRITION AMONG FEMALE STUDENTS

**Mohammed Abdulridha Merzah\***

\*Technical Institute of Karbala  
Karbala, IRAQ

Email id: merzah.karbala@gmail.com

### ABSTRACT

*Background: Diet is associated with five of the 10 leading causes of death in the U.S. Currently the greatest increase in overweight and obesity in the U.S. has occurred in 19-24 year olds. Those youth age groups are 43-times more likely to develop cardiovascular disease, as well as other risk factors such as high blood pressure and cholesterol, and Type 2 Diabetes, which poses a concern for the future health of Americans as well as the already excessive health care costs. This study was proposed in order to assess female-students' attitude and practices regarding healthy diet during preconceiving period. Method: The information was collected from eighty female students who enroll on fall courses at SIUC using a survey with 13 questions. The questions asked about the attitude and practices regarding nutrition such as attitude to a healthy diet, attitude to receive pre-conceptual care counseling, exercise, and some daily habits. Result: Eighty female students participated in this survey with the mean age of 24.5 (M= 24.5). The results show that most of the participants have attitude forward eating healthy food, attitude toward healthy practices such as exercise, and attitude to get more information regarding healthy diet during pre-conception period as well. Conclusion: There is a slight trend to an attitude to a healthy diet and practices during preconception period, but it is not highly significant. Since only 80 people participated on the survey, the results only present slight tendencies. Additional studies are required in order to get more reliable and accurate results.*

**KEYWORDS:** Attitude, Conceiving, Infertility, Pre-Conceptual Nutrition.

## 1. INTRODUCTION

*"Each women, man, and couple should make a reproductive life plan that includes whether and when they want to have children and how they will maintain their reproductive health"* CDC, 2006

Diet is associated with five of the 10 leading causes of death in the U.S., including coronary heart disease, certain types of cancer, atherosclerosis, and Type 2 diabetes (Schulman & Wolfe, 2000, p.107). Currently the greatest increase in overweight and obesity in the U.S. has occurred in 19-24 year olds (William et al, 2001). Those youth age groups are 43-times more likely to develop cardiovascular disease, as well as other risk factors such as high blood pressure and cholesterol, and Type 2 Diabetes, which poses a concern for the future health of Americans as well as the already excessive health care costs (Judith, 2013).

College life brings change in the lives of students, which can lead to compromised eating habits once away from their parent's home (Conklin et al, 2005). Diets of these students tend to be high in fat and saturated fat, while being low in fiber and complex carbohydrates. Portion sizes, high food availability, frequent intake of fast food and continuous snacking may be the main contributors to poor dietary quality. These eating habits are of concern because research shows unhealthy eating habits learned in childhood and adolescence tends to be maintained throughout adulthood. These eating behaviors put college students at risk for many chronic diseases (Butler, 2004)

Nowadays, many studies show that infertility is linked to diet and nutrition habits (Swinney, 2013). Therefore, preconception nutrition besides lifestyle changes are considered as a core factor in the prevention/ treatment of several common health problems of women and men prior to conception. Furthermore, nutritional and health status before pregnancy have influences on fetus development/ health, and decrease the risk of complication during pregnancy.

As shown previously that nutrition and lifestyle has various impacts throughout adulthood. Specifically, nutrition stats of women before pregnancy (Preconception nutrition) have impacts on health of women during pregnancy and the health of newborn (Judith, 2013). Therefore, improving and enhance knowledge, attitude, and practices regarding pre-conceptual nutrition among female college students is so important.

## 2. METHODOLOGY

The information was collected from 80 female students who enroll in fall courses at SIUC using a survey with 13 questions. The questions asked about the attitude and practices regarding nutrition such as attitude to a healthy diet, attitude to receive pre-conceptual care counseling, exercise, and some daily habits. Every question was proposed and then analyzed by the researcher. These surveys were filled out by 80 females after getting approved by the ethic committee of Southern Illinois University. For each question, there is four different choices can be selected: strongly agree (SA), agree (A), disagree (D) and strongly disagree (SD).

## 3. RESULTS AND ANALYSIS

The results about attitude and practices of female students at SIUC regarding pre-conceptual nutrition are summarized as the following:

The mean age of participants is (M= 24.5). The results of attitude to a healthy diet, attitude to get knowledge, and attitude to healthy lifestyles are represented as: 46% of participants are showing their attitude to get knowledge linked to diet and practices before conceiving. However 2% of them aren't agreeing. 41% are agreeing with the conception of health diet before being pregnant has impacts on pregnancy and newborn health. In contrast to 1% aren't agreeing. Regarding exercise before conceiving and its impact on pregnant health, 42% of the participants are agreeing with. Conversely 28%, 25%, and 5% are strongly agreeing, disagreeing, and strongly disagreeing respectively.

The results for the questions about attitude to healthy diet linked to pre-conceptual (questions 1, 3, 5, and 6). 56% of participants are disagreeing with the concept of continuing eating the food that they like with knowing that food is unhealthy. While some participants strongly agreeing (11%) and agreeing (33%) with continue eating the food they like even it is unhealthy. Also, 45% and 40% of participants are strongly agreeing and agreeing, respectively, with the idea of that good nutrition, good general health, and exercise are the most important aspects of getting ready for pregnancy.

Responding to the questions that related to the attitude forwarding healthy lifestyles show that of the participants, 53% agreeing and 37% strongly agreeing with the notion of that exercise is beneficial for health of reproductive organs. Regarding being overweight or underweight can reduce the chance of conceiving, participants respond as disagree with 42%, agree 37%, and 11% as strongly disagree and strongly agree (see figure 1).

Figure 1: Attitude to healthy lifestyles

One of the most important aspect regarding being health through the lifecycle is knowledge. Many studies show that being knowledgeable about healthy diet and lifestyles make you more aware about your diet (Dickson-Spillmann&Siegrist, 2011; Swinney, 2013).

Figure 2: Attitude to getting knowledge.

Figure 2 shows that most of the participants (47%) agree with the notion of receiving preconception diet counseling is beneficial for both mother and child, (43%) agree with the notion of following preconception guideline and recommendations regarding diet will improve the quality of my pre-conceptual health, and (47%) agree with the notion of talk to others who are hoping to get pregnant or were pregnant might be beneficial.

Responding to the questions, that are related to some practices during preconception period such as drinking alcohol and coffee and smoking, show that the average of coffee cups that drunk per week is higher (11.75 cups/week) comparing to alcohol consumptions (3.85 cups/week). However, the average of cigarettes smoked per week among participants is 8.5.

Finally, is important to point out that the survey was performed with only 80 female students. The results show a slight trend to a healthy lifestyle and attitude regarding diet before conceiving, but more research is required in order to get solid conclusions in the topic. With this preliminary information it can be said that the initial hypothesis must be changed because despite female students, in general, are aware that attitude and practices linked to preconception nutrition is feeble, they show a significant attitude and practice regarding pre- conceiving diet.

#### 4. CONCLUSIONS

The attitude and practices to a healthy diet during preconception period at Sothern Illinois University at Carbondale were studied preliminary by mean of a survey. The main findings are as follows: There is a slight trend to an attitude to a healthy diet and practices during preconception period, but it is not highly significant. However, initial hypothesis consider that attitude and practices regarding preconception nutrition is frail. Therefore, the initial hypothesis must be reevaluated.

46% of the participants are showing their attitude to get knowledge regarding diet and practices before conceiving. However 2% of them aren't agreeing. 41% are agreeing with the conception of health diet before being pregnant has impacts on pregnant and newborn health. In contrast to 1% aren't agreeing. Regarding exercise before conceiving and its impact on pregnant health, 42% of participants are agreeing with. Since only 80 people participated on the survey, the results only present slight tendencies. Additional studies are required in order to get more reliable and accurate results.

UZBEKISTAN

### ABSTRACT

*Article on test quality control of knowledge in training Foreign languages in the modern education system. The test method does not allow only to consolidate the acquired knowledge and skills, but also to identify gaps in the students. Passed material, allows the teacher to correct further curriculum according to the results of the tests conducted and pay more attention to badly acquired material. When preparing tests for foreign languages, it is necessary to select tasks that cover all grammatical, lexical, phonetic aspects, invite students to perform several exercises on a single topic, minimize chance when students choose any of the answer options. Test tasks activate mental activity, train students to independent to work and assiduity. The author concludes that, despite such shortcomings, this method like probability of guessing the correct answer, addictive to work with ready language and lack of ability to reveal individuality are the most a promising form of knowledge control that complies with the principles of humanization of education, improves the quality and learning of the material required for qualified specialist.*

**KEYWORDS:** *Testing; Knowledge Monitoring And Verification; Assimilation And Fixing Material; Intellectual Activity; Independent Work*

### INTRODUCTION

Knowledge of foreign language in the modern world is one of the most important conditions professional competence [4]. In the process of learning language skills

Teachers face the challenge of controlling the quality of knowledge. In modern times - this is especially relevant, as "pedagogical tests open promising directions

### Improving the quality of learning by improving the results monitoring system

Training in conditions of teacher-teacher cooperation. " [2] It is important to select objects and control forms. There are many forms of control of acquired knowledge - oral survey, Frontal polling, working in pairs, final control, phonetic dictant, etc. In Recently, mainly two types of control are used: oral interview and written work. An oral survey does not always provide a complete picture of the learned or Untapped material and time-consuming; Writing work requires a lot of Time to verify it. Both of these methods may not lead to an objective assessment of the resulting pupils of knowledge.

A control method such as testing can be successfully applied to the current, Intermediate and final knowledge check. You can test your knowledge with tests Students both selectively and generally. Testing is important for securing, Improvement of acquired knowledge, skills and skills, identification of gaps in knowledge. Students in higher education are more conscious and thorough in their verification Their knowledge, as their training places higher demands on their mental activity and independence. To learn the requirements for the study The program needs a sufficiently high level of development of generalizing, logical and Abstract thinking, as in older age students are more conscious of to study and submit it to certain tasks of life and future work on the chosen ones professions. Their thinking activities change as they grow up, too. They must be able to argue and draw conclusions. The criticality of thinking develops, i.e. at training students use testing is particularly justified and leads to increasing motivation both in the study of foreign languages and other subjects. Than is the test different from traditional control work? Test (from English word 'test' - Test, check, control, exercise, study) is a system of tasks, execution which allows you to verify the level of ownership of an object by using a specially designed knowledge assessment system. Thus, testing is a method of such testing of knowledge, skills and skills where the subject is tested performs a number of special tasks. These are called test jobs. As note Zharynova E.G. and Chernyaev E.V. test tasks must meet several criteria. First, the test task should be short and technological. Secondly, test task must be formulated logically and unambiguously. Third, response evaluation rules and the instructions shall be the same for all subjects [1]. Advantage of such tasks in that they allow teachers to evaluate in short periods of time degree of learned or non-learned material.

The test method has many advantages. Being an integral part of the class, it allows the student to work at an affordable pace, with a gradual transition from one level of knowledge development to another. Test jobs give time to think how much material is well acquired. When you use testing to consolidate language knowledge Concludes that both grammar and vocabulary will be better learned, which in turn.

Will allow the teacher to adjust and plan further training process according to the results of the tests conducted and pay more attention to the poor to the acquired material. Lack of time-consuming verification of written works allows to carry out tests quite often and creates a feeling of total in students control knowledge and get rid of psychological problems associated with personal student-teacher relationships that may not always be positive, i.e.

This form of knowledge control eliminates subjectivity. Combined with other species control, the use of testing is an effective technique that motivates preparation for each occupation. Testing facilitates the educational process. Especially This is clearly seen in high school and university students. Activity on classes also increase, the psychological atmosphere and connection

between by the teacher and students, which has only a positive impact on learning in whole. Testing takes time, but it should be seen as part of the training process. And motivation depends on how we use test results. If testing is seen as a competition between students, then they may not cause Motivation, and if testing is used as an opportunity to identify progress in students, then they motivate them and make them think about how to raise their level of knowledge.

Now let 's look at the disadvantages of this method.

1. When running tests, there is a chance of guessing: the student presents only the answer numbers, the teacher does not trace how he decided on whether or other choice. This disadvantage is common for tests consisting of jobs on selecting the correct answer from among the suggested ones. [6]

2. The compilation of tests is often based on a mental function - recognition, therefore, some methodologists believe that in selective responses, the student

Gets used to working with ready-made language and is unable to present the acquired knowledge in a different way.

3. There is often subjectivity in forming the content of the tests themselves, in their

Selection and instructions for test jobs, much also depends on the specific

Test system is allocated from time to knowledge control, etc.

4. There is a danger of automatic errors. For example, the subject did not understand

Instructions and began to respond at all not as required by the standard procedure.

5. Lack of ability to reveal identity when standard tasks.

Let 's take a look at the test functions and basic test requirements [by Shatilov S.F.]: 1) Control and correction function reveals degree of mastery individual groups of students with new material; 2) control and precautionary and control and stimulating functions draw the attention of trainees to what requirements are presented by the instructor, gaps in material absorption are detected, which allows

in due time to liquidate them; 3) control and training function is important for themselves students, as they repeat the material passed when performing tests; 4) the control diagnostic function allows to check the level of learning that is learned by them good, which is not very good, and what is poorly learned; 5) control and educational function testing allows to take into account personality characteristics; 6) control generalizing function is to identify skills and skills in the training course

(Final tests at the end of the subject, half-year, school year). [10] In form, the tests are divided into open and closed tests. In case of open form, the person to be tested

Must formulate or supplement the response itself. Test jobs contain questions, answers require the full implementation of acquired knowledge, skills and contribute to the preparation of new, more complex issues.

The closed test form has several options: 1) with one selection correct answer; 2) with multiple selection; 3) to determine compliance, such Jobs typically consist of 2 blocks between which to map (E.g. word and definition) 4) to determine the sequence, they assume that the student must

establish a certain order of action to get necessary result; 5) graduated - when all answers are correct, and the trainee must select the most correct answer of all; 6) alternative, which include only two answer options, not four as usual. Tasks of alternative answers are simple, but not the most common in the formulation of tests. Such tests can give students valuable information.

In addition, in the methodological literature and practice of teaching foreign languages two types of tests have been distributed: norm - referenced

Test) and criterion - referenced test. The first type of the test is designed to compare students' learning achievements. This test is widely used in the distribution of students by educational group, taking into account their language training abilities. The second type of test is used to check the degree of ownership of the training material. This kind of test is currently the most popular and easier to realize in practice. [8] But there are also disadvantages, namely, the degree of understanding of the test in reading process, hearings, comparisons and whether all skills should be checked or restricted a few and what then.

Types of test tasks in foreign language training to monitor passed grammars and vocabulary, and thinking logic are as follows: 1) cross-selection (matching); 2) multiple choice; 3) streamlining (rearrangement); 4) end (completion); 5) replacement (substitution); 6) transformation (transformation). It change the structure of the text specified in the test - its reduction, expansion, change word order; 7) intra-language paraphrasing is a transmission in his words the author's thoughts, clarifying it as far as possible; 8) interlingual cross-language paraphrasing/translating assumes the ability to find equivalent form for transmitting the content of text expressed by the means of the study language; 9) filling of gaps in coherent text (cloze procedure). Such a test should be cost-effective and include all grammar and vocabulary to be tested, and which would be interesting and cognitive. You can selectively use question-answer tests for the current or intermediate control of knowledge. It is also useful to use patch tests

Editing procedure and header selection tests for related statements.

The general criteria for evaluating test tasks are as follows:

- ☐ about 90% of the correct answers- are "excellent";
- ☐ 76%- 90% of the correct answers - are "good";
- ☐ 60%- 75% of the correct answers - are "satisfactory";
- ☐ less than 60% of the correct answers - are "unsatisfactory".

What are the recommendations for foreign language tests, for example for University students (both linguistic and non-linguistic)?

1. All answers to this question should look plausible, forcing

Students analyze each response option and identify inaccuracies in it or mistake (self-examination).

2. It is desirable that the test answer options are not random, but are,

Derived from their implementation, taking into account the knowledge gained; The most common errors during training. It minimizes chance when students choose any of the answer options if their native does not match any of the options given.

3. Test tasks should be formulated in such a way that they are most complete covered all grammatical, lexical, phonetic, etc. aspects of the language and allowed to control not only skills, but also learning by students theoretical knowledge.

4. When creating test variants, it is desirable to selectively suggest students perform several exercises on this topic. This method detects all errors in the test. Such a measure is also necessary. Because the teacher may not see a twofold interpretation and ambiguity in the proposed versions, as what is for the person skilled in the art is obvious, the student may raise well-founded questions.

Of course, there are difficulties in developing and applying testing and it is necessary to be able to overcome them. First, it is the need to distinguish between the types of speech activities and unambiguity of responses. Secondly, the complexity of the organizational nature - creating a supportive psychological environment as many students experience a certain stress in the tests. Therefore the goodwill is important teacher. You can overcome these difficulties if you follow the 3rd basic to the rules:

- 1) To give clear and unambiguous theoretical definitions of skills which it is necessary to check;
- 2) To determine precisely the conditions to be followed in conducting the test (the time given for its execution and monitoring of its execution);
- 3) determine (in points) the results. The tasks of the educational institution are to develop the educational system,

A personality-oriented student. All this applies to testing, as the connection

Russia to the Bologna process in September 2003 allowed to concentrate on

A structure of education that is compatible with the relevant structures European countries. [7] Testing, according to many scientists, complies with the principles humanizing education because it cannot be directed against the interests of the individual. Modern science testology offers a variety of approaches, models and methods verification of acquired knowledge. Every year the quality of tests improves, Increased probability of using test materials, various testing and test generation technologies for different levels of training. Understanding testing patterns will allow the teacher to improve the process of education and training to foreign languages.

UZBEKISTAN

### ABSTRACT

*At present, it is obvious that it is necessary to create optimal conditions in the pre-school educational organization for the comprehensive development of pre-school children, for their learning of socio cultural ties and traditions, in other words, for the formation of socio cultural competence, which acts as the purpose of teaching a foreign language. The article attempts to clarify the purpose of teaching the German language to pre-school children and defines the role of phonetic skills in the formation of socio-cultural competence.*

**KEYWORDS:** *Preschool Education, Socio-Cultural Competence, German Language, Formation Of Hearing And Pronunciation Skills.*

### INTRODUCTION

In today's conditions, when learning a foreign language has become not only a way of self-development, but also a necessity for many, especially young people, the organization of the process of learning a foreign language (IA) remains the focus of attention of methodologists and teachers, who are looking for ways to optimize this process and reserves to improve its performance. According to many, one such reserve is the shift of the beginning of the study of IJ to pre-school age. As a result, the popularity of teaching a foreign language in pre-school institutions increases every year, and the problems that arise in practice need to be solved. It should be noted that a number of studies consider certain issues of training of the IYA of pre-school children (see, for example, the works of T. B. Khlybova, A. N. Utehina, K. B. Zhigaleva, I. V. Zotova, Z. N. Nikitenko, etc.). However, it seems that not all issues of organization of activities on IY in children 's educational organization (DPI) are properly investigated, so, first, the most important is the correct definition of the purpose of education, as well as its maximum minimization and concretization taking into account the specific conditions of education in children 's preschool organization

As is known, at present, the purpose of IJ training at any stage is the formation of socio cultural competence. The term "socio cultural competence" has recently been increasingly used in foreign language teaching techniques and refers to a certain component of the ultimate goal of learning. Different definitions of socio cultural competence can be found, which, however, are close in essence. For example, I. I. Mantrova defines socio cultural competence, what is the ability to carry out their speech behavior in accordance with the knowledge of the national-cultural peculiarities of the country of the language studied, as well as the rules of speech and non-speech behavior in typical situations of communication [4]. The formation of socio cultural competence means the acquisition by students of a certain linguistic competence, universal human values, which help to properly build a dialogue with representatives of another culture. At the same time, the search for optimal means and methods of training plays a major role, which, on the one hand, would take into account the specifics of training of IA pre-school children, on the other, create conditions for the successful formation of socio cultural competence. Social and communication development, according to the pre-school education standard approved by the Federal State Educational Standard (hereinafter referred to as the Standard), means "the learning of norms and values adopted in society, including moral and moral values; Development of communication and interaction between the child and adults and peers; Development of autonomy, focus and self-regulation of own actions; Development of social and emotional intelligence, emotional responsiveness, empathy, formation of readiness to work together with peers, formation of respectful attitude and sense of belonging to the family and to the community of children and adults in the organization; Formation of positive attitudes towards different types of work and creativity; Formation of the foundations of safe behavior in the home, society, nature. "

It is obvious that the promotion of socio-cultural competence as a goal of education of pre-school children of IA is quite in compliance with the requirements of the Standard. The concept of "socio cultural competence" appeared relatively recently in the methodology of education. It is close in importance to social and communication development. Many scientists view the term from different angles. For example, E. G. Azimov and A. N. Schukin in the new dictionary of methodical terms and concepts (theory and practice of language education) define socio cultural competence as one of the components of communicative competence [5]. Several main goals of formation of socio cultural competence are identified: 1) expansion of information about culture of the country of the studied language; 2) ethical and aesthetic education; 3) correlation of native culture with traditions of other peoples; 4) development of the ability to perceive authentic texts of different styles; 5) understanding the dialogue of cultures; 6) development of pre-school personality. With regard to teaching the German language of pre-school children in socio-cultural competence, the following components can be distinguished: 428 • Linguostranology - knowledge about the history and geography of the country of the language studied, knowledge of the main attractions of the country. In DOO No. 178, children are well aware of the main historical monuments of Berlin. For example, das Brandenburger Tor, der Alexanderplatz, Unter den Linden, der Tiergarten. • Sociolinguistic - language clichés used in childhood. For example, Sag mal!, Seht mal!, Vorsicht! and others.

Socio-psychological - possession of the rules of speech behavior adopted in this culture. Например, Danke!, Moment mal!, Entschuldigen Sie, Darfich mal?, Darfichhinein / heraus? And others. • Cultural component - knowledge about the traditions of the country of the language studied, about its holidays and customs, peculiarities of culture, musical component (various

children's songs) and others. For example, the holidays of Ostern, Weihnachten, Backe songs, backeKuchen; O, Tannenbaum; Traditional heroes: der Osterhase, der Teddybär and more. With this approach, the IA acts not only as a means of communication, but also as a tool for formation of socio-cultural competence in pre-school children, expansion of their general outlook and harmonious development. However, the conditions for the formation of sociocultural competence are complicated by the fact that pre-school children learn only direct communication, i.e. oral and speech communication. Accordingly, the formation of linguistic competence takes place only in two types of speech activities (speaking and auditing), often older children of pre-school age are not yet able to read not only in a foreign language, but also in their native language. Accordingly, the principle of the oral basis of instruction is the leading principle, that is, the necessary language material is absorbed orally. That is why the development of hearing-pronunciation skills should be given special attention. It is obvious that this process should be based on the principles of approximation and consideration of the mother tongue. Approximation principle - means "condescending attitude" of the teacher to the permitted errors of the trainees in the process of speech activity, if they do not disrupt communication and do not lead to distortion of the meaning of the message [3, c. 172].

The principle of taking into account the mother tongue - involves taking into account the difficulties of the language studied caused by the divergence in the systems of the students studied and mother tongue [3, c. 168]. With regard to phonetic skills, this means that most sounds are pronounced based on the articulation base of the native language. Sounds that have no analogues in Russian, such sounds as [ This approach was tested during a number of classes held in MADOU "Child Development Center - Kindergarten № 178" Koluchko "in Ulyanovsk. 429 Purpose of classes: • to form hearing-pronunciation skills of senior pre-school children. Tasks: • to develop the ability correctly, from a phonetic point of view, to repeat German words behind the teacher, i.e. to form attention, phonematic hearing and simulation mechanisms; • to organize the mastery of lexical units on the topic of occupation; • to update the use of simple grammatical structures. The proposed algorithm of work on formation of hearing and pronunciation skills in senior pre-school children in MADOU "Child Development Center - Kindergarten № 178" Cloud "in Ulyanovsk looked as follows: At the beginning of the class, the following speech actions were used as phonetic charging: greeting" Guten Morgen/Tag, "as well as presentation using the phrase" Ichheiese.... " Further words the containing sounds [ä, ö, ü] were fulfilled. Auditory perception was supported by a visual row:

das Känguru, das Mädchen, das Kätzchen, der Bär, der Löffel, das Püppchen, München, die Vögel, Köln, der Löwe. The following stage suggested this rhyme: Das kleineKätzchenfängt die Maus, die kleineMausläuft ins Haus. It was also accompanied by a picture, which helped to understand its content. This type of work was consistent and logical when working out sounds and vocabulary, but caused difficulties in some children. Despite this work the choir was successful. The survey showed that the best trainees remembered the following words: der Bär, München, Köln, der Löwe, das Püppchen. In this way work on the following sounds was based [ä, ö, ü, ch]. In the occupation, sounds were practiced on the following lexical units: das Gesicht, der Bär, der Frühling, die Kleidung, München, das Brötchen, Köln, der Löwe. The words were also supported by appropriate illustrations. The strongest words children learned were der Frühling, der Löwe, München, Köln. When teaching pre-school children phonetic skills, it is particularly effective to unearth poems, songs, rhymes. Например, Mit den Händchenklipp,

klipp, klapp, mit den Füßchentripp, tripp, trapp, einmalhin, einmal her, rundherum, das istnichtschr. Einmalhin, einmal her, rundherum, das istnichtschr. The song was not only accompanied by a music video order, but also by corresponding movements. When unearthing verses and songs also 430 you can use exercises to expand the synthagma: working out isolated sounds, individual words, phrases, sentences. This type of work is not only interesting to children, but also quite effective.

Analysis of the conducted classes showed that 65-70% of children are able to distinguish sounds on hearing, as well as sufficiently successfully imitate them. The results of the testing confirmed the conclusion that only a clearly planned occupation taking into account all psychological and physiological characteristics of the age of the trainees can lead to a positive result. Thus, teaching children of older pre-school age to a foreign language contributes to the general development of the child in the process of language learning, active inclusion of thinking, memory, imagination, emotions, perception in this process. Successful acquisition of foreign language speech by children is also possible because children (especially of pre-school age) are characterized by the most flexible and rapid memorization of language material than at subsequent age stages; Absence of so-called language barrier [2, c. 160]. It becomes obvious that it is necessary to create optimal conditions in the pre-school educational organization for the comprehensive development of pre-school children, for their learning of sociocultural ties and traditions, in other words, for the formation of sociocultural competence. One of the means of achieving this goal is the acquisition of a foreign language, which in this case acts not only as a means of communication, but also as an instrument for the formation of socio-cultural competence among pre-school children, the expansion of their general outlook and their harmonious development.

 Institute Of Foreign Languages, UZBEKISTAN

### ABSTRACT

*The article shows that increasing the foreign-language competence of university teachers is equivalent to increasing the quality of the labour force. It is concluded that the language training of faculty is not their private concern, but is important for the university itself in order to ensure the quality of education, its compliance with international standards and an essential factor in international inter-university competition. It is proposed to move to compulsory or optional teaching of a foreign language by a university for its teachers.*

### INTRODUCTION

As you know, the UT (MIIT), as the leading transport university of the country, the Ministry of Transport of the Russian Federation has been instructed to develop a program to increase the global competitiveness of our university. Such a program has been in operation for at least a year and a half. In an interview with the newspaper "Big World 24" in April 152 this year, Rector of RUTH A.A. Klimov explained that the university "faces the task of entering global profile industry or subject world ratings." At the same time, the UT is well aware that the setting of such goals requires serious changes of almost all structural subdivisions of the university. Achieving such goals requires major changes in the work of the university and, in particular, a significant increase in the number of foreign students [1]. One of the most important steps towards engaging teachers and students in intercultural communication with the international academic community is the inclusion of subjects in foreign and, above all, English in the working curricula of education, which is necessary in the context of global competition in the world markets for the provision of educational services. In particular, the May 2018 decree of the President of the

Russian Federation established that by 2024 the number of foreign students in the Russian education system should increase at least twice [2]. In order to increase the prestige of Russian higher education, the Ministry of Education and Science of the Russian Federation initiated the so-called "5-100 project," the purpose of which is to appear five Russian universities in the rating of "100 best universities in the world" by 2020.

However, Russia is far from achieving the goal: in 2017 the highest place among universities of the Russian Federation in the ranking of universities of the world Times was 188 [3]. The construction of the Times rating is mainly based on research activities, citation and the university's "international image." At the same time, almost each of these items requires English language proficiency. In order to improve positions and achieve the goal "5-100," some Russian universities are beginning to increase the number of subjects taught in English and are introducing mandatory teacher training programs in English. For example, NIU Higher School of Economics, which received funding within the framework of the "5-100 project," plans to read about 20% of all disciplines in foreign language by 2020 [4]. The same attention is paid to the foreign-language competence of teachers, for example, at Taganrog Radio Engineering University, which was included not so long ago in the Southern Federal University. When evaluating the quality of teachers' work in the certificate sheet, up to 10 points are given for proficiency in foreign language depending on the degree of competence of the teacher, i.e. the same amount as for having a doctorate, and twice as much as for publishing a scientific article abroad (5 points) [5]. Thus, in IEF UT (MIIT), the development strategy was also set an ambitious task to make the institute as a whole bilingual (Russian and English) by 2030. It is quite natural that teaching subjects in English becomes an urgent task for teachers of our university.

The IEF employs teachers with highly professional qualifications. However, the level of their foreign language competence generally does not reach the level of "proficiency" in the language and accordingly requires a significant increase. This is not surprising, as according to the eighth edition of the EF EPI Index for 2018, compiled on the basis of the results of testing of 1.3 million people, Russia ranks 42nd out of 88 countries and regions of the world and only 28th out of 31 in Europe [3]. To wait for the general level of English language proficiency in Russia to increase, we simply do not have time if we want to participate in international inter-university competition on an equal footing. In addition, the level of English language proficiency varies widely by industry and official function. Workers with the highest level of English proficiency are known to be concentrated in certain functional divisions, such as strategic development, and in certain industries such as banking and information technology. Unfortunately, the employees of higher education are not among them, which only highlights the difference in foreign language training of teachers from the Russian Federation and other countries of the world. In the context of increasing globalization, the knowledge of foreign languages, especially English, in which business negotiations take place before the 80%, is regarded as an essential component of the human capital of the individual that it can apply in today's labour market. At the same time, Marx's idea that people, not machines, are the driving force of economic growth is not disputed by anyone these days and is confirmed in statistics.

Thus, according to the calculations of the American economist E. Denison, 16% of economic growth in 1948-1982 was achieved due to the increase in the educational level of the labor force, 34% - as a result of technical innovations and know-how, also related to education, and only 12% were determined by the increase in equipment costs [6]. There is an endogenous mechanism for generating economic growth, the sources of which are linked to the accumulation of human capital. The point of it is that in a long period of time output per unit of capital can increase, even when investments in fixed assets exhaust themselves, when technically trained employee and growing knowledge provide growth of production. That is, the economic return on training costs significantly exceeds the investment in new technology and equipment. Most consistently, this theory has been introduced in the practice of personnel management in Japan, where a Japanese worker is considered the most expensive resource, more valuable than the most expensive equipment. The use of this resource results in continuous improvement of the labor force through continuous training, official rotation, foreign internships. 154 Thus, increasing the level of language knowledge of teachers is equivalent to a significant increase in the quality of the labour force, as improving the foreign language professional competence of a specialist is a multilateral process affecting the development of professional qualities, increasing the level of education and expanding its outlook.

Therefore, the management of the university should be clearly aware that raising the level of language competence of teachers is not a private concern of the teachers themselves, to learn a foreign language, which would be desirable for their pleasure, but is extremely important for the university itself in order to solve the problem of ensuring the quality of education and its compliance with international standards. Considering that intercultural communication becomes an integral part of the professional life of a modern teacher of the university, we propose to move to compulsory or optional teaching of a foreign language for faculty by the university itself at the expense of its budget. This is how the issue of increasing foreign language competence in Russian institutions, which consider it necessary to know their employees foreign languages, is resolved in practice. Thus, in the Ministry of Foreign Affairs of the Russian Federation, all employees have the right to study foreign languages and improve their knowledge completely free of charge. This approach should be taken, in our view, by the management of universities if the aim is to deepen intercultural communication and integration into the international academic community. Of course, people differ from each other and their ability to study a subject is also different. This situation is quite normal. Just one may take a little longer to learn than the other. Therefore, education of this kind cannot but be multilevel. Experience of such teaching already exists in IEF.

All teachers wishing to study English were divided into three groups - beginners (Gr. I), improving the language (Gr. II) and preparing to read their courses in English (Gr. III). Literally in a year of preparation for four academic hours a week all students of Gr. III prepared courses for their conduct in English, and in another year students of Gr. II were able to hold seminars and give lectures on it, and one teacher from Gr. II went to France to give lectures in English. At the same time, even those students who initially did not expect to be able to prepare a course in a foreign language were given sufficient knowledge and motivation during regular classes to begin preparation for the maintenance of their subjects in English. In addition to regular classes, the IEF held an annual teacher competition for the best lecture in English, the last of which, held in

2017, was attended by about 20 teachers. According to the results of the competition, 7-8 people were sent to language courses in 155 Oxford and Portsmouth at the expense of the IEF budget. The well-designed system worked effectively and ensured the introduction of a number of teachers in the IEF, ready to prepare their training courses in English. For a number of reasons, unfortunately, this system is not yet in operation. But the results of the system have been extremely positive, and sufficient experience has been gained in this regard. It must now be institutionalized.

### ABSTRACT

*The article deals with the socio-economic situation in Turkestan in the late XIX - early XX centuries, taxes and their essence, types, economic and financial management system. It describes the socio-economic situation in the country in the first quarter of the twentieth century, including the pre-Soviet period and its early years, as well as the subordination of production to the interests of the Soviet regime and its early years.*

**KEYWORDS:** *Turkestan, Khanates, Russian Empire, Soviet Power, Chamber, County, Land, Property, Taxes, Farmer, Product, War, Economy, Finance.*

### INTRODUCTION

History has shown that in the early twentieth century, radical changes began to take place in the socio-economic and financial life of Turkestan. Such changes were especially directly related to changes in the political, administrative, economic system of the country. However, if we pay attention to the administrative division of the country, in accordance with the Regulation "On the management of the Governor-General of Turkestan" adopted in 1886, it included districts, volosts, village elders and aul communities [1906, 1910]. In the late 80s of the XIX century, the Governor's Office consisted of 5 provinces, 23 districts, which included many volosts. In general, by the first quarter of the XX century, the Governor-General of Turkestan was divided into five regions - Syrdarya, Fergana, Samarkand, Ettisuv, Caspian regions, regions into districts, districts into districts, districts into districts [2005. №3. S 75].

Along with the historically formed land ownership relations in the country, the active involvement of the administrative system of the Russian Empire in the economy did not go unnoticed in the socio-economic life of Turkestan. This undoubtedly led the empire to increase its sources of income and profit in the country. In this regard, before the establishment of Soviet power in Turkestan, the Russian Empire carried out a number of reforms to control the tax system and formed a number of financial structures. They were strictly under central control.

In particular, during the reign of the Russian Empire in Turkestan, there were special associations that directly supervised tax and financial issues, including the Ministry of Finance and the State Control Council, which were subordinated to the State Control Chamber (Gosudarstvennaya Kontrolnaya Chamber) and the State Treasury Chamber. 2005. №1, S 65-66]. The main task of the State Control and Treasury Chamber is to form the state budget, control the use and collection of taxes, revenues and other funds to the treasury, and has unlimited powers over them [2005 №1. S 66].

The State Chamber of Control performed administrative, budgetary and audit functions. It was established in Tashkent on the special instructions of the Turkestan Treasury Chamber and the Ministry of Finance. The Chamber had an office, treasury and inspection departments. It included 12 local treasury departments. Its chairman was a direct member of the Council of the Governor-General of Turkestan by participating in the resolution of certain issues related to taxes and revenues, revenues and expenditures [2005 №1. S 69]. In some cases, the central executive body of this structure worked with the Treasury Chambers of Omsk and Caspian regions [OP-1, D-99, L-10-11].

The receipt of taxes in the state budget was directly related to the activities of the Treasury Chamber, which operated primarily in the localities, ie in the districts. County administrations send information on relevant revenues, levies, and expenditures to the Treasury Chamber 2-3 times a month. All revenues, levies and receipts from local administrations were summarized on the basis of documents and sent to the Chamber of Control through it to the Ministry of Finance [OP-1, D-99, L-10-11].

In other words, the Russian Empire will begin a series of "reforms" in the field of taxation in the new capitalist relations. In particular, the economic oppression of the government will intensify under the pretext of the First World War and the Civil War. But when thinking about the socio-economic situation on the eve of Soviet rule and its early years, it is certainly appropriate to think about the First World War and its negative impact on the life of the country. Indeed, during this war, the situation in the country changed radically on the eve of Soviet rule. First the capitalist relations of production, then the process of building a society in accordance with the procedures of the socialist socio-economic system had begun. Especially during the war years and the civil war, the situation in the whole region became more tense, there were negative changes in the lifestyle of the population.

This led, first of all, to the deregulation of production, the aggravation of the economic and financial situation, the shortage of food and rising prices, the outbreak of various diseases, and the intensification of imperialist and Bolshevik oppression. According to sources, during the First World War, a pack of meat rose from 20 to 50 tiyins, a pack of sugar from 14-15 to 30-35

tiyins, and a pound of flour from 2 soums to 10 tiyins to 4 soums to 20 tiyins. Prices for cows and sheep have also risen. A horse for 50 soums was sold for 100-200 soums. The reason for the increase in the price of the horses was that they were sent to the front. Prices have risen frequently. A chit that costs 10-12 cents a gas, has risen to 30-40 cents. These prices have risen by 80-100 percent for food and 300-400 percent for fabrics [2019. №66. S 67]. The imperial authorities pursued a strict policy aimed at further oppressing the natives of Turkestan and making as much profit as possible for the needs of the war. This increases the anger and hatred of the local workers towards the ruling regime.

If we look at the numbers, at that time taxes were rising and the state of the tax system was getting worse. For example, according to the data, "the land tax collected in Turkestan increased from 6859021 soums in 1914 to 14311 771 soums in 1916, ie it doubled. The tax on artisans will increase from 1,149,676 soums to 2,839,240 soums. During the war, the Tsarist government imposed an additional tax of 2 soums 50 tiyins on a pound of cotton fiber sold at railway stations and piers [1993. S-146]. This brought even more disaster to the farmers in the first place.

During the war, the collection of various levies and taxes from the population increased. For example, in 1916, 3,360 horses and 119,640 soums were taken from the population of Namangan district, 4,325 horses, 200 hay, 178,656 soums from Skobelev (residents of Fergana. 302545 soums were collected from the population of Fergana region for war needs. In 1914-1916, 70,000 horses, 13,441 hay, 30,000 meters of felt, 300,000 tons of meat, 3 million pounds of cottonseed oil, 12,000 camels and other items were confiscated from Turkestan for "war needs." with in 1915 paid for a pound of cotton The average market price of 30 Uzbek soums to 24 soums reduced. This is serious effects on the financial situation of farmers by 1993. C-146-147].

As a result, protests among the local population have increased and strikes by workers of various enterprises have begun. For example, the strikes of workers of the Chelekan oil field and the Andijan cotton plant in 1915-1916, and in 1916 by employees of the Tashkent and Kyzyl-Arvat railway locomotive and repair enterprises are clear evidence of the deepening revolutionary process in the country [1993. S-146-147]

The specialization of the Central Asian economy in the cotton monoculture meant that the main economic sectors were tied to cotton. As the capitalist industrial products of the Russian Empire continue to dominate the Central Asian markets, the farms of local artisans, weavers, silkworms, blacksmiths, and others are in decline. Cotton planting has increased in the country, while the production of grain and other food products has declined. The imperial textile industry was supplied with cheap Turkestan cotton, where the purchase of cotton from the United States was restricted. As a result, the area under grain crops in Turkestan was reduced, the area under cotton in the country was expanded, the number of farms began to increase, and for many years they worked mainly for the benefit of the center.

During the First World War, on June 25, 1916, the decree of the Russian emperor was one of the terrible consequences of colonial policy. The Tsarist government, which feared a project to arm the "peoples of the periphery" and arm them, instead forced them to work hard behind the front lines to meet the needs of a bloody, unjust world war [2000. S-244-628]. The content of this

decree led to the spread of rumors among the local population that "the white king will be recruited for the war" or "will be recruited for the war."

Due to the war, from February 1917 the burden of taxation was aggravated by the interim government of the Russian Empire headed by Kerensky. As a result, the economic situation becomes more negative. Due to the relentless war and the ruined economy, the governor-general's income in 1917 was \$ 33.4 million. The deficit amounted to 65.6 million soums. soums [2009. S-133].

In difficult circumstances, ie in the early years of Soviet rule to restore the economy from the Civil War and the First World War, in particular, the Turkestan RKP (b), formed in October 1917, appealed to the RKP and the Finance Department of the RSFSR (Narkomfin) for financial assistance. However, they were told, "The property of all the rich should be confiscated and taxes should be levied on them. No support should be expected from the center." [2000. S-253].

The emergence of dual power as a result of the February Revolution of February 1917 also affected the economic and financial situation in the country. In particular, the events in Russia will affect Turkestan. On March 10, 1917, mass events began to be held in the cities of Turkestan in connection with the overthrow of tsarism. It was as if a large part of the people, who had just been formed and wanted to get rid of the Bolsheviks seeking power, even supported the fact that a revolution had taken place, that the old regime had been overthrown. For example, on March 11, residents of the village of Karabulak in the Syrdarya region sent a telegram to Tashkent: , we hope that there will be no taxes under the old system "[1993. S-132-133].

After the coup d'etat of October 1917, in the context of the Bolsheviks coming to power, improving the living standards of the population, first of all, providing them with food, became one of the most important problems. The government, under the slogan of abolishing private property, ending the wealthy class, and establishing equality in society, began to seize grain and other foodstuffs from the population (mainly the wealthy landowners).

As a result of these measures, in 1918 the food department of the Turkestan People's Commissariat was opened. To this end, on June 15, 1918, the Food Directorate was established to address food issues. However, the directorate operates without regard to local conditions. In one of his articles, M. Haydarov said, "... the directorate has made big mistakes in its activities. That is, the Muslim population expelled from power was also deprived of bread. As a result, the Muslim population, which could not escape starvation, began to die. There is an impenetrable wall between the new Russian city and the Soviet authorities and the local population living in it," he said [2003. №3. S-34].

Indeed, the introduction of a grain monopoly and food distribution has caused considerable discontent among local leaders and the working class, further exacerbating the living standards of the population. As a result, the government will be forced to loosen its financial monopoly on the tax issue for some time. In particular, cash taxes will be introduced only for the population living in cities and districts resettled from Russia, and for the population in rural areas, nomads and semi-nomads. According to researcher B. Isakov, cotton growers will be given some tax

benefits. Such a policy would, firstly, be aimed at strengthening the cotton monopoly in Turkestan and, secondly, at increasing the number of Russian farmers who had migrated to the country from Russia.

According to the author, by the beginning of the XX century alone, the number of migrants from Russia to Turkestan will exceed 197 thousand. Although they made up only 5% of the total population of Turkestan, they enjoyed tax benefits and owned 60% of the fertile land [1936. S 32].

Although there are separate Russian villages and towns for immigrants in the country, part of the displaced population is also housed in villages. In the Fergana region alone, 24,346 East Slavic people at that time lived in special suburban settlements, while in the cities their number was 14,722 [2011. S-87]. A large part of the population is also located in the villages of Semirechinsk and Syrdarya regions.

Taking advantage of this, the imperial government tried to allocate fertile land to Russian peasants by any means and increased land taxes, forcing the locals to sell their land. Such "vacant lands" were given primarily to retired soldiers, peasants migrating from Russia. For example, the lands seized from such settlements were 47,600 tanob in Syrdarya region, 75,000 tanob in Fergana region, 3,000 tanob in Samarkand region, and 7,000 tanob in Caspian region [2009. S-176].

Even those who were resettled had certain tax privileges in contrast to the indigenous peoples. That is, they were not taxed for a certain period of time. The government tried to absorb the idea that "it is not in the interests of the local population, as the settlers will settle on newly developed and vacant lands, while the local population will remain the full owners of the lands that fully meet their needs." However, this was not done in practice.

As a result, special taxes will be developed for people living in auls far from cities. For example, the "grass tax" levied on nomadic and semi-nomadic populations is not levied on their sources of income, but in most cases on the number of grains belonging to related species. In fact, as in the case of the settled population at that time, the nomadic volosts were divided into auls, which were divided into small (khutor) and large aul farms. Small auls consisted of 6-7 grasses, while large auls consisted of an average of 25-30 grasses, and in some cases 40-50 grasses. The population living in the villages is based on a certain ethnic basis, that is, on the principle of kinship. According to the administrative-territorial division of the country, the volosts consisted of 300-400 families (households or pastures), and the elders consisted of 100-200 households. [C-56-69] / As mentioned above, if we take into account that the collection of taxes is determined not by the total income of the grassland population, but by the number of grasses, it is not difficult to understand that "grassland taxes" are much higher for local herders.

On April 20, 1918, at the V Regional Congress of Soviets, the political and economic relations of Turkestan with the RSFSR were formalized and Turkestan was declared an autonomous republic within Russia. The adopted Constitution of the Turkestan ASSR gives Turkestan the right to set its own budget, set taxes and issue loans within the RSFSR [1994 / C 43-45]. However, the

situation with taxes in the country, as in all spheres, has not changed for the better in the context of the reconstruction of the economy, which has just emerged from the war and is in ruins. On the contrary, the sense of ownership of property, which had become a common way of life for thousands of years, began to disappear, and the property of the wealthy population, businessmen, and merchants began to be confiscated.

## CONCLUSION:

In conclusion, it should be noted that even in the remote regions of Russia, as a result of the decentralization of the economy, the labor company, the Bolshevik state and society, which were destroyed during the First World War and the Civil War, taxes and their types also increased. Because the only way out of the crisis was to solve the problem of finance and budget at the expense of taxes. In general, the socio-economic situation in the country in the first quarter of the twentieth century, including on the eve of Soviet rule and in its early years, was explained by the following important features:

First, due to the Soviet power and the socio-economic and political situation in the country in its early years, the economy of Turkestan, especially agriculture, underwent a huge crisis and conflict. The existing economic sectors proved to have served first in the interests of the Russian Empire and then in the interests of the metropolis and monopoly of the Soviet regime;

Second, taxes and levies from all branches practically did not allow the formation of an independent tax system and budget of Turkestan, as a result of which all taxes were managed centrally, first the Treasury Chamber of the empire and then the Soviet Ministry of Finance;

Third, after the establishment of Soviet power, the sense of ownership formed in the minds and lifestyles of the peoples of the country for many years began to disappear, the inviolability of foundation property, which was exempt from all taxes and fees, was completely abolished, confirming the introduction of taxes on such property.

### ABSTRACT

*The article is devoted to the problem of gaming activities in work with children of pre-school age. It reflects features of English language speech skills development through gaming activities. According to the characteristic age characteristics of pre-school children, the importance of using story-role play with pre-school children in the study of English is described.*

**KEYWORDS:** *Subject Role-Playing Game, Game Detail, Communication In English, Preschool Age. The Main Leading Activity In The Child 'S Life Is - The Game.*

### INTRODUCTION

K. D. Ushinsky wrote: "The game is a free activity of the child, and if we compare the interest of the game, and exactly the number and variety of traces stopped by it in the soul of the child, with similar influence of the teachings of the first five-six years, then, of course, the whole advantage will remain on the side of the game" [3, c. 11]. The game method is a way in which a child develops active speech, breaks down speech barriers. When pre-school children begin to feel comfortable in English classes, there is discomfort in front of the teacher and the child. They are interested, fun, funny to communicate with the teacher [5, c. 23]. As Grigorieva E. N. notes, Vanyushkin E. N.: "The game for a child is a research and creative activity, as in each child from nature there is an active activity and ability to self-realization" [1, c. 355]. In recent years, the problem of children 's play has been the focus of many research papers. In domestic psychology and pedagogy, the game is meant as an activity that is of great importance in the development of a child 's personality in pre-school age, when the pre-school student is in the world of actions, relations, tasks and motives of human activity (A. V. Zaporozhets, A. N. Leontiev, D. B. Elconin, etc.) [4, c. 103].

Teaching pre-school students English through gaming activities leads to communicative communication. Communication in English for preschool children should be motivated and targeted. It is necessary to create a positive motivation for the child to play. On several occasions, various pre-school institutions raised the question that playing activities do not reach a certain level and are gradually leaving the life of the child. Mostly children forget about story-role games in senior pre-school age [2, c. 152]. This is the age when a child begins to have a crisis towards himself. He begins to hesitate to speak to others or something wrong to say. At pre-school age, the development of the motor sphere of the child goes through certain stages: • The first stage - up to 1 year old - the child cannot predict the results of his actions; • The second stage - up to 2-3 years old - the child already has a preliminary visual image of the surrounding world, It is enough to remember how a child of 2 years of age jumps up to try something; • The third stage - up to the age of 4-5 - children arbitrarily control movements, Navigate in space when there are adults; • The fourth stage - up to 6-7 years - the child wants to feel space from several sides. Teaching English to preschool children is based on their age and psychological characteristics, namely: • rapid fatigue; • involuntary attention; • subconscious level of memorization. A child in pre-school age begins to get stuck in speech, to look clumsy when the speech is made wrong. During this period, in most cases, children have similar words in speech.

During playing activities children of pre-school age repeat after a companion, imitate adults, and to come up with something their own gives them harder. It is necessary to take into account all these age characteristics of organization of playing activities in teaching pre-school children English. We believe that the study of English is aimed at achieving the following goals: • ensuring the development of the child 's personality; • creating favorable conditions for early communication and psychological adaptation to the new language world and overcoming the psychological barrier in the use of English; • familiarizing with the world of foreign peers, children 's folklore, and artistic literature; • introducing new social experience using a foreign language. 415 The most basic task of teaching English to children is to develop children 's ability to communicate, both in their mother tongue and in English. When communicating with a child, personal qualities, expression of certain emotions, feelings are revealed. One of the main components in teaching children English is speaking. After all, it is with speaking that children are taught English, not reading and writing. And without the ability to speak it is impossible to communicate, to use the acquired knowledge in English. In the "Child Development Center - kindergarten № 134" Pearl "of the city of Cheboxary there are classes in English, where they work under the program of Yu. A. Komarova" English for pre-school children. " The purpose of English language classes is to create favourable conditions for children to acquire English as a means of developing children 's speaking, extensive interaction with the environment. During the class, educators play various games in English with their children. Various soft toys come to the children of the older group.

At the beginning of the class the teacher uses a surprise moment, someone knocks on the door, and welcomes the children together with the funny toy "Cheeky Monkey," further children together with the teacher turn into musicians and perform the song: Good morning, good morning, Good morning, to you. Good morning, good morning, I am fine. How are you? On the way, the children "disappear" their fingers and they all quickly find them, remembering how the numbers in English will be pronounced. So do they play the game "Who is it?" - "This is a cat, this is a dog, this is a frog, this is a car, this is a Cheeky Monkey and etc." Children turn into

violinists and sing words, at first quiet, then louder. Most of all, children like it when various animals come to them, when they disappear and manifest themselves. At the end of the class the teacher is interested in the children, what they remembered this occupation, and they receive for hard work stickers. But from time to time there are certain problems in organizing playing activities in English with pre-school students: • children are shy to say words, doubting the correctness of their pronunciation; • children know the correct answer, but are afraid to say it before comrades. These problems were solved by us in various ways. The main goal we set for ourselves in classes in English with up to 416 schoolchildren is to form a feeling of "motor joy" in the child, to connect his positive emotions with the class in English. The child has a natural biological need to play, and it is very important that the child remains in motion. If during the class the child is only engaged in sitting mode, he becomes bored, he will start jumping out of the place, interfering with other children. Therefore, the more creative the teacher in terms of planning the game activity in the English language class, the more interesting the child to be engaged in.

Creativity can also apply to parents. They can diversify a child's favorite game by introducing some new elements into it. It will be easier for a child to remember words-designations in English, for example, to show a spout, cheeks, eyes as he did, saying words in his native language. English for children will become closer and clearer if you call the items around it at home: toys, clothing or interior, various products and dishes. As we can see, teaching English at pre-school age contributes to the harmonious development of children - intellectual, social, moral. Through English classes in pre-school institutions, children are expanding their outlook and acquiring the new skills needed to continue their English studies in school. Summing up the above, it can be concluded that in teaching pre-school children English should take into account the age, physiological and psychological characteristics of children. It should be remembered that language is a means of communication and it is important to know that we form communication skills in pre-school children.

### ABSTRACT

*This article deals with the peculiarities of personal pronoun in English. Moreover, the investigation has been held on this topic, as well as, the semantics of personal pronoun have been identified with its combinability.*

**KEYWORDS:** *Personal Pronoun, Semantics, Combination, Characteristics, Research, Grammar Works*

### INTRODUCTION

Many researchers note the specificity of the semantics of the personal pronouns of modern English. The words I, you, he, she, it, we, they are deictic in nature, i.e. they show a meaningful dependence on the situation of speech, outside of which their meaning is vague and unclear; Are constantly related to the subject of speech; Allocating external objects not on the basis of their own characteristics independent of the speaker, but on the basis of their random relationship with the speaker; Their relevance is instantaneous and ephemeral and varies from one case of use to another.

So far, however, researchers have not gone further than pointing to these features. The semantics of personal pronouns taken in isolation, regardless of their combination, were studied. The connection of information about the combination of personal pronouns allows to reveal new features of their semantics.

The question of the combination of English personal pronouns still remains completely uncharted. At best, grammar works indicate that personal pronouns are not among those pronouns that are able to act as the main components of phrases. Meanwhile, it is worth taking a

careful look at the syntax behavior of this small group of words, as information about the syntax of personal pronouns undoubtedly helps to better understand the specifics of their semantics and the role in the polyfunctional development of the text.

First of all, the extremely low activity of personal pronouns draws attention. In the frequency scale of phrases of different digits, phrases with personal pronouns take the last place after phrases with uncertain pronouns, not to mention substance, verb, adjective phrases.

What to explain it with? Is this feature in conflict with the features of the semantics of personal pronouns or only confirms it once again?

Let's compare offers:

“What do you want?” old Tom mumbled. He wore a black slouch hat ... [109, p.195].

Two rangy shepherd dogs trotted up pleasantly, until they caught the scent of strangers ... [109, p.196]. old Tom two rangy shepherd dogs he they Updating of values of nouns of Tom, dogs is carried out in the considered offers through their syntactic activity by accession to these words of the dependent old components (old Tom), two rangy shepherd (two rangy shepherd dogs). Relevance of personal pronouns of he and they comes to light differently, only by means of the instruction, reference to the previous text, to an antecedent: he → old Tom; they – the two rangy shepherd dogs.

Thus, the syntax activity of personal pronouns is not due to the need to update the meaning of the personal pronoun similar to that of nouns. The main actualizer of the meaning of personal pronouns is the antecedent in context. Updating the meaning of personal pronouns through their syntax activity - side, auxiliary, secondary. There is a close mutual agreement between semantics and syntax behavior of personal pronouns.

Since synthetic activity of personal pronouns plays only a secondary role in updating their values, phrases with personal pronouns in their mass do not differ in structural diversity, and the amount of additional information carried by components attached to personal pronouns is very small.

Personal pronouns I, you, he, she, it, we, they can enter into both a compositional and a subordinate relationship with other components. The occurrence of compositional and subordinate phrases with personal pronouns is approximately the same.

Within writing phrases, English personal pronouns tend to be right-handed active. In this respect, they behave in the same way as nouns and undefined pronouns like someal, nothing. Postpositive models, i.e. models in which the personal pronoun joins other components on the right, in postposition, are 6.3 times more common than prepositive models.

In modern English, personal pronouns with right-hand writing connections are found in the following models:

Personal pronoun noun

George suddenly realized that he and the waiter were potential enemies [109, p.237].

Personal pronoun noun in opposition

We artists were both mad and amused [108, p.271];

Personal pronoun (personal or undefined)

He had no idea I or anybody was near [106, p.287];

Personal pronoun noun

“You didn’t even see him?”

And the sheriff told that too-how as he and the deputy and Flint stood on the gallery, they suddenly saw the old man looking out at them through a window... [108, p.162];

Personal pronoun group numeral

He went to the bedroom where he and two of the children slept and shut the door behind him [109, p.218];

The pretext of the personal pronoun noun

I came to know if you’d dine with me and Reggie to-night [106, p.270];

The pretext of personal pronoun the pretext of noun

They could see her hands holding to the window bars and a lot of them stopped along the fence, listening to her and to the jailer trying to make her atop [109, p.279] ;

The pretext of personal pronoun

The very rich are different from you and me [109, p.244];

The pretext of personal pronoun the pretext of pronoun

My father. I don’t know what he’ll do to me or to you either... [106, p.85].

The occurrence of all described combinatorial possibilities is very uneven. Among postpositive writing phrases, the most characteristic is the sequence "personal pronoun noun" like he and Ada and appositive phrases like we artists. They are 2.3 times more common than all other phrases combined. Of the low-frequency more common than others is the sequence "personal pronoun" type he or and "pretext personal pronoun noun" type for me and my family.

We have already noted that the role of components attached to personal pronouns as actualizers of the meaning of these pronouns is insignificant, hence the poverty of the additional information they carry. Against the background of this general pattern, the relationship between the value actualizer and the amount of additional information is mobile.

### ABSTRACT

*This article is based on theoretical and practical methods of organizing integrated learning technologies in language teaching. The role and importance of travel lessons in the organization of integrative lessons are illustrated with vivid examples. The author explains how to organize travel lessons step by step. Learning foreign languages and at the same time having knowledge about each country will give future students an advantage in conversations with foreign colleagues, adherence to the norms and rules of etiquette of a particular country. The works of fine art are based on exemplary ideas that the organization of trips to the museum will further develop students' interest in language learning. It was noted that it is important to educate students to be broad-minded and spiritually mature through the organization of travel lessons.*

**KEYWORDS:** Integrative Approach, Miniature, Exhibit, Travel, Communication, Technology, Monograph, Graphic, Consistency, Literary Heritage, Art.

### INTRODUCTION

In recent years, special attention has been paid to combining several disciplines to achieve consistency in a comprehensive education system. Such cases are especially noticeable in the process of teaching foreign languages. The concept of "foreign language" can be interpreted as follows: the methodological term "learning a foreign language" refers to the acquisition of speaking, listening, reading and writing skills in this language. [1] As part of the educational process, teachers and methodologists are actively working to create a concept of education based on interdisciplinary links, the main purpose of which is to increase the effectiveness of the educational process. One of the modern approaches is to promote different models of integrative

education, so that teachers try to find common ground on different topics, so that students can use the knowledge gained in one subject in the study of other subjects, and the learning process is more effective for students. rich in information, simple and interesting. All this allows to generalize and systematize the learned language experience, to make it more complete in terms of the education system. In solving the problems of interdisciplinary integration, it is necessary to take into account the problems of integration, which may be logical sequences within the topics. In the process of language teaching, it is necessary to establish a number of links between the components of the learning process that directly affect the consistency and quality of education, with the correct organization of lessons. Language is a means of knowing existence rationally, logically. Only with the help of language units and forms in the process of learning generalization, discussion and conclusion of the concept is carried out. [2] In the process of reading and discussing texts on language learning, conversations with the teacher, native speakers during meetings and excursions. The main part. We would like to talk about the role and importance of travel lessons in the organization of integrative education. In the process of extracurricular activities, one of the travel lessons in the museum will be meaningful and interesting, complementing the lessons in the classroom, enriching the imagination of students. Such lessons will remain in the memory of students for a long time, and their value in developing the culture of speech and broadening their worldview is immeasurable. The content of the use of an integrative approach in the classroom is based on the idea of working as a whole in the classroom, involvement in the teaching process, collaboration, comprehension. [4]. In particular, by combining foreign languages and mother tongue subjects in schools, students' interest in these subjects can be maintained and even increased. One of the necessary aspects to be considered in a lesson with an integrated approach is the use of didactic materials. The use of research in the teaching process, which is characteristic of an integrative approach to language learning, plays an important role in increasing the enthusiasm for language learning. Through the use of language-oriented, didactic resources in foreign language lessons, students gain a broad knowledge of the country in which they are studying. This is one of the integrated methods of teaching. Integrative approach expands the communicative features of the student. In such situations, it is easier for them to interact with themselves and those around them. Sources specific to the arts and culture give learners an inner desire to develop their lexical and grammatical skills in the classroom. Therefore, research should serve to satisfy the desire to learn a language and increase the demand for its acquisition. We express this as follows: 1) The demand for learning a foreign language; 2) Have a general idea of the country where the language is studied; 3) The level of activity of language learners; 4) Analysis of all studied data. We will continue to focus on our cultural and spiritual heritage. The exposition of the AlisherNavoi State Museum of Literature in Tashkent fully meets the requirements of the secondary school curriculum. In the museum you can study the life and work of the writer on the basis of rich evidence. In addition to listening to monographs in the native language under the guidance of a teacher in the museum, students get acquainted with the rich literary heritage, art and culture of our people. The teacher plans to hold the lesson in the museum. Special attention is paid to extracurricular and extracurricular activities, conferences on the life and work of the writer, creative meetings, summarizing the results. They translate words and phrases based on the knowledge and skills they have learned in English. Students expand their knowledge of their native language, English, literature, and geography at the same time. We consider the use of museum materials in the study of the life and work of AlisherNavoi below, so that the reader has

a comprehensive understanding of the works of great poets and thinkers. When the students are informed about the life and work of the poet, the museum's traveling conversation gives good results: in this case, he presents the material in a consistent monograph on the basis of exhibits. The teacher can also present the materials to the students on the basis of the demonstration method. In this case, the teacher must be well acquainted with the materials on display in the halls of the museum, or come a few days in advance and get acquainted with the materials about the author. For the lesson to be meaningful, the teacher should take the following measures:

1. Determining the topic of the lesson.
2. Selection of concrete examples, exhibition materials that reveal the content and essence of the topic.
3. Creative use of additional materials.
4. Defining the methods and techniques used in the lesson.
5. Determining the content and purpose of the conversation with students.
6. Interpretation of works of fine art.

The second floor of the museum is dedicated to the works of AlisherNavoi. It contains miniatures of the poet's life, his childhood, adolescence, the beginning and maturity of his work, as well as exhibits, manuscripts and books dedicated to his socio-political activities. Among them are unique manuscripts in the form of miniatures by famous artists of the East, painted by famous calligraphers of different periods, portraits created by various artists, graphic works. Before the lesson in the museum, the teacher announces a plan on "Life and creative activity of AlisherNavoi", then students are invited to the exhibition hall. Exhibitions of the XV century, Alisher's youth, the general image of the city of Herat, the cultural center of the XV-XVI centuries, the map of the cities where AlisherNavoi lived, studied, worked, the state of reading of the madras a student-Alisher, Navoi the opinions of his contemporaries, the opinions of Navoi about them, the written sources. The teacher briefly describes the period of AlisherNavoi's life. In this case, the important features of the Navoi period are revealed. Then the conversation about the poet's biography will continue on the basis of pictures depicting Navoi's childhood and school days. Explaining the life and work of Navoi on the basis of museum equipment, the teacher can effectively use school exhibitions, works of fine art and M. Mirfayozov's album about AlisherNavoi. At the end of this lesson, based on the museum exhibits and observations, write an essay at home on such topics as "Childhood and adolescence of AlisherNavoi", "Navoi in Samarkand," Navoi in construction ", " Navoi people's caregiver ", " Navoi's image " handed over. In such cases, the connection between the study of language and the science of literature and technology is significant. Because in literary works the ideas of labor education and diligence are blown. Giving students information about the plate for reading books, he spoke directly about the creative work of our scholars, such as Nizami, Al-Khwarizmi, Abdurahmon Jami, Lutfi, AlisherNavoi, Mukimi, Furkat. It is worth mentioning that they read the book using a device, ie a plate. It is worth mentioning that the poet Hisrav, in addition to being a famous poet, was a skilled carpenter. In this regard, the role of folklore is invaluable. Here it is necessary to cite the following folk proverbs: "Seven measures, one cut", "Unplanned work without bricks", "Don't count eight" and others. Works of art for reading at home should be recommended to students to check the results and help them to develop such qualities as love for

work, respect for work, a conscious attitude to work, the pursuit of creativity. Each subject has its place in language learning. Along with all subjects, the use of works of fine art at school is an important factor in educating students in the spirit of beauty, in the spirit of understanding the subtleties of art, ideological and aesthetic content from an early age. These classes also help students to understand the interrelationships and characteristics of the arts. To consolidate the knowledge gained in all subjects, the teacher plans to organize another trip to the museum with his students. The museum is preparing to hold a seminar on "Study of the life and work of Alisher Navoi." A. Abdullayev, Ch. Akhmarov, Uzbek artists using the paintings of Alisher Navoi and M. Mirfayozov's photo album "Study of the life and work of A. Navoi at school", booklets about the life and work of the poet. Portraits of V. Kuznechov, A. Rozibaev's brush, miniatures from the album "Miniatures of Alisher Navoi's works" compiled by the late professor H. Sulaymonov, miniatures of Navoi's works will be presented. This research course is of particular interest to students. The teacher also gets acquainted with the exhibits of the museum and develops methods and techniques to explain it:

1. Lesson topic: Life and creative activity of Alisher Navoi.
2. Educational purpose of the lesson: To explain to students the life and work of Alisher Navoi through museum exhibits.
3. Educational significance of the lesson: To educate students in the spirit of love for aesthetics, culture and art through this lesson. This will increase students' interest in the visual arts and strengthen their understanding.
4. Classroom: Use of museum exhibits to reveal the content and essence of the topic.
5. Additional materials: Fiction and methodical literature to help understand the works of fine arts.
6. Method of the lesson: Demonstration method.
7. Determining the content and purpose of the conversation with students: a) What works of art do you know about the life and work of Alisher Navoi? b) What can you comment on the miniature? Q. What works of art can you comment on? We believe that students will answer these questions based on their own ideas. A student who is able to feel the integration of sciences, that is, a special understanding of the works of literature and fine arts, will try to answer these questions in full. Commentary on works of fine art. Teacher said that, Alisher Navoi begins his biography with an introductory speech. He noted that he was at the peak of the literature of the twentieth century, his work in the literary, socio-political spheres, his love for music, fine arts and architecture, his upbringing brought up famous artists, calligraphers and architects. The focus is on a photo of the city of Herat. Before their eyes was a huge city connected to wide horizons. The teacher showed a portrait of Abdulhaq Abdullayev "Navoi" without referring to the illustrations showing that Navoi was born in this city on February 9, 1441. Children immediately recognize the image of Navoi, depicted on the background of the wide streets of Herat. The teacher draws the students' attention to the portrait of Alisher Navoi, a 16th-century brush by Mahmud Muzakhib, a student of the famous artist Kamoliddin Behzod. Then the teacher comments on the portrait of A. Abdullayev "Navoi" as follows: "Students, if we look closely, we see that it is very similar to the image of Navoi, which you see now, that is, Mahmud Muzakhib. His expression is thoughtful, deep and wise. The artist's skill is that in order to show his

greatness, the breadth of his creative potential, he portrayed him with his whole body against the background of the vast horizon of Herat. Look, those low houses and high madrasas seem to be approaching us from those streets of Herat, passing by us innocently. He frowned and stared ahead, as if to tell us something. Then the teacher said that the portrait of Mahmoud Muzahhib was from the 16th century and that the original was kept in the Astana Kurs Library in Mashhad, Iran. Then the teacher talks about the poet's youth and comments on such paintings as "Nazarov's meeting with Ali Yazdi", B. Boboyev's "Navoi and Hussein Boykaro at school". In order to highlight the friendship and creative cooperation between the teacher Navoi and Jami, ChingizAhmarov's "Navoi and Jami" miniature depicts a green hill and flowers, the roof of the altar against the background of a tree, two people on the carpets in front of a two-story door - Navoi and Jami. Jami is talking. The image of Ch. Akhmarov is artistically designed. Pencil, book, pen and writing paper on the table. The walls of the room are decorated with beautiful carvings, bookshelves. Navoi wore a sleeveless cloak over a yellow tunic, a compact white beard with a white turban. She is reading the book with pleasure to her teacher Jami, with determination in her face. Jami, a white-bearded man, listens to Navoi's words with pleasure. Respect for Navoi, kindness and satisfaction are shining in his eyes. Talking about Navoi's life in Astrabad, the teacher showed the children the feeling of longing for his hometown of Herat and showed the children a picture of "Chain Poem". The words "Zanjirbandsheir, yenaman der" from Uygun and Izzat sultan's drama "AlisherNavoi" will be the basis of the conversation. Students comment on the content of the picture. In the picture, the teacher says that Navoi symbolically chained his powerful poem to Astrabad by Hussein Boykaro. Then you are given the task to draw a picture of a lion based on this picture, to write sentences that correspond to the content of the picture. At the end of the lesson, the teacher tells about the life and work of AlisherNavoi, which is very complex and multifaceted. "AlisherNavoi's goal in writing five Uzbek-language epics" Khamsa "was from a young age. He achieved this goal in 1483-85.

The work spread the fame of Uzbek literature and became one of the masterpieces of world literature. "[3] Such travel lessons organized by teachers in museums play an important role in strengthening students' knowledge and instilling interdisciplinary connections in the minds of students. To reinforce the museum's travel lesson, please refer to the small text of The Natural History Museum in London in the Traveling section of the 7th grade English textbook to keep students informed of additional literature and manuals. focus on the rib exit. We develop students' perceptions of museums through this topic: In 1905 the best known dinosaur's skeleton appeared there. This dinosaur is called Dippy. This dinosaur is known as biggest in the world. The skeleton is 26 meters long. There are other types of dinosaurs, especially the popularT rex. Here are stuffed birds, with the extinct dodo bird. Every year the museum has new exhibitions as some events like the favorite "Wildlife Photographer of the Year" and butterfly house, "sensational butterflies". You can visit the museum after hours including movie nights, monthly late openings and the chance to sleep at the Museum with Dinosaurs. [5].Based on the integrative approach, students are asked the following question. Why do people travel? Students use the following phrases to answer. to discover new places; to see the sights;

To meet people;

To know the history, culture-to study history, culture;

To learn a language;

To visit new places;

to know customs, traditions- to study customs, traditions.

It is both a museum and the place where scientists work. It is a beautiful building. There are 80 million things in the Museum and Darwin Center. This means that students' independent thinking and active participation in the learning process are enshrined in state law. Particular attention should be paid to the age, physiological and psychological characteristics of students, including their abilities and talents. Based on the requirements of the Law "On Education", it is necessary to meet the following social requirements for education:

- to show the role and importance of our rich pedagogical heritage of the distant and recent past in the theoretical and practical development of pedagogical science; Formation of patriotism and national pride in students in English classes, directing them to independent and creative thinking with the help of various methods and tools of pedagogical analysis;
- Achieving conscious mastery of pedagogical knowledge of students as a subject of education;
- using new pedagogical technologies, in particular interactive teaching methods, to make each lesson a much-anticipated and fun activity for students;
- Strengthening the pedagogical skills and competencies acquired by students through various methods of assessment and control; focus on solving pedagogical and educational problems to improve the learning process of students in a logical sequence, based on the latest achievements of science;
- to create an integrated system of monitoring and evaluation of students' knowledge, skills and abilities in English lessons on the basis of test assignments,
- Development of key criteria;
- The basic concepts described in English lessons, the achievement of clarity of definitions, etc. form the socio-humanitarian democratic basis for the teaching of English in secondary schools on the basis of research problems. Independent study of students in English language classes is strengthened by legal and regulatory documents. Textbooks, manuals and other didactic resources are aimed at fulfilling a specific task in the education of students within the framework of State educational standards. The manuals are intended for teachers and contain recommendations on the purpose of the lessons, teaching aids and methods of use, the content of the lesson, practical exercises, additional assignments and more. For example, O.Madaev's methodical manual "How to write an essay" [7] shows the importance of essay types in the development of students' written speech on the basis of essay analysis, K.Yuldashev's "Teacher's book" methodical manual sample analyzes of works were carried out, the database is created on the basis of capabilities and means of computer technology, created in static and dynamic mode, equipped with sound and color images, contains a large amount of information, which can be presented in various forms (tables, diagrams, histograms, text, pictures, etc.). , go through a state list of important, widely used, widely used for independent study and control of their knowledge in the learning process An data set. Dictionaries are a set of second-language alternatives of words or terms in the alphabet in certain areas of language or science, which require extensive use in the process of working on questions and assignments. For example, H.Homidiy, S.Ibrahimova, M.Akhmadbaeva's "Dictionary of pedagogical terms", B.Sarimsakov,

N.Hotamov's "Russian-Uzbek concise dictionary of pedagogical terms" grammatical, etymological and scientific-scientific definition of pedagogical terms. given, examples of their application, information that such dictionaries can be used effectively as additional pedagogies in the lessons on working on the text.[6].

The digest opens the way to the use of the Internet on the basis of new pedagogical technologies as a collection of data, which provides a summary and commentary on the content of periodicals. Electronic literature is intended for the use of computer-based teaching methods, independent learning and effective learning of scientific teaching materials, scientific information, which are reflected in the following forms:

- Educational and scientific materials only in the form of verbs;
- Learning materials in the form of verbal (text) two-dimensional graphics; rotated) applications, i.e., data in three-dimensional graphical form, in the form of audio, video, animation, and partially verbal (text); Educational and scientific materials only in the form of verbs;
- Learning materials in the form of two-dimensional graphics;
- "Multimedia" – (multimedia) manuals, data in three-dimensional graphic form, audio, video, animation and partially verbal (text); It is necessary to form the process of pedagogical education on the basis of joint activities of teacher and student and their full support by students. Questions and assignments in textbooks are used as a scientific and didactic source to meet these requirements. At the stage of general secondary education, the mental and physical characteristics of students do not allow them to exaggerate. At the same time, if spiritual virtues, beautiful human deeds are shown as direct examples and instilled naturally in the souls of students without being imposed on them, these virtues and deeds can become an integral part of the nature of youth. We will discuss about traveling lessons again: “When you are in Samarkand, you will see visitors visiting ancient monuments, listening to their guides, writing something, photographing some cameras and cameras. And then I come up with a question: What is the beauty of this ancient young town? Isn't this elegant, charming force embodied in historic monuments, the inimitable beauty of diverse, unique architectural ensembles? Yes, it is, of course. Because they have marble, ornaments, gilt and adorned brick ornaments, and the unique artifacts created by the history. Foreign visitors are a treasure trove of ancient architecture. Another pupil writes: "I always look at the historical monuments. Watching the Khiva Panorama over the walls of the archipelago makes me very excited. Do you not see the high ceilings of the sky, the magnificent minarets, and the dome decorated with tiles made of gold? They are both beautiful and thought provoking. Each monument has its own history and details. The history of the construction of the Sherguzy, built in the first quarter of the 18th century in Khiva, is also tragic. The construction of this madrasa takes thousands of centuries. Slaves were promised freedom after the madrasah was built. But they did not expect the slaves to survive and free them because of the difficult conditions at work. One day, when a Sherhon construction site came to life, it was murdered, the uproar broke out, and even the central part of the city. Then the uprising will be cruelly suppressed. A new khan will be sitting on the throne of Khiva and the madrasah will continue to be built. enough. Just as the spiritual qualities formed during this period accompany children for a lifetime, the loss of such opportunities can be costly later. Therefore, the formation of children's personality traits in this period is one of the most important tasks of national education. At the stage of general secondary education, the mental

and physical characteristics of students do not allow them to exaggerate. According to the methodological analysis, the following issues are considered in the development of students' learning activities:

- Full mastery of the content of the studied topic;
- Use of visual aids according to the content of the topic; -
- determination of students' knowledge and understanding;
- Age and individual characteristics of students, and interest in the subject;

## CONCLUSION

When building phrases, students rely on their knowledge of the native language. In this process, students get acquainted with the nature of our country, look at the past and present of our people, as well as develop the ability to think in English, organize history through language skills, feelings of preservation of our spiritual and cultural heritage.

### ABSTRACT

*The article was written by foreign and local economists. the need to ensure the quality of asset portfolios of commercial banks to ensure their financial stability and liquidity. The main use of the conditions of Uzbekistan directions illuminated.*

**KEYWORDS:** *Asset Portfolio, Net Profit, Investment, Credit, Deposit Base, Subordination, Capital, Financial Ratio, Small Businesses, Deposit Base.*

### INTRODUCTION

In Uzbekistan, commercial bank loans are also considered an important factor in economic development. "The expansion of lending to promising investment projects, small businesses and private entrepreneurship was recognized as a necessary condition for ensuring the stability of macroeconomic growth" [1]. However, there are problems with improving the quality of the asset portfolios of commercial banks in the country. In particular, the issue of resource support for long-term bank loans has not been resolved. "Although 70 percent of bank deposits are short-term, 90 percent of loans are long-term given "[2]. Also, the risk of transformation in the country's commercial banks has increased. In addition, investment operations with securities of commercial banks in the country are underdeveloped. "Today, the share of commercial banks' investments in securities in gross assets is only 1.1%" [3], and this indicator indicates the underdevelopment of banks' investment operations with securities. In this regard, it is important to improve existing legislation.

---

## ANALYSIS OF LITERATURE ON THE SUBJECT

Certain theoretical and practical issues of improving the quality of asset portfolios of commercial banks were identified by foreign economists - J. Sinki [4], W. Soto [5], T. Mazurina [6], M. Matovnikov [7], S. It was studied in scientific the works of Moiseev [8], G. Panova [9], O. Blanchard [10], Yu. Morozkin [11], H. Markowitz [12] and others.

L. Muradova, an economist from Uzbekistan [13], M. Muminova [14], H. Otamurodov [15], A. Boimuratov [16], A. Omonov [17], I. Alimardonov [18], F. Kholmammatov [19] studied the specific aspects of improving the quality of portfolios of assets of commercial banks.

The issues of improving the quality of loan portfolios and securities portfolios of commercial banks around the world, in particular, ensuring a balance between loan yield and risk level, ensuring the optimal ratio between investments in highly liquid securities and corporate securities, are studied on a scientific basis.

## ANALYSIS AND RESULTS

Foreign economist prof. J. Sinki studied the issue of improving the quality of the loan portfolio of commercial banks and formulated a number of important conclusions and recommendations. He came to the conclusion that the analysis of the cash flow of the borrower plays an important role in reducing credit risk and is one of the necessary conditions for ensuring the quality of the loan portfolio. At the same time, the analysis of the client's cash flows should allow finding answers to the following pressing questions:

- Is the client's net profit sufficient to pay the current portion of his long-term debt?
- how much money does the company receive?
- How does the company finance its activities?
- The current state of the company is determined by what management actions or what external influences.

This conclusion by J. Sinki is important for the banking practice of Uzbekistan. This is primarily due to the low level of money supply in the country's economy, which impedes the stability of cash flows of business entities. As of January 1, 2019, the level of monetary support for the economy of the Republic of Uzbekistan was only 20.5% [20]. This is a very low indicator (in countries with economies in transition, the average is 40-45%). Secondly, the relatively high level of inflation and devaluation in the country negatively affects the stability of cash flows of customers of commercial banks.

According to Huerta de Soto, firstly, lower interest rates on loans from commercial banks will turn previously unprofitable investment projects into profitable investment projects; secondly, financing of investment projects by banks at the expense of loans not secured by voluntary funds, which ultimately leads to the disruption of investment projects and non-repayment of loans.

The above opinion of W. Soto is based on the results of his many years of research and is of practical importance. However, he did not investigate the possibility of lowering interest rates on loans from commercial banks in the face of relatively high inflation. However, interest rates on loans from commercial banks are the main factor determining the level of use of loans by legal entities and individuals.

According to T. Mazurin, for the development of lending to the real sector of the economy, the following conditions must be created:

- the state has an effective investment and industrial policy to be;
- risks associated with the implementation of investment projects which reduces the level to develop investment infrastructure;
- increase the investment attractiveness of enterprises.

This conclusion by T. Mazurin is important in terms of improving the quality of the loan portfolio of commercial banks. Because the quality of the loan portfolio directly depends on external factors, in particular, on the investment and industrial policies of the state and the level of risks associated with financing investment projects.

According to Matovnikov, the main obstacle to improving the practice of long-term lending to commercial banks is the lack of long-term resources in banks. A simple and realistic way to solve this problem is to obtain a loan from the Central Bank secured by liquid assets.

M. This conclusion by Matovnikov is refuted by the conclusion of S. Moiseev. He concluded that obtaining resources from the Central Bank by pledging liquid assets by commercial banks was not relevant to Russian banking practice. This is due to the fact that the presence of the Stabilization Fund in Russia does not force the government to increase the volume of public debt by issuing securities.

The Fund for Reconstruction and Development of the Republic of Uzbekistan is allowed to be used as a resource for loans from commercial banks. However, the fund's resources are used to finance large investment projects of strategic importance to the country.

According to G.S. Panova, to increase the ability of banks to provide loans, first of all, it is necessary to ensure the adequacy of their deposit base. At the same time, in order to ensure the adequacy of the deposit base of commercial banks, it is important not to allow the share of transactional deposits in gross deposits to exceed 30%, to introduce restrictions on the loan-oriented part of deposits based on German banking practice. In Germany, 60% of term deposits and 10% of transactional deposits go to credit operations.

This conclusion of G. Panov is of great importance for the banking practice of our republic. This is due to the fact that the country's commercial banks do not have restrictions on the share of transactional deposits allocated on credit. However, transactional deposits are unstable liabilities, and loans are high-risk assets.

According to O. Blanchard. The central bank influences the interest rate on loans through monetary policy and thus regulates the demand for money and money supply.

Blanchard's conclusion is of great practical importance for developing countries, including Uzbekistan. In particular, in 1980, in the United States, the Federal Reserve raised interest rates on loans by reducing the supply of deposits in the banking system by selling government securities based on repos. As a result, the growth rate of the money supply in dollars slowed down.

According to Yu. Morozkin and E. Svistunova, in the conditions of dynamic changes in the stock market, the formation of an optimal portfolio of securities is not always enough. In this context, a commercial bank will need to develop an improved strategy for building a portfolio of securities.

Management allows you to make adjustments to the portfolio of securities based on monitoring of one or another factor, which allows you to draw conclusions about the situation in the stock market. This makes it possible to make modern and clear decisions on investment strategy and portfolio composition.

This conclusion is important for banking practices in developing countries. This is due to the fact that high inflation and the devaluation of the national currency, the instability of financial legislation exacerbate the dynamic changes in the stock market. Moreover, the high probability that investments in securities denominated in the national currency will lose value under the influence of inflation and devaluation contributes to the growth of uncertainty in the stock market. In developed countries, the problems of inflation and devaluation do not currently exist.

Portfolio theory H. Markowitz is widely used in banking practice in developed countries, in the formation of the securities portfolio of commercial banks.

According to the theory of H. Markowitz, one of the mistakes that can be made is that the investor always provides a portfolio that provides low risk with an acceptable level of profitability or high profitability with an acceptable level of risk. To avoid this error, the investor should choose a portfolio in which the expected return cannot increase without increasing the risk, or, conversely, the risk should not decrease without increasing the expected return.

According to the Uzbek economist L. Muradov, it is necessary to increase the level of diversification of the loan portfolio of commercial banks by setting industry lending limits that impose restrictions on lending to certain enterprises, which make up 25% of the loan portfolio of commercial banks.

In our opinion, this conclusion by L. Muradova is of great practical importance for the banking practice of Uzbekistan. Because all the major commercial banks in the country do not provide a level of diversification of the loan portfolio. However, L. Muradova did not justify the possibility of ensuring a 25% diversification of the loan portfolio of commercial banks by industry, given the growing specialization of commercial banks in the country.

M. According to Muminov, “streamlining the organizational structure of banks, improving incentives for managing the bank from shareholders, in particular, large customers, as well as using strategic planning methods when introducing new regulations in the banking system, thereby reducing the risk level of the bank. protection is appropriate. ”

M. In our opinion, there are some aspects of Muminova’s proposal that need to be clarified. First, the procedure for implementing the proposed incentive mechanism in bank management is unclear; secondly, it is unclear which new regulatory documents to use in the banking system and which strategic planning methods to use.

According to Otamurodov, one of the ways to improve the management of the loan portfolio of commercial banks is to balance the credit potential and structure of loans.

In our opinion, this proposal of H. Atamurodov is not sufficiently substantiated. Because, firstly, there is no information on indicators characterizing the ratio of loans to the credit potential of banks (the dissertation abstract does not contain such information); secondly, there is no justification for the problem of ensuring a balance between the credit potential and the structure of loans in commercial banks of the Republic of Uzbekistan.

According to Boymuratov, in order to strengthen the resource base of commercial banks engaged in agricultural lending, it is necessary to increase the volume of bonds issued by them by more than a year and exempt investors from income tax on these bonds.

In our opinion, A. Boymuratov considered the issue of eliminating the risk of transformation, which is one of the most pressing issues related to improving the quality of the loan portfolio of commercial banks. Insufficient long-term resources required for long-term loans in the country's commercial banks have led to a deepening risk of bank transformation.

According to A. Omonov, it is advisable to increase the stability of their capital base and the size of the long-term resource base by including subordinated debt in the secondary capital of commercial banks.

A. Omonov proposes to strengthen the resource base of commercial banks by strengthening their capital base. However, subordinated debt obligations alone are not enough to strengthen the capital base of commercial banks.

I. According to Alimardonov, in addition to the composition of financial ratios, it is necessary to improve the methodology for determining the creditworthiness of small enterprises, including the size of profit, the debt service ratio and the debt turnover ratio of creditors.

This proposal of I. Alimardonov has not lost its relevance for commercial banks of the republic. This is due to the fact that the country's commercial banks use three financial ratios (liquidity ratio, coverage ratio, autonomy ratio) to determine the creditworthiness of clients with legal entity status. These coefficients do not allow the client to assess the rate of return, debt servicing, lender debt turnover rate.

According to F. Holmamatov, the following criteria are offered to improve the quality of the loan portfolio of commercial banks in order to improve the methodology of creating reserves for covering possible losses on loans for a realistic assessment of loan quality and providing reserves: from 1% to 10% for low-quality loans; non-performing loans from 11% to 25%; from 26% to 50% on doubtful loans; up to 100 percent on bad loans.

Conclusion F. Kholmamatova shows that it is impractical to create reserves for standard loans. Because, according to the current procedure, commercial banks of the republic also have a reserve of 1% for standard loans. In addition, F. Kholmamatov proposed stratifying reserve rates in a certain range.

The proposal of F. Kholmamatov is important for the banking practice of Uzbekistan. This is due to the fact that, firstly, the probability of bad debts on standard loans is low, and secondly, when issuing loans in the country, special attention is paid to highly liquid collateral.

## CONCLUSION AND RECOMMENDATIONS

Economists expressed different opinions about improving the quality of the portfolios of assets of commercial banks, and the following conclusions were made: reducing credit risk by analyzing the cash flow of the borrower;

- ensuring that interest rates on loans from commercial banks remain low and stable;

- Since the quality of bank loan portfolios directly depends on external factors, the level of risks associated with the state investment and industrial policy and the financing of investment projects plays an important role in improving the quality of their loan portfolios;
- the main factor hindering the improvement of the practice of long-term lending to commercial banks is the lack of long-term resources in banks;
- To increase the creditworthiness of banks, it is necessary to ensure the adequacy of their deposit base and introduce limits on deposits aimed at lending operations;
- in the context of dynamic changes in the stock market, the formation of an optimal portfolio of securities is not always sufficient, therefore, a commercial bank needs to formulate an improved strategy for forming a portfolio of securities;
- according to the theory of the portfolio of securities, the investor should choose a portfolio in which the expected return cannot increase without increasing the risk or, conversely, the risk should not decrease without increasing the expected return;
- Ensuring that the level of diversification of the loan portfolio of commercial banks is based on the criteria of 25% is one of the necessary conditions for ensuring the quality of the loan portfolio;
- The elimination of transformational risk plays an important role in improving the quality of bank loan portfolios. Insufficient long-term resources required for long-term loans in commercial banks of the Republic of Uzbekistan have led to a deepening risk of bank transformation. In turn, the risk of transformation has a strong negative impact on bank liquidity.

As a result of studying the scientific and theoretical views of economists on improving the quality of asset portfolios of commercial banks, we developed the following scientific proposals:

to reduce the level of credit risk by analyzing the cash flows of the borrower, to ensure that interest rates on loans from commercial banks are low and stable, the level of risks associated with state investment and industrial policy and financing of investment projects, since the quality of the loan portfolio of banks depends on external factors; Ensuring the level of diversification of bank loan portfolios plays an important role in improving the quality of their loan portfolios;

- the main factor hindering the improvement of the practice of long-term lending to commercial banks is the lack of long-term resources in banks;
- To increase the creditworthiness of banks, it is necessary to ensure the adequacy of their deposit base and introduce limits on deposits aimed at lending operations; the formation of an optimal portfolio of securities in the face of dynamic changes in the conditions of the stock market forces a commercial bank to develop an improved strategy for the formation of a portfolio of securities;

### ABSTRACT

*Improving the quality of unsuitable coal from the Angren coal mine in Uzbekistan, improving its quality, supplying quality coal to the population and industries for use as solid fuel, and efficient use of coal, which is our mineral wealth. Development of enrichment technologies for the production of waste-free, efficient fuel from brown coal, which is a factor in the development of industry and living standards of the country and a source of natural energy.*

**KEYWORDS:** *Lignite, Fuel, Coal Ash, Minerals, Heat Of Combustion, Chemical Reagent.*

### INTRODUCTION

So far, coal is the most promising source for the production of recycled solid fuels, with the goal of avoiding large amounts of waste that is highly toxic when used as a fuel in recycling and also, it is the most important product for obtaining various chemicals and composite materials [1]. Processing coal into synthetic fuel for domestic use and introducing it into industry has been identified as a strategic direction in countries that do not have their own oil. In this regard, there is a need to develop new methods of obtaining alternative fuels through the processing of coal resources located in the country [2]. As a result, in a short period of time, coal became the most

important source of energy for the development of industry and transport to meet the energy needs of society.

2BPK, 2BR-B2, 2BOM, and 2BR brown coals were chemically treated with nitric acid, hydrochloric acid, fluoric acid, and sulfuric acid, and good results were obtained when treated with 0.1 M HCl acid. Studies were conducted on the basis of Angren coal, Shargun coal and Baysun coal. Table 1 shows the technological parameters of coal [9].

**TABLE 1 TECHNOLOGICAL PARAMETERS OF COAL.**

View of the normative document	Product naming	Brand (group)	Piece size, mm	Quality indicators	
				Working moisture, Wr, %	Ash content Ac, no more %
Angren field					
ГОСТ 8202-87	Brown coal	2BPK	50-200	30	16
ГОСТ 8202-87		2BR-B2	0-200	40	24
ГОСТ 8202-87		2BOM	0-50	40	22
ГОСТ 8202-87		2BR	0-200	32,5	22
Shargun field					
TSh 12-12:1998	Coal	1SSSSH	0-13	10	30
TSh 12-12:1998		1SSKOM	13-100	10	25
Baysun field					
TSh 12-12:1998	Coal	1TR	0-200	10	24,5

Potentiometric titration method is used to check the mineral content of  $\text{SiO}_2$ ,  $\text{Al}_2\text{O}_3$ ,  $\text{MgO}$  in the ash content of brown coal grades 2BPK, 2BR-B2, 2BOM, and 2BR. [3]

Sodium and potassium oxides ( $\text{Na}_2\text{O}$ ,  $\text{K}_2\text{O}$ ) were determined using flame photometry. A PFP-7 photometer was used for this purpose. To do this, an aliquot is prepared from 0.1 g of crushed ash in accordance with the requirements of GOST, passed through a photometer (GOST 26148) and each oxide is tested separately.

Low and high combustion temperatures of coal were determined by colorimetric method. [4]

The experiment determined the amount of minerals in coal ash (35-60%). They not only incur excessive economic costs (increased costs and excess oxygen), but also reduce the heat of combustion of coal. [5] Excess oxygen is added to the non-combustible minerals, which leads to a decrease in the efficiency of the combustion reaction and less heat is released during combustion. [8]

In the experiment, high combustion heat of coal (organic, enriched part of coal burns during combustion) and low heat of combustion (coal burns when mineral mixtures are not purified) were tested [6] (Table 2).

**TABLE 2 COMBUSTION HEATS OF BROWN COAL GRADES**

Brand of coal	High combustion heat kcal/kg	Low combustion heat kcal/kg
2BPK	1620-2430	1670-2500
2BR-B2	1530-2350	1570-2480
2BOM	1680-2480	1690-2400
2BR	1590-2350	1600-2450

The table shows that the presence of mineral compounds in coal leads to low heat of combustion. This means that in order to increase the heat of combustion and improve the quality of coal, it is necessary to clean the coal from non-combustible mineral compounds. The coal ash level ( $A^\circ, \%$ ) was checked to determine the mineral content of the coal. This experiment was carried out using the accelerated method according to GOST11022-95, and the coal samples were determined as the amount of ash mass in the initial sample mass heated in the furnace to a temperature of  $850-875 \pm 25^\circ \text{C}$  [10] (Table 3).

**TABLE 3 THE ASH LEVEL OF BROWN COAL GRADES**

The brands of coal	The ash level, $A^\circ, \%$
2BPK	16
2BR-B2	24
2BOM	22
2BR	22

The composition of the coal ash was examined to determine the effective enrichment method.

**TABLE 4. THE MINERAL COMPOSITION OF BROWN COAL GRADES ASH WAS STUDIED.**

№	Chemical composition of coal ash %	The brands of coal			
		2BPK	2BR-B2	2BOM	2BR
1	$\text{SiO}_2$	57.0	66.4	61	60.2
2	$\text{Fe}_2\text{O}_3$	1.9	1.5	1.6	1.4
3	$\text{Al}_2\text{O}_3$	27.6	17.1	18.6	19.0
4	$\text{CaO}$	8.3	7.6	6.4	6.9
5	$\text{MgO}$	1.7	2.1	1.8	1.9
6	$\text{Na}_2\text{O}$	0.5	0.9	0.4	0.6
7	$\text{K}_2\text{O}$	1.1	0.7	0.9	1.4

Many components of a mineral mixture ( $\text{Fe}_2\text{O}_3$ ,  $\text{CaO}$ ,  $\text{MgO}$ ,  $\text{Na}_2\text{O}$ ,  $\text{K}_2\text{O}$ ) are highly soluble in acids. Therefore, the effect of different acids on the mineral compounds in coal was studied in the selection of a chemical reagent for processing coal. However, since these compounds are also soluble in water, in order to reduce acid consumption, the coal was first enriched with water and purified from water-soluble compounds. Hydrochloric acid 0.1n ( $\text{HCl}$ ) was selected for the acid treatment of coal. Because other acids, such as sulfuric acid ( $\text{H}_2\text{SO}_4$ ) and phosphoric acid ( $\text{H}_3\text{PO}_4$ ) with some ions in the coal, form water-insoluble sulfate, phosphate salts, causing an

increase in the amount of minerals, 0.1 M, 1 M was treated with HCl and the results are shown in Figure 1.

**Figure 1. Dependence of coal ash level on acid (HCl) concentration**

For 2BPK, 2BR-B2, 2BOM, and 2BR lignites, the use of 0.1 M HCl was significantly reduced. Therefore, the optimal concentration of hydrochloric acid treatment for the studied types of coal was set at 0.1 M (Table 5).

**TABLE 5. THE AMOUNT OF MINERALS AFTER ENRICHMENT OF BROWN COAL GRADES WITH HCL (%).**

The brands of coal	2BPK	2BR-B2	2BOM	2BR
The amount of minerals before enrichment, %	41,26	47,12	43,54	42,16
The amount of minerals after enrichment, %	28,75	33,87	32,52	31,35

When treating coal with water, it was found that due to the transfer of various water-soluble carbonates, sulfates, chloride salts, potassium, sodium and partly calcium and magnesium compounds into the water, we can remove 6-9 % of non-combustible minerals with the help of water.

When treated with hydrochloric acid (HCl), it was found that the amount of mineral compounds decreased by 12-13% due to the purification of acid-soluble compounds, mainly calcium and magnesium, partly from iron and aluminum compounds (Table 6).

**TABLE 6. AMOUNT OF MINERALS IN ASH AFTER TREATMENT OF 2BR -B2 GRADES OF BROWN COAL WITH WATER AND 0.1 M, 1 M HCL (%).**

The level of ash, %	The amount of minerals (%)						
	SiO <sub>2</sub>	Fe <sub>2</sub> O <sub>3</sub>	Al <sub>2</sub> O <sub>3</sub>	CaO	MgO	Na <sub>2</sub> O	K <sub>2</sub> O
2BPK 0.1M HCl	58.1	2.1	27.6	8.4	1.8	0,6	1.2
2BPK 1M HCl	58.4	1.8	28.9	8.1	1.4	0.41	0.9

One of the indicators of the quality of coal is that it does not pollute the atmosphere with harmful gases when burning coal (these gases react with water vapor in the air to form acid rain [11]). When the composition of lignite grades was studied, the presence of such a toxic gas-producing element, sulfur (S), was determined and the percentage of coal was calculated (Table 7).

**TABLE 7. THE AMOUNT OF SULFUR (%) IN THE BRANDS OF BROWN COAL NAMED 2BR-B2 AND 2BOMSSH-B2.**

The brands of coal	Sulfur (%)
2BPK	0.9-2.8
2BR-B2	0.3-3.5
2BOM	0.4-3.4
2BR	0.2-2.4

It is known that, when heated these substances decompose and release into the atmosphere toxic sulfur dioxide (SO<sub>2</sub>). Therefore, it is important to clean the coal of sulfur (S) compounds. By chemical treatment of brown coal grades, FeS<sub>2</sub>, CaSO<sub>4</sub>, FeSO<sub>4</sub> in coal are also partially removed from S due to partial solubility in acid.

## CONCLUSION

Non-combustible mineral compounds in coal degrade the quality of coal and reduce the heat of combustion. Compounds containing sulfur (S) pollute the atmosphere by releasing toxic gases when coal burns. The coal studied in this study contained a large number of non-combustible minerals, which were found to be significantly reduced by chemical treatment with acids, and partially removed from sulfur-containing compounds. The mineral content of brown coal ash has been determined. The chemical method of purification from mineral impurities has achieved an effective result.

### **ABSTRACT**

*Farmers spray pesticides indiscriminately, which are hazardous to their health. Pesticides being used in agricultural tracts are released into the environment and come into human contact directly or indirectly. The present investigation aimed to provide necessary information on level of awareness that the cotton farmers possess on effect of pesticides. The present study was conducted with specific objective namely to study the awareness of farmers towards effect of pesticides on human health. Nanded district was selected purposively for the study as it has larger area under cotton, from that district three tahsils namely Mudhked, Himayathnagar, Kinwat were selected purposively, four villages from each tahsils were selected and ten respondents from each village were selected for the study comprising of 120 respondents for the study. The study revealed that majority of the farmers had medium level of awareness (67.5%) followed by high level (20.00%) and low level (12.50%).*

**KEYWORDS:** *Indiscriminately, Purposively, Investigation*

### **INTRODUCTION:**

Agriculture remains the principal source of livelihood for majority of the population in India. The increased use of synthetic fertilizers and chemical pesticides in agriculture started in India since 1960s as part of the Green Revolution. Over the past five decades synthetic fertilizers' consumption has drastically increased several folds and India is now one of the leading

producers of agrochemicals in the world. Many of the chemical pesticides can have harmful effects on human beings either as acute or chronic toxicity. Acute exposure to pesticides can lead to death or serious illnesses.

India is the largest producer of pesticides in Asia and ranks 12<sup>th</sup> in the world for the use of pesticides with an annual production of 90,000 tons. Although Indian average consumption of pesticide is far lower than many other developed economies, the problem of pesticide residue is very high and has also affected the export of agricultural commodities in the last few years. Regarding the consumption of pesticide, cotton consumed 55 per cent of total pesticides in India while the total area under cotton was 11.90 million hectares. The estimated demand of pesticides in India during 2011-2012 is 55,590 tons ([www.indiastat.com](http://www.indiastat.com)).

Good management, use, and disposal of agrochemicals is an important health and environment issue in developing countries. Safe pesticide management is essential to the well being of all those involved with using pesticides. The total exposure of a person to pesticide is the sum of all exposures resulting during different working situations like mixing, applying, storing or disposing the chemicals. Exposure to pesticides and there by its health impacts can be minimized at community level by appropriate and judicious use of agrochemicals, Chemical use in farming and its health and environmental implications in a rural setting ,adopting recommended methods of mixing, applying, storing, disposing and practicing use of proper personal protective equipments (PPE).

The present investigation aimed to provide necessary information on level of awareness that the cotton farmers possess on effect of pesticides. The present study was conducted with specific objective namely to study the awareness of farmers towards effect of pesticides on human health. Nanded district was selected purposively for the study as it has larger area under cotton, from that district three tahsils namely Mudhked, Himayathnagar, Kinwat were selected purposively ,four villages from each tahsils were selected and ten respondents from each village were selected for the study comprising of 120 respondents for the study.

## **MATERIALS AND METHODS:**

The present study was conducted in Nanded district of the Marathwada Region of Maharashtra state. The geographical area of the district is 1033.1 hact Nanded district is the south eastern part of the Marathwada region of Maharashtra state. Annual rainfall is 993.1mm, maximum and minimum temperature is 43.3°c and 11.9°c, respectively. The soils of Nanded district are mostly belongs to order Vertisols ,inceptisols and Entisols. The soils varied with colour due to presence of different type of minerals. The soils of this district are medium black soils and light soils. It has slight slope towards South. Major *kharif* crops of the district are Cotton,Sorghum,Blackgram Soybean, whereas, major crops grown in *rabi* are Safflower wheat and *rabi* Jowar. The major cash crops grown are Sugarcane, Turmeric, Sweet orange Grape, Mango in some part of district.

Ex-post-facto research approach was used for the present research study. Cotton crop is selected as the reference crop for the selection of the respondents, as majority of the pesticide usage has been done by the cotton growers. The data were collected through personal interview method with the help of pre - tested structured schedule consisting of various items concern with the objective of study. The farmer was contacted personally at their home during their leisure time.

The content of the test is composed of items asked in the form of questions. The important factor considered in collecting the items for awareness test was to determine and classify the object to be measured by taking care of the respondent's abilities. Fifty items were collected from different sources like printed literature including farmers training manual in english, hindi language, in consultation with staff members of departments of entomology and extension education of college of agriculture, Latur.

Each item in the awareness test was read out to the respondents in translated version (Hindi) by the investigator and the responses in the form of correct or incorrect answers were recorded. The correct answer was assigned a weightage of 'one' and the incorrect with 'zero'. Based on the awareness scores obtained the farmers were grouped into 3 categories by using mean and standard deviation.

**TABLE NO -1 :SCORING PATTERN FOR THE RESPONDENTS IN MEASURING AWARENESS**

S.No	Category	Score range
1.	Low awareness	Below 12
2.	Medium awareness	Between 12-20
3.	High awareness	Above 20

#### Results:

In order to assess the overall awareness level of the respondents, necessary data were collected and they were categorized into three groups viz. low, medium and high based on mean and standard deviation, as presented in Table-1,

**TABLE .2. DISTRIBUTION OF RESPONDENTS ACCORDING TO THEIR AWARENESS (N=120)**

S.No.	Awareness	Frequency	Percentage
1.	Low	15	12.50
2.	Medium	81	67.50
3.	High	24	20.00
	Total	120	100

**Fig.1. Distribution of respondents according to their Awareness**

By examining Table.2. it can be revealed that majority (67.50%) of the respondents had medium level of awareness about effect of pesticide on human health followed by low (20.00%) and high (12.50%) awareness levels. The possible reason for this trend might be due to the fact that majority of the respondents were small growers with high school education, mass media exposure, innovativeness, social participation and scientific orientation. Hence, the above results were obtained. The agricultural department personnel and extension agencies must concentrate on growers by providing sufficient trainings regarding pesticide application, demonstrations and conducting meetings with growers to become aware of the health hazards that can cause due to indiscriminate use of pesticides. This result is in accordance with the results of Kalaskar *et al.*, (2001) and Swathi Lekshmi *et al.*, (2010). Awareness needs to be created on use of personal protective measures among growers, while handling pesticides. Growers need to be encouraged to reduce, if not eliminate the use of pesticides, with the introduction of incentives to the growers to help them shift from synthetic pesticides to bio pesticides and organic farming.

### CONCLUSION:

The findings of the study indicated that only (67.50%) of the farmers had medium level of awareness on effect of pesticide on human health. Hence, it is imperative that the State Department of Agriculture and agricultural scientists should make integrated and concerted extension efforts to create the awareness about effect of pesticides on human health. The practice of storing, mixing and applying agrochemicals without personal protection and unsafe disposal of pesticide containers appears to be widely prevalent in the study villages. A comprehensive program for creating awareness for safe management, handling and disposal of pesticides among both users and shop keepers is required to address this important health and environmental problem.

### **ABSTRACT**

*In networks and entity groupings that have sensitive resources, user identification is a crucial requirement for secure access, communication and transactions involving those resources. However, there are networks and entity groupings that require entity authentication while preserving the privacy of the entity being authenticated. There are several zero-knowledge protocols (ZKP) including the Feige-Fiat-Shamir that authenticate an entity anonymously. We present a revised Feige-Fiat-Shamir ZKP scheme for the Airborne Networks (ANs) that reduces the ping-pong effect in the scheme and speeds up the growth of the Verifier trust of the Prover, thus making the authentication process faster and more efficient.*

**KEYWORDS:** *Mission Critical, Time, Authenticity, Anonymity, Zero Knowledge, Authentication.*

## INTRODUCTION

**The urgency of the subject and founded:** In modern conditions, in networks and entity groupings that have sensitive resources, user identification is a crucial requirement for secure access, communication and transactions involving those resources and this will lead to a number of urgency issues. To solve these issues, the development of authentication protocols in open-key cryptography is discussed in this master's dissertation.

**Subject and object of research:** Feige-Fiat-Shamir ZK protocol was taken as a research object.

Master dissertation is dedicated to authenticity and which will summarize the Feige-Fiat-Shamir ZK protocol to improve the efficiency of the inspection process.

**Purpose of the research:** We propose a new approach to the Feige-Fiat-Shamir ZKP scheme that aims to reduce the number of challenge-response ping-pong exchanges and thus create a speed-up in the building of trust and increasing the effectiveness of the scheme.

## MATERIALS AND METHODS.

The Feige-Fiat-Shamir Identification Scheme is a classical, practical and widely used modular arithmetic ZKP scheme developed by Uriel Feige, Amos Fiat and Adi Shamir in 1988. Following the principle of all zero-knowledge proofs, the Feige-Fiat-Shamir Identification Scheme involves two entities, the Prover, and the Verifier. The Prover possesses a secret token and is seeking authentication and must prove to another entity, the Verifier, who must authenticate the Prover based upon the secret token the Prover has, through a series of challenges without getting to know the Prover's secret token.

### Procedure

The Feige-Fiat-Shamir process involves the Prover choosing two large Blum prime integers  $p$  and  $q$  where each is of the type  $4g+3$  and  $\gcd(g, 3) = 1$ . Also the Prover chooses two security integers  $k$  and  $t$ . Then computing the product  $n = pq$ . The protocol then uses this  $n$  in the modular arithmetic that follows.

### The congruence relation

Two integers  $a$  and  $b$  are said to be congruent mod  $n$ , if their difference  $a - b$  is an integer multiple of  $n$ . That is both numbers have the same remainder when divided by  $n$ . This is then expressed as:

$$a \equiv b \pmod{n}.$$

A good example are integers  $a = 38$  and  $b = 14$ . Then  $38 \equiv 14 \pmod{12}$  shows that  $(a, b)$  form a congruence class.

Using this  $n$ , choose or create secret vector  $s = \{S_1, S_2, \dots, S_k\}$  with  $\gcd(S_i, n) = 1$ , and  $c = \{c_{i=1,k} | c_i \in (0,1)\}$ .  $n$  is then made public. Now compute the vector  $v = \{v_1, v_2, \dots, v_k | v_i = S_i^2 \pmod{n}\}$  where  $\equiv$  is a congruency relation between  $v_i$  and  $S_i^2$ , meaning that  $v_i$  and  $S_i^2$  have the same remainder upon division by  $n$ .

The vector  $v$  then is sent to the Verifier. The difficulty the Verifier may encounter in recovering the vector  $s$  as it involves the computation of the modular square root without knowing the modulus' factorization. The Feige-Fiat-Shamir procedure goes as follows.

1. Prover chooses a random integer  $r$ , a random sign  $b \in \{-1, 1\}$  and computes  $x = (-1)^{c_i, i=1, k} * r^2 \pmod{n}$ . Prover sends this number to Verifier.
2. Verifier chooses numbers  $a_1, a_2, \dots, a_k$  where  $a_i$  equals 0 or 1. Verifier sends these numbers to Prover.
3. Prover computes  $y \equiv r S_1^{a_1} S_2^{a_2} \dots S_k^{a_k} \pmod{n}$ . Prover sends this number to Verifier.
4. Verifier checks that  $y^2 \equiv \pm x v_1^{a_1} v_2^{a_2} \dots v_k^{a_k} \pmod{n}$

This procedure is repeated with different  $r$  and  $a_i$  values until Verifier is satisfied that Prover does indeed possess the modular square roots ( $S_i$ ) of his  $v_i$  numbers.

## RESULTS AND DISCUSSION.

While the Feige-Fiat-Shamir Identification Scheme is the most celebrated, classical, practical and widely used modular arithmetic ZKP scheme, it suffers from the ping-pong problem. The Ping Pong problem in the ZKP solutions is caused by repeated, sometimes uncontrolled, challenge-response exchanges between the Verifier and the Prover, as the Verifier tries to get as much information as possible from the Prover in order to complete the authentication process in the shortest time possible but in the most sure way and as the Prover tries to provide the needed information for the authentication process without revealing the Prover's identity. The ping-pong problem is a resource guzzler. Given that the AN environment is time critical, the authentication process needs to be comprehensive, precise and take a short time. But in the Feige-Fiat-Shamir this cannot be accomplished because, there is no sure way of making the process short. In some cases, the authentication process may be short but not always. We propose a procedure that speeds up this process and it builds the trust quickly. The scheme still involves two entities, the Prover, who possesses a secret token and is seeking authentication and must prove to another entity, the Verifier, who must authenticate the Prover based upon the secret token the Prover has, through a limited series of challenges without getting to know the Prover's secret token.

### Procedure

The revised Feige-Fiat-Shamir protocol still involves the Prover choosing two large Blum prime integers  $p$  and  $q$  where each is of the type  $4g+3$  and  $\gcd(g, 3)=1$ . Also the Prover chooses two security integers  $k$  and  $t$ . The Prover then computes  $n = pq$ . Using this  $n$ , the Prover then chooses or creates a secret vector  $s = \{S_1, S_2, \dots, S_k\}$  with  $\gcd(S_i, n) = 1$ .  $n$  is then made public. Further the Prover still computes the vector  $v = \{v_1, v_2, \dots, v_k \vee v_i \equiv S_i^2 \pmod{n}\}$ . The vector  $v$  is then sent to the Verifier. Like in the original Feige-Fiat-Shamir protocol, the Holy Grail of the protocol is the difficulty the Verifier encounters in recovering the vector  $s$  as this involves the computation of the modular square root without knowing the modulus' factorization. The revised Feige-Fiat-Shamir protocol then goes as follows.

1. Prover chooses a random integer  $r$ , a random sign  $b$  in set  $\{-1, 1\}$  and computes  $x = b * r^2 \pmod{n}$ . Prover sends this number to Verifier.
2. Each time the Verifier chooses a challenge, there are  $C_{i=1, k}$  possible ways to choose the vector  $a = \{a_1, a_2, \dots, a_k\}$  where  $a_i$  equals 0 or 1. These choices are represented by the 0-1 matrix  $M = \{a_{ij} = (0, 1) | (i, j) = 1, k\}$ . From these rows of  $M$ , the Verifier randomly selects

a number of rows forming a sub-matrix  $D = \{a_{ij} = (0,1) | i = 1, k, j = 1, f.\}$  of  $M$  to concurrently send to the Prover as the challenge.

3. Instead of the Prover computing only one number  $y$ , the Prover uses the received matrix  $D$  to compute a vector  $y = \{y_1, y_2, \dots, y_f | y_i = r * S_i^{a_{ij}} \pmod{n}, i = 1, k \wedge j = 1, f.\}$ . The Prover then sends this vector  $y$  to the Verifier.

4. Verifier checks that each of the vector components of  $y$  satisfies  $y_j^2 = \pm x * v_i^{a_{ij}} \pmod{n}, i = 1, k \wedge j = 1, f.$

This procedure may be repeated with different  $r$  and different sub-matrices  $D = \{a_{ij} | i = 1, k \wedge j = 1, f.\}$  of  $M$  until the Verifier is satisfied that the Prover does indeed possess the modular square roots ( $S_i$ ) of his  $v_i$  numbers.

An Example:

1. Suppose either the Prover or a trusted center  $T$  selects the primes  $p = 139$ ,  $q = 347$ , and publishes  $n = pq = 48233$ .

2. The Prover chooses Integers  $k = 3$  and  $t = 1$  as the needed security parameters. Then the Prover does the following:

- Selects 3 random integers  $S_1 = 87, S_2 = 21649, S_3 = 523$  and 3 bits  $b_1 = 1, b_2 = 0, b_3 = 1$ .
- Computes  $v_1 = 7569, v_2 = 10310 \wedge v_3 = 32364$ .
- The Prover's public key then is  $(7569, 10310, 32364, 48233)$  and the Prover's private key is  $(87, 21649, 523)$ .

3. The Prover chooses integers  $r = 3209$ ,  $b = 1$ , and computes  $x = 24052$ , and sends this to Verifier.

4. Since  $k$  was chosen as 3, the Verifier has the following possible matrix

$M = \{000, 001, 010, 011, 100, 101, 110, 111\}$  of choices of challenges.

5. Suppose the Verifier chooses a sub-matrix  $D = \{010, 011, 111\}$  and sends it to the Prover.

6. The Prover must compute a vector  $y = \{y_1, y_2, y_3\} = \{16121, 5788, 36823\}$ .

7. The Verifier computes  $(y_1^2, y_2^2, y_3^2) = (259886641, 33500944, 1355933329)$ . Also computes.

8. To accept the Prover's identity the following pairs of numbers must be in the same congruency classes mod 48233:

- a.  $(259886641 \text{ and } 24052 * 10310)$
- b.  $(3350094 \text{ and } 24052 * 10310 * 32364)$
- c.  $(1355933329 \text{ and } 24052 * 7569 * 10310 * 32364)$

## CONCLUSIONS

In this paper, we have produced a revised Fiege-Fiat-Shamir protocol scheme in which the Verifier instead of choosing one 0-1 vector as a challenge to the Prove now chooses a sub-matrix whose rows are individual challenge vectors. Increasing the number of challenge vectors sent to the Prover at once speeds up the growth of the Verifier's trust of the Prover making the whole authentication process a lot faster and more efficient. We have also developed test programs to run the algorithm in a multithread environment. Further we have developed the necessary protocols to run the algorithm in a client-server model which gives it a real distributed environment. As we did this we took times tamps of each run and computed time grow th computation with the increasing size of the primes used. Looking at the times graph raises more and interesting questions that require extending this study. Such improvements may include finding more efficient and economical ways to move matrix D from the Verifier to the Prover. In our next attempt, we will focus on ways to move this matrix more economically. We want to investigate ways to either decompose the matrix or find some other loss less compression that will cut down on the amount of data passed.

### ABSTRACT

*This article demonstrates the effectiveness of opportunities in the use of electronic resources in education. The availability of educational material in electronic form, that is, viewing, studying, editing and recording textual, graphic, audio, animated materials on a computer screen, allows for more in-depth study. The application of information technology in the lecture, practice, laboratory and independent forms of teaching is rapidly yielding results.*

### INTRODUCTION

The President of the Republic of Uzbekistan Sh.M.Mirziyoev said, "The solution of another problem is very important: it is the professional level of teachers and professors, their special knowledge. In this regard, it is necessary to create an environment that actively promotes the process of education, spiritual enlightenment and the formation of true values. " - His views are important [1].

In the Republic of Uzbekistan, great attention is paid to reforming the education and training system, as well as raising it to the level of developed countries as a priority of public policy. It is well known that today the system of continuing education and training has become a decisive and important factor in the innovative development of any country in line with modern requirements.

Today's scientific and technological progress requires the introduction of innovative technologies not only in many areas of production, but also in the field of cultural, social and humanitarian

knowledge, education. It is known that the "National Program of Personnel Training" emphasizes "..... provision of the educational process with advanced pedagogical technologies" [2], which is carried out in stages of improving the quality of continuing education. was identified as one of the serious tasks. In this sense, the development of the independent Republic of Uzbekistan is a perfect educational system based on the rich spiritual potential of the people and universal values, as well as the latest achievements of modern culture, economy, science, technology and innovative technologies. The need to create and put into practice the theoretical and methodological basis of pedagogy and innovative pedagogical technologies is to reform the national education system, bring its potential to the world stage, create an education market and train competitive professionals.

## LITERATURE REVIEW

At present, the rise of scientific thinking, as well as scientific techniques, is taking place dramatically and intensively. Therefore, it is essential for teachers to keep up with modern knowledge.

Problems of computerization of education in the Republic and introduction of information technologies in educational process M.M.Aripov, U.S.Begimkulov, N.I.Taylakov, U.Yuldashev and methods of organization of use of computers in professional training N.A.Muslimov, A.D.Askarov.

On theoretical bases of designing the educational process and the development of interpersonal e-learning resources. I.A. Bashmakov, F.M.Zakirova have done research work, the importance of using multimedia technologies and tools in the learning process and their use bases. , Studied by M. Bekmuradov, B. Rajabov.

The use of a computer during the classroom provides new and unique opportunities for teachers and students to interact with interactive teaching materials. We need to be aware of modern programming languages for interactive tutorials created by the teacher, so that they can be readily accepted by students. The utilization of other computer training tools, such as projectors, electronic boards, increase the amount of information using visual applications, thus facilitating the efficient use of classroom time [3,4].

Nowadays, creating modern electronic applications as well as electronic study programs by using the possibilities of modern programming languages - Delphi, Matlab, Matchad, Math, Maple, C - make the learning process qualitative. As a result, the effectiveness of the teaching will increase and students' interest and attitudes will change positively[4].

## RESEARCH METHODOLOGY

Improving the quality of teaching depends on the use of new teaching methods. In the new teaching methods, a student should be constantly moving forward, to be more specific, a student should be able to acquire, process, and apply the knowledge gained to solve specific problems. The use of information technology in lectures, practice, labs, and independent forms of learning gives its fruitful outcomes quickly. For example, the use of virtual stands in the laboratory classroom is the basis for the good quality of the training.

The incredible development of computers and software products opens up great opportunities for the use of information technology in education. Training materials can be made in the form of

multimedia systems and can be made available to the public through computer networks and transmission facilities. The widespread introduction of computer technology into the education system requires revision of all types of training materials. Multimedia e-learning materials should be developed for each form of teaching [5].

Usually, information and communication technologies are rarely used in practical and laboratory studies. However, research in the field of teaching technologies shows that it is in these forms of learning that the resources for improving the quality of teaching are hidden. The fact is that, in traditional teaching methods, it is not always easy to engage the group and control their study performance. The availability of electronic learning of textbooks facilitates a deep learning, by editing and recording text, graphics, sound, and animated teaching material on your computer screen.

The electronic form of the training material is connected to an existing local network, which enables performing tasks in groups and information sharing. Computer-based computer and software tools allow students to take a personalized approach to the topic studied, to form their own ideas and to increase their activity [6].

The teacher is able to monitor and record each student's progress through the server computer and how the tasks are fulfilled.

Sharing single information hyperlinks (platform) provides a creative, collaborative learning experience for students and teachers.

In order to organize such training, the teacher needs to have the knowledge and skills in e-resource development programs and the availability of technical tools to provide the user interface in the classroom.

Modern teaching technology is an integrated (whole, dependency) system in which students acquire theoretical knowledge, skills, and experiences that are based on educational objectives as a well-organized set of elements of pedagogical activity focused on education. [7]

As a result of the full use of e-learning resources in the learning process, the following will be achieved:

- 1) They accept, understand, accumulate, but they do not recover consciously;
- 2) Analyzes, compares, summarizes, and implements practical actions in direct collaboration with the teacher;
- 3) Independently search for solutions to problems, independently determine ways and means of achieving expected results.

The higher the quality of e-learning resources made by modern programming tools, the more effective the learning process is [8,9]. Knowledge of interactive teaching methods is a special form of communicative activity in which learners are involved in the learning process and have the opportunity to explain what they know and think.

Pedagogical collaboration between students and teachers at classes using e-learning resources will encourage the student to remain indifferent, to think independently, to be creative, and to maintain a constant interest at the subject being taught[10].

## ANALYSIS AND RESULTS

Information and communication technologies, which are being developed in the educational system, serve to raise the educational process to a higher level. Of course, it is important to use modern techniques to make the learning process more meaningful. Besides, the use of modern means of computer, multimedia, internet, distance learning, a unique information environment and information and communication technologies is giving its results.

The success of the pedagogical experiment in the pedagogical experiment testifies to the need to consider organizational and pedagogical aspects in this process. Therefore, particular attention was paid to these aspects. The organization of the experimental work was organized with the knowledge of the views and opinions of the professors and teachers of the Navoi State Pedagogical Institute. The experimental work was carried out among students studying in "Informational Teaching Methods" of Navoi State Pedagogical Institute. A total of 168 students were selected for the experimental and control groups.

During the experiment, discussions and observations were conducted with professors and teachers of computer science on the main features of the information and educational environment. The results of the interviews and observations were attended by 28 professors and 168 students of computer science.

According to a survey of professors, 56.4% of teachers need to use e-learning resources in the classroom, 28.6% need to independently use 14.8% of difficult topics. can be used for assimilation, 0,2% believe that it does not help to master knowledge.

According to the survey results, 45% of teachers need to use e-learning resources in the classroom, 40.3% can be used independently, and 14.4% can be used to master difficult subjects. 0.3% thought it would not help them in acquiring knowledge.

Summary of the pilot phase The results of the number of data collected in 2019 were analyzed and summarized, and a mathematical-statistical analysis was performed using the Student-Fisher criterion to verify its reliability. The results of the calculations showed that the average improvement of the experimental group was higher than that of the control group, which is 11.2%.

## CONCLUSION

E-learning materials are guaranteed ahigh quality and effectiveness in all forms of learning.

The demand for e-learning resources for today's youth is even more complex. Education resources should be comprehensive, up-to-date, youth-friendly and innovative. Therefore, it would be desirable to use new programming languages.

Expected benefits of new pedagogical technology in the education system, its benefits, and the principles of improving the effectiveness of the lesson. By organizingonline learning resources createdby usingmodern programming languages, students will be able to enrich their knowledge, improve their remembering the materials, make lessons interesting, and improve their thinkingabilities, broadens the outlook, encourages students to work on themselves, teaches them to express and defend their own ideas.

E-learning resources for science are widely used in student learning, student evaluation, and learning management.

The analysis shows that the research is mainly focused on improving the use of information technology in educational institutions, the development of students' innovative potential, and the development of a didactic provision of the learning process aimed at developing independent creative activity. and little attention has been paid to its implementation. This calls for a comprehensive study of the issue of developing students' ability to use modern technology in developing independent thinking.

## LEXICAL-SEMANTIC AND COGNITIVE SPECIFICS OF POLITICAL DISCOURSE (BASED ON SI JINPING'S SPEECHES)

**Nasirova Saodat Abdullaevna\***

\*PhD, Associate Professor,  
Tashkent State University of Oriental Studies,  
Tashkent, Republic of UZBEKISTAN  
Email id: saodat888@mail.ru

### ABSTRACT

*The article is devoted to the lexical-semantic and cognitive analysis of the specifics of the translation of some proverbs and sayings, as well as metaphorical sayings in the discourse on the basis of Si Jinping's speeches about the "Chinese dream". The topic also included the analysis of factors affecting changes in the vocabulary of the lexical component, a linguistic analysis of the semantically-comparative phenomena of the social and political terminology of the Chinese language using descriptive description methods, features of the political discourse in Chinese, used as an object of translation, containing a rich vocabulary with background information. Particular attention is paid to the phenomenon of suggestion in political discourse. The research materials show the richness of the lexical layer of the Chinese language, the wide possibilities of transmitting thoughts using various social and political terms, transforming not only the tone, but also the cognitive paradigm of the text. These lexical and semantic features of Chinese sociopolitical terminology should be taken into account when translating articles, materials of negotiations, speeches, reports and speeches.*

**KEYWORDS:** *Chinese Initiative, Suggestion, Suggestor, Suggestor, Worldview, Strategy, International Cooperation, Globalization, Challenges And Threats, Expansion, Politics, "Soft" Socio-Political Terms, Trade, Infrastructure, Cooperation.*

## INTRODUCTION

The political situation and its change play a significant role in the development of the language. Political discourse is a phenomenon of modern everyday life. The more open and democratic the life of society, the more attention is paid to the language of politics, moreover, political discourse is of interest to both professionals involved in politics, journalists and political scientists, and the widest masses of citizens. The ability to understand the language of politics and conduct discussion on socio-political topics is also included in the circle of significant competencies of students.

Students studying a foreign language are increasingly confronted with the problems of translating lexical units of political discourse as part of a professionally oriented translation course and within individual disciplines. In this regard, there is a need to pay special attention to such fields of knowledge as political discourse, the linguistic and cultural component of socio-political discourse and the features of the translation of articles on socio-political topics.

Political discourse is an integral part of social relations, since it is formed by them and at the same time forms them themselves, being a complex unity of the linguistic form, knowledge and action. Thus, not only linguistic means, but also extra-linguistic factors that determine communication, as well as cognitive structures that determine the existence of the discourse, participate in the implementation of political discourse.

## METHODOLOGY

The main research method is a cognitive, comparative method, since modern political linguistics is discursive, where each speech, written or oral, is considered in the context of the political situation in which it is created, in relation to other political texts, political views and functions which it performs.

## RESULTS

An analysis of the translation of the speeches of the political leadership of the PRC in the era of reform and openness demonstrates the growing trend of interaction between national and international target audiences. Depending on the political origin, historical impacts in the domestic and foreign policy of the PRC, the Chinese sociopolitical terminology in the political discourse includes definitions relating to nationally significant events of social and political life, as well as other aspects related to the economy and culture. In this regard, translators should pay attention to the fact that when translating general cultural words, it is more accurate to take into account the cultural traditions of China and historical background.

The empirical material of the study in the framework of this scientific article was Si Jinping's talk about public administration and materials from the collection of "Stories from Si Jinping".

## DISCUSSION

The characteristics of the discourse are the activity, the processuality associated with the real speech production (discourse-as-process), and the text, which is the product of the speech production, is a certain complete and fixed form (text-as-product)[2]. Text and discourse are linked by implementation relationships: discourse finds expression in the text [ 7].

Yu.S. Stepanov substantiates an ideological approach to discourse, believing that discourse is special texts, behind which there is a special world, i.e. special grammar, special vocabulary, special rules of usage and syntax, special semantics[ 11, 44-45]. G.N.Manaenko discourse acts in the form of a construct that includes four components:

1. Environment (type of social event, its purpose, socio-ideological conditions, situation);
2. Social subject (social status, role relations, social activity of participants, their personal relationships);
3. Content (intentions and goals, worldview positions, general knowledge fund, knowledge of the rules and norms of communication);
4. Text (the topic of verbal communication, relevance to a particular speech genre, compositional arrangement of statements, specificity of selected language means for speech interaction[ 8,37].

Political discourse is a phenomenon that is of particular importance in society. At the same time, political discourse is a complex object of research that cannot be unambiguously defined, as it falls into the field of view of various disciplines - political science, social psychology, linguistics - related to the analysis of the form, objectives and content of the discourse used in certain ("political") situations[5, 118].

V.N.Bazylev considers political discourse as a variant of phatic speech (its genre variety), taking into account the fact that the private goals of political discourse (in addition to the actual information content) are subordinate to the initial contact impulse, and the informative task of expression becomes secondary[ 4].

In order for the "addressee" to correctly interpret the intention of the addressee (author of the text), an appeal to collective knowledge and ideas is necessary. If we are talking about a text related to the political sphere, then probably there should be an appeal to the cognitive base, as politicians and political observers refer (in any case, ideally should strive for this) to the entire population of the country, and not to some part of it.

If we look at the speeches of the Secretary General of the CPC Central Committee, Si Jinping, then we can trace the tendency to appeal to collective knowledge in the form of proverbs and sayings, as well as stories from the history of the Chinese people. The main concept that runs through all the speeches of Si Jinping is the realization of the Chinese dream 中国梦. Si Jinping skillfully uses the form of a story about reliable events, interesting episodes, historical facts, public figures, and ordinary people.

In his speeches, history speaks with modernity and expresses itself through modernity, space narrows and distances are reduced, the small expresses itself in the big and shows significance for the greater[12, 10].

As the leader of the country, Si Jinping often refers specifically to a certain part of the population, for example, youth, as the main addressee, and in this case he skillfully operates on a cognitive base through proverbs and sayings, phraseological units, metaphors, which are dotted with the linguoculturological layer of the Chinese language.

So, for example, in his speech on May 4, 2013, namely when meeting with the best youth representatives of various circles of Chinese society, he used 9 phraseological units (ideomatic expressions, proverbs and sayings), despite the fact that the text of the speech was only 6 pages.

Speaking about the revival of the Chinese nation, he resorts to the ancient proverb 行百里者半九十, i.e. "Ninety out of a hundred - count for half the way." The original of this proverb is taken from the collected works Zhangotse-5th part of the kingdom of Qin, which reads: 行百里者, 半与九十 "90 is only half a journey of 100 kilometers."

This collection of works, Zhan guo ce (Politics of the Warring States), is a collection of diplomatic and military strategies of political figures and their speeches during the historical period of military clashes and conflicts between the ancient Chinese kingdoms. The use of proverbs from such an ancient source suggests that Si Jinping is an expert on the history of his people and a skilled storyteller.

Through the mouths of Si Jinping, historical stories carry a huge patriotic charge and possess powerful humanistic potential. The main task set for China in the near future is to create a peaceful and stable international environment for the realization of the "Chinese dream", and the head of the PRC sees youth as the main driving lever in the implementation of the above task. 长江后浪推前浪。一代更比一代强。 "One wave of the Yangtze rushes to the other", just like youth - the duty of youth is to catch up and overtake the older generation. [16, 49].

Si Jinping skillfully operates with metaphorical sayings in his conversation with youth. For example, he compares the youth of the PRC with the new waves of the Yangtze River - the symbol of the Chinese nation or with the wings of the dream 青春梦想 (Chinese dream). With this comparison, he sets a powerful patriotic charge of the youth of China [16, 50].

Through phraseological units, he, as the leader of the country, poses specific tasks for young people, namely:

1) 功崇惟志, 业广惟勤。 "For great feat great aspirations are needed, and for great work hard work is necessary." By this, he emphasizes his idea that young people should have firm ideals and beliefs. Ideals lead a person through life, beliefs determine the outcome of a case. Their absence leads to 缺钙 spiritual void [16, 50].

2) 学如弓弩, 才能箭镞。 "Knowledge is like a bow, and talents are like arrows." This proverb is used as a call for young people to study, study and study again. The basis of study is like a bow, and talent is like the head of an arrow, talent can play a role only in the direction of deep knowledge [16, 51]. With this phrase, he formed a new concept of the Chinese dream, namely, that the dream begins with study, and the completion of the business depends on talent. Studying hard should become the driving force for long-distance swimming of young people, and increasing talent should be the energy of their selfless struggle.

Of course, we should pay attention to the elements of suggestion (suggestion) in these lines of Si aimed at youth. Here Si is already acting as a skillful manipulator of the minds of the "Chinese dream." In this case, the suggestion phenomenon is formed verbally, and it is in the form of discourse that it represents the process of verbal influence on the psychological sphere of the listener, as a result of which the person is controlled, subordinated to his will, influenced his way of thinking, attitudes, intentions, behavior and imposing the finished opinions to the addressee [9;15;1].

During a speech interaction, the suggest or (addressee, in this case Si Jinping) regulates the activities of the suggest or (communication partner, in this case, the youth of China) through speech, making the necessary correction of values, pushing him to perform certain actions (realizing the Chinese dream) influencing decision making or changing his picture of the world[10, 21].

As suggest or Si denotes the specific responsibilities of the youth of the PRC, namely ... *she (the youth) must ... continuously strengthen her confidence in our path, theory and system, strengthen her faith in the party's leadership, always follow the party and bear high the great banner of socialism with Chinese specifics.* [16, 50].

In this message of Si, one of the most effective suggestion tactics is hidden - metaphorization is the great banner of socialism with Chinese characteristics. It is expressively saturated and capable of creating effective images that are easily absorbed by the recipient. According to A.A. Fedoseyev, metaphorization is the most important means of expressing an assessment of the socio-political situation[13, 12]. A.A. Anisimova considers the political metaphor one of the main tools that are effectively used by the subjects[1, 42-44].

1) 苟日新，日日新，又日新。 "If you can update once, update every day, and so day after day." This idiom was used by Si Jinping as a call of youth for innovation. Young people should be bold in innovation and creativity[16, 61].

"Do not spare your youth in the name of building a country capable of self-renewal, in the name of increasing the vital energy of the nation" or "meeting the mountain, paving the way, and, meeting the river, build a bridge." As a skilled strategist, Si Jinping implements a pragmatic strategy of translating the Chinese dream into reality through pragmatic tactics, namely, predicts the possible behavior of young people and strategically directs it into the political channel of creating a new society.

"All types of strategies are united in that they present a kind of hypothesis regarding the future situation and have a greater or lesser degree of probability"[6,55].

2) 宝剑锋从磨砺出，梅花香自苦寒来。 "The sword will not be sharp unless sharpened, and the plum will not be more fragrant if it has not survived the frost." With this phraseological unit, Si gives a new attitude to the youth of China, namely, young people must, with inexorable will, wage a stubborn and selfless struggle. Young people must remember well that "hard work leads to prosperity, and ranting harms the country" [16,52].

3) 从善如登,从恶如崩. «Anyone who takes a good, will rise to the podium, and those who engaged in evil, there is a crash" (from the treatise "Guo Yu" "Speech kingdoms")[16,52]. This historical dictum was appropriately used by Si in order to launch the campaign "My Chinese Dream", aimed at educating adolescents and youth, at developing the tradition "Komsomol is always ready at the call of the party." With this dictum, he, as it were, mobilizes the masses of youth to support reforms.

## CONCLUSION

In the context of globalization, the manipulative moves of politicians are recognized as the main way to struggle for power. There is a large arsenal of means of influencing a mass audience that both politicians and journalists resort to create the image they need, and one of the shortest paths

to the subconscious is linguistic suggestion. The study of specific tactics of metaphorical influence in the texts of Si Jinping's political discourse requires a separate study

Si's appeal on 6 pages is replete with metaphors, such as cultural support, youth is the vanguard of the style of society, the revival of the Chinese nation is the leitmotif of the Chinese youth movement, innovation is the soul of national progress, etc. etc.

Within the framework of the cognitive paradigm, a metaphor is understood as a special form of thinking that forms an idea of an object, in this case, the Chinese dream acts as an object, as well as predetermining the way and style of thinking about it. Using a certain metaphorical model, the speaker builds in the mind of the addressee such a picture of the world that is beneficial to him. Most scholars (A.N. Baranov, I.M. Kobozeva, A.P. Chudinov and others) recognize the power of metaphor in political discourse and note its ability to influence the consciousness of the listener. It is thanks to the metaphor that a person's model of the world is replaced or changed by one that is skillfully built by a politician.

## THE CREATIVE INTERRELATION OF SCIENTIFIC DEBATE WITH SOCIAL LIFE, THE POLITICAL SITUATION AND THE DIALECTICAL WAY OF THINKING THAT REFLECTS THEM

**Turabova Sevara Kattakulovna\***

\*Doctor of Philosophy in Philosophy (PhD)  
Department of "Philosophy" of Termez State University  
UZBEKISTAN  
Email id: [turobova.sevara@mail.ru](mailto:turobova.sevara@mail.ru)

### ABSTRACT

*In this article, the creative interaction of the phenomenon of scientific discussion with the style of social life and dialectical thinking as a means of cognition is highlighted on the basis of modern logic principles. With the development of legal-democratic principles, the formation of political positions, the debate in the development of the program of action serves as one of the main techniques. Because the argument is an indicator of the Real implementation of democracy in society. This situation requires understanding of the social significance of the phenomenon of scientific debate, studying its epistemic aspect.*

**KEYWORDS:** *Scientific Argument, Communication, Argument, Proof, Problem, Society, Justice, Democracy, Thought, Point Of View.*

### INTRODUCTION

The argument constitutes an important part of socio-political life as a private view of evidence. It is reflected in various socio-political doctrines, ideologies, clashes of worldviews, struggles.

Discussion plays an important role in the modernization of sustainable development processes and the development of civil society in the world, including Uzbekistan. It is democracy that requires the existence of alternative views, opinions, listening to the views of the opposing party, taking them into account, and in cases where they do not agree, to oppose it with serious, convincing arguments. With the development of legal-democratic principles in our society, debate serves as one of the main methods in the formation of political positions and the development of a program of action.

---

## RESULTS AND DISCUSSION

Scientific and political debates are penetrating all spheres of human activity. People of today's society do not want to mechanically make decisions that are made without reasonable considerations, without studying alternative proposals, without going deep into the depths of the problem. Indeed, "the change of people's thinking, the formation of progressive features of the worldview of citizens in accordance with the times is reflected in the change and improvement of the structure of the state and society" [1, p.229]. Therefore, there is a need for argument and evidence as a means of solving various problems.

"Today, the experience of building a democratic society requires a creative approach to democracy, the implementation of all the internal potential to achieve it without violating the principles of justice, prosperity and equality" [2,p.481]. After all, the role of independent, free and grounded thinking in the rapid development of the processes of democratization and liberalization of society, the improvement of the political system, including the strengthening of the multi-party system, which manifests itself in alternative views, the level of social consciousness of the population of our country, the growth of the political and legal culture, is incomparable. The concept of further deepening legal and democratic reforms and development of civil society in Uzbekistan pays special attention to this issue. In this concept, the need for further deepening of democratic processes, the practical participation of the population in the life of political consciousness and society, the reform of the information sphere in order to increase its activity, the provision of freedom of information and speech, for this purpose, the transformation of the mass media into a pulpit that freely expresses its views, ideas. After all, "understanding and understanding the changes of the period, the intelligence of the general public to it, the correct orientation of its essence, serves as an important condition for its correct solution" [3,p.623] .

Information stability is an important tool in the fight against foreign ideas and ideologies. We are witnessing the process of globalization, in particular, the Internet, other global media is now becoming a sharp tool of spiritual influence for various purposes. In such a situation, a person who does not have the ability to think independently can not withstand the pressure of moral threats. A person with the ability to think logically can distinguish between creative ideas and destructive ideas. No destructive idea, not even an ideology, can withstand the power of logic. This is why the communist ideology is in crisis, unable to withstand the influence of democratic thinking in the conditions of openness and political pluralism.

In order for communication to be effective, it must necessarily be attended not only by scientists and publicists, writers and propagandists, but also by leaders of parties and social organizations. "Face to face with the people" - this slogan is also one of the manifestations of ensuring the peace and well-being of citizens, this is an opportunity to assess objectively, in determining who is whom by each citizen. The announcement of a new concept of dialogue with the people, the establishment of Virtual Receptions and Public Receptions of the President and Prime Minister of the Republic of Uzbekistan, the introduction of an integrated vertical system for their management, as well as successful activities that completely changed the worldview of citizens. and experts point out that this new phenomenon requires a reconsideration of the theoretical foundations in the field.

The fact that today there is a phenomenon of political self-consciousness can also be seen in the fact that many layers of our society are covered by discussions, debates, debates. In particular, one of the important signs of democracy in our society is the debate in parliament, where there is no longer a place for the pre-determined monopoly truth. After all, "the most important task in the field of State Construction and administration is to influence and influence the role of the Parliament of the country being the legislative power." [4, p.37]. In this regard, the president of the Republic of Uzbekistan Sh.Mirziyoyev expressed such an opinion: "democracy begins with the parliament. Parliament is a school of democracy. Therefore, we must turn the national parliament into a school of true democracy. A really controversial debate, printsiplial dispute must first be on the pulpit of Parliament, right here. It is only then that the true image and position of each political party, each party faction in Parliament, will be clear." [5]

So why is there growing interest in controversy today? Is this situation connected with the rapid democratization of our society? Of course so!

**First**, only the collision of thoughts allows you to open a new one by denying and rejecting the denial, comparing it with the old one, finding a way out of the current situation, destroying the hardened dogmas and cleaning up the necessary pathways for further actions and developments in the development of thinking.

**Second**, non-traditional approaches to solving complex issues are developed during the discussion process, concrete practical proposals are put forward, generalized, and the initiatives put forward are evaluated.

**Thirdly**, the controversy raises interest in economic and social processes in the participants, helps to identify the political motivations and positions of the speaker, demonstrates the ability to resist hidden injustices, teaches to critically analyze the opinion of the opponent or to criticize his or her wrong behavior.

**Fourth**, debates stimulate social activism in people, increase interest in change in their work and country, increase mutual demand, self-criticism, and form a reflexive ability to control the execution of concrete decisions. Indeed, it is "the subject of reflection in reflexive thinking that requires a deeper understanding of the problem in the range of human-world relations" [6,p.232]. Therefore, heads and leaders of many state and public organizations strive to learn the principles of collective research on complex issues, to understand the essence of the mechanism of verbal conflict, and the psychology of debate. "It should be clear to all of us that where indifference and indifference prevail, where the most pressing issues are left to selfishness, spirituality becomes the weakest point. And vice versa-where sobriety and vivacity, high intelligence and contemplation prevail, where spirituality becomes a powerful force" [7, p.115-116] .

Therefore, the need for the integration of scientific debate in the system of socio-political life can be considered on the following four principles:

- The **first principle** is the need to ensure the emergence of alternatives. Its logical basis was the method of analysis. In this case, the phenomenon of dividing the whole into components, breaking it into pieces, looking at something from all angles and studying it is observed. As long as there is no alternative, then there will be no analysis, no method for scientific research. Without the study of alternative, the debate loses its essential features as a dialectical method. One of the necessary conditions of the dialectical method is that contradiction is the source of

diversity of thought, the main condition for the development of thinking. Such contradictions, on the other hand, are the result of a clash of alternatives. As non-alternative thinking becomes a reflection of loneliness, the dialectical method thus loses its meaning. In this case, the pluralism of ideas is removed as a starting point, resulting in a formal limited “unity”. In this case, the mechanism for resolving the contradictions is lost. In this case, the method works in an interrupted form.

The first principle determines that people are ready for confrontation, understand other approaches, new ideas, tolerant attitude towards confrontation. Each party has an equal right to demand the truth and to promote initiatives. To ignore this principle is to eradicate new thinking, to deprive the solution of the problem of its own dialectic from the beginning. Ignoring this principle results in the following: Leaders who are able to resist dogmatic views will not rise. As a result, many people develop a fear of new ideas and a desire to follow the same lifestyle. In their view, centralized power remains the most rational system of government. However, in a society where ideas are based on a single source, maximum uniformity is achieved, and the ideals in it are transformed into genius and worshiped. As a result, monism inevitably leads to the conservatism of most people. Ultimately, ignoring the first principle leads to neglect of creative individuals, suffocation of initiatives, persecution of the opposition, monopoly of a single thought.

- **The second** principle unanimously warns of the danger of unreasonable unity. Such unanimity leads to complete agreement, unconditional affirmation, adherence to an embedded way of thinking, blind faith. Although consensus is a concept close to consensus, they are achieved in different ways. Consensus in the discussion is a product of the struggle of ideas. Unity avoids struggle and competition. If, as a result of the analysis, the parties come to a common ground in many respects interrelated contradictions, then it is considered that a legitimate transparent step towards the truth has been made. Therefore, synthesis is the logical basis of the second principle.

The second principle requires all participants in the discussion to be vigilant against the absoluteness of monism. Underlying such an approach will be hidden the conditions that lead to the stagnation of thinking. The second principle is that there should be no monopoly on reality. Therefore, the right of a free-thinking minority to the truth must be equal to that of others. The second principle ensures the prevention of serious mistakes, the fight against the manipulation of the mind, creates an environment for criticism. On the contrary, any dominant idea pretends that everything is fine, that there are no obstacles in life. But in the end, such an idea will face a crisis.

Ignoring the second principle results in the formation of a state of slave psychology, careerism, habituation in society. People lose their social activism, they become indifferent observers and owners of stereotyped thinking. Favorable conditions are created for the formation of stereotypes of dogma and cult of personality. Thoughtless unity is an echo of people’s desperation. This is the consequence of blind faith.

**The third principle** embodies constructive criticism. Criticism and self-criticism are a way of identifying contradictions. The word “criticism” in the context of the debate means denying the interlocutor’s erroneous conclusions and defending the thesis. Contradictions in the discussion are resolved through speech analysis, opposition analysis. In criticism, the law of negation of dialectics is manifested. This law is the driving force of progress and development. Indeed, “the

development of knowledge and the renewal of the worldview take place in the process of denial and inheritance." [8, p. 525]

The third principle explains the need to check the purity of any alternative force, to eliminate false arguments, to actively defend the truth, to eliminate stereotypes in thinking, to prevent the spread of false ideas. Only criticism can resist sophism and demagoguery. While constructive criticism explains not only 'no' but also 'why not', in this way it shows the invalidity of the thesis, the failure of the argument. This is the basis of the constructive approach to the debate.

The third principle defines the possibility of eliminating errors in discussion, preventing the defeat of proof, protecting oneself from errors and unfounded conclusions, and promotes the development of critical thinking. The consequences of ignoring this principle are serious. A person may not suddenly be convinced which of these alternatives is right, and as a result may adopt a nonsensical idea at the beginning of the activity.

Many leaders avoid arguing because it will be difficult to "transfer" the raw idea into a mature team. If a leader is outside the realm of criticism, he or she will not even feel responsible for his or her unreasonable decisions. Lack of mutual control leads to all kinds of offenses. As a result, it will lead to obscene ways of resolving disagreements and contradictions: slander, corruption, slander, deception, anonymous letters, provocations. Without constructive criticism, science, economics, and eventually life will begin to stagnate, and transparency will not be possible. The third principle precludes people from blindly believing in something.

**The fourth principle** explains the need to ensure the social security of the individual. In a society ruled by leaders instead of laws, transparency and freedom of speech, whose security is not guaranteed, are easily suppressed. We know that during Stalin's repression, many were even deprived of their lives for expressing their free will. This principle is the principle that determines the adoption of laws and norms that guarantee the right of a citizen not to be oppressed and protected from criticism.

The Constitution of the Republic of Uzbekistan provides for the protection of the requirement of the fourth principle within the law, ie in Uzbekistan "Everyone has the right to freedom of thought, speech and religion. "Everyone has the right to seek, receive and impart information of their choice, with the exception of information directed against the existing constitutional order and other restrictions established by law." [9]

In a democratic state based on the rule of law, the principle of "idea against idea, thought against thought, enlightenment against ignorance" must be applied. Because, "it is possible to argue with the idea only against the idea, against the idea only against the idea, against ignorance only with enlightenment." [10]

## CONCLUSION

Debate plays an important role in discussing social issues and making the necessary decisions. The existence of debate can be assessed as an indicator of the realization of democracy. "The evolutionary path of development chosen by Uzbekistan requires a democracy based on a political and legal culture. Democracy must be introduced not by artificially accelerating and exporting, but by shaping the need for it. The formation of the need for democracy requires a developed political and legal culture of society. In other words, for democracy to exist, there must be people who are able to live in a democracy." [11, p.90]

These and other examples show that the discussion of social problems and the development of society can be ensured not only on the basis of the collapse of the old and the resolution of the new, but also through the dialectical unity of contradictions, that is, through dialogue. Indeed, "understanding dialogue through socio-cultural relations is necessary for a deeper understanding of the essence of the radical changes taking place in our society today, to see the future, to understand the mentality of our people and bring it into line with modern requirements" [12, p.112].

## PSYCHOLOGICAL CHARACTERISTICS OF INTERACTION IN FOOTBALL TEAMS (ON THE EXAMPLE OF CHILDREN AND TEENAGERS SPORTS SCHOOL)

**Sultonov Baxtiyor Abdumurodovich\***

\*Head of the Department of Methods of Teaching Sports,  
Faculty of Physical Culture,  
Jizzakh State Pedagogical Institute, Jizzakh, UZBEKISTAN

### ABSTRACT

*A football game is a team game that helps team members develop qualities such as mutual understanding, good understanding, and team communication.*

**KEYWORDS:** *Football, Physical Education, Coach, Training, Style, Endurance, Endurance, Team, Role, Game, Teamwork, Speed, Interaction*

### INTRODUCTION

Team play involves the collaborative actions of all the players on that team. The main goal of team action is to organize the actions of all players and subordinate them to a single idea in order to achieve success. Collective action is organized using different systems. The placement of players in a team system is ultimately determined by their responsibilities in relation to the various game functions they perform. It facilitates competition with the team opponent through the use of certain communication systems. One of these systems is these mutual team ball transmissions. Mutual ball passes are the interaction of players in which one player passes the ball to another. Transmissions serve as a kind of intermediate link between individual and team movements in football. The player demonstrates his or her personal skills by deciding who to pass when and how, and implementing the decision made. At the same time, the transfer is a means of interaction of 2-3 athletes, that is, the implementation of group actions.

### MAIN RESULTS AND FINDINGS

Football belongs to the group of team sports. For him - the activity of the movement, aimed at defeating the opponent in teamwork with partners.

Given the fact that external signals change quickly and differently, football places high demands on the psyche of the player.

Hence, a good adaptation of the psyche to the various influences of the external environment; the ability to move and play skills in a creative approach based on anticipation of the actions of the opponent or partner. Football requires creative tactical thinking, the ability to play a combination game, as well as teamwork, discipline and self-control [1, 32].

The success of the defense depends not only on properly executed precautionary actions, interchangeability and mutual agreement of teams of players, but also on the ability of the defender to move individually against the player playing with and without the ball, i.e. how well the defender chooses the situation in relation to the player he is chasing. The correct choice of position is a guarantee of success of defensive actions [2, 45]. It follows that the interaction of the team and the resulting unity movement is a key factor in winning in football. The coaches of young football players, who are brought up in children's and youth sports schools, also absorb the interaction in these football teams.

In a football team, individual tactical moves in defensive mode include attempts to resist a player with and without a ball [1,27].

Actions against a player without a ball.

When moving against a player without a ball, the defender tends to:

- a) to prevent the opponent from taking possession of the ball, ie to "close".
- b) possession of a ball intended for an opponent.

Coaches teach young players in children's and youth sports schools this "closure" from an early age. Closing is when a defensive player changes his position on the field to make it harder for the opponent to take possession of the ball [1, 53].

To close the opponent, the defender must take a position between his goal and the player. The distance between the defender and the striker can be shortened or increased as the ball and the player move closer or farther towards the goal [2, 59]. The position also depends on the defender's running speed, the strength ratio of the couples fighting alone, and other factors.

Coaches teach ball communication between teams to form team communication. Capture of a ball is an action performed by a player on the defensive team to seize a ball passed to an opponent near the defender. Their success depends on the ability of the defender to choose the right situation, timely approach to the ball, assess the situation, speed. Usually, the distance between the defender and the striker is higher than when the ball is in possession. This is due to the fact that the defender is the active side in this situation and manages to move in the direction of the probability of the ball flying [3, 87-88].

Most of the tactical tasks that occur during a football game are solved using combinations. A combination is the action of 2 or more players who solve certain tactical tasks. This in turn serves to shape team communication [3, 90].

A football game consists of combinations and a chain of actions against them. Combinations can be pre-prepared and improvised during rehearsals, i.e., exactly during the game.

Each team consists of links, i.e. tactical units, which solve tactical tasks in interaction at certain stages of the game. Moving all the participants of the combination in a mutually agreeable way can lead to success [4, 69].

Each team consists of links, i.e. tactical units, which solve tactical tasks in cooperation at certain stages of the game. Moving all the participants of the combination in a mutually agreeable way can lead to success [4, 75].

As a result of playing sports, a person develops psychological structures. Knowledge, skills, abilities and habits are psychological structures. They develop and prosper throughout a person's entire life. For example, an engaged player (student, child) is associated with the ability to use their will-ideological, theoretical and practical knowledge, sports equipment and weapons during training; acquires and develops skills and abilities, habits of strict obedience to sports discipline.

The object of educational work carried out by a physical education teacher and a football coach is a certain person, a person. To nurture a disciplined, decent player who is part of a team, the coach must learn him as a person.

It is desirable that the coach of the football team and the athlete involved (student, child) know not only the psychology, but also the psychology of the sports team [6, 88].

Community psychology is the environment in which a particular group of children and adolescents are brought up in sports schools, their spiritual world. In the context of physical education and sports, a team, a group, a circle can be an example of a team [7, 98-99].

Thoughts, moods, relationships, traditions, needs and requirements constitute community psychology.

It should be noted that the psychology of the football team has a great educational and ideological impact. If a team unanimously condemns an athlete (student, child) who violates football discipline, an unscrupulous practitioner, this practicing player (student, child) will certainly change his or her attitude towards his or her sport and his or her duty. But, unfortunately, sometimes an unhealthy environment, unhealthy mood and interactions prevail on a football team. A physical education teacher and a football coach can prevent these negative changes by studying team psychology [7, 108-109].

1. Psychological processes - an event that consists of the emergence of mental phenomena, a legally consistent change and the transition from one stage of development to another, in which qualitative changes occur.
2. Psychological features are the main components of a person as a person, without which he can not perform any activity,
3. The relatively strong qualities that are formed in the process of human life are called psychological structures.
4. Psychological state is a person's positive and negative emotional experiences, which express his attitude to things and events in objective reality, to himself.

As an official organization, the football team will have specific tasks that both the coach and the sports team have been striving for since its inception. Fulfillment of the set tasks requires the activity of the coach and the team members to interact, to concentrate their efforts, to establish

formal contacts. "...During this process, the relationship between the participants of the joint activity is established, maintained and changed" [5, 64].

The formation of interpersonal relationships in football teams takes place on the basis of general laws in official organizations and goes through a complex, always non-directional path, which can be divided into several stages:

- the emergence of demand and its perception;
- the transformation of the need into a constant interest in this or that activity, satisfying the emerging need;
- compare their capabilities with the requirements of the activity to be met to meet the needs;
- formation of behavioral motives aimed at the search for activities that are able to meet the emerging needs.
- Establishing a relationship between the coach and the athlete in the process of activity, the emergence of a formal relationship that is able to meet the needs.
- The emergence of sympathy, friendship, common interests and interests on the basis of formal relations, the formation of informal relations [6, 64-65].

Each such relationship is further divided into formal and informal relationships.

The formal structure of the team occurs in the training process and in competitive activities. It is assumed that the correct adherence to the rules and instructions by team members will ensure that they meet the needs of their personal, coaching and superior organizations. However, in order for a team to function successfully as an official organization, it must have in its structure a "degree of freedom" based on certain "allowances" and preferences. These unintended, spontaneous interactions, behavioral norms, are called informal relationships in psychology.

As a result of performing such a complex activity, a player falls into various casual situations throughout his football life, and the success of overcoming them is directly related to the success of the activity itself. It is also possible to visually diagnose the presence of conflicts between players. Such a possibility was suggested by such scientists as V. Paranosich, L. Lazarevich. According to them, the destructive competition in the football team is accompanied by a number of characteristics that are manifested in communication and joint activities. These include trying to convince a player that another player is worse prepared than him, using non-sporting actions during training by the player, not trying to achieve his own success, but the athlete's joy at defeating his opponent, and so on. In a sports team, such situations can be explained by unresolved conflicts, destructive interactions between team leaders and leading players [5, 79-80].

In this regard, it is important to take measures to correct the behavior of leaders. According to Yu.L.Khanin, it is necessary to develop a program of correction of the actions of the coach and the team leader in conflict situations with the formation of the ability to deal effectively. To create such a program: to observe the process of behavior, to identify moments of unwanted behavior in leaders, to know to whom his behavior is directed, to study the psychological picture of such conflict situations through questionnaires and individual conversations, to discuss with the leader his behavior in crisis situations It is very important to explain its negative effects.

Students in children's and adolescent sports schools are usually in their teens. The age characteristics of these students require the right choice of their methods and means in making the right impact on the developing individual for their uniqueness. Addressing the principle of the individual approach implies that the pedagogical impact is appropriate to the player's capabilities, strength, and life experience. Therefore, it is necessary to take into account the physical, emotional, intellectual development of young people. Children, especially adolescents, grow up very quickly. It is very important for the teacher not to ignore the opportunities of complication that can occur in the implementation of different types of tasks, assignments that require maximum responsibility, spiritual zeal and whole will to achieve the goal [5, 40]. It is important to remember that within the same age, each person is unique in his or her inner world. It is a world of personal passions, passions, demands, thoughts, aspirations. That is why the educational process should be based on the individual characteristics of students. At the same time, it is necessary to create opportunities for the emergence of new, more valuable passions and needs, taking into account existing individual characteristics [5, 41]. In order to form young players studying in sports schools for children and adolescents as a single team, it is necessary to conduct separate psychological conversations with each of them, to prepare them as a garden of the team in case of their inner world.

## CONCLUSION

Bringing up a young player in a team is one of the leading principles of upbringing. Physical education pedagogy provides a wide range of opportunities for a teacher or football team coach to choose ways to address them. All forms of physical education of young players studying in children and youth sports schools, their content have great potential in the formation of social qualities of the individual. The organization of various competitions, the use of games and relays in the classroom, this important principle of physical education pedagogy can be successfully implemented in practice. It is only necessary to create situations of mutual responsibility and interdependence. This is achieved in a variety of ways.

In the first case, it is the responsibility of class activists to the community on physical culture. In another situation - the responsibility of one or two members of the team to the whole team. In the third case, it is the responsibility of all members of the team to its representatives. The coach's concern is not only the formation of a working relationship ("You have to"), ("We charge you"), ("You are responsible for this"), ie organizational and executive relations, but also care, kindness, compassion, mutual understanding relationship should also be. Only in these conditions can harmony emerge within the team and in personal relationships.

## **LACUNAS IN UTKIR HOSHIMOV'S "THE AFFAIRS OF THE WORLD" (FROM CHINESE TRANSLATION EXPERIENCE)**

**Valieva Noiba Abboskhanovna\***

\*Lecturer,

Uzbek-Chinese Institute named after Confucius,  
Tashkent State University of Oriental Studies,  
Tashkent, UZBEKISTAN

### **ABSTRACT**

*In this article, the Uzbek people's writer UtkirHoshimov's work "The affairs of the world" focuses on the issues of translation, the image of the Mother in the novel, the words and lacunas that express the traditions of our people, and briefly gives information about the types and methods of translation.*

**KEYWORDS:** *Literary Translation, Lacuna, Types Of Literary Translation, Hizr, Mentality, Translation Studies.*

### **INTRODUCTION**

"All mothers in the world are very similar in their treatment of their children. So, this work is dedicated to you, dear Mothers!" Influenced by the above verses written by the author in the introductory part of the work, we decided to translate this story about Mother. Of course, no matter what society or country a person lives in, it is the Mother who always cares for him, nourishes and supports him from childhood. Indeed, the mother is valued by people of all nationalities, regardless of language or tradition. From the point of view of the mentality of the Chinese people, the country of the East, history has shown a special respect for the cult of Mother. The translations of literary works have an important role in the further development of friendly relations between the two peoples and in the deepening of the way of life of the two peoples.

### **THE MAIN RESULTS AND FINDINGS**

Today's process of globalization shows that the literature of a particular nation cannot be studied separately, whether it is literary studies or translation studies. This is because literature today is a universal treasure, created as a result of the interaction of the literature of different nations and

peoples. Translation studies play an important role in this regard. The founder of Uzbek translation studies Gaybullat Salomov said: "The essence of the translation process is to find alternative means of language in order to preserve the unity and integrity of the form and the content reflected in the original. In addition, selecting the most alternative and appropriate option among the several options available to translate the content of the original in another language is also one of the main requirements of adequate translation. Finding these alternative language tools and choosing the appropriate one requires conscious effort from translator." Lacuna (Lat. Lacuna - a broken place in the concept, a gap, hollow; French. Lacune - a gap, a deficiency) - in linguistics in the lexical system of a language is the absence of a word expressing a meaning, that is a lexicon without equivalent.

The term 'lacuna' was first coined in the scientific literature by Canadian linguists J.P. Vinet and J. Darbelnet, who commented: "The state in which the meaning of one word does not exist in another language"

O.A. Ogurtsova, in turn, gives a new definition of lacunae: "A lacuna is a grammatical category expressed by a word or a phrase (free and phrase logical combinations) that exists in one of the languages being compared and in the other doesn't

"Lacunae are formed because denotative semaphores in different languages cannot be fully equivalent. This can be explained by the fact that the name of a concept or thing does not exist in the second language in one of the compared languages.

"Lacunae are a phenomenon common to all languages of the world. This condition is called lacunae, which is caused by a complete mismatch of denotative semantics in different languages."

"Thus, the process of translation is a process of taking into account mental-psychological factors and lexical-semantic features, creative understanding of the text and reconstruction at the level of originality, which is primarily aimed at identifying non-equivalent lexicon.

In order for the translation to be understandable to the reader, it is necessary to be able to choose a right word or alternative word in the second language, the meaning of which is reflected in the original. That is why it is important to explain and quote lacunae in translation studies, that is, in literary translation.

As in any language, the Uzbek language has a lot of words that are specific to traditions and myths. During the translation process, it is important to convey the above aspects correctly to the reader.

.Consider the following sentences from the short story "ErmonBuva":

- **"Good morning, grandad"**, - he greets.
- *"Good morning" said Ermon calmly - Still, his voice doesn't sound serious: his voice as thin as a woman's, but extremely kind. Every time I see him, I remember Khizr told by my mum. Because Grandpa Ermon's hair, beard, and even the eyebrows that turned to his eyes were white. He wears a long white jacket. Grandma Habiba always washes and irons her clothes. The hairs on his chest, which are visible from the collar of his jacket, are also white. Only two faces are bright red. According to my mother, Kind people's face shines like angel. I don't know what an angel would look like, but I love Grandpa Ermon. I love him so much.*

- “你好！乖孩子。”虽然他的声音像女生一样尖细但他很善良。

- 我每次看见他就想起来妈妈讲的黑泽尔。因为艾芒爷爷的头发、胡子、连眉毛也白色的，穿白色的袍子。哈比芭奶奶总是洗干净、熨好他的袍子。他全身都是白色的，只两个面颊是红色的。用妈妈的话来说，艾芒爷爷就像天使一样。我不能想象天使怎么样，但我喜欢艾芒爷爷，很喜欢。

- “Nǐhǎo! Guāiháizi.” Suīrántā de shēngyīnxiàngnǚshēngyīyàngjiānxiáidàntāhěnshànliáng.

- Wóměicìkànjàntājiùxiǎngqīlámāmājiǎng de hēizéěr. Yīnwèiàimángyéyede tóufǎ, húzi, liánméimáoyěbáisè de, chuānbáisè de páozi. Hābībānǎinaizǒngshìxīgānjìng, yùnhǎotā de páozi. Tāquánshēndōushibáisè de, zhǐliǎnggèmiànjiáshìhóngsè de. Yòngmāmādehuàláishuō, àimángyéyèjiùxiàngtiānshǐyīyàng. Wóbùnéngxiǎngxiàngtiānshǐzěnmeyàng, dàn wǒxǐhuānàimángyéyè, hěnxǐhuān.

The word "Khizr" is used in the sentence, and we have explained it to make it clearer to the reader. Khizr, Hazrat Khizr, Khizr Buva, Khizr Elijah is a pious person mentioned in the Qur'an as "the servant of Allah". Khizr is interpreted in sources and oral narrations as a prophet, a great guardian. His real name is Umriya. It is said that he will live until the Day of Judgement. Here is a brief summary in Chinese:

他是一个先知。根据传说他是个永生不死了，住在各个地方。他总是帮助没有钱的人

Tāshìyīgèxiānzhī. Gēnjùzhuànshuōtāshìgèchéngyǒngshēngbùsǐle, zhùzàigègedìfāng. Tāzǒngshìbāngzhùméiyǒuqián de rén

Apparently, this word is also a lacuna and is common among the peoples of the Muslim East, including Central Asia.

In the following short story "Comfort" shows a conversation between author and gravedigger:

You see, 'said the old man thoughtfully,' it rained that night. It didn't stop until we buried him in the grave. As we buried him, the sun shone brightly.

The Uzbek reader may understand what gravedigger means by this, the subject of the conversation is the mother, but it will be incomprehensible to the Chinese reader. At this point, in the process of translating into Chinese, it is necessary to approach some additions and explanations. For example, by adding the word "mother" to the sentence, it is possible to convey the full meaning to the Chinese reader.

“你看，他小声地说——你妈妈去世那天下了大雨，送葬以后雨就停了太阳出来了。”

Níkàn, tāxiǎoshēng de shuō—nǐmāmāqùshìnèitiānxiàledàyǔ, sòngzàngyǐhòuyǔjiùtíngletàiyángchūlái.

Showing that even nature mourns the death of a mother can only be conveyed to the reader through comments in the translation. The phrase "It did not rest until we put him in the grave" has a deep meaning, and translating it into a single sentence can weaken the meaning of the situation. Therefore, the process of translating into Chinese requires skills such as various additions,

explanation of customs, and the appropriate use of comments in the correct delivery of spiritual experiences. That is why we have given the following quote.

乌兹别克传统如果葬礼时下雨表示亡者是好人。

*Wūzībiékèchuántǒngrúguǒzàngrǐshíxiàyuǎbiǎoshìwángzhěshìhǎorén.*

Another sentence from the above novel:

*Dressed in a white cottonyaktak(jacket) and with a grey beard, he stood up after blessing on his face:*

- *That's it, son! Take care about yourself. That's the way the world works*

- *He remains silent for a moment, and added: -your mother was very kind. she didn't lie in bed, she didn't bother anyone ... Not everyone dies like this.*

... 有一个穿着无领白衬衫(yaktak), 留白胡子的老挖墓人说阿门(把双手放在面前) 就站了起来 :

“别哭我的孩子，不要那么伤心。在这个世界上每个人最终都要去世。生活就是这样，没办法。” 他想了一会就接着说“你的妈妈，是真正的好人。她死临死都没得病，没依靠别人.....她走得很安详。

*...Yǒuyīgèchuānzhuówúlingbáichènshān (yaktak), liúbáihúzi de lǎowāmùrénsuǒāmén (bǎshuāngshǒufàngzàimiànqián) jiùzhànleqǐlái:*

*“Biékūwǒ de háizi, biùyàonàmeshāngxīn. Zàizhègeshìjièshàngmǐgèrénzuìzhōngdōuyàoqùshì. Shēnghuójiùshìzhèyàng, méibànfǎ. ” Tāxiǎngleyīhuìjiùjiēzhesuō “nǐ de māmā, shìzhēnzhèng de hǎorén. Tāsìlǐnsǐdōuméidébìng, méiyīkàobiérén.....tāzǒudéhěnānxiáng.*

*In order to make it clearer to the reader during the translation of the phrase "with a blessing on his face"thereris a definition: “把双手放在面前”*

Yaktak (jacket) – 乌兹别克族的男子传统衣服无领，无袋,平时白色的衬衫.

*Wūzībiékèzú de nánzǐchuántǒngyīfúwúling, wúdài, píngshíbáisè de chènshān.*

Yaktak(jacket) –(one layer, unlined clothing) long, open chest, men's jacket.

At the same time, as mentioned above, we have tried to convey the original meaning, avoiding literal, colloquial translation in order not to weaken the meaning. We used the word "Volidaimehriboningiz " to mean "mother" 妈妈 *mama* because it is the main word in Chinese. In the Uzbek language, we can replace "Volidaimehriboningiz to other synonymslike "volidaimehribon" , "ona" , "oyi" and others. Besides, the phrase "xo'pyarlaqaganodamekanlar" was translated “是真正的好人» (good man), that's why reader can understand the meaning easily. The last sentence, "Bunaqabeozoro'limharkimga ham nasibetavermaydi" ("Such a harmless death is not for everyone,") is a true Uzbek sentence, so we translated it without distorting the original meaning. “她走得很安详”.

There are also words that reflect the customs, traditions, and dress of each nation, which cannot be directly translated into other languages. That is why in the above sentence we have given a special explanation to the word “yaktak”.

There are also place names in the translation process, and we translated some of them and left some in Latin. For example, in the novel "Two Legends", the author encounters the word "Dombrobod" in a conversation with his mother, and the Uzbek reader immediately understands the name of the place and where it is, but for the Chinese reader it is a completely unknown word. We also gave a brief explanation:

- Is Tashkent a big city?
- It's a big city.
- Is there any bigger one than that?
- Maybe, but you have to love Tashkent to love those cities. If you want to love Tashkent, love our Dombrobod, OK?
- “塔什干是大城市吗？”
- “很大的城市。”
- “比塔什干大的没有吗？”
- “可能有。如果你想喜欢大城市，先要喜欢塔什干。要是想喜欢塔什干，先要喜欢Do'mbirabod（塔什干一个小区的名字），要喜欢我们的胡同，好吗？”
- “Tāshéngàndàchéngshì ma?”
- “Hěndàdechéngshì.”
- “Bǐtāshéngàndàdeméiyǒuma?”
- “Kěnéngyǒu. Rúguǒnǐxiǎngxǐhuāndàchéngshì, xiānyào xǐhuāntāshéngàn. Yàoshìxiǎngxǐhuāntāshéngàn, xiānyào xǐhuāndo'mbirabod(tāshéngànyīgèxiǎoqūdēmíngzì), yàoxǐhuānwǒmēndehútòng, hǎoma?”

Another example can be seen in the novel “Gilampaypoq”, in which the words "Juba" and "Jurabi" belonging to the third language are left in their original form without being translated into Chinese.

*Every year when I go on vacation, I bring carpet socks to my mom. It can be found in the Caucasus. They call it “juba” or “jurabi”. My mother prays at length, as if she got something unique. He brags to the neighbors that he has such a loving son. Her leg is sick. It swells and hurts when it gets cold.*

我每年夏天去疗养的时候都会给妈妈买一双羊毛袜。在高加索那边有各种各样的袜子。那儿的人把它叫做“Juba”或“Jurabi”。每次看到妈妈都会像得到宝贝似的感谢真主。她向邻居吹嘘，告诉他们她有一个好儿子。因为她有老寒腿，每当变天时都会腿疼。

Wǒměiniánxiàtiānqùliáoyǎng de  
shíhòudūhuìgěimāmāyīshuāngyángmáowà.Zàigāojiāsuǒnàbiānyǒugèzhǒnggèyàng de  
wǎzi.Nà'ér de rén bātājiàozuò “Juba” huò  
“Jurabi”.Měicikàndàomāmādūhuìxiàngdédàobǎobèishì de gǎnxièzhēnzhǔ.Tāxiànglínjūchūxū,  
gàosùtāmēntāyǒuyīgèhǎoerzi. Yīnwèitāyǒulǎohántuǐ, měidāngbiàntiānshídouhuìtūitēng

As in most Eastern countries, the Uzbek people have a variety of rituals and superstitions. We came across lacunae many times during the translation. Of course, the Chinese also have different myths, customs and rituals, some of which are familiar or close to us, some of which are completely different.

In this sentence, "Therefore, there were from the feathers of a blue crow to a celosia the nail in the kitchen ...". We have tried to preserve the original meaning so that the meaning of the situation in the sentence does not fade, and commented as follows:

备注：这就是迷信或个人建议此处最好加以说明。挂蓝乌鸦的羽毛是为了避邪。

Bèizhù: Zhèjiùshìmíxìn huò gè rén jiàn yì cǐ chù zuì hǎo jiā yǐ shuō míng. Guà lán wū yā de yǔ máo shì wèi le bì xié.

*Note: There is a superstition or personal advice, and blue crow feathers are hung to ward off evil.*

"Literary translation has many requirements, such as re-creating the author's style, preserving the rhythm and intonation of the work, reflecting the speech of the characters with their naturalness, giving national color, finding alternative variants of phraseology, expressing dialectal features. They show that the translator really has a decisive status.

## CONCLUSION

- There is no culture completely similar to each other;
- There is no alternative vocabulary within two languages, as there is no completely similar culture;
- Lacunarity occurs mainly in lexemes expressing nationality and customs;
- In the process of translation, quotations and comments play an important role in conveying the lacunas to the representative of another language.
- From the above considerations, it is clear that languages, cultures, concepts are different, but human feelings are never different, especially motherly love is the same all over the world.

We all know that the Uzbek and Chinese people's have always been in good relationship. Just as there are similarities between these two peoples, there is uniqueness in their daily habits, living conditions, expressions, and attitudes toward the family. The play covers the daily life of the Uzbek people. We hope that our translation work will contribute to the further rapprochement of the Uzbek and Chinese peoples in the future.

## BASIC STAGES OF DEVELOPMENT OF PERSONAL CONSCIOUSNESS

**Mamaradjabova Bogzoda Abdilkhakimovna\***

\*Lecturer,

Termez State University, UZBEKISTAN

Email id: Obshir1982@umail.uz

### ABSTRACT

*The main link in the development of consciousness is the formation of self-consciousness. It helps a person in many ways, for example: to reflect the world; to know and experience the inner world. Throughout a person's life, under the influence of a large number of social influences, his image of "I" develops. The article presents the stages of development of personality self-awareness during the period of ontogenetic development.*

**KEYWORDS:** *Personality, Self-Consciousness, Stages Of Self-Consciousness, "Image-I", Elements Of Consciousness.*

### INTRODUCTION

Self-awareness is the ability to introspect and recognize oneself as a person separately from the environment and other persons. While consciousness learns its environment, body and lifestyle, self-awareness is an acknowledgment of this awareness. Self-awareness as an individual consciously knows and understands his character, feelings, motives and desires. Self-awareness is understood as a psychic phenomenon, a person's consciousness of himself as a subject of activity, as a result of which a person's self-image is formed into a mental "image-I". A child does not immediately realize himself as I; during the first years, he himself very often calls himself by his name - as those around him call him; at first it exists for itself rather as an object for other people than as an independent subject in relation to them [1].

### METHODS

The link in the development of consciousness is the formation of self-consciousness. It helps a person in many ways, for example: to reflect the world; to know and experience the inner world. The main functions of self-consciousness are: human access to the causes and results of actions; understanding of oneself, self-esteem.

With a negative assessment, a person can engage in self-improvement, self-development, include protective mechanisms, i.e. eliminate traumatic information that develops internal conflict. When the subject perceives himself as an individual, he acquires a special protective function - the desire to protect his individuality from the threat of its disappearance.

Self-consciousness in psychology can be called differently, for example, the image of "I", self-image. It is considered not an inborn sign, but acquired. Throughout life, a person under the influence of a large number of social influences develops his image of "I". This psychological education, according to V.S. Merlin contains four elements of consciousness:

- distinguishing oneself from others;
- "I" as the active principle of human activity;
- Mental properties, emotional self-esteem;
- Social and moral self-esteem, self-esteem, formed on the basis of experience in communication and activity.

As you know, self-awareness is not the original fact inherent in man, but a product of development. However, the embryo of the consciousness of identity appears already in the infant when he begins to distinguish between sensations caused by external objects and sensations caused by his own body, the consciousness of "I" - from about three years old, when the child begins to correctly use personal pronouns. Awareness of one's psychic qualities and self-esteem acquire the greatest importance in adolescence and youth. But since all these components are interconnected, the enrichment of one of them inevitably modifies the entire system.

There are four stages (or stages) of development of self-awareness:

- The discovery of "I" occurs at the age of 1 year;
- By two or three years, a person begins to separate the result of his actions from the actions of others and clearly recognizes himself as an actor;
- By seven years the ability to evaluate oneself is formed (self-esteem);
- Adolescence and youth - the stage of active self-knowledge, search for oneself, one's own style. The period of formation of socio-moral assessments ends.

The formation of self-identity of a person as a member of society is affected by assessments of others and status in a group of peers, the ratio of "I-real" and "I-ideal," the assessment of the results of one's activities [2. 177].

## RESULTS

People know themselves through the development of self-awareness. This particular type of self-development refers to knowing one's body and mental state of the mind, including thought, actions, ideas, feelings and interactions with other people. "Self-awareness does not occur suddenly through one specific behavior: it gradually develops through a sequence of different behaviors, all of which are related to oneself."

Monitoring of their mental states is called metacognition. It is considered an indicator that there is some idea of oneself. It is developed on the basis of non-auto components using sensory

sources. By developing self-awareness through self-exploration and social experience, you can expand your social world and become more familiar with yourself [3. 4]

According to Emory University Philippe Roche, there are five levels of self-awareness that unfold at the beginning of development and six potential prospects, starting from "level 0" (without self-awareness), ahead of complexity "Level 5" (explicit self-awareness),

- Level 0: Confusion. At this level, a person has a degree of zero self-awareness. This person does not know anything about mirror reflection or the mirror itself. They perceive the mirror as an extension of their surroundings. Level 0 can also be displayed when an adult repels himself in the mirror, mistakenly taking his reflection as another person, for only a second.
- Level 1: Differentiation. A person understands that a mirror is capable of reflecting things. They see that the reflection in the mirror is different from what surrounds them. At this level, they can distinguish between their own movement in the mirror and the movement of the environment.
- Level 2: The situation. At this moment, a person can connect the movements in the mirror to what is perceived within his own body. This is the first hint of self-examination on the designed surface, where what is visualized in the mirror is special for itself.
- Level 3: Identification. This stage is characterized by a new ability to identify oneself: a person can now see that in the mirror is not another person, but in fact he is. This is seen when a child, turning to the mirror, turns to himself, how he relates to himself, looking in the mirror.
- Level 4: Persistence. Once a person reaches this level, he can identify himself outside the real mirror image. He is able to define himself in previous paintings that he looks different or younger. In addition, she feels a sense of "constant self."
- Level 5: Self-awareness or "meta" self-awareness. At this level, not only himself can be seen from the first person, but he is understood, that is, he is also seen by third parties. They begin to realize that they may be in the minds of other people. For example, how they are seen from a public point of view.

It should be borne in mind that the child, coming into this world, does not have the slightest idea about what is around them, about the meaning of others around them. Over the course of the first year, they gradually begin to recognize that their body is actually separated from their mother, and that they are "active, pathogens in space." By the end of the first year, they realize that their movement is separate from that of their mother. This is tremendous progress, but they are still quite limited and cannot yet know what they look like, "in the sense that the child cannot recognize his face." By the time the average baby reaches 18-24 months, he finds himself and recognizes his own reflection in the mirror, but in many African populations this does not happen until six years. He begins to recognize the fact that the image in front of them is himself. At the age of 24 months, the baby will observe and correlate its actions with the actions of other people and the environment. After the child has gained a lot of experience and time in front of the mirror, he is able to recognize himself in reflection and understand that it is him. Face recognition occupies a large central point in the development of their self-awareness. By the age of 18 months, the child can give his name to others [4. 144].

Self-awareness begins to form at the end of preschool age due to intensive intellectual and personal development. The child first acquires the ability to evaluate the actions of other people (most often close adults), and then his own actions, moral qualities and skills.

Self-assessment depends on the assessment of an adult, a teacher. An adequate image of "I" is formed in a child with a harmonious combination of knowledge gleaned from my own experience (what I can do, as I did) and from communication with adults and peers. The development of self-awareness in this period depends on the characteristics of family education. There is an awareness of his experiences, manifested in the fact that at the end of preschool age he is oriented in his emotional states and can express them with the words: "I am glad", "I am upset", "I am angry". Self-realization in time begins, that is, at the age of 6–7 years, the child remembers himself in the past, realizes himself in the present and imagines himself in the future: "when I was little", "when I grow up big". Rational components of self-esteem arise, awareness of some of their qualities and behavior, consistent with the requirements of adults. But despite this, the child judges himself superficially and optimistically. If he is asked to describe himself, then he will do this mainly from an external point of view: hair color, growth, favorite activities.

## DISCUSSION

Around school age, the child's awareness of personal memory becomes a sense of self. At this stage, the child begins to develop interests along with likes and dislikes. This transition makes it possible to realize the past, present and future of the individual in order to understand how conscious experiences are remembered more often. As preschoolers, they begin to give much more specific details about things. For example, a child will talk about the Los Angeles Lakers basketball team and the New York Rangers hockey team, instead of the baby only that he loves sports. In addition, they will begin to express certain preferences (for example, Tod likes mac and cheese) and will begin to identify certain possessions (for example, Lara has a bird (as a pet at home)). At this age, the child is in the Piage stage, name to the operational stage of development. The child is very inaccurate in judging himself, because he does not have enough ideas about his personality. For example, the child at this stage will not think that he is strong, has the ability to penetrate the jungle of the gym at school , and they will not be aware of the fact that they can solve a mathematical problem due to their ability to count [5.84].

Two special forms of self-consciousness appear successively: a sense of adulthood and the "I-concept." Feeling of adulthood - a teenager's attitude to himself as an adult, sensation and self-awareness to some extent as an adult.

There is interest in your inner world, and then there is a complication and deepening of self-knowledge. In other words, a teenager discovers his inner world.

Self-esteem in adolescence is low in its general level and unstable, but can be high (as a compensatory mechanism).

In the course of socialization, the person's relations with people, groups, society as a whole expand and deepen, and the image of his "I" develops in the person. The image of "I", or self-awareness (self-image) does not immediately arise in a person, but develops gradually, throughout his life under the influence of numerous social influences, and includes four components: awareness of the difference between oneself and the rest of the world; awareness of the "I" as the active principle of the subject of activity; awareness of one's mental properties,

emotional self-esteem; social and moral self-esteem, self-esteem, which is formed on the basis of the accumulated experience of communication and activity [6.].

Some begin to be aware of their emotions in their youth. Most children experience emotions such as shame, guilt, pride, and embarrassment from the age of two, but do not fully understand how these emotions affect their lives. Reaching 13 years, children get used to these emotions and begin to apply them in their lives. A study called "Building I" found that many teens show happiness and self-confidence among friends, but at the same time, hopelessness and anger among parents because of the fear that they will become disappointment. Teens also showed that they felt smart and creative among teachers, and shy and nervous among people they were not familiar with.

## CONCLUSION

In adolescent development, the definition of self-awareness also has a more complex emotional context due to adolescent maturity compared to those in the early stages of childhood, and these elements can be taken into account, but they do not limit their self-esteem. Self-concept and self-awareness in many other ways could refer to the final ROCHAT level of self-awareness, but they are still different in their own previous definition. Social interactions mainly separate the element of self-consciousness in adolescents, and not in childhood, and also in the future - developed emotional recognition skills in adolescents. Sanda, Pânișoară and Pânișoară demonstrate them in their work with adolescents and show that there is a mature sense of self-awareness among students who were 17 years old, in the future providing a clear structure with elements such as self-concept, self-esteem and self-awareness.

## THE PRAISE OF MOTHERLAND IN AZIM SUYUN'S POETRY

**Keldiyorova Naima Nabijonovna\***

\*PhD Student,

Institute of Uzbek Language and Literature and,  
Folklore of the Academy of Sciences of the Republic of UZBEKISTAN

### ABSTRACT

*The article explores patriotic motives as one of the leading themes in the poems of the talented poet Azim Suyun. The artistic means used in his poems about the homeland are studied in terms of the poet's skill.*

**KEYWORDS:** *Artistic Image, Aesthetic Taste, Artistic Interpretation, Poet's Psyche, Life Episode.*

### INTRODUCTION

The artistic image reflects the form of life and creates a general view of the world; there are scientific ideas in the way. Also, the poetic image is a multifaceted concept, which not only expresses the subject, but also reflects the attitude of the lyrical "I". It is no coincidence that Jan Parodovsky did not express a well-founded metaphorical idea that "image is the blood of poetry". Certainly, the only raw material for a poetic image is the word, the power of the word, the subtlety and expressiveness of the image, the power of influence. Azim Suyun is one of our brilliant poets, who deeply understood the poetic power of the word and poured his tender feelings on paper.

### THE MAIN FINDINGS AND RESULTS

The national anthem is one of the eternal themes of literature. The poet connects one direction of his work with the homeland, the motherland. In their work, the homeland has become a unique poetic image, expressing various symbolic and symbolic meanings. One of the main directions in the work of the sensitive poet Azim Suyun is the theme of the homeland. If we look at his work of the sixties and seventies, we see that this theme is manifested in various forms and expressions.

In the poems of the poet, the homeland is like a plane tree. Elsewhere, it is manifested as the attitude of a prisoner of war captured. In general, attention is paid to the fact that the theme of the

homeland is reflected in the unity of this country with the brave, heroic people. In the poem “Plane”, written in the early years of the poet's career, the image of the homeland is reflected in harmony with natural phenomena. While glorifying the homeland in the image of a maple, the poet uses the image of a storm to create a vivid landscape. A raging storm bends the branches of the plane tree and tries to destroy it. But because the roots of the maple are firmly attached to the mother earth, it stands proud and vigorous. Here, the images of maple and storm are symbolic, expressing the motive of love for the motherland.

Poem “Prisoner” by the poet also reflects the patriotic motive on such high scenes through such vital, lively episodes. The captive boy is about to be defeated spiritually by his enemies, who once tell him that he has lost his mother and want to see tears in his eyes. But “he was proud, proud head”. The next time the enemies said to him, “You have lost your way”, but this time the proud head of the prisoner did not bow to the enemies.

The avenger did not know the boarder,

They said you lost your homeland

And the last pain in his eyes -

They wanted to see tears,

Drops of youth ... A shield ... John was that age!

It should be noted that here the poet expresses the concept of homeland through a very moving and vital episode. The fate of the captive is tragic, but his brave heart prefers to die proudly rather than bow to enemies. Here the poetic look of the poet is also marked by the choice of the most characteristic, the most honorable images, which are the honor of the young man. After all, both the mother and the beloved are as sacred to the young man as the motherland. These three concepts are intertwined in art as if they were life itself, and one requires the other. The skill of the poet is that he combines the images of mother and beloved with the image of the homeland that comes after him. The proud head, which remains proud in the news about the mother and husband, turns to life after the news about the homeland where their image is harmonized. After all, both the mother and the beloved are immortal with the notion that they are only the motherland. Although this poem was written in the seventies, it is one of the most beautiful and timeless poems written on the theme of homeland.

There is a certain harmony between the poet's poem “Homeland” and the poem “Nakurt village”. Although the poem “Homeland” embodies the wisdom that “everyone loves his homeland” through two small scenes, in its essence lies the love for the motherland, the native land.

In this poem, which is based on dialogue, his brothers and sisters living in the mountains ask how the people living in the desert live. Next time, the desert people will question him:

“How do they live, my friend?

In the midst of a bloody mountain?”

Apparently, the poet expresses the concept of homeland in the poem through two vital episodes - the love of the place where he was born and grew up, through the admiration of those who live in the desert through the mountains, and those who live in the desert to get used to the conditions.

In the poem of the poet “Nakurt” village, this content is expressed in full. Nakurt is the name of the poet's native village. Located in the middle of the Nurata mountain range, this village is surrounded by ravines, and in the open springs of each ravine there is a paradise where clear waters flow. The poet dedicates all his beautiful feelings to the mother earth, where the blood of the umbilical cord was shed.

As we read the poem, we witness the poet's pen ending with beautiful images that are similar to each other. The poet's lyrical protagonist begins by acknowledging that rainbow-like thoughts are playing in the horizons of the lodge, and that there is a home, a mother, who was born and raised against the backdrop of these rainbow-like thoughts. In the following verses, the poet goes on to describe the village of Nakurt. The poet expresses in the shepherd's tongue the pride of the wings of an eagle flying in the wind, the love of the endless expanses in the language of a shepherd, the child of a gazelle playing like light on diamond rocks, the mountain waterfall singing the song of sparrows singing at the head of springs. the eternity of life, the song of a little bird singing on a branch of a lily, the song of a lyrical hero, the mountain girl combing her hair in the moonlight near a golden fountain, and finally the stone wall, the muddy heritage for grandfather's house, and so on. Because the poet's flawless childhood, the happiest days of his life were spent on this land.

But in the poem, the poet not only describes the beauty of this native place in harmony with nature, but also its glorious past, the brave people who fought tirelessly, glorifying the sacred notion of homeland. Thus, through the image of a small village between the mountains, it creates a generalized image of the homeland.

We see that in the early days of Azim Suyun's work there was a desire to express the concept of homeland in an integral connection with the country of birth. His poem “Under the Horizon” has the same content as the above poems. Here, too, the landscape of the homeland is depicted in harmony with nature. Familiar landscapes in the poem, big rocks standing on the horizon, spruce groves in the sky, fast-flowing streams in the valleys, late ripening vines clinging to the trees, springs singing in the vast expanse, turquoise sky above the head, roaring walnuts, in short, the eternity of nature. moment. And here is a vital scene that unfolds at this moment:

There is a low hut on the hillside,

In front of the sofa, on the sofa -

The shepherd's gourd, sign,

Breathing breath in the stone oven...

It is obvious that in the center of the poet's poems about the homeland the image of his native land, the native village, occupies a leading place. The poet goes from the smallest to the largest, from the concrete to the generalization, and thus manages to reveal the glory of the motherland.

In some of his poems, the poet tries to illuminate the image of the homeland through national heroes and great historical figures. We see one of such heroes in his poems depicting the image of JalaliddinManguberdi, who fought against the Mongol invaders, especially Genghis Khan. The poet's poem “JaloliddinManguberdi” is reflected as a piece of history. In the poem, the poet glorifies the concept of homeland in the image of Jaloliddin by poeticizing the vital facts of the historical battle between Jalaliddin and Genghis Khan on the Sing River.

It is known from history that Jaloliddin, who fought heroically against Genghis Khan with a small army, threw his mother, beloved wife and son into the river before retreating, and jumped into the river on horseback and sailed to the other side. This vital fact was the basis for the poet to create a beautiful poem in the spirit of patriotism about the homeland.

Describing these life scenes in the poem, the poet emphasizes how much Jaloliddin loves both his mother and his beloved wife and child. The poet describes the vital fact that underlies such behavior as follows.

After all, Chingiz, Chingiz sucked alive the heart of a seven-year-old baby

And this holiday is waiting for you too

Bad luck.

Stop!

No one can be given live now

Rather than being left in the hands of the enemy happiness to die free!

The poet JaloliddinManguberdi tries to describe the fiery cries in his heart, all his hatred and anger for his enemy with all his might. The poet recreates the facts written in the history books through the poetic verses in their full scale, with the weighty essence, through the influential verses. Most importantly, this historical fact raises the poet's socio-aesthetic position to the level of pathos expressing patriotic motives.

Here,

A squint-eyed enemy

He shouted ...

The river suddenly became ...

And Jalaliddin on an Arabian horse

Playing the sword

He shouted:

“Thank you!”

My parents are my country!

My children are the right of my country!

My people are the right of my country!

You give me strength, Allah!

It is obvious that the poet expresses the image of the historical hero JaloliddinManguberdi in the poem, the love for the homeland, the strong hatred for the enemy through grassy interpretations through the image of a dramatic moment in his life. Here, the image of Jalaliddin is portrayed as a savage, brave and courageous hero, as in life itself. Most importantly, the poet was able to instill in the essence of the heroism of Jalaliddin a high sense of patriotism.

## CONCLUSION

Azim Suyun's work is wide-ranging and consists of colorful themes. At the same time, the main themes of the poet's poetry are the leading themes of the motherland, nature and human relations, love and affection, love for parents.

The theme of homeland occupies a central place in the poet's poems and is imbued with high patriotic ideas. Motives of love for the motherland are reflected in the poems of the poet from different angles: from the great human love for the native land, the steppe, the mountains, the springs and the world of medicine, to the birds and mammals, to the whole of Uzbekistan and our people.

Accordingly, we see that the poetic images created by the poet range from a small artistic detail to the peculiarities of our country and its place in the world community, to the peculiarities of the national values of our people formed over the centuries.

In general, among the examples of Azim Suyun's works completed during the first ten to fifteen years of his career, we see that his poems, irrigated with high patriotic motives and rising to the level of national anthem, are combined with his poetic conviction and high confidence.

## FORMATION OF THE SKILLS OF PORTRAYING THE FUTURE TEACHER OF FINE ARTS IN PENCIL DRAWING

**Baymetov Botir Boltaboevich\***

\*Professor,  
Department of "Fine Art",  
Chirchiq State Pedagogical Institute of Tashkent Region,  
UZBEKISTAN  
Email id: bbb19530625@gmail.com

### ABSTRACT

*The article deals with the techniques and skills of painting in the training of highly qualified teachers in the field of high fine arts. It also discusses in detail the skills of ancient master artists to improve their skills by copying from popular works of art, education independently.*

**KEYWORDS:** *Fine Arts, Methodology, Visual Techniques, Technical Skills, Academic Task, Composition, Line, Construction, Method.*

### INTRODUCTION

Over the past three years, economic growth has been observed in the country as a result of socio-economic changes. These processes set the task for universities to train a new generation of personnel for the renewed Uzbekistan. The "Concept of Development of the Higher Education System of the Republic of Uzbekistan until 2030" of the President of the Republic of Uzbekistan lists the following problems in the field of ensuring the quality of education in the higher education system: the current qualification requirements, curricula and programs are not focused on the formation of practical skills in graduates in terms of content; work on training in cooperation with higher education institutions and customer customers is not effective, the participation of employers in the formation of the content of higher education is insufficient; students do not have the skills of critical thinking, independent search and analysis of information; practical training in manufacturing enterprises is not effectively organized, the level of qualification of trained specialists does not meet the modern requirements of the labor market [1, 2019]. One of the conditions for overcoming the above problems is to improve the quality of training of future specialists in the field of fine arts.

It is known that a thorough mastery of the theoretical foundations of fine arts helps the student to see and understand the laws of the structure of all forms of nature, to accurately describe what he sees, and thoroughly prepares for future pedagogical activity. But these are not enough to become a skilled artist-educator in the future. Research shows that even if a student understands and remembers the basic theoretical principles of drawing from nature, there are cases when he is unable to apply the theoretical and practical knowledge he has acquired in practice. Therefore, in addition to theoretical knowledge, he must also have executive and technical skills to be able to depict in the fine arts. Technical skills are just as important to an artist as a young child who goes to high school needs to know the letters when writing calligraphy [2, 2006]. Free and skillful acquisition of technical skills allows the student to be fully committed to creativity, to realize creative abilities and to become a highly qualified artist-educator. A student who has mastered the art of drawing and technique is not able to feel free in the process of practical work and, as a result, is not able to fully express their thoughts and feelings. This applies to all types of art, especially pen painting, which is the basis of fine art. In ancient academic schools, great attention was paid to imaging techniques. Also, in ancient times, when artists first met their students, they gave students the task of making copies of masterpieces, and the main focus was on the technique of painting. These can be seen in the manuals of Julen, A.T. Skino, V.V. Pukirev, A.K. Savrasov. We also witness how such a wonderfully crafted work of art is so complete and elegant that the portrait of the great Eastern artist Kamoliddin Behzod, Sultan Hussein Boykaro, the king of Khorasan, was created through the technique of simple lines.

### THE MAIN FINDINGS AND RESULTS

The portrait of the protagonist of the work is arranged in a wonderfully harmonious way with the body part, which sits in an oriental sink. Her embroidered royal dress is adorned with floral patterns. This testifies to the fact that the teacher Kamoliddin Behzod was a high-level artist in the fine and applied arts. Figure 1. In the play we see that the law of perspective to be taught in European schools does not follow the requirements of realistic art such as light-shadow relations, but through simple local lines the protagonist is depicted in a form that pleases the tall, slender, delicate-looking beauty. This testifies to the fact that the unique artist of the East Kamoliddin Behzod has a high level of technique and skill in the fine arts [3, 1970].

One of the ways to develop the creative activity of a young teacher-artist in academic classes is to focus on the study of the skills and creative process of mature artists. Famous Uzbek artists U. Tansiqbaev, R. Akhmedov, M. Nabiev, G. Abdurahmonov, Z. Inogamov, A. Mirzaev, B. Jalolov, J. Umarbekov, R. Khudoyberganov, A. Nuritdinov and others, foreign artists Leonardo da Vinci, Salvador Dali, Henri Matisse, Paul Gauguin, Claude Monet, Pablo Picasso, Paul Cezanne, V. Surikov, K. Bryullov, A. Ivanov, V. Shishkin, and others, and the different interpretations of images in the works. By showing maturity, we can thus engage young people in an active creative process. This sometimes does not give sufficient results in the professional training of a future art teacher. Therefore, in addition to the academic tasks performed in the classroom, the educator should be given independent assignments to copy from the exemplary works of great artists as homework. These assignments not only teach the student to depict images more expressively, but also teach how master artists use visual aids. Some theorists see technology as an automated skill, a craft, far removed from creativity. But in reality, technical skill is the pinnacle of creativity. The development of technical skills has a great impact on the creative

activity of a young artist. An artist who does not have professional skills cannot create a perfect artistic image, which means that he cannot successfully solve a given problem.

In many cases, an important issue about the technique of depiction in the professional training of a future artist-educator is sometimes forgotten. It is therefore a mistake to say that the development of technical skills and abilities is not a creative activity is a mistake that has no scientific basis. The professional skills acquired by the student not only determine the quality of his pedagogical, educational process, but also help him to show his creative abilities. Ability is the foundation of any great person's talent.

Many years of scientific research, the results of pedagogical activities and examinations show that hand movement skills and practical exercises in drawing are manifested in three stages:

- Training the hand in different movements and performing a series of separate exercises (circular, semi-circular, vertical and horizontal lines, etc.).
- Achieving free movement of the arm muscles during visual activity.
- Improving the ability of the hand to move freely on the paper surface.
- Develop technical skills in observing and depicting nature.
- Depending on the nature of the task, highlighting the desired areas of the work, drawing light lines on the secondary parts, etc.).

In the elementary courses, the skills are initially expressed very loosely in the student, and then they are strengthened in the process of developing the right skills. It should also be noted that the image must have a 'pattern of action' in order to correct them when errors are made in the imaging process. Well-known psychologist B.F. Lomov writes about skills and abilities: "Skill is built on a complex mental process. Exercises are performed in conjunction with a system of skills appropriate to each type of activity. To achieve this, a person must have possessed only the necessary skills and knowledge system. "Skillful action" is what always determines the success of a job. The system of knowledge in the field of fine arts (law of perspective, proportions of shapes, linear constructive structure, light-shadow relations, shape plasticity, etc.) together with the system of skills determines the student's readiness to solve problems independently [4, 2008].

It is well known that in visual activity, knowledge is manifested in three forms: imagination, skill, ability. Being able to describe skillfully also develops the student's mental movements. To act skillfully means to act "intelligently", to plan work processes independently, to find the most appropriate ways of action in any situation.

Skill and ability differ from each other in some respects, and skill is inherent in the ability to perform an action automatically. Skill, on the other hand, is manifested in solving new problems. It seeks to find the right path in new circumstances, and involves creativity, not just as a return to the skills previously acquired in previous experience. For example, a student who has mastered the rules of fine arts in the educational process and has achieved high rating results may face some difficulties in demonstrating their knowledge in the field practice. Therefore, the process of

acquiring professional skills occurs and improves during continuous creation. It would be wrong to consider this process to be a simple mechanical operation.

Mastering the basics of fine art is a creative process, but it manifests itself differently in each student. In many cases, the low level of technical skills of the student also means the emptiness of his creative activity: the high level of technical skills, on the contrary, means the predominance of his great creative potential. At the same time, it is wrong to confuse the concepts of "drawing technique" and "style". Just as every poet has a unique style in the word and sentence structure of the writer, so does the artist have a unique style, which is related to the inner experiences, characteristics and actions of the creator. There are many technical methods of working with pencils, charcoal, sanguine, ink and other materials in the fine arts, and a certain technique of drawing can be achieved by a student only during a long practice.

Each type of fine art technique has its own characteristics. The student should be able to imagine what results can be achieved in the process of making images using a pencil, charcoal, sanguine, and how to achieve a volumetric, plastic perfect depiction of a particular shape with a single material (simple black pencil). For example, when working with charcoal or sanguine, different techniques can be used in the depiction: in the first case, shaping is limited to the shape, in the second case, the bar is combined with the shading. In the long run, the technique of drawing in the study of etudes and tablets, for example in the depiction of active animals in a zoo, is no longer necessary. This will require other techniques and materials. For example, by replacing a pencil with a pen or brush, the student saves a lot of time and is able to express the shape more fully and meaningfully in the picture.

When we talk about technical skill, we first mean the means of expressing creativity that have a strong meaning. Artistic form can be expressed in different technical ways. The task of the academic picture of education is to be able to apply these technical methods to students and to show them in practice by which methods. For example, the baroque technique of drawing for a graphite pencil is more appropriate, which we see in the artists of the old academic school: for charcoal, sanguine, sanguine - pink color is suitable for drawing larger images. We can see them in the works of famous artists such as Leonardo da Vinci, Albrecht Durer, and Rafael Santi.

However, it is also not possible to prioritize any method of drawing alone. The student can achieve good results on his own initiative, with the method and technical method he wants, and sometimes it is better to use the method suggested by the educator. In such cases, a certain pedagogical skill is required from the teacher, which requires the student to direct the characteristics of individuality in the desired direction. The educator should not try to influence the student and force him or her to work in his or her own way. Often educators, when correcting a student's work, show the technique, not the drawing technique: completing a small part of it and instructing the student to continue in this way, if the student feels that he is working in a different way, then he stops the work and begins to correct the picture of the student again. This style of work of the educator extinguishes the creative initiative of the student. For a young artist to be successful, it is necessary to ensure that his hands, eyes, and thoughts are in order, that his mind directs the movements of the hand, and that the eye checks the correctness of these movements. This simple truth should be known to teachers of fine arts, and should draw the attention of their students to it.

To help the student acquire drawing skills and abilities, he or she should be given special assignments that train his or her hand, eye, and mind. For this exercise to be effective, the following is required: 1) the student's desire to improve the quality of each practical exercise. 2) try to work better every time. 3) take into account the results and understand the reasons for the mistakes made in each task. 4. Self-control. 5) gradually move from simple to complex tasks to complex tasks. 6) proper allocation of time. 7) be critical of their work, be able to recognize the achievements of peer artists around them, and try to touch them. 8) always be a healthy competitor among your teammates.

The study of technical methods is inextricably linked with the nervous system and brain activity. The artist has been carefully preparing his hand movements for many years in the process of performing practical exercises.

These rules are very relevant today and help us to choose the right methodology when working with future artists-educators. The above rules also help to understand the reasons why some students achieve unexpected and intense success in drawing.

In the past, such cases were simply understood as innate talent. Many years of pedagogical experience show that almost every educator identifies a group of very talented students at the beginning of the school year. After that, their number decreases, and in the end only one or two remain. The opposite may be true, as the teacher begins to produce very skilled artists from students he does not trust. This shows that the growth of a young artist, the development of his creative abilities depends not only on his innate, natural talent, but in many respects on his serious and tireless work on himself.

It is also important to properly organize the training sessions and provide them with methodological guidance. The student must master the basics of penmanship, fine arts, as well as prepare himself for pedagogical activities. This is the main purpose of the classes at the Faculty of Fine Arts.

The future artist must be able to properly organize pedagogical training, master the scientific foundations of modern psychology and physiology. Only then can they find more effective ways to work with labs.

In the development of creative abilities and mastery, in freedom of movement and consciousness in drawing, as well as in keeping pace, it is of great importance. Maintaining rhythm during practical exercises not only improves line and tinting techniques, but also helps to see the image correctly and expressively.

Sometimes young people are not able to accurately and clearly depict the constructive shape of a shape when drawing a simple cube or prism. The lines come out crooked, the parallel lines don't match. The shape comes out clear and convincing only if you move the hand to feel the rhythm, draw vertical lines at the same time, and then the side.

This method is especially helpful in drawing a person's head and body. Too many teachers find this mandatory. For example, in order to position the head pieces correctly, the educator suggests that when marking the right cheekbones, mark the left side immediately, mark the right temporal bone and mark the left side immediately, mark the upper border of the right eyelid, and mark the left eyelid border.

However, the development of technical skills should not be carried out in isolation from the scientific basis and creative activity. The hand must do the work; its movements must be subject to the will of the mind. The success of creative activity depends on the precise adaptation of thought and movement processes.

Visualization is a source of information that a painter needs. Therefore, the task of the educator is to direct the student to the active perception of nature, to instruct him in accordance with a specific purpose in the performance of this or that stage of drawing.

## CONCLUSION

Many years of observation show that the development of creative ability is hindered by the fear of failure at work, being overly demanding. Careful monitoring of student work, the right approach to each of them, allows you to make the desired impact. The educator's praise, encouragement, and respect for his students are beneficial for creative activity. However, the method of motivation is useful only when it is consistent with the emotional attitude, the will of the student, the ability to work, the ability to self-assess.

As the use of different materials is allowed to draw the plates, the painters begin to show their creative abilities in different ways. The one who works with the brush first tries to show the movement of the volume, to show the 'big shape', while the one who works with the pen or the pen tries to use the meaning of the lines in the picture.

Summarizing the above considerations, it should be noted that in order to educate students successfully, the educator must take into account the unique individual characteristics of each of them. Each student requires special attention, and only in this way can the educator achieve great results in the development of creative abilities of his student.

## ISSUES WITH CONTRACTIONS OF SOME PARTS OF SENTENCE FORMED WITH COMPARATIVE FORM OF PREPOSITIONS “比 Bǐ” IN CHINESE LANGUAGE

**Makhamadtoirova Adiba Botir qizi\***

\*Independent Researcher,  
Department of “Chinese Language and Literature”,  
Tashkent State University of Oriental Studies,  
UZBEKISTAN

### ABSTRACT

*Comparison sentences are used to express the difference in quality and level, high or low, when made with the help of 比 bǐ prefixes. Basically two people, two objects, or differences in the levels of two states are compared. The words before and after the 比 bǐ prefixes have the same properties and structure. If the words before or after the 比 bǐ prefixes are the same, you can omit one. This article focuses on the fact that certain words are dropped when comparatively expressed with the help of 比 bǐ prefixes, the changes that occur in the sentence as a result of the words falling, and the omitted words do not affect the content of the sentence.*

**KEYWORDS:** *Analogy, Comparison, Analogy, Comparative Degree, Prefix, Object Of Comparison, Subject Of Comparison, Abbreviation, Omission, Keyword.*

### INTRODUCTION

Sentences in the context of comparison are represented by 比较句 *bǐjiào jù* terms in Chinese. If we look at the analysis of this word, 比较 comparisons mean *bǐjiào*, 句 *jù* sentences. There is no Chinese equivalent of the words comparison, analogy, and comparison in Uzbek, all of which are referred to as 比较句 comparisons. [6, 2001]

There are many ways to express the difference or similarity of things and events, states and qualities, and levels in Chinese, and in the research work, the specific construction models of the constructions selected from them, the functions of the sentence are analyzed. In modern Chinese, comparative sentences can be divided into two main groups:

The first group: comparative methods of expressing the difference, high or low, of quality and degree;

The second group: comparative methods of expressing the similarity of the levels of an object, an event, and a state.

## THE MAIN FINDINGS AND RESULTS

In Chinese, comparisons are used to compare how high or low the differences between words, things and events, situations and qualities, and levels are. Helps to make the speech stylistically concise and fluent. In such sentences, comparisons are expressed not only in adjectives, verbs, nouns, but also in adjectives [4, 1986].

In Chinese, there are many types of expressions of differences and similarities between things and events, states and qualities, and levels, and when the object of comparison is compared using 比 *bǐ* prefixes, the cut represents the result of the comparison. It basically puts the object or situation being compared, then 比 *bǐ* prefixes, then the object being compared, and then the result of the comparison, depending on the location. Semantically, the main structure is a case between a section with 比 *bǐ* prefixes and acts as a case in the sentence [3, 1962]. Comparing the differences in quality and level with the help of 比 *bǐ* prefixes, it is mainly done by the following form: [A (Subject) + 比 *bǐ* B (adverbial modifier) + predicate].

By comparing the differences in quality and level through 比 *bǐ* prepositions, if the words before or after the 比 *bǐ* prepositions are the same or similar in meaning, dropping one i.e. reduction will help the sentence to come out smoothly and smoothly. Below we will consider several different methods of their:

**1. The declension of the main word (中心语 *zhōngxīn yǔ* sentence core.** In the sentence, the main meaning is the word, and the sentence revolves around the same word.). If the noun A and B, which came before and after the 比 *bǐ* prepositions, is in the form of the pronoun identifier + 的 *de* the main word is in the form of the noun suffix", if the central parts are also the same, then in most cases the compound element that comes after 比 *bǐ*, that is, the main word "B" can fall. Just enough to keep the 的 *de* from attaching with the handle. For example:

1. 小英的布娃娃比他的(布娃娃)好看

*Xiǎo Yīng de bùwáwabǐtāde(bùwáwa)hǎokàn.*

*Xiao Ying's fabric toy is more beautiful than his fabric toy.*

2. 老虎的爪子比耗子的(爪子)大。

*Lǎohǔ de zhuǎzibǐhàozide(zhuǎzi)dà.*

*A real silk dress is more expensive than her dacron (from her dacron shirt).*

3. 真丝的衬衫比他的确良的(衬衫)贵。

*Zhēnsīde chènshān bǐtādiquè liángde(chènshān)guì.*

*The tiger's paws are bigger than the rat's.*

的 *de* cannot be omitted in these statements. If 的 *de* is omitted, the translation will change. [7, 2008] For example:

小英的布娃娃比他好看。

1. *Xiǎoyīng de bùwáwabǐtāhǎokàn.*

*Xiao Ying's fabric toy is more beautiful than that.*

2. 老虎的爪子比耗子大。

*Láohǔ de zhuǎzibǐhàozidà.*

*The tiger's paws are larger than those of a rat.*

3. 真丝的衬衫比的确良贵。

*Zhēnsī de chènshān bǐ dìquèliánguì.*

*A real silk shirt is more expensive than a dacron.*

Because the appearance of Xiao Ying's soft toy is comparable to that of "him"; The size of a "tiger's claw" and a "mouse's" body can be compared, and the price of a "real silk shirt" and a "dacron" can be compared. This means that if the horse falls after the 11 prefixes in the comparative sentence, the drop of 11 when the rhyme comes with the determiner cannot be omitted, either because the meaning of the sentence has changed [8, 1999].

The abbreviation method cannot be used when the defining keyword refers to kinship. For example:

1. 这些孩子的父母都比你们的父母年轻。

*Zhèxiē háizi de fùmǔ dōu bǐ nǐmen de fùmǔ niánqīng.*

*The parents of these children are all younger than your parents.*

2. 你的弟弟比我的弟弟淘气。

*Nǐ de dìdì bǐ wǒ de dìdì táoqì.*

*Your brother is smarter than me.*

3. 他们的领导比我们的领导能体谅不清。

*Tāmende língdǎo bǐwǒ mende língdǎo néng tǐliàng bùqīng.*

*Their leader is more nationalistic than our leader.*

**2. The omission of the main word and the auxiliary word 的.** Such statements, in turn, are subject to certain grammatical rules, and we can observe several types of them. They are:

1) If A and B are involved in such sentences, then B cannot have a definite article, which means that in addition to the main word, the auxiliary word may also be omitted [9]. That doesn't change the meaning. For example:

1. 他的字比我(的)(字)潦草。

*Tā de zì bǐ wǒ (de)(zì)liáo cǎo.*

*Her hieroglyph is more beautiful than mine.*

2. 王先生的行李比你(的)(行李)多。

*Wáng xiānshēng de xínglǐ bǐ nǐ(de) (xínglǐ) duō.*

*Janob Vanning jamadoni senikidan ko 'p.*

*Mr. Van's suitcase is bigger than yours.*

2) When A, B are used to compare time sequences or different spaces, 的decan usually be omitted. It is enough to keep the identifier of time and space [4, 1986]. For example:

1. 今年他的收成比去年(的)(收成)好多了。

*Jīnnián tā de shōucheng bǐ qùnián de shōucheng hǎoduō le.*

*This year's harvest is much higher than last year's.*

2. 老李这个月的收入比上个月(的)(收入)少。

*Lǎolǐ zhège yuè de shōurù bǐ shànggè yuè de shōurù shǎo.*

*Lao Li's income this month is less than the previous month.*

3. 我们家北京的亲戚比天津的亲戚多。

*Wǒmen jiā Běijīng de qīnqī bǐ Tiānjīn de qīnqī duō.*

*We have more relatives in Beijing than in Tianjin.*

3) If the key words of A and B are a person or thing and an event, it is better to omit it together with the *de*. For example:

1. 南方的夏天比北方(的夏天)热。

*Nánfāng de xiàtiānbǐběifāng (de xiàtiān) rè.*

*Summer in the south is warmer than in the north.*

2. 十年前的我要比现在(的我)更糊涂。

*Shíniánqián de wǒyàobǐxiànzài (de wǒ) gènghútu.*

*Ten years ago I was more confused than I am now.*

**3. Fall of the detector.** In the equestrian phrase A and B, if the determiner is the same and the keyword is different, then the determiner in the part following the 11 preceding auxiliaries may be omitted. [6. 2001] For example:

1. 我看他的法语说的比英语流利。

*Wǒ kàn tā de fáyǔ shuō de bǐ yīngyǔ liúlì.*

*I think he speaks French more fluently than English.*

2. 他的小说比诗歌写得好。

*Tāde xiǎoshuō bǐ shīgē xiědéhǎo.*

*His stories are better written than his poems.*

**4. The omission of a similar part between the determiner and the keyword.** If the descriptive and key words are the same in A and B 2 noun phrases, then we can abbreviate the preceding or following similar parts of prefix 比 *bǐ* [10, 1996]. For example:

1. 你的口头表达能力比(你的)笔头(表达能力)好。

*Nǐde kǒutóu biǎodá nénglì bǐ(nǐ de ) bǐtóu( biǎo dá néng lì ) hǎo.*

*Your speech is better than your ability to express it in writing.*

2. 我们学英语的时间比(我们)学法语(的时间)长。

*Wǒmen xué yīngyǔ de shíjiān bǐ ( wǒ men ) xué fáyǔ ( de shí jiān ) cháng.*

*We spend more time learning English than we do learning French.*

3. 他们 (前进的脚步) 比我们前进的脚步快。

*Tāmen (qiánjìn de jiǎobù) bǐ wǒmen qiánjìn de jiǎobùkuài.*

*We are faster than them.*

**5. The possessive-cut has in simple sentences or the cut-off is dropped.** If there is a simple sentence consisting of a cut with components A and B, and the cuts in the possessive participles are the same, we can shorten the components before or after 比 *bǐ*. If the owners of the cut-offs are the same, then we can reduce it to only after 比 *bǐ* [7, 2008]. For example:

1. 他睡觉比我(睡觉)早。

*Tā shuìjiào bǐ wǒ ( shuì jiào ) zǎo.*

*He goes to bed earlier than me.*

2. 我(吃饭)比他吃饭香。

*Wǒ ( chīfàn ) bǐ tā chīfàn xiāng.*

*Her food is delicious from my meal.*

3. 我学汉语比(我)学日语快。

*Wǒ xué hàn yǔ bǐ (wǒ) xué rì yǔ kuài.*

*Learning Chinese is faster than learning Japanese.*

4. 我住在北京比(我)住在广州好。

*Wǒ zhù zài Běijīng bǐ (wǒ) zhù zài Guǎngzhōu hǎo.*

*I live better in Beijing than GuangJoo.*

Sentences 1-2 in these examples can be changed as follows: 他比我睡觉早 *tā bǐ wǒ shuì jiào zǎo*, 我吃饭比他先 *wǒ chī fàn bǐ tā xiāng*. Sentences 3-4 cannot be changed. That is, 学汉语比我学日语快 *xué hàn yǔ bǐ wǒ xué rì yǔ kuài*, 住在北京比我住在广州好 *zhù zài Běijīng bǐ (wǒ) zhù zài* cannot be said. Abbreviations cannot be used if both the possessive and the participle are in the same word and the participle is not the same. For example:

你吃盐比他吃米多。

*Nǐ chī yán bǐ tā chī mǐ duō.*

*You eat more salt than you eat rice.*

**6. When “A 比 B” occurs, the front part A of the 比 bǐ front auxiliaries falls.** The words “A 比 B” compare the state of the same event at different times and in different places. Part A can be abbreviated if the preceding part of 比 bǐ prefixes means 现在(now), 当时(then), 在这里(here). For example:

1. 微风起来,吹动她的短发,确乎比去年白得多了。(现在)

*Wēi fēng qǐ lái, chuī dòng tā de duǎn fā, què hū bǐ qù nián bái dé duō le. (xiànzài)*

*The wind was blowing and her short hair was fluttering, and it was really much whiter than last year. (now)*

2. 我的身体比前好多了。(现在)

*Wǒ de shēn tǐ bǐ qián hǎo duō le. (xiànzài)*

*I am much healthier than before. (now)*

3. 今天我们比第次谈得多。

*Jīn tiān wǒ men bǐ dì cì tán dé duō.*

*We talked more today than we did the first time.*

4. 这几个孩子都比在那里听话。(在这儿)

*Zhè jǐ gè hái zǐ dōu bǐ zài nà lǐ tīng huà. (zài zhèr)*

*These guys are smarter than they were there. (here)*

**7. If both A and B are simple verbs or adjectives, the word will not fall.** If both parts A and B are all verb conjunctions or adjective conjunctions and consist of the same components, then they are not abbreviated in most cases [11, 2013]. For example:

1. 长一点比短一点好。

*Cháng yì diǎn bǐ duǎn yì diǎn hǎo.*

*A little length is better than a little short.*

2. 有文化比没有文化好。

*Yǒu wén huà bǐ méi yǒu wén huà hǎo.*

*The presence of culture is better than the absence of culture.*

In the case of the above example, or when the situation in the language is understandable. We can also drop the component before the 比***bǐ*** prefixes.

## CONCLUSION

The results of the article analysis came to the following conclusions:

- the purpose of comparing certain events, phenomena, characters, properties to each other is to determine the difference between them or to contradict them, to show that they are incompatible with each other. 比 the preposition is used to denote the difference between the quality and the degree, high or low, and is mainly used in the mutual comparison of the difference in the levels of two persons, two subjects or two cases;

- If the object of comparison is being compared using 比***bǐ*** prefixes, the cut represents the result of the comparison. It basically puts the object or situation being compared, then 比***bǐ*** prefixes, then the object being compared, and then the result of the comparison, depending on the location.

If the words before or after the 比 prefixes are similar, the part after the 比 prefixes is usually omitted. It does not affect the content of the sentence and helps to make the sentence concise and fluent;

- The problem of missing some words occurs in eight different cases. These include the omission of the main word, the omission of the auxiliary word, the omission of the determiner, the omission of the similar part between the determiner and the main word, the omission of the possessive in simple sentences, or the omission of the participle, [A 比B] + case The issue of the fall of the “A” section before the 比***bǐ*** front assistants was considered in detail.

- However, if both A and B are simple verbs or adjectives, the fact that the words do not fall out shows the uniqueness of this construction. When the comparative sentences were expressed through 比 prefixes, it was found that the problem of dropping some parts of the sentences differed from other comparative constructions in its variety and convenience to the speaker.

### ABSTRACT

**Aim:** To evaluate the effect of corneal cross-linking (CXL) on quality of life in patients with bullous keratopathy. **Methodology:** Ten patients with painful bullous keratopathy to whom CXL treatment was applied were included in the study group. Ten consecutive patients with painful bullous keratopathy who didn't accept CXL treatment were admitted as the control group. SF-36 (Short Form-36) questionnaire was performed to all patients at baseline, and repeated at 1, 3, 6 and 12 months. **Results:** A significant improvement in "Physical Functioning" and "Vitality" subscales starting from the first month after CXL treatment, continuing upto the postoperative 6th month ( $p=0.04$ ,  $p=0.01$ , respectively) was achieved. An improvement in "Bodily Pain" subscale was achieved starting at the 3rd month, and continued until the 6th month, but did not carry on upto the 12th month ( $p=0.01$ ,  $p=0.01$ ,  $p=0.02$ , respectively). Improvements in "General Health" and "Social Functioning" subscales at 6th month ( $p=0.04$ ,  $p=0.01$ , respectively), and "Mental Health" at 3rd month ( $p=0.01$ ) were obtained. Unfortunately, there was a deterioration in "Physical Functioning", "Bodily Pain", "General Health", "Vitality" and "Social Functioning" subscales starting from the 6th month, with statistically significant variations between the 6th and the 12th months ( $p=0.02$ ,  $p=0.02$ ,  $p=0.01$ ,  $p=0.02$ ,  $p=0.01$ , respectively). In the control group, there was a significant deterioration in "Physical Functioning", "Bodily Pain", "General Health", and "Social Functioning" subscales between baseline and the 12th month ( $p=0.02$ ,  $p=0.04$ ,  $p=0.02$ ,  $p=0.03$ , respectively). **Conclusions:** CXL may be a useful

*alternative method in symptomatic treatment of bullous keratopathy by temporarily improving the quality of life.*

**KEYWORDS:** *Bullous Keratopathy, Collagen, Cornea, Cross-Linking, Quality Of Life, SF-36.*

## INTRODUCTION

Corneal cross-linking (CXL) is an innovative approach to increase the mechanical and biochemical stabilities of the corneal stroma to halt keratoconus progression (1-3). The aim of CXL is to create new chemical bonds inside the corneal stroma tissue by application of riboflavin (vitamin B2) and ultraviolet A light (UVA, 370 nm). The light-induced production of oxygen radicals results in the formation of additional chemical bonds between collagen fibrils to induce stiffening of the cornea. Although, the genesis aim of CXL procedure was the treatment of keratoconus, a role for CXL has also been suggested for other forms of corneal ectasia and a number of non-ectatic corneal diseases, such as infectious keratitis, bullous keratopathy, and corneal ulcers (4).

Bullous keratopathy, caused by endothelial dysfunction, leads to chronic corneal edema, epithelial bullae, recurrent erosions, and subsequent visual impairment and ocular discomfort (5). With the [deterioration](#) of the endothelial pump function, fluid accumulates in the extracellular spaces between the collagen fibers and lamellae. CXL reduces this corneal edema by inducing more concentrated cross-linked fibers and reducing possible gaps for fluid accumulation (5-8). Due to these potential utilities, CXL has been suggested as a promising alternative method in managing bullous keratopathy by reducing ocular discomfort, increasing visual acuity and probably postponing or even eliminating the need for corneal transplantation (5-7).

Recently, assessing quality of life with general purpose or disease specific questionnaires has become popular. Health-related quality of life is defined as “health included physical, psychological and social areas that are affected by different areas such as person’s experiences, beliefs and expectations”. Health-related quality of life is important for measuring the impact of the diseases to persons lives (9). Short Form 36 (SF-36) is a general purpose quality of life scale that provides extensive measurements (10). The scale is easy to apply and it has a wide range of use (11).

In the present study we evaluated the effects of UVA CXL following intrastromal 0.1% riboflavin administration on quality of life and visual acuity in patients with bullous keratopathy.

## METHODOLOGY

This prospective, comparative, single-center, nonrandomized cohort study was conducted between June 2011 and February 2013. Ten *patients with unilateral painful bullous keratopathy waiting for corneal transplantation were included in the study group*. Ten consecutive patients with painful bullous keratopathy who didn’t accept CXL treatment, were admitted as the control group. Patients with active corneal infection, history of herpetic keratitis or chemical injury, pregnancy, autoimmune or connective tissue diseases were excluded.

Besides routine examination (best corrected visual acuity (BCVA), slit-lamp biomicroscopy, intraocular pressure (IOP) measurement) SF-36 questionnaire was also performed to all patients at baseline. All examinations and the SF-36 questionnaire were repeated at 1, 3, 6 and 12 months

after baseline for the control group and after CXL treatment for the study group. BCVA was measured on a decimal scale and converted to the logarithmic scale [logarithm of the minimum angle of resolution (logMAR)].

Each CXL procedure was performed by the same operator (EK), according to the same protocol. The patients were treated in an operating room under topical anesthesia. Mean operation time was defined as one hour. Eye drop instillation preceding treatment consisted of one drop %0.5 proparakain HCl (Alcaine®, Alcon, Fort Worth, Texas, USA), beginning 5 minutes before the procedure. After applying Betadine antiseptic solution and setting the sterile field with a blepharostat, the central corneal epithelium was mechanically debrided with a 15 blade, over a 9-mm diameter. The cornea was impregnated with a photosensitizing solution of riboflavin 0.1% with 20% dextran T500 (Ricrolin®, SOOFT, Montegiorgio, Italy) by corneal instillation at a rate of one drop in every 2 minutes for 20 minutes. After verification of the UVA laser source unit's calibration using a UVA power meter, the corneal collagen was polymerized for 30 minutes (Vega CBM X-Linker, CSO, Italy LED-UVA single 370-nm beam, 3 mW/cm<sup>2</sup> ± 10%, 5.4 J/cm<sup>2</sup>). The UV beam's focus was checked initially with an aiming beam produced by 2 centering LED (644 nm), and the irradiation was stopped automatically in every 5 minutes for checking the correct focalization of the UV beam. During this second step, riboflavin was instilled regularly to maintain its stromal concentration. After abundant rinsing with balanced salt solution and instillation of one drop of tobramycin (Tobrex®, Alcon, Fort Worth, Texas, USA), a soft bandage contact lens was placed. Postoperative treatment included topical tobramycin four times daily until closure of the epithelial defect, and topical artificial tears (Refresh Tears®, Allergan, Irvine, CA) for at least 1 month. All patients were seen again on the first and the 7th postoperative days, to assess epithelial healing and the absence of infectious complications and to remove the bandage contact lens.

Statistical analyses were performed using SPSS 15.0 (SPSS Inc, Chicago, Illinois). Normal distribution assumption couldn't be accepted for some parameters according to the Shapiro Wilks W-test. Therefore, non-parametric tests were used. Evaluation of intragroup inter temporal changes were evaluated by the Friedman test. When statistically significant results were obtained by the Friedman test, Wilcoxon test was used for dual comparison. Intergroup comparisons were conducted by U-Test (Mann-Whitney) and Chi-Square test. Results were presented as mean ± standard deviation (SD), median, minimum-maximum values. In all analyses, p<0.05 was considered statistically significant. This study was performed in accordance with the principles of the Declaration of Helsinki, after *Ege University* Ethical Committee approval. Written informed consent was obtained from all patients participating the study.

## RESULTS

Mean age of the study and the control groups were 61.5 ± 18.2 (range, 30-79) and 60.4 ± 17.7 (range, 30-80) years, respectively (p=0.9). Male to female preponderance in the study and the control groups were 7:3 and 6:4, respectively (p=1.00). Mean preoperative BCVA in the study and the control groups were 2.29 ± 0.9 (range, 0.52-3.10) and 2.27 ± 0.9 (range, 0.80-3.10) logMar, respectively (p=0.9). Mean preoperative IOP in the study and the control groups were 18.3 ± 6.6 (range, 12-30) and 14 ± 1.4 (range, 12-16) mmHg, respectively (p=0.1). In the study group, 5 patients had pseudophakic bullous keratopathy, 3 glaucomatous bullous keratopathy and 2 aphakic bullous keratopathy, while the control group consisted of 7 pseudophakic bullous

keratopathy, 2 glaucomatous bullous keratopathy and 1 aphakic bullous keratopathy. No statistically significant variation in BCVA and IOP between pre- and postoperative 12 months were detected in the study group (respectively;  $p=0.6$ ,  $p=0.06$ ). No complications due to CXL occurred in the study group.

When scores of SF-36 questionnaire were evaluated for the study group a significant improvement in “Physical Functioning” and “Vitality” subscales starting from the first month after CXL treatment ( $p=0.04$ ) continuing upto the 6th month of the therapy ( $p=0.01$ )(Table 1) was observed. An improvement in “Bodily Pain” subscale was achieved starting at the 3rd month after CXL, and continued until the 6th month ( $p=0.01$ ,  $p=0.01$ , respectively), however this improvement did not carry on until the 12th month ( $p=0.02$ ). Improvements in “General Health” and “Social Functioning” subscales at the 6th month ( $p=0.04$ ,  $p=0.01$ , respectively), and “Mental Health” at the 3rd month ( $p=0.01$ ) were obtained. Unfortunately, there was a deterioration in “Physical Functioning”, “Bodily Pain”, “General Health”, “Vitality” and “Social Functioning” subscales starting from 6th month, with statistically significant variations between 6th and 12th months ( $p=0.02$ ,  $p=0.02$ ,  $p=0.01$ ,  $p=0.02$ ,  $p=0.01$ , respectively). No statistically significant differences were noted in “Role-Emotional” and “Role-Physical” subscales ( $p=0.2$ ,  $p=0.5$ , respectively).

In the SF-36 scale evaluation of the control group, a significant deterioration in “Physical Functioning”, “Bodily Pain”, “General Health” and “Social Functioning” subscales between baseline and at 12th month were encountered ( $p=0.02$ ,  $p=0.04$ ,  $p=0.02$ ,  $p=0.03$ , respectively) (Table 2). It was observed that “Physical Functioning” and “General Health” subscales started to deteriorate by the 6th month in the control group ( $p=0.03$ ,  $p=0.02$ , respectively). No statistically significant difference was noted in any of the other subscales.

## DISCUSSION

Bullous keratopathy is one of the leading indications for keratoplasty all over the world (6,12). Although, the main indication for keratoplasty in these patients is visual loss due to hazy cornea, the secondary indication for keratoplasty is the disabling pain that restricts their daily life. Bursting of epithelial bullae causes significant pain, tearing and conjunctival hyperemia by leading corneal nerve endings to expose (13). CXL offers an alternative approach for reducing ocular pain by limiting the occurrence of macro- and microbullae. This treatment method may provide the greatest benefit to patients by reducing their pain (5-7).

As pain is one of the most important human senses, it is almost the most common complaint in clinical practice. Pain is accepted as a complex interaction including physical, behavioral, emotional and cognitive dimensions (14). Persons react differently to pain, moreover their pain durability and accepting that pain may also vary. It may be considered that all of this reflect on their quality of life (15). Having negative cognitions, affect the emergence of pain, such as playing a role in the perception of pain, pain severity and quality of life (16) The course of pain and quality of patients heal by the development of positive and effective cognitions, and starting to use appropriate dealing ways (15,17).

Herein, we used SF-36 questionnaire evaluating the general quality of life scale for all patients. One of the most important features of this scale is its self-evaluation format. Moreover, it can be completed within five minutes, and both negative and positive aspects of health status can be evaluated with this test (18). The questionnaire consists of 36 items which assess eight health

concepts: physical functioning (PF-10 items), role limitations due to physical problems (RP-4 items), bodily pain (BP-2 items), general health perception (GH-5 items), vitality (VT-4 items), social functioning (SF-2 items), role limitations due to emotional problems (RE-3 items), and mental health (MH-5 items) (10). These 35 items evaluate the last 4 weeks of the person. SF-36 also includes one more item – which is not used in the measurement - that assess changes in respondent's health status during the past year (10). Extensive background information on the SF-36, as well as standard scoring algorithms and interpretation guides are available in the literature (4,12,18). For each tested quality of life domain, item scores are coded, summed, and transformed into a scale from 0 (worst) to 100 (best) using the standard SF-36 scoring algorithms (18). SF-36 was translated into Turkish and validation studies of Turkish version of SF-36 were carried out in 1999 by Kocyigit et al (19).

To the best of our knowledge, no publication in the literature has ever evaluated patients with bullous keratopathy during 1 year with an objective quality of life scale, such as SF-36. In 2008, Krueger et al (7) performed CXL on a patient with advanced bullous keratopathy for the first time, and reported that a follow up of 6 months demonstrated a pain decrease in the patient (7). In another study, CXL was performed in 3 patients with bullous keratopathy and the bullous changes of the epithelium markedly improved in the following 8 months, resulting in loss of pain and discomfort in all patients (5). However, no objective evaluation scale was used in neither of these studies(5,7).

Ghanem et al (6) performed CXL on 14 painful patients with pseudophakic bullous keratopathy and used “National Pain Education Council” for the measurement of ocular pain intensity. They reported a significant reduction in pain scores at the first month, but this improvement declined and returned back to baseline values by the 6th month (6). After CXL treatment, the scores for “Physical Functioning”, “Vitality”, and “Bodily Pain” subscales improved significantly, however distinct from Ghanem et al’s study, these improvements started at the 3rd month and continued upto the 6th month.

The earlier improvement in “Physical Functioning” and “Vitality” subscales than “Bodily Pain” subscale might be caused by the psychological relaxation related to receiving a treatment during this time. Similar to “Bodily Pain” subscale, “Mental Health” subscale also improved at the 3rd month. However, “General Health” and “Social Functioning” subscales improved by the 6th month. This improvement delay in these subscales might be related to the warily approach after the treatment. The earlier higher scores for “Mental Health” subscale support the effect of pain on mental health. The deterioration in “Physical Functioning”, “Bodily Pain”, “General Health”, “Vitality” and “Social Functioning” subscales after 6 months, goes along with the temporariness of the treatment.

In the control group, a significant deterioration in “Physical Functioning”, “Bodily Pain”, “General Health” and “Social Functioning” subscales between baseline and 12 months after was determined. These results promote the quality of life getting worse in the course of bullous keratopathy.

Some studies report that in patients with bullous keratopathy CXL treatment might induce an increase in BCVA (6,7,20). Ghanem et al (6) observed an increase in BCVA at first month, but there was no difference between the 6th month and baseline values. Kozobolis et al (20) also observed a significant improvement in BCVA, in two patients with bullous keratopathy and

ulcerative keratitis after CXL treatment. Kruger et al (7) reported one case with a significant improvement in BCVA at the 6th month of CXL treatment. However, we detected no significant difference in BCVA of the treated patients.

The results of this study support that CXL is successful in the symptomatic treatment of bullous keratopathy by temporarily improving the quality of life. CXL may become a useful alternative method in the treatment of bullous keratopathy by extending the time of keratoplasty, particularly in patients with limited visual prognosis.

## ON ANALYSIS OF SPEECH BASED ON THE TRANSFORMATION MODEL

**Samandarov Rustam Dosyorovich\***

\*Researcher,  
Doctor of Philosophy (PhD) in Philology,  
Samarkand State Institute of Foreign Languages,  
UZBEKISTAN

### ABSTRACT

*This article explores the transformational model and its role in linguistics. The focus is on the analysis of the objects listed below.*

**KEYWORDS:** *Transformation, Application Model, Conversion, Nominalization, Derivation Process, Invariant and Variant*

### INTRODUCTION

The selective application of syntactic structures in the speech process occurs, of course, mechanically. This is because the speaker never thinks about which structural form to use when composing a sentence in his native language. He uses the necessary syntactic structures based on his speaking skills and experience. Of course, such an opportunity is inextricably linked to the speaker's many years of experience and skill. This is exactly what the speaker refers to the basic (nuclear) devices and the transformations that occur on their basis.

Since we are using the concept of transformation, we first have to give it a brief explanation. Transformation is directly related to the concept of meaning, because the transformation occurs only when the syntactic structures formed on the basis of a certain basic structure are common in content. This, in turn, requires that all syntactic structures formed in the transformation process be common in content. Such syntactic structures are called *transformations*.

### MAIN RESULTS AND FINDINGS

It is known that the theory of transformation was introduced into consumption by American scientists. This was based on the research work of linguists such as Z. Harris, N. Chomsky. By transformation, they mean the formation of other derivative structures while preserving the content of a particular given sentence. According to Z. Harris, there should be a lexical

commonality between the transformed sentence and its transformations (derivatives). The scholar also notes that the transformations with the main sentence must be semantically the same [1.237]. However, with some exceptions, he argues, affirmations and interrogations can also be studied as transformations.

In the theory of Z.S. Harris, we read the following: "We must consider the factor of meaning. Because the semantic weight does not change in the transformation. If a difference is observed between two structures that are in a transformational relationship with each other, this difference may be in the external grammatical status. For example, if NVN requires sentence status, NSVing N represents a group of nouns in the status of a phrase. It can also be observed that there are emphatic and stylistic differences between the transformations. We see this phenomenon in the active and passive forms of speech. Among some transformations, however, semantic differences based on specific morphemes are also observed. For example, the semantic inconsistency between the affirmative and the interrogative forms of speech can be a proof of this. "

However, in our opinion, the study of sentences that are not common in meaning in the form of transformations can cause some inconsistencies. Commenting on this, N. Turniyazov notes: "... what is problematic for researchers in describing the phenomenon of transformation is the question of meaning. This is because in some research papers, this interpretation of statements and interrogative pronouns or command and interrogative pronouns (i.e. in the form of transformations - R.S.) obscures the description of the issue a bit. In our opinion, the emergence of the phenomenon of transformation must fully comply with the commonality of meaning between the transformations "[2; 61-62].

Nevertheless, as Harris's theory of transformation has become popular, in many cases affirmation, interrogation, and command are studied as mutually transformational. For example, J. Buronov gives the following statements in the form of transformations:

- *The doctor is coming*
- *Is the doctor coming?*
- *The doctor will see the patient*
- *Whom will the doctor see?*
- *When will the doctor see the patient?* [3;50].

In our view, it is not a mistake to look for the point of intersection of the transformational model with the applied model in relation to the components of the transformers. However, we think that the main focus should be on the expansion or contraction of syntactic forms of transformations. For proof, let's look at the following example:

1. *These words of his mother aggravated the disappointment in the middle (H. Gulom. Tashkent residents).*
2. *Alijon did not dare to answer this question (H. Gulom. Tashkent residents).*

The following transformations can be made on the basis of the material of the first of the given examples:

1. The frustration in the middle was aggravated again by these words of the mother.

2. The sadness in the middle is aggravated again by the words of the mother.

At the same time, we first use a *conversion* transformation, in which we observe a change in the syntactic functions of the components of the sentence: instead of the possessive in the first preposition, we see that the word disappointment in the transformation (in the middle) performs a syntactic function. In the second transformation, we observe that the sentence is replaced by a phrase and a *nominalization* transformation is used.

In the second of the examples given, a similar derivative situation is observed:

- This question made Alijon, who did not dare to answer, think.
- Alijon can't answer the question.

It appears that at the level of each of the transformations generated in the derivation process, the components are connected in a uniquely applicable manner. If we pay attention to the second of the transformations of the given sentences, that is, the nominalization transformation, we observe that the number of components of the transformations is reduced by one or two, and on this basis we can prove the intersection of the transformative model with the applicative model. However, such a situation is not observed in the first transformations of both sentences, since the number of components in them is common to the number of components in the main sentences.

According to M.V.Vsevolodova, the transformational paradigm requires a kind of communicative paradigm. If we approach the problem description from this point of view, then we see that the environment also plays an important role in the relationship between the applied model and the transformational models. In this process, additional distribution in particular has a special influence. Naturally, the statements that can be formed in a particular speech environment are surrounded by and subject to the distributive and cognitive-pragmatic factors inherent in that environment. We can explain this by the example of the basic statements discussed above and their transformations.

Each speech distribution creates conditions for the formation of transformations. In this process, of course, there is also the opportunity for the intersection of applicative and transformational models. Of course, the emergence of such an opportunity is inextricably linked not only with the distribution of speech, but also with the style of speech of the speaker. We can easily observe this in the fact that everyone uses different syntactic structures to express a particular idea. For example:

- Ёз кечалари қисқа. Қоронғи тушгунча алламаҳал бўлиб қолади. (Х.Ғулом. Тошкентликлар).
- Meaning: Summer nights are short. It will be late until dark. (H. Gulom. Tashkent residents).

In this case, the applicative connection of the components of the first sentence takes place within the subject-predicate relationship, while in the second sentence, in addition to the subject-predicate relationship, the "-cha" applicator is also involved. It is observed that the components of the sentences given in this way are interconnected within their own levels.

The first of these statements requires a basic structure in terms of derivation, and the second requires a derivative structure (i.e., a derivative). The derivation process is used by the speaker in a specific way to convey a particular idea. In other words, an idea is expressed through two

syntactic devices. However, the distributive environment in which the derivation process takes place also provides an opportunity for the formation of several more syntactic devices. This can be called an additional distributive opportunity:

1. *Because summer nights are short, it stays late until dark.*
2. *Summer nights are short and stay late until dark.*
3. *Summer nights are short so it gets late until dark.*
4. *The reason it stays late until dark is because the summer nights are short.*

It seems that the transformational model currently creates five different possibilities for expressing an idea, and therefore, in addition to invariant devices (in addition to basic structures), the syntactic paradigms of transformations can also be easily applied in speech. This, in turn, also allows the speaker to select syntactic structures.

When we talk about the transformation model, it is also important to note that all types of transformation can be interchangeable. In the examples given above, we have seen that *conversion* and *nominalization*, as well as types of transformation called *contamination*, can partially replace each other. But this should not be seen as a permanent opportunity. This is because the exchange of transformations that can take place in some derivative environment is in some cases impossible. [4;90].

1. *Jamil blushed with anger (Oybek. Childhood).*
2. *The coolness of the morning breeze gives peace of mind (Oybek. Childhood).*
3. *Azam and I are going in a car (Oybek. Childhood).*

Transformations of sentences:

1. *It was Jamil who blushed with rage - Jamil blushed with rage.*
2. *Hearts rest from the coolness of the morning breeze - Rest of the souls from the coolness of the morning breeze.*
3. *We are going in a car.*

At the same time we see that the transformational possibilities of the first and second sentences are the same. In other words, in both cases, the conversion and nominalization types of the transformation take a derivative direction. However, in the next example, we observe that there is only a way for substitution (exchange).

It should be noted that in none of the types of transformations, called conversion, substitution, nominalization, we can not observe the true intersection of the transformative model with the applicative model, and in these cases the problem of expanding the syntactic form of speech is not reflected. However, a relatively different picture emerges in the type of transformation called contamination. [5;40]. For example:

1. *A bonfire on the street. Poplar and apricot sarjins are burning (Oybek. Childhood).*
2. *Surprised by this news, Oynisa had to look towards the pulpit (H. Gulom. Tashkent residents).*

In the first of the given examples, no contamination transformation took place. To make it happen, you have to mix two independent sentences, small and large, according to the applicative connection of the components:

*Poplars and apricots are burning in the street fire.*

In this transformation, the applied model and the transformational models literally intersect. At the moment, in our opinion, the application model is rising to its highest level. Indeed, it is not only the applicative connection of words that occurs, but also the applicative relationship of the two sentences, and at the same time the applicative model intersects with the transformation. Of course, transformation does not happen by itself. Its formation is based on certain means. In this case, the affix

“-da”, which is added to the word bonfire, acts as an applicator that provides transformation.

In this case, the transformation process takes the form of the following formula:  $P_1 + P_2 = P_3$

The extended form of the symbols given in the formula allows us to form an idea of the formal operation showing the intersection of the applied model with the transformational model.:

$P_1 = N_1 X N_2$ ;  $P_2 = X_1 X_2 X_3 N X_4 V$ ;  $P_3 = X_1 X_2 X_3 N X_4 X_5 X_6 V$ .

At the same time, the intersection of applicative and transformational models is simultaneously leading to an expansion of the syntactic form of speech. The formation of a complex structure from the intermingling of two sentences of this type is called the method of synthesis. Apparently, at the same time, the fact that the applicative model has undergone a transformation and thus demonstrated inter-sentence activity is an indication that it has not only some sort of tool, but also a large synergistic weight. True, the concept of synergetics means self-management. However, we can observe the same in the system-structural relationship of language units within the applicative model.

It should be noted that in the process of intersection of the applied model with the transformational model, it is necessary to correctly determine the syntactic model of the sentence and the syntactic positions of its components, because it is very important in the formation of synonymous transformations [6; 57-58]. In other words, the interpretation of the question of which of the components of the material being transformed, in particular, which of the statements involved in this process are in the function of the basic structure and which is to follow it, always requires serious attention. This is because in the process, some of the words being transformed also change their linguistic status. In this case, the sentence can become a phrase or serve as an identifier of one of the components of the base sentence. Moreover, as we have seen above, it is not always possible to form complex sentences from elementary sentences by means of an application model. Perhaps it is also possible to obtain information about their applicable related components by converting complex sentences into elementary sentences.

Naturally, we see that the interaction of two simple sentences within an applicative model always leads not only to the syntactic derivation of complex simple sentences, but also to the formation of compound sentences (complex syntactic devices). All such operations are inextricably linked with the cognitive-pragmatic environment (situation) that prevails in the process of intersection of the applicative model with the transformational model. Evidence of opinion can be observed in the speaker's style of speech and in his choice of syntactic models:

1. A low plank climbed over the wall and landed in the yard. There is no living soul. (Oybek. The sun does not darken).

2. The tortoise is crawling. Their necks are crooked, their eyes are dead (A.Mukhtor. Maple tree).

In both of the examples given, we see a specific way of speaking. Because at the same time the syntactic structures that can easily fit into the structure of a sentence are given by the speaker in the form of separate sentences. These statements can be combined through a transformation that takes place through an applied model. This, in turn, suggests that messages conveyed within a cognitive-pragmatic environment (situation) may occur in other ways:

1. *A low plank climbed over the wall and landed in the courtyard where no one was alive.*

2. *A dead tortoise with a crooked neck and crawling eyes.*

Apparently, there are two ways to convey a particular message at the discretion of the speaker, who is under the influence of a cognitive-pragmatic environment, namely, the use of particle devices or complex sentences with extended syntactic forms. The second of these methods, of course, requires the intersection of the transformation with the applicative model.

It should also be noted that at the disposal of the speech environment in most cases there are paradigms of syntactic structures adapted to give a certain expression of thought. We called this the communicative paradigm above. The communicative paradigm is broad, and its scope includes the transformation of simple sentences into compound sentences and compound sentences into simple sentences. In this case, mainly exchange, contamination transformations are used:

1. *Onabibi could not find anything to worry about, but she did not go to work again (A.Mukhtor. Maple tree).*

2. *Guzar, the streets were deserted, no one was visible (A.Mukhtor. Maple tree).*

In the first example, the syntactic derivation of a compound sentence (complex syntactic device) is observed in the speech environment in which there is an opportunity for syntactic derivation of the following sentences, each of which requires text status [1;28]:

1. *Онабиби бундан ҳеч хавотир оладиган нарса тополмаган бўлса ҳам, қўли ишга бормади.*

2. *Бундан ҳеч хавотир оладиган нарса тополмаган Онабининг қўли барибир ишга бормади.*

3. *Онабиби бундан ҳеч хавотир оладиган нарса тополмагани билан, қўли ишга бормади.*

Meaning:

1. *Onabibi didn't find anything to worry about, but her hand didn't go to work.*

2. *Unable to find anything to worry about, Onabibi's hand didn't go to work anyway.*

3. *Although Onabibi couldn't find anything to worry about, her hand didn't go to work.*

At the same time, the formation of the first and second sentences takes place within the framework of the so-called type of transformation in the broadest sense of the substitution. Here

we understand substitution, that is, exchange in the broadest sense, because in the transformation process, the operators of syntactic derivation take place: *-sa ham, bilan*. Both of these tools acquire syntactic activity in the process of exchanging an equally complex complex syntactic device given in the basic sentence with a subordinate component device in the sense of barrier. However, in subsequent transformations, both in the main sentence, the applicative model is more passively involved. In the second transformation, however, we see that the contamination transformation is applied because the syntactic form of an equally complex complex syntactic device shifts to an extended simple sentence. Moreover, most importantly, the applicable and transformational models intersect here. In the second example, it is observed that the complex syntactic device given has the following derivation possibilities:

1. *Гузар, кўчалар ҳувуллаб қолгани учун, бирор кимса кўринмас эди.*
2. *Гузар, кўчалар ҳувуллаб қолгани тўфайли, бирор кимса кўринмас эди.*
3. *Ҳувуллаб қолган гузар ва кўчаларда бирор кимса кўринмас эди.*

*Meaning:*

1. *Guzar, because the streets were deserted, no one could be seen.*
2. *Guzar, because the streets were deserted, no one could be seen.*
3. *No one could be seen in the deserted guzars and streets.*

At the same time, it is difficult to call the first two of the transformations a complex syntactic structure formed on the basis of an applicative model. But in the next transformation there is a simple sentence derivation in which the syntactic form is expanded by means of an applicative model.

True, the derivation operators used in transformations that require the complex syntactic structures given above (*-sa, ham, bilan, uchun, tufayli*) can be broadly called applicators. Such means, as L. Tener had previously mentioned in part, were called junipers. Their task is to connect independent words or nodes (wraps) formed by independent words to each other. The scientist gives the following example: *Les hommes craignent la misère et la mort - People are afraid of poverty and death.*

At this point, the “et” binder involved in the example given in French comes in the conjunctive status. The scientist showed that junipers can be compared to cement, which forms an inter-nuclear bond. It is noteworthy that the issue of expanding the syntactic structure of the sentence through the conjunctions was also emphasized by L. Tener.

We understand conjunctions not only as a derivative medium that binds the components of simple sentences, but also as a derivative that connects the components of compound sentences and complex syntactic constructions. Nevertheless, in the above transformations, we cannot observe the intermingling of the sentences given in the main sentence in the transformational process by means of the applicative model. In the second transformations of the first example and in the third transformations of the second example, the applicative and transformational models are literally intersecting. In other words, in this process, the derivation capabilities of a complex syntactic device are fully reflected.

In the analysis of the examples given, it should also be noted that each transformation exists based on the invariant form of a particular sentence. But the concepts of invariant and variant here differ sharply from the invariant and variant between phoneme and background, morpheme and morph, word and word form. If the concepts of invariant and variant between language units are of a constant nature, then the sentence and its invariant and variant forms are of a variable nature [7]. The point is that we always define its variants (transformations) based on the statement given for analysis. This, in turn, suggests that we need to know that the underlying sentence obtained for each analysis is invariant in nature.

When talking about invariant and variant structures, it should be noted that each variant structure (transformation in our examples) differs from the invariant structure in some respects. We see evidence of this in the update of derivation operators (applicators) and in the change of grammatical and semantic status of transformations. For example, if an invariant structure requires a complex syntactic device with an equal component, the transformation of the transform into a device with a dependent component or a simple sentence is an example of this. It is also important to have additional distribution options in the derivation process. It is precisely because of these possibilities that a favorable situation arises for the formation of the syntactic paradigm of transformations.

## CONCLUSION

In general, it is a very complex process, in which language, speech, cognitive-pragmatic and anthropocentric factors all intersect. Because if the expression of a particular idea is inextricably linked with the communicative process, then the choice of language units, speech model is closely related to the human factor and the speech environment that governs it. It should also be noted that regardless of whether the human factor is governed by the speech environment, without one of them, the other will not. More precisely, without the human factor, the speech environment (situation) cannot occur. It is therefore difficult to imagine the process of the speaker and the speech separately. In this process, the speaker deals with the selection, use, and, in general, the verbalization of speech quanta in continuous language material. This, in turn, suggests that the derivation process is directly related to semantic (e.g., semantic aspects of speech material), cognitive (e.g., concept selection for the formation of specific information), grammatical, and pragmatic factors.

### ABSTRACT

*The article presents the results of the analysis of clinical and functional features of venous cerebral circulation in 105 patients with hypertensive encephalopathy. The study revealed signs of cerebral venous dysfunction in 85 (81.0%) patients. Patients with venous Disgaea on the background of hypertensive encephalopathy were divided into 2 groups depending on treatment method: with the use of the drug Cytoflavin and without its use. Cerebral hemodynamics was studied in patients by duplex scanning of extra-and intracranial arteries before and after the course of treatment in 30 and 60 days. Patients with hypertensive encephalopathy on the background of treatment with Cytoflavin showed improvement in cerebral venous hemodynamics on the 30th day of treatment, but significant differences were found on the 60th day of treatment. Thus, the drug Cytoflavin quite effectively affects the state of cerebral venous hemodynamics, which allows us to recommend its use in the treatment of patients with hypertensive encephalopathy with the presence of venous cerebral dysgenia.*

**KEYWORDS:** Hypertensive Encephalopathy, Cerebral Venous Circulation, Cytoflavin.

### INTRODUCTION

Until recently, the study of the venous component of cerebral circulation lagged significantly behind the studies of arterial hemodynamics, which is partly due to the anatomical complexity and significant variability of the structure and difficulties in diagnosing blood flow disorders in the cerebral veins and sinuses of the dura mater, as well as the lack of simple objective methods

for diagnosing venous circulation disorders Interest in studying the features of the venous circulation of the brain and attempts to evaluate its importance in the cerebral circulation are determined on the one hand with a tendency to increase the number of patients suffering from vascular disease, on the other - the active development and introduction of modern imaging technology [1, 2010; 2, 2014; 5, 2007].

## THE MAIN FINDINGS AND RESULTS

Regional changes in the tone of intracranial veins lead to venous congestion and impaired cerebral circulation with atherosclerotic lesions of the brain vessels, arterial hypertension and hypotension, chronic lung diseases, cardiac pathology. It was recorded that compression of the jugular, brachiocephalic and vertebral veins is recorded in 15% of patients with hypertension; signs of impaired venous outflow of the brain are found in 91% of cases of hypertension, and in patients with stage 1–2 hypertension - in 55% of cases. At the same time, the compensatory capabilities of the brain and its circulatory system are so great that even serious difficulties in the outflow of venous blood for a long time may not cause clinical manifestations of increased intracranial pressure and impaired brain functions, so early diagnosis of this pathology causes certain difficulties [3, 2018; 4, 2015; 9, 2010].

However, changes in venous circulation are one of the important pathogenetic mechanisms for the development of vascular diseases of the brain. Two-thirds of the volume of the cerebral vascular bed is the venous section, but more than 90% of all works on vascular pathology of the brain are devoted to arterial blood flow. Underestimation of the venous section of cerebral circulation prevents the correct understanding of the pathogenesis and clinical picture of chronic cerebral ischemia [1, 2010; 7, 2009; 8, 2010].

*Purpose.* To study the features of cerebral venous hemodynamics of the brain in patients with hypertensive encephalopathy (HE) during therapy with Cytoflavin.

*Patients and research methods.* The study included 105 patients with arterial hypertension (AH), accompanied by hypertensive encephalopathy (HE), who were examined in the neurological department of the clinic of the Tashkent Medical Academy.

Of these, 85 (81.0%) patients had signs of venous cerebral dysfunction (B. Gafurov, 2018), the average age was  $58.7 \pm 6.34$  years. They constituted the main research group. 20 people (19.0%) without signs of ICD constituted a control group. Patient groups did not differ in age, sex, and stages of HE.

Clinical criteria for venous cerebral dysfunction were complaints caused by venous cerebral discirculation, such as morning pasture of the face and eyelids, a symptom of a “tight collar”, symptoms of “sand in the eyes” and “high pillow”, a family “venous” history, neurological symptoms, in the development of which venous cerebral discirculation plays a special role.

Patients of the main group suffered from hypertension (GB) for more than 8 years (average  $12.4 \pm 6.1$  years). In accordance with the classification of the Scientific Center of Neurology (1985), 29 (34.1%) patients were diagnosed with stage I HE, 32 (37.6%) stage II, and 24 (28.2%) stage III (Table 1.).

Patients of the main group — patients with VCD on the background of HE, were divided into two groups. Group 1 consisted of 39 people who, along with basic therapy, received Cytoflavin

from 1 to 30 days inclusive, at a dose of 2 tablets 2 times a day. Patients of 2 groups - 46 people received basic therapy.

The study of cerebral hemodynamics was carried out using a duplex-triplex scanner LOGIQ C-5 Premium. Echolocation of extracranial arteries was performed with a linear transducer with a frequency of 10 MHz, visualization of intracranial vessels using transcranial location with a phased transducer with a frequency of 2.5 MHz. Patients from the selected groups performed duplex scanning on the first day before treatment, on the 30th day, and also after 60 days (after taking Cytoflavin).

Statistical processing using the statistical 8.0 application.

### *Results and its discussion*

During the examination, the following syndromes were revealed in patients - cephalgic (87.6%), vestibular (72.9%), asthenic (54.2%), pulmonary syndromes (29.4%) and moderate (68.7%) cognitive impairment. It should be noted that in the main group the frequency of cephalgic syndrome was 95.8%.

Patients of the main group more often complained of night and morning headaches (89.2%) of occipital localization (45.8%) or diffuse nature (58.1%), bursting (22.7%), dull (68.3%), on the pastiness of the face and eyelids in the morning (92.9%). Complaints of dizziness, asthenic manifestations, and memory loss were noted in both groups with the same frequency: dizziness - in 46.7% of patients, memory loss for current events - in 52.8%, fatigue - in 62.4%, unmotivated anxiety - in 41.5% of patients.

"Venous" complaints in patients with ICD were significantly more likely than in the comparison group (Table 1.). Patients of the main group had an expansion of saphenous veins of the frontotemporal temporal region in 44.3% of cases, saphenous veins of the neck and upper shoulder girdle - 28.7%; which significantly prevailed ( $p < 0.001$ ) compared with patients in the control group who had an expansion of the saphenous veins of the frontotemporal region in 15.4%, in the neck and upper shoulder girdle in 13.8% of cases.

Decrease in corneal reflexes, soreness of exit points and hypesthesia in the innervation zone of the first branch of the trigeminal nerve and dissociation of knee and Achilles reflexes, in the development of which venous discirculation plays a role, in patients with CVD were determined already at the first stage of HE. But significant differences in these indicators are visible only in the group with GE III. For all three indicators, they were observed significantly more often than in patients with CG and patients with GE of the main group (Table 2).

**TABLE 1. "VENOUS" COMPLAINTS IN THE GROUP OF PATIENTS WITH HYPERTONIC ENCEPHALOPATHY (HE)**

	Main group		Control group	
	n	%	n	%
Females	49	57,6%	11	55,0%
Average age	58,7 ± 6,3		69,6±9,2	
<b>Stage of HE</b>				
I	29	34,1%	6	30,0%
II	32	37,6%	10	50,0%

III	24	28,2%	4	20,0%
<b>Symptoms</b>				
Symptom "tight collar"	72	84,7% *	4	20,0%
Symptom "high pillow"	69	81,2% *	2	10,0%
Symptom "sand in the eyes"	57	67,1% *	5	25,0%
Pastosity of the face and eyelids in the morning	79	92,9% *	6	30,0%

Note:

\* - significant differences between the main group and the control group ( $p < 0.05$ )

**TABLE 2. NEUROLOGIC SYMPTOMS IN PATIENTS WITH HE COMPARED WITH CONTROL GROUP**

	Main group		Control group	
	n	%	n	%
Decreasing of corneal reflexes	45	52,9% *	4	20,0%
Soreness of exit points and hypesthesia in the innervation zone of the first branch of the trigeminal nerve	59	69,4% *	2	10,0%
Dissociation of patellar and axilles reflexes	34	40% *	3	15,0%

According to the REG data in patients of the main group, difficulty in the venous outflow was revealed in 100.0% of cases. In patients with GE I, violation of the venous outflow was characterized by normo-hypertonic (32.5%) and arterial-hypertonic type of REG (65.7%), a decrease in the pulse blood supply of cerebral vessels (21.1%), in patients with GE II arterial-hypertonic type of REG (57.1%), vertebrogenic effect on the vertebral arteries (45.2%), decreased pulse blood filling - in 25.8% of cases. In the group of patients with group III HE, the arterial-hypertonic type of REG was found in 87.5%, vertebrogenic effect on the vertebral arteries - in 67.5, the decrease in pulse blood filling - in 48.9% of cases, which is significantly more common in all three indicators, than in groups of patients with GE I and GE II, respectively.

After a course of treatment with Cytoflavin, a decrease in the frequency and intensity of headaches was observed in 75.4% of patients, dizziness - in 48.2%. All patients noted an improvement in overall health, a decrease in asthenic manifestations. In this group of patients, the frequency of so-called "venous" complaints, namely night and morning headaches, face pastiness in the morning, and a feeling of "falling asleep eyes in the sand" in the morning, decreased significantly (72.6%). In patients of the main group, a significant decrease in the number of points on the HIT-6tm scale was observed on average from 65.2 to 32.8 points, in the control group - from 53.7 to 49.8 points.

All patients underwent a scan of the internal jugular, vertebral veins, central retinal veins, and Rosenthal veins. In the study of venous hemodynamics, some features of the state of the venous cerebral bed were found: in the main group, 85 (100%) patients showed an increase in the linear blood flow velocity (LSC) along the Rosenthal veins, 65 (76.5) - along the vertebral veins, and

54 (63 , 5%) - along the central retinal vein, 51 (60.0%) - along the direct sinus; in the control group, acceleration of blood flow through the Rosenthal veins was noted in 14 (70.0%) patients, along the vertebral veins - in 5 (25.0%), along the central retinal vein - in 7 (35.0%), by the direct sinus - in 6 (30.0%).

**Diagram 1. The state of venous hemodynamics (Vps, sm/s) in patients with HE associated with VCD during treatment with cytoflavin**

**Before treatment**

**After 30 days**

**After 60 days**

In the analysis of venous hemodynamics in the group of patients with VCD receiving Cytoflavin, a statistically significant decrease in BFV in the Rosenthal vein and vertebral veins was observed after treatment on the 60th day of treatment with Cytoflavin (chart 1). It should be noted that after treatment, a significant decrease in BFV in this group was recorded in comparison with the corresponding indicators before treatment, as well as in comparison with the group of patients who received basic GE therapy. A slight improvement in speed indicators was also recorded in this group, but it was not significantly significant (diagram 2).

**Diagram 2. The state of venous hemodynamics (Vps, sm/s) in patients with HE without VCD during treatment with cytoflavin.**

**Before treatment**

**After 30 days**

**After 60 days**

As a result of a comprehensive clinical and instrumental analysis of the effectiveness of course administration of the drug Cytoflavin in patients with GE, there was a subjective and objective improvement in the form of a decrease in complaints of night and morning headache, pasty face in the morning, dizziness, fatigue, as well as an improvement in General well-being and normalization of speed indicators of venous hemodynamics.

## CONCLUSION

In the majority of patients with HE (91.0%), according to the REG-examination, venous cerebral dyschemia is registered, which is manifested by characteristic "venous" complaints that reduce the working capacity and quality of life of patients. Therefore, the use of venoprotective drugs of Cytoflavin and detralex in the treatment of GE appears to be pathogenetically substantiated and promising, especially with course treatment and taking into account the corresponding comprehensive drug exposure on the most important pathogenetic factors of the development of HE.

As a result of treatment with Cytoflavin, a significant improvement in the majority of indicators in patients was noted (based on the analysis of complaints, dynamics of the neurological status and hemodynamic parameters). Thus, the preparations of Cytoflavin are quite effective in relation to the effect on the state of cerebral venous hemodynamics, which allows us to recommend its use in the complex treatment of patients with HE with the presence of venous cerebral dysfunction.

## TRADE RELATIONS AND THE DEVELOPMENT OF CRAFTS IN CENTRAL ASIA IN THE LATE XIX AND EARLY XX CENTURIES

**Mamarajabov Gayrat Abdulhakimovich\***

\*Senior Lecturer,

Termiz State University, Termiz, UZBEKISTAN

Email id: [turon1980@mail.ru](mailto:turon1980@mail.ru)

### ABSTRACT

*This article provides information on trade relations and caravanserais, markets, shops in Central Asia in the late XIX - early XX centuries, which were a source of income from trade. It is also said that the cities located on the cavdo roads played an important role in Central Asia's trade with neighboring countries. In turn, various raw materials, including cotton, silk, wool, astrakhan leather, cattle skin, silk and cotton yarn, various handicrafts and dried fruits were exported from the region. It has been scientifically analyzed that foreign goods such as industrial goods, Indian tea, spices, dyes, precious stones, sugar, and medicines produced in factories and plants of Russia and European countries were brought to Central Asia. During this period, trade and handicrafts were taxed separately, that is, the types of taxes in the markets could be broker money, place money, market money, and so on. Islamic, zoomorphic, geometric, epigraphic and astral-celestial ornaments were widely used in the decoration of handicrafts. The handicrafts produced also reflected the traditional and distinctive local features of Central Asia.*

**KEYWORDS:** Trade, Tax, Handicraft, Artisan, City, Village, Ware, Product, Market, Cotton, Silk, Jeweler, Fruit, Shop, Aksakal (Elder Person)

### INTRODUCTION

Economic growth and the growth of productive forces in the cities of Central Asia led to the location of trade caravanserais at the crossroads of the Great Silk Road, the strengthening of the interaction of cultures of different peoples, that is, the emergence of socio-economic relations. This process has also taken place due to the policies and natural-geographical conditions of the ruling circles of different states. As a result, it has had a significant impact on the ethno-political situation and socio-economic relations in the region.

---

## MAIN RESULTS AND FINDINGS

The great changes in the development of production in the cities of the Central Asian khanates date back to the second half of the XVIII century. During this period, "internationally, including the Russian market in the second half of the eighteenth century, as a source of raw materials for Central Asia and demand for certain handicrafts, encouraged as much reconstruction as possible in domestic production relations"[1.286]. After the conquest of the Central Asian khanates by the Russian Empire, civil wars in the country ended. Economic, cultural and trade ties have been restored and expanded in the country. The products of local artisans will be exported to Russia, and the demand for them in the domestic market will increase with the influx of handicrafts.

Samarkand, Bukhara, Tashkent, Shakhrisabz, Karshi, Khiva, Urgench, Kokand, Margilan, Andijan, major centers of domestic, foreign and transit trade played an important role in the socio-economic and cultural development of the Central Asian khanates in the late XIX - early XX centuries. From the various products needed for daily living needs created by local artisans in these cities, the raw materials needed for various craft industries are made by urban craftsmen. The artistic handicrafts made by them were traded with the goods produced by the people living in the neighboring countries and in the surrounding villages.

In the transformation of Central Asian cities into shopping centers, the size of the markets also depends on their location, what kind of products they sell and their specialization. For example, the gray market, the leather market, the horse saddle market, the knife market, the carpet market, the cotton market, the vegetable and horticultural markets were separate. A.Vamberi said about the city markets during his stay in the Bukhara Emirate in the XIX century: "The markets are a dazzling sight with the diversity of peoples, clothes, customs in the eyes of a foreigner"[2.361].

Crafts associations have been established in the cities, such as Samarkand, Bukhara, Tashkent, Shakhrisabz, Karshi, and more than a dozen guzars [3.230]. Such guzars were mainly inhabited by artisans engaged in a particular type of craft, and their workshops were located in the courtyards where they lived [4.248]. There were also artisan associations with separate shops and workshops at the market or near the stalls. Hence, it can be observed that in the development of trade the specialization of handicraft associations and the proximity of cities to the trade routes. Sometimes the production of handicrafts is considered to depend on natural - geographical and political processes. In this regard, the fact that there were many mountainous areas in the Eastern Bukhara principality, as a result of the demand for the protection of the principality, there was a great need for the production of weapons. Swords, spears, shields, knives, water cannons, truncheons and various large and small weapons, small items were produced in the arms workshops. Iron and coal ores used in Yurchi, Boysun and Sherabad principalities were used. The Boysun principality had 25 ore smelting furnaces, which employed 50 people. Although the workpieces made with ordinary pressing force are made for hard work, the imported high-quality blacksmiths, such as guns, needles, nails, begin to squeeze out the products of labor made by local craftsmen [5.17]. Especially in the 80s of the XIX century and the beginning of the XX century, as a result of the construction of railways in the territories of the Central Asian khanates, a wide access to local markets for Russian products was opened. Many local craft workshops find themselves in a difficult economic situation.

With the transfer of the railway network from the Russian Empire to Turkestan, the territory of the Central Asian khanates, iron, cast iron, tin, brass, tin, steel, mercury, bitter stone, glue,

amylene from paints, various metal products, glassware, leather products, non-ferrous metals, medicines, sugar, sugar and other products were imported [6.136.]. Also, after the invasion of Tsarist Russia, high-quality porcelain, textiles, precious stones, jewelry, spices, dried fruits and other products from China, India, Iran and Afghanistan entered the Russian markets through the cities of the Central Asian khanates [7.56] as well as delivered by those country merchants and Bukhara merchants. By the end of the 19th century, the import of metal from Russia to Central Asian cities had increased 10 times and metal products 2/3 times [8.114].

The sale of handicrafts was done by artisans, brokers and traders in local markets. In the city markets there are special rastas for craftsmen, jewelers and blacksmiths. The artisans themselves also sold handicrafts in the workshop shops. Traders who had written permission from a representative of the Russian government in the Bukhara Emirate and the Khiva Khanate were able to open shops in local markets [9.147.]. Information was given that he was planning to open a store and sell his goods. Products are made in cash or by exchanging a certain amount of goods.

In the Surkhandarya oasis, "beqasam (national cloth)" is also a favorite fabric of the locals. Beqasam fabric is thin-striped and differs from "alacha (shovel)" by its quality and method of preparation. His 48 "arshin" of the highest grade cost 12 soums and 60 tiyins, and coats made of it cost up to 9 soums. The people of the oasis made coats, jackets, coats and blankets from "beqasam". The locals made clothes for men from cotton woven pencil fabric, the pencil was in the form of a rougher fabric. For women's and children's clothing, coarser fabrics were also used. In addition, velvet and adras fabrics are also much older fabrics, mostly woven at home. Women's and children's clothes, skullcaps, blankets and pillows are sewn from velvet. Velvet weavers weave 2 arshin of velvet a day and sell it for an average of 2 soums for 70 tiyn. Velvet is a favorite fabric of goldsmiths and was used to make various items.

The settlers "chigatoys" and "togchi" were engaged in various branches of handicrafts, such as blacksmithing, carpentry, textiles, sewing, pottery, milling, handicrafts, embroidery, doppichi, etiquette, leather. The semi-settled population of "kungrads", "juzs", "mangits", "saroyes" were mainly engaged in weaving carpets, making the necessary equipment for pastures [10.160.]. The exchange of goods with the settled population and semi-settled people living around the city, along with a large number of handicrafts such as sheep, goats, cattle, as well as raw materials for the textile and leather industries - wool, leather and various district carpets. In addition, the agricultural population exchanged various agricultural products, such as melons and vegetables, for handicrafts [11.].

In the late nineteenth and early twentieth centuries, there were about 40 types of taxes in Central Asian cities. In addition, the main tax levied on artisans and traders is income tax, with Muslim traders charged an amount of 40 "chervon" for each "rasta (stall)" in foreign coins, while Russian traders are charged up to 12 "chervon". There is also a "zakat" tax of 40/1 of the income from the sale of products made by artisans. Another type of tax levied on artisans and merchants was the "ulpon (tribute)," which was very difficult for small artisans and merchants to pay. [12.]. In the markets, artisans and traders also had payments such as "place money", "tea money", "market money" [13.185].

## CONCLUSION

In short, in the late nineteenth and early twentieth centuries, craft associations in Central Asian cities had their own centuries-old traditions and customs. This is due to the fact that the patriarchal relations of trade unions in society are well preserved. That is why social relations between people have remained unchanged for centuries.

## TEACHING PRAGMATICS IN A FOREIGN LANGUAGE CLASS AND ITS IMPORTANCE IN LANGUAGE LEARNING

**Karoeva Hilola Muinovna\***

\*English Language Teacher,  
Samarkand State Architectural-Civil Engineering Institute,  
UZBEKISTAN

### ABSTRACT

*This article discusses the importance of the role of pragmatics in teaching and learning a foreign language. The issue of teaching pragmatics in a foreign language classroom is relevant today, as the younger generation who is learning a foreign language must be familiar with its language levels and rules of language use in order to learn and communicate successfully in social and academic environment. But often foreign language teachers are unable to present pragmatic ability in the classroom as long as there are shortcomings in how to teach pragmatics or they are not able to put it into practice sufficiently. At a time when the prestige of foreign language teaching and learning is growing, the number of studies on pragmatics teaching is also increasing. It is especially important to develop the skills between the teacher and the student to be able to use it in communication, especially in requesting and inviting.*

**KEYWORDS:** *Foreign Language Teaching And Learning, Pragmatics, Qualification, Pragmatic Competence, Language Skills*

### INTRODUCTION

At present, with the rapid development of new technologies and sciences around the world, especially in our country, there is a growing demand for learning a foreign language and its effective use in communication. Therefore, in recent years, our country has undergone significant reforms in the system of teaching and learning foreign languages, which is to raise the prestige of our country in the world arena and ensure that the younger generation is educated to the fullest. Therefore, learning or knowing two or more languages provides the basis for the learner to use it effectively in the future. When learning a language, it is important not only to use it in the classroom or in communication between peers, but also to communicate with people

of other nationalities, whose main purpose of learning a foreign language is to study their culture and linguistic origins. To achieve this goal, in teaching pragmatics, it is necessary to pay more attention not only to the practical component of a foreign language, but also to its linguistic component.

Various studies conducted around the world emphasize that foreign language learners should not only know linguistics, but also have its pragmatic competence, i.e. learn and develop the function of language and the rules of its use [13, 16]. Language is a complex system used for social or cultural communication and necessary for interaction between people. Therefore, how, with whom, and how to use a language depends on how well the student has mastered the language. Teaching pragmatics in a foreign language classroom and understanding more of its specific features will undoubtedly help to learn a foreign language effectively.

### **THE MAIN PART**

Research in many countries shows that it is precisely the lack of pragmatic skills in foreign language teaching that makes it difficult to communicate it effectively to the listener or reader. According to a study by Cohen, foreign language learners can learn the entire syntactic context and lexical layer of a language well, but no one can guarantee that this reader will be sufficient to convey their goals without knowing the pragmatic layer of language [8]. Although our Russian-speaking students seem pragmatically gifted when they speak Russian, it is still difficult for this ability to reflect in their foreign languages. That is why they should learn the pragmatic aspects of the language in the foreign language classroom by applying pragmatics. This in turn teaches pragmatics, allowing them to express their ideas more pragmatically and fluently.

#### **The need to teach pragmatics in a foreign language class**

Teaching pragmatics and introducing it in foreign language classes is one of the most effective and important approaches. Research by Kasper has shown that the process of teaching a foreign language serves to increase students' pragmatic competence. In addition, many studies in this area have focused on the teaching of pragmatics and its important role in enhancing the pragmatic skills of students learning a foreign language [3, 12, 16, 17].

In addition, a study by Bardovi-Harlig discussed the need to teach pragmatic aspects of language in the acquisition of pragmatic knowledge in a foreign language-teaching environment [4]. Another study showed that teaching pragmatics does not have sufficient opportunities in a foreign language-learning environment. This is due to the lack of local experts who communicate in the language during the study of a foreign language, and therefore students tend to pay more attention to the rules of the language rather than communicating in the process of learning it from non-native speakers of a foreign language [15].

At the same time, in teaching a foreign language, teachers do not use the full potential of the language and as a result, the use of the language in the mind of the student prevents the increase of pragmatic information. The reason is that teachers and students combine the same language and social environment in a pragmatic learning process, and cultural ties between countries are limited because they speak the same language. The situation would have been much different if there had been a clash of multi-linguals and cultures in the classroom, especially if there were students learning the same foreign language as their mother tongue. Because this changes the social environment and gives students, the opportunity to learn the language through a natural

process, and it becomes much easier to acquire pragmatic competence. In Uzbekistan, almost all teachers and students communicate outside of class, mainly in Uzbek, and then in Russian, Karakalpak and Tajik. During the study of a foreign language, however, it is used only formally in the classroom, and this does not create the basis for its natural wrapping. However, it would be wrong to say that this is the same in all educational institutions, because, for example, in order further improve the language, some students go to tutoring courses, or especially students in higher education institutions study a foreign language in a specialized way. In such cases, of course, it is much easier to learn and practice the pragmatic layer of the language. However, it is wrong to conclude that they are learning it completely, because sometimes even a student who speaks the language very well can make spiritual mistakes when communicating in a foreign language, such as in asking, inviting, requesting, or apologizing.

In addition, some studies have suggested that teaching pragmatics leads to “success” in various fields [4, 5, 16]. The above-mentioned research emphasizes the need to teach pragmatics in different situations in a foreign language environment. A study by Alcen-Soler (2005) suggests that pragmatics should be used to enhance the pragmatic aspects of foreign language learners and help them develop social connections. In other words, the importance of teaching pragmatics is to give foreign language learners a purposeful knowledge of the socio-cultural rules of language, and to form it continuously throughout communication and to teach the differences between two languages naturally by creating a foreign language environment rather than rules.

Although there is a growing interest in teaching pragmatics today, it is still not fully covered in practice, i.e. in the process of learning a foreign language. This is because many foreign language curricula, although language learners know when and how to use certain language rules, are unable to produce words that are pragmatically appropriate for foreign language learners or sentences that need to communicate based on the spoken context. Consequently, foreign language teachers need to incorporate pragmatics into their teaching practices in the process of language teaching, as teaching pragmatics facilitates the formation of skills to ask, demand, request or suggest in the learning process and enable students to communicate successfully in any situation.

In particular, the use of language in some of the material created may not serve as a good source for adequate communication between the speaker and the listener [6]. In other words, teaching materials are not designed with pragmatics in mind, therefore it is difficult for teachers to combine it with pragmatics in the process of teaching a foreign language, and sometimes pragmatics is completely overlooked. In addition, the lack of opportunities to demonstrate pragmatic aspects in a foreign language-learning environment, as well as the lack of opportunities to put language aspects into practice, make it more difficult to achieve the functional ability of a language in foreign language teaching. Thus, the need to learn pragmatics is more serious for foreign language learners, who do not communicate effectively with professionals who know the foreign language at the native language level and are not able to use the foreign language effectively because of the same social environment in the classroom [1, 9].

Furthermore, Casper argues that it is difficult adequately develop many features of pragmatic competence without knowing or learning some methods of teaching pragmatics. In his view, if the form-function of students' native language is similar to that of a foreign language, some features of pragmatics can be developed without teaching it. Unfortunately, most students do not

know what they have, so they do not use it effectively. Therefore, first, it is necessary to inform foreign language students about what they know in their native language and encourage them to use a foreign language by teaching pragmatics. Based on the above, it can be concluded that foreign language teachers can be a key role model for Uzbek students in achieving pragmatic competence. However, for this, a teacher who teaches a foreign language to Uzbek students must be well aware of the pragmatic knowledge of the language being studied.

### **Research in the field of pragmatics**

Pragmatics is one of the most important components of communication, and this field has developed mainly as part of linguistics since the late twentieth century, first as a field of study and then as the best developed field of linguistics. The field of pragmatics is the growth of the dynamics of language learning in linguistics, which studies the meaning of the words of the speaker in the context in which he is speaking. Many linguists, enlighteners, have studied pragmatics over the years and scholars, and various perspectives have been identified throughout the study [11, 18, 20].

In our country, many researchers in this field have conducted their research as well, in particular, in the pragmatics and Uzbek linguistics such as N.Mahmudov, Sh.Safarov, A.Nurmonov, D.Lutfullaeva, S.Muminov, M.Khakimov, D.Khudoyberganova, S.Boymirzaeva. The contributions were invaluable. In their research, they studied pragmatics in connection with different levels of Uzbek linguistics.

Research has also suggested that pragmatics is a field that studies “the functioning and interpretation of language in relation to the context of use” [7]. In addition, another study shows that pragmatics is the study of “meaning in use,” which focuses on how the mother tongue speaker is used in the development of various functions of language in social and cultural communication [19]. These include aspects that play a key role in speech development, such as how the level of politeness is conveyed, how speech acts are performed in different communication environments, the direct impact on the syntactic structure of speech, and the “speech interpretation” of the goal.

In addition, the pragmatics of foreign language learners is a feature of this communicative competence, and such pragmatic aspects must be selected successfully and purposefully so that they are designed to be more challenging, interesting, and engaging in the foreign language classroom. In addition, pragmatics does not focus on grammatical knowledge, but on how well students can use the language in communication in a foreign language classroom. Pragmatics also aims to help the reader create meaning rather than developing a perfect grammatical structure. Therefore, Shauer argues, the most basic definition of pragmatics is “the coding and decoding of words spoken by the narrator and the listener” [18]. It can be seen that the above definitions focus on the meaning of the word, taking into account the similar features of pragmatics.

In fact, previous research in foreign language learning and teaching in pragmatics has emphasized the need to help language learners improve their ability to ask, beg, and communicate successfully in a variety of situations during speech [2, 17]. The results of previous research provide ample evidence of the need to develop pragmatic skills for foreign language learners. Nevertheless, it is worthwhile for students to experiment in different contexts using different models to gain a deeper understanding of how they can develop such a skill in their

classrooms. It is also important to conduct goal-oriented strategic lessons to learn pragmatics. The results of the study found that strategy-based teaching was effective in developing the four skills of listening, speaking, reading, and writing for foreign language learners.

On a regular basis, opinions have been expressed by researcher Kim on the need to establish forms of motivation and supportive attitudes towards teaching and learning pragmatics [14]. In his research, he examined students' attitudes toward learning pragmatics, and the results of the study showed that students were more interested in learning pragmatics and that they needed to consider pragmatic features when communicating in a foreign language. The researcher concluded that teaching pragmatics developed students' communication skills and use of speech acts, improved their pragmatic awareness of socio-cultural differences, and boosted confidence in their communication in a foreign language.

Learning pragmatics also helps foreign language learners to use a second language or a foreign language successfully and communicate effectively. According to the researchers, it is important to have enough learning or skills in pragmatics when using a foreign language, as extensive pragmatic assistance has been argued that it provides a basis for a foreign language learner to use language and its functions for positive and understandable communication [10].

Thus, pragmatics is an important feature in the teaching and learning of any language and contributes greatly to the growth and development of the language. Consequently, the study of pragmatics is the most important element of academic achievement for foreign language or second language students. In addition, teaching pragmatics in the classroom is very important and can be effective in developing students' awareness of learning speech acts, especially in the process of asking for and communicating something in a foreign language [8]. Research by Casper and Rose suggests that the basic laws of pragmatics are important in the teaching of pragmatics, such as speech acts, speech function, the art of addressing, barriers to communication, and conversation structure [12]. Focusing on these aspects increases language learners' awareness of language use in the classroom setting. Therefore, teaching foreign language pragmatics plays an important role in raising the language awareness of Uzbek students.

## CONCLUSION

In summary, this article explores the main role of teaching pragmatics in a foreign language as a new method, as well as its essence and features. It also presents various studies on the teaching of pragmatics in the study of foreign languages, the role of pragmatics in the study of foreign languages by Uzbek students and the features of its effective use in communication. Research has shown that the study of pragmatics leads to the effective and correct use of language in a foreign language classroom, especially the formation of the etiquette of asking in a foreign language and the study of its strategies helps the student to communicate in that language without spiritual errors. Since pragmatics is also the key to success in language learning, its effective use allows the teacher to create a foreign language environment in the classroom in a natural way, and students consolidate the knowledge they have acquired in the classroom.

### INTRODUCTION

From the first days of independence, the main focus of the country's leadership has been on the restoration of cultural and spiritual heritage, preservation of values, inculcation of the ideology of independence in the minds of our people. In the conditions of independence, the country aims to implement a national model of training mature personnel who can fully meet today's requirements, to cultivate young people who are aware of the achievements of science and understand their national identity. Also, the issue of radical reform of education, the introduction of world-renowned advanced pedagogical technologies, the cleansing of the education system from outdated ideological views and obsolescence, the training of highly qualified personnel has become one of the most pressing tasks of state policy. "The supreme tasks of inculcating the idea of national independence in the minds of our compatriots, the future of the country - the formation of the younger generation as a harmoniously developed person have risen to the level of state programs" [2,2001]. It is well known that one of the manifestations of perfection is manifested in a person's speech, etiquette, culture of behavior.

## MAIN RESULTS AND FINDINGS

The perfection of a society's speech activities is also usually shaped in a variety of ways. Uzbek folk proverbs are one such tool. Therefore, it is observed that folk proverbs address almost all issues related to the formation of perfection in speech activity.

For example: *Avval o'yla, ketin so'yla; Aytilgan so'z – otilgan o'q; So'z qadrini bilmagan, o'z qadrini bilmas; Sihat tilasang – ko'p yema, izzat tilasang ko'p dema.*

Meaning: *Think before you speak; The word is a shot; He who does not know the value of the word, does not know his own value; If you want health - don't eat a lot, if you want glory - don't say a lot.*

Therefore, proverbs are one of the means of forming such qualities in the upbringing of the younger generation. It is true that the role of folk proverbs in ensuring the effectiveness of speech and enhancing the art of speech is also invaluable.

For example: *Anglamay so'zlagan, og'rimay o'lar; Aravasiga tushdingmi – ashulasini ham aytasan; Ariqni suv buzar, odamni so'z (gap); Yig'inga kirganda tilingni tiy, u yog'ini o'zing bilasan* [1,1984].

Meaning: *He who speaks without understanding, dies without pain; Did you get in the car - you also sing; The stream is polluted by water, the word (speech) of man; Keep your tongue out when you enter a meeting, and then you know what will happen.*

Uzbek folk proverbs, as it is known, are a separate system that increases the richness of the language, rounding and harmonizing according to their semantic, grammatical and phonetic structure, and is one of the special units. Just like phrases, it acquires the status of a lexical unit and is recorded in dictionaries. Language becomes the unit that provides wealth, and in this respect it becomes the wealth of the hand. At the same time, it is one of the pictorial means of language. As long as it is a visual medium, it will be the focus of attention of those who pay attention to speech. Every speaker strives to choose them. Thus, it serves to create exemplary, effective speech and provides effective speech communication.

Therefore, proverbs have not appeared today. They have been formed by our people over the centuries, polished and refined over time. It is a cream of ideas about nature and society, the changes that are taking place in it, the different relationships between people. According to these features, on the one hand, it is close to philosophy, on the other hand, it reflects the peculiarities of artistic creation. Proverbs play an important role in the Uzbek folklore as the most concise but universal genre. The article reflects the way of life, cultural and spiritual level of our people, deep philosophical observations, national identity, conclusions based on the results of experiments. In its meanings, it refers to the spiritual heritage of our people over the centuries. It briefly and clearly reflects the life experience of our ancestors, conclusions about nature and society, lifestyle, human relations, education, profession, advice. The proverb is easy to absorb, memorized, as it contains ideas in a concise, concise, clear, logical, effective way. Therefore, it is among the genres of folk oral art. It later began to move from oral to written literature as an easy and convenient, effective means of expression. Therefore, proverbs are actively used today in the form of oral and written speech. Some of them have been used only in certain periods of our history, while some are still used in our speech today. It also appears that the nature and vitality of proverbs are directly related to the history of the people. As time goes on, some of them go out of consumption, while others come into our speech. The proverb is often referred to in fiction

as a subtle and beautiful expression of thought. If we look at the history of Uzbek literature, we see that proverbs from Mahmud Kashgari have been used in the works of artists to this day. If we look at the pages of the past, Mahmud Kashgari's "Devoni lug'atit turk" contains about 400 proverbs and examples common among the Turkic peoples, Muhammad Sharif Gulkhani's "Zarbulmasal" has more than 300 proverbs, Sulaymonqul Roji's "Zarbulmasal" and the fact that more than 400 articles have been used confirms our view. Proverbs were used in the works of many writers of the late XIX, first half of the XX century and later, including A. Kadyri, Fitrat, Behbudi, Hamza, Oybek, A. Qahhor, S. Ahmad, P. Kadyrov and many others. . This is complemented by the fact that there have been many studies that have revealed issues such as the impact of the language of the work, as well as the skill of the authors in the use of proverbs. Proverbs are one of the genres of folklore, characterized by the diversity of their types, which are equally relevant to all areas of human activity. Among them are issues of speech culture, communication etiquette.

Of course, there are a lot of folk sayings related to the etiquette of conversation. All of them emphasize the need to assess whether a person has perfection, especially in this regard, and to pay special attention to the issues related to the formation of perfection in them. In addition, there are many articles that emphasize this very idea: *"O'ynab gapirsang ham – o'ylab gapir"*; *"Bilmagan qopib gapiradi, bilgan topib gapiradi"*; *"So'zingga ehtiyot bo'l boshing ketmasin, Tilingga ehtiyot bo'l, tishing sinmasin"*. Meaning: *"Even if you play and talk - think and talk"*; *"He who does not know speaks, he who knows speaks"*; *"Be careful of your words, do not lose your head, be careful of your tongue, do not break your teeth."* So, all such proverbs are examples of very logical situations, rules and laws, which have come from life-tested situations, have been experienced, recognized by the people. Without thinking, without knowing the background of the word, without taking into account the situation, the mood of the interlocutor, the time, and many other aspects, every word that comes into the mouth can lead to very bad consequences. Many other issues, such as the fact that this can degrade the speaker, and the circumstances related to a person's cultural level, are reflected in the above articles. Expressing the thought of thinking in a thoughtful, calm, unhurried way in the brain shows that a person is a civilized person in this respect. This quality, which is one of the main signs of being a perfect human being, is the ability to think, to form it in a person. It was this seemingly small feature that had to be used in all the means of education. (A person who speaks thoughtlessly is punished - embarrassed, specially trained, reprimanded, warned, when the time comes, he is specially treated. Fiction, stage productions, and many other means are used to teach thinking). In other genres of folk oral art, many other ideas are expressed in legends. In religious books (the Qur'an and the hadiths) there are separate notes on contemplation: *"So'zni ko'p so'zlamasdan biroz oz so'zlagin, ming so'zli chigalni bir so'z bilan yechgin"*; *"So'zni o'ylab so'zla, shoshilma, qo'nimli bo'l, shoshilib so'zlangan so'zning oqibati o'kinchli bo'ladi"* (Yusuf Khas Hajib). Meaning: *"Speak a little without saying a lot, solve a thousand-word mess with one word"*; *"Speak the word thoughtfully, do not rush, be calm, the end of a hasty word will be regrettable"* (Yusuf Khas Hajib).

There are many proverbs in the books of Uzbek folk proverbs, which indicate that people think of every sentence, and they contain the issues of developing this skill.

People took a very responsible approach to creating proverbs. Because the article should express as much meaning as possible in as few words as possible. The wise Plutarch said: *"Nutqning*

*kuchi oz so'z bilan ko'p ma'no anglata olishidadir*". Meaning: "The power of speech lies in the fact that it can mean a lot in a few words." Similarly, the sage I. Winkelman says: "In the art of speech, it's harder to speak succinctly than to talk too much". Both thoughts require a great deal of thought in the brain, the expression of speech in general. Noting that it is important to think carefully about "what to say" and "what not to say," the famous speaker Cicero said: "One of the greatest virtues of a speaker is not only to say what is necessary, but also not to say what is not necessary." At the same time, he is conveying this idea to the speaker (in the original sense, i.e., in relation to the speaker-speaker in general). P. Chekhov rightly said: "Speech is one of the strongest pillars of culture, both now and in the past." After all, the speaker thinks about his speech, takes it seriously, and then speaks. Indeed, as L.N Tolstoy put it, "Uncertainty in the Word (Speech) is undoubtedly a sign of uncertainty of thought." It is important to think the idea, mature it, and then state it in a speech mode. The writer A.Qodiri said: "It takes a long time to speak a word and compose a sentence from it". That is, each sentence must be thought out very carefully and then said. This is the main characteristic of a perfect man. Yusuf Hos Hajib writes:

*"Bor so'zni so'z sanab tebranmasin til,*

*Ko'rib, o'ylab so'zla, keragini bil"*. ("Qutadg'u bilig")

Meaning: "Let not the tongue tremble at every word,

*See, think, and know what you need. "*

A. Navoi's "Word is countless - it is countless"; "Disregard for the word - self-regret"; It is not in vain to use proverbs or sayings such as "The root of the disease of the body is to eat a lot, and the cause of the disease of the heart is to eat a lot." Alisher Navoi, quoting the above-mentioned thoughts on reasoning, reinforces his opinion with the following words: "If he has a healthy brain, his speech will be pleasant and error-free." Prof. S. Ibragimov said: "The subject of speech culture is a very broad concept. It is, first of all, to follow the language culture (it is a deeper speech), to speak and write correctly, appropriately, in an understandable way, based on the norms of speech, and at the same time to follow the ethics of speech, to be sober, smooth, pleasant. Only those who have noted certain aspects of the topic of speech culture as a broad concept (other aspects of speech, such as logic, clarity, eloquence, communication etiquette, are not reflected in the ideas expressed, that is, are not included in the definition). Because the culture of speech covers all issues related to speech activity (there are aspects such as knowledge, humility, honesty, honesty, patriotism, generosity, eloquence, openness, sincerity...). Knowledge of the power of words, folk proverbs, and adherence to the most logical ideas repeatedly emphasized in expressions, of course, require deep thought. Because all Uzbek folk proverbs, without exception, were created by the people with the aim of forming a perfect man. Therefore, if we pay attention to the thematic content of folk proverbs, we can see that they cover all aspects of human activity, and even proverbs are created that lead to maturity within a particular profession: "Olim bo'lsang, olam seniki"; "Er haydasang, kuz hayda, kuz haydamasang, yuz hayda"; "Obro' topay desang, kam de, sihat topay desang, oz ye...". Meaning: "If you are a scientist, the world is yours"; "If you plow the land, plow the autumn, if you do not plow the autumn, plow the face"; "If you want to find prestige, say less, if you want to find health, eat less." The conciseness and conciseness of the form in the proverbs, the depth and sharpness of the content, and thus the combination of such ideas as the promotion of the most important morals, humanity, and the call to humanity and honesty are astonishing.

Nowadays, everyone, especially young people, need to be taught to think carefully about the situation, the mood of the interlocutor, other situations, the time, place, topic, different course of the conversation, to talk about the goals and objectives of the interlocutors. It is becoming more and more important to teach them to think deeply, to form calmness in them. That is why our people have the following proverbs and sayings that have been used since ancient times:

*Think first, then speak; He who speaks without understanding, dies without pain; The wise speak both thoughtfully and farsightedly; Think a thousand, say a thousand; Think at night, get up the next day; Think more, speak less; He who speaks thoughtfully will be praised, and he who speaks thoughtlessly will be ridiculed; It is the work of a fool to say what comes into his mouth...; Don't say eight without counting, don't say thirty without thinking; Think without speaking; Return yourself from where your word has returned; Be careful with your tongue so that your teeth do not break (there are also options - A.A.) [1,1984; 5,1987-1988; 6,1990]; If he utters any word, the insane person will say only the words he needs; Speak the word knowingly, let your word be a seeing eye to the blind; Think the word carefully first, then speak, speak only when asked, and finish the word immediately. Listen more, don't talk too much yourself, speak intelligently, model the word with knowledge; The word that speaks knowingly and wisely is a sign of wisdom, and the word of the ignorant is the word of the ignorant.* There are many proverbs and sayings of this type told by folk sages. They say, *"Think first, then speak."* Because words spoken without thinking kill the soul... Words that come out of a person's mouth are like snow, rain and hail. It is not for nothing that they give life to people or kill them "[4,2017]. Because thoughtless words can "hurt" people, because our wise people say that "the tongue is sharper than a sword", so it is necessary to protect it - to be able to manage it. Otherwise, his "wound" will be severe and incurable: *"The knife wound will heal, the tongue wound will not heal."* A person's attention to language in the process of communication, his perfection in all respects, depends on this upbringing and knowledge. Such issues are exemplary ideas, which are emphasized in folk proverbs and proverbs. That is why it is necessary to pay attention to language: *"Pay attention to language - pay attention to people"*. The thoughtless, inappropriate sentence is reassuring: *"Keep your tongue, don't break your teeth."* All of these proverbs are tried and tested life experiences told by our people and that can come to mind because of not thinking.

## CONCLUSION

Therefore, the role of proverbs in ensuring the observance of speech etiquette, etiquette in the process of communication, the effectiveness of speech, its effectiveness is invaluable. Of course, this needs to be studied and taught in the process of upbringing. All of them have served to form a perfect man in all periods. It is clear that these wisdoms and proverbs have a special place in both education and communication today. However, unfortunately, few of them are found in the educational process. Among teachers and educators, there are few who promote them at events. So, one of the defining characteristics of perfection is the need to think, to speak, which is related to the culture of speech. While this is considered in the context of a culture of communication, etiquette, the role of folk proverbs in the formation of this characteristic, positive feature in young people is invaluable. Effective use of them in the education system will always be the most important tool.

### ABSTRACT

*The article analyzes the sources of financing investment activities of textile companies. The practice of financing investment projects of textile enterprises, using their funds, bank loans and foreign investments were identified. The process of financing investment activity at industrial enterprises and methods for assessing the effectiveness of investment projects are investigated.*

**KEYWORDS:** Industry, Textile Enterprises, Investment Activity, Investment Financing, Investment Strategy, Sources Of Financing, Equity, Bank Loans, Foreign Investments.

### INTRODUCTION

It is clear that, the main tasks of industrial enterprises, which are an important link in the economy of the country, are the development and modernization of innovative products to produce, sell new types of products and ensure their competitiveness. Note that, in the current context of liberalization and development of the economy, the search for sources of investment to implement the above tasks and their involvement in the financing of investment projects of enterprises is the crucial issue.

In order to ensure the sustainable development of the textile industry, one of the leading sectors of the industry, a comprehensive solution to the problems associated with other sectors of the economy, the government is taking large-scale measures to effectively use and further develop the production potential of textile enterprises. The development of the textile industry in the country, the improvement of the mechanism for financing the investment activities of textile enterprises and the support of these activities through large-scale investments appear to one of the important tasks of today's day and age.

The investment activity of textile enterprises is directly related to the economic recovery of the country's industrial sector. Investments include all types of property and intellectual values that are invested in the objects of entrepreneurial activity, which ultimately results in a positive financial result.

Currently, the investment activities of textile enterprises are carried out within the framework of public investment programs. At the same time, the peculiarity of financing the investment activities of textile enterprises is that they require a large amount of money. Therefore, the financing of investment projects of textile enterprises requires a large number of financial resources for them. The use of advanced methods in the analysis of the cost-effectiveness of investment projects is a factor in the successful implementation of the investment strategy of the enterprise.

### **LITERATURE REVIEW ON THE SUBJECT**

There are different opinions among foreign and local economists on the financing of investment activities of enterprises, their management and development of investment strategies. Each of the scientists and researchers is distinguished by the fact that they have their own approach and opinion on investment, financing investment, the effectiveness of investment projects, financing the investment activities of enterprises. Among such scientists and researchers as Z.Bodi, R.Merton, B.R.Mihaela, L.L.Igonina, V.V.Kandeeva, E.V.Dmitrieva, E.A.Kuznetsova, I.S.Vinnikova, D.G.Gozibekov, B.S.Mamatov, D.Y.Khojamkulov, M.B.Pulatova, N.I.Kenjaev can be included. These economists have studied the problems of modern principles of financing and management of investment activities in the real sector of the economy and industrial enterprises.

Z.Bodi, R.Merton in their works expressed their views on investment projects, planning of investment projects and improvement of production methods of investment projects, development of strategies for the implementation of investment projects and the analysis of its financial basis [1].

B.R.Mihaela developed a methodology for conducting financial analysis of publicly funded investment projects in her research, taking into account the economic and financial condition of enterprises and scientifically substantiating the need to have the necessary information to determine investment-financing opportunities before analyzing the risks associated with the investment project gave [2].

L.L.Igonina studied important issues such as attracting investment in production, identifying sources of financing for investment activities of real sector enterprises, as well as developing a mechanism for attracting funds to the economy [3].

V.V.Kandeeva while analyzing the innovation and investment activities of industrial enterprises, identified the relationship between the development of innovation and investment activities of industrial enterprises and the mechanism of its management [4].

In her research, E.V.Dmitrieva highlighted the problems of developing a system of financing the investment activities of industrial enterprises and attracting investment based on their sectoral characteristics, as well as the development of modern mechanisms for financing the investment activities of industrial enterprises [5].

E.A.Kuznetsova, I.S.Vinnikova studied the methods of assessing the effectiveness of investment projects of industrial enterprises, analyzing the reasons for the lack of innovation in improving the efficiency of investment projects of industrial enterprises in their research [6].

In his scientific literature, D.G.Gozibekov covered the issues of investment, investment climate, investment policy, investment projects, financing of vain investment activities and attracting investments to the economy [7].

B.S. Mamatov, D.Y.Khojamkulov in their scientific works focused on traditional and discounting methods of assessing the financial efficiency of investment projects, as well as the analysis of cash flows in investment projects [8].

M.B.Pulatova, studying the investment projects in industrial enterprises and modern directions of their management, expressed her views on the classification of investment projects [9].

In his research, N.I.Kenjaev developed scientific proposals and recommendations on improving the complex examination of investment projects [10].

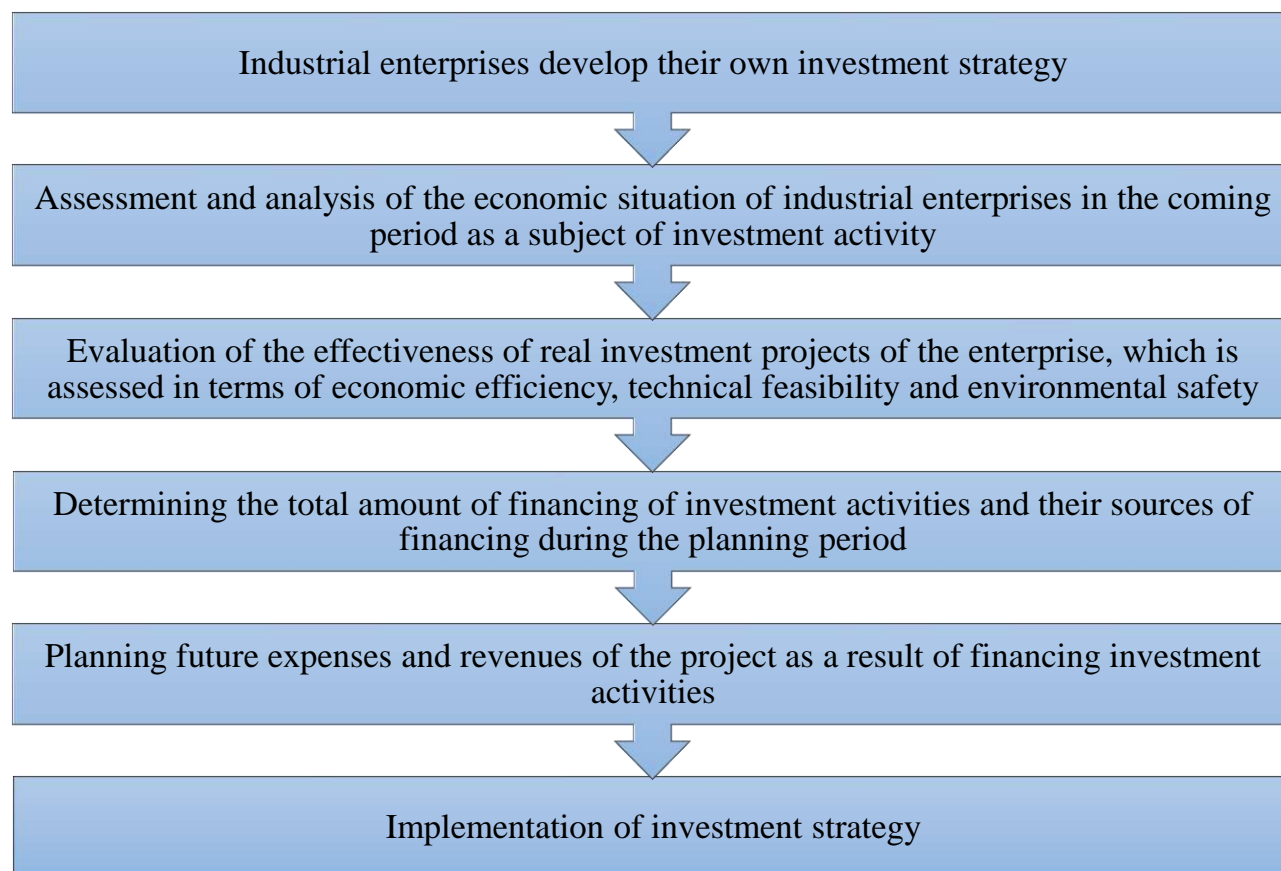

The development of investment financing in the industrial sector, in particular in the textile industry, has become one of the priorities of the state, and in order to achieve its supply, great attention is paid to attracting investment in the sector, including foreign investment.

In Uzbekistan, along with the automotive, oil and gas, chemical, mechanical engineering, pharmaceutical and radio electronics industries, it requires constant modernization of production in the textile industry and the widespread use of scientific advances. Therefore, the involvement of the most modern equipment and technologies in industrial enterprises remains one of the priorities today.

## ANALYSIS AND RESULTS

Improving the effective investment activity of textile enterprises and, accordingly, the mechanism of continuous financing of investment activities means sustainable growth of the enterprise. Nowadays, as the main source of financing investment activities of textile enterprises is a real investment, it is important to find additional sources of financing for their investment projects and to raise funds to finance investment activities from their profits. We know that one of the most important tasks today is to choose the sources of funding for investment projects. This shows the interdependence of investment and financial activities of the enterprise.

When financing the investment activities of industrial enterprises, foremost, the enterprise must develop its investment strategy. Through this strategy, the company will gradually finance the planned investment projects. The stages of the process of financing investment activities in industrial enterprises are shown in Figure 1.

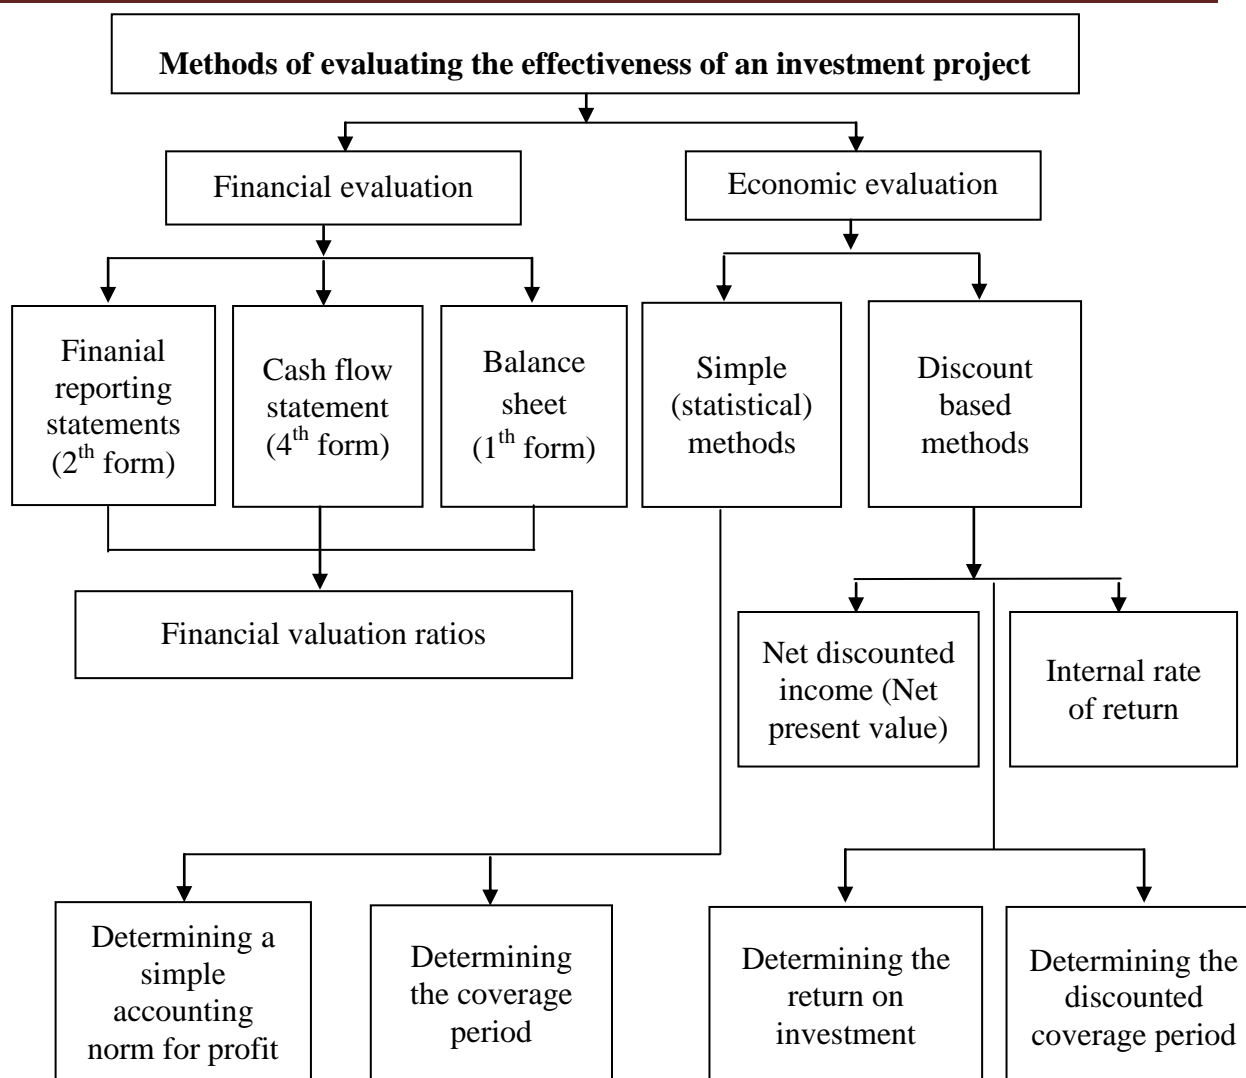

**Figure 1. Stages of the process of financing investment activities in industrial enterprises [11]**

As a result of the planned implementation of the stages of the financing investment process activities in industrial enterprises, the most important task will be to consider the effectiveness and efficiency of investments aimed at financing the investment activities of enterprises.

Generally speaking, making investment decisions is a very difficult task for any enterprise, the main criterion of which is to increase the wealth of the investor, to increase the value of the enterprise. Its factors are the growth of enterprise income, financial risk or reduction of production costs, increase the level of efficiency of the enterprise [12].

Researches show that, the evaluation of the effectiveness of investment projects of enterprises is carried out based on two criteria, namely, financial and economic evaluation. Both of these criteria for evaluating the effectiveness of an investment project are complementary.

The task of financial evaluation is to determine whether an enterprise has sufficient financial resources to meet its total financial obligations to implement the project on time. On a figure 2 below shows the basic detection methods for the two types of criteria.

**Figure 2. Assessing the effectiveness of investment projects [13]**

Financing of investment activities of textile enterprises is carried out through external or internal sources. The most common sources of external financing of investment activities are own funds, bank loans, syndicated loans, raising funds through the issuance of shares and bonds, and foreign investment. Internal resources are significantly scarce, and often their size is not sufficient to finance the investment activities of enterprises, which increases the need for external sources of financing.

The first of the internal sources of financing the investment activities of textile enterprises is the company's funds. The development of an efficient investment mechanism for the enterprise will increase the competitiveness of the enterprise in the economy in the future and lead to the efficient circulation of idle funds.

Based on Figure 3 below, we analyze the dynamics of financing of investment projects of textile enterprises from their funds over the past three years, with a total value of 33 projects worth \$ 103.9 mln. in 2017, 57 projects worth \$ 274.5 million in 2018, and in 2019 85 projects with \$

289.5 mln. value was financed from their funds. In 2019, the financing of investment projects of textile enterprises at their own expense increased by almost 280% compared to 2017.

**Figure 3. Dynamics of financing of investment projects at own expenses of the textile enterprises (in mln. US dollars) [14]**

Studies show that the object of directing the existing funds of textile enterprises are:

- purchase and installation of new equipment and devices, technical means;
- financing of new innovative ideas;
- construction and commissioning of new buildings and structures;
- repair, renewal of fixed assets;
- increase the range of products;
- staff training.

The peculiarity of the investment activity of textile enterprises is that investments in these enterprises are made in the form of real investments, financing of investment activities through other types of investments is rare in practice.

In financing the investment activities of textile enterprises, it is expedient to proceed from the investment activity and its specific features. Investment activity is an activity related only to the process of making investments. Spending a relatively large amount of money on an investment activity is important in achieving a profit or other beneficial effect.

Thus, the development of the industrial sector is very important in ensuring the development of the country's economy, which is explained, first of all, by the intensive development of the economy and the attraction and development of new technologies.

In the Address of Sh.Mirziyoyev, President of the Republic of Uzbekistan to the Oliy Majlis dated January 24, 2020, it was mentioned that deep measures are being taken for the widespread introduction of public-private partnership mechanisms in transport, energy, roads, utilities,

medicine, education, as well as energy, oil and gas, geology, also in deep structural reforms in transport, road construction, agriculture and water management, drinking water and heat supply, and in a number of other sectors, also was noted that modernization and competitiveness programs are being implemented in 12 leading industries, resulting in an increase in industrial production by 6.6% in 2019 [15].

In 2019, \$832.3 million, in other words, it increased by 151,0 % compared to 2018, was allocated from all sources of financing under the state program to finance investment projects of textile enterprises, which are a key component of the industrial sector. US dollars or 151.0% more than in 2018. Of this amount, \$ 373.5 million were invested in textile enterprises, \$169.3 mln. in bank loans and \$ 289.5 mln. in foreign investments. It should be noted that no investment projects under the state program have been funded from other sources. This indicates the need to identify other sources of financing for investment activities in enterprises (Table 1).

**TABLE 1 ANALYSIS OF SOURCES OF FINANCING INVESTMENT PROJECTS IN TEXTILE ENTERPRISES (IN MLN.USD) [14]**

<b>№</b>	<b>Sources of financing investment projects</b>	<b>2017<sup>th</sup> year</b>	<b>2018<sup>th</sup> year</b>	<b>2019<sup>th</sup> year</b>
1	Own funds	260,7	274,5	289,5
2	Loans from commercial banks	103,9	262,8	373,5
3	Foreign investments and loans	23,8	13,5	169,3
4	Other sources	0	0	0
	<b>Total</b>	<b>388,4</b>	<b>550,8</b>	<b>832,3</b>

In order to ensure economic growth in textile enterprises, in the current conditions of economic development of the country, it is necessary to create a system of additional market incentives for investment development in the strategic future, taking into account the requirements of natural resources and environmental safety of commodity-technological specialties'. Economic growth in textile enterprises is able to provide the necessary investment resources for qualitative changes in the national economy and technological modernization of production.

The size and growth of the domestic market for textile enterprises is a key factor in investor decision-making. Significantly, the role of the state in the use of mechanisms that encourage investment in all sectors of the economy.

## CONCLUSIONS AND RECOMMENDATIONS

In our country, there is a lack of own investment sources (own funds of the enterprise) in financing the investment activities of textile enterprises. Due to the poor financial performance of enterprises, the financial condition of enterprises deteriorates, because of which they feel the need for external sources of financing to finance investment activities.

One of the conditions for attracting funds to finance the investment activities of textile enterprises is to increase the natural flow of investment, taking into account the experience gained in the field of investment cooperation. To do this, the country must take the necessary measures to increase the attractiveness of the investment climate and local investment opportunities of enterprises. This has a positive impact on the investment activity of the enterprise and creates the basis for the creation of a specific mechanism for financing investment activities.

When financing the investment activities of textile enterprises, it is necessary to pay attention to the following:

- creation of a mechanism for the use of funds raised in the financing of investment activities in textile enterprises;
- creation of conditions for the use of non-traditional methods (for example, venture financing) in addition to traditional methods in attracting funds to finance the investment activities of textile enterprises;
- Use of innovative tools (introduction of digital financing (crowd funding)) in the financing of investment projects in textile enterprises.
- Development of a mechanism for financing investment projects in textile enterprises in order to ensure the modernization of the material and technical base of textile enterprises.

Only an effective mechanism of financing investment activities will ensure high efficiency of the enterprise. Moreover, in turn, such a system will help the company to realize and achieve its goals.

## THE EFFECT OF ENSURING THE CONTINUITY OF MATHEMATICS SCIENCE IN TERTIARY -INSTITUTION ON THE EFFECTIVENESS OF TEACHING

**Nigora Shermatovna Erkaboyeva\***; **Khurshida Aliyevna Ustadjalilova\*\***

\*Doctor of Pedagogical Sciences,  
Kokand State Pedagogical Institute,  
UZBEKISTAN

\*\* Associate Professor of Business,  
Candidate of Pedagogical Sciences,  
Kokand University, UZBEKISTAN

### ABSTRACT

*The article discusses the features of teaching mathematics to students. The questions of teaching combinatorics and mathematical analysis are considered. The article shows the features of studying mathematics in the Humanities, the faculty of natural Sciences, and computer science.*

**KEYWORDS:** *Mathematics, Continuity, Method, Mathematical Logic, Combinatorics, Differential Calculus, Geometry, Integral Calculus, Mathematical Symbolism, Sets, Digit Of Numbers, State Standards Of Higher Education.*

### INTRODUCTION

This article, devoted to the problems of teaching methods of mathematics, examines the specifics of teaching interdepartmental mathematics in pedagogical universities. The article describes the features of conducting mathematics lessons in higher education pedagogical institutions and improving the planned and future level of professional training in teaching mathematics, the study of their advanced pedagogical experience and the use of modern educational technologies. aims to improve their skills and abilities. Mathematical Sciences in this regard have great potential. Therefore, the study of mathematics in a coherent, step-by-step and interrelated with other disciplines will help students to grow their independent thinking skills.

The basis of Mathematical Sciences in the Republic is taught within the framework of certain courses in accordance with the psychological and pedagogical characteristics of students in accordance with the educational content of educational institutions operating at different stages.

Ensuring continuity between courses that cover the basics of mathematics in higher education, the selection of teaching materials in accordance with the age characteristics of students of different levels of education, their placement on the basis of a certain logical sequence, interdisciplinary membership and consistency, achieving the leading role of the principle of membership in the learning process and creating a problem of pedagogical justification of this situation and shows the relevance of the chosen topic.

Methods of teaching mathematics in higher education Alikhanov S.[1], M. designing the process of teaching mathematics. Report this website on pedagogical technologies H. Avliyakov, it was studied by Musaeva [2] and others.

The introduction of the topic of elements of mathematical logic in the content of mathematics education in academic lyceums and professional colleges has increased the attention and demand for this science. According to A.A. Stolyar, the course "Theory of Mathematical Logic and Algorithms" is of special importance in the training of mathematics teachers [3]. The study of mathematical logic by future mathematics teachers is two-pronged. On the one hand, it is aimed at in-depth study of the field (construction of mathematical theory, content and structure of mathematical proof, mathematical clarification of the concept of algorithms, logic of computers), and on the other hand, to develop the thinking culture of the future teacher.

It is difficult to achieve the above goal without the development of science, technology and engineering, increasing the effectiveness of scientific research, the effective use of the results in the educational process, the introduction of new pedagogical technologies in teaching practice. Therefore, the teaching of mathematics in pedagogical universities must meet the following requirements:

- The purpose of bachelor's degree in mathematics in pedagogical universities first and foremost, it should be in line with the goals of school, academic lyceum, vocational colleges, as well as master's mathematics education;
- Based on these goals, the content of undergraduate mathematics education in pedagogical universities should be the basis for the scientific substantiation of the content of mathematics education in schools, academic lyceums, professional colleges and the continuation of the winter in the master's degree;

The structure of mathematics education in the bachelor's degree of pedagogical universities should fully cover the structure of mathematics education in schools, academic lyceums, professional colleges, so that you can continue to receive education in a clearly selected specialty at the next stage of education. must consist of the necessary knowledge;

- In order to increase the interest of students in science in the process of teaching mathematics, to instill in them a love for professional activity, it is necessary to effectively use new pedagogical and information technologies of education. [6]

## THE MAIN PART

The fundamentals of higher education are aimed at distinguishing between real-world processes, objects, and events, and have been adopted as the basis for educating highly qualified professionals. State educational standards place high demands on the qualifications and skills of

the trainees. These requirements are directly related to modern conditions, and their goal is to form a national intellectual elite of young people studying.

Among the requirements of the SST for the humanities, the requirements for mathematics have a special place. This is reflected in the curriculum.

Like all sciences, mathematics has its own alphabet. The alphabet is made up of letters, numbers, and special characters, each of which is a single character.

It is well known that the linguistic objects that make up a language are best represented by mathematical structures that are somewhat similar to them. Therefore, in modern times, mathematical methods are effectively used in the construction and analysis of mathematical models that are able to explain and predict the events and facts that occur in linguistics.

Often, the use of mathematical methods in linguistics can replace an intuitive problem with one or more simple and logically correct mathematical problems. Typically, such problems have an algorithmic solution, so such an approach is necessary for the automatic analysis and synthesis of oral communication using modern computer tools, information processing, the creation of automatic translation systems. At the same time, it is advisable for each bachelor to use a certain degree of mathematical thinking in the linguistic analysis of texts, finding lexico-grammatical phenomena, understanding the structural-semantic and stylistic features of the text functionally and pragmatically.

If we look at the specific disciplines in the example of 5110700 - Methods of teaching computer science, the program requires algebra and geometry, differential and integral calculus of functions of one and many variables, numerical and functional series, differential equations, elementary theory of functions of complex variables. and mathematical statistics, the equations of mathematical physics, their applications, and the history and development trends of this science.

Mathematics is a course included in the block of general professional subjects and should be taught in the 1st year. Mathematics is a major part of mathematics education in schools and secondary special education institutions. Therefore, there are special requirements for mastering this science. This subject is an integral part of the computer science teacher training system. The curriculum includes 126 hours of classroom hours and 226 hours of general study hours.

The purpose of teaching science is to acquaint students with the basics of modern mathematics, to consciously study the issues of professional activity, to explain the essence of the possibilities of mathematics in solving problems and to teach them to apply them.

The task of teaching mathematics is to acquire a culture of thinking through the conscious mastery of the content, rules and methods of mathematical concepts, to understand, generalize and analyze information, to set goals and choose ways to achieve them;

- express their ideas logically, accurately and rationally based on oral and written speech;
- Achieve competencies in the application of basic methods of mathematics, including mathematical analysis and modeling, theoretical and experimental research methods in professional activities.

The following requirements are set for the knowledge, skills and abilities of students in science.

For example, in the course of mathematics at the Faculty of Natural Sciences, special courses are needed, such as statistical analysis of experimental results, multivariate analysis, the application of mathematical statistics in medicine. For specialists in radio engineering and electronics, small courses, such as the correlation function and its statistical evaluation, the introduction to random processes, are important for future activities of students.

It also needs to bring future math teachers closer together with the school, high school and college community, as well as parent organizations, in order to guide them in their careers. In high schools and colleges, it is desirable to have a "hour" of a great scientist, academician, well-known specialist once every 15-20 days. It is good for a scientist to talk about his science, his results and their applications. Such scientific dialogues are extremely useful in ensuring continuity between education systems and types.

Topics such as "Probability Theory and Elements of Mathematical Statistics" and "Elements of Combinatory" in interdepartmental mathematics programs are extremely relevant in the context of a broad aspiration to acquire economic knowledge. These issues also need special attention.

One such method is to present the material in the form of a logically complete, coherent whole - didactic units.

We will focus below on the normalization of returns and iterations on the topics of differential and integral calculus of one-variable functions in existing programs of secondary, secondary special, vocational and higher education.

A total of 472 hours are devoted to the subject "Fundamentals of Algebra and Analysis" in the curriculum of mathematics for academic lyceums, including homework:

210 hours are devoted to the topics of functions, function limit, product and their applications, integrals and their properties.

The Faculty of Physics and Mathematics of pedagogical institutes allocates a total of 300 hours for the program of mathematics in the field of physics and astronomy, which is taught in the I-II courses. However, 96 out of 156 hours in the first year are devoted to the elements of mathematical analysis, product of functions, indefinite integrals, exact integrals, its geometric meaning, numerical series, polynomial function, product of polynomial function. The content of the subjects in these programs exceeds the norm of repetition of the intermediate-special algebra course. So, they would only resort to this as a last resort.

In addition, a total of 196 hours are allocated for the program of mathematics in the field of computer science teaching methods, which is taught in the first year. Of the 120 hours, 108 hours are devoted to the topics of the module of elements of mathematical analysis. These are the following topics:

- Numerical sequence and its limit. The concept of function and its limit
- Definition of product, geometric and physical meanings.
- Differential of a function, its geometric meaning. Derivatives of parametric and implicit functions. Higher order derivatives and differentials.
- Basic theorems of differential calculus. Taylor formula. Increase and decrease of function, extremums

- Unclear integral, properties. Substitution of variables, partial integration
- Integration of rational functions Integration of irrational expressions. Euler exchanges.
- Integration of trigonometric expressions.
- Exact integral. Newton-Leibniz formula. Applications of exact integrals.
- Positive boundary lines. Numerical rows, private sets Necessary condition for convergence. D'alambert and Koshi sign.
- Rows of interchangeable signs. Absolute and conditional convergent series, properties. Leibniz's theorem.
- Functional rows. Areas of detection and convergence.
- Differentiation and integration of functional series. Taylor and McLaren pumps.
- Multi-variable functions. Graph of a function of two variables. Limit and continuity of multivariate functions. Private and full discounts. Private crops. Full differential.
- Specific derivatives and complete differentials of implicit and complex functions. Taylor's formula for a function of two variables.
- Extremes of functions of many variables. Extremum condition for functions of two variables Maximum and minimum values. Conditional extremums.
- Two- and three-dimensional integrals and their properties and their calculation.
- Change variables. Two-dimensional integral in polar coordinates.
- Three-dimensional integral in cylindrical and spherical coordinates. Applications of two- and three-dimensional integrals.
- Problems leading to differential equations. First-order differential equations solved with respect to the product.
- Linear differential equation. Bernoulli's equation.
- Full differential equation. Integrating multiplier.
- Clero and Logrange equation.
- High-order differential equations of decreasing order
- Differential equations with homogeneous coefficients of the second order.
- Differential equations with non-homogeneous coefficients of the second order.

However, 12 hours are devoted to topics related to the elements of probability theory and mathematical statistics that have been removed from the high school and college curriculum.

However, in the 11th grade of the existing secondary schools, 56 hours are allocated in the department of functions of differential and integral calculus.

Analysis of the State Education Standards and Curricula in Mathematics of Secondary, Secondary Special, Vocational and Higher Education in Mathematics, in particular, shows that they have a lot of repetitions and iterations. At the same time, the repetition of topics completely

undermines the interest of students in mathematics, the effectiveness of teaching, as well as the developmental impact of education, as cybernetics argues, that repetition alone does not give the student any new information. Because in this case the information coefficient is zero.

In order to prevent this, methods that allow subjects to be described with special emphasis on their internal connections play an important role.

In order to minimize the negative effects of repetition of the content of the topics, it is better to rely on the previous study of the study material, which should be studied in the process of enlarging the didactic units of knowledge acquisition.

The following experiment was conducted in the teaching of differential and integral calculus of one-variable functions of the course "Mathematical Analysis" in the field of methods of teaching mathematics.

Given that students are familiar with the study material that needs to be studied, several similar sections are described simultaneously. This provided an opportunity to draw conclusions from the analogy. Also, in a sense, the opposite concepts are expressed simultaneously (in parallel).

For example, it is very convenient to study the properties of infinitesimal and infinitely large quantities at the same time. It is also of great importance to choose icons for the designation of quantities:

$a(x)$ - unlimited small quantity;

$A(x)$ - unlimited large quantity.

While the concepts of function limit and function continuity are interrelated, they are usually described separately in different sections of the course. However, their similarities and differences appear faster and clearer than usual when they are described at the same time.

It is useful to place similar definitions and assertions in parallel columns.

#### **Function limit**

If  $0 < |x - x_0| < \delta$ , then  $|f(x) - b| < \varepsilon$

in this formula  $b$  is the limit of the function

#### **Function continuity**

If  $|x - x_0| < S$ , then  $|f(x) - f(x_0)| < \varepsilon$

Definitions and confirmations the inscription placed in parallel columns also serves as an additional source of information. Analyzing the records from the first line presented above, the student draws attention to the peculiarity of the concepts being compared: argument when calculating the function limit, and  $x_0$  when calculating the function limit is not considered in the point itself (it is also possible that the function is not defined at this point, but there is a limit).

In the traditional system, first all the elements are derivatives of the functions, then the differential formulas of these functions are given, and they are used in the next chapter to study the inverse problem, that is, the indefinite integrals.

Because students are already familiar with these concepts, we introduced them at the same time. This approach was interrelated.

$$(u + v)' = u' + v', \quad d(u + v) = du + dv$$

$$(u+v)' = u' + v', \quad d(u+v) = du + dv$$

$$\int (u+v) dx = \int u dx + \int v dx \text{ and the relationships between them.}$$

It also provided an opportunity to look at reciprocal issues of integration and differentiation in one session.

$d(\sin x) = \cos x dx$ ; check:

$$\int \cos x dx = \sin x + C;$$

$$\int x^2 dx = \left( \frac{x^3}{3} \right) + C$$

; check:

$$\left( \frac{x^3}{3} + c \right)' = x^2 + 0,$$

such an approach allowed students to develop the ability to draw conclusions by analogy, as well as to see inverse assertions. This results in significant time savings.

**Results.** As a result, it is possible to look at non-standard exercises that help to determine the level of mastery of the mathematical operations in question. In this case, exercises to restore the lost expressions are effective, for example:

$$\lim_{x \rightarrow 0} \frac{tg(?)}{5x} = 3$$

$$(?)' = 3x^2(?) - (?)\sin x, \quad \int (?)\cos(?) dx = 5\sin 4x \text{ and so on}$$

Textbooks and manuals used in the learning process provide a wide range of standard exercises for finding the derivative, differential, or initial function of a given function, and non-standard exercises like the above are almost non-existent. However, they can be created by the teacher and included in the text of lectures, electronic manuals and other teaching aids.

## CONCLUSION

In short, in enlarging the didactic units of knowledge acquisition, it is necessary to take into account the repetitions in the transition from one type of education to another, that is, the fact that the learning material to be studied was studied in the previous type of education. It serves as a factor in ensuring membership.

The radical changes taking place in the life of our society today pose a challenge to continuing education institutions, including secondary special, vocational education institutions, to train creatively active professionals who can think logically and independently. The science of mathematics has infinite possibilities for the formation and development of such qualities in future professionals. This, in turn, requires the use of the most effective forms, methods, tools

and technologies of teaching mathematics in the stages of education, ensuring the continuity between the stages of education.[7]

## DEVELOPING THE SPEECH OF HEARING-IMPAIRED PUPILS IN PRIMARY SCHOOL BASED ON GAME TECHNOLOGY

**Temurova Gulchekhra Khudoykulovna\***

\*Lecturer at the Department of Defectology  
Jizzakh State Pedagogical Institute,  
UZBEKISTAN

### ABSTRACT

*The use of games in the development of speech in children with hearing impairments is important in the organization of educational activities. It stimulates thinking, critical observation, speech development, and learning. Play is a powerful motivating factor in activating the interests and abilities of children with hearing impairments as educational methods that help them achieve their goals in learning new material. An analysis of play techniques aimed at developing the speech of pupils with hearing impairments in primary school based on game technology is presented.*

**KEYWORDS:** *Play, Children With Hearing Impairments, Teacher, Speaking Skills, Activation, Methods, Learning Activities.*

### INTRODUCTION

In recent years, the country has improved the living standards of people in need, expanding the range of services provided to them, ensuring continuity of education, improving the quality of the education system, early detection of children with disabilities and their rehabilitation. In particular, the "Strategy of actions on the five priority areas of development of the Republic of Uzbekistan for 2017-2021" includes the development of the social sphere. Presidential Decree No. 5270 of December 1, 2017 "On measures to radically improve the system of state support of persons with disabilities" to improve the living standards and quality of life of persons with disabilities, medical care for this category of persons - to expand the effectiveness of social rehabilitation, inclusive education, to implement a wide range of tasks aimed at improving their education. These works prove that the humanitarian policy is being implemented in our country [1,2].

---

## THE MAIN RESULTS AND FINDINGS

The inability of hearing-impaired children to fully master speech like their normally developing peers, as a result of hearing loss, creates a number of problems in the formation of their personalities as they find their rightful place in social life. The inability of a person to speak due to a hearing impairment, and therefore isolation from members of society, creates a number of problems in finding their place in social life. These are due to various interrelated reasons, including L.S Vygotsky states: "Social upbringing leads to the underdevelopment of speech, the underdevelopment of speech leads to isolation from the community, separation from the community. This slows down the development of social upbringing and speech". L.S Vygotsky's method of developing oral speech focuses on the fact that a child's meaningful life is carried out in conditions that are not related to his interests. He compared the acquisition of speech without taking part in social life to the learning to swim on the beach. He emphasizes that the social environment and its structure are the ultimate and decisive factor in any educational system: "A child's life should be organized in such a way that it is necessary and interesting for him to speak. Education should be directed towards the interests of the child, not against them. It is necessary to create a need for universal speech, and only then will speech emerge. Speech occurs on the basis of communication and thinking, as a result of adaptation to complex life conditions "[8, p. 65]. "In the special education system, game technology is an important factor in the development of children's creative thinking, independent learning skills and the acquisition of new knowledge through the application of accumulated knowledge, skills and abilities in new situations. It is important to cover the social relations in everyday life, the relationship between nature and the objects of natural phenomena in an artistic way. the use of games in the process of special education, aimed at the acquisition of new knowledge in the process of step-by-step solution of the problems created on this basis, based on the knowledge resources of children themselves, has a positive effect. The use of games in the development of speech in children with hearing impairments is an important part of the learning process. It stimulates interest in thinking, critical observation, speech development, and the performance of certain tasks "[6, p. 34]. Play is a powerful motivating factor in activating the interests and abilities of children with hearing impairments as educational methods that help them achieve their goals in learning new material.

Currently, children with hearing impairments need to work with a deaf educator and a group of pupils (deaf educator - pupil, pupil - pupil) in the development of speech through interaction, taking into account personal relationships. Because group activities have a positive effect on the pupil's personality. Interaction allows children with hearing impairments to develop communication and speaking skills "[8, p. 34]. The need to use didactic games in the formation of oral speech as a means of communication and the development of auditory perception in children with hearing impairments demonstrates the effectiveness of these methods and the importance of acquiring the necessary knowledge and skills. Didactic games play an important role in the formation of personal qualities of children with hearing impairments, the implementation and development of speech development and speech communication. It is well known that role-playing games play an important role in the conditional reflection of human activity in the objective world, in improving the effectiveness of education. Role-based games activate and motivate speech in children with hearing impairments. Play is a natural and favorite activity of school-age children. Therefore, in order to develop the skills of teaching and applying them in practice, the emphasis is on organizing the lessons as a game, depending on the characteristics of

the age. Indeed, the child is more motivated and interested in the game than in any other activity. Role-based play, as a method of education, organizes children and expands their cognitive opportunities and shapes them as individuals. Role-playing games allow the child to think freely, to say, ask, prove, and explain something to the other person. Unlike dialogue, role-playing games answer questions such as motive and goal, reason. In this way, the children in the game focus on the content of the conversation. During the game, children acquire skills such as starting a conversation, asking questions to the interlocutor, answering questions. Children can achieve the expected result if they play the game with a clear goal. Should be familiar to them. Each image must be interpreted in advance. The child may play secondary roles in the play, but not in the lead role. Because in this case, role-playing becomes one of the traditional methods of education. It is better to discuss the shortcomings of communication not during the game, but later. As children develop their speech, it is important to use methods that encourage independent thinking, inquisitiveness, and generalization. Didactic games can be used to introduce pupils to new material, reinforce previously acquired knowledge, increase their vocabulary and develop their thinking. It should be noted that simplicity, uniformity, and involuntary repetition make children tired and indifferent. During the game, "Who's Faster?" can interest in increasing their activity. They also try to win tasks, not to lag behind others, to show that they are capable of doing them. Playing games plays an important role in the mental and physical development of children. Because it is inextricably linked with a wide range of educational issues. Games are not only a didactic tool, but also a key form of children's activities. Therefore, we cannot solve the responsible tasks before us without taking into account the subtleties of the game and learning to manage the activities of the game. There are different types of didactic games: role-playing, rules-based, creative. The goal is to increase children's vocabulary, broaden their horizons, and foster community relationships.

Play is a means of learning, working and educating children [9, pp. 122]. However, the educator should not turn the main part of the lesson into a game, but should not use the game to fill the free time in the lesson, and should understand the main purpose of the lesson before the game. Elements of the game and tasks of a play nature are determined by the children's mastery of the training materials. It is well known that when we approach speech activity from a psychological point of view, we see that the process of expressing an idea consists of several stages: motive, purpose and intention.

They are expressed in words and sentences in the form of pleading, giving orders, agreeing with or disagreeing with a person, persuading him, or denying a statement. In the present life situation, motive, purpose and intention are realized in the form of natural communication. However, in order to increase the vocabulary of hearing-impaired children, it is necessary to create special situations to express their thoughts and desires and encourage them to receive information. These situations must come from their need. Games are the best way to approach these situations. That's why it's important to use games. Enhancing vocabulary through role-playing games is also based on the child's ability to speak and act on imaginary situations. If the game has good conditions for understanding the meaning of each sound, word and speech pattern, the child will master them thoroughly. Special games can help a hearing-impaired child to hear and understand speech, to pronounce it correctly, and to master the tone of everyday speech. But it helps to better understand the meaning of the words included in the dictionary of games, to strengthen and activate them [3, p.33]. When children play, their vocabulary increases

and they learn to connect newly introduced words with the words they learn and use them in speech. Here are some ways in which you can do that.

In the process of primary education, R. Johnson, D. Johnson's method is used to teach pupils to form oral speech, to develop the ability to compose text from interrelated sentences, to think freely, to express their attitude easily. A method based on a pupil completing a task is extremely effective. For example, a pupil in a class is selected by drawing lots. The class is divided into two groups according to a certain rule (number, optional), with each pupil writing a sentence based on the description on a piece of paper. One group of pupils give a positive grade and the other group give a negative grade. For example, Nafisa is an excellent pupil. Nodira is an angry pupil and so on. One pupil will be selected from each group. Pupils in both groups try to prove their point. The following method has a positive effect on the development of conversational speech in primary education: pieces of paper with the number "1" to "10" are placed on the teacher's desk or in his hand. The teacher asks the pupils to "try their luck. It is important to keep the number simple for each pupil. It is important that if there are two or more numbers, you need to create a text that is related to the content. The subject is free. The semantic features of the sentences composed by the pupils should also be identified. It is necessary to make a sentence according to the number.

The following tasks are given to develop written speech, engage pupils, and draw attention to a point. The pupil should express his wishes to his partner sitting next to him. This assignment format may change slightly. The pupil is asked to write a letter to a parent or friend in another country. In doing so, it is important to determine the context in which the text is used. The cluster method allows the creation of an idea by combining different concepts related to a single concept in general. For example, pupils may be asked to give a specific concept and identify its adjectives. "What kind of country is Uzbekistan?" The question combines such qualities as "independent", "rich", "legal", "great", "advanced", "leading", "democratic", "prosperous". These words can also be grouped by structure. Or pupils will be asked to describe movie and cartoon characters.

For example, the main character of the fairy tale "ZumradvaQimmat" Zumradcan be described as follows; "Victim", "tolerant", "resilient", "strong", "trustworthy", "kind", "beautiful", "caring". The validity or invalidity of these definitions will be determined in the course of the lesson through discussion. It is suggested to find a separate word for each sound of a word. For example, "manners", "moon", "friend", "mirror", "head". The teacher uses verbal-tactile and sign language to explain the task to the pupils. If a pupil with a hearing impairment finds it difficult to articulate the task orally, using a gesture or tactile speech, the teacher then encourages the pupil to complete the task orally.

The use of the Sinkwain method in the formation of speech in children with hearing impairments is effective. To do this, the following scheme is provided and asked to complete:

\_\_\_\_\_ Subject (noun)  
 \_\_\_\_\_ Symbol (adjective)  
 \_\_\_\_\_ Action (verb)  
 \_\_\_\_\_ Sentence related to the topic

***The scheme must be completed in the following order:***

- a specific topic is given by the teacher or chosen by the pupils;
- choose a word from two adjectives that characterize the topic;
- find three verbs that express the essence of the topic;
- a sentence on the topic is made;

Example:

Teacher smart, kind, to teach, teach, educate Respect your teachers

This method encourages pupils in special schools to work independently, express themselves freely, and develop oral and written communication.

At the teacher's request, one pupil places a picture of an apple on the canvas, the other children place a picture of an apple on the left side of the table, and a picture of a tomato or fruit on the right side. They pronounce the adjectives related to these things verbally using tactile letters. For example, "apple" - "sweet", "sour", "elongated", "red", "yellow", "round". Tomatoes are "sour", "red", "round", "elongated". Then they compare the characteristics of fruits and vegetables and find similarities and differences.

When the teacher says, "Night," the pupils close their eyes. When she says, "Day," they open their eyes and answer. She gives the task of determining the sign, the property of something. For example, "fragrant flower", "white flower", "beautiful flower", "red flower", "artificial flower" and so on.

The teacher puts pictures of three animals (for example, a rabbit, a fox, a wolf) on the canvas. Places certain numbers next to the pictures ( the rabbit - 4; the fox - 5, the wolf - 6 ) It is necessary to list the characteristics of the animal according to the number indicated in these numbers. For example, the rabbit is white, agile, cowardly, beautiful.

The teacher shows two or three pictures (apple, tree, girl) and suggests choosing one of them. Once pupils have selected one of the pictures, the teacher will give a brief description of it. The children ask questions based on the sign of the object and find out what it is. For example, "Big", "Sweet?", "Round?", "Red?", "Is it edible?" "Is it worn?" and so on. The pupil answers these questions only by saying "Yes" or "No".

**CONCLUSION**

The teacher should organize the game according to the plan and the goal. She should prepare for the lesson, prepare the necessary didactic materials in advance, monitor the organization of the game, complete all the activities, such as completion, evaluation and motivation. The implementation of comprehensive structural reforms in the education system is determined by the use of game technology in the educational process. Because today, gaming technology is becoming a key component of the educational process. The use of game technology in the educational process stimulates the lessons, organizes them interestingly, broadens the horizons of pupils, allows them to master the material.

## APPLICATION TEMPLATES OF PEOPLE RELATED TO THEIR PROFESSION AND POSITION IN KOREAN AND THEIR TRANSLATION

**Ashirbaeva Dilorom Ravshanovna\***

\*Researcher,

Tashkent State University of Oriental Studies,  
UZBEKISTAN

Email id: hangook2019@gmail.com

### ABSTRACT

*This article analyzes several patterns of application forms for positions and professions in Korean society, highlighting the similarities and differences in their translation. The fact that there is no similar equivalent in the translation of some Korean appeals into Uzbek may indicate the difficulties encountered in the translation process. At the same time, it was noted that the category of respect should be emphasized in the application process and this category should be used with caution in relation to the "boss and employee" and the rules of ethics in the work process.*

**KEYWORDS:** *Profession, Position, Application, Category, Mr., Mrs., Director, Teacher, Employee, Chairman, Manager.*

### INTRODUCTION

At the heart of modern methods of teaching foreign languages is the task of forming language, culture and interpersonal communication, as this integrative approach allows foreign students to communicate in a foreign language as if it were their mother tongue. This anthropocentric direction of modern linguometrical research appears at the intersection of linguistics and cultural studies, and this phenomenon can be considered as a linguocultural science that studies the representatives of folk culture reflected in language<sup>1</sup>.

The study and consideration of the results of the interaction between language and culture is necessary in the teaching of foreign languages at any level. It allows to anticipate the successes and challenges in the interaction of different cultures and analyze the problems that may arise in the process of teaching foreign languages [Vereshchagin, Kostomarov 1990, Kharkov 1997, Mitrofanova 1999, Zinovieva M.D. 2003, Schukin 2003, Elizarova 2005, Sadokhin 2005<sup>2</sup>].

## THE MAIN RESULTS AND FINDINGS

Speech culture units, which are one of the important conditions for the formation and improvement of linguistic and cultural competence of foreign students, including communication units used by representatives of foreign languages, are also an important part of linguocultural units. N. I. As Formanovskaya points out, "speech etiquette enters culture in two ways: a) speech etiquette is an element of communication culture; b) speech etiquette is an element of language and a product of culture."<sup>3</sup>

In expressing different communicative-pragmatic types of ideas, addressing as one of the most important means of attracting attention is an important means of speech communication. Dialogic speech is the main area of use of references. The use of contact forms depends on people's level of mutual acquaintance, social status, age, "boss-employee" relationship<sup>4</sup>. There are two situations of speech communication, the first is to address an acquaintance and the second is to address a stranger. The largest and most diverse group of references are nouns. This includes first names, last names, nicknames, first and last names, and titles<sup>5</sup>.

During the exchange of ideas, the speaker's address to the listener with his profession, position, title, etc., in general, the units of reference referring to a person's profession, position, position, are called identifiable (equivalent, equalization) nomination in linguistics<sup>6</sup>.

In Uzbek, the words profession and title are often used together with surnames and first names (surname + title).

In Korean, the phrase 성+직함+님 "surname + title + nim" indicates a high level of respect.

Applications in the "boss-employee" relationship include the title of position, title, academic title or academic degree. In communication, they are rarely used independently, in Uzbek they are often expressed by onomastic means such as "surname + first name, first name + patronymic" and so on. In Korean, when referring to a person with a high social status, the form «성+직함+님» is used in the form "surname + position name, title + nim".<sup>7</sup> While forms of communication play an important role in the culture of human behavior, it also reflects the position of communicators.

Job-related appeals in Korean can be formed on the basis of the following templates, depending on the relationship between the speaker and the listener, as well as the position held<sup>8</sup>:

### (1) 직함+님 + position / title + 님 template references:

교수님(kyosunim) – dear professor;

선생님(sonsengnim) – dear teacher;

과장님(gwajangnim) – dear head of department

사장님(sajangnim) – dear boss

부장님(pujangnim) – dear deputy director

Based on this pattern, it is mainly applied to people who have held a position. The suffix 님 in Uzbek is translated as dear in Uzbek. But when we translate an appeal, it is preferable that it be translated without this word.

-학교에서 (선생(님)) - At school ((dear) teachers)

“홍선생, 요즘 교무실 분위기가 어떤 것 같습니까?”

"Master Hong, what is the work environment like these days?"

(<녹천에는 똥이 많다>, 교장 → 준식)

("There is a lot of garbage in Nokchon", school director → Junshik)

-“잘알겠습니다. 교장님.” (준식 → 교장)

"I know, I know. Mr. Director." (Junshik (teacher) → to the director)

In this example, the school principal referred to the teacher as 홍선생(Hon sonseng) without the suffix 님, and the school teacher responded to the principal with the suffix nim 교장님(kyojangnim) as dear director. In this example from the story “There is a lot of garbage in Nokchon,” the interaction between the school principal and the teacher shows that Korean society is based on a hierarchical relationship.

Since the principal and Junshik are individuals working in the field of education, the ‘선생님’ (sonsengnim) teacher’s reference was used in the original sense. But in Korean, this address is used in many cases in daily life. For example, drivers, police officers, doctors, and strangers in general are often referred to as ‘선생님’ (sonsengnim). But not all people were referred to as ‘선생님’ (sonsengnim) during the Chosun period. The reason is that it was applied only to the highly educated representatives of the upper class.

It should be noted that in Uzbek speech, the meaning of respect is understood even when addressing professors and teachers as a teacher without the participation of the word “dear”.

*No problem, domla? - Sirojiddin quickly brought water again and filled the well.*

*I'm sorry, domlajon, 'he said sarcastically. "I didn't know she was your man."*

In both of the above examples, “domla, domlajon” appeal can be observed. The Uzbek language is widely used as “ustoz” for those working in the field of public education, and as “domla” for those working in higher education.

"Position + 님" is applied to adults as an appeal to respect the listener. In the Uzbek language, it is observed that such appeals are addressed to people mainly in meetings with respectful words.

(2)

성+직함+(님) last name + position / title + (님)

김교수(님)(*Kim kyosunim*) (dear) professor Kim;

이부장(님)(*Li pujangnim*)(dear) head of department Li;

박대리(님)(*Pak terinim*) (dear) employee Pak.

In Korean, it is common to apply in the form of "surname position / title" or only in the form of a position. It is always obligatory to apply to a high-ranking official in the form of "position 님". The lower position can be addressed in the form of "first and last name". This will be analyzed in the following examples.

“김부장님,-----그만 진정하시고....,,

김부장님 (*Kim pujangnim*) deputy director Kim This address in the form of "surname and position" is often used in the workplace and is used by colleagues with the suffix "님" or "님" after the name and surname. Although it sounds a bit confusing when translated into Uzbek, it is normal for Korean communication.

When a position or profession is written separately, a suffix 님 denoting respect is added to a position or word denoting a profession to form an appeal. Units representing a profession such as 교수(kyosu) professor are not used as a reference in individual cases. Units denoting a profession, such as 간호사(kanhosa) or 판장(panchang), are often used as a unit of reference<sup>9</sup>. At the same time, 대통령(tetongnyong) president is not used in conjunction with the suffix 님 denoting semi-respect, and 국무총리(kungmuchongni) prime minister. Although the "name" cannot form an application with the position, the "surname" or "surname + first" template can be used together with the position. In this case, a representative of respect can join the post. It is like 김용집부장님 the head of the department Mr. Kim Yong Jeep.

(3) 성+이름+직함+(님): last name + first name + position / title+(님)

김영수교수(님)(*Kim Yong Su kyosunim*) (Dear) Professor Kim Yong Su;

이영호과장(님)(*Li Yong Ho gwajangnim*) (Dear) Head of Department Li Yong Ho;

김부장님(*Kim pujangnim*) (Head of Department Mr. Kim);

김용집부장님(*Kim Yong Jip pujangnim*) (Head of Department Mr. Kim Yong Jip).

such a form of appeal is mainly used to avoid misunderstandings in the communication of people holding the same position. Such forms can only be used by adults or if the interlocutors are of the same age.

김용집부장님 - Head of department Mr. Kim Yong Jip

It can be used without

김용 집부장 - Head of department Kim Yong Jip

But when translated into Uzbek, there is no difference.

Although both “name+ position+님” (이름+직함+님) and position+ 님 (이름+직함+님) are similar to each other, the latter one is more formal the latter one.

When the position is used without the suffix of respect, it is written together with the name, and this applies to people who are the same age as the interlocutors or who are younger than the speaker. When the addressee and the addressee are of the same age, the “name+ position+님” pattern used indicates that the two interlocutors are more closely related than the form of respect.

If there is a difference in position between the interlocutors, then it is expedient for the superior to use any form of appeal, even if it is obligatory for the superior to use the suffix 님, which is a sign of respect for the superior. Usually, low-ranking people are treated with the suffix 님, which is a form of expression of respect for the interlocutor, and respect for the interlocutor is a form of adherence to the "official etiquette". However, once a professor's student becomes a professor, the professor usually does not call his or her student as a “professor”. This is the norm in the "unwritten rules" of the Korean language.

#### (4) 성+이름+[-님, -씨, -군/양]: last name+first name+ [-님, -씨, -군/양]

김영수(Kim Yong Su) Kim Yong Su;

김영수님(Kim Yong Sunim) Dear Kim Yong Su;

김영수씨(Kim Yong Su shi) Mrs. Kim Yong Su;

김영수군 (Kim Yong Su gun)Mr. Kim Yong Su;

이영미/양 (Li Yong Mi yang) Ms. Li Yong Mi.

*Don't pay attention, Klara Khodjaevna, - said our chairman. "Grandmothers are illiterate."*

*"Don't listen to the grandmothers, comrade Jamoliddinov!", - Said Alisher.*

The Uzbek language uses a template such as "first name + last name" or "first name + father's name" in appeals related to people's profession and position. in the first sentence the chairman addresses the woman with “name and father's name,” while in the second sentence the word *comrade* is used instead of the name.

#### (5) 외래어형(Mr/Mrs+성):

미스터김 Mr.Kim,

미스리 Mrs Li.

“보세요 *미스터리*,

혼자만의시간과공간이필요하다고하시면서도아내의손실을그누구보다도-----

(<사랑의예감>, 신옥→신옥의남편)

"Look, Mr. Lee, even if you say you need your time and space, but your wife's hand is more than anyone else's.

(Sense of Love, Shin Ok → Shin Ok's Spouse)

**경칭** it is an appeal of respect, a method widely used in almost every aspect of Korean culture, from the profession to society. For example, “minister”, “senator”, “director” and so on. In such cases, the use of the phrase "Position + **님**" means respect for the listener.

Since there is no universal form of address for the second person in Korean, the required reference unit can be used depending on the situation. **사장님** (sajangnim) is sometimes referred to as the director, the boss, the chief, and **사모님** (samonim) the chief, or the professor's wife - the lady. Whether or not the person being addressed is a “boss” or a “boss’s wife,” encountering such appeals in a dialogue of Korean culture reflects the uniqueness of the Korean people and the Korean language. Even when they know that they are not actually the “boss” to the store employee in the stores, you can see that the customers who apply sometimes say **사장님** (sajangnim) as boss”.

When introducing himself in new circles, it becomes customary to first introduce the position or career and then say the name. For example:

도지사 000 입니다 – Governor 000.

XXX 회사대리 000 입니다 -I am a representative of XXX Company.

## CONCLUSION

In conclusion, it should be noted that although Korean and Uzbek belong to the same family and are agglutinative languages, there are commonalities and differences in the discourse and applied moral norms of the two languages. As people interact, they will, of course, benefit directly from this or that appeal, depending on the situation. In Korean society, it is clear from the examples given in the article that appeals related to the profession and position of people can or cannot be translated into Uzbek. At the same time, there are universal forms of appeal, and people will be able to use these appeals in order to avoid mistakes. This topic, which is analyzed in this article, has not yet been fully explored and requires in-depth and systematic research in the comparative study and analysis of the two languages.

### ABSTRACT

*The article deals with the analysis of hyperbole in English, Uzbek and Russian in translation in the process of reading. The study of the use of hyperbole has always been one of the most important, interesting issue of not only Typology or Stylistics, but also of general linguistics and translation. Some examples related to hyperbole and their translation in three languages are mentioned in this article.*

**KEYWORDS:** *Equivalence, Original, Exaggeration, Stylistic Device, National Colorings, To Express.*

### 1. INTRODUCTION

Translation requires a complete understanding of the customs, traditions, manners and lifestyle of a group of people to translate in a manner that communicates to that culture's worldview.

The basic determination of translation is to reproduce different types of texts, comprising literary, religious, scientific, poetic, philosophical texts etc. in another language and thus making them available to wider book readers, to a greater number of target audience and to bring the world closer and closer.

Translation equivalence norms require as nearly as possible a common sense of the source and target text. When the sense in the target text is transgressed, equivalence norms are completely broken, and the translation is considered unsatisfactory. If a translation is made at a low level of

equivalence, the norms are relatively broken, and the translation is regarded as acceptable. [1, p.219]

The translator should be able to choose words that pass the concepts of the phrase correctly and properly. Formal equivalence implies word for word translation or literal translation. It translates not only the exact appearance of vocabulary but also the idioms and grammatical structure used in the original.

## 2. MATERIAL AND METHOD

Hyperbole is a stylistic device based on the interaction between the logical and emotive meanings of the word. It is deliberate overstatement or exaggeration of some quantity, quality, size, etc., the aim of which is to intensify one of the features of the object to such a degree that from the practical point of view the fulfillment of which is impossible. Both the writer and the reader (or the speaker and the listener) are fully aware of the deliberateness of the exaggeration. The use of hyperbole shows the overflow of emotions in the speaker and the listener. We constantly use expressions containing hyperbole in our everyday speech. Such exaggerations are distinguished from a hyperbole as a stylistic device.

For example, I haven't seen you *for ages*, (*Seniko 'rmaganimgayuzylbo 'ldi*), You promised it *one thousand times*, (*Yuzmartava 'daberding*) *A thousand pardons, scared to death*, (*O'lgudekkechirimso 'rayman*). By comparing two languages here, we find out some definitions between two languages. Here, English people exaggerate much more than ours do.

American poet W.H. Auden writes in “**As I Walked Out One Evening**”

*I'll love you, dear, I'll love you*

*Till China and Africa meet,*

*And the river jumps over the mountain*

*And the salmon sing in the street.*

*I'll love you till the ocean*

*Is folded and hung up to dry.”*

The use of hyperbole can be seen in the above lines in the meeting of China and Africa, the jumping of the river over the mountain, the singing of salmon in the street, and the ocean being folded and hung up to dry are exaggerations, not possible in real life.

We also wanted to translate the poem by comparing our Uzbek style of translation with English one, paying attention our Uzbek stylistic devices.

*Meningsevgimumrbod, ishon!*

*Toki, tog' bilan tog' uchrashmaguncha.*

*Sersuvdaryolarsuvitugab,*

*Hamdabaliqkuylamaguncha.*

*Meningsevgimumrbod, abad*

*Toki, ummonsuviqurumaguncha.*

*In Uzbek translation, we tried to give some expressions, which are close to Uzbek people, Uzbek national colourings instead of using "till China and Africa meet" and "the salmon sing in the street". In both languages, we can also notice the usage of exaggerations by giving national colourings and devoting the readers to appreciate the sense of love by the poet.*

We asked our Russian teacher to translate the same poem into Russian. It occurs a bit different from Uzbek and English.

*Поверь, любовь вечная,  
Пока гора гору не встретит,  
И не останется вода у рек.  
Любовь вечна моя, навеки,  
Пока не запоем рыбаки  
Инеобмелеет океан.*

"He cried all night, and dawn found him still there, though his tears had dried and only hard, dry sobs shook his wooden frame. But these were so loud that they could be heard by the faraway hills ..." *The Adventures of Pinocchio* (By C. Colloid).

"The crying of Pinocchio all night until his tears became dry" is an example of Hyperbole.

The translation of this sentence into Uzbek and Russian will be close in both languages. In Uzbek "ko'zyoshlari qurub qolguncha" and "Пока не высохнут слезы" in Russian. And also, "ovo shunchalik baland ediki, hattoki uzoq qoyalardan eshitilib turardi" in Uzbek. Russian version translation is also the same way. "Голос настолько был пронзительным, что отдавалось эхом от скал"

Very often hyperbole is used to create humorous or satirical effect and so to express the author's attitude towards the described." Shunaqaozib – tuzib ketib diki, xuddi ignayutgan itdek bo'lib qolibdi" (Xudoyberdi To'xtaboyev "Shirin qovunlarmamlakati"). The translation of the sentence is "He was so thin like a dog that swallowed a needle" or "He is all skin and bone"

By watching the films, we can also hear some exaggerations.

Царь Иван Васильевич Грозный: «— Так, это, стало быть, ты тут живёшь? Даа, **хоромы-то тесные**». (Говорит Шурику про его квартиру)

-So, you live here? Well, **very cramped quarters**. (addressing to Shurik)

-Ha, shunday qilib senshuyerdashaysanmi? **Koshonang juda tor ekan**. (Shurik gamurojat etib) (L. Gayday rejissiyorligida ishlangan komediya «Ivan Vasilovich o'z kasbinio'zgartirdi» Kinostudio "Mosfilm", 1973.) Modern people do not live in palaces nowadays.

Hyperbole may be used in combination with other stylistic devices - hyperbolic similes. "His mind began to move **like lightning**." *Uning fikri, xotirasicha qoqkabite zishlaydi*.

Иван Евсеевич медленно вышел, а генерал схватил себя за щеку и заходил по комнатам.

- Ой, батюшки! – вопил он. – Ой, матушки! **Ох, света белого не вижу!**

Ivan went slowly out, and the general clutched his cheek, and went rushing through the house.

- "Ouch! Oh Lord!" he howled. - "Oh, mother! Ouch! *I'm as blind as a bat!*"

Ivan sekinginauydanchiqdiyu, ammo general uniyonog'idanushlab, xonabo'ylabyurdi.

-“Voh!Voh! Xujayin!” uvilladi u. –“Voh, onajon! Voh!  
*Ko'rshapalakdekhechnarsaniko'rmayapman!*”[2, p3]

Я помню, *в двух шагах от нашего дома*, под горой, было озеро. Это озеро, - я как будто вижу его теперь, — это озеро было такое широкое, светлое, *чистое, как хрусталь!*[3, p79]

I remember how beside our house, at the foot of a hill, there lay a large pond, and how the pond – I can see it even now! – shone with a broad, level surface that was *as clear as crystal*.

Bizninguyimizdanuzoqbo'lmagan, tog' etagida,xuddi-ki, hozirko'ribturganimdek, birko'lborlinieslayman. – ko'ljudakeng, ko'rimlivaxuddi*billurdektozaedi*.

Hyperbole may be found in repetition:"I'd have been out there *days ago, days ago*". (S. Leacock) "Men u yerdabirnechavabirnechakunoldinbo'lganman"

-Men senga qayta qayta aytdima, bormagin deb. Ana senga yanavayanatashvishbo'ldi.

- I told you again and again not to go there. Now, you have more and more problems.

A translator is to convey not only the ideas and themes of the source text (meaning, sense); s/he should also pay attention to the adequate form to express these ideas. S/he should not become carried away with a free (loose) form of translation, nor force the target language by following the source text word for word. [1, p11]

While reading both Uzbek and English literary works, we often face to face many stylistic devices in which somehow difficult to compare and translate. It is also very interesting job to compare two languages while translating a stylistic device, Hyperbole. We can differentiate between the traditional and the genuine hyperboles in the Uzbek, Russian and English literary works. "Dadanglar bilan borganimizda hurmat utavozesiga og'zimizni ochib qoldik". (Mirmuhsin. "Ildizlar vayaproqlar", Toshkent 1989 yil, 162 bet) "Когда мы пошли твоимотцом, мы рот раскрыли от такого уважения". When we went to there with your father, we *kept opening our mouths* for their respect addressing to us.

"Bu holnieszlarkan, uningko'zlaridan olovcha qnabketardi". (Mirmuhsin. "Ildizlar vayaproqlar", Toshkent 1989 yil, 162 bet) "Её глаза вспыхнули огнём, когда вспомнила случившееся. Remembering the situation, we saw *the fire in his eyes*. Given above three examples in three languages are very close to each other's translation.

1. -Men senga *uzmarta* aytdim. -Я говорил тебе сто раз. -I have told you hundred times.
2. -Bu narsa *uzmartabo'lgan*. -Этo случилось сто раз. -It occurred 100 times.
3. Uning fikri, xotirasi *avtomatdek* tezishlaydi. (in oral speech) Его мысли, память *работают молниеносно*. He is characterized by *brainy memory and he works lightning fast*.

-I mentioned you *twenty times*.

-Men senga *uzmarta* aytdim.

-Bu narsa *uzmartabo'lgan*.

- That's been *a hundred billion times*. By comparing two languages, the we can see some definitions between the numbers, but meaning is the same.

In our daily conversation, we use hyperbole to create an amusing effect, or to put emphasis on our meaning. Hyperbole is a figurative language technique where exaggeration is used to create a strong effect. With hyperbole, the notion of the speaker is greatly exaggerated to emphasize the point. However, in literature it has very serious implications. By using hyperbole, a writer or a poet makes common human feelings remarkable and intense to such an extent that they do not remain ordinary. In literature, usage of hyperbole develops contrasts. When one thing is described with an over-statement, and the other thing is presented normally, a striking contrast is developed. This technique is employed to catch the reader's attention.

Hyperbole is the use of over-exaggeration to emphasize a point or to be humorous. It is not intended to be taken literally. Any writing tool that adds emphasis is going to lend itself particularly well to literature. If you want to give some life to the point you're trying to make and bring an idea home for your readers, hyperbole can help. With a nod to some of great literary masters, let us look at some examples of hyperbole and theirs translation in literature.

The exaggeration in *Parker's Back* by Flannery O'Connor helps to set up the characterization: "The skin on her face was as thin and drawn as tight as the skin of onion and her eyes were gray and sharp like the points of two picks." "Uningyuzterisishundoq ham noziklashibketganedi-ki, xuddikipiyozpustidekyupqa, ko'zlariesao'tkirtig'libirjismgao'xshabchaqnabturardi".

In Uzbek translation, this sentence is translated not word for word translation. Readers have to pay much more attention to source and target language equivalents very carefully. Hyperbole and literature - the two just go hand in hand. It is also used in everyday life, in advertising, and in speeches, songs and movies.

Hyperbole: How to Use It Well. Here, we also want to add Nathaniel Hawthorne's quotation about words. "Words, so innocent and powerless as they are, standing in a dictionary; how potent for good and evil they become in the hands of one who knows how to choose and combine them."

We would not use hyperbole in formal writing, such as a business memo, a letter to a business, a scientific report, an essay, or an article for publication. It could have its place in fiction or other types of creative writing when used for effect.

Scientist Rubin suggests that there are three major types of strategies used by learners. She identifies six main cognitive strategies contributing directly to language learning. Clarification/verification refers to strategies used by learners to check whether their understanding of a rule language item is correct. Here, learners can clarify their basic knowledge by checking. [4, p 23]

1. Guessing/inductive inferencing refers to various strategies concerned with making hypotheses about how the language works. Here, learners need to be able to select appropriate information, attend to what is important.
2. Deductive reasoning is a strategy where the learner uses knowledge of general rules to produce or understand language. By writing essays, control works, doing some research work learners can appreciate their understanding the language.

3. Practice is concerned with storage and retrieval of language. This includes such strategies as repetition and rehearsal. Learners may check their knowledge by acting and making presentations, explanations before audience.
4. Memorization. This category includes mnemonic strategies and using lexical groupings.
5. Monitoring refers to learners' checking of their own performance, including noticing errors and observing how a message is received.

Here, we can also mention communication strategies. They are used by a learner to promote communication with others. These processes are very important to language learners.

#### **CONCLUSION**

As a teacher, we make sure our students get a lot of successful translating experience: through encouraging them to choose their own simplified translators, for example, and giving them time to translate the tasks. We should give interesting tasks before asking learners to translate, so that they have a clear purpose and motivating challenge and use texts that are interesting enough to provide their own motivation. By comparing and contrasting this stylistic device, they can easily enlarge their vocabulary and expand their knowledge.

## **PSYCHOLOGICAL MECHANISMS OF NATIONAL AWARENESS AND THEIR USE IN THE PROCESS OF EARLY ADOLESCENT EDUCATION**

**Umurzakov Dilmurod Kholmuradovich\***

\*Senior Teacher,  
Department of Pedagogy and Psychology,  
Faculty of Art Sciences, Navai SPI,  
UZBEKISTAN

### **ABSTRACT**

*The following article deals with the psycho physiological mechanisms and laws of understanding and formation of national identity in young people After the transition of the Republic of Uzbekistan to the path of independence, one of the most actual problems in the field of education became the inculcation and formation of the ideology of independence in the minds of young people.*

**KEYWORDS:** *Inculcation, Mechanisms, Ideology, Concern, Honor, Dignity,*

### **INTRODUCTION**

What is an ideology and what is the basis of its formation?

In our opinion, ideology is a common quality that provides a solid foundation for the political, economic, legal, moral foundations of a particular state or society, unites the citizens of that state or society - national pride, political views, worldview, faith, honesty, it is a set of moral and spiritual values such as compassion, kindness and consequence, conscience and concern, honor, dignity, love for the motherland.

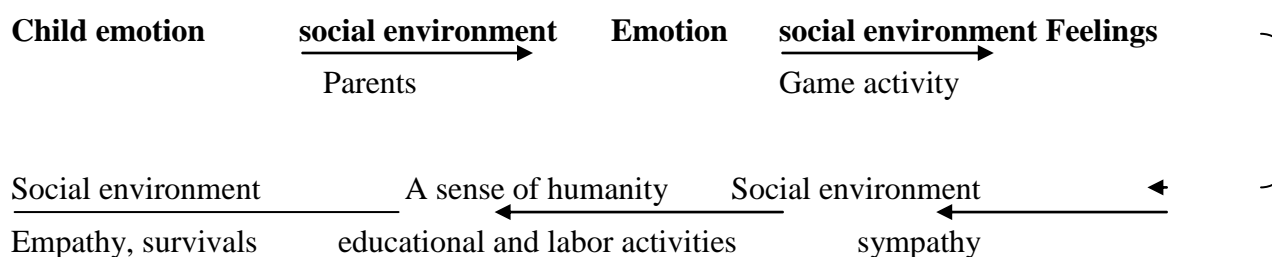

These human qualities must be raised to the level of values that meet the needs of that society in the course of its development, and therefore need constant nurturing.

At the heart of the ideology of independence are our spirituality and values, first of all, humanity, patriotism, diligence, solidarity, compassion, honor, national feeling. The results of our research show that emotional education is based on the psychophysiological mechanism of formation of such values in the younger generation.

In our view, human emotion has a polar significance. Negative emotion is innate and is an emotion designed to inform about the birth of needs (organism, material). Positive emotions, on the other hand, are formed in the process of upbringing after birth, which is associated with the satisfaction of needs. Indeed, a child's spiritual feelings, that is, his attitude towards the environment, are shaped by the influence of positive emotions by the parents.

So, the moral attitude of the younger generation to nature, the motherland, the people around it, its spiritual growth, should be carried out on the basis of positive educational influences by parents, educators, and this is one of the important factors in the child's national and universal moral values. Thus, emotion, empathy, moral feelings underlie the formation of a person's empathic experiences.

The formation of national and universal values in the educational process can be shown using the following scheme.

It is obvious that emotional upbringing is ensured first of all by parents and then by the positive educational influence of educators in the process of various activities of children.

The formation of a sense of national identity in young people can be ensured on the basis of emotional education, through the balanced formation of national spiritual and universal values. It would be expedient if this process was carried out in the form of the formation of conscious beliefs of schoolchildren in parents, the Motherland, the book. Because in the dream of raising a child, a parent forms in him a sense of devotion to work, homeland, people, and on this basis forms in him the buds of qualities such as sophistication, intelligence, intelligence, religion. In the future, it will become the moral qualities of the child and form the basis of the ideology. While the formation of the ideology of independence and understanding of national identity is based on emotional education, not only the family but also preschools, schools, academic lyceums and vocational colleges should play a special role in the formation of national values in the minds of young people. However, it should be noted that the formation of a sense of national identity in high school students and first-year students of vocational colleges is based on a different psychological mechanism. The understanding of national identity is related to the philosophy of ideas, and it is formed under the influence of certain ideas, ideologies.

The perception of national identity in young people is based on the formation and assimilation of social and spiritual national values in their minds on the basis of their self-awareness.

So, in the process of educating young people, as social values are formed in the human mind on the basis of educational influences, on the basis of what mechanisms are they provided? What is the basis of them? - What mental phenomena and processes ensure that a person realizes that he belongs to a certain nation? Is it possible to influence the functioning of this mechanism and accelerate the realization of one's own freedom by belonging to a particular nation?

To find answers to these questions, we turned to the field of psychophysiology, because the above questions are related to the psycho physiological laws of the individual and his spiritual development.

According to subsequent literature, a number of processes in modern man have retained their physiological significance and radically changed the "natural face" psychologically. According to the authors (P.V. Simonov, B.I. Dodonov, A.S. Abdukhadov and others) opinions, emotions and thinking from mental phenomena are primarily in the service of the social needs of the individual and have completely changed their nature. This thought elevates emotions and thinking to the level of social values.

The formation of certain values in the consciousness of the person and its role in the understanding of national identity has not yet been studied completely.

According to E. Clapered, in the phenomenological sense, the following descriptive indicators of emotions can be distinguished:

1. The place of emotions in the human mind in the form of direct internal experiences;
2. The fact that these cases have a dual psycho physiological nature, on the one hand, the affective experience, and on the other hand, its organic expression;
3. Subjectively vivid expression of emotions and their specific "intimacy".

The latter is expressed by words experienced by man, but is not expressed in appearance. Emotions cannot be transmitted to someone through images as an image. The essence of the "intimacy" of emotions is that the subject experiences emotions and retains their significance that is observed in a pleasant or unpleasant form, without resorting to past experience.

In the philosophical and psychological literature, emotion and thinking are very closely related<sup>1</sup>. But they are a completely different process. Sometimes the concept of emotional thinking can also be found in the scientific literature. In this case, the transformation of thinking into emotionality in rationality takes place only by adding its main direction (tendency) to the desire and desire that triggers the emotion in its process and results. Here, contemplation connects subjective moments (moments) to the objective properties of things and events that are material (existing), which do not depend on consciousness at all<sup>2</sup>. When classifying mental phenomena into classes, however, thinking is traditionally drawn to the processes of cognition with perceptions, cognition, memory, and other internal mental activities. Emotions, on the other hand, are associated with a particular situation or volitional qualities.

In our opinion, thinking and feeling, thinking and emotions, thinking and perception, or thinking and perception, have a very complex relationship and reflect the relationship of mind and heart of our great scholars from a philosophical point of view.

"Pure" perceptions or "pure" intelligence are processes of information exchange, which are activities designed to remove the ideal (copy) from existence. When we transfer this idea to the formation of the person, it serves to be copied by the subject, the appearance of the chosen ideal, its individual elements by intuition and perception. But they never trigger or unload certain behaviors in the body. According to the example of the American scientist D. Wooldridge, frontal lobotomy (surgery) does not eliminate pain on its own, pain is preserved as an organic sensation, but it loses the emergence of a general emotional assessment of pain. Another

example: a person who has lost a leg or arm from a war veteran “feels” the “frontal” pain, the unbearable pain of a missing leg or toe, and complains to the medical staff about it. In the first example D. Wooldridge argues that lobotomy makes the patient indifferent to pain, but does not reduce the pain itself. In the second example we give, the system that controls the human body sometimes evaluates it emotionally, despite the fact that the system that receives information about its condition is defective, which is why a person feels pain in an organ that is not real and naturally evaluates it subjectively.

The information itself is of no importance, it may have this importance based on the needs of the subject. Emotions and thinking are first and foremost internal activities. In the process, primary information about being is processed in a certain way. As a result, the organism (individual, person) has arguments to follow.

Here we realize that thinking and feeling are very close, and that they are very close based on the activities they perform. It hides the existing closeness of feeling and thinking with its essence and functions.

The secrecy of emotion is the absoluteness of the epistemological aspect of human thought on the one hand, and the call of emotion on the other, not the traditional mental processes, but their end product is affective excitement and bodily changes, makes them easy to understand for introspective and external observation. This evidence is of particular importance in evaluating and learning about a person's behavior.

Contemplation is a special type of selective activity, planning (orientation activity) at its origin and end point. Its task is to transform the external world into the inner world of man, to ensure the perfect satisfaction of man's needs. It is in any case a process aimed at determining the value of material, spiritual, social things and events. In other words, thinking is the process of determining what a person needs

Ultimately, truth and error, chance and necessity provide the axiological content of the separation of good and evil in man through contemplation. This function of thinking serves not only to ensure the perfection of the individual, but also to accept healthy spiritual ideas, concepts and thoughts at the level of value and to deny social activism and beliefs in this direction.

Thus thinking performs an axiological function, and what is useful and harmful to man is of special importance for the knowledge of phenomena.

When it comes to feelings, it is as wrong to think of them as "affective excitement" or a physiological reaction, just as to understand only letters or individual words in the same writing process.

In fact, emotions are the activity of evaluating the information received by the brain, encoding the information that enters the brain in the external and internal world as a subjective image of perception and perception as a state.

Thus, emotions are a process of specific assessment and identification of being, which is the assessment of information about being in a specific order (P.K.Anokhin, 1969, P.V.Simonov 1986, D.Wooldridge 1965, G.N.Kassil 1960, V.P. .Dodonov 1988, A.S.Abdakhadov 1978-1989). These scientists have shown that they compare images of an entity that reflect the content of emotional activity in the brain with temporary or permanent programs that exist in the brain.

According to P.K. Anokhin, a positive emotional state, such as enjoyment, satisfaction, passion, which arises in the satisfaction of an important need, can appear exactly similar only if the receptor of the action corresponds to the negative affect information from a particular event, and vice versa, inconsistency with acceptors leads to the emergence of negative feelings (emotions).

Many scientists, including B.I. Dodonov (1978) believe that emotions are not just a simple comparison effect with the information the brain receives from being, but provide an "axiological comparison".

In other words, the fact of valuing an asset constitutes its essence in terms of plans of needs that arise individually. This idea raises the question of why emotion arises, why nature is limited only by contemplation, and it is natural. This is because ancient emotions were very vital in animals without thinking, but simple thinking served as the ancient and earliest form of thinking that performed functions. Emotions evaluate a being very perfectly and convey it to the organism in the language of experience, determining how the organism behaves in different environmental situations. This means that emotions (feelings in humans) make it possible for even non-intelligent animals to judge how nature should behave in different situations (Dodonov, 1978). Thus the process of emotional states is of a similar nature to logical thinking.

Emotions, like the process of thinking, rely on the results of their past experiences in their comparisons. If contemplation serves the emergence of understanding, the emotions experienced will surely lead to emotional generalization.

So another question naturally arises: If emotions and thinking rely on comparisons in a similar way, what difference can there be between them? According to B.I. Dodonov, in the process of word-logical thinking, the images of the objective being and the concepts about them are compared, or those images and concepts are compared on the one hand, and "ideas of needs" on the other. These processes are mainly provided by the cortex of the "brain" hemispheres and by the secondary signaling system.

The emotional process, on the other hand, triggers the cortex beneath the cerebral cortex, the lower layers of the brain. This fact was reflected in the previous works of S.R. Rubinstein<sup>3</sup>.

It is impossible to contrast thinking with emotions, in general, with the structure (components) of the perceived and incomprehensible. But this idea has been formed on the basis of a limited notion in the field of psychology that for many years emotions have been involved in the emergence of thinking activity motivations. In fact, the research of O.K. Tikhomirov shows that emotions not only activate the process of thinking, but also participate in its structure and perform a heuristic function<sup>4</sup>. This fact is reflected in the research of A.S. Abduakhadov and even in the formation of social and professional values in the human mind, and its role in absorption is clearly shown<sup>5</sup>.

In particular, the role of heuristic emotions in heuristic activity is clearly shown in the mathematical works of other authors. According to many scholars, emotions, figuratively speaking, play a role similar to the role of 'hot' and 'cold' in the search for a hidden object in children's play in finding the right solution.

Such readings of emotion and contemplation are, figuratively speaking, the two branches of a tree in modern conditions. They have common sources of origin and are firmly connected to each other in their higher processes.

So if emotions arose before thinking, why do they “invalidate” thinking after it has emerged in the evolutionary development of large beings, but allow it to retain its independent significance?

To answer this question, it is worth recalling the dual psycho physiological nature of emotions.

Emotions not only reflect the being, whether or not it meets our needs, instructions and predictions, they not only provide an assessment of information about the reality entering the brain, but also adequately prepare the body for line movement energetically and functionally.

Their integration into the "decisive qualities" of emotions is. They cover almost an entire organism, integrating its total functions (into one whole). Only emotions are stored within vital functions<sup>6</sup>.

In general, "physiological changes in emotions are a very important factor in the organization of human activity." That is why the activity, which is related to human emotions, is very productive. A person's activity without emotion is very cold, i.e., the activity he is forced to perform is very unproductive. According to G.H. Shingarov (1971), physiological changes in emotions provide all "analyzers", as well as intrapsychical control and coordination of other mental processes<sup>7</sup>. Human emotions retain their physiological significance and psychologically radically change their "natural face". Emotions are primarily at the service of a person's social needs, completely changing their subjective nature. Moral emotions and other human experiences begin to occupy a very important place in the life of the subject. The role and expressiveness of subjective components in the architecture of emotions has greatly increased. In particular, a component of emotions such as “affective excitement” has become particularly important to humans.

According to scientists, emotions not only develop it as a form of assessment of the fact of affective excitement, but are also added in new assessments and comparisons.

Every emotional fact is, first of all, a holistic activity. Emotions can be considered mental activity only on the basis that they are filled with an emotional assessment of a person's experiences to the end. Emotions, according to P.V Simonov, mean not only the fact that the objective being corresponds to the probabilities of the subject, but also a mental fact, such as whether the changes taking place in the subject itself are good or bad.

Thus, the evaluative function of emotion is necessary for the development of the organism and the individual. Emotional evaluation is a much-needed value for us. They not only perform an evaluation function but also act as an independent positive value. For example, when a person is engaged in any activity, he does it not only for pleasure, but also for pleasure. In this process, emotions are activated not only as a value, but also as a motive for the activity performed. Natural emotion can act as a motive for action and even as a motive for morality. (B.I.Dodonov, 1978)

This fact is of great importance, and the role of emotions in education, including in young people's understanding of themselves and others, and on this basis in comparing (identifying) their ideal "I" with real "I" or drawing conclusions by comparing themselves with others, It plays a special role in the formation of national and universal values in the minds of young people, serving in the understanding of their belonging, national self-assessment.

A person's ethical guidelines are generally social in nature and naturally they affect a person's assessment of any subjective experience. But the moral moment only independently determines a person's valuable attitude towards his own experiences and feelings.

Emotions independently draw a person to reality and therefore even determine a person's emotional direction.

It should be noted that pleasure plays a huge role in human life. People have a need to enjoy and not satisfying it produces very strong negative experiences. For example, any work is hard and it is known to everyone. Intensification of the labor process, depression, emotional stress, and, in general, "creative pain" are not uncommon. But the enjoyment of labor eliminates these situations and increases labor productivity. Here, this emotional state is used as a positive value, and therefore it is important to form this state in different areas of education, and if it is based on the education of young people in any profession, it is easier to ensure the spiritual and professional maturity of young people.

Therefore, it is not on the basis of forcing our youth to form positive social attitudes towards the Motherland, our nation, that is, on the basis of forcing them to form humane and patriotic values in their minds, but on the basis of giving them an emotional thirst for these values. It is necessary to go. Such an opportunity can be provided to schools by classes conducted on the basis of new educational technologies in high school students. The interactive methods used in it activate the cognitive processes of young people by invoking continuous emotional thirst and activating their emotional satiety needs, because there is always a need for emotional satiety in a person, as the harder the work, the higher the situation. On the basis of the need for emotional saturation in the human person are formed programs of experiences, which are characterized by individualized and socialized experiences, that is, in which the emotional direction is formed. This is the basis of any socially positive direction, and is very important in the formation of socially positive values in the mind of the individual, including in ensuring the national self-awareness of the individual.

### ABSTRACT

*This article discusses the issues of optimizing primary education and increasing its effectiveness as a result of current needs. As a result, the integration of secondary special and higher education systems has been formed at the level of demand. Also, the process of reforms in the general secondary education stage requires the interdependent development of pre-school, primary and general secondary education. In our approach, primary education textbooks should be popularized after pedagogical experimentation. At the same time, it would be useful to study the foreign experience gained over the years.*

**KEYWORDS:** *Need, Standard, Primary, Education, Theory, Practice, Knowledge, Skill, Qualification.*

### INTRODUCTION

In 2020 - the "Year of Science, Enlightenment and Digital Economy", the task is to optimize the education system, as well as all areas. In this regard, it is emphasized in the Address of the President of the Republic of Uzbekistan to the Oliy Majlis [1]. The principles of continuity and consistency are important in optimizing the education system. According to him, the stages of education should be complementary and interdependent on the principle of continuity, and the principle of continuity is based on the unity and consistency of program areas. This approach has been implemented during the years of independence of the education system of our country. As a result, the integration of secondary special and higher education systems has been formed at the level of demand. Also, the process of reforms in the general secondary education stage requires

the interdependent development of pre-school, primary and general secondary education. Because from 2019, the preschool education system has become an integral part of general education. This situation requires improvement of the functions of primary and general education. Therefore, over the past three years, the problems of primary education have been discussed by specialists, scientists and teachers of primary education in practical activities at scientific and practical conferences throughout the country. The aim is to improve the function of primary education, increase its efficiency and introduce new technologies into the system. Therefore, at this point we draw our attention to the problem of optimizing primary education.

It should be noted that optimization means the following:

- updating the content of education in accordance with modern requirements;
- strengthening the process of integration of the education system;
- specification of the principles of education and upbringing;
- Achieving financial and economic independence of educational institutions.

All this is expected to be applied to the primary education system. According to him, the following are accepted as the basis for optimizing primary education:

- 1) definition of functions of primary education and its coordination with functions of preschool education;
- 2) development of new generation textbooks;
- 3) updating the methodology of primary education;
- 4) study of foreign experience in primary education.

There are different approaches to defining the functions of primary education, and in our opinion, it is advisable to follow the following:

- the main task of primary education is the formation of the student's ability to acquire knowledge and its orientation to knowledge;
- definition of curricula and programs of primary education as the initial stage of curricula and programs of general education;
- organization of primary education management on the basis of various technologies (for example, it should be noted that the cluster method of teaching is effective in this regard);
- monitoring the process of primary education.

It is expedient that all this be clearly and optimally defined in the forthcoming Education Code.

The fact is that in connection with the adoption of the Law of the Republic of Uzbekistan "On Preschool Education", the functions of primary education, such as literacy, reading, writing and drawing, were transferred to the stage of preschool education.

Therefore, it is necessary to coordinate the function of primary education with the preschool and general education stages, to define and identify its main factors.

Creating a new generation of textbooks for the primary education system is an important factor in optimization. In our opinion, the following approach will yield the expected results:

- correction of primary education subjects and the creation of a system of interdependence between them;
- to place the subjects of primary education on a logical basis and to avoid duplication of subjects;
- provide accurate and up-to-date information in primary education textbooks in a concise and understandable way;
- providing primary education textbooks with additional teaching materials, methods and tools.

With the implementation of these tasks is divided by the possibility of updating the methodology of creating a new generation of textbooks for primary education. Because in recent years there is a need to improve the methodology of creating textbooks in primary education. For example, methods of teaching science are much outdated. According to current educational standards, textbooks should be written based on different teaching methods. The main reason for this is the development of information and communication technologies. In our approach, primary education textbooks should be popularized after pedagogical experimentation. At the same time, it would be useful to study the foreign experience gained over the years.

The methodology of teaching primary education in our country has a two-century history. At the same time, there is a need to optimize the content of this process while maintaining the methods of teaching explanation, teaching and adaptation. For example, Jadid educators recommended the appropriate adoption of methods of coercion and freedom in teaching [2]. The essence of this approach is as follows: in the transfer of basic knowledge, the child's personality is forced, if necessary, based on the method of freedom in shaping the child's worldview and independent thinking. In our opinion, such an approach is not so new. Therefore, the optimization of teaching methods in primary education can be based on:

- to study the approaches of modern educators to primary education and to adopt its most positive aspects;
- mastering world standards and practices of primary education and putting them into practice on the basis of national approaches;
- involvement of primary school teachers with advanced methodological experience in the process of preparing textbooks;
- monitoring of teaching methods in primary education.

Such an approach provides an opportunity to update the teaching methodology and increase its effectiveness. The main goal is to deliver the expected amount of teaching materials to primary school students. The study of advanced foreign experience is important in the optimization of primary education. Our approach in this regard is as follows: to study the achievements of foreign educational experience of Russian, French, German and English countries, to apply their most advanced aspects in practice on the basis of national criteria. For example, the ideas and concepts of the Russian pedagogue A. Ushinsky on primary education have been adopted by many countries around the world [3]. A. According to Ushinsky's approach, in primary education, first of all, the native language, literature and the spirit of the people should be given priority. The implication of this view is that the primary school student must first acquire the basics of

knowledge in his or her mother tongue, and the teaching of foreign languages must be taken as an adjunct to it.

In our opinion, the study of advanced foreign experience in the optimization of primary education should be as follows:

- Primary study of the experience of German, Russian, French and English-speaking peoples in primary education;
- adherence to the principle of acceptance of the best foreign experience;
- first pedagogical testing of foreign experience and then its implementation in practice;
- to pay as much attention as possible to innovative ideas, methods and tools in the study of foreign experience.

All this allows the use of foreign experience in the optimization of primary education. We have studied the Russian, German, French and English primary education systems highlighted in this regard. It should be noted that they have specific methods and approaches that are acceptable. The aforementioned tools for optimizing primary education require a consistent study and approach. To this end, we would like to remind you that the establishment of cooperation between scientific educators and direct practical teachers will bring the expected results.

The modern requirement is that primary education should provide the student with the expected level of knowledge in a short period of time and quickly form his or her learning ability. Because data, information and messages are updated every day. Therefore, there is a need to optimize primary education.

It should be noted that some foreign countries have some experience in optimizing primary education. For example, in the Russian Federation over the past twenty years, consistent scientific and practical work has been done to reform primary education and optimize its content. It turns out that Russian educators are based on two principles:

- preservation of the accumulated national experience in primary education;
- monitor the primary education reforms of the Commonwealth of Independent States and adopt their most advanced achievements. In this regard, each state has its own approach to optimizing primary education. It is important to develop a unique approach of our country in this regard.

In the context of innovative development in Uzbekistan, one of the key issues is a broad discussion of the problems of primary education and finding optimal solutions. It is important to create an integration of scientific and practical approaches in this regard. Addressing this issue as expected will serve the effectiveness of primary education.

## CLASSIFICATION OF SINGLE-PARENT FAMILIES AND THEIR SOCIAL-PSYCHOLOGICAL-PEDAGOGICAL CHARACTERISTICS

**Shaumarova Zilola Abdushukurovna\***

\*Doctoral Student,  
Research Institute of Pedagogical Sciences,  
Republic of UZBEKISTAN

### ABSTRACT

*This article is single-parent (an incomplete) family, their classification and types of information about the social, psychological and educational characteristics. The least likely is in single-parent families where the child is adopted or unmarried, because the most important thing in these types of children is that women have no motive to get married and have become accustomed to a free way without a husband. In such families, the child acquires sufficient knowledge, skills and abilities from an early age by engaging in foreign languages, music, sports. Her outlook is broader than her peers because she works with the child on a regular basis.*

**KEYWORDS:** *Single-Parent Family, Social, Psychological, Pedagogical, Classification.*

### INTRODUCTION

To stop the abrupt growth of single-parent families, to prevent unjustified divorces, to help women find family, motherhood, femininity and enjoy it for a lifetime, to use the intellectual and spiritual potential of women and their parents in the development of society and the country and, most importantly, the formation of children growing up in a fragile family as a harmoniously mature person, the various social, economic, psychological, pedagogical problems that may arise in their lives, prevention, mitigation, effective use of these problems in the upbringing of children, if necessary, is one of the most pressing scientific problems and important tasks of family pedagogy, the theory of education today.

The origin and factors of this social problem, its growth, complications and other aspects are related to a number of disciplines outside of pedagogy, including sociology, economics, psychology, demography, medicine, genetics, ethnology, gerontology, ecology, suicide and others.

Based on the goals and objectives of our study, the growth of a child in a single-parent family, the study of the various pros and cons of the single-parent family in the process of its formation as a person requires first of all a complete scientific understanding of the existing single-parent family.

Based on this scientific need, we have developed a classification of single-parent families.

Single-parent families consider the proposed classification on the basis of a family of origin, caused by factors, their economic, educational, psychological, cultural and spiritual potentials, existing or potential problems, such as families of children in the near future, the prospect of an incomplete family provides valuable information about the current and future status of the woman. The information shows how to help disadvantaged families by type.

According to the origin (occurrence) of the single-parent family:

- Complete family formed on the basis of divorce;
- complete family due to widowhood (based on the death of a husband or wife);
- an abnormal family as a result of long-term absence of the parent from the family (migration, imprisonment for many years, living with another family in another city, country, etc.);
- unmarried, illegitimate family with children;
- unmarried family living with an adopted child.

Based on the above-mentioned criteria, which serve as the cause and factor of the emergence of a single-parent family, it is impossible to determine their prospects according to family types.

The prospects of family species are largely determined by the performance of psychogenetic, socio-pedagogical, psychological, economic and family functions.

The chances of remarriage are more likely to be in a single-parent family that is based on widowhood.

This is due to the fact that the widow has no contribution to the formation of an illegitimate family, the widow has no negative experience of family life, marital relationships, and the motives of marriage in a woman are sufficiently expressed.

The least likely is in single-parent families where the child is adopted or unmarried, because the most important thing in these types of children is that women have no motive to get married and have become accustomed to a free way without a husband. A certain proportion of such women, according to our research, grew up in 31%<sup>1</sup> of unmarried families, and we believe that the parents modeled the family model.

However, the age of most women is also 35 and older. This further reduces their chances of getting married.

The main obstacle that makes it difficult for families formed on the basis of divorce to remarry is the negative experience they received in the first divorced family life, negative perceptions about family life, family relationships.

Unfortunately, this negative experience can sometimes have a negative impact not only on remarriage, but also on the stability of a remarried second marriage. The reason for this is the

negative psychological establishment formed from the first failed marriage in relation to family life.

Changing this negative attitude and preventing it from having a negative impact on a second marriage will largely depend on the woman's personal qualities and the professional qualifications and life experience of the family psychologist who works with her on a regular basis.

Education, women who do not have a high level of culture, who do not see a strong family as ideal, who start sex before puberty, who do not approach the upbringing of children with sufficient disability, most mothers (fathers) are officially in the full reality. form the child's personality in disadvantaged families who do not provide financial support, do not fulfill their paternity, masculine duty) or lose the prospect of a good family life due to premature births and live with their unmarried children. There are more socio-economic and socio-psychological problems than the above.

Some are children in the family, including the family intellectual, physical, moral, spiritual, and cultural factors have played a significant role in determining their impact on the development prospects of one of the fathers and mothers' level. The level of knowledge, in turn, is one of the indicators of the external expression of the genealogical potential of this dynasty, the seed.

Therefore, the level of education of the mother (father) plays a very important role in the mental and spiritual development of the child in the formation of the child as a person in a single-parent family.

The mother is a member of the intelligentsia, and if she has a higher education, she will pay attention to her child's education, no matter how difficult it may be, to further education, to love knowledge, to a level not inferior to her, and to provide financial support to her child, teaches family management.

From the point of view of scientific justice, it should be noted that the offspring of a father who does not live with a family because of the purpose of divorce, death or life in general, plays an important role in who the child grows up in a family with genes and what he achieves in life.

In a single-parent family, the mother's level of education is often equal to or close to that of her siblings, siblings, and other close relatives.

A child growing up in a single-parent family with a higher education has a sufficient educational impact not only on the level of education, way of life, spiritual world, life values, cultural level, life plans of the older children of his mother, but also aunts and uncles.

For children from single-parent families, some of the mother's close relatives serve as referent circles. Communication with them, adult advice, counseling, various forms of assistance, if necessary, help children to determine their way of life, choose a suitable profession, enter the appropriate higher education institution, study there, get a job after graduation, spiritual enrichment, professional, creative, administrative growth, economic stability, and other issues.

Given that there is a sufficiently pronounced link between the education of a mother in a single-parent family (and in a full-fledged family) and the mental and spiritual development of their children, school leaders, school psychologists should pay more attention to individual work with low-educated mothers (fathers), psychological and pedagogical counseling.

In particular, it is necessary to raise the level of requirements for students in these families, to keep them out of the circle of unknown referees, to pay attention to their upbringing, to identify their innate abilities early and to allow them to engage in relevant arts and sports.

That is, the mother due to the low levels of incomplete information out of the reach of children in the family, their community, neighborhood, schools, non-governmental organizations and others take their order.

Single-parent families a strong influence on the child's personal characteristics of the material rate.

According to this feature, we have divided the following five types of disadvantaged families:

- Rich single family;
- A well-off single-parent family;
- Middle-income single-parent family;
- Low-income single family;
- economically helpless family.

The division of families into types according to their financial means was first published in the journal "Psychology" by M. A. Utepbergenov among them was a conditionally derived criterion. But they were thinking about full families.

In our dissertation, the criteria were taken from the example of an incomplete family.

In our scientific study, rich unmarried families were not studied as respondents. The respondents we studied were mostly (87%) middle-income, low-income single-parent families.

Well-off poor families - 4% and low-income poor families - 5%, economically disadvantaged poor families - 4%.

In wealthy families, if labor education is not given enough, if there is no idea about life and its trials, if every wish is fulfilled immediately, the child will develop excessive egoism, weak will, and inability to cope with life's trials, inability to empathize with others, and so on. Dramatically increases the risk of personality problems.

In rich and well-off single-parent families, the upbringing of the child is sufficiently attended by people close to the mother (nurse, teacher, educator, etc.). This helps the child's personality to form harmoniously and serves to prevent the problems mentioned above.

Wealthy and well-off single-parent families place great emphasis on additional education.

This is their greatest and most important advantage in terms of their impact on the child from another family marriage. In such families, the child acquires sufficient knowledge, skills and abilities from an early age by engaging in foreign languages, music, sports. Her outlook is broader than her peers because she works with the child on a regular basis.

Raising children in low-income and economically disadvantaged families, not looking at the lives of peers in rich and well-off families, looking with a healthy eye, not envy, studying well, finding the right place in society, choosing the right profession, working hard and working hard to respect the species, not to see the difficulties, to overcome the problems that can be

encountered in the life of every person, to be intelligent, reckless, courageous, to be lazy in carrying out complex (powerful) tasks masculinity, life plan, he accelerated, will go towards the mobilization and the current state of their peers in rich, well-creation of her mother and the children should be able to explain that.

It is single-parent families, children with psychological power of beautiful life in a healthy way, hard work and motivation to achieve the activity to start.

Well-income and wealthy single-parent families bring this motivation, the formation of more complex.

At the same time rich and well single-parent families are dealing with children, to help the needy, they explain the burdens of life, special attention should be paid to the formation of the qualities of generosity.

Wealth in the upbringing of children of a rich and well-off family, well-being is the product of great labor, entrepreneurship, intelligence of his parents, grandparents, if the children in such families are thrifty (not greedy), work hard, constantly mobilize the will, father - The need to use what the mother finds sparingly, to try to provide the conditions created by the parents for their children in a more perfect way, should be instilled in the mind from early childhood. Otherwise, it is necessary to explain that after one generation, a rich and well-off family may fall into the category of low-income, economically helpless families in future generations.

The great wealth of every child is not the level of material security around him, but the intellect, knowledge, spiritual image of the person who creates these material values and their contribution to the welfare of himself, his family, subordinates, the system, fully manifesting them in the relevant profession, labor activity, ability to get. To do this, a child, regardless of the family in which he grows up, must be well aware of the need to work hard, research, creative approach, strengthen the mind with knowledge and follow it.

## POSSIBILITIES OF USING INNOVATIVE ELECTRONIC TEXTBOOK AND VIRTUAL EDUCATION TECHNOLOGY IN CHEMISTRY LESSONS

**M. Sh. Ahadov\***

\*Teacher

Department of Chemistry Teaching Methods,  
Navai State Pedagogical Institute,  
UZBEKISTAN

### ABSTRACT

*The following article deals with is the role of virtual learning technologies and an innovative electronic textbook in teaching chemistry in higher education, using V-Academy, distance learning technology and using these tools.*

**KEYWORDS:** *Innovative Electronic Textbook, Crocodile chemistry, Virtual Education, V-Academy, Distance Learning Technology, Three Dimensional Environment, Virtual Reality, Master Class.*

### INTRODUCTION

Today, the use of information and communication technologies in education is widespread globally. At the same time, interactive software tools, including the creation of an interactive learning environment, the improvement of innovative methods and technologies for developing students' thinking and worldview, the development of electronic textbooks and resources, educational programs, automated control systems for learners and simulators are improving access to education and that is being recognized as a pressing issue.

Introduction of modern information technologies and software into the educational process in the framework of systemic reforms to develop the base of electronic educational and methodological resources of educational institutions on the basis of comprehensive innovative approaches, strengthen the material and technical base, radically modernize the system of teacher training and the level of support has increased.

Facilities and conditions helps to develop the quality of education through the improvement of technologies for the effective use of innovative software tools in chemistry education and to prepare students for professional activities on the basis of a competency-based approach.

The Strategy of Actions for the Further Development of the Republic of Uzbekistan identifies the priority task as "Improving the quality and efficiency of Higher education institutions based on the introduction of international standards for assessing the quality of education and training."<sup>1</sup> For developing the use of technology, methodological support, system of competencies for the organization of the educational process on the basis of electronic software in the system of teacher training, the President of the Republic of Uzbekistan adopted resolution of № PF-4947 on February 7, 2017 "Strategy of Actions for further development of the Republic of Uzbekistan"; Resolution of the Cabinet of Ministers of the Republic of Uzbekistan dated July 25, 2012 №PP-2909 "On measures to further develop the system of higher education of the Republic of Uzbekistan"; Resolution of the Cabinet of Ministers of the Republic of Uzbekistan of № 228 "On the establishment of a center for the introduction of e-learning in educational institutions under the Ministry of Secondary Special Education and extensive use of electronic textbooks and virtual technologies to improve quality and efficiency".

As a result of the research work on the theme "Improvement of modular systems and methods of creating innovative electronic textbooks in Chemistry lessons" an innovative electronic textbook was created on the subject "Inorganic Chemistry".

The structure of innovative e-textbooks in teaching of Inorganic Chemistry includes for each topic: interactive lectures, modern presentations, lesson plans, pictures, animations, multimedia products, virtual laboratories in Crocodile Chemistry software, crossword puzzles in Hot Potato, (video) methods of solving chemical problems on the board, world chemists life and works, intellectual games, cartoons on various topics, 11 types of non-standard tests in inspiring Quiz Maker, case bank, interesting questions and answers, Uzbek-English dictionaries, assimilations, glossaries and more.

In order to effectively use innovative e-textbooks in the practice of Chemistry lessons, it is necessary to pay attention to the following:

1. Gradually develop students' skills in preparing innovative electronic textbooks on chemistry.
2. Expansion of the range of didactic tools, first in the preparation of innovative e-textbooks, then in the preparation of presentations, interactive tests, assignments.
3. Develop skills and competencies to work with innovative e-textbooks with complex content.
4. To study the methodology of creating catalogs of lesson plans based on interactive and innovative technologies.
5. Effective use of innovative electronic textbooks based on a creative approach.

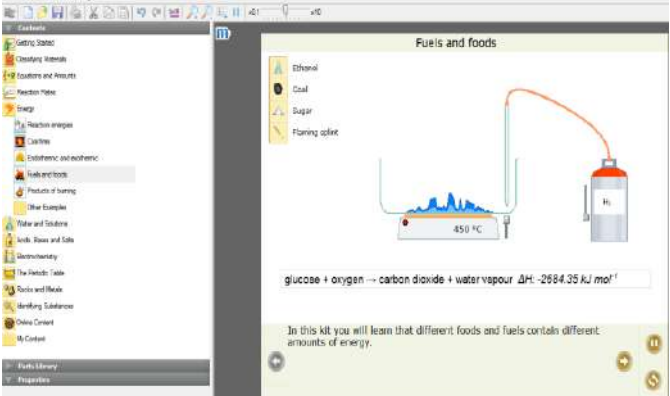

During the experimental work, in teaching the subject of "Inorganic Chemistry", skills and competencies in the design of chemistry lessons and their use in educational practice, skills and competencies in the design of chemistry lessons were formed. The stages of developing students' skills in working with innovative electronic textbooks have been developed. By developing students' skills in working with innovative electronic textbooks students are able:

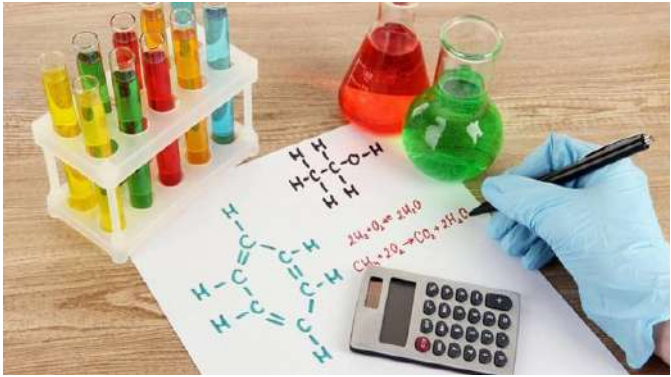

- To study the effective use of ICT in chemistry lessons;

- ☐ enrich the content of chemistry lessons, connect chemistry to everyday life, organize lessons with the help of additional information to the textbooks, revealing aspects of the subject, taking into account the age of the student;
- ☐ Also teachers should be able to take an independent, creative approach to the overall preparation for the lesson, to work on them regularly, and to be able to keep up with the times;
- ☐ To be able to understand the exact chemical properties of the relevant substances, the logical connection of the given situation and events in the problem, and to use convenient methods in mathematical calculations to overcome the difficulties in solving chemical problems;
- ☐ to study the experience of other countries in the field of chemistry education and use them taking into account our national mentality;
- ☐ organize the lesson on the basis of information that always connects with life, connects one topic with another, reveals the purpose of the transition to a new topic;
- ☐ to apply the effective experience of the countries where the language is studied with the localization of international experience in the system of teaching chemistry;
- ☐ Demonstration of educational information from innovative electronic textbooks used in chemistry lessons, supplementing the content of manuals published in the traditional educational method, animation of visual aids, testing of acquired knowledge and skills to achieve the manifestation of pedagogical information and software as an opportunity;
- ☐ Chemistry teacher has the opportunity to model the lesson in a modern way using multimedia, to have additional information to deepen knowledge, and to prepare theoretical and independent work;
- ☐ Virtual demonstration of Crocodile Chemistry laboratory and practical classes in chemistry, which are not available;
- ☐ Innovative e-textbook, educational films, virtual laboratory work, many advantages of using electronic resources, explanation of a new topic, questions and issues to strengthen the topic, visual experiments in the absence of equipment in the classroom, laboratory work Crocodile Chemistry ability to adequately use the opportunity to perform in the program in the form of virtual demonstrations;
- ☐ Audio files have the ability to reinforce the theme by listening. This contributes to the quality and effectiveness of education.

Our main goal to create innovative e-textbooks (IED) is to improve the mechanism, create a database of fundamental research and achieve the effectiveness of education at the level of other Universities around the world.

**IED shortcuts and their functions**

In order to test the IED on the subject of "Inorganic Chemistry" and determine the level of quality of the experiment, the Navoi State Pedagogical Institute, Faculty of Natural Sciences, Chemistry Teaching Methodology was destined to conduct observations. The observations were made in collaboration with Computer science and Chemistry teachers and researchers.

First of all we have defined an experimental field, then the experimental teachers tested the IED in Inorganic Chemistry to ensure that it meets modern requirements for content, design, and form compatibility.

**(TABLE 1) ANALYSIS OF THE MAIN CRITERIA FOR CREATING AN INNOVATIVE E-TEXTBOOK**

	<b>The main criteria for creating IED</b>	<b>Availability</b>	<b>Quality degreeS (%)</b>
	Possibility of working individually	+	100 %
	Possibility of working in Local network	+	100 %
	Theoretical knowledge module	+	96 %
	Module of practical knowledge	+	95 %
	Non-standard testing tasks	+	92 %
	Video lectures and videos	+	65 %

	Electronic library	+	70 %
	Didactic additional materials	+	96 %
	Information about author	+	100 %
0	Manual about working with IED	+	90 %
1	Ability to solve chemical problems	+	90 %
2	Possibilities to listen audio files	+	90 %
	<b>Average quality level:</b>		90,3 %
	<b>Criteria for the compatibility of IED content, design and form</b>		
	Lecture notes	+	99 %
	Course developments	+	86 %
	Modern presentations	+	76 %
	Photo illustrations	+	86 %
	Animation and gif.s	+	75 %
	Auadio files	+	88 %
	Issues Video links	+	98 %
	English-Uzbek dictionaries	+	85 %
	Glossary	+	70 %
0	Interesting information	+	100 %
1	About chemists	+	80 %
2	Assessment	+	90 %
	<b>Average level of quality:</b>		86 %

The analysis showed that an average of 90.3% of the criteria for IED software development were 86% of the criteria for compliance with the content, design and form of IED.

The following activities have been planned and implemented to organize and conduct tests with students:

Control and experimental groups on the subject of "Inorganic Chemistry" are selected for students of the II stage of the direction of teaching chemistry;

E-learning resources for teaching the subject of "Inorganic Chemistry" have been developed for experimental work;

Innovative e-textbook teaching of Inorganic Chemistry has been introduced in selected experimental groups;

Methodological recommendations, guidelines for teaching science were developed and implemented in the control and experimental groups involved in the experimental work;

Students' knowledge, skills, abilities and competencies in the teaching of "Inorganic Chemistry" were assessed and the results were mathematically and statistically processed; (Table 2)

**TABLE 2 STUDENT MASTERY RATES BASED ON THE IED DEVELOPED ABOVE:**

Today, along with e-textbooks, the importance of virtual learning technologies in the Higher education system is growing. Virtual education gives us the opportunity to experience knowledge and experience it. Virtual reality is the opposite of reality, and it means the perception of the imaginary (virtual) world.

Today, educational resources based on virtual reality can be classified as follows:

- First level - access to virtualization through special equipment (helmet-display, special gloves, etc.);
- Second level - three-dimensional (or hysteroscopic) monitors with the help of a projector and special glasses;
- The third level is the demonstration of virtual reality based on the computer's standard control and projection.

**Advantages:**

- Virtual reality can create different virtual environments;
- Allows us to explore places;
- In virtual reality, the user has the opportunity to experiment with artificial devices;
- Simplifies and facilitates virtual reality education.

**Disadvantages:**

- The most expensive devices currently used in virtual reality;
- Consists of a set of technologies;
- We cannot move to real life in virtual reality;
- Negative sides are not fully investigated.

Today, a three-dimensional V-Academia education that is close to real life is widespread.

V-Academia is one of the three points of view in the world that are closest to real life environment. 3D tutorials are no different. The V-academy virtual environment provides a high level of opportunity for any teacher to be computer literated.

Through V Academia, we will be able to enrich the educational institution virtual environment with high-quality new electronic resources. The VAcademia virtual environment allows students to learn new, high-quality alternatives to classroom lessons.

V Academia provides high-quality education through virtual environments, games, simulators, master classes.

Here are some suggestions on how to implement virtual education:

- First, to evaluate the positive and negative consequences of the use of virtual learning technologies in our educational environment, based on world experience;
- Second, to pay special attention to the development of manuals on the effective use of virtual educational technologies in Uzbek;
- Third, conduct research and promote software and hardware to create national virtual learning environments and devices;
- Fourth, conclusions and recommendations can be made on the implementation of government incentives for developers of virtual learning resources.

Suggestions and recommendations on development of distance learning technology in education are followings:

1. We can improve the quality of education through the widespread use of interactive teaching methods.
2. There gain an opportunity to use specially developed teaching aids (innovative e-textbooks, training courses, videos, audio-video lectures, etc.).
3. Integration between the listener and the teacher is ensured in the assessment of students' mastery through a developed test bank.
4. The development of skills enables us to become a world leader in ARM.
5. Distance education system helps to improve the skills of professors and teachers.
6. During the implementation of the development, applicants will be trained on the basis of a payment contract, in addition, the educational institution will not require additional buildings, inventory, electricity, faculty and others.
7. Implementation of this project allows listeners to retrain innovative e-textbooks, training courses, video films, audio-video lectures.
8. We have the opportunity to play the role of a dean (tutor) among the audience.
9. The interaction between the teacher and the learner is kept.
10. Additional opportunities will arise through the implementation of the practice (loss of "workbook", "seminar book", "journal grades", etc.).
11. Commercialization increases the economic potential of Higher education.

In short; the use of IEDs and virtual learning technologies in the teaching of Chemistry in Higher education institutions creates a wide range of opportunities for both, traditional and distance learning.

Virtual learning technologies and distance learning technologies in education solves the problems such as the development of individualized teaching methods, the formation and improvement of student knowledge and the level of acquired knowledge. The use of distance learning technologies in the educational process has a strong impact on the positive change in the content, forms and methods of education.

It should be noted that teaching in an information and communication environment requires teachers to master new interactive pedagogical technologies. In addition: in the educational process it is necessary to use computer technology, video projector, plasma panels, electronic whiteboard and its compact analogues, software products, Internet resources, e-mail, IED and multimedia teaching aids in a virtual learning environment will be.

At the same time, it is an important tool for the formation and development of skills and competencies of future chemistry teachers to become competitive professionals, which is the basis of the original goals of our country for future generations.

### ABSTRACT

*The article is a two tasks allow different solutions. Shows the role of integration of the study of theorems decision problems different methods for solving problems. Considered different approaches to tasks as well as in this article shown approaches integration non-geometric and geometric methods in mathematics education and methods in mathematics education and methods challenges in line with the system analyses with involvement of data various research areas of mathematics.*

**KEYWORDS:** *Integration, Various, Equation, Education, Expression, Inequality, Smallest Value, Considerations.*

### INTRODUCTION

The integration of geometric and non-geometric methods involves solving problems in various methods and ways, which gives students the opportunity to subsequently choose the method of solving the proposed problem.

When solving problems with only one method, their only goal is to find the right answer. If there are several methods for solving the problem, student try to choose the most rational of them. The situation of choice is an informal procedure, it requires knowledge of many theoretical facts, the ability to analyze them in terms of applicability to a given situation in a problem, etc. All this

activates the educational activities of students, gives it a search, creative character, while developing their creative abilities, alternative thinking.

An important feature of creative activity is the independent transfer of knowledge and skills to a new situation. The integration of non-geometric and geometric methods in teaching mathematics allows students to transfer geometric knowledge and skills into non-geometric and geometric – info geometry and based in this, combine new ways of solving problems, proving theorems. It is advisable to demonstrate to students different approaches to the tasks. Tasks that allow various solutions are usually interesting and instructive. Each of them demonstrates the capabilities of any one method, and a comparison of solutions allows students to develop their own system of approaches to tasks, develops their intuition, and provides the necessary experience.

### We present problems admitting various solutions.

Task 1. If equation  $x^4 + ax^3 + bx^2 + ax + 1 = 0$  has at least one real root, then find the smallest value of the expression  $a^2 + b^2$  ?

Solution 1. **Algebraic method:** Let the original equation have root  $x > 0$ . But then for this value  $x$

$$x^4 - |a|x^3 - |b|x^2 + |a|x + 1 \leq x^4 + ax^3 + bx^2 + ax + 1 = 0$$

or

$$|a|x^3 + |b|x^2 + |a|x \geq x^4 + 1. \text{ Inequalities are easily verified}$$

$$x^4 + 1 \geq 2x^2 \text{ and } x^4 + 1 \geq x^3 + x.$$

Using them, we get

$$x^4 + 1 \leq |a|x^3 + |b|x^2 + |a|x \leq |a|(x^4 + 1) + |b| \cdot \frac{x^4 + 1}{2} = \left(|a| + \frac{|b|}{2}\right)(x^4 + 1), \quad \text{where from}$$

$$\left|a\right| + \frac{|b|}{2} \geq 1, \text{ or } |b| \geq 2 + 2|a|$$

Then

$$a^2 + b^2 \geq |a|^2 + (2 - |a|)^2 = 5|a|^2 - 8|a| + 4 = 5\left(|a| - \frac{4}{5}\right)^2 + \frac{4}{5} \geq \frac{4}{5}$$

If the original equation has a negative root  $x$ , then it is easy to see that  $(-x)$  is a positive root of the equation

$$x^4 - ax^3 + bx^2 - ax + 1 = 0$$

We apply what was proved above to it and we obtain that  $a^2 + b^2 \geq \frac{4}{5}$ . Case  $x = 0$  is impossible.

So, in all cases, expression  $a^2 + b^2$  is not less than  $\frac{4}{5}$ .

Solution 2. Lemma. For any real  $x(x \neq 0)$ , the inequality

$$\left|x + \frac{1}{x}\right| \geq 2$$

Since expression  $x + \frac{1}{x}$  is odd, it suffices to verify the inequality for positive  $x$ . But in this case it is a consequence of inequality  $x^2 + 1 - 2x = (x-1)^2 \geq 0$ . The lemma is proved.

We now consider the equation given in the condition of the problem. Since  $x = 0$  is not the root of this equation, we can transform the equation to the form

$$x^2 + ax + b + \frac{a}{x} + \frac{1}{x^2} = 0 \text{ or } \left(x + \frac{1}{x}\right)^2 + a\left(x + \frac{1}{x}\right) + b - 2 = 0.$$

For fixed  $x_0 (x_0 \neq 0)$ , the set of pairs of real numbers  $(a, b)$  for which the original equation has a root equal to  $x_0$  is determined by the linear equation

$$y_0^2 + ay_0 + b - 2 = 0,$$

$$\text{where } y_0 = x_0 + \frac{1}{x_0}.$$

The set of pairs of numbers  $(a, b)$  satisfying this equation is represented by a straight line in the coordinate plane  $(a, b)$ . In this plane, the expression  $a^2 + b^2$  can be geometrically interpreted as the square of the distance from the origin to the point  $(a, b)$ . Therefore, from geometric considerations, it is clear that for points  $(a, b)$  on our line, the minimum value of the expression  $a^2 + b^2$  will be equal to the square of the length of the perpendicular drawn from the origin to the line in question (fig.1). To calculate the length of this perpendicular, note that the line cuts off a segment of length  $\left|\frac{2 - y_0^2}{y_0}\right|$  from axis "a", and segment  $|2 - y_0^2|$  from axis "b".

Considering the corresponding similar triangles (fig.1), we calculate that the square of the length of the perpendiculars is

$$\frac{(y_0^2 - 2)^2}{1 + y_0^2}$$

so, we found the minimum of the expression  $a^2 + b^2$  for a fixed value of the root  $x$ . Considering

now all sorts of real  $x_0$  and taking into account that

fig. 1. in this case  $\left(x_0 + \frac{1}{x_0}\right)^2 = y_0^2 \geq 4$ , we find that the corresponding

values  $a^2 + b^2$  are not less than the minimum of expression  $\frac{(y^2 - 2)^2}{1 + y^2}$  at  $y^2 \geq 4$ .

**Mathematical analysis method** Show now that the function.

$$f(t) = \frac{(t-2)^2}{1+t} \text{ increases at } t \geq 4.$$

$$f(t) = \frac{(t-2)^2}{1+t} = \frac{t^2 - 4t + 4}{1+t} = t - 5 + \frac{9}{1+t}$$

$$f'(t) = 1 - \frac{9}{(1+t)^2} > 0 \quad \text{at } t \geq 4$$

Therefore, the function  $\frac{(t-2)^2}{1+t}$  considered for  $t \geq 4$ , takes the smallest value at point  $t = 4$ .

Thus, the value are  $a^2 + b^2$  for all possible real roots  $x_0$  is not less than.  $4/5$ . But it can equal  $4/5$ , since  $x_0 = 1$  is the root the original equation at  $a = -4/5$ ,  $b = \frac{2}{5}$ . So,  $4/5$  is the required

smallest value of expression  $a^2 + b^2$ .

**Task 2.** Real numbers  $x_1, x_2, \dots, x_n$  belong to the interval  $[-1, 1]$  and the sum of the cubes of these numbers is 0. Prove that the sum  $x_1, x_2, \dots, x_n$  does not exceed  $n/3$ .

**Solution 3. Geometrical considerations.** Let us place on the graph functions  $y = f(x) = x^2$ ,  $-1 \leq x \leq 1$  (see fig.2)  $n$  of equal masses at points with abscises  $x_1, x_2, \dots, x_n$ .

Let

$$X = \frac{x_1 + x_2 + \dots + x_n}{n}, \quad Y = \frac{y_1 + y_2 + \dots + y_n}{n} \quad - \text{ be the coordinates of the center } C$$

of these masses. It is clear that point  $C$  lies within the "convex hull" of our graph, in particular, above the tangent to the graph drawn from the point  $(-1, -1)$ , the red line in the figure. We find

the equation of this tangent.

This is a straight line  $y = g(x) = t(x+1) - 1$ , where  $t$  is chosen so that the difference of function

$$\begin{aligned} f(x) - g(x) &= x^2 - (t(x+1) - 1) = \\ &= (x+1)(x^2 - x + 1 - t) \end{aligned} \quad (*)$$

has, apart from  $x = -1$ , a multiple of the root  $x = x_0$ .

For this, the discriminant of the square trinomial  $x^2 - x + 1 - t$  must turn into 0:  $1 - 4(1 - t) = 0$ , whence

$t = 3/4$ , and the

fig. 2

corresponding root

$x_0 = \frac{1}{2}$ . Since point  $C$  lies no lower than the red line  $y = g(x)$ , i.e.

$$Y \geq \frac{3}{4}X - \frac{1}{4},$$

at  $Y = 0$  we get the estimate.  $X \leq \frac{1}{3}$ . Where from

$$\frac{x_1 + x_2 + \dots + x_n}{n} \leq \frac{1}{3} \quad \text{or} \quad x_1 + x_2 + \dots + x_n \leq \frac{n}{3}.$$

**Algebraic method.** From (\*) we get for  $t = \frac{3}{4}$  the polynomial

$$p(x) = f(x) - g(x) = (x+1)\left(x^2 - x + 1 - \frac{3}{4}\right) = \frac{1}{4}(x+1)(4x^2 - 4x + 1) = \frac{(x+1)(2x-1)^2}{4} \geq 0 \Leftrightarrow$$

$$\Leftrightarrow 4x^3 - 3x + 1 \geq 0$$

$$4x_1^3 - 3x_1 + 1 \geq 0$$

$$4x_2^3 - 3x_2 + 1 \geq 0$$

$$4x_n^3 - 3x_n + 1 \geq 0$$

Adding  $n$  obvious inequalities, we obtain the following inequalities

$$4(x_1^3 + \dots + x_n^3) - 3(x_1 + \dots + x_n) + n \geq 0,$$

by condition of the problem

$$x_1^3 + \dots + x_n^3 = 0$$

where from

$$x_1 + x_2 + \dots + x_n \leq \frac{n}{3}$$

**Solution 2.** Let  $x_1, x_2, \dots, x_n$  – be a set of numbers satisfying the conditions of the problem. Let among them “ $k$ ” non-negative:  $y_1, y_2, \dots, y_k$  and  $l = n - k$  negative:  $-z_1, \dots, -z_l$ .

Then

$$S = x_1, x_2, \dots, x_n = y_1 + y_2 + \dots + y_k - z_1 - z_2 - \dots - z_l$$

by condition

$$y_1^3 + y_2^3 + \dots + y_k^3 = z_1^3 + z_2^3 + \dots + z_l^3$$

We denote this sum by  $x$ . Since the positive numbers  $z_i$  ( $i = 1, 2, \dots, l$ ) do not exceed unity, we have  $l \geq x$ , i.e.  $k \leq n - x$

Let us estimate the number “s” from above since  $s_j^3 \leq z_j$  is at  $i \leq j \leq l$ , then  $z_1 + z_2 + \dots + z_l \geq x$ . On the other hand, since

$$\left( \frac{y_1 + y_2 + \dots + y_k}{k} \right)^3 \leq \frac{y_1^3 + y_2^3 + \dots + y_k^3}{k}$$

then

$$y_1 + \dots + y_k \leq k^{2/3} x^{1/3} - x$$

Let us prove that

$$(n-x)^{2/3} \cdot x^{1/3} - x \leq \frac{n}{3}.$$

After transformations of this inequality, we obtain the equivalent inequality

$$(n-x)^2 x \leq \left( x + \frac{n}{3} \right)^3$$

or

$$3x^2 - \frac{2}{3}nx + \frac{n^2}{27} \geq 0, \text{ i.e. } \left( 3x - \frac{n}{3} \right)^2 \geq 0,$$

The statement of the problem is proved.

### Solution 3. Trigonometric method

Denote

$$x_1 = \cos \alpha_1, x_2 = \cos \alpha_2, \dots, x_n = \cos \alpha_n$$

According to the well-known formula

$$\cos 3\alpha = 4 \cos^3 \alpha - \cos \alpha$$

we obtain the following system of inequalities

$$4 \cos^3 \alpha_1 - 3 \cos \alpha_1 \geq -1$$

.....

$$4 \cos^3 \alpha_n - 3 \cos \alpha_n \geq -1$$

Adding these inequalities we get

$$4(\cos^3 \alpha_1 + \dots + \cos^3 \alpha_n) - 3(\cos \alpha_1 + \dots + \cos \alpha_n) \geq -n$$

where from

$$4(x_1^3 + \dots + x_n^3) - 3(x_1 + \dots + x_n) \geq -n$$

by condition of the problem

$$x_1^3 + \dots + x_n^3 = 0,$$

where from

$$-3(x_1 + \dots + x_n) \geq -n, \text{ or } x_1 + x_2 + \dots + x_n \leq \frac{n}{3}.$$

## CONCLUSION

The role of integration in the study of theorems and problem solving, which involves carrying out different proofs of the theorem and different methods of solving problems (analytical, geometric and integrated) in one lesson, leads to the fact that one and the same object is interpreted in different interpretations, relationships, therefore, students a holistic view of it is created. In addition, they are included in the active cognitive activity a creative nature.

The conducted pedagogical experiment confirmed the effectiveness of the developed methodology for teaching mathematics based on the integration of geometric and non-geometric methods, which leads to the intensification of cognitive activity of students, the development of their creative abilities, and the improvement of holistic ideas about mathematical methods.

## **CRISIS IN THE PADDY CULTIVATORS IN ANDHRA PRADESH-A STUDY OF GUNTUR DISTRICT**

**Dr. Kishore Babu. Karri\***

Post-Doctoral Fellow (UGC),  
Dept.of Economics, Acharya Nagarjuna University,  
Guntur, Andhra Pradesh, INDIA  
Email id: kishore5500@gmail.com

### **ABSTRACT**

*Andhra Pradesh is historically known as the "Rice Bowl of India", Andhra Pradesh stands 6th in area, 3rd in production, and 2nd in productivity and contributes nearly 12% of the national rice production. Andhra farmers grow rice annually in an area of 3.98 M Ha in 22 districts. Rice is grown under a wide variety of conditions in India as well as in Andhra Pradesh. During the year 2011-12 in Andhra Pradesh, Paddy production in the Kharif season was 112.64 Lakh MT and in the Rabi season was 103.64 Lakh MT, totaling to 216.28 Lakh MT. East & West Godavari districts alone contributed 61.05 Lakh MT. The Fig-1 shows Area, production and yield of rice in Andhra Pradesh year-wise for the last 10 years. This paper is to analyze the cost and return of the paddy cultivation in coastal Andhra Pradesh. This paper is based on the primary data of 100 sample respondents are selected on simple random sampling method. The sample households are selected from Krapa village of Kollure mandal in Guntur district of Andhra Pradesh. This paper collected the information about the cost of cultivation, income from the paddy cultivation. The cost of cultivation of paddy in coastal Andhra region is 1783/- per quintal because of increasing the price of all inputs. Basically paddy is a labour intensive crop, now a days the wages are hiked and labours are not available at the time of harvesting stage due to MGNREGA works and migration of labours from other districts. Shortage of labour has a reason to introduce the mechanization in transplantation and harvesting of paddy. Today the price of all fertilizers like urea, 20-20, DAP, and other complex fertilizers prices are increased 120 per cent. The cost of fertilizers is 30 per cent of the total cost. Majority of suicides farmers are tenant or marginalized farmers in Andhra Pradesh. It's covered 50 to 60 per cent of the sown area. The rental value of lease in land is in bag and cash is 30 bags and Rs 20000/-*

*per annum. The tenant farmer are face high rent of land and he is insecure the owners to continue his tenancy in future. All the inputs prices are increased and the same way the prices of the entire consumer good also increased like vegetables, cereals, pulses, oil, and onions. Today the price of rice increased Rs15/- to 45/- rupees and it leads to increasing the consumption expenditure. This is a mistory the farmers sold their output with less price in the same he purchased with can paid high price in the market .All these thinks are pushed the farmers in to debt crisis and majority of farmers are depended on the money lenders, traders and commission agent for credit and this is leads to increasing the indebtedness then its leads to suicides. Many states including Punjab, Andhra Pradesh, Karnataka, Maharashtra and Kerala have recorded a spurt in distress driven suicides among the farmers. The status of suicides victims was poor and which belongs to tenants, marginal and small farmers who could not sustain frequently price stock.*

**KEYWORDS:** *Andhra Pradesh, Crop Holiday, Cost of Cultivation, Paddy and Crisis*

## **INTRODUCTION:**

India has the largest paddy output in the world and is also the second largest exporter of rice in the world. Paddy fields are a common sight throughout India, be they be northern Gangetic plains or southern peninsular plateaus. Paddy is cultivated at least twice a year in most parts of India, the two seasons being known as „Rabi“ and Kharif“respectively. The paddy cultivation plays a major role in socio-cultural life of rural India. Festivals such as”Sankranthi” in Andhra Pradesh celebrates harvest of Paddy. Andhra Pradesh is historically known as the "Rice Bowl of India", Andhra Pradesh stands 6th in area, 3rd in production, and 2nd in productivity and contributes nearly 12% of the national rice production. Andhra farmers grow rice annually in an area of 3.98 M Ha in 22 districts Rice is grown under a wide variety of conditions in India as well as in Andhra Pradesh. Rice is the only cereal that can stand water submergence. For hundreds of years, natural selection pressures such as drought, submergence, flooding, and nutrient and biotic stresses led to a great diversity in rice ecosystems. With construction of dams and after the Green Revolution, rice became predominantly a canal-irrigated crop. Traditional Tank systems were totally neglected.

Gradually farmers even in rain fed areas started cultivating rice under tube well irrigation. This has led to exhaustion of the ground water and several cascading ecological and economic problems. An acre of rice production in ponding conditions requires about 6 million liters of water which translates to 5000 liters of water for each kilogram of rice production. This shows the burden on the scarce natural resource „water”. Though paddy is a self pollinated crop and has wide variation, research scientists focused on developing hybrids - as a highend technology by public sector research and to retain control over the seed by the private companies forcing the farmers to buy seed every year.

During the year 2011-12 in Andhra Pradesh, Paddy production in the Kharif season was 112.64 Lakh MT and in the Rabi season was 103.64 Lakh MT, totaling to 216.28 Lakh MT. East & West Godavari districts alone contributed 61.05 Lakh MT. The Fig-1 shows Area, production and yield of rice in Andhra Pradesh year-wise for the last 10 years

The reasons cited by farmers for declaring a Crop Holiday include Reason:

- Late release of canal water.
- MSP not covering the actual cost of production.
- Non-enforcement of existing MSP.
- High cost of cultivation on account of high cost of labour and inputs.
- Non-availability of labour in peak season of agricultural operation on account of NREGS.
- Non availability of the Credit and quality inputs in time.
- Ineffective procurement.
- Insufficient storage space
- Poor drainage maintenance.
- Apprehensions about AP Land licensed cultivators or finance.
- Delayed settlements of crop insurance.

### **Objectives and Methodology**

This paper is to analyze the cost and return of the paddy cultivation in costal Andhra Pradesh. This paper is base on the primary data of 100 sample respondents are selected on simple random sampling method. The sample households are selected from Krupa village of Kollure mandal in Guntur district of Andhra Pradesh. This paper collected the information about the cost of cultivation, income from the paddy cultivation

### **Results and Discussions:**

This paper mainly focus on the why the farmers have to decided to take a crop holiday and analyze the cost and returns of the paddy peasants in the study area

### **Cost of Cultivation:**

The cost of cultivation of paddy in study area is 1783/- (Table-1) per quintal because of increasing the price of all inputs .Basically paddy is a labour intensive crop, now a days the wages are hiked and labours are not available at the time of harvesting stage due to MGNREGA works and migration of labours from other districts .Shortage of labour has a reason to introduce the mechanization in transplantation and harvesting of paddy. These are very popular in other than Andhra Pradesh and also some part of Andhra Pradesh. Another important input is fertilizers in the cultivation. Today the price of all fertilizers like urea,20-20, DAP, and other complex fertilizers prices are increased 120 per cent .The cost fertilizers is 30 per cent of the total cost. Another input is pesticides in the markets most of the pesticides are duplicate in this circumstance the farmers are not identified whether it is quality or not he purchase and applied but the crops are not saved from the insects. In this reason the yield was decreased, its genuine problem every farmer are faced in all the regions of Andhra Pradesh. The traders are miss guidance by the farmers because he doesn't know which the quality of goods is, his decision is depended on traders in the market and co-farmers, because majority of cultivators are illiterates. The farmers are not followed the government extension services.

Another constrain of the cultivation is tenancy rate. It is common not only Andhra Pradesh and also in India. Majority of suicides farmers are tenant or marginalized farmers in Andhra Pradesh. It's covered 50 to 60 per cent of the sown area. The payment of rent for leased in land is a choice of the farmer, the number of bags of paddy gives as rent to the owner and rent paid to cash. In this study observed the prevailing rates in bag and cash is 30 bags and Rs 20000/- per annum. The tenant farmer are face high rent of land and he is insecure the owners to continue his tenancy in future.

Another important constrain is formal credit facility, there is need credit to meet both consumption as well as production purpose. Now a day All the inputs prices are increased and the same way the prices of all the consumer good also increased like vegetables, cereals, pulses, oil, onions. Today the price of rice increased Rs15/- to 45/- rupees and it leads to increasing the consumption expenditure. This is a mistory the farmers sold their output with less price in the same he purchased with can paid high price in the market .All these thinks are pushed the farmers in to debt crisis and majority of farmers are depended on the money lenders, traders and commission agent for credit and this is leads to increasing the indebtedness then its leads to suicides. Many states including Punjab, Andhra Pradesh, Karnataka, Maharashtra and kerala have recorded a spurt in distress driven suicides among the farmers. The status of suicides victims was poor and which belongs to tenants, marginal and small farmers who could not sustain frequently price stock. With mountain debt burden along with the rising risk in production and price fluctuation leading to low remuneration. It is no wonder that a lot of distress in generated among the farmers .The incidence of indebtedness among the farm households was highest in Andhra Pradesh (82 per cent)

**TABLE-1 INPUT WISE COST OF CULTIVATION IN PADDY (VALUES IN RUPEES)**

Farming Category	Marginal	Small	Semi-Medium	Medium& Large	Total
land preparation	415	494	500	600	500
Machined labour	1938	2155	1800	1628	1845
Bullock labour hired	1200	1250	1200	1000	1195
Seeds	2500	2200	2000	1900	2200
Fertilizers	5395	5524	4500	4700	5358
Manure hired	923	1022	750	900	920
Pesticides	2643	2703	2200	2443	2473
Hired labour	7688	7981	7782	7588	7832
Owened labour	2687	2454	2120	2589	2473
Irrigation	998	938	850	978	950

Marketing charges	200	100	150	200	180
Miscellaneous charges	641	623	450	300	632
Total	48904	49375	46197	46042	47400

Source: Sample survey

### Income from the cultivation of Paddy

The data in the table -2, shows the gross income, cost of cultivation, net income and per cent of change of the sample respondents. It's observed that the gross income from the paddy cultivation is Rs 43700 per acre. The intra size group reveals that the gross income is increasing with increasing the firm size. The gross income is found to be high in medium and large farmer. The income from the paddy cultivation is found to be negative which is accounting for – 8.47 per cent, only the semi medium, medium and large farmers are found a positive return to scale. But the net income is very low among the two farming category. This table clearly concluded that the cost of cultivation found to be increased with increasing the farm size. The net income from the cultivation among the marginal and small farm is found to be negative,

**TABLE- 2 GROSS AND NET INCOME FROM THE PADDY CULTIVATION (VALUES IN RUPEES)**

Farming. Category	Gross income of Paddy	Cost of Cultivation	Net Income	% of Change
Marginal	39012	48904	-9892	-25.36
Small	42475	49375	-6900	-16.24
Semi-Medium	47250	46197	1053	2.23
Medium and Large	48590	46042	2548	5.24
Total	43700	47400	-3700	-8.47

Source: Sample Survey

### Suggestions:

1. As, NREGS is affecting the agricultural operations as the labour are engaged by this programme. NREGS
2. Programme should be linked up with agricultural operations like transplantation, weeding, harvesting etc., will solve the problems of farmers.
3. FCI/State procurement agencies to procure Paddy produce on the lines of States of Chattisgarh and Punjab and export policy to be announced early i.e., before March.
4. Supply of subsidized (at 70%) subsidy suitable machines for cultivation to all categories of farmers.
5. Additional bonus per quintal Paddy is to be announced by the State Government.
6. Ensuring availability of quality inputs like fertilizer/pesticides/seed

### CONCLUSION:

Andhra Pradesh is historically known as the "Rice Bowl of India", Andhra Pradesh stands 6th in area, 3rd in production, and 2nd in productivity and contributes nearly 12% of the national rice production. Andhra farmers grow rice annually in an area of 3.98 M Ha in 22 districts Rice is grown under a wide variety of conditions in India as well as in Andhra Pradesh. During the year 2011-12 in Andhra Pradesh, Paddy production in the Kharif season was 112.64 Lakh MT and in the Rabi season was 103.64 Lakh MT, totaling to 216.28 Lakh MT. East & West Godavari districts alone contributed 61.05 Lakh MT. The Fig-1 shows Area, production and yield of rice in Andhra Pradesh year-wise for the last 10 years, this paper is concluded that

The cost of cultivation of paddy in costal Andhra region is 1783/- per quintal because of increasing the price of all inputs .Basically paddy is a labour intensive crop, now a days the wages are hiked and labours are not available at the time of harvesting stage due to MGNREGA works and migration of labours from other districts .Shortage of labour has a reason to introduce the mechanization in transplantation and harvesting of paddy. ### ABSATRACT

*In the late 19th and early 20th centuries, Khorezm's Muhammad Rahimkhan Feruz created a unique literary atmosphere around his palace. Poets and writers who are Tabibi, Mutrib, Bayani, Avaz Otar, and Chokar worked during this period. The works of the poets are in Persian-Tajik and Turkish languages and have their own traditions. The interest in science significantly grew in Khiva. According to the khan's decree, qualified secretaries set up devons, mukhammases, bayozs, tazkirs, and complexes. At present, such works are kept in the manuscript fund of the Institute of Oriental Studies of the Academy of Sciences of the Republic of Uzbekistan and in the Ichankala Museum in Khiva. The collection "Majmuai mukhammasoti ash-shuaroi Feruzshahiy" is a large source of lyrical works of Khorezm literary environment. The complex was built in the second half of the XIX century and was built by Tabibi by royal decree.*

*It contains samples of poems by contemporary artists. This source, which provides valuable information about the literary environment of its time, is now stored in the main fund of the Institute of Oriental Studies named after Abu Rayhon Beruni of the Academy of Sciences of Uzbekistan under inventory number 1134. The complex differs from other collections in that it consists of poems of the mukhammas genre. Muhammad Hasan Devon Haji Tabib o'g'li Mutrib Khonaharab is one of the poets whose works are included in the creative heritage of the poets. The article analyzes the mukhammases of Mutrib Khonaharab, which are connected with the ghazals of the master poets Ogahi and Feruz. The artistic features of Mutrib's mukhammases, which are not found in manuscripts, have been studied. It is based on primary sources that the poet's ghazal retains aspects such as weight and content, and introduces innovations, focusing on the gradual development of the content. The mukhammas and musaddas included in the*

*collection were studied from the point of view of textual and source studies, comparing them with the poems copied to the manuscript.*

**KEYWORDS:** *Manuscript, Complex, Masnavi, Ghazals, Poem, Mukhammas, Musaddas, Inventory, Source.*

## INTRODUCTION

One of the most important issues today is the study of its history, national culture and rich literary heritage left by our ancestors. It is a good idea to study such a heritage, the works of which have not yet been fully applied to scientific use. 1134 inventory digital manuscripts kept in the fund of the Institute of Oriental Studies named after Abu Rayhon Beruni of the Academy of Sciences of Uzbekistan are valuable sources. Written in the second half of the 19th century, the complex contains lyrical works of 19th-century Khorezm. Another important aspect of the complex is the mukhammas associated with Feruz's poems by the poets of that time.

## MATERIALS:

The manuscript, entitled Majmuai mukhammasoti ash-shuaroi Feruzshahi, was originally written in red ink is titled "Debochai masnaviyoti muxammasotu majmuat ush-shuaroi Feruzshohiy doma mulkahu va davlatahu va zayyada umrahu va shavkatahu...".

After "Bismillahir Rahmanir Rahim" there were poems of praise, and praise of the four caliphs. The masnavi master, which consists of eleven verses of musammani mahzuf weight, is an example of respect for the poet. Here are some verses of this masnavi:

*Shahi oliy iqbolu gardun sarir,  
Jahon mulki ichra amiri kabir...  
So 'zi dur, dil oinasin sayqali,  
Ko 'ngul uqdasi mushkulining halli.  
Qachon bir suxan aylasa oshkor,  
Ongo fazl eli jonin aylar nisor.  
O 'zi chun balog 'atg 'a ma 'dan erur,  
So 'zi ham fasohatg 'a ma 'dan erur...  
Taxallus ongo bor edi Ogahiy,  
Maqomi va lekin fanoning rahi....*

In this masnavi, the author describes Ogahi as a konisukhan. The word is likened to a mirror that polishes the mirror of the tongue. "He is a man of maturity, a man of eloquence," he said.

The manuscript contains transcripts of Feruz's mukhammas connected with Ogahi's ghazals after the masnavi. The complex also includes Sultani, Sadiq, Saadi, Ghazi, Assad, Bayani, Aqil, Mirza, Nazir, Shinosi, Ghulami, Purkomil, Kamali, Inoyat, Doi, Ojiz, Haqiri, Niazi, Khaki, Habib The mukhammas of 33 poets, such as Yusuf, Tabibi, Rogib, Devoni, Mutrib

Khonaharob, Avaz, Nadimi, Khadim, Chokar, Muznib, Umidi, Totor, which were first connected to Ogahi's ghazals and then to Feruz's ghazals, are arranged in order.

These assumptions about Ogahi's ghazals, in turn, indicate that he was a kind of teacher for the creators of the later Khorezmian literary environment.

The complex was built by Tabibi in 1326/1908 according to the decree of Sayyid Mukhammas Rahim Bahodirkhan.

### DISCUSSION:

The collection also includes mukhammas of Mukhammas Hasan devon Haji Tabib o'g'li Mutrib, which are connected to the Ogahi and Feruz ghazals. Each mukhammas is preceded by a text of two or four lines written by the author. The fact that all 33 poets were preceded in their poems by Masnavi reveals their qualities shows that this collection is of a tazkira nature. The text of the Masnavi is as follows:

*Biri Mutrib ul zoru Xonaxarob –  
Ki, nag'omatg'a qilg'usi irtikob..[7]*

Or:

*Qilib Mutrib zoru Xonaxarob,  
Bu olam aro mayli changu rubob[7].  
Biri nazm elin Mutribi zor erur –  
Ki, sozandayi changu setor erur[7].  
Ongo gar xarob o'lmasa xonasi,  
Bu ash'or bo'lg'usi afsonasi.*

Speaking about Mutrib's work under the pseudonym "Khonaharob" and composing music, Tabibi said that writing poetry was his motto. He says he is sharp-witted and self-confident. The following verses also confirm this idea:

*Demaki, nazm bo'lmish shiori oning,  
Jahon mulkida yodgori oning[7]  
Vale gohi fikri musaddas qilib,  
Muni qildi zohir muxammas qilib[7].  
Kelib Mutrib ul zoru xonaxarob –  
Ki, hushu xiraddin erur bahrayob[7]/  
Muni aylamish zohir ul boxirad –  
Ki, fazl ahli ichra erur mu'tamad[7]/  
Dedi, Mutrib zoru Xonaxarob,  
Bu shiorni jahd etib behisob[7].*

Bobojon Tarroh Khodim also said in his commentary "Khorezm' poets and musicians" that the poet had the talent to play the tanbur, memorized six and a half notes, learned seven different sciences, namely, poetry, music, books, medicine, have a good command of the Persian-Tajik language, but at the same time does not lose to anyone in the debate [2].

The collection contains 5 mukhammas of Mutrib related to Ogahi and Feruz ghazals.

These are not found in the manuscripts of the poet's office kept in Institute of Oriental Studies named after Abu Rayhon Beruni of the Academy of Sciences of Uzbekistan. In particular, the poet Ogahi's rajazi musammani is associated with the ghazal, which begins with the verses "Jonbaxsh la'ling uzra to xat qildi paydo orazing" in a solim weight (-- V - / - - V - / - - V - / - - V - ).

The first paragraph of mukhammas is as follows:

*Qildi xirad begonasi ko'rgach, nigoro, orazing,  
Aylab manga har lahzada mehr oshkoro orazing,  
Bazming'a yetkurdi bu tun ming zebu oro orazing,  
Jonbaxsh la'ling uzra to xat qildi paydo orazing,  
Xurshid uza jam' ayladi Xizru Masiho orazing.*

The poet omits the third and sixth verses of Ogahi's 9-verse ghazal and connects them to 7 bytes. The omitted verses are as follows:

*Zohid tilar jannat guli sarvin magarkim ko'rmamish,  
Lutf ichra zebo qomating husn ichra hamro orazing.  
Oydek yuzung mahjurlari shom g'amini yorutur,  
Partav maning shoming'a ham solg'aymu oyo orazing.*

Author also linked the rajazi musamman of Ogahi to radif ghazal "Qoshu kozung" in solim height (- - V - / - - V - / - - V - / - - V - ) The first paragraph of the work is as follows:

*Bir g'amzada soldo mango sonsiz yaro qoshu ko'zung,  
Jonu dilimg'a yetkurur ming mojaru qoshu ko'zung,  
Man xastadin yo topdimu jurmu xato qoshu ko'zung.  
Vah, ne balodur bilmadim, ey dilrabo, qoshu ko'zung –  
Kim, bir nazarda soldo o't jonim aro qoshu ko'zung.*

This poem is thirteen verses long. The takhmis created by the poet consists of seven verses. Apparently, the six verses of the ghazal, the third, fifth, eighth, tenth, eleventh and twelfth verses, were omitted by the poet. Here are the verses:

*Jonimg'a qo'ydi dog'lar rashk o'tidin xoli labing,  
Ko'nglumga yetkurdi tumon dardu balo qoshu ko'zung.  
Qoshu ko'zung bedodidin dod aylasam ermas ajab –*

*Kim, ne jafolar qilmadi oxir mango qoshu ko'zung.  
 Yo 'qtur mango ishqing aro yurmak tirik imkonikim,  
 Jonimni yo qaddu yuzung olg'usi yo qoshu ko'zung.  
 El qatlini qasd aylabon mastona qilg'och bir nazar,  
 Soldi jahong'a nolayi vo hasrato qoshu ko'zung.  
 Aylay hayotim naqdini har dam nisoru sadqasi,  
 Yoshurmog'il man zordin aylab hayo qoshu ko'zung.  
 Majlis fazosida usul etgan chog'i raqqos o'lub,  
 Har g'amzada yuz jon olur, ey mahliqo, qoshu ko'zung.*

Mutrib Ogahi's poems "Orazing" and "Qoshu ko'zung" were not changed by his teacher. But most of the verses of the poem are omitted. In our opinion, the reasons for this can be explained as follows: firstly, the poet did not dare to make any assumptions in these verses of these poems, composed by Ogahi;

secondly, it is probable that in the source on which the poet relied, i.e. in the manuscripts of the variants copied to the bayoz, the complex, or the devons, the above verses are given in abbreviated form; and third, that the poet may have relied only on the verses of his choice.

The first verse of the verse, which is related to Feruz's eleventh verse "Ohista-ohista" verse:

*Muruvvat ko'rguzub, huro, nishon ohista-ohista,  
 Mayi la'ling qilib rohat rason ohista-ohista,  
 Boqib yuz jilva birla har zamon ohista-ohista,  
 Mango rahm ayla bul shirin zabon ohista-ohista,  
 Yetushti boshim uzra nogahon ohista-ohista.*

This mukhammas is also found in inventory number 1127. The text in this source and in inventory manuscript 1134 were compared. At the same time, the ghazal, which is the basis of the mukhammas, was compared with the text in Feruz's manuscript inventory number 1152 (p. 676a) compiled by Tabibi. In Mutrib's mukhammas, it is observed that some parts of Feruz's ghazal have been changed.

The word "qilg'ali" in the second verse of the ghazal has been edited and copied as "ayladi" into inventory numbered manuscripts 1127 (p. 57b), 1134 (p. 54a / b). This verse of mukhammas is as follows:

*Uzorin gulgul aylab jannatosa o'lgali gulshan,  
 Tarahhumlar qilib, bilkul bo'lurg'a bu kecha bir tan,  
 Ko'rub holi xarobim hajr aro ul dilbari purfan,  
 Firoqida qarorg'on ko'zlarimni ayladi ravshan,  
 Ochib ruxsorayi xurshedson ohista-ohista.*

In the inventory number 1127 [10], the word "ruxsorayi" in the compound "ochib ruxsorayi" is copied in the form "rukhsorani". The phrase "qucharsan, quch" in the eighth verse of this poem is edited in the mukhammas as "vagar quchsang":

*Agar istarsen o 'pmaklikni eng jonfizo la 'lim,*

***Qucharsan quch** belim eng miyon ohista-ohista.*

In Mutrib's mukhammas:

***Vagar quchsang** belim eng miyon ohista-ohista.*

There is no doubt that such edits were made by Mutrib. This is because in most cases the weight of the poet's mukhammas verses is preserved, but in some places the text has been changed.

Mutrib also linked Feruz's seven-verse ghazal, which begins in the form of a question and answer, with the words, "Dedim, ko'zumni ravshan et, mehri jamoling ko'rsatib."

The first paragraph of mukhammas is as follows:

*Bu ne itob, ul maning dardi nihonim qo 'zg'otib,*

*Yetdim o 'larga furqating domida g'am birla yotib,*

*O'zni nihon etmak nedur, yuz uzra zulfing torqotib,*

*Dedim, ko'zumni ravshan et, mehri jamoling ko'rsotib,*

*Dedi, uzorim o 'tig'a joning netarsan o 'rtotib[7],*

The comparison of the "sango bergum ani" compound in the fourth verses of Feruz's ghazal with the text in the inventory number 1152 (p. 79b) and the text of the inventory number 1134 is as follows.

In real form:

*Dedim, visol ichra labing shahdi maning komim erur*

*Dedi, **sango bergum oni** zahri firoq ichra qotib[6].*

In 1134 inventar manuscript:

*Bag'rimni qoni hajr aro sahboyi gulfomim erur,*

*Ishq ichra chekkan nolishim zotingg'a payg'omim erur,*

*Tokim tirikman, halqai zulfing mani domim erur,*

*Dedim, visol ichra labing shahdi maning komim erur,*

*Dedi, **oni bergum sango** zahri firoq ichra qotib[7].*

The same mukhammas have been copied to the 1127th inventory manuscript collection [p. 10: 78b] in accordance with the original. The fourth paragraph of mukhammas is copied to inventory manuscript № 1134 in the form of "Bazm ichra topti shodlig' bu lahza ko'nglum uyi" with the suffix "'s" in the word "ko'nglum". This mukhammas text has been restored from inventory manuscript 1127 [10: 23<sup>b</sup>, 24<sup>a</sup>]. The edited item is as follows:

*Bazm ichra topti shodlig' bu lahza **ko'nglumning uyi**,  
 Sunbulmu atrafshon erur boshingni, jono, gesuyi,  
 Ketdi ko'zumdin tiyralig' tushgach jamoling partavi,  
 Dedim, labingni sharbati, shirinmu yo kavsar suy-i,  
 Dedi, bo'lurmu har **suvni** obi baqog'a o'xshotib.*

The word "water" in the last verse is copied to Manuscript No. 1127 as سویی (suyi) from inventory number 1152.

The change in the place of the composition "Oni bergum sango" did not affect the content of the work. However, due to the secretary's negligence, the omission of the suffix "'s" caused a weight loss.

### ANALYSIS:

Professor Nurboy Jabborov recommends studying editing in two ways according to its size and scope: "1) editing of the whole text; 2) editing related to a particular part of the text" [3, 28]. The examples also show that the edits in the source under study are mainly related to a particular part of the text. The praise of the above ghazal was also slightly edited by Mutrib. For example, "Dedim, ko'zungdin o'rgulay Feruzg'a bir bo'sa ber..." changed to "Feruzg'a" in accordance with the words "dil so'zg'a", "kunduzg'a", "navro'zg'a" in the verses of mukhammas (inventory №. 1127). The same page [10] inventory manuscript 1134. (Pages 79a / b [7]). The text of the poem is as follows:

*Fosh aylabon mehru vafo man tashnayi dilso'zg'a,  
 Keldi qoshimg'a cho'lg'anib, sanjob ila qunduzg'a,  
 Ey Mutribo, emdi do'nub, har bir kuning navro'zg'a,  
**Dedim, ko'zungdin o'rgulay, bir bo'sa ber Feruzg'a,**  
 Dedi, yuzumni og'ritur har yon xating nishi botib.*

The first verse of Mutrib's hymn to Feruz's nine-verse rajazi musamman in solim weight is a radif ghazal "Labing":

*Tushgach ko'zum qildi mani sargashtayi hayron labing,  
 Har nuktasida bergusi o'lgan tanimga jon labing,  
 Aylab oyo ilking tutub qilg'ung mango pinhon labing,  
 Yoqutdurmu bilmadim yo, la'l, ey jonon, labing.  
 Yo orazing gulzorida bormu guli xandon labing.*

In the second verse of Feruz's poem, the poet replaces the words "jovidon", "jonon" to "tozakim", "hayvon". For example,

*La'lingni bir o'pmak bila topdim hayoti **jovidon**,  
 I'jozi Isomu ekan yo sharbati **jonon** labing[1152-inv.].*

*La'lingni bir o'pmak bila topdim hayoti tozakim,*

*I'jozi Isomu ekan yo sharbati hayvon labing[1134-inv.].*

The seventh verse of Feruz's ghazal has also been slightly edited. Mutrib “Doim ko‘ngulda saqlabon pinhon labingning shavqini” (inventory manuscript 1152. pp. 387<sup>b</sup>-288<sup>a</sup>) in the verse he omitted the suffix “ning”, he uses the suffix “ni” in the first, second, and third verses of the poem. For example:

*Jon ichra tun-kun asradim jonon labingni shavqini,*

*Aylab dili mahzunima mehmon labingni shavqini,*

*Xavf aylab ag'yor ahlidin olon labingni shavqini,*

*Doim ko'ngulda saqlabon pinhon labingni shavqini,*

*Emdi yetibman o'lgali o'ptur mango pinhon labing.*

Textologist Nafas Shodmonov writes: “... the author of the text, while reflecting the reality of the action, undergoes a certain creative mental process. In the process, it can change its attitude to certain parts of the text under the influence of objective and subjective reasons, and make corrections of various sizes. Such corrections and changes form the basis for the study of the historical, artistic, ideological and methodological aspects of the material, creation, formation, construction, etc. of the text.

“Although Mutrib’s poems in the collection do not reflect the reality of the movement, it is clear that the author has gone through a certain creative mental process. Edits in the text should be considered as a product of this creative process. Therefore, the edits mainly served to improve the text.

The mukhammas analyzed above have not been copied to the manuscripts of Hamid Suleiman of the Institute of Oriental Studies of the Russian Academy of Sciences and Mukhammas Hasan devon Haji Tabib o‘g‘li Mutrib devon of inventory numbers 2679 / II, 903 / V, 906 / VII kept in the main funds. Although this bayoz was copied in 1326 AH and 1908 AD, it was not included in the above three devons. (Inventory number 2679 / II was copied in the same year as digital manuscript, inventory number 903 / V was copied in 1907, inventory number 906 / VII the copying year is not known)

These mukhammas vary in size, with the smallest being 7 points and the largest being 11 points.

Some of the muhammads transferred to the collection (beginning with Feruz's 7-line verse "I said, brighten my eyes, showing your kindness ..." and 11-verse "Ohista-ohista", 7-byte "Labing", Ogahi's "Qoshu ko'zung" radif muxammas) inventory number 1127, copied in 1908, in the bayoz. Only Ogahi's 7-point radiz muhammad "Orazing" was not found in this complex.

One mukhammas and two musaddas of Mutrib, which are included in inventory number 2679 / II, are also found in the inventory number 1134. However, when comparing the texts of these poems from these two sources, differences were observed. For example, the fourth verses of a 9-verse mukhammas beginning with “Ko‘rgach yuzingni ketdi ilkimdin ixtiyorim...” copied to the devon as “Bu dam kelib boshimg‘a daf‘ aylagil xumorim...”; to inventory manuscript № 1134 revised as “Bir tun kelib yonimg‘a raf‘ aylagil xumorim”.

In the dictionary [6], the phrase "Raf" aylamak" has two meanings. 1. Raise, elevate; 2. Delete. "Daf" aylamak" means to return, to reject, to remove, to drive away. [6]

When analyzing mukhammas's verses, the word "def" comes from the context. It turns out that in the process of copying the collection from the original, some of these subtleties were overlooked. The author did not make such a mistake. However, in this mukhammas text, which was copied to the manuscript, there are some loss.

## RESULT:

The differences between two sources are shown in the table:

№	Manuscript divan under the inventory № 2679.	Complex under the inventory № 1134.
<b>The differences in the first verse</b>		
1/1	Ko 'rgach yuzingni ketdi ilkimdin ixtiyorim,	Ko 'rgach yuzingni ketdi ilkimdin ixtiyorim,
	Chiqdi falakka, ey sho 'x, ishqingda ohu zorim,	Chiqdi falakka, ey sho 'x, ishqingda ohu zorim,
	Mag 'ruri husning o 'lg 'ach hech qolmadi qarorim,	Mag 'ruri husning o 'lg 'ach hech qolmadi qarorim,
	<u>Bir dam</u> kelib yonimg 'a <u>daf</u> aylagil xumorim	<u>Bir tun</u> kelib yonimg 'a <u>raf</u> aylagil xumorim
Oromijon nigorim, sarvi ravon nigorim.		
<b>The differences in the second verse</b>		
2/2	<u>Vaslingg 'a bermasang yo 'l, ey sarvari diloro</u>	<u>Soldi xayoli husning boshimg 'a turfa g 'avg 'o,</u>
	La 'ling zilolin istab ko 'nglumda <u>muncha savdo,</u>	La 'ling zilolin istab, ko 'nglumda <u>yuz tamanno,</u>
	<u>Husning xayoli birla boshimda muncha g 'avg 'o,</u>	<u>Hajr ofatidin aylab qaddimni xam mudomo,</u>
	Tokay jaf o qilursan, <u>tark</u> aylamassan aslo,	Tokay jaf o qilursan, <u>kam</u> aylamassan aslo,
Oromijon nigorim, sarvi ravon nigorim.		
<b>The differences in the third verse</b>		
3/3	Fahm aylamassan, ey sho 'x, ishqingda mubtaloman,	Fahm aylamassan, ey sho 'x, ishqingda mubtaloman,
	Kelmasmu <u>emdi</u> rahming, <u>bezori</u> benavoman,	Kelmasmu <u>zarra</u> rahming, <u>bir zori</u> benavoman,
	<u>Tokay</u> tilab visoling <u>shomi sahar</u> gadoman,	<u>Har dam</u> tilab visoling <u>sargashtai</u> gadoman
	Vaslingdin, ey sumanbar, bilmon ne deb judoman,	Vaslingdin, ey sumanbar, bilmon ne deb judoman,
Oromijon nigorim, sarvi ravon nigorim.		
<b>The differences in the forth verse</b>		
4/6	<u>Shavq o 'ti(g 'a)</u> jong 'a etgach beixtiyor	<u>Ishq o 'ti</u> jong 'a etgach beixtiyor o 'lubman,

	<i>o'lubman,</i>	
	<u><i>Gul orazingni bir</i></u> dam ko'rmakka zor <i>o'lubman,</i>	<u><i>Mehri ruxingni har</i></u> dam ko'rmakka zor <i>o'lubman,</i>
	<u><i>La'ling mayini, jonon, behad xumor</i></u> <i>o'lubman,</i>	<u><i>Shirin kaloming istab devonavor</i></u> <i>o'lubman,</i>
	<u><i>Shirin kaloming istab ko'b intizor</i></u> <i>o'lubman,</i>	<u><i>La'ling mayini, jono behad xumor</i></u> <i>o'lubman,</i>
<i>Oromijon nigorim, sarvi ravon nigorim.</i>		
<b>The differences in the fifth verse</b>		
5/8	<i>Sansiz manga tiriklik dahr ichra pur</i> <i>jafodur,</i>	<i>Sansiz manga tiriklik dahr ichra pur</i> <i>jafodur,</i>
	<u><i>Zebo</i></u> qading xayoli ko'nglumga <i>muttakodur,</i>	<u><i>Sarvi</i></u> qading xayoli ko'nglumga <i>muttakodur,</i>
	<u><i>Baxtim kamolig'a ham la'li labing</i></u> <i>davodur,</i>	<u><i>Har g'amza(nga), nigoro, jonu jahon</i></u> <i>fidodur</i>
	<u><i>Har g'amzanga, nigoro, jonu jahon</i></u> <i>fidodur,</i>	<u><i>Chun murg'i ko'nglum iki zulfunga</i></u> <i>mubtalodur</i>
<i>Oromijon nigorim, sarvi ravon nigorim.</i>		
<b>The differences in the sixth verse</b>		
6/7	<u><i>Chekmak ishim fig'ondur la'li ziloling</i></u> <i>istab,</i>	<u><i>Tinmay ko'zumni ashki la'ling zilolin</i></u> <i>istab,</i>
	<i>Har lahza iztirobim ikki hiloling istab,</i>	<i>Har lahza iztirobim ikki hiloling istab</i>
	<i>Sorg'ordi</i> <u><i>orazim, chun nozik</i></u> <i>niholim(ng) istab,</i>	<i>Sorg'ordi</i> <u><i>rangi ro'yim, nozik niholing</i></u> <i>istab,</i>
	<u><i>Jodu ko'zing tegida parvona xoling</i></u> istab,	<u><i>Oadim duto yuzungni bir dona xolin</i></u> istab,
<i>Oromijon nigorim, sarvi ravon nigorim.</i>		
<b>The differences in the seventh verse</b>		
7/5	<i>O'rtar xayoli hajring, ey podshohi</i> <u><i>xo'bon,</i></u>	<i>O'rtar xayoli hajring, aylab ko'zumni</i> <u><i>giryon,</i></u>
	<u><i>Kulbam sori qadam qo'y chekdurma ohu</i></u> <u><i>afg'on,</i></u>	<u><i>Etdi chiqarg'a jonim, ey kokili parishon,</i></u>
	<u><i>Vomuq g'amida goldim, ey kokili</i></u> <u><i>parishon,</i></u>	<u><i>Muncha jafo qilursan ne muddao sanga</i></u> <u><i>jon</i></u>
	<u><i>Muncha jafo qilursan, ne muddao sanga</i></u> <u><i>jon,</i></u>	<u><i>Chekmak ishim tunu kun shavq ichra ohu</i></u> <u><i>afg'on</i></u>
<i>Oromijon nigorim, sarvi ravon nigorim.</i>		
<b>The eighth verse of the mukhammas copied to the divan is radically different from the mukhammas bytes copied to the complex.</b>		
8/4	<i>Ko'rma ravo jafoni boshingdin</i> <i>oylonaman,</i>	<i>Yig'larman hasratingdin begona</i> <i>bo'lmag'uncha,</i>
	<i>Tuz ahdinga vafoni qoshingdin</i>	<i>Tiyg'i firoqing ichra vayrona</i>

	<i>oylonaman,</i>	<i>bo 'lmaq'uncha,</i>
	<i>Yetganda, o 'nsakizda boshingdin</i> <i>oylonaman,</i>	<i>Ishqingda dahr eliga afsona bo 'lmaq'uncha</i>
	<i>Ming jilva birla otg'on toshingdin</i> <i>oylonaman,</i>	<i>Rahm aylagil g'amingda g'amxona</i> <i>bo 'lmaq'uncha,</i>
<i>Oromijon nigorim, sarvi ravon nigorim.</i>		
<b>The differences in the ninth verse</b>		
9/9	<i>Bemori hajring o'ldim, <u>ey xo'b la'li</u></i> <i><u>xandon,</u></i>	<i>Bemori hajring o'ldim, ey <u>lablari</u></i> <i><u>durafshon,</u></i>
	<i><u>Ko'ksing</u> jahon boshimg'a go'yoki bo'ldi</i> <i>zindon,</i>	<i><u>Bo'ling(di)</u> jahon boshimg'a go'yoki, bo'ldi</i> <i>zindon,</i>
	<i><u>Furgat yarosi ichra bu Mutribi xush</u></i> <i><u>alhon,</u></i>	<i><u>Nolangni qilmag'ilkim, ey Mutribi xush</u></i> <i><u>alhon,</u></i>
	<i><u>Bu dam kelib, nigoro, dardimga ayla</u></i> <i><u>darmon,</u></i>	<i><u>Shoyad kelib nigoring, dardingg'a qilsa</u></i> <i><u>darmon,</u></i>
<i>Oromijon nigorim, sarvi ravon nigorim.</i>		

It should be noted that the table fully reflects the issue of the history of the text of the mukhammas. According to D.S. Likhachev: "The concept of text history covers all issues of the text of a particular work. Only a thorough (or, if possible) study of all issues related to the work will allow us to fully explore the history of the text of the work "[5, 33]. Nurboy Jabborov explains in detail how the history of the text covers the process from the search for a work of art to the publication and publication of a work of art.

"... the history of the text, from examining the genealogy of manuscript sources to studying the worldview and ideas of the author and even the secretary who copied the source, from the realization of the author's creativity in its creation covers all the processes leading up to the study of the interrelationships with monuments "[4, 12].

It would be more accurate to link the edits here to the factor of "the realization of the author's creative intent in the creation of the work." It seems that there is a mismatch between the whole points of the work. Buhol, firstly, affected the content of the mukhammas, and secondly, caused weight loss. For example, in the text of the mukhammas copied to the devon, the word "Bir zori" is in the form "Bezori", the suffix "... ga" is superfluous, "Ziloling istab", "Niholing istab" is a rhyming compound, in the third verse of the mukhammas, it is given as "Niholim istab" which caused serious mistakes.

Mistakes in the collection: The word "gamzanga" in the verse "Hargamza (nga) nigoro jonu jahon fidodur ..." means "g'amza", "Bo'ling(di) jahon boshimg'a go'yoki, bo'ldi zindon..." the word "Boldi" in the verse is copied with textual flaws in the style of "Boling".

The text of Mutrib's poems, which begins with "Mash'ali bazmima husnini balosini ko'rung...", "Gulshan ichra jilva-u yuz nozi izhor ayladi" verses, was studied comparatively on the basis of inventory number 2679 / II and manuscript set number 1134.

When comparing the text of these poems, there are some differences between them. In particular, in the seven-line verse “Mash’ali bazmima husnini balosini ko’rung...”(pp. 231a / b) the phrase “Balosini ko’ring” has been transferred to the complex as “Jilosini ko’ring”. It should be noted that the option is correct in its “Mash’ali bazmima husnini jilosini ko’rung...” content. Therefore, it can be said that in the future, in the preparation of the scientific-critical text of the poet's works, it would be expedient to restore this sacred text on the basis of the version in the manuscript collection inventory number 1134.

The following table shows the differences in the text of the poem, which begins with the verse "Gulshan ichra jilva-u yuz noz izhor ayladi":

Poem and verse	Manuscript divan under the inventory number - 2679	Complex under the inventory number - 1134
1/1	“Qilmadim komim ravo <u>ul</u> yorlig‘ hangomida” (232 <sup>b</sup> -bet)	“Qilmadim komim ravo <u>chun</u> yorlig‘ hangomida” (209 <sup>a</sup> -bet).
3/1	<u>Doimo</u> ko’rgach o‘zin majnunshior aylar ongo...	<u>Dahr eli</u> ko’rgach o‘zin majnunshior aylar ongo...
6/3	Ohkim, ehsoni lutf ila dame <u>shod</u> etmayin, Xasta ko’nglumni g‘amu hijrondin <u>ozod</u> etmayin, <u>Lablarini kavsaridin</u> qatra <u>xayrod</u> etmayin, Mutribi sargashtani bir jom ila <u>yod</u> etmayin, Do’stlar, ul dilrabo ishq i mani zor ayladi, Rashk tiyg‘i jon ila ko’nglumni afgor ayladi.	Ohkim, ehsoni lutf ila dame <u>shod</u> etmayin, Xasta ko’nglumni g‘amu hijrondin <u>ozod</u> etmayin, <u>Lablaridin kavsarini</u> qatra <u>xaridor</u> etmayin, Mutribi sargashtani bir jom ila <u>yod</u> etmayin, Do’stlar, ul dilrabo ishq i mani zor ayladi, Rashk tiyg‘i jon ila ko’nglumni afgor ayladi.

Apparently, the word "ul" means "chun" while the word "doimo" is edited as "dahreli. The next verse of the poem “Lablarini kavsaridin qatra xayrod etmayin” radically changed the content of the work as “Lablaridin kavsarini qatra xaridor etmayin” in “Bayozi majmua”. In particular, it is illogical to translate the word "haridor" as a rhyme to the words joy, freedom, and remembrance in the following verses of the musaddas.

In general, based on the analysis of sources, it can be said that the text of this poem is only more perfectly found in the inventory number 2679 / II. Inventory number 1134 contains many weight and rhyming errors in the text of mukhammas and musaddas.

This source is covered with solid black cardboard.

The title "Amali Muhammad Rahim sahhof 1326" is inscribed on the top and bottom of the three ornaments on the cover.

The text was copied on factory paper in black and red ink, in a nasta'liq letter, in the form of two columns. Each page contains 17 lines of text. Dimensions 27x17. The collection consists of 432 pages, 4 pages are blank at the beginning and end of the source. The manuscript is preserved very well.

## CONCLUSION

In short, "Majmuai muxammasoti ash-shuaroi Feruzshohiy" is a source of special importance not only for the study of Ogahi and Feruz's works, but also for the study of the Khorezmian literary environment. In particular, the source plays an important role in the study of Mutrib's lyrical heritage from the literary point of view. A comparative study of Mutrib's poems in this manuscript with other sources preserved in the fund of the Institute of Oriental Studies of the Academy of Sciences of Uzbekistan also plays an important role in the study of the text's history and text editing. The facts surrounding the text editing in the collection are also valuable in that they provide a deeper insight into Mutrib's creative laboratory, explore the poet's secrets of working on words, and explore his creative spiritual world more fully.

UZBEKISTAN  
Email id: gm.akrom@gmail.com

### ABSTRACT

*Many extreme problems can be solved by not a classic method. In this article we have shown a few example of such tasks. To do this, we applied the discriminant, geometric methods. And also considered the application of inequalities to finding the largest and smallest values of the function.*

**KEYWORDS:** *Not a classic method, geometric and discriminant methods, the expression, optimal, extreme, function.*

### INTRODUCTION

You can select a class of non – linear problems related to the classic method optimization. Such tasks arise when you try to optimize the planning and management of complex systems, first of all economic systems. Optimization problem can be formulated as follows find variables  $x_1, x_2, \dots, x_n$  satisfying the system of equations

$$\gamma_i(x_1, x_2, \dots, x_n) = b_i \quad i = 1, 2, 3, \dots, m$$

and forming  $a$  maximum (minimum) of the objective function

$$Z = f(x_1, x_2, \dots, x_n)$$

Such tasks in principle, you can solve the classical methods differential calculus. However, along the way there are such computing difficulties that make it necessary to search for other methods solutions.

For example – 1. Find the greatest value of expression of  $x + 2y$ , if  $x$  and  $y$  negative and satisfy the inequality of

$$x^2 - 4xy + y^2 + 3 \leq 0$$

Solution. Find out, under what values of  $A$  system

$$x + 2y = A$$

$$x^2 - 4xy + y^2 + 3 \leq 0$$

has solutions  $x < 0$ ,  $y < 0$  most of these values and will be the decision of the problem. Substituting  $x = A - 2y$  in the inequality, we give it to mind

$$13y^2 - 8Ay + A^2 + 3 \leq 0$$

This inequality has solutions in

$$D \geq 0 \text{ or } 64A^2 - 4 \cdot 13(A^2 + 3) \geq 0.$$

From here  $A^2 \geq 13$ . At  $A = -\sqrt{13}$  one of his solutions  $y = -\frac{4}{\sqrt{13}}$ , and then the decision of the system is a couple

$$\left( -\frac{5}{\sqrt{13}}; -\frac{4}{\sqrt{13}} \right).$$

Thus, the desired the greatest value equal to  $-\sqrt{13}$ .

Example 2. The number  $x$ ,  $y$ ,  $z$  are such that the

$$x^2 + 3y^2 + z^2 = 2$$

what is the greatest value can take the expression of

$$2x + y - z$$

Solution. Let

$$2x + y - z = t$$

Expressing  $x$ ,  $y$  and  $t$ , come to the equation, the square about  $y$ :

$$4y^2 + 2(2x - t)y + 5x^2 + t^2 - 2 - 4xt = 0$$

For the existence of making this equation is necessary to perform condition non-negativity discriminant, or after the calculations, the condition

$$16x^2 - 12xt + 3t^2 - 8 < 0$$

In order to this inequality had  $a$  solution, in turn, must non-negativity it discriminant that leads to the inequality

$$12t^2 \leq 128, \quad t \leq \frac{\sqrt{32}}{3}$$

i.e  $\max \{2x + y - z\} = \frac{\sqrt{32}}{3}.$

Example 3. Find the greatest value of the expression

$$\sqrt{(x_1 - y_1)^2 + (x_2 - y_2)^2}$$

if  $x_1^2 + x_2^2 = 1$  and  $y_1^2 + y_2^2 = 4$

Solution. Can be given  $a$  geometric interpretation: if  $A(x_1, x_2), B(y_1, y_2)$  - two point plane, the length of the segment  $AB$  not more than the sum of the lengths of segments  $OA$  and  $OB$ , where  $O(0, 0)$ .

$$OA + OB \geq AB$$

$$AB = \sqrt{(x_1 - y_1)^2 + (x_2 - y_2)^2}$$

$$OA = \sqrt{x_1^2 + x_2^2} = \sqrt{1} = 1, \quad OB = \sqrt{y_1^2 + y_2^2} = \sqrt{4} = 2$$

$$\sqrt{(x_1 - y_1)^2 + (x_2 - y_2)^2} \leq \sqrt{x_1^2 + x_2^2} + \sqrt{y_1^2 + y_2^2} = 1 + 2 = 3$$

Example 4. Find the greatest and the smallest value of the expression  $f = x_1 \cdot y_1 + x_2 \cdot y_2$ , if known that the  $x_1^2 + x_2^2 \leq 2, y_1^2 + y_2^2 \leq 4$ .

Solution. Applying the Cauchy-Bunyakovsky inequality, we obtain

$f^2 = (x_1 \cdot y_1 + x_2 \cdot y_2)^2 \leq (x_1^2 + x_2^2) \cdot (y_1^2 + y_2^2)$ , location using the conditions of the problem we find

$$f^2 \leq 8, \quad \text{i.e. } f \leq \sqrt{8} = 2\sqrt{2}.$$

Example 5. Find the lowest value expression of  $(x + y) \cdot (x + z)$ , if  $x, y, z$  - positive numbers and

$$xyz(x + y + z) = 1$$

Solution. We set  $a = y + z, b = x + z, c = x + y$  and let us consider the Triangle

with the parties  $a, b, c$ ; it exists, because each of numbers  $a, b, c$  less than the sum of the other two (fig). The perimeter of Triangle is equal to

$2p = a + b + c = 2(x + y + z)$  and the, according to Heron's formula

$$x = p - a$$

$$y = p - b$$

$$z = p - c$$

$$x + y + z = p$$

$$S = \sqrt{p(p-a)(p-b)(p-c)} = \sqrt{(x+y+z)xyz} = 1$$

On the other hand,  $2s = bc \sin \alpha$ , where  $\alpha$  – the angle between the parties  $b$  and  $c$ , so  $(x+z)(x+y) = bc \geq 2s = 2$ .

And equality is achieved for a rectangular Triangle, that is subject to  $a^2 = b^2 + c^2$ , equivalent to this:

$$x(x+y+z) = yz$$

(In particular,  $(x+y)(x+z) = 2$  at  $x+y = x+z = \sqrt{2}$ ,  $y+z = 2$ , i.e. that is  $y = z = 1$ ,  $x = \sqrt{2} - 1$ )

Guessed, when is achieved equality, easy to find and short purely algebraic the proof of using inequality

$$p + q \geq 2\sqrt{pq}$$

$$(x+y)(x+z) = x(x+y+z) + yz \geq 2\sqrt{xyz(x+y+z)} = 2.$$

Example 6. Find the lowest value function

$$f(x) = \sqrt{2x^2 - 2x + 1} + \sqrt{2x^2 - (\sqrt{3} - 1)x + 1} + \sqrt{2x^2 + (\sqrt{3} + 1)x + 1}$$

Solution. Since the

$$f(x) = \sqrt{2x^2 - 2x + 1} + \sqrt{\left(x - \frac{\sqrt{3}}{2}\right)^2 + \left(x + \frac{1}{2}\right)^2} + \sqrt{\left(x + \frac{\sqrt{3}}{2}\right)^2 + \left(x + \frac{1}{2}\right)^2},$$

then for points  $M(x, x)$

$$A(0,1), B\left(\frac{\sqrt{3}}{2}, -\frac{1}{2}\right), C\left(-\frac{\sqrt{3}}{2}, -\frac{1}{2}\right) \quad f = MA + MB + MC, \text{ and how easy to check}$$

$ABC$  – the right Triangle the center at  $O(0, 0)$ .

Is known to the least amount of distance to the vertices of the right Triangle has its center, i.e the sum of  $MA + MB + MC$  takes the lowest value for the point of  $M(0, 0)$  and there fore

$$f_{\min} = f(0) = 3.$$

Example 7. Find the lowest value of expression of

$$\frac{x^2}{x+y} + \frac{y^2}{y+z} + \frac{z^2}{z+x}, \quad \text{if } x, y, z > 0$$

and  $\sqrt{xy} + \sqrt{yz} + \sqrt{zx} = 1$

Solution. Note first, that

$$\frac{x^2}{x+y} = x - \frac{xy}{x+y} \geq x - \frac{xy}{2\sqrt{xy}} = x - \frac{\sqrt{xy}}{2}, \text{ and denoting the set expression through}$$

$f(x, y, z)$ , we obtain that  $f(x, y, z) \geq x + y + z - \frac{1}{2}$ . Because of the well-known inequality

$$a^2 + b^2 + c^2 \geq ab + bc + ac$$

we have

$$f(x, y, z) \geq \sqrt{xy} + \sqrt{yz} + \sqrt{zx} - \frac{1}{2}, \text{ i.e}$$

$$f(x, y, z) \geq \frac{1}{2}. \text{ In } x = y = z = \frac{1}{3}$$

we have

$$f\left(\frac{1}{3}; \frac{1}{3}; \frac{1}{3}\right) = \frac{1}{2}, \text{ so that the lowest value } f(x, y, z) \text{ equal to } \frac{1}{2}.$$

### **ABSTRACT**

*The following article deals with the Golden gram plant and its effects on soil fertility. The results of the scientific research conducted by local and foreign scientists on the Golden gram plant, the analysis of conclusions and opinions are described in detail. The results of research on agro technologies of Golden gram cultivation, different planting procedures, norms and methods, as well as their impact on the growth, development, yield of golden gram, and the data presented in the literature are described. It also reveals the theoretical and practical significance of the collected results, and provides recommendations for the implementation of research results in practice.*

**KEYWORDS:** *Golden Gram, Soil Fertility, Planting Schedule, Cereals, Legumes, Repeated Crops, Growth, Development, Yield, And Root-Stubble Left In The Soil, And Humus In The Soil.*

### **INTRODUCTION**

Today, the issue of food security has become one of the priorities in all countries of the world. Due to favorable soil and climatic conditions in the country, corn, golden gram, soybeans, rice, millet, sesame, sorghum, soybeans, soybeans, soybeans, sorghum, soybeans, sesame fodder crops, potatoes and various vegetables are planted, and there are opportunities to grow high and quality crops up to twice a year.

Today, moss is the leading producer of legumes in the world. Myanmar (Burma) is the largest exporter of moss with 58.5%. India consumes 39.6 percent of the golden gram grown and China 13.5 percent. According to the Food and Agriculture Organization of the United Nations and the World Health Organization, millions of people around the world are currently experiencing the problem of malnutrition.<sup>1</sup> At the same time, food prices are rising day by day. Research in solving these problems is aimed at maintaining and increasing soil fertility through high yields of golden gram crops and crop rotation.

At present, the country pays great attention to grain, legumes and oilseeds and expands their arable lands. Great opportunities have opened up for the development of agriculture and the efficient use of land. One of the most pressing issues today is the issue of protein, i.e. meeting human demand for protein, in this case, the importance of legumes are in the growth.

In the conditions of the republic, there is an opportunity to increase the grain yield from winter wheat to 60-70 t / ha, and from golden gram crop to 15-20 t / ha, and to increase the grain yield to 75-90 t / ha during one season. Legumes are grown on 135 million hectares of land. Among legumes, moss is the second largest crop in the world after soybeans (about 74 million hectares worldwide), followed by peas (about 10 million hectares worldwide).

It is widely used in the food industry in the Central Asian and Caucasus republics. If you add it to the dark, it will increase the saturation. It belongs to the group of legumes and grains; 24-28% of ox toxin is accumulated in the grain. In addition to the food industry, it is possible to grow nutritious fodder for livestock. Bacteria also grow in the roots of the plant, absorbing free nitrogen and increasing soil fertility.

According to scientific sources, moss accumulates 50-100 kg of biological nitrogen and organic matter in the soil during the growing season, which, along with increasing the natural fertility of the soil, provides a healing grain rich in protein and vitamins.

The origin of Golden gram is related to India. It is currently grown in many countries. In particular, it is grown in large areas in Uzbekistan, Turkmenistan, Azerbaijan, Georgia, China, Korea, Japan, India, Pakistan, Egypt, Ethiopia and other countries. According to the Ministry of Agriculture, more than 23-27 thousand hectares are cultivated in the country as a secondary crop.

Golden gram is an annual herbaceous plant. The root of the plant is an arrow root and it is vigorously developed. It grows to a depth of 110-140 cm in the soil, but the main part of the root is spread in the topsoil. Although the stem looks round, it is angular. From the beginning of the growing season it grows upright, then creeping or half-lying. Height 30-130 cm, average 50-60 cm, and well branched. The lateral horns are spreading or branched.

**Agrotechnics.** Golden gram maintenance is a complex of activities. These include cultivation, irrigation, weed control, pest and disease control, and crop nutrition. The scale of the work varies depending on the condition of the soil, the condition of the crop, the availability of water, fertilizers and other conditions. During the dry season, during the flowering and flowering period, it is irrigated 3-4 times at the rate of 800-1000 m<sup>3</sup> / ha. The number of irrigations per sow is 1-2 times depending on the location of the water table. As a result of the study, the irrigation norms were increased to 900 m<sup>3</sup> during the growing season, and the soil yield was 29.9 t / ha when the soil was kept at 70-75-65% humidity. This means that the increase in moisture leads to an increase in crop yields. The plants need to be cultivated at a depth of 6-8 cm in the first 3

leaves, and at a depth of 10-12 cm in the second crop. The porosity of the soil ensures the good growth of the plant, the activity of the bacteria, which creates the conditions for the better growth of microorganisms in the soil, is further increased and the field is cleaned of weeds, the soil is kept moist. In order not to leave weeds, the weeds are planted with special equipment. When sown as mosquito repellent with the formation of pods, it is pressed horizontally, becomes discal and drives to a depth of 27-30 cm [4-7].

## RESEARCH METHODS

Studies were conducted in laboratories settings and fields, phenological observations and biometric measurements were carried out in scientific research on the basis of "Methods of State Variety of Agricultural Cultures", "Methods of conducting field experiments" (UzPITI). The obtained data were analyzed mathematically and statistically on the basis of B.A.Dospekhov's program "Methods of field experience".

### Part of the experiment

Based on the goals and objectives of the research, first and foremost short alternate planting (1: 1; 1: 2 and 2: 1) systems and the effects of crop types on soil fertility have been identified, as well the effects of improved crop rotation systems were studied.

Therefore, in 2018, repeatedly planted in light gray soil conditions crops growth, development, yields and amount of root remnants were determined. Recycled crops in observations on seed germination dynamics compared to 1.07 days that the most germinated were corn (43.4%) and golden gram (36.4%), less sprouted crops were soybeans and green peas 35.2; 34.6%. Seeds of repeated crops in the experiment average corn (71.5) when germination dynamics were observed at 5.07 days%) and golden gram (61.1%). Compared to soy and blue pea seeds were less, 56.5; 59.8 %. In comparison with the experiment (10.07) more (faster) sprouts - corn (94.7%) and golden gram (93.8%) was found to be less germinated were soybeans and blue pea seeds as, 92.9; 92.1% [5, 6].

Golden gram is a heat-loving plant due to its biological properties. The optimum temperature for seed germination is +25<sup>0</sup>C and can be even higher. However, the soil when sowing golden gram seeds excessive moisture adversely affects germination. Golden gram seeds require 90–92% moisture relative to weight after sowing sprouts in a short time. Planting of average and repeated fodder crops on irrigated lands creates a solid fodder base for livestock, provides animals with blue grass in early spring that is the basis for the organization of the blue conveyor. Also, these crops increase soil fertility; according to scientific data (M.K.Kayumov, 1989) driving 1 ton of blue mass and burying it in the ground is equivalent to 4 tons of manure. When high yields are obtained from 5-7 and more tons of plant mass (roots, stems, leaves) remain per hectare. This situation has a positive effect on the yield of cotton and winter wheat, which are the main crops in Uzbekistan, and ensures the efficient use of fertilizers applied to these crops.

Differences in the growth and development of secondary crop even in the amount of debris and root remnants that left them in the soil appeared.

**TABLE 1 THE REMNANTS OF REPEATED PLANTS ROOTS AND STALKS OF THE REPLICAS**

Option mode	Type of repetition	Residues, s / ha		
		Stubble	Root	Total
1	-	-	-	-
2	Golden gram	9,6	28,5	37,6
3	Poppy	9,4	16,0	25,4
4	Soy	9,1	20,3	29,6

Golden gram, which left relatively high residues among legumes is a plant, the above figures are 9.6-28.5 c / ha, respectively total was 37.6 c / ha. The remaining plants in the soil residues were observed to be in the range of 25.4–29.6 c / ha. Experience as can be seen from the data is golden gram plant that has a high root and a stubble, compared to the blue pea 12.2; 8 c / ha more organic residue than replanted soy left.

It should also be noted that the effect of the root stubble residues left on these repeat crops is favorable for the crops planted after them to create conditions.

The crop that leaves the most residues in the soil is alfalfa, but the current one-year legumes after autumn wheat with period demand. The planting can also maintain positive soil fertility [4; 26-p].

It should be noted that in all variants of repeated crops planted the volume mass in the soil driving layer is less than the control was found. The volume mass of the soil in the variant planted corn (2) drive (0–30 cm) 1.231 g / cm<sup>3</sup> before planting in the stratum and 1.285 g / cm<sup>3</sup> in the fall thus 0.050-0.010 g / cm<sup>3</sup> more proportionally than the control was After soybean planting, the above values are 1,235 g / cm<sup>3</sup> - 1,270g / cm<sup>3</sup>, and in the case of golden gram planted 1,230-1,280 g / cm<sup>3</sup>, relatively less was observed.

So, in the experiment, soybeans and golden gram were planted after the winter wheat. The size of the soil at the expense of roots and furrows left in the soil in the options mass was observed to decrease.

In studies, we have also studied soil water permeability properties. First of all, it should be noted that in all variants it was observed that the water permeability of the soil decreased by 1 hour. This indicates that the soil is compacted by water, resulting in an increase in volume and a decrease in porosity.

In the experiment were analyzed repeated crops before planting and at the end of the application period the total humus, nitrogen and phosphorus content in the soil (Table 2).

The soil in the spring in the unplanted (controlled) option of repeated crops

The humus content in the 0-30 and 30-50 cm layers is proportional. While it was 1,146-0.976%, the figure rose to 1.335% in the fall decreased. Similarly, the total nitrogen and phosphorus content in the driving layer decreased from 0.163-0.277% to 0.160-0.274%, which means that the situation should be understood as due to the assimilation of plants.

In the corn-planted variant, the above figures are 1,149; 0.162 and the amount of humus at the end of the application period from 0.331% compared to the spring 0.011%, total nitrogen - 0.023%, phosphorus - to 0.012% was observed.

Relatively favorable indicators in the experiment were planted golden gram plants taken, the amount of humus increased from 1.753% to 1.156% i.e. 0.003%. Similar figures were again obtained for total nitrogen and phosphorus.

In practice, the highest rate is in the variant of repeated golden gram planting. The amount of humus in the layer of 0–30 cm is 1.147% by the end of the growing season.

This indicator increased by 1.154% or 0.007%. It should be noted that the soil is also affected by the remaining types of secondary crop improved productivity, i.e., a relatively acceptable golden gram.

**TABLE 2 HUMUS IN THE SOIL, TOTAL NITROGEN AND PHOSPHORUS (%),  
FIELD 1, 2018**

№	Repeated plants varieties, 2018 year	Humus, %		Nitrogen, %		Phosphorus, %	
		0-30 cm	30-50 cm	0-30 cm	30-50 cm	0-30 cm	30-50 cm
In spring							
1	Repeated plants were not planted	1,146	0,976	0,163	0,971	0,277	0,321
2	Golden gram	1,147	0,986	0,167	0,990	0,277	0,340
In autumn							
1	Repeated plants were not planted	1,135	0,080	0,160	0,963	0,274	0,320
2	Golden gram	1,154	0,980	0,169	0,9 85	0,271	0,332

So, the balance of nitrogen and phosphorus in the soil of replanted soils is relatively low, satisfactory, but unsatisfactory of potassium, potassium fertilizers should be allotted depending on the amount in the soil.

## CONCLUSION

- The planting of golden gram and other legumes from secondary crops has been shown to have a positive effect on the fertility of light gray soils, improving their agrophysical and agrochemical properties.
- When sowing winter wheat + repeat crop golden gram the amount of organic residue remaining in the soil is equal to that of winter wheat and stubble organic residues left in the soil by the planted soy, it was found that in the 0–30 cm layer of soil increased humus relative to the initial amount.

- Repeated legume-grain cropping in short rotation systems organic that leaves them in the soil as a result of the cultivation of crops the volumetric mass of the soil at the expense of the residues, compared to the original, observed an improvement in the water permeability of the soil.
- In the yield structure of golden gram varieties, the number of pods per plant, the number of grains in pods, the number of branches decreased when row spacing was 60 cm and 45 cm, respectively, due to the increase in sowing rates. The increase and decrease in sowing norms affected the grain weight of 1000 golden gram varieties. When both crops were planted with row spacing of 60 cm, it was found that in all planting norms, the grain yield formed in plants was higher than in the variant with row spacing of 45 cm.
- The highest cost-effectiveness in our research, crops short-rotation sowing, winter wheat, followed by repeated sowing, yielded an additional profit of 1,799,600 sums, and the yield was 90.1%.

### RECOMMENDATION

In order to maintain and increase the fertility of typical light gray soils, in the new crop rotation system (1: 1, 1: 2, 2: 1) used in the new farming system for continuous abundant and high-quality production of cotton, legumes are grown as a repetition of winter wheat and planting is recommended.

### **ABSTRACT**

*India's economic growth cannot be conceived in isolation of its household and tiny level industry such as the Aligarh lock industry. It is more so as the growth of India's petty industrial units has not at par with the over all, rather rapid economic growth of the country and the artisans engaged in the household and tiny level units have also not been equally benefitted with the consequential profits. The Muslims who constitute large number of artisan class have particularly been at a loss as they tend to excessively concentrate in the low-paying jobs, engage in artisanal sectors, or else serve as casual labour. Most of them are self-employed in low income artisan based works. Above all, they are educationally more backwards than their counterparts in other communities. Restrained further by over all security scenario all this goes to curtail their mobility. The present field based study that ascertains the status of Muslim artisans of Aligarh lock industry brings forth the fact that the artisans have been struggling hard for sustaining with the bare minimum of resources (income), yet aspiring to stick to the same hereditary profession. Availing of educational facilities is a far cry for them. Yet, they like to expose their children to formal education, even though it looks the least beneficial to them. This takes us to the next stage: how to improve their lot through educational means that could be geared to provide craft centred education to*

---

*them all and educate them in the art of marketing their product, a more profitable step for raising levels of income.*

**KEYWORDS:** *Lock Industry, Muslim Artisans, Educational Status Of Artisans, Reasons Of Educational Backwardness, Socio-Political Condition Of Muslim Artisans*

## INTRODUCTION

The rapid economic growth— over six percent GDP growth since the 1980s (IHD, 2014, p. 1)— has given India a heightened status in the global economy. Yet, the benefits of economic development have not improved the quality of life of a vast number of socio-religious groups which remain largely conditioned by structurally and historically defined exploitative contexts. Due to the persistent conditions of structural disparity and social inequality, the economic development boom may hardly generate desired social change and class mobility at an equal rate for all social classes, caste groups, and religious minorities. Muslim community is at the heart of this paradox. Accounting for 14.4 percent of India's vast population, making it the largest of all religious minorities in India, the community has been the subject of considerable development discourse, for it has the lowest levels of educational attainment when compared with major socio-religious groups in India and the lowest standard of living in the country (see Ghosh, 2013). Research indicates that Muslims, on average, spend 32.7 rupees per day, whereas Sikhs spend 55.3, Christians 51.4, and Hindus 37.5 rupees (Ghosh, 2013). Muslims' contribution being 11.2 percent to the country's overall GDP growth is relatively low as compared to that of the Dalits and Adivasi (indigenous groups defined as Scheduled Tribes or ST), contributing at 16.5 percent (*Times of India*, 2013). Its major cause lies in their being excessively concentrated in the low-paying jobs. They are mostly self-employed and engaged in artisanal sectors, or else serving as casual labour. Although a copious number of schemes by Government of India and the non-Government organizations took measures aimed at transforming Muslims' social and economic condition but unfortunately these remains notably unchanged. The root cause lies in their educational backwardness and remains true even after the attempts having been made to improve their educational conditions.

In a discussion paper based on research evidence, Humayun Kabir (2016) reported that despite structural constraints, Muslims and other backward classes have responded to the processes of economic and social change in which education is a significant factor (Jeffrey, Jeffery, and Jeffery, 2004). In north India, and especially in Uttar Pradesh, not only Muslims but also other disadvantaged groups have failed to secure salaried employment and "respectable jobs," which often refers to government jobs. Compared to the Dalits, Muslims have a greater tendency to depend on local wage labour and artisanal work, which pay low salaries and have been less successful in obtaining educational credentials and securing regular salaried jobs (Jeffrey et al., 2005, p. 2090). Unlike Dalit youths, Muslim youths are less visible in wider Indian society when translating their social frustration into political activism. What distinguishes Muslims from Dalits is that, when pushed out of formal and regular jobs, they tend to form a "minority enclave labour market" characterized by self-employment, casual labour, and low-paying local artisanal work (Das, 2008). This pattern, resulting from lack of land ownership, appropriate educational credentials, social networks, and cultural capital, continues to reproduce ghettoization and the differences between Muslims and other social classes.

The dearth of scholarship and robust empirical evidence on how social, political, and cultural forces interact in such a way as to restrict social change and sustain the status quo has compelled researchers to depend on tabulated numerical representations of Muslim community in India. Widely held public perceptions often pinpoint religious and cultural conservatism as causal factors of the Muslim community's backwardness. However, recent scholarship and several government reports suggest that the interplay of political, cultural, social, and economic forces continues to produce and reproduce the differences between Muslims and other social and religious communities in India (see GOI, 2006; Das, 2008), thereby challenging the broader public perception that tends to blame the Muslim community for its own poverty. *The Sachhar Committee Report*, a widely circulated and much-quoted study by a government commission, captures multifaceted factors associated with the political, cultural, and social problems that Muslims face in everyday life (GOI, 2006; Basant, 2007). Although many of these factors are also equally applicable to other backward social and religious communities, what distinguishes the Muslims from other groups is *a political and cultural sense of alienation from mainstream Indian society*. Historically defined political conditions, sensitivity to communalism in political campaigns and discourses, and the construction of Indian nationalism in close connection to the notions of "Hindu" land poses a serious political question to Muslims: "Can a Muslim be Indian?" (Pandey, 1999). In this political condition, "Muslims carry a double burden of being labeled as "anti-national" and as being "appeased" at the same time" (GOI, 2006, p. 11). Issues of insecurity and vulnerability push many Muslims to live in a particular location, and therefore Muslim "ghettoization" is markedly visible in housing, schooling, and jobs (GOI, 2006, p. 14; Basant, 2007, p. 828). Low representation in public and private regular employment sectors, collective alienation, perceptions of discrimination in government employment, lack of security, and suspicion of Muslims among state apparatuses and agencies tend to reproduce this process of ghettoization, causing Muslims to attach less importance to formal secular education and preventing them from translating their education into respectable and desirable jobs. Moreover, many Muslims find that making the effort to learn Urdu, a marker of their cultural and religious tradition, presents another limitation within the context of school textbooks and communities that use a different language (GOI, 2006, pp. 14–15; Basant, 2007, pp. 828–829). This is one of the reason Muslims have developed a tendency to depend on local wage labour and artisanal work, which pay low salaries. If we see any artisans' work whether it is chikan kari, dardozi, woodwork, handloom work, lock industry hand tools industry we may find excessive Muslim concentration.

Amongst the artisan based work places we come across Aligarh lock Industry situated in U.P. Aligarh is famous for its Muslim University and lock industry. Aligarh's locks provide security and sense of security to millions of houses in India and neighbouring countries. According to the 2011 Census, the total population of Aligarh district is 12, 74,408. More than 2 lakh people (around 15.7 per cent) are associated, directly or indirectly, with at least 5,000 lock manufacturing units. Muslims form the majority of artisans in the industry whereas big manufacturing units and business houses are owned by both, Hindus and Muslims. Muslims artisans manufacture about 80 per cent of locks of Aligarh. As labourer-artisans they manufacture goods for big players. They are artisans by heredity. All the family members are engaged as labourer-artisans and involved in the process of lock making. At the same time they prepare their next generations artisan-labourers. Although a central University with minority character and dozens of schools are located in their surroundings but they seem to have put their

self made locks on the doors, against the educational opportunities which are available on their doorsteps. The question however remains as to why and to what extent they lag behind in education. To find the answers a survey was done with the following objectives in mind.

**Objectives of the Study**

- To examine the educational status of the artisans of lock manufacturing industry.
- To investigate the causes of educational backwardness.
- To analyze the problems or hurdles in getting Education.
- To suggest the measures for educational improvement and income enhancement

**METHODOLOGY:**

The study was qualitative in nature. The data was collected from different wards of Aligarh city.

**The Sample:**

The study was conducted in the mohallas of Aligarh namely, Rasalganj, Sarai Rehman, Usman Para, Jeevan Garh, Atish Bazan, Delhi Gate, Bhojpura, Shahjamal, Hathi Pul, Tantanpara and Chowk Bundu Khan. In all, 1154 respondents were contacted

**Tools of the study:**

The study is, in main, based on primary data collected through field surveys. Household level survey was conducted in through the questionnaire based interviews. The interview was mainly focussed on their educational status and causes of educational backwardness.

**Data Collection:**

For data collection interview model was chosen. This enabled and facilitated asking questions, elicit answers, uncover perspectives and notions, and give the subjects the opportunity in which to give meaning to their respective roles.

**Analysis and Discussion**

After conducting the interviews and having taken field notes it was found that the lock industry employed three categories of workers that are regular, casual, and family workers. The family workers in household units included family members sharing kitchen and some relatives who were paid for the job. Almost all the workers were reported to be more than 16 years of age and thus happened to be adults. The incidence of child labour as reported was found to be very nominal. It may however be mentioned that the figure about number of children engaged as reported by the respective units was presumably much less than the actual number working in the industry. When researcher entered the units she noticed the children working with adults. But owners immediately asked the children to stop working and go inside. It was purported that the children had come to meet their parents. The unit owners were conscious of the fact that they are not allowed to employ child labour. They, therefore, did not appreciate any inquiry related to child labour.

Literacy is generally considered an important condition for both acquisitions of technical skills as well as for upward occupational mobility. The lock industry had large number (72 per cent) illiterate workers. Only 15 per cent of the workers had education up to primary level and another

13 per cent were middle pass. Not even a single worker in household units of the industry had graduation degree. 90 per cent of the women were illiterate and, not a single woman has studied beyond primary level of education. A very few, (just one per cent) could read and write and claimed to have passed primary level examination. The female children worked at household units, the girls helped the parents in family occupations after the school hours or after completing cooking, washing and other household works.

In regards to the reason of not getting education, the respondents of the study reported a number of reasons. Amongst them the prominent ones were the poor quality of schools, pathetic, non-cooperative and idle teachers. The state's institutional discrimination against Muslims is an undeniable presumption. State investment in education in Muslim-dominated areas has been pathetic. Muslims have also not sufficiently benefited from various government schemes meant for general educational and economic advancement.

A very interesting thing reported by a number of respondents was that 'we will neither get admissions in the good institutions nor get jobs only because of our belongingness to a particular religion then why should we waste our time and energy'. One respondent convinced the researcher in a very informed way, 'madam! We are born as a labourer and will die as a labourer only'. Muslims routinely argue that despite possessing adequate educational qualifications they are not employed in government services, and point out that Muslim representation in the services is much less than that warranted by their proportion in population. What is the use, many Muslims ask, of investing in their children's higher education if they are refused government employment simply because of their religion? In the private sector, too, Muslims, like Dalits, believe that discrimination continues unabated, further dampening their enthusiasm for higher education. This has led to demands by some Muslim organisations for reservations for Muslims, either as a single category or for backward caste Muslims, in government jobs and in educational institutions.

Poverty, overall non-conducive environment for learning, lack of assistance for children in homes and the schools non-supportive attitude towards them were other reasons that the workers underlined. That was why that even if they get their children enrolled in schools, they leave the schools midway. Hence the dropout rate is a bit high. In addition, the neo-liberal economic policies of the last two decades or so have hit various Muslim artisan communities across the country, rather severely. Mounting economic marginalisation and deprivation naturally make higher education an impossible proposition for many Muslim families. Given their poverty and the feeling of discrimination in both private and public sector employment and education institutions, many Muslims feel it is enough for their children to receive basic education before seeking some sort of petty self-employment to contribute to the family upkeep. These facts account for the higher dropout rate among school-going Muslims children at all levels as compared to other religious communities. Periodic riots in places where Muslims have witnessed some degree of economic progress have resulted in pushing large sections of the community against the wall, leading to a process of ghettoisation and further strengthening insularity and religious conservatism. Even the Muslim religious scholars (Ulema) take little interest in the real-world concerns of ordinary Muslims, focusing instead on religious, symbolic or identity-related issues.

It was also felt by the researcher that deep-rooted upper caste prejudices, pre-colonial ruling elites (Muslim and Hindu) took little or no interest in the development of lower segments Muslim community. The historical record reveals a deep-rooted contempt displayed for indigenous Muslim converts (profession based castes, in main) by the Muslim nobility or shurafa, who claimed foreign descent. Like other Dalit and low caste groups, these Muslim segments remained educationally deprived. In other words, the caste-class based constraints of many Indian Muslims explain, in part, the overall educational marginalisation of the community today. The partition in 1947 also had momentous consequences for Muslim education. In its wake the bulk of the modern-educated north Indian Muslim middle class shifted to Pakistan, leaving behind millions of economically and educationally deprived co-religionists.

Before 1947, the north Indian middle-class, particularly the products of the Aligarh Muslim University, had played a key role in promoting modern education. In the absence of a class that championed liberal or progressive causes, the prospects for education turned out to be bleak. There was also the fear, not entirely unfounded, that government schools, with their Hindu-oriented syllabus and alleged anti-Muslim bias, would result in de-Islamisation of Muslim children.

Another reason for the overall educational marginalisation of the Muslim community, particularly in north India, is the fact that the community is deeply divided within, and lack political leadership. The Muslim community, particularly in north India, where most Muslims live, is bereft of a substantial educated middle class. This has allowed Muslim clerics or ulema to assert their claim of being its spokesmen as well as the defenders of Islam and Muslim identity. They are backed by various political parties, who use them to garner nothing but Muslim vote. This is also a reaction to Hindu chauvinism, with Hindutva groups also deliberately raking up such issues to create a Hindu vote-bank and to keep Muslims on the defensive, giving them little space to think of their economic and educational concerns or to demand their rights from the state. Consequently, since education, particularly of the marginalised, is not a prime concern of the so called existing Muslim leadership, particularly in north India, Muslims have not been active in setting up community-based educational institutions in sufficient number.

Talk of a hidden nexus between political parties, even those that claim to be secular, Muslim political and religious leaders and Hindutva groups, all with vested interests in keeping Muslim educational and economic issues out of political discourse, is thus not unwarranted.

The measures to be taken up for up-lifting the lot of Muslim artisans may include general strategy as well as specific steps of concrete nature.

The artisan community of lock industry of Aligarh is struggling hard to compete with international players in the era of today's globalization. Large number of Muslim lock workers has lost jobs in the past few years in face of cheaper Chinese locks. If these artisans have to survive in the present era, their upliftment is an essential condition.

Due to forces of competitive market and globalization and also due to deteriorating socio-economic condition of master craftsmen/artisan these skills are not being pursued by the young generation productively. Government of India is of firm conviction that the traditional craftsmanship is needed to be preserved. There is a need to augment traditional arts and entrepreneurial skill which are the backbone of cottage and small scale industry and establish better market linkages enhance branding and ensure access to credit.

Need persists for inculcating trust in the Muslim artisans so as they may come to believe that they are as good Indians as others. They need to be empowered psychologically. This may be done by roping in psychologists and social scientist. The NGOs may also be involved to work at the grass-root level.

Some success stories and case studies of Muslims as well as other artisans may be presented and demonstrated in the related areas. Such stories may motivate for upward social mobility.

With the purpose of enhancing levels of income, technical side of workmanship need to be linked with the marketing of the finished product. This linkage will correlate need for education with the idea of marketing.

Education of girls has to be given top priority. They need to be provided with required facilities in their immediate neighbourhood having female teachers.

Craft oriented education may be arranged for the children, youngsters as well as craft persons' children mainly because craftsmanship is virtually hereditary profession. Adult education centres having specific provisions for craft centred learning and reorientation may be established in the neighbourhood of artisans' settlements/mohallas, etc. Such centres should provide instructions as are linked with the artisans' job requirements.

## CONCLUSIONS AND RECOMMENDATIONS

In north India, and particularly in Uttar Pradesh Muslims and other disadvantaged sections of society have a greater leaning to depend on local wage labour and artisanal work, which pay low salaries and have been less successful in obtaining educational qualifications and securing regular and white collared salaried jobs. If we see any artisans' work whether it is chikan kari, dardozi, woodwork, handloom work, lock industry hand tools industry we may find excessive Muslim concentration. Aligarh is famous for its Muslim University and lock industry. Aligarh's locks provide security and sense of security to millions of houses in India and neighbouring countries. But the workers of this industry are living a insecure life. Education is still a distant dream of the workers of this industry had large number (72 per cent) illiterate workers. Only 15 per cent of the workers had education up to primary level and another 13 per cent were middle pass. 90 per cent of the women were illiterate and, not a single woman has studied beyond primary level of education. Poor quality of schools, pathetic, non-cooperative and idle teachers, poverty, overall non-conducive environment for learning, lack of assistance for children in homes and the schools non- supportive attitude towards them were other reasons of educational backwardness of Muslims.

There is urgent need to the measures be taken up for up-lifting the lot of Muslim artisans may include general strategy as well as specific steps of concrete nature.

### ABSTRACT

*This article examines the poet's methods of interpreting new images, proves them through poetic examples, and highlights the poet's poetic skill in this direction, his masterful use of the arts. The success of Sayfi Bukhari in the poetry of the XV century lies in the skillful placement of new content and images in the traditional form of the ghazal genre. He was one of the first in oriental literature to introduce a variety of professions to the genre of ghazal, thus making a major turn in the ghazal of his time. As a result, the image of craftsmen in the poems of the poet comes to the fore. The article shows that when comparing the contemporaries and predecessors of Sayfi Bukhari's ghazals with examples of creativity, the images he created differed from traditional images. At the heart of this are clarifications on the role and contribution of Sayfi Bukhari in the process of the literary period.*

**KAYWORDS:** *Ghazal, Theme, Image, Novelty, Reality, Skill, Craftsmanship, Literary Environment, Fine Arts.*

### INTRODUCTION

There are many creative works created in the XV century, which vividly reflect the literary and cultural life of the period. For example, in Alisher Navoi's Majolis-un-nafois, we can see many examples of the literary environment of the XV century, the life of craftsmen and artists. Because some craftsmen also took an active part in the poetry of the period and contributed to the growth of the literary process. Especially in the second half of the XV century in Samarkand, Bukhara, Herat, Tabrez and other famous centers the large-scale development of handicrafts influenced the literary life of that period. As a result, Mavlono Qadimiy - drummer, Mavlono

Zayn-kisadoz, who was interested in poetry and wrote poems, Mavlonov Havoipainters, Mavlonov Said Kulol-kosagars, Mavlonov Argun-khaymadoz, Mavlonov Khovariy-zardoz, Mavlonov Baqoi-kamongars, Mavlonov Majnuni-calligraphers. Under the influence of this, the emphasis on the theme of artisans is vividly reflected in fiction, including poetry.

### THE MAIN PART

The poetry of a number of poets, including Abishak, Sayfi Bukhari, Darvesh Dehakiy, who created in the literary environment of Samarkand and Herat, realistically shows the character of the people of art and craft, their role in cultural life. Among the poets whose names are mentioned, the activity of Sayfi Bukhari is noteworthy. Sayfi Bukhari was born in Bukhara in the 1840s. He studied in Bukhara and Herat madrassas and spent most of his life in Herat. In his poems, Sayfi Bukhari praised farmers and professionals. The divan Sanoe'-ul-badoi was famous in Herat, and each of its ghazals was dedicated to a single profession and art, such as butcher, needleman, baker, carpenter, tokiduz, bird, musician, fisherman, halvagar, and others. It is more important that these poems are formally simple and that they do not exceed 5-6 bytes. What is important is that at the end of the poem, the poet reports on what he was called and to what extent he found a position in his time:

In nusxa, kitolibandxosumash,  
Farxundachuog'ozbuvadanjomash.  
Lafzashhamasan'atastuma'nesh bade',  
Az on gasht "Sanoe'-ul-badoe" nomash. [6, p. 301]

**(Contents:** Everyone wants this copy, it's fun to read from start to finish. The language is an example of art and its content is a work of art, hence its name (Sanoe'-ul-badoi').

According to the literary critic Alokhan Afsahzad, the manuscripts of Sanoe'-ul-badoe' in the library of the University of Iran, numbered 43-44 and 45-85, are complete and complete, consisting of 1320 bytes. According to the scholar, the poet considered various professions, which are an integral part of city life, as the main object of description and described a total of 133 people from the professions. [3, p.103]

Hazrat Navoi, in his Majlis-un-nafois, gives information about his contemporary poet Sayfi Bukhari, noting that his poems soon became famous. Welcoming the poet's ghazals written in a unique theme and style, he said, "He has written many latoif poems for the people of art and hirfa, and in this way he is authoritative," and cites a verse from his ghazal dedicated to the beautician. [1, p.340]

Apparently, the theme of Sayfi's ghazals was the life of craftsmen and artisans, so it was recognized by Navoi as a novelty in ghazal poetry of that time. "... Alisher Navoi," writes academician Botirkhon Valikhodjaev, "in his Majlis-un-nafois, supports one of his contemporaries, Sayfi Bukhari, for including the working people, especially craftsmen, in the image of the ghazal, calling him an inventor in this field." [4, p.78]

While praising every artist and craftsman, Sayfi embodies him in the form of a friend, for example, "the needle is important." (Mohi so'zangar, ki dar dil mexalad mijgoni o'), "attor gulruxsorim" (Do'ston, to oshiqam attori gulruxsorro), "rangchi guluzorim"(Gul'uzori rangrez

kori maseho mekunad) he begins and tries to express his relationship in a romantic tone. As an example, it is expedient to consider the text of the poet's "Ghazal of Attar":

Do'ston, to oshiqam attori gulruxsorro,  
Do'st medoram ba bo'i o' hama bozorro.[6, p.302]

**(Contents:** Friends I am in love with ul gulrukhsor attor because I love all the markets because of its smell).

Expressing his love for the perfumer, the poet sells perfume, he wants to say that the reason is that he not only likes the market air, but enjoys it all his life. In other verses of the poem, the poet describes in detail the role of the acting profession in the life of that period, the delicate taste and culture of this profession. In other words, using the interpretation of the image of "attor", Sayfi tries to define the cultural life of the city in the XV century, the social status of the professionals who work in it. The poet's "Ignachi Ghazali" also attracts attention with its subtlety and art:

Mohi so'zangar, ki dar dil mexalad mijgoni o',  
On ki dil mexonamash man, hast so'zandoni o'.  
Chashmi Sayfi basta bud az dard to ro'I tu did,  
Boz shud chun chashmi so'zan az farah chashmoni o'. [6, p.307]

**(Contents:** The eyelashes of the needle-needle pierce the heart, and when I call it the heart, for it my heart has become a box of needles; Sayfi's eyes were closed with pain, but when he saw your face, his eyes opened like needles with joy).

In this ghazal, the poet used the art of rhyme more and was very adept at finding new images and analogies. The lashes-needle in the ghazal, the heart-word box, the iron heart of the charmer-sandon, the hammer-and-needle hammer's allusions are not visible in poetry until Sayfi. In traditional poems, we often see the mistress's eyelashes being likened to a spear, a merciless heart to a stone, and the power of a lover's ahi to fire and storms. For example, if we pay attention to the following verses of Kamol Khujandi, a famous representative of the Persian-Tajik ghazals of the 14th century:

Nisbati xoro chi kunam bo dilat,  
Chun dili berahmi tu sangintar ast.[7, p.160]

**(Contents:** I made you like a stone because of the cruelty of your heart, it seems to me even harder than a stone).

Apparently, the poet complained about the cruel heart of the lover and compared it to a stone, the hardness of the lover's heart - indifference, cruelty - reminds the poet of the hardness of the stone. Sayfi goes beyond this tradition and manages to find a new allegory in the "Gazelle of the Needle". He compares the hardness of the needle wound to the hardness of the iron that makes the needle, the needle that processes it.

In his ghazals, Sayfi addresses new heroes through a new theme. He replaces the image of the mistress, which is predominant in traditional gazelles, with representatives of various professions, such as baker, tailor, needleworker, painter, blacksmith, farmer, drummer. From each ghazal of the poet new images and images are formed in the eyes of the reader. In this style,

the object of the image in Sayfi's ghazals changed in contrast to the traditional ghazals, and this situation required a state of diversity and renewal even in the layer of artistic image. The skill of the poet in the needle of the needle is also seen in the fact that he managed to bring the protagonist - the needle needle into reality from the world of fantasy through new words and images. In other words, the poet introduced the real hero to the students on the basis of his profession, position and character. In this important work, the poet was able to include in the image the tools typical of the art of needlework, including needles, needle boxes, egov, steel, hammers, sandals.

This style of interpretation can also be seen in Sayfi's Balikpapan Ghazali. The text of this ghazal begins as follows:

Mohi mohipaz, ki teg'ash raxna dar jonam kunad,

Sinaam bishkofadu bar toba biryonam kunad. [6, p.305]

**(Contents:** The knife of the fisherman mohim pierces my soul; pierces my heart and cooks it on a hot stone).

The poet wrote this poem about a fish-cooking crack. It is known that the profession of fishing has been known to our people since ancient times, and many people have lived in this profession. It is clear from Sayfi's ghazal that this profession was widespread among the people in the 15th century, and the poet describes this very profession. This time the poet interprets his mistress in the image of a fisherman. Now he creates new images using the tools used in the craft. The poet likens the state of a man in love with a fisherman to the state of a fish he encounters every day. In the poet's image, his gaze is sharper than the knife in his hand, and with this knife he pierces the poet's heart like a fish, and cooks it on a hot stone. Through these new images, Sayfi interprets the wound of this profession in the image of a ruthless and suffering mistress.

## CONCLUSION

1. Speaking about the novelty and achievements of the talented poet Sayfi Bukhari in the ghazal poetry of his time, which attracted the attention of many contemporaries, it is expedient to draw the following conclusions:
2. The ghazals written by Sayfi Bukhari to the people of the profession are not only new in terms of subject matter, but also the heroes who took part in it can be found first in terms of their time.
3. The unique artistic style in the poems of the poet helped to vividly interpret the image of craftsmen. He tried to create new images and new images in each of his poems. He introduced the craftsmen to the student based on his profession. He interpreted how delicate and charming they were.
4. On the one hand, Sayfi Bukhari enriched the poetry of his time with his poems dedicated to the arts and crafts, and on the other hand, gives a wide range of information about the development of crafts in the life of the peoples of Central Asia in the XV century and the cultural life of various professions.

## POETIC CONTENT AND FORM OF FERUZ'S POETRY

**Maxammadieva Yulduz Yashnarovna\***

\*(PhD) Doctoral Students,  
Language and Literature,  
Tashkent State University of Uzbek  
Email id: yulduzmaxammadieva@gmail.com

### ABSTRACT

*Muhammad Rahimkhan Soni-Feruz has a special place in the formation and development of the literary environment in Khorezm in the second half of the XIX - early XX centuries and has a special place in the history of Uzbek literature. As a great statesman, he sponsored the development of culture and the arts. As a potential poet, he left a rich poetic legacy. The more important the socio-political activity of Muhammad Rahimkhan Feruz the more valuable his poetry, called the "Great Enlightener" the famous orientalist V.V. Bartold. Much work has been done in the study of the literary and social environment of the period, and although many scholars have conducted research, the study of Feruz's work requires more research. The study of Feruz's work, his artistic mastery, is one of the urgent tasks of today's literary criticism. The article examines the images in the poems of the king and poet, a representative of Uzbek literature Muhammad Rahimkhan Feruz. Based on the analysis of the poet's poems, the issue of artistic interpretation of the romantic theme in his work is studied. The mastery of the arts, the secrets of the poetic mastery of the artist are covered.*

**KEYWORDS:** *Ghazelle, Classic, Love, Tashbeh, Tanosib, Talmeh, Tazod, Rival, Lover, Beloved.*

### INTRODUCTION

As a result of the influence of Feruz, who had a huge heart, more than a dozen artists emerged from the khan's generation. Each of them arranged at least one divan. About fifty artists in this environment, regardless of social class, profession and nationality, had a certain level of artistic talent, creating works in different genres. Feruz himself left a rich poetic legacy as a poet. The study of these poetic works on a scientific basis, which has not lost its relevance in today's XXI century, in particular, the study of the scope and genre features of the poet's poems, is one of the

most pressing issues facing literature. The study of the works of Muhammad Rahimkhan Soni Feruz was widespread during his lifetime. Muhammad Riza Ogahi in his work "Shahidu-l-Iqbal" about the period of Feruz Shah writes about the high level of his poetry, as well as the full coverage of his administrative-political, socio-economic, spiritual and enlightenment activities under his rule.

Besides, valuable information is also given in the works of Bayani's "Shajarai Khorezmshahiy", Ahmad Tabibi's "Majmuai muhammasoti ash-shuaroi Feruzshahiy", Hasanmurad Laffasi's "Biography of Khiva poets and writers", Bobojon Tarroh's "Khorezm musicians", and Kamil Khorezmi's "Latoyifu-z-zaroyif". It should be noted that during the independence period, the services of Davlatyor Rahim, Shikhnazar Matrasul, and Gulsara Ismailova were special.

As noted in the textbook "Uzbek literature of the period of national awakening", Feruz's creative heritage has come down to us in a fragmentary form. But he did not take seriously the collection and arrangement of his poems. This is probably why his creative legacy that has come down to us is not so great. The total volume consists of 2534 verses - 98 ghazelles, 7 muhammas, 2 musaddas, 4 masnavi, 7 rubais "[1; 78]. As a result of Gulsara Ismailova's services, on the basis of manuscript sources 12060, 3446 in the fund of the Institute of Oriental Studies of the Academy of Sciences of Uzbekistan, the poet's divan was published under the name "Elga shohu ishqqqa qul" [2]. The article analyzes the samples from the poetry collection.

## MAIN PART

Feruz's poetry is colorful in terms of subject matter. The thematic scope of the poet's poetic heritage, which seeks to continue the classical poetic traditions with dignity, can be grouped as follows:

- 1) romantic;
- 2) religious and enlightenment;
- 3) social.

The theme of love is one of the main themes of all-Oriental poetry, including Uzbek literature. If we look at the history of literature, we can see that every artist has enriched this old theme with new metaphors. According to the literary critic Rahim Vahidov, "it is absolutely impossible to find a poet who does not sing love and a poem that does not mix the pain of love" [3; 142].

A significant part of Feruz's literary heritage was romantic lyricism, in which he sang love in almost all genres of poetry, depending on the possibilities of the same genre. G. Ismailova, a literary critic who is directly involved in the work of the poet, also emphasizes this: "Most of Feruz's works are poems about love, details of human experiences, and the beauty of a charming place" [4, 5]. In his poems on this subject, the poet has repeatedly referred to the dream of date, the sufferings of separating, the conflict of soul and beauty. The poet began writing poetry on this subject in the early stages of his career. Feruz studied the works of poets as Navoi, Lutfi, Fuzuli, his great contemporary Ogahi, his fellows Kamil and Bayani. He considered Muhammad Riza Ogahi as his mentor. His teacher tried to continue the tradition with dignity:

*Komil ersam nazm aro Feruzdek, ermas ajab,  
Ogahiydek she'r mashq aylarda ustodim mening.*

Muhammad Rahimkhan Feruz was a musicologist and composer, as well as an art critic with a perfect knowledge of music. He did a great job with the great thinker Kamil Khorezmi and his son, composer, musicologist Muhammad Rasul, in preserving the status of Khorezm and passing it on to future generations. The depth of Feruz's love poems and the great attention he paid to his artistic perfection can be explained by his perfect knowledge of music.

The artistic interpretation of the theme of love is the basis of any poet's work. Indeed, as a lyrical poet, Feruz sings with pure human emotion - passion, passion and pleasure. He praises love in a unique way and puts the feelings of the heart into poetry. In his poems, he describes human love in rhythm. He explores the sacred feeling of not knowing time and space - unique methods of expression for the definition of love - and the search for rhymes and rhymes that match the experiences he wants to portray. It should be noted that at this point it is necessary to dwell on the most important of such studies.

*Azmi guliston ayla zulfunga berib ziynat,*

*Rashk o'tiga sunbulning paykarini so'zon qil.*

The ghazelle with the radif "Qil" is widely used in Uzbek literature, in the works of poets such as Amiriy, Uvaysiy, Fazliy, Ado (Sultonxonto'ra Ahroriy), Hotif, Nola, Xijlat, Feruz, Furqat, Muqimiy, Haziniy, Kamiy, Hamza, Sidqiy Xondayliqiy. As the poet chooses this radif for the description of the ideas and experiences he wants to express in his ghazelle, he enters into a creative contest with the poets who have finished the ghazelle in this radif. At the same time, he manages to express in a unique way the feelings, the sufferings of love, which are stored in the depths of the soul:

*Ko'zunga chekib surma, yuzunga urub g'oz,*

*Lola birla nargisni ul ikovga hayron qil.*

This verse shows that Feruz was deeply aware not only of the works of the Khorezm literary environment, but also of the traditions of the poets and writers of the Kokand literary school. He also studied the works of the representatives of the literary environment of Kokand during the reign of Amir Umar Khan through Fazli's "Majmuai shoiron".

The main theme of Feruz's lyrics, which is known as the "Councilor of romantic gazelles", is love. The poet has written his own captivating poems on the subject. His lyrics expressed the emotional experiences and sufferings of an ordinary man - a lover, not the king. In Feruz's poems there is a symbol of a lover with high human qualities - a lover and a single beauty, sometimes kind, sometimes cruel. According to the lyrical protagonist, the king and the slave are equal in love:

*Garchi erurman tole'i Feruz ila olamg'a shoh,*

*Lek ul parilar sarvari oldidaturman qul bu kun" [5;63].*

Analyzing this verse, Nusratullah Jumakhoja, Doctor of Philology, expresses the following points: "This verse shows that there is such a law in art that a career-like closeness between crowned poets leads to a closeness of thought and emotion." As we read this verse of Feruz, we involuntarily remember Babur's famous rubai:

Sen gulsenu men haqir bulbuldurmen,  
 Sen shu'lasenu ul shu'lag'a men kuldurmen.  
 Nisbat yo'qdur deb ijtinob aylamakim,  
 Shohmen elga, vale senga quldurmen" [1;78].

It should be noted that in Feruz's poetry, as in traditional romantic poetry, the main characters are the *lover, beloved, and the rival*. In his romantic lyrics, the poet expresses his feelings, his attitude to love through the images of a lover and beloved. In the poet's lyrics, the mistress is interpreted as an incomparably beautiful. Therefore, many traditional adjectives are applied to it, such as «sweetheart», "moon-faced", "chubby", "fairy", "fay", "peri", "petite", "flower" and "beauty". The helplessness of the lover, his constant hope for the vision, is vividly reflected in the images of "propeller", "begger", "whacky", "nightingale" used by the poet. The purpose of love is vision. There is no creature more beautiful for a lover than a lover. Nothing else interests him:

*Lutf etib agar yoring kelsa bazmingg'a, Feruz,*  
*Bu aziz joningni maqdamig'a qurbon qil [2;63].*

The opponent is an image that walks side by side with a lover and a lover in romantic lyrics. Described with such adjectives as "white", "other monk", "stranger", this image occupies a leading place in the poet's poems. In Feruz's lyrics, this "third person" is often the main cause of love and grief. The lover's attention is more on it. This, of course, breaks the heart of the lover:

*Ul sanamga o'zga rahbon bor ekandur, bilmadim,*  
*Ko'ngli oning moyili ag'yor ekandur, bilmadim [2;68].*

The fact that the lover has an "other rahbon" - a guide, a "heavy-hearted" - touches the heart of the lover. But the lover is patient with all the persecutions of his lover. He wants sweetheart's sunny face to shine. He sees this as the only remedy for the pain of longing:

*Ko'zumni ayla ravshan mehr yanglig' orazingdinkim,*  
*Bo'lubtur tiyra, asru torta-torta intizoringman [2;74].*

In the verse, the art of tasbeh (mehr yanglig' 'oraz), tazod (tiyra - ravshan) is skillfully used to describe the lyrical romantic mood. As a result, the impact of the idea was achieved. Feruz's love poems are mainly in the traditional direction, and the artistic means are also aimed at depicting the hijra experiences of the lover, the beautiful beauty of the lover, the flirtations. In the image of the poet, the mistress is extremely compassionate, commiserative, every word of which gives life to a dead body like Masih, and from her beauty the evening of the lover turns into the morning, the morning of the mourner into the evening. The lover is so pleased with the poet's heartfelt compliment that he wishes him the highest status and happiness from Allah:

*Bu oqshom keldi ul dilbar adab birla salom aylab,*  
*O'luk jismimga jon berdi Masihoso kalom aylab.*  
*Shabistonimni qildi orazing mehriddin ravshan,*  
*Ochib ruxsorida parda quyosh yanglig' xirom aylab.*

*Ayon aylab jamolin qildi shomim subhga tabdil,  
 Yuzi hijronida ag'yorning subhini shom aylab.  
 Kelib yuz nav' nozu ishva birla mehr etib og'oz,  
 Qoshimda o'lturub dedi tili mu'jiz kalom aylab  
 Ki: «Ey, hajrimda ko'ngli loladek dog' uzra dog' o'lg'on,  
 Yurursan bo'yla toki ayshu rohatni harom aylab?  
 Visoling'a chu yetting shodu masrur aylabon o'zni,  
 Bayon ayla menga sen arzi holingni tamom aylab...» [2;19]*

If we pay more attention to the poem, the poet will find tazod (gloom - bright, night - day, separation - date), tasbeh (Masih, like the sun, as the spot on the tulip), and question and answer (dialogue between lover and beloved), we witness that he skillfully used poetic arts such as talmeh (Masih). Through this, it is observed that the poet strives to make the thought impressive and the expression artistic.

As described in the poet's radiant ghazelle "Yo, Rab", the lover is extremely beautiful, in love with his "worldly beauty" - the poet also wants clarity for his feast. But it only hurts the suffering lover. The portrait of the mistress is perfectly depicted in the poem. This fact testifies to Feruz's mastery of portraiture as well. The poet tries to show the oppression he inflicts on the lover by describing the beauty of each member in the appearance of the wound. In this way the poet manages to give a deeper picture of the psyche of the lyrical hero. But in any case, the lover hopes for the cabbage of grace, is patient:

*Yetushti hajridin jonimg'a yuz ranju alam, yo, Rab,  
 Ko'rub holimni, kam qilmas manga bir dam sitam, yo, Rab.  
 Sochi savdosida doim qorong'udur manga olam,  
 Mening bu shomi hijroning'a yetkur subhidam, yo, Rab.  
 Jahonoro jamolidin mening bazmimg'a ham bir tun  
 Yeturg'aymu ekan ravshanlig' ul mahvash sanam, yo, Rab.  
 Agar lutf aylabon o'z ilki birla bersa bir sog'ar,  
 Ko'ngulda qolmas erdi orzuyi jomi Jam, yo, Rab.  
 Na yanglig' sabr qilsun ul quyosh hijronida Feruz,  
 Ziyod aylar jafosin, aylamas bir zarra kam, yo, Rab [2;18].*

This prayer - the theme of love in the ghazelle - is written with high art. The poet expresses his resentment at the emigration of his friend, and complains of his cruelty. Separation explains why he stays in the dark with his friend's hair color. He asks the Creator to bring clarity to the night of separation. Jamshid says that he does not dream of a jam if he shows a yorlutf and holds a sagar with his own hand. Ghazelle praises him for his patience in the hijrah of his companion, who is increasing day by day without diminishing his suffering in the last verse. In drawing the image of

the mistress, the poet makes very appropriate use of the symbols and metaphors that exist in our classical literature:

*Orazing davrida har yon zulfi anbarmu ekan?*

*Yo'qsa ganj ustida yotg'on ikki ajdarmu ekan? [2;77]*

Oraz is a symbol of treasure in Eastern poetry. The two curls are dragons and snakes. According to legend, where there is a treasure, there will be a guardian dragon. The poet skillfully used the art of rhyme in this verse.

## ANALYSIS

Feruz's love poems are mainly in the traditional direction, and the artistic means are also aimed at depicting the hijra experiences of the lover, the beautiful beauty of the lover, the flirtations. In the image of the poet, the mistress is extremely compassionate, compassionate, every word of which gives life to a dead body like Masih, from her beauty the evening of the lover turns into the morning, the morning of the mourner into the evening. The lover is so pleased with the courtesy of the poet's lover that he wishes him the highest status and happiness from Allah. It is known that the use of the art of talmeh in romantic lyrics - the naming of great historical figures, famous literary and artistic figures - has become a tradition in classical poetry. In the works of the poets who were the great predecessors of Feruz, the verses adorned with the art of talmeh are distinguished by their special influence. However, the construction of the whole ghazelle on the basis of talmehsan is a unique phenomenon that is not found in the poets of this period. The following ghazelle by Feruz is an example of the renewal of poetic traditions in terms of its adornment with the art of the end:

*La'li shiriningni ta'rif aylab o'lmish shahdkom,*

*Anvariyyu Fazliyyu, Xoqoniyu Masnad mudom.*

*Chashmi fattoninga nargisni nechuk tashbeh etar,*

*Soyibu Bedil, Hiloliy, Hofizi shirinkalom.*

*Vah, ne yanglig' sharh qilg'ay orazing tavsifini,*

*Unsuriyyu Asjadiyyu Farruxu Sa'diy, Humom.*

*Ko'rsa husnang Layliyyu Shirinni vasf etmas edi*

*Xusraviyyu ham Navoiy, Jomiyu Shayx Nizom.*

*O'xshatib bo'lmas yangi oyg'a muqavvas qoshlaring,*

*Sayyidoyu Nozimu Lutfiy, Kiromiyu Xisom.*

*Sarvoso qomating vasfin qilurda lol o'lur,*

*Andabilu Ravnaqu Ziyarak masihiy xush kalom.*

*OGahiyu Komilu Feruz, Xolis, Chokaring,*

*Rojiyyu Mirzoyu Akmal, Munisu Xokiy, G'ulom [2;71].*

This ghazelle can prove that Feruz has a high level of poetry. After all, the content of each verse corresponds and corresponds to the high rank achieved by each poet in the creation. For example, Feruz mentions the names of Saeed, Bedil, Hilali and Hafiz, who rose to the status of a high artist in poetry.

Describing the unequal beauty of his land, he came to the astonishing artistic generalization that if he saw this beauty, he would stop describing the great Hamsanavis - Khusrav, Navoi, Jami and Nizami Layliyu Shirin. The last stanza of the ghazelle is that in makta, the names of the poets Chokar and Ghulam are used both in the sense of nicknames and in the lexical sense (slave, servant), creating a unique example of the art of iyham. Building a poem from the beginning to the end on the basis of art is found not only in this ghazelle, but also in other lyrical works. To prove this, this ghazelle, which was created on the basis of contemporary art, can be cited as an example:

*Qilurman yutub shavqi la'lingda qon,  
Fig'onu fig'onu fig'onu fig'on.  
Yuzung to mani zordin aylading  
Nihonu nihonu nihonu nihon.  
Ko'zumga qorong'udir ondin beri  
Jahonu jahonu jahonu jahon.  
Tilarman ko'zung fitnasidin mudom,  
Omonu omonu omonu omon.  
Erur qoshlaring ishq eli qatlig'a,  
Kamonu kamonu kamonu kamon.  
Guli husnungga yetmasun dahrdin  
Xazonu xazonu xazonu xazon.  
Kel, ey sho'x, Feruz ko'ksini qil  
Makonu makonu makonu makon [2;75].*

It should be noted that the words repeated in each byte served to strengthen the expressed content, increase the impact of the thought, and provide melody. The repetition of these words does not bother the reader in the slightest; on the contrary, it leads to the rise of art from line to line, the deepening of the content, and the emphasis on the essence of the verses. The fact that the ghazelle is based on such an impressive repetition from beginning to end testifies to Feruz's great skill as a poet. In the poet's lyrics, the theme of love is sung on high curtains. Feruz manages to express himself on this ancient theme through beautiful poetic arts, allegorical allegories, metaphors. As the saying goes, "Love is an old pain, but every heart renews it," there is no poet left who has not written the theme of love in poetry. But every artist discovers a new side of it, in other words, creates something new at the heart of the tradition. As Feruz sings of love, he writes:

*Ishq bir o'tdurur, nechukkim barq,  
Aylamas shoh bila gadoni farq.  
Tushsa ondin ko'ngulga bir uchqun,  
Kuydurub boshiga solur qaro kun [2;124].*

The poet, who skillfully uses the opportunities of such artistic arts as tanosib (grass - lightning), tazod (king - begger), tashbeh (nechukkim bark), tries to give a difficult, new definition of love and achieves it.

The art of analysis, which means "beautiful proof", is used in Eastern poetry in the unique way in the work of each poet, and plays an important role in the expression of deep meaning in a beautiful artistic form. The following verse by Feruz is a unique example of this art:

*Sayri bog' etsang agar, ey sarvqaddu gulbadan,  
Sarv ayoqingg'a qo'yar bosh, chok etar gulpirahan [2;72].*

That is, when a cypress tree leaves a flower garden for a walk, a lover who is fascinated by its beauty bows at the foot of its cypress tree, and the flower tears its collar out of jealousy of its beauty. In order to prove the idea that "Sweetheart is unique in beauty", the poet uses the art of analysis of the beauty of the face (cypress puts his head on the foot of the flower, tears the neck of the flower), tanosib (garden, cypress, flower) also uses skillfully. This creates the perfect example of art. It can be evidence of an artistic expression of thought.

Or it is in this verse that the poet depicts the unparalleled beauty of the land through the art of allegory. It is said that the land of sweetheart is the sun of the beautiful sky. Grace (latofat) is artistically described as even better:

*Husn avjining xurshididur, ey mohsiymo, orazing,  
Bilkim, latofat ichradur ondin ham a'lo orazing.*

In the next verse, the poet, who skillfully uses the arts such as diagnosis (animation), adjective (pure face), manages to express the idea in a more beautiful way:

*Kun zohir aylab infiol o'ldi shafaq ichra nihon,  
Subhi saodatdin tulu' etgach musaffo orazing [2;53].*

That is, on the morning of bliss, when the pure fast of the lover appears, the day hides in the dawn, embarrassed that it is not so bright. Byte analysis as a whole is a rare example of the art of beautiful proof.

## CONCLUSION

In general, the theme of love, which occupies a leading place in the poetry of Muhammad Rahimkhan Feruz, is characterized by the poet with high artistic skill. The poet tries to portray the traditional images of lover, mistress and rival in a unique way, through which he manages to express ideas of great importance. They manage to give a new spirit to the interpretation of the traditional theme of love.

The theme of love occupies a leading place in Feruz's poems. The study of the interpretation of the theme of love in the poems of the poet shows that they have a unique artistic interpretation of the images of the lover, mistress and rival (rival) in the tradition of our classical literature. The dreams and aspirations of the creator, the riots in the psyche, the inner experiences, the joys and sorrows are expressed through this trinity.

The lover, who is interpreted as an incomparably beautiful in the poet's lyrics, has many moments such as «sweetheart», "moon-faced", "chubby", "fairy", "fay", "peri", "petite", "flower" and "beauty" are described by means of traditional adjectives. The helplessness of the lover, his constant hope for the vision, is vividly reflected in the images of "propeller", "begger", "whacky", "nightingale" used by the poet. In romantic lyrics, the image of a lover walking side by side with a lover is interpreted with such qualities as "gentleman", "other guide", "and stranger".

In his interpretation of the theme of love, the poet not only continues the creative traditions of his predecessors such as Alisher Navoi, Ogahi, and Munis in creating a poetic image, but also clearly demonstrates his individual artistic skills. He makes unique creative experiments on the harmony of poetic form and poetic content. Loading a lot of meaning into a few words can show that a person has mastered the art of expressing an image through unique images. The interpretation of love in Feruz's poetry corresponds to Alisher Navoi's "xoslar ishq" in "Mahsub ul-qulub". Describing the beauty of the world, the poet said in the words of Hazrat Navoi: "A pure eye brings a pure face to a pure face, and a pure heart is aroused by a pure face and with this pure means of mockery, the lover enjoys the true beauty of the lover." In this respect, the poet remained faithful to the traditions of our classical literature and developed them.

### ABSTRACT

*In this article, the concept, nature, meaning and characteristics of the right to use a land plot, the scientific and legal basis for restriction of land use rights in the republic have not yet been developed and implemented. Therefore, the study, development and implementation of the current situation of restriction of land use are one of the most pressing problems facing the land cadastre and legislation.*

**KEYWORDS:** *Ground Servitude Legal, Restriction Of Land Use Rights, Servitude Agreement, Servitude Legal, Types Of Land Servitude.*

### INTRODUCTION

Efficient use of land at the level of scientific development, ensuring its protection is one of the key factors of economic development.

However, despite the formation of laws and other normative-legal and technical documents adopted during the years of independence, the number of cases of non-compliance with the requirements and rules of land use in our country has not decreased. The current situation is exacerbated by the fact that the current state of land use legislation, in particular land servitude legislation, is unsatisfactory and inadequately regulated, there is a need to improve land legislation, as well as insufficient research on scientific issues related to limited land use rights in Uzbekistan.

Indeed, one of the most pressing issues is the rational and efficient use of land resources, optimal management of land use, improvement of the system of regulation of land relations, especially land servitude and the implementation of the state control system aimed at its legal protection.

In our opinion, in near future (5-10 years) the issues of implementation of the land servitude system and the regulation of relations in the field will remain relevant. Thus, the practical and theoretical study of the relationship with the technical and legal regulation of land servitude, as well as the improvement of relevant legislation is one of the most pressing issues facing scientists today.

The laws and regulations that form the legal basis for the implementation and regulation of land servitude, the history of the implementation of the servitude, the development of our national legislation, as well as theoretical and practical aspects of the application of international and foreign experience in regulation. Limited use of land, scientific and practical aspects of the introduction and regulation of land servitude, as well as issues of their improvement.

The main purpose of this study is to develop a system of servitude types on the example of land users, scientific analysis of existing problems in the limited use of land.

In the face of radical positive changes in Uzbekistan, there is a growing need to regulate limited land use. There is also a need to study the existing problems of limited land use in the country on the basis of international and foreign experience.

The practical significance of this research work is reflected in the fact that scientific and theoretical ideas have studied the procedures, the limited use of land and help to improve the legislation. When a particular need or necessity arises, one or more landowners and land users serve to exercise limited use of another's land.

Hence, a land servitude can be described as a limited use of another's land. It is also important in terms of resolving the inconveniences and conflicts that arise due to the fact that private ownership of land is defined and the benefits are not evenly distributed among individual land users, which encourages the introduction of land servitude.

In general, a servitude is a limited right of another to use a plot of land, ie a limited use of one or more adjacent areas.

Servitude (Latin "servitus", "servitutis" - "dependence", "slavery") - the right to limited use of another's property, the formation and development of which is directly related to private ownership of land. The allotted plot of land will not have all the features necessary for its use. In particular, the lack of water on the plot of land or the lack of access to public roads, and so on. In order for this land to be usable and economically viable, there is a need for limited use by the neighbor.

Land servitudes are divided into several types, such as the servitude of agricultural lands, that is, the servitude of urban lands for cultivation, and the servitude of land given for the construction of buildings. Figure 1 below shows the mechanisms for introducing land servitude.

→	<b>Mechanisms of introduction of land servitude</b>
→	Research and introduction of foreign experience in limited land use in the Republic
→	Theoretical and methodological study of the introduction of land servitude
→	Improving land servitude based on research of legal bases
→	Development of samples of land servitude contract by types of implementation
→	To study the reasons, procedure and factors of termination of the right of land servitude
→	Development of legal procedure and methods of introduction of land servitude
→	Development of the procedure for establishing the rights, tasks, scope and powers of the service bodies for the management, control and dispute resolution of the introduction of land servitude
→	Development of models and samples for the introduction of land servitude and their testing
→	Assumptions in the direction of land servitude, development of scientific and methodological bases for determining the future stages

**Figure 1. Mechanisms for the introduction of land servitude in Uzbekistan.**

- Based on the current legal and technical basis of the easement, the specific features include:
- - the use of another's land is required as a condition for the formation of the land servitude;
- - land servitude usually arises by mutual agreement;
- - the use of another's land plot as a condition for recognition as a land servitude is used incompletely, i.e. in a limited way;
- - land servitude agreement is bilateral or multilateral and can be determined or ruled in court;
- The land servitude agreement is required to be registered by the state authorities.

In addition to the specific features determined by the legal basis of the land servitude, the following important features should be noted, namely:

- The servitude is not limited to certain persons. The conditions of the easement remain the same even if the neighbors or one of them changes, provided that the conditions requiring the formation of the land servitude are maintained.
- in servitudes in agriculture, the landowner or user must fully recognize the limited use of this land plot by a neighbor. However, he will not be obliged to provide financial assistance to his neighbor in the use of his land plot. For example, it does not undertake to allocate an additional separate road or prepare a road for crossing.
- the contract of land servitude is also terminated in case of loss of the bases of activity necessary for existence of the land servitude.

As a result of studying and analyzing the theoretical and methodological bases and normative documents of land allocation for state and public needs in the territory of the administrative district, it is possible to identify priorities for a positive solution to this problem.

The principle of participation of citizens and public organizations in decision-making on land rights in the legislation on the basic principles of land legislation, given in Article 2 [1] of the Land Code of the Republic of Uzbekistan, based on the right to participate in decision-making on the needs of citizens and society we consider it expedient to supplement it with.

Article 35 of the Land Code of the Republic of Uzbekistan stipulates that the state registration of rights to land plots and land transactions may be appealed in court in accordance with Article 16 of the Law of the Republic of Uzbekistan "On State Land Cadastre". It is also desirable to determine.

The grounds for termination as a result of the revocation of the circumstances that were the basis for the establishment of the land servitude as a result of the restriction of the intended use of the land plot in respect of which the servitude was established, can be recognized as a list of standard grounds.

We believe that the implementation of the model easement agreement in the legislation of the Republic of Uzbekistan, along with the efficient use of land, will eliminate various conflicts, save land and generate additional revenue for the state treasury.

**Biography of the author****Jurakulov Doniyor Ochilovich**

From October 22, 2018 to the present he is the head of the department "Cadastre of buildings and structures" of the Samarkand State Institute of Architecture and Construction. Year of birth: 01.01.1957 Place of birth: Gallaorol district of Jizzakh region.

Education: Higher

In 1980 he graduated from the Tashkent Institute of Irrigation and Agricultural Mechanization Engineers, Faculty of Land Management. Candidate of Technical Sciences, Associate Professor

**WORK ACTIVITY:**

1975-1980 - Student at the Tashkent Institute of Irrigation and Agricultural Mechanization Engineers

1981-1985 - Assistant of the Department of "Engineering Geodesy" Samarkand State Institute of Architecture and Construction

1985-1988 - Postgraduate student of Moscow Institute of Civil Engineers

1989-1995 - Junior Research Fellow at Samarkand State Institute of Architecture and Construction, Assistant Professor, Department of Engineering Geodesy, Deputy Dean of the Faculty of Construction Technology

1995-1996 - Dean of the Faculty of Construction Technology, Samarkand State Institute of Architecture and Construction

1996-1997 - Acting Head of the Real Estate Cadastre Service of Samarkand Region

1997-2006 - Head of the Real Estate Cadastre Service of Samarkand region

2006-2008 - Head of the Department of Land Resources and State Cadastre of Samarkand region

2008-2010 - Deputy Head of the State Unitary Enterprise "Ermulkkadastrxizmati" Samarkand region, State Registrar

2010-2018 - Head of the Department of Geodesy, Cartography and Cadastre of Samarkand State Institute of Architecture and Construction

2018y. Till present. - Head of the Department of Cadastre of Buildings and Structures of Samarkand State Institute of Architecture and Construction.

### ABSTRACT

*In this article considered the use of inequalities to find the limits of fairly complex sequences. To this end, proved a few inequalities and with the help of these inequalities calculate limits.*

**KEYWORDS:** *The Limits Of, Sequence, Inequality Harmonic Series, Convergent, Divergent*

### INTRODUCTION

The important role of inequalities is determined by their application in various questions of natural scenic and technology.

The fact is that the values determined from one practical task, or another can be found not exactly, but approximately. In the decision of practical problems have to take into account all error measurements. Moreover, as the improvement of the art and complications problems have to improve and technique measurement values.

In the following tasks, using inequalities, we calculate the limits of fairly complex sequences.

Lemma. For any natural  $n$ , the following inequality holds

$$\frac{1}{n+1} < \ln\left(1 + \frac{1}{n}\right) < \frac{1}{n} \quad (1)$$

Evidence. It is known that a monotonically increasing and bounded variable has a limit. Therefore, there is a limit to the variable  $x_n$ . This limit is denoted by the letter  $e$ , i.e.

$$e = \lim_{n \rightarrow \infty} x_n = \lim_{n \rightarrow \infty} \left(1 + \frac{1}{n}\right)^n$$

Since the value of  $x_n$  approaches its limit increasing, then  $x_n$  is less than its limit, i.e.

$$x_n = \left(1 + \frac{1}{n}\right)^n < e \quad (2)$$

It is easy to check that  $e < 3$ . We now show that the limit of the variable  $Y_n$  is equal to  $e$ . In fact

$$\lim Y_n = \lim \left(1 + \frac{1}{n}\right)^{n+1} = \lim \left(1 + \frac{1}{n}\right)^n \cdot \left(1 + \frac{1}{n}\right) = e \cdot 1 = e$$

As  $Y_n$  approaches number  $e$  decreasing, that

$$\left(1 + \frac{1}{n}\right)^{n+1} > e \quad (3)$$

Combining inequalities (2) and (3) we get

$$\left(1 + \frac{1}{n}\right)^n > e < \left(1 + \frac{1}{n}\right)^{n+1}$$

Logarithm these inequality in the basis of  $e$ , finally we find

$$n \ln \left(1 + \frac{1}{n}\right) < \ln e = 1 < (n+1) \ln \left(1 + \frac{1}{n}\right), \quad \frac{1}{n+1} < \ln \left(1 + \frac{1}{n}\right) < \frac{1}{n}$$

Lemma proved.

The task of 1. Believing

$$x_1 = 1 + \frac{1}{2}, \quad x_2 = \frac{1}{2} + \frac{1}{3} + \frac{1}{4}, \quad x_3 = \frac{1}{3} + \frac{1}{4} + \frac{1}{5} + \frac{1}{6},$$

$$x_4 = 1 + \frac{1}{4} + \frac{1}{5} + \frac{1}{6} + \frac{1}{7} + \frac{1}{8}, \quad x_n = \frac{1}{n} + \frac{1}{n+1} + \frac{1}{n+1} + \frac{1}{n+2} + \dots + \frac{1}{2n},$$

find  $\lim_{n \rightarrow \infty} x_n$ .

The solution. Replacing  $n$  by  $n-1$  in the first part of inequality (1), we get

$$\frac{1}{n} < \ln \left(1 + \frac{1}{n-1}\right) = \ln \frac{n}{n-1}$$

From this inequality and the second part of inequality (1) it follows that

$$\ln \frac{n+1}{n} < \frac{1}{n} < \ln \frac{n}{n-1}$$

Now, using inequalities (4), we write inequalities

$$\ln \frac{n+1}{n} < \frac{1}{n} < \ln \frac{n}{n-1},$$

$$\ln \frac{n+2}{n+1} < \frac{1}{n+1} < \ln \frac{n+1}{n},$$

$$\ln \frac{n+3}{n+2} < \frac{1}{n+2} < \ln \frac{n+2}{n+1},$$

.....

$$\ln \frac{2n+1}{2n} < \frac{1}{2n} < \ln \frac{2n}{2n-1}$$

Adding then and taking into account that the sum of logarithms is equal to the logarithm of the product, we get

$$\begin{aligned} \ln \frac{(n+1)(n+2)(n+3) \dots (2n+1)}{n(n+1)(n+2) \dots 2n} &< \frac{1}{n} + \frac{1}{n+1} + \dots + \frac{1}{2n} < \\ &< \ln \frac{n(n+1)(n+2) \dots 2n}{(n-1)n(n+1) \dots (2n-1)} \end{aligned}$$

i. e.

$$\ln \frac{2n+1}{n} < \frac{1}{n} + \frac{1}{n+1} + \dots + \frac{1}{1n} < \ln \frac{2n}{n-1} \quad (5)$$

Because

$$\frac{2n+1}{n} = 2 + \frac{1}{n}, \quad \text{that}$$

$$\lim_{n \rightarrow \infty} \ln \frac{2n+1}{n} = \lim_{n \rightarrow \infty} \ln \left( 2 + \frac{1}{n} \right) = \ln 2$$

Exactly the same from

$$\frac{2n}{n-1} = 2 + \frac{2}{n-1} \quad \text{that}$$

$$\lim_{n \rightarrow \infty} \ln \frac{2n}{n-1} = \ln 2$$

So, the extreme members of inequality (5) have the same limits. Consequently, the middle term has the same limit, i.e.

$$\lim_{n \rightarrow \infty} \left( \frac{1}{n} + \frac{1}{n+1} + \dots + \frac{1}{2n} \right) = \lim_{n \rightarrow \infty} x_n = \ln 2$$

The task of 2. Putting  $z_1 = 1$ ,  $z_2 = 1 - \frac{1}{2}$ ,  $z_3 = 1 - \frac{1}{2} + \frac{1}{3}$ , ...,  $z_n = 1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \dots + \frac{1}{5} - \frac{1}{6} + \dots + (-1)^{n-1} \frac{1}{n}$ , calculate  $\lim_{n \rightarrow \infty} z_n$ .

The solution. we have

$$\begin{aligned} z_{2n} &= 1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \frac{1}{5} - \frac{1}{6} + \dots + \frac{1}{2n-1} - \frac{1}{2n} = \left( 1 + \frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \frac{1}{5} + \frac{1}{6} + \dots + \frac{1}{2n-1} + \frac{1}{2n} \right) - \\ &2 \left( \frac{1}{2} + \frac{1}{4} + \frac{1}{6} + \dots + \frac{1}{2n} \right) = \left( 1 + \frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \frac{1}{5} + \frac{1}{6} + \dots + \frac{1}{2n-1} + \frac{1}{2n} \right) - \left( 1 + \frac{1}{2} + \frac{1}{3} + \dots + \frac{1}{n} \right) = \\ &\frac{1}{n+1} + \frac{1}{n+2} + \dots + \frac{1}{2n} \end{aligned}$$

In the previous task we put

$$x_n = \frac{1}{n} + \frac{1}{n+1} + \dots + \frac{1}{2n}$$

Consequently,  $z_{2n} = x_n - \frac{1}{n}$ . But  $\lim_{n \rightarrow \infty} x_n = \ln 2$ . In this way,

$$\lim_{n \rightarrow \infty} z_{2n} = \lim_{n \rightarrow \infty} \left( z_n - \frac{1}{n} \right) = \ln 2$$

Note also, that  $z_{2n+1} = z_{2n} + \frac{1}{2n+1}$ , and hence  $\lim_{n \rightarrow \infty} z_{2n+1} = \lim_{n \rightarrow \infty} \left( z_{2n} + \frac{1}{2n+1} \right) = \ln 2$

So,  $\lim_{n \rightarrow \infty} z_n = \ln 2$ .

The task of 3.

Series

$$1 + \frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \dots + \frac{1}{n} + \dots$$

is called harmonic series. Prove that harmonic series diverges.

The solution. according to inequality (1)

$$\frac{1}{n} > \ln \frac{n+1}{n}$$

Assuming  $n = 1, 2, 3, \dots, n$ , we write  $n$  inequalities:

$$1 > \ln \frac{2}{1},$$

$$\frac{1}{2} > \ln \frac{3}{2},$$

$$\frac{1}{3} > \ln \frac{4}{3},$$

.....

$$\frac{1}{n} > \ln \frac{n+1}{n}$$

Adding them, we get

$$x_n = 1 + \frac{1}{2} + \frac{1}{3} + \dots + \frac{1}{n} > \ln \frac{2 \cdot 3 \cdot 4 \dots (n+1)}{1 \cdot 2 \cdot 3 \dots n} = \ln(n+1)$$

From this inequality it follows that  $\lim_{n \rightarrow \infty} x_n \geq \lim_{n \rightarrow \infty} \ln(n+1) = \infty$

Therefore, the harmonic series diverges.

The task of 4. Find limit

$$\lim_{n \rightarrow \infty} \frac{1 + 2^\alpha + 3^\alpha + \dots + n^\alpha}{n^{1+\alpha}}, \quad \alpha > 0$$

The solution. we first prove inequality

$$\frac{n^{\alpha+1}}{\alpha+1} < 1 + 2^\alpha + 3^\alpha + \dots + n^\alpha < \frac{(n+1)^{\alpha+1}}{\alpha+1}, \quad \alpha > 0$$

Since  $\alpha > 0$ , then  $\alpha+1 > 1$  and therefore

$$\left(1 + \frac{1}{n}\right)^{1+\alpha} > 1 + \frac{1+\alpha}{n},$$

$$\left(1 - \frac{1}{n}\right)^{1+\alpha} > 1 - \frac{1+\alpha}{n}$$

Multiplying these inequalities by

$n^{1+\alpha}$  we get

$$(n+1)^{1+\alpha} > n^{1+\alpha} + (1+\alpha)n^\alpha,$$

$$(n+1)^{1+\alpha} > n^{1+\alpha} - (1+\alpha)n^\alpha,$$

From these inequalities it follows that

$$\frac{n^{1+\alpha} - (n-1)^{1+\alpha}}{1+\alpha} < n^\alpha < \frac{(n+1)^{1+\alpha} - n^{1+\alpha}}{1+\alpha}.$$

We write these inequalities at values of  $n = 1, 2, 3, \dots, n$ :

$$\begin{aligned} \frac{1}{1+\alpha} < 1 < \frac{2^{1+\alpha} - 1}{1+\alpha}, \\ \frac{2^{1+\alpha} - 1}{1+\alpha} < 2^\alpha < \frac{3^{1+\alpha} - 2^{1+\alpha}}{1+\alpha}, \\ \dots\dots\dots \\ \frac{n^{1+\alpha} - (n-1)^{1+\alpha}}{1+\alpha} < n^\alpha < \frac{(n+1)^{1+\alpha} - n^{1+\alpha}}{1+\alpha} \end{aligned}$$

Adding them we get

$$\frac{1}{1+\alpha} < 1 + 2^\alpha + 3^\alpha + \dots + n^\alpha < \frac{(n+1)^{1+\alpha}}{1+\alpha} < \frac{(n+1)^{1+\alpha}}{1+\alpha}$$

From here

$$\frac{1}{1+\alpha} < \frac{1 + 2^\alpha + 3^\alpha + \dots + n^\alpha}{n^{1+\alpha}} < \frac{\left(1 + \frac{1}{n}\right)^{1+\alpha}}{1+\alpha}$$

The last part of the last inequalities is the constant number  $\frac{1}{1+\alpha}$ , and the right side tends to the limit equal to  $\frac{1}{1+\alpha}$ , when  $n$  tends to infinity. Hence, the middle part of the inequalities tends to the same limit, i.e.

$$\lim_{n \rightarrow \infty} \frac{1 + 2^\alpha + 3^\alpha + \dots + n^\alpha}{n^{1+\alpha}} = \frac{1}{1+\alpha}$$

### ABSTRACT

*This article deals with the work of Rauf Parfi. In particular, the poetry of national and relative peoples, which was the basis for the formation of his literary and aesthetic views, is analyzed. In order to look to the future of our poetry, we involuntarily refer to his personality and poetry, to his extraordinary creations. Rauf Parfi's personality and poetry are extraordinarily unique and captivating. He was humble and humble, a man and a dervish, a poor man and a poor man, a gentleman and a wise man, a man of truth and courage. Anyone who does not understand Navoi does not know or understand his people today. As an ordinary poet, I say, is not the infinite sin of not understanding Navoi great? Isn't that a big mistake? [5.78-p.].*

**KEYWORDS:** *Literary-Aesthetic View, Theme, Idea Style, Research, Interpretation, Analysis*

### INTRODUCTION

*...there is no poet, there is poetry.*

**Rauf PARFI**

"One who understands both worlds may not understand the third world, poetry," said one scholar. There are reasons for this, of course. Poetry, unlike both worlds, has its own rules, forms, and methods of expression. They enchant, attract, delight, excite. He convinces them of his wisdom, says Shukur Qurbon.

They come to the world in search of truth, valued by love. They live with the forgiveness of the afflictions and the afflictions of the heart. Until the Day of Judgment, man's destiny will be beautiful, burning, pure, and adorned with words. It is not in vain that it is said, "There is magic in words and wisdom in poetry." Indeed, the address of humanity's example and lesson, hope and trust, is also approached through the enlightenment of poetry. [Page 5.6].

The poet Rauf Parfi Ozturk (Tursun Parpiyev), who entered the literature in the second quarter of the last century with bold, unique steps, has a bright place in Uzbek literature with his unique poetry and translations. In order to look to the future of our poetry, we involuntarily refer to his personality and poetry, to his extraordinary creations. Rauf Parfi's personality and poetry are extraordinarily unique and captivating. He was humble and humble, a man and a dervish, a poor man and a poor man, a gentleman and a wise man, a man of truth and courage. It is important that a person burns, lives, devotes himself to the word - poetry to the extent that he worships, loses, and finds, accordingly, arouses admiration, respect, and love. to poetry, to this poet. Rauf Parfi is a schoolboy poet who has had a profoundly positive effect on his peers and even some of his teachers, especially those who followed this path with enthusiasm and showed new passages to the creators they considered to be destiny, enriching the poetic landscape and addresses. In order to look to the future of our poetry, we involuntarily refer to his personality and poetry, to his extraordinary creations. In short, the understanding and discovery of this poetry is in its infancy. Rauf Parfini's research and development can be traced back to the development of Uzbek literature and poetry, the retreats from our own rivers due to the social events of the last two centuries, and various other influences.

Rauf Parfi's first steps were taken with the white blessing of his teacher, poet and literary critic Askad Mukhtar. An article published in the 1966 issue of Sharq Yulduzi under the heading "White Road" praised the poet's work.

"I think Rauf Parfi started singing in a voice that I don't think anyone else has. Such an event is very precious for poetry. From the very beginning of his work, such a poet begins to add a new symbol to poetry, a fresh breath...

Rauf Parfi began to sing in a voice unlike anyone else. This is a difficult creative process. But in Rauf's work, this difficulty is not felt, it is as smooth, natural, sincere as if it were easy to move. There is no declarative, no exhortation, no illustration, no didactic nudity in these poems. They are born out of the poet's world of pleasure. If the world expands and waves, if it is enriched with human passion and civic sense, Rauf Parfi will undoubtedly become a sensitive poet".

We have seen many cases of real talent being influenced by the environment and the social environment, even if they live only by their own laws. Attitudes toward Rauf Parfi and his work, who did not want to submit much to the demands of socialist realism, changed radically.

Rauf Parfi drew good conclusions about the position of poetic forms in poetry and did research on poetic forms such as sonnets, rondel, tanka, hokku, and they became experiments.

In the sonnet, which is mainly devoted to dedication, Rauf Parfi continues this tradition not only to the beloved, but also to the Motherland (three sonnets "Homeland", three sonnets "Pain"), classics and historical figures "Beethoven", three sonnet ("Michelangelo's love", "Alexander Ulyanov"), great artists and famous characters they create (three sonnets "Hamlet", "Chingiz Aytmatov") and their devotion to such sacred people and ideals reflected. The poet's sonnets

were highly appreciated by A. Mukhtor (his sonnets in "Return" were "artistically designed"), N. Rakhimjanov ("Hamlet").

Rondels also have a special place in the poet's work. Rauf Parfi enriched our poetry with a new form with his Rondels such as "Goodbye...", "I am transient...", "It's a sad night..."

We see that Rauf Parfi adapted his poems in the form of tanks to the weight of a finger:

*Sen-la ko 'rishmog'im kerak, Albatta – 11 hijo*

*Ne uchun? Bilmayman. Albatta kerak – 11 hijo*

*Taxminan, men senga – dunyo qorong'u, - 11 hijo*

*Dunyo bir bedarddir – kabi so 'zlarni – 11 hijo*

*Aytmog'im uchun ham keraksan menga – 11 hijo*

Not only in Rauf Parfi's "tank" and trinity, but in most of his poems, the conclusion is left to the reader. Not only do our poets not know the requirements of the poetic form, but they are also very accustomed to concluding poems...

In the discussion of the spiritual world of the lyrical hero Rauf Parfi (referring to the debate covered in "UzAS" in 1981-1982), a critic said that it is necessary to pay attention to his art, and therefore to analyze the poems. did not throw.

In addition to the above analysis, Rauf Parfi's free-flowing poems are analyzed separately, and the similarity of the poet's and Nazim Khikmat's styles is discussed:

Nozim Khikmat:

*Otliqlar g'oyib bo'lar*

*quyosh botar yerda...*

*Otliqlar, otliqlar, qizil otliqlar,*

*Otliqlari shamol qanotlilar...*

*Otlari shamol qanot...*

*Otlari shamol...*

*Otlari...*

*Ot...*

By Rauf Parfi:

*Ikki rang: Oq va qora*

*Haqiqat va yolg'on.*

*ey jafokash haqiqat.*

*Bu san'at,*

*san'at!*

*san...*

He also quoted A. Mukhtor as saying that in the environment of R. Parfi's research there are such painful, rebellious and eloquent poets as Nazim Hikmat, Oybek, Garcia Lorca, Ghafur Ghulam, Pablo Neruda, Andrey Voznesensky, Mahmud Darvesh, Mirtemir. meditates on the fact that the wide sea, which arises from many streams, drinks water from the ocean. B. Akramov's article "The Artist of the Spirit" [pp. 3.48-51] analyzes the poet's poems in terms of ideas and peculiarities. The analysis is divided into two:

1. The motivation of poetry, the fate of the poet
2. Orifona punctuation marks

The poems, which reflect the creative spirit in them, reveal the harmony and influence of the works of Khazrat Navoi:

*Rom etmas, hech narsa, sahrodir ko 'ngil,*

*Osmonlarga faqat afsona so 'zlar*

*Malomat toshida ochilgan bir gul,*

*Dam o 'tmas qular ul, dam o 'tmas bo 'zlar.*

Surprisingly, Hazrat Navoi figuratively called his lyrical hero, the poet, the sage, the lover, the rind, the governor, the dervish, the nobleman, a "nightingale of reproach." Rauf Parfi, following the words of a very responsible person, such as "You are in a hurry to recite a poem only in the blessed language of the great Alisher", encourages the poet's metaphor and encourages the poet's unique heart in endurance and devotion. a flower that opens from a stone. ”

... The rebellious spirit is sometimes expressed in a hopeless-sad tone (this is a bright hope for poetry!), Which is reminiscent of the involuntary Navoi line. "People's despair has brought joy to my heart." This strange contradiction has a special tone in Rauf Parfi:

*Hechnarsayupatmas, shoir, hechnarsa,*

*G 'aribbaxtiyorlikendiyupatar.*

*ehtimol, nohaqman, ehtimolhaqman,*

*Lekin men muqaddas so 'zni izlarman.*

In the article "Symbols of the Spiritual Creation" B. Akramov introduces the poet's unique creative world. In the article he took account into the followings:

- Specific parables of the poet;
- Experiences of the lyrical hero;
- Symbols drawn on the word board;
- Analysis of poems

The attitude to the poet's work is reflected in the articles published about him in the press.

Based on the views of Rauf Parfi, a great representative of the sonnet writing of the 60s and 80s, academicians B. Nazarov and S. Mamajonov, the concepts of truth and justice at the heart of the poet's poetry It can be acknowledged that the genre of poetry of other nations is elevated on the

basis of national poetry. Rauf Parfi's works include "Dilorom's Eyes", "Michelangelo's Love", "Hamlet", "Love", "Mother Tongue", "Abdurauf Fitrat", "Abdulhamid Sulaymon Cholpon", "Mother Turkistan", "Sunbula", "Pain", "Black Wall", "Siyovush", "Passenger", "Without You", "Missing God", "The Last Poem of Thakur", "A Letter to the World, My Mother" and analyzes some of them. In particular, the analysis of the series of sonnets "Mother Turkiston" leads to the following conclusions:

"The patriotic poet Rauf Parfi has managed to place the nation's hundred-year past in one work. Symbols, through metaphors, promoted the most dangerous, most rebellious ideas in an environment of an unjust system. From the point of view of poetry, he expanded the possibilities of the sonnet and the series of sonnets by combining three epochs (late 19th century, early 20th century and 70s). Each of the sonnets in the category has three tenses. They became so intertwined that the three sonnets became a single work [p. 10.106].

Commenting on the aesthetics, images and essence of the poet, N. Rakhimjanov said:

- The poet's point of view in the evaluation of the work of art in determining the artistic aesthetic function of the word in the poem;
- The phenomenon of freedom is artistically studied in the aesthetics of Rauf Parfi at the level of socio-philosophical category;
- Justification of truth and truth, rebellion against it, hypocrisy, oppression, etc., are the essence of Rauf Parfi's aesthetics;
- The fact that the artistic word in the aesthetics of Rauf Parfi has brought a new wave of realism to the direction of figurative thinking, based on fantasy, in favor of a brutal truth;
- Love in the poet's interpretation is an unattainable love in the form of a dream;
- The word itself, the eye of truth, is the essence of Rauf Parfi's poetry.

N. Rakhimjanov in the article "Factors of formation of literary and aesthetic views of the poet" from the book "Independence and modern literature" gradually analyzes the work of Rauf Parfi and discusses in detail the factors of its formation. From the first exercises of the poet at the age of 16-17 to the last years of his life, he focuses on the issue of poetic aesthetic ideals in his poems. The poet's spiritual world focuses on his "burning words":

"Do poets now live for scientists alone? If no student knows what you're talking about, isn't that a false life, a false creation? Who benefits from it? After all no one can enjoy ?! Well, do we know Navoi? We need to start the culture of understanding Navoi from kindergarten. Anyone who does not understand Navoi does not know or understand his people today. As an ordinary poet, I say, is not the infinite sin of not understanding Navoi great? Isn't that a big mistake? [5.78-p.].

O. Oltinbek notes that in the article "Literary and aesthetic views of Rauf Parfi" published articles on the literary and aesthetic views of Rauf Parfi, although the views of previous critics were published, they did not cover the topic in full. N. Rakhimjanov's articles are based on the poet's article, literary dialogue and preface, and in his article he uses the poet's poetry as the source. The article discusses the most frequently repeated word in Rauf Parfi's poetry - the WORD, a remarkable image in his creative development - about the bird, the influence of

inspiration on the poet, etc. reaches in particular, the image of a bird did not rise to the level of an image in the poet's first exercises (50s), but he dreamed of seeing a resemblance to it, and later (in the 60s) wrote a poem to the level of a bird's artistic image. that he rose and approached the poet, that he sang hopefully with a sorrowful heart, though unknown, and that in a poem written in 1994, the bird began to sing bitterly, though it remains unknown. In a poem written in the last years of Rauf Parfi's life:

*Yo 'q, men qushman, chala so 'yilgan qushman,*

*Aytilmagan bir so 'zim bor bog 'zimda.*

By saying that, it is thought that the poet himself became a bird. In his article, O. Oltinbek enriched his previous research by analyzing the literary and aesthetic views of the poet.

The results of research show that the phenomenon of the poet, his analysis, has always been in the spotlight and recognition of the literary community. In the study of Rauf Parfi's work, the articles and reviews written about the poet in his early speeches, in particular, the articles and reviews of A. Mukhtor and I. Khaqqul, play an important role. Although the first and later articles show a two-pronged approach to the poet's work, Rauf Parfi has a special place in the literature of the period.

The period of independence was a time of opening new horizons for the study of the poet's work, as well as a period of appreciation for his work. From the first days of independence, Rauf Parfi's work was recognized and awarded the International Mahmoud Kashgari Prize. The researches of such scholars as N.Rahimjanov, B.Akramov, O.Oltinbek on the art of the poet's work play an important role in this period. His literary and aesthetic views are studied in N. Rakhimjanov's articles "Conversation with words and colors", "Edges of mastery", O. Oltinbek's articles "Literary and aesthetic views of Rauf Parfi". There is a beautiful analysis of the poet's work based on the demands of art.

The study of Rauf Parfi's work serves as a basis not only for the individual poet, but also for the renewal of Uzbek poetry, which began in the 1960y, and for its current horizons.

## SCIENCE AND EDUCATION IN THE RENEWED HISTORY OF UZBEKISTAN: ANALYSIS, AND STRATEGIC GOALS

**Zokir Khudoy berganov\***

\*A Teacher of Physical Training Department,  
Tashkent State Technical University, UZBEKISTAN

### ABSTRACT

*The article highlights the systematic changes in recent years in the field of science and education, including new initiatives in science, preschool, secondary specialized, higher education. It also contains views on the issues put forward by the President of the Republic of Uzbekistan to the Oliy Majlis Yanuar 24 2020 y.*

**KEYWORDS:** Science, Academy Of Sciences, Education, Preschool Education, Higher And Secondary Specialized Education, Higher Education, Statement, Decision, Decree, Kindergarten, Lyceum, College, Institution, University, Reform.

### INTRODUCTION

#### Relevance of the topic:

The rapid changes taking place in our society, especially the large-scale reforms in science and education, play an important role in ensuring the socio-economic development of our country. The upbringing of the younger generation, their level of knowledge, spiritual and physical maturity is one of the priorities in the development of our state. In particular, the near-term development of this industry is scientifically and theoretically substantiated in the Action Strategy for the five priority areas of development of the Republic of Uzbekistan for 2017-2021. In particular, it is important to bring up young people who are physically healthy, mentally and intellectually developed, independent-minded, loyal to the Fatherland, with a strong outlook on life, and increase their social activity.

For several years now, the Addresses of the President of our country Shavkat Mirziyoyev to the Oliy Majlis have put forward important initiatives for the accelerated development of science and education, as well as all other spheres, and put forward many proposals for their solution. The economy and development of any country is based primarily on science, science and modern technologies. Therefore, based on numerous discussions and international experience in terms of

building an economy based on digital technologies, enhancing the prestige and prestige of science in the life of the state and society, and taking into account the views of the general public, 2020 is the Year of Science and Digital Economy in Uzbekistan. was announced. This will be a solid foundation for the rapid development of science and education in the future.

2. Research methods: Accelerated reforms in science and education, including new initiatives and systemic changes in the development of science in the "Renewing Uzbekistan" on the basis of comparative, historical comparisons, methods of historical analysis and in the Address of the President of the Republic of Uzbekistan to the Oliy Majlis on January 24, 2020 the conceptual issues raised were analyzed.

3. Research results: In the new history of our country, attention is paid to the history of the President's Addresses. The Address dated December 28, 2018 addresses the issues of strengthening the role of academic science in the development of the state and society, development of research and innovation, implementation of advanced scientific achievements, enhancing the prestige of local scientific schools and enhancing the country's scientific potential internationally. special attention was paid. A lot has been done in the last two or three years, a lot of progress has been made in this regard. It is noteworthy that the Decree of the President of the Republic of Uzbekistan "On approval of full members of the Academy of Sciences of the Republic of Uzbekistan" (December 29, 2017) [1].

As noted in the Address of the President of the country to the Oliy Majlis on December 28, 2018, the last elections for the full membership of the Academy of Sciences were held in 1995. Since then, the issue has been neglected, prompting new reforms in this area. It was no secret that the number of academics has more than halved over the years for various objective and subjective reasons. Even by December 2017, there were only 63 full members left in the academy.

As a result of special attention to the field, in a short period of time a series of targeted measures aimed at further improving the regulatory framework and funding mechanisms, strengthening the material and technical capacity and increasing efficiency have been consistently implemented. As a result, 9 research institutions were returned to the Academy of Sciences, a number of scientific organizations were reorganized, 3 departments of the Academy of Sciences and the Navoi branch were established, and the Public Council for the Modern History of Uzbekistan was established.

The head of state adopted the "Comprehensive Program of Measures to Strengthen the Infrastructure of Research Institutions and Develop Innovative Activities for 2017-2021" and stressed that systematic work is being done in this area. The Action Strategy for the five priority areas of development of the Republic of Uzbekistan for 2017-2021 includes the promotion of research and innovation as the most important areas of development of science and education, the creation of effective mechanisms for the implementation of science and innovation, higher education and research. Serious attention is paid to the establishment of specialized scientific and experimental laboratories, high-tech centers and technoparks at the institutes.

In particular, by 2018, after a long break of the last 22 years, the most suitable scientists were selected on a competitive basis to confirm their academic status in the Academy of Sciences. In accordance with the Presidential Decree, 32 new full members of the Academy of Sciences have been approved on the recommendation of full members who are active in the development of science, education, culture and arts, sports. From January 1, 2018, full members of the Academy of Sciences of the Republic of Uzbekistan and former members of the Academy of Agricultural Sciences of Uzbekistan are paid 12 times the minimum wage, corresponding members of the Academy of Agricultural Sciences of Uzbekistan are paid 8 times the minimum wage [3]. It is noteworthy that these fees are exempt from personal income tax.

Particular attention has been paid to the ongoing work on reforming the preschool education system in modern Uzbekistan. This is confirmed by the following examples. That is, by 2019, the number of kindergartens in our country increased by 1,400 to 6,367. In this regard, it should be noted that in recent years, a number of important decrees and decisions have been adopted, which serve to raise the education system to a whole new level. In accordance with the decree of the President of the Republic of Uzbekistan dated September 30, 2017, the Ministry of Preschool Education was established for the first time in our country. In a short period of time, more than 980 kindergartens have been built and put into operation, where educational work is carried out using the most advanced methods and tools. As the head of our state noted, "The number of private pre-school educational institutions built on the basis of public-private partnership has doubled over the past year and now stands at 568. Practical work has begun to open another 1,000 such kindergartens."

As a result of the reforms launched in the Address of the President to the Oliy Majlis on January 24, 2020, 5,722 public and private family kindergartens were established in 2019. It was noted that the coverage of our children with preschool education has increased from 38% to 52% in one year [4].

Another important reform in the field of education over the past 3 years is the radical changes in the areas of general secondary as well as secondary special, vocational education. In this regard, a comprehensive analysis of the results of the transition to 12 years of compulsory education has shown that the current system of secondary special, vocational education is not responsive to today's students and needs to be radically reformed. In order to systematically address the existing problems in this area, to radically improve the system of vocational education based on the experience of advanced foreign countries, the Presidential Decree of January 25, 2018 "On measures to radically improve the system of general secondary, secondary special and vocational education." accepted.

If we look at the numbers, in 2019, 4 Presidential schools and 3 creative schools with a completely new content and form were launched. As of January 1, 2019, more than 5.2 million students study in 9.7 thousand schools in the country, more than 450 thousand employees work in the educational and management process. Special attention was paid to the issues of their material life and social status in society. In particular, President Shavkat Mirziyoyev at a meeting on July 17, 2018 on the reform and development of the general secondary education system stressed the need to raise the social status of teachers. The world experience confirms

this, the President said. For example, in countries such as South Korea, Japan, Germany, and Canada, a teacher's salary is 1.5 times higher than the national average. In our country, the salary of a teacher is only 79% of the average average salary [4].

However, as a result of radical reforms in the industry in our country over the past two and a half years, important reforms in this area have been reflected in the following:

The salaries of primary and secondary school teachers have been equalized. In this sense, today the creation of all facilities for teachers, the provision of housing for teachers, the allocation of car loans to them has become a product of great attention. According to the resolution, a part of affordable housing built annually in rural and urban areas on standard projects is provided to teachers working in the public education system for a period of 20 years, with a grace period of 3 years and the first 5 years at 7% per annum. of particular concern is the issuance of a mortgage loan with an initial assessment rate of 10 per cent in the amount of the refinancing rate.

From September 1, 2018, the salaries of more than 450,000 teachers and administrators working in schools have been increased. A special state award was established for them. The practice of involving teachers in various other economic and compulsory activities and conducting unfounded inspections in schools has been curtailed. In the last 2 years, about 13,000 male teachers have returned to schools, and the full payment of pensions to working retired teachers has been introduced.

In the new era of reforms, the next stage of the education system - higher education - is also being modernized. For example, in 2017-2019, extensive work was carried out in our country to create a system of higher education that meets international standards. In today's era of rapid changes in the field of higher education, in the context of increasing attention to the training of qualified personnel, the period itself requires an increase in the level of admission (quota) of higher education. If we look at the figures, including the data of the State Statistics Committee, until 2017, 163 out of every 1,000 people aged 25 and older in the country had higher education. Compared to the total population, only 12% of the population had higher education. According to the State Investment Committee, there were 18.5 million people with secondary, secondary special and higher education in Uzbekistan. These indicators indicate that the coverage of higher education in the country is still narrow [5].

Analyzes and studies have shown that in our country today, the majority of the population, who have fallen into the ranks of unorganized youth without access to education and employment, make up the majority of those with higher education. In our opinion, the main reason for this problem is, first of all, the low level of coverage of young people in different stages and forms of education, especially in higher education.

If we compare the level of enrollment of students in higher education institutions in our country until 2018 with the Central Asian republics, we will see that so far our indicators are much lower than in these countries. For example, if we take into account that at that time Kazakhstan had a population of more than 17 million, there were 122 universities with more than 496,000 students. Kyrgyzstan has a population of more than 7 million and more than 230,000 students study at 56

universities in the country. In Uzbekistan, as of September 1, 2018, for a population of more than 32 million, 81 higher education institutions, 15 regional branches, 260,905 students studied in 7 branches of foreign universities [6]. These figures show that the coverage of higher education is much lower than in neighboring countries. This shows the need to involve more people in education today, especially young people. Only when a citizen has a specialty can he or she think about a job. It goes without saying that only a citizen with a secondary special education or no education will have limited access to employment.

As noted in the Address of President Shavkat Mirziyoyev to the Oliy Majlis on January 24, 2020, 19 new higher education institutions were opened in 2019, including branches of 9 prestigious foreign universities, for the development of higher education. In cooperation with leading foreign universities, training on 141 joint educational programs has been launched. A total of 146,500 students were admitted to higher education institutions, or 2 times more than in 2016.

Over the past three years, the country has made significant progress in this area. If we look at the numbers, in 2018 alone, a total of 13 new higher education institutions in the country, including the International University of Tourism "Silk Road" in Samarkand, the Almalyk branch of the Russian Federal State Autonomous University "National Technological Research University", Tashkent, South Korea. A branch of Puchon University, a branch of Amiti University in India and a number of private higher education institutions have been launched. In accordance with the Decree of the Head of State, the El-Yurt Umidi Fund has been established under the Cabinet of Ministers. In 2018, for the first time, a national ranking of higher education institutions was created on the basis of international experience, and the processes of education and research were analyzed.

For three years, about a dozen higher education institutions and their branches have been established in our country. For example, Chirchik State Pedagogical Institute of Tashkent region, Almalyk branch of Tashkent State Technical University, Termez branch of Tashkent State Technical University, Termez branch of Tashkent State Pedagogical University, Denau branch of Termez State University, Termez branch of Tashkent Medical Academy, Termez branch of Tashkent State Agrarian University, Uzbekistan Fergana regional branch of the State Institute of Arts and Culture. Among them is a branch of the Moscow Institute of Steel and Alloys in Almalyk and Webster University in Tashkent. Due to the demand and needs in the real sector of the economy, part-time and evening departments have been established in higher education institutions. In addition, the Samarkand Institute of Veterinary Medicine, the University of Journalism and Mass Communications of Uzbekistan were established. These efforts are playing an important role in expanding the scope of higher education and increasing the number of graduates.

In this direction, for the first time since 2019, a system of simultaneous application of applicants to 3 universities was introduced, the admission process in 2018 and 2019 was organized in a transparent and fair manner, resulting in a wide range of applicants who could not enter for several years. created opportunities.

But we must all sincerely feel that we have a huge task ahead of us in this regard. As noted in the Address of the President to the Oliy Majlis on January 24, 2020, the coverage of the admission quota of higher education institutions has been increased to 25% compared to graduates of secondary schools and in 2021 to 50.60%. However, this figure is 74% in Russia and 96% in the Republic of Korea.

In the future, special grants will be allocated for girls. The Women's Committee was tasked with developing criteria for the selection and selection of candidates for training on the basis of these grants. The President emphasized that the focus is on optimizing the entrance exams to higher education institutions, simplifying the admission process, and getting real knowledge and education in higher education institutions. It is also necessary to create a national test system for assessing knowledge of the mother tongue. If young people take the exam at any time and receive the appropriate certificate, there will be no need to retake the test in their native language at the time of enrollment. Higher education standards will be improved on the basis of foreign experience, educational directions and disciplines will be reconsidered. The number of non-specialty subjects will be halved,"the President said in his address.

Clearly defining the priorities in the field of science for the country is to develop several priorities of science each year. In particular, it was noted that this year it is necessary to intensify fundamental and applied research in mathematics, chemistry, biology and geology, to create all conditions for scientists, to radically reconsider the mechanism of allocating targeted grants for fundamental and innovative research in science. Every higher education and research institution must establish cooperation with prestigious foreign universities and research centers. This year, the President noted that the El-Yurt Umidi Foundation should send more than 700 scientists, professors and teachers abroad for research and training [7].

To address these issues in the country, the program of integrated development of higher education in 2017-2021 sets target parameters for training. According to him, by 2021 the quotas will be 18.4 in the humanitarian sphere, 3.5 in the social sphere, 3.5 in the economy and law, 32.8 in the industrial and technical spheres, 38.5 in agriculture and water management, health and social security. 25.7 percent in the service sector and 39.7 percent in the services sector. The gradual implementation of this work by 2021 has been identified as a strategic goal [8].

As a strategic direction of the industry from 2020 in 6 areas of pedagogical education, the duration of training is set at 3 years, 10 higher education institutions will move to self-financing. Science grants will be doubled in the future, and Aiti Praks with modern infrastructure will be built in the capital Tashkent and regional centers. To implement these tasks, it is planned to develop a program "Digital Uzbekistan -30".

#### 4. CONCLUSIONS:

reforms and innovations, opportunities for scientists and researchers, aspiring students and youth in the field of science and education are expanding. In particular, the transition to various forms of science and education, radical reform of preschool education, fairness and transparency in the admission of applicants in higher education, the possibility of self-determination of admission quotas in universities, expanding the scope of students, the introduction of modern digital

technologies. is the result of new reforms. The most important thing is that the work carried out in all spheres of science and education is being reformed on the basis of critical analysis, strict discipline, which means that our society has entered a new era of development..

### ABSTRACT

*The article discusses modern trends in the development of integration processes and trade and economic relations in Central Asia in the context of the Great Silk Road, the dynamics of market services and prospects for deepening economic cooperation. Particular attention is paid to the development of foreign economic activity of the Republic of Uzbekistan, the efforts of the leadership to expand economic relations with China. Uzbekistan's foreign policy is aimed at developing good neighborly relations, at weakening economic cooperation with all countries of the Central Asian region.*

**KEYWORDS:** *Republic Of Uzbekistan, China, Trade And Economic Relations, Economic Cooperation, The Silk Road, Foreign Trade, Integration Ties, Strategic Partnership, Market Services.*

### INTRODUCTION

The strengthening of mutual understanding between peoples, the mutual rapprochement and enrichment of cultures and civilizations on this basis, the promotion of a deep understanding and respect for the traditions and customs of people - are among the most important missions of any state and society. Today, in this interdependent world there is not a single country, where representatives of only one nation or adherents of only one faith would live. All countries are multinational and multiconfessional. All this requires all states to conduct a deeply thought-out ethnocultural policy within their countries, as well as expand cultural and humanitarian cooperation and interaction with other countries, which will certainly serve to strengthen mutual understanding between people and states. In this context, I would like to emphasize that new Trends in Uzbekistan's foreign policy are based on giving even greater importance to strengthening cooperation in various areas, including the development of cultural and humanitarian exchanges, especially with neighboring countries in the region, as well as the

closest states, including China, which has always been and remains a close and reliable friend for Uzbekistan, a time-tested partner.

The interaction between the people of Uzbekistan and China has historical foundations, originating from the distant past. Millennia ago on the Great Silk Road there were traces of friendly and mutually beneficial contacts between the two people. The fact that the bonds of friendship between Uzbeks and Chinese have deep historical roots is a solid foundation for further strengthening good neighborliness between Uzbekistan and China. The territory of present-day Uzbekistan has been an important hub on the Great Silk Road since ancient times. There is no doubt that the Great Silk Road contributed to the development of relations, the exchange of information between states and regions, the spread of new types of products, the mutual enrichment of cultures. Being on the key sections of this historic transnational path of movement of social, economic, spiritual and cultural values - both of our countries made an important contribution to the development of world civilization. There are many rare and valuable Chinese written sources (books) in the book depositories of the Beruniy library of the Institute of Oriental Studies in Tashkent our historical cities of Bukhara, Samarkand, Khiva. Scientists believe that "The history of ancient ties between the Uzbek and Chinese peoples is most fully reflected in the writings of the Ambassador of the Han Empire, the scientist and traveler Zhang Tsang, which date back to the 2nd century BC.

And today you can see many similarities in the outlook on life and traditions of our people. This is a vivid example, the fruit of a centuries-old neighborhood and the interaction of the ancestors of the Uzbeks and Chinese. Both nations honor their relatives and value friendship. There are many examples. In particular, a common feature in the culture and mentality of the two people is respect for elders. This helps to easily establish trusting relationships with people (spiritual traditions); again one of the similar and mutually understandable features in the behavior of Uzbeks and Chinese is their attitude to entrepreneurship and the ability to organize trade relations. Visiting markets and private artisan shops in both countries, one can see similar features of the culture of trade relations (economic traditions). All this gives reason to note that Uzbekistan and China are countries that have many similarities in socio-cultural terms. One of them is hospitality - an indispensable norm for both Uzbeks and Chinese. We are also used to living in large families, surrounded by neighbors, and take into account public opinion. Today, Uzbekistan attaches priority to solving the problems of socio-economic development, enhancing economic cooperation with neighboring states of the region and leading countries of the world. In this context, the restoration of the Silk Road (within the framework of the large-scale project "One Belt, One Way") and the key role of Uzbekistan on it are considered as a strategic task, a condition for the country's prosperity. Finally, Uzbekistan, like China, is a colorful country with a rich historical and cultural heritage, unique ancient architectural monuments and Muslim shrines, which are carefully protected by the people and the state. In this context, I would like to note that Uzbekistan, according to many tourists and travelers, remains an important tourist center on the Great Silk Road, a very interesting link in this route.

After gaining independence, Uzbekistan has gained its place, position and voice in the world community. Many countries around the world are close to our country. It has been establishing international friendly relations on the fronts. The Republic of China and Uzbekistan, which are currently setting an example to many countries in the world with their rapid development, have established cultural, social, economic and political cooperation. In particular, the relations in the

field of education, science, technology and culture are developing and showing results. On the foreign policy of the Republic of Uzbekistan President Shavkat Miramanovich Mirziyoyev on December 22 In his address to the OliyMajlis in 2017, he put forward the following points. “Over the past period, significant results have been achieved in the field of foreign policy in the development of friendly and mutually beneficial relations with foreign countries, especially with neighboring countries. In 2017, 21 high-level visits took place. Meetings were held with leaders and representatives of more than 60 countries and international organizations. As a result, more than 400 agreements and arrangements were reached, trade and investment agreements worth about 60 billion US dollars were signed”<sup>1</sup>. The achievement of independence has opened the door to great opportunities for our country to join the world community. Uzbekistan is deeply involved in global integration processes, carrying out scientific and cultural cooperation based on openness, equality and multilateralism. In this regard, the first President of the Republic of Uzbekistan I.A.Karimov said: “We use the experience of developed countries to liberalize the governance of the state and society, human rights and freedoms, diversity of ideas in our lives. We stand for peace, freedom and prosperity, mutually beneficial cooperation with the whole enlightened world and the international community”<sup>2</sup>.

The Republic of China recognized the independence of the Republic of Uzbekistan on December 27, 1991. Diplomatic relations were established on January 2, 1992. Bilateral cooperation covers all aspects of relations and is conducted in the spirit of friendship and mutual benefit. Mutually trusting relations between the leaders of the two countries form the basis of cooperation. The commonality and closeness of views on terrorism, extremism, separatism, drug trafficking, illegal arms trade and other security threats play an important role in the conduct of mutually beneficial cooperation between Uzbekistan and China. Visits and meetings of the head of two countries are being held many times. In 1992, 1994, 1999, 2005, 2011, 2012 and 2014, the First President of the Republic of Uzbekistan I.A Karimov visited China. The President of the Republic of Uzbekistan visited Shanghai in 2001 and 2006 and Beijing in 2012 to participate in the SCO summits, as well as Beijing in 2008 to attend the opening ceremony of the 29th Summer Olympic Games. In return, the Presidents of the Republic of China Jiang Zemin (1996), Hu Jintao (2004, 2010), Xi Jinping (2013, 2016) visited Uzbekistan. 2017- The official visit of the President of the Republic of Uzbekistan Sh.M.Mirziyoyev to China on May 11-13, 2012, which was rich in meetings and negotiations, served as an important historical stage in the relations between the two countries. During the visit, talks were held with Xi Jinping - President of the Republic of China, Li Keqiang -Premier of the State Council, Zhang Desjiang - Chairman of the Standing Committee of the National People's Congress and leaders of leading Chinese high-tech enterprises. In 2017, 15 rounds of political consultations between the Ministries of Foreign Affairs and meetings on cooperation within the SCO were held in order to strengthen strategic cooperation between Uzbekistan and the Republic of China, broad trade and economic cooperation, sees the expansion of investment and financial cooperation as a priority of bilateral relations based on the principles of mutual interest and equality. According to the Trade and Economic Agreement signed in 1992, in trade and economic relations between the two countries the mode of maximum convenience is set. China is one of the largest trading partners of Uzbekistan. In 2017, bilateral trade amounted to \$ 5 billion. Exports and imports amounted to \$ 2.8 billion. The bilateral investment partnership is implemented within the program of cooperation between the Governments of the Republic of Uzbekistan and the Republic of China in the field of raw materials and high technologies, signed in 2010. Uzbekistan and China are

actively developing cooperation in the implementation of various projects, especially in the field of high technology. In particular, Uzbekistan supported the initiative of the Chinese leadership in 2011 to establish an Uzbek-Chinese high-tech industrial park with the participation of Chinese companies. A number of Chinese companies produce hydrocarbons in the country. Uzbekistan supports the construction of the Uzbekistan-China gas pipeline and the China-Kyrgyzstan-Uzbekistan railway. There are 786 enterprises with Chinese capital operating in the country. 95 of them are based on 100% Chinese investment. Representative offices of 73 Chinese companies operate in our country. Cooperation in the field of education is developing rapidly, there is a wide exchange of students and interns in the framework of interdepartmental relations.

The Confucius Institute for the Study of Chinese Language and Culture has been operating in Tashkent since May 2005 and currently has more than 350 students, merchants and researchers studying at the university. Since the establishment of the institute, more than 2,500 people have been trained. In September 2013, during the state visit of Chinese President Xi Jinping to Uzbekistan, cooperation was established to establish another Confucius Institute in Samarkand. In accordance with the bilateral agreement and within the SCO, the Government of the Republic of China in the 2014-2015 academic year provided grants to 120 Uzbek students and interns. About 50 Uzbek students study at Lanzhou University through the Confucius Institute. Starting from the 2012-2013 academic year, Uzbek language is taught at Peking University of Foreign Languages. On May 15, 2013, the SCO Research and Diplomacy Research Center of Uzbekistan was opened in Shanghai for the first time in China on the basis of the SCO People's Diplomacy Research Institute at Shanghai University. The program of cultural cooperation for 2017 has been adopted. "Uzbekistan-China", established in 1998, and the Republic of China-Central Asia, established in 2007, have been working to strengthen bilateral cultural relations. On March 13, 2017, on the eve of the 25th anniversary of the establishment of diplomatic relations between China and Uzbekistan, a statue of AlisherNavoi was unveiled at Shanghai University. Tashkent-Shanghai, Navoi-Zhuzhou (Hunan Province), Samarkand-Xi'an (Shaanxi Province) Bukhara-Loyan (Henan Province), Tashkent-Hunan, Samarkand and Shaanxi Regions on the development of regional cooperation between the two countries. There is a fraternal relationship between them.

We all know that China is undoubtedly one of the fastest growing countries in the world today with a strong economy and a high potential for international education. Comprehensive cooperation and partnership between Uzbekistan and China is based on strong friendship and trust. Historical sources show that trade, economic and cultural ties between our people have developed thousands of years ago. In particular, the Great Silk Road, which has a history of more than two thousand years, has united the two countries for centuries. Chinese tourists and ambassadors have written a lot of valuable information about our history and culture. In particular, Chinese chroniclers have written valuable information about the countries that ruled our land, such as Davan (Fergana), Qang, the Turkish Khanate, the values and customs that exist among us on this land. Even today. Relations between Uzbekistan and China are developing and strengthening day by day. This can be seen in the political, economic and diplomatic relations between the leaders of the two countries. In particular, the Chinese magazine- Diplomat magazine recently published an article dedicated to the 25th anniversary of the establishment of diplomatic relations between Uzbekistan and China. It was noted that at the present stage, bilateral relations between Uzbekistan and China are developing successfully in various

directions. Cooperation within international organizations such as the UN and the SCO is also expanding. Today, China is one of the most important partners of Uzbekistan in the world, one of the largest investors actively involved in long-term projects to modernize the Uzbek economy. There are more than 650 enterprises with Chinese capital operating in our country.

To conclude, cooperation between our countries in the fields of culture, science, education and tourism is always developing day by day. Uzbekistan-China and China-Central Asia Friendship Societies are functioning. Scientific cooperation between scientific and technical institutions, student exchange between universities is expanding. Uzbek is taught as a subject at Chinese Central Nationalities and Beijing Foreign Language Universities. Chinese language is taught in a number of universities in Uzbekistan. The Uzbek Research and Education Exchange Center has been opened on the basis of the SCO Public Diplomacy Research Institute at Shanghai University. Many of our young people are studying in the Republic of China, taking advantage of these and similar opportunities. Of course, such opportunities will pave the way for further development of cooperation between the two countries. It is gratifying to see a number of young Uzbeks taking advantage of such opportunities.

## WAYS TO IMPROVE THE ORGANIZATIONAL AND ECONOMIC MECHANISMS OF TOURISM DEVELOPMENT AND THE USE OF THE AIDA MODEL OF ADVERTISING

**Matluba Abdimanabovna Kuymuradova\***

\*Namangan Institute of Engineering and Technology,  
UZBEKISTAN

### ABSTRACT

*The article considers ways to improve the organizational and economic mechanisms of tourism development and the use of the AIDA model of advertising. It explains the organizational and specific economic mechanisms used in the development of tourism. The author's recommendation is added to both directions. While the use of information and communication technologies is added to the organizational mechanism, the economic mechanism is recommended to use the AIDA model of advertising, which can be used to attract the world's population to tourism.*

**KEYWORDS:** *AIDA Model, Tourism, Organizational And Economic Mechanism, Tourism Services, Diversification, Advertising, Efficiency, Information And Communication Technology, Domestic Tourism, Inbound Tourism.*

### INTRODUCTION

At the end of the XX century and the beginning of the XXI century, in the context of globalization, the development of tourism has reached a new stage. According to the World Tourism Organization (UNWTO), "tourism accounts for 10% of the turnover of the production and services market on the planet. According to the analysis, by 2020, revenues from international tourism are projected at \$ 2.0 trillion a year. The number of tourists coming to our country from around the world is also growing every year. "The number of incoming tourists increased from 240,000 in 107 countries in 2005 to 2.5 million in 2017 and 5.3 million in 2018. formed a man. Of these, 5 mln. 325,000 came from CIS countries and far abroad. This is evidence of the fact that the opportunities for the wider and more effective use of tourism potential in the world are expanding. Accordingly, there is a need to accelerate the development of tourism in our country. This situation requires in-depth research in this area. It is this necessity that determines the relevance of this topic.

**Analysis of the literature on the subject.** Problems related to scientific-theoretical and practical issues of tourism development were studied by economists of the country NTTukhliev, KHAbdurahmonov, ISTukhliev, N.Ibragimov, A.Norchaev, B.Mirbabaev, O.Kim, S. Ruziev, N.Raximova, D.X.Asanova A.F.Saidov, B.Sh.Safarov, T.Abdullaeva, B.X.To'raev, O.M.Pardaev, O.X.Khamidov, M.T.Alimova etc.6. In the works of these scientists, extensive attention is paid to the theoretical and practical issues of further development of tourism in Uzbekistan, improving the quality of tourist services and their improvement. However, the issue of improving the organizational and economic mechanisms, strengthening the role of advertising in it is poorly studied. This situation necessitated research on this topic.

### Analysis and results

The structure of organizational and economic mechanisms of tourism development used information and communication technologies and the AIDA model of advertising. Demonstrating the attractiveness of the valley through participation in tourism exhibitions and conferences in foreign countries, popularization of the valley's unique national cultural heritage abroad, regular participation in international exhibitions in major cities around the world to attract more foreign tourists to the region, as well as the Internet and It was noted that in order to use the opportunities of information technology and the development of domestic tourism, it is necessary to hold various exhibitions and public events aimed at attracting the population of our country.

At the same time, in order to modernize the process of tourist services, it is necessary to use the opportunities of abortion technologies in the promotion of tourism, attracting tourists from around the world. This will require the modernization of the means used in the provision of tourist services. There is a need to expand the organizational and economic mechanisms, using the model of advertising "AIDA" using information and communication technologies to showcase the potential of tourism around the world.

Our research has shown that there is a number of literature on the types, classification and groups of organizational and economic mechanisms. In our opinion, the most detailed of them is the monograph of OM Pardaev. Because it covers in detail the specific economic and organizational mechanisms. However, this recommendation is given in this table (Table 1).

**TABLE 1 CLASSIFICATION, GROUPS AND TYPES OF ORGANIZATIONAL AND ECONOMIC MECHANISMS<sup>1</sup>**

Organizational mechanism	Property relations	Private property
		Collective property
		State property
		Private property
		Mixed property, etc.
	Organization of business process	Specialization
		Cooperation
		Introduction of division of labor
		Organization of multidisciplinary work
	Structural structures	Independent enterprises
		Associations
		Joint stock companies

Recommend ations	Using the AIDA model of advertising to attract the world's population	A - Attention
		I - Interest
		D - Desire "desire",
		A - Astion "trytobuy"
		Visitingtourists

As can be seen from this table, these organizational and economic mechanisms do not include either information and communication technologies or advertising. However, today, if information and communication technologies and advertising based on them are not used for the development of tourism, it will be very difficult to "invite" the world's population to our country. Due to this information is from communication technologies

In order to attract the world's population to our country as tourists, it is necessary to use the model of advertising "AIDA".

The content of this AIDA model consists of the capital letters of the English words A - Attention, I - Interest, D - Desire, A - Astion. consists of. It is obvious that the use of information and communication technologies and the AIDA model of advertising can attract the world's population. The Uzbek abbreviated version of this model is called the "Advertising EQXX" model. By applying this model, tourism organizations first draw people's attention to tourist

facilities and then arouse their interest. Then there is a desire to visit our country and finally try to buy tickets and vouchers for a trip to our country. It is scientifically and practically justified that all this is an important factor for the development and efficiency of tourism. The AIDA (Advertising EQXX) model of advertising includes the means of transmitting advertising. In the second step, the EQXX appearance of these is represented sequentially and finally its effectiveness is achieved. The structure of this is shown in the following figure (Figure 1).

**Figure 1. The structure of the AIDA model<sup>2</sup>**

As can be seen from the picture, the AIDA model of advertising can be used in tourism through the use of information and communication technologies. Because from a distance, it will be difficult to increase the number of domestic and inbound tourists, create new jobs in the region, improve the welfare and living standards of the population as a result of reaching the five stages of spirituality in people.

Conclusions and suggestions. A number of conclusions and recommendations were made by studying the ways to improve the organizational and economic mechanisms of tourism development and the use of the AIDA model of advertising.

First of all, despite the great importance attached to the development of tourism in our country, the organizational and economic mechanisms of tourism development are sufficiently studied and, accordingly, poorly covered in the economic literature.

Second, during the study, we gave a separate explanation of the organizational and economic mechanisms used in the development of tourism, added to it the issue of the use of information and communication technologies, and tried to fully justify it. In the current digital economy, it is impossible not to use this support.

Third, we recommended the use of the AIDA model of advertising in the economic mechanism of tourism development. This model can also be used to attract the world's population to tourism in our country.

## CONCLUSION

In short, the recommendations developed by the author will have not only theoretical but also important practical significance for the future development of tourism in our country. Ultimately, it will also serve the implementation of the concept for the development of tourism in our country for 2025.

### ABSTRACT

*This paper we describe the misuse of one part of speech in the function of other parts of speech in the modern Chinese language, because it is the most prominent representative of isolating languages: the relationships between words in Chinese are not expressed by the form of words, but with the help of function words, word order in sentence, and no form of words does not depend on the other, which at first glance complicates the selection of parts of speech in Chinese.*

**KEYWORDS:** *Chinese, Funksional Transpozitsiya, Parts Of Speech, Types Of Transition Parts Of Speech, Syntactic Transposition, Conversion, Conversion Homonyms.*

### INTRODUCTION

In some languages, especially in languages that are characterized by poorly developed word forms, one can observe cases of the so-called transition of a lexical unit from one part of speech to another. A word belonging to one lexico-grammatical category, as a result of a change in position in a sentence and a different verbal environment associated with it, as it were, passes into another lexico-grammatical category, changes its categorical affiliation.

Thus, the exchange between words is a kind of exchange of functional features inherent in individual parts of speech. Use was expressed by a different education in different functions, depending on its occurrence in a particular syntactic education, S. Bally called functional transposition [Bally S. 1955: 130].

Functional transposition is especially characteristic of languages of an isolating type, since in them the concretization of the lexical unit occurs mainly depending on the syntactic position it occupies.

In Chinese, functional transposition is a widespread phenomenon. Often you can observe verb transition into a noun.

However, often a noun, due to a change in position, becomes a representative of the verb category. In addition, sometimes there is a transition of a verb into an adjective, an adjective in an adverb, as well as an adjective into a noun and a noun into an adjective. Transposition is sometimes accompanied by the appearance of earlier not characteristic of the lexical unit of the inflection paradigm.

Given the features associated with the transition of a word from one lexico-grammatical category to another, it is advisable to outline and consider separately two varieties of transposition.

If the transposition is not accompanied by a change in the morphological environment and, consequently, the formation of a new inflection paradigm, and the result of this process is only a change in the syntactic functions of the original lexical unit, then this kind of transposition is usually called as a transposition.

For the Chinese language, especially for its old literary norm of Wenyang, the most characteristic process is precisely the syntactic transposition, that is, the use of the same word in the function of different parts of speech. In Chinese, “a word, without breaking up into homonyms, can combine the features of several parts of speech” [Korotkov N.N. 1968: 397].

## RESEARCH METHODS

The basis of the transposition is the asymmetry of the linguistic sign, the semantic or functional juxtaposition of linguistic units. As for the Chinese linguistic tradition, on the issue of transposition, many linguists hold the view that in the Chinese language there is a complete (morphological) and - in a more debatable form - syntactic transposition, when there are no formal affixes of the transpositional word and, due to the isolated character of the Chinese language, any changes to the word. In Wenyang, the process of transitions of parts of speech had a high frequency and, in the case of syntactic transposition, a stylistic coloring.

*Here are the transitions of parts of speech of a verb-noun in ancient Chinese texts [Lee Tinnin]:*

### Morphological transposition phenomena in Wenyang

Hieroglyph- word	Nominal value (noun)		Verb meaning	
部长	the minister	49,5%	appoint a minister	50,5%
雨	rain	55,2%	it's raining, falling out precipitation	44,8%
朋友	friend	60,2%	make friends relationship	39,8%
宾馆	hotel	56%	live in a hotel	44%
蚕	mulberry worm	65,4%	grow mulberry worms	34,6%
衣服	clothes	70,5%	dress	29,5%

家	nest	70,8%	make a nest, live in a nest	29,2%
帽子	headdress	7,7%	put on your head	22,3%
大门	gate	78,4%	attack the city gates	21,6%

In the modern language of Putonghua, there are also quite a lot of them. We give examples and statistical use of words in the position of the noun / verb on the material of the modern Chinese language.

#### Morphological transposition phenomena in putonghua.

Hieroglyph- word	Nominal value (noun)		Verb meaning	
学习	study	63%	study	37%
生产	production	43%	produce	57%
决定	decision	51%	make a decision	49%
行动	act	45.5%	act	54.5%
安装	setting	38%	to establish	42%
通知	notice	87%	to inform	13%
传真	fax	32%	throw off by fax	68%
要求	demand	61%	require	39%
进攻	attack	33%	make an attack	67%
声明	statement	81%	declare	19%
阐述	description	61%	to describe	39%
保证	guarantee	52%	to guarantee	48%
宣传	propaganda	74%	to advocate	26%

In general, we can say that in the Chinese language there are three types of part-transitions.

#### *Types of Transposition in Chinese*

[Dragunov, 1952; Solntsev, 1977; Kurdyumov, 2005 Tan Aoshuang, 2002]

transposition

occasional

stable

fixed

When determining the common-word affiliation of the Chinese word, the etymological criterion (2.1.5) is relevant. Any part-transition in the Chinese language, enshrined in the norm (i.e., according to the European classification, is morphological rather than occasional, is subject to certain laws: i.e., units that are now interpreted as prepositions can have verb functions in a

different context). Thus, any Chinese preposition in diachrony is a derivative of the previous verb meaning, while in synchrony one unit can be used in both meanings, for example:

在 他的位置在第九排 *His place is in the ninth row.*

在 他读在大学 *He studies at the University.*

在 我在大学 *I am at the university.*

Thus, the issue of highlighting parts of speech in Chinese remains debatable.

## RESULTS AND DISCUSSION

We adhere to the point of view that, despite the syntactic criterion for distinguishing parts of speech in the Chinese language (names, verbs, adjectives, adverbs acquire their partial affiliation only in the sentence), we can talk about the part of speech in a noun, based on Formal and semantic indicators. The formal indicators of Chinese nouns are counting words - classifiers, suffixes and half suffixes.

The syntactic indicators of nouns in Chinese are: the syntactic position of the subject; syntax position of the complement; use of a noun in a frame design. The peculiarity of the Chinese noun (and the Chinese language as a whole) is the phenomenon of transposition: in modern Chinese there are transitions from one part of speech to another (for example, a name in a verb and vice versa), and transitions within the same part-ternal meaning (inside a noun)

There are quite a few types of syntactic transposition. Consider only some of the most common types.

**Type Noun — Adjective.** In this case, the noun as the original lexical unit as a result of changing the syntactic position, being in a different verbal environment, denotes the relative attribute of the subject and thereby serves as an adjective.

1)用木头做东西 – make things out of wood ; 木头桌子 – wooden table;

2)金比铁贵 - Gold is more expensive than iron; 铁箱 – iron box;

3)科学和艺术 – science and art ; 科学工作 – scientific work;

这种论点是不科学的。 - This statement is unscientific (汉俄词典) .

这句话本身就不科学的 。 - This situation is not scientific in itself. (报上) .

4)讲卫生 - observe hygiene; 卫生体操 – hygienic gymnastics;

不卫生的习惯 – unhygienic habits;

吃的睡的都不卫生. (报上) - Do not hygiene with food and sleep.

Since the words 科学 and 卫生 have become predicative, we can say that they have a double syntactic valency, or bivalence.

**Type adjective-noun** This transposition is the case when an adjective, taking a different syntactic position, which is not peculiar to it, is combined with pronouns or numbers and, thus, becomes able to fulfill the function of a noun.

1) 在这里生活是很寂寞，很单调的。（巴金） - Life here is very boring, very monotonous.

这寂寞，这单调，真叫人难忍受下去。（巴金） - - This boredom, this monotony is truly unbearable for people.

2) 好人是活不长久的。（巴金） - After all, good people do not live long.

他的性情，他的学识，我都知道，没有什么不好。（一圣陶） - His character, his knowledge I know; there is nothing wrong with it.

3) 我和你的情况两样。（汉俄词典） - The situation with you is not the same (different).

没有什么两样。（同上） - (There is no difference (no difference) in this).

4) 这个办法对。（汉俄词典） - This is the correct method.

没有什么不对。（书） - (There) there is nothing wrong.

5) 发生了一件不痛快的事。（汉俄词典） - An unpleasant story has happened.

您要是再给他一个不痛快，我就把您这两年做的事都告诉哥哥。（曹禺） - If you trouble her again (do something unpleasant), I'll tell my older brother what you did two years.

**Adjective Type — Adverb.** This transpositional model is widespread. In Chinese, one can often observe its many realizations. It is a transposition in which a high-quality adjective, being in a preposition or postposition in relation to a verb, explains it and thereby fulfills the function inherent in an adverb.

The given examples illustrate functional-semantic features, a kind of 'internal mechanism' of syntactic transposition.

1) 早春 - early spring; 早霜 - early frosts; 睡得早，所以醒得早（书） - I go to bed early, so I wake up early.

2) 快车 - fast train ; 快中子 - fast neutron;

他们走得很快。 - They walked very fast.

3) 高山 - high mountain; 高价 - high price; 鸟飞得很高 - The bird flies very high.

Syntactic transposition, in contrast to morphological transposition, without being associated with the formation of the inflection paradigm, is, in fact, a special case of the functioning of lexical

units. The free movement of a word from one position to another and, as a consequence of this, intercategory substitutions, meaning a kind of interchange of functions between parts of speech, this is the essence of syntactic transposition.

If the transposition is associated with a change in the lexical-morphological environment and as a result of this, the earlier inflection paradigm that is not inherent in the lexical unit arises, and other syntactic features also appear, then this kind of transposition is usually called a morphological transposition.

Morphological transposition, often referred to as conversion (conversion transposition), is a word-formation method using the word-changing paradigm without involving a special structural component (a special derivational morpheme) as a word-formation tool. The formation of a new word occurs by moving some foundation to another inflection paradigm. Thus, the conversion is defined as “the process of morphological transposition of the basics” [Kuryakova ES 1974: 75].

For the Chinese language with its underdeveloped form-formation, conversion is not characteristic as a process of morphological transposition, and words created by conversion do not form any consistent paradigm of inflection. They are attached to only single word forms, a kind of 'fragments' of the paradigm.

V. M. Solntsev believes that “apparently, one can speak about conversion as a word-formation technique only when such pairs of words have clearly expressed systems of forms (characterizing at least one word of the pair) and a system of formal syntactic features” [Solntsev VM 1975: 75]. Developing this position, it should be said that sometimes only a derivative word forms a paradigm, sometimes only a producing word has a paradigm. A morphological transposition, having a word-building character, as applied to the peculiarities of this process in the Chinese language, could, by analogy with semi-affixation, be called semi-conversion.

Let us consider two main types of morphological transposition on the actual material of modern Chinese.

**Type Noun — Verb.** This conversion model, according to Lu Shusyan, is represented in Chinese by a small number of lexical units [吕叔湘。1989 年: 17 页]. The ability of registered morphemes of this type to combine with the suffixes of productive verbs, form affirmative temporal and modal forms, and also to take an addition denoting a direct object, translates them into a class of verbs, thereby changing their categorical affiliation.

Examples:

1) 一把锁 one lock, 这把锁 this lock, 锁上 close the lock, 锁上了 closed the lock, 锁着 closed the lock, 锁门 close the door to the castle;

拿把锁把门锁上。(叔相) - Taking the lock, close the door.

2. 一把锯 one saw, 这把锯 this saw, 锯树 saw wood, 锯木头 saw wood, 锯开了 sawed, 锯不动 impossible to saw. 把木板锯成两段 (汉语词典) - cut the board in half.

3. 一把剪 one scissors , 这把剪 these scissors , 剪发 - cut the hair , 剪指甲 cut the nails , 剪成两件 cut the scissors in half.

这个简讯是从报上剪下来的。(汉俄词典) - This note is cut from a newspaper.

This model is characterized by the fact that only the derivative word (verb) forms the paradigm, while the producing word (noun), without a system of forms, has only a certain set of syntactic features (in particular, the ability to combine with pronouns and numerals).

**Type Verb — Noun.** This conversion is the case when a verb, being in a syntactic position unusual for it, is able to fulfill the function of a subject or complement with a verb predicate, as well as accept a definition expressed by a pronoun or an adjective, that is, acquire syntactic features characteristic of a noun. This model is characterized by the formation of a paradigm only in the generating word (verb). Regarding the derived word, then it has only some syntactic features, usually inherent in the noun.

#### Examples:

- 1) 在等待 expect, 等待了 expected , 这等待 this is expectation , 我似乎在等什么。 (巴金) - I kind of expect something. 这等待是相当痛苦的。 (巴金) - This expectation was rather painful.
- 2) 在要求 demand , 要求过 demanded , 我的要求 my claim , 一个要求 one claim , 这个要求 this requirement bi talab , 提出要求 make a claim 我们要求满足我们的要求。 (曹禺) - We require you to satisfy our requirements. 我有一个要求。 (曹禺) - I have requirement.

曾金要求过, 这次又是。(茅盾) - Previously demanded, this time again (required).

#### CONCLUSION

The factual material discussed above shows that the lexical units in the conversion relationship have the identical sound and graphic forms in the Chinese language, but differ in word forms (though few), and, perhaps more importantly, in functional features, which manifest themselves in different compatibility with lexical units other classes.

As a special group of lexical homonyms, conversion homonyms are sometimes distinguished, meaning by this term single-rooted lexical units formed by conversion [Khamatova A.A. 1977: 11].

The so-called conversion homonyms are homonyms of a special type. They differ significantly from homonyms themselves. Homonymous words formed by conversion are in close semantic dependence, while homonyms themselves are characterized by a complete absence of a semantic connection or a very distant semantic connection, the establishment of which sometimes requires special research.

It can be reasonably said that homonymy is in some cases a consequence of the synchronous coincidence (sometimes random) in one sound complex of several words of different meanings,

while conversion is usually the result of a diachronic process that leads to the sound coincidence of two close in meaning lexical units.

In Chinese, a conversion relationship often arises between a verb and a noun as two lexical-grammatical categories.

At the same time, in modern Chinese, in some cases, one can observe a tendency to formally separate the noun from the verb, which ultimately leads to the elimination of the conversion relations that exist between certain pairs of words.

Formally, isolation is carried out by attaching a semisuffix to the original lexical unit. In this case, the original lexical unit and neoplasm coexist in the modern language

### ABSTRACT

*By achieving modern methods, customer-oriented organizations and institutes are constantly trying to search for other solutions to inspire more customers so that based on their interests and*

*attitudes, they voice their opinion to the superiors of the organization. Numerous researches all indicate that customers can change the production line. Therefore, organizations consider "voice of customer" more than before. They are constantly ready to meet customers' demands. In this paper, we study the voice of customer in The municipalities of tehran . Fuzzy multiple criteria decision making (FMCDM) is one of the suitable models of ranking the key criteria of the voice of customer. In fuzzy analytic hierarchical process (Fuzzy AHP) and Fuzzy decision making trial and evaluation laboratory (Fuzzy DEMATAL), we ranked the key criteria of the voice of customer in Iran in the municipalities of Tehran.*

**KEYWORDS:** *Fuzzy DEMATEL, Fuzzy AHP, FMCDM, Voice Of Customer.*

## INTRODUCTION

Many different theories and methods of performance for conducting an evaluation have been applied in various organizations for many years. These approaches include ratio analysis, total production analysis, regression analysis, Delphi analysis, balanced scorecard, analytic hierarchical process (AHP), data envelopment analysis (DEA), decision making trial and evaluation laboratory (DEMATEL), fuzzy AHP(FAHP), fuzzy DEMATEL, etc. Each method has its own basic concept, aim, advantages and disadvantages. Which one to choose for assessing performance depends on the status and type of the organizations? However, all successful enterprises have some common features including a specific vision, positive actions, and effective performance evaluation (Wu et al., 2009).

Decision makers always like to know which option is the best of all alternatives. In the category of cardinal information on the criteria or attribute of multiple criteria decision making (MCDM) methods, alternatives are ranked by their cardinal values of performance (Shih, 2008; Chou, 2010). Although, there are different definitions for MCDM in literature, regardless of the type of MCDM task, two pivotal problems arise; how to compare an alternative? And how to evaluate them? First problem is especially important if the results of evaluations fo alternatives are presented by interval or fuzzy numbers (Sevastjanov and Figat, 2007).

Decision making is the most important and popular aspect of application of mathematical methods in various fields of human activities. In real world situations, decisions are nearly always made on the basis of information that is at least partially fuzzy in nature (Vasant et al., 2007). Also Decision making is the process of defining the decision goals, gathering relevant criteria and possible alternatives, evaluating the alternatives for advantages and disadvantages and selecting the optimal alternatives (Wu, 2008).

However, in the real life, the available information in a MCDM process is usually uncertain, vague, or imprecise, and the criteria are not necessarily independent. To tackle the vagueness in information and the essential fuzziness of human judgment or preference, fuzzy set theory was proposed by Zadeh in 1965 and a decision making method in a fuzzy environment was developed by Bellman and Zadeh (Yang et al., 2008; Kahraman, 2007). Fuzzy set theory was developed exactly based on the premise that the key elements in human thought are not numbers, but linguistic terms or labels of fuzzy sets. A fuzzy decision making method under multiple criteria consideration is needed to integrate various linguistic assessments and weights to evaluate location situation and determine the best selection (Chou, 2007).

MCDM may be considered as a complex and dynamic process including one managerial level and one engineering level. The managerial level defines the goals, and chooses the final “optimal” alternative. The multi criteria nature of decisions is emphasized at this managerial level, at which public officials called “decision makers” have the power to accept or reject the solution proposed by the engineering level (Opricovic and Tzeng, 2004).

The DEMATEL technique was used to investigate and work on the complicated problem group. DEMATEL was developed on the belief that pioneering and proper use of scientific research methods could ameliorate comprehension of the specific problematic, the cluster of intertwined problems, and contribute to recognition of practical solutions by hierarchical structure. DEMATEL has been successfully applied in many situations, such as marketing strategies, e-learning evaluation, control systems and safety problems (Chen, 2009). Fuzzy DEMATEL method is used for solving and modeling some of the complex group of decision-making problems such as strategic planning, e-learning evaluation and decision making in RandD projects (Coussement and Poel, 2008).

#### Voice of customers

Richins (1997) and Smith and Bolton (2002) emphasize that emotions differ when the context change; buying a pair of shoes may not generally raise the same kind of motions as do consumption where the amount of the monetary exchange is more considerable and maybe includes risk (Roos et al., 2009).

In systems of the real world, environmental planning and investment in sustainable development industries may essentially be conflicts analyses characterized by sociopolitical, environmental and economic value judgments. Several strategies should be considered and evaluated in terms of many different criteria, resulting in a vast body of data that are often inaccurate or uncertain. However, in many areas such as manufacturing, engineering, medicine, meteorology and human judgment, evaluation and decisions often employ natural language to express thinking and subjective preferences, but when using the word as a label for a set, the boundaries within which objects do or do not belong to the set become fuzzy or vague (Chiou, 2005).

It is now a leading firm strategy to develop a model from customer expectation. The service quality affects all leisure firm service activities. The performances are usually with multiple criteria for many customers' expectations to judge by the best service quality performance. Improving service quality, increasing assessment and reliability occurs while competition ever increases and tries to retain customers. Service quality conditions might influence a firm's competitive advantage by retaining customer patronage and with this comes market share, and ultimate profitability. Service quality has developed for several years. Service quality is measured to assess service performance, diagnose service problems, and manage service delivery. The criteria used for evaluation of service quality effectiveness are numerous and influence one another (Bell et al., 2005; Lin et al., 2009).

In the past, companies focused on selling services and products with little knowledge or strategy concerning the customers who bought the products. Today business is evolving from this 'product-centered' to a 'customer-centered' environment. Companies need to find ways to capture and enhance market share while reducing costs. Consequently, existing companies must reconsider the business relationships with their customers (Coussement and Poel, 2008b). Customer loyalty are defined as a consumer's intent to stay with an organization (Bell et

al., 2005). Since public services are not perceptible, fewer customers can directly evaluate services by comparing the quality of physical products (David et al., 2006). Customers and consumers constantly search for suppliers who provide much better goods and services for them. There are a lot of evidence and documents indicating that in today's competitive world, discovering needs of customers and meeting their demands before competitors is the basic term for enterprises to succeed. Thus, organizations and businesses are to trying to achieve superior situation in comparison with other competitors by obtaining exclusive advantages. One of the most popular approaches to determine the quantity of meeting needs and demands by means of goods and services offered by organizations is assessment of customer's consent.

In customer-oriented organizations usually the customers are the most fundamental means to identify weak and strong points of organizations. During their relations, they can actually advise you to choose the method of communication with customer, production and design of services. The organization can achieve strategies for new services by surveying its customers and analyzing their needs and find out its weak points of the current services. Some authors believe that customers create different levels of making profits and all customers do not create desired income for companies. Therefore, companies have been recommended to develop their relations with beneficial customers and cut relations with non-beneficial customers (Vukmir, 2006).

Based on a study and an interview with some customers, researches could reach at important facts that determine satisfaction of customers with products and services of a company. Generally, the facts include:

1. Stability of provider
2. Following schedule of goods delivery
3. Technical particulars of products
4. Competitive prices
5. Credit policy of the company
6. Warranty and guarantee

And such items can put an effect on satisfactions with providers (Chakraborty et al., 2007).

Internet enables customers to easily express their problems with a product or a service. Consequently, customer complaint management and service recovery are going to become key drivers for improved customer relationships (Coussement and Poel, 2008a). Further studied customer involvement in new product development, especially in the early stage of product conceptualization plays an important role for a successful product (Chen and Yan, 2008). It is well recognized that voice of customer boasts numerous benefits for organizations. They include customer loyalty increases in satisfaction and product evaluation mutual agreeable problem solving improved offerings and prevention of future problems the opportunity to redress the problem customer "venting" to the organization, rather than to others and reduced likelihood of other negative consumer behaviors such as exit and/or negative word-of-mouth (Bove and Robertson, 2005).

Successful companies have to pursue customer-centric strategies in order to sustain a competitive advantage. Voice of customer (VOC) analysis can play an important role in understanding customer requirements in a new product or service development. Moreover, it can provide value to customers and it can leave the customer with a favorable impression. The VOC analysis system can help determine what customers need and predict what they will need in the future. In

turn, this can assist in the development of appropriate corporate strategies to meet the needs (Bae et al., 2005). However, different customers or experts have different attitudes toward the same requirement. To cope with this situation proposed to use a group decision-making technique to obtain the importance weights for customer requirements. Then, AHP or DEMATEL are proposed to be used in rating customer requirements analyzed the sensitivity of the voice of customer in QFD (Lai et al., 2008).

#### FUZZY MULTIPLE CRITERIA DECISION MAKING (FMCDM) AND FUZZY DECISION MAKING TRIAL AND EVALUATION LABORATORY (DEMATEL)

Human lives are the sum of their decisions-whether in business or in personal spheres. In daily lives, people often have to make decisions. “When decision is made” is as important as “what is decided”. Everyday life and history are full of lessons that can help people recognize the critical moment. People learn by attempts and by examples. Deciding too quickly can be hazardous; delaying too long can mean missed opportunities. What people need is a systematic and comprehensive approach to decision making (Özdağoğlu and Özdağoğlu, 2007).

Fuzzy set theory introduced by Zadeh was developed for solving problems in which descriptions of activities, observations and judgments are subjective, vague and imprecise (Liu, 2009). Since Bellman and Zadeh (1970) developed the theory of decision behavior in a fuzzy environment, various relevant models were developed and they have been applied to different fields such as control engineering, artificial intelligence, management science and MCDM among others. The concept of combining the fuzzy theory and MCDM is referred to as fuzzy MCDM (FMCDM) (Hung et al., 2010; Shieh et al., 2010).

A FMCDM model is used to assess alternatives versus selected criteria through a committee of decision makers, where suitability of alternatives versus criteria and the importance weights of criteria, can be evaluated in linguistic values represented by fuzzy numbers. Numerous approaches have been proposed to solve fuzzy MCDM problems (Chua and Lin, 2009). Although, the problem of obtaining well-defined criteria for a MCDM problem is well-known for more general results, it is often neglected in MCDM theory, methods, and applications (Gal and Hanne, 2006; Keskin et al., 2010; Yu and Hu, 2010).

Fuzzy set theory is very helpful to deal with the vagueness of human thoughts and language in making decisions. Decision-makers tend to give assessment according to their past experiences and knowledge and also their estimations are often expressed in equivocal linguistic terms (Lin and Wu, 2008). Many decisions are involving imprecision since goals, constraints and possible actions are not precisely in description. In fuzzy logic, each number between 0 and 1 indicates a partial truth, where as crisp sets correspond to binary logic [0, 1] (Tseng, 2009a). To deal with the vagueness of human thought and expression in making decisions, fuzzy set theory is very helpful. In particular, to tackle the ambiguities involved in the process of linguistic estimation, it is a beneficial way to convert these linguistic terms into fuzzy numbers (Tseng, 2009; Chang and Hung, 2005).

MCDM is a well-known branch of decision making. It is widely used in ranking one or more alternatives from a set of available alternatives with multiple attributes (Yu and Hu, 2010; Malekly et al., 2010; Chou, 2010; Tzeng et al., 2009; Yu and Tzeng, 2006; Wang et al., 2005) and MCDM techniques support the decision makers in evaluating a set of alternatives (Keskin et al., 2010; Wang et al., 2005). MCDM techniques can help identify desired measures among a

variety of alternatives through analyzing multiple criteria by which the strengths and weaknesses of various adaptation options could be evaluated. Thus, they could be adopted as evaluation tools to help identify the priorities of sustainable goals and to rank the desirability of adaptation options (Qin et al., 2008). Traditional MCDM models are based on the additive concept along with the independence assumption, but individual criterion is not always completely independent (Tseng, 2009a). Multiple attribute decision-making (MADM), like MCDM, deals with the problem of helping the decision maker to choose the best alternative, according to several criteria (Tzeng et al., 2009). Alternatively, MCDM or MADM is the approach dealing with the ranking and selection of one or more vendors from a pool of providers. The MCDM provides an effective framework for vendor comparison based on the evaluation of multiple conflict criteria (Shyur and Shih, 2006).

However, in many cases, the judgments of decision making are often given as crisp values, but crisp values are an inadequate reflection of the vagueness of the real world. The fact that human judgment about preferences are often unclear and hard to estimate by exact numerical values so that fuzzy logic is necessary for handling problems characterized by vagueness and imprecision. Hence, there has a need to extend the DEMATEL method with fuzzy logic for making better decisions in fuzzy environments (Wu and Lee, 2007). The DEMATEL method is used to construct the interrelations between criteria to build an impact-relation map (Yang et al., 2008). FAHP or FMCDM analysis has been widely used to deal with decision-making (DM) problems involving multiple criteria evaluation or selection of alternatives (Hsieh et al., 2004).

#### Decision making trial and evaluation laboratory (DEMATEL)

Complex evaluation environment can be divided into many criteria or subsystems to judge differences or measure scores of the divided criteria groups or subsystems more easily. The factor analysis method is commonly used to divide criteria into groups (Tzeng et al., 2007). The foundation of the DEMATEL method is graph theory. It allows decision-makers to analyze as well as solve visible problems (Chen and Chen, 2010).

The DEMATEL method has been successfully applied in many fields. Recently, there have been a lot of studies on fuzzy DEMATEL applications in different fields (Tzeng et al., 2007). DEMATEL method was developed by the Battelle Memorial Institute in Geneva. Those days, the DEMATEL method was used to study the world's complicated problems, such as: Race, hunger, environmental protection and energy, etc. In the recent years, many scholars have broadly applied the DEMATEL method to solve problem in different fields (Chen and Yu, 2009; Hu et al., 2009; Fekri et al., 2008; Wu et al., 2010). The DEMATEL method is an analytic technique of relationship structure. It can find the critical aspect or criteria of the complex structure system (Lin and Tzeng, 2009). The applicability of the DEMATEL method is widespread, ranging from analyzing world problematic decision-making to industrial planning (Wei and Hshiong, 2009; Li and Tzeng, 2009). The original DEMATEL was aimed at the fragmented and antagonistic phenomena of world societies and searched for integrated solutions. Digraphs are more useful than directionless graphs because digraphs can demonstrate the directed relationships of sub-systems. Moreover, digraph portrays a basic concept of contextual relations among the elements of the system, in which the numeral represents the strength of influence. The DEMATEL is based on digraphs, which can separate the involved factors into cause group and effect group (Kim, 2006; Chang and Cheng, 2009; Wu, 2008; Yang et al.,

2008). DEMATEL has been widely used to extract a problem structure of a complex problematic. By using DEMATEL, we could quantitatively extract interrelationship among multiple factors contained in the problematic. In this case, not only the direct influences but also the indirect influences among multiple factors are taken into account (Tamura and Akazawa, 2005; Wang et al., 2005; Wu, 2008).

#### Fuzzy decision making trial and evaluation laboratory (DEMATEL)

DEMATEL method is presented in 1973 as a kind of structural modeling approach about a problem. It can clearly see the cause-effect relationship of criteria when measuring a problem (Chen-Yi and Gwo-Hshiung, 2007). The decision-making involved in selecting appropriate management systems to create sustainable competitive advantages is a very important topic, which can be formulated as a MCDM problem (Tsai and Chou, 2009). Applying the DEMATEL illustrates the interrelations among criteria, finds the central criteria to represent the effectiveness of factors or aspects and avoids the “over fitting” for evaluation. Thus, non-additive methods, fuzzy measure and fuzzy integral are used to calculate the dependent criteria weights and the satisfaction value of each factor or aspect for fitting with the patterns of human perception (Chen-Yi and Gwo-Hshiung, 2007).

Although, this DEMATEL method is a good technique for evaluating problems and making decisions, we decide the relationships of systems to be usually given by crisp values in establishing a structural model (Liou et al., 2007; Chiu et al., 2006). However, it is generally understood that human perceptions on decision factors are usually judged subjectively. The judgment in social science is always represented as exact numbers. In many practical cases, the human preference model is uncertain and might be reluctant or unable to assign exact numerical values to describe the preferences (Tseng and Lin, 2008). The matrices or digraph portrays a contextual relation between the elements of the system, in which a numeral represents the strength of influence. Hence, the fuzzy DEMATEL method can convert the relationship between the causes and effects of criteria into an intelligible structural model of the system (Chen-Yi and Gwo-Hshiung, 2007; Kim, 2006; Lee et al., 2008). The fuzzy DEMATEL method has been successfully applied in many fields (Lee et al., 2008).

Figure 2.1. The digraph of the Fuzzy DEMATEL example (Lee et al., 2008).

#### STEP1: Defining the evaluation criteria and designing the fuzzy linguistic scale

However, evaluation criteria have the nature of causal relationships and usually comprise many complicated aspects (Wu and Lee, 2007). To gain a structural model dividing involved criteria into cause and effect groups, the Fuzzy DEMATEL method is an appropriate technique. To deal

with the ambiguities of human assessments, the research discard the comparison scale used in crisp DEMATEL method but adopt the fuzzy linguistic scale used in the group decision-making proposed[21-14-78-34].( Wu and Lee, 2007; Kim, 2006; Coussement and Poel, 2008b; Chen-Yi and Gwo-Hsiung, 2007).

**TABLE 2.1.THE CORRESPONDENCE OF LINGUISTIC TERMS AND LINGUISTIC VALUES (EXAMPLE)**

<i>Linguistic terms</i>	<i>Linguistic values</i>
No influence (No)	(0, 0, 0.25)
Low influence(L)	(0, 0.25, 0.5)
High influence(H)	(0.25, 0.5, 0.75)
Stronglyinfluence(VH)	(0.5, 0.75, 1.0)

Different degrees of “influence” are expressed with five linguistic terms as “Strong”, “High”, “Low”, “No” and their corresponding positive triangular fuzzy numbers are shown in Table 2.1 (Shieh et al., 2010).

*STEP 2: Organizing the directed-relation matrix*

Acquire the assessments of decision makers to measure the relationships between the critical success factors which are demonstrated by  $C = \{C_i | i = 1, 2, \dots, n\}$ . The groups of the chosen experts were asked to make sets of pair wise comparisons in terms of linguistic terms. Hence fuzzy matrices  $\tilde{N}^1, \tilde{N}^2, \dots, \tilde{N}^p$ , each corresponding to an expert and with triangular fuzzy numbers are obtained. Fuzzy matrix  $\tilde{N}$  is called the initial direct relation fuzzy matrix of expert. Denote  $\tilde{N}$  as:

$$\tilde{N} = \begin{bmatrix} \mathbf{0} & \tilde{n}_{12} & \cdots & \tilde{n}_{1n} \\ \tilde{n}_{21} & \mathbf{0} & \cdots & \tilde{n}_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ \tilde{n}_{n1} & \tilde{n}_{n2} & \cdots & \mathbf{0} \end{bmatrix}; k=1, 2, \dots, p. \quad (1)$$

$$\tilde{N}_{ij} = (l_{ij}, m_{ij}, u_{ij}).$$

Without loss of generality, the  $\tilde{N}_{ii}$  ( $i = 1, 2, \dots, n$ ) number  $z = (0, 0, 0)$  when it is necessary ( Lee et al., 2008; Coussement and Poel, 2008b).

*STEP 3: Establishing the structural model*

The linear scale transformation is used here as a normalization formula to transform the criteria scales into comparable scales. Let

$$\tilde{a}_{ij} = \sum_{j=1}^n \tilde{N}_{ij} = (\sum_{j=1}^n l_{ij}, \sum_{j=1}^n m_{ij}, \sum_{j=1}^n r_{ij}) \text{ And } r = \max_{1 \leq i \leq n} (\sum_{j=1}^n r_{ij}) \quad (2)$$

Then, the normalized direct-relation fuzzy matrix, denoted by  $\tilde{E}$ :

$$\tilde{E} = r^{-1} \otimes \tilde{N} \text{ then } \tilde{E} = \begin{bmatrix} \tilde{e}_{11} & \tilde{e}_{12} & \cdots & \tilde{e}_{1n} \\ \tilde{e}_{21} & \tilde{e}_{22} & \cdots & \tilde{e}_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ \tilde{e}_{m1} & \tilde{e}_{m2} & \cdots & \tilde{e}_{mn} \end{bmatrix}, \text{ where } \tilde{e}_{ij} = \frac{\tilde{n}_{ij}}{r} = \left( \frac{l_{ij}}{r}, \frac{m_{ij}}{r}, \frac{r_{ij}}{r} \right) \quad (3)$$

As that in crisp DEMATEL method, we assume at least one  $i$  such that  $\sum_{j=1}^n \tilde{N}_{ij} < r$  and

$\lim_{k \rightarrow \infty} \tilde{E}^k = [0]_{n \times n}$ . This assumption is well satisfied in practical cases (Lee et al., 2008; Wu and Lee, 2007).

*STEP 4: The total-relation matrix*

The total-relation matrix  $T$  can be acquired by using the following equation, in which the  $I$  is denoted as the identity matrix (Hu et al., 2009).

$$T = \tilde{E} + \tilde{E}^2 + \dots + \tilde{E}^k = \tilde{E} (I + \tilde{E} + \tilde{E}^2 + \dots + \tilde{E}^{k-1})$$

$$= \tilde{E} (I + \tilde{E} + \tilde{E}^2 + \dots + \tilde{E}^{k-1}) (I - \tilde{E})(I - \tilde{E})^{-1} = \tilde{E}(I - \tilde{E})^{-1},$$

when  $\lim_{k \rightarrow \infty} \tilde{E}^k = [0]_{n \times n}$

$$T = \begin{bmatrix} t_{11} & t_{12} & \dots & t_{1n} \\ t_{21} & t_{22} & \dots & t_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ t_{m1} & t_{m2} & \dots & t_{mn} \end{bmatrix}; \text{ where } t_{ij} = (l'_{ij}, m'_{ij}, r'_{ij}) \quad (4)$$

$$[l'_{ij}] = \tilde{E}_l \times (I - \tilde{E}_l)^{-1}$$

$$[m'_{ij}] = \tilde{E}_m \times (I - \tilde{E}_m)^{-1}$$

$$[r'_{ij}] = \tilde{E}_r \times (I - \tilde{E}_r)^{-1}$$

*STEP 5: The sum of rows and columns*

Produce a causal diagram. The sum of rows and the sum of columns are separately denoted as vector  $d''$  and vector  $r''$  through formulas 5. In these equations, vector  $d''$  and vector  $r''$  denote the sum of rows and the sum of columns from the total-relation matrix  $T$  respectively. (Chen and Chen, 2010; Tseng, 2009b).

$$T = [t_{ij}]_{n \times n}, I, J \in \{1, 2, 3, \dots, n\}$$

$$d'' = (d''_1)_{n \times 1} = \left[ \sum_{j=1}^n t_{ij} \right]_{n \times 1}, r'' = (r''_1)_{1 \times n} = \left[ \sum_{j=1}^n t_{ij} \right]_{1 \times n} \quad (5)$$

*STEP 6:* As that of most fuzzy model, we had to covert the final fuzzy data into a crisp value. Here, we suggest the CFCS (Converting Fuzzy data into crisp scores) method proposed by Opricovic and Tzeng (2003) for defuzzification. This method has the advantages of giving a greater crisp value with greater membership function and distinguishing two symmetrical triangular fuzzy numbers with the same mean (Lin, 2010). Let  $\tilde{N} = (l_{ij}, m_{ij}, u_{ij})$ ;  $k=1, 2, \dots, n$  be the positive triangular fuzzy number, and  $\tilde{N}_k^{jdef}$  denote its representing crisp value. Computing  $L = \min(l_k)$ ;  $R = \max(u_k)$ ;  $k=1, 2, \dots, n$ , and  $\Delta = R - L$ , then

$$\tilde{N}_k^{jdef} = L + \Delta \times \frac{(m-L)(\Delta+u-m)^2(R-L)+(u-L)^2(\Delta+m-L)^2}{(\Delta+m-L)(\Delta+u-m)^2(R-L)+(u-L)(\Delta+m-L)^2(\Delta+u-m)} \quad (6)$$

STEP 7: We draw the causal diagram based on the calculations in step 6

STEP 8: Analyzing the results

Assumethat  $\mathbf{d}''_i$  denotes the row sum of  $i$ -th row of matrix  $T$ ; then,  $\mathbf{d}''_i$  shows the sum of influence dispatched from factor  $i$  to the other factors both directly and indirectly .Supposed  $\mathbf{r}''_j$  denotes the column sum of  $j$ -th column of matrix  $T$  .Then,  $\mathbf{r}''_j$  shows the sum of influence that factor  $j$  is receiving from the other factors (Chen-Yi and Gwo-Hshiung, 2007; Tseng, 2009b; Wu and Lee, 2007).

The order of elements from column  $\mathbf{d}''_i$  indicates hierarchy from influencing elements and the order of elements from column  $\mathbf{r}''_j$  indicates hierarchy from influenced elements. The actual place of each element in the final hierarchy is determined by columns  $(\mathbf{d}''_i + \mathbf{r}''_j)$  and  $(\mathbf{d}''_i - \mathbf{r}''_j)$  . If  $(\mathbf{d}''_i - \mathbf{r}''_j)$  is a positive number, it is influencing and if it is negative, certainly, it is an influenced element.  $(\mathbf{d}''_i + \mathbf{r}''_j)$  indicates the sum of density of an element along (longitude axis) regarding being either influencing or influenced. Final hierarchy is gained from the direct and indirect relations of  $(\mathbf{d}''_i + \mathbf{r}''_j)$  and  $(\mathbf{d}''_i - \mathbf{r}''_j)$  in the diagram.

#### FUZZY ANALYTIC HIERARCHICAL PROCESS (AHP)

The AHP was first proposed by Thomas Saaty in 1980. The AHP weighting is mainly determined by the decision makers who conduct the pair wise comparisons, so as to reveal the comparative importance between two criteria. If there are evaluation criteria, then to decide the decision making, the decision makers have to conduces  $C(n,2)=n(n-1)/2$  pair wise comparisons (Li and Huang, 2009; Lin, 2010; Lee et al., 2008).

The goal of MCDM method is to aid decision makers in integrating objective measurements with value judgments that are based not on individual opinions but on collective group ideas. Further, there are situations in which information is incomplete or imprecise or views that are subjective or endowed with linguistic characteristics creating a “fuzzy” decision making environment. The FMCDM approach is designed to minimize such adverse conditions and strengthen the partnership selection process (Chou, 2007; Ding and Liang, 2005; Vaidya and Kumar, 2006).

Traditional evaluation methods usually take the minimum cost or the maximum benefit as their single index of measurement criteria, although, these approaches may not be sufficient for the increasingly complex and diversified decision making environment. Thus, we utilize a FAHP to assess the sustainable development strategies for industry (Chiou et al., 2005). Fuzzy method weighs levels of criteria importance and the determination of weights is the key point in comprehensive evaluation. The propriety of weights subsets will influence the results of the comprehensive evaluation (Hung et al., 2010).

AHP is a powerful method to solve complex decision problems. Any complex problem can be decomposed into several sub-problems using AHP in terms of hierarchical levels where each level represents a set of criteria or attributes relative to each sub-problem (Cheng et al., 2005; Sun et al., 2009). The AHP method is a multi-criteria method of analysis based on an additive

weighting process, in which several relevant attributes are represented through the relative importance (Sun et al., 2009; Hung et al., 2010).

In fuzzy MCDM problems, criteria or attribute values and the relative weights are usually characterized by fuzzy numbers. A fuzzy number is a convex fuzzy set, characterized by a given interval of real numbers, each with a grade of membership between 0 and 1. The most commonly used fuzzy numbers are triangular and trapezoidal fuzzy numbers, whose membership functions are respectively defined as For brevity, triangular and trapezoidal fuzzy numbers are often denoted as  $(a, b, d)$  and  $(a, b, c, d)$  (Wang and Elhag, 2006; Zammori et al., 2009). Human judgment of events may be significantly different based on individuals' subjective perceptivity or personality, even when using the same words (Chiou et al., 2005). Fuzzy linguistic variables are extensions of numerical variables in the sense that they are able to represent the condition of an attribute at a given interval by Taking fuzzy sets as their values (Emre and Ugur, 2009). Triangular fuzzy numbers have been developed to appropriately express linguistic variables (Chiou et al., 2005).

AHP is widely used for multi-criteria decision making and has successfully been applied to many practical problems (Tiryaki and Ahlatcioglu, 2009; Wang et al., 2008). If uncertainty (fuzziness) of human decision making is not taken into account, the results can be misleading. A commonality among terms of expression, such as “very likely”, “probably so”, “not very clear”, “rather dangerous” that are often heard in daily life, is that they all contain some degree of uncertainty (Lee et al., 2008). The concept of fuzziness in traditional AHP directly and without using fuzzy series has been taken into account. In fact, in this method, by using linguistic terms in table 3.1, the concept of fuzziness is applied to determine pair comparison matrices. In this regard, we can refer to models offered by Buckley (1985), Laarhoven & Pedrych (1983), Chang (1992), Lin, 2010, Kahraman et al., 2006).

**TABLE 3.1. NUMERICAL SUM FOR PREFERENCES IN PAIR COMPARISONS**

Linguistic Terms	Numerical Sum
Preference with full and Absolute Importance	9
Preference with very strong importance	7
preference with strong importance	5
Preference with little importance	3
Preference with equal importance	1
For preferences between above linguistic terms	2,4,6,8

A wide study in regard to these techniques can be observed in works of Kahraman (2004).

Some papers published used the fuzzy AHP procedure based on extent analysis method and showed how it can be applied to selection problems (Önüt et al., 2010). In this study, fuzzy AHP is described based on extent analysis method by Chang because this method has been simpler than other fuzzy AHP and similar to the method of classic AHP method.

Extent analysis method of Chang

If  $\mathbf{X} = \{\mathbf{x}_1, \mathbf{x}_2, \dots, \mathbf{x}_n\}$  is the set of objects and  $\mathbf{U} = \{\mathbf{u}_1, \mathbf{u}_2, \dots, \mathbf{u}_m\}$  is wishes, then based on the extent analysis method by Chang, by considering one object, the extent analysis can be

considered for every Wish ( $g_i$ ). Therefore, there is the sum of “m” extent analysis for each object:

$M_{g_i}^1, M_{g_i}^2, \dots, M_{g_i}^m$  where  $i=1,2,\dots,n$

$$\begin{matrix} & w_1 & w_2 & \dots & w_m \\ \begin{matrix} o_1 \\ o_2 \\ \vdots \\ o_n \end{matrix} & \begin{bmatrix} M_{g_1}^1 & M_{g_1}^2 & \dots & M_{g_1}^m \\ M_{g_2}^1 & M_{g_2}^2 & \dots & M_{g_2}^m \\ \vdots & \vdots & \ddots & \vdots \\ M_{g_n}^1 & M_{g_n}^2 & \dots & M_{g_n}^m \end{bmatrix} \end{matrix}$$

Figure 3.1.shows matrices of wish (W)) and (object(O).

Where  $g_i$  is the goal set ( $i = 1, 2, 3, 4, 5, \dots, n$ ) and all the  $M_{g_i}^j$  ( $j = 1, 2, 3, 4, 5, \dots, m$ ) are Triangular Fuzzy Numbers (TFNs).

Figure 3.2. Shows a triangular fuzzy number (Yu and Hu, 2010; Celik et al., 2009).

The steps of Chang's analysis can be given as in the following:

*Step 1:* To obtain a fuzzy compound equation for each object:

If  $M_{g_i}^1, M_{g_i}^2, \dots, M_{g_i}^m$  is the sums of  $i^{th}$  object with respect to  $m$  wishes, then the fuzzy compound equation of  $m$  Wishes for  $i^{th}$  Objects is defined as below:

$$S_i = \sum_{j=1}^m M_{g_i}^j \otimes \left[ \sum_{i=1}^n \sum_{j=1}^m M_{g_i}^j \right]^{-1} \quad (1)$$

If  $M_{g_i}^j = (l_{ij}, m_{ij}, u_{ij})$ , then  $\sum_{j=1}^m M_{g_i}^j$  is defined by the fuzzy addition operation of  $m$  extent analysis as below:

$$\sum_{j=1}^m M_{g_i}^j = (l_{i1}, m_{i1}, u_{i1}) \oplus (l_{i2}, m_{i2}, u_{i2}) \oplus \dots \oplus (l_{im}, m_{im}, u_{im}) = \left( \sum_{j=1}^m l_{ij}, \sum_{j=1}^m m_{ij}, \sum_{j=1}^m u_{ij} \right) \\ = (l'_i, m'_i, u'_i) \quad (2)$$

Also to obtain  $\left[ \sum_{i=1}^n \sum_{j=1}^m M_{g_i}^j \right]^{-1}$  by the fuzzy addition operation, we will have:

$$\sum_{i=1}^n \sum_{j=1}^m M_{g_i}^j = \sum_{i=1}^n \left( \sum_{j=1}^m l_{ij}, \sum_{j=1}^m m_{ij}, \sum_{j=1}^m u_{ij} \right) = \left( \sum_{i=1}^n l'_i, \sum_{i=1}^n m'_i, \sum_{i=1}^n u'_i \right) \quad (3)$$

And then compute the inverse of the vector in the equation (3) is then obtained equation 4:

$$\left( \sum_{i=1}^n \sum_{j=1}^m M_{g_i}^j \right)^{-1} = \left( \frac{1}{\sum_{i=1}^n u'_i}, \frac{1}{\sum_{i=1}^n m'_i}, \frac{1}{\sum_{i=1}^n l'_i} \right) \quad (4)$$

There for:

Step 2: Assessment of degree of priority:

The degree of priority  $S_i$  to  $S_k$  is  $S_i = (l_i, m_i, u_i)$  and  $S_k = (l_k, m_k, u_k)$  then the priority of  $S_i$  to  $S_k$  which is indicated by  $V(S_i \geq S_k)$  is described as equation 6:

$$V(S_i \geq S_k) = \sup_{x \geq y} (\min\{\alpha_{S_i}(x), \alpha_{S_k}(y)\}) \quad (6)$$

And the equation is true for triangular fuzzy number:

$$V(S_i \geq S_k) = \alpha_{S_i}(d) = \begin{cases} 1 & \text{if } (m_i \geq m_k) \\ 1 & \text{if } (l_k \geq u_i) \\ \frac{l_k - u_i}{(m_i - u_i) - (m_k - l_k)} & \text{otherwise} \end{cases} \quad (7)$$

Where  $d$  is the highest intersection point  $\alpha_{S_i}$  and sees Figure 3.3)

Figure 3.3. Intersection point of  $\alpha_{S_k}$  and  $\alpha_{S_i}$ 

To compare and  $S_k$ ; we need both the values of  $V(S_i \geq S_k)$  and

*Step 3:* The degree possibility for a convex fuzzy number to be greater than  $k$  convex fuzzy numbers  $S_i$  ( $i = 1, 2, 3, 4, 5, \dots, k$ ) can be defined by (Wang et al., 2008)

$$V(S \geq S_1, S_2, \dots, S_k) = V((S \geq S_1), (S \geq S_2), \dots, (S \geq S_k)) \\ = \min(V(S \geq S_1), V(S \geq S_2), \dots, V(S \geq S_k)) = \min V(S \geq S_i) \quad (8)$$

$$i = 1, 2, \dots, k$$

If  $d'(A_1) = \min V(S_i \geq S_k)$  for ( $k = 1, 2, \dots, n$   $k \neq i$ ) then the weight vector is given in equation 9 (It is note worthy that the obtained weights are fuzzy):

$$W' = (d'(A_1), d'(A_2), \dots, d'(A_n)) \quad (9)$$

Where  $A_i$  ( $i = 1, 2, 3, 4, 5, 6, \dots, n$ ) are  $n$  elements.

*Step 4:* Normalization of vector  $\hat{W}$  and obtaining weight vector of normalized weight of  $W$ .

$$W = (d(A_1), d(A_2), \dots, d(A_n)) \quad (10)$$

Algorithm of fuzzy analytic hierarchical process (AHP) in the method of extent analysis of Chang

The general process of algorithm of fuzzy AHP in the method of extent analysis of change is as below:

*Step 1.* Building up a hierarchy for the problem

*Step 2.* Determining pair comparison matrices and judgment operations, in traditional state (absolute), Table 3.1 is used for judgment operations; that is, the corresponding number is entered the pair comparison matrices by linguistic preferences.

But in the fuzzy state, we enter the sum of corresponding number with linguistic preferences in pair comparison matrices by triangular fuzzy numbers (Anagnostopoulos et al., 2007). Table 3.2 can be used in this regard. The fuzzy numbers given here are not equal to regular linguistic comparisons 1 to 9 but they are suitable for Fuzzy AHP and are used.

**TABLE 3.2. CORRESPONDING FUZZY NUMBERS WITH PAIR COMPARISONS PREFERENCES**

Linguistic Terms to Determine Preferences	Triangular Fuzzy Number
Preference or full and absolute importance	$(\frac{5}{2}, 3, \frac{7}{2})$
Preference or very stronger importance	$(2, \frac{5}{2}, 3)$
Preference or stronger importance	$(\frac{3}{2}, 2, \frac{5}{2})$
Preference or little importance	$(1, \frac{3}{2}, 2)$

Preference or nearly equal importance	$\left(\frac{1}{2}, 1, \frac{3}{2}\right)$
Preference or equal importance	$(1, 1, 1)$

It is to be mentioned that all elements on the main diameter of pair comparison matrices are equal to (1, 1, 1) and if the element of row  $i$  and column  $j$  of pair comparison matrix is equal to  $M_{g_i}^j = (l_{ij}, m_{ij}, u_{ij})$ , then element of row  $j$  and column  $i$  of this matrix is equal to:

$$M_{g_i}^j = (M_{g_i}^j)^{-1} = (l_{ij}, m_{ij}, u_{ij})^{-1} = \left(\frac{1}{u_{ij}}, \frac{1}{m_{ij}}, \frac{1}{l_{ij}}\right)$$

### Step 3. Computing relative weights of criteria and options

To compute the relative weight of the options with respect to each criterion and the relative weight of criteria with respect to object, we use the extent analysis method of Chang for each of pair comparison matrices. Therefore, a relative weight vector corresponding to that matrix is obtained for each matrix.

### Step 4. Computing the final weight of the options

The final weight of the options is obtained by modulation of relative weights. The key criteria as mentioned before are  $C_1$  (price),  $C_2$  (Colprocessor),  $C_3$  (capacity of customers (quantity)),  $C_4$  (special features of telecommunications),  $C_5$  (flexibility of the equipment in future),  $C_6$  (the number of customers supported by each rack).

**TABLE 3.3. COMPUTING THE FINAL WEIGHT**

Object	C1	C2	C3	C4	C5	C6
C1	$(1, 1, 1)$	$\left(1, \frac{3}{2}, 2\right)$	$\left(\frac{1}{3}, \frac{2}{5}, \frac{1}{2}\right)$	$\left(2, \frac{5}{2}, 3\right)$	$\left(\frac{2}{7}, \frac{1}{3}, \frac{2}{5}\right)$	$\left(\frac{5}{2}, 3, \frac{7}{2}\right)$
C2	$\left(\frac{1}{2}, \frac{2}{3}, 1\right)$	$(1, 1, 1)$	$\left(\frac{2}{7}, \frac{1}{3}, \frac{2}{5}\right)$	$\left(\frac{5}{2}, \frac{1}{2}, \frac{2}{3}\right)$	$\left(\frac{5}{2}, \frac{1}{2}, \frac{2}{3}\right)$	$\left(\frac{1}{2}, \frac{2}{3}, 1\right)$
C3	$\left(2, \frac{5}{2}, 3\right)$	$\left(\frac{5}{2}, 3, \frac{7}{2}\right)$	$(1, 1, 1)$	$\left(1, \frac{3}{2}, 2\right)$	$\left(1, \frac{3}{2}, 2\right)$	$\left(\frac{3}{2}, 2, \frac{5}{2}\right)$
C4	$\left(\frac{1}{3}, \frac{2}{5}, \frac{1}{2}\right)$	$\left(\frac{3}{2}, 2, \frac{5}{2}\right)$	$\left(\frac{1}{2}, \frac{2}{3}, 1\right)$	$(1, 1, 1)$	$\left(\frac{3}{2}, 2, \frac{5}{2}\right)$	$\left(1, \frac{3}{2}, 2\right)$
C5	$\left(\frac{5}{2}, 3, \frac{7}{2}\right)$	$\left(\frac{3}{2}, 2, \frac{5}{2}\right)$	$\left(\frac{1}{2}, \frac{2}{3}, 1\right)$	$\left(\frac{2}{5}, \frac{1}{2}, \frac{2}{3}\right)$	$(1, 1, 1)$	$\left(\frac{1}{2}, \frac{2}{3}, 1\right)$
C6	$\left(\frac{2}{7}, \frac{1}{3}, \frac{2}{5}\right)$	$\left(1, \frac{3}{2}, 2\right)$	$\left(\frac{2}{5}, \frac{1}{2}, \frac{2}{3}\right)$	$\left(\frac{1}{2}, \frac{2}{3}, 1\right)$	$\left(1, \frac{3}{2}, 2\right)$	$(1, 1, 1)$

$$\sum_{j=1}^6 M_{g_1}^j = (1, 1, 1) \oplus \left(1, \frac{3}{2}, 2\right) \oplus \left(\frac{1}{3}, \frac{2}{5}, \frac{1}{2}\right) \oplus \left(2, \frac{5}{2}, 3\right) \oplus \left(\frac{2}{7}, \frac{1}{3}, \frac{2}{5}\right) \oplus \left(\frac{5}{2}, 3, \frac{7}{2}\right)$$

$$= (7/116, 8/733, 10/4)$$

$$\sum_{j=1}^6 M_{g_2}^j = (3/086, 3/667, 4/733); \sum_{j=1}^6 M_{g_3}^j = (9, 11/5, 14)$$

$$\sum_{j=1}^6 M_{g_4}^j = (5/883, 7/567, 9/5); \sum_{j=1}^6 M_{g_5}^j = (6/4, 7/883, 9/667)$$

$$\sum_{j=1}^6 M_{g_6}^j = (4/286, 5/5, 7/067); \sum_{i=1}^6 \sum_{j=1}^6 M_{g_i}^j = (35/721, 44/8, 55/367)$$

$$\left( \sum_{i=1}^6 \sum_{j=1}^6 M_{g_i}^j \right)^{-1} = \left( \frac{1}{55/367}, \frac{1}{44/8}, \frac{1}{35/721} \right) = (0/018, 0/022, 0/028)$$

$$S_1 = (7/116, 8/773, 10/4) \otimes (0/018, 0/022, 0/028) = (0/128, 0/192, 0/291)$$

$$S_2 = (0/055, 0/081, 0/133); S_3 = (0/162, 0/253, 0/392)$$

$$S_4 = (0/105, 0/166, 0/266); S_5 = (0/115, 0/172, 0/271)$$

$$S_6 = (0/077, 0/121, 0/198)$$

$$V(S_i \geq S_k) = \begin{cases} 1 & m_i \geq m_k \\ 1 & l_k \geq u_i \\ \frac{l_k - u_i}{(m_i - u_i) - (m_k - l_k)} & \end{cases}$$

$$V(S_1 \geq S_2) = 1, V(S_1 \geq S_3) = \frac{(0/162 - 0/291)}{(0/192 - 0/291) - (0/253 - 0/162)} = 0/153$$

$$V(S_1 \geq S_4) = 1, V(S_1 \geq S_5) = 1, V(S_2 \geq S_6) = 1$$

$$V(S_2 \geq S_1) = 0/043, V(S_2 \geq S_3) = 1, V(S_2 \geq S_4) = 0/248; V(S_2 \geq S_5) = 0/165$$

$$V(S_2 \geq S_6) = 0/583, V(S_3 \geq S_1) = 1, V(S_3 \geq S_1, S_2, S_4, S_5, S_6) = 1$$

$$V(S_4 \geq S_1) = 0/841, V(S_4 \geq S_3) = 0/545, V(S_4 \geq S_2) = 1, V(S_4 \geq S_6) = 1$$

$$V(S_4 \geq S_5) = 0/962, V(S_5 \geq S_1) = 0/485, V(S_5 \geq S_2) = 1, V(S_5 \geq S_6) = 1$$

$$V(S_5 \geq S_4) = 1, V(S_5 \geq S_3) = 0/574, V(S_6 \geq S_1) = 0/496, V(S_6 \geq S_2) = 1$$

$$V(S_6 \geq S_3) = 0/214, V(S_6 \geq S_4) = 0/674, V(S_6 \geq S_5) = 0/619$$

Now we obtain preferences of  $S_i$ :

$$\begin{aligned}
 V(S_1 \geq S_2, S_3, S_4, S_5, S_6) \\
 &= \min(V(S_1 \geq S_2), V(S_1 \geq S_3), V(S_1 \geq S_4), V(S_1 \geq S_5), V(S_1 \geq S_6)) \\
 &= \min(1, 0/153, 1, 1, 1) = 0/153
 \end{aligned}$$

$$V(S_2 \geq S_1, S_3, S_4, S_5, S_6) = \min(0/043, 0/248, 0/145, 0/583) = 0/043$$

$$V(S_3 \geq S_1, S_2, S_4, S_5, S_6) = 1$$

$$V(S_4 \geq S_1, S_2, S_3, S_5, S_6) = \min(0/841, 1, 0/545, 0/962, 1) = 0/545$$

$$V(S_5 \geq S_1, S_2, S_3, S_4, S_6) = \min(0/485, 1, 0/574, 1, 1) = 0/485$$

$$V(S_6 \geq S_1, S_2, S_3, S_4, S_5) = \min(0/496, 1, 0/214, 0/674, 0/619) = 0/214$$

$$W' = (0/153, 0/043, 1, 0/545, 0/214)$$

We calculate normalization of fuzzy numbers:

$$W = (0/0627, 0/0176, 0/4098, 0/223, 0/1988, 0/0877)$$

#### APPLICATIONS OF PROPOSED METHOD

Now we use the steps of the procedure to identify the relationship between the critical success factors of agile voice of customers (VOCs) process as follows:

Step 1: Selecting a committee of VOCs experts including 12 managers.

Step 2: Developing the evaluation criteria and designing the fuzzy linguistic scale.

In our case the criteria are the critical success factors of agile VOCs, which were extracted by explanatory factor analysis. In this step also the different degrees of influence of a factor on the other factor are expressed in five linguistic term: “Very High, High, Low, Very Low, and No influence and the corresponding positive triangular fuzzy numbers as mentioned before are shown in Table 4.1.

**TABLE 4.1. THE CORRESPONDENCE BETWEEN THE LINGUISTIC TERMS AND LINGUISTIC VALUES**

<i>Linguistic terms</i>	<i>Linguistic values</i>
No influence (No)	(0, 0, 0.25)
Low influence (L)	(0, 0.25, 0.5)
High influence (H)	(0.25, 0.5, 0.75)
Strongly influence (VH)	(0.5, 0.75, 1.0)

**TABLE 4.2. LINGUISTIC EVALUATION OF CRITERIA OF VOICE OF CUSTOMER (EXAMPLE)**

	C <sub>1</sub>	C <sub>2</sub>	C <sub>3</sub>	C <sub>4</sub>	C <sub>5</sub>	C <sub>6</sub>
C <sub>1</sub>	--	VL	H	L	H	VH
C <sub>2</sub>	NO	--	H	VL	NO	NO
C <sub>3</sub>	H	VH	--	NO	L	L

$C_4$	L	L	VL	--	L	VL
$C_5$	VH	VL	VL	VL	--	VL
$C_6$	H	NO	NO	VL	VL	--

Step 3: Acquiring the assessments of decision makers. To measure the relationships between the critical success factors;  $C=\{C_i/i=1, 2, \dots, 6\}$  the group of the chosen experts (17 people mentioned in step 1) was asked to make sets of pairwise comparisons in terms of linguistic terms. Hence 17 fuzzy matrices each is corresponding to an expert and with triangular fuzzy numbers as its elements are obtained. For example matrix  $\tilde{N}$  is as follows:

$$\tilde{N} = \begin{bmatrix} (0,0,0) & (0,.25,.5) & (.5,.75,1) & (.25,.5,.75) & (.5,.75,1) & (.75,1,1) \\ (0,0,.25) & (0,0,0) & (.5,.75,1) & (0,.25,.5) & (0,0,.25) & (0,0,.25) \\ (.5,.75,1) & (.75,1,1) & (0,0,0) & (0,0,.25) & (.25,.5,.75) & (.25,.5,.75) \\ (.25,.5,.75) & (.25,.5,.75) & (0,.25,.5) & (0,0,0) & (.25,.5,.75) & (0,.25,.5) \\ (.75,1,1) & (0,.25,.5) & (0,.25,.5) & (0,.25,.5) & (0,0,0) & (0,.25,.5) \\ (.5,.75,1) & (0,0,.25) & (0,0,.25) & (0,.25,.5) & (0,.25,.5) & (0,0,0) \end{bmatrix}$$

step 4: Acquiring the normalized direct-relation fuzzy matrix. Consider a triangular fuzzy number  $(\tilde{a}_{ij})$  according to equations 2 and 3 to calculate each direct-relation fuzzy matrix  $\tilde{E}$  for each matrix. For example for matrix  $\tilde{N}$ , the normalized direct relation fuzzy matrix  $\tilde{E}$  can be calculated by equations 2 and 3 as follows:

$$\tilde{E} = \begin{bmatrix} (0,0,0) & (0,.059,.118) & (.118,.176,.235) & (.059,.118,.176) & (.118,.176,.235) & (.176,.235,.235) \\ (0,0,.059) & (0,0,0) & (.118,.176,.235) & (0,.059,.118) & (0,0,.059) & (0,0,.059) \\ (.118,.176,.235) & (.176,.235,.235) & (0,0,0) & (0,0,.059) & (.059,.118,.176) & (.059,.118,.176) \\ (.059,.118,.176) & (.059,.118,.176) & (0,.059,.118) & (0,0,0) & (.059,.118,.176) & (0,.059,.118) \\ (.176,.235,.235) & (0,.059,.118) & (0,.059,.118) & (0,.059,.118) & (0,0,0) & (0,.059,.118) \\ (.118,.176,.235) & (0,0,.059) & (0,0,.059) & (0,.059,.118) & (0,.059,.118) & (0,0,0) \end{bmatrix}$$

Step 5: The procedure of calculation matrix  $T$  (The total-relation matrix) according to the Equations 4 is as follows:

$$Matrix[L_{IJ}] = \begin{bmatrix} .066 & .026 & .13 & .063 & .137 & 0.195 \\ .017 & .022 & .122 & .001 & .009 & .01 \\ .147 & .183 & .039 & .009 & .079 & .087 \\ .075 & .061 & .016 & .004 & .069 & .014 \\ .188 & .005 & .023 & .011 & .024 & .034 \\ .126 & .003 & .015 & .007 & .016 & .023 \end{bmatrix}, \quad Matrix[M_{IJ}] = \begin{bmatrix} .196 & .173 & .269 & .188 & .285 & .341 \\ .065 & .064 & .206 & .076 & .047 & .047 \\ .293 & .302 & .122 & .077 & .206 & .218 \\ .219 & .183 & .144 & .056 & .189 & .142 \\ .33 & .135 & .154 & .122 & .1 & .168 \\ .24 & .049 & .065 & .1 & .126 & .078 \end{bmatrix}$$

$$Matrix[U_I] = \begin{bmatrix} .64 & .59 & .719 & .569 & .729 & .7 \\ .424 & .293 & .508 & .342 & .367 & .349 \\ .748 & .622 & .482 & .436 & .621 & .598 \\ .642 & .531 & .53 & .333 & .569 & .5 \\ .671 & .471 & .514 & .429 & .41 & .493 \\ .609 & .37 & .409 & .388 & .463 & .338 \end{bmatrix}$$

$[T_{ij}] =$

$$\begin{aligned} & (.066, .196, .64)(.026, .173, .59)(.129, .269, .719)(.063, .188, .569)(.137, .285, .729)(.195, .341, .7) \\ & (.017, .065, .424)(.022, .064, .293)(.123, .206, .508)(.001, .076, .342)(.009, .047, .367)(.01, .047, .349) \\ & (.147, .293, .748)(.183, .302, .622)(.039, .122, .482)(.009, .077, .436)(.079, .206, .621)(.087, .218, .598) \\ & (.075, .219, .642)(.062, .183, .531)(.016, .144, .53)(.004, .056, .333)(.069, .189, .569)(.014, .142, .5) \\ & (.188, .33, .671)(.005, .135, .471)(.023, .154, .514)(.011, .122, .429)(.024, .1, .41)(.034, .168, .493) \\ & (.126, .243, .609)(.003, .049, .37)(.015, .065, .409)(.007, .103, .388)(.016, .126, .463)(.023, .078, .338) \end{aligned}$$

Step 6: After computing the matrix  $T$ , the amounts of  $d'' + r''$  and  $d'' - r''$  are calculated by Equations 5.  $d''$  and  $r''$  are sum of the rows and the sum of the columns of matrix  $T$  respectively. Table 4.3 illustrates the amounts of  $d''$ ,  $r''$ ,  $d'' + r''$  and  $d'' - r''$ .

**TABLE 4.3. COMPUTING SUMS OF  $d''$  AND  $r''$**

	$d''$	$r''$	$d'' + r''$	$d'' - r''$
C1	(0.6166, 1.4518, 3.9463)	(0.6193, 1.346, 3.7338)	(1.2359, 2.7978, 7.6801)	(-0.0027, 0.1058, 0.2125)
C2	(0.1822, 0.5045, 2.2814)	(0.3012, 0.9056, 2.8769)	(0.4834, 1.4101, 5.1583)	(-0.119, -0.4011, -0.5955)
C3	(0.5449, 1.2184, 3.507)	(0.3446, 0.9592, 3.1613)	(0.8895, 2.1776, 6.6683)	(0.2003, 0.2592, 0.3457)
C4	(0.241, 0.9329, 3.1037)	(0.0955, 0.6221, 2.4959)	(0.3365, 1.555, 5.5996)	(0.1455, 0.3108, 0.6078)
C5	(0.2845, 1.008, 2.9877)	(0.335, 0.9531, 3.1581)	(0.6195, 1.9611, 6.1458)	(-0.0505, 0.0549, -0.1704)
C6	(0.1907, 0.6639, 2.5768)	(0.3643, 0.9935, 2.9769)	(0.555, 1.6574, 5.5537)	(-0.1736, -0.3296, -0.4001)

Step 7: Now we use the equation 6 for diffuzification of the amount of ( $d''$ ) and ( $r''$ ), ( $d'' + r''$ ) and ( $d'' - r''$ ) and convert to  $d''^{def}$ ,  $r''^{def}$ ,  $(d'' + r'')^{def}$  and  $(d'' - r'')^{def}$  respectively. These amounts are illustrated in the Table 4.4

**TABLE 4.4. COMPUTING SUMS OF  $d''^{def}$ ,  $r''^{def}$  AND FUZZY AHP**

	$d''$	$r''$	$d'' + r''$	$d'' - r''$	Fuzzy AHP
C1	1.777	1.667	3.446	0.108	0.063
C2	0.808	1.212	2.036	-0.329	0.018
C3	1.557	1.299	2.859	0.265	0.41

C4	1.27	0.93	2.204	0.326	0.223
C5	1.304	1.294	2.601	0.026	0.199
C6	0.984	1.294	2.287	-0.35	0.088

STEP 8: Then we draw the causal 4.1 Analysis of results diagram based on these calculations . Figure 4.1 illustrates the causal diagram of the criteria.

Figure 4.1. Diagram  $d''_i + r''_j$  on axis x and  $d''_i - r''_j$  on axis y.

## DISCUSSIONS

In column  $d''$ , elements  $C_1$ ,  $C_2$  and  $C_3$  accordingly indicate the most influence and in column  $r''$ , elements  $C_1$  and  $C_3$  are accordingly influenced more than other elements of this column. We know that every element in the hierarchy is determined by  $(d''_i + r''_j)$  columns and  $(d''_i - r''_j)$ . In column  $(d''_i + r''_j)$  where the total strength of an element either influencing or influenced are indicated, element  $C_1$  has the highest priority and  $C_3, C_5, C_6, C_4$  and  $C_2$  are accordingly placed from the second to the sixth rank. In column  $(d''_i - r''_j)$ ,  $C_4, C_3, C_1$  and  $C_5$  are influencing elements but  $C_6$  and  $C_2$  are influenced elements because they are negative. In table – the ranking of elements are calculated in the method of Fuzzy AHP where  $C_3, C_4, C_5, C_6, C_1$  and  $C_2$  are accordingly ranked from 1 to 6.  $C_3$  in  $(d''_i + r''_j)$  ranking is the second but in  $(d''_i - r''_j)$  ranking and the method of Fuzzy AHP, this element is placed the first rank. But  $C_2$  is the last in both methods and elements  $C_5$  and  $C_6$  are the third and the fourth in both ranking methods.

## CONCLUSIONS

Fuzzy DEMATEL method as a very useful group decision making tool has been used to transform the complex interactions between the criteria of the problems of practical life into a visible structured model. In this paper this method is proposed and applied to find the cause and effect critical success factors of voice of customer, which have been extracted by the explanatory factor analysis method.

Hence the DEMATEL method can convert the relationship between the causes and effects of criteria into an intelligible structural model of the system. The DEMATEL method has been successfully applied in many fields.

Using multiple fuzzy decision-making in ranking key factors of voice of customer is also effective in the municipalities of Tehran. Fuzzy AHP is one of the fuzzy ranking methods pairwise comparison criteria but Fuzzy DEMATEL was developed to solve very complicated issues of the world and it is used to structuralize the hypothetical information. With this method, it is possible to estimate the quantity of the effects of direct and indirect relations of elements with each other and promote the quality of relations and interrelations of the group. It is also used in group decision making. Fuzzy DEMATEL can be used together with models such as fuzzy QFD. In this model, the calculation can be easily performed by software such as MATLAB, EXCEL, MINITAB and SPSS. In group decision making, this model is preferred to other fuzzy models such as fuzzy AHP.

### ABSTRACT

*Future teachers will be able to work steadily with their activities only if they fully acquire professional knowledge. In this article highlights of methodology of giving professional knowledge to future teachers.*

**KEYWORDS:** *Teacher, Methodology, Professional Knowledge, Education.*

---

## INTRODUCTION

In the system of continuous education, which is defined in the "National program of Personnel Training", the orientation of young people to the profession takes a special place. Attention to this is becoming increasingly important in the Republic of Uzbekistan. Its theoretical basis is based on the law "On education" and the "national program of Personnel Training" (1997). Therefore, the prospects of this work from the point of view of implementation decree of the president of the Republic of Uzbekistan "on the strategy of action for further development of the Republic of Uzbekistan" dated February 7, 2017, DP-4947, decree of the president of the Republic of Uzbekistan "on measures for further development of the higher education system" dated April 20, 2017 resolutions DP-5264 of November 29, 2017 "On the establishment of the Ministry of Innovative Development of the Republic of Uzbekistan", DP-5313 January 25, 2018 "On measures to radically improve the system of general secondary, secondary special and vocational education" decree and other relevant normative legal acts in this area.

The above-mentioned issues are reflected in the works of a number of Eastern thinkers, Ismail al-Bukhari, Yusuf Khos Hajib, Abu Nasr Farabi, Abu Rayhon Beruni, Abu Ali ibn Sina, Abdurakhman Jami, Alisher Navoi, Jalaliddin Davani, Abdulla Avloniy, who recognized the world of pedagogical vocational training and professional stability of young people as well as the glorification of the teaching profession in society.

## MATERIALS AND METHODS

Scientists are engaged in problems of preparation of students for professional activity and formation of its stability in higher educational institutions in the direction of pedagogy. In the process of pedagogical higher education, issues of formation of teacher personality in students and increasing social activity of students on the basis of self-management in future teachers and diagnosis of professional formation are discussed. A.Abdullajonova, O.A.Abdulina, A.A.Akbarov, X.A.Abdurakhmanova, S.V.Safonova it was studied in the studies. Pedagogical scientists who studied the professional skills of the teacher H.Abdukarimov, N.Azizkhujaeva, A.Aliyev, A.Ahrorov, A.A.Verbisky, R.H.Juraev, B.R.Juraeva, J.G.Yoldoshev, S.M.Markova, G.M.Maxmutova, L.M.Mitina, A.G.Morozov, U.N.Y.Nishonaliev, M.Ochilov, B.Rakhimov, N.Saidahmedov, V.A.Slasyanin, U.Tolipov, A.RKhodjabayev, A.A.Khalikov, N.Shadiev, A.Haydarova, A.A.Hamidov, F.R.Yuzlikayev pedagogical skills of the teacher, which are considered an important factor in the formation of professional stability of future teachers in the scientific work of yuzlikaevs, the opportunities of the teacher to use modern innovative educational technologies, as well as the outlook of future teachers, ways and methods of further development of the culture of communicative communication are investigated. A.A.Badalev, E.M.Ivanova, E.Gaziev, M.G.Davletshins covered the psychological and psychophysiological aspects of professional education of the teacher's personality. V.Adolf, I.Zimnyaya, A.Karabaeva, N.Kuzmina, N.Muslimov, Sh.Sharipovs studied the problem of the formation of professional competence of the teacher. The analysis of literature shows that the content and definitions of the competency and the competency approach, as well as the professional qualities of the modern teacher, have been extensively studied. However, the system of diagnosis of the process of formation of professional stability of future teachers in higher educational institutions, the content, form, methods and means of innovative co-operation on the formation of professional stability of future teachers have not been sufficiently studied.

In the preparation of future teachers for educational processes on the basis of analysis of the extent to which the students are armed with the knowledge of the teaching profession, as well as on the basis of the requirements of the system for the promotion of the teacher's position in the society, a plan of measures was developed for graduates of pedagogical It was found out that on the eve of the graduation of Higher Education, future teachers will have the following qualities and qualities:

1. Stage of training psychological himself to work in the educational system: to feel himself responsible for giving knowledge to the future teachers and educating them as a competent person. Trust in the pedagogical system to operate in modern conditions within the framework of the requirements for the personality of the modern teacher.
2. Attributes of spiritual maturity: the attainment of the qualities inherent in a harmonious person as a result of the constant increase in the knowledge of future teachers ( humanism, achievement of spiritual maturity, fairness, internal and external culture, pedagogical exertion and etc.)
3. Qualities related to the acquisition of professional secrets: the fact that future teachers have well mastered educational and educational knowledge, as well as the timeliness of their effective use.
4. Educational norms-attributes of work with documents: future teachers know how to work with SES, curriculum, science program, textbooks, manuals, methodological manuals and monographs.
5. Attributes of working with information and telecommunications: the fact that future teachers have the qualities of professional stability so that they can work with the tools used in the process of education and training.
6. Quality of knowledge of languages: future teachers should have a good position in front of their colleagues and be aware of the news by reading foreign literature in its original form.
7. Attributes of management: knowledge of pedagogical control, management of educational and educational process.
8. Quality of scientific activity: understanding of scientific research work, preparation of articles and abstracts, preparation of textbooks, manuals, methodological manuals and monographs.

Future teachers will be able to work steadily with their activities only if they fully acquire professional knowledge. The work to be done for this is reflected below. First of all, in the integration of professional knowledge into the minds of future teachers, it is necessary to fully explain to students the “basic printouts of the state policy in the field of Education”, which are reflected in the law “on education”. Education is declared a priority in the field of social development of the Republic of Uzbekistan. The main print-outs of public policy in the field of education are as follows: the fact that education and training are of a humane, demoralizing nature;

- continuity and consistency of education;

-general secondary, as well as secondary special, compulsory vocational education;

-the direction of secondary special, vocational education: the choice of study in an academic high school or vocational college;

- the fact that the educational system is of a secular character;
- openness of education for all within the framework of state educational standards;
- a single and differentiated approach to the selection of educational programs;
- to be educated and encourage talent;
- harmonization of state and public administration in the educational system in the process in the educational system, the content of which in the state educational standards is defined as follows:

Determines the quality of personnel training, the general requirements for the content of education; the necessary and sufficient level of knowledge of training of Education recipients, as well as the general qualification requirements for graduates of higher education institutions; the size of the educational load; procedures for assessing the activities of educational institutions and the quality of training. Proceeding from this, when preparing future teachers, one should first pay attention to the quality of personnel training. When we arm students with the necessary level of professional knowledge in higher education, we can achieve professional stability only if we form their professional worldview in accordance with the modern requirements. Secondly, from our attainment of the professional stability of the future teachers, it is imperative to fulfill the general requirements for the content of Education. This is reflected in the SES years below: for example, humanitarian and socio-economic, mathematical and natural-scientific, general-military, specialized, additional, provided for the mastering of the blocks of compulsory subjects of the student.

### Analysis

The content of each educational science block is also subject to general requirements in alokhi. Participants in the educational process, which fulfilled these requirements in a timely manner, fully absorb the content of education. For example:

The general requirements for the content of the block of humanities and socio-economic sciences are as follows:

- complement and develop the knowledge acquired on the basis of general secondary and special secondary, vocational education;
- form the scientific and humanitarian worldview, high spirituality and democratic culture, economic, legal and creative thinking on the basis of the idea of national independence and democracy, national and universal values, and socio-political activity;
- ensuring the unity of education with history, philosophy, folk traditions, customs, preservation and enrichment of the culture of the peoples of Uzbekistan, respect for the history and culture of other peoples;
- develop the spirit of humanism, patriotism and internationalism;
- it is necessary to ensure that the process of education and training is directed to the formation of an independent thinking, capable of making decisions, comprehensively developed, harmonious personality.

When we properly organize the work, due to the above – mentioned general requirements for future teachers in the educational process, they become active participants in this process. As a

result, the following qualifications appear in them. These are:

- the worldview is radically changed, acquiring knowledge in a systematic and justifiable way. As a result, as a result of the fact that future teachers understand the actual issues of public policy, they will be able to independently solve social problems;
- students who fulfill the universal requirements for the content of science, first of all, will have a sense of self-confidence, second, there will be a sense of respect for national and spiritual values, there will be a patriotism for the future of our native land;
- students have a holistic scientific imagination and create the opportunity to use it in the future.
- one of the necessary knowledge for future teachers forms a pure human attitude towards personality society and existence. It turns out that the desire to teach the legal and moral criteria of this relationship not only to himself as a student, but also to the younger generations in the future;
- through the proper use of information sources, the ability to work independently with new knowledge and to lead a healthy lifestyle and apply to it is formed. They put this knowledge into operation in fairy tale activities and prepare the ground for a happy activity will serve to ensure professional stability.

Pedagogical sciences form the basis of ensuring the professionalism of future pupils. In the pedagogical sciences, a sense of correspondence with respect to the profession is formed. Increasing the possibility of acquiring pedagogical skills in the direction of future teachers to pedagogical professional activity is one of the important factors. Proceeding from this, we drew attention to the following sources, which serve to ensure the professionalism of future readers in this chapter of our scientific work. These are:

These are: the study of the activities of scientists, who brought the art of speech to a high level. For example; Perikl, Aristotle (384-322) in Central Asia is famous for the name Arastu, Socrates (about 427-347y.y.), Demosfen (384-322), Mark Tully Tsitseron (103-43), Likurg (324 died in the year), Katon (234-145 BC years), Mark Antony (143-87 BC years) to achieve something beautifully explained to readers by teaching their activities.

Eloquence is one of the most ancient art of the word art of the past wherein this art was called preaching in the Muslim East. Accordingly, speech - vowels are interpreted as preachers.

According to historians, such figures as Bahovuddin Valad, Jalaliddin Rumi, Hussein Koshifiy, Muin Voiz, Mohammed Rafik Voiz, Voiz Kazvini, Shirvani, Muhammad Voiz, Quraysh Saidi, Voiz Samarkandiy, Qazi Oshiy, Hussein Voiz Koshifiy, Sahibkiran Amir Temur, Alisher Navoi, Hussein Boykaro, Babur, Mirzo Ulugbek, who were the preachers of the Central Asian preachers treasure of the art of preachers' preaching those who thoroughly mastered and skillfully used it in their activities.

## DISCUSSION

The art of preaching is mainly in three forms: dabilirlik, khatiblik, muzakkirlik. The first of these consisted in a written statement of correspondence in the status of the state and reading it with recitation, the second-reading the sermon before noon prayers on Fridays, the third-commenting on religious, moral, legal issues after the letter at conferences on Fridays, Eid and other solemn

days. They were mainly imams, imams, imams, mudarris. In addition, in the works of great educators and pedagogical scientists, the formation of correspondence and stability to casab is taken as the main criterion by explaining the leading ideas of education to students. For Example: Abdurauf Fitrat. "The road of salvation", Abdulla Avlani "Turkiston Gulistan or morality", Abu Nasr Farabi "The city of virtuous people" Avliyakov N.X., Musaeva N., "New pedagogical technologies", Adizov B.R. Theoretical basis of creative organization of primary education: PED.science doc... diss., Azizkhodjaeva N. "Pedagogical technology and pedagogical skill", Asomova R.S. "The motivation for choosing a profession and its dynamics", Begimkulov U.Sh. Theory and practice of organization and management of information on pedagogical educational processes: PED. science doc...diss., Jamoldinova O.R. Improvement of pedagogical norms of the principles of continuity and continuity in the development of the culture of healthy living of young people: PED. science doc...diss., Yuldashev Q. Scientific and methodological bases of teaching literature in updated pedagogical thought and secondary schools: PED. science doc...diss., Yoldoshev J.G, Usmonov S.A. Fundamentals of pedagogical technology, Mardanov Sh.Q. Pedagogical bases of training and professional development of pedagogical personnel on the basis of educational values: PED. science doc...diss., Musurmonova O. Pedagogical bases of the formation of the spiritual culture of students of the upper classes: PED.science doc...diss., Nishanova Z.T. Psychological basis of the formation of independent creative thinking: Psych.science doc...dis., Reyimav Sh.K. Pedagogical bases of formation of culture of awareness and self-sacrifice in the students of the higher educational institution.: PED. Science can,...diss., Ruzieva D. Scientific and pedagogical bases of formation of national pride in the students of higher educational institution: PED. science doc...diss., Tulenova G.J. The role of the spiritual factor in increasing the social activity of young people (socio-philosophical analysis): Philo. science. doc...diss., Sharipov Sh.S. Theory and practice of ensuring the continuity of professional creativity of students: PED. science doc...diss., Sharipova D. Nauchnie osnovi hygienicheskogo vospitaniya obuchayutshixsya osnovi: Authoref. ...diss., Shodmonova Sh.S. Formation and development of the thinking of independence in the students of the higher educational institution (on the example of the direction of vocational education): PED. science doc...diss. – Egamberdieva N.M. Theory and practice of personal and professional socialization of students on the basis of cultural-humanitarian approach (pedagogy on the example of higher educational institutions): PED. science doc...diss.

## CONCLUSION

The above information shows that the profession of teacher and the people involved in it, not only today, but also several centuries ago, in the processes of directing young people to the profession, they relied on the methodology of the formation of professional stability skills in it. In place of the conclusion, we can say that from the above-mentioned sources, we can give the following definition given to the methodology that we can use as a methodological basis in the formation of professional stability of future teachers.

Methodology (from the words method and...logic) is a system of organizing the theoretical and practical activities of the researcher, the principles and methods of restoration, as well as the doctrine of such a system. Methodology is also described as a doctrine about methods or gross-common cognition method. The methodology teaches the way to approach the techniques and the realities as a whole. Teaches a certain part of reality, some aspect, some state of its development.

## **MODERN ICT IN ENGLISH LANGUAGE TEACHING**

**Ziyaboyeva Sevara\*; Kazakova Marifat\*\*; Ibrokhimova Mukhaddam\*\*\***

1,3EFL Teachers of Namangan State University,  
UZBEKISTAN

### **ABSTRACT**

*The modern stage of society development is characterized by the process of informatization, the use of information as a public product that provides for the intensification and intellectualization of the main spheres of human activity, acceleration of the scientific and technical process and the democratization of society. A person who is proficient and effective in technology and information has a different, new style of thinking, and approaches the assessment of the problem and the organization of their activities in a different way. This article discusses modern*

*information and communication technologies (ICT) and the possibility of their application in teaching English.*

**KEYWORDS:** *Information And Communication Technologies (ICT), Computer, Internet, Multimedia Presentation, English Language Teaching.*

## INTRODUCTION

Modernization of the content of education at the present stage of development of society is not least associated with innovative processes in the organization of foreign language teaching. In recent years, the question of the use of new information and communication technologies (ICTs) in secondary higher education institutions has been raised more frequently. These are not only new technical tools, but also new forms and methods of teaching, a new approach to the learning process.

ICT is a term of the beginning of the twenty-first century, the term of the new information society that humanity is building. Information technologies - "a system of methods and methods for collecting, accumulating, storing, searching, transmitting, processing and issuing information using computers and computer communication lines."

It is impossible to imagine a modern higher education institution without new information technologies, because the modern level of the educational process involves the use of computer technologies in higher education institution. The use of information technologies in the classroom is one of the modern means of implementing a person-centered approach to teaching English in higher education institutions. The modern lesson involves a new level of knowledge development, development of cognitive interests, intellectual and creative abilities.

The use of ICT in the educational process contributes to:

- improving the quality of training;
- Effective organization of active cognitive activity of students and formation of a high level of motivation;
- Formation of information and technical culture of students and sustainable interest in educational activities;
- Development of students' independence;
- The possibility of visual and dynamic presentation of information using images and sound (text, graphics, audio and video information, animation);
- Access to information resources that attract scientific and cultural information.

One of the goals of teaching a foreign language in secondary higher education institutions, along with educational, educational and developmental, is the formation of foreign language communicative competence. It includes the ability and readiness of students to use a foreign language in various communication situations in accordance with the norms of this language, when working with foreign language information. The task of the teacher is to create conditions for practical language acquisition for each student, to choose such teaching methods that would allow the student to show their activity, their creativity.

Teaching English at the modern level is impossible without the use of information technology. The use of ICT is an important factor in increasing the motivation of students to learn a foreign language, making lessons more rich, productive and interesting, developing all types of communicative competence of students through educational and extracurricular activities on the subject. The use of information technology is very relevant today. Modern education places increasing demands on the teacher to learn a foreign language at higher education institution, focusing on the communicative competence of students in all its components.

Modern information technologies offer great opportunities to expand the educational framework for each higher education institution subject, and a foreign language is no exception. Learning English today is a creative process. In the study of English, the multimedia potential of new information technologies is used, which shows the high efficiency of using the didactic capabilities of computer technologies.

The use of ICT contributes to the effective solution of the following didactic tasks of teaching English:

- Formation of skills for reading foreign texts;
- Improvement of listening comprehension skills;
- improving the skills of reading;
- improving the ability to build monologue and Dialogic statements;
- Improvement of writing skills in the preparation of various types of essays, retellings, essays;
- adding vocabulary to the vocabulary of modern foreign languages;
- Formation of a stable motivation for foreign-language activities with the help of operational materials on the Internet, e-mail, search engine results.

The computer best "fits" into the structure of the educational process, most fully meets the didactic requirements and brings the process of learning English as close as possible to the real conditions. Computers can perceive new information, process it in a certain way and make decisions, can remember the necessary data, reproduce moving images, and control the operation of such technical training tools as speech synthesizers, video recorders, and tape recorders.

The computer also provides comprehensive control of the educational process. Control, as we know, is an integral part of the educational process and serves as a feedback between the student and the teacher. When using a computer to control the quality of students' knowledge, a more objective assessment is also achieved.

Another advantage of the computer is the ability to accumulate statistical information during the educational process. Analyzing statistical data (the number of errors, correct and incorrect answers, requests for help, time spent on the implementation of individual knowledge, etc.), the teacher judges the degree and quality of knowledge formation in students.

One more factor should be noted: the computer removes such a negative psychological factor as "phobia". During traditional classroom classes, various factors (pronunciation defects, fear of making mistakes, inability to formulate their thoughts aloud, etc.) do not allow many students to show their real knowledge. Being "alone" with the display, the student, as a rule, does not feel constrained and tries to show the maximum of their knowledge.

---

Computers also create favorable opportunities for organizing independent work of students in English lessons. Students can use the computer to study individual topics, as well as to self-control their knowledge.

Multimedia presentation is a didactic tool for organizing the educational process, the expediency of which in the educational process is due to the specific possibilities of presenting information: multi-channel, visual, integrality, modeling of the studied processes and phenomena, interactivity, game form.

One of the obvious advantages of an English lesson using a multimedia presentation is its visibility. The use of visualization is all the more important because higher education institutions usually lack the necessary set of tables, diagrams, reproductions, and illustrations.

Multi-media presentations allow you to focus students' attention on significant points of the information presented and create visual effective samples in the form of illustrations, diagrams, diagrams, graphic compositions, etc. The presentation allows you to influence several types of memory at once: visual, auditory, emotional, and in some cases motor. Increased interactivity leads to more intensive participation in the learning process of the learner, which contributes to improving the efficiency of perception and memorization of educational material.

The advantages of implementing Internet technologies in the process of teaching English are currently not in doubt. The use of Internet technologies provides a unique opportunity to connect to any point of the world using search engines. Learning already goes beyond the classroom and takes on limitless features.

The most widely used features of the Internet when teaching English are used for:

- e-mail correspondence with peers from the countries of the language being studied;
- Participation in testing, competitions, and Olympiads;
- distance learning courses;
- Participation in telecommunications interregional, national, and international projects.

Internet information resources contain text, audio and visual material on various topics in different languages. Educational Internet resources (IR) are created exclusively for educational purposes.

An interactive whiteboard is a valuable tool for teaching the entire class. This is a visual resource that helps you present new material in a fun way, and is a valuable tool for explaining abstract ideas and concepts. You can easily change information and move objects on the Board.

The introduction of lessons using an interactive whiteboard into the teacher's work has made not only the lessons more interesting and exciting, but also the preparation for them. Students' interest in the subject increases. The perception of the lesson is sharpened: video, sound, graphics, animation. The positive aspect of such lessons is that the students themselves are actively involved in the preparation process. Training programs are an indispensable tool for activating and fixing thematic lexical units, as they allow for their repeated repetition, accompanied by the presentation of images, increase the motivation of students and involve involuntary attention in the process of memorization. To test students' comprehension of lexical units and grammatical material, you can use simple presentations made in the form of riddles or

multiple-choice tests, in which the slides of tasks and correct answers alternate (used during speech charging when working with students in front).

The use of ICT expands the teacher's ability to choose materials and forms of educational activity, increases the effectiveness of the lesson, makes it bright and exciting, informative and emotionally rich.

Thus, multimedia products can be a powerful motivational factor and attract students to learning. At the same time, the role of the teacher will not become less significant. No amount of cutting-edge technology can replace the teacher in the classroom. The most important thing in the lesson is live communication. The role of the teacher in the educational process is the leading one, so the mechanism of using information technologies in learning a foreign language will require increased efforts of the teacher. Effective use of ICT directly depends on the information culture and computer literacy of the teacher. The teacher cannot and should not lag behind the achievements of science and technology, he is called to ensure that technical capabilities serve the development of the human soul. Therefore, every teacher must constantly look for new ways to conduct the lesson, strive to make each lesson more interesting and exciting, so that the lesson material will remain in the memory of students for a long time. One way to achieve this goal is to use ICT in the preparation and delivery of lessons.

The possibilities of using computer technology are limitless. They facilitate the work of the teacher and arouse great interest among students, offer simple and convenient tools for solving a wide range of tasks, and provide students with an additional incentive to learn a foreign language.

The use of information technologies gives an impetus to the development of new forms and content of traditional activities of students, which leads to their implementation at a higher level. The results of the use of ICT are-improving the quality of education, high cognitive activity of students, individualization of learning, development of creative approach in the performance of educational tasks. Today, information and communication technologies can be considered a new way of transferring knowledge, which corresponds to a qualitatively new content of learning and development of the child.

## CONCLUSION

The use of new ICTs helps to implement a personal-oriented approach to learning, contribute to the individualization and differentiation of learning, taking into account the abilities of children, their level of learning, the intensification of independent work of students, increase cognitive activity and motivation, increase the volume of tasks completed, the ability to show creativity.

The introduction of ICT contributes to achieving the main goal of modernizing education - improving the quality of education, increasing the availability of education, ensuring the harmonious development of a person who is oriented in the information space, is attached to the information and communication capabilities of modern technologies and has an information culture.

## INNOVATIVE TECHNIQUES FOR ESP PAIR WORK

**Djuraeva Mastura\***

\*Teacher,  
Fergana Polytechnic Institute,  
UZBEKISTAN

### ABSTRACT

*Innovative ideas in the field of technology have simplified the work and helped our rapid development. These ideas contribute to the creation of innovative technologies over time. In order to create this innovative idea, it is necessary to have the knowledge, which is fundamental in this process. Thus we get the scheme: knowledge idea technology. Not all classroom activities are designed for pair work. The best time to use pair work is during oral activities, as these activities allow students to get more speaking time than they would in a class setting.*

---

**KEYWORDS:** *Simplify, To Contribute, Idiomatic And The Prepositions, Your Outlook, Receive And Transmit.*

---

## INTRODUCTION

One should say that English is not an easy language to learn. There is a big problem of spelling, of the large number of exceptions to any rule. This language is very idiomatic and the prepositions are terrible. English is one of those languages which may seem easy in the beginning, but then the bridge between basic knowledge and mastery takes a long time to cross. If you cross this bridge, it will give you great satisfaction. You will be able to speak to people from other countries, to read foreign authors in the original, which makes your outlook wider. To know English today is absolutely necessary for every educated man, for every good specialist.

Innovative ideas in the field of technology have simplified the work and helped our rapid development. These ideas contribute to the creation of innovative technologies over time. In order to create this innovative idea, it is necessary to have the knowledge, which is fundamental in this process. Thus we get the scheme: knowledge idea technology. To date, innovative technologies are traditionally divided into two segments: information technologies (technologies of automated information processing) and communication technologies (technologies for storage and transmission of information). For example, with the help of communication technologies, people can receive and transmit various contents, being in different corners of our world. International relations, including education, business negotiations and much more are now possible faster and more efficiently. If we recall the communication innovations in the field of education, first of all, it should be emphasized that people can enter higher education institutions and study remotely regardless of their location. Furthermore, every qualified pedagogue teaches something new and useful.

Communication with representatives of other countries contributes to our self-development. All this eventually promotes the creation of qualified unique staff.

Information technologies allow:

- To automate certain labor-intensive operations;
- Automate and optimize production planning;
- Optimize individual business processes (for example, customer relations, asset management, document management, management decision making), taking into account the specifics of various branches of economic activity.

## MATERIALS AND METHODS

Information technology is used for large data processing systems, computing on a personal computer, in science and education, in management, computer-aided design and the creation of systems with artificial intelligence. Information technologies are the modern technological systems of immense strategic importance (political, defense, economic, social and cultural), which led to the formation of a new concept of the world order - "who owns the information, he owns the world." The spread of information and communication technologies play an important role in structural changes in all the areas of our life. For someone, it will be difficult to learn these technologies. Workers who will not be able to study will have to give way to the

younger generation. Thus we are faced with a problem because, in order to use innovations in technologies and develop it, it is necessary to have a qualified youth. First and foremost there is the question of education. Anyway, only education can create a developed generation that will continue to strive for new knowledge and will meet the requirements of innovative technologies. In addition, I am convinced that innovative ideas in technologies have created a completely new life, which poses new challenges for our country. How we will cope with these tasks depends on the future of our country.

The first mistake many teachers make when assigning pair work is to let students choose their pairs. While that may be fun for those in the class who are already friends, your job as the teacher is to assess each student's strengths and weaknesses and put them with someone they can work with well. In other words: you make the pairs. If you know that two students are particularly good at conjugation, it might be interesting to put them together so that they have a real challenge. If one student is exceptionally shy, don't stick them with the class loudmouth; they'll only be over shadowed. The best way to set up pair work in the classroom is to allow no expectations amongst students that they'll be picking their own partners.—We're going to go about this activity in pairs!

For example: Sasha with Kevin, Lucy with Mary. By making it obvious that you'll be the one deciding who works with whom, no one will get upset or try to fuss. Once the pairs have been established, it's time for your most important role: monitoring pair work. While most pair work should finish with a group discussion or individual evaluation, the purpose of the pair work is lost if you aren't listening and gently correcting. While you should be wary of over-correcting and silencing a student, do wander the room, listening for errors that you know a student can correct him or herself. Then you can gently remind the student how to properly use that language. This serves two purposes: not only does it reinforce correct use of English, but it also ensures that students know you're listening. This way, they're sure to give the pair work activity their all. Not all classroom activities are designed for pair work. The best time to use pair work is during oral activities, as these activities allow students to get more speaking time than they would in a class setting. But you can't just ask students to talk to each other for two minutes—you need a bit more structure than that!

## DISCUSSION

Here are 7 great ESL pair work activities that you can use in a variety of ways to get your students talking.

### 1. Investigative Journalist.

Investigative journalist is a classic pair work activity for a reason: it works! It can be used in a variety of scenarios and tailored according to specific grammar or vocabulary points that you've been reviewing in class. The basis of investigative journalist is for students to interview one another in pairs and present their findings. It can be used for groups at all levels from beginning to advanced, as long as you tailor it to their levels. Beginners may do a simple version, asking their partners about their family structure, favorite colors and foods, pets and hobbies. Intermediate students could use investigative journalist to practice past tense structures by asking about their interlocutor's childhood. Advanced students might benefit from a murder mystery version of the game, where each student is assigned a character to play and the game concludes with the murderer being succeed out as a result of the questions.

Have fun with this game, and remember: if you give your students the tools to succeed, they'll surprise you!

## 2. Debate.

Debate is another classic that can incorporate pair or group work, depending on the size of your class. Create groups and assign each group or pair a side of an argument. Use pair work time to allow students to develop their argument and conclude with a class-wide debate. Debate is made even more interesting when you present students with authentic materials to use as support for their claims.

## 3. What's your secret?

What's your secret? Does a pair work activity that truly involves the whole class? In this game, which is a play on investigative journalism, each student writes a secret down on a piece of paper, things like: "I play the clarinet", or "I have a twin". The papers are placed in a hat and each student draws one: that's where the game begins. What's your secret? Can either be played by allowing students to mill about the classroom freely or by setting up a speed dating scenario, where each pair has 1 minute to speak before rotating. Students may ask one another yes/no questions they may not ask directly if what's on the piece of paper is true about them or not. Students then must to whom the secret they drew belongs.

## 4. It's Your Turn: Teach a Class!

Teach a class! Is a fun activity for advanced EFL students? In this activity, you assign each pair a grammar, vocabulary or culture point that they'll have to teach to the class. The pair works together to prepare activities and lesson plans and teaches the point to the class. Unlike many of these other activities, the conclusion portion of this activity is built right in: when the pair teaches the class, the teacher should play the role of the student, but you may evaluate the lesson at the end and feel free to correct any mistakes the - teachers' make!

## 5. Following Directions.

Following directions is an interesting game that offers a change from classroom routine. In this game, each student in the pair draws a picture, keeping their paper shielded from the eyes of their partner. Ideally, pictures should be fairly geometric. Once the picture is complete, they explain to their partner, using words only, how to replicate the image. For example, if a student has drawn the stereotypical square house with a triangle roof, he might say: -Draw a square in the middle of the paper that's about a third of the size of the paper. Draw an equilateral triangle on top of the square, using the top side of the square as the bottom side of the triangle. The goal of this game is for each partner to replicate the other's drawing going by these spoken directions.

## 6. Games! Yes, No

Many pair work activities can feel like games, but sometimes it's fun to introduce some real games into the mix. Yes, no is a game where the only two words that students aren't allowed to say are yes and no. Pair students off and play. When a student loses, he or she is out and the winning partner is paired with another winning partner. In this way, you can create a tournament of yes, no. Other versions of the game also forbid - maybe and - Consider these versions when the game is lasting too long or students need an extra challenge.

## 7. Games! Who?

Who is a version of 20 questions that focuses entirely on people? Students draw the name of a famous person out of a hat (you'll need to prepare these slips in advance!) and their partner tries to who's on the paper by asking a series of yes/no questions. Like yes, no, who can be turned into a tournament-style game.

Concluding a Pair Work Activity Remember: a pair work activity isn't a lesson in and of itself. There should be a brief introduction, letting students know what you expect them to do during the activity. There should be especially conclusion. Be sure to budget it into your class time or the pair work activity will be useless. During your conclusion, you should gather the information gleaned during the activity and go through it as a group. This will allow you to correct errors and it'll also allow students to learn from their peers. Many pair work activities also benefit from being followed up by an individual activity such as a written response, worksheet for homework or short oral presentation to the group presenting the student's findings. Once you've mastered the art of pair work, your students will be speaking up (and correctly!) before you know it!

Oh, and One More Thing...

Another way to truly engage your students with English is to use fluently. Fluently takes real-world videos-like music videos, cartoons, documentaries and more-and turns them into personalized language learning lessons for you and your students. It's got a huge collection of authentic

English videos that people in the English-speaking world actually watch on the regular. There are tons of great choices there when you're looking for songs for in-class activities. You'll find music videos, musical numbers from cinema and theater, kids' sing-alongs, commercial jingles and much, much more.

## CONCLUSION

On Fluently, all the videos are sorted by level and are carefully annotated for students. Words come with example sentences and definitions. Students will be able to add them to their own vocabulary lists, and even see how the words are used in other videos. For example, if a student taps on the word - brought they'll see this: Plus, these great videos are all accompanied by interactive features and active learning tools for students, like multimedia flashcards and fun games like - fill in the blank. It's perfect for in-class activities, group projects and solo homework assignments. Not to mention, it's guaranteed to get your students excited about English! There is the closest of links between language dominance and economic, technological, and cultural power, too, and this will become increasingly as the history of English is told. A strong power-base, of whatever kind, no language can make progress as an international medium of communication. Language has no independent existence, living in some sort of mystical space apart from the people who speak it. Language exists only in the brains and mouths and ears and hands and eyes of its users. When they succeed on the international stage their language succeeds. When they fail, their language fails.

Students are also encouraged to learn material in greater depth than they might otherwise have done, and to think of creative ways to convince the teacher that they have mastered the required material.

**ABSTRACT**

*In this article highlights of about some useful and poisonous plants of the family a piaceae L. The resinous substance in the roots of these plants, cyclotoxin, has a significant effect on the centers of excitation of the spinal cord of animals, that is, on respiration, heart rate and blood pressure. From plants of the Apiaceae L. family, especially from the root of the plant, cattle are particularly affected. We know from history that the great ancient Greek philosopher Socrates died of poisoning from this plant. From ancient times in Athens, people sentenced to death were ordered to drink poisonous drinks made from this plant.*

**KEYWORDS:** Plant, Family Apiaceae L., Jizzakh Region.

**INTRODUCTION**

One of the largest families of dicotyledonous plants is the *Ferula* L. family, which belongs to the *Apiaceae* L. family. We can find about 3,500 plant species in 300 genera. Of these, 420 species belonging to 93 genera are found in Central Asia. In Uzbekistan, there are more than 40 species of plants and about 20 species in the Jizzakh region.

Representatives of this family are important medicinal, fodder, honey plants, edible and poisonous plants. In some species of this plant, Estrogen, one of the most important substances, can be found. Estrogen preparations are used for many purposes in medicine and animal husbandry.

## MATERIALS AND METHODS

The glue extracted from the roots and stems of these plants has been used by different peoples for different purposes, in the treatment of various diseases. It is possible to make 100 tons of glue from the roots of some species of *Ferula* L., for example, *F. foetida*, *F. diversivittata* and *F. kohistanica*. It is even possible to export this glue to foreign countries. We know that pinoferol and tefestrol can be obtained from the *F. kohistanica* and *F. tenuisepta* series of plant species.

We need to pay more attention to the conservation and rational use of this family of plants, obtaining high-quality raw materials from certain plant species, and growing seeds in nature for use.

The most common member of the family *Apiaceae* L. is widespread in the northern hemisphere, tropical and subtropical countries. There are both useful and poisonous species of plants of the family *Apiaceae* L. Especially for livestock, plant poisoning can be observed in the early stages of vegetation and during dew.

It is clear that in some families of members of the *Apiaceae* L. family there are poisonous species, including *Ferula* L., *Aethusa* L., *Chaerophyllum* L., *Oenanthe* L., *Astrantia* L., *Sium* L., *Cicuta* L., *Muretia* Boiss., *Prangos* Lindl., *Conium* L. Some species even contain alkaloids. These species are toxic not only to humans but also to livestock.

In particular, *C. virosa* L. belonging to the *Cicuta* L. and *S. latifolium* belonging to *Sium* family can be found in some parts of Central Asia, and many plant species can be found in Europe. The resinous substance in the roots of these plants, cyclotoxin, has a significant effect on the centers of excitation of the spinal cord of animals, that is, on respiration, heart rate and blood pressure. From plants of the *Apiaceae* L. family, especially from the root of the plant, cattle are particularly affected. We know that species having a narcotic effect of the genus *Ch. temulum*, which belongs to the family *Chaerophyllum* L., are found in the Crimea and the Caucasus. They stimulate the mucous membranes in the digestive tract of cattle, pigs and lambs.

Some members of the *Prangos* Lindl. family are poisonous to cattle, pigs and lambs when they are just starting to grow. At this time, it is very harmful to the sight of the horses, it can even lead to blindness, but its hay is harmless.

In addition, the resinous enantotoxin in plant species *Y. aquatica* (L.) Poir. in the family *Oenanthe* L. is present in all parts of the plant, especially in the root system.

The essential oils in the fruits of *Heracleum spondylium* L. and *Heracleum lehmannianum* Bunge of plant species of the *Heracleum* L. family have an unpleasant odor and are known to burn the skin.

In addition, the thorns of the plant *Caucalis daucoides* L. are found among the milk thistles, which greatly injure the oral cavity and digestive organs of all livestock. *Anthriscus vulgaris* Pers., *Sium cisarroides* (DC) and many other species of plants are poisonous.

## DISCUSSION

Let's look at some poisonous plants belonging to the genus *Conium maculatum* L., i.e. spotted rust and *Ferula* L.

Of the *Apiaceae* L. family, spotted conium or rust may be an example. This plant is also called stinky grass, in Tajik - dogdar, shavkaron. This plant is a biennial herbaceous plant and its scientific name is *Conium maculatum* L. The word "conium" is derived from the word "conao" and means dizziness.

In all irrigated lands, along waterways and in abandoned lands, this herb can be found as a weed. The leaves of this biennial herb with a spike-like root are trimmed three times in a triangular shape, the canopy is up to ten long and short, the shape is radiant. The leaves are triangularly trimmed three times. This plant blooms for 3 months, ie in May-July, and bears seeds in July-August. During flowering, this plant can be distinguished from other plants. For example, the height, the formation of umbels and their white color, and umbels can be compared to wild carrots. The stem of this plant is much stronger. Therefore, the stems of this plant will stand up until the end of autumn. We often see this plant in the deserts of Central Asia and in the Tien Shan Pamirs.

Among the toxins, alkaloids, concein, conhydrin, conin, methylconin and pseudoconhydrins can be found in the plant *Conium maculatum* L. Several scientists of the Institute of Plant Chemistry named after Academician S.Y.Yunusov, for example, professor S.Akramov and his students have isolated more than a dozen alkaloids from plants.

Alkaloids in the poisonous plant *Conium maculatum* L., quickly act on the center of the nervous system and paralyze nerves. The world-famous scientist Abu Ali Ibn Sina also called this plant "deadly poison" in his own language. The juice of *Conium maculatum* L. also has sedative properties. From ancient times, the plant has been used in folk medicine for the treatment of various diseases. It is also very useful in the treatment of common cough, breast cancer, gastrointestinal pain, uterine fibroids, epilepsy and external rheumatism. In a number of countries, including India, the plant is used in the treatment of skin diseases, and in Tajikistan, the root decoction is used in the treatment of cardiovascular diseases and several gastrointestinal diseases. It is also used as a hemostatic agent. The people of Tajikistan also use this plant as a means of promoting health. Decoction of the seeds of the plant is very useful in relieving pain, rheumatism and muscle injuries. People should be careful when using *Conium maculatum* L. Poisoning with this plant can cause drowsiness in people, salivation, dizziness, thirst and vomiting, as well as cases of blurred vision. In severe cases, the disease can even lead to death.

In addition, the fruits of this plant are poisonous too and contain up to 1% of alkaloids. The roots are the most poisonous part in the spring. The seeds of the plant contain 0.7% to 2% of alkaloids, as well as up to 1% of conium alkaloids. The content of alkaloids in the leaves of this plant is 0.1%, in the stem - 0.12%, and in the roots - 0.15%. During the flowering and fruiting of plants, the amount of alkaloids is high. In addition to alkaloids, such poisonous plants contain essential oils, flavanoids, a number of additives, vitamin C, provitamin A. The most famous poisonous

plant is *Conium maculatum* L. We know from history that the great ancient Greek philosopher Socrates died of poisoning from this plant. From ancient times in Athens, people sentenced to death were ordered to drink poisonous drinks made from this plant.

In scientific medicine, the extract and ointment of the plant *Conium maculatum* L. are also used for analgesia of the skin. Oncologists also use the plant *Conium maculatum* L. in the treatment of cancer. In folk medicine, it is known that the use of the flower is useful when the eye hurts, applying gruel from the plant to the stomach stops bleeding from the intestines, and applying to the forehead stops bleeding from the nose. Since ancient times, rural doctors soaked the plant in boiling water, even boiled it in milk, put it in bags, chopped the leaves of the plant, mixed with honey and applied to all open wounds on the body. A liquid made from flowers, that is, a mixture of a 10-12% solution of vodka, is widely used as a sedative in the nervous systems.

The plant *Ferula communis*, belonging to the family *Ferula* L., is poisonous until flowering, the next growing season is non-toxic. Livestock love and eat this plant. However, goats and sheep are often poisoned, and signs of poisoning are always visible a week after grazing. In this case, the first from small cattle goats and sheep are poisoned. Signs of poisoning include nasal discharge and nosebleeds in animals, bleeding from the intestines, and even a mixture of purulent blood in the feces of the animal.

The reason for the toxicity of plants, for example, *F. communis*, is associated with ferula alkaloid, ethyl 4-oxumaric acetic acid, umbelliferin. All of these substances are antagonists of vitamin A and play an important role in the function of the liver, the disruption of blood clotting in the body. The clinical manifestations of these diseases are tachycardia, as well as bleeding from the coronary arteries and intestines (Kurmukov et al. 1994)

The surface of this plant is also poisonous. According to MF Infante in 1965 about poisoning cattle and goats that consumed the plant, *F. communis* poisoning disrupts the activity of 2,4,5,7 and 9 coagulation factors in the body, and the following clinical signs of poisoning are observed characterized by increased bleeding, anemia, hematuria and intestinal bleeding.

In the study of some species of *F. marmarica* plants distributed in Egypt, it was observed that their toxic properties poison all agricultural animals (Kamel, Bayonumi, 1972). An emulsion made from this plant causes symptoms similar to dukumarin. In an experiment conducted under the skin of mice, a solution of the plant in alcohol was treated with benzene, and the rest was prepared in the form of an emulsion with olive oil.

## CONCLUSION

In conclusion, we can say that we can meet both beneficial and harmful species of any plant, so we need to know the characteristics of all plants. Only then can we use this plant. Otherwise, the plant can become a poison for the body. Instead of treatment, it may cause serious diseases. Studying the properties of plants means that all living organisms receive the “healing” that they need.

### ABSTRACT

*This article discusses one of the most effective ways to provide information protection is the Feistel network-based block encryption algorithm, its features and structure. There is a simplified and easier-to-understand version of teaching computer science and information technology in general secondary schools.*

**KEYWORDS:** *Feistel's Cipher, Cryptography, Cipher, Key*

### INTRODUCTION

Effective organization of data exchange in information and communication systems is of great practical importance in the conditions of informatization and mobilization of society. The rapid

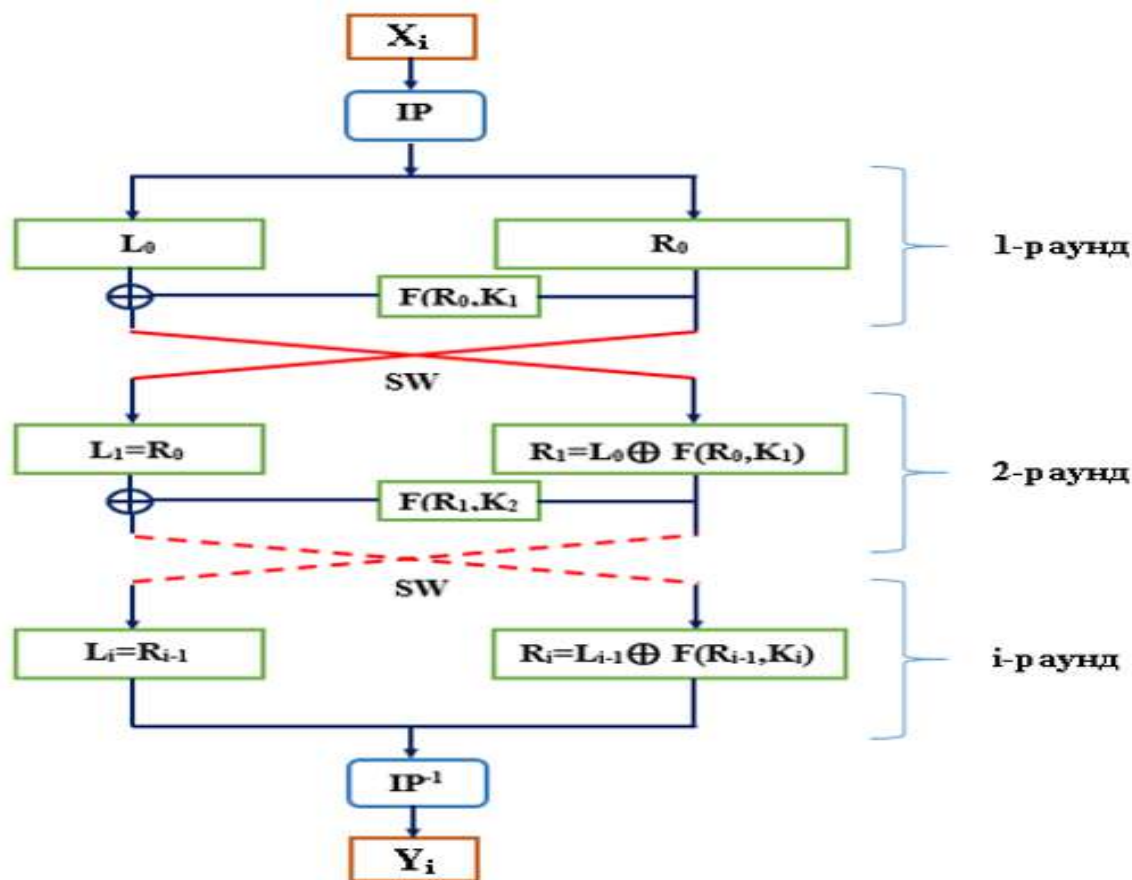

development of information and communication technology has led to the emergence of various information services available to the population. One of the urgent issues is the provision of information protection, especially in banking and other payment systems, systems where rapid and reliable exchange of important information related to the interests of the state and society is required. One of the most effective ways to ensure information protection is the use of cryptographic algorithms.

Today, the left and right part of the data block that must be encrypted is the block vectors, and the encryption process, called the Feistel network, is based on a functional device-algorithms that allow the gradual implementation of the same types of accents with different keys on them – are widely used to illustrate standard algorithms such as FEAL, LOCI, Khufu, Khafre Blowfish, Focus, CAST, DES, ГОСТ 28147-89[2]. These algorithms are among the algorithms that involve complex encryption processes and are somewhat difficult for students to understand.

In this work, however, we will focus on a simplified variant of the block-based encryption algorithm based on the Feistel network, which is somewhat easier to understand by students. Its features and structure is like the standard encryption algorithm of the DES (Data Encryption standard), but has much smaller parameters [1]. Therefore, it will be more expedient to use it in teaching the process of data encryption to students.

The DES standard encryption algorithm was published in 1977 by the US “National Standards Office”. In 1980, the National Institute of Standards and Technology of the United States adopted it as the standard for the use of an encryption algorithm to protect non-confidential but important data from unauthorized individuals and legal entities in the public and Commercial Finance Sector [2]. The structure of the algorithm is shown in Figure 1, where each input block ( $X_i$ ) uses a 12-bit initial text block and each round uses a 10-bit part Key ( $K_i$ ), while at the output a 12-bit block ( $Y_i$ ) of encrypted text is generated. In reverse decryption to this process, a 12-bit encrypted data block is also used as the initial data and a 10-bit part Key used for encryption, resulting in a 12-bit open text block being generated.

The algorithm includes the following: initial replacement (IP), complex function ( $F(R_{i-1}, K_i)$ ), in which two left ( $L_i$ ) and right ( $R_i$ ) parts are exchanged for the Place (SW), and a replacement ( $IP^{-1}$ ), which is reversed to the initial replacement after the  $i$ -round.

This 12-bit  $X$ -incoming block is divided into left ( $L_0$ ) and right ( $R_0$ ) bits, each of which consists of 6 bits after the initial replacement of the IP. The right part passes through a complex function ( $F(R_{i-1}, K_i)$ ) and 2 modules ( $0 \oplus 0 = 0$ ,  $0 \oplus 1 = 1$ ,  $1 \oplus 0 = 1$  ва  $1 \oplus 1 = 0$ ), in the first round, 6 bits of the left ( $L_1$ ) and the right ( $R_1$ ) are formed from the part blocks. This process continues until round- $i$ , then the finally phase of the algorithm, that is, the reverse displacement ( $IP^{-1}$ ), is executed, and finally an output cryptographic part Block ( $Y_i$ ) of 12 bits is generated.

Now we will consider in detail the elements of the encryption process, which are presented in Figure 1.

Algorithmmga as the initial data comes from a 12-bit block of Open Text, and in relation to it, the initial replacement given by the IP function listed in Table 1 is used.

**1-TABLE IP STARTING POSITION REPLACEMENT.**

12	2	5	8	3	9	10	7	4	11	1	6
----	---	---	---	---	---	----	---	---	----	---	---

All bits of the Open Text retain their value when they are replaced. At the convergence stage of the algorithm, the reverse displacement is performed (Table 2).

**2-TABLE  $IP^{-1}$  REVERSE SEAT REPLACEMENT.**

4	8	12	1	6	9	3	10	11	5	2	7
---	---	----	---	---	---	---	----	----	---	---	---

Finally, this outgoing 12 bit cipher will be the section block of the text.

Encryption is a complex function of the algorithm. In this part of the algorithm, namely  $F(R_i, K_i)$ - the complex function includes the following: replacement of the position with an extension (E/P), addition of the part Key ( $K_i$ ), transition from blocks ( $C_1$ ,  $S_2$  and  $S_3$ ), replacement and displacement (P6) processes (Figure 2).

The 6 bit information in the incoming right part ( $R_i$ ) is converted into 3 bits by replacing the position with the extension listed in Table 10, that is, as a result of the double writing of some (1, 2, 4 and 6 bits).

**3-TABLE EXTENSION SEAT REPLACEMENT SCHEDULE**

E/P									
2	4	1	6	3	5	4	2	6	1

**2-picture. Complex function of encryption algorithm.**

After that, the 10-bit round part key to this 10-bit extended data ( $K_1$  in 1-round,  $K_2$  in 2-round and etc.) 2 is added on the module. And the 10 bits of data generated by the insertion result, respectively, are divided into one four and two three-bit blocks, each of which, respectively, passes through the  $S_1$ -block,  $S_2$ -block and  $S_3$ -block, and at the output from each block, two bits are visible. The results are presented in tables 4, 5 and 6, in which the incoming bits of the block  $a_1$ ,  $a_2$ ,  $a_3$ ,  $a_4$  are made according to the following principle.

$S_1$ -блокдаги  $a_1$  ва  $a_4$  лар сатр,  $a_2$  ва  $a_3$  лар эса устун битларини белгилайди. Масалан, кириш 1010 бити бўлсин, у ҳолда 10 сатр ва 01 устун бўлади ва жадвалдаги улар кесишган жойда 2 рақамни кўриш мумкин, бу эса блокдан 10 (иккилик санок системасида) чиқишини англатади.

$a_1$  and  $a_4$  lines in the  $S_1$  block,  $a_2$  and  $a_3$  define the column bits. For example, let the input be a 1010 bit, then it will be 10 lines and 01 column and in the table they intersect, you can see the 2 number in the square, which means the output of 10 (in the counting system 2) from the block.

**4-TABLE  $S_1$ -BLOCK $F(R_{I-1}, K_I)$ TABLE OF EXCHANGES**

$\begin{matrix} a2a3 \\ a1a4 \end{matrix}$	00	01	10	11
00	2	3	2	1
01	3	1	3	2
10	1	2	1	3
11	3	1	2	1

**5-TABLE  $S_2$ -BLOCK $F(R_{I-1}, K_I)$ TABLE OF EXCHANGES**

$\begin{matrix} a1a3 \\ a2 \end{matrix}$	00	01	10	11
0	2	1	3	2
1	3	2	1	3

**6-TABLE  $S_3$ -BLOCK $F(R_{I-1}, K_I)$ TABLE OF EXCHANGES**

$\begin{matrix} a1a3 \\ a2 \end{matrix}$	00	01	10	11
0	1	2	2	3
1	2	1	3	2

In  $S_2$ ,  $S_3$ -blocks are slightly different, in which  $a2$  is the row, while  $a1$  and  $a3$  – determines whether the column corresponds. The resulting six-bit message passes through the substitution process, and at the output the result of the complex function is generated  $F(R_{I-1}, K_i)$  (Table 7).

**7-TABLE REPLACEMENT SCHEDULE**

P6					
2	3	6	4	1	5

Calculation of the keys of the encryption algorithm. The 12 bit key used in this algorithm should also be present in the message sender and the recipient of the message. Using this key, at certain stages of the encryption and decryption process, 10-bit partial keys consisting of several cycles are created (Figure 3).

Initially, the replacement of key bits locations is performed as follows. If 12 bitkey( $K_1, K_2, K_3, K_4, K_5, K_6, K_7, K_8, K_9, K_{10}, K_{11}, K_{12}$ ) if expressed in appearance, the P12 replacement can be done with the following formula.

$$P12(K_1, K_2, K_3, K_4, K_5, K_6, K_7, K_8, K_9, K_{10}, K_{11}, K_{12}) = (K_9, K_6, K_8, K_{12}, K_4, K_1, K_{10}, K_3, K_{11}, K_7, K_2, K_5).$$

3-picture. Algorithm for creating partial keys.

R12 replacement result can be expressed in the form shown in Table 8.

**8-TABLE REPLACEMENT SCHEDULE**

P12											
9	6	8	12	4	1	10	3	11	7	2	5

The numbers in this table indicate the location of the key bits. After that, for the first and subsequent six bits, 1 cyclic siljish (LS – 1) is performed on the chap, which is often called a separate conversion. Then, using Table 9, 10 bits are selected and the R10 replacement is applied. As a result, the partkey  $K_1$  is generated.

**9-TABLE REPLACEMENT SCHEDULE**

P10									
4	9	2	6	3	10	5	8	1	7

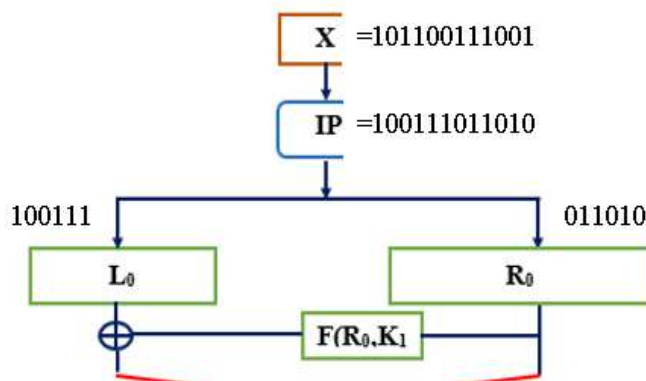

Then, by returning to the two 6-bit strings obtained as a result of the application of the LS-1 function and performing the cyclic silencing of the two-position chap (LS-2) with each of them, a  $K_2$  part key is generated, supporting the displacement of the R10 to the result obtained. Then continue this process, you can generate up to six part keys.

Function-changer.  $F(R_{i-1}, K_i)$  function only change six left bits. Therefore, the next action of the encryption algorithm is the use of the SW function, and in the subsequent use of the  $F(R_{i-1}, K_i)$  function, it replaces the left and right part bits to work with the other six bits. In the use of  $F(R_{i-1}, K_i)$  in subsequent rounds of the function, parts E/P, S1, S2, S3 and P6 remain unchanged, just as in the first round, only the part in turn is used instead of the key.

We will consider this encryption process in detail through the example below.

Example. Two-round encryption algorithm let  $M_1=101100111001$  block of Open Text come as initial data, and whether the implementation of the encryption process using  $K=100110101011$  key is required. It is done as follows:

After the arrival of the Open Text block, 100111011010 is generated as a result of the initial replacement performed by the IP (Table 1) function. Then the 12-bit Block is divided into two equal 6-bit fragments.

We look at the issue of determining the result of the complex function  $F(R_0, K_1)$  of the right part Block(011010) bits.

By performing the extension position switching (Table 3) action on the incoming 6 bit data, we get 10 bits at the output.

E/P									
2	4	1	6	3	5	4	2	6	1
1	0	0	0	1	1	0	1	0	0

After that, the insertion procedure is performed on the 1 module on the ten-bit  $K_2$  part Key and the extended incoming data. The  $K_1$  part key expression, which is defined in the section calculating the keys of the encryption algorithm, will be as follows:

$$E/P \oplus K_1 = 1000110100 \oplus 0011011011 = 1011101111$$

The result of the addition is divided into one four bits and two three-bit blocks, each of which, respectively, passes through  $1011 \rightarrow S_1$ ,  $101 \rightarrow S_2$  and  $111 \rightarrow S_3$  blocks.

The first  $S_1$  block is 01chiquadi. Because the block incoming  $a_1=1$ ,  $a_2=0$ ,  $a_3=1$ ,  $a_4=1$  bits 01 in the column and 11 in the intersection of the bar replacement block (Table 4) 1, which means 01 output from the block.

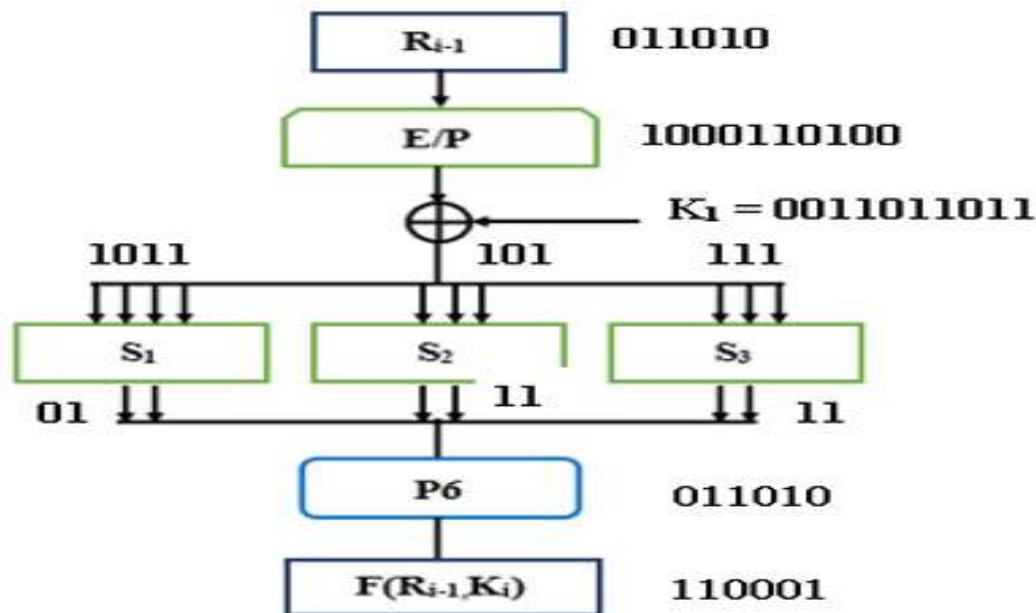

$a_2 a_3$				
$a_1 a_4$	00	01	10	11
00	2	3	2	1
01	3	1	3	2
10	1	2	1	3
11	3	1	2	1

In the same order,  $S_2=2 \rightarrow 10$  and  $S_3=2 \rightarrow 10$  are determined and the six bits formed (011010) are replaced according to Table 7.

P6					
2	3	6	4	1	5
1	1	0	0	0	1

Formed bits  $F(R_0, K_1)=110001$  it will be visible.

At the end of the first round, the values of the left ( $L_1$ ) and right ( $R_1$ ) part blocks that enter the second round are determined as follows and the first round is completed:

$$L_1 = R_0 = 011010;$$

$$R_1 = L_0 \oplus F(R_0, K_1) = 100111 \oplus 110001 = 010110$$

In the second round, too, in this order, only the encryption process is performed using the  $K_2$  key, and the following result is obtained:

$$L_2 = R_1 = 010110;$$

$$R_2 = L_1 \oplus F(R_1, K_2) = 011010 \oplus 110001 = 101011$$

After the second round, all the twelve (010110101011) bits of the Open Text pass through the reverse ( $IP^{-1}$ ) displacement process, which is the convergence phase of the algorithm, resulting in the output  $M_1$  of the openmatn block  $Y_1$ .

4	8	12	1	6	9	3	10	11	5	2	7
1	0	1	0	0	1	0	0	1	1	1	1

$$Y = 101001001111$$

Algorithm for creating keys of the encryption algorithm: initially, the displacement of key bits  $K=1001101011$  is performed as follows:

P12											
9	6	8	12	4	1	10	3	11	7	2	5
1	0	0	1	1	1	0	0	1	1	0	1

Then, for the first and second six bits separately, the operation of 1 cycle siljish (LS-1) is performed on the chap.

First	110011
Second	100110

With the use of Table 9, 10 bits are selected and the R10 position change is applied.

P10									
4	9	2	6	3	10	5	8	1	7
0	0	1	1	0	1	1	0	1	1

For the first round  $K_1 = 0011011011$  part key is generated.

The second part is applied to the two 6 bits obtained as a result of the use of the LS-1 function to form a key, a cyclic silge action is applied to a separate place left (LS-2). The resulting value P10 passes through the displacement and  $K_2 = 0011110110$  part Key is obtained.

In this algorithm, after six cycles of silencing, the part keys are repeated.

In conclusion, it can be noted that the use of the proposed simplified algorithm allows to form a holistic picture of complex encryption algorithms in students in the process of teaching the science of Informatics and Information Technology in general secondary schools.

#### ABSTRACT

*In the article, man and his units are considered to be the creators and carriers of moral culture. There can be no moral life without a man. Therefore, attention is drawn to the fact that man and his units are the core of moral life, the main substantial element of moral culture that makes up the system, the creator, and carrier of moral culture from generation to generation. The article aims to identify and substantiate the objects of the formation of moral culture, the implementation of moral education processes.*

**KEYWORDS:** *Man, Morality, Moral Culture, Substance, Moral Life, Moral Education.*

#### 1. INTRODUCTION

Ethical culture is a part of moral life created by processing to regulate social relations and educate people. It is the substance, that is, the basis of moral life. Substantial elements that make up moral culture as a substance consist of: firstly, man as a moral culture, secondly, the moral needs of human beings, thirdly, the moral consciousness that arises from the need to understand moral needs and includes moral goals, plans, etc., fourthly, a view of human creative activity is moral creativity, which is based on moral understanding and takes place in parallel with it, fifthly, the results of moral creativity are the teachings, the manners of behavior, the moral customs and institutions, sixthly, the application of the results of moral creativity in life.

#### 2. MATERIALS AND METHODS

From the wholeness of the substantial elements that make up moral culture as a substance, a moral way of life, individual moral relations, moral tendencies, and behavior are formed. Hence, the six components of moral culture that make up the above system are the core, that is, the central part of moral life.

Moral lifestyle, individual moral relations, moral tendencies, and behavior occur depending on the level of this central part of moral life. In this system, the first and main substantial element of moral culture is the subject of human moral life, the second substantial element is the moral need and interest in the forms of moral life, the motive for its development and application, the gnoseological basis of moral consciousness, the creative existence of moral life. Also, the functions of the next mode of existence of moral life are the results of moral creativity, the source, and means of moral life.

Moral creativity and the use of its results in life are manifested in two stages of human moral activity.

Hence, the quality of moral life depends on the scale and level of moral culture. With the change of moral culture, moral life also changes and develops. But moral culture is the basis of the existence and development of society - an element of a whole cultural being. Because one of the four aspects of cultural existence, that is, part of it, is spiritual culture. And one of the six components of spiritual culture is moral culture. Moral culture is required in all spheres of social life and is based on their substantiality.

Therefore, just as the whole has a predominance over parts and elements in general, moral culture is determined, firstly, by the basic cultural being of the existence and development of society, and secondly, by the levels of spiritual culture. Because cultural being is the core of society as a whole, including moral life. Moral culture is the manifestation of this cultural being in moral life. The priority of cultural existence in moral life is that it is manifested through moral culture.

### 3. DISCUSSION AND RESULTS

We now turn to the analysis of the main substantial element that makes up the system of moral culture. In this regard, we consider it necessary to cite the following points emphasized by scientists in the research work of B.Sh. Mamarasulov: "in all societies and at all stages of human development, at the heart of social change, man, radically different from other living beings in his consciousness and thinking, and performing purposeful activities is a subject of social life, " [1,12].

The word "man" means "Adam" in Arabic. The concept of "Adam" is also an Arabic word, meaning a living being who can think, speak, and work, and therefore is superior to all other creatures [2,520].

"From Adam and Eve, written in the book "Vatantuyg'usi", there must have been no one who did not love and was not loved. There must be no writer or poet who wrote about love. Man has two worlds. One is the material world, the other is spirituality. This is the main difference." [3,54]

In our opinion, spirituality is also divided into two: the positive spirituality that embraces humanity and the negative spirituality that embraces evil. "Humanity, - says S. Norkuziev, - is a moral norm, which means the work done within the boundaries of humanity, a virtue that suits man, adorns him, glorifies the person, a humane attitude to life and the fate of mankind" [4,40]. In our view, humanity has a broader meaning than this. It encompasses all moral virtues as positive norms, and these moral norms revolve around "that the human duty of man on earth is to do good". The second part of human spirituality — the part that adapts vices to itself — is

regarded in science as negative norms, and they revolve around evil. Since the main substantial element of moral life, including moral culture, is a man and his units, in this regard we have relied on the following philosophical ideas of E.T. Kalkanov: "Man and his units. They are the creators and descenders of the subjects of the emergence of cultural existence. They are also subjects of patriotism. The manifestation of the human body as a biocultural phenomenon and, consequently, its subordination to social relations and its manifestation as a peculiar civilized physical force serve as the biocultural volitional ground of patriotism. If a biocultural organism is the first side of a person, the social psyche and ability to function are the second side of it.

Patriotism is one of the aspects of the social psyche and ability to function. Therefore, since man is the creator and carrier of cultural being from generation to generation, it does not happen without patriotism" [5,12].

President Sh.M.Mirziyoev - "Another issue that does not lose its relevance and importance for us is the task of educating our children as independent-minded, true patriots with modern knowledge and professions, strong life position" [6,103].

So, we conclude based on the inductive method: patriotism is one of the moral civilizations. Morality, on the other hand, is part of the socio-cultural part of human beings. Hence, the biocultural and socio-cultural aspects expressed humanly are the basis for the manifestation of man as a moral being.

According to the concept of dialectical understanding of history, man is a biosocial cultural phenomenon. If we interpret man in a biological sense, then this concept is equated with the concept of man in anatomy. In the human body, aspects such as metabolism, tissues, sex, instincts, hereditary traits, conditioned reflex, nervous system are biological phenomena. The human body is a biological species and a unique phenomenon in space.

The human body consists of physical strength and biological spirit, which are semi-transformed in the system of socio-cultural norms. Because the animal assimilates the ready products of nature, and man changes events (or phenomena) as well as himself as a result of social relations. This is a purely cultural process in which the structure of the human body has changed. For example, the law of natural selection was lost as a man began walking on two legs. Hence, man is also biologically a semi-cultural phenomenon.

That human is bio culture is realized in the scale of socio-cultural, including moral processes. And that human is bio culture serves as the biological basis of his sociality, morality.

Man must first be biologically healthy and mature. Such a person becomes a healthy-minded and spiritually pure person if he is formed in a system of healthy social relations. Therefore, during the years of independence, our country has focused on the issue of human health when naming many years. In particular, 2010 was declared the Year of harmoniously developed generation, 2014 the Year of Healthy Child, and 2016 the Year of Healthy Mother and Child. As long as the nation and its representatives are not biologically healthy as individuals, it will also be difficult to think of a fully spiritual individual and population. That is why I.A. Karimov said, "When I say healthy generation, personally, I understand, first of all, that a healthy generation is not only physically strong but also spiritually, mentally healthy, whole-faith, educated, spiritually strong, brave and courageous, patriotic generation" [7,94]

The upbringing of young people as competent people capable of taking on the burdens of the time and their education are recognized as issues of strategic importance. All conditions have been created for them to receive a thorough education under the requirements of the time, to acquire a profession, to find a worthy place in society. After all, "National spirituality is an intellectual and spiritual power that reflects the unique features, traditions, customs, values, and mentality of the nation reflects its" itself, defines its identity and it is the inner potential that drives it to development." [8,164] Human spirituality is formed only during education and becomes a driving force.

Aspects of human language, beliefs, profession, etiquette are socio-cultural aspects. The fact that man is a moral being is the first aspect of social culture. One of the manifestations of human bioculture is that the sexual division between husband and wife, the age division, the kinship ties (e.g., the relationship between parents and children) serves as the biological basis for being a moral being. Conversely, these biocultural aspects of man are manifested through socio-cultural aspects - connections, for example, the husband and wife maintain their status in society and the family, that parents maintain their status in the system of relations with children and apply under social norms. The status and responsibilities of masculinity are also ethical cultural processes.

Gender-related manners are also historical. The fact that matriarchal and patriarchal lifestyles have given rise to specific moral requirements is clear evidence of this. As thinkers point out, the first slavery is the slavery of women. From this period, patriarchy, that is, the priorities of the rights of the male and accordingly, moral demands have arisen. Proof of this is the fact that in ancient India, at the funeral of a Brahman, both his slaves and his wives were added to the burial rite in the verse that they would "serve".

Humanity is the core, the main part, the essence of morality. True humanity began in the transition from a primitive herd state to a hereditary system and dates back to the days when a family was made up of a couple instead of a blood family (i.e., a brother, a sister is a husband and a wife to each other at the same time).

In the period of the emergence of socio-class structures, the way of life and moral order of the nobility, priests, and the intelligentsia also emerged.

There is also a hedonistic approach to the science of aesthetics. Hedonism means to enjoy in the Greek language. In "Philosophy: an encyclopedic dictionary," it is said, "it is the pursuit of an idea and a way of life that underlies the idea that enjoyment should be the essence of human life." [9,235] Today, a model of hedonistic moral culture is being put forward in the West, and as V. Jadan says: "A group subject of hedonistic moral culture included mainly aristocrats because their lifestyle was at a level that allowed them to develop their intellectual abilities. Besides, this group included peasants with intellectual potential, who were involved in creative activities by the aristocracy" [10,56].

#### 4. CONCLUSIONS

Man and his units are the creators and carriers of moral culture. Without them, moral life will not happen. That is why man and his units are the core of moral life - the main substantial element that makes up the system of moral culture. "Our main asset," said I.A. Karimov, "and our mainstay on the path to build a developed state is man." He is a highly qualified and highly spiritual person" [11,25-26].

Moral culture is essentially reflected in the socio-economic, political, and spiritual development of a society. The main goal of moral culture is to lead a person to the truth, to bring him up as a perfect person. At the same time, moral culture comes into direct contact with social life. Development of moral culture, to study the experiences of the peoples of the world in this field and application in various spheres of social life prevent ideas such as egocentrism, individualism. After all, moral culture contributes to the upbringing of young people who find their place and identity in life, able to withstand the requirements of modern times and ideological struggles, have mastered a particular science or profession and are constantly researching to improve their skills in this field, are progressive-minded and have high spirituality and national ideology.

If we analyze the morality of man and his units in terms of the dialectic of generality, specificity, and individuality, the macro-units of human beings share the commonality of nation and humanity, and in this, we see the superiority of the moral mentality over the micro-units of human beings — family and labor communities and the spiritual image of the individual. "Civil society," says B.U. Rakhmonov, "legally and objectively regulates the delicate and vital situations of a self-organized person based on law, if morals and values cannot regulate them" [12,15]

The common side and foundation common to all human beings is rationality. Raising morality in the individual happens through the processing of the mind. Commonality is substantive. Commonality is manifested in particular through individuality, so the role of the middle link - the family and work communities (including kindergartens and secondary schools) - is of primary importance in the formation of man as a moral being.

In Article 5 of the Law of the Republic of Uzbekistan "On State Youth Policy" adopted on September 14, 2016: "The main directions of the state policy on youth are as follows: ensuring the rights, freedoms and legitimate interests of young people; protecting the lives and health of young people; promoting the spiritual, intellectual, physical and moral development of young people; ensuring open and quality education for young people; employment of young people and creating conditions for their employment;

to educate young people in the spirit of patriotism, citizenship, tolerance, respect for the law, national and universal values, to have a strong belief in life, being able to resist harmful influences and religious currents "[13] therefore, the main activities on moral education should be focused on family and labor communities, especially kindergartens and general secondary schools. This covers the individual to a certain extent: at least, the raising of the moral image of the individual takes place at the level of the requirements of society. That is why W. Humboldt said, "Where there is a small moral image, there is no great man" [14,106].

As noted by President Sh. Mirziyoyev - "We will mobilize all the forces and capabilities of our state and society for the development and happiness of our young people as independent thinkers, with high intellectual and spiritual potential, who are not inferior to their peers in any field around the world" [15,56]. The time itself requires the practical work of characteristics of great ancestors such as courage, bravery, fearlessness, patience, kindness, tolerance, humanity, compassion, thoughtfulness and gentleness, and constant adherence to it.

In short, human beings are the creator of moral culture, the nucleus of society, including moral life, and the bearer of it from generation to generation. That is why man and his units are the main substantial element that makes up the system of moral culture of society as well. The

fulfillment of the law of the social basis of man and his units concerning all spheres of social life is explained by the fulfillment of the law of his defining role as a moral subject in the moral life.

### ABSTRACT

*In this article considered the basic techniques solutions geometric problems with the help of the area of. With this method is shown proof of theorem Pythagoras, Cheva theorems, Erdos – Mordell inequality. Considered a few problems in which are used different formula to calculate the area of the triangle. This article discusses problems for which the area method is used.*

**KEYWORDS:** Triangle, Area, Area Of A Triangle, Reception, Polygon, Parallelogram, Cercal, Radius.

### INTRODUCTION

In the solution of various tasks is often useful to consider any subsidiary the item is not present the formulation of the problem. The area method in studying geometric and algebraic theorems helps to comprehend the concise language of mathematical formulas, to see what is hidden behind analytical calculations. Geometric illustrations in some cases allow students to independently come to the right conclusions, make their discoveries. They give visibility distracted by the concept and formulas, give accelerated methods for solving problems and reliable means of control, instill a taste for elegant and concise solutions without stereotyped and long conversions, without unnecessary entries. All this increases the activity and interest of

students in mathematics, develops ingenuity, resourcefulness, helps to find diverse and original methods of evidence and solutions to problems, simple memorization of formulas.

Example: When learning abbreviation formulas:

a) square difference:  $a^2 - b^2 = (a - b)(a + b)$

b) squared amount:  $(a + b)^2 = a^2 + 2ab + b^2$

c) squared difference:  $(a - b)^2 = a^2 - 2ab + b^2$

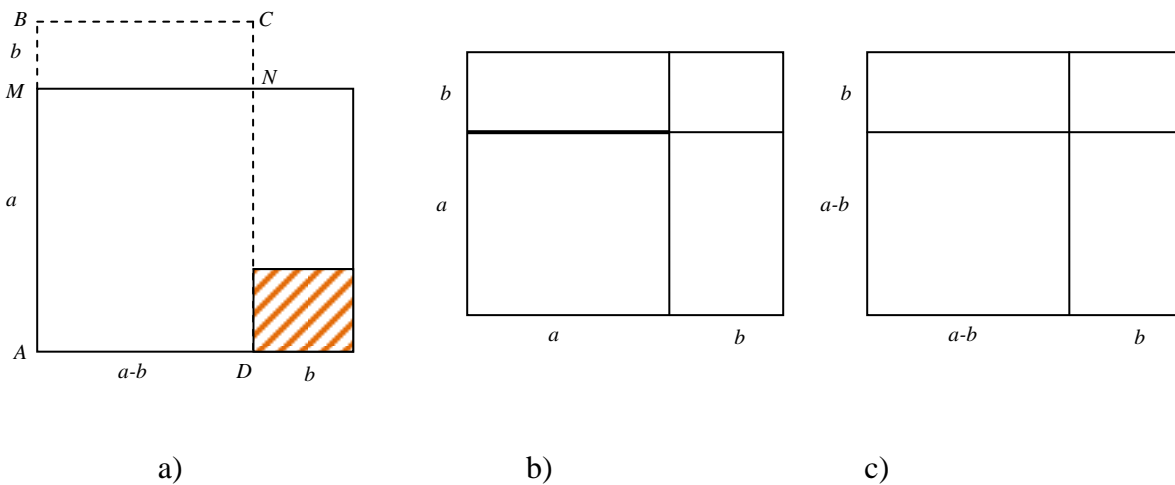

figure – 1.

Let  $a > b > 0$ . In the case of a) method areas convinces in justice formula the difference of squares. Not painted figure transform in the rectangle so, as shown in (fig. 1. a) then we get:

$$S_{ABCD} = S_{AMND} + S_{MBCN}$$

$$(a + b)(a - b) = a(a - b) + b(a - b) = a^2 - b^2$$

In the case of b) method areas adequate formula the square of the amount of  $(a + b)^2 = a^2 + 2ab + b^2$  (fig. 1 b), and therefore allows students self – open its. Here are necessary skills for a given method areas be algebraic expressions.

### LITERATURE REVIEW

Extensive use of algebraic machine up to date geometry, on the hand, expanded the possibility of students in the decision of geometric tasks on the other hand, active application of analytical methods in geometry often was the cause damage to the formation of traditional, purely geometric, and skills students.

Method areas in the training mathematics (including with decision problems) is considered in the dissertation research V.A. Dalinger, T.A. Ivanova,

Z.G. Murtazin, S.S. Vardanyan, R.M. Kitaeva, G.T. Saranzev and other. In these works attention was paid to the study of the method of geometric transformations, coordinate, vector methods. During this period connection between the algebra and geometry installed in the main by using analytical methods for solving the geometric tasks.

In the conditions of acceleration of scientific and technical progress on the basis of information technology geometric knowledge needed to every thinking person. At one time academician A.D. Alexandrov wrote about it: "All appliances permeated geometry and begins with the geometry, for everywhere, where need slightest the accuracy of the size and shape, where need structural mutual location parts – there effective geometry". Geometry today all the more acts as a method of knowledge and the way of thinking. Geometry – is the basis. In addition, it is the material embodiment of embodiment of characters expressing all the perfect, sublime. It gives us a high satisfaction of mathematical accuracy.

## METHODOLOGY

We will analyze the basic techniques for solving geometric problems using area.

Reception 1. If the Polygon cut in the number of polygons, the amount of space is equal to the area of the original Polygon. The most famous the use of this reception is one of the many proof of theorem Pythagoras.

Example 1. (Pythagorean theorem). Prove that the sum of squares the lengths of cathetuses rectangular Triangle is equal to the square of the length of hypotenuse.

Solution. Let  $a, b$  – length cathetuses,  $c$  – the length of hypotenuse. We prove that the sum of the squares with sides  $a$  and  $b$  is equal to the square area with side  $c$ . Consider this a square from party  $a + b$  and cut it in two ways, as shown in figure 2. In the first case of this a square breaks up 4 of rectangular Triangle with cathets  $a$  and  $b$  and two square from party  $a$  and  $b$ , and in the second – by 4 rectangular Triangle with cathets  $a$  and  $b$  and square from party  $c$ .

figure 2.

Example 2. Given  $a$  Triangle  $ABC$ . Let  $s$  – it area,  $j$  – angle  $ACB$ , and  $l$  – length bisectric spend from vertex  $C$ .

a) Prove that the 
$$S \geq l^2 \operatorname{tg} \frac{j}{2}$$

b) For which triangles  $ABC$  equality holds?

Solution. We denote by  $a$  and  $b$  side  $BC$  and  $AC$  triangle  $ABC$

figure 3.

then

$$l^2 \tan^2 \frac{\gamma}{2} = \frac{4a^2 b^2}{(a+b)^2} \cos^2 \frac{\gamma}{2} \cdot \frac{\sin \frac{\gamma}{2}}{\cos \frac{\gamma}{2}} = \frac{4ab}{a^2 + b^2 + 2ab} \cdot \frac{1}{2} ab \cdot 2 \sin \frac{\gamma}{2} \cdot \cos \frac{\gamma}{2} \leq$$

$$\leq \frac{4ab}{2ab + 2ab} \cdot \frac{1}{2} ab \sin \gamma = S$$

It is obvious that equality is carried out if and only if  $a^2 + b^2 = 2ab$ , that is, if and only if  $a = b$ .

Example 3. Polygon described around the circle the radius of  $r$ , cut arbitrarily on the triangles. Prove that the amount of radii inscribed circles of these triangles more  $r$ .

Solution. We denote the radii inscribed circles received triangles  $r_1, r_2, \dots, r_n$ , their perimeters  $p_1, p_2, \dots, p_n$ , area – through  $s_1, s_2, \dots, s_n$ . Area and the perimeter of the original Polygon we denote by  $s$  and  $p$ .

Since the  $p_i < p$ , ( $i = 1, 2, \dots, n$ )

$$r_1 + \dots + r_n = \frac{2s_1}{p_1} + \dots + \frac{2s_n}{p_n} > \frac{2s_1}{p} + \dots + \frac{2s_n}{p} = \frac{2s}{p} = r.$$

Example 4. From the point of  $O$ , lying in the right Triangle  $ABC$ , omitted perpendiculars  $OA_1, OB_1, OC_1$  on the sides  $BC, AC, AB$  respectively. Prove that the amount of  $OA_1 + OB_1 + OC_1$  does not depend on the provisions of the point of  $O$  and is equal to the height of the triangle.

Solution. Let the side length of triangle  $ABC$  be  $a$ , and the length of the height be  $h$ . It's clear that

$$S_{ABC} = S_{BCO} + S_{ACO} + S_{ABO}, \quad \text{that is} \quad \frac{1}{2}ah = \frac{1}{2}aOA_1 + \frac{1}{2}aOB_1 + \frac{1}{2}aOC_1. \quad \text{Therefore}$$

$$h = OA_1 + OB_1 + OC_1.$$

Reception 2. The ratio of the lengths of segments can be replaced on the ratio of the areas of triangles.

If segments  $AB$  and  $CD$  lie on the same line not passing through the point  $M$  and  $S_1$  and  $S_2$  - the area of triangles  $MAB$  and  $MCD$  respectively

(figure 4), then

$$\frac{S_1}{S_2} = \frac{AB}{CD} \quad (*)$$

figure 4.

Example 5. In the triangle  $ABC$  on the side of  $AC$  taken point  $M$ , and on the side of  $BC$  - point  $N$ . Segments  $BM$  and  $AN$  intersect at the point  $O$  (figure 5). Get the area of the triangle  $CMN$ , if the area of triangles  $AOM$ ,  $AOB$  and  $BON$  respectively  $S_1$ ,  $S_2$ ,  $S_3$ .

Solution. Let  $S_{MON} = Q_1$ ,  $S_{CMN} = Q_2$ . Of (\*) it follows that  $\frac{S_1}{Q_1} = \frac{AO}{ON} = \frac{S_2}{S_3}$ , where

$$Q_1 = \frac{S_1 S_3}{S_2}. \quad \text{Similarly}$$

$$\frac{Q_2}{Q_1 + S_3} = \frac{CN}{NB} = \frac{Q_2 + Q_1 + S_1}{S_2 + S_3}, \quad \text{where}$$

$$Q_2 = \frac{Q_1^2 + Q_1 S_1 + Q_1 S_2 + S_1 S_3}{S_2 - S_1}. \quad \text{Substituting the}$$

figure 5.

last formula found the value of  $Q_1$ , we obtain the  $Q_2$ .

$$Q_2 = \frac{S_1 S_3 (S_2 + S_1)(S_2 + S_3)}{S_2 (S_2^2 - S_1 S_3)}$$

Example 6. In the triangle  $ABC$  on the side of  $BC$  selected point of  $D$  so that  $BD : CD = 1 : 2$ . What respect to the median  $CE$  divides the line segment of  $AD$ ?

Solution. Solutions based on the comparison of the areas triangles. Let  $M$  – the intersection point of  $AD$  and  $CE$  (fig. 6). We denote

$S_1, S_2, S_3, S_4$  area triangles  $AEM, EMB, MBD, CMD$  respectively. Using the formula of (\*), we obtain

$$S_1 = S_2, S_4 = 2S_3, S_{ABD} = 2S_1 + S_3 = \frac{1}{3}S_{ABC}$$

$$S_{EBC} = 3S_3 + S_1 = \frac{1}{2}S_{ABC}. \text{ From the}$$

figure 6.

$S_{ABC} = 3(2S_1 + S_3) = 2(3S_3 + S_1)$ , or  $3S_3 = 4S_1$ . Now is easy to find the desired ratio:

$$AM : MD = S_{ABM} : S_{BMD} = 3 : 2$$

Example 7. (Theorem Cheva). On the sides  $AB, BC, CA$  triangle  $ABC$  taken point  $C, A, B$  respectively. Prove that the direct  $AA_1, BB_1, CC_1$  intersect at one point if and only if

$$\frac{AB_1}{B_1C} \cdot \frac{CA_1}{A_1B} \cdot \frac{BC_1}{C_1A} = 1$$

Solution. Let the first direct  $AA_1, BB_1, CC_1$  intersect at the point  $O$ . As in previous problem, we obtain

$$\frac{CA_1}{A_1B} = \frac{S_{ACO}}{S_{ABO}}, \frac{BC_1}{C_1A} = \frac{S_{BCO}}{S_{ACO}} \quad \text{and} \quad \frac{AB_1}{B_1C} = \frac{S_{ABO}}{S_{BCO}}.$$

Multiplying these equalities, we obtain

$$\frac{AB_1}{B_1C} \cdot \frac{CA_1}{A_1B} \cdot \frac{BC_1}{C_1A} = 1$$

We now assume that

$$\frac{AB_1}{B_1C} \cdot \frac{CA_1}{A_1B} \cdot \frac{BC_1}{C_1A} = 1$$

and let  $O$  – point of intersection of segments  $AA_1$  and  $BB_1$ . We denote by  $C_1^1$  point of intersection of direct  $OC$  segment  $AB$  (figure 7). Then, as we just have proved

$$\frac{AB_1}{B_1C} \cdot \frac{CA_1}{A_1B} \cdot \frac{BC_1^1}{C_1A} = 1 = \frac{AB_1}{B_1C} \cdot \frac{CA_1}{A_1B} \cdot \frac{BC_1}{C_1A}$$

Consequently, the  $\frac{BC_1^1}{C_1^1A} = \frac{BC_1}{C_1A}$ . It remains to note that as the point  $X$  moves on the segment  $AB$

(not leaving for its limits), then the value of  $\frac{BX}{XA}$  changes monotonously, and therefore

$C_1^1 = C$ , that is, the lines  $AA_1$ ,  $BB_1$  and intersect at one point.

This wonderful theorem deserves to make some comments. Readers know that all the medians of a triangle intersect at one point, as well as the angle bisectors, and the heights. It is not surprising that all of these facts – consequences of some more general theorem.

figure 7.

Reception 3. Different formulas for the area allow you to get the ratio between the sides,

height, perimeter, etc.

Example 8. The lengths of the sides of the triangle form an arithmetic progression. Prove that the radius of the circumscribed circle of this triangle is  $\frac{1}{3}$  of one of the heights.

Solution. Let the lengths of the sides  $a, b, c$  form an arithmetic progression. Then the semi-perimeter  $p$  is  $\frac{3}{2}b$ . Since  $\frac{1}{2}h_b \cdot b = S = r \cdot p$ , we get  $r = \frac{b}{3}$ .

Example 9. Inside the  $ABC$  triangle, the point  $M$  is taken. We denote the distances from the point  $M$  to the vertices  $A, B, C$  by  $R_a, R_b, R_c$ , and the distances from the point  $M$  to the sides  $BC, CA, AB$  – by  $d_a, d_b, d_c$  respectively.

- Prove that  $a \cdot R_a \geq c \cdot d_c + b \cdot d_b$
- (Erdos – Mordell inequality) Prove that

$$R_a + R_b + R_c \geq 2(d_a + d_b + d_c)$$

Solution. a) We omit from points  $B$  and  $C$  the perpendiculars  $BK$  and  $CL$  to the line  $MA$  (fig. 8). Let  $a_1 = BK$ ,  $a_2 = CL$ . Clearly  $a_1 + a_2 \leq a$ . Therefore

$$\begin{aligned} \frac{1}{2}aR_a &\geq \frac{1}{2}a_1 \cdot R_a + \frac{1}{2}a_2 R_2 = S_{ABM} + S_{ACM} = \\ &= \frac{1}{2}bd_b + \frac{1}{2}cd_c \end{aligned}$$

Note that in the proofs we used only the fact that

the point  $M$  lies inside the angle

figure 8.

 $BAC$ , and not that the point  $M$  lies inside the triangle.

b) Applying the inequality of paragraph a) to the point, symmetric  $M$  relatively bisector angle  $A$ , we obtain the inequality

$$R_a \geq \frac{c}{a}d_b + \frac{b}{a}d_c,$$

Similarly

$$R_b \geq \frac{c}{b}d_a + \frac{a}{b}d_c \quad \text{and} \quad R_c \geq \frac{a}{c}R_b + \frac{b}{c}R_a$$

Folding these inequality, we obtain

$$R_a + R_b + R_c \geq \left(\frac{b}{c} + \frac{c}{b}\right)d_a + \left(\frac{a}{c} + \frac{c}{a}\right)d_b + \left(\frac{b}{a} + \frac{a}{b}\right)d_c \geq 2(d_a + d_b + d_c), \text{ since the}$$

$$\frac{x}{y} + \frac{y}{x} \geq 2.$$

Reception 4. If through the point of  $E$  lying within the parallelogram  $ABCD$ , carried out direct parallel to the parties and smashing it on four parallelogram, then parallelograms adjacent to the top of  $B$  and  $D$ , are equal if and only if the point  $E$  lies on the diagonal  $AC$ .

Example 10. Through the point  $M$  lying within parallelogram  $ABCD$ , carried out direct  $PR$  and  $QS$  parallel to the sides  $BC$  and  $AB$  (point of  $P, Q, R, S$  the sides  $AB, BC, CD, DA$  respectively). Prove that the direct  $BS, PD$  and  $MC$  intersect at one point (fig. 9).

Solution. Through the point of  $N$  intersection of direct  $BC$  and  $CM$  carry out direct  $Q_1S_1$  and

figure 9

ie  $S_{NQ_1QG} = S_{NFRP_1}$ . Point  $N$  lies on the diagonal  $BS$  parallelogram  $ABQS$ , so  $S_{AP_1NS} = S_{NQ_1QG} = S_{NFRP_1}$ . Consequently, the point of  $N$  is on the diagonal  $PD$  parallelogram  $APRD$ .

$P_1R_1$ , parallel direct  $QS$  and  $PR$  (point of  $P_1, Q_1, R_1, S_1$  lie on the parties  $AB, BC, CD, DA$  respectively). We denote the point of intersection of direct  $PR$  and  $Q_1S_1$ ,  $P_1R_1$  and  $QS$  through  $F$  and  $G$ . As the point  $M$  lies on the diagonal  $NC$  parallelogram  $NQ_1CR_1$ ,  $S_{FQ_1QM} = S_{MRR_1G}$

## CONCLUSION

Study of the methods of mathematics, it is important and methodological respect, as is an opportunity for disclosure of the content of the method and allocation of components of the method of.

Methods of mathematics in the process of learning on the one hand act as the purpose of the study, and on the other, as a means the study of mathematical material. The a method can become one of the means of the study of mathematics only if the students are able to use it in the solution of practical problems. This means that in the process of the formation of the method of mathematics, students will inevitably face the need to solve the two tasks. The first is that the students captured party method, and the second is to learning the application of the method.

Solution of the first tasks assumes the assimilation of students assimilation of the activity components of the method, without reliance on which activity components cannot be implemented. The second task can be solved provided that students learn the epistemological components of the method associated with the establishment of new properties of the studied abject, types of tasks, their features, learn how to choose a method that is appropriate to use when solving a particular problem: therefore, teaching a method is learning how to choose a method.

### **ABSTRACT**

*The following article deals with the study of the dynamics of salinization of agricultural soils in the conditions of the Aral Sea. We have studied the interaction of salts and vegetation cover with the salinity of the Southern Aral Sea, the distribution of salt, the systemic effect on the salinity of the soil of the Aral Sea. The collected research results were analyzed.*

**KEYWORDS:** *Aral Sea, Soil, Salinity, Ecosystem, Model, Aerosol, Condensation, Transformation.*

### **INTRODUCTION**

A great attention is being paid on studying the interrelationships between climate and ecosystems around the world, including assessing the impact of climate change and environmental transformations on natural resources and agriculture, developing and improving climate change adaptation measures, preventing environmental change and mitigating biodiversity. It is also important to model climate mathematically and environmental changes globally, assess the impact of salt-dust migration from the dried bottom of large water bodies on the environment and ecosystems, and develop methods to prevent and mitigate the negative effects of meteorological factors. In our country, certain positive results are being achieved in mitigating the effects of the drying up of the Aral Sea and improving the ecological, socio-economic conditions of the Aral Sea region. The Action Strategy for the further development of the Republic of Uzbekistan for 2017-2021 sets important tasks to take "Systemic measures to mitigate the negative impact of global climate change and the drying up of the Aral Sea on the development of agriculture and human activities" [1]. In this regard, scientific research was

aimed to conduct at studying the sensitivity of agro-climatic resources to changes in hydro-regime, the reduction of vegetation cover in the Aral Sea region and other environmental changes is of great importance.

At different times with the study of agricultural issues and the state of the environment in the Aral Sea region, foreign scientists Yu. Shuttser, S. Brooke, P.P. Miklin, Dj. F.Kreto, F.Papa, T. Ressler et al. Most of the scientific research in this area is carried out in Russia (L.S.Berg, A.S.Kes, L.K.Blinov, I.P.Gerasimov, A.A.Grigorev, V.B.Lipatov, B.G.Vager, Z.M.Utina, N.M.Bogdanova, V.P.Kostyuchenko, P.O.Zavyalov, N.M.Novikova) [3], Kazakhstan (M.A.Orlova, O.E.Semenov, O. S.Galaeva, I.V.Kaipov) and scientists of Uzbekistan (A.A.Rafikov, G.A.Tolkacheva, S.K.Kabulov, I.V.Rubanov, V.A.Dukhovny, V.E.Chub, F.Kh.Khikmatov, E.I.Chembarisov, O.I.Subbotina, S.G.Chanysheva, R.M.Razzakov and others) [4]. As a result of their research, the dynamics of changes in the Aral region and Aral Sea geoecosystems were studied, soil composition was studied and mapped, the distribution of salts from the dried seabed, the dynamics of phytocenoses were analyzed, hydrological and hydrochemical processes were identified, the thermochalin structure and biotic status of the Aral Sea were studied.

## RESEARCH METHODS

Systematic modeling methods using mathematical physics methods, numerical methods, mathematical statistical methods, atmospheric physics, soil physics, meteorology, climatology, hydrology, ecology and geobotany methods were used.

A necessary attribute of systematic research is to show a clear logical and structural basis of the research, a set of systematic methods and tools aimed at solving complex problems, as well as the terminology used. For this purpose, research is organized on the basis of the concept of systematic modeling of complex ecometeorological processes. [5]

### Research work and results analysis:

An important plan in the concept of systematic modeling of a complex ecological-meteorological process (CEMP) is that we assume modeling as a research process in general. There are two aspects in the modeling of CEMP systems: design and research aspects. In terms of design, systematic modeling consists of creating a SM model and the means to implement it in a machine. The research aspect involves identifying the laws of SM performance using a structured model, understanding, generalizing, and interpreting the results of computational experiments in terms of physical reality. The optimal organization of the computational process is the concentration of all additional functions in the information-statistical block (ISB) through the creation of special unified modules. This prevents duplication of homogeneous structural units in model applications. Creating a control block (CB) is not only a possible but also a necessary element of CEMP modeling. Thus, CEMP the machine model is a software system that can be divided into three categories: model blocks (MB), ISB, and CB The computational data obtained during the implementation of the CEMP machine model usually do not have accurate information about process dynamics and their interrelationships. Therefore, additional processing of output data is required to determine the CEMP elements and the operating patterns of the system as a whole. Identified laws need to be formalized, which helps to classify the types of relationships that are mathematically expressed. As a system of equations, the formalized structure of the CEMP gives a more complete understanding of the object of study, its

characteristics and development trends. In addition, in order to make predictions, it is necessary to simulate and formalize the results of modeling. We are debating the CEMP analytical model of the formalized structure of the CEMP as a set of equations, which is an analytical view of the most important interrelationships between the processes of the CEMP, obtained during the implementation of the machine model. The simulation model of CEMP is constructed not only in terms of numbers, but also for forecasting. The structural table of the CEMP machine model reflects the set of factors in the future and is called the forecast model of the CEMP [5].

The analysis of the results of research on the processes of CEMP allowed me to identify and distinguish important relationships in the analysis of correlation and regression, their quantitative assessment, analytical expression. In our opinion, the most important link in the CEMP is the 24 repetitive recursive links that determine both the dynamics of the dynamics and the systemic interactions between the factors. In general, the dynamics of the system of CEMP factors under study is characterized by accelerated transformation in the first and fourth decades of modeling with significant changes in the first and second decades of modeling. The transformation of the components of system factors took place mainly on the basis of exponential laws. For retrospective, modeling the dynamics of the island's water-salt regime will lose its monotony and will not be studied in general. The model of the eastern part of the island in 2009 is repeated for non-traditional periods. After the construction of the pits, the partial flooding leads to the depletion of the water basin, which means that in the PS, the salt accumulation regime and, consequently, the resulting changes in the chain. Due to the lack of monitoring results for the eastern part of the island for 2006-2017 (input data for models 1 and 2) we have proposed the following for forecasting the current period and 2030:

- The surface area of the water area changed from 2005 to 2030;
- Salinity also varies linearly from 2005 to 2030 up to 10 g / l [5];

Due to the diversity of the mechanisms of salinity of the ecological transformation system to the salinity of the soil, it was studied separately for post-arid (PA) and Kubla-Aral. The salinity of the PA is influenced by the structure of the Aral Sea, the distribution of salts and vegetation, the system of all factors, the salinity of the South Aral Sea, the distribution of salts and the vegetation cover.

The systemic effect of salt dispersion from vegetation cover (VC) and PA on salinity of Kubla Aral Sea soils is characterized by an increase in the opposite effect of these two factors (**Table 1**). One of the basic laws of spatial-periodic dynamics of soil salinity will be the intensification of the process over time and by zone

**TABLE 1 DYNAMICS OF SOIL SALINIZATION WITH SALINE AEROSOL AND VC**

Parameters	By the period of decades			
	966- 1975	1976-1985	1986-1995	1996-2005
Precipitation (mm / year)	120	1 22	13 9	144
Precipitation mineralization (mg / dm <sup>3</sup> )	43	7 9	23 7	1072
Increase in soil salinity due to precipitation	17,1	3	10	514,

mineralization (g / m3)		2	9,7	6
Dry aerosol drop (DAD kg / ha / year)	93	4 98	13 68	1931
Increase in soil salinity due to dry aerosol fall (g / m3)	31	1 66	45 6	644
Salinity of soil under the influence of saline aerosol (% per year)	0,012	0 ,05	0,1 3	0,18
Absorption of salts by the roots of the arrow system (kg / ha)	-8	- 26	-45	-68
Protection of ammunition from DAD (kg / ha / year)	-1,9	- 32,4	- 154	-252
Effect of VC on evaporation of salt from soil (kg / ha)	-100	- 225	- 362	-465
Effect of VC on soil salinity (% per year)	- 0,006	- 0,015	- 0,031	- 0,043
Systemic effects (% / year)	0,006	0 ,035	0,1	0,13 7

As can be seen from the table, the system of all factors affects the air temperature. The presence of marine conditions in the coastal areas of the factors is conditioned by the effect of maximum cooling in the first decade.

Table 2 shows the forecast results of CEPT for 2030 with the help of MIDACS. The eastern part of the country will be completed by 2022.

**TABLE 2. THE IMPACT OF FACTORS ON CLIMATIC CHARACTERISTICS AND SALINITY OF THE SOIL ALONG THE KUBLA ARAL SEA IN 2030**

Factors-Object	$\Delta t_o$ January	$\Delta t_o$ July	$\Delta V$ July	$\Delta R$	$\Delta MR$	$\Delta S$
1. Aral Sea	+0,0 05	- 0,01	+0, 028			
2. Saline aerosol	- 0,12	- 3,07		+9, 4	+3 80	+0, 58
3. Plants		-0,7	+2, 6			- 0,17
Systemic effect	- 0,115	- 3,78	+2, 628	+9, 4	+3 80	0,4 1

Note:  $\Delta t_o$  January - January temperature increase;  $\Delta t_o$  July - increase in air temperature;  $\Delta V$  - percentage increase in specific gravity (%);  $\Delta R$  - growth of annual rainfall (mm);  $\Delta MR$  - precipitation mineralization growth (mg / dm<sup>3</sup>);  $\Delta S$  is the percentage of soil salinity (%).

In 1970-2000, the total ecological transformations of the Aral Sea decreased by 36.4 thousand km<sup>2</sup>, the vegetation decreased by 8% and the salinity increased by 25 million tons / year. These changes will lead to an increase in air temperature by 1.1 ° C, a decrease in relative humidity by

4.1%, an increase in annual precipitation by 9 mm and an increase in soil salinity by 0.05%. The further reduction of the sea area will affect the climate of the sea, ie by 2030 the only dominant factor in the system of factors will be the rise of salt and the degradation of vegetation. In 2030, the amount of salt will increase to 69 million tons per year tons will lead to a decrease in air temperature by 0.9 ° C compared to 2000. In 2030, precipitation is expected to increase by 11.9% due to the presence of clouds in the north (up to 1 km), while the number of cloudy days without precipitation is expected to increase. This is explained by the peculiarity of the distribution of saline aerosols in the post-dry land of the Mediterranean: the accumulation of numerical nuclei in condensation up to a height of 1 km does not exceed the critical value, above which the concentration of particles exceeds the critical value.

## CONCLUSION

The results of the study are as follows:

1. The interactivity of the components of the ecosystem and the interdependence of their transformation requires the systematic conduct of ecological research, the creation of a separate model system for the description of ecological processes by mathematical modeling.
2. At a salt aerosol concentration of 400 mgk / m<sup>3</sup>, the condensation level in some cases leads to an increase in precipitation up to 1.6 mm, at higher concentrations the aerosol effect changes in the opposite direction - no precipitation and thus the number of cloudy day increases.
3. The drying up of the Aral Sea and the consequent loss of its regional salt-absorbing role are of great importance in the salinity of soils in the Aral Sea region. To assess this role, it is necessary to conduct a comprehensive study of groundwater and surface water flow systems in the Amudarya basin, taking into account the dynamics of water quality.

## **EFFECT OF MINERAL FERTILIZERS ON THE CHEMICAL COMPOSITION OF SOYA SEEDS**

**Userbaeva Tamarakhat\*; Kunakbaev Nurjan\*\***

\*Dotsent,

Department of Plant Sciences Tashkent State Agrarian University  
Nukus Branch, UZBEKISTAN

\*\*Student,

UZBEKISTAN

### **ABSTRACT**

*The content of the following article is devoted to the study of the effect of mineral fertilizers on the chemical composition of soybean seeds. At the same time, the productivity and grain quality indicators of different varieties of soybean were analyzed. The effect of fertilizer norms on the amount of organic matter in soybean seeds was studied as well and analyzed research results were collected.*

**KEYWORDS:** *Soybean Plant, Chemical Composition of Seeds, Carbohydrates, Protein, Oil, Mineral And Local Fertilizers.*

### **INTRODUCTION**

In recent years, special attention has been paid to the placement and cultivation of non-traditional agricultural crops in the country. In particular, in 2017, for the first time in the country, soybeans were planted on more than 12,000 hectares, 14,000 tons of soybeans were grown, and more than 2,000 tons of soybean oil and 10,000 tons of high-nutrient soybean meal were delivered to poultry farms. [1]

In the developed world of China, with a population of more than a billion people, Japan, Korea and other countries where arable land is extremely scarce, the protein needs of the population are met mainly by soybean protein.

Another feature of this plant is that it belongs to the legume family and provides 55-60 kg of pure nitrogen in the soil. Today in our country the issue of restoring or maintaining soil fertility

is an actual issue. There is no need to apply large amounts of mineral fertilizers to the field during the growing season, as the plant itself is able to absorb and use nitrogen from the air.

In terms of crop area, it ranks 4th in world agriculture after wheat, rice and corn. Gross grain yield will reach 220.64 million tons. While Brazil, the U.S.A. and Argentina are the leading exporters of soybeans, the main buyer countries are our neighboring neighbors China, Korea and other Asian countries.

The Action Strategy for the further development of the Republic of Uzbekistan sets the tasks of "Development of industries, modernization and diversification of industry, the use of energy-efficient methods in practice, ensuring food security, production of competitive and export-oriented import-substituting products"<sup>1</sup>. In this regard, research aimed at the production of quality high-strength edible oils using vegetable oils for the preparation of margarine products is important.

It is necessary to provide the population with nutritious food, solve protein deficiencies, increase vegetable oil production, improve seed quality and soil fertility. To solve these problems, it is necessary to create and improve new varieties of soybean crops and cultivation technology. Farms will be able to grow soybeans on a regular basis, meet the current demand for food, and at the same time meet the needs of future generations: new environmental technologies will be introduced, productivity will increase, human health will increase, and rural people will be provided with safe, nutritious food and the social and economic situation of the farm will improve. A drastic change in food production is required. Food security has become an economic, social and political problem as the population grows and so does the demand for food. As a result of measures taken to address this problem, the cultivation of grain from autumn crops on irrigated lands amounted to 1372.7 thousand hectares. In this regard, special attention is paid to the supply of plant protein. The supply of plant protein is solved in different ways. One of these methods is to plant more multi-protein crops, among which soybean crops are distinguished by the amount and quality of protein. Soybeans are an oily and leguminous crop that plays an important role in agriculture. According to the FAO in 2013, soybeans were planted on 111.0 million hectares of land. Soybeans contain 30-52% protein, 17-27% fat and 20% carbonated water. The high prevalence of soybean in the world is related to the quality of grain and protein. The amount and proportion of protein, fat and other important organic and mineral substances in the grain allow it to be used in various industries. Soybeans are used to make butter, margarine, cheese, milk, flour, confectionery and canned food. Soybean oil makes up 40% of the vegetable oil produced in the world. [2] The main problem in the development of soybean grain is the low productivity of existing varieties, and rapid nausea, rapid loss of its properties are under the adverse conditions. Due to this, the creation of new varieties of shade is considered one of the most pressing issues. Soy products belong to the group of exported products. More than 1 million soybeans are exported from China every year. It is necessary to expand the area under soybeans in the state economy. The area under shade crops on earth is constantly expanding. Exporting soybeans are Brazil, Argentina and other Latin American countries [2,3].

## RESEARCH METHODS

Laboratory and field experiments, morphological, phenological, biometric, statistical and modern methods were used in the research.

The methods of N.M.Karmanenko and O.F.Kazantseva were used to determine the effect of fertilizer norms on the amount of carbohydrates in soybeans.

The reliability of the research results is characterized by the use of modern methods, the publication of the results in scientific publications, statistical analysis of data, as well as the validation of practical results by authorized government agencies and statistically reliable materials collected during field research.

### **Research results and their analysis:**

The experiments were carried out in the fields of the Scientific Elite State Farm of the Grain, Rice and Legume Selection and Seed Research Station of Uzbekistan. The scientific elite state farm is located in the southeastern part of Tashkent region, 15 km from Tashkent, on the left bank of the Chirchik River, on the Greenwich scale at 69° 18' East longitude and 41° 20' North latitude. The soil layers are swamp-type soils that are characteristic of the oasis. There are also mixtures of large and small stones and sand in different depth layers. These soils resulted from typical excess moisture conditions on the left 6 banks of the river. The pH of soil solutions is 6.8-7.3 units, and the mechanical composition is heavy clay. Soybean selection was carried out on the basis of recommendations developed by the State Variety Testing Commission of Agricultural Crops and UzShITI, field experimental methods [3,4]. The planting area for each variety in the collection nursery is 1.8 m<sup>2</sup>. (without repetition). 5 plants were taken for analysis. In the selection nursery, the sown area for each variety is 3.6 m<sup>2</sup> (without repetition). 5 plants were taken for analysis. In the control nursery, the planting area for each variety was 25 m<sup>2</sup> and planted in pairs according to the standard method. The sowing area was 50 m<sup>2</sup> for each variety of the variety selection nursery and was carried out in 4 rounds. For all saplings, regionalized middle-ripe "Uzbek-2" and late-ripe "Uzbek-6" varieties of shade were planted. Sowing rate is 60 kg per 1 ha, row spacing is 60 cm, and plant spacing is 10 cm, 2 seeds in each nest. Agrotechnical measures in the experimental areas were carried out on the basis of recommendations of scientists of the Institute for the cultivation of legumes in Uzbekistan. , potassium) phosphorus and potassium fertilizers were sown manually in small pieces, (100% phosphorus, 50% potassium from the annual norm before planting), the remaining 50% potassium mineral fertilizer was given during the flowering phase of the plant. In 2012-2014 years 215, 238 and 100 varieties were studied over the years in the collection nursery, which consists of varieties of the world collection. For control comparison, regionalized varieties "Uzbek-2" and "Uzbek-6" were planted after every 10 samples. In this nursery were divided into early, middle and late ripening varieties of shade. In 2012-2014, 204 varieties of soybean were planted in the nursery. Phenological observations were carried out on the basis of recommendations developed by UzShITI, and according to the results obtained, 30 varieties of seedlings were selected from the breeding nursery. In the control nursery 2012-2014 years, 113 samples were placed in an area of 25 m<sup>2</sup> and studied by zoning varieties "Uzbek-2" and "Uzbekistan-6". Phenological observations were made during the growing season of the plant, morphological and biological parameters were evaluated, and 25 cultivar specimens were isolated. In 2016-2018, 32 varieties were tested in the nursery. The Uzbek-2 shade variety was planted for control. The yield and grain quality of the selected samples are given in the table below.

**TABLE 1 YIELD AND GRAIN QUALITY INDICATORS OF DIFFERENT VARIETIES OF SOYBEAN**

Varietyname	Origination	Grain yield s / ha	Protein %	Oil %
Uzbek-2	Uzbekistan	27,5	42,0	21,0
464170	USA	32,0	33,5	13,6
7213	Uzbekistan	33,5	33,1	17,5
K-15	USA	33,8	41,8	19,2
3926	Primorsk	33,0	34,5	12,3
9177	Russsia	35,6	34,6	18,1
K-2	USA	31,2	44, 2	18,6
5382	PRCh	33,	1 38,2	14,0

These varieties can be used in targeted selection and production in terms of yield, protein and fat content. Among the varieties selected for yield, the variety marked with the catalog number 9177 stood out. In terms of protein content, it was found that the K-2 variety differed from the standard variety. The varieties selected for the standard variety in terms of fat content could not be matched. It is necessary to find a solution to the problem of increasing the fat content of soybean varieties.

Now let's look at the amount of carbohydrates in the seeds of Uzbek 2 and Uzbek 6 varieties.

The chemical composition of soybean seeds is greatly influenced by external factors. Of these, the effect of mineral fertilizers in particular is much stronger. When the amount of fatty acids in soybeans is analyzed, it appears that soybean oil in general is of high quality. This can be seen from the following information. Carbohydrates in soybeans can be up to 22%. The amount of insoluble carbonated water in the cereal extracted from soybean oil is 17%, soluble 21%. The amount of carbohydrates in the fat extracted from shrot: sucrose-5.7; raffinosa-4.1; staxiosis-4.6; arabinan 1.0; rabinogalactan-8-10 and sour polysaccharides-5-7%. Soy products also contain minerals. Their quantity varies by product type. Carbohydrates are one of the most common organic compounds in the plant kingdom and are important in life. They make up 80-90% of the plant component. Carbohydrates are the main product of the process of photosynthesis. When these plants are broken down in the process of respiration, a lot of energy is released. This energy is expended in various synthesis reactions that take place in living organisms. Compounds in which carbohydrates play an important role in vital processes are particularly important in the formation of proteins, nucleic acids, and fats. Most carbohydrates accumulate in plants as a reserve substance. In order to determine the effect of fertilizer norms on the amount of carbohydrates in soybean varieties, a field experiment was conducted. The field experiment consisted of 6 variants and was performed in 2 repetitions: 1 variant without fertilizer; Different doses of mineral fertilizers were applied in 2-3-4-5 options and 60 tons of manure in 6 options. Fertilizer norms and distribution by phases are shown in **Table 2**. Work was carried out on Uzbek-2 and Uzbek-6 varieties of soybeans. The following mineral fertilizers were used in the experiment:  $\text{NH}_4\text{NO}_3$ -ammonium nitrate, containing 34.6% nitrogen,  $\text{Ca}(\text{H}_2\text{PO}_4)_2$  2 granular superphosphate, containing 20.0%  $\text{P}_2\text{O}_5$ , Potassium salt, containing 40%  $\text{K}_2\text{O}$ . Manure was used as an organic fertilizer. Plant samples at 3–4 true leaves, flowering, pods, and ripening phases were taken for analysis on variants and repetitions. Studies have shown that different agrophons have different effects on the amount of carbohydrates in the soybean leaf and legume. The results

of the analysis are presented in Table 2, where there was a significant difference in the amount of carbohydrates between the variants as a result of the increase in fertilizer norms. In the 3rd-4th leaf phase, the lowest result was 5.9% in the fertilizer-free (control) variant. Fertilizer norms were  $N_{60}P_{120}K_{90}$ ,  $N_{60}P_{120}K_{120}$ , and the amount of carbohydrates in options 2 and 3 were (6.1-6.9%). Fertilizer norms were higher in  $N_{60}P_{120}K_{90}$ ,  $N_{60}P_{120}K_{120}$  in 4 and 5 variants (7.9-7.8%). The highest result (8.4%) was observed in 6 variants with 60 tons of manure per hectare. amount (4.3-5.0%). High results (5.6-5.7%) were observed in variants 4 and 5, where fertilizer norms were  $N_{60}P_{120}K_{90}$ ,  $N_{60}P_{120}K_{120}$ . The highest result was in 6 variants (6.25%) where 60 tons of local fertilizer was applied per hectare.

**TABLE 2 TO THE AMOUNT OF CARBOHYDRATES IN SOYBEAN SEED SEFFECT OF FERTILIZER NORMS**

Variety	Version	Seed content Repetition			x	S	s	M	C	M	S
Uzbek -2	1	,7	,8	,7	,73	,040	,07	,028	,479	,603	,845
	2	,9	,7	,9	,83	,070	,11	,046	,972	,805	,200
	3	,1	,3	,1	,16	,070	,12	,048	,986	,808	,136
	4	,6	,8	,8	,73	,070	,12	,049	,812	,739	,040
	5	,5	,9	,9	,76	,132	,23	,093	,960	,200	,701
	6	,0	,5	,5	,33	,16	,29	,118	,480	,420	,920
Uzbek -6	1	,7	,8	,7	,76	,040	,07	,028	,479	,605	,849
	2	,8	,6	,9	,76	,091	,15	,064	,743	,120	,579
	3	,9	,7	,9	,83	,070	,12	,049	,786	,729	,024
	4	,5	,2	,5	,4	,1	,17	,070	,331	,951	,351
	5	,7	,7	,4	,6	,1	,17	,070	,276	,929	,315
	6	,0	,4	,4	,26	,13	,23	,095	,832	,156	,634

**Note:** X - arithmetic mean Sx - mean arithmetic error, Ms - its error, S - standard deviation, Cv - coefficient of variation, Msv - its error, Sx% - relative error

The sharp decrease in the amount of carbohydrates in the flowering phase can be explained by the fact that as a result of plant growth, the carbohydrates in the leaves are transferred to the yield elements. The amount of carbohydrates in legumes also varies significantly according to the options. The lowest carbohydrate content was in the fertilizer-free (control) option (3.5%). Fertilizer norms were  $N_0P_{90}K_{60}$   $N_{30}P_{90}K_{60}$ , and the amount of carbohydrates in options 2 and 3 was (4.2-5.5%). High results were observed in variants 4 and 5 with fertilizer norms  $N_{60}P_{120}K_{90}$ ,  $N_{60}P_{120}K_{120}$  (6.0-6.3%). The highest result was in 6 variants (6.7%) given 60 tons of local fertilizer. There is no significant difference between the amount of carbohydrates in the Uzbek-2 and Uzbek-6 varieties of shade in the 3-4th leaf and flowering phase. The seeds of the soybean plant contain 4 to 15%. Different agrophones have different effects on the amount of carbohydrates in the soybean seed. The results of the analysis are presented in Table 2. The lowest result is 4.7% in the fertilizer-free (control) option. The amount of carbohydrates in variants 2 and 3 of Uzbek-2 and Uzbek-6 varieties with fertilizer norms  $N_0P_{90}K_{60}$ ,  $N_{30}P_{90}K_{60}$  is Uzbek-2 (5.8-6.1%) in Uzbek-6 variety (5.7-6.8%) forms. High results were observed in 4 and 5 variants of fertilizer norms  $N_{60}P_{120}K_{90}$ ,  $N_{60}P_{120}K_{120}$  Uzbek-2 variety (6.3-7.7%) and Uzbek-6 variety (7.4-7.6%). The highest results are in Uzbek-2 and Uzbek-6 varieties (8.3%) in 6 variants using local fertilizers. There is no significant difference in the amount of carbohydrates in soybean varieties Uzbek-2 and Uzbek-6 seeds. Based on the results obtained, the following conclusions were drawn:

1. Under the influence of fertilizer norms, the amount of carbohydrates in soybeans increases. The minimum amount of carbohydrates in the period of 3-4 leaves was 5.9% in the Uzbek-2 variety and 5.8% in the Uzbek-6 variety without fertilizer (control). The high yield results were 7.9-7.8% in Uzbek-2 variety and 7.0-7.6% in Uzbek-6 variety in variants 4 and 5 with  $N_{60}P_{120}K_{90}$ ,  $N_{60}P_{120}K_{120}$ . The highest result was 8.4% in Uzbek-2 variety and 7.8% in Uzbek-6 variety in 6 variants with 60 tons of local fertilizer per hectare.
2. Different agrophones have different effects on the amount of carbohydrates in soybean seeds. The lowest result is 4.7% in Uzbek-2 and Uzbek-6 seeds without fertilizer (control). High results are 6.7-7.7% in Uzbek-2 seeds and 7.4-7.6% in Uzbek-6 seeds in variants 4 and 5, where fertilizer norms are  $N_{60}P_{120}K_{90}$ ,  $N_{60}P_{120}K_{120}$ . The highest result is 8.3% in Uzbek-2 and Uzbek-6 seeds in 6 variants using local fertilizers. There is no significant difference in the amount of carbohydrates in soybean varieties Uzbek-2 and Uzbek-6 seeds.
3. There was no significant difference in the amount of carbohydrates between Uzbek 2 and Uzbek 6 varieties.

### CONCLUSIONS:

1. Soybean collection was studied, samples of varieties that meet important economic characteristics were transferred to the next research nursery, and samples were selected for State sanitary control transmission.
2. Variety samples on soybean ripening were selected and a primary source for selection work was created.
3. Variety samples for high soybean yields were identified and considered as a source for further selection work.

4. Among the soybean varieties, a variety with a higher protein content than the control was selected.

5. It was found that the K-2 variety differs from the standard variety in terms of protein content.

6. It was found that different agrophons have different effects on the amount of carbohydrates in the leaves and legumes of soybeans.

## INTERPRETATION OF LEXICAL AND SEMANTIC FEATURES OF UZBEK-TAJIK WORDS IN JAMAL KAMAL'S POEM "UZBEK LANGUAGE"

**Akramova Surayo Renatovna\***

\*Lecturer,

Department of Theory of Primary Education,  
Faculty of Preschool and Primary Education,  
Bukhara State University. Bukhara city,  
The Republic of UZBEKISTAN

### ABSTRACT

*The following article deals with the lexical and semantic features of Uzbek-Tajik words on the example of the analysis of the Uzbek language by Jamal Kamal. The work of Jamal Kamal and his role in Uzbek literature are presented as well.*

**KEYWORDS:** *Jamal Kamal, "Uzbek Language", Uzbek-Tajik, Lexico-Semantic Features.*

### INTRODUCTION

As we get acquainted with the works of JamolKamol, who has a special place in the Uzbek literary environment with his unique poetry, excellent translated works, marvelous lines in Uzbek literature, his unique images, the best and most charming words of Persian-Tajik language in his poetry. We can see there have been cultural and social ties between peoples for centuries, so there are interlingua communication and assimilation between languages as well.

The lexemes learned from Tajik to Uzbek are also interconnected as a result of centuries of coexistence of the two peoples, long-standing socio-political, cultural, literary and linguistic relations, which help to express some subtle semantics depending on the speech situation.

The book "Lexicology of the Uzbek language" created in collaboration with several scholars. The section "Vocabulary of the Uzbek language according to the scope of consumption" written by G. Muhammadjanova also contains the following views in this regard:

"... some words from the Tajik language have been acquired as a result of socio-political, literary, cultural and linguistic relations, and they are widely used, mainly in the unlimited

lexical layer of the Uzbek language. For example, Tajik words such as river, tree, iron, bread, flower, city, friend, lamp, and brick are among them. As a result, during the course of historical development, even some Persian-Tajik words (iron, bread, city, flower, below) ousted ancient Turkic words (utyuk, ekmak, kala, agach, chechak, tubanda) from the general or neutral lexicon, and some of them in modern Uzbek only stylistically limited vocabulary is included. [6, 9 p]

It seems that linguistic laws, like social laws, are manifested in a peculiar way. From this point of view, general and specific laws can be observed in the development of language. General laws refer to linguistic phenomena, processes that are specific to all languages.

The communicative and expressive functions of language are due to the uneven development of language level the rapidly change lexical layer relative to other linguistic layers because of constant motion. (5, 54-p)

**The main part.** In linguistics, specific linguistic factors include the specific rules of each specific language. For example, each language (even in languages belonging to the same language family) has its own phonetic, lexical level, grammatical structure, and stylistic style. Hence, these two types (factors) require each other, including commonalities.

Words also acquire a different semaphore over time or, for some reason, condition, or situation, losing their semantic semantics.

In the example of Jamal Kamal's poem "Uzbek language" in the process of studying the lexical and semantic features of the language of his poems, it is observed that many Persian-Tajik lexemes in the Uzbek literary language are mastered, manifested in different semaphores, depending on the speech situation:

**Dilbarimsanshujahonda,**  
**dilraboo`zbektilim.**  
 Ham go`zalsan, ham asal,  
 Ohanraboo`zbektilim.(1. 33)  
 You are my heart in this world  
 My charming Uzbek language  
 You are both beautiful, and honey  
 Marvelous Uzbek language.

“Dilbar”- is a Persian word that expresses the heart, attracts, attracts, pleases, fascinates, attracts. Out of the 5 semas mentioned in the annotated dictionary, the pleasant sema of the word “dilbar” prevails in the Uzbek language.

In the process of studying the word **charming** in linguistics, there is also a hierarchy of beautiful-beautiful-pleasant-charming-charming. As for the fact that the charming lexeme is at the top in this ranking, we see that the poet used the best, most weighty, burdensome lexeme in relation to the mother tongue.

In the dictionary "Farhangizabonitochiki" our word is interpreted as follows:

1.“Dilbar”- pleasant, charms someone;

## 2. “Yor” - beloved;

There are also “dilbarak, dilbari” expressions of the “dilbar” lexeme in the Tajik language, each of which has a spiritual connection, as well as a subtle semantic difference.

That is, in the lexeme of “dilbarak”, the meaning of the form is “dilbar”, and in the lexeme of “dilbari”, the meanings of “dilrabo, maftunsozi, zebo, khushroi, rano” are reflected in the main semantics. In the literature, the use of the charming lexeme in relation to beloved is common:

Goodbye, darling, I'm going to the heart ...

In mystical terms, the lexeme “dilbar” is also used to refer to the beloved that makes the language self-evident. The social situation in society has always been reflected in language. It is natural that the development, evolution, rise and decline of society are all reflected in linguistics, because language is a phenomenon of social consciousness. The only word that exists in our language expresses different semantics depending on the situation in the speech structure. Our subconscious views are expressed through a lexeme that accurately expresses our mental state.

If we pay attention to the psycho-linguistic state of the poet's lyrics, the language is the soul, the life-giving force, the life-giving ring that nourishes the soul. It has a charming melody and charm. The soul finds peace in its tone and brilliance. The Uzbek language has such power. The poet's use of the charming diagnosis in the verse in relation to the mother tongue is a fitting metaphor, as if he were looking at a ring.

After all, RasulKhamzatov's famous poem "Christ is my soul is my mother tongue" is used in the literature. Nothing can give life to my dead soul, and the very idea that my mother tongue is my resurrection means that my mother tongue is as precious to me as my soul. In Turkish poetry, the teacher Navai, who suffered and conquered the world of humanity with the power of words with only one pen, says the following:

The word is pure in the body of the dead,

The stain of the soul is the loss of words between the bodies. (A. Navai, “Hayratulabror”)

Focusing on the analysis of a single charming lexeme in different linguistic layers in the Morphemic Dictionary of the Uzbek Language, edited by Rakhmatullaev, we observed that it is divided into components as a language “bar”. (7)

### Heart.

1. Circulatory system, heart.
2. Inside, included between something
3. Inner, mind, spirit.
4. Thought, thought
5. Inclination, desire, passion
6. Sweetheart, friend, lover.
7. Courage, bravery, courage

If the “**bar**” is used in the sense of a pronoun, the two independent semas combine to form a joint lexeme in a syntactic (compositional) way. [2, 141 p.]

In the second verse, the lexeme “dilirabo”, which is gradually evolving in relation to the Uzbek language, is also borrowed from the Persian-Tajik language and expresses the captivating, “diltortar”, charming semantics. “Dilirabo” melody can be combined with “dilirabo” landscape lexemes. In the poem, “dilirabo” is combined with a lexeme of language, dominated by metaphorically engaging, charming semantics.

It is said: Persian is like a sugar,

The Arabic-speaking word duhar (priceless)

You are sugar, you are pearl

**Priceless** Uzbek language.

The “durri” used in the byte is a “guhar” -isophalic compound, and we see the mutual harmony of both the Persian and Arabic linguistic layers:

“Dur” is a pearl, a pearl, a large type of pearl, the best in a figurative sense. In the portable poetic sense, valuable, meaningful, deeply meaningful words, light, light semaphores lead.

“Ore” –is a precious stone, pearl, carved diamond, ore. Used in a poetic layer in a rare, priceless sense.

As for Mazi, the old Uzbek literary language in the Navai period is also mentioned in the chapter “Word definition” of “Hayratul-abror”.

So`z **guharig`a**erurangasharaf

Kim bo`laolmasangagav**hars**adaf

Tilbuchamanningvara qilolasi

So`z duridinbo`lubonjolasi

It's an honor to speak up

Who can't be a pearl?

The tongue is the leaf tulip

The word pearl is its estimation.

We see that in Jamal Kamal’s work there are references to the linguistic layer that gives the literary breath of the past. In Navai's “Khamsa”, which proved the great power of the great Turkish language, the word is likened to the words “guhar” and “gavhar”.

The fact that the poet uses the terms Persian as sweet as sugar, Arabic as “dur”, as precious as a pearl, and the Uzbek language as sugar and “guharsan” in a meaningful way reveals the contextual meaning in linguistics.

After all, the poet himself describes such a union and unity as follows:

How many words did you get from Persian?

How much is Chun arabian,

Enough its Turkish agility

Marvelous, Uzbek language.

In the interpretation of the “**Serjilva**” **marvelous** lexeme, we know that the -ser suffix is plural in Persian, and in dark horses it is a quality-forming prefix denoting plurality, abundance. In the poetic layer, it serves to express the glittering, glittering, playful metaphorical semaphores.

We know that the definite material, formal nomenclature of the external is determined by the state of speech, by the origin and possibilities of the speaker (author of the speech). Nomema, i.e., external meaning, form speech condition, is determined by the situation and does not affect the essence of the lexeme. The essence of a lexeme is revealed through its inner side, that is, through the semema and, accordingly, the way in which the lexeme interacts with other language units. But nomema is of great importance in speech, especially in poetic speech. In poetic speech great attention is paid to the nomema and its occurrence. Because the meaning of a word occurs in a particular text and speech context, it is understood clearly and unambiguously. The meaning of the word does not have diversity, commonality, as a semema that exists only in the form of chance. In different texts and contexts, many words can have many meanings, hints of meaning, as the occurrence of a single lexeme. At the same time, these meaning paints are different speech-methodological manifestations of a semema, if it is realized through a semema. Semema can manifest several different events in speech. This, in turn, depends on which word it is linked to, and its position in the text.

Language is divine in the world,

The word is divine again,

Reflected in your words,

The God is beautiful, myUzbek language.

In any linguistic unit the relation to the concept to which semema is related in the sense of the word is preserved, but at the same time there is no abrupt change in the relation of nouns, expressions, and function semantics in semantics:

God - lord, ruler-master.

1. According to the religious concept, in particular, according to Islam, the supreme divine power that created and governs the whole being, the universe; the basis of belief of any religion (synonymous with the word “Allah” in Muslims).

2. The supreme ruler of some part of the universe in polytheism.

The semema of God is dominated by the nomema- Lord meaning, which represents a simple meaning. So, the words of the Uzbek language glorified by the poet reflect the beauty of God. Those words are so powerful. It glorifies the beauty that captures the human heart, the embodiment of true power.

Senjahondanbahramand,

Sendinjahonbahramand

**Bahramandlik**qomating

Etdiraso ,o`zbektilim.

You enjoy the **world**,

**Enjoy** your **world**,

**Enjoying** made you beautiful,

My Uzbek language.

“Jahon” – world, universe, the earth and all that is in it, globe. In the poetic layer, it means all the peoples of the world, all humanity.

“Bahramand” -lucky; partner; beneficiary; enjoyable.

The exclusion of some semantics, which differ in certain semantic subtleties in the semantic structure of the word, and, conversely, the reinforcement of some, the difference between the semantically connected concept and the semantically connected concept, is called the semantic mobile event. The figurative meaning of a word is also referred to in linguistics by terms such as figurative meaning, occasional usage, and metaphorical usage.

The figurative meaning of the word is formed mainly by the partial exclusion of noun semantics in the semantics due to the requirements of the situation, and by strengthening the satellite and expression semantics for a specific purpose. The more the lexical meaning, that is, the semantics of the noun, is removed, the more the semantic and semantic semantics of the word are strengthened. In particular, in the above byte, in the lexeme of enjoyment, the semaphore of benefit is excluded, and the sema of enjoyment is preferred. You are liked by the whole world. All is enjoyed; this pleasure is enhanced by the sema that has made your body upright. In speech terms, noun semantics can also be called dominant semantics, and occurs in speech. Such a linguistic phenomenon occurs in H. Nematov, R. Rasulov's book "Fundamentals of Uzbek systemic lexicology" and speech is interpreted as **transferred meanings**. In linguistics, this type of figurative meaning in words is called a metaphor - a figurative meaning formed on the basis of analogy. Artistic style, as the most common method of creating such a portable meaning, is one of the most basic factors in the art of speech. The formation of a portable meaning in speech on the basis of the semantics contained in the semantics is inherent in almost all words that do not have an unambiguous nature of a term.

You are our honor,

Fountain of life,

If you wouldn't exist

We wouldn't be happy

My Uzbek language.

**Happiness** is destiny; share, contribution:

1. A spiritual and moral concept that manifests itself as a person's complete satisfaction with the results of his activities, achievements in life, satisfaction with the way of life, the achievement of a certain goal, the realization of dreams and hopes.
2. A state of complete satisfaction and helplessness in life.

In many cases, the word unfortunate has a metaphorical meaning with its black quality.

1. Dark is the darkest of all things; cauldron, coal-colored; opposite white.

2. Dark, without light, without light. Contrast light.

Portable is generally a negative sign, meaning bad.

Apparently, semema arises through verbal and figurative (metaphorical) meanings and occurs as a specific meaning of a word in a particular context.

As the scope of the use of verbal metaphorical meaning expands, the metaphorical meaning may move away from the semantics, and the metaphorical meaning may have its own specific noun semantics. At the same time, the figurative meaning can be detached from the semema, which is the basis and source for itself, and develop towards an independent semema in the lexeme. Such a development can be a source of study of semantic development in lexemes taken separately from historical (diachronic) linguistics, rather than systemic lexicology. [8] This process cannot be explained or explained on the basis of system analysis. For example, in the explanatory dictionary of the Uzbek language [3] 12 types of meanings of the black lexeme are noted. All of these types of meanings have a common meaning. The use of the word happiness in our poem is taken for analysis and helps to understand which sema of it is brighter, that is, consistent with its meaning without light, without light.

As a simple black color, the negative side grows as a result of the acquisition of figurativeness towards the semantics of lightlessness. In turn, the black lexeme exaggerates the meaning of verse-specific negativity:

## CONCLUSION

In conclusion, it can be said that JamolKamol's poetry, which is characterized by its simplicity has a unique style, that is, the rhythm of Uzbek-Tajik words harmonization and the expressive beauty of the two languages as well.

It follows that the fact that in the language of the poet's work each sema acquires a dyed style shows the richness of the lexical layer of the language and the richness of its essence.

### ABSTRACT

*The article discusses the basic techniques of painting fabrics. Today's fabric painting techniques are traditional techniques rethought and redesigned in accordance with the dictates of the time, greatly simplified and enriched at the same time. A huge variety of colors and accessories allow even beginners to paint for the manufacture of clothing and interior. Moving from simple to complex, you can master various techniques and learn how to combine them correctly to achieve maximum decorative effect.*

**KEYWORDS:** Reception, Painting of Fabrics, Paints, Decorative, Batik.

### INTRODUCTION

Drawing with paints on paper, we dip the brush into the paint, draw along the paper and get a clear line. If you repeat the same thing on the fabric, the result will be unpredictable - the smear will spread, turning into a shapeless blot. The fabric dictates its conditions, and, obeying them, we are forced to look for ways to keep the paint in the outlines given to us (contours).

All methods of painting fabrics in one way or another solve the problem of subjecting the fabric to the creative imagination of the artist. Wax, paraffin, salt and a whole arsenal of techniques are called upon to help.

Today's fabric painting techniques are traditional techniques rethought and redesigned in accordance with the dictates of the time, greatly simplified and enriched at the same time. A huge variety of colors and accessories allow even beginners to paint for the manufacture of clothing and interior. Moving from simple to complex, you can master various techniques and learn how to combine them correctly to achieve maximum decorative effect.

The technique of cold batik arose at the beginning of the 20th century, and today it is the most common and favorite painting technique. Its distinctive feature is the presence of characteristic contour lines that perform the function of separating different color spots and additionally carry a graphical load. Contour lines can be either white or colored, performed by a special reserve composition, which is an adhesive mixture based on natural rubber and gasoline, and applied using special glass tubes.

To work on a cold batik, you will need the following materials and tools: fabrics, paints, brushes, frames (preferably sliding, collapsible), buttons, hooks and the main tool for a cold batik - a glass tube, with which a contour line from a backup composition is applied.

The reserve is sold in specialized stores for artists and can be both domestic and imported, both colorless and colored. But it can be cooked at home. The main recipe for the reserve: 200 grams of rubber glue, 200-250 grams of gasoline. 20 grams of paraffin. To prepare the reserve, you will need metal dishes with a volume of about 1 liter, a wide metal bowl or pan for a water bath and a spoon for stirring the mixture. The glue is squeezed out of the tube into the dish, gasoline is added - all this is mixed, then grated or planed paraffin is poured and mixed again. The dishes with the mixture are placed in a large bowl of hot water so that the water level in the bowl reaches the level of the gasoline-glue mixture in a smaller bowl, this will help the mixture warm up faster. But water should not get into smaller dishes. Heat the mixture over low heat with constant stirring until the paraffin is completely dissolved. The availability of the reserve is determined by the appearance of a large number of small bubbles. It can be used after complete cooling. There are other recipes in the literature where beeswax and rosin are included in the components, but for many years this is most often used.

Before starting the painting, it is necessary to develop a preliminary sketch of the composition, then all the contours of the drawing on whatman paper in full size of the painting. Next, you need to transfer the pattern to the fabric. If the fabric is transparent, then the task is simplified - it is enough to put it under the fabric stretched over the frame and transfer it with a pencil. It is advisable to use colored pencils for fabric, they are easily removed from the fabric, unlike simple pencils. If the fabric is opaque, you can use carbon paper (special in sewing stores), it stains less, does not leave greasy stains.

The fabric on the frame should be tight. The thin end of the glass tube is lowered into the container with a reserve, and through the wide end the solution is collected, you can use a rubber bulb, or you can carefully do this with your lips, like with a straw for a cocktail.

Applying a reserve is the most critical stage of work in a cold batik. Hold the tube in your hand as you would a pencil. The movement of the hand should be smooth and continuous, during stops the tube should immediately be lifted end up. A napkin should always be at hand to wipe drops on the tip of the tube - this prevents the appearance of thickenings. Spaces and dashed lines are not allowed. The quality of the lines is a matter of time and experience. The line should soak the fabric completely to its full thickness. The integrity of the contours is easy to check after

drying by looking at them in the light. After doing the work, the tube is washed several times with gasoline, by pulling it inward.

You can start painting after the reserve has completely dried. Paints work on the principle of: light to dark. It must be remembered that a faint color can be made more intense, and dark is very difficult to lighten. Having finished painting, the fabric is removed from the frame and designed according to your desire and taste.

Hot batik technique involves the use of hot molten wax or paraffin. Modern hot batik is rooted in traditional methods of decorating fabrics in the Middle East and Southeast Asia. And today, on the islands of Indonesia, batik is a craft that is practiced by entire villages.

In a classic batik, the pattern is applied to the fabric with molten wax, then the fabric is immersed in the tub with the lightest paint, dried, again covered with hot wax and painted in the tub with darker paint - this is repeated as many times as the colors require for the ornament. The last color - the background color - should be the darkest. Melted wax is applied using brushes or special devices - *chian-tings* (*changings*).

Modern hot batik is less laborious, but retained all the characteristic features of traditional batik.

For work you will need: fabric, frames, white household candles or pharmaceutical paraffin, two metal containers, aniline dyes, brushes for aniline dyes, newspapers, an iron.

The fabric is pulled onto the frame in the same way as in a cold batik. Paraffin is melted in a water bath. To do this, a white household candle is placed in a small bowl, which is placed in a large bowl with hot water. A water bath allows for a long time to maintain the temperature of the molten paraffin relatively even. It is not recommended to melt paraffin in another way, for example, by heating a bowl with a candle on a stove. In this case, the paraffin heats up too much, smokes, and when applied to the fabric spreads shapeless spots. It should not be forgotten that paraffin is flammable and may catch fire when exposed to open flames.

An example of a simple batik. Color spots are applied to the fabric stretched over the frame so that they flow smoothly into one another. To do this, the border between them is wetted with water. Then the fabric is dried and a paraffin pattern is applied with a wide brush. The nature of the pattern may be arbitrary. The main thing is that each smear of paraffin overlaps several color spots, then the flow of color into color will be emphasized in the finished painting. However, a sense of proportion must be maintained. After solidification of the paraffin, the entire fabric is covered in black. After drying, paraffin is removed by ironing the fabric through newspapers.

Having mastered the technique of hot batik, you can perform work of varying degrees of complexity, as well as combine the techniques characteristic of cold batik and free painting in one work with hot batik.

It is possible that the nodular batik is one of the first, very primitive ways to create a pattern on the fabric. More precisely, this is not even a painting technique, but a method of dyeing a fabric, in which a pattern arises from the binding of individual sections of fabric with knots.

A peculiar pattern occurs on the fabric due to the fact that the paint does not penetrate those areas of the fabric that are connected in a knot or wrapped in a cord.

For work you will need: fabric (silk, cotton, linen, woolen, knitwear), aniline or vegetable paints, durable thick threads, dishes for diluting paints and stains, detergents, paint fixers, household gloves.

Before dyeing, the fabric is folded in a certain way, in accordance with the conceived pattern, tied with strong threads or cords according to a certain pattern. Further immersed in a container with dye. After staining and washing in running water, the nodules are untied. The result is a pattern of the same color, but with transitions from light shades to more saturated, since the paint penetrates differently in bandaged and non-bandaged areas. Leastly stained are those areas that were tied with cords or knotted, they retain their original color. Fragments free from any dressing are painted with maximum saturation. The remaining parts are stained to varying degrees, resulting in a kind of color transitions that form unique patterns.

To obtain a multi-color pattern, the operation with dressing and dyeing of the fabric is repeated. This procedure can be repeated several times, depending on the result that you want to get in the end. One thing to remember is that each subsequent color should be darker than the previous one.

After dyeing, the fabric is rinsed, fixed in a solution of water with the addition of vinegar or other means, carefully untie the knots, then thoroughly washing and drying, smoothing in a wet state. The result is always original, unique, since it is simply impossible to fold and tie the fabric twice in exactly the same way.

The term "free painting" means several methods of painting fabrics, united by a general principle - the paint freely spreads over the fabric. The free painting can include watercolor technique, similar to the work of watercolor on wet paper.

The technique of free painting is the best suited for beginners. Having mastered then cold and hot batik, you can return to free painting on a qualitatively different level, having the opportunity to combine different techniques in one work. The materials used are the same as for cold batik, with the exception of the backup composition. In free painting there are several methods - free painting in saline, with starchy thickening and the "dry brush" method.

It is necessary to paint the fabric quickly, literally "in one go", including both thoughts and skill. The best material for free painting is all kinds of silk. In ancient times, silk was valued not only for its excellent external qualities. There was a deep belief in its beneficial effects on human health.

The technology of free painting consists in the fact that all kinds of fabrics are subject to very weak redundancy by various thickeners, as a result, the paint spreads over the fabric, it becomes possible to make drawings with free strokes, correct the shape found, saturate with light, without leaving any boundaries. In a word, ample opportunities for artistic creation. As a rule, a decorative composition is based on images and associations and carries not a plot, but an emotional burden. The fact is that different images evoke different associations in us. The square seems to us heavy and steady, the circle - harmonious, complete, balanced. We consider orange to be cheerful and warm, and blue to cold and calm. Creating a decorative composition, each expresses his creative individuality and conveys his vision of the world through the beauty of forms and lines and the harmony of color. There is a whole arsenal of techniques - symmetry, asymmetry, static, dynamic, dominant (compositional center), color saturation, color tone, color harmony.

### **ABSTRACT**

*This article discusses the methods of motivating students to play sports as part of training. The purpose of this article is to show students the importance of motivation and sports in their lives, and how much motivation is important for sports.*

**KEYWORDS:** Sports; Physical Education; Motivation; Student.

### **INTRODUCTION**

From the moment of birth, people are subject to physical stress, and such stress is an integral part of our life. Slightly less than half of our body (40%) consists of muscles that every day support you and me in our daily routine. The concept of things, body balance control, breathing, head turns, etc. all this is done thanks to muscle mass.

Since ancient times, people have adapted to high loads, hunting, construction, agriculture, etc. But in the age of technology, sport, unfortunately, has faded into the background, because now the main thing is knowledge, not a well-developed body. Many routine tasks, such as raising large beams in construction, plowing vast areas of land, etc., fell into the hands of technology, people's lives have become easier and better, but still many lack physical exertion. Due to the lack of stress, people have health problems: the functioning of organs and systems deteriorates, the motor apparatus loses its functions, the body becomes decrepit, weakened and becomes more vulnerable to diseases.

Sport, like body training, is necessary for people, because it is not only a “pumping” of the body, but also emotional unloading, and as you know: a good body condition affects the functioning of the brain. No wonder they say: “The body is our temple.” Training helps us improve many of our life metrics.

Relevance. Health in our life plays a too big role, and if you do not monitor your health from the early years of our lives, you can pay bitterly. This article encourages you to start monitoring your health, and the sooner the better.

In all educational institutions, sport is an integral part, and is included in the curriculum of students. When training activities can not put training in the background. Simply put, the brain is physically in the body. And if the body is decrepit or sick, then how, in this case, can the brain be healthy, as an integral part of the body? The answer suggests itself. However, it is important not to go to extremes. Therefore, for good learning, students need physical activity.

Nevertheless, academic institutions put education much higher than physical education classes, because educational organizations are needed for this. Nothing can be done with this, students should give all their best in the classroom, and also go in for sports in their free time.

“Physical culture” as a subject in institutions of higher professional education should perform: educational, social, developmental and educational functions.

The implementation of these functions occurs through the solution of some problems:

- Gain experience in the creative use of physical culture and sports to achieve life and professional goals.
- providing general and professionally-applied physical fitness that determines the psychophysical readiness of students for their future profession;
- the formation of a motivational-value attitude of students to physical education, installation on a healthy lifestyle, physical self-improvement and self-education, the need for regular physical exercises and sports;
- mastery of the scientific and practical foundations of a healthy lifestyle and physical education;
- mastery of the system of practical skills and abilities that ensure the preservation and strengthening of health, mental well-being, the development and improvement of psychophysical abilities and personal qualities, self-determination in physical culture;
- the formation of students' understanding of the role of physical culture in personality development and preparation for professional activity; personal development and preparation for professional activities;

Motivation is an impulse to a certain action; that is, the psychophysiological process that controls human behavior, sets the direction of activity, the organization of its further actions, stability and activity; as well as the ability of a person to satisfy his needs through his actions.

It is quite difficult to imagine today's world without motivation. Every day people try to make their life better, and every day these tasks become more and more difficult, but what controls them in these aspirations? Each person has their own motivation for a particular business. So what should happen in a person's life in order to receive a push in the form of motivation?

As the leading Soviet psychologist A. Leontiev wrote: “Motive is an objectified need”, that is, a person relies on motivation to satisfy his needs, for example, a person is very thirsty (need), he has a desire to satisfy this thirst (goal), and he reaches for a water bottle (motive). With the help of motive and motivation, a person develops, in addition to everyday things (eating, drinking, going to the toilet, personal hygiene), people are still keen on deeper things (work, art, science), and all this is the merit of motivation - the thing without which there would be no world in its manifestation today.

Vanity is an integral part of student life. Studying, part-time, personal affairs, all this consumes a significant amount of time from the life of the student. It is very difficult to find at least an hour in your free time in order to devote time to sports, and then physical education classes come to the rescue. Time allocated for self-development in the field of sports, which is mandatory included in the curriculum. But because of great worries, students do not pay due attention to their own health, what about sports. Every day, students suffer from overwork due to study or personal matters, and fatigue does not allow them to think about training.

So how do you show students the importance of physical activity? To answer this question you need to delve into the problem itself. Many scientists have identified 3 groups of causes of these problems: reasons of an organizational nature, methodological nature and personality. Basically, the methodological nature is the problem of the mismatch of physical capabilities with the proposed workloads, the personal nature makes it possible to see that the level of one's physical fitness is quite low, and on the organizational side, this is a lack of interest groups. There are also many factors that play an active part in physical culture and sports in everyday life: the orientation of the educational process, the content of classes, the availability of material sports facilities, the level of requirements for physical condition, the teacher, the frequency of classes, their duration and atmosphere. You can also note the students' desires: just pass the session or increase the level of health and physical development.

It is not for nothing that it is believed that the attitude of young people to physical education is one of the pressing socio-pedagogical problems. A lot of scientific articles have already been written, and no less research has been conducted that shows that physical culture and sports activities did not take root among students as an urgent need and did not turn into personal interest.

In order to direct young people to sports, a careful approach is needed. At the very least, good pedagogical conditions are needed that contribute to the transfer of the value potential of consciousness of students to a higher, civilized level, as well as the formation of positive motivation among young people, which will affect the physical culture of consciousness.

It is difficult for students to motivate themselves to sport under the enormous burden of their responsibilities. To do this, they need a high-quality teacher, a modern education system, made certain requirements for the selection of staff for the position of teacher: he must form subjective-personal, as well as value-based attitudes to the subject being taught. The teacher needs to have a sufficiently large set of personal qualities that complement the ability to teach physical exercises through the formation of an internal position of confidence in the need for a healthy lifestyle. In this regard, the problem of physical education goes into the plane of scientific substantiation, formation and development of qualitatively new, more subtle and flexible relations of communication between student and teacher.

Quite cruel requirements, but under the guidance of such a mentor, it will be easier for students to understand for themselves the importance of this discipline. It is necessary to use a differentiated and individual approach to the physical abilities and preparedness of students based on the following types of motives:

Wellness motives - the strongest motivation of students to exercise is to improve their health. In the end, everyone gets a little happier when they feel good.

Motive and activity motives - the implementation of mental activity leads to a decrease in the percentage of perception of information. Performing special physical exercises for the muscles of the whole body and visual apparatus significantly increases the effectiveness of recovery than passive rest and the pleasure of the process of physical exercises.

Competitively competitive motives - This type of motivation is based on a person's desire to be the best among friends, and because of this, the desire to beat himself in sports will increase.

Aesthetic motives - the motivation of students is to improve the appearance and impression made on others.

Psychologically significant motives - sport significantly affects the mental state of young people. Certain types of exercise are a means of neutralizing negative emotions in a person.

Educational motives - physical education classes develop in the person the skills of self-control and self-training.

Communicative motives - it is easier for people who are in the same community and are engaged in the same business to find a common language.

Cognitively developing motives are a motivation that is closely related to a person's desire to know his body, his abilities, and then improve them with the help of physical culture and sports.

Creative motives - physical culture and sports provide great opportunities for the development and maturation of students' creative personality.

Professionally-oriented motives - a group of this motivation is associated with professionally-oriented students, in order to increase their level of preparation for future work.

Administrative motives - physical education classes are mandatory in educational institutions. To obtain control results, a system of credits was introduced, one of which was on the subject of "Physical Culture".

Cultural motives - this motivation is acquired from the younger generation under the influence of the media, society, social institutions, in the process of forming the individual's need for physical exercises.

## CONCLUSION

Nowadays, the physical well-being of mankind is at a rather low level, every year our life is simplified, manual labor is replaced by robotization. Man gets less and less physical exertion, but at the same time the amount of mental effort is growing. For all the time of its existence, mankind has become accustomed to the struggle for life; nowadays, it has more and more begun to be "lazy", relying on the brainchild of the industrial revolution. Although recently people nevertheless came to understand that physical culture is necessary in our life. But in any case,

you need to educate all age categories in the field of physical education and sports, because many have an inferior knowledge base in this area, and not a full awareness of the need for exercise for their health.

We need to seriously pay attention to the problem of physical education of children and youth, because these are 2 age categories that will represent the entire human race, which will transmit the knowledge gained over their entire lives to future generations. And knowledge of a healthy lifestyle is one of the most important for all of us.

Department "Theory of Primary Education",  
Bukhara State University Bukhara City,  
The Republic Of UZBEKISTAN

### ABSTRACT

*The article is devoted to the current problem of the use of digital educational resources in elementary school. The work touches on the conditions for the effective use of digital educational resources in the educational process of primary school. The author studies the opinion of primary school teachers on the appropriateness of using digital educational resources in teaching younger students and the difficulties that arise. The article presents possible measures to create favorable conditions for the fruitful use of digital educational resources in educational institutions. The article may be of interest to future primary school teachers, teachers of pedagogical universities.*

**KEYWORDS:** *Digital Educational Resources, The Use Of Digital Educational Resources By Primary School Teachers, Elementary School Students, A Survey Of Primary School Teachers.*

### INTRODUCTION

The development, improvement and dissemination of information and communication technologies cause a significant impact on all components of the educational process - its goals, content, tasks, forms, methods, training tools. The most obvious changes regarding educational tools: the use of digital educational resources forms the face of modern education.

Informatization processes permeate all levels of education, but their intensity decreases from higher to primary school. A certain slowdown in the use of pedagogical software at the first stage of school education was caused by numerous warnings of psychologists, teachers, doctors, physiologists, hygienists who drew attention to the negative aspects of attracting younger students to work with a computer, the presence of risks to the health of the child, the possibility

of undesirable consequences of immersion into the virtual world. Today, a significant expansion of the use of digital educational resources in primary school is stimulated by a number of factors: the transition to continuous school education in the field of information technology, the availability of affordable high-quality pedagogical software for teaching subjects in the natural mathematical and humanitarian cycles; the saturation of everyday life of a modern person with digital devices, as a result of which children with well-established user skills come to school, the level of which goes beyond the elementary; evidence of the positive impact of working with a computer on the intellectual development of a student, his motivation for learning; the interest of parents in the modernization of school, and in particular, primary education.

It follows from the foregoing that the use of electronic teaching aids in elementary school is distinguished by certain specifics: it requires pedagogical justification, well-planned, balanced and careful, accurate selection of funds both from the point of view of contributing to the achievement of the didactic goal, and from the point of view of taking into account individual educational opportunities and student needs. The indicated specificity actualizes research aimed at developing the scientific foundations for the effective use of digital educational resources in elementary school.

Problems of choosing digital resources for teaching primary school students.

The problems of using digital educational resources in the education of primary schoolchildren are widely discussed in the psychological and pedagogical literature. The issues of teaching certain disciplines in elementary school using a computer are devoted to the works of M.S. Tsvetkova, D.V. Zaretsky, Z.A. Zaretskoy, Yu.A. Pervina, N.V. Fedyaninova, V.V. Shakotko and others. In studies P.M. Bisirkina, Yu.A. Beetle, N.I. Tolyarenko examines the impact of computer-based learning tools on the individual characteristics of elementary students. The problems of creating didactic situations using a computer in teaching younger students are highlighted in the works of V.M. Andrievskaya.

The issues of developing a set of requirements for digital educational resources are in the field of view of many psychologists and teachers, scientists and practitioners, in particular I.A. Ankudimova, M.I. Belyaeva S.G. Grigoriev, V.V. Grinshkuna, G.A. Krasnova, G.P. Lavrentieva A.V. Molokov

N.V. Molotkova, A.V. Aspen, M.O. Sviryayeva, I.A. Smolnikova, M.P. Shishkina and others. The problems of preparing a teacher for the use of information technology in the educational process are highlighted in the fundamental research of G.V. Lomakovskoy, V.V. Kotkova, L.E. Petukhov, A.V. Spivakovsky, O.V. Sukhovirsky, A.I. Shiman and others.

At the same time, the pedagogical literature did not find sufficient attention to the issues of introducing productive approaches to the implementation of the didactic potential of digital resources in the educational process of elementary school, which primarily involves conducting theoretical studies aimed at clarifying and revealing the essence of the functions of such resources in teaching younger students.

The aim of the article is to reveal the didactic potential of digital educational resources for elementary schools.

The powerful didactic potential of digital educational resources is undeniable, however, the decisive factor for its effective implementation in teaching practice is the conscious support of

certain didactic functions that are essential in terms of solving a particular pedagogical task. This is what constitutes the basis for the design of didactic situations, in which the use of digital resources is the central point.

Revealing the spectrum of didactic functions of digital educational resources in teaching younger students is of interest from another point of view. The existing restrictions of a medical, sanitary and hygienic nature have led to rather stringent standards for the use of such resources in elementary school, including those relating to the allowable time for a student to work at a computer. These restrictions, combined with didactic requirements, such as accuracy of the lesson's purpose, accessibility for students, the presence of the necessary balance between academic and game goals, make it difficult for the teacher to choose the right resource. In such cases, the most acceptable way out is the creation of an author's educational resource by the teacher, which requires the teacher to become familiar not only with practice-oriented technologies and tools for designing such resources, but also with its theoretical basis - the didactic functions of electronic resources.

The analysis of psychological and pedagogical research devoted to the problems of the development and use of digital educational resources in the education of primary schoolchildren has revealed the totality of the basic didactic functions of these resources. Despite the diversity and variety of the allocated functions, they are interrelated and mutually agreed: the quality of the implementation of some determines and affects the quality of the implementation of others.

The disclosure of the essence of the studied functions requires their preliminary systematization. We have proposed systematization, the basis of which is the allocation of the leading pedagogical goal of using the resource in the learning process. This approach makes it possible to distinguish four groups of functions of digital educational resources in the education of primary schoolchildren. The first group contains functions focused on the formation of a positive attitude of the child to the process and learning outcomes; This group includes functions:

- Development of the student's own motives for the implementation of educational activities,
- Tracking and approval of the student's successful actions,
- creating a favorable emotional background for educational activities,
- realizing the connection between the content of instruction and life.

The second group contains functions that contribute to the assimilation of the content of training; This group combines functions:

- Visualization,
- Training,
- Correctional,
- Integration,
- Adaptive,
- providing timely assistance in mastering the content of training,
- Compensatory.

The third group consists of functions aimed at optimizing the educational process, namely functions:

- Control
- Diagnostic;
- monitoring,
- Intensification of the educational process.

The fourth group combines functions that contribute to the success of further education of the student. This group includes the functions of meta-subject and personal value, the significance of which goes beyond the effectiveness of the current educational process and is promising in nature, contributing to the formation of general educational skills and the formation of cognitive activity of a school student. This group includes functions:

- Instrumental,
- Research,
- Mobilization,
- development of the student's intellectual skills,
- The formation of his holistic worldview.

We give a brief description of these functions, considering them in accordance with the selected groups.

1. The functions of forming a positive attitude of the child to the process and learning outcomes.

The formation of the needs and motives of the student's activity occurs in the process of the activity itself, therefore, for the emergence, strengthening and development of the student's cognitive motives, he should be involved in learning activities and conditions under which such activity will arouse his interest and bright positive emotions. This is what makes it possible to make electronic didactic resources.

In digital educational resources, the function of developing a student's motives for performing educational activities is realized through: unobtrusive involvement of the student in educational and cognitive activity, which takes place not at the direct instruction of the teacher, but at the student's own will to resolve the situation that appears on the computer screen; the variability of educational tasks, the variety of methods for their presentation and design, which makes the usual process of developing skills attractive; the possibility of "authorization" of the resource by the student. This opportunity is embedded in resources open for modification, which allows the student to supplement them with materials reflecting his personal experience.

A child of primary school age requires constant attention to the results of his activities, he needs praise for successful actions and in encouragement in case of failure. The function of tracking and approving the student's successful actions is implemented in digital educational resources due to the ability to accumulate and analyze statistical data on the student's achievements, developing a programmed reaction to positive changes. At the same time, not only the improvement of the result as a whole can be noted, but also small achievements in individual indicators, for example, an increase in the number of correctly solved problems per unit of time,

correct answers to control questions, a decrease in the number of unsuccessful attempts to complete a task, mistakes made, and requests for help etc.

No less important for the formation of a positive attitude of the child to learning is the creation of a favorable emotional background for learning activities. The use of educational resources in the lesson, as a rule, does not leave a single student indifferent. The formation of positive emotions and aesthetic feelings is facilitated by the pleasant resource interface, harmoniously selected color scheme, the use of special techniques to attract and focus the student's attention, the development of his imagination, thinking, memory. The creation of a positive emotional background is also facilitated by the opportunity at any time to cancel the performed actions and return to the previous step. To find the right or effective way to solve the learning problem, the student can make several attempts without fear of any negative consequences.

The use of educational resources expands the possibilities for realizing the links between the content of instruction and life realities. A training task on a computer screen can be presented with all the attributes it needs: for example, objects that need to be counted, the basket in which they are contained, weights and weights for weighing. The situations simulated in the tasks can be quite real - the purchase of goods in a store, travel in public transport, sending SMS messages that use the genuine prices of goods, the cost of travel, the price of mobile communications are the ones that a child encounters in everyday life. The statement of the problem itself may be close to reality not only in terms of wording, but also in the variability of possible solutions. Electronic resources allow us to propose a problem related to the need to choose a rational way to solve it.

In many psychological and pedagogical studies, the visualization function is defined as the leading function of didactic tools. The importance of this function is due to such factors as the capacity of the visual way of presenting information, increasing the availability of educational material for students, and increasing the volume of educational material that must be learned as part of a separate lesson. In modern conditions, the importance of the considered function is enhanced by the emergence of new powerful technologies for visualizing objects of various nature, improving the quality of expressive means of computer graphics, as well as the visual form being the preferred form of presenting information to the younger generation.

The use of digital resources significantly expands the range and quality of illustrative materials available for use in training: traditionally used drawings, photographs, reproductions are supplemented by animated images, flash illustrations, videos of real events, digitized rare materials - historical archival documents, unique book editions, photographs of a past era etc. Among visual aids, schemes and tables deserve special attention, which are widely used in teaching practice and can be quite capacious, including both a compact representation of the current educational material and a demonstration of its logical connections with concepts previously studied in the framework of this or another discipline.

In digital educational resources, the visualization of the learning object is controllable: the scale of the object on the screen is adjustable, any fragment of it can be reviewed repeatedly as many times as necessary. Visualization allows students to demonstrate processes that occur in real conditions too quickly or too slowly, visualize macro and microworld objects, reproduce events from the distant past, introduce them to phenomena that are difficult, impossible or unsafe to reproduce in real conditions.

The value of implementing the visualization function in educational resources lies in the fact that it contributes to the formation of correct ideas about new objects for the student, and during further education, these ideas can be deepened, clarified, avoiding the need for their correction.

Timely assistance is an indispensable condition for the success of a younger student in school. In digital educational tools, the function of providing timely assistance in mastering the learning content is realized by accompanying the student's activities with individualized tips, directions, explanations, etc. Such assistance to the student can be provided both at his request and automatically. A signal about the need for help can be a long delay of the student with the start of work or with the execution of the expected actions, a significant number of unsuccessful attempts to solve simple problems. The level of help can range from concise directions to demonstrating a detailed solution to the problem with explanations. At the same time, ensuring the success of the educational activities of each student should not relieve him of certain efforts in completing tasks that, although they go beyond his current capabilities, but not so much as to exceed the level of difficulty that is extremely accessible to him.

The mismatch between the conditions of schooling and the individual needs of the student often inhibits his development. The compensatory function of electronic didactic resources is aimed at creating optimal conditions for realizing the potential capabilities of each student, ensuring his both educational and personal progress; to reveal the gifts inherent in every child, and to promote their development. The implementation of this function is based on the properties of electronic resources described above during the consideration of the training, adaptation, integration, correctional functions, and timely assistance functions. At the same time, we consider it necessary to single out the compensatory function, taking into account its significance from the point of view of arranging the correct emphasis in training, the effectiveness of which should not be measured in estimated indicators, but in terms of the so-called "surplus value" that characterizes the progress of each individual student.

### ABSTRACT

*In this Hadith, the idea stands out that God gives wealth to a person, first of all, not to satisfy personal needs, but to perform good deeds for other people. The Sufi must strictly follow the sunnah of the Prophet, his companions and comply with all the instructions of the Sharia. The basis of the Naqshbandi path is a passionate attraction to Truth and a quiet dhikr ("Knock out, cut out in your heart the remembrance of the name of God." The crown of his work is the book "Al-Kashshofan hakoik it-tanziyl wa yunilakoviyl fi vuzhuh it taviyl" ("Revealing the truths of revelation"). His commentary on the Qur'an al-Kashshof, completed on February 20, 1134 in Mecca, to this day, is a canonical work in this area. The author paid much attention to the lexicological part of this book and examines in detail the discrepancies. Today, caring for the priceless manuscripts created by the great scientists, thinkers, poets, historians in the Middle Ages is a tribute to their contribution to the development of world civilization, reflects the eternal desire for the accumulation of spiritual wealth. The life of our great scientists and enlighteners is an instructive example for young people, an expression of fidelity and devotion to the Motherland.*

**KEYWORDS:** *Thinkers, Historians, Accumulation, Enlighteners*

### INTRODUCTION

Scientists such as Imam Al-Bukhari, Imam At-Termezi, Bahouddin Naqshband, Khoja Ahmad Yassawi, Mahmoud al-Zamakhshari and others made a great contribution to the development of Islamic theology. At the opening ceremony of the Tashkent Islamic University, President of Uzbekistan I. Karimov noted that Studying the heritage of great thinkers and saints - Imam Al-Bukhari, Imam At-Termezi, Bahouddin Naqshbandi, Khozh Ahmad Yassawi, Mahmoud az-

Zamahshari and thousands of our other ancestors, generalizing and passing them on to our people, especially the younger generation, is our holy duty<sup>1</sup>. The most significant contribution to the development of Islamic theology was made by Imam Al-Bukhari. He was born in 810 in a family of Iranian descent in Bukhara, and died in 870 in the village of Hartang, Chelek district, Samarkand region. From childhood, he showed great interest in the humanities. Starting to study hadith from the age of 10, Al-Bukhari showed extraordinary abilities and extraordinary memory. For many years he traveled, comprehending the science of hadith in various provinces of the Caliphate (Hijaz, Egypt, Iraq, Khorasan). Al-Bukhari listened to the hadiths of more than a thousand Shaykhs. He set out to collect all the "reliable" (sahih) legends about the statements and actions of Muhammad. Al-Bukhari checked, as they say, 600 thousand hadiths, which were then in use, and, in addition, another 200 thousand, which he himself recorded with his teachers and informants. Of this enormous number of traditions, Al-Bukhari selected only about 7,400 hadiths as "impeccable". Of these, he composed the Al-Jomi as-Sahih code. This is the first collection of hadiths compiled according to the principle of musannaf, i.e. with the classification of hadith according to the plot. This construction principle allowed us to significantly expand the circle of legends, to include hadiths of the most diverse content - legal, historical, biographical, ethical, medical. He divided his collection of hadiths into 97 books with 3450 chapters (the title of each chapter indicates the theme of the hadith contained in it), which conclude 7397 hadiths with complete isnad. Studying the works of Muslim scholars, he traveled to India, Iran and other countries. So, the main achievement of Al-Bukhari is the creation of a collection of the most reliable hadiths "Al-Jomi al-Sahih." This collection occupies the second place in the Islamic world after the Koran. In all Islamic religious educational institutions, the collection of Al-Bukhari is studied along with the Qur'an. According to the Muslims of the whole world, this is one of the greatest books created by mankind<sup>1</sup>. At the same time, the great merit of Al-Bukhari is the development of a methodology for selecting hadiths for collections. This technique contains the following principles - taking into account the views of the most respected theologian; taking into account the opinion of most theologians; by analogy (by similarity); conformity of the hadith to the Islamic good (given the degree of conformity of the hadith to the interests of the Islamic religion, the Islamic world). The collection of Al-Bukhari hadiths contains eternal spiritual values that do not lose their relevance for the social life of modern Uzbekistan. In the Sunnah of al-Bukhari, the following hadeeth is given: "One person asked the prophet: "What is the best about Islam?" "The nurse and the greeting," "Peace be to you all," he replied. This Hadith determines that the main value for Muslims should be peace and tranquility for all people, acquaintances and strangers, Muslims or non-Muslims.

Another hadith says: "It is permitted to envy a person with white envy in two cases: Allah gave wealth to a man, and he spends it on good deeds. Allah gave knowledge to man, and he acts accordingly and teaches others. " In this Hadith, the idea stands out that God gives wealth to a person, first of all, not to satisfy personal needs, but to perform good deeds for other people. This idea is especially relevant in modern conditions, when the development of market relations leads to social stratification of the population, to an increase in the number of rich people.

The next thinker who made a significant contribution to the development of Islamic theology was At-Termezi. Born in the city of Termez. From the age of eight he worked diligently in the religious sciences. At twenty-eight years old, At-Termezi went to Mecca. Having returned from pilgrimage, he embarked on the Sufi path: secluded himself from people, studied mystical

treatises. Among his teachers are the famous Khorasan shahs - Abu Turaban Nahshabi, Yahyu al-Jalla, Ahmad Khadravaikhi, etc. His wife, who fully shared his views, played a large role in the fate of At-Termezi. Among the sermons and writings include "Ilal al-Shariah" and "Khatm al-auliya," in which he talked about the meaning of Muslim rites, about "love of God", about various categories of mystics, etc. This caused dissatisfaction of the Fakihis and those in power.

Fleeing persecution, At-Termezi was forced to move to Balkh, then to Nishapur, where he gained numerous supporters. When opponents of At-Termezi were forced to emigrate as a result of a change in the political situation, he was able to return to his hometown. There he died, surrounded by disciples and followers. The significance of At-Termezi's activity is determined by his writings, of which he has about eighty. The teachings in them about the "soul", its "states" and "movements", about the ways of self-improvement and curbing the base instincts, about suffering as purification, had a huge impact on subsequent Sufi psychology. The highest knowledge available to man, At-Termezi considered mystical "gnosis" (marifa or hikma), which he identified with the "divine light" contained in the hearts of people. Unlike ordinary knowledge, which comes down to the interpretation and application of the provisions of Sharia, "gnosis" comprehends the secret meaning of things and, in the end, "divine essence."

Probably At-Termezi was the first to theoretically substantiate Sufi ideas about Auliya, effectively equating them "in rights" with "messengers" and "prophets". His ideas about the correlation of "prophecy" and "holiness" about the hierarchy of "saints" in Sufism were developed by Ibn Arabi, who often included large fragments from At-Termezi's treatises in his writings. According to researchers, At-Termezi was familiar with Buddhist, Christian and Manichaean teachings, the influence of which can be found in his writings. Paying tribute to the depth of his knowledge and breadth of horizons, contemporaries gave him the honorary nickname al-Hakim (Sage).

Bahouddin Naqshband is the largest representative of Central Asian Sufism of the 14th century. The name of the Sufi brotherhood of Naqshbandiyya comes from his craft (nakshband - chaser), however, the tradition of the brotherhood does not consider him to be the founder: he is the fifth in the chain of leaders of nakshbandiyya. Bakhouddin Naqshband was born in the family of a craftsman in the village of Kasr-i Hinduvan, later renamed in his honor Kasr-i Arifan, and died in his native village. His father was a weaver and chaser (nakshband). The grandfather, who had strong ties with the Sufis, played the main role in the fate of Naqshbandi, and he aroused his grandson's interest in mysticism. Almost all his life Nakshbandi lived in Bukhara and the surrounding villages. Hadjtwice.

It is presented in the sources as a preacher of contentment with small and voluntary poverty (he earned his bread by his labor, was content with the old mat and a broken jug, and considered it a sin for the Sufi to have servants or slaves). After the death of Naqshbandi, he was gradually recognized as a saint and intercessor before God, the wizard and patron of Bukhara. Naqshbandi was canonized, and his cult was widespread, both in Central Asia and in neighboring countries, and the mausoleum above his grave, erected back in 1544 by Shibanid Abd al-Aziz Khan, became an exceptionally popular pilgrimage site: it was believed that a triple visit to his grave replaces the hajj to Mecca and Medina. Naqshbandi rejected the ostentatious piety and ritualism leading to the side of a true mystic: forty-day fasts, vagrancy, begging, public delights with music, singing and dancing, a loud dhikr. Spiritual purity, refusal of money-grubbing, voluntary

poverty, no contacts with the authorities are his basic requirements. The Sufi must strictly follow the sunnah of the Prophet, his companions and comply with all the instructions of the Sharia. The basis of the Naqshbandi path is a passionate attraction to Truth and a quiet dhikr ("Knock out, cut out in your heart the remembrance of the name of God.")

Naqshbandi did not leave written works. An important contribution to the development of Islamic dogma and theology was made by Hajj Ahmad Yassawi. He was born in 1103 in the city of Sairam in the Chimkent region of Kazakhstan into a very reputable religious family. His family came from Fatima, the daughter of the prophet Muhammad. The graves of his father and mother are places of religious worship. The first teacher of Ahmad Yassawi was the Turkish sheikh Bab-Arslan, who was considered the heir to the symbol of the Islamic idea (the spirit of Islam) from the prophet Muhammad himself. After the death of Bab-Arslan, Yassawi moves to study in Bukhara, the most important center of Islam or, as he was called, the "Dome of Islam". His teacher becomes the Sufi sheikh Yusuf Hammadi, who had great authority among the followers of Islam, since he personally performed 38 hajjs to Mecca and prepared 213 sheikhs. Relying only on his own strength, Ahmad Yassawi went from an ordinary murid to a sheikh of all Sufis in Bukhara. He became famous for his asceticism not only in Central Asia, but throughout the Muslim world. Possessing great influence among hundreds of thousands of believers, by his old age he did not even have the means for his own funeral. His favorite phrase - the life principle - was the statement of the Prophet Muhammad "My poverty is my pride."

Ahmad Yassawi condemned the desire for wealth and luxury, and was not afraid to condemn the shahs, viziers, as well as sheikhs and imams for this sin. Some Sufi sheikhs in northern Africa seized power in a number of countries and lived in great luxury. The main creation of A. Yassawi is a collection of his religious poems "DivaniHikmat" ("Book of Wisdom"). According to some historical sources, Yassawi wrote a total of 4400 hikmats. In addition, he created the theological treatise "Risolai." Poems of Ahmad Yassawi were popularly called "divine hikmats." Most of the verses are set to music and are performed on different occasions - both in grief and in joy. Yassawi has developed a system of communication with a higher spirit. This connection was carried out through the five parts of the soul that were in the human chest. The human soul consists of two parts: soul, spirit, mystery, hidden, secret. He spent the rest of his life a hermit in an underground cell. At the age of 56, he moved to the city of Iasi, where he dies. At the place of his burial, Amir Temur built a mausoleum, which is one of the shrines of Islam and an outstanding monument of Islamic architecture. The dome of this mausoleum has a height of 41 meters, comparable to a modern 13-story building. This mausoleum is annually visited by tens of thousands of pilgrims from all over the world.

Mahmoud al-Zamahshari is one of the great thinkers of the Muslim Renaissance. The traditions of Khorezmian science, which survived even after the Arab conquest, had a strong influence on the formation of him as a scientist. Mahmoud al-Zamahshari, using his pseudonym in his own name, chose the place where he was born, and thereby his small homeland became known throughout the East. Regardless of the country in which he lived and worked, Mahmoud al-Zamahshari retained a sense of love for the Motherland, considered it a matter of honor and a sacred duty to faithfully serve its prosperity. Mahmoud al-Zamahshari was born on March 19, 1075 in the town of Zamakhshar (Izmikhshir, now in Turkmenistan) into a poor family.

In the XI – XII centuries. in Central Asia, the literacy of the population in the Muslim world was one of the highest and the value of education grew. It was comparable to the literacy of the population of ancient Athens. The emergence of maktab and madrassas played a huge role in this. As a child, he attended elementary school - maktab, and also studied under the guidance of his father. Here, children were mainly taught reading, writing, grammar and Islam. In childhood, one leg was amputated due to illness and he moved on the prosthesis. The father decided that his son should learn tailoring, but Mahmud asked to go to the capital of Khorezm - the ancient Urgench (Gurganj), where he finds a job due to his good handwriting. In his youth he makes many educational trips, as a result he perfectly masters the Arabic and Persian languages. Mahmud Az-Zamahshari died in 1144 in his native Khorezm and was buried in ancient Urgench (now KunyaUrgench, modern Turkmenistan). After completing his studies in Bukhara, Mahmud al-Zamakhshari served as a scribe at the court of Khorezmshahs. Already in his young years, Mahmud al-Zamakhshari wrote several philological works. He offers his services to prominent dignitaries at the court of the Seljuk Sultans and sends them his Qassids.

In 1118, after suffering a dangerous illness, Mahmud azzamakhshari, changing his lifestyle, switched to solitude and teaching. Twice makes a pilgrimage to Mecca. In Mecca, he continues his scientific work, deeply studies the grammar and dictionaries of local Arab tribes, their customs and proverbs, collects information about the geography of the region. He writes many of his works in Mecca. Therefore, the word "Jarullah", that is, "protected by Allah" was added to his name.

Returning from Mecca, he visits Baghdad, Damascus, Isfahan, Nishapur and other cities. Then he meets with such prominent scholars as ad-Damgani, Ibn al-Shajari, al-Javaliqi and others. Mahmud al-Zamakhshari is a major historian, philosopher, geographer, literary critic, linguist and connoisseur of grammar and literature of the Arabic language, teacher, a poet of his time, became famous in such sciences as tafsir, hadith, fiqh. The great scientist has written over 50 works. According to their content, they can be classified into the following groups: religious sciences, lexicology, grammar, aruz (the science of rhythm), literature and literary criticism, pedagogy, history, geography, logic. Hespreadknowledgethroughhisbooksandstudents.

In his works, Mahmud al-Zamakhshari expresses interesting thoughts about the high spirituality and spiritual culture of the peoples of Central Asia. For example, he writes that one should not indulge in praise, false pride, verbosity and verbiage: "The path with truth and honor is comparable to the gait of a lion in the forest," "The merchant's honor and authority is in his pocket, and the scientist's in his books," "A person who always denigrates someone will not achieve much success, as there is nothing to whiten in resin", "An honest person is always at peace and calm, a traitor and thinking about evil, is always doomed to failure"1. In general, Mahmud al-Zamakhshari writes about the will, the human desire for prosperity and prosperity, which can be achieved through knowledge and universal human qualities. Humanity and honesty, mercy and courage - these are the main qualities of man. The main works of al-Zamakhshari are devoted to theology. The crown of his work is the book "Al-Kashshofanakoik it-tanziyilwaunyunikoviyl fi vuzhuh it taviyl" ("Revealing the truths of revelation"). His commentary on the Qur'an al-Kashshof, completed on February 20, 1134 in Mecca, to this day, is a canonical work in this area. The author paid much attention to the lexicological part of this book and examines in detail the discrepancies. In fact, this interpretation is the first example of scientific criticism of the text of the Koran. This work was widely known under the name Al-

Kashshof. When writing his book, Az-Zamahshari used many sources, such as tafsir, hadith, fiqh and other knowledge related to Sharia. The work of Mahmoud al-Zamahshari "AlKashshof" at one time was described by scientists as follows: "If there hadn't been Al-Kashshof, then the interpretation of the Koran would not have been open." Therefore, in the East, his work "Al-Kashshof" is very popular - the interpretation of individual verses of the Koran.

In Egypt, students at Al-Azhar University are still studying the Qur'an based on the work Al-Kashshof. According to the information of the German orientalist Karl Brockelman, about 100 manuscripts of Al-Kashshof and more than 20 comments on this book are stored in various manuscript collections of the world. Arab grammar experts unanimously confirm that Al-Kashshof is one of the first places among the commentaries on the Qur'an that were written at different times. Unlike other Qur'anic comments, AlKashshof in Mahmud azZamahshari paid much attention to the philological analysis of this holy book. The rich scientific and literary heritage of Mahmoud al-Zamahshari has long been revered as an authority in the East and West. During his lifetime he was awarded such high titles as "Ustaz-ul-duniya" (a teacher of the whole world), "Ustaz-ul-arabwa-l-ajam" ("a teacher of Arabs and non-Arabs"), "FakhruHvarazm" ("Pride of Khorezm"). Over the years of independence in Uzbekistan, the study of the heritage of Imam Al-Bukhari, Imam At-Termezi, BahouddinNaqshbandi, Khoj Ahmad Yassawi, Mahmoud al-Zamahshari and thousands of our other ancestors has reached a new qualitative level. Today, caring for the priceless manuscripts created by the great scientists, thinkers, poets, historians in the Middle Ages is a tribute to their contribution to the development of world civilization, reflects the eternal desire for the accumulation of spiritual wealth. The life of our great scientists and enlighteners is an instructive example for young people, an expression of fidelity and devotion to the Motherland.

## **A RESEARCH ON INTERACTION OF IDENTIFIED, INTEGRATED, INTERJECTED REGULATION WITH MOTIVATION**

**Dr. Avelina M. Aquino\***

\* Bulacan State University,  
City of Malolos, Bulacan, PHILIPPINES

### **ABSTRACT**

*For several years now, intense studies have been made about self-regulation as well as intrinsic and extrinsic types of motivation; the distinction between them has shed important light on both developmental and educational practices. Interaction is a process through which extrinsically motivated behaviors become more self-regulated. In the same way, interaction specifies the social contextual conditions that support intrinsic motivation and facilitate extrinsically motivated tasks. Learning is the acquisition of some symbolic representation that serves as guide for future behavior. Self-regulated behavior is triggered by motivation in the natural human propensity to learn and assimilate information. In this paper, the researcher attempted to explore how identified, integrated, and introjected regulation remains important constructs that relate itself to motivation. The researcher used the descriptive method of research with questionnaire as the main instrument for gathering data. To explore the crucial interaction between self-regulation on student learning and motivation, the researcher used the Pearson  $r$ ; data were treated using the SPSS version 19. Findings of this study were summarized that there is a significant relationship between participants' regulation to their academic performance in Principles of Teaching 2, thus the null hypothesis is rejected.*

**KEYWORDS:** *Identified, Integrated, Interjected, Self-Regulation, Motivation*

### **INTRODUCTION**

The term **self-regulation** can be described as a process that guides learning. Students learn self-regulation through experience and self-reflection. Self-regulated learners are characterized by autonomy and control. That is, self-regulation is a process of bringing one's emotions, thoughts, and behavior under control. It is construed that students can control their behaviors in order to improve their academic learning and performance. In the same way, self-regulation is an

integrated learning process, consisting of the development of a set of constructive behaviors that affect one's learning. Likewise, self-regulation involves the ability to control one's impulses, behavior, and emotions until an appropriate time, place, or object is available for expression (Berns, 2007). Moreover, self-regulation is not a mental ability or an academic performance skill; rather it is the self-directive process by which learners transform their mental abilities into academic skills. When self-regulated learners find inadequate learning strategies, they regulate their learning activities. Regulating refers to "the fine-tuning and continuous adjustment of one's cognitive activities" (Chen, 2002 citing Pintrich et al.). As discussed in Chen's literature review, research found that both self-monitoring and effort regulation training resulted in achievement. Abundant research revealed that higher achievers use more self-regulatory strategies, control their physical environment to meet their needs, seek help when needed, and use time management skills. Regulated behavior often involves postponing or modifying immediate gratification for the sake of a future goal. It involves more than mere knowledge of a skill; it involves the self-awareness, self-motivation, and behavioral skill to implement that knowledge appropriately. Aptly put, self-regulation is not a trait that students possess. Rather, it involves the careful use of specific processes that must be personally adapted to succeed at a learning task. Therefore, self-regulated learning is volitional.

Self-regulation refers to several complicated processes that allow children to appropriately respond to their environment (Bronson 2000). Self-regulation in learning represents an internalization of the social connections and scaffolding that have helped students learn in the past. Self-regulation refers to alertness and selectivity in receiving information, being able to connect the information to one's own experiences and knowledge base to plan and initiate a question or learning strategy, and continuous monitoring (Cornelius-White & Harbaugh, 2010). Self-regulation involves different domains; regulation of one domain affects other areas of development. Emotional and cognitive self-regulation is not separate, distinct skills. Rather, thinking affects emotions and emotions affect cognitive development (Blair & Diamond 2008). When provided with appropriate opportunities, students can learn intentional self-regulation. Researchers Elena Bodrova and Deborah Leong, for instance, taught preschoolers to plan their play activities and found planning helped children develop stronger self-regulation skills (Bodrova & Leong 2007). Helping students develop their self-regulated learning is likened to helping them develop their motivation. In hindsight, self-regulation is what allows a person to control his or her response or behavior when confronted with externally imposed stimuli.

Motivation can be extrinsic or intrinsic. Extrinsic motivation is a factor outside the individuals which includes money, good grades, and other rewards. Motivation refers to the inducement of actions, feelings, and thoughts (Deckers, 2005). Intrinsic motivation refers to the internal desires that energize individuals to perform a particular task. Ryan and Deci (2002) termed extrinsic motivation a form of self-regulation. In short, intrinsic motivation directs people to do certain tasks because it gives them pleasure or it develops a particular skill. On the other hand, extrinsic motivation is a factor outside the individuals which includes money, good grades, and other rewards. In other words, motivation refers to the inducement of actions, feelings, and thoughts (Deckers, 2005). With this, it is construed that motivation can be regulated or controlled.

There are at least three types of self-regulation for extrinsic motivation: identified, integrated, and introjected regulation (Ryan & Deci, 2002). *Identified regulation* occurs when students participate in an activity because such is considered important and of high value, even if they do

not enjoy the activity itself. Behavior is internally regulated but in a self-determined way. An example would be students who choose to do extra work in Principles of Teaching 2 because they believe that this will eventually improve their ability in that subject. *Integrated regulation*, on the other hand, occurs when students perform activities to benefit different aspects of life, rather than for the pleasure of participating in the said activity. Integrated regulation is the most autonomous type of extrinsic motivation. It does not only involve identifying with the importance of the behavior, but the regulation is evaluated and brought into harmony with the individual's own personally values, goals, and needs that are already a part of the self (Ryan & Deci). The third type of self-regulation for extrinsic motivation is *Introjected regulation*. It occurs when students participate in an activity because of various pressures. For example, students would be forced to study well because of guilt.

One notable finding from research: the actual process of self-regulating can be a source of motivation, even for those tasks that may not be motivating themselves. Motivation is a critical component of learning. Motivation is important in getting students to engage in academic activities (<http://www.psychologycampus.com/educational-psychology/motivation.html> retrieved on March 3, 2012). It is also important in determining how much students will learn from the activities they perform or the information to which they will be exposed. Students who are motivated to learn something use higher cognitive processes in learning about it. Motivation to do something can come about in many ways. It can be a personality characteristic or a stable long-lasting interest in something. There are several existing theories for motivation. Some state that motivation is tied to the idea that behaviours that have been rewarded in the past will be more likely to be repeated in the future. Therefore past experiences will motivate a student to perform in future ones.

There are three types of intrinsic motivation: Knowledge, Accomplishment, and Stimulation (Weinberg & Gould, 2003). *Knowledge* occurs when students participate in activities because of the pleasure and satisfaction they get from learning, acquiring, and studying something new in their subject. This, for example, would include learning how to write lesson objectives or assessment strategies in Principles of Teaching 2. Being intrinsically motivated for *accomplishments* occurs when students participate in activities because of the pleasure and satisfaction they get from mastering various skills. For example, knowing how to formulate objectives would help them write lesson plans. Being intrinsically motivated for *stimulation* occurs when students participate in activities because of pleasant sensations such as excitement. For instance, the rush they have when they submit task analysis in lesson planning might give them a feeling of excitement.

Based on the personal observation of the researcher, many students are physically present in the classroom but largely mentally absent; they fail to invest themselves fully in the experience of learning. It is for this reason that learning often becomes associated with drudgery instead of delight. However, she believes that all students are motivated in one way or the other. One student may be interested in classroom subject matter and seek out challenging tasks, participate actively in class discussions, and earn additional points on assigned projects. Another student may be more concerned with the social aspect of school, interacting with the entire student body frequently, and attending extracurricular activities. Still another may be focused on athletics, excelling in sports, such as tennis, volleyball, football, basketball or dancesports. In any of these instances, one thing is certain—students are motivated in one way or the other.

The same thing happens in every subject. Some students are motivated; some are not. Since motivation, like culture, can never be superimposed on others, it is incumbent upon teachers to do something about their motivation. There is no such thing as unmotivated behavior (Bluestein, 2008). There has to be something for students to strive to perform certain tasks. That something may be for pleasure, avoidance of pain or punishment, satisfaction, commitment, or pursuit of a larger goal. It is believed that motivation is a critical component of learning. Motivation is important in getting students to engage in academic tasks. It is also important in determining how much students will learn from the tasks they perform or the information to which they will be exposed. However, students have the ability to regulate their motivation.

It is in this context that the researcher wanted to explore the interaction of self-regulation and intrinsic motivation with the participants' academic performance (final grades) in Principles of Teaching 2. The researcher handles professional education subjects in the College of Education. One of which is Principles of Teaching 2. She believes that in the teaching-learning process, there must be something that propels the students' mind or dangles in front to make them more active and vibrant. In classroom teaching and learning, self-regulation is present while the interaction of motivation comes into the picture.

In the given paradigm, it can be expected that an interaction between self-regulation and intrinsic motivation occurs among the participants particularly in their performance in Principles of Teaching 2 subject (See Conceptual Framework of the Study).

Ho = There is no significant relationship between participants' self-regulation to academic performance in Principles of Teaching 2.

### **Statement of the Problem**

The main purpose of the researcher was to explore the interaction between self-regulation and intrinsic motivation to the performance in Principles of Teaching 2 among the participants. Specifically, the following ancillary problems were posited:

1. How may the participants' self-regulation be described in terms of:
  - 1.1 identified;
  - 1.2 integrated; and
  - 1.3 introjected regulation?
2. How may the participants' intrinsic motivation be accounted as to:
  - 2.1 knowledge;
  - 2.2 accomplishment; and
  - 2.3 stimulation?
3. What is the academic performance of the participants in Principles of Teaching 2 with regard to their final grades?
4. Is there a significant relationship between the participants' self-regulation and intrinsic motivation and their grades in Principles of Teaching 2?

### **METHODS AND MATERIALS**

The researcher utilized the descriptive-survey method in gathering data using co relational design to explore the interaction of identified, integrated, and introjected regulation with motivation in the participants' performance in Principles of Teaching 2 subject.

### Participants

A total of 91 second year BSED English major students from 3 sections were used as participants in this study. They are currently enrolled in the College of Education, Bulacan State University, City of Malolos during the academic year 2012-2013.

### Instruments

The researcher used the questionnaire as the main instrument for gathering data. It was composed of two parts: the first part dealt with the self-regulation items. There were a total of 30 items; 10 items each were allotted for the identified, integrated, and interjected regulation. The second part of the questionnaire had also a total of 30 items; 10 items each were slated for knowledge, accomplishment, and stimulation. The researcher likewise obtained the participants' grades in Principles of Teaching 2. She also conducted cursory interviews with the participants.

### Data Collection and Analysis

Questionnaires were modified based on the suggestions of the experts after the dry-run had been conducted. Then, the final draft was reproduced for the actual conduct of the research. Questionnaires were distributed to the target respondents. The data were gathered, sorted, tallied, tabulated, and analyzed using frequency counts and means to describe the participants' self-regulation and intrinsic motivation. The researcher also used the SPSS version 19 to determine the relationship between the participants' self-regulation and intrinsic motivation.

A 5-point Likert scale was used to measure the significant interaction between self-regulation and intrinsic motivation, where:

Mean Numerical Rating	Verbal Interpretation	Descriptive Equivalent
4.50-5.0	Strongly Agree	High Regulation
3.50-4.49	Agree	Sufficient Regulation
2.50-3.49	Undecided	Fair Regulation
1.50-2.49	Disagree	Minimal Regulation
1.0-1.49	Strongly Disagree	Low Regulation

### Results

#### Participants' Self-Regulation

Of all the components of extrinsic motivation, Identified regulation received the highest mean score of 4.66 and was interpreted as "Strongly Agree" while Integrated regulation got a mean of 4.64 and was interpreted as "Strongly Agree;" Introjected regulation obtained a mean score of 4.47 and was interpreted as "Agree" (See Table 1).

For Identified Regulation, items 1 and 2 got the same highest mean of 4.84 and were interpreted as "Strongly Agree." Item number 8 "Learning is transfer of knowledge" got the lowest mean score of 4.37.

For Integrated Regulation, item number 19 “I want to be an agent of social transformation” got the lowest mean of 4.36 and was interpreted as “Agree.” On the other hand, item number 13 “Learning does not only happen within the four walls of the classroom” received the highest mean of 4.94 and was interpreted as “Strongly Agree.”

For Introjected Regulation, item number 22 “When I learn, I feel my ego is at the highest level” obtained the lowest mean of 4.00 and was interpreted as “Agree.” Item number 28 “When I learn, I feel that my parents’ sacrifices worth it” received the highest mean of 4.80 and was interpreted as “Strongly Agree.”

### **Participants’ Intrinsic Motivation**

Knowledge component obtained a mean score of 4.43 and was interpreted as “Agree;” Accomplishment component got a mean score of 4.52 which was interpreted as “Strongly Agree,” while the Stimulation component received a mean score of 4.54 and was interpreted as “Strongly Agree.” Seemingly, the stimulation component got the highest mean score (See Table 2). For knowledge component, both numbers 1 and 9 received the lowest mean of 4.21. “Learning refines my reasoning about concrete items versus abstract ideas” and “Learning develops my ability to arrange ideas in a chain-like progression that takes on meaning and on itself.” Item number 5 “Learning gives me the freedom to think out of the box” got the highest mean score of 4.71 and is interpreted as “Strongly Agree.”

For Accomplishment component, item number 13 “Learning enhances my computation skills using basic numerical concepts” got the lowest mean of 4.16 and was interpreted as “Agree.” On the other hand, item number 14 “Learning develops my conversation skills” had the highest mean score of 4.57 and was interpreted as “Strongly Agree.”

The third and last component, Stimulation component reveals that item number 23 “Learning stimulates me to recognize that a problem exists” got the lowest mean score of 4.44 and was interpreted as “Agree.” Item number 27 “Learning stimulates me to acquire, store and share the knowledge I gain so that others may also benefit from it” obtained the highest mean score of 4.64 and was interpreted as “Strongly Agree.”

With regard to the participants’ academic performance as to their final grades in Principles of Teaching 2, it could be said that out of 91 participants, only 3 or 3.30 percent got a grade of 1.75; 45 students or 49.45 percent obtained a grade from 2.25 to 2.0; 39 or 42.86 percent received a grade from 2.5 to 2.75; and 4 or 4.40 percent had a grade of 5.0 or a flunking mark.

### **Relationship between the Participants’ Self-regulation and Intrinsic Motivation to their Final Grades in Principles of Teaching 2**

All the components of self-regulation are significantly correlated to their final grades in Principles of Teaching 2. In the same way, all the components of intrinsic motivation are also correlated to their final grades in principles of Teaching 2. Therefore, the null hypothesis is rejected.

### **DISCUSSIONS AND CONCLUSIONS**

The participants believe that learning the lesson is important because without a deep understanding of the lesson, they will not have anything to share. A well-trained and certificated teacher must show evidence of mastery of subject matter. In fact, according to Dunhill (2000)

teachers' knowledge must be of two-fold nature. Good teachers must first possess a wide range of general knowledge and within the confines of this general knowledge, a sound understanding of the subject they are to teach in the classroom. In hindsight, teachers must be well-versed in their area of specialization; they must know which to teach, when to teach and how to teach. The quantity and quality of teachers' knowledge will give them enough material and confidence to teach effectively. Based on the result, the participants believe that learning is more than just transfer of knowledge. They know that learning goes beyond the ordinary way of transferring knowledge. This result was supported by Cornelius-White and Harbaugh (2010) when they say that learning is not only transmission of knowledge from the enlightened teacher to the naive students. For them, students inherently construct knowledge and develop according to self-organizing principles. In fact, learning undergoes several stages such as acquisition, fluency, maintenance, or generalization (Algozzine, Daunic, & Smith, 2010). Most psychologists agree that "learning is a relatively permanent change in one's behavior as a result of his interactions in the environment." With this definition, it can be said that learning is really more than mere transfer for it can be a change in behavior or a result of practice and experience. One thing obvious in this result is the idea that the participants have acquired a plethora of definitions of learning based on the different theoretical perspectives. This only shows that participants strongly agree that learning can take place everywhere. Learning can take place anytime, anywhere, with anyone (Coates, 2010). The participants know that learning is situated and context dependent. Since learning is a process that involves action and experience, the participants believe that learning requires interaction and collaboration. It means that learning, both outside and inside school, advances through collaborative social interaction and the social construction of knowledge. This result is supported by Jean Lave's theory of Situated Cognition. Central to the situative perspective is the belief that one should abandon the treatment of concepts as self-contained entities and instead conceive of them as tools that can be fully understood only through use. According to Oliver (2000), meaningful learning will only take place if it is embedded in the social and physical context within which it will be used. Results only show that the participants put so much emphasis on the hardships and sacrifices of their parents particularly in educating their children.

The participants do not yet realize the importance of concrete reasoning. Concrete reasoning is important because it is the basis of all knowledge. Students need a firm understanding of basic conceptual knowledge and problem solving. This enables them to learn new ideas. It helps with later learning because it gives students the ability to link new ideas to previously learned ones. In the same way, this promotes stronger long-term memory of concepts. The first kind of reasoning is sequential reasoning, where each assertion follows the next through a chain of implication. It means that students strongly agree that looking at a problem from different perspectives is important in finding new ways of learning.

During the cursory interview with the participants, they disclosed that they disliked Math, which is why they majored in English. It means that as English majors, they love to learn more of the language so that they can harness their conversation skills; they love to master their craft as effective conversationalist.

The participants are stimulated to learn based on their understanding that knowledge should be constructed, shared, and negotiated. According to the constructivist view, learners construct their own knowledge by looking for meaning and order; they interpret what they hear, read, and see

based on their previous learning and habits. Students who do not have appropriate backgrounds will be unable to accurately “hear” or “see” what is before them (<http://www3.telus.net/linguisticsissues/constructivist.html> Retrieved on April 21, 20112). In other words, knowledge has different meanings for different students; knowledge has personal meaning and it is created by individual students. As corollary, item number 28 “Learning stimulates me to assess my knowledge, skills, abilities, and potentials so that I can make effective matches between my abilities and the demands of the profession I have chosen” got a mean score of 4.63 and was interpreted as “Strongly Agree.” These results reveal that the accent is placed on learning. In hindsight, it is the learners who interact with their environment and thus gain an understanding of its features and characteristics. They are the ones who construct their own conceptualizations and find solutions to their own problems. Results indicate that majority of the participants are fairly regulated.

### CONCLUSIONS

In the light of the findings of this study, the following conclusions were drawn:

Self-regulation provides the foundation for students to perform. Extrinsic motivation which can be regulated may guide students to set goals for themselves. Since students have the ability to have dominion over their extrinsic motivation, their self-regulation can be identified, integrated, and introjected.

There is the inherent tendency for students to seek out to explore and learn for themselves. Maintenance and enhancement of this intrinsic motivation requires supportive conditions such as self-regulation. Intrinsically motivated students perform for stimulation, accomplishment, and knowledge.

Motivation to learn is paramount to students’ success; therefore, the higher the students’ self-regulation and intrinsic motivation, the higher is their academic performance.

Identified regulation and Stimulation are found to be most powerful in extrinsic and intrinsic motivation.

### Recommendations

Based on the conclusions drawn, the researcher recommends that:

1. The College of Education provide its teachers with seminars on teaching strategies that focus on increasing the level of students’ self-regulation and intrinsic motivation.
2. Teachers design lesson activities that are both focused on self-regulation and intrinsic motivation so that students make learning a rewarding and interesting endeavor.
3. Teachers increase the level of students’ knowledge so that the latter may fully develop high motivation for learning.
4. Other researchers conduct studies that account for related constructs to self-regulation and intrinsic motivation such as self-concepts or self-fulfilling prophecy as other interesting variables for motivation. Others may determine and explore how different types of motivation affect the learning process and promote performance.

### ABSTRACT

*Tasks such as reforming the higher education system, strengthening the material and technical base, radically modernizing the system of teacher training, bringing the quality of the educational process to a new level, "continuous improvement of the quality and level of professional skills of teachers" in the priorities of the higher education system marked. On this basis, the purpose of the study is to study the process of improving the technology, methodological support, systems and mechanisms of activity-related competencies to improve the professional training of deaf teachers in the implementation of the system of speech development of hearing-impaired children in the process of literary education. This article describes the content of increasing the professional training of deaf teachers-students on the implementation of the system of speech development of hearing-impaired children in the process of literary education. The directions of professional development of deaf pedagogues-students will be revealed.*

**KEYWORDS:** *Literary Education, Hearing-Impaired Children, Speech, Development, System, Deaf Pedagogues-Students, Vocational Training, Pedagogical System Directions*

### INTRODUCTION

The quality of education in higher education institutions around the world, the training of quality personnel is gaining momentum. The concept of international education until 2030, adopted by UNESCO, identifies "creating opportunities for quality education throughout life" as an urgent

task [3]. The implementation of innovative ideas in the field of education is the basis for achieving high results in the modernization of the system of training deaf teachers. In particular, the pedagogical-psychological and professional-pedagogical orientation, practical effectiveness of the future deaf pedagogue-teacher is important in the education system of developed countries. Opportunities to ensure the effectiveness of education have been expanded in our country by reforming the system of higher education, strengthening the material and technical base, radically modernizing the system of teacher training, bringing the quality of the educational process to a new level. The priorities of the higher education system include such tasks as "continuous improvement of the quality and level of professionalism of teachers" [2]. On this basis, it is important to improve the methodological training of future deaf pedagogues, the technology of organization of this process, methodological support, the system and mechanisms of competencies related to the activity.

### THE MAIN RESULTS AND FINDINGS

Tasks such as reforming the higher education system, strengthening the material and technical base, radically modernizing the system of teacher training, bringing the quality of the educational process to a new level, "continuous improvement of the quality and level of professional skills of teachers" in the priorities of the higher education system marked [2]. On this basis, the purpose of the study was to study the process of improving the technology, methodological support, systems and mechanisms of activity-related competencies to improve the professional training of deaf teachers in the implementation of the system of speech development of hearing-impaired children in the process of literary education. Issues of development of professional competence were discussed by B.Abdullaeva, S.Bazarova, N.Muslimov, Yakubjanova D.B. studied in scientific researches of scientists of the republic [11,15,26,]. Theoretical and practical bases of methodical training of students and teachers in the CIS countries S.Abdulina, G.Abramyan, V.Aleynikov, K.Angelovsky, R.Arefev, O.Badagueva, V.Bespalko, L.Vygotsky, P.Galperin, N.Gomulina, Studied by such scientists as V.Davydov, N.Kuzmina, M.Seliverstova, V.Shadrikov [4,5,6,7]. Identifying a set of pedagogical measures that contribute to a qualitative change in the system of training specialists in higher education requires a change in the organizational and meaningful component of education, establishing links with other components of education and the formation of new components [16, -12b]. At the Tashkent State Pedagogical University named after Nizami in the direction of education 5111900 - Defectology (Deaf Pedagogy) bachelors are prepared on the basis of educational-professional programs. special pedagogical education is carried out, the third stage (3-4 years of education) is aimed at the formation of special professional competence in students. However, practice shows that graduates do not have enough information on the literary education and speech development methods of students with hearing impairments. The reason for this is the lack of courses in the basics of literature, children's literature, introduction to literature, literature of the XVIII, XIX and XX centuries in the educational-professional curricula, the main methodology is characterized by a small amount of hours devoted to academic subjects. In this study, we focused on a content-based system of knowledge that allows to increase the special competence of bachelors and specialists in the field of literature, children's literature and introduce innovative approaches in teaching reading and speech development to children with hearing impairment [12, p.145].

Students' readiness to teach students with hearing impairments to read on the basis of a new pedagogical system - an understanding of the importance and necessity of solving the problem of speech development of students with hearing impairments; knowledge of the basic principles and components of the pedagogical system of speech development of hearing-impaired children in the process of literary education; personal participation in its popularization in practice; the ability to consciously choose one's actions; the analysis of the results obtained is reflected in the ability to plan further actions.

The required level of professional training of deaf pedagogues-students can be achieved through a specially organized educational process at the university and taking into account the relevance and importance of this problem for teachers and students [16, -23b]. the need for interaction, which is a condition and means of development of the participants in the learning process, to become a creative, evolving subject [13, - 145.p.]. In accordance with the objectives of the study, we developed areas for improving the professional training of deaf teacher-students:

- Developed an improved curriculum of general professional subjects "Deaf pedagogy", "Special methods of teaching native language";
- a new specialized subject "Technology of Literary Education" was included in the educational-professional curriculum, a curriculum was developed within the subject;

Curricula for new courses developed on a competitive basis in subject preparation. In the 2019-2020 academic year 5111900 - Defectology (Deaf Pedagogy) undergraduate curriculum increased the number of hours of general education subjects "Deaf pedagogy", "Special methods of teaching the mother tongue", developed an improved curriculum and book [14,15]. In these students, in the third academic year, the technology of literary education plays a fundamental role in the study of sciences. In the curriculum of the bachelor's degree program (Surdopedagogy) a new specialized subject "Technology of Literary Education" was introduced. This course is aimed at developing students' knowledge, skills and abilities in the content of literary education in a special school, the principles and methods of literary education, forms of organization of literary education, literary education technology, speech development technologies for deaf and hard of hearing students. A curriculum and textbook have been developed within the framework of the new specialized subject "Literary Education Technology". The third direction of improving the training of deaf pedagogues-students required us to develop elective courses. The purpose of these courses is to address the problems and modern foundations of literary education, innovative approaches to teaching reading, and modeling of teaching sessions. We have developed special courses on "Developing the Speech of Visually Impaired Students in the Process of Literary Scholarship" and "Using Interactive Methods in Working with Art in a Special School".

We plan to implement the system of preparation of deaf pedagogues-students for the development of speech of hearing-impaired children in four stages [12, -125.p.]:

The first stage is the formation of students' ability to identify, analyze and solve creative pedagogical tasks, as well as the development of creative curiosity, the independent transfer of previously acquired knowledge and skills to a new situation, in the implementation of the system of speech development of hearing-impaired children. to see the problem and the new function of the object in the situation, to identify the components of the object, to see an alternative solution

or its methods, to transform it into an innovative product by combining previously mastered methods of activity with a new problem and to develop creative thinking in teachers;

In the second stage, students will be able to acquire the basics of the methodology of scientific speech development in the stage of pedagogical research, to acquaint them with the conditions of the system of speech development of hearing-impaired children, its basic concepts.

The third stage involves the organization of participation of deaf pedagogues-students in the creation of authoring programs, the development of methods of independent authoring programs, the further development of innovations and the analysis and prediction of difficulties in the application of innovations in educational practice.

The fourth stage includes the organization of practical work of deaf pedagogues-students in special schools, correctional work and monitoring of experimental results at the stage of implementation of the system of speech development of hearing-impaired children. At this stage, in the process of implementing the system of speech development of hearing-impaired children, the skills of self-analysis of their professional activities increased, their views, directions, attitudes to news have changed, innovative views were formed.

The study used the methods of systematic analysis of psychological and pedagogical phenomena, modeling of the pedagogical process, study of best pedagogical practices in higher education, questionnaires, interviews, observation, mathematical and statistical analysis of experimental results. In the 2016-2020 academic year, 201,202,301,302,401,402 students of 5111900 - Defectology (Deaf Pedagogy) undergraduate education participated as research objects. On the basis of methods, techniques, models and teaching aids to implement the system of speech development of hearing-impaired children in the process of literary education developed in this study in the 2016-2020 academic year, the special pedagogical faculty of Tashkent State Pedagogical University named after Nizami conducted pedagogical experiments. This system showed to be effective in improving professional training and it recommended that they be put into practice. The indicators of pedagogical reflection, which determine the interdependence of criteria affecting the improvement of methodical training of deaf teachers of higher education institutions, improved on the basis of competence requirements for the quality of their training. In addition, in the course of experimental work it was found that on the basis of improving the methodological training of deaf teachers-students can form the following values of professional and personal significance: moral satisfaction (lessons, educational hours, good extracurricular activities high level of opportunity to improve direct communication, communicative, public speaking skills with the class; to be a human being who transmits his knowledge, life and spiritual experiences to students; to consider pedagogical activity as an opportunity for personal development, to open the possibility of its potential which was not previously demanded and realized; attitude to professional difficulties (communication, learning problems, ethical situations, etc.) as an opportunity to overcome them, to apply pedagogical experience; Perception of the teaching process as a progressive cultural process that develops teachers and students; understand that he was focused on his professional development in the field of science, methodology, develop and apply his approach to education and upbringing; create promising professional development based on continuing education, self-education, professional development; designing future professional and material status in relation to the level of success and continuous professional development and social status. It was found that the improvement of

methodological training on the basis of the developed methodological developments and tools for deaf pedagogues-students has an effective impact on the personal and professional socialization of future professionals. In particular, students process, select, evaluate, re-evaluate their educational, professional, life-oriented orientation, motives, goals; activation of intellectual activity, manifestation of "authorship" - independent formation of ideas and concepts; students' solid, deep mastery and understanding of the material in connection with their great contribution to its independent organization; clearly form important new relationships, along with facts and events on social and pedagogical activities; identify the strengths and weaknesses of their communication, specialization, socialization; it was shown to identify developmental contradictions as self-improvement and stimulation. Within the framework of the proposed system, future deaf educators demonstrated activity and independence in interaction with others, took a responsible approach to their chosen professions, acquired self-management and self-development skills, qualified and pedagogical staff showed higher creative activity during the internship.

The main goal of the special school is to shape the speech of children with hearing impairments as a means of communication. In this regard, the deaf pedagogue-teacher is a person who ensures the formation of speech of children with hearing impairments as a tool of communication. The formation of professional training of future deaf pedagogues consists of the formation of professional skills, creative skills, culture of communication, pedagogical techniques and technologies, building the initial potential of teaching skills, observation, creativity, independent mastery of advanced pedagogical practices, ensures the distribution of attention, knowledge, skills and abilities in the process of reading and teaching, the ability to manage mental states.

## CONCLUSION

In order to improve the professional training of future deaf pedagogues, it is necessary to organize, regulate and adapt pedagogical activities on a scientific basis, to develop the intellectual, motivational, volitional, personal, moral qualities of a teacher from a modern point of view. It is recommended to improve the methodological approaches to the stages of improvement on the basis of creating and conducting demonstration experiments, designing opportunities for the preparation and use of didactic materials. On the basis of theoretical research and analysis of research work, it was proved that the improvement of professional training of future deaf teachers involves the effective use of hours allocated for general and specialized subjects in the curriculum, improvement of science programs and substantiation of its scientific and methodological aspects. The proposed system consists of developing professional skills, creative skills, communication skills, pedagogical techniques and technology skills, building the initial potential of teaching skills in future deaf educators, teaches students the secrets of observation, creativity, independent mastery of advanced pedagogical practices, attention in reading and teaching, distribution, knowledge, skills and abilities, provides the ability to manage mental states.

### ABSTRACT

*The article describes the technology of obtaining mixed yarn for rope in the weaving of denim fabric, in which cotton, polyester spandex yarns are obtained for the raw material and the physical and mechanical properties are studied. The technology of adding and baking different compositions was obtained from them to obtain experimental sample yarns. Physico-mechanical properties of the obtained sample yarns were studied.*

**KEYWORDS:** *Cotton Fiber, Artificial And Synthetic Fiber, Polyester, Lycra, Deformation, Elongation, Hygienic Property.*

## INTRODUCTION

Demand for denim clothing is growing because it fits the human body, is easy to move, durable during operation, has good air permeability, and has the ability to change its aesthetic properties during chemical and mechanical processing (boiling, printing, coloring, softening, etc.). One of the main tasks of the textile industry of the republic is to increase the competitiveness of production, the search for and rational use of local raw materials, deep processing of finished products, especially denim and textiles. Targeted scientific research and studies are being conducted in this regard today.

## THE MAIN PART

Foreign experience in the production of jeans is being studied in depth and widely implemented in practice. New production facilities based on modern equipment and technologies are being created. The main raw material for denim fabrics is cotton [1]. But in order to expand the range of denim fabric, it is also produced from yarns mixed with various artificial and synthetic fibers. Analysis of the products of modern jeans manufacturers and scientific research conducted by many researchers [6-10] has shown that the leading brands [2-5] currently use mainly 100% cotton fiber, cotton-elastane, cotton-polyester-elastane, denim fabrics are also produced from mixed fibers such as cotton-viscose-polyester-elastane, cotton-liotsell-elastane. The purpose of adding chemical yarns to denim fabrics is to improve the quality of the yarn and increase the range of new denim fabrics. For example, when mixed with polyester fiber yarn, the strength of denim fabric increases, it looks beautiful, elastic yarns shape the garment into a human figure, making it comfortable to move [9]. According to the results of the analysis, the production of garments made of denim fabrics woven with a mixture of yarns containing natural fibers and elastic properties is increasing day by day. Such blended fabrics are mainly used in various denim garments for children, men and women, as well as as covers for furniture accessories. For denim fabric, fiber quality and staple length are important. The longer the fiber, the smoother, finer and more durable the yarn is. Therefore, mainly long-fiber cotton is recommended for knitting denim fabric. It is possible to produce chemical yarns in the required sizes. For a new range of composite denim fabric with elastic properties, the Tashkent Institute of Textile and Light Industry conducted research on the experimental sampling of polyester, elastic yarns and cotton fibers in a mixture of different compositions and baking. For the experiment, 30/1 (18.8 tex) snow-spun cotton, 9 tex spandex and 75/36 DTY (8.7 tex) polyester yarns were obtained as back yarn (Table 1).

**TABLE 1. PHYSICO-MECHANICAL PERFORMANCE OF SAMPLES FOR EXPERIMENTS**

Sample yarns	Linear density, tex	Delay force, F (cH)	F (sN) Specific tensile strength, (sN / tex)	Tensile elongation, $\epsilon$ (%)
--------------	------------------------	------------------------	--	---------------------------------------

		Average	variance	of coefficient variation	Average	variance	of coefficient variation	Average	variance	of coefficient variation
Cotton	18,8	210,68	8,56	4,07	11,21	0,46	4,07	3,36	0,36	7,6
Polyester	8,7	245,36	21,8	8,88	28,2	2,51	8,88	18,49	2,05	11,09
Spandex	9	277,14	17,12	6,18	30,79	1,9	6,18	21,84	1,68	7,69

Selected yarns were wrapped in 6 different variants of yarn in the laboratory of the department "Spinning Technology" in the Italian machine FADIS, adding the same tension in different proportions. In the next stage, the added yarns were baked on a German Saurer VTS-08-0-S machine. Figure 1 shows a schematic of the wrapping technology by adding individual yarns.

Figure 1. Diagram of wrapping technology with the addition of mixed yarn

Sample 1: yarn with a linear density of 38.4 tex, wrapped in two 18.8 tex single cotton yarns;

Sample 2: yarn with a linear density of 58.2 tex, wrapped in three 18.8 tex single cotton yarns;

Sample 3: yarn wrapped with the addition of three 8.7 tex polyesters with a linear density of 26.1 tex;

Example 4: yarn with a linear density of 27.7 tex, wrapped with two 8.7 tex polyester and 9 tex spandex yarns

Sample 5: single cotton with a linear density of 49.1 tex, 18.8 tex, polyester with 8.7 tex, two spandex yarns of 9 tex;

Sample 6: Three single 18.8-text cotton yarns with a linear density of 81.4 tex and two 9-tex spandex yarns were woven together.

The characteristics of the obtained rope yarns are given in Table 2, the physical and mechanical properties are given in Table 3.

**TABLE 2. CHARACTERISTICS OF YARNS OBTAINED FOR WEAVING**

№	Indicators	Type of samples					
		№ 1	№ 2	№ 3	№ 4	№ 5	№ 6
1	Fiber content, %:						
	Cotton	100	100	-	-	50	67
	Polyester	-	-	100	67	15	-
	Spandex	-	-	-	33	35	33
2	Linear density of yarn, tex	38,4	58,2	26,1	27,7	49,1	81,4
3	Number of circles	150	150	150	150	150	150

**TABLE 3. PHYSICAL AND MECHANICAL PROPERTIES OF SAMPLE YARNS**

Sample yarns	Linear density, tex	interruption power, F (sN)			Specific tensile strength, (sN / tex)			Elongation at Break, $\epsilon$ (%)		
		Average value	variance	coefficient of variation	Average value	variance	coefficient of variation	Average value	variance	coefficient of variation
1-sample	38,4	379,33	14,69	3,87	9,88	0,38	3,87	3,63	0,21	5,75
2-sample	58,2	612,8	29,44	4,8	10,53	0,51	4,8	4,94	0,21	4,35
3-sample	26,1	821,21	18,3	2,23	31,46	0,7	2,23	24,42	1,19	4,89
4-sample	27,7	891	14,53	1,63	32,17	0,52	1,63	30,05	1,56	5,18
5-sample	49,1	936,31	4,38	0,47	19,07	0,09	0,47	31,69	0,87	2,76
6-sample	81,4	872,08	48,37	5,55	10,71	0,59	5,55	7,28	0,19	2,6

The results showed that although the linear density of sample 6 was almost 60% higher than that of sample 5, samples 4 and 5 were the most mature yarns (891 sN and 936.31 sN). In our opinion, the strength of samples 4 and 5 is that they contain spandex and polyester fibers. The elongation index of these specimens is also explained by the high content of spandex and polyester fibers. Based on the results obtained, an elongation graph of the yarn samples was constructed (Fig. 2). When analyzing the average elongation graph of the back yarn samples, it was observed that the maximum tensile strength of the 5th sample yarn was 936.31 sN, an elongation of 31.69%. This is due to the addition of polyester and spandex yarns. Since samples 1 and 2 are made of 100% cotton, it can be seen that their toughness is lower than that of mixed composite samples (379.33

sN and 612.8 sN). Due to the fact that the number of yarns added in the 2nd sample increased by one, its toughness increased by 40% compared to the 1st sample, and its elongation at break increased by almost 28%. Since the main fiber content of samples 3 and 4 was polyester, it was found that their hardness was also high (821.21 sN and 891 sN), respectively. It was observed that the specific tensile strength of these samples was higher than 30% compared to the rest.

Figure 2. Graph of average elongation of yarn samples.

## CONCLUSION

Analysis of the test results of the yarns obtained in the experiment revealed that the mechanical properties of the 5th sample yarn obtained by adding cotton, polyester and spandex yarns were higher than other samples. Based on the study, it was confirmed that the quality of yarn with the addition of mixed fiber yarns is higher than other yarns. While polyester fiber increased the toughness of the yarn, spandex yarns increased its elasticity. Such performance of the yarn allows you to get the desired, quality denim fabric.

### ABSTRACT

*The article is about peculiarities of forming special terminological lexicon of the English language from the point of view of its starting period of formation. The author puts forward his own original viewpoint on the problem and tries to suggest scientifically grounded arguments in favor of his position. The study showed that the processes of abstraction and generalization - in the linguistic aspect - in the English language did not exist unchanged at all stages of historical development. The study also showed that the English scientific terminology of the era under study was a developing metastable system in a relatively stable state and subject to various kinds of micro changes.*

**KEYWORDS:** Terminology, Historical Perspective, Formation, Development, Cognition, Reflection, Abstraction, Evolution.

### INTRODUCTION

The formation of scientific (in the broadest sense of the word) vocabulary in England during the formation of the national language (15th century) was characterized by two factors. The first is the impact of national specifics of socio-economic and cultural development. The second is a reflection of the main trends in general language evolution. Such lexical units reflected various levels of abstraction in thinking and cognition of the world. Initially meaning only specific objects and visible situations, they indicate that the movement from concrete to abstract was reflected not only in the name of units of the language, but also in the nature of their functioning.

Terms, as you know, are a linguistic explication of a certain stage in the development of cognition, when boundaries blurred in the awareness of the difference between the material and

the ideal, cause and effect, personality and surrounding nature, when the laws of perception still had a certain effect on the processes of abstraction [1;4]. In terminology of this order of this period, we came across words that, at first glance, refer only to the field of natural and psychological disciplines or, in general, as if they contain nothing concrete [2]. However, when we correlated them with the attempts of philosophical understanding of the authors of the terms, it turned out that these lexical units undoubtedly have the character of a terminological orientation [3].

## RESULTS AND DISCUSSION

The bulk of the terms was created on the basis of borrowings from classical languages and by rethinking the meaning of words and combinations of the general literary national language. At the same time, imagery and connotation played a special role. This turned out to be a remarkable feature of the formation period of English terminology. Our conclusion is not in all respects consistent with existing ideas about terms as units that tend to rigidly explicate concepts and lack connotations. Modern English is characterized by a number of active word-formation processes, among which derivation is not the last place, carried out without adding the word-forming affix to the basis of the motivating word. One of the most productive methods of such word-formation is conversion.[6]

The process of the formation of English science led to the further growth and spread of both oral and written English. It turned out that in the era of the most rapid social transformations, there are also rapid processes of improving the language. The process of borrowing from other languages, as well as the entire system of word production, is activated.

The material under study showed that the formation, evolution of English national vocabulary of a terminological nature occurred in independent ways, which determined the “face” of national terminology, when a large number of lexical units that existed in the ordinary language and the language of science are defined terminologically and rise to the level of philosophical concepts, giving words with a narrow limited specific meaning, generalized logical-conceptual meanings. The transformation of the basic concepts of English terminological vocabulary of the formation period of the English national language (XIV-XVII century), which determines the language situation, is associated both with the socio-cultural and philosophical worldviews of the corresponding era, however, the qualitative specificity of the formation of the determinants of the genesis of scientific knowledge and, accordingly which form the system of terms in terms of language, have completely different forms in different eras, which constitute the stages of the emergence and approval of dominant new scientific concepts and directions.

The study showed that the processes of abstraction and generalization - in the linguistic aspect - in the English language did not exist unchanged at all stages of historical development. The formation of abstract meanings and their formal, verbal shells is closely related to the development of the abstract category and therefore represents the undoubted mutual interest of philosophy and philology, because the development of language and, in particular, linguistic meanings and categories, is a necessary component of the study of the laws of development of human thinking and cognition, an integral part of the theory of knowledge of any scientific system.

The study also showed that the terms in English are units used in the functions of hard-informative nominators of the phenomena of reality within the framework of a scientific and

terminological system that reflects the worldview of a particular scientist or school, which characterizes their originality and national specificity.

The main trends in the development of English general scientific vocabulary of the research period (and further replenishment of its conceptual apparatus), the speech expression of which was manifested in the vocabulary, were the following three main directions: firstly, the expansion of the composition of English scientific vocabulary in its content reflected the emergence of qualitatively new phenomena in the language societies of the period of formation and formation of a nation; secondly, a characteristic feature of this period was the emergence of new words to express already known concepts. To a large extent this was due to the abundance of French borrowing. But there is another reason - this is the incompleteness of the English dictionary in the early New English period, which led to the diversity and instability of the expression of certain concepts. This feature of the English national language is also characteristic of scientific vocabulary; thirdly, the introduction, assimilation and interpretation of new words were mainly facilitated by the authors' targeted goals.

We also established some patterns of the linguistic organization of scientific texts of the studied period, which are as follows: a) texts that reveal various aspects of scientific knowledge created by authors who are different in their professional inclinations and vocation, nevertheless, contain a certain set of lexical and vocabulary - grammatical units of the language system and demonstrate a similar picture of the syntactic design of text fragments; b) the main compositional-speech form of the thinker when creating his scientific works is "reasoning / reflection"; c) the main line of work of a scientific nature of the period is either explanation, or justification, or evidence or refutation.

The study also showed that the English scientific terminology of the era under study was a developing met stable system in a relatively stable state and subject to various kinds of micro- and macro evolutionary changes. Despite the highly dynamic nature of the terminological system, the elements of statics that make up its core prevailed over the elements of dynamics that form the periphery of the system.

In the XIV-XVII centuries the replenishment of the vocabulary of the English language as a whole and the creation of scientific terminology, in particular, was largely due to Roman borrowings, mainly from Latin. Secondary borrowing of the English terminological system is largely associated with the high susceptibility of the English language of the XIV-XVII centuries to borrowing in general and to term-creation, in particular. It is this feature of the English language, its "openness" to borrowing, and the ease of this process that during the period under study had a favorable effect on its gradual exaltation as the international language No. 1 in modern conditions. It was the long and absent-minded "absorption" of other people's words without scientific and bureaucratic obstacles that allowed the English language to reach a wide range of intercontinental, interregional, interstate and interethnic relations and become an effective means of humanity's communication in the context of expanding globalization in the modern world. In general, the studied material testifies to the strength and versatile nature of the influence of Latin on the vocabulary of the English language and covers the main areas of activity of English society in the XIV-XVII centuries. For the period of formation (XIV-XV centuries) and development (XVI-XVII centuries) of general scientific vocabulary, the replenishment of the thematic series by Romanisms and, especially, Latinisms is due to the fact

that, firstly, this historical period was the beginning of a systematic presentation in English the first scientific works, and, consequently, the beginning of the formation on the English soil of the semantic core of modern English professional terminology. The use of this vocabulary in the works of various genres is one of the characteristic features of the XIV-XVII centuries. At the same time, there is a process of gradual professional differentiation of the language of science in connection with the specialization of knowledge, the design of each direction in a separate science. This process is accompanied by the terminization of individual words and their lexical-semantic variants, an increase in the number of terminological phrases.

Since ancient times, the number has been serving as a means of describing the world order and orientation of a human in it. They attributed the hidden meaning and magical ability to influence on everything. Numbers were considered as integral characteristics of all creatures and objects: they controlled not only physical harmony and the laws of life, space and time, but relationship with God, which was understood as World Unity, the Highest Truth.[5]

The historical and hermeneutical analysis of the formation and development of the categorical-conceptual apparatus of English scientific terminology seems promising in solving the problem of the relationship of science directions. The historical and genetic relationships revealed by such a study of a different register of words can serve as additional material in solving the complex problem of developing a terminological system and its dialectics, in particular, in determining and refining the initial beginning in its formation. The combined efforts of philosophy and linguistics in the study of Gasparov B. M. Language of memory, image. Linguistics of linguistic existence. Linguistics of linguistic existence. M.: New literary review, vol. IX / Ed. Volume I. Prokhorova. 1996. Gasparov B. M. Language of memory, image. Linguistics of linguistic existence. Linguistics of linguistic existence. M.: New literary review, vol. IX / Ed. Volume I. Prokhorova. 1996. the process of complex formation of the English vocabulary of the period under study can make a significant contribution to the further development of dialectics, the evolution of its terminological base.

Semantic parallels in the content of words in the process of their formation in English thinking serve as the basis for the conclusion about the fundamental unity of the formation of ideas about this vocabulary.

The revealed regularities of the process of formation of the conceptual apparatus of English terminology allow us to give a critical analysis of some hermeneutic statements about their origin, concepts of the causal nature of human thinking in the period under study, and linguistic relativity theory.

## CONCLUSION

And, finally, one cannot fail to note the following circumstances: the complex and long historical path of the formation and development of the system of terminology and scientific concepts in English is instructive in many respects for the Uzbek reality and the Uzbek language. In our opinion, two completely separate and independent periods in the formation and development of the term system and concepts in the Uzbek language require special attention: a) the period of the VIII-XVI centuries and b) the period of the XIX-XX centuries. They had their distinct features. But, on the other hand, they are internally interconnected, since it was one language at different stages of its development and in various historical eras and political situations. With such a statement and understanding of the meaning of our research, we can understand and understand

the fundamental position that we study the history of our own and other countries and peoples not for the sake of studying, but for practical tasks, in this case, to clarify and justify further ways of developing and improving the language sciences in independent Uzbekistan, systems of its categories and conceptual apparatus.

### ABSTRACT

*Zahiriddin Muhammad Babur (1483-1530), the founder of the great Baburi dynasty, was not only a talented poet but also a literary theorist. This article highlights Babur's own scientific and theoretical views on the structure of the divân, a collection of poems in the classical period of Eastern Islamic literature, based on the author's work. The material is based on information about Babur's collection of poems in Turkish and manuscripts of this collection.*

**KEYWORDS:** *Zahiriddin Muhammad Babur, Manuscript, Divân, Divân Structure, Theory.*

### INTRODUCTION

Zahiriddin Muhammad Babur (1483-1530) is one of the great figures of Turkish classical literature. His special work on literature is *AruzRisolasi*, which is about the poetic dimension of *Aruz*. In addition, the work “Boburnoma” contains information about literature, literary works and literary personalities. He is a poet who is well-versed in lyrical genres as well. There is also a collection of poems – **ديوان (divân)** of this collection of works, and his literary-theoretical views on the creation of a special **divân** in Eastern Islamic literature are contained in the poems of this devon.

### THE MAIN FINDINGS AND RESULTS

First of all, about Bobur's divân. According to recent research, the number of manuscripts of Babur's divân preserved in the world's book treasures is ten [1, 114-116; 2, 51-61]. They are:

1. رساله ترکی منظوم نوشته دستی تصنیف بابر پادشاه قلمی

(Risâlai turki manzum, navishta dasti tasnifi Bâbur pâdshâh, qalami)

(India, Rampur Raza Library, №19)[3].

**2. دیوان ترکی بابر پادشاه (Divâni turki Bâbur pādshah)**

(Paris, Bibliotheque Nationale, Suppl. Turc. 1230) [4].

**3. دیوان بابر شاه چغتائی (Divâni Bâburshah chig'atay)**

(Istanbul University library No: 3743) [5].

**4. دیوان سلطان اعظم بابر میرزا (Divâni Sultânul a'zam Bâbur mirzâ)**

(Istanbul, Topkapı Palace Revan library no: 2314) [5].

**5. دیوان میرزا بابر (Divâni mirzâ Bâbur)**

(Istanbul, 100. Yıl Atatürk Library (Municipality Ktb.) Muallim Cevdet manuscripts K. 332) [5].

**6. دیوان بابر پادشاه (Divâni Bâbur pādshah)**

(India, Salar Jung State Library No: 4) [6, 49-51].

**7. دیوان بابر پادشاه (Divâni Bâbur pādshah)**

(India, Salar Jung State Library No: 18) [6, 49-51].

**8. دیوان بابر پادشاه (Divâni Bâbur pādshah)**

(London, The British Library D.P. 1402, Turki Ms 25) [7, 14-20].

**9. دیوانی بابر (Bâbur divâni)**

Tashkent, Fund of the Alisher Navoi State Museum of Literature, Manuscript No. 317.

10. Another **divân** manuscripts are reported by the Turkmen scholar R. Kurenov in his research [8]. According to him, the manuscript is number 3 in the Islamabad National Library in Pakistan. This copy of **divân** seems to be close to the Paris manuscript in textual terms. [Although this dissertation is intended to be a textual study of Babur's **divân**, it should be noted that it did not result in a complete study due to ignorance of many works on the subject and the lack of study of many important materials.]\* \* \*

During the study of the above-mentioned manuscripts, it can be concluded that:

A) They are mainly manuscripts copied between the XVI-XVIII centuries (the Tashkent copy is foreign);

B) None of them is in the form of a literally traditional Eastern classical structure;

C) They are, first of all, an existing collection of the poet's poems or drafts;

G) There are some ornate copies among them, and it is these ornate manuscripts that are important from the point of view of source studies and textual studies, as well as from Babur studies;

D) Almost all of these manuscripts are written in fluent and beautiful calligraphy (mostly in Nastaaliq script).

The question is, “**Did Babur make divân with his own hands?**” it is natural that the question arises [9, 114-117; 10, 41-43]. It is well known that being the owner of a devon is an element in

classical literature that requires the poet to be literally the owner of classical poetry. This requires great responsibility and talent from the poet. The composition of **divân** has a centuries-old tradition, and only a poet who has mastered it could do it.

We do not think it is correct to answer the above question on the basis of the manuscripts of his office without studying the views of Zahiruddin Muhammad Baburshah. Therefore, it would be appropriate to draw a more solid scientific conclusion by studying the author's theoretical views on whether or not Babur compiled **divân**. It can be said that Babur has his own approach to composing **divân**. However, his special scholarly work on the structure of poetry, including aruz [11; 12] and we do not know the full text, which contains his theoretical views on the science of aruz, which reflects his scientific views on the structure of **divân**. However, among his writings there are some passages devoted to the subject through which we see that the author has a perfect knowledge of the subject as well.

In one of his rubai he writes:

*Divânima ne rabtu ne tartibedur,  
Ne jadvalu ne lavhu ne tazhibedur.  
Gar sangayibordimani, aybaylamakim,  
Divâningnitilargataqribedur.*

In one place in the “Boburnoma” the governor of Samarkand, one of the Shaybanis, writes “*Fólod Sultonga divânimni yibordim*” [13, 174]. This incident took place in 1518, when Babur was still in Kabul. Accordingly, it can be said that the poet arranged the first drafts of his devon at this time. But when was the quoted rubai itself written? Before or after 1518? Who else is Babur asking for in exchange for his office? Why is he counting the shortcomings of his office and what are their “faults”? Does a quartet really raise so many questions?!

True, it is very difficult to find answers to all of them now. In particular, the question of to whom it is addressed will remain open until clarity is established on the basis of a reliable source.

But first of all, it should be noted that Babur did not have time to complete his collection of poems in the traditional classical style. In addition, this rubai was written after the collection was sent to Folad Sultan. That is, the poet's first collection of poems – **divân** was written after the end.

And we have a reason to think so. First of all, this rubai text comes in only three copies of the manuscripts of the poet's **divân**. They are manuscripts kept in Istanbul. Secondly, the first of these sources – the copy at Istanbul University – is the largest collection of poems by Babur's divâns. The mentioned rubai is on pages 67<sup>b</sup>-68<sup>a</sup> of the manuscript. In addition, this copy served as the basis for two other sources in Istanbul.

The fact is that the absence of this rubai in the copies of Rampur and Paris, which are considered the most revered of Babur's divâns, also indicates that it dates back to 1528-1520. This is because it is the largest collection of Babur's poems at Istanbul University. Even a few poems in it are not found in other sources. According to the calligraphic features on some of its pages, the Turkish scientist B. Yujel also suggested that the author's autograph [5, 21]. But you can't agree

with that. After all, the source that confirms the existence of Zahiriddin Babur's handwriting is a copy in Rampur.

Even when comparing the text of the copy of Istanbul University with the text of Babur in the copy of Rampur, B. Yujel's opinion was not confirmed. Moreover, the publication of the source at Istanbul University dates back to the second half of the 16th century. That is, long after the author's death.

Let us now return to Bobur's theoretical views.

In his rubai, Babur mentions the important elements of the structure of the divan. That is, here the author emphasizes, albeit briefly, the elements that serve the formal and theoretical foundations of bureaucracy.

So, in the opinion of Babur, in order for the **divân** to be formally complete, it is necessary to answer the following:

1. ربط (**Connection**). This term means “communication” and “system”. Accordingly, the internal structure of the sofa should be disciplined, i.e. interconnected. That is, first there is a preface and then there are poems of praise, supplication and nat type;
2. ترتب (**Order**). The meaning of this term is known. Only, in this regard, the poet is referring to the order of the alphabet and genres in the **divân**– the sequence;
3. جدول (**Table**). This term is widely used in Middle Eastern Muslim book art [14, 103] and is considered important. Table is one of the most widely used artistic ornaments in book art. It can be simple, elegant and golden. A separate table is drawn around the text on one page of the manuscript, or a single table is drawn around the text on both pages. If a text on a page consists of several columns (mostly poetic works), each column is separated from each other by table lines. In the devons, in the bayoz, each poem is also tabulated. The titles and pictures (miniatures) in the manuscript are also separated by a table. A simple table is often one-line red drawn around the text; the elegant table is very thin and consists of two, three, or even four rows of several colors; the gilded table consists of one or more rows given golden water;
4. لوح (**Writing board, board**.) This term is also widely used in the art of bibliography [14, 141]. This word has several meanings in relation to the objects it expresses. But in Babur's rubai, the East comes as one of the main artistic ornaments in book art. The sheet can be worked at the beginning of the manuscript, if the manuscript contains several works, at the beginning of each work, and sometimes at the beginning of chapters and chapters. A sheet consists of a pattern drawn across the width of half or one-third of the page where the text begins. In the Eastern book art of the XIV-XVI centuries, the plate was made mainly of golden water. (Manuscripts of the XVII-XIX centuries are distinguished by the fact that they consist of more simple paints.)
5. تذهیب (**Tazhib**) This term was also active in ancient bibliography according to its application [14, 301]. Tazhib is the gilding of manuscripts, the decoration with golden water. Of the manuscript ornaments, most are engraved with gold watercolors, engravings, titles, plates, patterns, tables. Some manuscripts are embellished by sprinkling golden water on the border of the page. Such a frame is called a “*tazhibihoshia*”.

So, if we pay attention to the above-mentioned rubai, Babur considers these five terms, in a sense, important or sufficient, in order for the **divân** to be complete and reach the hands of the reader.

Looking at the next two verses of the rubai, the word “*Gar sanga yibordim ani, ayb aylamakim*” asks not to blame his office, even if there are no five main elements – “*connection*”, “*order*”, “*table*”, “*writing board*” and “*tazhib*”.

In turn, the reason for this is “*Divâningni tilarga taqribedur*”. That is, he is sending this rubai to another pen-poet, the **divân**-compiler, and is willing to send his unfinished **divân** and ask for his collection in return.

It is understood that the tree and fame of Babur's **divân** were still famous before the author gave it a complete order. Fans, who read it at the request of the author himself, though not in a perfect way, begged him to enjoy it as soon as possible.

From the rubai of Babur it is possible to draw the following theoretical conclusion in connection with the structure of the **divân**. The first two terms – “*connection*” and “*order*” are related to the textual structure of the **divân**, while “*table*”, “*writing board*” and “*tazhib*” are terms related to the appearance of the **divân**, the decoration of the book.

Hence, **divân** (a collection of poems) should have a strict internal order in terms of text (sequence of letters of the alphabet, sequence of rhymes, sequence of genres; *introduction of prefixes, praises, prayers and verses*), and then it is appropriate to have internal manuscripts depending on the structure used. It should also be noted that **divân** copies of a simple copy, even without artistic decoration, are common. However, at this point it would be appropriate to assume that Babur was a king and a highly talented artist.

## CONCLUSION

It is clear that Babur Mirza is a poet who strives to organize his **divân** in a perfect way on the basis of the above-mentioned requirements of classical **divân** and to show his sensitive creative aspects in this regard as well. His **divân** views on composition and clerical work once again confirm that he is a talented artist with a perfect knowledge of the classical clerical traditions, experience and skill.

This means that during his lifetime, Babur did not have time to complete his collection of poems in the traditional classical style. [Only, the London manuscript is in a certain **divân** state. However, it was also copied in 1190 AH (1776) and was thus compiled by the scribe.]. Even in Babur studies, the perfect copy of the poet's **divân**, which is composed in full accordance with the tradition of composing the classical **divân**, is still unknown.

### ABSTRACT

*This article provides the necessary recommendations for all parents, the role of the family in teaching reading culture to the child, methods of fostering a culture of reading, to form a culture of reading, which is one of the five initiatives.*

**KEYWORDS:** Book, Family, Reader, Library, Reading, Listening, Audio Books, Bookcase, Discussion, Sample Presentation.

***"A child who reads one book today can lead ten children who are watching TV tomorrow".***

***Shavkat Mirziyoev***

### INTRODUCTION

"There is a wealth in the world that will never wear out, and it is the knowledge and skills that you give to your child. But where and from what can knowledge and enlightenment be obtained? First of all, from a treasure called a book." We must always keep in mind these valuable thoughts of our President ShavkatMirziyoev and incorporate them into our way of life [1, 2017]. This is an important principle in shaping the culture of reading in the younger generation. Of course, our scientists have done a lot of research on the culture of reading, its stages of development, reading. In particular, the phenomenon of reading A.O.Umarov, its role in the development of harmoniously developed people, optimization of reading processes in society, pedagogical and psychological opportunities of B.N.Ganieva aimed at shaping the reading culture of primary school students and the reading culture of primary school students; the essence, content, form, methods and means of educating the culture of reading are defined. The issues of formation of reading culture of schoolchildren are also reflected in the research work of

M. Kayumkhodjaeva. Scholar SafoMatchon's contribution to children's reading, the development of their speech, and the most appropriate methods and forms of introduction to the world of art, highlighting the role and importance of literature lessons in engaging students in reading, is great [2, 2019].

If we look at the lives and activities of many celebrities, writers, poets and statesmen, we can see that they grew up reading books in their youth and listening to works of various genres such as fairy tales and poetry. One day the famous German poet Heinrich Heine said to an acquaintance: "When I was a child, I became a poet because my mother read poems. My uncle Solomon became a bank clerk. Because her mother only read her books about traders" [3, 2018].

### THE MAIN FINDINGS AND RESULTS

It is not in vain that our wise people say that they do what they see in the bird's nest. The culture of reading is also formed primarily in the family. There is a difference between a child who sees his parents reading a book and a child who grows up not seeing his parents holding a book. A vivid example of this is the Avar poet RasulKhamzatov, known and respected not only in Dagestan, but all over the world. What made him famous was the book. In his book *My Dagestan*, he wrote: "I imagine my father only reading a book "The young Rasul always saw his father reading a book, loved books since childhood, read many books and grew up to be a famous poet. So how can a child be a reader if the parent does not read the book himself? The essence of the "Reader's Family" contest held in our country is to return parents to reading. That is, if parents read books, children will also read books [4, 2019].

Children's favorite writer H. Tukhtaboev said, "In developed countries, reading has risen to the level of science. "Reading is not just about promoting a book; it's also about learning to read, to choose a book to read, to grasp the essence, to understand oneself with the help of a book". Psychologists believe that in the process of reading a book together, a special relationship is established between parents and children. They say such an attitude never occurs when they watch TV together. Children who read a lot of books master the lessons well [5, 2018].

When shaping your child's reading culture, remember that the most important role model is yourself. Often parents do not have time to read at all because they work, their time and energy is enough to read newspapers and magazines. And stay-at-home moms use social media to watch serials or over the phone. From the moment a baby is born, he sees the phone in his mother's hand, and even modern mothers, instead of saying goodbye, put their child to sleep through music and songs on the phone, and give him a phone so that he can sit quietly in his arms when he cries. As a result, if a child learns to prefer a television or computer to a book, it is difficult to convince a child that reading a book is better and more rewarding. The best way out of this situation is to read a family book together. P.A. Pavlenko says, "No family can be a spiritually complete family without reading a book" [6, 2017].

Monitoring the regular performance of teacher assignments in school also helps primary school students to become literate, to acquire reading skills correctly and quickly, but also a personal example of a parent in the family is to cultivate a culture of reading based on values from birth. This means that everyone has a role to play in shaping the child's reading culture. As a result of studying the information about the role of the family in this matter, what work they should do, it is recommended that parents systematically do the following in the formation of a culture of reading to their children:

- Read funny, fun stories and poems to your child outside of the school program. Every day, it is recommended that one parent read with the child and spend half an hour or hours of free time discussing what they have read with him or her.
- Act out a story from a book with your child, play a “theater” game, and experiment with the plot. Change your game to run away from a fox, meet a dragon or ask the “Golden Fish” what you want, who is to blame in the fairy tale “Zumrad and Kimmat”, why, how to interpret the fairy tale “Bobo and Sholgom” in Uzbek (in modernized form), etc. allow to enter. Your child will develop creativity.
- Draw a picture of the heroes of the works you read with your child, you will know how the heroes of the work look, what they think about it. You determine if your child has the ability to draw.
- Look for life events similar to the plot of the story in the reading book, identify their different sides. You learn to observe and analyze the events around you.
- Compare the books you read with the movies and cartoons created for them, discuss what fits and what doesn't, talk about what changes the film makes and what aspects it doesn't add. The ability to think independently grows.
- If the child refuses to read any additional books, do not force him; try to teach him the kiosk he wants. You will know his interest through the book of your choice.
- Teach your child to use quotes from what they read in their speech. The use of memorized poems, proverbs, wise sayings, conclusions drawn from the story gives good results. In the future, this skill will decorate and enrich your child's speech. Thanks to these methods, the content of books is closely connected with the daily life of the child, forcing him to read what is natural and necessary. In addition, examples of folk oral art contribute to the development of the child's imagination and speech.
- Have a family book reading evening. You can read in turn: first it to you, then you to it, or vice versa. With older children, reading the play in roles will give good results. You will learn how to vote for which heroes, how they mastered their character, their actions, their acting skills.
- If the child has learned to read together in the evening, but does not want to read it himself, try a little trick. Stop reading in an interesting place the day before, and the next day talk about how busy you are with the necessary work, and tell the child to read the rest of the book himself and then tell you what happened. However, don't let the lie make you feel “busy” - the child may realize that you're forcing him to read it that way.
- Don't strive for speed of reading; pay more attention to reading words, intonations, and content correctly. Teach your child to retell what they have read, to repeat, to ask questions. It develops their skills of oral retelling, narration, essay writing.
- It is good to start with homework reading as it helps to engage the child in lesson preparation, but do not exceed the norm of reading aloud to the child every day - reading aloud on demand is 8-10 minutes for 1st grader, 10 for 2nd grader It should take -15 minutes.
- The child should not be allowed to study as a punishment. Don't be punished by reading instead of playing, walking, or watching TV. Because in the process of reading, the child's

imagination is in that game or TV show. You can punish a child by depriving them of evening reading together, but not vice versa. It is a punishment for the child, his parents, and his siblings to be left out of the discussion of the work of art that they are reading and debating at this time.

- Separate time should be set aside for reading, don't force your child to read instead of watching their favorite TV shows. They have the right to spiritual rest.
- If your child is interested in a book, never turn it off. Reading something is better than not reading anything. Make sure this is quality literature. You don't have to interest a child in comics, "horror," love, and detective novels. Once a child is formed as an independent reader, he or she can read the works of art of his or her choice when he or she reaches adulthood, during which time he or she learns to draw the necessary conclusions [7, 2018].
- Teach your child to take care of books. Not tearing the book, keeping it clean, and making it "as dear as bread" are also first understood from the attitude of parents towards the book. Your bookshelf should always be neat and tidy with interesting, rare works, pictures-rich books. Remember that what you pay special attention to will not go unnoticed by your child either.
- One of the constant gifts for a child should be a book that is appropriate for his or her age. If you find the book too difficult or not interesting, don't insist on reading it. Set it aside for a while. But don't miss the moment when a child starts to "master" a certain type of book.
- Teach your child to use the library. To get started, sign up together at the school, neighborhood, or county information library, and select books together.
- When you go for a walk with your child, don't forget to go to the bookstore and buy a book. Let him choose the book himself and bring it, even if it is expensive. Then he realizes that the book is more important than anything in human life.
- With the help of modern media, the child can hear the audio, recorded discs of the book. Of course, this is useful when the child has learned to read and opens the book with the text on the disk and watches it. Audio books teach children to distinguish letters, pronounce sounds correctly, write words correctly, and read with intonation. As a result, the child is happy and proud to learn letters and sounds independently, freely [8, 2020].

## CONCLUSION

Following these recommendations in the family and systematically implementing the formation of reading skills in the upbringing of children will give the expected result. And together we will be able to nurture perfect people who are the owners of a great future.

In Uzbekistan, people have always recognized the family as a sacred place and attached great importance to the upbringing of our future owners - children. Family reading is also important for the world that the baby sees from the moment he or she is born to grow up with the traditions and values in it. At this point, I found it necessary to quote the words of Abdullah Avloni: "Education is for us a matter of life or death, salvation or destruction, happiness or disaster" [9, 1967].

The above-mentioned ideas are effective recommendations for the formation of reading in the upbringing of children in the family, and in the words of our wise people, we have no right to delay a day in upbringing from the moment the mother is three months pregnant. In conclusion,

as the President said, "the desire to read books should begin, first of all, with the family, and parents should be readers themselves, so that they instill in their children a love for reading" [1, 2017.2, 2019].

## PECULIARITIES OF THE FORMATION OF ANIMATED NON-SIGNIFICANT USING SUFFIXING IN THE MODERN CHINESE LANGUAGE

**Hashimova Sabohat Abdullayevna\***

\*Assosiated Professor, PhD,  
Tashkent State University of Oriental Studies,  
UZBEKISTAN

### ABSTRACT

*This article is devoted to the study of the features of the formation of animate nouns with the help of suffixation in modern Chinese. The relevance of the study is due to the fact that this phenomenon is widespread in the word formation of the modern Chinese language and takes the second place in the productivity of the forming of both new lexical units and various forms of the word. In this regard, this article is aimed at identifying productive affixes that serve as material for the formation of such nouns. The article presents constructions with affixive morphemes, on the basis of which nouns are formed, the lexical features of each of the suffixes are revealed, new constructions are revealed, on the basis of which new nouns are formed, were analyzed the lexical features of forming the nouns using these morphemes.*

**KEYWORDS:** *Affixation, Suffixation, Morpheme, Vocabulary, Attributive Model, Subject-Predicative Model, Verb-Object Model.*

### INTRODUCTION

In modern Chinese language, word-formation methods have been studied to varying degrees by both domestic and foreign linguists. For example: Gao Yaoichi [1, p. 220], Zhang Jing [2, p. 220], Sun Changsuy [3 p. 493], Li Gao [4, p. 120], Lu Zhivei [5, p. 160] Zhen Xuelyan [6, p. 320], Zhang Shoukan [7, p. 96], S. Nosirova [8, p. 150], S. Khashimova [9, p. 150] and many others. So, one of the methods of word formation is affixation. This method is widely used in the formation of various words related to different parts of the speech of the modern Chinese language. This article is devoted to the study of affixes, with the help of which animated words-nouns are formed in modern Chinese. In modern Chinese, the semi-affixes that form words related to the part of speech, the noun, make up a significant part of affixes. They form noun

words with the meaning of human professions, names of objects, their qualitative shades, etc. These semi-affixes, as examples, include the following morphemes: 员 “yuan”, 师 “shi”, 生 “sheng”, 汉 “han”, 士 “shi”, 夫 “fu”, 客 “ke”, 手 “shou”, 丁 “ding”, 鬼 “gui”, 虫 “chong”, 蛋 “dan”, 派 “pai”, 份子 “fenzi”, 物 “wu”, 品 “pin”, 素 “su”, 体 “ti”, 力 “li”, 处 “chu”, 心 “xin”, 意 “yi”, 性 “xing”, 切 “que”, 当 “dang”, 学 “xue”, 论 “lun”, 主义 “zhuyi”, 化 “hua” and etc. Consider the features of some of the affixes that form animated nouns in modern Chinese.

Affix 手 “shou” forms the names of various professions, and also forms words denoting people who are knowledgeable and are specialists in the relevant field. The root of this morpheme is morpheme 手 “shou” (“arm”). For example: 对手 “duishou” “competitor”, 帮手 “bangshou” “assistant”, 助手 “zhushou” “assistant”, “assistant”, 提琴手 “tiganshou” “violinist”, 打手 “dashou” “watchman”, “guard”, 射手 “sheshou” “mergan” [10, P.89]. Nouns containing this morpheme are formed using this suffix, based on the following models: [noun + 手 “shou” = noun]: 歌手 “geshou” “singer”, 航手 “hangshou” “ferryman”, 2) [verb + 手 “shou” = noun] : 凶手 “shashou” “killer”, “flayer”, 护手 “hushou” “guard”, “watchman”, 能手 “nengshou” “Master”, 3) [adjective + 手 “shou” = noun] : 好手 “haoshou” “master”, 4) [numeral + 手 “shou” = noun] : 一把手 “yibashou” “first hand” (here in the meaning of the first customer), 三把手 “sanbashou” “third hand” (here in the meaning of third customer).

## THE MAIN FINDINGS AND RESULTS

The modern period of development of grammatical elements in word formation is marked by the interchangeability of the half-suffix 匠 “jiang” instead of the half-suffix 手 “shou”. The use of 手 “shou” has a wide range in modern Chinese, so if 匠 “jiang” is used mainly with monosyllables, then affix 手 “shou” is used both with monosyllabic and polysyllabic roots.

In military vocabulary, with the help of affix 手, words are formed that denote people shooting from any weapon. For example: 机枪 “jiqiangshou” “machine gunner”, 迫击炮手 “pojipaoshou” “mortar machine”. Possibly, the primary form of this suffix was in the form of a two-syllable lexical unit 射手 “sheshou”, which later contracted to a reduction to form 手 “shou”. In such terms, it is not possible to interchange the affix 手 “shou” with synonymous affixes, such as 者 “zhe”, 家 “jia” and 员 “yuan” [11, C .56].

In modern Chinese, there are words that can be used simultaneously with several affixes and form lexical units with the same meanings. For example: words 画家 “huajia”, 画手 “huashou” are lexical units with the meaning “artist”. The root of these words is the verb 画 “hua” “draw”. In this case, these words are formed using the suffixes 家 “jia”, 手 “shou”, forming nouns. Another example: the words 音乐家 “yinyuejia”, 音乐手 “yinyueshou” “musician”. In these words, the root is the word 音乐 “yinyue” “music”. In this case, these words are also formed using the suffixes 家 “jia” and 手 “shou”, forming nouns. Based on the foregoing, we can conclude that the area of use of the suffixes 者 “zhe”, 家 “jia” and 手 “shou” is similar and complementary.

Morpheme 工 “gong” has the meaning of “work” and as a suffix forms words according to three constructions:

1) [noun + 工“gong” = noun], for example: 电工 “diangong” “electrician”, 车工 “chegong” “master”.

2) [AB (noun formed according to the verb-object model) + 工“gong” suffix = noun]. For example: to the word 学徒“xuetu” “student”, formed according to the verb-object model (学“learn” (verb) + 学“student” (noun) = 学徒“xuetu”), by adjoining affix 工 “gong” the word 学徒工 “xuetugong” is formed “worker-student”.

3) [adjective + 工“gong” = noun], for example: 壮工 “zhuanggong” “wrestler” (壮 “zhuang” “strong”), 青工 “young worker” (青 “qing” “bright”, “clean”).

Morpheme 丁“ding” means “adult person”. Words with this morpheme are formed according to the following constructions:

1) [noun + 丁“ding” = noun], for example: 园丁 “yuanding” “gardener”, 家丁 “jiading” “master”, 男丁 “nanding” “man”, 保丁 “guard”, 门丁 “watchman”.

2) [adjective + 丁“ding” = noun], for example: 壮丁 “zhuangding” “strong”, 成丁 “chengding” “man”. Words with a given morpheme indicate male nouns. [11, 53].

Morpheme 汉 “han” has the meaning of “Chinese” and, unlike the suffix 丁, “ding” forms words related to both male and female. Words with the suffix 汉 “han” are formed according to two constructs:

1) [noun + 汉 “han” = noun], for example: 单身汉 “danshenghan” “unmarried (male)”, 英雄汉 “yingxionghan” “hero” ..

2) [adjective + 汉 “han” = noun], for example: 醉汉 “zuihan” “drunk”, 大汉 “dahan” “official”, 老汉 “laohan” “old man”, 硬汉 “yinghan” “despot”, 好汉 “haohan” “good man”.

The lexical meaning of affix 匠 “jiang” is “master”. In modern Chinese, affix 匠 “jiang” forms the words “master”, “specialist”, “artisan” and is considered an unproductive affix. For example: 铁匠 “tiejiang” “blacksmith”, 瓦匠 “wajiang” mason, 木匠 “mujiang” “carpenter”. Words with the suffix 匠 “jiang” are formed according to the construction [noun + 匠 “jiang”].

Morpheme 郎 “lang” has the meaning of “man” and forms the words related to the male gender. Words with morpheme 郎 “lang” are formed according to three constructions:

1) [noun + 郎 “lang” suffix = noun], for example: 货郎 “huolang” “bear the burden”, 儿郎 “erlang” “boy”, “child”.

2) [AB (noun formed according to the verb-object model) + 郎 “lang” = noun], for example: 卖油郎 “maiyoulang” “seller” ([卖 “mai” “sell” + 油 “you” “oil”] + 郎 “lang” = 卖油郎 “maiyoulang” “seller of oil”), 放牛郎 “fangniulang” “shepherd” ([放 “fang” “shepherd” + 牛 “niu” “cow”] + 郎 “lang” = 放牛郎 “fangniulang” “shepherd”).

3) [adjective + 郎 “lang” = noun], for example: 新郎 “xinlang” “new employee”.

Morpheme 信 “guan” has the meaning of “shepherd”, as a suffix forms new words only with nouns, related to a part of speech a noun according to the construction [noun + 信 “guan” = noun], for example: 牛信 “niuguan” “looking after a cow”, 马管 “maguan” “looking at a horse”, 羊信 “yangguan” “looking after the sheep.”

Morpheme 豪 “hao” means rich. Words containing this suffix form only according to one construction: [noun + 豪 “hao” = noun], for example: 文豪 “wenhao” “scientist”, 土豪 “tuhao” “master of the earth”.

A morpheme with the meaning “lord” 主 “zhu” forms new words according to three models:

1) [noun + 主 “zhu” = noun] : 物主 “wuzhu” “possessor” (物 “wu” “item”, “thing”), 财主 “caizhu” “cashier” (财 “cai” “wealth”).

2) [verb + 主 “zhu” = noun] : 失主 “shizhu” “lost man” (失 “shi” “lose”).

Morpheme 众 “zhong” “society” as a suffix forms new words according to three constructions:

1) [noun + 众 “zhong” = noun], for example: 群众 “qunzhong” “group (of people)”

2) [adjective + 众 “zhong” = noun], for example: 公众 “gongzhong” “audience (society)”, 大众 “dazhong” “audience (most of the society)”,

3) [verb + 众 “zhong” = noun], for example: 观众 “guanzhong” “audience (viewer)”, 听众 “tingzhong” “audience (listeners)”.

Morpheme 属 “shu” has the meaning of “relate to” and forms new words according to three constructions:

1) [noun + 属 “shu” = noun], for example: 家属 “jiashu” “family member”, 军属 “junshu” “army member”,

2) [adjective + 属 “shu” = noun], for example: 亲属 “qinshu” “relative”,

3) [verb + 属 “shu” = noun], for example: 下属 “xiashu” “subordinate employee”.

Morpheme 派 “pai” “group” also forms new words as a suffix. Our research has shown that words with the suffix 派 “pai” are formed according to two constructions:

1) [verb + 派 “pai”], for example: 反对派 “fanduipai” “opposition”,

2) [noun + 派 “pai”], for example: 乐天派 “letianpai” “a group of optimists”.

It should be noted that words related to a part of speech are a noun, a verb in the composition of these constructions, are formed according to various word-formation models (verb-object, copulative, etc.).

In modern Chinese, there is also a group of words that is on the periphery of transformation into word-forming morphemes. This group includes the second elements of four-syllable constructions formed according to the “noun + noun” model. For example: a combination of morphemes 分子 “fenzi”. This combination translates as a “molecule”; as a suffix, this morpheme loses its lexical meaning. Words formed by this suffix indicate specific qualities or

character of people. For example: 知识分子 “zhishifenzi” “intellectual”, 危险分子 “weixianfenzi” “dangerous man”, 动摇分子 “dongyaofenzi” “two-faced” [11, p. 54]. Words with this suffix are constructed according to the following models: [noun + 分子 “fenzi”], [adjective + 分子 “fenzi”], [verb + 分子 “fenzi”].

Morpheme 物 “wu” has the meaning of “thing” and also retains its meaning as a suffix, for example: 人物 “personality”, “person”, 买物 “sold thing”. Words with the suffix 物 “wu” are formed according to the construction [verb + 物 “wu”], [noun + 物 “wu”].

Morpheme 巴 “ba” has the meaning of “bar,” “desire,” when used as a suffix, loses its lexical meaning. This suffix is widely used in the Beijing dialect. It is well known that the Beijing dialect serves as a literary Chinese language. Therefore, all words with the suffix 巴 “ba”, functioning in the Beijing dialect, also occur in all dictionaries relating to the vocabulary of the Chinese language. With the given suffixes words are formed that relate to both animate and inanimate words, for example: 嘴巴 “zuiba” “mouth”, 下巴 “xiaba” “tail”, 泥巴 “clay”, 盐巴 “yanba” “salt”, 结巴 “jieba” “stutter”, 想把头 “xiangbatou” “thought”, 眼巴前 “yanbaqian” “before your eyes”. Words with the suffix 巴 “ba” are formed according to the construction [verb + 巴 “ba”], [noun + 巴 “ba”].

Morpheme 亲 “qin” has the meaning of “relative” and retains its lexical meaning as a suffix, for example: 父亲 “fuqin” “father”, 远亲 “yuanqin” “distant relative”, 近亲 “jinqin” “close relative”. Words with the suffix 亲 “qin” are formed according to the construction of [noun + 亲 “qin”], [verb + 亲 “qin”].

Affix 鬼 “gui” forms nouns with evaluative expressive coloring. These nouns express people with negative qualities. Zhen Suelyan marks this morpheme as (比喻性的词尾 “biyuxingde ciwei”) “suffix with estimated coloring”. The root of this affix is the root morpheme 鬼 “gui” (“hell”). Words with this affix 鬼 “gui” appeared in colloquial speech, but, despite this, are widely used in the literary language. For example: 醉鬼 “zuigui” “drunkard”, 胆小鬼 “danxiaogui” “coward”, 丑鬼 “chougui” “freak”, 穷鬼 “qionggui” “beggar”, 油滑鬼 “youhuagui” “cunning”, 烟鬼 “yangui” “drug addict”. Nouns are formed using this suffix based on the following models: 1) [noun + 鬼 “gui” = noun]: 酒鬼 “jiugui” “drunkard”, 2) [verb + 鬼 “gui” = noun]: 讨厌鬼 “taoyangui” “cheater”, 3) [adjective + 鬼 “gui” = noun]: 穷鬼 “qionggui” “beggar.” Thus, we can safely say that words formed by this suffix have a negative meaning, for example: 酒鬼 “jiugui” “drunkard” (酒 “jiu” “alcoholic beverage”, “wine”), 烟鬼 “yangui” “drug addict” (烟 “yan” “cigarette”), 赌鬼 “dugui” “person, keen on gambling” (赌 “du” “gambling”).

Using affixes 虫 “chong” and 蛋 “dan”, a subjective (negative) meaning is added to the lexical unit. These affixes are semi-suffixes and are genetically related to morphemes 虫 “chong” (“insect”, “worm”) and 蛋 “dan” (“egg”). Nouns are formed using these semi-suffixes only using the following construction: [“adjective” 虫 “chong”/蛋 “dan” = “noun”]. Moreover, these affixes, being part of complex words, partially lose their original meaning, for example: 糊涂虫

“hutuchong”, 糊涂蛋 “hutudan” “idiot”, 笨蛋 “bendan” “fool”, 浑蛋 “hundun” “stupid”, 21 “beggar”.

Morpheme 贼 “zei” has the meaning of “thief”, this morpheme as well as 霸 “ba”, 棍 “gun” forms words with a negative meaning. Words formed by this morpheme are formed according to the model [verb + 贼 “zei” = noun], for example : 穷光蛋 “qiongguangdan” “traitor”.

Morpheme 霸 “ba” “tyrant”, “despot”, “hegemon” forms words with a negative connotation, lexical units are constructed according to two models:

- 1) [noun + 霸 “ba” = noun], for example: 路霸 “luba” “road”,
- 2) [adjective + 霸 “ba” = adjective], for example: 恶霸 “eba” is “bully”.

The morpheme 痞 “pi” has the meaning of “bully” and forms words according to two models:

- 1) [noun + 痞 “pi” = noun], for example: 文痞 “wenpi” “rogue”, 街痞 “jiepi” “bully”.

Morpheme 犯 “fan” “spoil” as a suffix also forms nouns :

- 1) [monosyllabic noun + 犯 “fan” = noun], for example: 首犯 “shoufan” “leader versus law” ,
- 2) AB (noun formed according to the subjective-prejudicial model) + 犯 “fan” = noun], for example: 政治犯 “zhengzhifan” “person opposing politics” ,
- 3) [AB (noun formed according to the verb-object model) + 犯 “fan” = noun], for example: 杀人犯 “sharenfan” “killer” ,
- 4) [preposition + 犯 “fan” = noun], for example: 从犯 “congfan” “accomplice”, “accomplice” ,
- 5) [monosyllabic verb + 犯 “fan” = noun], for example: 罪犯 “zuifan” “person who broke the law”.

The morpheme 棍 “gun” has the meaning “stick” and forms new words related to the part of the speech noun according to two constructions, the words formed with this morpheme have a negative connotation:

- 1) [noun + 棍 “gun” = noun], for example: 土棍 “tugun” “bully” ,
- 2) [adjective + 棍 “gun” = noun], for example: 恶棍 “egun” “bastard”.

Based on the foregoing, we can conclude that:

- 1) As one of the methods of word formation, affixation, when constructing new lexical units, forms various lexical units with various structural and semantic features.
- 2) The affix is a formal morpheme, it adjoins a significant morpheme.
- 3) Affixes according to the functional classification are divided into word-forming and form-forming. In this division of affixes into these groups, it is based on functional-semantic, structural, and distributive criteria.
- 4) In modern Chinese, affix word formation in terms of productivity takes second place after collocation.

5) In modern Chinese, word-forming affixes mainly consist of root morphemes. However, there is still a group of affixes in modern Chinese that have not completely moved from the root to a purely affix morpheme. These morphemes occupy an intermediate place between affixes and word-forming morphemes and are referred to as semi-affixes. In linguistics, affixation and semi-affixation are considered two independent types of word formation.

## CONCLUSION

Based on the foregoing, we can conclude that: 1) As one of the methods of word formation, affixation, when constructing new lexical units, forms various lexical units with various structural and semantic features. 2) Affixes according to the functional classification are divided into word-forming and form-forming. In this division of affixes into these groups, it is based on functional-semantic, structural, and distributive criteria. 4) In modern Chinese, affix word formation in terms of productivity takes second place after collocation. 5) In the course of the study, the corresponding constructions with these suffixes were identified, such as:

suffix	construction
丁“ding”	[noun + 丁“ding”], [adjective + 丁“ding”]
犯“fan”	[monosyllabic noun + 犯“fan”], [AB (noun formed according to the subject-predicative model) + 犯“fan”], [AB (complex noun formed according to the verb-objective model) + 犯“fan”], [ preposition + 犯“fan”], [monosyllabic verb + 犯“fan”]
夫“fu”	[noun + “夫“fu”= ot], [verb + “夫“fu”= ot], [adjective + “夫“fu”= ot]
工“gong”	[noun + 工“gong”], [AB is a complex noun formed according to the verb-object model + 工“gong”], [adjective + 工“gong”]
官“guan”	[noun + 官“guan”]
棍“gun”	[noun + 棍“gun” suffix], [adjective + 棍“gun” suffix]
汉“han”	[noun + 汉“han” ], [adjective + 汉“han”]
豪“hao”	[noun + 豪“hao”]
郎“lang”	[noun + 郎“lang”], [AB (a complex noun formed according to the verb-object model) + 郎“lang” suffix], [adjective + 郎“lang”]
痞“pi”	[noun + 痞“pi” ]
生“sheng”	[noun + 生“sheng”], [verb + 生“sheng” ],[ adjective + 生“sheng” ]
士“shi”	[noun+士“shi” ], [verb +士“shi”], [adjective + 士“shi”]
师“shi”	[noun + 师“shi” ],[ verb+ 师“shi”]
属“shu”	[noun + 属“shu”], [verb+ 属“shu”], [adjective + 属“shu”]
员“yuan”	[noun + 员“yuan”], [verb+ 员“yuan”]
众“zhong”	[noun + 众“zhong” ], [verb+ 众“zhong” ], [adjective + 众“zhong”]
主“zhu”	[noun + 主“zhu”], [verb+ 主“zhu”]

## FEATURES OF THE LIMNIC ECOSYSTEM ECOMONITORING SYSTEM IN THE KHOREZM REGION OF UZBEKISTAN

**Jumaniyazova S. I\***; **Mamadalieva S. M\*\***

\*Urgench State University,  
UZBEKISTAN

\*\*Karakalpak Scientific Research Institute of Natural Sciences,  
UZBEKISTAN

### ABSTRACT

*The article discusses the research of limnic ecosystems in the conditions of the Khorezm region of Uzbekistan. It was noted that in order to assess the structure and functioning of limnichny ecosystems, it is necessary to move from private assessments to integrated studies, including monitoring the state of both biota and environmental components. The ecological feature of the hydrochemical regime of the studied reservoirs is the seasonal nature of the change in the concentration of nutrients. Their dynamics is characterized by two maxima - spring and summer.*

**KEYWORDS:** *Khorezm Region, Limnic Ecosystems, Biota, Factors, Hydrochemical Regime.*

### INTRODUCTION

The ecologically destabilized natural environment of arid zones causes the manifestation of a number of new patterns of development and dynamics of natural systems, which changes not only their composition and type of organization, but also changes the conditions themselves, and the strategy of evolution of the organic world. Global trends of environmental degradation are also typical for the territory of the Central Asian republics. The processes of degradation of the natural environment on the territory of the CAR have reached a regional scale and in a number of places have manifested themselves in the form of crisis situations for people. Changes in the hydrological regime of water ecosystems lead to a deterioration of their sanitary and environmental indicators, which in turn aggravates the overall environmental situation in the region.

Uzbekistan's water resources are only part of the total water resources available in the Aral sea basin. Surface water resources of the Republic of Uzbekistan consist of water resources coming

from rivers from mountain regions of neighboring States and resources formed on its territory. In addition, part of the river flow comes through irrigation and drainage reservoirs and channels. To the internal water resources include waters of lakes and water reserves in glaciers on the territory of Uzbekistan. In recent years, the environmental situation in the southern Aral sea region, due to the drying up of the Aral sea and the deterioration of the composition of surface and underground waters, has become particularly acute. One of the reasons for this disaster is the scientifically unjustified use of water and land resources in the region [1, 4].

### THE MAIN PART

Khorezm region is located in the North-West of Uzbekistan in the lower reaches of the Amu Darya river. The total area is 6,100 thousand square kilometers, which is 1.4 percent of the territory of Uzbekistan. In the North, Khorezm region borders with the Republic of Karakalpakstan, in the South with Turkmenistan, and in the northeast with the Bukhara region of Uzbekistan. Geographically, the region is located between 40°-42° North latitude and 60°-62° East longitude. The climate of Khorezm is classified as continental, with hot summers and cool winters. Summer temperatures often exceed 40 °C; winter temperatures are about -2°C, on average, but can fall to -40°C. The coldest month is January, with a minimum temperature of -27°C. The hottest month is July with a maximum temperature of 42°C. The region is quite arid, with an average annual precipitation of 60 to 120 millimeters, mostly precipitation in winter and spring. In the period from July to September, there is little precipitation, which significantly restricts the growth of vegetation during this period. The wind direction is mainly North-East and North.

The main waterway of the Khorezm region is the Amu Darya river. There are irrigation channels as: left Bank, Tashsaka, Shovot, Palvan, Gazavat, and drainage channels lake, Daryalyk, Checkcol, Giancoli. Ground water is very shallow, ranging from 0.7 to 2.5 meters, in some areas up to 5 meters. Groundwater recharge occurs due to underground runoff from the Amu Darya and channels, as well as due to infiltration of irrigation water and precipitation. The content of mineral substances in ground water differs significantly, from 1.5 to 50 g/l, this is due to the high salt and corrosion potential in relation to concrete.

According to the geomorphological structure of the soil in the Khorezm region are loess-like loams interspersed with lenses of sand and gravel with a thickness of 2 to 40 m. The soil structure is dominated by layers of silty loam along with sandy loams and loams, which make up almost 80% of the entire soil layer. The content of organic matter in irrigated soils is low, on average 7.5 g / kg (0.75%) in the upper layers of the soil, and decreases in deeper layers. Most of the underground layers in Khorezm are slightly or medium saline, while most of the upper layers, above 60 cm, are highly saline.

To assess the structure and functioning of limnic ecosystems, it is necessary to move from private assessments to complex studies that include observations of the state of both biota and environmental components. At the same time, it is very important to quickly monitor changes in the environment. Therefore, the proposed approach of joint application of remote sensing methods that allow rapid assessment of changes occurring over large territories using new biomonitoring methods that provide a comprehensive assessment of anthropogenic impact is very relevant [3, 8].

One of the most frequent causes of environmental violations is the discrepancy between the type of nature management and the socio-economic and natural conditions of the territory. From this point of view, it is important to study both the nature of nature management itself (in particular, land use) and its impact on the biological productivity of ecosystems [3, 5].

Observation system for environmental monitoring in order to distinguish the state change of the biosphere influenced by human activities, is particularly necessary for regions such as the Aral sea basin, where occur violations of intersystem relationships and situations characteristic of the ecologically destabilized environment of the whole region of the Aral sea region [5, 7].

It is known that the ecological balance in limnic ecosystems is determined primarily by the balance of production and destruction processes. Therefore, the tasks of qualitative assessment of primary products are extremely relevant in the system of environmental monitoring at the present time [2, 6].

The complex of external abiotic factors on the functioning of natural ecosystems and formation of water quality in water bodies most significantly influenced by changes in the hydrological regime of the river by regulating its flow, which is reflected in a sharp deceleration of flows, reduction of water exchange, changing the type of the nutrient cycle in the ecosystem [3, 6]. As a consequence, significant changes in the hydro chemical regime of the water body and going through complex change, characterized by rapidity and character of their manifestation. As a result of receipt and sedimentation of suspended sediments, ingress and accumulation of nutrients (nitrogen, phosphorus and other biogenic elements) of organic compounds, heavy metals, silting occurs, which leads to violations of their oxygen regime and other links of the biotic cycle [5, 6, 8].

Since the hydrological regime of the lower reaches of the Amu Darya is extremely dynamic, the need for the most up-to-date information is necessary for drawing up promising water management measures, which also applies to information on the content of biogenic elements. The high content of biogenic elements is characteristic of the surface runoff of watersheds developed in agricultural terms, and is the result of anthropogenic impact on the water ecosystems of the region [1, 2, 4].

The main properties that characterize reservoirs as an external environment for the development of organisms should be considered such factors as: temperature, salt composition, the supply of organic and biogenic substances [3]. Research covering a complex of biochemical, chemical, physical and chemical processes in specific conditions of aquatic ecosystems in the arid zone under strong anthropogenic influence is extremely relevant [7, 8].

In connection with the current environmental situation in the southern Aral sea region, monitoring studies on the quality of surface water, which carries an increased anthropogenic load, are of particular importance [7] the Characteristic features of the hydrological and hydrochemical regime in the lower reaches of the Amu Darya are the development of irrigated agriculture, flow regulation, the flow of highly mineralized return water into the riverbed, and the reduction of river flow. At the same time, the quality of incoming water flow is deteriorating. Some characteristics of the studied limnic ecosystems are shown in table 1.

**Gaukel(Гаукуль)**

**Agamikal (Аджаликуль)**

**Shurkul(шуркуль)**

**TABLE 1 SOME CHARACTERISTICS OF THE STUDIED RESERVOIRS**

Indicators	Agamikal (Аджаликүль)			Гаукел(Гаукул)			Shurkul (Шуркуль)		
	2018	2019	2020	2018	2019	2020	2018	2019	2020
Total area (ha)	46654 2	45190 7	45684 3	4211 28	433820	4060	4260 97+3 3671 7	4220 22+2 4594 1	40388 9+268 096
Length (km)	1,40	1,37	1,45	1,3	1,5	1,27	1,20+ 0,94	1,13+ 0,84	1,15+ 0,83

Note also that the ratio of ions and salinity of water itself is not a limiting factor for the development of hydrobionts. However, they are important for the characteristics of the aquatic environment. Water mineralization, content of sulphates, chlorides as stable characters

heretics can serve as a certain indicator of the level of trophic activity and very clearly determine the degree of pollution, especially from household and waste water, as well as from agricultural land.

Water salinity in the studied reservoirs ranges from 0.74 to 2.3 g/l. All studied reservoirs have seasonal changes in the ionic composition of water. Minimum values are typical for irrigation channels that feed these reservoirs, and already higher indicators in the reservoirs themselves.

Studies have shown that the oxygen content is very variable and depends on many factors and is determined by the seasons. During the period of spring and autumn homothermy and complete mixing of water masses, dissolved oxygen is distributed unevenly in the water column. In all lakes, the content of dissolved oxygen in the surface water layers is higher, but decreases with depth.

Also note that the high oxygen content in watercourses is due to the presence of current and good aeration of water masses. In reservoirs, its distribution is very specific and is determined by a combination of numerous environmental factors. These include temperature, namely, in low-

water lakes temperature stratification is more pronounced, in deeper lakes-weaker. In shallow water reservoirs, the range of fluctuations is sharper, i.e. the maxima are greater, the minima are less, which is very unfavorable for various hydrobionts.

During winter stagnation, there is a stratification in the oxygen content almost every meter: in epilimnion, its content is 7 mg/l, which corresponds to 57% saturation, in hypolimnion, the values decrease to 4 mg / l (32.2% saturation). And during the summer stagnation, such a sharp difference in the stratification of water masses in terms of oxygen content does not differ, because of the specificity of the reservoir, which is located parallel to the wind rose of this region, in open places, water masses are well mixed. The difference between highs and lows is only 3-4 mgO<sub>2</sub>/l. [6, 8].

Thus, the formation of water quality in water bodies is a complex, multi-faceted process that depends on a complex of various factors related to the functioning of water ecosystems, as well as the conditions of the surrounding landscape and the bed of the reservoir. The ecological feature of the hydrochemical regime of the studied reservoirs is the seasonal nature of changes in the concentration of nutrients. Their dynamics is characterized by two highs – spring and summer.

## PLACEMENT OF CITIES OF UZBEKISTAN ON MAJOR WATER AND ECONOMIC REGIONS

**Ismatov Jakhongir Atavullayevich\***

\*Senior Lecturer,  
Chirchiq State Pedagogical Institute of Tashkent Region,  
UZBEKISTAN

### ABSTRACT

*The article analyzes the differences between the division of Uzbekistan into large water areas, the distribution of cities in these areas, the density of the urban system and network, and their demographic capacity.*

**KEYWORDS:** *Water Management, River Basins, Amudarya, Syrdarya, Zarafshan, Kashkadarya, Region, Hydrological Indicators, Cities, Population, Network Of Cities.*

### INTRODUCTION

From ancient times the roads have played a key role in the formation and location of cities in most parts of the world. Due to the sharply continental climate, the hydrographic network, along with roads, plays an important role in the formation of settlements, especially cities, in Central Asia. For example, most cities in Uzbekistan are formed along rivers and streams [1, 1981]. These factors need to be taken into account when expanding or establishing new cities, as the development of urban economy and population capacity are determined by hydrological indicators such as water consumption, flow rate, flow rate, flow modulus, river slope. This issue is especially relevant in arid countries such as Uzbekistan. To more accurately assess the impact of the above factors on the formation and development of cities, their demographic capacity, it is necessary to select smaller areas as the object of study. The territory of Uzbekistan is divided into many basins by many hydrologists and geographers based on the purpose of scientific research. In particular, according to Professor VL Schultz, the territory of Uzbekistan is divided into four major (main) basins: Amudarya, Syrdarya, Zarafshan and Kashkadarya [5, 1969]. It should be noted that although some areas belong to a hydrologically historically specific river basin, they are now supplied with water through other river basin sources. For example, the Bukhara oasis belongs to the Zarafshan river basin, the western part of the Kashkadarya region to the Kashkadarya basin, but today these areas are supplied with water from the Amudarya, which

is part of the Amudarya water management region. Therefore, it is expedient to divide the territory of Uzbekistan into large (main): Amudarya, Syrdarya, Zarafshan and Kashkadarya water management regions. In this article, the cities of the republic were studied within the framework of these water management regions.

## THE MAIN FINDINGS AND RESULTS

### *I. Proposed Methodology*

In this work, the scientist VL Schultz (Shults V.L., Mashrapov R. Central Asian hydrography. - T., Teacher, 1969. - P.65.), Who made a significant contribution to the work of hydrological zoning of the territory of Uzbekistan, as well as zoning, statistical analysis and geographic comparison methods were used.

### *II. Result Analysis*

As of January 1, 2019, 1191 cities and towns are registered in Uzbekistan, with a total of 16.8 million people or 50.4% of the country's population (Table) [6]. The country's urban areas and their population are distributed differently across major water areas.

The Amudarya water management region is the largest water management region of the republic, occupying more than half of the country's territory. The southern, central, western and north-western parts of Uzbekistan (administratively the Republic of Karakalpakstan, Khorezm, Bukhara, Surkhandarya regions, the western part of Kashkadarya region and the southern and south-western Navoi region) belong to the Amudarya water management region. 368 urban settlements of Uzbekistan, ie 30.8% of cities and towns are formed in the Amudarya water management region. In addition, 4 mln. more than urban dwellers (24 percent of the country's urban population). More than 82% of the urban areas in the study area are small towns (population up to 10,000). At the same time, there are 35 small, 14 semi-medium, 9 medium, 2 large (Urgench, Termez) and 3 large (Nukus, Bukhara, Karshi) cities in the region. The analysis shows that although the Amudarya region is ahead of other water regions in terms of area, the network of large cities is underdeveloped, and very large and millionaire cities do not exist at all [2, 2020].

**The Syrdarya water economy region**, which is the largest in the country in terms of cities and towns and urban population, includes the northern and north-eastern parts of Uzbekistan (Fergana, Andijan, Namangan, Tashkent, Syrdarya and Jizzakh regions and the north and northeast of Navoi region). The region consists of 612 urban settlements (51.4% of the country's cities), which are home to 61.9% of the country's urban population (about 10.4 million). The only millionaire city of Uzbekistan is Tashkent, one of the two largest cities is Namangan, two of the five largest cities (Andijan and Fergana), 6 of the 10 largest cities (Kokand, Margilan, Jizzakh, Chirchik, Angren and Almalyk) are located in this region. The large number of urban settlements in the Syrdarya water management region, which occupies about 30% of the country's area, has led to the density of the urban network.

**TABLE DISTRIBUTION OF CITIES OF UZBEKISTAN BY MAJOR WATER MANAGEMENT REGIONS**

Reservoirs	Number of cities and towns City population (January 1, 2019, thousand people)											Percentage of total
	300 000 ча	30 00- 50 00	500 1- 100 00	100 01- 200 00	200 01- 500 00	500 01- 100 000	100 001 - 250 000	250 001 - 500 000	More than 500,0 00	Millio n, field	On the Reser voirs	
Amudarya	$\frac{124}{340,3}$	$\frac{12}{510,1}$	$\frac{56}{393,6}$	$\frac{35}{550,3}$	$\frac{14}{475,7}$	$\frac{9}{609,3}$	$\frac{2}{286,8}$	$\frac{3}{860,9}$	-	-	$\frac{368}{4027,0}$	<b><math>\frac{30,8}{24,0}</math></b>
Syrdarya	$\frac{105}{273,8}$	$\frac{18}{481,0,9}$	$\frac{185}{134,4,4}$	$\frac{77}{111,9,7}$	$\frac{42}{125,5,7}$	$\frac{9}{655,3}$	$\frac{6}{106,0,3}$	$\frac{2}{717,7}$	$\frac{1}{612,2}$	$\frac{1}{2510,0}$	$\frac{612}{1036,0,0}$	<b><math>\frac{51,4}{61,9}</math></b>
Zarafshan	$\frac{41}{103,6}$	$\frac{47}{20,0,5}$	$\frac{25}{197}$	$\frac{12}{191,6}$	$\frac{10}{297,1}$	$\frac{2}{150,1}$	$\frac{1}{136,4}$	-	$\frac{1}{510,2}$	-	$\frac{139}{1786,5}$	<b><math>\frac{11,7}{10,7}</math></b>
Kashkadarya	$\frac{24}{61,9}$	$\frac{28}{89,3}$	$\frac{10}{70,1}$	$\frac{4}{48,5}$	$\frac{5}{169,9}$	-	$\frac{1}{137,1}$	-	-	-	$\frac{72}{577,1}$	<b><math>\frac{6,1}{3,4}</math></b>
<b>Total</b>	<b><math>\frac{294}{779,6}</math></b>	<b><math>\frac{38}{416,10,8}</math></b>	<b><math>\frac{276}{200,5,1}</math></b>	<b><math>\frac{128}{191,0,1}</math></b>	<b><math>\frac{71}{219,8,4}</math></b>	<b><math>\frac{20}{141,4,7}</math></b>	<b><math>\frac{10}{162,0,6}</math></b>	<b><math>\frac{5}{157,8,6}</math></b>	<b><math>\frac{2}{1122,4}</math></b>	<b><math>\frac{1}{2510,0}</math></b>	<b><math>\frac{1191}{1675,0,6}</math></b>	<b><math>\frac{100}{100}</math></b>

*Note: the fractions in the table show the number of cities, the denominator shows the total population of these cities, the last column of the table shows the corresponding percentage of these figures.*

*The table was compiled by the author.*

**Zarafshan water management region** occupies the south-eastern part of Samarkand region and Navoi region, mainly the Zarafshan river valley. This region covers 11.7% of the total urban area and 10.7% of the urban population. These figures show that the Zarafshan water management region is almost the same as the urban settlements and the share of their population in the national average. Most of the cities of Zarafshan water management region also consist of small and medium towns. Kattakurgan and Urgut are medium, Navoi is large and Samarkand is very large.

**Kashkadarya water management region** consists of the eastern regions of Kashkadarya region. This region is the smallest among the largest water management regions of Uzbekistan in terms of area, cities and urban population. There are 72 urban settlements in the region, which account for 6.1% of urban areas and 3.4% of the urban population (about 0.6 million) [4, 2020].

The largest city of the Kashkadarya water management region - Shahrisabz (137.1 thousand) belongs to the group of large cities in terms of population. The cities of Kitab, Kamashi, Guzar, Chirakchi and Yakkabag in the region form a layer of semi-middle cities. Although the role of Kashkadarya in the historical formation of the city of Karshi is great, at present the river almost does not reach the territory of the city. Currently, the city of Karshi and surrounding lands are supplied with water from the Amu Darya through the Amu-Karshi canal. Therefore, the city and adjacent areas were included in the Amudarya water management region.

## CONCLUSION

The cities of Uzbekistan are distributed differently in terms of quantity and quality of large water management regions. Although the Amudarya water management region occupies the largest part of Uzbekistan, the share of urban population is relatively low. This is due to the formation of most small towns in the area. In the Syrdarya water management region, the opposite is true. In other words, the proportion of urban population in the total number of cities in the country is significantly higher. The lack of water in the Zarafshan River and Kashkadarya has limited the formation and development of large cities in these areas.

To more accurately assess the impact of hydrological factors on the formation and development of cities, their demographic capacity; it is necessary to conduct large-scale studies in each of the large and small water management regions of the country.

Tribhuvan University, Kathmandu, NEPAL  
Email id: panthi\_rishikesh2006@yahoo.com

### **ABSTRACT**

*For the survival and growth every organization should be capable to translate its plans and programs enhancing performance. Nepal Airlines Corporation(NAC) was incorporated on 1 july 1958 through enactment of Nepal Airlines Corporation Act.2019, with mains objective to provide air transport service to any person, agency,or organization who need such service for transportation of men and materials from one airport to another either within or outside the country. Nepal Airlines started glorious aviation landmark of airlines business with its DC-3 Docota within 97 employees and still was remarkable development in 1990.The national flag carrier has been suffering from the operational loss for the last few years. In this context this article explores the capacity and performance level of NAC and discusses its major challenges. For the discussion, about capacity utilization, scheduling and planning, reliability and punctuality, passengers flow on the based on NPM theory assumptions, secondary data are obtained from NAC offices and some of the key personnel of the NAC are also interviewed. The findings show that there are still important roles of NAC for air service delivery system, economic development, improving tourist flow, which however, also facing problem of fleets, lack of smart management, lack of proper attention of government and politics*

---

## INTRODUCTION

### 1. Background

After the world war-II, numerous states owned enterprises were created in both developed and developing countries to address market deficits, reduce capital shortfalls, promote economic development, reduce mass unemployment or ensure national control all over the economy of the country (U.N, 2005 P. 3). Nepal was also not exception for establishing such entities. Nepal establishes more than five dozens of such enterprises up to the late sixties. Nepal Airlines Corporation (NAC) the existing Royal Nepal Airlines (RNAC) was one of these corporations related to airlines which has been established in Nepal primarily with a view to improve the socio-economic condition of the country through air transport service. The strong air travel growth in the global economy helped air travel deregulation and technology to promote more connectivity between cities. (Airbus, 2009).

NAC the then RNAC was established by special Act, 1962 on July 01, 1958 as the national flag carrier. It has been considered as the geographical and cultural bridge connecting Nepal within and beyond the country. Initially it started glorious aviation landmarks of airlines business with its DC-3 Docota with 97 employees in 1958. From 1958 onwards fleet expansion process accelerated till the induction of two jets-Boeings 757 in the year 1987 and 1988 in its fleets, totaling 19 aircrafts including few other twin otters, Avro, Focker and a couple of Boeings 727. The airlines were on growth stage till 1990 which was also marked as golden era in the history of the airline in Nepal. During that time it had four jet aircrafts, three Hawker Siddeley (HS), four Avro, ten Twin otters and two Pilatus porters. The airlines had spread its wings from Japan in east to Europe in west as international sector and also made 40 domestic operations within the country. It is also customary with RA to have the air business ups and downs as RA decided to stop its Europe Operation in 2001. Later withdraw the number of flights in Frankfurt (FRA), London (LHR) and Peris (CDG) by the year 2001. In addition RA also was stopped to operate flight to Osaka. Shangaia and Japan which was operating over 13 years. Furthermore the flight to Colombo (CMB), Rangoon (RGN) Karachi (KHI), Dhaka (DAC) and Male (MLE) sectors were also stopped. Besides national flag carrier used to provide chartered flights for UN and British Gorkha-Regiments was also stopped. It was obvious that curtailment of such international flights put RA in critical position for its sustenance. On the other hand, the liberalization policy in the airline sector also affected RA in critical position to compete with other international airline services. At present, RA has been operating in eight international destinations. It is also pity that RA occupies only four aircrafts for international flights. Of them one is 30 years and the other 32 years old. In addition RA has three twin otters, two MA60, and two more 2Y12 in the inventory. At present, NAC has been running with a small number of aircrafts to operate in domestic or international destinations. In this content it is also interesting to what extent NAC has been performing which enable to sustain and maintain regular services to its clients. For the purpose of writing this article the financial and operation performance of RA has been reviewed. In addition, some of the key informants were interviewed. The secondary information was triangulated with primary information for substantiating the factual information.

## 2. Understanding Airlines performance

There is ongoing debates and discussion among the researchers and academics with regard to the performance management of public sector entities (Gautam, 2012, p. 202). Aviation plays a significant role in the world as it supports social and economic development in both emerging and established nations. Air travel deregulation and technology have allowed more connectivity between cities (Air bus, 2009). International air passenger transport is an important factor in facilitating trade and development of others sectors of an economy.( Gonenc and Micoletti (2000) quoted in (piermartini, R. &Rousova, L. 2008) cited by Kankaew K.(2004).Trace, Keith, FrielingBarend, Hew Denis (2009) also mentioned that improved air connectivity through air mentioned that improved air connectivity through air transport links which is an essential components of economic growth, tourism growth, trade growth and so on as it provide personal access to the regions for business, social or recreational purpose as well as physical access to resources and markets. Improved access allows producers to take advantages of an expansion of trade, commerce, economics of scale and specialization (Kankaew, P.1, 2014).

Owing to the fast economic growth, people have gained improved opportunities to enjoy national and International tours and business Rapid economic growth and the deregulation of commercial airlines market worldwide have driven growth in air passenger transportation. Public enterprise (PES) in most of countries of the world, so as also in Nepal were created to accelerate, economic and social development but main issue in Management and organization is corporate sustainability which includes organization performance. Organization performance is one of the strategic issues for any management. Therefore it is needed for airlines to focus on service quality if the airlines aspire to improve on market share and further enhance financial performance in Domestic and international Market (Albrecht and Zemke, 1995).

In this back drop productivity of Airlines depends on the capacity utilization performance, operational performance, Flight scheduling and planning, on time performance. Employee satisfaction, capacity of operation, human resource planning and management and some of the natural phenomenon which is directly related with airlines performance.

Globally, 2000 Airlines operating more than 23,000 aircraft, providing service to over 3,700 airports around the world (Aerospace Global Report, 2011& AIO-2006, P.2). In 2006, there were 28 million scheduled flight departures and carried other the two billion passengers.The growth of world air travel has averaged approximately 5% per year over the past 30 years with annual growth in air travel which would be double over next 10-15 years (AIO, 2006, P.2).

The aviation industry is, by its very nature a global industry or large growing industry, facilitating economic growth, world trade, international investment and tourism so that central to the globalization taking place in many other industries. In order to survive and be prosperous in this sector, airlines have recognized the need for radical change. The new trends emerging in the aviation industry in global scenario are the increased globalization of economics, liberalization of aviation policies, new technological developments in civil aviation.

Over the last decades, the airlines accumulated massive financial losses along with crippling debt arrears from it failure to the service. Its loans and sustain its operation.(Ochieng, M.D.& Ahmed .A. H, 2014).

Performance Management (PM) denotes with achievement of goals or results. Research has shown that large numbers of organizations rely mostly on output Performance measures which include sales volume, sales growth and profitability (Asiegbu& et al., 2011). Performance involves also the economic concept of creation of wealth or value to the organization .Thus, performance is a relation between cost(operation cost of the organization) and the value of benefits obtained(Lorino,2001).Performance is a multi-dimensional concept. In case of Airlines performance should be compared with the achieved result. Nepal airline is considered as 'A' class public enterprise should demonstrate success which could be a model to other enterprises.

Performance of Airlines depends up on the trend of aircraft utilization, aircraft availability aircraft designs, fleets, resources utilization capacity, flight schedule planning and operational capacity, organization capacity and management commitments, organization leadership, organization politics, state policy towards the aviation Industry/Airlines operational capacity, trained and skillful manpower, human resources planning and others. In addition age and modality of the aircraft, employees satisfaction, motivation and moral of the employees, organization philosophy, civil aviation policy of the nation also contribute its performance.

### **3. Indicators of Performance**

The International Air Transport Association (2003) uses many performance indicator to track the annual performance of its member airlines these performance measures can be a Operating performance, financial performance, passenger follow or load factor, capacity utilization, passenger revenue tariff, operating efficiency or reliability and punctuality. Despite NAC is aA class enterprise issues raised from different corners about its performance. Some of the key issues as follows:

#### **I. Financial Performance**

Financial performance occupies a significant place in the performance evaluation of Airlines. Financial profitability, with regard to financial performance evaluation, shows its "ability to earn profits proves a measure of its market strength, its ability to keep down costs. Profitability also affects the amount of investment, for much industrial investment is financed out of reinvested profits, and hence the contribution of the firm to the overall growth of the economy "(Killick, 1983:183) Similarly, Mary M. Shirley (1983:30) argues that "profit is a composite indicator that applies positive weights (price) to benefits (outputs) and negative weights to costs (inputs). If the prices are correct, a profit maximizing firm strives to achieve maximum benefits for minimum costs - the definition of efficiency. "Financial profitability is thus a simple and straight forward indicator which indicates the extent of success of an airlines .The Nepalese PEs have been largely criticized on the ground of financial performance. Despite the huge capital investment these enterprises have not been able to reveal satisfactory increase the volume of outputs to a given level of inputs. With regard to economic performance, a variety of indicators, such as capacity utilization, capital- output ratio, labour-output ratio, labour-administrative cost per output, etc. can be adopted.

#### **II. Economic Performance**

Economic performance provides a firm base for measuring the performance of NAC which shows the result, i.e., ability to increase the volume of outputs to a given level of inputs. With

regard to economic performance, a variety of indicators, such as capacity utilization, capital-output ratio, labour-administrative cost per output, etc. can be adopted.

### III. Capacity Utilization

Capacity utilization is an important indicator in course of performance evaluation. Economic efficiency of an enterprise, indeed, depends much upon the capacity utilization. It has been well realized that the capacity of the enterprise has to be utilized to its maximum in order to improve the performance. However, the capacity utilization rate of the NAC has not increased significantly over the past few years. A World Bank report (1979:25) has stated that the average capacity utilization rate is below 60 percent and this was regarded as one of the major causes for the poor NAC performance. It is noteworthy, while analyzing the capacity utilization rate on the individual enterprises, to note that there are variations in the capacity to use its potential capacity.

### IV. Capital-Output Ratio

The capital-output ratio of NAC is also regarded as not being at a satisfactory level. Capacities of the enterprises have been utilized below to their optimum capacities. Capital-output ratio, labour productivity ratio, and value added-employee ratio have not been improved as desired by the government on the one hand and the enterprises on the other. These could be identified as the convincing reasons for the poor economic performance of NAC.

### V. Distributional Performance

It has been clearly mentioned in the various periodic plans that one of the basic reasons behind creating NAC in Nepal is to generate employment opportunities and also reduce regional economic imbalances. It can, therefore, be observed that NAC is expected to pursue social objectives rather than the economic ones. It is more often noted that the "non-economic" considerations dominate the "economic" ones.

## 4. Analysis and discussion

### I. Utilization of aircraft (fleet wise in HRS:)

Aircraft utilization is a key performance indicator for airline operations and a significant differentiator for same business models. Aircraft utilization is a function of a number of elements, including aircraft design, features and characteristic, Airlines maintenance programs, aircraft technical reliability, airlines business philosophy, market demand characteristics and availability of trained and skilled labor. The status of aircraft utilization of NAC as against the revenue generation is still not very satisfactory as given in Table 1.

**TABLE NO.1 AIRCRAFT UTILIZATION (FLEET WISE IN HRS :) IN 2015**

FleetB-757&A-320	Annual operation (in days)	Total flights hours	Average per day flight HRS	Maximum per day fit HRS
9N-ACA	250	3,602.86	14.41	18
9N-ACB	179	1808.33	10.10	18
9N-AKX	185	1,387.27	7.49	18
9N-AKW	251	1,836.44	7.37	18

Source: Engineering Department NAC, Management, 2016

The above Table 1 shows that the aircraft of NAC utilization was calculated as the sum of block-to-block hours divided by aircraft days available. As per the standard set by ICAO the aircraft utilization on the basis of monthly and annual NAC stands much lower level. According to the definition, utilization of an airframe is calculated as a sum of block-to-block times of all flights which were realized during the observed period of time, i.e., the numbers of days in the month. Afterwards, for each aircraft daily value of utilization is calculated as sum of block-to-block times divided by the numbers of days in a month. Depending of the types of utilization analysis grouping, i.e., range, aircraft type, business model, Airlines philosophy and market segment, a medium value for all airframes per month was calculated and adopted as a representative utilization value for bench marking.

Capacity utilization is an important operational metric for airlines business and it's also a key economic indicator applied to aggregate productive capacity. Capacity is an important for assessing a company's current operating efficiency and it's helps to illuminate cost structure in the short term or long terms. A company with less than 100% utilization can theoretically increase production without incurring expensive overhead costs associated with purchasing new equipment or property.

From above table, the NAC has been operated it's four aircrafts in different sector during the period of 14April 2015 to13April2016.

The above Table 1 Shows that its maximum flights operation was 251 days per year and 14.41 hours for per day in operation and minimum for 179 days per years and 7.31 hours per day in the operation. NAC had been operating its aircraft since 32 years which is quite surprising to use such old age aircraft in international sector. Among the Boeing aircraft and airbus utilization rate the Boeing aircraft has higher rate of flight than the Airbus though Airbus is newer than Boeing.

Airlines operational plan aim to maximize profitability. Aircraft utilization is a key indicator which can be used to optimize planning for airlines schedules and thus increasing profitability. According to data given in Table 1 can be said as the number schedules of operating flights and Aircraft type, features, characteristics, maintenance programs airplane technical reliability, airlines business model or philosophy, market strategy, Demand, characteristics and availability of trained skillful main power plays important role for making profit.”

Optimizing airplane utilization, which includes efficient airplane turn-time at the gates, can help an airline maximize the large capital investment it has made in it's airplanes. Efficient airplane utilization requires close coordination among the airline's own fleet planning, schedules planning, passenger reservations, flights operation, ground operations and airplane maintenance system as well as with air traffic controllers and Airport authorities.

Low capacity utilization is concerned both for fiscal and monetary policy and its effective implementation still NAC is lacking for proper management, operation and utilization of aircraft operation which need serious concern for its development.

## **II. On time flight Performance/ Maintaining schedule**

On time performance is a measure of the ability of transport services to be on time. Almost all transportation systems have time tables, which describes when aircrafts have to arrive at scheduled stops. Transport services has higher utility where services run on time as anyone planning on making a use of the service can align their activities with that of the air transport

service system. On time performance is particularly important where service should be frequent that helps to people to maintain their time/schedule.

Usually airlines are closely monitored on their ontime performance. Typically on time performance is measured by comparing each service with its flight schedule. The on time performance is a key dimension of airlines quality. Airlines can choose to incur higher costs in order to improve on time performance. In this research we try to find out what's the actual on-time-performance situation of NAC? What is the punctuality and Reliability ratio of NAC flight? Table 2 shows the on-time flight performance of NAC

**TABLE NO.2 ON TIME FLIGHT PERFORMANCE: (ONLY KTM STATION) IN 2015/16.**

Fleet B-757 & A-320	Proposed number of flight	OPTD		Aircraft Change		ON Time	Delays	Cancelled	Reliability (%)	Punctuality (%)
		OPT same day	Post pond next day	TO other	From other					
9N-ACA	410	390	03	-	08	227	163	16	94.87	61.79
9N-ACB	186	185	05	01	05	118	67	04	86.75	57.55
9N-AKX	226	231	-	01	08	182	49	-	100.00	83.64
9N-AKW	318	309	-	10	02	260	49	01	94.44	85.97
Overall	1140	1115	08	12	23	787	328	21	95.24	72.23

Source: Operations Department of NAC, Management, 2016

The above table No.2 shows that NAC operations, Engineering & planning division proposed overall number of 1140 flight from KTM Station annually while 97 percent flight schedules were maintained and only three percent flight schedules were not maintained. All together 12 Aircrafts had been changed in that operation duration. Overall 787 No. of flight were departed on time, all together 328 No. of flight was delayed and 21 No. of Flight were cancelled due to different reasons. The Reliability rate of overall flights of this duration was 95.24% and punctuality rate was 72.23% NAC operated above all flight by their 4 Aircraft B-757 (2) and Airbus A-320 (2) in their international flight based upon the KTM station which was found on time performance. The data shows that Airbus is better performing than Boeing, 20:1.

It is natural that the airlines worldwide aim to maximize profitability. Facing worsening economic conditions airlines had to plan their operations in way to minimize losses. This can be achieved by improving quality of services particularly maintaining time schedule. However it depends on how to maximize time spent air bone (block-to-block-time) in comparison to the time they spend other ground (turn around phase of flight, technical checks, overnight stays etc.). Efficient scheduling have also a significant influence on aircraft utilization and on time performance. On the day of operation scheduled times may differ from the actual ones due to uncertainty and lack of predictability (route, weather, Notam etc.). This forces airlines to compromise for maintaining their schedules. During the operational day, airlines tend to

maximize block-to-block time and minimizing turnaround time. When fixing schedules very tightly, airlines have to handle the problems of delays due to very tight planning. The cost of delay is very high and varies depending of the length of a delay and whether it occurred on the ground or in the air.

Flight delays or flight cancellation rate determines the overall performance of aviation industry worldwide. On-time-performance is one of the key indicators of air transport service. It's always deals with reliability and punctuality. Punctuality is one of the key performance indicators in the airlines industry and an important service differentiator especially for valuable high-yield customers. (Allen and Hamiltorn,1999). In addition, improved on-time-performance can help achieve significant cost savings. Various research on performance of major Airlines suggests that there is a positive correlation between on-time performance and operating profit. In this similar phenomenon on-time performance leads to highest productivity, quality service, reliability and punctuality as well.

On-time performance depends up on the network planning and control of the management, aircraft availability, ground operations departure, process and arrival process, weather, Notam, (runway close) civil aviation policy and others variables as well. Despite the increasing attention that Nepal Airlines pay to punctuality the industry's on-time performance is still far below satisfactory levels. So that Reliability, punctuality, investment, turnover, utilization, planning, scheduling, operational and other performance targets need to be managed effectively.

### **III. Earning Capacity/Tariff & Revenue performance of NAC**

Aviation plays a significant role in the world today. It supports social and economic development in both emerging and established nations. The strong air travel helps to grow globalization of economics, air travel deregulation and technology and enhanced connectivity between cities (Airbus, 2009). According to Gonenc&Nicoletti (2008) quoted in (piermartini, R.; Rousava L; 2008) that international air passenger transport is an important factor in facilitating trade and development of other sectors of an economy. Trace Keith, FrielinkBarend, Hew Denis (2009) also mentioned that improved air connectivity through air transport links is an essential component of economic growth, as it provides personal access to the region for business, social or recreational purposes as well as physical access to resources and markets.

Performance is behavior evaluated in terms of its contribution to goals of the organization (Dalrymple et al, 2004; Johnston & marshal, 2003). Sales volume and profitability are among the most frequently used marketing performance (Kokkinaki&Amblier 1999; Ambler and kokkinaki 1997; Cark 2000). Financial performance measure of aircraft depend upon the economic viability, including directing cost comparison, ignore both of the non-cash elements and the time value of money. Aircraft investment out of general revenues to support overall economic development rather than the to produce profit. Operation performance focuses on financial performance such as profit ration and sales growth rate. No-financial performance factors, such as customer satisfaction, employee satisfaction and operating efficiency are important with company's future success. In this Research we can try to find out what the actual traffic and Revenue performance of NAC on the basis of financial performance which is given below on table No. 3

**TABLE NO. 3 TARIFF & REVENUE PERFORMANCE OF NAC**

S.N	Period of time for Revenue collection (in %) Station	17Jul. 2011 to 16Jul.2012	16Jul.2012 to 15Jul. 2013	16Jul.2013 to 16Jul.2014 2071	17Jul.2014 to 16Jul.2015
1.	KTM-BKK	4.35	5.08	4.78	4.64
2.	BKK-KTM	4.32	4.15	3.25	4.20
3.	KTM-DOH	5.03	11.48	16.60	14.01
4.	DOH-KTM	5.21	10.14	11.38	11.93
5.	KTM-DXB	3.34	0.41	-----	-----
6.	DXB-KTM	3.21	0.23	-----	-----
7.	KTM-HKG	11.68	11.19	10.59	11.19
8.	HKG-KTM	12.08	10.78	9.55	11.24
9.	KTM-KUL	22.74	22.76	26.63	20.60
10.	KUL-KTM	26.77	23.73	17.19	18.00
11.	KTM-DEL	0.65	-----	-----	2.46
12.	DEL-KTM	0.57	-----	-----	1.68
Total		100	100	`100	100
		3636525584	4551554201	4629989343	4624968831

Source: Commercial Department of NAC, Management, 2016

In above table No.3, NAC has been conducted/operating six countries within 6 international destinations in 2011. In this duration NAC earned highest revenue from KUL-KTM sector 22.74% and lowest from DEL-KTM Sector 0.57%. In the fiscal year 2011/12 Overall NPR-3636525584 Revenue was collected from international network or flight. Next fiscal year 2012/13, Also highest revenue earned from KUL-KTM sector 23.73% and lowest from DXB-KTM sector 0.23%. In this fiscal year all together (NPR-4551558201) revenue collected from international network. Again, Fiscal year 2013/14 also highest revenue collection through the KTM-KUL which is on 26.63% and lowest from BKK-KTM sector is only 3.25%. Overall NPR-4629989343 revenue collected from international flight network as a same fiscal year. At last fiscal year 2014/15 , Highest revenue collection through the KTM-KUL sector which is 20.60% and lowest from the DEL- KTM which is 1.68%. All together NPR-4624968831 revenue collection from Nepal airline international Network in the fiscal year 2014/15.

According to above data it shows that there is a growth trend of flight revenue but flight is going to be decreasing due to shortage of sufficient Aircrafts. Though Malaysia (KTM-KUL-KTM) sector is very high revenue earned sector of all of above fiscal years. Hong Kong (KTM-HKG-KTM) is the second profitable business revenue collection sector of NAC and Quarter (KTM-DOH-KTM) is the 3<sup>rd</sup> largest revenue collection sector of NAC and other sectors also satisfactory for revenue collection point of view.

In above analysis shows that NAC get satisfactory in terms of revenue collection from all the international Networks. Higher productivity of airline is the key to faster economic growth of an economy. There is still lacking of proper planning for capacity utilization, Aircraft utilization and expand its wings to other part of the world.

#### IV.NAC Capacity Utilization

Capacity is defined as the managerial and strategy system required for realization of performance improvement(Jas and Skelcher,2005).it is curious that does NAC able to utilize full capacity of the available seats in the international sector. The capacity of NAC and number of passengers flow is given in Table 4.

**TABLE NO. -4 PASSENGERS FOLLOW/CAPACITY UTILIZATION**

S.N	Sector	2011/12		2012/13		2013/14		2014/15	
		Available Seat	Used seats by PSG. (%)	Seat production	PSG.fl own(%)	Seat production	PSG.F low n (%)	seat production	psg flown (%)
1.	KTM-BKK	19950	54.27	19760	72.57	17860	78.67	19030	79.19
2.	BKK-KTM	19950	43.57	19760	45.38	17860	41.11	18964	55.05
3.	KTM-DOH	13624	86.52	33725	89.08	33921	84.58	32300	87.37
4.	DOH-KTM	14124	91.07	33193	83.11	32384	84.38	30062	81.37

6.	HKG-KTM	25944	71.97	26299	71.54	24440	64.09	25268	66.84
7.	KTM-KUL	52820	80.63	54150	87.93	55290	89.39	50730	79.64
8.	KUL-KTM	52440	82.22	53960	78.34	55480	67.37	50920	83.57
9.	KTM-DEL	9500	42.07	-----		-----		16914	70.36
8.	DEL-KTM	9500	37.76	-----		-----		16914	59.86
9.	KTM-DXB	13490	61.69	1805	65.54	-----		-----	
10	DXB-KTM	13395	68.72	1710	43.62	-----		-----	
TOTAL		260869	73.92	270682	78.37	26175	75.69	286520	76.44

Source: Commercial Department of NAC, Management, 2016

In above table No.4 shows that NAC, has been operating it's flight for 6 international countries within six destination all sector wise passenger was mention on table No.-6. In a fiscal year 2011/12. The total seat production for all sector overall, 260869 and occupancy was 192842 (73.92%). The highest seat production capacity was KTM-KUL (52820) and DOH-KTM was 91.07%. The highest passenger flown in KUL-KTM sector was 43117. During 2012/13 the total seat production capacity of NAC was 270682 and occupancy rate was 212124 (78.36%). In 2012/13 highest seat production capacity of NAC International Network also was KUL-KTM

which was 53960 and occupancy rate of passenger was KTM-KUL sector 87.95%. The lowest seat production sector of this year was KTM-DXB only for 0.35% But after their few time flight was withdraw due to shortage of Aircraft so that KTM-DXB-KTM and KTM-DEL-KTM both sector flight schedule remove from it's international network. Again, Fiscal 2013/14, NAC only operate it's Flight for only 5 international countries within five destinations. In this year total number of seat production capacity of all of above international network of NAC was 2626875 and occupancy capacity was 198080. Both of capacity of this year decreasing than previous fiscal year due to shortage of Aircraft. In this year highest seat production capacity of KUL-KTM sector 55480 and highest occupancy rate passenger was KTM-KUL sector which is 89.39% and lowest seat production form KTM-BKK was 17860 and occupancy rate of BKK-KTM sector which was only 41.11%. At last fiscal year 2014/15 the total number of seat production capacity of NAC from its international network was 286520 and occupancy rate or passenger follow of 75.69% which was greater than previous all years. The highest seat production capacity of these fiscal years was KUL-KTM 50920 and Highest occupancy rate of KTM-DOH sector was 87.37%. The lowest seat production capacity of this year was KTM-DEL-KTM 16914 and occupancy rate of BKK-KTM sector was (DEL-KTM) 55.01% because of KTM-DEL-KTM flight only re-launching or started from 27 feb2015.

Passenger follow of Airlines is of almost importance for the overall growth of the economy of Airlines. Seat production capacity is an importance productivity of any Airlines. Seat selling capacity or marketing capacity/ strategy only determinants the load factors of Airlines industry. The High level of load factors or occupancy rate determinants to the capacity utilization of Aviation industry. High capacity utilization leads to be high productivity and high productivity lead to be high performance of any organization.

The above phenomenon shows that seat production capacity utilization depend up on the marketing policy or strategy of the organization. So that, NAC also need to focus on online sells, online booked, online check-in, frequent flyer card and priority (facilities), firm issued, pay by credit card, mobile team for capacity sells, code sharing, transit connection management and provide for different skills for regular passenger (like; buy two get one free, etc.) and also need to be improve their regularity, reliability punctuality, aviation safety and security as well.

#### **V. Operational performance of NAC:**

Operational performance occupies a significant place in the performance evaluation of airlines. Operational performance determinates to the financial profitability, with regard to the financial performance, shows its "ability to earn profits proves a measure of its market strength it is ability to keep down costs. (Operation)". Profitability also affects the amount of investment, for much industrial investment is financed out of reinvested profits and hence the contribution of the firm to the overall growth of the economy (Killick, 1983, P.183). Capacity utilization depend upon the operational performance so that in this research try to find out the what is the actual operation performance of NAC in their different fiscal years which is given below on table No.-5.

**TABLE NO.5 OPERATIONS PERFORMANCE OF NAC**

S. N	Station Sector	2011/12			2012/13			2013/14			2014/15		
		Flt as per schld	No. of flt.opt.(%)	No. of flt.xx D.(%)	Flt as per schld	No. of flt. opt.(%)	No. of flt.xx D.(%)	Flt as per schld	No. of flt. opt.(%)	No. of flt.xx D.(%)	Flt as per schld	No. of flt. opt.(%)	No. of flt.xx D.(%)

Source: Operations Department of NAC, Management, 2016

The table No.5 shows that Nepal Airlines corporation has purposed 2363 flight to upgrade its overall performance. This could help to maintain schedules in the international network. As mentioned earlier all together 72.24 % of flight were operated as a same day and overall 27.76 % of flight were cancelled due to different reasons. In 2011/12, all together 1591 No. of flights proposed as per schedules but only 92.39% of flights were operated as a same day of flights schedule but 7.61% flights were cancelled in 2012/13. Again, fiscal year 2013/14, Overall 1687 No. of flights on proposed as per it's schedules but only 82.34% of flight were operated as the same day but 17.66% of flights were cancelled as same duration. Alltogether 1799 No. of flights on their schedule but only 86.33% of flights were operated and 13.67% of flight were cancelled in the duration of last fiscal year 2014/15.

When discussing the overall performance of NAC it is still a regular phenomenon that flight cancellation rate is still high due to some sorts of technical reason, having old aircraft, insufficient management and operational ability, lack of skills or trained skillful manpower planning, lack of proper planning & management, various fleets of aircraft utilization, lack of proper resource planning and other natural phenomenon, etc.

#### VI. NAC performance of Domestic Sector

NAC started its preliminary business from the domestic market. Before coming of different private airlines, NAC was only one entity to deliver air service in Nepal. During late 1980s the number of aircrafts for domestic sector was quite high. After enacting the deregulation Act 1992, the domestic sector by NAC got less attention. At present it has 6 aircrafts which provides air transportation service various destinations of the country. The number of passengers who used RA and the volume of revenue generated from domestic sector which is given in the following Table 6.

**TABLE NO .6 REVENUE & PASSENGER FLOWN PERFORMANCE OF DOMESTIC SECTOR**

S.N	Region	2011/12		2012/13	
		Total passenger flown	Total revenue (%)	Total passenger flown	Total revenue (%)
1.	Central Region	35105	45.80	24139	53.99
2.	Eastern Region	16228	31.91	23874	27.60
3.	Western Region	9807	22.30	12082	18.40
Domestic Total		61140	100	60095	100
		-	2429377172	-	249265971

Source: Commercial Department of NAC, Management, 2016

The Table.6 shows that altogether 61140 passengers used RA to travel their respective destinations. From the domestic air service total NPR-242397172 was earned in 202011/12. The rate of passengers flew in central region (35105) and revenue collection also highest at same sector (111277189) and lowest passenger flown from the eastern region (9807) and revenue on NPR-54179997 only. Again in 2012/13 altogether 60095 No. of passenger flown and NPR-249265971, revenue collection from its domestic networks.

In above situation analysis, NAC flight operation situation in domestic network is not much satisfactory and revenue collection was not satisfactory. NAC also have some sorts of social and co-operative responsibility in the society and nation, i.e., being the state owned air service, RA has also employ subsidized rate in remote places like Jumla, Humla, etc.

#### VII. Operational performance of Domestic Sector

Higher productivity of airline industry is the key to factor of economic growth of an economy. The financial performance of airline depend up on the operating capacity of airlines which is determinants by operational performance so that, operation performance is very important factor for overall productivity of/or performance of any airlines (see Table 7)

**TABLE NO. 7 OPERATIONAL PERFORMANCE OF DOMESTIC SECTOR**

2011/12					
S.N	Region	Flights as per schedule	No. of Schedules flight operated (%)	No. of flight cancelled (%)	Total (%)
1.	Central	1384	88.05	11.95	100
2.	Western	2016	80.10	19.90	100
3.	Eastern	1457	87.98	12.02	100
Total		4857	84.72	15.28	100

Source: Operations Department of NAC, Management, 2016

Table 7 shows that during 2011/12 scheduled domestic flights were 4857 but NAC managed only 84.72% of flights to operate. It shows 15.28% of flights were cancelled which is quite alarming. Western Region proposed 2016 No. of Flight as per schedule but only 80.10% of flights were operated in the given period. The cancellation rate of domestic flight in the Western region was 19.90% which was highest in the domestic sector as the reference year. All together 1384 No. of flights as per schedule in central region only 88.05% of flights were operated and 11.95% of flights were cancelled on their given duration .

From the above phenomenon, it can be said that NAC domestic flight cancellation rate is quite high which also affect total revenue earning from the domestic sector. This leads to be loss day to day, i.e., there is lack of efficient and effective flight operational performance in domestic sector.

### VIII. Capacity Utilization in Domestic sector

Capacity is defined as the managerial strengths which require for realization of performance improvement (Gas & skelcher, 2005 cited by Jentabead, 2013 P.1). Organization capacity and capability utilization in Airline determine the overall productivity and performance of airline. Organization capacity covers the study of the capacity within the organization level (child & Falkner, 1998; Finder & Brand, 1999). Table 8 discusses to find out the actual capacity utilization situation of domestic sectors Nepal airlines in Nepal.

**TABLE NO. 8 CAPACITY UTILIZATION IN DOMESTIC SECTOR**

S.N	Region	Total seat production	Passenger flown / capacity utilization	In %
1.	Central	20203	17103	84.65
2.	Western	22129	19987	90.32
3.	Eastern	25375	24147	95.16
Total		67707	61237	90.44

Source: Commercial Department of NAC, Management, 2016

The above Table 10 shows that average 90.44 percent of the domestic sector available seats were utilized in the reference period. When analyzing region-wise it was found the highest utilization rates was in the Eastern region sector compared to other Western and Central Development regions. From this situation it can be said that the percentage of capacity utilization was good but still unable to run in full condition need to planning for maximum capacity utilization in Nepal.

**IX. Status of profit and loss situation of NAC**

Different indicators over the last 10 years, i.e., from 2007 to 2017 shows performance of NAC is in the negative trend especially in case of cumulative loss (See Table 9).

**TABLE 9: CUMULATIVE P/L OF NAC**

S. N	Indicator of PM	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017
1	Net profit /loss(in lakh)	117	3421	(1970.59)	300.16	1262	203.11	200	3105.26	624	2140	433
2	Cumulative loss/profit	(23208)	(15663)	(17634.51)	(16661.92)	(15575)	(19212.18)	(15614)	(11044.56)	(17.4545)	(18858)	(18209)
3	Final audit	2001/2	NA	2005/6	NA	NA	2007/8	NA	2012/13	NA	2016	NA
4	Employees	1417	1472	1412	1369	1426	1411	1411	1273	1239	1328	1265
5	Gross operating income	41615	NA	33128.34	NA	NA	52992	59448	NA	68368.48	78888	NA
6	Total expenditure	44329	NA	35098.93	NA	NA	51717	58440	NA	64789.17	76036	NA
7	Operating profit	(2714)	NA	(1970.59)	NA	NA	1275	1008	NA	NA	NA	NA
8	Other income	2831	NA	NA	NA	NA	267	802.00	NA	NA	NA	NA
10	Loan from GON.	678	764	679.00	764	NA	3693	3493	35486	5193	5693	5893
11	From Banks and financial institution	7628	7310	10692.54	9299.8	NA	12153	11961	103319	10491	10799	114396
12	Net profit ratio	NA	NA	(6.01)	NA	0.57	0.35	0.34	NA	NA	NA	NA
13	Seat factor	NA	72.42	70.0	84.3	NA	80.35	NA	NA	NA	NA	NA
14	Load factor	NA	73.32	72.0	69.2	NA	79.0	73.92	78.37	75.69	76.44	NA

Source: GoN/MoF, Annual Performance status of Public Enterprises, Kathmandu

Over the analyzed period net profit shows positive trend except in 2009, however, the cumulative loss accounted to 1820.9 million in 2017 which was 2320.8 million in 2007. This shows there is slightly improving, but still could not manage to make profit. One of the main reasons to have such huge loss was due to the inappropriate decision for leasing Chase Air which added unnecessary liabilities to NAC. So NAC still could not buy additional aircraft on the contrary, growth of nonproductive expenses such as salaries other administrative expenses could not control. However, NAC started to curtail around 7 percent employees from 2014. NAC has also taking loans both from GoN and other banking institutions to maintain its annual capital and regular expenditures. In case of not taking enough attention to control the unproductive expenses, the loan financing would be suicidal to NAC's future. From this discussion it can be argued that NAC's financial performance is shaky and need to improve.

### **5. Causes of Poor Performance**

The government adopted privatization of airlines industry mainly to bring private sector to expand more air services in the country. NAC was also not able to fulfill the demands of air services to both international and domestic due to the lack of sufficient number of aircrafts. It can also be said government has given little or no attention to expand NAC's capacity enhancement. In addition weak management and politicization for recruitment of executives and among the employee for managing RA also affected to enhance the capacity which directly or indirectly affect the performance of NAC. How to development its capacity for improving performance of NAC has become challenging in Nepal. Of course there is enough opportunity to capture the demands of air services as RA occupies only 10 percent of total air service demands in Nepal.

### **6. Challenges of NAC**

NAC (existing Royal Nepal Airlines) was established long ago like other airlines in Thai airways, Singapore airlines, etc. and gaining good experiences among the technical and other employees. The expansion of airlines market has also been steadily growing; having full ownership of the government could be very helpful to have higher success of NAC. But due to a number challenges NAC could not achieve satisfactory results. Some of the key challenges are NAC has to compete with other mega carriers particularly the foreign airlines, having limited aircrafts, absence of smart management of NAC, having diverse nature of aircraft added for efficient fleet operation, unnecessary intervention from the politics, and increasing financial loss over the period.

### **7. CONCLUSION**

Performance of Nepal Airlines Corporation in this article is discussed on the basis of resource utilization capacity, on time performance capacity, seat production capacity and passengers flown rate, Financial performance, revenue collection tendency, flight delays, postpone and cancellation tendency including safety, security, reliability and punctuality rate. In addition it also take into account the social recognition and image/goodwill of the carrier as the important factors which depend upon airlines performance.

With regard to aircraft utilization it was found annual flights were taken place maximum 251 days to minimum 179 days and in terms of hours/per day it was maximum 14.41 hours to only 7.37 HRS per day during the reference years. Such tendency indicates low level capacity

utilization of NAC. Analyzing on time flight performance it was found to be 70.58% on time, 29.42% delays and 1.88% of flight were cancelled. This indicator shows that still NAC has not been managing on time flight performance. Such tendency is reliability and punctuality is not very much encouraging.

The data shows the traffic & revenue performance of NAC has been increasing despite the decreasing trend of flight schedule.

The data of NAC for the last four years shows that there is uneven growth of passenger flown rate and occupancy rate which gives unsustainable growth of NAC. With regard to operational performance, i.e., financial profitability of NAC has been improving. The ground handling service has significantly contributing to improve financial profitability of NAC, which however, operational performance of RA flights is still not satisfactory.

Despite NAC has bright future as it is only the national carrier which is taken as nation's pride, and also the demands of air services both in domestic and international markets has been increasing the performance of NAC is not that expected level. There is also a tendency of promoting the national carriers such as Belgium air, Swiss Air, Qatar airways, Thai Airlines, Air India, etc. NAC has not getting enough attention by the government in Nepal. By promoting the national flag carriers, the chances of promoting tourism, developing and balancing foreign trade, providing more air services to the people, etc. would be achieved. For this, improvement of performance of NAC is the primary requirement.
