(Affiliated to Kurukshetra University, Kurukshetra, India)

**ACADEMICIA**

An International Multidisciplinary Research Journal

ISSN (online) : 2249 –7137

Editor-in-Chief : Dr. B.S. Rai

Impact Factor : SJIF 2020 = 7.13

Frequency : Monthly

Country : India

Language : English

Start Year : 2011

Indexed/ Abstracted : Scientific Journal Impact Factor (SJIF2020 - 7.13), Google Scholar, CNKI Scholar, EBSCO Discovery, Summon (ProQuest), Primo and Primo Central, I2OR, ESJI, IJIF, DRJI, Indian Science and ISRA-JIF and Global Impact Factor 2019 - 0.682

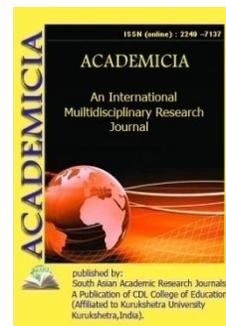

E-mail id: saarjournal@gmail.com

**VISION**

The vision of the journals is to provide an academic platform to scholars all over the world to publish their novel, original, empirical and high quality research work. It propose to encourage research relating to latest trends and practices in international business, finance, banking, service marketing, human resource management, corporate governance, social responsibility and emerging paradigms in allied areas of management including social sciences , education and information & technology. It intends to reach the researcher's with plethora of knowledge to generate a pool of research content and propose problem solving models to address the current and emerging issues at the national and international level. Further, it aims to share and disseminate the empirical research findings with academia, industry, policy makers, and consultants with an approach to incorporate the research recommendations for the benefit of one and all.

## 1.0 INTRODUCTION

The performance review or performance review meeting is only one part of an overall strategy for improving performance that we call performance management (Bacal, 2004). PA is one of the most functions of HRM and the term 'PA' is concern with identifying, measuring, influencing and developing job performance of employees in the organization in relation to the set norms and standards for a particular period of time in order to achieve various purposes (Opatha, 2002). Management is a dynamic process, while appraisals are part of performance management. Therefore, without appraisals management becomes difficult. (Rao, 2004). Effective and Timely feedback during the performance appraisals period addressing employee performance on elements and standards is an essential component of a successful performance management program (US Department of the Interior, 2004). The evaluation of organizational and employee performance permits managers to check that strategic business objectives are valid, are being successfully communicated throughout the organization and are being achieved. Performance appraisals are important for staff motivation, attitude and behavior development, communicating and aligning individual and organizational aims, and fostering positive relationships between management and staff. Organization need ever-improving performance to survive and prosper in today's competitive world: individual and organizational performance improvements are keys to competitive advantage.

### 1.1 Research Problem

Performance appraisal systems are critical among the most important Human Resource practices and also a comprehensively discussed research topic. It is an integral part of any organization. Appraisals help to develop individuals and improve organizational performance. Performance appraisal system is important for an organization, as it helps organization ensuring employees are working hard to contribute to achieving the organization's mission and objectives. Performance appraisal system sets expectations for employee performance and motivates employees to work hard in ways that is expected by the organization. Moreover, performance appraisal system provides a completed and professional management process for organizations to assess the performance results of organizations and employees. Employee motivation could be expected, assessed and encouraged. Macky and Johnson (2000),pressed that the importance of performance appraisal system is on continuously improving organizational performance, and this is achieved by improved individual employee motivation. Therefore, improving employee motivation by using performance appraisal system is away to improve organizational performance. Thus, research problem of this study is to identify the relationship between performance appraisal systems and the motivation of non-academic staff in university of Jaffna.

### 1.2 Research Objectives

- To identify what is the relationship between performance appraisal system and motivation of non-academic staff in university of Jaffna.
- To find out the impact of performance appraisal system on motivation of non-academic staff in university of Jaffna.

## 2.0 LITERATURE REVIEW

Performance Appraisals (PA) are essential for the effective management and evaluation of staff. There are two types of terms referring to performance appraisal; one type is referred to as the

academic terms while other is referred to as practical terms. Terms like performance appraisals, merit rating, employee assessment, employee evaluation and performance rating are considered as academic terms while the terms such as confidential report, annual report, increment report and company report are identified as practical terms used by industry practitioners (Opatha, 2002). Judge and Ferris (1993) mentioned that, accurate appraisal of the performance of employees has long been regarded as a key to organizational success. Appraisals help to develop individuals and improve organizational performance. Performance management is a continuous process. Appraisals are periodic activities. Performance management can be defined as a systematic process for improving organizational performance by developing the performance of individuals and teams. It is a means of getting better results by understanding and managing performance within an agreed framework of planned goals, standards and competency requirements (Armstrong, 2006).

The overall aim of performance management is to establish high performance culture in which individuals and teams take responsibility for the continuous improvement of business processes and for their own skills and contributions within a framework provided by effective leadership (Armstrong, 2006). Performance appraisal can be defined as the formal assessment and rating of individuals by their managers at, usually, an annual review meeting.

Performance management is a continuous and much wider, more comprehensive and more natural process of management that clarifies mutual expectations, emphasizes the support role of managers who are expected to act as coaches rather than judges, and focuses on the future (Armstrong, 2006) According to him, Performance Appraisal tended to be backward looking, concentrating on what had gone wrong, rather than looking forward to future development needs.

The true role of the performance management is to look forward to what needs to be done by peoples to achieve the purpose of the job, to meet new challenges, to make even better use of their knowledge, skills and abilities, to develop their capabilities by establishing a self-managed learning agenda, and to reach agreement on any areas where performance management need to be improved and how that improvement should take place (Armstrong, 2006).

## **2.1 Empirical Studies**

Performance appraisal has been regarded as the most critical human resource function within organizations by which assessors or supervisors analyze and assess performance of their subordinates (Keeping and Levy, 2000). the outcomes of performance appraisal assists managers to select specific pay rates, promotional decisions, development and training needs and motivational factors for employees (Zapata-Phelan et al., 2009). In this regard, performance appraisal system has been widely researched within organizational psychology to assess employee performance. However, despite of resources applied and attention made to this particular topic, prior researchers have found continuing dissatisfaction among employers and employees about outcomes of performance appraisal systems in terms of unfair, inaccurate and political outcomes (Rao, 2004; DeNisi and Pritchard, 2006). Therefore, it is important to study the factors affecting outcomes of performance appraisal system.

Literature has identified several indicators that affect the outcomes of performance appraisal system. In this regard, one critical factor is the appraisal source. This factor suggests that employee performance can be evaluated through multiple sources such as supervisors, managers, self, peers and even customers (Wood and Marshall, 2008). Another important characteristic of

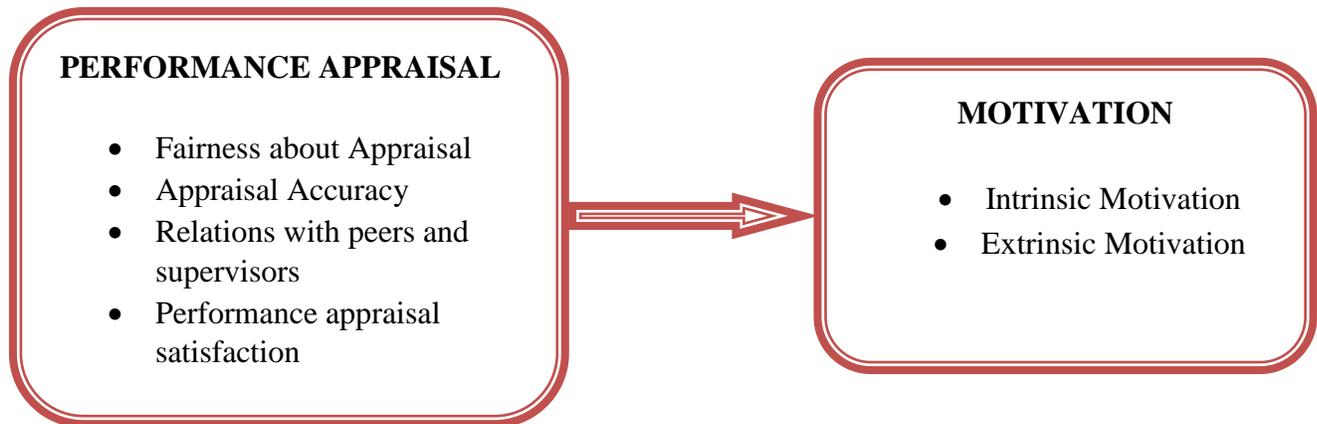

performance appraisal is the purpose for which performance has been appraised or evaluated (Thurston, 2001), and typically, performance appraisal systems are utilized for multiple purposes ranging from developmental and administrative purposes. Feedback richness is also an effective indicator that may affect the outcomes of performance appraisal. Feedback richness elaborates the specific appraisal environment by which frequent, specific and timely feedback is provided by employees to employers regarding job (Kinicki et al., 2004). Perceived accuracy of performance appraisal has been regarded as an important aspect to evaluate the satisfaction and motivation in employees in relation to performance appraisal (Wood and Marshall, 2008; and Selvarajan and Cloninger, 2009). In this regard, prior studies suggest that if employee perceive that appraisal outcomes are accurate, they are more likely to recognize these results and act on them (Roberson and Stewart, 2006).

On the other hand, employee perception of fairness also measures effectiveness of performance appraisal outcomes (Young court et al., 2007). In this respect, previous studies have suggested that justice or fairness of performance appraisal can be evaluated into three dimensions. These are distributive, interactional fairness and procedural (Colquitt et al. 2001). In this regard, distributive fairness represents the extent to which outcomes of appraisal are distributed fairly (Smither and London, 2009). In the appraisal context, the distributive context relates with the ratings of performance appraisal gained by employees. On the other hand, procedural fairness aims at the extent to which procedures deployed by organization for appraisal are fair in deriving outcomes of appraisal (Zapata- Phelan et al., 2009). Contrary to this, the concept of interactional fairness represents the extent to which employees receive treatment of peers and supervisors during the process of appraising performance (Roberson and Stewart, 2006). Prior studies about meta-analysis of performance appraisal and perceptions of justice suggest that it enhances performance and satisfaction of employees (Roberson and Stewart, 2006). On the contrary, appraisal satisfaction represents the contentment of employees with the results of appraisal system. Levy and Williams (2004) suggest that analyzing employee satisfaction is important as it determines reactions of employees towards appraisal. Contrary to this, motivation represents the degree to which employees are willing to make improvements in their performance (Roberson and Stewart, 2006). Some authors suggest that perceptions about fairness hold a critical importance within organizations because it avoids negative outcomes such as disruptive behaviors and employee turnover and also enhance positive outcomes of organizations such positive citizenship, commitment and satisfaction with the job (Selvarajan and Cloninger, 2009).

Thurston (2001) has addressed the specific aspects related with performance appraisal and also reveal that effectiveness and success of appraisal system depends on reactions and feedback of employees. This suggests that employee feedback is critical factor in assessing effectiveness of appraisal system. This feedback can be positive or negative regarding outcomes of appraisal system. Prior studies have revealed that positive feedback is more likely to be accepted whereas employees often hesitate to accept negative outcomes of appraisal system (Rao, 2004). On the other hand, Roberson and Stewart (2006) suggest that if negative feedback is delivered in an effective and persuasive manner, employees will take it seriously and will focus on eliminating the negative aspects in their performance.

### 3.0 Research Methodology

#### 3.1 Conceptual Model

Source : Develop by Researcher

#### 3.2 Research Hypotheses

- H<sub>1</sub>: There is a significant relationship between performance appraisal system and motivation of non-academic staff in university of Jaffna
- H<sub>2</sub>: There is a significant impact of performance appraisal system on motivation of non-academic staff in university of Jaffna.

#### 3.3 Population and Sample of the Study

Population of this research is all the non-academic staff in university of Jaffna. Simple random sampling method was adopted to select respondents. The 36 non-academic staff was considered for the survey to collect data to examine impact of performance appraisal system on motivation of non-academic staff in university of Jaffna.

#### 3.4 Data collection procedure

Primary data were collected using questionnaire. Questionnaires were distributed by the researcher individually. Each completed questionnaire was checked immediately, and was entered for data analysis.

#### 3.5 Data analysis

Data analysis strategy in this study consists of both descriptive statistical analysis and inferential statistical analysis in addition to test of reliability the measurement scales. The Statistical Packages for Social Science (SPSS) version 21 was used for data analysis. Firstly all variables were assigned with names and coded for computer entry. Secondly, all the responses were coded to facilitate computer data input.

## 4.0 RESULTS AND DISCUSSIONS

### Reliability

Variables	Cronbach alpha	No of items
Fairness About Appraisal	.703	04
Appraisal Accuracy	.855	03
Relations With Peers And Supervisors	.758	04
Performance Appraisal Satisfaction	.841	03
Motivation	.859	14

Cronbach alpha is most widely used method for checking the reliability of scale. It may be mentioned that its value varies from 0 to 1 but, satisfactory value is required to be more than 0.6 for the scale to be reliable (Malhotra, 2002). Present study satisfies the reliability measures requirement in this study.

### Correlations Analysis

Correlations		
		Motivation
Performance Appraisal System	Pearson Correlation	.572**
	Sig. (2-tailed)	.000
	N	36
**. Correlation is significant at the 0.01 level (2-tailed).		

Correlation analysis was carried out to find out association among the variable based on the value of correlation. The performance appraisal system and motivation are significantly correlated at 0.05 significance level. ( $r = .572^{**}$ )

### Regression analysis

Model Summary				
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.572 <sup>a</sup>	.327	.288	.41044
a. Predictors: (Constant), Performance Appraisal System				

### ANOVA

Model		Sum of Squares	Df	Mean Square	F	Sig.
1	Regression	4.184	3	1.395	8.278	.000 <sup>b</sup>
	Residual	8.592	51	.168		
	Total	12.775	54			

a. Dependent Variable: Motivation

b. Predictors: (Constant), Performance Appraisal System

Regression analysis was carried out to test the impact of performance appraisal system on motivation of non-academic staff in university of Jaffna. Here performance appraisal system is the independent variables and motivation is dependent variable. Model summary table indicates, we can observe that performance appraisal system is influenced by motivation by 32.7%, which is significant at 0.01 levels.

## 5.0 Conclusions and Recommendations

### 5.1 CONCLUSIONS

The results of the study support to confirm the prediction made by the researchers regarding a significant and positive relationship between performance appraisal system and motivation. Results confirm that there is a positive relationship between those variables.

### 5.2 Recommendations

According to the conclusions researcher has found that performance appraisal system is at moderate level. In order to improve the performance appraisal system up to high level it is necessary to develop dimension relating to performance appraisal system, and also motivation should be increased further. In order to do that researcher suggests following recommendations. Appraisal process has been dealing with much of paper works it has to be reduced as possible by using computerized appraisal system through the network and also there should be online filling system for filling appraisal forms. It is necessary to develop and communicate relevant goals for the year before starting the evaluating year that is beginning of the year. Evaluators need to pay much more consideration regarding the goals to be achieved through their subordinates. At least semi annually evaluation should be done. Appraisers and Appraisees should be trained properly about how to carry out a proper evaluation without any biases that are lead to create wrong results about motivation Performance Evaluation results should be used further to take important decision like promotions, increments, training need identification etc.

**ABSTRACT**

*The article considers the current state and development of the poultry industry on the example of Surkhandarya region. The research describes the main trends in the development of poultry. Comparative and dynamic statistical methods of statistics using local statistical data were widely used in the course of the research work. In particular, feathers are used in the production of household goods, toys, fishing gear and poultry feed. Poultry manure is a valuable fertilizer in the wet state. In addition, dry poultry manure is used in the production of mixed fodder in an unconventional way.*

**KEYWORDS:** *Market Economy, Agriculture, Animal Husbandry, Food Security, Poultry, Broiler, Agricultural Enterprises, Farms, Economic Efficiency, Product Cost, Export, Import, Dynamics, Population, Living Standards, Employment.*

**INTRODUCTION**

Today, the country is taking consistent measures to further develop the poultry industry and increase the volume of production of finished products for export and expand the range of products, as well as to provide the population with quality and affordable poultry products.

We can see that the Resolution of the President of the Republic of Uzbekistan Sh.M. Mirziyoyev dated November 13, 2018 "On additional measures for further development of poultry" and a number of decrees and resolutions of our government on the development of poultry pay great attention to the development of this sector. In his Address to the Parliament, the President of the Republic of Uzbekistan noted that "... we must sharply increase the volume of food production through the development of poultry."

Poultry is one of the most important branches of animal husbandry, which provides the population with dietary food products (eggs and poultry), industry with raw materials (feathers, feed). Poultry manure is also a valuable organic fertilizer for growing agricultural crops. The poultry industry is a low-cost, market-oriented, cost-effective sector, which plays an important role not only in improving the living standards of the population, but also in providing employment. Therefore, there is a need for a comprehensive economic statistical analysis of the development of the poultry industry.

## **MATERIALS AND METHODS**

The development of the poultry industry has been studied by a number of foreign and local scientists using economic statistical methods. In particular, E. Darde developed a methodology for statistical analysis of the livestock sector, which divided livestock enterprises into three categories: agricultural enterprises, farms and households, and in its analysis used the methods of statistical grouping, comparison and dynamic analysis of statistics [4].

N.Bykova widely used statistical methods in studying the role of the poultry industry in ensuring national and regional food security [3].

N.Bykova widely used statistical methods in studying the role of the poultry industry in ensuring national and regional food security [3].

L. Gulyaev used the methods of dynamic, monographic and comparative analysis of the current state and development trends of the poultry industry [5]. The author considers the widespread use of a cluster system, which covers the process from the cultivation of poultry products to its sale, as well as the deep processing of poultry products as a necessary factor in the development of this industry.

One of the scientists of our country, H.R. Rakhmankulov used typological and analytical grouping, dynamic, comparative and monographic analysis methods in the study of reducing the cost of production and increasing the profitability of farms in the livestock sector in Surkhandarya region. Livestock farms were divided into state farms, collective farms, and specialized poultry farms [7].

V.I. Nechaev analyzed the current state and main trends in the development of the poultry industry and the poultry market in the Russian Federation using the main methods of statistics. In this analysis, three categories of poultry farms: agricultural enterprises, population farms and dekhkan (farmer) farms were carried out over the years [6].

Based on the above considerations, we consider it expedient to implement comparative and dynamic analysis of three categories of poultry farms in Surkhandarya region: agricultural enterprises, farms and households, taking into account the specifics of the development of this sector in the development of the poultry sector.

It is known that poultry eggs and meat are used for food purposes. Eggs are made primarily from chicken, quail and tsesarka. Eggs contain the most important nutrients and biologically active substances for human health. According to experts, poultry eggs contain 13% protein, 11% fat, 1% mineral and vitamin complex. In terms of nutrition, 10 chicken eggs weigh 0.8 kg. corresponds to beef. Eggs contain about 85% water, the rest is pure protein, vitamins and enzymes. Poultry egg yolk contains 52% water, 32% fat and about 16% protein.

Poultry is also distinguished by its high nutritional and dietary qualities. The highest quality poultry is obtained from broilers. They are grown on specialized farms. The white meat of broilers contains 20% nutritious protein, 1-2% fat, 92% essential amino acids. Therefore, in developed countries, more attention is paid to the cultivation of broilers in conditions where the feed base is limited.

In addition, poultry by-products are also widely used in industry. In particular, feathers are used in the production of household goods, toys, fishing gear and poultry feed. Poultry manure is a valuable fertilizer in the wet state. In addition, dry poultry manure is used in the production of mixed fodder in an unconventional way. It contains many vitamins and minerals that are part of a mixed diet. Incubation and slaughter wastes are also used in the production of mixed fodder.

When there are sufficient conditions for the development of poultry, there are specific features that determine the economic efficiency of poultry development:

- Poultry farming is one of the fastest growing industries. It is characterized by high rates of reproduction of poultry, low consumption of material resources per unit of output and low labor costs;
- Due to the low level of seasonality, it is possible to evenly distribute the volume of production and sales of poultry products throughout the year, which is important in the context of inflation;
- Since poultry products are a basic necessity, the demand for them will always be stable, regardless of the economic and political situation in the country;
- Eggs and poultry go directly into the process of trade and processing, so there is no direct supply and demand for it;
- Poultry farming is a sector that is quick to adapt to sharp changes in production compared to other livestock sectors, as the number of poultries is not so dependent on the size and quality of land;
- In foreign experience, the main producers of poultry products are specialized enterprises (poultry factories), which can produce the bulk of poultry products. The production process in these enterprises covers everything from the incubation process of eggs to the feeding process;
- Poultry feeding is mainly carried out at the expense of purchased feed (mixed and vitamin-fortified feed), so the development of this industry is closely linked to the grain market and the volume of mixed feed production.

Poultry farms have four sectors, as in the Commonwealth countries: egg, meat, egg-meat and breeding.

In our country, as in other countries of the world, chickens are mainly used in poultry. They make up almost half of the total poultry in the world, providing 95% of eggs and 85% of poultry meat.

At present, Surkhandarya region produces 194 eggs per capita, compared to 221 at the national level. According to international standards, the consumption of eggs is 219, the national consumption is 112. Currently, egg production in our country is at the level of international standards, and more than 109 eggs are produced above national standards.

In 2019, the country produced 221 eggs per capita, while in Kazakhstan this figure was 236 in 2013. Today, Uzbekistan has developed a national norm of consumption of eggs and poultry: 121 eggs and 9.6 kg of poultry per capita.

The demand for eggs in our country is mainly met by domestic production. That is, 80% of the product is exported to the domestic market and 20% of the product is exported to the foreign market. The level of poultry production currently remains dependent on imports.

According to the Food and Agriculture Organization of the United Nations, the average world meat consumption is 38.7 kg.

In the ranking of world meat consumption, Uzbekistan ranks 120th out of 177 countries with a population per capita of 25.8 kg. According to medical standards, a person should consume an average of about 60 kg of meat per year (160 grams per day), while consuming 28 kg per year is equivalent to 75 grams per day.

Uzbekistan produces 43 kg of live weight meat per capita. According to medical standards, it should weigh 55-58 kg, which lags behind neighboring Kazakhstan and Kyrgyzstan.

Poultry farming is slowly transitioning to a path of rapid development. In our country, according to national traditions (meat consumption consists mainly of mutton and beef), the level of consumption of poultry meat lags behind. The average consumption of poultry meat in Kazakhstan is about 35 kg, in Turkmenistan - 12 kg, in Kyrgyzstan - 6 kg, in Uzbekistan - 5.8 kg, and in Tajikistan - 3 kg. Given the increase in the price of beef and mutton, we can also observe an increase in the consumption of poultry meat.

The main objectives of the statistical study of poultry are:

- to determine the level of development of poultry, their individual branches and the processes that take place in them;
- coverage of the status and development of poultry farming in individual agricultural enterprises, their groups and various economic categories operating in the poultry sector;
- study of the situation with the placement of poultry in the regions of the country;
- assessment of the conditions of production of poultry products and identification of reserves to increase the volume and improve the quality of poultry products;
- to determine the place and role of poultry in the agro-industrial complex, including the livestock sector.

The system of poultry statistics should always provide a reliable and comprehensive coverage of the state of the industry, reveal the laws of its development and the most important interrelationships, assess production efficiency and regulatory measures, reveal existing imbalances, eliminate them and use available resources.

This system primarily covers two specific indicators:

1. Indicators of the number of heads of agricultural poultry - indicators of quantity, composition, quality, movement and use. This is the need for constant updating (care) of farm poultry, which requires the study of specific indicators of herd reproduction.
2. In accordance with the indicators of gross output of poultry (volume, composition, quality, formation and movement), productivity of poultry, yield and productivity of grain crops.

Poultry farming is mainly concentrated on specialized poultry farms and private households. The dynamics of the number of poultry heads for all farm categories are described in Table 1 below.

**TABLE 1 DYNAMICS OF THE NUMBER OF POULTRY BIRDS IN SURKHANDARYA REGION**

Years	In all farms	Including by economic categories (in thousands)		
		In agricultural enterprises	On farms	In households
2007	1359,7	236,3	76,4	1047
2008	1640,4	286,7	195,9	1157,8
2009	1834,6	334,4	244,6	1255,6

<b>2017</b>	<b>4099,9</b>	<b>1320,5</b>	<b>342,8</b>	<b>2436,6</b>
2018	4554,4	1332,4	729,6	2492,4
2019	4808,5	1201,8	1099,1	2507,6
2020	4893,7	2140,7	245,0	2508,0

Source: Surkhandarya regional statistics department

In 2012, there were 2673.2 thousand heads of poultry in all categories of farms, in 2015 this figure increased by 25.4% and amounted to 3351.7 thousand heads. From 2009 to 2020, the number of birds in Surkhandarya region has been growing steadily. At the beginning of 2020, this figure reached 4,893.7 thousand (about 2.6 times more than in 2009 and 1.8 times more than in 2012).

In 2009-2020, the increase in the number of poultry in all categories of farms increased by 3059.1 thousand heads, while in agricultural enterprises in 2020 increased by 6.4 times compared to 2009, 3.2 times compared to 2012 and reached 2140.7 thousand heads. The number of poultry on farms in 2020 reached 245 thousand, which is 3 times less than in 2018 and 4.5 times less than in 2019. In 2020, this figure increased by 2 times compared to 2009 and 1.4 times compared to 2012, and the number of poultry amounted to 2508.0 thousand heads.

The share of agricultural enterprises in the total number of poultry in the region increased from 18.23% in 2009 to 32.21% in 2017, and in 2020 amounted to 43.7%.

The share of farms in Surkhandarya region in 2009 amounted to 13.33%, and a downward trend can be observed until 2017. While the number of birds will increase in 2018 and 2019, we can observe that in 2020 the number of birds will decrease. In 2020, it doubled compared to 2018, and decreased by 4.5 times compared to 2019, and in 2020 the share of farms was 5%.

The share of households has been declining from year to year. In 2007, the share of households in the total number of poultry was 77%, and from 2007 to 2018 the share of households has a

steady downward trend. In 2010, this figure was 68.4%, in 2017 it was 61%, in 2018 it was 54.7%, and in 2020 it was 51.2%.

**TABLE 2 INDICATORS OF POULTRY PRODUCTION IN SURKHANDARYA REGION**

*Source: Surkhandarya regional statistics department*

According to the table, egg production in Surkhandarya region has increased due to an increase in the number of poultry. The volume of egg production in the region in 2019 increased by 2.4 times compared to 2013 and 1.5 times compared to 2017. While the share of households in egg production was 69% in 2013, in 2019 this figure decreased to 42.6%. The share of specialized agricultural enterprises increased from 29% to 42.6%. The share of farms has also increased.

During the analyzed period, the volume of poultry production increased steadily from 2013 to 2017. In 2018 and 2019, poultry production decreased. That is, in 2019, it decreased by 33% compared to 2013, and by 52% compared to 2017.

Poultry farming in the region is mainly accounted for by households. The share of farms in this category was 92.3% in 2013, and in 2019 it was 78% due to a decrease in the volume of poultry meat. During this period, the share of farms and specialized agricultural enterprises increased.

In Surkhandarya region, egg production per capita in 2007 was 175 eggs, and from 2008 to 2014 it decreased to 77 eggs. In 2015-2016, it increased by 185-191 units. In 2017-2019, there was a decrease in egg production per capita.

Based on the economic statistical analysis of the development of poultry in Surkhandarya region, we came to the following conclusions:

- In Surkhandarya region, poultry production has changed mainly due to an increase in the number of poultry. We can observe changes in the number of birds across different farm categories. In the past, poultry products were mainly distributed to households, but now it can be seen that the share of agricultural enterprises and households has decreased, while the share of farms has increased. In many countries, poultry production is mainly performed by agricultural enterprises;

- When all the necessary conditions are in place in poultry, the impact of seasonality on its development is minimal. This situation can be observed in farms transferred to the industrial basis. It is not always possible to provide such conditions in households. Such conditions can be provided in agricultural enterprises and farms. Therefore, poultry production has increased in this category of farms;
- In recent years, the price of meat products has increased significantly. The main reason for this is the increased costs associated with growing them. Poultry production has increased mainly due to the fact that their products are fast-growing and low-cost, as well as their rapid recovery;
- The government is creating all the necessary conditions for the development of poultry farming and the promotion of export activities. This leads to an increase in poultry production and an increase in productivity.

## CONCLUSION

Based on the above, in order to further develop the poultry industry in Surkhandarya region, first of all, it is necessary to introduce modern technologies in this area, modernize production processes and expand exports of finished products:

It is necessary to promote the development of other species of birds in Surkhandarya region. Depending on the conditions of the regions, it is necessary to establish farms engaged in the cultivation of other types of poultry: ducks, geese, turkeys, quails, sparrows, hawks;

Not only increase the production of poultry products in the form of eggs and poultry, but also increase the export of products through their processing and the introduction of recycling of poultry waste;

Reducing the impact of the poultry industry on the environment, timely elimination of poultry diseases and attention to the cultivation of environmentally friendly products;

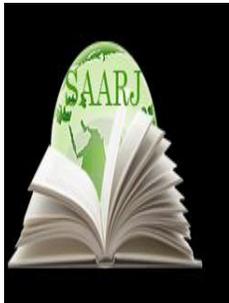

Establishment of import-substituting nutritional and vitaminized feed production in poultry farming in the region;

Training of specialists engaged in this activity in poultry farms and increase of their experience in poultry farms in the development of poultry farming.

## ESTABLISHMENT OF TURKESTAN AUTONOMY AND SUPPORT OF INDIGENOUS PEOPLE

**Yuldash Haydarov Hazratovich\***

### ABSTRACT

*This article analyzes the support of the indigenous population for the national democratic state-Turkestan autonomy, established in November 1917, on the basis of information obtained from newspapers published at that time. Historical research during the Soviet era has shed light on the attitudes of indigenous peoples toward Turkestan Autonomy through comparative comparisons. Scientific conclusions free from objective and ideological approaches are given. The role of the study of this topic in the minds and hearts of young people during the period of independence has been shown to arouse a sense of involvement in the fate of the country.*

**KEYWORDS:** *Turkestan, Autonomy, Law, National Statehood, Soviet System, Government, Indigenous People, People, Rally, Demonstration, Newspaper, Oppression.*

### 1. INTRODUCTION

The emergence of Turkestan Autonomy and its support by indigenous peoples have been variously covered in the historical literature. In the literature based on the class approach during the Soviet era, this issue is covered one-sidedly. Despite the predominance of Soviet-era coded history and its paradigms set by the Soviet regime, there have been attempts to portray the indigenous peoples' attitudes toward the Soviet regime in a non-Soviet way. Including L. Reztsov took a similar approach to the issue in his work.

Some studies suggest that large sections of the local population were not involved in the revolutionary movement. According to F.Bozhko, "the government of autonomy was defeated not by the local people's struggle for autonomy, but by itself as a result of internal class struggles

and conflicts that eroded the counter-revolution." Due to the fact that there are conflicting approaches to the support of the indigenous population for the autonomy of Turkestan, it has become a requirement of the time to shed light on the objective truth in this matter. The extremely difficult situation in Turkestan, which became more and more complicated after the establishment of the Soviet power, mobilized the patriotic and progressive forces of the country. They took the initiative and set out to establish a democratic, state-based, nation-state that could stand up to Soviet rule, led by the Bolsheviks. Serious preparations have been made in this regard. On November 26, 1917, the IV Extraordinary Congress of Muslims of the region was convened in Kokand. As a result of the three-day uninterrupted activity of the Congress, the Autonomy of Turkestan was established. Indigenous people sincerely welcomed the establishment of the Turkestan Autonomy and supported its activities on the path of national statehood. The article provides detailed information about these processes.

## **2. METHODS**

Although the Soviet government sought to use the science of history effectively to implement the new system and assimilate its ideology into the local population after the October 1917 coup, we tried to state that Turkestan's autonomy was supported by indigenous peoples through scientifically based analysis and comparisons.

## **3. Results**

An important event in the history of the statehood of indigenous peoples was the formation of the so-called "Autonomy of Turkestan" on November 28, 1917. After the end of the IV Extraordinary Congress of Muslims of the All-Turkestan region on November 26-28, 1917 in Kokand, on December 1, a special Address signed by members of the Provisional Government of the Turkestan Autonomy (8 people) was published. The petition called for unity and solidarity among all the people of Turkestan: regardless of race, nationality, religion, gender, age and political beliefs. The Turkestan Autonomous Region, a national government of the country's noble and nationalist elites, has been established and has been entrusted with glorious tasks. Most importantly, the realization of Turkestan, whose dignity and pride were humiliated by others, the gradual restoration of its freedom and independence, and its elevation was the main task and goal of the people's government. For this reason, millions of citizens of the country welcomed the declaration of Turkestan Autonomy with great satisfaction and enthusiasm. In early December 1917, in the cities of Tashkent, Namangan, Jalal-Abad, Kokand, Samarkand and other regions, thousands of people organized rallies and demonstrations in support of the Autonomy.

Historical data show that the Autonomous Government was strongly supported by the people of Turkestan. The rally held on December 6, 1917 at the Jome 'Mosque in Tashkent is a clear proof of this. The rally was attended by 60,000 people. According to the Great Turkistan newspaper, "The interior of the mosque and the roof are full of people". The rally was chaired by Saidghani Mahmud and was attended by Munavvarqori, Mulla Odil, Sherali Lapin and others. The participants of the rally unanimously approved the Autonomy and decided not to recognize any government in Turkestan other than this Provisional Government. At the end of the rally, a decision was made to support the Turkestan Autonomy. It read: "We, the Muslims, applaud the

Turkestan Autonomy, regardless of class and rank, and wholeheartedly support the decision to establish the Turkestan People's Government announced by the Extraordinary Congress in Kokand ... and unite all Muslims around the Autonomous Turkestan Government. We urge you to refrain from any hostile dealings with the interim organizations which are at the head of the present provincial administration. We must maintain peace and harmony so that the Turkestan Autonomy can be established in practice as soon as possible. Long live Autonomous Turkestan!"

The support of the Autonomous Government by the people of Turkestan can also be seen in the fact that thousands of people applauded the Autonomy in various cities and villages of the country. For example, on December 1, a demonstration was held in Namangan district with the participation of about 100,000 people. "Long live autonomous Turkestan and its government!" this words were swaying.

On December 6, a demonstration was held in the village of Khanabad in the Jalal-Abad volost on the occasion of the declaration of autonomy. More than a few thousand people gathered from the tomb of Fozilkhan to the market. Abdullah Eshan and Hussein Validi spoke at the demonstration and explained to the people the establishment of the Autonomy and its goals. On December 7, in Kokand, and in December in Samarkand, meetings of indigenous peoples in support of the Autonomy were held. At a meeting of the regional council convened in the Caspian region, a decision was made to join the Turkestan Autonomy. In the national press, prominent Turkestan enlighteners, politicians and public figures congratulated the Autonomy in their articles.

In particular, Abdurauf Fitrat in his article "Autonomy" expresses his views on the Autonomy of Turkestan as follows: "Autonomy of Turkestan..... I do not believe that there is a more prosperous, more sacred, more joyful word among the true children of Timur Hakan, among the Turks of Turkestan. Turkestan has a power that boils the blood of Turks and raises their faith, and there is only one word: Turkestan Autonomy!" .

For fifty years we have been oppressed, humiliated, our hands tied, our tongues cut off, our mouths shut, our lands oppressed, our property plundered, our honor lost, our honor usurped, our rights violated, our humanity trampled underfoot - we stood up and persevered. We obeyed every command that relied on power, we lost our whole being. We did not give a single thought, we enlightened, we kept our faith alive: Turkestan Autonomy!

When we returned from the courthouse crying, when we lay in lightless prisons, when we fell under the blows of a predatory gendarme, when our lands were burned, when our believers were hanged, we lost consciousness, our brains were corrupted, our eyes were left without light, we could not see anything. At that moment, a bright star shone in a distant part of that dark world to lift our fallen spirits. Our eyes, which hadn't moved on to anything, could see that. What was he? Autonomy of Turkestan!

The pages of newspapers and magazines were widely used to inform the local population about Turkestan Autonomy. Began publishing in government newspapers in Uzbek, Kazakh, and Russian. In particular, the previously published newspaper "Great Turkestan" began to pay special attention to the activities of the autonomous government. In order to improve the publishing work, O.Mahmudov's printing house was transferred to the government.

The petition, signed by members of the Turkestan Autonomous Government, contained information about the congress's decisions and the government's immediate work plans, as well as an appeal to the people of Turkestan. All citizens of Turkestan - Muslims, Russians, Jews, workers, soldiers and peasants, all peoples and nations living in the country, city and administrations, political, social and trade unions, all state, public and private institutions unite around the Turkestan People's Government was called upon to assist in the implementation of the tasks entrusted to it.

In the early days of the proclamation of Turkestan Autonomy, rallies and demonstrations by indigenous peoples in support of the autonomy government intensified. In those days, the Tashkent Soviet received an application for a rally and demonstration on behalf of the residents of the Old City.

According to the decision of the Soviet, it was approved to hold the rally and demonstration in the Old City of Tashkent, but not in the New City. According to "Hama razera", a publication of the Turkestan Bolsheviks, "The Soviet Union prevented the Muslim masses from falling prey to Russian counter-revolutionary gangs and becoming victims". "Early in the morning on December 13, the Old City looked like a holiday," the Great Turkestan newspaper said. Crowds of people began to pour in from all directions, from the streets and alleys to the Shaykhantahur Mosque. At 12 o'clock a crowd of many thousands gathered. Leaders of the ruling parties and members of the Council of People's Commissars (Sovnarkom) joined the rally. In addition to Muslims, Russians, Jews, Armenians, as well as representatives of various socio-political organizations other than the Bolsheviks took part in the demonstration. Demonstrators gathered in front of the Shaykhantahur Mosque. About 100 red-blue and green flags fluttered over the heads of those gathered. The rally will be opened by Munavvarqori. Representatives of various organizations and associations spoke at the rally. The participants of this rally unanimously approved the government of Autonomous Turkestan and announced that they have now decided in Turkestan not to recognize any government other than this interim government.

The autonomous government began to form a national army. During an inspection in early 1918 with the participation of Minister of War Ubaydulla Khodjaev, there were 2,000 soldiers. The government has launched a domestic loan of 30 million soums in the economic sphere. Members of the government also took practical steps to solve the problem of bringing grain from the Caucasus through Orenburg to the starving people of Turkestan.

#### **4. DISCUSSION**

The question of the emergence of Turkestan Autonomy and its support by the indigenous population was covered in some Soviet-era literature on the basis of one-sided, class approaches, and was adapted to the content of the Communist Party's and the Soviet government's documents on national issues. Soviet history also made extensive use of newspapers and magazines covering the political, social, and cultural processes of Turkestan in order to achieve its goals. These publications were tasked with protecting the new government from internal and external enemies, destroying the old ones and encouraging them to build a new marriage. They published an article on their pages based on the Marxist-Leninist approach to the construction of the Soviet state. In the example of autonomists, the creation of the image of "enemy" in the minds of society, the spread of false facts and views began to become widespread. Those who finished the

struggle for national statehood more objectively, as well as those who exposed the mistakes of the Bolshevik national policy in Turkestan, were politically branded and criticized.

In order to present the history in an objective and ideological way, the newspapers published during the Turkestan Autonomy were widely used, the information in them was compared with each other, and real information about the formation of the Turkestan Autonomy and its support by the indigenous people was given.

The data show that progressive forces in the Bukhara Emirate also supported the Turkestan Autonomy. The attitude of Fayzullo Khodjaev, Abdurauf Fitrat, Muinjon Aminov, Mukammil Burhanov, Said Akhrori, Usmonkhodja Pulatkhodjaev, Atoulo Khodjaev, Musa Saidjanov and the population of the emirate to the Turkestan Autonomy is not fully covered in the historical literature. There is no doubt that the Turkestan Autonomy, supported by all Muslims, has also attracted the attention of the progressive forces in the Bukhara Emirate.

The defeat of the Kokand Autonomy in February 1918, first of all, shocked the clergy, who had close ties with Fergana. "Refugees" from Kokand gathered in Bukhara. The Kokand incident woke up and angered all Muslims. The Emir sent ambassadors to Afghanistan and elsewhere, urging Muslims to act together. The information presented in this article confirms our opinion.

In particular, the love and devotion of the indigenous people to the foundations of their national statehood serves as a model school for the present generation.

## CONCLUSION

One of the brightest pages of our history is the establishment of the National Democratic State-Turkestan Autonomy, established in November 1917, and its support by the local population. Muravevsky's pamphlet reflected the fact that the local people allegedly supported the Soviet struggle against the autonomous government. It describes Turkestan's autonomy as "a counter-revolutionary government organized by the bourgeoisie and the intelligentsia against Soviet rule." However, the author contradicts his conclusion in this pamphlet, that is, referring to the Third Regional Congress of Soviets, held in Tashkent on November 15-25, 1917, which states that the European stratum treats the Soviet government as a "government from Russia" and writes that it has not yet been able to quickly involve the unbelieving native people in the formation of the government.

Another young Marxist historian, who worked in various educational institutions in Turkestan. In E. Fedorov's article, supporters of the Turkestan Autonomous Government also "relied on the help of Russian officials and the Ural Cossacks returning from the Caucasus front". The article provides a wealth of information in response to the Soviet-era controversy. There was no doubt that autonomy was supported by indigenous peoples.

The government of the Turkestan Autonomy soon gained great attention among the people. Fiery poets of the Uzbek people, such as Fitrat, Cholpon, Hamza, wrote poems praising the Autonomous Government. No matter how much the Turkestan workers support the formation of their national government and increase their confidence and hopes in it, the Turkestan Soviet government and its local authorities, which are based in the country and hold the reins of the main administration, will not allow this to happen. made his way with all the precautions. The violent dispersal of a large rally in Tashkent on December 13, 1917, and the mass casualties of

Soviet guns and machine guns were the first assassinations of the Turkestan Autonomy. The ruling Center and its authorized rulers in Turkestan vowed to forcibly overthrow the legitimate Autonomy government, which was formed as a result of the will of the people of the region. Everything necessary and means at the disposal of the Soviet government were used to achieve this vile goal. Necessary military units and weapons were directed to it. Eventually, the Turkestan Autonomy was drenched in blood. The most horrible thing is that during this bloodshed, thousands of innocent, helpless citizens of Kokand, who had no guilt, suffered unprecedented losses.

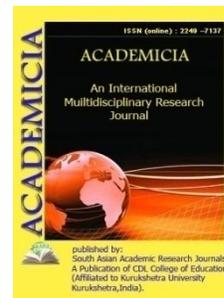

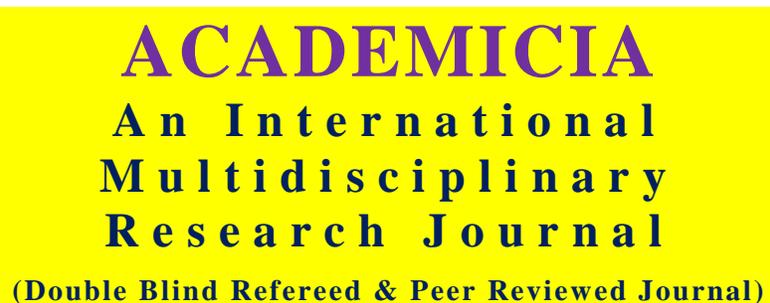

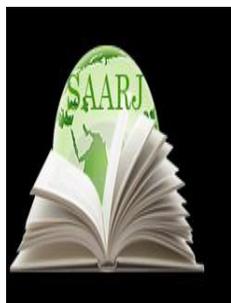

Although the Turkestan Autonomous Government lasted only 72 days, it called on our liberal people to fight for national independence and sovereignty. Although more than 100 years have passed since the establishment of the Turkestan Autonomous Government, it is important to provide the younger generation with a brief analysis of the history of our national statehood, the measures taken by the Turkestan Autonomous Government and the support of indigenous peoples.

An objective and non-ideological approach to the issues of the emergence of Turkestan Autonomy and its support by the local population strengthens the sense of involvement in the fate of the country in the minds and hearts of the younger generation. As the President of the Republic of Uzbekistan Shavkat Mirziyoev noted, "We have set as our main goal the creation of a new period of awakening in Uzbekistan, the foundation of the Third Renaissance." In order to successfully fulfill this task, it is important to know the glorious history of Uzbekistan, including the history of the struggle for national statehood. From this point of view, the study of the history of Turkestan's autonomy and its support by the local population is also an important source in this regard.

## VOCAL AND CHORUS VALUE IN THE EDUCATION OF A DEVELOPED GENERATION

**M. Mirabdullaev\***

\*Senior Teacher,  
Namangan State University,  
UZBEKISTAN

### ABSTRACT

*Singing is one of the most delicate and demanding artwork types. This article provides some suggestions for this field representatives and methodical guides for vocal education for students of "Musical theater acting". In 1982, the Uzbek television and radio choir was awarded the title of "Honored choir of the Republic of Uzbekistan" for active concert programs and choral music promotion. It is currently a choir under the Culture and sports ministry. In various religious ceremonies, such as children gathering and singing during the Ramadan month, or adults singing zikr (oblige) and marsiya (ode) songs, it is also a community performance form.*

**KEYWORDS:** *Singer, Vocals, Singing, Breathing, Song, Skill, Art.*

### INTRODUCTION

The singing art, which is an integral part of Uzbek national musical culture, has been developing for a long time and for centuries. Singing alone and in groups has been associated with the whole life of almost all peoples since ancient times. It is known that traditional ceremonial folk songs were performed as songs group woven by the people on this or that ceremony occasion, and they have survived to the present day.

### Main part

The singing art has a special place in the life of our people today. The voices are heard on radio and television, in theaters and concert halls, in schools and stadiums. It is hard to imagine any event or celebration in our country without songs.

All the events of our lives are closely connected with the song. It enriches people's inner world and invites their lives towards beauty.

In order to develop a harmoniously developed generation, to form a national ideology, to educate young singers and musicians in the spirit of our rich cultural heritage, centuries-old traditions and universal values, love for the motherland, devotion to the independence ideas, to discover young talented singers the Republican singers contest named after People's artists of Uzbekistan Hoji Abdulaziz Abdurasulov, Komiljon Otaniyozov, as well as Mamurjon Uzokov and Jurahon Sultanov has been announced. All this is aimed at Uzbek musical culture development.

Also, the announcement of 2010 as the "Year of harmoniously developed generation" is an important factor in ensuring a comprehensively developed and mature generation development, the future of the country. It is our responsibility to bring up harmonious, intelligent, educated young people, to use the art of music in the national and universal values formation. That is why in the past, the peoples of Central Asia, including the Uzbek people, have a long singing tradition as a group, although they do not have a professional choral art. In various religious ceremonies, such as children gathering and singing during the Ramadan month, or adults singing zikr (oblige) and marsiya (ode) songs, it is also a community performance form. Also, during the traditional "Navruz" and "Lola Sayli" holidays, boys and girls sang and had fun as a group.

From time immemorial, yor-yor (hymeneal), yalla (song), and lapars (ditty), performed at weddings, have been performed as a group. These traditional ceremonial songs were performed unison by men and women. Such traditional folk songs of Uzbek people and their collective performance have laid the foundation for the further development of choral amateurism, as well as choral art among Uzbek people.

Polyphonic choral art began to enter our republic in the 20-30s of the XX century. Choral art was originally used in musical dramas and comedies, as well as in operas. For example, Tolibjon Sodikov's operas "Layli and Majnun", S.Vasilenko and M.Ashrafi's "Buron", "Dilorom" are among them. These have greatly contributed to Uzbek polyphonic choir performance development.

The choir led by B. Umidjanov, founded in 1961 under the Republican television and radio, made an important contribution to the national professional choral art emergence in Uzbekistan. People's artist of Uzbekistan, composer B.Umidjanov is not only the choir leader, but also made a huge contribution to its creative wealth with more than 70 original and reworked songs of the peoples of Central Asia. This choir actively promoted choral art on television and radio. In 1982, the Uzbek television and radio choir was awarded the title of "Honored choir of the Republic of Uzbekistan" for active concert programs and choral music promotion. It is currently a choir under the Culture and sports ministry.

In recent years, the children's choir has also developed in the country. The traditional annual "Art Festival" competition attracted many choirs from music and secondary schools.

One of the leading children's choirs in Uzbekistan is the national children's choir "Bulbulcha" of Uzbek television and radio, led by People's artist of Uzbekistan Sh. Yormatov. This choir has successfully demonstrated its performance skills in Moscow, Azerbaijan, Turkey, Finland and a number of other foreign countries. Today, the ensemble is also a choir under the Culture and sports ministry.

Currently, there are vocal and choral ensembles in many secondary schools, music and art schools, music, art and pedagogical colleges, pedagogical universities, Uzbek state art and culture institute, Uzbek state conservatory.

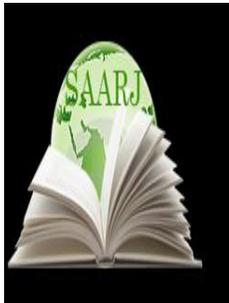

Children and adults are eager to sing, to go to concerts, to show their talents to the people. Music helps to awaken the younger generation minds, to cultivate aesthetic feelings, to bring them into the world of beauty. Singing in a choir can be a serious basis for popular music education for singers, especially children.

### **CONCLUSION**

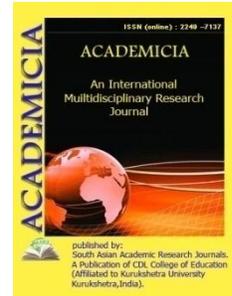

In our free and prosperous land, every child, no matter what profession he chooses later, must learn the art of music and be thoroughly acquainted with it. The sounds of music not only decorate our lives, but also give it a festive mood. There are also works of music that serve to make life more solemn, joyful, beautifying, enriching, and improving.

## FACTORS THAT SHOULD BE CONSIDERED IN MUSICAL THEATER ACTORS EDUCATION

**Gulsanem Tursunova\*; Bobur Karimov\*\*;**

\*Teacher at Fergana Regional Branch,  
 Uzbek State art and Culture Institute,  
 UZBEKISTAN

\*\*3rd year student at "Musical theater of acting" direction of  
 Fergana Regional Branch,  
 Uzbek State arts and Culture Institute,  
 UZBEKISTAN

### ABSTRACT

*This article discusses the cultural, vocal, speech, and voice capabilities of future actors in a musical theater. The article also discusses how to improve your singing and speaking skills. When I saw the performances of all regional and republican theaters, our theater critics, directors, professors and scientists tried to highlight their problems and shortcomings. They're just talking about directing, dramaturgy, acting skills, scenery, music, lighting, but there's no any word about the language of the character or the language of the scene. . It is not in vain that we dwell on this subject. It is today that the majority of young people who choose theatrical and directing arts are interested in these areas. However, we cannot say that not all of these young people have the talent in these areas. In general, the most important thing in this regard is not how the educational process is conducted, but the acting skills formation in students as deeply as possible and effective results achievement in this way.*

**KEYWORDS:** *mastery, speech, orthoepy, vocals, performance.*

*"Initially, it is necessary good works to turn a theater into a real spiritual hearth. Therefore, it is needed to create a creative environment by organizing meetings with well-known artists and playwrights".*

## INTRODUCTION

Theatrical art has always been and will remain the nation mirror, national and universal values' promoter. Times change, one generation is replaced by another. However, the duty, trust, the artist responsibility to the audience and the people does not change. Encouraging people to do good through the performing arts always remains an important task.

### Main part

It is known that musical drama has always had a special place on Uzbek theater stage. It is no exaggeration to say that the musical drama workshop, its formation, maternity hospital are the current Uzbek state art and culture institute and its Nukus and Fergana regional branches, the Uzbekistan state conservatory. Today, many professors, teachers, well-known and respected artists teach students in these higher education institutions, which strive to form qualified personnel with higher education, mature actors and performers in the republican and regional theaters, private theater studios. Of course, every creative process taught by the masters of their profession, the education and upbringing of qualified professionals, will be useful in the future activities of young and active students.

It is well known that the Uzbek state musical theater named after Mukimi, which is the main workshop for presenting musical dramas to the general public, has created many artistic masterpieces written in golden letters in Uzbek culture history of twentieth-century. It is not in vain that we dwell on this subject. It is today that the majority of young people who choose theatrical and directing arts are interested in these areas. However, we cannot say that not all of these young people have the talent in these areas. The thirst for interest, aspiration and popularity that is driving young people's passion for such fields. Maybe their choices are right, but not all of them can be leaders in this profession. What is the problem? The problem is in that student. This may be true in some sense. Did you know that in the above-mentioned higher education institutions, the real leaders are teaching young people. However, as a result of some students being a little indifferent and careless in their Acting skills, Stage speech and Vocal lessons, a number of problems will arise in their future skills, speech and singing process.

Speaking of this topic, I decided to dwell on it while I am still a student, and to mention some achievements as well as some shortcomings. During my short observations, I read a number of scientific and professional literature, as well as during classes, to what extent what we have learned and are learning from our professors has a positive impact on the creative activities of student actors entering the field. If we think about something like that. Acting skills, stage speech, vocals, plastics, rhythmic, pantomime, dance and a number of other creative lessons nurture an entire "actor". That's true. If a student actor is indifferent to any of the above lessons or misses a regular lesson, what kind of actor will he be in the future? This is also a pertinent question. Why am I saying or writing this? Times have changed today, and demand must be accordingly. Therefore, if it is expedient for the student actors to listen to every lesson given by the teachers, to listen to it regularly, to apply it in practice and to repeat it regularly, it will be a good result. If the given tasks are not fulfilled, in the future in cinema, theater and television there will be images with many flaws in voice and speech. This in itself leads to the sphere collapse, not its development. Do you think that there are no people working in the above-mentioned areas with such shortcomings now? We have written them with the aim of sharing

their experiences with our professors and teachers, as well as with ourselves, through this article, free from the idea of pointing out their shortcomings or saying who they are.

One of the technical part functions of speech, which is one of the main theatrical art components, is sound. The speech of every theatrical artist should be resonant in nature, sound, healthy, rich in nuances, pleasant. But is that the speech of all our actors? One of the main tasks of stage speech science is to ensure that the pronunciation of each sound, word, and sentence can meet clear, fluent, effective, orthoepic rules.

Sometimes word performers understand literary pronunciation to mean full adherence to the speech spelling rules, that is, to pronounce it exactly as it is written in the book. This communication is a mistake because in transferring process written speech to the live speech ground, one must not only fully form all speech sounds, but also be able to creatively apply in practice a number of phonetic phenomena such as weakening, assimilation, desimilation, metothesis, prothesis. But this does not mean using a dialect in a word pronunciation. Rhetorical speech not only violates this orthoepic rule norms, but also impairs the speech intonation, its stage line movement. Therefore, the artist who deals with the speech art, the speech culture, must know perfectly orthoepic rules. One of the most valuable stage speech qualities was its aesthetic reflection in the figurative manifestations of its objective reality. Therefore, stage speech, a deep study of vitality basics in speech, it is necessary to strictly adhere to them in practice. These are the rules that define the literary pronunciation norms, including orthoepic. However, this does not mean that it is enough for the speakers to master the literary pronunciation norms. Because in stage creativity, character language, stage speech, and musical theater actors have singing arias and songs processes in pure pronunciation.

In an interview with Karim Yuldashev, honored artist of Uzbekistan, honorary professor of Fergana regional branch of Uzbek state art and culture institute, director, our teacher, he expressed such views as a producer-teacher. “-2018 “Debut 2018” theater festival. When I saw the performances of all regional and republican theaters, our theater critics, directors, professors and scientists tried to highlight their problems and shortcomings. They’re just talking about directing, dramaturgy, acting skills, scenery, music, lighting, but there’s no any word about the language of the character or the language of the scene. However, our actors do not know how to speak. We teach speech techniques to actors, that is, our students, from stage speech, but we cannot find the tone and speech sound in performances. It is very difficult to understand the actors words in our staged performances, but I think that in the dramaturgy, drama, tragedy, comedy and musical drama also have their own language, and we need to teach our students this language essence today. Because in the future you will not feel such shortcomings.”

From the above, it is clear that we have some shortcomings today. Therefore, we think that it is necessary to apply and find new methods in teaching student actors speech (stage speech). Understanding the life realities on stage depends on the initial words and actions. Because all action is born from words, sentences, thoughts. The sound is primary in musical performances. What sound melodious, of course musical sound. Above we have touched on detailed ideas and considerations about speech defects and speech art. If there are no flaws in the actor’s speech, I don’t think there will be any problems with his speech on stage and his singing voice.

What is sound and performance?

Sound is the human higher nervous system product, the source which is the vocal cords located in the throat. These fibers are composed of a very sensitive and mobile mucous membrane. With a certain higher nervous system signal, the vocal cords vibrate, lengthen, contract, perform a very delicate movements complex, resulting in sound. It hits various resonators before it goes out. This is called a sound.

Speech, singing is an art, a field that requires a delicate approach to the creative task. For the actor and the singer, his body and voice are important tools of specialization, on which it is possible to improve and express the voice as a result of long-term work, training. It is important to practice regularly so that your vocal cords are constantly in a "fighting position". It is well known that surgeons practice on a variety musical instruments to ensure the constant mobility of their fingers. Such exercises are necessary for the voice members. Exactly such exercises are given in the "alphabet". The activity of an actor, a musician and even an educator is a psyche work. It is said that "even of a teacher", because if the actor and musician interact only with emotions, the teacher works mainly with the mind, intelligence. In order to leave a deep imprint in the hearts of the listeners and to give warmth to their souls, it is necessary to master a weapon as important as sound. Those who say that they will have such a weapon in the short term are mistaken, it will take many years of hard work, patience and perseverance. Because it seems like a mistake to ask a child who still doesn't know how to walk to perform a dance move. Man first learns to walk and stand, and then to dance, and thus begins with the simplest movements. Therefore, the student must first pronounce some sounds correctly, perform the simplest vocal exercises, and then enrich and complicate their skills and repertoire. Exercise is the most important exercise! Going on stage, realizing one's creative intentions, and gaining the audience's attention requires a great deal of skill. Schools for the actor's work were created by such great artists as Delsart, Stanislavsky, M. Chekhov. An educator, a lawyer, a speaker, a conductor, may not have acting skills, but I think it is expedient for a 'person on stage' to know the basic laws of behavior. In K.S. Stanislavsky words, work is the first condition of working on oneself. This work should turn hardship into habit, habit into light, lightness into beauty. "Studying the creation laws can extinguish the inspiration spark in the average actor, and in a real artist, the spark becomes a flame".

It is clear that in order to sing and speak, it is important for the actor and the student actor to work tirelessly on themselves. Even if it is naturally voted for, it needs to be developed and perfected. Speech also requires attention. That is why K.S. Stanislavsky writes: "The pronunciation art on stage is not easier than singing, it is the great preparation and technical practice result to achieve perfection."<sup>[1]</sup>

That is why all the time students are given technical exercises to try to overcome their organic and inorganic deficiencies. However, at the same time we forget to find the voice tone and sound. What we mean by this is that it would be appropriate if our actors practiced a bit of speech technique, breathing, warming up and vocal sounds pronunciation before rehearsals in theaters. Speech disadvantages in musical performances are that some actors sing out of position when moving from word to aria or duet. However, actors sometimes forget that they have to sing because of the situation, because of what is happening, and this is a condition.

In general, the most important thing in this regard is not how the educational process is conducted, but the acting skills formation in students as deeply as possible and effective results

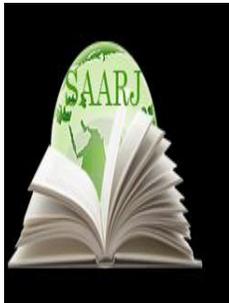

achievement in this way. The stage is a sacred place. Every student entering the art school must have a love for this scene, at least a deep sense of respect.

### CONCLUSION

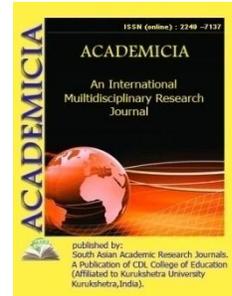

Those who work in the theater are actively involved in raising the cultural level of people. The actor's contribution to the play successful performance is enormous. Because the actors are always in touch with the people, through language they convey the essence and the stage work content, its essence to the audience. Therefore, actors need deeply master stage speech skills. The stage speech fluency and clarity helps to quickly understand the stage works content, to deeply understand their essence. This shows that the actor must constantly work on his speech and work tirelessly to improve it. It has become a habit to discuss the speech and voice of a skilled actor, to criticize them in the same way. This criticism is sometimes neither liked nor accepted by the actors. The lack of speech on stage is audible to everyone, both aesthetically and grammatically. The word is an important means of expressing a single vital role.

## MECHANISM FOR MANAGING INNOVATIVE DEVELOPMENT IN THE REGION

**Sevara Abdukaxarova\***

\*Doctoral Student,  
 Center Scientific Research Department of Scientific Foundations,  
 Problems of Economic Development of Uzbekistan,  
 Tashkent State University of Economics,  
 UZBEKISTAN

### ABSTRACT

*The article discusses regional innovation processes for realizing the competitive advantages of the region, increasing the economic efficiency of regional strategic management, bringing the regional economy to a new innovative path of development.*

**KEYWORDS:** *Competitive Products, Innovation Processes, Innovative Development, Innovative Technologies, Intellectual Potential, The Intensity Of Modernization, Investment, Strategic Management.*

### INTRODUCTION

In modern conditions, the rates of economic development of regional socio-ecological and economic systems are increasingly dependent on the main trends in the development of science and technology. Research is being carried out to improve the organizational and economic mechanisms for managing the infrastructure of innovations in the world, including in the following priority areas: macroeconomic models of the innovative structure of economic growth, development of the theory of innovation and technological paradigms, improvement of technological platforms, and attraction of investment companies. The experience of innovation policy in developed countries characterizes the need to create a favourable environment for the development of innovation at the regional level. The impact of scientific and technological progress on the development of regional systems in the context of growth trends and modern economic conditions demonstrates the relevance and importance of strategic innovation management, including at the regional level [1].

In international practice, various aspects of management and organization of innovative processes can be found in the works of D. Arzhibuji, D. Bell, P. Drucker, B. Lundvall, N. Mazur, V. Ivanov, I. V. Milkina, E. Popova, A. V. Tebekin, J. Schumpeter, R. Fatkhuddinov, S. Radosevic, N. Rosenberg and other scientists [2-15].

Strategic management of regional innovations includes consideration of planning and implementation of innovative processes, projects, programs of the socio-ecological and economic system. Regional strategic management based on innovative changes is focused on significant changes in the economic, social and ecological subsystem of the region.

## **MATERIALS AND METHODS**

The socio-economic modernization of the region is the modernization of the entire reproduction process, the entire system of economic relations in the process of production, distribution, exchange and consumption that occurs in the regions. Socio-economic modernization of regions should be aimed at achieving a reduction in the cost of production based on local production, scientific and technical, labour force, full and effective use of natural potential and high competitiveness of the region's economy in foreign markets. An urgent problem in the management of the region's innovative development is the methodological substantiation of the features that predetermine the current state of the economy:

- a system for increasing, distributing and redistributing intellectual potential;
- Model of reproduction of social perception in society of innovative changes;
- regional development of an innovative management mechanism;
- regional innovation model;
- The mechanism of using the intellectual potential of the region, including scientific and technical, innovation, educational and cultural potential.

The mechanism for managing the innovative development of a region should be considered as an ordered set of institutional conditions that ensure that economic entities achieve strategic guidelines for the development of the region. An effective mechanism for the innovative development of the region is needed to ensure sustainable socio-ecological and economic development based on expanded reproduction and effective use of scientific, technical, economic, natural, and social potential. Important defining indicators of the socio-economic modernization of regions are:

- The orientation of the region's industry towards modern science-intensive technologies, elimination of high material, energy and commodity production capacity;
- Active involvement of natural and agricultural raw materials in deep industrial processing to eliminate the industry's focus on raw materials, to obtain high-quality, competitive products;
- improving the structure of the region's industry based on the elimination of internal imbalances in the industry due to the orientation of industrial production on raw materials;
- strengthening the position of the region's industry in the external and internal markets based on the expansion of industrial production in accordance with international standards, the

organization of high-tech and science-intensive industrial production, which makes it possible to produce high-quality, competitive products;

- effective foreign economic activity and strengthening its influence on stimulating the development of industry in the region; active attraction of foreign investment, development of joint activities for the production of competitive industrial products; expansion of sales markets for products based on the provision of goods for export; development of forms and structure of market relations, mutually beneficial economic cooperation;
- Improving the territorial structure of the industry is an important task for the industrialization of regions. The solution to this problem will make it possible to more fully use the existing local natural, industrial, scientific and technical, labour potential in the economic turnover, to increase the level and quality of life of the population.

The level of socio-economic modernization of the region is characterized by the share of new products produced in the region in the total volume of shipped products. It is proposed to determine the intensity of socio-economic modernization of the region according to the ratio of the share of new products in the total volume of exports to the structural restructuring of the economy and innovation reforms, the growth rate of gross costs for innovation. The effectiveness of the socio-economic modernization of the region is determined based on the ratio of the new product to the total costs of innovation, institutional reforms and structural restructuring of the economy in the region (3).

In general, the study of the characteristics of the socio-economic development of the republic, especially in the regions, plays an important role in improving the quality of life of the population in an unstable economy, creating conditions for the development of economic entities. It should be borne in mind that each region of Uzbekistan has conditions for socio-economic development and the ability to effectively use limited resources within the existing set of various types of labour activities that provide general conditions for the production of material goods and general living conditions in the region.

## CONCLUSION

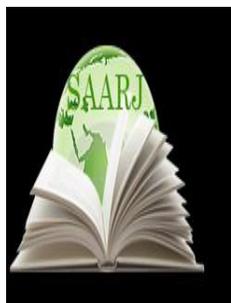

Thus, with a systematic solution of strategic tasks of modernizing the economic development of the region, it is necessary to ensure:

- formation of an effective regional innovation system that ensures the introduction of innovations as a leading factor in economic and social growth;
- implementation of long-term projects based on public-private partnership, which will ensure the leading position of the region in the markets of high-tech goods and services;
- expanding innovative activity in traditional sectors of the economy, ensuring their technological modernization and increasing competitiveness, as well as developing a new economy - the knowledge economy;
- Improving the use of land and other natural resources used in agricultural production;
- Creation of institutions that integrate strategic planning into the management of regional development, reduce administrative barriers and improve the quality of public services and the development of public-private partnerships (16).

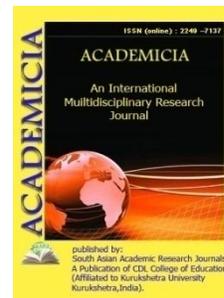

The socio-economic modernization of the regions includes the improvement and renewal of the economy through the introduction of new scientific and technical achievements and advanced technologies, advanced structural changes and institutional reforms aimed at increasing the efficiency of the economy, ensuring its competitiveness in the interregional and international division of labour.

## THE ROLE OF MAKOM ARTIN THE SPIRITUAL UPBRINGING OF YOUTH

**Tursunova Laylo Ergashevna\***

\*Lecturer,  
 Department of Music Education,  
 Fergana State University,  
 UZBEKISTAN

---

### ABSTRACT

*Due to the stability of the peaceful social and spiritual environment in our homeland, art occupies a special place in the content of our spiritual heritage, which is inextricably linked with science, culture, literature and art. National music is the heart of the nation. The arrival of the sounds of history that our people have been listening to for a long time, and their design in different styles, the art of classical music served as spiritual food for our people. Since ancient times, the art of classical maqom has been closely connected not only with the spiritual life of the Uzbek people but also with their daily life. Uzbek classical music differs from the art of the peoples of the world in its attractiveness, cognitive value, philosophical content and unique melodic systems.*

**KEYWORDS:** *Maqom, Classical Music, Art, Khorezmmaqom, Shashmakom*

---

### INTRODUCTION

Melodies of makoms have existed since ancient times on the basis of the unique musical wealth of each of the peoples of the East, embodied in the process of long historical and socio-cultural development by historical musicians, singers and composers who embody historical events and customs. From The word, makom is an Arabic word meaning a place of residence, and in musical practice, it means a place where today the sounds that makeup melodies and songs are placed on musical instruments, that is, on curtains. The term makom has been used in the musical practice of the peoples of the East since about the 9th century.

Resolution of the President of the Republic of Uzbekistan ShavkatMirziyoyev dated November 17, 2017 “On measures to further develop the art of the Uzbek national maqom” and on April 6,

2018 “On holding an International conference of maqom” for the first time in the history of Uzbek musical culture. was a universal guide to the preservation, development and prosperity of classical traditional professional music.

## **MATERIALS AND METHODS**

In 1882 Khan of Khorezm Muhammad RakhimkhanSoni (Feruz) wrote in a special “Decree of the Almighty”: “Let the power of Khorezm be declared the inviolable property of the people who challenged and insulted this“ Decree ”and violated it (s).May our punishment be severely punished!”We entered the history of Uzbek musical culture. In many historical and theoretical works and sources of historical and literary content on the musical culture of the East, special attention is paid to the issues of status performance, which form the basis of folk music. It is known that in the development of oriental musical culture, especially in Central Asia, the ancient and eternally young art form of maqom was passed down over the centuries by teachers, musicians and singers.

This is both the theoretical and practical basis of maqom art and an example of the unique classical style of music of the peoples of the East. At the same time, the world intelligentsia recognizes that the works of maqom, which have preserved these samples in the musical culture of the peoples of Central Asia and passed them on to future generations, have become the best and priceless treasures of oriental and world music in the world of spirituality and sophistication....The songs and instruments of the maqoms are a complex of musical works created in a certain order, a kind of musical form of our people. Maqom's works are an encyclopedic product of the art of a generation of musicians, singers and composers, arising from the historical development of the traditions of classical music.

Today in Uzbekistan three types of maqom art are being introduced in musical practice - Bukhara maqom (or shashmakom), Khorezmmaqom and Fergana-Tashkentmaqom techniques. The classic traditional poppy seed, which has been firmly rooted in the hearts of our people for centuries, is one of the priceless spiritual values of our national ideology in shaping the consciousness and thinking of our people today. Spiritual and artistic beauty embodied in makoms, unique styles of singing and instrumental performance, embodying the past of our ancestors, their dreams and hopes, will not leave any music lover indifferent.

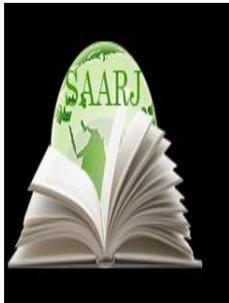

On August 5, 2017, the President of the Republic of Uzbekistan ShavkatMirziyoyev, at a meeting with representatives of the creative intelligentsia of Uzbekistan, made a report “Development of literature, art and culture - a solid foundation for the elevation of the spiritual world of our people”.

## **CONCLUSION**

“Shashmakom” is the result of centuries-old scientific and creative searches and high spiritual thinking of our peoples.The masterpieces of musicians and singers have preserved and passed on to future generations the works of maqom, which are now on the path of further development of the spiritual art of oriental and world music, educating the younger generation in the field of art.Art schools of maqom, focusing on the development of children's music and art schools, are the main basis for the further prosperity and development of maqom art, Uzbek music and culture, the cultural heritage of our ancestors, which is the treasure of our people. We think it will serve.

### ABSTRACT

*The article compares Amir Temur's "Statues of Temur" and Zahiriddin Muhammad Babur's "Boburnoma" and analyzes the aspects of public administration, succession social relations. For example, the name of Nizamulmulk, a political and writer, public figure and scholar who played a major in the socio-political, cultural and enlightenment life of the East is mentioned in several places. "If a corrupt, black-hearted, inferior man is in charge, the state and the kingdom will soon collapse", he said. Malikshah Seljuk, for example, demoted his minister, Nizam-ul-Mulk. In particular, many stories and legends about Amir Temur, Mirzo Ulug'bek, Alisher Navoi and Hussein Boykaro, folk tales and tales about Babur can serve as evidence of our opinion.*

**KEYWORDS:** *Inheritance, Succession, Political Views, Social Relations, Public Administration, Author's Position, Criteria Of Justice;*

### INTRODUCTION

Works of different genres and acquire universal significance If they are studied in syncretic harmony with new aspects of life and reality, the development of time and society, the density of man and humanity, and this poetic research on the basis of new ideological, aesthetic and philosophical generalizations. "Temur's Statues and "Boburnoma", which we are talking about, have been in the center of attention of their readers for many centuries with such features.

### Main part

Man's relationship with the environment to which he belongs has long been an important part of our social life. Examples of folklore that have come down to us, especially. In fairy tales and proverbs, anecdotes, the image of particular hero has helped to reflect the wisdom and ingenuity of the people. It can be said that the relationship with the environment played a certain role in the demonstration of the potential of the people's heroes, in the public outcry. In particular, many stories and legends about Amir Temur, Mirzo Ulug'bek, Alisher Navoi and Hussein Boykaro, folk tales and tales about Babur can serve as evidence of our opinion.

For centuries, our great ancestors have sought to understand the inner logic of historical development and on this basis, to positively address the problems of economic, political and spiritual development of mankind and introduce the most optimal, just ways of governing society.

If Amir Temur had not built his state on the basis of laws and procedures in accordance with requirements of the time, the prestige, potential and such a state would have damaged, and its ruler would not have been recognized at this level.

Zahiriddin Muhammad Babur founded a great empire that included both India and Afghanistan, determined to adapt to the conditions. At the same time, he inherited the system of government of the Timurid Kingdom and acted on the basis of the political and legal traditions of his time.

As early as the tenth and twelfth centuries, science flourished in Movarounnahr, the observance of Islamic law became a social necessity for the development of society, and many jurists created a set of just laws. In particular, Burhaniddin Marginoni gained a great reputation not only among rules, scholars, but also among the common people as a "soldier of the path of guidance". His work "Hidoya" became very popular among Muslim jurists.

Amir Temur and Babur, who were well acquainted with such works of jurisprudence, also carefully studied the documents of state importance, such as Yaso(yasak). That's why, as honorable rulers, they gave their state a set of just laws and rules, a set of judgments-"Rules", a memoir, such as "Boburnoma", a generalization of life experiences.

Ibn Arabshah writes in his book "History of Amir Temur". He went so far to say that if the reader made a mistake, Temur would correct him and ask a question. The following opinions of the famous historian sharaffuddin Ali Yazdi can be used as a basis for concluding that the rules were written in the Turkic language in the office of Amir Temur: "... In this order it was composed in the form of a Turkish poem and Persian work, separately containing poetry and (prose), containing the great events and experiences of the life of Hazrat (ie Amir Temur). In the recently published "Qissai Temur" in full, "I ordered that a copy of the letter be recorded in many diary,"- the source of Temur's own handwritten words leads to the same conclusion.

"While this work was being written ", says I.Muminov's pamphlet, "Temur read its chapters many times, corrected and edited some of them, and when additional evidence was needed, he sent people to the scene to find out. He demanded that it be covered in accordance with the truth."

Zahiriddin Muhammad Babur was also forced to write "val uhdatu alar ravi"(if the lie is on the neck of the person who said the sin) only if he did not binclude it in the "Boburnoma" until he

saw and investigated everything he heard. This is one of the main factors determining the position of the author's of "Tuzuklar" and "Boburnoma".

Society has its own necessary laws. Without these necessary laws, various inequalities in society will inevitably arise and thus undermine the development of the state. For this reason, the great centralized empire Amir Temur, uniting 27 states, was, of course, created on the basis of a set of laws and had to be strictly enforced.

In this sense, it can be said that Zahiriddin Muhammad Babur, in addition to the "Boburnoma", also described the laws of Islamic law, tax and zakat system in a poetic way and left a legacy under the name "Mubayyin" was a continuation of the traditions of Amir Temur.

Amir Temur had a set of rules developed on the basis of life experience and raised to the level of law by his successors as a system of laws, as well as, life experience and advice. This collection includes historical works and translations in different languages: "Temur's Statues", "Tuzukotiy Temuriy", "Temur's Sayings" and "Temur's Events"- "Temur's Experiences", "Temur's Story", "Malfuzoti Temur's" is known by their names.

It is known that "Boburnoma" was also called "Voqeoti" by its author, and after Babur's death he became famous as "Voqeoti Boburi", sometimes as "Tuzukoti Boburiy", and later as "Boburnoma" consistently continued the traditions of Timur. The concise expression, firm conclusions, and logically sound decisions in both works also define the commonality in the position of the authors.

In his "Statues" Amir Temur gives a narration, a story or historical information about his contemporaries who lived in the past and left a significant mark on social development. For example, the name of Nizamulmulk, a political and writer, public figure and scholar who played a major in the socio-political, cultural and enlightenment life of the East is mentioned in several places. "If a corrupt, black-hearted, inferior man is in charge, the state and the kingdom will soon collapse", he said. Malikshah Seljuk, for example, demoted his minister, Nizam-ul-Mulk. The minister was wrapped in good qualities from head to toe. Instead, he appointed a lowly, a bad man as his minister. As a result of the vile deeds, oppression and depravity of his selfish minister, the kingdom building began to be demolished...[3.18]

These notes of Amir Temur are reminiscent of the information about Hussein Boykaro's ministers in "Boburnoma". It is known from history that a minister named Majiddin exaggerated oppression and tyranny in the palace of Hussein Boykaro, and also went into conflict with Alisher Navoiy. Eventually he fell into disrepair and left the world in disgrace. The "Boburnoma" describes the activities and actions of this minister as follows: They tried and persuaded him, arrested Majiddin and acquainted him.[5.159]

Another interesting example: In Timur's Statues we read: "I have heard that Nizamulmulk had fewer bad deeds and more good deeds. When he was about to go on Hajj, one of the saints said to him: "The goods deeds you do in the palace and the help you give to the servants of God are equal to performing Hajj."[3.77]

These notes of Amir Temur remind us that a similar event took place in the life of Alisher Navoiy, when people told him that the work of the poet and man for the peace and prosperity of the country was no less than the reward of hajj. Zahiriddin Muhammad Babur also equated many aspects of navoiy with Nizamimulk and wrote: " let it never appear... Muncha binoyi khayrkim,

ul did, few people fit the world. What did Mirzodin not get, but he used to give mizogin all the money a year ...”[5.154].

Mazhar Shihab’s research on the creation of rules and language provides information. It contains the following notes on behalf of Amir Temur. “I wrote these memoirs in the Turkic Chigatay language by order of my ancestors. This (good) deed was completed with the help of Allah, the protection of our Prophet Muhammad (peace and blessings of Allah be upon him) and his followers. By the grace of God, I was lucky enough to sit on the throne and reach the judgment of the country. These achievements have been instilled in me through my courage, tenacious struggle, and fighting . . .I have definitely adhered to these basis rules and procedures. I am sure that some of my grandchildren will sit on the throne in the future. That’s why **I have compiled these provebs for them**, so that they may follow these laws and regulations and act on them.” [3.15]

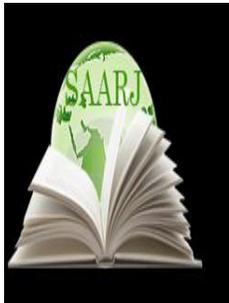

Similar historical notes of the work are also available in “Boburnoma”. Zahiriddin Muhammad Babur clearly shows the date of his accession to throne of Andijan. This leaves no room for doubt as to the creation, language, style, and authenticity of the book: I became the king in the province at the age of twelve”.[5.5]

## CONCLUSION

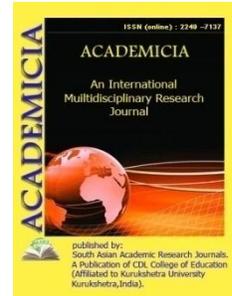

It seems that both Amir Temur and his descendants, the great king and poet Babur, based on the requirements of their time, the requirements of the historical environment, managed to manage the socio-political life on the basis of certain procedures, to update the rules. In this regard, their board outlook, consistent position, impartial and fair attitude to events in society, and their ability to see far were important.

## CONTEXTUALIZING THE STATEHOOD FOR VIDARBHA

**Chaketi Raju\***

\*Research Scholar in Political Science,  
 Centre for Political Studies, Jawaharlal Nehru University,  
 New Delhi, INDIA  
 Email id: rajuchaketi@gmail.com

### ABSTRACT

*There are new trends of asymmetrical development and rising regional disparities which have paved the way for political disenchantment and economic frustrations of the people. However, in response to the socio-economic and political background of the country, economic frustrations may transform into political formation culminating into regional movements for statehood demands. As a result of intrastate disparities, uneven development occurred and demands like Vidarbha emerged quite early. In response, new states kept being formed and the process goes on even today. This article attempts to address the issue of statehood for Vidarbha in the growing political development in the state of Maharashtra in the post-polls period. This study is also proposed to demonstrate the hurdles in achieving the statehood for Vidarbha.*

**KEYWORDS:** *Statehood For Vidarbha, Smaller States, Maharashtra Assembly Polls, India.*

### INTRODUCTION

In recent times in the month of July-August, the issue of separate statehood for Vidarbha led to a ruckus in the Maharashtra Assembly with both the houses being adjourned for some time. Notably, once again the long-standing demand for the separate state of Vidarbha has gained fresh momentum in the wake of Maharashtra post-polls politics. With the creation of “Telangana” as India’s 29<sup>th</sup> state recently, the shout for a separate state in the Vidarbha also got political dressing in more or less way. Nevertheless, there have been more demands for separate states from all four regions of the country such as a proposition to divide UP into four parts- Bundelkhand, Awadh Pradesh, Purvanchal and Western UP, Gorkhaland in West Bengal, Bodoland in Assam, Coorg in Karnataka. But here, it will make a special study on statehood for Vidarbha in the context of changing electoral consequences in pre and post-poll Maharashtra politics; this article

intends to analyze the possibility of achieving statehood for Vidarbha which is backed by the popular movement for a long time.

### **Vidarbha in the Background**

Vidarbha is positioned in the eastern region of Maharashtra and made up of the Nagpur Division and the Amravati Division. <sup>1</sup>It occupies 31.6 percent of the total area and holds 21.3% of total population of Maharashtra. The people of this region often feel that the political class has over time neglected the issues facing such as its backwardness, farmers suicides, and situation of severe agrarian distress. These serious concerns have never occupied adequate attention in Maharashtra policies in order to eradicate the regional imbalances. Thus, the demand for Vidarbha rose mainly on the ground of regional economic inequality.

In the initial period of 1955 itself, the <sup>2</sup>State Reorganization Commission recommended the creation of Vidarbha as a separate state. Dr. B.R. Ambedkar also welcomed this move as his view is based on the socio-economic status of the deprived sections of the society which could be better served in the separate state of Vidarbha in a holistic manner. Later in 1996, the demand for statehood occupied a prominent role in the BJP's electoral manifesto and subsequently it was disappeared due to its alliance with Shiv Sena, which devoted for a Marathi chauvinistic regional identity opposing the idea of curving the state. Hence, the separation with Shiv Sena appears in a fresh light that the people of the region hope present BJP leadership would positively respond to bifurcation since having a full majority at the Centre as well as forming its government at the state level in absenteeism of substantial resistance from regional parties in the region.

### **Post-Poll Political Development Scenario**

As a part of Maharashtra, the Vidarbha region is representing by 62 seats at the state level. According to the 2014 assembly elections, BJP has emerged as a single largest party by winning 46 of its 62 that gives hopes for statehood in the Vidarbha. In terms of percentage, BJP managed to get 75% seats, whereas Shiv Sena permitted to only four seats in the Vidarbha region. In this case, the electoral success of BJP, of course, based on the factor of Narendra Mody popularity, there was also a noteworthy support to the party in this election that the people of the region marked it as their choice in order to fulfill their aspiration of statehood.

There are two reasons for positive thinking of the people pertaining to the statehood. One is that BJP's victory in the elections without Shiv Sena alliance and no longer BJP's substantial reliance on small parties at the state level. In this game of politics if they pursue statehood, BJP would benefit more in the future as it dominates in the Vidarbha region that they will expand their distinctive regional base to become politically strong in the future, and for that matter BJP had experience in getting political benefits in the case of creation of new states in 2000 such as Chhattisgarh and Jharkhand and Uttarakhand. Second reason is the inclusion of Vidarbha's leaders in the mainstream of government such as Devendra Fadnavis and Nitin Gadkari and others who actively participated for statehood, hails from Nagpur part of Vidarbha. Very recently Chief Minister of Maharashtra Mr.Devendra Fadnavis made a clear comment that a separate state of Vidarbha will be formed at an appropriate time. Therefore, it is believed that the "will of the people" will be carried by this strong political leadership and could influence the party in the favorable stand at very quietly.

Here we need to talk about the Sharad Pawar's NCP<sup>3</sup> that won merely one seat in the Vidarbha region after broke up with the Congress, which gained ten seats, both are also struggling to take up a clear stand on this contentious issue. While responding to a bifurcation in pre-poll time, Pawar says that "let the people and not the politicians take a decision on Vidarbha state". Interestingly it means to say that let all the people should support the demand, then he would not have any problems. Thus, he made himself flexible to join with any party and it seems there won't be that much resistance from the NCP and Congress.

In a brief, in order to materialize the statehood, there are two difficulties which seem to be more complex for BJP: One is the fear of losing its strength in other parts of Maharashtra thus the BJP feels this electoral triumph should not be seen so much as a referendum in supporting the statehood for Vidarbha. Moreover, still, there is a possibility that Shiv Sena would be joining into coalition government which may bargain its best to stop the bifurcation. Some of the leaders may also argue that in order to hijack the statehood issue they may suggest for framing and implementing 'the regionally relevant plan' very effectively under good leadership. The second one is 'the absence of strong mass mobilization and losing its relevance in the present political scenario'. Anyhow if they really determine to statehood such level of the allegation does not matter, for example in the case of a separate state of Chhattisgarh, it was created where at that time it did not have any mass mobilization despite it took born as a separate state. Thus, these are the issues in front of the BJP which need to tackle and hold up progress in the context of changing political calculations in a post-poll scenario in granting the statehood for Vidarbha.

## CONCLUSION

Finally to conclude, in any case of creation of the new state, the phenomenon of political regionalism always get associated with the local issues such as sons of the soil tensions and the claims for an internal self-determination. But in this context, one should keep in mind that the state creation not to be in the interest of few people to become powerful elites in the region at the cost of majority people as Ambedkar warned. In fact, the statehood for Vidarbha may also remain like ongoing demand and it makes probable to see how politicians frequently support the idea of statehood for political expediency without necessarily expecting a new state to see the light of day, and that they can shift their position over time. And it has become a useful tool to keep alive in a bid. Therefore, this can be seen as another replication of statehood issue that is drawn into short-term political maneuvers. As Lous Tillin made amply clear that "the demand for statehood arises as conciliation between interest groups competing for position rather than reproducing a radical break in the dispersal of power that raises questions about the representative quality of democracy as well as political economy of development" which are sharp end of the job in the creation of new states in Indian context.

## VOCAL PERFORMANCE ROLE IN PERFORMING ART

**Toshpolat Akbarov\***

\*Senior Lecturer,  
Ferghana Regional Branch State,  
Institute of Arts and Culture,  
UZBEKISTAN

### ABSTRACT

*Singing is one of the most delicate and demanding artworks types, the article provides some suggestions for this field representatives and methodical guides for vocal education for students of "Musical theater performance". Hold the breath for a moment before recreating the sound - the breathing position, the fixation moment of the breathing position, the breathing set should be maintained during the whole singing, the whole fixation exhalation, which forms the breathing basis. The singer's breathing and exhalation are separated by holding the breath for a moment and then exhaling begins. Hold the breath for a moment before recreating the sound - the breathing position, the fixation moment of the breathing position, the breathing set should be maintained during the whole singing, the whole fixation exhalation, which forms the breathing basis. Our compatriots are actively participating in various international competitions and festivals, gaining the recognition of the prestigious jury and public applause.*

**KEYWORDS:** *Singer, Vocals, Singing, Breathing, Song, Skill, Art.*

### INTRODUCTION

Allah, who created eighteen thousand universes and all beings, has bestowed the thinking and speaking blessing only on man among these creatures. It is in these respects that man differs from the animal kingdom. In the words of our great ancestor Alisher Navoi:

Сўздурки, нишон берур ўликка жондин,  
Сўздурки, берур жонга хабар жонондин.  
Инсонни сўз айлади жудо хайвондин,  
Билким, гуҳари шарифроқ йўқ ондин.

*(It is said that the target is the dead soul,  
That is to say, it is a message to the soul  
The human can speak unlike the animal  
I know, there is no more honorable than guhari.)*

There is someone who has the ability to speak, who expresses his thoughts through his words, expresses his feelings, and of course sings.

### **Main part**

It is no exaggeration to say that art is the field that reveals the human soul pearl secrets that excites the soul emotions. This kind of art is an art variety, which has a special place among them, it is distinguished by its sincerity, peace of mind.

Singing traits must first and foremost be congenitally transmitted to the performer by Allah. If the performer character traits and vocal abilities are shaped in accordance with singing field, it will be much easier for him to grow into a great singer in the future. Otherwise, that is, if the voice opportunity and the talent bestowed by Allah are less, it is necessary to work more with the person. But in this case, the desired result is not always achieved.

If an artist doesn't practice one day, only he knows. If an artist doesn't practice for two days, those around him will know. If he doesn't practice for three days, the whole nation will know" said a master artist Fakhriddin Umarov [2, 103].

A musical theater actor must meet not only the stage movement but also the singing performance requirements, to be able to move freely, listen to the orchestra and be in constant contact with the conductor, perform dynamic tones in the ensemble [3, 32].

The work of an actor, musician and educator is the psyche work. To leave a deep imprint in the hearts of the listeners and to give warmth to their souls is required to master an important weapon such as sound.

Enrico Caruso forced the voice of his only student to be like his own, and the student voice who could not bear such a burden with his naturally normal voice was damaged [5, 4].

Singer-actor creativity is defined by the combination of two artistic elements, such as music (song) and drama (a high level of stage skill), which come together as a whole during the creative process.

Hearing perception is formed through the vocal organs activity. When we hear a song or two of music, we repeat them with a few sounds inside us, and only then do we perceive them.

Further improvement of the sound possibilities inherent in it and the development of its natural qualities are achieved through a very close perception of the vocal by the teacher and the student.

Well-known opera singer F.I. Chaliapin once said: "I must say with regret that I have rarely seen real vocalists - artists. There are good and even great singers, but there are no vocalists, no full-fledged artists"[6, 349].

It is no secret that the vocals, which played a major role in the singing direction, are now quite popular. Vocal is a unique type of musical art, based primarily on a singing art high mastery level.

In the formation and development of vocal skills, the members work involved in it develops. Excessive effort is reduced, what is needed is strengthened and improved.

The singing breathing development as a basis for singing takes place in the working process on the singing sound and is gradually, systematically nurtured. It should promote the natural coordination of all the systems involved in a rhythmic, free, sound formation. Conditions are created for an organized, calm breathing "resting" sound associated only with singing. Such a sound sounds complete and beautiful.

Breathe in before making a sound. This breathing phase can be controlled. During the singing breath, the lungs fill with air and the vocal apparatus is prepared to produce sound. The singing breath is taken with a much deeper, semi-yawning tone without noise.

It is not good to take in large amounts of air while breathing, because the sound making and producing process itself is also difficult. The singer's breathing and exhalation are separated by holding the breath for a moment and then exhaling begins. Hold the breath for a moment before recreating the sound - the breathing position, the fixation moment of the breathing position, the breathing set should be maintained during the whole singing, the whole fixation exhalation, which forms the breathing basis. The main function of proper exhalation is to exhale it slowly, sparingly, creating the pressure in the subcutaneous space that is necessary for the normal functioning of the vocal cords. The ability to spend the breath turning it into a sound to the end defines mastering skill the singing breath.

Forming the right vocal tone requires the peculiarities knowledge of Uzbek language. Features of Uzbek folk singing, phonetic features, lip tuning, rhythmic features, one-voice perception and thinking make it difficult to equip Uzbek students with academic singing skills, the ability to maximize their voice in a solo singing class.

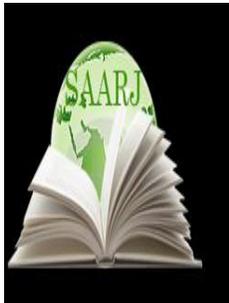

The tradition of dividing vocal into traditional, classical and pop genres has come to our country from highly developed countries. The physiological nature of vocals, based on human physiology, which is common to all ethnic groups and cultures, produces methods of sound development, which allows Uzbek songs to become popular beyond our great homeland. Our compatriots are actively participating in various international competitions and festivals, gaining the recognition of the prestigious jury and public applause.

## **CONCLUSION**

In conclusion, it can be said that the little talent bestowed by Allah and the tireless work done with the help of teachers will not fail to bear fruit. Just as a person digs a well with a needle, so it is required to master the secrets of singing step by step with perseverance and endurance.

## PROBLEMS OF LEARNING GRAMMATICAL TERMS IN SECONDARY SCHOOLS AND WAYS TO SOLVE THEM POSITIVELY

**Sultanova Aydin Menglibayevna\***

\*Senior Lecturer,  
 Department of Uzbek Language,  
 Nukus State Pedagogical Institute,  
 Doctor of Philosophy in Pedagogical Sciences (PhD),  
 UZBEKISTAN

### ABSTRACT

*In the Uzbek and Karakalpak languages, the use of an explanatory translation method in the interpretation of grammatical terms naming the same concepts differently is necessary to avoid the negative impact of the native language on the use of the term. "In order to correct and adjust his speech, the student must learn to use grammatical terms as a bridge in the application of rules." "... in order to be able to find all the rules in a book, he must have mastered the grammatical terms and be able to use them as a means of finding the appropriate rule." Work on such terms begins with explaining and repeating the term to students by comparing it. After all, a person who is learning another language will refrain from speaking if he does not see the ability to put the pronunciation of a word in place. From this it can be concluded that in Uzbek and Karakalpak languages it is possible to identify terms that are the same or close to each other and have the same meaning, or even terms that are expressed in different words, as familiar words without resorting to ready-made definitions.*

**KEYWORDS:** *Explanatory, Interpretation, Identification*

### INRODUCTION

Development of methodological problems of teaching the younger generation in the world, including the identification of similarities and differences between sister languages, the study of existing features of the two languages, the search for different ways to improve the speech of young people, grammar based on comparative knowledge of foreign scholars The issues of mastering the elements are a priority. Accordingly, one of the urgent tasks is to identify the

linguistic and methodological bases of teaching grammar materials of the Uzbek language in schools with Karakalpak language of instruction, to develop their speech, to expand their worldview.

There is some research done on teaching terms. For example, M. Mirmakhsudova's dissertation on the method of developing students' speech using grammatical terms in the lessons of mother tongue in grades 5-7 of schools with Uzbek language of instruction and a methodical manual based on this work, T. Yusupova's monograph on repeating morphology in 8th grade syntax takes place. However, the teaching of grammatical terms in the Uzbek language in Karakalpak-language schools requires specific methodological solutions. The main problem is explained by the expressive features of grammatical terms in both languages.

In the process of working on grammatical terms, it is natural for the teacher to ask the following questions:

- 1) Why terms should be taught;
- 2) Which terms need to be taught theoretically;
- 3) How to teach.

The purpose of developing oral competence is clear: to teach young people to speak correctly and express their ideas in writing, following the norms of the Uzbek literary language. But the limit of linguistic competence has not yet been defined: knowledge of language levels or taking a normative grammar course? The linguistic concepts presented in the Uzbek language textbooks for grades 5-7 may meet the requirements of a little knowledge of the language levels. But they are not enough for a normative grammar course. Some of the knowledge selected from the language levels addresses the needs of speech development. This means that while some of them (e.g., semantic types of nouns, semantic types of adjectives, etc.) lead from such needs to linguistic competence, what this knowledge should actually be has not been scientifically researched and substantiated. In this regard, the following statement of the Methodist scholar M. Mirmakhsudova's dissertation is important: "In order to correct and adjust his speech, the student must learn to use grammatical terms as a bridge in the application of rules." "... in order to be able to find all the rules in a book, he must have mastered the grammatical terms and be able to use them as a means of finding the appropriate rule." It is clear from these thoughts of M. Mirmakhsudova that it is necessary to know the rules for correct speech and writing, to find the necessary rule in the textbook or other textbooks based on the terms, and to fully master the terms. We think that the word "complete" used by the author is used to mean a school mother tongue course. In order to remember the terms, in our opinion, it is necessary to be able to distinguish language levels. L.A. Trostentsova also interpreted this idea differently: "... without mastering morphological concepts, mastering morphological terminology, the reader can not apply a number of spelling rules, analyze the use of word forms in the text, compose phrases and sentences, correct various errors he feels difficulties "[105,25].

The study of linguistic concepts is a prelude to theoretical knowledge. A modular approach plays an important role in the proper organization of this work. In adapting the modules (4 modules) developed by V.E. Gladchenko in relation to the study of the text in the research work to the work on the terms, we identified them as follows:

Module 1 - to involve the student's knowledge of the native language in the process of defining terms in the Uzbek language (I got acquainted with a new term - I learned).

Module 2 (theoretical-educational-cognitive module) - mastering the term-concept in the context of theoretical information (I learned - where I plan to use); work on theoretical knowledge based on a new concept.

Module 3 (practical module) - application in speech, application in the example of exercise materials: the purpose of which is to create an associative connection in the mind of the student between the term and the phenomenon of language.

Module 4 (control-reflexive module) - introduction to one of the language levels, exercises, tests; games, sinkway, essay, oral and written analysis.

It was considered expedient not to reflect in the content of education, as it is easy to express in lexical terms the similarity or partial difference in pronunciation and spelling of words that are close to each other in Uzbek and Karakalpak languages. But it was thought that they could be used as familiar vocabulary in the name of a topic, in theoretical information, in the context of an exercise or assignment. Work on such terms begins with explaining and repeating the term to students by comparing it. After all, a person who is learning another language will refrain from speaking if he does not see the ability to put the pronunciation of a word in place.

Terms (three to four terms) may also be recommended for reading: Read the given words. Note that grammatical terms in Uzbek are expressed in Karakalpak.

ot - atlyq

last - digital

Introduce students to the difference between the two languages in terms of partially different terms (keyword - bass word, productive - productive, question - question, etc.), show pronunciation and spelling, at the end of this work aimed at mastering the difference between the two languages it is enough to do exercises.

Education in Karakalpak-language schools can be used to bring the Uzbek language closer to the methodology of the native language, taking into account the level of knowledge of students in grammatical terms, the peculiarities of their mistakes. In other words, the use of some grammatical terms in the context of theoretical observations directly within the topic, the comparative explanation of some as concepts, ie the introduction of more lexical through translation, the use of information technology can be an optimal solution to existing problems. Such an approach, that is, teaching lexical terms that are relevant and close to each other in the Uzbek and Karakalpak languages, avoids grammar, while at the same time requiring teachers to go beyond the textbook format. It is expedient to use the Karakalpak variant to mean the Uzbek term. Speaking about the study of words in another language, Methodist scholar R. Yuldashev writes: It can be said that the Uzbek word is "equivalent" to the task performed by the word in the native language. This kind of behavior in teaching speech is called functional concurrence. Accordingly, mastering a word means understanding its meaning, concretely imagining its functional aspects and scope of application. " We think that this idea also applies to grammatical terms that can be learned in the lexical aseno: when linguistic phenomena in both languages (the language being studied and the mother tongue) are common, the reader does not re-learn

linguistic definitions and rules, but transfers the concept from one language to another. It will be possible to theoretically approximate the terms available for such transfer by means of comparative data.

In some of the lessons they observed, teachers were able to interpret all of the independent word groups as above. From this it can be concluded that in Uzbek and Karakalpak languages it is possible to identify terms that are the same or close to each other and have the same meaning, or even terms that are expressed in different words, as familiar words without resorting to ready-made definitions. But if the term is not learned in native language classes, it cannot be done as above. If there is a need to use Uzbek alternatives to terms not studied in the native language, the Uzbek term as a new linguistic phenomenon will have to go through processes that serve to create understanding using the same types of work as in native language lessons. Thus, in the study of grammatical terms in the Uzbek language, it is necessary to follow the principle of taking into account whether the Karakalpak alternatives have been studied in the native language classes.

It is good that the Uzbek term was introduced after learning the Karakalpak alternative. To do this, it is necessary to improve the content of education on the basis of integration, to encourage Uzbek language teachers to consider the topics covered in the program and textbooks of grades 5-7 of Karakalpak schools, to be aware of innovations in teaching methods and techniques used in mother tongue lessons. Taking into account the topics covered in the native language classes facilitates the work on the term in the Uzbek language classes.

Grammatical terms introduced in the lexical plan by specifying the equivalent are reinforced using the following types of work:

1. An appropriate grammatical term is used in the exercise context. The teacher uses the term in her speech as she explains how to do the exercise. He then asks the children about the condition of the exercise.
2. Grammatical terms are worked with a table that reflects. In this case, more classification information is assimilated.

In the exercise, which is organized on the basis of a table that reflects the classification of independent word groups, students use grammatical terms in speech as if they were reading, that is, ask questions, answer questions, and so on. The ability to read terms from a table makes the exercise receptive-reproductive, as students are not in a position to memorize the terms.

3. Students are given a list of terms belonging to a particular group and practice on the pronunciation and spelling of these terms.
4. Work on a bilingual dictionary of grammatical terms.
5. Dictionary dictation is conducted.
6. Spelling exercises are performed.
7. Words, word forms are recited and a competition is organized for students to quickly name grammatical terms.

Grammatical terms serve as a noun in the classification of linguistic phenomena, serve as a basis for recalling the rule on the use of grammatical means, finding them from external carriers. To

do this, it is necessary to ensure that grammatical terms are remembered by students. Educational activities aimed at reinforcement and repetition help to trigger this mental activity. For this purpose, the methods of analysis of the phenomenon of language, the types of analysis recommended in the methodology of teaching the native language are used. Ms. Mirmaxsudova presents the process of activating grammatical terms in the following stages:

- 1) Grammatical concept and definition of the term on the basis of linguistic phenomenon;
- 2) Remember the grammatical term;
- 3) Development of skills and competencies in grammatical terminology;
- 4) Teaching to use the grammatical term as a bridge to remember rules;
- 5) To achieve full activation of grammatical terms in the process of improving written speech.

When M. Mirmaxsudova says "building skills and competencies in grammatical terminology", she means more analysis. He writes on the basis of practical lessons: "Our conclusion is that without a thorough analysis of every second or third of the mother tongue lessons, the necessary knowledge, skills and competencies in this area will not be formed. When the types of partial and full analysis are exchanged, it becomes clear that there will be no classes where this type of work will not be conducted."

The author distinguishes the following types of grammatical analysis in order to achieve consistency, from easy to difficult, from simple to complex, from familiar to unfamiliar:

- 1) Partial analysis within a small topic;
- 2) Partial analysis within two to three sub-topics;
- 3) Partial analysis within a larger topic;
- 4) Detailed analysis within the thematic group (independent words, auxiliary words, etc.);
- 5) A comprehensive analysis of major topics (such as morphology, lexicology, syntax);
- 6) Partial analysis of inter-departmental, inter-level mixed type;
- 7) Complete analysis of inter-departmental, inter-level mixed type [8; p. 91].

Types of analysis play an important role in memorizing grammatical terms and encouraging their use in speech. The following exercise conditions are met:

Say which word group the given words belong to.

Tailor, forty, called, all, ...

Analyze the given sentences morphologically.

Example: Uzbekistan is a country with a great future. Uzbekistan - horse; future - at, the consonant k at the end of the word -i became g due to the addition of the possessive suffix...

Say the names of the agreement. Say independent word groups.

Say which word group the words separated from the text belong to.

The ability to memorize grammatical terms quickly in the process of analysis provides the basis for activating them. There is an emphasis in the methodological literature that it is useful and

effective to require students to tell a story. For example, you could ask them to talk about independent word groups. In this case, the reader first classifies, then says each word group and gives an example.

The grammatical term is a means of understanding the content of theoretical information, and then finding the appropriate rule in the textbook when necessary. But it is difficult to find a rule that has already been covered in the textbook based on the term. Ms. Mirmaxsudova also found that "... to find and read a rule, you need to turn the pages of the textbook for about 5 minutes." This situation, he said, "... indicates the lack of appropriate qualifications, the lack of special work on the formation of such skills" [8; 110-b.].

The following opinion of the methodologist T.Yusupova can clarify what should be the results of strengthening and repetition of grammatical terms: must be able to distinguish "[10; 71-b.].

There is absolutely no need to give a definition of grammatical terms when it is clear that all students understand them. For example, in the 7th grade textbook "Uzbek language" [9] after Exercise 39 on the topic "Chama numbers" the following description is given: "Know. Approximate numbers represent an approximate amount." [9] The term chama should not be defined if the term is approached as 'familiar'.

It is of great benefit to start using many terms in the text analysis process. This work is organized in connection with the following cases:

1. When conducting types of grammatical analysis.
2. In the organization of grammar games.
3. When working on tests.
4. In organizing a "mental attack".
5. "Who remembers fast?" in the game.
6. In terms of question or assignment: "Read the numbers separately from the text", "Which noun in the first sentence is used instead of the diamond in the second sentence?"

Mastering a word means using it knowing its function in a sentence. The function of the word in speech cannot be memorized, it can only be mastered in the process of speech activity. Terms-based questions and answers, narratives provide such an opportunity.

When a grammatical term is also a word, the translation from Karakalpak into Uzbek, that is, when the meaning of the term in both languages is the same, allows it to be used directly in linguistic observations. In this case, the Uzbek term assumes the function of the Karakalpak term.

In the Uzbek and Karakalpak languages, the use of an explanatory translation method in the interpretation of grammatical terms naming the same concepts differently is necessary to avoid the negative impact of the native language on the use of the term. Because the Karakalpak alternative is a word used in the Uzbek language (for example, there is a word equivalent to the Uzbek member in the term of speech), students sometimes go the way of translating the Karakalpak term with the alternative itself (member). As a result, they make mistakes, such as using the Karakalpak term instead of the Uzbek term. In our opinion, in cases of such expression

it is not enough to show the grammatical term in both languages, that is, to give it as a dictionary. It is worth noting that different terms are used in Uzbek and Karakalpak languages.

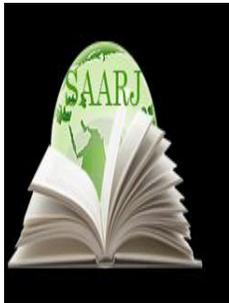

In the form of various grammar games, competitions on grammatical terms, it is possible to organize strengthening exercises as follows:

- Translation of Uzbek grammatical terms into Karakalpak, Karakalpak grammatical terms into Uzbek;
- Morphological analysis of given words (sentences) on the basis of the sample;
- mutual question and answer using grammatical terms;

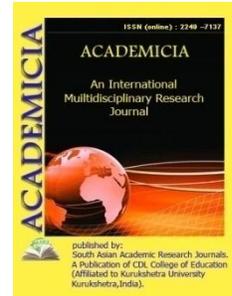

Terms translated from Uzbek into Karakalpak with unfamiliar words do not create confusing situations. Accordingly, we believe that it is sufficient to give students such terms in the form of a dictionary and to carry out exercises to strengthen their bilingual expression.

## PIANO PERFORMANCE AND CONCERT GENRES IN THE WORKS OF UZBEK COMPOSERS

**Kholmatov Sherzod Khushbekovich\***

\*2nd year Master of Termez State University,  
 Master's Department, Music and Art,  
 UZBEKISTAN

### ABSTRACT

*This article discusses the genres of piano and concert genres in the works of Uzbek composers. There is information about the concert life in Uzbekistan in the XX century, then the development of concert genres, the opening of professional music schools in the capital and regions of the country, the great pianists.*

**KEYWORDS:** *Piano, Concert, Stage, Musical Lectures, Instrumental, National Dance, Creativity, Art.*

### INTRODUCTION

It is devoted to the analysis of the concert life of Uzbekistan in the period of the adaptation of European traditions in the XIX-XX centuries, when the active influx of foreign musicians brought new forms of concert activity to the region. It will feature colorful ensembles such as wind and symphony orchestras, choirs, and instrumental ensembles, as well as the creation of specially constructed stage areas that can accommodate a large number of listeners. Regular concert rallies, music lectures and music evenings in various places played an important role in familiarizing the general public with classical music and promoting it among the local population. The creators of the first musical community V.Leysek, V.Mikhalek, as well as talented performers such as V.Buyukli, L.Shvarts, K.Koren, S.Vonsovskaya, musicologist M.Kulyabo-Koretsky and others made a significant contribution to this work. Literary appeals of Uzbek enlightened poets Furkat, Ahmad Donish, Muqimi and Fitrat strengthened the involvement of the public as listeners, and talented young people as participants of concert events.

**Main part.** No matter how active foreign musicians are in the development of European forms of concert performance in our country, if the concert basis of Uzbek music was not related to the

traditional method of professional expression (T. Gafurbekov) - concert performance, their adaptation to the new conditions of monodial traditions would not have developed. First of all, it is necessary to distinguish such genres as lapar, yalla, big game, which are widespread in the territory of Uzbekistan, they have all the elements of competitive performance and are a prototype of a unique modern theatrical musical dialogue recreated in concert opus of XX-XXI centuries. Some connections are observed in the musical-poetic competitions of the past, which are popular in the East - in didaishma and mushaira, literary and musical gatherings - during which participants demonstrate their virtuoso poetic and musical talents. Valuable information about this is available in various literatures, in particular, in "Selected Works" by A. Navoi and "Nightmare" by U. Kaikovus.

Concert life in Uzbekistan in the XX century, then the development of concert genres, the opening of professional music schools in the capital and regions of the country, great pianists (K.Igumnov, L.Oborin, G.Ginzburg, E.Dolinga), violinists (K.Dumchev, M.Erdenko, B.Fishman, M.Goldstein), cellists (R.Felitsiant, D.Shafran, M. Rastropovich) and academic singers (I.Golyanda, E.Orleneva, E.Obraztsova) are closely connected with the emergence of concert halls where they performed.

The role of the creative tandem of composer-performer highlights the problems of cooperation between composer and performer, the harmonious tandem of which allows to create the best examples of concert genres. The joint creative activity of G. Mushel and R. Kerer is a vivid example of this, the composer dedicated to him his famous Second Piano Concerto; as well as S.Boboev and A.Odilov, I.Khamroev and S.Takhalov, now - M.Bafoev and A.Sharipova, R.Abdullaev and S.Gafurova, as well as with the whole ensemble or orchestra of the composer (symphonic, or « Sogdiyona »(Uzbek Folk Instruments Orchestra), which also led to the creation of a number of concert pieces for Uzbek folk instruments.

The growth of the performing culture was largely driven by the training of highly qualified personnel, which had a direct impact on the creation of new concert works, as composers often target a specific musician who was able to fully recreate the ideas and images expressed in the music they created.

As composers and performers work in a creative tandem with each other, it is important to consider the role of each, while demonstrating that they are knowledgeable about each other. It is expressed in different forms: as a "zone of knowledgeable composer" and "zone of knowledgeable performance" (the term N. Mityaeva). This is the "creative space" reserved by the composer for the performer. The performer, in turn, should not violate the idea of authorship, but complement it with an individual style, reading the artistic idea of the work with his own eyes.

Types of solo concert works are analyzed: piano, string and wind instruments, as well as concert works created for sound and orchestra. Research has shown that piano concerts are more popular, which is largely due to the presence of performers, as well as the fact that the composer himself knows how to play the instrument. The piano concerto has undergone a significant development and evolution: the founder of the genre, G. Mushel, has moved away from imitating the classical three-part series to classical samples, relying on the intonation-rhythmic structure of traditional music culture, enriched with new content and new means of expression. is the path to sound

compositions. This type of stickThe authors are N.Zokirov, R.Abdullaev, H.Rakhimov, M.Bafoev, M.Otajonov and many other composers.

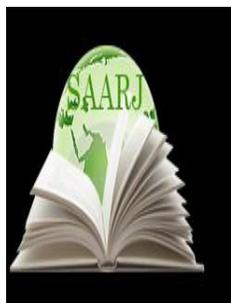

### CONCLUSION

The reasons for the renewal of the semantics of concert genres are highlighted, in which the expansion of the figurative range of opus to be created, enriched with colorful themes and ideas, plays an important role. The central theme is the image of the people, its life and way of life, holidays and musical traditions. The appeal to the events of the historical past filled the content of the concert compositions with poetry, as well as the depth of expression and philosophical direction. In this regard, the traditions of Sufism, which are the basis of the ideological concept of concert works, as well as the appeal to ancient genres such as mavrigi, bench, which enriched the musical palette of concerts with serjilo jargon, also play an important role.

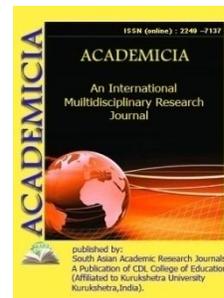

The programmatic idea of many works related to the revival of traditional holidays and images of folk heroes strengthens the theatrical basis in them and turns the concert into a "musical theater". The second concert of B.Gienko "Clowns", R.Abdullaev "Navruz melodies", M.Bafoev's concert-ballet "KhojaNasriddin and Carmensita in Bukhara", H.Rakhimov's "Shum bola" and piano based on G.Gulam Concertino for orchestra is one of such works.

## RELIEF FORMS OF MIRZACHUL OASIS

**Toshboev Zafar\***

\*Senior Teacher,  
 Department of Geography and Fundamentals of Economics,  
 Jizzakh State Pedagogical Institute,  
 UZBEKISTAN

### ABSTRACT

*The article explores the forms of relief in the Mirzachul oasis, the stages of formation of relief forms, the role of the relief component in the formation of oasis landscapes. In the operation of irrigated lands and hydraulic structures, the development of new protected lands should be monitored and all natural processes occurring in the area should be taken into account. Each of its components plays a unique role in landscape development. In landscape development, the study of their role plays an important role in the assessment of landscape development because their components are interconnected and interact together. At the end of the epoch, it rose epherogenically, but as early as the Paleogene, the southeastern part of the Central Asian region began to fill up again below sea level due to subsequent bending, and included a shallow coastal basin or lagoon-type basin. Marine transgression lasted until the Lower Oligocene.*

**KEYWORDS:** *Anticline, Bending, Depression, Erosion, Eolian, Accumulative Structures Of Relief.*

### INTRODUCTION

Today, when the impact of human economic activity on nature is growing, there is a growing interest in studying, analyzing and classifying changes in nature and some of its components. In determining the general trends in the development of the nature of the Mirzachul oasis under study, it is necessary to determine the current natural components and the time of formation of natural complexes, to reveal their aspects in modern landscapes. The study of the development and dynamics of the formation of landscapes of Mirzachul oasis, their division into morphological units, genetic sequencing, the study of factors of composition of natural and anthropogenic landscapes is of particular importance today in the development of an important sector of the economy.

Climate, relief, and surface water flows serve as the three main geographical factors in landscape formation. Climate plays an important role in the formation and development of the landscape and its components across latitudes. But the role of relief in the formation of the landscape of certain small areas is incomparable. The direction of surface water flow is closely related to the relief structure [4, 35-38]. Each of its components plays a unique role in landscape development. In landscape development, the study of their role plays an important role in the assessment of landscape development because their components are interconnected and interact together. The study of the relief component in the study of landscapes of the Mirzachul area makes it more convenient to divide the area into landscape morphological units. Lithogenic factors - relief, lithological composition of the rock that forms it play a key role in the separation of landscape types in the Mirzachul region. It is relatively stable among landscape-forming factors, is the foundation of the landscape, and determines the rock and soil conditions of the landscape.

### **The main part**

The landscapes of the Mirzachul oasis have been formed since ancient times in the conical deposits formed by the ancient rugged terraces of the Syrdarya, the deposits brought by permanent and temporary runoff from the Turkestan and Nurata ridges. One of the factors involved in the formation of the landscapes of the Mirzachul oasis is its relief. The relief of the area is peculiar, orographically open on the north side, and bordered on the south by mountain ranges. Such orographic structure of the earth's surface, in turn, plays an important role in the formation of the climate of the region. Due to the obstruction of the mountains in the south by air masses coming from the north, several permanent and temporary streams - rivers and streams - formed. The proluvial plains, which have long been formed and formed in the part of the outflow of rivers and streams, have also formed oases such as Zaamin and Jizzakh in the conical distributions [3, C 131-134].

The analysis of the geological-relief component in the study of landscapes of the Mirzachul area makes it easier to divide the area into landscape morphological units. It is necessary to pay attention to the stages of development of the relief component in the composition of the landscapes of the Mirzachul region. The Mirzachul region is structurally part of the boundary zone between the Turan plate and the Western Tianshan mobile orogenic zone, and occupies the western half of the Tashkent-Mirzachul basin. In the Meso-Cenozoic rocks of the basin there are large structural elements, the largest of which is Chirchik-Mirzachul. Its direction is close to the latitudinal direction, and the bottom is complicated by dense Paleozoic rocks, mainly limestone and shale.

The southern part of the Chirchik-Mirzachul fold is bordered by the Mehnatkash-Pistalitog anticline zone and consists of eastern (Mehnatkash) and western (Pistalitog) uplifts. The outer surface of the former is somewhat bare, with the Neogene strata exposed in the bedrock of the eastern uplift, and the Paleozoic strata in the west. The anticline zone is represented by the Pistalitog, Baliklitog and Khanbanditog, and in the east by the Mogultog remnant mountains. Between the Mehnatkash-Pistalitog anticline and the Turkestan ridge branches is the Lomakin (Zarbdor) fold, bordered on the west by the Koytash intermittent basin and on the east by the Fergana Depression. The bedrock of Paleozoic shale and limestone, granitoid intrusions in the fold area reaches a depth of 1400 m. The fold is filled with thin deposits of Cretaceous and Paleogene periods and relatively thick Neogene-Quaternary rocks.

The tectonic development of the Tashkent-Mirzachul basin is divided into two stages: platform (Upper Paleozoic - Middle Oligocene) and postplatform (Upper Oligocene - Anthropogenic). During the Triassic and Jurassic periods, the subsurface probably covered a flattened area, and the Paleozoic period formed a surface erosion crust. Paleogeographic evidence testifies that the first significant bending and transgression of the Tashkent-Mirzachul basin took place at the beginning of the Upper Cretaceous. At the end of the epoch, it rose epherogenically, but as early as the Paleogene, the southeastern part of the Central Asian region began to fill up again below sea level due to subsequent bending, and included a shallow coastal basin or lagoon-type basin. Marine transgression lasted until the Lower Oligocene.

The Mirzachul region is usually divided into two parts: the ancient valley of the Syrdarya in the north and northeast, and the plain part of the foothills - in the south. The foothill plain is bounded on the south by the Turkestan and Nurata ridges, and the part of the plain consisting mainly of deluvial-proluvial plumes and spreading cones of rivers includes the accumulative terrace of the Syrdarya. AA Rafikov (1974) as a result of large-scale mapping and analysis of Mirzachul relief shows the division of the following types of relief according to genetic and hypsometric features:

I Structural-erosion relief - low mountains and residual heights;

II Sculptural-erosion relief - sculptural plains (Koshkent ridge);

III Erosion-accumulative relief: 1) foothill deluvial-proluvial sloping plains; 2) less proluvial plain with mountain slope (conical spreads of rivers and streams); 3) deluvial-proluvial plane of flatness; 4) oblique deluvial-proluvial plane in the depressions between the diffusion cones; 5) Lomakin (Zarbdor) plateau - ascending wavy proluvial plane; 6) flat low proluvial plane at the pouring edges of the diffusion cones; 7) proluvial-alluvial plane in the central part; 8) flat-bottomed lowland; 9) wavy alluvial plain in the northern and northeastern parts; 10) undulating terraced plain on the lower terraces (Syrdarya valley); 11) Boyovut erosion massif; 12) The plain at the site of Lake Tuzkon

VI. Eolian-accumulative relief is a wavy plain of sandy sandstone.

The structural-erosion relief type includes the Molguzar Mountains, the northern branches of the Nurata Mountains, in particular, the Pistalitog, Baliklitog, Etimtog and Khanbanditov lowlands. In the sculptural-erosion relief type, the Koshkent ridge includes a raised surface with a general slope in the north-west and is branched in the meridional direction by many ravines - rivers, in particular, Shurbuloksay, Koshkentsay, Kattasay, Donasay, Altikotonsay. The erosion-accumulative relief type is occupied by steep deluvial-proluvial plains, Turkestan ridge, Koytash Mountains, Baliklitog, Pistalitog mountains. The proluvial plains of the foothills are located at the foot of the northern slopes of the Turkestan and Nurata ridges. The deluvial-proluvial plains of the flat plateau are located between the northern slopes of the Koytash Mountains and the southern foothills of the Pistalitog, Baliklitog, and Etimtog. The sloping deluvial-proluvial plane in the basin of the range of distribution cones occupies the area between the Zominsuv cone distribution in the west, Khojamushkentsoy and the foothills of the Turkestan ridge in the west. The ascending-wave-proluvial plane - the Lomakin (Zarbdor) plateau - ends between the Sangzor and Zominsuv conical distributions.

The confluence of the conical formations is a flat lower proluvial plane at the edge, the third part of the Sangzor, Ravotsay, Pshagarsay, Zominsuv, Khovosoy cones. The flat proluvial-alluvial

plain in the central part of Mirzachul is located between the margins of the cones in the south and the streamless basin in the north. , small hills and lowlands. The flat-bottomed, streamless basins are located in the central part of Mirzachul and extend from south-east to north-west. These are Ettisoy, Sardoba, Karakaray, Arnasay basins.

The small wavy proluvial-alluvial plains in the northern and north-eastern part of Mirzachul are part of Terrace III and are lithologically and geomorphologically related to the activity of the Syrdarya, Ahangaron and Chirchik rivers. The small wavy terraced plain of the lower terraces occupies the present valley of the Syrdarya. The terrace I rises 2.5 m above the river crossing. Terrace II rises 2.5-5.0 m above the river. The stream-shaped streamless Shurozak basin occupies the western part of the terrace. The Boyovut erosion massif stretches along the southeast of the Mirzachul Plain, including several elevated low-sloping plains, sloping to the northwest, and is the terrace III of the Syrdarya. The Tuzkon Lake Plain is located in the southwestern part of the Mirzachul Plain and has the shape of a streamless plateau, at the center of which is present-day Tuzkon Lake. The Arnasay basin is partially flooded due to discharge water from the Chordara Reservoir and the Central Mirzachul Canal drainage stream. Eolli-accumulative relief. The Kyzylkumoldi sandy wave plateau is located in the western part of Mirzachul and serves as a border zone between Kyzylkum and Mirzachul. The relief is fragmented: sandy-sandy gryada and ridges, clayey-suglinka basins with no flowing clay height and depth of 2-5 m and above.

In connection with the development of the Mirzachul region since the middle of the last century, various anthropogenic landforms have emerged. The area of irrigated lands in the area, soil composition, groundwater level and mineral composition were studied. Here, vertical and horizontal drainage networks have been constructed, taking into account the rising groundwater level and soil salinity during irrigation. Horizontal drainage networks were excavated in the form of ditches, and the soil excavated during excavation formed anthropogenic relief forms in the series of hills along the edge of the ditch. In the developed areas, flat landforms suitable for irrigation have been created [1, pp. 25-30].

The various forms of natural and anthropogenic landforms in the Mirzachul region are an important component in the formation of landscapes, each of which reflects its own latitudinal zoning and altitude regional laws. In the plains, the difference in climate, groundwater, soil and biocomponents varies in latitude, while in the foothills and mountainous areas, the elevation varies regionally and the landscapes change. This, in turn, in the study of landscapes in the Mirzachul area requires their division into different landscape morphological units - landscape type, types of tracts and facies [2, pp. 96-98].

## CONCLUSION

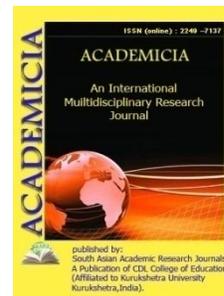

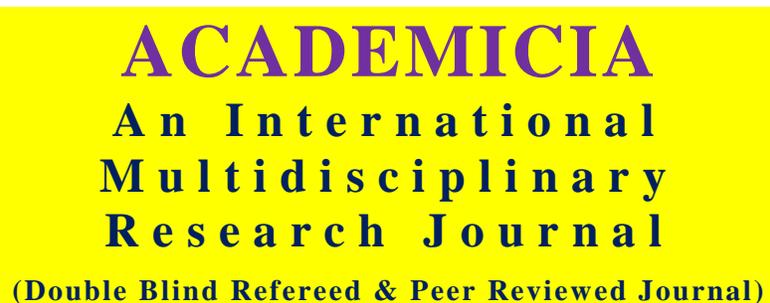

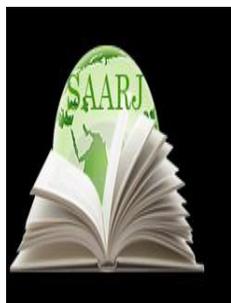

In the study of landscapes of the Mirzachul area are important natural processes of reclamation significance that may occur in connection with the relief. In the operation of irrigated lands and hydraulic structures, the development of new protected lands should be monitored and all natural processes occurring in the area should be taken into account. Depending on the dynamics and nature of the formation, these processes depend on the coefficient of land use (EFC), water resources, construction and placement of engineering structures, the volume and cost of work.

The processes occurring in nature in the Mirzachul region in the following periods are associated with the following activities of reclamation significance: wind - eolli, evaporation; surface water

- soil leaching, irrigation and deepening erosion, cliff formation, suffocation and karst formation, coastal leaching, floods, turbidity of irrigation facilities, landslides, vegetation cover, groundwater - intensive salinization, trace the slope of irrigation facilities exit, their lateral deflection; groundwater and surface water - swamps, landslides, rising groundwater levels.

### ABSTRACT

*The article tells about paraphrase - a descriptive turnover, which is a combination of a noun with a consistent or inconsistent definition. The main, pivotal word can be the name of a well-known, famous person, in a row with whom, according to some common features for them, the person designated by this paraphrase is placed.*

**KEYWORDS:** *Paraphrase, Descriptive Turnover, Periphrastic Formations, Key Word, Expressive Means, Evaluative Function, Proper Name.*

### INTRODUCTION

In fiction and journalism, proper names can fulfill a certain stylistic task, serve as an expressive means. So in works of art, names-characteristics are used (Skotinin, Judushka), sometimes the common noun meaning of a proper name is deliberately emphasized (Karamazov - Chernomazov, from the Turkic kara-black). Personal names are often replaced with descriptive phrases. This turnover emphasizes any feature that belongs only to this person. Periphrases can be so vivid and precise that they become widespread, and are used alongside their own names.

### MATERIALS AND METHODS

Periphrases (Greek περι - "around, around" and φράζο - "I say") are substitutes for proper names, represented by phrases or sentences, descriptively or allegorically characterizing the object. Periphrase - an indirect reference to an object by not naming, but by description (for example, "night star" = "moon" or "I love you, Peter's creation!" = "I love you, St. Petersburg!").

In paraphrases, the names of objects and people are replaced by indications of their signs, for example, “writing these lines” instead of “I” in the author's speech, “falling asleep” instead of “falling asleep”, “king of beasts” instead of “lion”.

Despite the fact that periphrastic combinations have been known since biblical times, were noted by the ancient theorists of language and style (Aristotle), for a long time they were on the periphery of research attention in Russian and East Slavic linguistics.

Since the beginning of the 70s, interest in periphrasis has noticeably increased. For the first time, the term periphrase was used by A.G. Mogilevsky. The periphery is a complex formation that has always interested scientists, from ancient times to the present day. The periphery has a variety of functions and properties, which are closely interconnected in speech, interact. At the same time, the variety of functions and properties gives the capacity and variety of peripheral expressions.

- The term "paraphrase" in philology denotes a fairly wide range of linguistic (speech) phenomena, that is, this term does not have a clear and uniform subject matter. Scientists have always been interested in peripheral formations in spoken and literary language.
- The paraphrase phenomenon has a rather long history. However, the nature and essence of this phenomenon have not yet been clarified, and the definition of periphrases is not clear and unambiguous. The polysemy of the term is associated with its wide use in various fields of scientific knowledge (literary criticism, logic, stylistics, rhetoric, sociolinguistics, morphology, music), which allows us to consider the periphery not only within the framework of linguistic analysis.

Some of these expressions are owned by specific authors. For example, the famous dictum sun of Russian poetry (about A.S. Pushkin) was first used by V.F.Odoevsky on January 30, 1837. Here is how A. A. Surkov writes about it: "... In one of the poor noble houses of Moscow, a man was born, to whom history has given the honorable place of the founder of new Russian literature, whom his younger contemporary and friend of the poet called the sun of Russian poetry ..." ("Pravda", July 5, 1974); "The sun of Russian poetry" - this is how I. Andronikov's interview to the Literaturnaya Gazeta was titled (May 28, 1975).

M. Gorky owns the expression Homer of the twentieth century, which he called the Dagestani poet Suleiman Stalsky: “Wonderfully named A. M. Gorky ashug Suleiman. "Homer of the twentieth century," he said in his closing speech ... "(Literaturnaya Gazeta, August 14, 1974).

According to the method of formation, syntactic structure, the considered descriptive turns are a combination of a noun with an agreed or inconsistent definition. The main, pivotal word can be the name of a well-known, famous person, in a row with whom, according to some common feature for them, the person denoted by this paraphrase is put: Homer of the 20th century - S. Stalsky, Polish Pushkin - Adam Mitskevich. “I know Berg’s translations, but I don’t know Mickiewicz's poems. Once I thought I knew this "Polish Pushkin": I read Berg's translations "(V. Doroshevich. Influents).

## RESULTS AND DISCUSSIONS

The basic word is a common noun. In this function, the word “father” is used in some groups of revolutions. With the help of this word, descriptive phrases are formed, which designate the founders, ancestors of directions in science, technology, literature, etc. Here are some examples.

The father of Russian science – M.V. Lomonosov: “Further searches finally determined all the stages of the unusual fate of the library of the father of Russian science” (Izvestia, November 2, 1972); the father of Russian aviation - N. Ye. Zhukovsky: “On the Vladimir land, in the village of Orekhovo, N. Ye. Zhukovsky, the father of Russian aviation, lived and worked” (Pravda, November 26, 1973); the father of history is Herodotus; the father of medicine is Hippocrates; father of tragedy - Aeschylus; the father of comedy is Aristophanes.

This should also include formations that have not yet become widespread, but are used to designate only these persons. The father of Russian agrochemistry – D.N. Pryanishnikov: “The monument to the father of Russian agrochemistry was opened” (Pravda, August 15, 1973); the father of cybernetics - Norbert Wiener: "The" Father of Cybernetics "Norbert Wiener once expressed the idea that people play chess only because they do not know exactly how to play them correctly" (Literaturnaya Gazeta, August 6, 1975).

Descriptive names express the attitude towards people known for their activities in a particular area - state, public, scientific, literary, etc. Therefore, such means of expression give the designated person a positive assessment: the sun of Russian poetry.

From the considered periphrases, one should distinguish combinations consisting of a person's own name and an officially or unofficially assigned definition - an epithet. There is a similarity between them: both have an evaluative function in the sphere of personal proper names. For example: Peter the Great - Peter 1, Alexei Mikhailovich the Quietest - Russian Tsar Alexei Mikhailovich, Alexander the Great - Alexander the Great, Philip the Handsome - the French king Philip IV, Augustus the Strong - the Polish king and the Elector of Saxon August III. The above formations are still not descriptive turns in the full sense of the word; in them, the definition - an epithet can become, as it were, a surname with a given name (or it may not become, for example: the frantic Vissarion - VG Belinsky), but unlike real surnames it does not pass by inheritance.

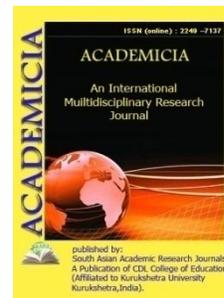

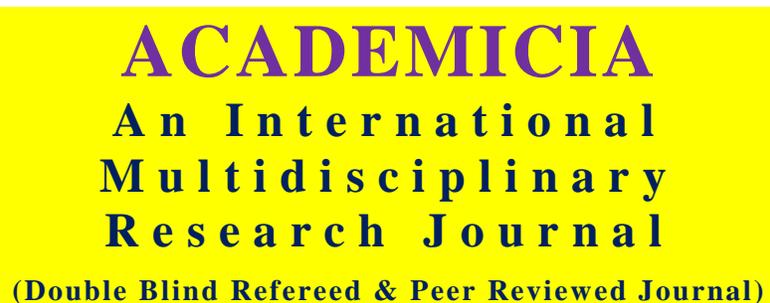

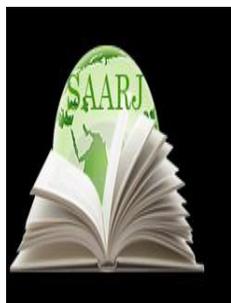

## CONCLUSION

Periphrases with the meaning of a certain person are most often used in journalism. The demands of newspaper genres also give rise to individual-author's combinations, which are created on the basis of the descriptive turns that have developed in the Russian language.

### ABSTRACT

*This article discusses the problem of the formation of communicative competence; the use of the methodology of the formation of communicative competence to increase the effectiveness of teaching a foreign language to non-linguistic students in socio-cultural situations.*

**KEYWORDS:** *Communicative Competence, Methodology, Socio-Cultural Situations, Teaching A Foreign Language, Non-Linguistic Students*

### INTRODUCTION

Today, the modern demand of learning foreign languages has increased as the labor market and socio-cultural situation requires the emergence of specialists who can speak a foreign (English) language at the proper level. The professional demand for specialists is to become fluent in a foreign language (usually English, one of the languages of international communication) among modern employers, on the one hand and their own interest in expanding their opportunities in the labor market and in cultural interactions among specialists themselves, on the other hand motivates the modern student not to formal study of the language. Increasing the effectiveness of teaching a foreign (English) language, implementing a communicative approach with the final result (whether a graduate has a developed communicative competence) remains one of the most important tasks in a higher educational institution and one of the urgent problems in training a specialist in our country as well.

## MATERIALS AND METHODS

We can define communicative competence as followings:

- 1) Meaningful speech as a result of the realized knowledge of a number of rules (systematic knowledge obtained in the course of studying the following disciplines: "Foreign language", "Business negotiations in a foreign language", "Foreign language in the field of professional activity"), grammatical, lexical and phonetic rules;
- 2) The ability to adequately build a communication strategy in the business and interpersonal sphere of communication, to determine their own functions in a specific language situation and the means of communication necessary in this situation;
- 3) The ability, if necessary, to correct the situation; the ability to build coherent statements (spontaneously and with preparation);
- 4) The ability to transmit and receive the necessary information in a specific linguistic situation in conditions of a shortage of means of expression (primarily grammatical, lexical);
- 5) The ability to interact with representatives of another culture, to take into account the specifics of etiquette, ethical, social, cultural aspects of communication while maintaining their own "face" - the appearance of a representative of Uzbek culture and society. Concentration of attention on the communicative aspect within the framework of the communicative approach is not new in the study of a foreign language and teaching it. However, the inability to speak and think freely in a foreign language is an urgent problem in the field of education at all levels (including at the university).

The need for the implementation of new techniques in teaching speaking requires special trainings. One of them is implementing cognitive activity in the classroom in the process of live interaction. Each student take the opportunity to regularly express their thoughts about various phenomena, processes, events, cultural realities, abstract categories, participants in communication, etc. Regular participation in such communicative acts gradually relieves the state of psychological tension associated with the lack of experience of participation in situations of live speaking and the fear of getting an unexpected question, with inadequate perception of something other than one's own opinion, with rejection of positive and negative criticism from outside. There are also barriers associated with the interaction of the "teacher - student" sides are gradually disappearing: the teacher in most conversational situations becomes a direct participant in such situations, the student disappears a sense of some subordination and fear of "incorrectly" speaking, making a linguistic, meaningful or other mistake. The absence of negative emotions associated with a subordinate position in the interaction "teacher - student" has a positive effect on the student's motivation, in the process of a natural conversation with the teacher, mistakes are corrected without focusing on the situation of failure of a particular student, making mistakes is gradually minimized (the experience of speaking of other participants and taking into account the mistakes already made allows the listener to correct his speech already in the course of the conversation) [2, p.276].

In any language classroom, cognitive activity is planned such a presentation of the material involves the use of the following techniques:

- 1) The formulation of main and secondary questions to the text, various answers (from short, monosyllabic, colloquial answers to full and detailed presentation of the point of view on the question);
- 2) Reproduction of monologue texts in the form of dialogue, dialogical text in the form of a monologue;
- 3) Drawing up a dialogue, polylogue, monologue on a topic, situation;
- 4) A change in the dialogical situation in connection with a change in the topic, in connection with the spontaneous inclusion of other participants in the situation;
- 5) An explanation of your own answer and the answer of another participant in the dialogue;
- 6) Combining several dialogues into one;
- 7) Drawing up a polylogue, dialogue, monologue based on keywords, unfinished statements, a complex plan, drawing up a dialogue on an arbitrary topic, comments on the statements of the participants in the conversation, reproduction of the original statements with their change depending on the situation (modeling);
- 8) Denial and confirmation of the thesis within the framework of the statements of one participant in the conversation, highlighting cliches, stable colloquial phrases in the speech of native speakers (in the process of listening to texts and dialogues reproduced by native speakers and specialists), etc.

It is extremely important to determine the ratio of dialogical and monologic statements: dialogical form of communication prevails over monologue, monologue speech (depending on the purpose of communication) is included in the dialogue, polylogue is widely used. As a rule, students' language skills related to understanding and reproducing a monologue are formed to a greater extent than skills related to understanding and reproducing dialogic speech.

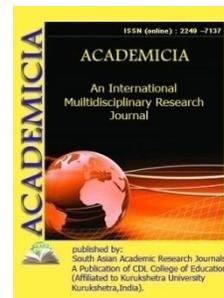

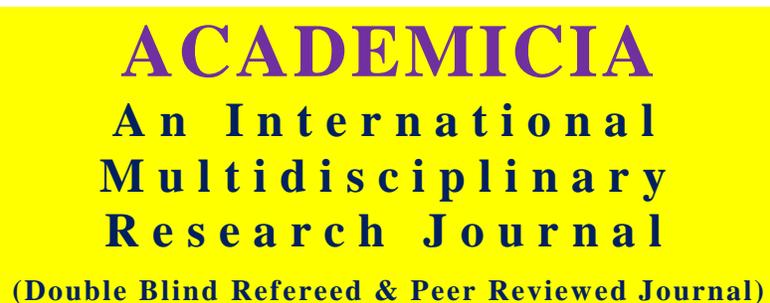

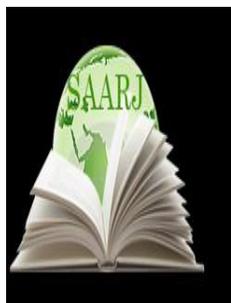

In cognitive activity while forming communicative competence, we differentiate the learning process: the use of such a technique can be implemented at all stages of training (from initial to final), but with the obligatory phased introduction of new knowledge in groups with different levels of training (from basic to advanced) ... The specificity of the primary, initial stage of mastering the material lies in the fact that the teacher takes into account the lack of lexical means of students, ignorance of grammatical material, realities associated with the culture and specificity of the society of the country of the target language.

## **CONCLUSION**

As conclusion we can say that the main goal of speech interaction is the implementation of competent, motivated speaking with a simultaneous understanding of the problem situation, the perception of which is reflected in speech at the linguistic and cultural level. In the process of forming communicative competence in the implementation of a communicative approach in teaching, constant modeling of an educational, but "live" conversational situation is a rational and optimal solution to the problem of increasing the effectiveness of teaching a foreign (English) language in modern conditions.

## THE USE OF INNOVATIVE TECHNOLOGIES IN TEACHING GERMAN LANGUAGE

Maripova Gulsora\*; Siddikova Nargiza\*\*

<sup>1,2</sup>Lecturers of Fergana State University,  
UZBEKISTAN

### ABSTRACT

*This article discusses the use of innovative technologies in teaching German at a non-language faculty and the desire to effectively build the learning process in a short time and achieve certain results with the formation of foreign language communicative competence, the development of key competencies necessary in the field of professional activity.*

**KEYWORDS:** *Competence-Based Approach, Competence, Communication, Teaching German At A Non-Linguistic Faculty, Authentic Material*

### INTRODUCTION

In modern conditions of globalization, the real participation of our country in preparing the specialists who can speak in foreign languages in order to enter the world market is increasing every year. A modern specialist should not only master the ever-increasing flow of information on his/her native language, but also be able to obtain information available to the world community. Ability to speak in a foreign language is a prerequisite for professionalism. It is the knowledge of a foreign language that makes it possible to search for the necessary information in foreign language sources, to actually communicate with colleagues in different countries, and to publish one's scientific developments in foreign scientific journals. Scientific and personal development prospects of Uzbek specialist depends on the level of training in German language at non-language faculties.

### MATERIALS AND METHODS

The modern requirements for the goals of teaching German language in the context of a two-level education in a non-linguistic university, the status of both the student and the teacher is changing, moving from the teacher-student scheme to innovative technologies.

Teachers of a foreign language in a non-linguistic university need to fulfill the social order of the society - to prepare in a short time a specialist who is fluent in a foreign language. It is possible to achieve the set task - to teach the student to speak, understand, and extract information of a different nature from original sources within a limited educational framework - by combining traditional and innovative teaching methods, based on the principles of communicative communication. Innovative technologies for teaching foreign languages in a non-linguistic university consist in a combination of traditional and intensive teaching methods based on the functional and communicative linguodidactic model of the language, and the development of an integral system of teaching speech communication on professional topics. Knowledge of the German language at a level at least sufficient for professional communication in the professional field is one of the requirements of modern society for young professionals and an obligatory component of the professional training of a modern specialist. The course of a foreign language in higher educational institutions is of a communication-oriented and professionally oriented nature, and its tasks are determined by the communicative and cognitive needs of specialists of the corresponding profile. However, at present, a foreign language course is characterized by a decrease in the total number of classroom hours, and teaching a foreign language in many higher educational institutions is carried out, as a rule, in the initial courses, when students are just beginning to get acquainted with their future specialty and acquire only initial knowledge of the specialty. For this reason, many teachers note that in the classroom they are forced to engage not in the development of students' language and speech skills or communication skills in a foreign language, but to explain specific terms that are not within their competence, and thereby limit themselves to reading popular science texts in their specialty and memorizing general terms. All this hinders the successful implementation of the educational process and does not contribute to the development of cognitive activity of students within the framework of the educational program being implemented. In addition, as practice shows, most students of higher educational institutions stop practicing a foreign language at the end of the course of teaching foreign languages and lose their previously developed language and speech skills and abilities.

As a result, having entered the magistracy or postgraduate study, where the study of a foreign language is carried out at a higher linguistic and professional level, students are forced to practically start over the study of a foreign language. They experience considerable difficulties, since proficiency in a foreign language becomes necessary not only for passing exams, but also for familiarization and detailed study of foreign literature on a specific object of scientific research, which is necessary for writing a scientific work, as well as for successful performances at international conferences of young specialists.

The purpose is to obtain and exchange information necessary for further their scientific activities. In the case of insufficient formation of language skills and speech skills within the framework of the secondary school program, this stage includes an appropriate introductory-corrective course. At the second stage (during the third and fourth semesters), the ultimate goal of training is to acquire the communicative competence necessary for the study and creative reflection of foreign experience in the mainstream and related fields of science, as well as for business professional communication. In turn, the final requirements at the final stage are the availability of communicative competence necessary for qualified information and creative activities in various areas and situations of business partnership, joint production and scientific work. However, the proposed continuous course of teaching a foreign language is designed only for students who

successfully passed the exam at the end of the first stage of training, which does not correspond to the main task of training young specialists.

## **RESULTS AND DISCUSSIONS**

In the organization of the educational process, it is possible to identify a number of contradictions associated with teaching foreign languages: - between the need to know a foreign language at a sufficiently high level and insufficiently developed technologies for teaching it; - the absence of close interdisciplinary links between the disciplines of the professional cycle and a foreign language as the language of professional communication; - between the initially weak knowledge of a foreign language among students of non-linguistic universities and the high requirements for professional competencies that a graduate must possess upon graduation from the university; - limited time is often reflected in the content side of education, its forms and methods. From the above contradictions, it follows that it is necessary to effectively build the process of teaching a foreign language, taking into account professional competencies, that is, to turn to the competence-modular approach in teaching a foreign language.

According to the pedagogical content, the concept of "competence" refers to the central concepts and includes learning outcomes: knowledge, abilities, skills, and value orientation. Professional competence should be considered as the readiness and ability to act in accordance with the requirements of the case, methodically and independently to decide tasks and problems, as well as independently assess the results of their activities. The purpose of teaching a foreign language at a non-language faculty is the ability to use the knowledge gained in relation to your profession. Ideally, it is assumed that the specialist can read articles from newspapers and professional magazines in a foreign language, participate in work international conferences, make presentations, answer questions, lead professional discussions. Achieving this goal at a non-language faculty is possible with a good level possession of the school curriculum, that is, in the event that first-year students already have a basic set of knowledge and skills: a certain vocabulary, knowledge of grammar, and have communication skills. The higher the initial level, the greater success in learning a professional foreign language can be achieved.

One of the main conditions for successfully mastering a professionally oriented foreign language is the authenticity of the materials studied.

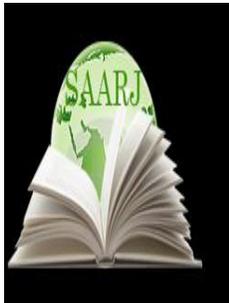

By authentic material, we mean samples of monologue and dialogical speech created by native speakers for non-educational purposes. It is such materials collected from various sources: journalistic, scientific and legal literature and documents in German language can be used in the selection of texts for reading, listening, most grammatical, lexical and other types of exercises and assignments. Authentic texts have a number of advantages over educational texts, which makes it possible to pose the question about the greater expediency of their use in the educational process than just educational texts.

## **CONCLUSION**

In conclusion, we should say that the use of innovative technologies in teaching German transforms the modern way of teaching and learning. The integration of innovative technologies has a great benefit for learners and teachers to master the language in the process of preparing specialists who are fluent in a foreign language in a short time.

## DEVELOPMENT OF SMALL SCALE HANDMADE PAPER INDUSTRY IN INDIA

**Dr. B. Venkateshwarlu\***

\*Assistant Professor,  
 Department of Applied Economics,  
 Telangana University, Nizamabad, india  
 Email id: drbvltutu@gmail.com

### ABSTRACT

*This paper is concerned with examining the growth performing small-scale industries in paper making in under developing countries with reference to India. The analysis based on data published in the economic review government of India. This information provides on the possibility of developing small scale paper making industries with uses of regional available other than wood and pulp resources. This research article is the study of utilization of regional resources for Paper making in rural areas which helps to analyses growth of income and employment in small scale industry. How the rural people can use resources and cater for local markets with low capital investment? This is especially in countries like India and other developing countries. The study is concerned that for papermaking, there are many factors are taken into account in deciding on the scale, the type of product, the raw materials, the investment and the required skill levels. In addition, there are equally as many non-technical considerations as environmental issues, marketing competition, consumer expectations and economic development. All these concepts will decide viability of the small scale industry in paper making with the existing regional resources.*

**KEYWORDS:** *Paper Making, Local Resources, Market, Technology*

### INTRODUCTION

Paper is used for writing and printing, for wrapping and packaging, and for a variety of other applications ranging from kitchen towels to the manufacture of building materials. In modern times, paper has become a basic material, commonly found in almost all parts of the world. The

development of machinery for its production in large quantities has been a significant factor in the increase in literacy and the raising of educational levels of people throughout the world.

Paper industry in India is the 15th largest paper industry in the world. It provides employment to nearly 1.5 million people and contributes Rs 25 billion to the government's kitty. The government regards the paper industry as one of the 35 high priority industries of the country. Paper industry is primarily dependent upon forest-based raw materials. The first paper mill in India was set up at Sreerampur, West Bengal, in the year 1812. It was based on grasses and jute as raw material. Large scale mechanized technology of papermaking was introduced in India in early 1905. Since then the raw material for the paper industry underwent a number of changes and over a period of time, besides wood and bamboo, other non-conventional raw materials have been developed for use in the papermaking. The Indian pulp and paper industry at present is very well developed and established. Now, the paper industry is categorized as forest-based, agro-based and others (waste paper, secondary fiber, bust fibers and market pulp).

In 1951, there were 17 paper mills, and today there are about 515 units engaged in the manufacture of paper and paperboards and newsprint in India. The pulp & paper industries in India have been categorized into large-scale and small-scale. Those paper industries, which have capacity above 24,000 tonnes per annum are designated as large-scale paper industries. India is self-sufficient in manufacture of most varieties of paper and paperboards. Import is confined only to certain specialty papers. To meet part of its raw material needs the industry has to rely on imported wood pulp and waste paper.

Indian paper industry has been de-licensed under the Industries (Development & Regulation) Act, 1951 with effect from 17th July, 1997. The interested entrepreneurs are now required to file an Industrial Entrepreneurs' Memorandum (IEM) with the Secretariat for Industrial Assistance (SIA) for setting up a new paper unit or substantial expansion of the existing unit in permissible locations. Foreign Direct Investment (FDI) up to 100% is allowed on automatic route on all activities except those requiring industrial licenses where prior governmental approval is required.

**Methodology:** This paper is a review of article, data used in the paper is mainly collected from secondary sources like research papers, books, articles, project reports, annual reports of government, economic survey of paper industry of India census report, to give a comparison of the utilization of raw materials in large scale industries and small scale industries, use of waste paper in recycling.

**Objectives of the study:** 1. To analyse the paper making in small scale handmade paper industry India.

2. To analyse the facilities and resources available for developing small scale handmade paper industries in rural areas.

**Characteristics of hand-made paper production:** Handmade paper units are defined essentially by the fact that their operations are carried out manually with pure cellulosic (or raw) materials to be pulped, mechanical rather than chemical pulping methods would be used. In fact, the existing handmade paper industry relies wholly on secondary resources. There is no theoretical limit to the size of handmade paper units, though in India they are often limited in practice to a production capacity of 300 tonnes per year. According to the Khadi & Village

Industries commission, the combined production of 310 working handmade paper production units in India amounts to some 7000 tonnes per year. This sector produces goods valued at \$2.5 million with a work force of 5300 persons.

The handmade paper industry uses exclusively non-forest raw materials. At present, it uses only cellulose-rich materials such as cotton rags, waste paper and waste kraft. This could easily be extended to the use of biomass materials and agricultural residues, some of which can be grown specifically for handmade paper production. Non-wood biomass resources have the additional advantage of being amendable to conversion by environment friendly processes. Some steps have already been initiated in this direction for the utilization of straws, rice husk and grasses. Handmade paper production also offers extensive possibilities for in-plant recycling. The paper waste emanating from industries incorporating intensive use of paper can very conveniently be recycled for reuse in the parent industry, often saving costs. Moreover, opportunities exist for interfacing paper recycling systems with a host of industries involved in, for example, packaging, printing, and industrial filter manufacture.

In its effort to develop effective systems for small-scale paper production, a development alternative has analysed the performance of the Indian paper industry on all scales. This analysis has drawn on industry publications and information concerning technology, trade and production obtained directly from operating units.

The Indian paper industry can be divided into four categories:

- i. Large –scale (integrated) units – 50,000 tonnes up per year.
- ii. Medium-scale units – 10,000 to 50,000 tonnes per year.
- iii. Small-scale agro based units –up to 10,000 tonnes per year.
- iv. Handmade paper units – 60 to 300 tonnes per year.

Our analysis indicates that specific consumption of resources is lowest in handmade paper units. Water consumption per tonne of paper is 150 cubic meters for handmade paper, compared with some 250 cubic meters for paper from large-scale integrated units. Large-scale integrated units also consume large quantities of electricity and chemicals, and are polluting. Small-scale agro-based units are severely polluting, as they are usually unable to afford pollution control equipment.

Large-scale units consume an average of 2.5 tonnes of forest-based raw materials per tonne of paper; small-scale units consume an average of 3.5 tonnes of raw materials, mostly agro-based, per tonne of paper. In contrast, a handmade paper unit uses only 1.1 tonne of paper produced. One important reason for this is that waste generated in the manufacturing process is internally recycled without loss of quantity.

**Growth of handmade paper industry:** Growth of paper industry in India has been constrained due to high cost of production caused by inadequate availability and high cost of raw materials, power cost and concentration of mills in one particular area. Government has taken several policy measures to remove the bottlenecks of availability of raw materials and infrastructure development. For example, to overcome short supply of raw materials, duty on pulp and waste paper and wood logs, chips has been reduced. Outlook for paper industry in India looks extremely positive as the demand for upstream market of paper products, like, tissue paper, tea

bags, filter paper, light weight online coated paper, medical grade coated paper, etc., is growing up. More recently, TARA (Technology and Action for Rural Advancement) has developed over 100 varieties of handmade paper using a wide choice of waste paper, rags, natural biomass mixtures, and agro-residues.

Handmade papermaking has enjoyed a major revival over the past 30 years, using new and innovative approaches to this ancient craft. Handmade paper has a unique texture and an individual quality that makes it not only a surface to write, paint, or print on, but an object of beauty in its own right. In addition, the versatility of paper in its wet form has led artists to experiment with paper-making as an art medium, creating two- and three-dimensional images of textural richness and diversity, some on a vast scale.

**Facilities, limitations for handmade paper making:** In order to understand what might or might not be possible in papermaking it is first necessary to have knowledge of the technicalities of the process. The basic process of making paper involves two stages: the breaking up of raw material (which contains cellulose fiber) in water to form a pulp (i.e. a suspension of fibers), and the formation of sheet paper by spreading this suspension on a porous surface, and drying, often under pressure. Typically, a hand-made paper producer will manufacture only a few tonnes of paper per year often for a highly specialised market. Mechanised plants, on the other hand, only become economically viable when dealing with an output above several tonnes per day. In India, where paper making machinery is manufactured indigenously, and hence costs are kept lower, mechanised paper making on a small scale is very common. These mills provide higher levels of employment, not only in the mill, but amongst associated industries, such as waste paper collection and machinery manufacture. Smaller mills are more flexible in their acceptance of raw materials.

The product range is also more flexible in small paper making plants, with the ability to cater for a variety of demands, but, sometimes, with a slightly lower quality than that of the larger plants. Paper comes in an enormous variety of shapes, sizes, qualities, grades, colours and finishes. Some of the typical characteristics used to determine paper quality are given here. The types of tests that will be carried out on a batch of new paper depend upon the use for the paper.

**TABLE 2. SHOWS TYPES AND QUALITY OF PAPER**

<b>Weight in grams per square metre (referred to as GSM or GRAMMAGE)</b>	<b>Brightness / shade</b>
Thickness or calliper (measured in microns)	<b>Porosity</b>
Density or bulk (a function of the previous two qualities)	Smoothness / gloss
Tensile strength	Oil-resistance
Burst	Moisture absorption
Folding	Moisture content
	Optical properties
	Adjustable using mineral fillers

**Raw materials required for the paper making:** The raw material for all papers is cellulose fiber which comes from a wide range of natural materials. The large scale producers rely almost entirely on fiber from timber although, especially in India, other materials such as bamboo, eucalyptus, straws and grasses are also used. The cellulose fiber can also be extracted from such

things as waste cotton rags, banana pseudo stem, and bugassee, in fact almost anything which has grown naturally.

**TABLE 3: RAW MATERIALS COMMONLY USED FOR PAPER PRODUCTION**

Raw Material	Source	Suitability
Straw (e.g. from wheat, barley or rice)	Between 5 and 10% of all straw which is produced is burned.	Short fibred (1.5mm), it is often mixed with other pulp to provide a suitable pulp stock for a variety of uses.
Bagasse*	From sugar cane after the sugar has been extracted.	Slightly longer fibre than straw. Suitable for high quality writing and printing paper.
Maize stalks	Remaining after maize harvest.	The high moisture content and need for collection make maize stalks suitable only for very small-scale production. Properties similar to straw.
Bamboo	Grown for use.	Fibre length of 2.7mm, suitable for all types of paper making without addition of other fibre. Supply is often limited.
Cotton	Cuttings, lint and fluff from cotton mills.	Cotton is a high value fabric and is therefore only used for specialist papers. Has a fibre length of 25 32mm.
Rags (from cotton material)	Collected	Often require sorting and bleaching. Common writing paper.
Flax	A residue from the manufacture of linen.	Long fibres make this material suitable for high quality paper.
Hemp and sisal	From old ropes and tow from rope making factories.	6mm fibre length, processing similar to that of cotton.
Jute	From old sacks and hessian.	Jute does not bleach well and is therefore used for its strength rather than for high quality grades
Water Hyacinth	Weed	Paper not having adequate strength
Jute and Water Hyacinth		Unique textured paper
Mulberry Bark		Excellent, silky, transparent papers of different kinds
Jute and Hemp		A reasonable good quality paper.

However, the quality of fibers varies a great deal depending on the natural material from which it is collected. The quality, usually assessed according to the length of the individual fibers, is extremely important to the quality of the paper which can be made. A high proportion of long fibers are essential for reasonable paper quality, regardless of scale or method of production.

**Recycling waste paper:** Using waste paper is the easiest way into papermaking as all the difficult first stages have been done. There is no need for chemical digestion, bleaching and complex screening operations. The waste may only require re-pulping before being reformed as new paper. Compared with producing a tonne of paper from virgin wood pulp, the production of one tonne of paper from discarded paper may use half as much energy and water. The clay originally added to the paper to make it glossy will help to separate the ink from the paper during recycling.

There are limitations to recycling that need to be considered. Paper can be recycled only 5 to 8 times before the fibers become too short and weak to be reused. It is therefore essential to use as high a grade of waste as possible as the starting point. From both pulp quality and ink points of view, computer waste is a very useful raw material for the recycler. Old newspapers are commonly used to make tissue and cardboard, while magazines are often recycled into newsprint. Waste paper will carry some form of printing which, if not removed, will cause the product to be discolored. The process of removing the print, called de-inking, is often, not worthwhile for the small-scale operator, involving as it does, even more, expensive equipment. It is a better policy to concentrate on unprinted materials if these can be obtained.

## CONCLUSIONS

Hand-made paper producer will manufacture only a few tonnes of paper per year (depending on the number of employees) often for a highly specialised market. In India, where paper making machinery is manufactured indigenously, and hence costs are kept lower, mechanised paper making on a small scale is very common, with plants operating at outputs of 5 tonnes per day and upwards. De-inking, is often, not worthwhile for the small-scale operator, involving as it does, even more, expensive equipment. One of the major parts of recycling is the collection, sorting, baling, and transportation of waste paper. The variety of equipment is needed for a small handmade paper making industry in India. Much of the machinery required for a mechanised production facility is sophisticated and expensive.

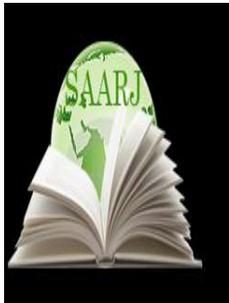

### Measures need to be taken for Indian paper industry:

1. Import duty on Machinery and waste paper should be reduced.
2. Duty free imports of new & second hand machinery, equipment should be allowed for technology up gradation.
3. Training and financial support should provide for small Entrepreneurs for the establishment of handmade paper industries in the local regions.
4. Capital and machinery should provide with subsidized rates.
5. Revision of forest policy is required for wood based paper industry so that plantation can be raised by industry, cooperatives of farmers, and state government. Degraded forest land should be made available to the industry for raising plantations.

## MISSIONARY IN THE FORM OF IDEOLOGICAL THREATS AND THEIR FORM OF MANIFESTATION

**Khabiba Naimovna Oblomurodova\***

\*Senior Lecturer,  
 Tashkent State University of Law,  
 UZBEKISTAN  
 Email id: h.oblamurodova@tsul.uz

### ABSTRACT

*We know that each period has its own characteristics, principles of development, the XXI century was the century of the peak of cultural, spiritual, scientific, technical integration. Along with this, we had to face certain difficulties and unsolved tasks in these areas, and this has its objective, subjective reason. It should be noted that today it has become mandatory to be on the alert to possible threats, the separation of true religious values from fake and directly scientifically justify the educational and religious culture and worldview of human from a philosophical point of view. The article analyzes the the history of missionary activity, its ideological foundations and modern forms. The purpose of the study is to reveal with examples extensive information about the goals, the methods and tools used by the centers and organizations involved in these activities. The article also explains the legal basis for preventing missionary movements, the role and importance of religious education and tolerance in ensuring stability and prosperity of society.*

**KEYWORDS:** Religion, Mission, Religious Mission, Missionary Activity, Proselytism, Globalization, Method, Mean, Ideological Immunity, Religious Education.

### INTRODUCTION

As a result of major socio-political changes, the imbalance as a result of the establishment of the two polar world radically changed the ideological picture of the world. Countries of the world are divided into developed and developing countries. It is these developed countries that have gained their national independence and are trying to ideologically take possession of developed countries, world arenas [1, 100].

Poverty, environmental problems, lack of reserves, mass diseases, religious fundamentalism and terrorism were inherited from the twentieth century to the twenty-first. Moreover, having come to the twenty-first century, the list of risks expanded due to the efforts of some forces. Such risks as demographic crises, missionary work, and export of democracy, “mass culture” and the introduction of the Western lifestyle appeared. A superficial glance at these threats, which challenge the sovereignty of states and do not recognize them as a source of threats, will bring even more problems to humanity. Therefore, the primary task is to identify the destructive ideas that form the ideological foundations of such events that threaten the development of our country.

Among the social factors that have a significant impact on the development of society, the role and importance of the religious factor are incomparable. Religion has always prompted people to do good deeds and good deeds, to help them grow spiritually. For example, the use of religions of the past for various purposes, the interpretation of ideas in the spirit of destructiveness, proved that it brought innumerable suffering to humanity. Attempts to use religion for various destructive purposes are currently considered in very serious aspects. Missionary efforts that carry out their activities in colorful forms are also clear evidence of this.

### **Socio-historical analysis of missionary activity**

What is missionary work? What is its threat to national life today? We will try to find answers to questions.

Missionary (in Latin “mission” – “appointment”) is an activity of a certain religion, faith or sect, aimed at spreading its religious doctrine [2, 25]. A missionary is a person who spreads a religious doctrine that he / she spreads in other religious communities [3, 108].

Proselytism is part of missionary service (the Greek “proseh / tos”) – this is the theoretical and practical activity of a certain religion, confession, nomination or sect of other religions or atheists directly related to religion [4, 27]. Therefore, proselytism is a theoretical and practical activity aimed at rejecting religion and adopting another religion as a direct result of missionary activity. That is, proselytism is the highest point of missionary activity.

Missionary activity can be divided into several groups. In particular, it is important to emphasize missionary activity as follows:

- ❖ *political missionary;*
- ❖ *ideological missionary;*
- ❖ *economic missionary;*
- ❖ *religious missionary.*

We also encountered the following points in our resource analysis. Some of the people who are recognized today by famous religious scholars are in fact the first Christian missionaries, and the fact that some of those recognized as “famous religious scholars” have no idea who they really are and in what circumstances they become “world-renowned experts” can lead to self-esteem. A historical fact is that William Jones (1746-1794) first learned Sanskrit, and Franz Bopp (1791-1867) compiled a Sanskrit dictionary. Joseph Lafito (1681-1746), the famous religious scholar Charles De Bros (1709-1777) in North America, has accumulated unique information about Western languages, religion, traditions, and the primitive life of people in West Africa. Matteo Riki (1552-1610) participated in similar events in China and wrote several papers on religious

views in his regions of activity. The works of J. Lafito “Comparison of the Traditions of the Wild American Traditions with the Early Periodic Traditions” (1723) and S. Drouss “Tactics of Fetish Gods” (1760) are proof of our reasoning. But for what purpose did they carry out this work? Why did they deal with the historical, geographical and ethnographic aspects of the occupied territories of Asia, Africa and America, creation of records, dictionaries and textbooks for indigenous peoples? How can it be that the religious beliefs, customs and rituals that they analyzed are now completely abolished? If we answer these questions accurately and honestly, then we can say that they effectively participated in their missionary work, and regardless of the value they have today, they can be viewed as missionaries who have made significant progress in promoting religion, and not as a religious scholar, historian of the country.

Therefore, the scientific, social, and philosophical study of the missionary movement is of great importance today.

It is clear to us that religion is a permanent place in a person’s life and in the consciousness, attitudes and activities of a person. But the problem is that religious propaganda is focused on positive or negative goals, and missionaries can play a special role in spreading a certain religion and educating people.

Therefore, it is important to understand the true meaning of this concept, focusing primarily on the linguistic, scientific and philosophical essence of missionary work and how it works.

The word Missionary comes from the Latin verb “mission”, which means “sending”, “appointment” and “missionary” as “mission”, and “missionary” as a set of theoretical and practical tasks.

In addition, missionary concepts were given different definitions in different sources, almost all of which describe its specific features. In particular, in the National Encyclopedia of Uzbekistan, the missionary mission is to worship and promote another religion among the nations of the world [5, 26]. Missionary (LAT, Missions) - 1) Representatives sent to another country for a specific mission; 2) a permanent diplomatic mission of a state in another country (as opposed to an embassy) [5, 27]. In the World Book encyclopedia (reissued every year), a missionary is a person sent to propagandize and propagandize other religious groups, in the Moscow Encyclopedia of Cyril and Mifody 2005: “Missionism is a religious association an attempt to spread its faith among other religions” [6].

Nowadays, missionaries are also called “tabsir” (prophecy), “tinsirm” (Christianization), and they use many beautiful names to disguise their true work and say, “You are one who is different from others,” “Spiritual spirits” who impart various divine qualities and thereby keep them in their ranks.

The term “proselytism” is directly related to missionary work, and proselyte - from the Greek (“newcomer” [7, 73]), who entered a new sect, proselytism means trying to convince a believer from another faith [8, 411], to give up his own religion and force others to accept religion” [9, 36].

Based on the foregoing, the definitions can be concluded that the data in various sources and publications are very close and similar to each other. Based on these descriptions, we concluded that “missionary activity is a dangerous political activity aimed at spreading and promoting religion among various religious communities, nations and nations through various social means

and factors,” because it showed that its hidden activities is a dangerous political activity, we are witnessing that it caused many years of political instability in the lives of many countries.

Looking at missionary history as a separate social activity, we see that it has a long history. The implementation of such activities may be associated with the emergence of religions. Because in all religions, special attention is paid to the spread of their religious doctrine, an increase in the number of followers.

According to sources in the field of religious studies, this activity was first recognized in the III century BC in India by King Ashoka in the work of monks sent to neighboring countries for the propaganda of Buddhism and in Christianity since the fourth century AD.

In the early years of our era, missionary work began to spread rapidly in western countries, where the Roman Catholic Church dominated. It should be noted that missionary activity was primarily aimed at promoting church doctrine and the spread of the Catholic religion, but this activity was widely used for political purposes - colonization and development. In particular, the missionaries of the Catholic Church played an important role in the formation of colonies in Latin America and Africa in the 15th and 16th centuries in Spain and Portugal.

In 1622, Pope Gregory XV founded the Congregation for Religion for Democracy (since 1967 the Congregation for the Biblarization of Peoples) to expand the Catholic missionary movement. Missionaries studied the religions and traditions of the peoples of the countries in which they are located in order to work effectively. For example, the works of G. Lubia “Meeting with Buddhists in the East” by M. Rykki (1552–1610) and J. F. Lafitto (1670–1740) “Primitive nature of America’s primitive character” [10, 108] can be shown. During the colonization of Latin America by Spain, the missionaries of the Catholic Church developed a special alphabet for the study of the languages of American indigenous peoples and the promotion of their work.

In the 17th and 18th centuries, Dutch and British colonial policies became widespread, and missionaries began to develop in Protestantism. In the 19th century, missionary societies also appeared in the United States. During this period, the attention of Christian missionaries was given to the more African continent. The activity was mainly carried out in educational institutions, medical institutions, as well as in public organizations in the field of culture, sports and other fields.

In 1910, a Scottish missionary conference was organized in Edinburgh at the initiative of the volunteer movement activist John Mott. The conference discussed the strategy of Christianization of all the peoples of the world and an agreement was reached on cooperation between various Christian unions in teaching missionaries, translating the Bible into different languages. This conference contributed to the formation of modern missionary work”[11, 18].

After the collapse of colonial power after World War II, missionaries sought to preserve the position of churches in the former colonial states. In 1969, 16,000 men and 30,000 women from various Christian missions in Africa were members of the Church.

To adapt to new conditions, missionary society activists used such methods as instructing local church leaders to use local music and dance, use appropriate religious rituals, promote the local language, and make extensive use of television and radio programs [12, 1].

Today, Protestant Christianity is a leader in missionary activity. In 1970, more than 220,000 professional missionaries worked in 2,200 Christian missions, and 420,000 missionaries in 4,800 foreign missions in 2000 conducted outreach activities to the local population. In 1970, \$ 3 billion was spent on overseas missions, and in 2000 it reached \$ 12 billion. Among the largest missionary centers are the Mission and the World Christian School (Birmingham), the Henry Martin Center (Cambridge, UK), the Universities of Gregorian and Urbani (Vatican), the Center for the Study of Foreign Missions (New York, USA) [13, 39].

Missionaries are working to identify areas that are important for their implementation in a particular area. Global mission projects take into account a particular country or region. Christian missionaries, mostly Christian Protestants, are concentrated in an area called “from 10 to 40 mirrors”. The region stretches from the coast of Africa west of the Atlantic Ocean to the Minor and Central Asia, the Arabian Peninsula and the Pacific coast of South Asia, between the 10th and 40th parallel of northern latitude.

The majority of the population in this region preach the Islamic, Buddhist, Confucian and Hindu religions. It should be noted that the world's largest reserves of gas, oil, uranium, intercontinental strategic importance of transcommunication routes are concentrated in these regions, and in the XIX century already prominent political figure A. Mechen called this area “Conflict Zone” [14, 12]. Viewed from a modern point of view, social and political tensions, armed conflict takes place in most countries in the “10-40 window”.

In the 1990s, due to the collapse of the former socialist camp in the countries of Eastern Europe and the independent states that emerged in the former Soviet Union, there was a noticeable increase in the number of Protestant groups in Western countries. Local non-traditional religious propagandists were busy expanding their ranks, not taking any responsibility for social harmony to society and the state. For example, in Russia alone, 4,5 thousand (at the end of 2000) of Protestant churches and denominations are officially registered.

The desire to divide on a religious basis citizens speaking the language of nationality, which has a common history and a unique state, can be considered as a threat to society. Attempts to expand the ranks of non-traditional religious communities without taking into account interfaith conflicts have serious consequences. This can be illustrated by the ongoing conflicts between religions in different parts of Africa and Asia as a result of missionary and proselytism as a result of the violation of the religious element of the indigenous population.

In particular, in the southern regions of the Sudan Republic, located in northeastern Africa where the main oil reserves were located, were active Christianized Catholic and Protestant missionaries during the past century. According to some estimates, about 1.5 million people were killed in an attack on the central government in the region. In 2011, Africa, the largest Muslim country, is divided into Sudan in which the majority of the Muslim population and the Republic of South Sudan in which mainly Christians [15, 12].

In the Christian regions of Indonesia, Sumatra, Sulawesi and Molucca there are clashes, murders and terrorist acts in which Muslims and Christians are involved in religious conflicts. It is reported that in Indonesia there are 27324 Christian missionaries, 44 European and 20 missionary centers of the United States, which currently ranks first in the Muslim population [16, 23].

From the first days of independence, various non-Muslim religious denominations made active efforts to spread their religious beliefs among the local population in Central Asia. Organizations from non-traditional religious denominations have also been officially registered and operate in the countries of the region. As of October 2012, 3088 religious organizations were registered in Kazakhstan, of which 2,229 were Islamic, 280 were Orthodox, 2 were Buddhist, 4 were Jewish, 6 were Bahá'í, 8 were Krishnayans, 79 were Roman Catholic churches 480 are Protestant communities [17, 11].

In August 2011, there were 2,299 religious organizations in Kyrgyzstan, of which 1,913 were Islamic, 51 were Orthodox, 4 were Catholic, 1 was Buddhism, 1 was Jewish, 12 were Bahá'ís, 1 was sultology, and 316 were Protestant groups [18, 13, 23, 24].

It should be noted that the number of new non-traditional religious communities, especially Protestant ones, is increasing, mainly due to the indigenous population of predominantly Muslim Orthodox Christians. Missionary work in neighboring Kazakhstan and Kyrgyzstan has not been banned, and missionaries have the opportunity to promote the ideas of new religious communities.

Missionaries focus on educating the local population. Proselite activists have the opportunity to benefit from the management of local communities, financial and other forms of non-transparent activities of foreign missionaries.

In the region, missionary centers of foreign protestants, who are more active than other denominations, operate as follows:

I. Education. The South Baptist International Service Corps (ISC, USA) has sent volunteers to Central Asia to work in the education system since 1990. Open Doors International offers short-term leadership and bible study courses. The Central Asian Association of Christian Schools is a primary school and summer camps, and the Christian organization of international camps organizes summer camps for children.

Some missionary centers began their work in the region with language training centers. In 2000, the Christian Educational Institution of the International Educational Service took an active part in teaching missionaries and teachers English, management and law in Hungary, Russia, China and Central Asia [19, 8].

II. Economic factor. Missionary centers in the United States and Great Britain, such as Fronties, People International and Interserve, send their missionaries to the staff of large western companies operating in the region.

III. Christian mass media. In October 2002, the Finnish International Religious Radio and Television (MRR / TV), the Evangelical Association Billy Graham (Russia) and the Campus Crusade for Christ created the Central Asian Christian Television and Radio Broadcasting Union. Similarly, missionary propaganda was promoted in the languages of the peoples of Central Asia through FEBC (Far Eastern Broadcasting Company), Voice of America (World Radio HCJB).

IV. Distribution of Christian publications. Organizations such as Slaviska Missionen (Sweden), People International (UK), International Bible Society (USA, Sweden) translate the Bible into local languages and distribute it in various ways.

V. Short-term missions. Folk Internationals, Open Door International (Whitney, Oxon), England, Youth Mission (Amsterdam, Netherlands) and Southern Baptists (USA) are engaged in sending missionaries for short periods to conduct evangelism through social projects on the continent.

VI. Establish intercultural communication. Some missionary centers in Central Asia are engaged in the development of cooperation between Protestant churches in the region and Western churches [20, 14-16].

The missionary activity is financed by financial assistance from overseas centers through donations from local production, service and sales departments, community members and community donations.

## CONCLUSION

By taking into account the growing role of the missionary movement in society in the context of globalization, it is necessary to use scientific, logical and proven methods to solve problems, eliminate problems and limit people's ability to believe in lies.

Therefore, in-depth study of the teachings of world religions and analysis of their teachings with the help of scientific, philosophical reasoning and raising their level of thinking about religion and faith have become an urgent need of today, and the enlightenment of ignorance belongs only to those who are highly conscious.

As you can see, protection of the country's security, especially young people, from religious envelopes is today a requirement. For this purpose, propaganda and the media in everyday life should be practiced by radically accurate, accurate, well-known intellectuals, religious figures and conscientious people in radio, television, newspapers and magazines.

If this is so, then national nihilism ("nihilism" is Latin - "nothing" - lack of trust in oneself and one's country, low assessment, tomorrow's mistrust, disappointment) leads to the fact that representatives of certain nationalities are discriminated by nationality, ignoring their country and not understanding the scale of the changes taking place in the country.

Ideologically, the immune system of young people who have been diagnosed with national nihilism is weak and they become "vulnerable to despair" [21, 4], who quickly adopt a frank ideology who cannot protect the interests of their country, are indifferent to any achievements of their country and are disappointed in them [21, 6].

The lack of religious education among young people and the lack of necessary literature in the field of religious studies force the younger generation to be exposed to such dangerous societies. In addition, the impartiality of knowledge given in the religious sphere should contribute to the growth of human spirituality and the development of society. Knowledge gained in the field of spiritual enlightenment should be closely related to the interests of the Motherland, the nation and humanity. At the same time, the fact that young people have a good and adequate knowledge of religions is one of the basic conditions for immunization against various ideological risks.

## SUGGESTIONS AND RECOMMENDATIONS.

– **Based on the above, the following suggestions can be made:**

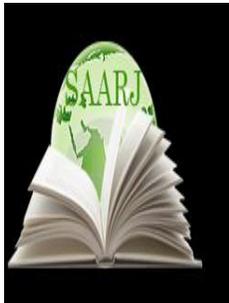

- Effective use of the potential of intellectuals in the fight against missionary work, the methods and tools they use;
- encouraging the activities of think tanks capable of opposing the ideas of modern missionary organizations and centers;
- development of priority areas for a positive orientation of the factors of the language, region and ethno-cultural unity;
- creation and promotion of constructive ideas reflecting high human qualities, values and culture that fit into the roots and interests of the development of the nation in the context of globalization, provided by missionary activities;
- formation of innovation and development programs related to the education system, media activities and other similar institutions, in order to achieve positive results in combating missionary work;
- enhancing the role of state institutions and civil society institutions in protecting the spiritual worldview of the younger generation from missionary work;
- development of strong creative ideas against psychological and psychological attacks that threaten interethnic relations and their introduction into the life of society;
- studying the dynamics of legislative policy in multinational countries and making the necessary proposals;
- encouragement of the idea of solidarity with the consciousness of every citizen, the content of his life and his daily lifestyle in strengthening inter-ethnic relations.
- Indeed, the formation and development of a spiritual world outlook in educational institutions and in general is one of the most pressing issues of our time. Accordingly, in our opinion, it is necessary to carry out the following tasks:
  - Teaching the history of world religions and their true meanings in accordance with age and the wishes of students-students of secondary schools, academic lyceums and colleges, the evolutionary growth of topics, learning based on non-repeating principles;
  - explain to the youth the importance of religion in human and public life, in particular, that the faith of a representative of religion increases even more at the expense of respect for someone else's faith;
  - coverage of the essence of all world religions, in particular the religion of Islam, with specific examples in the media, on the most popular youth web sites on the Internet based on clear examples;
  - explaining to the population that extremism, violence, sabotage is alien to religion based on reliable and convincing, proven materials sources;
  - achieving a clear and comprehensive understanding of knowledge in order to develop the ability to distinguish between secular and religious issues, especially among young people.

### ABSTRACT

*Alisher Navoi's epic "Lison-uttayr" has a special place in the author's work as a work that summarizes and concludes the advanced philosophical and mystical views put forward throughout the creative career of the great thinker-poet. In this article, we try to reveal the truth behind the metaphor in the works of the poet Alisher Navoi.*

**KEYWORDS:** *Alisher Navoi, Lison-Uttayr, Farididdin Attar, Mantiq-Uttayr, Metaphor, Use Of Bird Language*

---

### INTRODUCTION

The main purpose of the great poet and thinker Alisher Navoi's epic "Lison-uttayr" is to systematize and introduce his many years of views in the field of the doctrine of unity through the use of bird language in Farididdin Attar's epic "Mantiq-uttayr" (the poet himself calls this work a translation of Attar's epic). This can be seen in the words of the author about his work as Attar's epic had an early effect on Navoi, and the poet dreamed of writing this type of work all his life.

### MATERIALS AND METHODS

The poet's creative intention and dream came true, and "Lison-uttayr" was written in 904 AH (melody 1498-99) as the sixth epic after Navoi's "Khamsa" epics. The above instructions of the poet in many respects have something in common with the factors that led to the writing of epics, which were part of his famous "Khamsa". It was known that Navoi's "Khamsa" first of all

satisfies the demand of the Uzbek people for such deeply meaningful and artistically epic epics as Persian-Tajik works, raises Uzbek literature to the level of the most developed literatures of the East, and, most importantly, proves in practice that Uzbek language is not inferior to Persian-Tajik and was created in the way of such lofty goals. Thus, the writer seeks to create a unique philosophy of human life through the image of a particular bird, to reveal its essence and meaning, to determine the causes of marital disasters, personal tragedies.

In addition to embodying such familiar realistic scenes in front of our eyes, the author captures the current problems of the image of the person, even the sharp contradictions. In particular, the play raises issues of time and space, environment and reality, which directly affect the psyche of the individual as one of the most pressing problems. According to the poet's interpretation, the difficulty of living in harmony with his time is determined by the terrible flaws in him. As one of such defects, the play depicts the defects and shortcomings of a particular society and individual.

At the climax of the saga, only thirty of the many birds that set out in search of Simurg, with great difficulty, reached their final destination and saw Simurg in their image there. According to the poet's interpretation, birds, which are the figurative image of man, experience certain stages of perfection (seven valleys) and realize that they co-exist with Simurg.

## **RESULTS AND DISCUSSIONS**

The author reveals the "pharaoh" in man, that is, the flaws in the questions and discussions between birds and Hudhud. The remarkable aspect of these debates is that here Navoi uses the images of birds to criticize various moral and behavioral flaws that hinder spiritual maturity. The birds refuse to travel to Simurg, which is the epitome of supreme beauty and perfection, and make all sorts of excuses and excuses. In these excuses, the characteristic feature of each of them is reflected. The point is, this trait is consistent with a particular moral trait or defect in a person. In this sense, the Parrot is a symbol of selfishness and selfishness, the Peacock and Tazarv are the figurative images of vices such as pride in external beauty, Kabki Dari (sparrow) and Kuf (owl) are obsessed with amassing personal wealth and possessions, Qarchigai is ignorance and ambition.

While Hudhud sharply criticizes the flaws in their character, he calls on others to be free from such vices. The inclusion of stories related to the subject in exposing such shortcomings and flaws enhances the readability and vitality of the work.

The questions and answers between the birds in the epic and Hudhud are also mainly devoted to moral and spiritual issues, in which the discussion of vices and human qualities is widespread. At the same time, they express important practical and theoretical views on mysticism. The relationship between the murshid and the murid, the teachings and its conditions, the issues of repentance and sin, the methods of purification in the way of Truth, etc., have found their artistic-aesthetic, ideological-philosophical statement. Given that Alisher Navoi was not only a great thinker, wise man, genius artist, but also a great statesman in the socio-political realities of his time, he could not stay away from the processes in society. It should be noted that it was natural for the poet to incorporate into the essence of the work not only divine and mystical ideas, but also moral views that are important for the society to which he belongs.

In this way, the writer draws on the image of a certain bird that one of his goals is to make the foundation of the religious-spiritual faith, which should lead mankind to spiritual purification and spiritual maturity, in the face of simple logic.

Through the images of birds, the author tried to embody the image of a real man and a perfect person created in his imagination, in his dreams of high perfection, rather than drawing the image of someone he meets at every step in the environment and society to which he belongs. The heroes of "Lyson-ut-tayr" differ from most of their contemporaries by their honesty in dealing with reality, devotion to their ideals, fullness of conflicting feelings and, most importantly, their boundless desire to understand the truth. The poet is well aware of the difficulty of finding such people in the present life, and is well aware that they do not rise to the level of type in marriage. [6, 75]

No matter how much space is given to the description of people, landscapes, problems and contradictions of their time, the main goal of the writer is not to create a comprehensive, complete image of them. The interpretation of the image of a person who has found artistic expression through the image of birds serves as a tool for the great poet to make an artistic analysis of the problems of human life.

The current reality seems to be relentless in solving not the problems of human life, but the twists and turns that can be crossed by the demands of life.

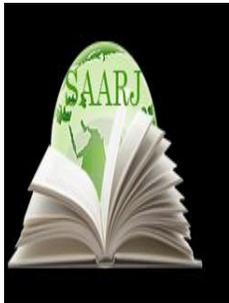

In this way, the author tries to use the events of everyday life as a mirror that clearly shows the problems and disasters of human life. In the artistic interpretation of the problems of human life, the author follows the path that gives much better results in the artistic image, that is, the principle of self-description in the language of the protagonist, giving greater freedom to the elements of narrative imagery. Among the elements of the above image used effectively in Lyson-ut-tayr are the extensive use of symbols and their infinitely deep meaning, the emphasis on unexpected events and the importance of certain issues through their repetition, the pursuit of brevity in psychological analysis and methods such as avoiding realism-specific detail.

## **CONCLUSION**

In conclusion, we can say that the most used symbols are appropriate to emphasize the symbols of striving for perfection and monotheism - the desire to reach God. These symbols also reflect the essence of human life, that is, the spirit of encouragement to make a good name in the transient world. In these respects, Alisher Navoi's epic "Lison-uttayr" vividly demonstrates the features of popularity and modernity.

### ABSTRACT

*Today, the need to teach the art of public speaking is prerequisite skills for the training of future engineers and economists. The lack of special disciplines aimed at developing presentation skills leads to the fact that the majority of university graduates are not ready to speak at scientific conferences and professional meetings. Therefore, our course "Practical English" which includes the formation of skills of communicative speech activity is the best suited for these purposes. In this article, we will share our experiences in teaching preparation skills of presentation activities of undergraduates of technical areas English lessons.*

**KEYWORDS:** *Presentation Skills, Teaching Methods, Foreign Language, University Students, Bachelor's Degree.*

### INTRODUCTION

Presentation activity is one of the types of public speaking that has become very popular in the business community. Today, it is impossible to imagine a highly qualified manager or engineer who is not able to provide business or professional information to promote their advertising products or technical ideas, as well as a scientist who does not participate in scientific conferences to present research results to a wide range of people. In this regard, teaching presentation skills becomes relevant for training specialists in higher educational institutions. Presentation has long been not only a form of transfer of lecture materials by university teachers, but is also used in various classes to control knowledge or for oral presentation of material prepared by students independently. The presentation of information by students is most often formal in nature, since there is no preliminary training in the art of presenting material in the

form of a presentation, which, in the end, will adversely affect their future professional activities as an engineer, manager, teacher or scientist. One of the problems of developing presentation skills in technical universities is the lack of special disciplines for the preparation and conduct of presentations. This problem can be partially solved through the training in undergraduate which includes teaching presentation skills as one of the types of speech communication.

## **MATERIALS AND METHODS**

Currently, we can find a large number of scientific and methodological works devoted to the classification of presentations, the analysis of their tasks and goals. A.V. Murovtseva defines the purpose of any presentation as influencing the behavior of the audience and encouraging them to act, which are beneficial to the speaker [1]. O. Yu. Popova defines based on an analysis of various literary sources, distinguishes two types of presentations: intracultural for representatives of one culture and intercultural for representatives of different cultures [2]. S. Rebrik classifies presentations from the point of view of the subject of information provision [3]: - management presentations necessary to discuss projects for the further development of companies and enterprises; - commercial and advertising presentations aimed at promoting new products and services to consumers; - scientific presentations providing information on new scientific research; - public and political presentations necessary to promote political figures or candidates of various electoral programs. Griban classifies presentations by purpose and subdivides them into educational, research, and portfolios [4]. Instructional presentations are used by teachers and educators to teach and monitor knowledge. Research presentations provide information on research and development. The portfolio provides information about an individual person in order to familiarize with his professional and personal achievements. The ways of presentations are presented have undergone a number of changes, from the chalkboard and paper posters to high-tech hardware and software. One of the most widespread and popular computer programs is Microsoft Office PowerPoint [5], which allows you to successfully demonstrate text, graphic, tabular, photo and video information, as well as creates visual support for oral presentation. In the works of L.P. Khalyapina and T.E. Dobrova [6, 7] describes the formation of communicative and technological competence, which includes the ability to apply in practice the skills of multimedia presentation of information. A number of works are devoted to the structure of the presentation [4, 8, 9].

In general, any presentation can be divided into four main parts:

- Introduction,
- Main part,
- Conclusion,
- Questions and answers.

Each part of the presentation has its own characteristics and rules for presenting information. A large number of foreign and domestic works are devoted to the issues of teaching planning and preparation of presentations and oral reports. The authors pay attention to the development of the skills to successfully convey information through presentation to the audience at the visual, auditory, verbal and non-verbal levels. And a number of teaching and learning techniques are being developed [4, 11-13] for the successful planning, preparation and presentation of the presentation. Authors pay special attention to the ability to present themselves and their material, to interest the audience and to communicate with it throughout the presentation.

For example, in the work of A.Yu. Tsymbal discusses the issues of intonation features of English-language presentations for academic and educational purposes [11]. In the book by Meyers and Holt, to develop the skills of successful presentations, special tasks have been developed for working with the audience, planning presentation materials for various fields of science and technology, as well as developing intercultural oral communication skills [11].

Yu.A. Filyasova suggests teaching the skills of English-language presentation activities based on a text-based approach, which consists in using authentic texts of technical content, accumulating knowledge and preparing presentations based on them [12]. E.V. Chernysheva proposes an approach to preparing a group presentation in a foreign language in the form of a stage game, a round table, a TV show, a quiz and artistic creativity, which makes it possible to activate the skills and abilities of teamwork, communicative dialogical and monologue speech in foreign languages [14].

## RESULTS AND DISCUSSIONS

The course "Practical English" in the direction of training engineers was included a section "Skills of presentation activities", which can be divided into the following stages: 1. Planning a scientific presentation. 2. Design of the main parts of the scientific presentation. 3. Speech clichés for oral presentation in English. 4. Presentation of the presentation.

Planning a presentation is the first and most important step in the job. In order for the presentation to be successful, students need to choose the right topic and reveal it fully and interestingly for a specific audience. It is best to select the topic of the presentation together with the supervisor of the undergraduate student in order to activate the professionally oriented component of teaching a foreign language and create an opportunity to use this work when defending his/her thesis or in the professional activity of a future master. To develop the skills of planning a scientific presentation among undergraduates, a special lesson in English was developed. The lesson consists of a number of exercises, performing which the undergraduate builds a plan for a future scientific project for himself in the form of the following points:

1. Statement of the main task or question of the project (to define a question).
2. Definition of a hypothesis or description of existing experience on this issue (to formal hypothesis).
3. Planning the experiment (to design an experiment).
4. Collection and analysis of the data obtained (to collect and analyze the data).
5. Description of the results (to interpret the data).
6. Conclusions on the work done (to draw conclusions).

Based on the skills acquired in the lesson, the undergraduate determines the content of the scientific presentation, which, as a rule, has the following structure:

1. Introduction.
2. The main part of the presentation (Main body).
3. Conclusion

This structure is generally accepted as it allows the audience to better understand the main ideas and provisions of a scientific project. In the introductory part of the presentation, the speaker should greet the audience, introduce himself, his project and briefly list the main tasks of the scientific project, that is, explain to the audience what will be discussed. The start of the presentation should be bright, memorable and planned in such a way as to attract the audience to the presentation and help the speaker adapt to the audience, thereby setting a successful tone for the presentation. The first page of the presentation is usually devoted to the title of the report, the presentation by the speaker of himself and his organization. It is very important to choose the right name for the scientific project. It should be short and reflect the main idea of the project in order to be understandable to the audience and at the same time to interest them from the first minutes of the presentation.

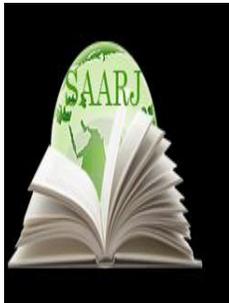

## CONCLUSION

In conclusion, we can say that in the final part of the presentation, students will summarize the entire scientific project that had already been presented, and briefly, in thesis form, repeat the main points and achievements using the following evaluation criteria were used: - independence of work on the project; - relevance, significance and completeness of the topic; - presentation structure and slide design; - grammar and style of the English language; - answers on questions; - scientific and technical terminology; - artistry and expressiveness of performance, appearance; - the use of visual aids and technical means.

## INTRODUCTION OF BAIHUA IN PERIODICALS

**Feruzha Khasanova\***

### ABSTRACT

*The article examines the language of everyday communication of the Chinese at the beginning of the XIX century, as well as the introduction of baihua into periodicals. Due to the lexical-semantic and grammatical features of the Baihua language, its ease of expression in terms of foreign language, in contrast to the ancient Chinese Venyan, is of particular importance. Because the Venyan language does not provide such an opportunity, the use of affixes in the expression of new concepts in Chinese allows the translation of terms in various fields into Chinese, revealing the meaning of the term. When the first periodicals were published in Baihua, information about scientific literature from various western languages began to enter Chinese. In this regard, the introduction of the Chinese language Baihua into periodicals was of great importance.*

**KEYWORDS:** *Baihua, Periodical, Assimilation Word, Term, Affix.*

---

### INTRODUCTION

By the beginning of the XIX century, the Baihua language gradually began to supplant the Venyan language, embodied in a pure literary language in which novels and stories were written. For Baihua to develop as a perfect modern written language, it had to develop both functionally and structurally. Baihua's structural and functional development was marked by the addition of new vocabulary to reflect new concepts, as well as the improvement of grammatical tools.

#### **The main results and findings**

Baihua did not take a lot of effort to expand the vocabulary to reflect the new concepts. Modern socio-political and scientific terminology, created by translators of Chinese and Japanese

publicists of the XIX century, quickly penetrated into the language and texts of baihua communication. The Baihua language came in handy with more eloquence than the Venyan language. The assimilation word was mainly represented by two or more morphemes. Newspapers, which quickly learned new words from abroad, spread with pictures, which was an important factor. Periodicals began to appear in Baihua.

In 1898, the first “无锡白话报 Wúxī báihuà bào Ushi baihua newspaper” was published in Ushi. After that “苏州白话报 Sūzhōu báihuà bào Suzhou Baihua Newspaper”, “新青年 Xīn qīngnián *New Youth*” began to appear in a number of publications. The circulation of the first editions in Baihua was large enough to be distributed in only one province. Thus, a “small press” began to form in the baihua. These newspapers were shallower in content and smaller in size than the “big press”[1].

After the Xinjiang Revolution of 1911, Baihua texts began to appear in the Chinese press. Baihua's works began to appear in the artistic columns of newspapers, while the works in Venyan, mainly essays and poems, were published under the traditional 文园 “garden of art”. For the works in Baihua, 小说 is organized in the sections “Baihua stories” and 短篇小说 “Baihua narratives”. Baihua's works of art were published in several issues of the newspaper. In order to bring news and political information to as many people as possible, some newspapers carried special 白话新闻 “baihua news” in parallel with the columns in Venyan.

“无锡白话报 Wúxī báihuà bào Ushi Baihua is one of the most popular publications in the history of the Chinese press, inheriting the ancient Chinese language and promoting the development of modern Chinese. The newspaper has been used as an important source in the field of modern Chinese lexicon research and lexicography, with many neologisms in the newspaper texts being given in the baihua[2].

“新青年 Xīn qīngnián During the period from 1915 to 1926, 63 issues of the newspaper “*New youth*” were published. As the main position of the movement for a new culture, the newspaper had a very colorful theme and rich content in the fields of politics, philosophy, education, culture, economics. It has great linguistic value as it operated during the transition from Venyan to Baihua. “新青年 Xīn qīngnián According to the Chinese linguist 杨学彬 Yáng Xuébīn Yang Xuebin, who took the lexicon of the newspaper “*New Youth*” as a source and studied the comparative analysis of the lexicon of Venyan and Baihua, the frequency of two-syllable words in newspaper texts is much higher than that of single-syllable words. When studying the ratio of words belonging to the 500 most frequently used noun word groups in venyan and baihua, we can see that the proportion of single-syllable noun in venyan is 15.80% higher than in baihua. According to the ratio of verbs, we see that the frequency of single-syllable verbs in the venyan is high, while in the baihua the ratio of single-syllable and double-syllable verbs is equal. 杨学彬 Yáng Xuébīn According to Yang Xuebin, some verbs are used in a mixture of venyan and baihua. The main reason for this is explained by the theme of the newspaper and the specificity of that period. Also, Venyan and Baihua are two different systems of the same language. Both contain not only words that are general or specific, but in some cases these systems use different words to express the same concept. Baihua also predominates in counting words, and counting words mainly consist of monosyllabic words, and there are very few such words in Venyan. Although some prefixes, such as 于 and 以 prefixes, belong mainly to Venyan,

but in the texts of the newspaper“新青年 Xīn qīngnián New Youth, the Baihua also expresses the same meaning[3].

At the end of the Qing dynasty, in 1918, a local commercial newspaper, “北京白话报 Běijīng báihuà bào Beijing Baihua, began to be published in Beijing”.This newspaper has served as a source for many scientific studies on the peculiarities of the Beijing dialect, new terminology in the field of commerce, the analysis of socio-political lexicon.Researcher at Xiamen University 赖一鸣 Lài Yī míng Lay Iming 《北京白话报》词语研究 *A study of the lexicon of the Beijing Baihua newspaper* studied the features of Beijing dialect in his dissertation on the topic.The abstract of the dissertation focuses on the reflection of the Beijing dialect in the baihua, the ratio of monosyllabic and polysyllabic lexical units, as well as the analysis of new assimilation words[4].

It was first published in Beijing in 1918 “北京白话报 Běijīng báihuà bào *Beijing Baihua Newspaper*” published in the Baihua, using new punctuation.Following, a number of periodicals also gradually began to switch to baihua, a language understood by the common people.At first small comments, appendices, edits, and then the whole edition began to be given in the baihua.It should also be noted that even after the introduction of the baihua, Venyan did not “surrender” in the field of journalism for a long time.About this in 1934 “大公报 dàgōngbào *A large mass newspaper*” in which publicist Hu Shi expresses the view that the need to move to the baihua is a topical issue.He writes that some of the printed publications at that time were published in full in the Baihua.“However, it should be noted that if we look at modern publications, we find more Venyanism in them.In addition, their number has not decreased from year to year, but has increased”[5].

Analyzing terms assimilated from western languages into Chinese through periodicals, we can recognize that western languages had a great influence on Chinese.In particular,洋, 西, 电, 感, 作用, 主义, 学, 机, 化, 家, 业 such affixes appear(We call these morphemes conditionally affixes. Because the lexical meanings of morphemes in Chinese are very strong.Although their function in word formation is strong, but due to the specificity of the Chinese language, we can say that sometimes these morphemes lose their lexical meaning and form words, sometimes retaining their lexical meaning.According to this principle, we can call some morphemes affixes and some conditionally affixes.). These affixes have been used in the construction of terms of a particular field of terminology.For example, 感 postfix in terms of psychology,作用 in terms of physics,主义 terms used to describe the theoretical properties of any system[6].

A morpheme denoting a basic lexical meaning is called a base.A morpheme that does not have a real lexical meaning and is only used to make a word is called an affix.Words formed using affixes are called artificial words[7].

In Chinese, an affix is a formal morpheme that combines with independent meaningful morphemes.Just like in other languages, independently meaningful words are lexical units that arise as a result of the loss of meaning and the transformation of words into word-forming means.It is well known that an independent meaningful word loses its lexical meaning as it passes into the affix function.The affix has an abstract-grammatical meaning and loses the subject-lexical meaning[8].

洋 yáng affix (洋 yáng the original lexical meaning of the hieroglyph is ocean; foreign) used as a prefix in words belonging to any noun phrase learned from European languages, for example: 洋针 yáng zhēn *μηχανή*; 洋伞 yáng sǎn *umbrella*; 洋胰子 yáng yí zǐ *soap*; 洋白菜 yáng bái cài *cabbage (white cabbage)*; 洋纸 yáng zhǐ *paper (used for publication)*; 洋手巾 yáng shǒu jīn *napkin*; 洋人 yáng rén in words like *foreign*.

西 morpheme (西 The lexical meaning of the hieroglyph (western) is also used to express terms derived from European languages, for example:

西乐 xī yuè *western music*; 西学 xī xué *western education*. The word meant European and American natural science and socio-political doctrine at the end of the Ching dynasty.

电 affix (电 the original lexical meaning of the hieroglyph is thunder; electricity) is mainly used in the manufacture of telegraph and press terms, for example: 贺电 Hè diàn *congratulatory telegram*; 急电 jí diàn *emergency telegram*; 唁电 yàn diàn *condolence telegram*; 感谢电 gǎn xiè diàn *acknowledgement*; 慰问电 wèi wèn diàn *condolences*; 通电全国 tōng diàn quán guó *nationwide telegram*;

感 affix (感 feel the lexical meaning of the hieroglyph) is mainly used in biological terms, for example: 感光行 Gǎn guāng xíng *photonastia*; 感水性 gǎn shuǐ xìng *hydronastia*; 感震性 gǎn zhèn xìng *seismonastia*;

作用 as a two - syllable word, *role, function* meanings. Combined with two-syllable verbs, it is mainly used in the construction of chemical terms, for example: 同化 *assimilate*; combine — 同化作用 *assimilation*; 刺激 *cause*; call - 刺激作用 *stimulation*; 积聚 *collect* — 积聚作用 *accumulation*.

Language develops in harmony with the development of society. The Baihua people have developed as a language of oral communication, gradually penetrating and strengthening their positions in various areas of Chinese society such as science, technology, culture and politics. Unlike Venyan, it was much easier to translate new concepts and terms in the development of science into Baihua. The reason is that such assimilated terms are mainly polysyllabic lexical units, and it would not be logical to explain their reflection in Venyan.

When assimilating a foreign language word, of course, there is a change in some sounds: the form of a foreign language word changes in accordance with the phonetic characteristics of the acquired language. In the process of phonetic assimilation, speakers replace the sounds of another language with the phonemes of their own language. The hieroglyphic writing of the Chinese language is not so adapted to reflect the sound system of words coming from foreign languages, because hieroglyphs cannot represent individual sounds and even syllables, but single-syllable words or single-syllable morphemes as a whole [9].

Baihua differed significantly from Venyan in the expression of polysyllabic words learned from other languages. The new assimilation word was mainly reflected in the oral speech, because its semantic unit was not a separate hieroglyph, but a combination of several hieroglyphs, which in their set were equivalent to the word in the baihua. For example, if a word consists of four syllables, then in written language this word is given by four hieroglyphs, and the phonetic sign of each corresponds to each of the syllables that make up the word. For example, “无产阶级

wúchǎn jiējí - *the proletariat*” The word is given in several hieroglyphs: 无 wú not (denied)+ 产 chǎn give birth; create + 阶 jiē layer; class + 级 jí degree; phase meanings[10].

New terms enter China not only through printed literature, but also through direct live speech, which receives them phonetically; by recording spoken words with a combination of melodic hieroglyphs, the written language perceives them phonetically and, in this way, creates a phonetic and semantic sign of a number of foreign terms. For example: “democracy” – 德谟克拉西特 “demokelaxite” (according to Beijing pronunciation) and “民主 minzhu” = people + power; “多数党 duoshudang” = party + majority; “Utopia” – “乌托邦 wutuobang” and “空想 kongxiang” = like nonsense + ideas.

At the end of the Qing dynasty, the Baihua entered the field of journalism rapidly. Periodicals began to be published in a language that was understandable to the public, in a language that was much simpler and easier to understand than in Venyan. It should be noted that when translating from western languages into Chinese, Baihua was convenient. Matteo Richchi (1552-1610), an Italian missionary sent to China during the Ming dynasty, translated a number of works that introduced western culture into Chinese and wrote the works himself. Through the translation of such works, many new words entered the Chinese lexicon. In particular, “Euclid” (Euclides (3rd century BC) - Greek mathematician; author of works on mathematics, optics, mechanics, music. Euclid was originally from Tira (Lebanon) and lived and worked in Alexandria, where he established his own scientific school. His main mathematical work is “Fundamentals”. In it, Euclid logically arranged the rich mathematical material collected in Greece, laying the foundation for the further development of mathematics. This work played an important role in the development of mathematics.) translates his work into Chinese for the first time. In the Chinese translation of this work, the terms used to describe the concepts of mathematics and geometry are as follows.[11]: For example:

*straight line* - 直线 zhíxiàn. In this 直 zhí *straight*, 线 xiàn *line* are hieroglyphs that mean

*curved line* - 曲线 qūxiàn - 曲 qū *curved* + 线 xiàn *line*

*boundary line* - 界线 jièxiàn - 界 jiè *boundary* + 线 xiàn *line*

*plane* - 平面 píngmiàn - 平 píng *flat* + 面 miàn *surface*

*square* - 平方 píngfāng - 平 píng *flat* + 方 fāng *square*

*cubic* - 立方 lìfāng - 立 lì *vertical*; *flat* + 方 fāng is represented by hieroglyphs such as *square*.

Baihua's features were convenient in translating from other foreign languages into Chinese, especially in reflecting the translation of terms, and had a direct influence on the development of science and technology. As the scientific sources of many western countries were translated into Chinese, the lexicon of baihua was also enriched by the expression of concepts and terms in them.

As can be seen, the terms and concepts pertaining to various spheres of society have not been sufficiently served by the Venyan possibilities in the Chinese language. With this, the spaniard itself was partially used, as a semi-dead language. In Venyan, because words were monosyllabic

and any concept or term was represented by only one hieroglyph, it made it difficult to express the meaning of words, new concepts unfamiliar to the Chinese language.

However, despite this, the intelligentsia of Chinese society and some representatives of the scientific community began to talk about the fact that the complete abandonment of Venyan would not bring good results. They expressed the view that the baihua was not as attractive as the Venyan, and could not reveal the essence of philosophical and spiritual concepts.

The main reason for the adaptation of the Chinese press to the Baihua language was the abolition of state examinations in Venyan after the Xinjiang Revolution. Such state examinations were held in Venyan, and those who passed the examination were appointed to public office. After the abolition of the exams in Venyan, the status of Venyan fell by itself, and now Venyan has become the only language of traditional Chinese culture. In secondary schools, the Venyan sciences were reduced from year to year at the expense of the humanities, and as a result, secondary school graduates from year to year began to master less and less Venyan [12].

The periodicals had to adapt to that period in order to attract more readers. Therefore, in the struggle for the reader, the main focus was on the language of the newspapers. It is for this reason that baihua works and materials in baihua have proliferated and become popular. By the May 4 movement, the baihua had undergone a path of functional and structural development. Now there were all the conditions for the baihua to be conducted not only as the language of fiction, but also as a socio-political, scientific and technical language.

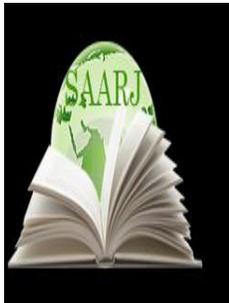

## CONCLUSION

We can acknowledge that the structural and functional development of Baihua was supplemented with new vocabulary reflecting new concepts, and with the improvement of grammatical means, the influence of western languages on Chinese was great. In particular, 洋, 西, 电, 感, 作用, 主义, 学, 机, 化, 家, 业 such affixes in terms of medicine, chemistry, psychology 感, in terms related to the field of physics 作用, in terms of terms that express the theoretical features of any system 主义 postfixes began to be put into circulation.

## THE REPRESENTATION OF SEMANTIC FEATURES OF INTERJECTION PHRASEOLOGICAL UNITS

**Sabirova Dilshoda\***

\*Senior Lecturer,  
 Department of English,  
 Samarkand State University,  
 UZBEKISTAN

### ABSTRACT

*This article is about structural peculiarities of Interjectional Phraseological Units and the models of forming new Interjectional Phraseological Units. This article is about semantic peculiarities of Interjectional phraseological units, according which there were found some special groups as benevolence, evilness.*

**KEYWORDS:** *Structure, Modal, Phraseological Nest, Noun, Adjective, Formation, Emotion, Feelings.*

### INTRODUCTION

When representing interjection phraseology, it is necessary to emphasize that interjection phraseological units (IFU) is a special language material that is designed to express the feelings, emotions, and wishes of a person. This may include feelings of joy, admiration, threat, fear of horror, etc. It should be emphasized that IFU is a unique layer of spoken speech that gives it a special vitality of dynamism and expressiveness. For example, the English IFU:

*By the Lord Harry! Damn it!* It is used as a means of amplifying statements with shades of indignation, indignation or irritation [1].

Or English. IFU *-Mon alive! Quick, quick!, good God!, Here are those on!* an exclamation expressing surprise, annoyance [1].

Semantic analysis of IFU made it possible to determine two large groups:

1) IFU-benevolence. *Success to your efforts!* I wish you success in your endeavours.

2) IFU -malice. *Drop-dead!* Let you die! In turn, they can be grouped into numerous subgroups. An important characteristic of IFUs is their functioning in context. They are realized in context through the expression of their emotional content, which is often a complex set of shades of linguistic reproduction of a person's mental state. Therefore, the essence of IFU, which consists in the realization of emotions and expressions of will, is revealed only in relation to a specific moment of speech. The situation allows neutralizing the semantic diffuseness of the IFU, unambiguously highlighting a specific assessment in their denotation. The assessment of the criticality of the situation is made from different, sometimes incompatible points of view. What is positive, based on one vital necessity, can create a critical situation in relation to another. As for the individual categories of the IFU, the dependence of their functional implementation on the nature of the speech situation of use is obvious. In this regard, GV Kolshansky [2] notes that the type of situation affects "the type of context, and the type of context predetermines the choice of one or another value of the linguistic unit." In addition, in terms of emotional tension, speech situations can vary greatly among themselves. In some of them, emotional tension incomparably increases due to the especially intense emotional reaction of the subject to the reality he is facing.

## MATERIALS AND METHODS

Studies show that in situations of increased emotional tension, in the vast majority of cases, functioning in IFU speech is usually noted. It is fair to say that "typed contexts can be linked to typed nominative situations." [2].

For example: But he knew better: there would be a pretty kettle of fish!. [4, 5]. English. IFU can characterize both positive and negative situation, *Don't fuss! It's full!* (J.G.Forsythe Sage ch 5. p. 41). This is also true of the trace of IFU, who express reassurance about joy, trouble. English. IFU *Good Lord! My God! My Lord! Oh God!* (joy, admiration, surprise, hatred, hostility, anger!) (J.G.F.S. p. II ch.I p.104)

English. IFU *Good Lord! My God! My Lord! Oh my God!* (joy, admiration, surprise, hatred, dislike, anger !,)[3]; IFU *My aunt! Here are the ones on! My hat! Wow! Whoever would have thought it! Who would have thought! (surprise at joy, trouble!) Great guns! Hell! A pretty business! Nice little business!*

*By jingo! Oh my God!* (joy, admiration). Thus, most IFUs are semi-functional, sometimes expressing directly opposite meanings, which are revealed only through context. The semantic analysis of the IFU allowed us to single out two large groups of IFU: goodwill and ill will. IFU - *goodwill*. They are distinguished by the variety of different semantic subgroups.

1. IFU- greetings and goodbyes: Good day!; Good afternoon! Good afternoon!; How do you do ?, How are you? Hello, how are you? How are you getting on ?, How goes it? How are things? How are you?
2. IFU with the meaning of various good wishes: a good (happy) journey, pleasant rest, well-being, health, luck, success, etc. Wed samples: Success (he) to your efforts! I wish you success in your endeavours !, Good luck with you !; Good luck! Happily! I wish you success! Victory be yours! I wish (you) victory !; All happiness bechance to thee! May luck accompany you in everything!; I wish you every success! I wish you every (complete) success !.

Of course, we have identified only the most developed semantic groups of

1. IFU- greetings and goodbyes: Good day!; Good afternoon! Good afternoon!; How do you do ?, How are you? Hello, how are you? How are you getting on ?, How goes it? How are things? How are you?
2. IFUwith the meaning of various good wishes: a good (happy) journey, pleasant rest, well-being, health, luck, success, etc. Wed samples: *Success (he) to your efforts! I wish you success in your endeavours!*, Good luck with you!; *Good luck! Happily! I wish you success! Victory be yours! I wish (you) victory !; All happiness bechance to thee! May luck accompany you in everything!; I wish you every success!-I wish you every (complete) success !.*

Of course, we have identified only the most developed semantic groups of IFU, meaning various kinds of figurative plays of a benevolent nature. In the languages under consideration, there are still many such IFU of benevolent semantics, which is distinguished by a noticeable difference in image construction with one or another meaning of benevolence. For example, you can refer to these of them: meaning various kinds of figurative plays of a benevolent nature. In the languages under consideration, there are still many such IFU of benevolent semantics, which is distinguished by a noticeable difference in image construction with one or another meaning of benevolence [6-8].

IFU, meaning various kinds of congratulations, for example, holidays: *Merry Christmas! Merry Christmas !, Happy Christmas !;A glad New Year! Happy New Year!*

3. IFU - toasts and MFE - health resorts: *Three cheers for our visitors! Long live our guests !;(To) your health! (For your health!;Hob and nob!, Here's how! For your health!*

IFU- goodwill can be not only widespread among the people but also limited by the functional framework of a certain language version - professional, social, territorial, etc.

As such samples, let us point out such from the IFU as *Happy Landings! Happy flights! (pilots toast); For your health! (IFU- toast; Americanism), etc.*

IFU- ill will. In the language under consideration, the IFU of this semantic category is distinguished by an exceptional wealth of figurative and modal-evaluative characteristics, often complicated by shades of rudeness, contempt, anger, hatred, derogation, etc. The most developed are the following groups of malicious IFU:

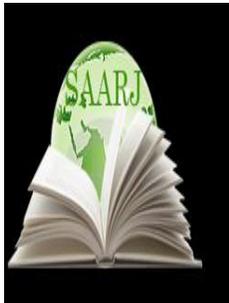

1. IFU giving rude orders to someone to leave, *Go lay an egg! Get Out !, Get Out !, Go to the devil! Get the hell out of it! Get (go) along with you! Get out! Go away! Don't darken my door again! So that your feet are no longer in my house! I won't let you on the threshold!*
2. IFU - wishes for death, misfortune, damage, disease, etc. to anyone: *Drop dead! Let you die! This also includes IFU - curses: Damn your eyes! Damn you! Let it go hand! Damn it! Levant me! So that you were empty!*
3. IFU Threats: *You will catch it! Will be for your nuts!* It is noteworthy that, structurally, such IFU are built according to the models of complete sentences with an incentive modality. They emphasize clearly the dynamism of the speaker's actions, who owns the threats. Therefore, personal pronouns are usually used as a subject here.
4. IFU -appeals. This category of interjection phraseology is distinguished by the variety of functions inherent in directive statements, can play the role of a filler in remarks. Depending

on the presence of a common semantic dominant, it is possible to distinguish other associations of such IFU.

A special subgroup is made up of IFU calls, which functionally specialize in maintaining a conversation, decorating its fragments. *Just fancy! Only fancy!* You can imagine !, Just think !.

### ABSTRACT

*The article argues that musical art has a strong influence on personality formation as a key factor in the development of spiritual and social thinking. Music lessons in the family, preschool institutions, secondary schools and out-of-school educational institutions are an important tool for enriching the spiritual inner world of the younger generation if they are purposefully organized.*

**KEYWORDS:** *Spirituality, Enlightenment, Threat, Globalization, Danger, Extremism, Terrorism, Immunity, Ideology, Thinking, Imagination, Social, Observation, Emotion, Perception, Persistence, Attention, Memory, Tempo, Rhythm, Measurement, Register, Dynamics.*

### INTRODUCTION

At present, when our country is gaining prestige in the world community, strengthening the spiritual and educational foundations of the life of our people, implementing the basic concepts and principles of national patriotism, forming feelings of love and devotion to the Motherland and its people in the hearts of the younger generation. One of the features of our people is the upbringing of harmonious, purposeful and energetic youth.

An important tool in the emergence and development of new directions in the education system in the implementation of the principle "Five important initiatives to improve the morale of young people and meaningful organization of their leisure", adopted at the meeting chaired by the President of Uzbekistan Sh. Mirziyoyev on March 19, 2019. Today it is no secret to anyone that globalization processes are intensifying in the world, new threats and dangers to peace and stability are growing[1-3]. In such a difficult and dangerous situation today, one of the most

pressing problems is to organize a harmoniously developed generation based on modern requirements, to seriously approach the spiritual realization of the current situation and a meaningful organization of their leisure. At the same time, this initiative is aimed at educating young people in families, residential areas and educational institutions, at paying special attention to targeted and ideological work with unorganized youth in remote regions of the country, at strengthening ideological immunity against crime, religious extremism and terrorism. is an important target system for protecting interests. The need for the comprehensive development of the younger generation in our country, the development of their interest in national traditions and art, thinking, acquaintance with national works of art and the reorganization of music education in our educational institutions is obvious. Appeared[1,3].

Music is an art form that reflects human emotional experiences, thoughts, the realm of the imagination through a sequence of musical sounds or content. In the formation of a person's spiritual and social thinking, the music combines different moods, such as sublime, happy, joyful, observant, sad, frightening, expressing the feelings, dreams, desires and desires of a person in a unique artistic language. Music is both science and art. Because music is a constantly evolving living art. Music is a constant companion of human life, it can penetrate deeply into the heart of a person and reflect his inner experiences.

Also, the music reflects the expressive qualities of a person, that is, purposefulness, purposefulness, thoughtfulness, poise and his character. We all know from human society that intuition and perception, arising under the influence of reality, are the main source of thinking. Children have insufficiently developed brains and senses, so their sensitivity is somewhat impressive. Attention, memory and thinking are necessary and important to fully understand music. To fully understand music, the activities of human psychology must be varied. Russian teacher V.A. Sukhomilinsky called music "the great source of human thought". One of the peculiarities of children's emotions is that they are associated with certain conditions, that is, emotional experiences that arise in children arise only under certain conditions. By listening to a piece of music, children learn to distinguish between the different sounds of the music, such as tempo, rhythm, melody, register, and dynamics, as well as the genres of music they hear.

The role of the art of music, like all other fields, in achieving this goal is unique.

Music has been the main content of human life, expressing spiritual freshness, pace, social thought and experience of historical periods, meeting the spiritual and social requirements of each period. In the past, all peoples used the power of the spiritual and social thinking of music for specific purposes, increasing the combat readiness of their armies. In it, the brightness and sublimity of the music helped to enhance their fighting spirit and potential. Even music has long been a means of negatively influencing human thinking during the execution of prisoners. It is in this process that the sounds of the music performed to have a profound effect on the psyche of prisoners on death row or the sounds of music played during funerals and farewells, reflecting the qualities of deep sadness, longing and remorse. At the same time, music embodies such views as life and death, personality and society, good and oppression, strength and weakness. When the created beautiful musical works are imbued with deep philosophical content, they are sealed in human consciousness. Musicologists, thinkers and scientists have long drawn the attention of

musicologists to the inexhaustible possibilities of music for influencing the human psyche and thinking.

If we turn to the history of our past spirituality, which embodies the national traditions and values of the Uzbek people, then our ancestors did a great deal of practical work in teaching each other to perform musical works.

Abu Nasr al-Farabi, one of the greatest thinkers in the history of music, wrote in his book "The Origin of Science" about the magical power, miraculous effect and importance of music for strengthening spirituality and human health. regulates the behaviour of people who are out of balance, improves immature behaviour and maintains the balance of unbalanced human behaviour[3-4].

This knowledge is beneficial for the health of the body, because when the body is sick, the soul also dies, and when the body meets an obstacle, the soul also meets an obstacle.

Thus, the sound of words played on musical instruments heals the body, healing the soul, and the soul regulates its strength and receives nourishment from it”.

According to Abu Ali ibn Sina, “Music invigorates the soul and cleanses it of unnecessary fantasies. It can have a healing effect, creating a good mood, causing cheerful emotions”. The art of music has a strong influence on personality formation as a key factor in the development of spiritual and social thinking. Music lessons in the family, preschool institutions, secondary schools and out-of-school educational institutions are an important tool for enriching the spiritual inner world of the younger generation if they are purposefully organized. Each nation has its national sounds and national styles of performance. Nowadays, music melodies that are alien to "mass culture" are also included in national, spiritual and ideological music. Today it is no secret to anyone that performers harm people's minds with their performances that do not fit into any musical style, expressing their personal feelings in melodies and creating novelty among the general public. We are witnessing the emergence of such music in the media, the fact that music performed on large stages, at weddings, on radio vehicles, negatively affects the spiritual and ideological thinking of listeners. In particular, industry representatives are annoyed that a speech style that does not correspond to our national traditions, values and customs, moral norms, enters the life of young people and affects their spiritual and social environment[3-9].

President of the Republic of Uzbekistan Shavkat Mirziyoyev, in his speech at a meeting with representatives of the creative intelligentsia of Uzbekistan in August 2017, said: "The development of literature, art and culture is a solid foundation for the elevation of the spiritual world of our people." If we say that the threat of "mass culture" comes only from abroad - from the West, we are seriously mistaken. This misfortune, unfortunately, can come from ourselves. I am not saying this from heaven. It is natural for any sane person to come to this conclusion after watching songs and dances from some newspapers, magazines, music videos and films published in our country. " They said. Apparently, the head of our state did not warn the creative intelligentsia of Uzbekistan, knowing in advance that the idea of “mass culture” distorts the consciousness of young people. To prevent such a situation, it is necessary to create a stable social and spiritual environment among figures of musical culture, raise the spiritual world and the cultural level of the younger generation, help our youth enjoy classical music, along with classical works of the Uzbek national and world musical culture. For this, it is important to lay the foundation and develop musical education.

“Music should be a mirror of spiritual and ideological thinking”. The possibilities of music in the development of human thinking are so wide that musical works created at a high level have qualities that contribute to the development of further development. Several Decrees and Resolutions by the President of the Republic of Uzbekistan Sh. Mirziyoyev, aimed at the development of Uzbek musical culture and art based on historical foundations, published reflections on the life of our people and world communities. In particular, on August 28, 2017, Samarkand will host the XI International Music Festival "Sharq Taronalari", in April 2019 in Termez "Xalqaro dostonchilik-baxshilar" and in July 2019 at the Margilan International Music and Folklore Festival 2019 in Samarkand. "International Craftsmen". Today the music performed at the festival's mass concerts plays an important role in shaping the spiritual and social thinking of young people.

## CONCLUSION

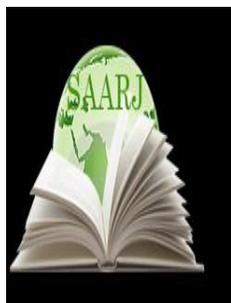

Music does not know granites and crevices and does not choose the performer.

I believe that the created musical production will become the immortal heritage of our people if it combines the qualities of love, mutual respect and patience in the development of human thinking. Based on the specific target tasks set by the President of the Republic of Uzbekistan Shavkat Mirziyoyev at the video conference "On increasing the efficiency of spiritual and educational work and bringing the development of the industry to a new level" dated June 28, 2017, held on March 19, 2019, by the head of our state, “five important initiatives to improve the spirituality of youth and the significant organization of their free time”, to radically improve the content of spiritual and educational work, increase their skills and expand the scale, enlighten the homeland in the formation of a healthy worldview among young people, it serves as the main force in the education of a harmoniously developed people, the implementation of intelligence and creativity.

**ABSTRACT**

*The article deals with the problem of scientific identification of spiritual and aesthetic potential of the individual in conditions of mass informatization of society. The main categories and presumption of aesthetics are interpreted in terms of semiotics. The essence of interpretation of the aesthetic potential of the individual*

**KEYWORDS:** *Information Anthropology, Artefact Environment, Semiotics, Эстетический Потенциал, Spirituality Phenomenon, Iconic Sign, Sign Index, Sign Symbol, The Law Of Harmony.*

**INTRODUCTION**

In global are, which has covered all spheres of life of modern society, the conditions of life and activity of people change significantly. A fundamentally new, informational way of life and professional activity of people is formed, as well as a new artefact virtual habitat of mankind, which forms in millions of people new habits and stereotypes of behaviour, as well as cultural requests and values. Global informatization significantly changes the human being as well. [1] The study of the processes of systemic transformation of society and human activity is most often carried out within the framework of interdisciplinary sciences. As the name of one of the sciences investigating computer science at the intersection of a range of disciplines, researcher K.K. Colin proposed the term information anthropology. [2] Mass informatization can be seen as a unique point of bifurcation in the history of society, which marked the trajectory of a new problem field of aesthetics. The presentation of complex problems on the systemic study of man from the point of view of the information approach is reflected in the methodology of research of problems of philosophy of aesthetics in general, and aesthetic culture and aesthetic potential of

society and the individual in particular. The identification of the anthropological essence of semiotic systems involves the identification of the fundamental basis of human existence - spirituality.

## **MATERIALS AND METHODS**

Spirituality as a phenomenon, as a value state of consciousness, as an intellectual and moral - psychological potential of man, which is updated in specific forms of his self-determination, is recorded in an identical concept, which occupies its corresponding place in the system of philosophical concepts. Unlike the philosophy of classical antiquity and the Middle Ages, modern philosophical concepts provide a scientific, secular interpretation of spirituality. At present, the spiritual problem is formed into a relatively independent area of human life with its structure. Therefore, the definitions and categories that characterize the spiritual sphere in the information society can be extended to spirituality.

When determining the essence of spirituality there are various approaches: idealistic and religious, religious and mystical, vulgar-materialist (in the Soviet totalitarian state) in literature within Marxism. None of these approaches, A. Erkayev believes, today does not satisfy us. [3] Man is harmonious. Life biorhythms are defined by laws of harmony. The nature of aesthetic feeling and aesthetic consciousness of man is also based on the laws of harmony. Human spirituality can be seen as a kind of harmony in the sphere of human consciousness.

Spirituality is a complex social system and a peculiar form of worldview consists of four interrelated parts: 1) the functional side of mental representation, worldview and world perception in the form of active attitude to the world; 2) spiritually - esthetic culture as a way (performing folklore) - mythology, songs, poems, the epos, fairy tales, sayings, proverbs, riddles, etc.; Works of decorative and applied art, literature, architecture, fine arts, theatre, cinema, music, Estrada, etc.; Science, religious values, mass information, educational system, recreation, sports, customs and traditions, etc.); 3) will (hardness, perseverance, self-sacrifice, honour, national pride, fear, etc.); 4) spiritual environment - intellectual and emotional.

The sphere of cultural and aesthetic activity, such as art, determines the deepest part, the core of cultural and aesthetic attitude and humanitarian talent. This is because art contains, represents a "golden supply" of spiritual values of mankind. They are not just invested in art but have accumulated for centuries in diverse forms. They are encrypted in a special art form of each work, which requires always meaningful actions of the person of culture to decrypt them according to the laws of this art, skill, self-expression of the author who created this work.

Psychological setting on the search for personal meaning and its reflection in the work, cultural and aesthetic emotionally - the evaluation attitude of the person is a kind of "key" for adequate perception, "discovery" of art. In the formation and improvement of the positive setting on adequate perception, the process of conceptualization in the consciousness of personality of certain cognitive structural-semantic formations - concepts is of great importance. The concept of aesthetic culture is the quintessence of mental representation in the consciousness of man, which contributes to the perception of art at the level of ordinary consciousness. And, on the other hand, a concept is by means of what people - the private, the ordinary person himself enters culture, and in certain cases and affects it. It should be noted that as the patterns of creative activity are realized, the way in which the realities of artistic creation are conceptualized changes. Thanks to this, in the sphere of consciousness, the concepts of aesthetic culture,

characteristic of ordinary consciousness, acquire a new, more perfect form of identification of aesthetic values - categorization.

The creative personality, who has learned the basics of art theory, is aware of the essence of the concepts reflected in the categories "beautiful - ugly," comic - tragic, "sublime - low-lying" Categories of aesthetic culture are not only invested in art but have been identified for many centuries in various forms. Each era puts a new meaning into the content of these categorical concepts.

Aesthetic relations as a spiritual expression of the nonutilitarian interest in objects (natural and anthropogenic) express a person's desire to "communicate" with them in the context of social relations. Personal attitude towards objects of aesthetic value is formed under the direct influence of the system of socio-cultural values, the totality of which forms the spiritual and aesthetic potential of society. The concept of social potential (economic, spiritual, moral, aesthetic, etc.) has recently become particularly relevant and it is no accident that this definition in scientific and popular social and political literature. The reason for the wide appeal to this concept in the philosophy of aesthetics and art history is the need for scientific identification of the main presumption, reflecting objective patterns of formation of aesthetic culture of the individual in the process of development of the system of spiritual and aesthetic values of society.

In the concept of aesthetic school in linguistics (ideological neo-philology), of which Carl Fossler (1872 - 1949) was the founder. The famous linguist notes that "the autocratic queen of philology is aesthetics, all other sciences are auxiliary. Aesthetics is the science of the expression of the Spirit and the purpose of linguistics is knowledge of the Spirit - the only reason for all linguistic forms." Masterpieces of art are created by geniuses, individual spiritual creativity. It is rated by Fossler as "a moment of absolute progress." However, genius personalities need to be reckoned with the surroundings. This creates people's contacts, resulting in collective language creativity. It comes down to imitation and repetition. This is a moment of relative progress in linguistics.[ 5]

Aesthetic education is one of the types of personality education, the purpose of which is to form aesthetic taste, aesthetic attitude to reality, ability to realize its aesthetic potential in all spheres of activity, a manifestation of its bright individuality in artistic creativity. The heart of aesthetic education is exposure to means of art.

Artistic education is a purposeful process of shaping an individual's ability to perceive, feel, experience, love, appreciate, enjoy and create artistic values. Artistic education is closely related to artistic education aimed at mastering the body of art historical knowledge, skills and skills. Artistic and creative development is the purposeful formation of aesthetic abilities and aesthetic potential of gifted personality.

The aesthetic potential of society and the individual is a complex systemic-structural entity that is shaped and functions as a cumulative whole in the mental ring of the sphere of consciousness, super-consciousness and the unconscious. In the global information space, the conditions of life and activity of people change significantly, so the methods of knowledge characteristic of information anthropology - a new scientific direction, which studies the information aspects of human nature. The founder of semiotics Ch.S.Pirs has established three types of sign value, Psychological mechanisms of formation of aesthetic culture are directly connected with the formation of sign structures in human consciousness. The icon signs are based on the actual

similarity (likeness) of the meaning and meaning, which is why the meaning can replace the recognizable meaning. This type of sign contributes to the perception and awareness of aesthetic subjects in discourse "here and now." Index characters (indexes). assume the actual, real-life contiguity meaning and meaning. A turning point in the formation of aesthetic consciousness and potential is the formation of symbolic signs. The character's essence is: That the real similarity between meaning and meaning is established by a predetermined rule. You can only interoperate a sign-symbol by knowing this rule. Professor Yu B. Borev on sensory effects divides signs into audio, visual and audiovisual types.[ 6 ]

In psychology idea of mental (mental) representation as about reflection of some qualities of the outside world was initial. Based on an in-depth analysis of the mechanisms of building mental representations, J. Piage gave a new interpretation of this method of processing information related to the formation of operational structures characterizing the ability to manipulate in mind individual elements of visual impressions, knowledge, available cognitive schemes. According to a well-known psychologist, mental representation "allows to reproduce reality in its entirety and to free the action from slave submission situational" here and now"[7]

The establishment of symbolic signs in the sphere of human consciousness is crucial in the formation of the aesthetic potential of the individual. A special place in artistic art is the creation of a realized world in the form of symbols. A prime example of an artistic image-bearing obvious symbolic content is Layleigh from AlisherNavai 's poem "Laylei and Mejnun." Layliei is not only an actor but also a symbol of pure beauty at the same time. However, "pure beauty" is again a symbol, though more intellectual. The meaning of it becomes more understandable if you remember that Navai found it possible to liken Laylie to a symbol of spiritual beauty and perfection. To fully understand the harmonious combination of body beauty with moral perfection, it is necessary to understand the essence of the symbolic designation of this image. It is clear here that the explanation of the meaning of the symbol inevitably leads to new symbols that are not only unable to exhaust its full depth, but also require clarification.

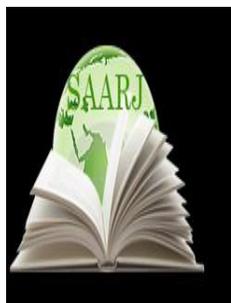

## CONCLUSION

Therefore, the purpose of aesthetic education today is to form the aesthetic culture of man in the context of information anthropology, focusing on the harmonic combination of the feeling of the beautiful with the moral perfection of the individual. The basis of aesthetic education should be the ideas of humanism, which involve shifting the meaning emphasis of education from the development of the external (directed to the external world and implying its subordination and consumption) to the development of the internal potential, that is, the development of the individual, her higher spiritual needs.

### ABSTRACT

*Resolutions and decisions of the Government of the Republic of Uzbekistan, which are the basis for maintaining the state cadastre of roads, its implementation, procedure and composition, application techniques and technologies, research methodology in innovative methods, remote sensing design, geospatial database The suggestions are covered in the article.*

**KEYWORDS:** *Geo information System (GAT), software, Arc GIS, Agisoft MetaShape, thematic layers, database, attributes, state geodetic networks, planned elevation feeds.*

## INTRODUCTION

The Law "On State Cadastres", the Resolution of the Cabinet of Ministers No. 66 of February 16, 2005 and the State Committee for State Geodesy and Cadastre of 2014 № 2618 The structure of the data of the state cadastres belonging to the unified system of cadastres and the procedure for their submission” is the basis of a number of legislative acts.

Statistical data on the attributive and geographical location of highways are required for the maintenance of the state cadastre of roads and the implementation of design developments. The existing highways in the country are divided into types of roads of international, state and local significance. Highways of international importance include M34, M37, M39, M41, A373, A376, A377, A378, A379, A380 and A381, with a total length of 3979 km. The total length of state roads is 14069km, and local roads are 24606 km. In total, the length of roads classified by international, national and local importance is 42,654 km.

## MATERIALS AND METHODS

Methods of comparative analysis, study and nationalization of foreign experience, studying and orientation of computer software capabilities, historical, logic and generalization methods were used in the article.

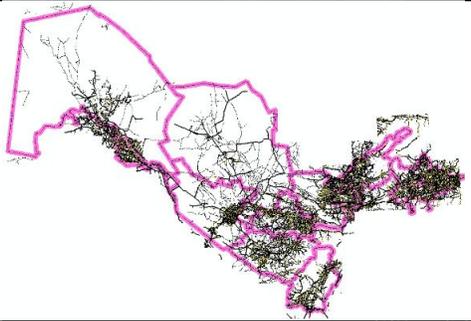

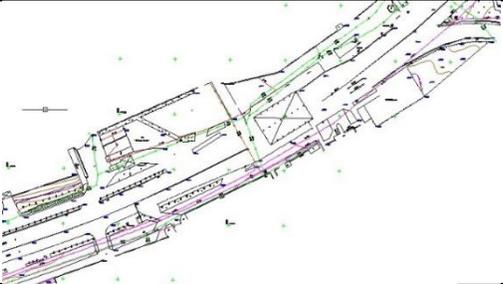

**The problem.** There are cadastral passports of all types of roads in the territory of the Republic, and in several types of software, drawings on the location of the road are formed. Paper cadastral passports and drawings in various formats by several organizations are not systematized. In addition, it is not projected into a single state coordinate system. Although all highways have topographic plans with electronic geographic location, they are not at the level required for interactive service to the government.

**Offer.** Taking into account the geographical location of the country, the development of a network of modern roads is a priority task in increasing the competitiveness of the economy, developing the transport potential of the country and expanding export opportunities. Based on the above-studied problems, it is expedient to initially form a nationwide generalized geospatial database of highways on a small scale (1:50000). It is then proposed to gradually upgrade to a geospatial database of major highways on a 1: 2000 scale. In general, the formed highways allow obtaining the required analytical results quickly and transmitting information to the relevant organizations.

**Mechanism.** The sequences listed in Table 1 below are recommended for targeted work organization and high results

**Table 1**

№	Steps	Explanation
1	Creating a generalized geospatial database of highways	

2	Download the basics of space photography of existing roads in the country	
3	Vectorization of highways at a scale of 1: 50000 and input of attributes	
4	Transformation of topographic plans on a large 1: 2000 scale into a geodata database	
5	Ensuring the integration of all topographic and geodetic works performed in the regions into the geodata database	

Targeted organization of the mechanism by a higher organization and integration of the results of all ongoing topographic and geodetic field surveys in the regions into a geodata database form the basis for the formation of information on the road in one system. Based on the above procedures, it is now necessary to form a database by production organizations. This process is updated mechanically every season (Figure 1).

**Figure 1. Integration of space and topographic maps.**

In addition, the visual data will not be complete because the state cadastre objects of highways do not consist only of the road itself. Roads consist of the following thematic layers:

- general view of highways;
- highways;
- artificial structures;
- objects of regulation and equipment;
- road intersections and junctions;
- protective structures;
- buildings and structures.

## **RESULTS**

High efficiency can be achieved as a result of automation and modulation of this process. This requires field research to be performed using a GPS device or electronic taximeters and coding in ArcGIS. Once the mechanism is up and running, it will be possible to use a wide range of geodatabases. Take, for example, the loss at the Sardoba Reservoir. Within 5 minutes after the announcement of the flood, it will be possible to draw analytical results based on the constructive type of roads, traffic intensity and the date of reconstruction in the geodata database. Based on the results, the analysis performs analyzes such as the most optimal way to evacuate the population and the most optimal way for special teams to enter the scene to eliminate the risk and provide high-precision data (Figure 2).

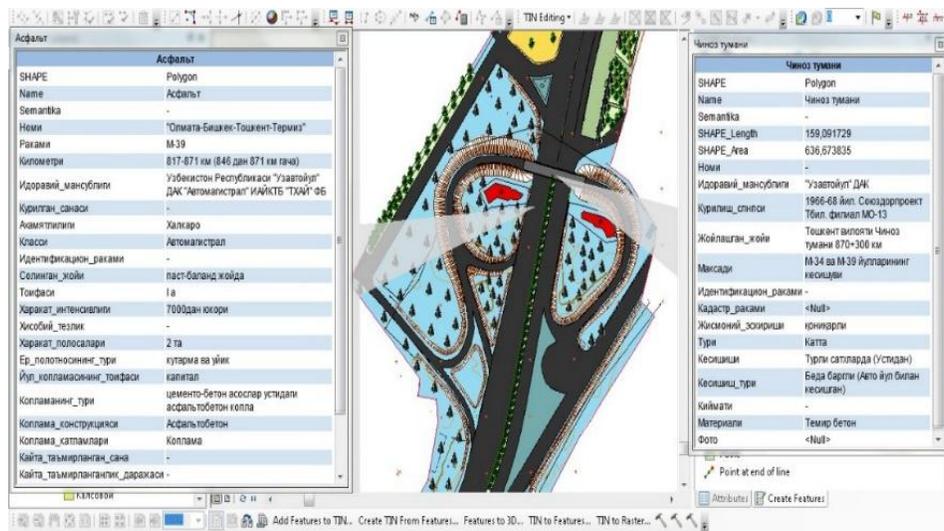

Figure 2. Highway filled in attributes in ArcGIS.

Prospects. Based on the attributive data of the thematic layers of highways in the geodata, we will be able to analyze the date of reconstruction or the information about the road that will be needed in the implementation of road projects. In addition, it will be possible to create a cartogram of land surveying and visualize the area in three dimensions. With the help of thematic layers in the geodata created for the study area, a three-dimensional dome of the highway was viewed and widely used by experts in the implementation of road design work. In particular, it is widely used in solving problems such as identification of residential and non-residential areas built in the protection zone of the highway and the protection zone belonging to the highway, orientation to state geodetic networks or planned elevation networks (Figure 3).

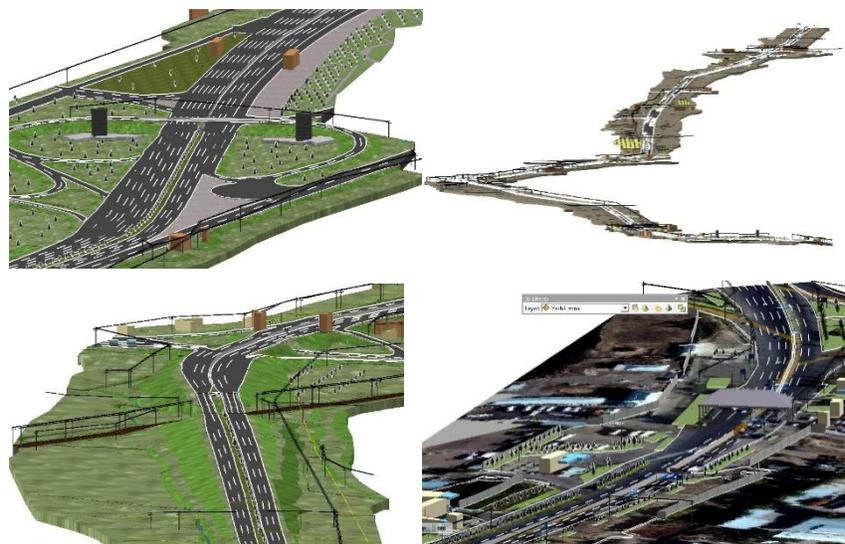

Figure 3. A three-dimensional model of a highway

In particular, it will be possible to explore the area not only in space photography but also on the basis of data obtained from the drone device to obtain high-precision metadata. Drone-assisted aerial photography can be used to study the area topographically and geodetically and to create a three-dimensional model (Figure 4).

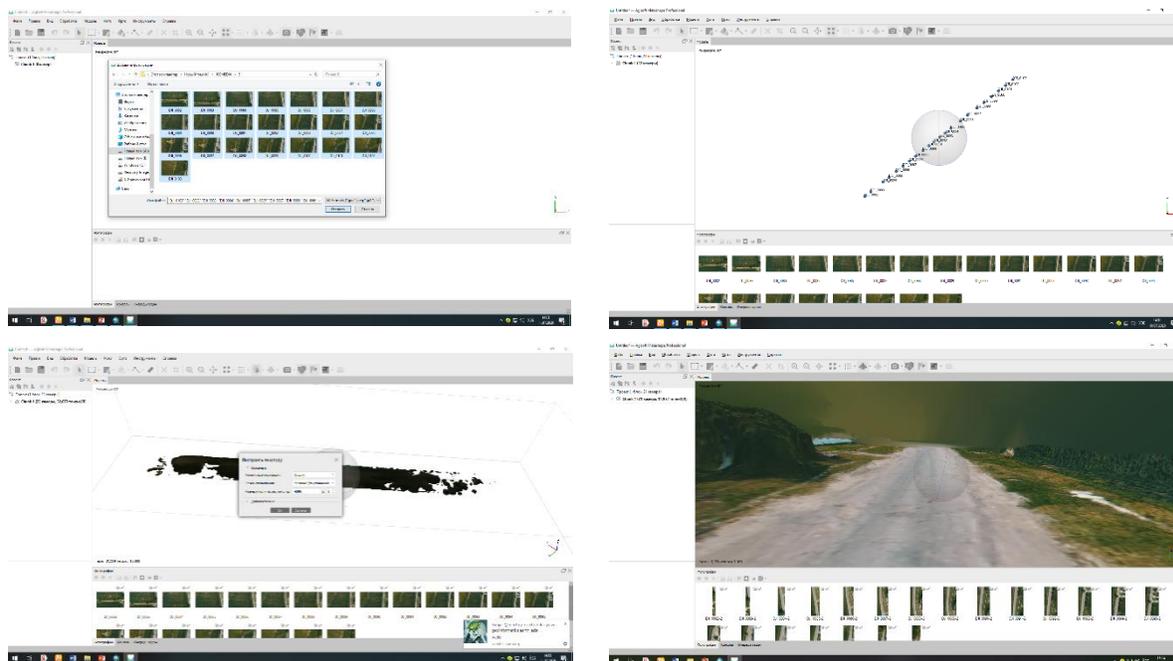

Figure 3. Three-dimensional (3D) model of the highway

## CONCLUSIONS

Electronic digital accounting of roads, construction of roads and the creation of modern toll roads announced by our government in the tender will provide foreign investors with a visual image. In addition, road tourism will be strengthened, as in developed countries. Most importantly, it provides analytical conclusions based on the theory of orthodromics and loxodromy on issues such as evacuation of the population through predictions in the event of various natural disasters.

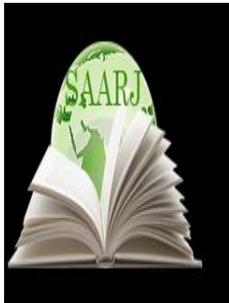

## ACKNOWLEDGEMENTS

We thank the research director A.Inamov and N.Ergasheva for their help for translate into English.

### ABSTRACT

*Coronavirus or COVID-19 (SARS-COV-2) is very popular word among all as a deadly and infectious disease in the world. It is spreading through droplets of saliva or discharge from the nose when an infected person coughs or sneeze. It also spreads through the non-tangible objects that has virus on it, if someone touches it and touches their eyes, nose or mouth. The best method to prevent this disease is social distancing, sanitization, and stay at home and use of mask. The World Health Organisation(WHO) have declared it as pandemic. To restrict the spread of this disease different nations have declared shut down or lock down the entire country and closes all the educational institutions and other activities. Sudden declaration of the lockdown, gives importance to online learning resources and its providers. The national, international, and private educational bodies give more importance to online learning. Online learning has widened the scope of education and transcend it beyond classroom boundaries. This online learning technology is more transparent and does not discriminate between the front and back bench student. Digital learning can be possible when the society will be switching from the*

*traditional to the modern digital world and it creates lots of e-content. The enrolment of the MOOC Courses has been increasing at the accelerating rate within the last three months. This articles gives information about the different online learning platforms which are helping to the students, teachers and parents to learn the different subjects through the online in India and aboard. It also explains the importance, limitation of online learning.*

**KEYWORD:** COVID-19, Coronavirus, Online Learning, MHRD, AICTE, UNESCO, IGNOU, World Bank,

## 1. INTRODUCTION

The word *Coronavirus* or COVID-19 which was come back to light on December,31st,2019, when China informed to WHO relating to a case of pneumonia which was out broke in the city of Wuhan city in Hubei province, then it was spread to the other part of the world. The WHO declared it a pandemic. This virus has been named as SARS-COV-12 and disease now called as COVID-19. The coronavirus is zoonotic means they are transmitted from the animals to humans and this virus transmitted from bats. (The Hindu,2020). This virus was first discovered in the 1930s, when the domestic chickens were facing the infectious bronchitis virus in Dakota. In 1960 human coronavirus was discovered and it were studied on human patient who were suffering from the common cold. (Wikipedia).

World Health Organization (WHO) mentioned Coronavirus is an infectious disease caused by a newly discovered coronavirus and declared it as pandemic. The infected people with this virus have mild to moderate respiratory illness and needs special treatment. *It is spreading through droplets of saliva or discharge from the nose when an infected person coughs or sneeze. It also spreads through the non-tangible objects that has virus on it, if someone touches it and touches their eyes, nose or mouth.* Medical professionals are doing researches to develop its vaccine and medicine. “Stay at home, maintain social distancing, maintain clean and hygienic life, wash hand frequently with soap, use medicated alcohol-based sanitizer, use mask and globe, avoid touching eyes, nose and mouth, practice repertory hygiene.”

To prevent it, Government of affected nations have closed all the educational institutions, and declared forced holidays to their students and staff unexpectedly. Because of this they have not completed their courses, examination, and other academic activities in time. To complete the courses, all are adopting online classes, and providing online study materials, live classes to their students by using the different online tools. The national and international organizations are giving more importance to online learning because it covers to all the students even in the remote areas. It increases the self-learning among the students and they can learn at anytime and anywhere, it creates a new educational environment in the dynamicworld. It works as a good panacea at the time of crisis.

## 2. Statement of the Problem

Before the lockdown, the online learning and its resources are considered as a secondary source of learning. No doubt, the government, and other service providers are giving importance to it, but it was neither so highlighted nor popular. All are giving more importance to the regular mode of education or classroom education only. But this pandemic has changed the importance of online learning and its related tools. It gives a new flavour to it. Because of the lockdown or

declaration of the holiday, all the educational institutions of the affected countries are closed and follow the “Stay at home” principles to avoid the spread of the coronavirus. The ideal mind is the devil, so to engage the students time properly and fruitfully, the educational institutions are using the online platform, online tools, supported software, and doing the online classes, online seminars or webinars, and other online services for their students. Students are away from their classroom teaching due to pandemic, it is only online learning is the best solution to provide the education to the student.

### **3. Need of the Study**

In the present scenario all the students and teachers are staying at home to prevent the coronavirus and in maximum affected nations have been declared holiday to their students. All the academic institutions from the school to university are trying to provide education to their students through the online learning mode. E-resources are the only solution for it. Government and so many private agencies are started their works on it. In the present scenario only the online learning platforms and online learning resources play a vital role in the academic environment. This article gives importance to different online learning and it uses during this pandemic.

### **4. Objective of the Study**

The main objectives of this study are

1. The online learning resources help to the students during this pandemic in India and around the globe.
2. Explain the different online learning resources and their importance in pandemic.

### **5. COVID-19 and India**

Government of India and state governments are taking all necessary and effective steps to combat the effect of the coronavirus well in advance. The people of India have also well supported the government decisions and follows the rules and regulations declared by the government from time to time. The most important factor in preventing the spread of the virus locally is to empower the citizens with the right information and taking precautions as per the advisories being issued by the Ministry of Health & Family Welfare. (mygov.in). The best method to prevent this disease is social distancing and sanitization.

The government of India on 17th January,2020 had released an advisory travel to travellers who visiting China. After that government have been issuing different advisory to the travellers from time to time and it has been taking so many efforts to control the spread of this coronavirus in India. On 19th March,2020 Hon’ble Prime Minister Sri Narendra Modi addressed to the nation relating to combat the COVID 19 and requested to the citizen of India to support the people curfew or Janata curfew from 7 a.m. to 9 p.m. on 22nd March, 2020. People curfew means curfew imposed for the people, by the people, and on the people themselves. The honest citizen of India followed it very peacefully. He mentioned in his speech “This people’s curfew will in a way be a litmus test for us, for our nation, this also time to see and test how prepared India is for fighting off a corona like global pandemic”. After successful of Janata curfew on 23rd March,2020 Hon’ble Prime minister declared 21 days’ lockdown in the entire country from 24th March,2020 to 13th April,2020 which come into force at midnight local times. He mentioned “To save India and every Indian, there will a total ban on venturing out of year homes.”

Government of India by considering the different factors it has extended the lockdown from 14th April, 2020 to 3rd May, 2020. The government requested its citizen stay at home only, maintain social distance use masks when going outside, and taken maximum no of steps to combat the COVID-19. On 1st May 2020 again government increases the lockdown for more fifteen-day i.e. up to 17th May, 2020 but classifies the areas into green, orange, and red zone, it gives some liberal to the green zone and put some restriction to the orange and red zone. The fourth phase lockdown has been started from the May 18<sup>th</sup> with some guidelines issued by the central government.

## **6. COVID-19 and International Organisation**

The Coronavirus or COVID-19 affects more than 200 countries of the world badly. Some developed countries like the USA, Russia, France, Italy, China, Germany, the United Kingdom, and others are seriously suffered from this virus. International agencies like United Nations Educational, Scientific and Cultural Organization (UNESCO), World Health Organisation (WHO), International Mutual Fund (IMF), United Nations (UN), International Labour Organisation (ILO), World Bank, and others have given importance to combat the virus from the different part of the world. All the affected countries have been taking different initiatives for their people. They declared full or semi lockdown, shutdown and other methods to control the spread of virus. All the state has unexpectedly declared holiday to all the educational institutions and other units of work.

## **7. Online Education: India and Aboard**

The important pedagogy in digital learning is developing an important link between course content, educationist technology, and course takers. This online learning technology is more transparent and does not discriminate between the front and back bench student. Digital learning can be possible when the society will be switching from the traditional to the modern digital world and it creates lots of e-content, it means content in the electronics form. The main goal of the e-content is to create, receive, share, and utilized information and knowledge for the development of the economic, social, and upliftment. The e-content should be technologically friendly, learner's centric, teacher's friendly, employing learner-centric, pedagogy self-evaluative and there must be object-based learning-content creates a virtual reality where there is no gap between the teacher and taught. The digital learning has so many synonymies like e-learning, webinar, electronic training, distance learning, on-line course, on-line training, networked education, tele education, networked education, virtual learning, web-based learning. It is considered to be a relatively cheaper mode of education in terms of the lower cost of transportation, accommodation, and the overall cost of institution-based learning. (Dhawan, Shivangi, 2020).

Besides the pre-recorded materials there is another specific type of distance learning i.e. Synchronous online class or synchronous communication, in which face-to-face and remote students receive instruction together at a real-time. It helps both teachers and students to contact each other through online. Maximum no of the educational institution has been adopting this communication as digital learning during the pandemic. But the only disadvantage is the lack of online infrastructure. This lockdown has accelerated the adoption of digital technology and digital India vision of the government is emerging as a vital instrument for solving the present

crisis due to COVID-19. It changes the teacher's centric education to student-centric education and it develops a technology-centric education. (Economic Times Blog, April,15,2020).

The online education is the ultimate solution to provide education to the children for fighting against the Coronavirus by stay at home. More than 1.5 billion students are affected by school and university closures due to the COVID-19 outbreak, so remote learning or online learning mitigate the immediate disruption caused by COVID-19 and it establishes to develop a more open and flexible education system in future. UNESCO in its circular mentioned so many platforms as acts as a distance learning solutions aims to help parents, teachers and school administrator and University of Cambridge launches a global learning platform "The Learning Passport" to help the children and youth who are badly affected by COVID-19 to continue their education at home. On 24th February,2020 Duke university is the Ist University draw Massive Online Courses (MOOC) in response to novel coronavirus and its leaders shifted all teaching online to respond to the spread of infection in China. (edusurge.com).

The World Bank working with different countries to provide the distance learning education to the student and teachers during this pandemic. In Argentina Educ.ar creating digital resources for teachers, administrators, students, and families. In Austria, an e-content platform Eduthek developed to provide online to school and kindergarten. Bhutan launched an e-learning program for its student on 27th March, 2020. Bulgaria launched an e-learning system on 16th March,2020, and nearly 89% of students enrolled in this e-learning platform. Chile hosts the Aptus platform for the digital learning, in China on 9th Feb.,2020 million primary and secondary school students started their new semester online. The ministry launched an initiative entitled "Ensuring learning disrupted when classes are disrupted". Colombia started quarantine on 16th March,2020 and the academic calendar was adjusted and the students have accessed the e-content from "a Prender Digital" a platform of ministry of education with more than 80000 digital content. Croatia provides digital education and develop a website "school for life" for the school student. Chez republic launched a website "distance learning" on March 21 for the students and teachers. Ecuador develops a guide for the teachers, Egypt implemented distance learning education on March,15th and they extended the access to Egyptian Knowledge Bank for the student and it had contracted with Edmodo for online learning. France provides access to "ela Maison" (My Class at home). Jamaica, Italy, Japan, Jordan, Kenya, and other countries are also developing their distance learning platforms for their student, teachers, and parents. The UAE provides free online education to its student with digital teaching platform i.e. madrasa.org.

All the educational intuitions have declared an unexpected holiday to their student and staff because of coronavirus. To provide the education to the learners, in India all the central and state government agencies like University Grant Commission(UGC), All India Council for Technical Education (AICTE),Ministry of Human Resource Development ( MHRD), Council of Board of Secondary Education(CBSE), National Council of Educational Research and Training (NCERT), Medical Council of India(MCI), Indian Institute of Technology (IIT), national Institute of Technology (NIT), Different universities and the different state government education department have encouraged for the online education to the students, teachers, and public. Online learning has widened the scope of education and transcend it beyond classroom boundaries. It reduces the ancient education system and reduce the inequalities in our system and transform our country into a true digital online learning economy. Learning act as a great supporting instrument not only to the student but to the teacher across the globe. The online

teaching tools facilitate the incorporation of self-learning methods. (Martínez-Jarreta, et al., 2009). With the customized learning modules teachers and students are acquiring knowledge through the online learning or e-learning platform. Online learning is an alternative space to learn hand on, industry-specific tools from the industry leaders. (Dalporto, G.,2020). To provide good online education to the student a good pedagogical and technical knowledge is more importance, it needs a rigorous quality management programme and its continuous improvement is highly required to overcome this type of crisis.

Before COVID-19, the growth of the online tools is high and reaching US\$ 18.66 billion in 2019. and it is projected to reach \$350 billion by 2025. There is a significant growth of it because of the pandemic. Byjus has seen a 200% increase in growth (Miral,Mohit), in Wuhan around 81% of the students are attending classes via the Tencent K-12 online school. Lark, a Singapore based collaboration initially developed by ByteDacne as an integral tool and offering teachers and students unlimited online videos and conferencing and other facilities in Singapore. Alibaba Cloud part of Alibaba distance learning solution deploys more than 100000 cloud servers in just two months for providing online resources to its users.BBC also encouraging the virtual learning Bitesize daily launched on 20th April,2020 offering curriculum-based learning for the Kids in the UK. The ongoing pandemic has increased interested online education; MOOC provides have seen a drastic growth, Coursera has over 10 million course enrolment over the last 30 days, a 644% increases compared to last year. EdX enters into 1000 top websites of the world. (classcentral.com). Mountain 101 one of the best online courses of all time reported a 300% increase in enrolment. Dr. Barbaba Oakley who takes the popular MOOC i.e. Learning How to Learn Started that within the last two weeks more than 65000 learners have joined the course. (classcentral.com)

In India, during this pandemic on 18th March,20th March and 27th March both UGC and MHRD have circulated the notice regarding the online learning tools or platform where the learner can spend their time fruitfully. Hon'ble HRD Minister of India Sri Ramesh Pokhriyal Nishank has appealed to the student to take advantage of the different online learning platforms and utilize their valuable time on learning and make it optimum use. The National Law University, Delhi has launched E-library for providing the e-resources on legal to its students and the legal industry during the lockdown. It also developed a guide to open online resources (Live Law, 2nd May,2020). Different department of the different institutions of affected countries have been conducting the webinar and different online training programme for the different types of learners.

To provide the information on COVID-19 the Govt. of India has launched an app i.e. Arogya Setu and advised all to install it in their mobile app to know the latest information about the coronavirus. It also launched a website COVIDgyan, it is a multi-institutional, multilingual science and communication initiative taken for develop a repository on coronavirus. The main theme of this initiative is to create, curate and communicate scientifically credible and authentic COVID-19 related content and resources. This website covers the science as well as guidance for health and wellbeing.

Hon'ble Finance Minister Nirmala Sitharaman in the fifth and last tranche of Rs. 20 lakh crore packages of Atmanirbhar Bharat Abhiyan, she informed that to boost the online education, government will launch PM e-Vidya programme immediately for multi-mode access digital

education. Under this programme there will be 12 DTH channels introduced which will be dedicated to each class. She mentioned that the top 100 universities which includes IITs, IIMs, Institute of Eminence and national institute will be permitted to start online courses by May 30. She mentioned about DISKHA and students who do not have access to internet. Radio, community radio and podcasts would be extensively used for the same.

### **8. Digital Learning Tools-UNESCO**

To utilize the lockdown time appropriately and productively the educationalist, the publishers, experts, trainer, and other eminent persons and different educational institutions have been organizing the virtual workshop known as webinar, Quiz, and online classes from their home. The government agencies have been encouraging by publishing the different circulars from time to time for online classes to their student and research scholars. Maximum no of the universities, colleges, and schools have followed it. They are doing this by using the different free and paid software.

UNESCO and other agencies have suggested different tools for the online learning during this pandemic.

- Digital learning management system: Century Tech, Clasdojo, Edmodo, Edrakk, EkStep, Google classroom, Moodle, Nafham, Paper, Airplanes, Schoology, Seesaw, and Skooler.
- Systems built for use on basic mobile phones: Cell-Ed, Eneza Education, Funzi, KaiOS, Ubongo, and Ustad Mobile.
- System with strong Offline Functionality: Kolibri, Rumie, Ustad Mobile.
- MOOC Platform: Alison, Canvas Network, Coursera, European Schoolnet Academy, Edx, iCourse, Future Learn
- Self-Directed Learning Content: British Council, Byju's, Code it, Code.Org, Code week, Discovery Education, Duolingo, Feed the Monster, Geekie, Khan Academy, KitKit School, Labxchange, Mindspark, Mosoteach, One course, Polyup, Quizlet, Siyavula, YouTube.
- Mobile Reading Applications: African Storybook, Global Digital Library, Story Weaver, Worldreader.
- Support Live Video Communications: DingTalk, Lark, Hangouts Meet, Teams, Skype, Zoom
- Tools for teachers to create digital: Thinglink, Buncee, Edpuzzle, Kaltura, Nearpod, Pear Deck, Squigl.
- External Repositories for distance learning solutions: Brookings, Common Sense Education, Commonwealth of Learning, Education Nation, EdSurge, Global Business coalition for education, Keep Learning Going, UNHCR.

School closures widen learning inequalities and hurt vulnerable children and youth disproportionately. We have a special responsibility to ensure continuity, inclusion, and equity for all students. In the world 90.2% of the world's student population affected by school closures, 1.57 billion learners out of school, and 191 countries affected by social closures (UNESCO, 2020).

## 9. Digital Learning Platforms in India

Following are the list of online learning platforms in India and learners are learning the different concepts at their home and follow the discipline principle of COVID 19 i.e. Stay Home and Stay Safe by using these platforms.

### a. SWAYAM

Study Web and Young Aspiring Mind (SWAYAM) is the most popular, highest enrolled users, and the largest online learning platform in India. It provides the different online courses or MOOC courses to all levels of learners i.e. From the school level to the Postgraduate level. To facilitate the learners during this lockdown time, the SWAYAM content can be access without registration, earlier it was mandatory. It has been found that about 50,000 people have accessed SWAYAM since 23rd March 2020. More than 25 lakh learners enrolled in 571 courses of January 2020 semester under SWAYAM. It is a world's vast repository of 1900 courses of the different disciplines and being accessed by the 60 countries people. The significant majority is from India and the other countries include the USA, UAE, Germany, Nepal, Singapore, Canada, United Kingdom, and Australia. This program is initiated by the government of India and designed to achieve three main principles i.e. access, equity, and quality. It seeks the bridge the digital divide for students. It creates a digital learning revolution in India and the great success of the Digital India program. It provides the courses on engineering, secondary and Presecondary courses, diploma and certificate courses to the learner at free of cost. For certificate it charges the very minimal prices. After qualifying the requisites learner will get the certificate. Universities and colleges approving the credit transfer for these courses and they can use it for qualifying the main examination. Even some universities make it mandatory for the research scholars to enroll some MOOC courses under it during the course work. SWAYAM 2.0 is more interactive and technically advance compare to the previous one.

URL : <https://swayam.gov.in/>

### b. E-Pg Pathashala

E-Pg Pathashala is a high-quality curriculum-based e-content containing 23000 modules in 70 no of the postgraduate courses in the different disciplines. It contains both text and video materials. It is developed MHRD under its national mission on education through the ICT being executed by the UGC. It maintains the three projects i.e., E-Adayan(e-books), UGC MOOCs, and e-pathaya (offline access). It also facilitates offline access till 21st April, 2020 it has 20000+ e-text, 19000+ videos, 3200+ experts, 3000+ quiz on 70 subjects, and 723 no of papers.

URL: <https://epgp.inflibnet.ac.in/Home>

### c. SWAYAM PRABHA

The SWAYAM PRABHA is a group of 32 educational channels telecasting continuously or repeatedly the different concepts on the different subjects using GSAT-15 satellites. It telecasts a high-quality educational program on a 24x 7 basis. The contents are developed by NPTEL, IITs, UGC, CEC, IGNOU, NCERT, and NIOS. The INFLIBNET Centre maintains the web portal. The different channels of SWAYM PRABHA telecasts curriculum-based courses from school education to postgraduate level covering the different disciplines such as art, science, commerce, arts, social science, humanities, engineering, technology, law, medicines, agriculture and many more. Curriculum-based courses that can meet the needs of life-long learners of Indian citizens

in India and abroad. It assists the student who is preparing for the different competitive examinations. Till 21st April, 2020 It has 32 no of channels and covers 242164 no of the titles. Now these channels are available not only DD or DTH but in the Jio TV app, in Videocon channel no 476, Airtel Digital-438, TataSky, and DishTV-497 are telecasting the programs of the SWAYAMPRAKHA. During the lockdown the Kendriya Vidyalas and Central schools are following the online courses prepared by the NIOS and NCERT. Three channels i.e. Channel no 27(Panini), 28 (Sharda), and 31(Kishore Manch) make it mandatory to all the TV telecaster in India during the lockdown to encourage the online learning. It also telecast the content for the Dibrang student which is one of the rare features of it.

URL: <https://www.swayamprabha.gov.in/index.php/>

#### **d. Consortium of Educational Communication (CEC)**

The Consortium of Educational Communication(CEC) is one of the inter-university centres set up by the UGC. The main goal of this consortium is to fulfil the need of higher education through the powerful medium of television with ICT. It was started in 1993 as a nodal agency to coordinate, guide, and facilitate the different educational production at the national level. Today totally, 21 media centres are working under the umbrella of CEC. It provides UG and PG MOOC courses through the SWAYAM platform. It has developed more the 400 MOOC out of which 327 courses have been offered by SWAYAM. More than six lakh students have registered. Around 100 no of UG and PG courses are scheduled on the SWAYAM platform from Jan-June, 2020. It has undertaken three projects i.e. SWAYAM, SWAYAM PRABHA and NME-ICT, VYAS channel, CEC MOOCs, Open education resources, today in History, Flipped, and YouTube channels.

URL: <http://cec.nic.in/>

#### **e. DHRUV**

DHRUV is a Pradhan Mantri innovative learning program initiated by MHRD. The main objective of the program is to allow students to realise their complete potential and contribute to society. This program covers two areas i.e. science and arts. This program is launched by ISRO. DHRUV program represents the true spirit of Ek Bharat Shreshtha Bharat. It acts as a platform to explore the talent of outshining and meritorious students, help them achieve excellence in their specific areas of interest may it be science, performing arts, creative writing, etc.

#### **f. NPTEL**

National programming on Technology Enhanced Learning(NPTEL) is an initiative by IITs and IISc Bangalore for creating course contents in engineering and science. The contents provided by the NPTEL are based on the model curriculum suggested by AICTE and adopting the syllabi of major affiliating universities in India. The course content providers by the NPTEL are very useful for teacher to improve the quality of education. The course materials both web and videos are freely accessible by everyone through the SWAYAM and through its own website. Presently, it is one of the largest repository in the world of course in engineering, basic sciences selected humanities and basic sciences. It also provides the online courses along with certificates since 2014. More no of the students are using platform for preparation of GATE examination and higher studies. It also makes partner with more 3500+ colleges and start NPTEL Local Chapters

and each college have coordinator to promote the NPTEL courses in the college. Recently, it has taken so many initiatives like laboratory workshop, internship, soft skill workshop for improving employability, support to attend the technical conference, analytics of the data accrued, continuous portal development and translation of English transcript to NPTEL video.

URL: <https://nptel.ac.in/>

#### **g. National Digital Library (NDL)**

COVID-19 lockdown not to affect your study, study through the National Digital Library(NDL). The resources of NDL can be assessed without login but it is advised to better to register. It provides different learning resources relating to different subject domains i.e. school, under graduate in engineering, science, language, management, law, computer science...many more subjects.NDL hosted 47,917,213 items and it is increasing rapidly.

The NDLI-COVID-19 research resources repository is a single window to access the different research resources which support to researchers, academician, innovators, incubators, entrepreneurs, social scientist and different professionals of the different domains. This repository contains scholarly publication, data sets, documents and videos, journals and conferences, ideas and funding and different challenges and start-ups declared by the different government and private agencies relating to coronavirus.

The NDL's COVID-19 repository is growing with passage of the time and it also invites the contributors to contribute for the enrichments of this repository.

URL: <https://www.ndl.gov.in/corona-research>.

#### **h. DIKSHA**

DIKSHA is a national digital infrastructure for our teachers. During this pandemic time government of India and states encourages to use this portal to provide online learning resources to the students, teachers and parents. It is one of the most important concepts of PM E-Vidya initiative of dept of education. It provides learning materials to student, teachers and parents. Almost every state and Union Territories(UT) are using this platform for augmenting learning and teaching activities. Presently, it has been covered 80,000+ contents of the different subjects of different grades. It provides contextualized content in 18 languages. Anyone can be accessed it at free of cost.

It can be accessed with the help of the below mentioned URL.It provides the QR Code in every content can be accessed by scan it. Through this platform a user's can explore the materials of NCERT, CBSE and other state boards digital books. As on dated 12th October,2020 the dashboard mentioned that totally 60,33,37017 learning session have been conducted. A user can access the content by its app also.

URL:<https://diksha.gov.in/explore>

#### **i. National Education Alliance for Technology(NEAT)**

NEAT is a government of India's portal and AICTE as act as an implementing agency of it. It is developed for skilling the different learners in the recent technology through the public private partnership (PPP). It is a portal for quality digital teaching solutions and developing the innovative products relating to education. The products are providing under the NEAT have high demand and very helpful to the learners for employability. Any learner may be register on this

portal and learn through the digital mode, some courses are paid basis and some are free. Codetantra is a registered organisation provides different computer programming languages free of cost during the COVID-19 for the specific period of time only. Even students under “Free Seat Scheme” of AICTE nominated by the respective educational institution at free of cost.

The different agencies who are providing the different technical and other courses to the learners through the NEAT are Letzconnect which develops the virtual university, ek.class, LearnEngg, Codetantra, eBox, TalentRank, WileyNXT, Englishbolo, Career Path Navigator (Training Recommendation and intervention), Embibe, aspiration.ai and Upgrad.

It is a single educational platform for the different learners which brings the best technological products using Artificial Intelligence for the customised learning with high motto of develop employable skills. This is a pilot project launched by Ministry of Education for the AICTE approved Government colleges of India only.

URL: <https://neat.aicte-india.org/>

#### **j. All India Radio (AIR)**

During this lockdown the All India Radio(AIR) telecast three hours programme daily in different subjects for the students. AIR broadcasting the virtual classes to aid the students during the lockdown. Student can download the AIR mobile app to listen to the classes through their mobile phone. It telecast the different content through their regional channels across the country on TV, radio and YouTube. Mukta Vidya Vani (MVV) is an open education radio facility provide by AIR to the students for better learning. The previous telecast also available round the clock on NIOS website at <https://nios.iradioindia.in>.

Another imitative of AIR is Radio Vahini FM 91.2 MHz, it is a community radio station which provides the education to the dropoutstudents, learners who are enrolled through the ODL.It also provides education to the urban women and others people of the society who are unable to attend the regular class during the normal time.

Shiksha Vaani is an intitative of CBSE which is available Android App store.It also covers the various subjects of secondary and senior secondary level, it is also available both English and Hindi language. More than 400 audio files of NCERT curriculum are available on Shiksha Vaani.

AIR silchar decided to join hand with Secondary Education Board of Assam(SEBA) to take lectures to the students who are not able to attend the regular classes. In Andhra Pradesh the Education minister declared that “Tune into AIR for EAMCET tanning” from Akshvani Vijayawada centre from 10.30 a.m. to 11 a.m. form April,16<sup>th</sup>, 2020.DD Saptagiri is more popular channel in the Andhra Pradesh which telecasts the different educational programme in Andhra Pradesh. In the Leh and Ladhak, around 200 schools are using the AIR for the online learning. The AIR archives is the rich repositories of India for the different materials telecast in the AIR.DD Bihar name the educational programme i.e. Mera Doordarshan Mera Bharat which makes it more patriotic and more popular.

URL:<http://allindiaradio.gov.in/>

#### **k. Indira Gandhi National Open University**

Indira Gandhi National Open University(IGNOU) also develops the different online platforms for its enrol students and the other learners too. It has its own six no of the high quality platforms which provides different courses. The six platforms are Gyan Darshan, Gyanvani, Gyandhara, Interactive radio counselling (IRC), Shakhat and You Tube archives or E gyankkosh

URL:<http://www.ignou.ac.in/>

#### **i. One Nation One Digital Platform**

One Nation One Digital Platform is an integrated (Class I to PG level) e-Content portal which provides facility to search and browse all hosted content or metadata of other hosted content wherein a learner can easily access the desired material including audio/video learning material, textual material, multimedia enriched materials etc. It is developed by the INFLIBNET and it is a dream project of Ministry of Education to make one nation one program. It provides the different learning resources to the higher, school and teacher education. It also accelerated hands on learning with E-yantra, fossee, spoken tutorials and virtual lab.

In India, different central and state educational agencies like Ministry of Education, UGC, AICTE, NCERT, CBSE, state education departments and others private agencies are encouraging to the students to stay at home safely and learn through the online mode only. They are providing the different portal's information through the public notice, social media, news Paper advertisement and other methods. Besides these above platforms so many apps other platforms like Shodhganga, Shodhgongotri, NISTHA.Vidya Mitra, Virtual Labs, FOSSEE, Spoken Tutorial, e-Yantra, Oscar++, E-Kalpa, SAKSHAT, ATALAcademy, Youth4Works, National Knowledge Network... are providing the different concepts to the learners in the different modes.

URL: <http://odp.inflibnet.ac.in/index.php/main/latest>

#### **m. National Repository of Open Educational Resources (NROER)**

National Repository of Open Educational Resources (NROER) is a collabotary platform Initiated by the Department of School Education and Literacy, Ministry of Human Resource Development, Government of India and managed by the Central Institute of Educational Technology, National Council of Educational Research and Training, the Repository runs on the MetaStudio platform, an initiative of the Gnowledge Labs, Homi Bhabha Centre for Science Education. A portal equipped with best quality informational content on diverse topics in multiple languages a total of 14527 files including 401 collections, 2779 documents, 1345 interactive, 1664 audios, 2586 images and 6153 videos on different languages.

URL:<https://nroer.gov.in/welcome>

#### **n. E-Content for the visually Impaired Students**

NIOS have developed Indian sign language for hearing impaired students, it has also developed epub and DAISY enabled talking books for the students. It has developed more than 270 videos in sign languages in seven subjects includes Yoga courses for the students. These videos can be accessible at [https://www.youtube.com/playlist?list=PLU\\_uOqp8QaNB1Skq\\_ZURX0RGcaomsPfkDsI](https://www.youtube.com/playlist?list=PLU_uOqp8QaNB1Skq_ZURX0RGcaomsPfkDsI).

**o. Online Coaching**

IITPAL (IIT professor Assisted Learning) is a series of lectures prepared by different IIT professors to the students who are preparing for different entrance examination. The videos are broadcasted on Swayam Prabha channels. NTA (National Testing Agency) has prepared a platform for aspirants i.e. abhayaas. Through which students can practice the sample questions.

**p. AICTE's e-learning portal ELIS**

AICTE has partnered with Microsoft to provide online learning to the technical course enrolled students across the country to make them future ready skill. Under this initiative over 1500 courses modules will be available to students and educators free of cost. It covers the courses relating to the latest technologies like AI, IoT, datascience, cloud computing and other courses which will accelerate the skills of the students. It can also provide Azure for the students. It will also sponsor 1000 Microsoft certification examination vouchers to the students.

**URL:**<https://free.aicte-india.org/>

**10. COVID 19 and Publishers**

The different publishers who have been playing a key role in the publication of research articles and which gives a special identification to a scholar who have published his/her handwork of their life in these journal or conference proceeding or books or transaction. During this pandemic they also extent their helping hands to there searchers' scholars and learners by providing the access of their valuable articles at free of cost. The reputed publisher of the world like Wiley, Springer, IEEE, Elsevier, Cambridge, Oxford, The Lancet, Chinese medical journals, Science, SSRN, AIP, IOP, Sage, STM, ACS, ASME, Brill, Emerald, Royal Society Chemistry, Taylor and Francis, Wolters Kluwer and many more are providing their different articles relating to the coronavirus at freely to the users. Bentham Science have started a new journal in the name of the coronavirus and asking for the articles for it. publishers are also helping to the academic institutes by providing the subscription database by using their own remote access or login credentials or by institutional domain email, so that users of this institute will use the publishers' database at their home and utilise the time in purposefully.

**11. COVID-19 and Private E Learning Platform**

The private e-learning platform during this pandemic plays very important role to provides education to the learners. Because of the unquenchable thirst for learning and working internet connection any one can learn at anytime from anywhere. In the globes so many top private e-learning course providers like Coursera, edX, YouTube, Lynda, Open culture, Open Yale courses, MIT Open courseware and in India BYJU's, Edu comp, NIIT, Edukart, Dexler education, Simplilearn, Zeus learning, Meritnation, Excel soft are the best providers. BYJU's and Excel Soft provides free live classes to the learners because of the COVID-19. We believe education can transform the world and we believe technology can transform education (Excelsoft). Udemy provides the more discount on its different online courses to the students during this pandemic. On 16th April, 2020 the Cyber Coordination Centre of Ministry of Home Affairs (MHA) issued an advisory and states the ZOOM is not a safe platform, so it advised to its official not to use it for official purposes.

In India the top online learning platforms are providing different teaching courses and learning concepts to the learners. According to toptenners.com the top online learning platforms in India are Eduncle.com, Admission News, Shiksha.com, India Education, Indiaedu, SolidEssay, Dimdima, Unacademy, Aglasem.com, Toppr, Meritnation.com, Jagranjosh.com, Vedantu, Pagalguy.com, Cambridgeindia.org, StudyIQ, Minglebox.com, Extramarks, Studybook, TheTubeGuru.com, Zigya.com, Chekrs, Educationobserver.com, Motachashma.com, IBPS Guide, Gate Ies Academy, admissionfever.com, Careerlauncher.com, Metaeducationindia, Mota Chashma, Teachoo, Kreatry are providing different content to the learners.

## 12. Limitation of the online Learning

For the successfully implementation of the digital learning all the educational institution has to develop the required infrastructure to that level. Today no doubt all are interested to provide it but they are facing lot of criticism because of lack of infrastructure and expertise. Maximum no of the students has the smart phone but they do not have the laptop or computer, so that they are facing the problem when they go for online education. So some countries are providing the online teaching through their community radio. Accessing the internet with proper speed is the another limitation of the online learning, so the government have to developed that level of infrastructure for it. The online education also creates an eye problem to the learner. When a learner is learning by using the mobile, laptop or desktop it creates eye and backbone or health problem to the users.

## 13 CONCLUSIONS AND SUGGESTION

Technology has the potential to help address this global learning crisis. But that potential is not yet being realised. This pandemic creates a great loss to the world. People are suffering and living at their house with a fear and shocking environment, no one trust to the others about their health. All are maintaining the social distance, all are using the mask at face, washing hand with soap frequently, sanitize their hands, office, roads, building still the coronavirus spreads rapidly. The online learning platforms provides a ray of hope to the education system around the globe. The total education is thinking about the digital in the foreseeable future with the right infrastructure and proper digital learning policy to handle it. Online learning should not be considered as a substitute of learning but it should be a part of the regular education. The entire human being of the world pray to the almighty to the save the human being from this coronavirus crisis and FOBO and FOMO means fear of better options and fear of missing out.

### ABSTRACT

*A new disease caused by severe acute respiratory syndrome, coronavirus 2 (SARS-CoV-2), is a major pandemic event at present. Since its introduction in China in December 2019, there is strong evidence that the new SARS-CoV-2 is a dangerous virus, and it is associated with a wide clinical spectrum, ranging from acute respiratory distress to multiple organ failure. SARS-CoV-2 recognizes human angiotensin-converting enzyme 2 as a cellular receptor that allows it to infect various host cells. In particular, a significant incidence of many kidney disorders associated with COVID-19 has been reported, including proteinuria, hematuria, and acute kidney injury. In this article, we will discuss the impact of SARS-CoV-2 infection on kidney function.*

**KEYWORDS:** *Kidney Damage, Angiotensin Converting Enzyme 2, COVID-19, Proteinuria.*

### INTRODUCTION

Since 2003, severe acute respiratory syndrome (SARS) caused by various viral agents has been recognized as a clinical subject of great epidemiological concern, as it can lead to death (4, 22). In December 2019, Zhu and others (22) reported a group of patients with pneumonia of unknown etiology associated with a seafood market in Wuhan, China; since then, a new coronavirus, SARS-coronavirus 2 (SARS-CoV-2), has been isolated and identified. The infection spread rapidly in China and beyond, and the world health organization declared a global emergency on January 31, 2020; 11 days later, it announced the name of the new coronavirus disease as 2019 coronavirus disease (COVID-19) due to its appearance last year. On March 11, 2020, the world health organization said that COVID-19 was considered an epidemic, as there were already more than 120,000 cases, of which 40,000 were diagnosed in 114 countries outside of China, with 4,291 deaths. As of April 13, 2020, COVID 19 is widespread around the world.

## MATERIALS AND METHODS

A previous study of SARS-CoV infection showed that the RNA of the virus is effectively detected in the urine 10 days after the onset of symptoms, and excretion gradually decreases until the 21st day; unfortunately, it has not yet been studied in SARS-CoV-2. Autopsies of patients confirmed with SARS-CoV showed the presence of the virus in tubular epithelial cells using immunohistochemistry and in situ hybridization(20). In addition, 35% of the heart samples of patients infected with SARS-CoV showed the coexistence of viral RNA and reduced expression of the ACE2 protein (52). A retrospective study during the SARS-CoV outbreak found that only 6% of SARS-CoV infected patients had kidney damage (15). However, kidney damage was a fatal complication of SARS-CoV, given that almost 92% of SARS-CoV patients with kidney damage died. This study also evaluated the presence of active SARS-CoV replication in the tubular cells of post-mortem patients infected with SARS-CoV by analyzing the presence of viral particles using electron transmission microscopy. SARS was not detected in any of the analyzed samples, and it was suggested that kidney dysfunction was probably associated with multiple organ failure (15). This study showed that kidney damage in patients with SARS-CoV may be the result of cytokine release syndrome rather than active replication of the virus in the kidneys (68).

Unlike other studies with patients infected with SARS-CoV, recent studies have shown that human kidneys are a specific target for SARS-CoV-2 infection (19, 25, 53, 66). In fact, a viral nucleocapsid protein in the kidneys of post-mortem patients and found that SARS-CoV-2 antigens accumulate in the renal epithelial tubules, suggesting that SARS-CoV-2 directly infects the human kidneys, which leads to impaired kidney function and contributes to the spread of the virus in the body. The difference between the higher renal tropism of SARS-CoV-2 compared to SARS-CoV can be explained by the increased affinity of SARS-CoV-2 for ACE2, which allows for increased viral load in several organs, and especially in the kidney, which can act as a viral reservoir (57). An additional examination of 16 autopsies by electron microscopy revealed viral particles characteristic of SARS-CoV-2 in the proximal tubular epithelium and podocytes (66). This discovery was associated with the Erasure of the foot process and episodic vacuolation and detachment of podocytes from the glomerular basement membrane (66).

The most common detection of kidney dysfunction in patients with COVID-19 is mild to moderate proteinuria (13). Only a small fraction of plasma proteins are filtered in the renal glomeruli, and most of them are effectively reabsorbed in the proximal tubule, so that mostly proteins do not appear in normal urine. The glomerular filtration barrier depends on the adequate function of its three components: endothelial cells, glomerular basement membrane, and podocytes (9). Podocytes are known to be particularly sensitive to RAAS homeostasis, with angiotensin-1-7 being the most common product, probably due to the specific expression of ACE2 in this area (70). If the pathological process increases glomerular angiotensin II levels, podocytes acquire a dysfunctional phenotype mediated by cellular responses to this octapeptide due to shear stress and leading to hyperfiltration of single nephrons. This phenotype includes Ca<sup>2+</sup> signaling, cytoskeletal restructuring, and nephrin internalization, which ultimately manifests as proteinuria (38, 65). Proteinuria is a partial consequence of direct podocyte infection with potential RAAS changes that together would affect the glomerular filtration barrier and lead to increased filtration of plasma proteins.

Damage to the tubules can also increase renal protein excretion, usually at moderate intensity. Interestingly, patients with COVID-19 with elevated serum creatinine levels had a higher incidence of moderate proteinuria on admission compared to patients with normal serum creatinine levels (30.2% vs. 7.5%) (13). However, there is no evidence that this depends on impaired RAAS and in fact depends on the response of the proximal tubule cells to damage (7, 54).

The incidence of kidney damage in patients infected with SARS-CoV-2 was found primarily in critically ill patients (77, 83). Patients in the intensive care unit have been reported to have higher levels of IL-1 $\beta$ , IL-8, interferon- $\gamma$ , and TNF- $\alpha$ , among other cytokines, compared to non-critically ill patients (33). This suggests a potential role for CRS, also called a "cytokine storm", comparable to kidney damage associated with sepsis, where an uncontrolled systemic inflammatory response leads to kidney dysfunction. The occurrence of cytokines in COVID-19 has been documented since the first reports of this disease (33, 80). In patients with cytokines, kidney damage may occur as a result of intrarenal inflammation, increased vascular permeability, and volume depletion, which is expressed in the results of autopsies of erythrocyte aggregates that block the lumen of capillaries without platelet or fibrinoid material. Proinflammatory IL-6 is considered the most important cytokine pathogen in CKD. Among patients with COVID-19, the concentration of IL-6 in blood plasma is increased in patients with acute respiratory distress syndrome (80). Extracorporeal therapy has also been proposed as an approach to removing cytokines in patients with sepsis and could potentially be useful in critically ill patients with COVID-19 (29). The rational use of these treatments is that removing cytokines can prevent CRS-induced organ damage (61, 62).

In addition, it is well known that an imbalance of RAAS components can contribute to kidney damage by altering renal hemodynamics, changing the tubular regulation of electrolytes with higher metabolic demand, and inducing Pro-inflammatory phenotypes in both epithelial and immune cells. It is highly likely that this imbalance may contribute to the renal dysfunction seen in severe patients with COVID-19, which may also be accompanied by a decrease in ACE2 activity (8, 46, 60). It became clear that kidney damage associated with sepsis is multifactorial, including an inflammatory reaction of the kidneys, microcirculation dysfunction, and metabolic reprogramming with mitochondrial damage (55). These mechanisms are compatible with our current understanding of SARS-CoV-2 infection and biology, supporting the prevailing hypothesis that COVID-19-associated kidney damage occurs in a severe disease scenario with a complex pathophysiological network, but unlike other SARS-related viruses (14), Direct infection of the proximal epithelium SARS-CoV-2 can significantly support a causal relationship in the development of kidney function disorders (66).

## CONCLUSION

Finally, the detection of hematuria in at least 20% of infected patients is of clinical concern. There are several causes of hematuria, including both kidney damage and extrarenal abnormalities, and to eliminate them, it is necessary to carefully evaluate the urine sediment (78). Unfortunately, as far as we know, hematuria was only described as a General finding, without studying its characteristics (2a, 13). There are many possible explanations for hematuria in COVID-19, including coagulopathy, kidney inflammation, and glomerular barrier disorders (as

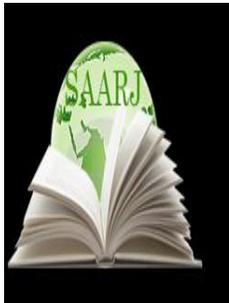

discussed earlier) (83). However, the available information makes it very difficult to come up with an acceptable hypothesis.

## PENSION REFORMS AND OPPORTUNITIES TO USE FOREIGN BEST PRACTICES

**Mamatkulova Yayra Dilmurod Qizi\***

\*Basic Doctoral Student,  
 Tashkent State University of Economics,  
 UZBEKISTAN

### ABSTRACT

*The article discusses the reforms implemented in the pension system in Uzbekistan. Scientific proposals and practical recommendations for improving pension provision based on the best practices of foreign countries have been developed.*

**KEYWORDS:** *Pension System, Pension Provision, Distributive Pension System, Generational Solidarity, Accumulative Pension System, Retirement Age, Demography, Life Expectancy, Models Of Pension Systems, Social Protection, Three-Level Pension System.*

### 1. INTRODUCTION

During the years of independence, Uzbekistan has also carried out large-scale reforms in the pension system. Until 2004, there was only one form of pension provision - "distributive - generational solidarity" ("pay as you go"), and from 2005, a funded pension system was introduced. Accordingly, the reform of the pension system in Uzbekistan began in 2005. From 2021, it is planned to move to a three-tier pension system [1].

It is known that in the "distributive" model, that is "solidarity of generations", the pension payments of pensioners were provided by funds formed on the basis of social contributions from the legal income of current legal entities and individuals. Such a model was "introduced in 1889 by Otto von Bismarck, the first chancellor of the German Empire"[2]. It should be noted that Bismarck's pension reforms, ideas and initiatives laid the foundation for the development of the social protection system. The peculiarity of this system is that social insurance is compulsory and based on contributions, and both employers and workers must have their share in its financing. "The measures of labour and pension insurance developed by O. Bismarck are relatively well developed, and other developed countries have begun to apply them in their practice, and they have served as a basis for future social reforms." [3].

On January 1, 2005, a funded pension system was introduced in addition to the state pension system. This system means the participation of employers, as well as citizens engaged in employment based on an employment contract in the mandatory pension system"[4]. Mandatory monthly contributions to personal pension accounts of citizens in 2005 are made as a percentage of the employee's calculated salary (income), excluding the amount of income tax calculated in accordance with the legislation of individuals. Currently, the figure is 0.1 percent[5]. As can be seen from this, citizens receive pensions from two sources (distributable and accumulative) after retirement, which increases their pension amounts and allows them to further improve their well-being.

## II. METHODS

Since 2010, all pension departments of the Ministry of Labor and Social Protection and the Medical Labor Expert Commission have been transferred to the Extrabudgetary Pension Fund under the Cabinet of Ministers of the Republic of Uzbekistan. The organizational structure of the Extrabudgetary Pension Fund under the Ministry of Finance of the Republic of Uzbekistan has been reorganized.

In 2011, the Regulation on the Procedure for Assignment and Payment of State Pensions was adopted, and on the basis of this Regulation, the procedure for resolving issues related to the appointment and payment of state pensions, application of pension benefits and provision of pensions to citizens was established. Some periods of activity, which are preferentially added to the length of service, are excluded. The Regulation "On the procedure for payment of pensions to working pensioners" was adopted.

In 2012, a centralized PC "Pension" program for the appointment, payment and reporting of pensions and social benefits was developed and implemented. This software is an automated information system that allows you to establish effective electronic cooperation between all departments of the Pension Fund, create a single centralized database, provide users with complete, reliable and fast information through the use of modern innovative software products. In 2013-2018, the Central Bank of the Republic of Uzbekistan and commercial banks, the Medical Labor Expert Commission, the Tax authorities, the Judiciary, the Treasury departments exchanged electronic information through the PC "Pension" program.

In 2013, the list of professions and positions for retirement on preferential terms was fully inventoried.

In accordance with the State Program "Year of Respect for the Elderly" dated February 18, 2015, in order to pay due to attention to persons aged 100 and over, as well as to strengthen targeted social protection and financial support for retirees, veterans of the war of 1941-1945 from May 1, 2015, additional payments in the amount of 100% of the minimum wage will be made to the pensions of citizens who have completed and exceeded their pensions, and these funds are financed from the Extrabudgetary Pension Fund under the Ministry of Finance of the Republic of Uzbekistan.

As well as, in 2016 in order to further improve the system of accounting for insurance contributions of citizens to the Extrabudgetary Pension Fund under the Ministry of Finance of the Republic of Uzbekistan and to simplify the process of assigning state pensions, an individual

accounting of information on insurance contributions to the Extrabudgetary Pension Fund was introduced.

Since 2016, procedures have been developed for the payment of insurance premiums to the Pension Fund by citizens of the Republic of Uzbekistan working abroad and not taking into account working hours, as well as accounting for their length of service and salary for the calculation of pensions. From July 1, 2016, the minimum length of service required for a pension appointment has been extended from 5 to 7 years. The Instruction "On the order of deductions from pensions, benefits and other payments" has been developed.

In order to radically improve the system of payment of pensions and social benefits, unconditional protection of the rights and legitimate interests of pensioners, from February 2017, all types of pensions were introduced in full in cash throughout the country without any restrictions.

To further strengthen the state social support of pensioners, including those engaged in creative activities, who have made a significant contribution to the socio-economic development of the country, comprehensive care for the elderly, as well as the gradual improvement of the state pension system from January 1, 2018: to pensioners who have been awarded by the President of the Republic of Uzbekistan the honorary titles of "Xalq ..." ("People ..."), "Xizmatko'rsatgan ... Arbobi" ("Honored ... Worker") and "Xizmatko'rsatgan ..." ("Honored ...") for their significant contribution to the socio-economic development of the republic, regardless of their field of activity; and to pensioners who receive income only in the form of royalties (honorarium) for the creation and use of works of science, literature and art, but do not work under an employment contract, pensions will be paid in full.

From January 1, 2019, the full amount of pensions will be paid to all working retirees, and the maximum amount of wages for the calculation of pensions will be increased from eight to ten times the minimum wage [6]. Also, according to the concept of improving tax policy, insurance premiums deducted from the income of citizens in the form of wages to the extra-budgetary Pension Fund have been abolished.

From January 1, 2020, the interagency software and hardware complex "Unified National Labor System" (Unified National Labor System) was fully implemented.

### III. RESULTS

The three-tier pension system, which is planned to be introduced from 2021, envisages a private pension system at the same time as the above two models.

In the future, this system will allow citizens to receive a guaranteed state pension, as well as voluntarily determine how much they will receive when they reach retirement age. It will also ensure the participation of pension funds in the capital market and the further development of the national financial market.

The analysis of statistical data shows that the number of pensioners in Uzbekistan in 2013-2020 is growing from year to year, and as of January 1, 2020, 9.8% of the total population are retirees. According to the World Bank, the share of people aged 65 and over in the total population is 27% in Japan, 25.4% in Russia, 21% in Germany, 20% in France and 16% in Australia.

An average of 250,000 people receives pensions in Uzbekistan every year. As of January 1, 2020, the total number of retirees was 3312,723, which is increased to 627,453 compared to January 1, 2013.

As of September 1, 2020, 83.3% of the total number of pensioners are old-age pensions, 11.3% are disability pensions and 5.4% are survivors' pensions. In August 2020, the average pension amounted to about 744 thousand soums.

The average monthly pension in Uzbekistan is \$ 74, which is higher than in the CIS countries only in Tajikistan (\$ 29) and Kyrgyzstan (\$ 69). This is a negative situation in terms of ensuring a decent standard of living for retirees in Uzbekistan.

It should be noted that experts from the international consulting company Mercer and the Center for Financial Research at the University of Monash have published the Melbourne Mercer Global Pension Index (MMGPI), a ranking of global pension systems. The study's authors explored the pension systems of 37 countries, home to nearly 63 percent of the world's population. As a result, the Netherlands, Denmark and Australia were listed as the countries with the best pension systems in 2019. The next places went to Finland, Sweden, Norway, Singapore, New Zealand, Canada, Chile, Ireland, Switzerland and Germany. Experts took into account more than 40 indicators in compiling the rating [7].

Countries with the best pension systems use different models of pension provision. For example, state pension provision, voluntary pension insurance, funded pension system, non-state pension provision. In this regard, it is expedient to reform and improve the national pension system based on the study of the experience of Georgia and Latvia, and there are specific reasons for this. First of all, these countries are currently reforming their pension systems. In particular, Georgia has begun to reform the pension system from 2019. The main purpose of this is to further improve the well-being of citizens who have reached retirement age (retirement age is set at 65 for men and 60 for women) and to develop the financial market.

Georgia's new pension system operates on a "2 + 2 + 2" scheme. In particular, a pension account has been opened for every citizen of Georgia and foreign citizens permanently residing in the country.

- 2% - at the expense of the employee's salary, with an annual income of up to 24,000 lari (79.6 million soums);
- 2% - by the employer;
- 2% - the state (for those earning less than 24,000 (US \$ 9006) per year, for those earning between 24,000 and 60,000 lari (US \$ 24,514) the state pays 1% pension contributions, if the annual income exceeds 60,000 lari, the state does not contribute).

Also, in the first stage, every Georgian who has reached retirement age, regardless of whether or not he participates in the new pension system, is entitled to receive a standard state pension (currently 200 lari - \$ 75) [7].

Employees will be able to accumulate between 4% and 6% of their pension funds in their retirement account each month.

Self-employed citizens are obliged to transfer 4% of their monthly income to their pension account on a monthly basis.

The Republic of Latvia has a three-tier pension system:

- Tier I – distributed, that is a pension system based on the solidarity of generations (pay as you go);
- Tier II –state-funded pension system;
- Tier III –a pension system based on private voluntary insurance.

The tier I pension system provides for the provision of pensions to current retirees at the expense of social contributions paid to the state budget, and it means a pension guaranteed by the state. All citizens who pay social insurance contributions will take part in it. This pension system provides pensions to all citizens with at least 10 years of insurance experience, and a state social security pension for citizens with less than 10 years of insurance experience.

Tier II pension system is also formed at the expense of social insurance contributions, and part of it is accumulated only for the person who paid social insurance contributions and is not spent on the payment of pensions of current retirees. Accumulated pension funds of citizens participating in the tier II pension system are invested in the financial markets, multiplied and accumulated in the personal accounts of citizens. Citizens participating in this system can participate in investing funds until retirement.

The Tier III pension system allows every citizen to save money in private pension funds of their choice. This system is also known as the private voluntary pension insurance scheme. The peculiarity is that every citizen saves money for himself, for his future. Voluntary participation in this system is at the discretion of the citizen. This system provides for the free choice of each citizen, that is, to save additional funds for their pensions by allocating contributions to private pension funds. Private pension funds are licensed financial institutions that accept contributions from individuals or employers in favour of individuals. Such funds organize the investment of contributions paid by citizens and employers for their social protection in old age, and at the expense of these funds pay pensioners' pensions.

#### IV. CONCLUSIONS AND SUGGESTIONS

World experience shows that a multi-level pension system based on a distributed, accumulative and mixed system ensures the financial stability of the pension system and its more efficient operation. Pension reforms in most developed and developing countries include:

- introduction of a multi-level pension system combining accumulative and distribution schemes, providing minimum guarantees, improving the existing ones;
- reduction of informal employment and strengthening of the insurance mechanism for financing pension programs by legalizing the employment of those employed in the informal sector;
- limiting the conditions of early retirement and raising the retirement age to ensure a balanced increase in the labour force in the context of increasing life expectancy and increase the duration of their employment, reduce the burden on financing pension programs;
- strengthening the relationship between the participation of citizens in the formation of pension reserves for the entire period of employment and the number of pensions;
- strengthening monitoring and control over the financial activities of pension funds (for example, Germany has adopted a law on strengthening financial risk management and independent control, etc.);
- establishment and stability of financial activity of private pension funds, functioning of non-state pension provision (including corporate pension programs).

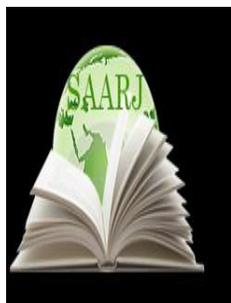

- The goals and functions of the third-tier pension system in Latvia differ and reduce the demographic and financial risks for each participant in the system and ensure the stability of the pension system. In these systems, the personal interests of the provision of each citizen in old age and the interests of the solidarity of generations are mixed. The basic principle of the pension system is that the more social payments are made today, the higher the number of pensions will be tomorrow, and vice versa. Simultaneous operation of all levels of the pension system will mitigate the expected demographic and financial risks and ensure the stability of the pension system.

Based on the experience of Georgia and Latvia, in addition to the state pension system in our country, it is expedient to establish a state social protection fund or private pension funds. This, in turn, will lead to further improvement of the living standards of retirees in the future through investment in pension funds, and secondly, to the accumulation of long-term financial resources necessary for economic development and thus the development of the capital market.

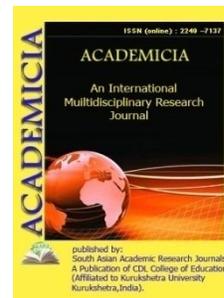

Shortly, the accumulative pension system around the world and the voluntary pension contributions within it will remain the main source of formation of pension funds.

### ABSTRACT

*Physical and chemical analysis of the interaction of components in different systems makes it possible to obtain new compounds with different properties. The synthesis of new complex-acting defoliating substances with a high defoliant and physiologically active effect also does not lose its relevance in agriculture. This article presents data on the study of interaction in three-component water systems involving magnesium chlorate and ethanolamines to justify the processes of obtaining new defoliating compositions.*

**KEYWORDS:** *solubility, components, triple system, magnesium chlorate, monoethanolamine, diethanolamine, triethanolamine, polythermal solubility diagram, identification.*

### INTRODUCTION

The physiological and agrochemical properties of both chlorates and ethanolamines are widely known, so by studying the interaction of components on each other in a wide temperature and concentration range, it is possible to optimize the action of each component in the composition of newly synthesized drugs. On the basis of the obtained research data, polythermal solubility diagrams of systems from eutectic freezing points up to 40 °C are constructed. Systems of a complex type and the formation of new compounds that were identified by chemical and physicochemical methods of analysis are revealed. For systems, the compositions of the liquid and solid phases, as well as their corresponding crystallization temperatures, are determined

accordingly. The solubility diagrams show isothermal solubility curves every 10 °C. The nature of mutual solubility of components depending on temperature and their concentration is revealed, which is of great practical importance in the further development of technology for new defoliating preparations of agricultural crops.

## MATERIALS AND METHODS

Magnesium chlorate is one of the widely used defoliant of inorganic origin. Ethanolamines and derivatives thereof are effective additives to chlorate-containing defoliant [1]. In order to clarify the behaviour of magnesium chlorate with mono-, di- and triethanolamine, solubility in the corresponding triple systems was studied by the visual-polythermal method [2] from the temperature of complete solidification of the solutions to 32.4 °C.

The polythermal solubility diagram of the Mg  $\text{Mg}(\text{ClO}_3)_2 - \text{NH}_2\text{C}_2\text{H}_4\text{OH} - \text{H}_2\text{O}$  system in the temperature range - 52.5-30.3 °C is characterized by the presence of the surface of the liquidus of ice, dihydrate, monohydrate and anhydrous monoethanolamine, sixteen, twelve and six-water magnesium chlorate and a new compound of the composition  $\text{MgOHClO}_3 \cdot \text{NH}_2\text{C}_2\text{H}_4\text{OH} \cdot 2\text{H}_2\text{O}$ .

The solubility diagram of the Mg  $\text{Mg}(\text{ClO}_3)_2 - \text{NH}(\text{C}_2\text{H}_4\text{OH})_2 - \text{H}_2\text{O}$  system in the temperature range - 53.6-32.4 °C consists of ice crystallization fields, sixteen, twelve and six-water magnesium chlorate, diethanolamine and a new compound of the composition  $\text{MgOHClO}_3 \cdot \text{NH}(\text{C}_2\text{H}_4\text{OH})_2 \cdot 2\text{H}_2\text{O}$ . These fields converge at four double and four triple nodal points. In terms of the occupied volume, the crystallization field of the compound  $\text{MgOHClO}_3 \cdot \text{NH}(\text{C}_2\text{H}_4\text{OH})_2 \cdot 2\text{H}_2\text{O}$  is greatest, which indicates its low solubility relative to other components of the system.

In the solubility diagram of the system  $\text{Mg}(\text{ClO}_3)_2 - \text{N}(\text{C}_2\text{H}_4\text{OH})_3 - \text{H}_2\text{O}$  [3] in the temperature range - 56.0-31.2 °C, the temperature and concentration intervals of the existence of the following phases were revealed: ice,  $\text{Mg}(\text{ClO}_3)_2 \cdot 16\text{H}_2\text{O}$ ;  $\text{Mg}(\text{ClO}_3)_2 \cdot 12\text{H}_2\text{O}$ ;  $\text{Mg}(\text{ClO}_3)_2 \cdot 6\text{H}_2\text{O}$ ;  $\text{N}(\text{C}_2\text{H}_4\text{OH})_3$  and a novel compound of the composition  $\text{MgOHClO}_3 \cdot \text{N}(\text{C}_2\text{H}_4\text{OH})_3 \cdot 2\text{H}_2\text{O}$ .

The crystallization region of the compound occupies most of the polythermal diagram. We have established temperature and concentration limits for the formation of magnesium complexes of mono-, di- and triethanolamine hydrochlorate. It is found out that the monoethanolamine complex is formed at a temperature interval of -52.5 ÷ 30.3 wasps, and di- and a triethanolamine complex respectively at -53.6 ÷ 32.4 and -56.0 ÷ 31.2 wasps. The complex  $\text{MgOHClO}_3 \cdot \text{NH}_2\text{C}_2\text{H}_4\text{OH} \cdot 2\text{H}_2\text{O}$  is formed at the concentration range 0.9-92.6%  $\text{NH}_2\text{C}_2\text{H}_4\text{OH}$  and 1,0-57,6%  $\text{Mg}(\text{ClO}_3)_2$ .

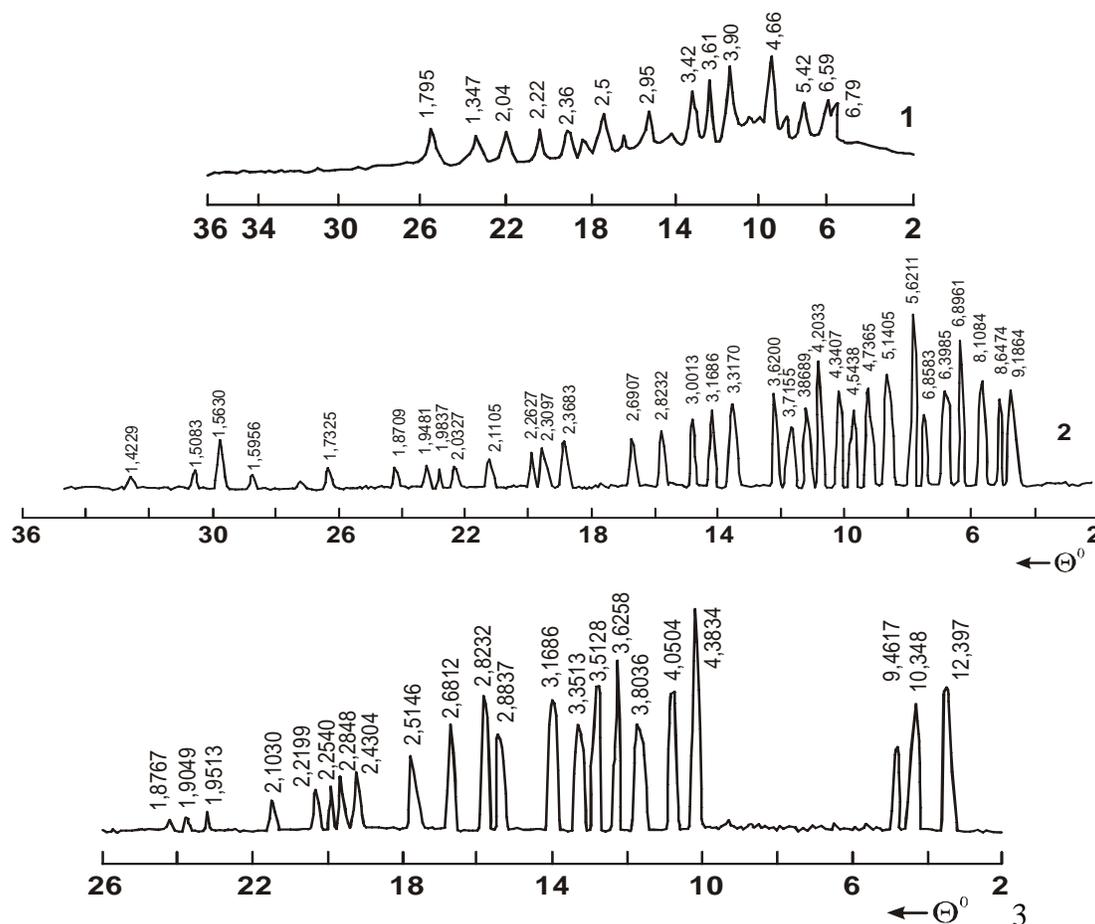

The formation of compound  $\text{MgOHClO}_3 \cdot \text{NH}(\text{C}_2\text{H}_4\text{OH})_2 \cdot 2\text{H}_2\text{O}$  is observed at a concentration of 3.3-89.2%  $\text{NH}(\text{C}_2\text{H}_4\text{OH})_2$  and 2.4-59.8%  $\text{Mg}(\text{ClO}_3)_2$ , and  $\text{MgOHClO}_3 \cdot \text{N}(\text{C}_2\text{H}_4\text{OH})_3 \cdot 2\text{H}_2\text{O} - 8,0-84,8 \%$   $\text{N}(\text{C}_2\text{H}_4\text{OH})_3$  and 9.4-57.8%  $\text{Mg}(\text{ClO}_3)_2$ . Analysis of the solubility diagram of the studied aqueous systems shows that during the transition from monoethanolamine to triethanolamine, a decrease in the crystallization region of the complexes formed in the systems is observed and their solubility is accordingly increased.

## RESULTS

With an increase in the molecular weight of ethanolamines in the homologous series, the concentration range of magnesium chlorate and ethanolamines causing the formation of complexes narrow. While the temperature range of formation of the complexes under

consideration expands. In the same sequence, the minimum concentration of magnesium chlorate and ethanolamines causing the formation of complexes varies.

The results of the X-ray phase analysis confirm the individuality of crystal lattices of complexes characterized by their own diffraction reflexes, the intensity of diffraction reflexes that are not characteristic of the original components.

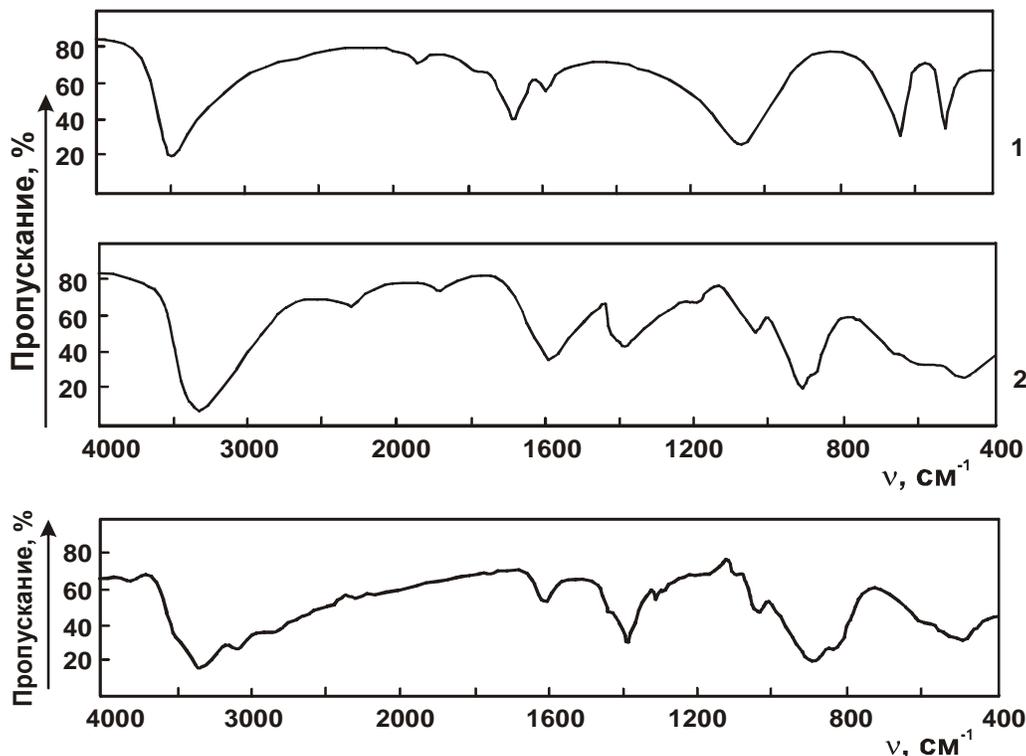

**Figure 1. Radiographs:  $\text{Mg}(\text{ClO}_3)_2 \cdot 6\text{H}_2\text{O}$  (1),  $\text{MgOHClO}_3 \cdot \text{NH}(\text{C}_2\text{H}_4\text{OH})_2 \cdot 2\text{H}_2\text{O}$  (2).  $\text{MgOHClO}_3 \cdot \text{N}(\text{C}_2\text{H}_4\text{OH})_3 \cdot 2\text{H}_2\text{O}$  (3).**

The mono-, di- and triethanolamine in the magnesium hydroxychlorate complexes are coordinated to the magnesium ion through the nitrogen of the primary, secondary and tertiary amino groups, as evidenced by the shifts of the absorption bands  $\nu(\text{NH}_2)$ ,  $\nu(\text{NH})$  and  $\nu(\text{CN})$  to the low-frequency domain by 30-28. 20-10 and 25-18  $\text{cm}^{-1}$ , respectively. Characteristic thermal effects of the heating curves of the hydroxychlorate of magnesium complexes of ethanolamines are the effects of cleavage of crystallization water and exothermic decomposition of complexes and their degradation products. According to thermogravimetric analysis, removal of the first molecule of crystallization water is completed in the range of 118-140  $^\circ\text{C}$ .

This water molecule is connected to the complex through a hydrogen bond and is located in the external coordination sphere of the complex. The second molecule of water is coordinated through oxygen with magnesium ion and is located in the internal coordination sphere of the

complex. Therefore, its removal occurs at 180-200 °C. The exothermic effect of decomposition of the complexes in question is observed in the range of 220-230 °C. It corresponds to the decomposition of the chlorate ion of dehydrated complexes with the simultaneous burning of the organic part of the molecules. Total weight loss after the exothermic effect is 82-87%.

**Figure 2. IR spectra:  $\text{Mg}(\text{ClO}_3)_2 \cdot 6\text{H}_2\text{O}$ (1),  $\text{MgOHClO}_3 \cdot \text{NH}(\text{C}_2\text{H}_4\text{OH})_2 \cdot 2\text{H}_2\text{O}$  (2),  $\text{MgOHClO}_3 \cdot \text{N}(\text{C}_2\text{H}_4\text{OH})_3 \cdot 2\text{H}_2\text{O}$  (3).**

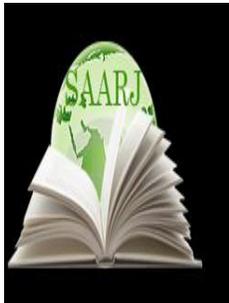

As the molecular weight of the complexes increases in the homologous series, the thermal stability of the complexes decreases. Based on the solubility diagrams of the studied systems, defoliant compositions were selected at the following component ratios: magnesium chlorate 2.5-3.5, mono-, di- and triethanolamine 1.0-2.0.

Agrochemical tests of synthesized compounds and defoliant compositions on cotton showed that they cause 84.8-86.7% of leaf fall and act gently on plants, stimulate the opening of boxes up to 88.9%.

**ABSTRACT**

*The article tells about the scientific work of the great Uzbek scientist Muhammad al-Khwarizmi and his historical merits in world science. Algorithms are one of the hundred names of al-Khwarizmi. The article details the evolution of this term. The article also shows the role of algorithmic ideas and the al-Khwarizmi scientific school in becoming of well-known European mathematicians such as Leonardo Pisansky, Paccioli and many other Renaissance scientists.*

**KEYWORDS:** *Al-Khwarizmi, Algorithm, Central Asia, Mathematics, Arithmetic Treatise, World Civilization.*

**INTRODUCTION**

As is known Uzbekistan is one of the cradles of world science in the history of the development of world civilization. It was Uzbek land which had given the world such prominent thinkers of the Oriental and Western sciences as Beruni, Farabi, Al-Khwarizmi, Ulugbek and many others.

The achievements of mathematics and computational - algorithmic sciences of Central Asia during IX-XV cc. have left the lasting trace in the development of the world scientific thought. In the works of Central Asian mathematicians of paramount importance was the development of computational techniques. The zeal towards the perfection of these techniques was revealed in the works of Uzbek classicists of science which served as the basis for European mathematics and affected greatly the development of the world computational-algorithmic trend.

The works of prominent mathematicians of Central Asia and Uzbekistan enjoyed an invariable authority in the Orient in XI-XV cc. and later in Europe.

### LITERATURE REVIEW

Al-Khwarizmi's contribution had been studied and commented by the scientists of subsequent generations being the guidelines for research in various fields of mathematics.

Of special interest were scientific works of the outstanding Uzbek scientist Muhammad ibn Musa al-Khwarizmi who was at the source of contemporary mathematics and computer science, astronomy, geography; - he made a weighty contribution to the treasure-house of the world science: no wonder a noted American scholar of science George Sarton has named the whole first part of IX c. the epoch of Al-Khwarizmi as "the most famous mathematician of his time and taking into account all the circumstances – one of the greatest of all times".<sup>1</sup>

German scientist K.Vogel named Khwarizmi "the teacher of the West not only in algebra but also in his introduction of new Indian figures and methods of calculations".<sup>2</sup>

K.Vogel continues: ... arithmetics beginning with words "Dixit Algorizmi" lay down the foundation of the rapid growth of mathematical knowledge which had occurred in Western Europe during XVI-XVII cc."<sup>3</sup>

A well-known American scholar of Central Asia Frederick Starr also argues that "In mathematics, Khwarizmi was the first to elaborate a theory of equations solvable through radicals, which can be applied to the solution of a variety of arithmetical and geometrical problems. The result was a book, Algebra that gave its name to the field; the term algorithm is a corrupted form of his name. Khwarizmi advanced the field of spherical astronomy and did more than anyone else to popularize the decimal system that had been invented in India".

### ANALYSIS

In fact, the arithmetic treatise of Khwarizmi "Kitab hisab al adad al hindi" ("the book on counting by Indian figures") has played a leading role in history not only in arithmetics, mathematics and its computational – algorithmic trend, but also the world culture at large as the main source of propagation of positional number notation. It replaced throughout the considerably less elaborated alphabetic system of calculation used by Greeks, cumbersome Roman number system, complicated Chinese diagrams and the like. Arithmetics based on positional decimal number notation with the use of zero was first given in it. Since mid-XII c., the principles and techniques of decimal positional arithmetics the first propagandist of which in Bagdad was al-Khwarizmi gained wide recognition in Western Europe. At that time the intense activity of a group of translators of scientific literature from Arabic into Latin (universally accepted at that time in the learned world) began to develop.

After the conquest of Spain and Portugal by Arabs (early VIII c.) the Arab-Muslim culture had found its place for long. The Arabic language was an international language of science for European intellectuals. Therefore this period in the history of science and culture is sometimes called "Arabic". The Spanish towns Madrid, Cordova, Toledo, Seville were cultural and scientific centres not only in the Pyrenees peninsula but also in other states of Western Europe. "The people from neighbouring France, Italy and Britain came to learn sciences from Arabs".<sup>4</sup>

The period of the highest development of the civilization of the peoples of Central Asia – the Oriental Renaissance coincided in time with the strongest oppression of Church orthodoxy in all fields of European culture and science. As a result, there was a low level of mathematical knowledge and other natural sciences. Therefore the propagation of Arab – Muslim culture in Spain played an important role in the development of the European culture including mathematics. Of leading value for mathematics here was the propagation of the achievements of Bagdad school starting from works of Muhammad al-Khwarizmi.<sup>5</sup>

Western Europe was a successor and bearer of scientific ideas of ancient Rome and used Roman figures. Therefore “Indian counting” did not spread here immediately. At first, it was close to the deep-rooted Roman number system, -counting board in the letter-number system. Being afraid to draw terrible accusation on themselves in heresy the scientists went to Spain secretly to learn new alien skills for them.

Before half XII c. Europeans “learnt Arabic sciences through the language of the original”. Of paramount importance for the progress of mathematical knowledge in Europe were as it was already said, the translations from Arabic both original writings and Greek literature as well which were in the Arabic language. Translations from Arabic were in great use in XI-XII cc., however, the European mathematicians continued studying the Arab manuscripts in XV-XVII cc. as well. Based on the above-mentioned work of Khwarizmi there came into being an algorithmic (algorithmic) tradition in the Latin West in XII-XIII cc.

New arithmetic started to be named al - Khwarizmi in the Latinized form: “algorithm” or “algorism”, because the Latin translation of the book starts with the words: Algorizmi said (Dixit Algorizmi).

It is universally known that the Arabic original has not been found so far. The only copy of the manuscript, which was available in former times in the British abbey, was kept in the library of Cambridge University. According to the catalogue of the manuscripts which was made up in 1858, it was rewritten in small letters (XIII c).<sup>6</sup>

Each algorism (algorithm) was intended to popularize a new number system. New methods of counting with Indian figures suggested by al-Khwarizmi were much superior to the old, arduous ones. The work of al-Khwarizmi in the Latin translation served as the basis for the development of “Indian” arithmetics in Europe as well. As G.Sarton put it, this writing can be the main channel by which a new system became known in Europe.<sup>7</sup>

## DISCUSSION

The first translations of al-Khwarizmi’s works were performed by Adelardo from Bat (1126 y.), Johan Seville (XII c.) Robert from Chester (1145 y.), Gerardo from Cremona (XVII c.), Magister A. (1143 y.), Leonardo of Pisa (early XIII c.).<sup>8</sup>

The translation work was accompanied by making compilation writings and was international: those who were involved and accepted Christianity were Arabs, Spaniards, the families who accepted Islam before, Spanish Jews, Britishers, Italians, Slavs, Flanderers. There came a great amount of literature on “algorisms” to become one of the bases of further progress of science in Europe. As M.Simon put it: “Of crucial importance in accepting in Europe decimal positional number notation and new figures arithmetics, primarily with arithmetics of al-Khwarizmi.<sup>9</sup> Among several treatizes writhen in Latin and later in living languages between XII-XV cc. of

paramount interest are and play a vital role the following writings, because they are the most ancient of all known and it is these that call al-Khwarizmi the source of inspiration... In particular, we are dealing with one of the most ancient algorisms written in XII c. and more or less dating back to the lost Arabic arithmetics of Khwarizmi. One of these treatizes is available in the form of the only manuscript in Cambridge and was published in transcription in 1857 by Italian historian B. Boncompagni.<sup>10</sup>

The author of translation is not exactly known: probably it was Gerardo from Cremona. Some of the scholars assume that its author is Adelard from Bat, a British scholar and a thinker who played an important role as a pioneer of propagation of Arab science and philosophy in the first part of XII c. (J. Ruska, A.P. Yuschkevich, O. Fayzullaev, G.P. Matvievskaia, A. Akhmedov etc.) According to Andre Allard, a scholar from Belgium who studied the first translation of the text algorism it is impossible to identify its author.<sup>11</sup>

However, the manuscript does not represent an exact translation of al-Khwarizmi's work at all. The translation is probably a copyist of an earlier period, tailored the work of the Oriental scientist to the needs of the European reader. He substituted Arabic numerals and figures used by al-Khwarizmi and which were in use in Western Europe of that time for Roman figures. The arithmetic treatise – algorism of Khwarizmi was revised in mid-XIII c. by Spanish scholar Johann Seville. His work was called “Liber Algorismi de practica arismetrice” (the book of Algorism on the practice of arithmetics).<sup>12</sup>

The Latin revision is kept in Paris national library.<sup>13</sup> The manuscripts of J. Seville served as a source for the propagation of decimal positional arithmetics in Europe. Another writing often called “the Book on the introduction of Alhoarism in astronomy art compiled by magister A”. (“liber ysagogarum Alchorismi in artem astronomical a magistro A”.)<sup>14</sup> is known in two records, one of which has a date 1143. The authorship of the book is ascribed to magister A, to be considered by many scientists as Adelard from Bat, although there is no true evidence in favour of this hypothesis, according to A. Allard is not available so far.<sup>15</sup>

The copies of the manuscript are kept in Viena national library, in Bavaria state library in Munich, in Parisian national library and Ambrosian library.<sup>16</sup>

The development of arithmetics and mathematics at large in medieval Europe down to XVI c. was underway under the strong influence of al-Khwarizmi. It testifies that the name al-Khwarizmi in Latin transcription (algorithm) came into being in modern mathematics and the sphere of information technologies in the form of the name for calculation system performed by certain rules. A prominent scientist S. Gondz wrote: “the works of Khwarizmi – the start of the European science...”.<sup>17</sup> The number of works on algorism grew rapidly, they were available in various countries being first in Latin (the Latin language was the means of instruction in higher schools in Europe until XVIII c.) and later in living folk languages:

The arithmetic treatise “Algorismus demonstratus” (“The interpreted algorism”) the author of which is magister Gernard (Magister Gernardus XIII c.)<sup>18</sup> arouse great interest among the researchers.

Also, of great publicity was “Common algorism” (Algorismus Vulgaris) or “a Treatise on art of counting” (circa 1250 y.) (“Tractatus de Arte numerandi”) by an Englishman John Halifax.<sup>19</sup> The Latin nickname of this scientist – Johann Sacrobosco (Johannes de Sacrobosco, circa 1200-

1256). During XIII-XIV cc. hundreds of students studied at European Universities. The professors explained the manual on “algorism” Sacrobosco<sup>20</sup> in Latin – the international language of science.

For centuries this book had become the main textbook on calculations in the decimal positional system of calculus in many European Universities.

Almost at the same time with algorism of Sacrobosco there came “the Interpretation of algorism” (Demonstratio Jordani de algorismo”) by Jordan Nemorany mentioned in numerous lists.<sup>21</sup> Jordan Nemorany, the professor of Paris University and the General of one of the monks Orders propagated algorism in the Church monk circles.

French mathematician Alexander de Villa Dei from Normandy (died c.1240 y) set forth algorism of integer number in poetry – in 284 hexameters. His “Song on algorism (Carmen de algorismo”) was translated into French, English and Irish languages.<sup>22</sup>

An anonymous French algorithmic manuscript belongs to the second half of XIII c. The ancient English algorism “The art of Counting” (“Crafte of Nonbrynge” c.1300 y) as well as the first famous book on algorism in the Italian language (“Tractatus algorismi” was drawn up by a Jacobo from Florence in 1307.<sup>23</sup>

An essay “A book on abacus” by Italian merchant Leonardo of Pisa or Fibonacci (1202)<sup>24</sup> played an important role in propagation in Europe of the positional number system. Much information taken from the mathematical works in the Arabic language was classified in it. Fibonacci is a fervent supporter of Indo – Arabic arithmetics. Since the essay was mainly intended for commercial people, it was also common among the population at large. Although the work bears the name “A book on abacus”, it has nothing to do at all with calculations using the counting board. The headline seems to be for Leonardo a term abacus as a synonym for arithmetics – in this sense, it was used by Italians later.

The introduction of the positional system into school education, the common use of builders, engineers, calculators, calendars, traders, book-keepers, clerks and others gave rise to spread of calculations in social life, science (astronomy) and technology. The growth of algorithmic literature was largely due to the invention of book-printing, some treatises were reprinted more than once. In XIV-XV cc. Indian arithmetics was widely in use among merchants and calculators (mainly in Italy and later in Germany and France).

In Germany due to the growth of towns, expansion of trade and handicrafts there came a demand for business circles for learning methods of counting. It was in XIII c. that there appeared specialized schools in which would be calculators were trained. They were called rechenmeisters (German trade towns.)<sup>25</sup> Calculators played a great role in the introduction of Indo-Arabic arithmetics. The instruction was in German and in this manner the German mathematical terminology was drawn up. Soon alongside Latin there came into being numerous German textbooks on “algorism”.

Among the first and the most significant writings of such kind published in XV-XVI cc. one should name the textbooks written by Ulrich Wagner and Johann Widman. Wagner’s book entitled “Bamberger rechenbuch” (publ. in 1482) was the first printed German writing on “algorism”.<sup>26</sup> In the book by Johann Widman (1489 y) “Behende und Rechnung Auf Allen Rauffmanscaff” only one section out of three was devoted to practical arithmetics.<sup>27</sup> Over three

centuries the European algorithmicians had made a lot of changes and improvements in the Khwarizmi's counting system. Particularly, in the "Treatise on algorism" by P. Beldomandi (died in 1428) which was published in 1483, the arrangement of operations takes an up-to-date form.<sup>28</sup>

Muhammad ibn Musa al - Khwarizmi's Nisba<sup>29</sup> in its Latin forms – more often *algorithmus* or *algorismus* turned into the name of new arithmetics, algorithm or algorism.<sup>30</sup> Later the term algorithm was to be meant any regular computational process. Approximately, at the same time mention was made on "algorists", (for instance, the word "algorists" is to be found in the "A book on algorism from Salem monastery i.e. adherents to algoristhetic arithmetics, the opposite to "abacusists").<sup>31</sup> This name comes from the special device – abacus which resembles present-day counting boards with the help of which all practical calculations were performed.

It should be noted that the spread of algorithmic arithmetics was not so fast (although in the middle of XIII c. new arithmetic was known both in Austria and Bavaria), and it was not due to the quality of the book and its translation but far more common reasons: the resistance of the old, strong school, i.e. abacusists, the very limitation of a group of mathematicians and dissociation, the very small number of schools, the lack of book-printing etc. Algorithmic arithmetics as from XII c started gaining its positions in a fierce struggle with abacusists who used Roman numbering and duodecimal Roman fractions and too cumbersome ways of multiplication and division.

Thus, we see that Latinized name al-Khwarizmi was entered in the title of the book and nowadays, there is no doubt that the word "algorithm" came into the European languages because of this writing. It can be said with certainty, that the Uzbek scientist Muhammad al-Khwarizmi has taught Europe the art of counting and his writing on Indian arithmetics by its worthiness deserves the honour to be a handbook of the first algorithmicians of the East and West.

## CONCLUSION

Al-Khwarizmi's works, as it was already said, gave rise to a new mathematical object and algorithm being widely-used in the field of informational technologies. At the outset, "algorithm" meant the name of the scientist, later numbering in the positional system of counting, and now any system of calculations made according to stringent certain rules.<sup>32</sup> Algorithm - a regular successive process to be used for solving problems of a given type.<sup>33</sup>

Thanks to al-Khwarizmi the European and world scientific thoughts have got acquainted with the notion algorithm, one of the basics not only in the sphere of mathematics and computer science but also in the field of informational technologies. In the XXI c. algorithm has acquired a special significance. Mathematical logic and computer science have also raised their claim to it. The present-day Internet and informational technologies cannot do without the theory of algorithms. Nowadays we know web-algorithms, algorithmic languages (Alpha, Fortran, Basic, HTML, Java etc, all in all, more than 500 algorithmic languages operating in various countries worldwide), algorithms of information retrieval on the Internet. The name al-Khwarizmi has been immortalized in the very name of the scientific notion. The word "al-Khwarizmi" has developed and changed over twelve centuries and again has taken on the form "al-Khwarizmi", but along with the notion "algorithm", al-Khwarizmi, Algorizmi, Algorismus, Alchwarism, Hwarism, Algorithm al-Khwarizmi algorithm.

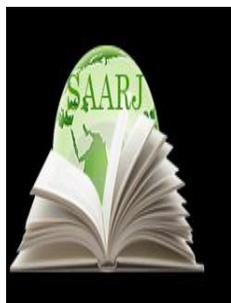

The first – scientist’s name, the second - notion. It is difficult to overestimate the great service of al-Khwarizmi for world science. He was a forefather of the strong cohort of scientists of the Medieval Orient who built the bridge from ancient science towards the epoch of European Renaissance. The writing of al-Khwarizmi (Khoresmi – author’s note), particularly his arithmetics served the basis both for the Oriental and for the European mathematical literature as well during the first years of the era of Renaissance. If Khwarizmi’s arithmetics was an inspiring source of any chisabu Hindi in the Orient, in the West i.e. in Europe over the last period of Medieval stagnation of scientific thought and in the first years of Renaissance it performed the same role, it was Oriental school of Muhammad ibn Musa al-Khwarizmi that trained prominent mathematicians like Leonardo de Pisa nicknamed Fibonacci, Lukas du Burgo nicknamed Paccioli and others.<sup>34</sup>

One can say with certainty that al-Khwarizmi and Central-Asian scientists, in general, have made their contribution to making Renaissance in Western Europe. Academician N.I.Conrad<sup>35</sup> was right when he said that Central-Asian culture at that time as in many fields of technology and material culture, especially in art and in the field of the legislature, political doctrines, philosophy, historiography, science and fiction had developed earlier and had been richer in content than all these spheres of culture in the West.

### INTRODUCTION

Revealing pedagogical and psychological prerequisites for establishing the volume and criteria of students' independent work is one of the most important problems in pedagogical science. On one hand, it is rooted in the problems of theoretical and experimental study of the motivation of human behavior posed at the beginning of the 21st century. On the other hand, any independent activity forces the primary reasons for the creative activity of the individual: this activity must be supported and developed, revived, and promoted to change for the better.

The importance of talent, initiative and human creativity is expanding in the context of the transition of the entire system to a market economy, the need for a sharp increase in attention to education and culture. Moreover, it is impossible to create a prosperous economy here, to raise domestic science and technology to the world level without putting the work of improving independent work and the creative activity of an individual to the proper level.

We can say that the problem of determining the volume and criteria of independent work in any educational institution has many aspects, sometimes it is even called riddle # 1.

The importance of the development of independent creative thinking and creative activity is recognized by everyone, however, as an object of a special kind, they have not been analyzed

enough. In our opinion, an integral indicator that expresses the creative independent activity of a person is his participation in independent creative activity.

In order to achieve this, it is necessary for all teachers to focus on determining the volume of independent work of students. From the very first year, teaching independent creative work is, first of all, fostering a new attitude to their profession: developing a “search skill”, revealing the causes and consequences of imperfection in the organization of production process, its technologies and techniques. The student must firmly grasp that nothing is completely perfect and everything that exists can be made even more perfect.

The work is mainly devoted to the presentation of our approach to the constructed model of pedagogical and psychological foundations for improving independent work in educational institutions, substantiating the theoretical model of the system, the volume and criteria of independent work, describing the methods developed for studying the students ‘occupancy in independent work.

Conducted research on the study of the occupancy in independent work among freshmen showed that it is 58% of the total established possible workload. For sophomores, 106%, for third-year students, 75%, and for graduates, 130%, the fact that the percentage of first-year students with a low level of workload on independent work remains significant, and among graduating courses it is overloaded, these uneven distribution of the volume of independent work of students makes them improve the system of independent work. Teacher - student - independent work - feedback.

It seems to us that by now there is a need for scientific multilateral analysis and identification of the reasons for the uneven workload of students with independent work.

Let us introduce the concept of an indicator of uneven students ‘occupancy in independent work; this indicator is linearly determined by the following formula:

$$\Pi(t) = q * t(1)$$

where  $\Pi(t)$  – indicator of the level of students’ occupancy on independent work (in percent);

$q$  – Indicator of stability of growth and development volume and complexity of students’ independent work;

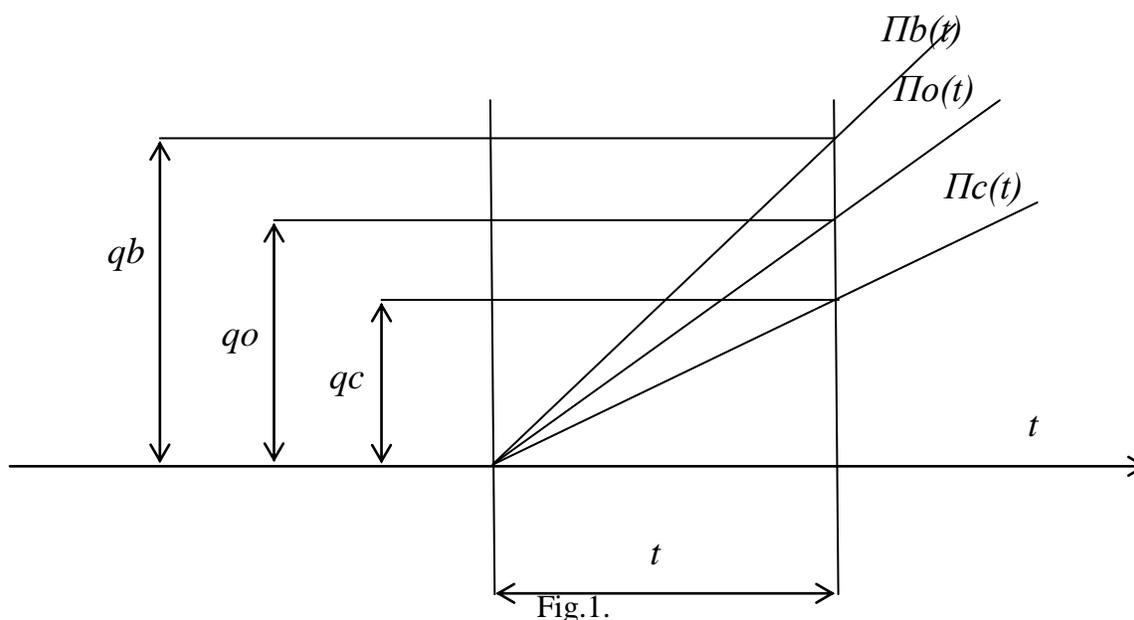

$t$  – Generalized time (academic years)

From formula (1) it can be seen that the indicator of uneven workload of students with independent work is the first derivative of the curriculum, which means

$$q = \frac{q\Pi(t)}{qt} (2)$$

The analysis of formula (2) shows that the effectiveness of the organization of students’ independent work largely depends on the successful development of the current curriculum of universities.

Can be imagined as follows (Fig.1):

Where  $qc$ ;  $qo$ ;  $qb$  – a corresponding indicator of the stability of growth and development of independent work in terms of the volume and complexity of the average, optimal and high levels of the developed curricula.

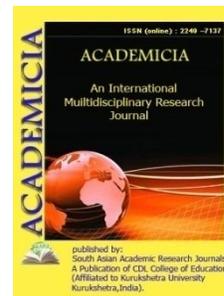

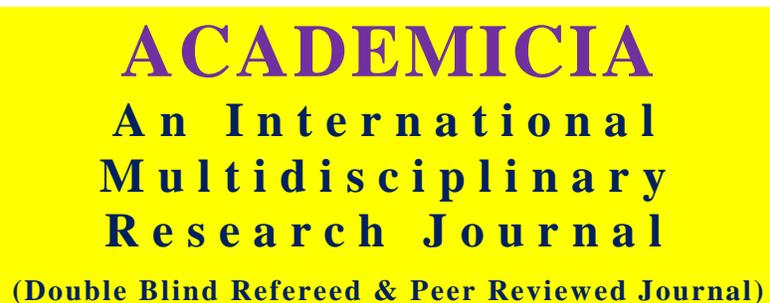

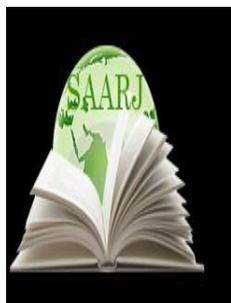

The graph shows that with the same generalized time and the same conditions, the indicator of the stability of growth and development of independent work mainly depends on the reasonable development of the curriculum.

This means that the curriculum system, the curriculum (workprogramme), independent work will be developed with stable growth only if it is provided with a highly qualified education planning.

Taking into account the forecast of ensuring the uniformity of the students' occupancy in independent work, we can say that this is a complex function and it depends on a number of factors, specialists, direction of profiles, activities and conditions. Therefore, the task of pedagogical education and scientists today is to find such a fundamental theory that would actually ensure the greatest stability of growth and development volume and complexity of independent work in the system curriculum and the curriculum (work programme) in the institutions of higher education.

### ABSTRACT

*This article is about mastering the methods of teaching foreign languages, strengthening the motivation of the content of education, and much more. German or French as a foreign language should not be excluded from this development of foreign language teaching methods. Knowledge of the basics of the methodology is necessary and useful for teachers. This allows textbooks to be classified according to the appropriate basic method. Knowledge of the methods allows you to choose the appropriate method (textbook) or the best methodological path for the relevant target group, their skills and the learning objectives.*

**KEYWORDS:** *Strengthening, “Living Languages”*

### INTRODUCTION

The historical development of foreign language teaching can also be read from the sequence of methods. The methods of teaching in the ancient languages (Greek and Latin) were first transferred to the so-called newer languages (English and French) introduced in school lessons. With the changing demands on foreign language teaching to teach the “living languages” in such a way that they can be used both in writing and orally outside of school assignments, the methods have changed and are changing too. They often took in and absorb what may previously have been neglected by the previous methods and responded to current needs of society. They also take into account the latest results from the various related sciences.

German as a foreign language is not to be excluded from this development in foreign language teaching methods. Knowledge of the basics of methods is necessary and useful for teachers. This makes it possible to classify textbooks based on the method on which they are based. Knowledge of methods makes it possible to select the appropriate method (the textbook) or the best possible

methodological path for the respective target group, their skills and the given learning objectives (see Jung2001,137).

The term method / methodology is derived from the Greco-Latin word method's / method us and means something like: access / path that leads to a specific goal.

The present work aims to address four most important methods and show their differences and similarities: the grammar - translation method, the audio-lingual / audio-visual method, the communicative-pragmatic-oriented method and the mediating method.

### **2.1 Grammar Translation Method**

The grammar translation method was adopted from ancient language teaching (Latin, Greek) and transferred to teaching modern foreign languages. German was presented using the categories of Latin grammar, with many exceptions naturally being listed, the learning of which was then often given great importance in class.

The model of language teaching was the written language of aesthetic literature. The language was understood as a building that is composed of certain building blocks according to logical rules.

Learners should understand and learn to use the construction rules of the language. The learning concept was cognitive: language learning should promote the development of logical and orderly thinking (see Heyd1991,25).

The lessons after the GÜM consisted of 3 phases: the introductory phase, in which grammar was presented; from the practice phase, in which sentences on grammar subjects were formed; from the application phase, in which reading, writing and translating were practiced as an application of the subject matter. The focus was on learning grammatical rules, which led to the formation of correct sentences via example sentences. The predominant forms of exercise were grammatically correct completion of clauses in the gaps or grammatically oriented transformations and translations. The back and forth translation of texts served as proof of language proficiency. The spoken target language played a very subordinate role (see Jung 2001, 137).

The learner was not given the opportunity to work out a problem area independently. His mind was not nurtured either. The learners participated more passively than actively.

### **2.2 Audio-lingual / audio-visual method**

According to the universal dictionary Duden, the terms audiolingual and audiovisual are defined as follows: audiolingual [from Latin audire = to hear and lingua = tongue]: [in language lessons] based on the spoken word; audiovisual: audible and visible at the same time. With regard to language lessons, the first case concerns the use of sound devices such as e. Cassette recorders, CD-ROMs, in the second case media such as video recorders, audio courses with textbooks, computers. The AL / AV method grew out of a combination of behavioristic learning theory and linguistic structuralism. In the USA, structuralism had established itself as the linguistic basis of foreign language teaching in the 1940s.

The working methods of structuralist linguistic research were transferred directly to foreign language learning as methodological principles.

The AL / AV method encourages natural language acquisition (one should teach a foreign language like the mother teaches her child the mother tongue). Language is seen as a bundle of speaking habits, as verbal behavior (see Heyd1991,29).

Language acquisition is explained with considerations from behavioral psychology, which reduces human behavior to the mechanical sequence of stimuli and reactions of pretending and imitating, and thus restricts the creative abilities of humans to a minimum and leaves little room for active psychological processes.

The aim of the AL / AV method was the development of language skills and no longer language knowledge. The teaching principles of the AL method included.

- Priority of the oral over the written
- Situativity of the lesson
- Authenticity of the language models
- Practice of speech patterns through imitation and frequent repetition
- Basic monolingualism in teaching, exclusion of the mother tongue from teaching
- Progression of the learning program based on the grammar subjects by systematically increasing the complexity of the language patterns of the target language
- Characteristic forms of exercise of the AL method
- Pattern drill exercises
- Setting switchboards / substitution exercises
- Fill in the gaps / insertion exercises
- Learning by heart and replaying model dialogues (cf. Neuner et al 1993, 61)

The AV method represents a further development of the audio-lingual method. The teaching principle of the AV method consists in combining language with visual material wherever possible. The teaching techniques of the audiovisual method include:

- Presentation of an image or a sequence of images and a dialogue recorded on tape. - In the second phase the meanings of individual conversation units are explained
- In the third phase, the dialogues must be learned by heart by repeating the image and text several times - In the fourth phase, the learners are asked to make their own dialogues about the pictures
- Pattern drills are carried out every hour - Writing and reading will be included in the class later in the course

A comparison of audio lingual and audiovisual methods with regard to their methodological procedures reveals clear parallels. Just like the ALM, the AVM attaches great importance to the spoken language, it uses simple model sentences to practice individual sentence structures (pattern drills), allows the various patterns to be learned by heart and uses technical aids in teaching (cf. Neuner et al 1993, 62ff).

### **2.3 Communicative - pragmatic - oriented method**

The communicative method wants student-centered teaching. After a phase of fascination with the subject matter and the concentration on objectively and measurable learning objectives in the field of linguistic systems that can be measured with objective test procedures, a stronger focus on the learner than on the subject of the learning process and on the learning process itself is characteristic of the current state of the discussion (Neuner et al 1981 , 13).

In the development of communicative didactics since the first half of the 1970s, two basic directions have been observed: one that is more pragmatic and functional and one that is more pedagogical. In the 1970s, new target groups came up (secondary school students, adults, participants in professional development) who required a change in teaching methods. The result was a student-centered communicative method that later no longer starts with the subject matter, but with the student as the subject of the educational process. The learner has been activated and is understood as a partner in the learning process. This is linked to the change in social forms. The traditional frontal teaching is expanded by variable forms of individual, partner and group work.

In foreign language teaching, the needs of the learner must be taken into account. The role of teacher is also seen in a new way. The teacher is more of a helper in the learning process and no longer a media technician. The topics dealt with should affect the learner. He should be motivated to learn foreign languages. It is based on the experience of the learner. The content should mean something to the learner. They should help him to orientate himself in the foreign world and to develop a new perspective on his own world. Comprehension skills become the starting point for foreign language learning. The media play a very important role in this. They are integrated into the classroom. The individual skills are no longer isolated, but practiced in conjunction with one another. Discursive and partner-related speaking will distinguish. A distinction is made between a grammar of understanding and a grammar of communication, and both are developed differently. Both authentic factual and popular scientific texts are dealt with increasingly. The importance of global and selective understanding of authentic listening and listening / seeing texts is recognized and the learner is taught appropriate strategies for this. Regional studies are intended to expand the learner's world experience. It is based on the experiences that the learner has gained in their own culture. For this purpose, the conditions of the target culture are presented in a differentiated manner and compared with the experiences and attitudes of the learner.

Linguistic activity is considered to be an intellectual and creative activity of the student. Communicative skills are derived from the situation, role and text variety analysis (see Heyd191, 29ff).

### **2.4 Mediating method**

This is understood to be a method that selects principles and elements from closed, strict method concepts and mixes them with one another. When making the selection, the criteria of applicability and reliability in practice play a central role.

It is accepted that the reasons and deductions for sub-goals and sub-areas of language teaching are inconsistent and sometimes contradict each other (e.g. cognitive justification of language acquisition / exclusive use of imitative forms of exercise or explanation of second language

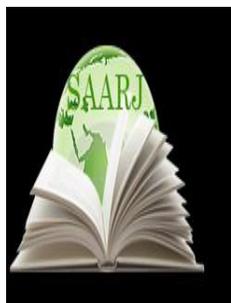

acquisition in analogy to mother tongue acquisition /Use of bilingual explanatory procedures and exercises).

Standards of the mediating method that have developed in particular in foreign language teaching at secondary schools:

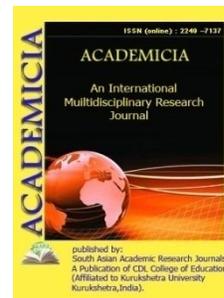

- Orientation towards intellectual and formal educational concepts (simple waiter German is sufficient)
- High priority in grammar lessons (ability can only be achieved through knowledge; from example to rule)
- the grammar lessons run in cyclical progressions (from elementary to specific)
- High importance of literature lessons (text analysis / reflection on texts ") - Orientation towards pragmatic learning goals (understanding in conversations is important)
- Emphasis on dialogical communication (everyday communication) - Observance of the principle of enlightened monolingualism (understanding must be ensured) - preference for frontal forms of teaching (the teacher must control the acquisition of skills and knowledge)
- Consideration of forms of instruction that promote the independence of the learner (the learner's own activity must be supported)

### ABSTRACT

*A new anion-exchange granular sorbent was obtained by cross-copolymerization of 1,3,5-triacrylyltriazine with acrylonitrile and its chemical modification with hydroxylamine. In this reaction, hydroxylamine showed a catalytic effect, bringing the static exchange capacity (SEC) of the anion exchanger to 4.7 mg-eq/g. The influence of the concentration of hydroxylamine, temperature and reaction time on the static exchange capacity (SEC) of the anionite was investigated. Carrying out the amination reaction at 95 ° C for 5 h and increasing the hydroxylamine concentration in the reaction mixture to 10 mass% turned out to be the most optimal conditions for modification. The potentiometric titration curves showed that the resulting anion exchange had low basic groups. The ionization constant of the functional groups of the anionite ( $pK = 7.1$ ), found in the graphic solutions of the Henderson-Hasselbach equation, confirms the low basicity of the anionite. The sorption capacity of the anion exchanger for metal ions from aqueous solutions containing a mixture of  $Ag^+$ ,  $Pd^{2+}$ ,  $Pt^{2+}$ ,  $Cu^{2+}$ ,  $Sc^{2+}$ ,  $Ba^{2+}$ ,  $Sr^{2+}$ ,  $Ni^{2+}$ ,  $Co^{2+}$ ,  $Cd^{2+}$ ,  $Cr^{3+}$  and etc. ions is 10-8 g/l and  $pH = 5-6$ . It has been established that the new anion exchanger selectively and quantitatively (100%) absorbs  $Ag^+$  and  $Pd^{2+}$  ions, which is promising as a selective sorbent for  $Ag^+$  and  $Pd^{2+}$  ions.*

**KEYWORDS:** *Copolymer, Modification, Anion Exchanger, Potentiometric Titration, Sorption*

## I. INTRODUCTION

It is known that sorption materials are increasingly finding their application in various fields of industry, where it is required to improve the quality of raw materials and products, deep purification of technological solutions. It is important that sorbents used in industry to increase the yield to a high percentage are technologically and economically viable. Accordingly, the problem of synthesizing ion-exchange materials capable of selectively sorbing metal ions from complex technological solutions remains urgent.

The aim of this work is to synthesize new ion-exchange granular sorbents based on a copolymer of acrylonitrile and hexahydro 1,3,5-triacrylyl triazine, to find the optimal modification parameters, and to study the physicochemical properties of the obtained anionites.

## II. Experimental technique

The modification of the copolymer of the porous structure of AN and GTT with hydroxylamine was carried out in a 5% solution of dimethylformamide at 369-371K for 5 hours in a weakly acidic medium in order to partially swell the granules [1, pp.25-30].

The resulting anion exchanger was identified by IR spectroscopy, which confirms the absorption bands of ionogenic groups, in particular, in the regions of 2250, 1650 and 1250  $\text{cm}^{-1}$ , corresponding to the vibrations of CO, NH,  $\text{NH}_2$  bonds.

The acid-base properties of the sorbents were determined by potentiometric titration. To determine the pK functional groups of the ion exchange sorbent, ie to establish the relationship between the degree of their ionization and the pH values of the solution, we used the Henderson-Gesselbach equation [2, p. 110]:

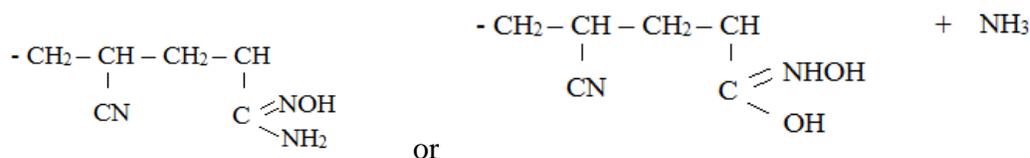

$$pH = pK \pm \lg \frac{1-\alpha}{\alpha},$$

where the sign in front of the second term of the equation is positive for bases and negative for acid groups.

The sorption of metal ions was studied by a dynamic method. The initial concentration of elements was  $10^{-8}$  g/l, and the pH of the solution was 5-6. For the quantitative characterization of sorption, the neutron activation method was used, for which the initial solution and the sample of the ion exchanger were irradiated after sorption. The value of the degree of sorption was calculated from the difference in the pulse area of the elements that correspond to certain energy values (in keV).

## II. RESULTS AND ITS DISCUSSION

It is known that the interaction of cross-linked polyacrylonitrile and granules based on it with hydroxylamine will lead to the production of polyacrylamidoximes or polymeric hydroxamic acids. The modification process can be schematically represented as follows:

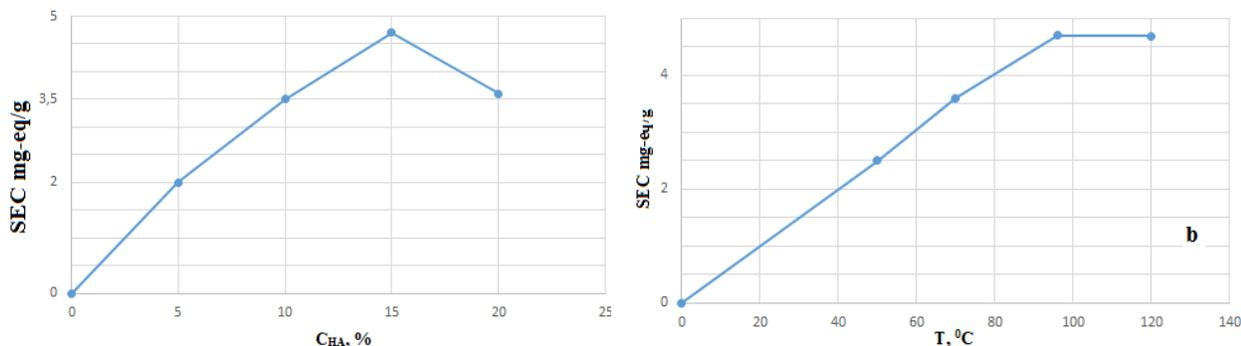

As a result of the modification reaction in the presence of a catalyst, the SEC of the anionite reaches 4.7 mg-eq/g.

It is known that the development of a new method of anion exchanger requires optimal conditions for the synthesis of his research, which is important both from a technological and economic point of view. To find the optimum synthesis conditions have been studied the effect of various factors (the concentration of hydroxylamine, temperature, reaction time) for static exchange capacity (SEC) ion exchangers, which is the basic measure of the qualitative and quantitative evaluation of the reaction product.

To establish the effect of hydroxylamine concentration on SEC, the modification was carried out in the concentration range from 5 to 16 mass percent of the aminating agent. Figure 1 (a) shows the dependence of the SEC of anion exchangers on the concentration of hydroxylamine.

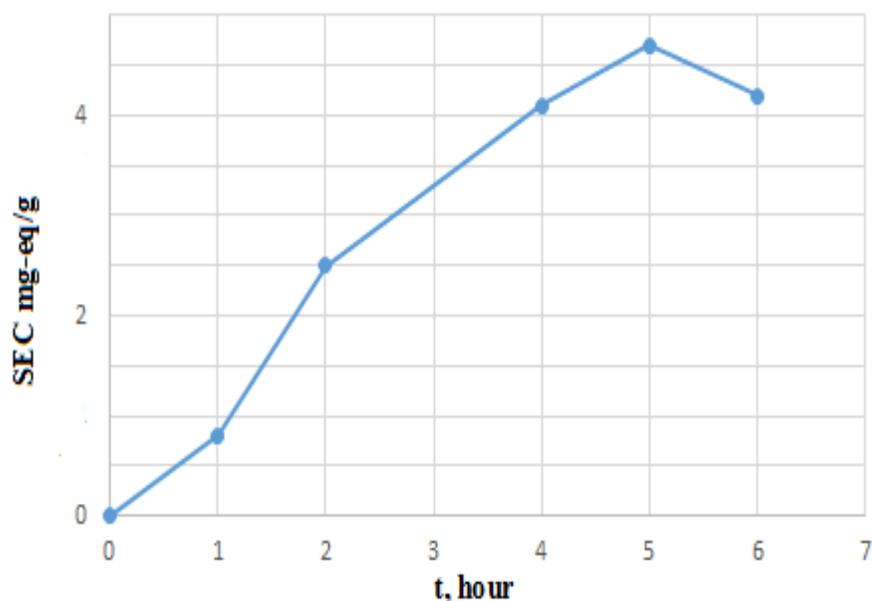

The results of studying the effect of temperature on the SEC of modified copolymers are shown in fig.2. As can be seen from the data presented in fig.1(b), in the temperature range of 369K, the SEC value of anionite sharply increases.

**Figure 1. Dependence of the SEC of the anionite on the concentration of HA in the reaction mixture (a) and the process temperature (b)**

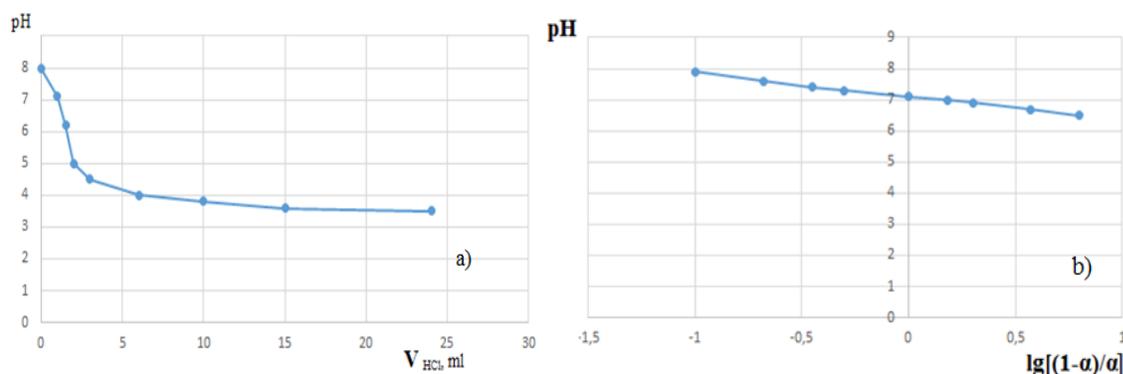

The effect of the duration of the amination reaction was studied in the range from 2 to 8 hours, the results of which are shown in fig.2.

As can be seen from the data presented in Fig. 2, the dependence curve comes through a maximum with a reaction duration of 5 hours. An increase in the reaction time leads to a decrease in the SEC.

**Figure 2. Dependence of the SEC of the anion exchanger on the duration of the amination reaction**

As can be seen from the data presented in fig.3. The obtained anion exchanger has a weakly basic character, the pK of which is 7.1

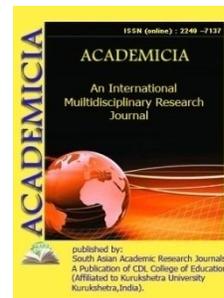

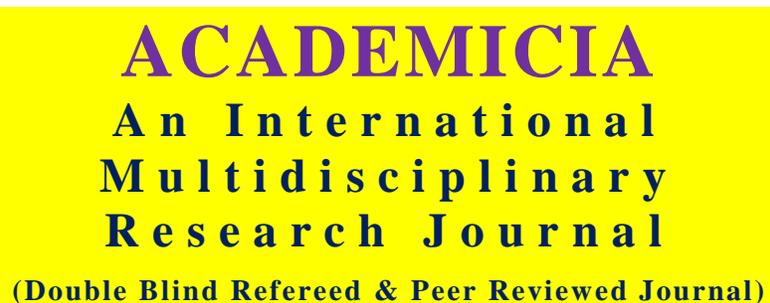

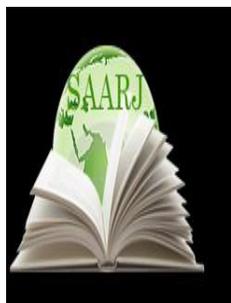

**Figure 3. Curves of potentiometric titration of anionite: differential (a) and expressed in the coordinates of the Henderson-Hasselbach equation (b)**

The presence of imine and amine groups containing a lone pair of electrons, as well as a spatial structure, imparts complexing properties to the anion exchanger [3]. To clarify the complexing properties of the obtained anionite, the sorption of metal ions from aqueous solutions containing mixtures of various ions such as  $Ag^+$ ,  $Pd^{2+}$ ,  $Pt^{2+}$ ,  $Cu^{2+}$ ,  $Sc^{2+}$ ,  $Ba^{2+}$ ,  $Sr^{2+}$ ,  $Ni^{2+}$ ,  $Co^{2+}$ ,  $Cd^{2+}$ ,  $Cr^{3+}$  and others with an initial concentration of  $10^{-8}$  g/l and pH = 5-6 was studied. It was found that the new anion exchanger selectively and quantitatively (100%) absorbs  $Ag^+$  and  $Pd^{2+}$  ions, which has prospects as a selective sorbent for  $Ag^+$  and  $Pd^{2+}$  ions.

### ABSTRACT

*The analysis of the used mathematical models of technical systems is carried out. The groups of models are distinguished depending on the level of the hierarchy, the form of presentation, the nature of the displayed properties, the method of obtaining, the level of physical properties of technical objects, the ability to predict the results.*

**KEYWORDS:** *Mathematical Model, Technical System, Form Of Presentation, Degree Of Abstraction.*

### INTRODUCTION

At present, the development of technology is characterized by a rapid change in the models of manufactured products and an increase in the number of developments with higher consumer qualities. This affects the intensification of the processes of creating new technology, improving the quality of projects, developing and organizing the production of competitive products in a short time. An important role is also played by the timing and quality of design work. Their compliance with modern requirements can be ensured by using a new design technology based on the use of mathematical modeling methods.

The relevance of the study lies in the fact that the modeling of technical systems is a modern scientifically grounded method used in experimental and theoretical scientific research.

The purpose of the study is to identify the features of mathematical models used in the study of technical systems.

The purpose of the study identified the tasks:

- To analyze the used mathematical models of technical systems;
- To distinguish groups of mathematical models of technical systems depending on various parameters.

Modeling is based on replacing an object with some of its model, followed by research to obtain the necessary information about the object.

Any model of a technical system is some non-identical analogue of it. To be analogous to a system means to be similar to it. The similarity of various systems can be physical and mathematical [2].

When studying deterministic processes in which their determining values change according to certain laws, physical modeling is effective. Mathematical modeling is usually used to describe various systems, processes, phenomena. It makes it possible, through mathematical symbols and dependencies, to compose a description of the operation of an object in the surrounding environment, to determine output parameters and characteristics, to obtain an assessment of quality performance indicators, etc.

Physical and mathematical modeling are not opposed, but complement each other. At the same time, mathematical modeling, which considers a whole class of similar phenomena described by the same equation, is a system more general than physical modeling.

Mathematical modeling of technical objects is a kind of mathematical modeling. The object of mathematical modeling is a certain technical system. When designing, describing the operation of a technical object, many types of mathematical models are used, depending on the level of hierarchy, the degree of decomposition of the system, aspect, stage and stage of study.

In particular, models at the micro and macro levels of mechanical, hydraulic, thermal and electrical systems are considered.

The mathematical model is an analogue of the object under study. The degree of its adequacy to the object is determined by the formulation and correctness of the solutions of the research problem.

The set of variable parameters (variables)  $X$  forms the space of variable parameters  $R_x$  (search space), which is metric with dimension  $n$  equal to the number of variable parameters.

The set of independent variables  $Y$  forms the metric space of the input data  $R_y$ . In the case when each component of the space  $R_y$  is specified by a range of possible values, the set of independent variables is displayed by some bounded subspace of the space  $R_y$ .

The set of independent variables  $Y$  determines the operating environment of the object, i.e. external conditions in which the investigated object will work.

It can be:

- Technical parameters of the object, not subject to change during the study;

- Physical perturbations of the environment with which the research object interacts;
- Tactical parameters that the researcher must achieve an object.

Input considered a generalized model of a metric space criterion indicators the  $R_{the G}$ .

The analysis of scientific literature [1-4], considering the problems of modeling technical systems, made it possible to identify the following groups of models:

- by the form of presentation of the mathematical model;
- by the nature of the displayed properties of the technical object;
- by the degree of abstraction;
- by the method of obtaining a mathematical model;
- accounting for the physical properties of a technical object;
- by the ability to predict results.

*By the form of representation of mathematical models*, invariant, algebraic, analytical and graphic models are distinguished.

An invariant model is a mathematical model specified by a system of equations, without any connection with the method for solving these equations.

When using an algebraic model, the relationships are associated with the chosen numerical solution method and are written in the form of a sequence of actions - an algorithm.

The dependence of the sought variables on the given values is represented by the analytical model. This type of model is obtained either on the basis of physical laws, or as a result of direct integration of the original differential equations using tabular integrals.

The representation of graphic objects: graphs, equivalent circuits, diagrams, etc., is carried out by a graphic model. To use graphic models, a rule of unambiguous correspondence of conditional images of graphic elements and components of an invariant mathematical model must be defined.

*By the nature of the displayed properties of a technical object*, mathematical models are divided into functional and structural.

The processes of functioning of technical objects in the form of systems of equations describe functional models. They are used at all hierarchical levels, stages and stages in functional, structural and technological design.

When solving problems of structural synthesis, structural models are used and they display only the structure of objects. The parameters of structural models have signs of functional or structural elements that make up a technical object and by which one variant of the object structure can be distinguished from another. Such models are in the form of tables, matrices and graphs.

*According to the degree of abstraction*, three main hierarchical levels are distinguished: meta level, macro level or micro level.

The initial stages of research correspond to the meta level. At this level, scientific and technical search and forecasting, development of a concept and technical solution are carried out. Methods of automatic control theory, mathematical logic, graph theory, queuing theory are used.

When investigated at the macro level, an object is considered as a dynamic system with lumped parameters. Models of this level are used to determine the parameters of a technical object and its functional elements and represent a system of ordinary differential equations.

As a continuous medium with distributed parameters, the object is represented at the micro level. To describe functioning processes, partial differential equations are most often used.

*According to the methods of obtaining, mathematical models* are divided into theoretical and experimental.

When describing the physical processes of the functioning of an object, theoretical models are obtained.

When studying the behavior of an object in the external environment, experimental models are obtained.

Physical and formal approaches are used to build theoretical models. The physical approach is reduced to the direct application of physical laws to describe objects. The formal approach is used in the construction of both theoretical and experimental models.

*Taking into account the physical properties of a technical object,* mathematical models can be: dynamic and static, continuous and discrete, linear and nonlinear.

The description of the process in time during the transition from one mode to another is carried out using a dynamic model, while a connection is established between the main variables when changing over time. When the main variables of the process change in time and space, partial differential equations are used, when changing only in time, ordinary differential equations are used.

The description of the process in the steady state is carried out using a static model. A static model of a typical process is built taking into account all possible modes of operation of objects and is expressed by a system of algebraic equations.

A model in which all variables and parameters are discrete quantities is a discrete mathematical model. Such models serve to describe processes that are assumed to be discrete.

If the model contains continuous quantities and allows you to reflect continuous processes in systems, then this is a continuous model.

Linear functions of basic variables and their derivatives contain linear mathematical models.

Mathematical models that include nonlinear functions of the main variables and their derivatives are nonlinear.

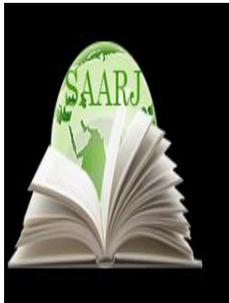

*According to the method of predicting the results,* mathematical models are divided into deterministic and probabilistic.

Models that describe processes without the use of statistically probable distributions are called deterministic and are based on linear difference equations, differential equations, integral equations and operators.

Stochastic processes describe probabilistic models; they reflect the laws of statistically probable distributions.

### ABSTRACT

*Trading grain and other agricultural items have been the trend in many nations of the world. In previous times, the exchange system that existed for exchange in items was the structure for trade in goods. Gradually, this gave an approach to economic merchants from all over the world, and trade in agricultural products gave strong economic advantages. The SPS Agreement under the Uruguay Round Agreement on Agriculture (URAA) defined the Sanitary and Phytosanitary (SPS) Guidelines as steps taken to ensure human, animal or vegetation or well-being from hazards associated with imported agricultural goods. Technical barriers to trade are legislation and interventions to supervise the supply of goods to the national market, which have as their main objective the correction of market wasteful aspects arising from externalities related to the production, distribution and consumption of those goods. This paper focuses on historical study of Indian foreign health and phytosanitary measures and Trade Barrier Treaties (TBT).*

**KEYWORDS:** *Agricultural Products, SPS Measures, TBT Measures, Indian.*

### 1. INTRODUCTION

As income earning for their countries, developed countries used their agricultural output. In order to guarantee safety and prevent trade-related illnesses and rodents, nations have compelled laws to ensure the well-being of human beings and animals. Unlike other goods, farm yields need extra attention. In addition to viability and efficiency at production stage, certain critical protection precautions need to be considered when the commodity is extracted and delivered, as a result of agricultural commodities. If these precautionary steps were not applied, the essence of

the commodity would effectively influence and extend wastage and consumer esteem would decline. Moreover, both linear and treated food goods remain unchanged. It is also in the immediate interest of producers, just as exporters are responsible for ensuring that clear clean and adequate protection protocols are followed. The GATT has promoted national food protection, animal and plant health since its establishment. The Uruguay Round was eventually the first to emphasize the areas never previously concerned – nutritional security and nutritional safety [1]. The Uruguay Round took place. And eventually, in 1995, the agreement was concluded with the intention of supplying the customers of a world with healthy products, and guarantees that human, animal and plant health protections were not implemented as a matter of priority, protecting the domestic producer[2], with the goal of ensuring the availability of secure goods for the customers of the countries in question.

Inclusion of agricultural trade into its terms is the main question of the GATT / WTO Agreement. This has been rendered unparalleled to the international conference by the historical backdrop of GATT. This participation also ensured that the producing nations are particularly truly subjected to their own home areas to make profit, as well as to livelihoods and industries. The fact that agricultural production is being incorporated into the WTO system itself is not resisted, but as agriculture becomes a source of contention it will become the full range of concerns such as budgets, permitted rights to invention, plants, new barriers to trade such as the environment and working conditions. While much has been stated about the benefits of the WTO agreement for the development of countries, a large part of the research into the gracious response to agriculture in the development countries shows that improvements in trade due to the WTO introduction are likely to be unusually inelastic. Real, a portion of the study shows negative responses but, because of WTO requirements, there are some beneficial advantages of trade in agriculture. These regulations cannot be incredibly enormous for the development of nations, because of the deeply damaged market sectors in agriculture products as foreign product advertisement is dominated for all purposes by a few global firms in each product field.

## **2. IMPLEMENTATION OF TBT AND SPS AGREEMENTS**

Under WTO funding, SPS and TBT agreements are labelled along with various separate Agriculture Agreements (AoA)[3]. Truth be told, AoA definitely supports the implementation of the SPS Agreement via its Article 14 notes that: "Members consent to give force to the Introduction of Sanitary and Phytosanitary Measures." In any event, SPS and TBT Agreements are not granted the same kind of concern from industries and specialists. The biggest misunderstanding is recognizing the difference between SPS and TBT agreements. They may be distinguished as follows – SPS papers allude to the section of food and agriculture alone, while TBT steps allude to all things including fruit. SPS agreement means protecting human, creature, and plants or well-being from bugs and diseases resulting from food and agricultural imports.

On the other side, TBT agreement handles object requirements that include scale, form, weight and content bundling prerequisites like naming and caring for well-being. SPS steps confirm international principles, laws and standards to ensure individual, organism or vegetation or well-being. For food products, the universal gauges, guidelines and recommendations allude to the Codex Alimentarius Committee (CAC) guidelines. "CAC is a commission founded by the Food and Agricultural Organization (FAO). While the CAC recommendations had little support for international law, the WTO's adoption of these requirements by SPS and TBT agreements made

them de facto mandatory"[4]. An important CAC guideline for food handling organizations is to adopt the food risk monitoring system called Danger Identification and Essential Control Points (HACCP). Also, "US and European Community (EC) have already made this framework obligatory for food processing firms. EC banned imports of fish from Gujarat firms that did not follow the HACCP framework (IE,1999). Furthermore, about 100 crores of herbal product exports from India, targeted for 1997-98, were seriously affected as the US intended to place a ban on imports of these items unless they verified HACCP (EFP, 1997).

Indian seafood processors are taking assistance from foreign experts at exorbitant prices to incorporate HACCP in their processing units (CP, 1997)"[5]. As it might be, they should not rely only on sending out market sectors. The dropsy-death scene in a palatable oil showcase in 1998 was just to demonstrate that the Indian household industry has a lot of improvement in agro-treatment and food safety. Multinational companies like Nestle-India only needed to grow and plan HACCP for espresso (ET, 1997). Article 14 of the AoA expects people to affect the Sanitary and Phytosanitary Agreements. Stuff, however, aren't as simple as they seem. Almost definitely, if India disagrees with SPS posts, it will face non-duty trade barriers. However, one must note that a significant majority of SPS publications support Western countries. As an expansion of Articles 3.1 and 3.2, Article 3.3 states that 'Members may implement or sustain sanitary or phytosanitary measures resulting in a higher degree of sanitary or phytosanitary security than would be achieved by measures based on applicable international standards, guidance or recommendations if scientific rationale exists.'[6].

The SPS agreement in Article 5.1 allows interventions to be focused on an evaluation of person, creature, and vegetation or well-being threat. It doesn't even involve the taking in country itself to do the hazard evaluation. Furthermore, Article 5.2 clarifies that the kind of details would be treated when assuming responsibility for threat assessment. Article 5.3 defines the economic factors to be considered for animal or plant well-being risk analysis. However, Article 5.7 provides for the removal of Articles 5.5 and 5.6 by allowing interim steps to be taken in the event of lack of adequate scientific data relating to specific health measures. Article 5.5 specifies that countries apply their health policies fairly in diverse situations [7]. Under Article 9, Member States are responsible for promoting technical assistance to other nations, particularly economically vulnerable developing nations, and Article 10 deals with while implementing any SPS steps they should also take into account the need for longer transition times for emerging nations and less developed nations.

Article 11 of the Agreement states that the provisions of the Conflict Resolution Framework shall extend to mediation and dispute resolution under the Agreements. According to Article 12, the agreement defines the formulation of a committee on SPS initiatives to accommodate a review of consultation on sanitation or creature and plant well-being figures affecting trade and promoting the application of the agreement [8]. "Australia placed a ban on importing chilled or frozen fish to protect its domestic fish stock from various diseases. Canada believed salmon introduced for human consumption is unlikely to bring a variety of diseases. The panel ruled that the import ban violated Article 5.5 since it was not based purely on any risk assessment for ocean-caught pacific salmon, and the panel found no reasonable connection between the regulation and risk assessment. No risk assessment was conducted for other salmons. Thus, Australia 's policies violated Articles 5.5 and 5.6 by implementing a more draconian than required measure"[9]. SPS agreements allow Member States to implement policies that meet

with international norms. The foreign bodies are prepared as follows:

Food protection CAC [10] (as mentioned above).

\* International Business Epizootics [11], and

\* International Plant Health Convention [12].

Member States are entitled to set standards higher or lower to these international standards, and whether the standards are higher than international standards are not appropriate to cope with food, animal and plant protection in the country implementing such a norm. Although SPS is a legally binding document on Member States implementing Codex, IPPC or OIE has no binding effect. There can be no legal opposition to Member States implementing Codex rules, criteria, and recommendations [13]. They're called free in nature.

### 3. SITUATION IN INDIA

India has managed to establish a strong position on the global food market, and is already one of the world's top producers of many food products. They are the production of wheat and paddy, livestock, meat, and India has worked out how to make a fair condition on the worldwide marketplace and is now one of the world's major producers of different food products. They are wheat and paddy, pork, leafy food, fish, etc. The scale of the Indian food industry is well above INR 250 billion, sending merchandise worth INR 1450 million, contributing around 10 percent of the nation's overall export [14]. A massive local presence meant that there was a primed demand and therefore a driving force for producers to use successful methods of development leading to a greater amount and improved yield quality. Subsequently, the handling sector has an average growth rate of roughly 15% [15]. Agricultural growth is much smaller. However, there remains an enormous undiscovered production potential that helps us to grow as the largest producer of important food products on the residential front when exploited, better creativity in both formation and handling circles will offer more noteworthy skills.

Additionally, good delivery arrangements and storerooms are important to mitigate the misfortunes of decay and food wastage. "Some figures say that about 20% of all foods produced in India are wasted. Furthermore, easy credit availability is essential, lacking which causes a bottleneck in solving other issues. Internationally, emphasis has moved to two subjects. Next, the nation will be better off manufacturing refined food products than main production. India is the world's second-largest fruit and vegetable producer, but only around 2% is processed. Similarly, while we are the main milk manufacturer, the coordinated sector processes just about 15 percent. On average, India's raw commodity value is just 7 percent. This is even less than China's 23 percent, Philippines' 45 percent, and UK's 88 percent. Secondly, impeding the importation of non-standard goods from other countries. Incidents have happened in the past where low-quality agricultural items were shipped from other countries. Incidents have occurred in the past when developing countries shipped low-quality food goods to India, deemed unfit even for their domestic market.

Now, with greater understanding and stronger negotiating power, India would expect to stop emerging countries using its domestic markets as dumping grounds"[16]. The nation's big test is motivating the export potential of packaged food products. In this way, in the following section, we examine problems surrounding the quality of SPS Agreements in India, the actions taken and the organizations responsible for them. In the ongoing past, perception of the importance of well-

being initiatives and fear of well-being threat suggested an unambiguous upward trajectory even in not all that produced nations like India [17]. Food products Orders, Vital Goods, and Food Adulteration Avoidance Acts suggest relations for staple producers and dealers. 00These goals are to maintain sanitary and safe environments at all gracefully supply chain stages and set the basic prerequisites for:

- \* Sanitary and hygienic environments, climate and staff
- \* Water for planning
- \* Machinery, Hardware
- \* Product norms

Other than this, the most severe additive, additional substances and pollutants limits were also calculated for various products. Ministry of Food Manufacturing Industries, Ministry of Agriculture, and other organizations would be responsible for reviewing this law. Makers don't know which institution to approach for regulations, and which entity has the place to perform evaluation. Repeating practices by other agencies will result in futility exercise and properties. Following are various corporate rules and their descriptions:

#### **4.1. LEGISLATION AND INSTITUTIONAL SET UP**

##### **4.1.1. Ministry of Agriculture**

- \*Insecticide Act
- \*Milk and Milk Product Control Order
- \*Meat Food Product Order 1973

##### **4.1.2. Ministry of Rural Development: Directorate of Marketing and Inspection (DMI)**

- \*Agriculture Produce (Grading and Marking Act)

##### **4.1.3. Ministry of Health and Family Welfare**

- \*Prevention of Food Adulteration Act 1954

##### **4.1.4. Ministry of Food Processing Industries**

- \*Fruit and Vegetables Product (Control) Order – FPO 1955

##### **4.1.5. Ministry of Commerce**

- \*Export (Quality Control and Inspection) Act 1963

##### **4.1.6. Ministry of Civil Supplies, Consumer Affairs and Public Distribution**

- \*Standards of Weights and Measures Act
- \*Standards of Weights and Measures (Enforcement) Act
- \*Solvent Extracted Oils, De-oiled Meal and Edible Flour Control Order 1967
- \*Vegetables Product Control Order 1976
- \*Bureau of Indian Standards Act 1986

#### **4.1.7. Ministry of Environment and Forests**

\*Aquaculture Authority Notification 1997 and 2002

\*Environment Protection Act 1986, Environment Protection (Third) Amendment Rule 2002

\*Coastal Regulation Zone – Notification 2002

Other focuses, along with these pillars, are attempts to plan and enforce sanitary and phytosanitary practices. They are clarified as follows:

#### **4.2. Bureau of Indian Standards (BIS):**

This is the first association to set guidelines. To date, more than 17,000 standards have been laid down, of which 150 are mandatory, while others are optional. The method adopted by BIS is the same as in other parts of the world.

A proposal from a customer or company shall be deemed feasible by the Committee before the final proposal is drawn up. All BIS requirements are voluntary, unless otherwise specified by the Government [18].

#### **4.3. Food and Agriculture Department (FAD)**

It manages standardization in the field of food and agriculture and packaged food, agricultural knowledge sources, agricultural equipment and animal husbandry. Craze accepts the following exercises:

\* Review of the new standard.

\* Finish the norm when the process is done.

Recognition of the region where a new standard needs to be developed, as there is no old standard.

#### **4.4. Ministry of Food Processing Industry (MFP)**

It sets out the techniques and criteria for the food processing industry. In this way, the leads are assembled in respect of the corresponding push regions:

\* Material to be used for the food-contact machine and equipment.

\* Quality of the water used for processing and other uses, such as washing and cleaning.

\* Requirements for in-house labs.

\* Assessment of consistency by food technicians.

\* Standards relating to the chemical content, physical characteristics, levels of pollutants and additives permitted in food.

#### **4.5. Export Inspection Council (EIC)**

This is a zenith office that encourages exports of SPS consistent items. It likewise offers guidance to the legislature with respect to measures to be taken for authorization of value control an inspection. EIC gives three sorts of inspection and certification:

\*Consignment-wise inspection.

\*In-process quality control.

\*Food safety management system-based certification.

Endeavors of these organizations plainly do not get the job done to address each issue concerning the food production industry of the nation. The significance of pretended by these offices in empowering the makers to satisfy the wellbeing security guidelines, cannot be sabotaged. However, there is a need to take a few measures at authoritative and conciliatory level. Central Government is responsible to assume the significance at this point. Such a necessity emerges when a few nations force trade barriers under the camouflage of technical barriers (SPS Measures). Then the government raises the issues at WTO, Dispute Settlement Bodies or at the international courts [19].

## **5. SPS BARRIERS FACED BY INDIA**

Some of the areas where India has had difficulty exporting its food products to other members are listed below:

### **5.1. Various Food Products**

Exports of various food products from India have long been confronted with serious issues on the basis of aflatoxin content above the EU's most severe standards. Prerequisites are given for the MRLs estimate of aflatoxin in products such as flavours, peanuts, groundnuts, grains, different other processed foods, and so on. The MRLs are often more serious than the international principles defined by the CAC. Moreover, the examination technique to evaluate the proximity of aflatoxin is so perplexing and expensive in a technological and economic way that it is difficult for a nation like India to encounter it. A few years ago, with a view to better addressing the issue of aflatoxin in peanuts, APEDA (Agricultural and Processed Food Products Export Development Authority) referred to the UNDP (United Nations Development Program) in order to work out unusual preparations for Gujarat nut ranchers to boost their aflatoxin board fitness[24]. A few ranchers have been set up under this unique scheme. Issues that differentiate UNDP executives from aflatoxin during that period include trade displacement, the permissible limits are not identical in different countries, lack of shared understanding of the irrationality of sample size, lack of financial and technical capital, etc.

### **5.2. Mango and Mango Pulp**

The majority of Indian primary production takes place in an unorganized small-scale market. The EU requires that every mango farmer keep records of the use of his mangoes in the processing of mango pulp. The explanation given by the EU is that if a shipment of mangoes is found to be tainted or harmful, it can be tracked back to the farmer. However, there would be no need to keep such records if the pulp processor follows strict quality checks at every stage. In such a case, the pulp processor and the exporter would be responsible for standard enforcement. [25].

### **5.3. Rice**

Indian rice exports are faced with SPS-related issues in countries such as the EU, the USA, Japan, the Middle East and Russia. In June 2007, Russia limited imports of rice, sesame and groundnuts from India on the grounds of exposure to irritation in the shipment of rice. Issues in the EU and Japan largely relate to pesticide deposits, visit amendments to the guidelines and lack of clarification on the rational interpretation of the principles. The problems of exports to

the Middle East stem fundamentally from the lack of clarification in the specifications of the gauges and the large documentation needed by the government offices. Basmati rice has been described by the US as facing a greater number of issues than the various classes of rice. Occasionally, this bid rises to the suspicion of SPS standards that have been used to obtain high cost residents of US rice, which may be confused with 'Basmati' (rice), ignoring the way in which the nomenclature and prestige of 'basmati' is related to its land base in the Punjab state of India. Essentially, the need to agree to tough US gauges builds up production costs. In addition, there are problems that associate with delay the handling of the shipment, the rehashed test and the cost reduction bid. As a result, the motivation to export rice to the USA is extremely low [26].

#### **5.4. RedChilli Powder (Sudan Red)**

Sudan Red (three assessments: 1, 2, 3) is a processed colorant used in the food industry a long time ago. On the grounds that Sudan Red is conceivably cancer-causing, the EU has limited its use in prepared foods. 'In October 2003, the EU specified the criteria for Sudan-free certificates for all spices, including red chili powder, and notified the relevant agencies in India (the Spices Board and the Export Inspection Council) (EIC) after finding traces of Sudan Red in some export shipments of red chili powder from India. While in India spice processors do not use synthetic dyes in processing plants, in accordance with EU requirements, the Spices Board of Laboratories checked all export shipments for Sudan and issued certificates of conformity. Despite these measures, some shipments of red chili powder have continued to be refused in the EU. Upon thorough analysis, it emerged that advanced EU equipment could detect traces of Sudan Red at parts per billion (ppb) levels, whereas Indian equipment could detect traces at parts per million (ppm) levels.

Subsequently, the Spices Board invested Rs. 1.5 crores in modern gas chromatography mass spectrometry (GCMSMS) equipment, which could provide the same degree of accuracy as the EU equipment [27]. After the hardware tests were carried out, few of the shipments in India were not allowed to export. However, having found that the zest processor does not use colorant, it was difficult to pursue the root of the issue for a while. In the end, it was discovered that bean stew ranchers in some units in Andhra Pradesh applied dyes to the dry chillies while moving them to the mandis, with the hope that more substantial expenses will be paid. These sections were stirred up by various parcels entering discount markets, making it difficult to follow the start of Sudan Red. The Spices Board is of the opinion that the unhealthy impacts of Sudan Red can only occur at consumption levels of stew powder which are considerably higher than that even in countries such as India, where bean stew is a key fix that every day refrains from consuming. This kind of high degree of admission is unexpected in the European nations [28].

#### **5.5. Milk Products**

India is the world's largest producer in the dairy sector. In any event, Indian dairy products would not be allowed to be exported to the EU. This is despite the manner in which the National Export Inspection Council (EIC) operates a Food Safety Management System-based Certification (FSMSC) for the export of milk products to ensure that the quality of the exported goods satisfies the requirements of bringing into the country. During the ongoing visits of the FVOs (Food and Veterinary Office) mission group from the EC to India to assess the regulation of deposits in live animals and to note the regulation of veterinary medicinal products in

compliance with Council Directive 96/23 / EC, the method for controlling the build-up of milk in India will be investigated. Generally speaking, the group was pleased with the quantitative controls set up in India, starting with milk production at the level of processing and, furthermore, with the systematic offices available in the country. In the same vein, India referred to the EC for a visit by the FVO Mission Group to evaluate Indian Milk Processing Units in order to enable the export of milk products from India. Despite these operations, India has yet to prevail with regard to the export of milk products.

### 5.6. Tea

India is the world's largest producer and user of tea. The build-up of pesticides in Indian tea has become a major cause of concern for India as regards market access to export destinations, such as the EU. As an example, in Darjeeling tea, Germany has been grappling with an elevated level of ethion build-up. Assam, Terai and Dooars tea powders were also objected to a large amount of bifenox. India was challenged as to the reason for these objections on the EU market. For example, in 1995, the furthest increase of 0.01 mg of tetradifon and 2 mg of ethion per kg of tea was reportedly forced to some degree by Germany subjectively due to the lack of knowledge from India on the safety limits of its pesticide for tea. Subsequently, Teekanne Darjeeling Gold brand tea was discarded in the light of the fact that it contains 0.24 mg of tetradifon per kg, which is multiple times the point of rupture set by Germany. These refusals were soon followed up by a study by the German Institute of Environmental Analytics, Messzelle, which described them as risky [29].

There was no rejection by the United Kingdom, however, of any other European marketplace. This led to an analysis that the German boycott was a protectionist one. "India, along with China, raised the question of tea at the SPS Committee meeting in March 2005. They pointed out that, in July 2001, the EC released a directive on residual pesticide tolerance and control methods for tea in which the maximum residue limits (MRLs) laid down by the EC for seven types of pesticides were higher than those laid down in the Codex guidelines. India expressed concern that tea was listed as rigid residual limits, while other competing products consumed in larger amounts in the EC were not affected. The EC has recently, by means of a new Directive addressed to the Member States of the Group, amended some Annexes to the earlier Council Directives with regard to the maximum allowable amounts of pesticide residues in processed Agri-crops, cereals, fruit and vegetables and tea, among others. The steps provided for in the new Directive are said to be in line with the opinion of the Standing Committee on the Food Chain and Animal Health of the EU [30]. According to the WTO, the Group exchange accomplices were consulted on the new MRLs and suggestions on the pesticide level were considered when appearing on the new MRLs. The Guidelines mandated the part-conditions of the EU to enact and transmit, by 14 June 2008, the statute, legislation and administrative requirements had become important for the consent of the new order.

These are only some of the examples where India and other developing countries face difficulties in compliance with the tougher standards followed by developed countries on a day-to-day basis. The Indian food basket has evolved from primary products to a whole new range of processed foods, and India is trying to bring its food security regulations in line with current needs. The Food Safety and Norm Act, 2006, combined all previous Food Safety Control Acts, such as the Animal Import Act, 1898, the Food Adulteration Prevention Act, 1954, the Milk and

Milk Products Order, 1992, the Food Products Order, 1995, etc. It aims to provide a single point of reference for all kinds of food safety and standards in India.

Consequently, with such rapid changes taking place at national and international level in the field of food products, it is also the duty of developing countries to try to achieve higher levels of food security and developed nations to have some appropriate time for compliance. Developing nations must try to update their technologies and boost their ability to compete with the standard [31].

## 6. CONCLUSION

From the point of view of the developing world, they will have to take a more compassionate approach to the whole problem. "It would not be enough merely to enforce less strict requirements. Equally significant is the fair weighting of the voices raised from developed countries. Another problem to be tackled by developing countries is the availability of timely and complete information. This will undoubtedly reduce any needless problems for the exporting countries. Furthermore, the imposition of trade barriers under the SPS Agreement is something that should be opposed under all circumstances. This will definitely inhibit the development of 'fair and open' trade in the world" [32]. As developing countries, if they want to succeed in the highly competitive world of foreign trade in food, they need to upgrade themselves. India, as a developing country, does not need to upgrade its production systems to meet the sanitary requirements of Europe or the United States, it must think in such a way that it will eventually benefit its customers who have the same right to eat food that is rich in nutrients and free of any pollutants.

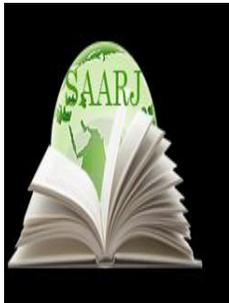

"In order to achieve the goals of the SPS Agreement, developing countries, including India, must introduce some domestic reforms. They must concentrate on educating their staff in post-harvest quality control methods and food processing activities. A further significant change in this direction is awareness-raising and education for people at school level on human, animal and plant health"[33]. In addition to this, accountability in the WTO framework is also an important need for better harmonization. However, the SPS agreement has succeeded in providing a strong forum for trade in agricultural and marine products between nations and has helped to some degree to harmonize the requirements set by different countries, but what is missing is that while food laws are complex in nature, the SPS has not yet been updated to comply with these complex food safety regulations. It should be kept up to date with the changing needs of countries.

## PROBLEMS OF ENSURING MEMBERSHIP AT THE LEVELS OF MUSIC EDUCATION IN THE TRAINING OF TABOURINE PLAYERS

**Qobilqoriyev Quدراتilla Bakhtiyor ugli\***

\*Teacher of the Uzbekistan State Institute of Arts and Culture,  
 UZBEKISTAN

### ABSTRACT

*We all know that Uzbek musical art is rich in genres, and in each of them the tambourine has a special place. With this in mind, tambourine performance classes have been organized at each stage of music education, where many young people are learning to play the instrument. This article examines the problems of training tambourine performers in the process of music education and ensuring continuity between the stages of education, and offers suggestions on what needs to be done to overcome them.*

**KEYWORDS:** *Music Education, Tambourine Performance, Children's School Of Music And Art, Membership, Schools Of Art And Culture, Stages Of Education, Specialized Music Academic Lyceum, Continuing Education.*

### INTRODUCTION

The training of specialists in the field of music education in the country is carried out on the basis of a three-stage system. "To date, there are 312 children's music and art schools, 20 specialized art and culture schools in the country, as well as the Republican Specialized Music Academic Lyceum named after R. Glier, the Republican Specialized Music Academic Lyceum named after V. Uspensky, the UzDC. Academic Lyceum for Gifted Children and Higher Education Institutions for Music Education[1.B.86].

### Main part

The first is the out-of-school education phase, which focuses on the development of basic knowledge, skills and competencies in the relevant areas of music education, mainly in children's music and art schools.

The second stage in the system of secondary special vocational education (now vocational education) in specialized schools of arts and culture, academic lyceums, special boarding schools through the training of junior specialists who provide secondary special education to students is being implemented.

The last stage is to provide bachelor's and master's degree students in higher education institutions, including the Uzbek State Conservatory, the Uzbek State Institute of Arts and Culture, the Tashkent State Pedagogical University named after Nizami and its regional branches. is carried out through.

Over the past years, extensive work has been done to build children's music and art schools, overhaul existing ones, and strengthen their material and technical base. These educational institutions create modern conditions at the level of international standards. In addition, the activities of academic lyceums specializing in music and art, as well as higher education institutions in the field have been coordinated, forming a single system of continuous music education.

At the same time, the quality of education has improved. As a result, hundreds of talented young people are participating in various prestigious international competitions in foreign countries, showcasing their art on the world stage, astonishing foreigners and winning prizes.

Along with the achievements in music education, there are also shortcomings and problems. Below we would like to highlight the shortcomings in the training of tambourine performers to ensure continuity in music education.

The most important stage in the training of tambourine performers in music education is the children's school of music and art. The duration of training in the implementation of the tambourine in the UNHCR is five years. At this stage, the student has the first idea of the instrument of the tambourine and masters the initial processes of mastering the skills of performance. In this process, it is important to master the state of performance, style, strokes (strokes) on the instrument. In addition to theoretical knowledge, practical performance skills are acquired during the training.

Lessons on mastering the instrument of specialization are carried out individually in the educational process. It is planned to spend 2 academic hours (45 minutes) per week for each student in grades 1-4, and 3 academic hours for grades 5 (graduates).

"Tambourine performance educators at children's music and art schools need to be able to see a student's ability to develop their performance skills and develop a work plan accordingly" [4.B.60].

From the first lesson, the teacher should give a brief overview of the history of the tambourine, its place in our national art, the teacher who popularized it among our people. It is necessary to conduct lessons in a theoretical and practical way.

Gradually move on to more complex measurements and exercises. Various hand exercises, tambourine methods created and performed by master tambourines together with etudes, methods used in all spheres of our national music culture, examples of methods performed in tambourine dances in the classroom, from simple to complex, depending on the ability of

students to perform. It is advisable to teach music in the desired form, paying attention to the literacy of the note.

“Students should warm up the tambourine at medium level for 15-20 minutes before entering the classroom, do hand exercises, and then enter the classroom. Otherwise, performing without heating the fingers, without adjusting them to the tambourine, as well as immediately performing a heated tambourine can lead to pain in the hands, the desired result is not achieved”[5.B.96]

As a result of our observations, it became clear that some children in the music and art schools do not follow the above-mentioned aspects of the tambourine classes. In the learning process, the teaching of tambourine methods is carried out mainly orally. This has a negative impact on students' musical literacy and their ability to perform in a tambourine in the future. Unfortunately, it is not uncommon for some children in music and art schools to be taught tambourine music by teachers with other musical specialties. It is safe to say that this is the result of neglect of the tambourine instrument.

The next stage of training tambourine performers will be in schools of culture and arts, academic lyceums for gifted children. Students study there for two years. One of the pressing issues at this stage is that they have been transformed into two-year specialized schools. Students who take a two-year music course in a tambourine do not have enough knowledge in their field. The reason is that the period of teaching tambourine performance in BMSMs is five years. Meanwhile, in UNHCR, some students complete their IEPs before completing general secondary education. As a result, there is a gap between the next stages of music education. During this period, the student forgets the knowledge acquired in the UNHCR and has to start all over again at the next stage. Also, the large number of non-specialty subjects in the curriculum, the time of individual lessons related to specialty subjects is set at 45 minutes, which prevents students from mastering the specialty. The works performed by students studying tambourine performance should be in accordance with the requirements of the educational stage in which they are studying. There are also shortcomings here.

As in any instrument, the development of performance skills in the framework should gradually develop from simple to complex. However, we can observe that students currently studying in UNHCR perform works that should be studied in the next stage of education. As a result, we see that some students can not perform the work without the full rhythm, lack of performance skills. Probably, such works are selected depending on the talent of the student. However, it would be expedient to study the works step by step on the basis of a systematic program at each stage. The student learns the works that need to be studied in higher education during the school years. As a result, during the four years of higher education, there are cases of completion of works performed at a lower level. This is due to the fact that in the field of music education is not sufficiently integrated.

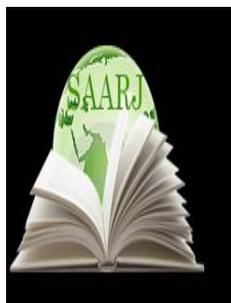

## CONCLUSION

In order to overcome the above-mentioned shortcomings and problems, it is necessary to establish interaction between all stages of music education, to organize a systematic teaching process between them. To do this, it is necessary to establish cooperation between qualified specialists working at each stage. It is expedient to formulate executive programs in a systematic way. By involving experienced professionals who teach tambourine performance in music

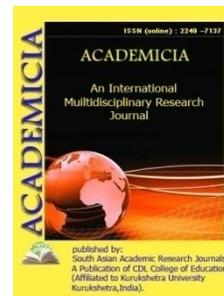

education institutions in these processes, it is possible to establish a link between the stages of education and thus improve the quality of education.

### ABSTRACT

*The use of computer and information technologies, telecommunications, data transmission networks, Internet services, which are included in the priorities of the policy of our country, is developing and modernizing. The widespread introduction of modern information technologies in all spheres of our society in our daily lives will ensure the achievement of our future goals. The use of the Internet in the activities of any industry increases productivity.*

**KEYWORDS:** *Network Security, Transmission Networks, Telecommunications, Access, Identify, Altering Information, Port Scanning.*

### INTRODUCTION

Quick data exchange using the exact network allows you to save time. In particular, the formation of the e-government system in our country and the organization of strengthening the interaction between public administration and the population on its basis will be carried out using the network. Effective use of the network ensures the formation of a democratic information society. In such a society, the speed of information exchange increases, and information is divided into those with faster results in the collection, storage, processing, and use of information.

However, protection against problems such as illegal access to the network, use and alteration of information, loss has remained a topical issue. Businesses, organizations and government agencies that connect their activities to the network should pay close attention to network security before connecting to the network for information exchange. Network security is achieved through the use of various tools and methods, taking measures and implementing measures to ensure a reliable and systematic way of transmitting, storing and processing

information. The tool used to ensure network security must quickly identify the risk and take countermeasures against it. There are many types of threats to network security, but they are few divided into categories:

- Eavesdropping by attacking, transmitting, and altering information;
- refusal to provide services; (Denial-of-service);
- port scanning.

In the process of transmitting information, it is possible to listen, change and block information without informing users in the exchange of information through telephone and telephone lines, instant messaging via the Internet, video conferencing and faxing. This attack can be carried out through several network analysis protocols. Through attack software, CODEC (convert video or audio analog signal to digital signal and vice versa) easily converts digital audio to high quality but large volume audio files (WAV). Usually the process of performing this attack is not noticeable to the user at all. The system performs the specified operations without excessive voltage and noise. There is absolutely no doubt about the theft of information. Only those who already have information about this threat and want the transmitted information to retain its value will be able to exchange information through a protected network as a result of the application of special network security measures. There are several effective technologies that can be effective against hearing and altering information sent over the network during data exchange:

- IPSec (Internet protocol security) protocol;
- VPN (Virtual Private Network) virtual private network;
- IDS (Intrusion Detection System) is an intrusion detection system.

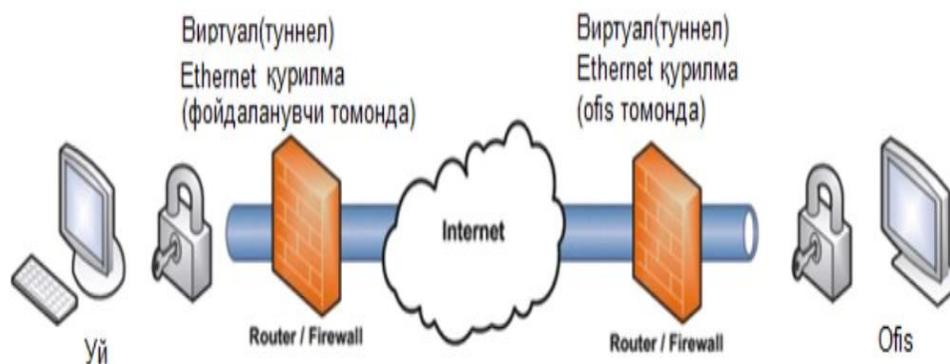

IPSec (Internet protocol security) allows secure data exchange over the network using these security protocols as well as encryption algorithms. This special standard ensures that software and data as well as hardware are compatible in the interaction of computers on the network. The IPSec protocol ensures the confidentiality of the information transmitted over the network, that is, it is understandable only to the sender and receiver, the purity of the information and the authentication of packets. The use of modern information technology has become a necessary tool for the development of any organization, and the IPSec protocol provides effective protection for:

- When connecting the head office and branches to the global network;
- Remote control of the enterprise via the Internet;
- In protecting the network connected to sponsors;
- in improving the security of e-commerce.

A VPN (Virtual Private Network) is defined as a virtual private network. This technology is based on the formation of an internal network within another network to share all data between users, aimed at providing reliable protection. The Internet is used as the network base for VPN. The advantage of VPN technology. By connecting local area networks to a common VPN network, it is possible to build a low-cost and high-level protected tunnel. To create such a network, you need to install a special VPN gateway on one computer of each network part,

which serves to exchange information between branches. The exchange of information in each section is done in a simple way. If you need to send data to another part of the VPN network, then all the data will be sent to the gateway. In turn, the gateway performs data processing, encrypts it based on a reliable algorithm, and sends it to the gateway in another branch via the Internet. At the specified point, the data is decrypted and transmitted to the final computer in a simple manner. All this is done in a way that is completely imperceptible to the user and is no different from working on a local area network. Using the eavesdropping attack, the information heard becomes incomprehensible. In addition, a VPN is a great way to connect a separate computer to an organization's local area network. Imagine if you went on a business trip with your laptop, there was a need to connect to your own network or get some information from there. With the help of a special program, you can connect to a VPN gateway and act like any employee in the office. It is not only convenient but also inexpensive. The principle of operation of a VPN. To set up a VPN, in addition to new devices and software, you need to have two main parts: the data transfer protocol and the tools for its protection.

An unauthorized access detection system (IDS) identifies the method or means by which an attempt is made to compromise a system or network security policy. Unauthorized access detection systems have a history of almost a quarter of a century. The first models and prototypes of unauthorized access detection systems used the analysis of audit data of computer systems. This system is divided into two main classes. It is divided into a Network Intrusion Detection System and a Host Intrusion Detection System.

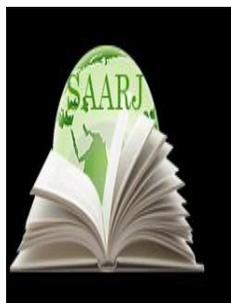

Picture 1 below suggests a secure method for exchanging information between the two parties. It describes how to set up a VPN network between a user's home and office.

Picture 1. Scheme of organization of VPN network

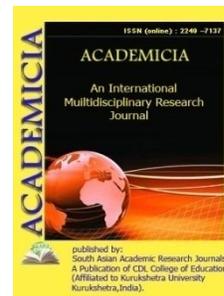

The method proposed above is an effective solution to ensure its security when exchanging information using a network. In it, the user can easily use confidential information in the office from home. A VPN network and authentication system set up for the secure use of user confidential information is a reliable tool.

## ECONOMIC AND ENVIRONMENTAL EFFICIENCY OF THE USE OF IRRIGATED LANDS

**Mirzaev Abdulla Kurbanovich\*; Yusupov Gulboy Amirovich\*\***

\*Associate Professor,

### ABSTRACT

*Environmental factors play an important role in increasing the efficiency of irrigated land use in the country. This article provides important conclusions and recommendations for determining the economic and environmental performance of land and water resources in agriculture.*

**KEYWORDS:** *Economy, Ecology, Efficiency, Reclamation, Irrigated Capital, Funds, Measures, Factors, National Economy, Approach.*

---

### INTRODUCTION

Extensive development of irrigated lands in the country, salinization, soil and irrigation erosion, water pollution, restriction of natural water flow in rivers, deforestation and other factors not only reduce the productivity of irrigated lands, but also worsen the ecosystem of irrigated areas.

The need to address this topical issue was noted by President Mirziyoyev Sh.M. It is also specified in the Concept of nature protection in the Republic of Uzbekistan until 2030, approved by [1].

The quality of water, currently used for irrigation, is mainly class II and III. Discharge of polluted water into water bodies has resulted in damage to open water streams. This causes irreparable damage to flora and fauna, as well as a negative impact on human health. Currently, 324 species of flora and 184 species of fauna are included in the International Red Book [1].

Currently, 56% of the desert zone in Uzbekistan is affected by wind erosion, 43.3% of irrigated lands by irrigation erosion, 31.5% of them are weak, 36.8% are moderately damaged, and 5.5% are severely damaged.

These processes are intensifying in Samarkand, Tashkent and Kashkadarya regions.

In 2018, the area of salinity of different levels in the country amounted to 2254.7 thousand hectares. The Republic of Karakalpakstan, Bukhara, Kashkadarya, Khorezm, Navoi, Syrdarya, Jizzakh and Fergana are among the regions with the largest salinity [11].

This requires, first of all, the development of a scientific and methodological framework that allows to assess the state of soil, economic and environmental factors and the use of land and water resources [7].

Agricultural producers should optimize their economic activities for the benefit of man and nature and focus on conservation and reproduction of natural resources, increase the value of land, create environmentally sustainable and cost-effective irrigated agriculture.

Environmental measures on irrigated lands include reducing the negative load on the main components of land reclamation, improving the technical level of irrigation and drainage systems, improving irrigation techniques, reducing non-productive water losses in the system and arable lands, regulating the water-salt regime of lands, etc. included.

Such an approach requires the development of a multi-purpose, natural and material resource management strategy that provides the greatest environmental and economic efficiency in the use of irrigated land.

This approach should include not only the implementation of hydrotechnical reclamation (improvement of reclamation systems), but also other types of reclamation (chemical, agro-technical, agro-forest reclamation).

At present, there is no single approach to justify the economic and environmental efficiency of land reclamation systems. The work of many well-known economists around the world and the country is devoted to the issue of increasing the economic efficiency of capital investment in irrigated land use systems. In solving this problem theoretically and practically, Khachaturov T.S. [4], Dmitriev V.S. [2], Zuzik D.T. [3], Raskin G.F. [6], Omurzakov U.P. [5], Timofeev A.F., [9], Maslovskiy A.A. [9], Sultanov A.S. [8] and others made significant contributions.

In particular, Timofeev A.F., Maslovskiy A.A. emphasizes the following: The national economic approach is a mandatory condition for justifying the calculations of the efficiency of capital expenditures on land reclamation, as the bulk of these funds are financed by the state. This means that the acceptable option of capital expenditure should not only be effective for a particular sector, but also serve to increase the efficiency of the whole economy [9].

According to V.S. Dmitriev and G.F. Raskin, the economic efficiency of land reclamation is determined by the level of solution of economic problems (increasing crop yields, achieving a certain amount - wheat, vegetables, potatoes, cotton and other agricultural products) [2,6].

T.S. Khachaturov proposes to calculate the coefficient of economic efficiency of reclamation measures ( $E_k$ ), the annual efficiency of the implemented measure ( $E_y$ ) (minus current expenditures -  $X_j$ ) by the ratio of capital investment ( $K$ ) [4]:

$$E_k = (E_y - X_j) / K, (1)$$

Determined efficiency coefficient -  $E_k$ , the normative coefficient of capital investment is compared with  $E_m$ . If the calculated efficiency ratio is greater than its normative value

( $E_k > E_m$  condition is met), the considered direction of capital use is considered effective. The normative cost-effectiveness ratio of capital is  $E_m$ , 0.12.

In a market economy, the cost-effectiveness of capital expenditures is determined by the ratio of outcome to expenditure. When investing in fixed assets, formula (1) looks like this:

$$E_y = N/K, (2)$$

Where  $E_y - E$  is the annual economic efficiency of the equity;

$N$  – full annual efficiency;

$K$  – the effective cost.

It is not possible to find a single indicator of reclamation efficiency. Some economists have suggested that land reclamation efficiency be determined by profitability, labor productivity, and other indicators. But these figures only take into account some aspects of the issue.

However, the economic efficiency of reclamation is determined by the efficiency of agricultural production on reclamation lands, so the economic efficiency of reclamation measures depends not only on the activities of water management enterprises, but also on the activities of agricultural enterprises.

Zuzik D.T. recommends that the economic efficiency of capital expenditures in the agricultural sector be determined by the ratio of annual net product growth (obtained by comparing dapromads received before and after the reclamation event) to the capital investment that generated this growth [3].

$$E_y = (D_2 - D_1)/K = (\Delta D) / K \quad (3),$$

Where:  $D_1$  and  $D_2$  income received before and after the reclamation event, soums;

$\Delta D$  – income growth, soums;

$K$  – capital expenditure (investment) for reclamation measures, soums.

Such methods of calculating the cost-effectiveness of land reclamation measures Omurzakov O.P. [5], and Sultanov A.S. [8] and others.

Farms and dehqan farms in the country, clusters are the main agricultural producers, they occupy more than 90% of the irrigated area. They are not part of large farms. Although farms are independent, construction and operation of inter-farm irrigation canals, construction and operation of large pumping stations, cleaning of collector and drainage systems, and similar works are carried out by the state in the form of subsidies (even in developed countries farms are subsidized by the state). Therefore, in determining the economic efficiency of large reclamation measures, it is necessary to follow the approach from the point of view of the national economy [10].

However, in today's world of rapid development of machinery and technology, it is not enough to take into account only the cost of production, cost and capital in determining the economic efficiency of enterprises.

A prerequisite for the implementation of any economic measures is to follow the approach of the national economy. According to him, the event with the maximum value in the following expression is the best:

$$Et = Hm - Xm, (4)$$

By erda: Et – cost-effectiveness of the event;

Hm – the value of the direct and satellite results of the implementation of the event at the specified t-time;

Xm – the value of all the costs of carrying out the event at a given t-time.

This rule can also be used to determine the cost-effectiveness of the use of land and water resources in the objects under study.

From the above, the following conclusions should be noted: Until yesterday, the choice of technical solutions in irrigation systems was based on the assessment of the amount of useful economic efficiency or the rate of cost recovery. Nowadays, these are no longer enough. There is a need to take into account the environmental factors, i.e. the level of environmental impact of the option under consideration.

The main characteristics of the environmental impact assessment of the option are:

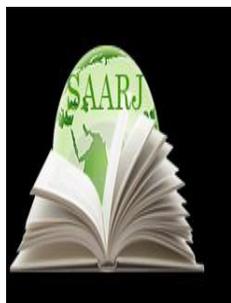

- the scale of the need for the use of natural resources and the degree of impact of production on the environment (for example, the volume of water resources, salinization and soil contamination);
- the volume of industrial waste and the degree of their impact on the environment (e.g. the volume of drainage water and the content of minerals and organic matter in it);
- full utilization of resources and the possibility of reuse of waste (for example, SFK, EFK, the possibility of reuse of drainage water).

**ABSTRACT**

*This article discusses the impact of drought and anthropogenic factors on seedlings in the establishment of nut orchards in the mountainous regions of Uzbekistan, soil and climatic and economic conditions of districts and farms, proper selection and placement of varieties, methods of growing and caring for orchards based on scientific and advanced experience. The establishment of such pistachios at an altitude of 500-1400 m above sea level and in the foothills with a rainfall of not less than 300 mm for the establishment of pistachio industrial plantations in Uzbekistan. These are the foothills of Samarkand region. In addition, recommendations are made on the possibility of growing pistachios in the foothills of Fergana, Namangan, Kashkadarya, Jizzakh regions with an annual rainfall of 300-400 (500) mm, and the compatibility of the foothills and mountainous areas of the above regions.*

**KEYWORDS:** *Lemon Seedlings, Accumulation Device, Irrigation Regime, Water Consumption, Snow And Rain Water, Drought, Anthropogenic, Factor, Varieties, Grafting, Vegetation, Artificial Propagation, Slope, Plantation, Scheme, Vegetative Organ, Atmospheric Precipitation, Temperature.*

## 1. INTRODUCTION

It ends with the development of technology for the efficient use of rain and snow water in nature and how to collect it, chemical analysis of collected water in the laboratory and its analysis whether it depends on the seasons and their quality levels.

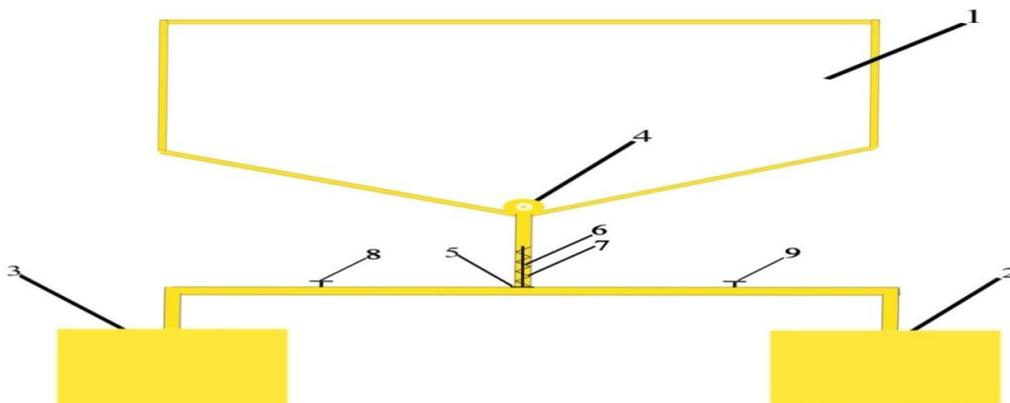

For these purposes, in late autumn 2016, experimental work was carried out on the territory of T. Mirzaev farm of Andijan district with the installation of a specially designed rain and snow water accumulation device. The rain and snow water collection area of this device is 5 square meters, and the accumulated water storage tank is 0.5 tons. The thickness of the rain and snow water collection area is 0.3 mm, and the collection tank is 0.4 mm. made of white zinc. The accumulator was buried underground to a depth of 0.5 m. The purpose is to ensure that the collected water is not heated by sunlight and that the temperature is always kept constant.

Since early spring 2017, several pumpkin seeds have been harvested using rain and snow water collected on the device. In addition, 30 almond seedlings were planted on 2 hundred hectares of unused land. The same rain and snow water was used to irrigate the pumpkin and almond seedlings.

## 2. Main part

If rain and snow water is suitable for consumption, it can be used for two different purposes. The first is to irrigate and plant trees where it is not possible to remove water during the summer. The second is to study the results of in-depth experiments and their comprehensive analysis, which can be used in pharmacies and other relevant places. This is because when rain and snow begin to fall, they initially carry dust and other particles in the atmospheric air with them for a certain period of time. It is therefore necessary to make the accumulation tanks in two separate ones. For this purpose, a reversible technology for collecting rain and snow water over time has been developed (Figure 1).

**Figure 1. Reverse technology for rain and snow water collection.**

1. Plain surface with rain and snow, 3.5 m<sup>2</sup>
2. Reservoir used for trees and plants.
3. Reservoir used for consumption.

4. A pipe that directs water collected on a flat surface to a reservoir.
5. Sealing valve.
6. Valve core.
7. Valve purjinası.
8. Ruzurvuvar ventel used for consumption.
9. Ruzurvuvar ventel used for irrigation.

From the above, it can be concluded that the establishment of new gardens in unused areas in our regions, as well as the introduction of the device in the formation of water reserves in areas where it is impossible to withdraw water, is not without benefits.

In the "STATE PROGRAM on the implementation of the Action Strategy for the five priority areas of development of the Republic of Uzbekistan in 2017-2021" in order to optimize the use of land and water resources, improve the reclamation of irrigated lands, development of irrigation and land reclamation facilities, their safety. and ensuring sustainable operation, rational and economical use of water resources, and on this basis to achieve sustainable production of agricultural products.

According to the program, handon pistachio plantations can be established on about 50,000 hectares of Uzbekistan. These areas are located at an altitude of 500 - 1300 meters above sea level, where the annual rainfall is 200 - 400 mm, the average temperature is 13.1 - 16.0 ° C and the vegetation period is 210-220 days. All of these indicators are very conducive to the growth and yield of handon pistachios. The selected handon pistachio forms and varieties provide an opportunity to establish its industrial plantations on many arable lands. This option can solve several problems:

Including:

- Satisfaction of the population's demand for nutritious food products;
- prevention of erosion in mountain and foothill areas;
- expansion of existing forest areas;
- High yields of agricultural crops;

Saving water on irrigated lands, etc.

Taking into account the demands of the day and the medical needs of the population, the government has set a task to increase productivity by 1.5-2 times for the production of fruit per capita. This, in turn, will require fruit-bearing districts and farms to rely on factors such as soil-climatic and economic conditions, proper selection and placement of varieties, methods of growing and caring for orchards on the basis of scientific and best practices.

There are peculiarities of growing fruit trees in the foothills and foothills. First of all you need to choose the right fruit varieties. These varieties should be as drought-resistant as possible, ripen quickly and have a short growing season. Varieties that are transferred to higher climbs should also be more resistant to frost. Almonds, pistachios and unabi can be grown on the mountain slopes, ie in areas with 350-400 mm of rainfall, from very drought-resistant varieties. When

planting these fruits, it is advisable to choose lands with as flat a terrain as possible, without cliffs and ridges, without large stones. It is good that the slope of the slopes on which the garden is built is up to  $15^{\circ}$ . For almonds, steep slopes with a slope of  $30-35^{\circ}$  are preferred.

On slopes with a slope of less than  $10^{\circ}$ , trees are planted horizontally facing the slope. The contouring of trees is determined not by the verticality of the slopes, but by the degree of slope of the horizontal of the plots. Walnut orchards with an area of more than 32,000 hectares have been established in the mountainous regions of Uzbekistan. Of these, 27,000 hectares (84%) were not welded. The area under cultivated coconuts is 16% of the total coconut. There are 2,500 hectares of almond orchards in Uzbekistan, of which 1,500 hectares are wild (non-grafted) almond orchards. Walnut crops are widespread in the mountainous and foothill areas of Tashkent and Fergana and Surkhandarya regions. Subtropical fruit trees can be found mainly in the Fergana Valley, Kashkadarya and Surkhandarya regions. [3.16 pg]

In addition to walnuts and almonds, pistachios are also grown. The main areas of the Handon pistachio are located in mountainous and dry mountainous areas in areas with an annual rainfall of 300-350 mm. The vegetation period in these areas is 210-220 days. The maximum temperature is  $47-48^{\circ}$  C. The roots of the Handon pistachio penetrate to a depth of 10-12 m. According to many scholars (Korzinsky, Lisnevsky, Popov), Uzbekistan was indeed a pistachio country. However, in mountainous areas, natural regeneration does not occur as a result of their cutting. [8.186 pg]

In pistachios in mountainous areas, medium-sized nuts make up 44%, large-sized nuts 19%, and very large-sized nuts only 6%. The number of nuts with a moisture content of more than 10% per 1 kg of walnuts is 1510, the average weight of 1 walnut is 0.73 grams, the fat content in the kernel is 56.8% to 68.7%, which is less than in the southern exposure.

Almond seedlings should be planted in moist soils with shallow water on the surface, connected to plum and mountain grafts, and in dry soils with well drained water, connected to bitter almond grafts. Almond seedlings are planted in autumn and spring. Almond orchards are built from annual seedlings. Seedlings attached to the plum and ridge grafts are held at a distance of 6x5m, and those connected to the bitter almonds are held at a distance of 8x6m.

Almonds are mainly pollinated from the outside. Therefore, several varieties are planted mixed to form almond orchards. In the year of transplanting the garden is watered 8-10 times, and in the years of full harvest, depending on the conditions of the area where the almonds are planted and the mechanical composition of the soil, it is watered 4-7 times during the growing season and 1-2 times. Almond trees are formed in a sparse-tiered system, leaving 5-6 main branches, placing them at a distance of 20-30 sm from each other. In rare cases, almonds are given a cup-shaped shape. Almond branches are rarely cut when entering the crop. Each hectare of almonds is fertilized with 40 tons of manure every two years and 120 kg of nitrogen, 90 kg of phosphorus and 40 kg of potassium per year. When almonds are propagated from seed, the seedlings are harvested 4-7 years after planting, and the grafted ones are harvested in the second or fourth year after planting. Almonds ripen in August-September and stand in the bush without spilling. Yields 3-4 years after planting, is fertile up to 12-15 years, gives good yields up to 40 years, lives up to 60-100 years. Up to 60-80 kg is harvested from each bush.

In areas with low slopes (up to  $10-12^{\circ}$ ) of mountainous lands, especially on hills, fruit trees are **placed in a contoured** or embossed manner. Each row of trees cannot be left at the same width

all the time horizontally, not along a straight line to the slope horizon. Depending on how steep the slope is, the rows will sometimes move farther or farther apart. If it is possible to irrigate in such conditions, irrigation plots with a slope of  $0.002-0.005^0$  on the horizontal side are obtained. This traps rainwater flowing down the side slope, as well as water supplied during irrigation, and protects the soil from leaching and erosion. [3.20 pg]

Drought is extremely dangerous in our conditions, it reduces the flow of rivers, lowers the groundwater level, resulting in a shortage of water resources. As a result, the water supply of the population will deteriorate, crop yields will decrease, and hydropower production will decrease. Rising global temperatures are putting the country's most water-scarce regions in dire straits in the first place. In other words, the regions are working on new projects to create high-yielding, disease-resistant, fast-ripening varieties suitable for these conditions, water-saving, introduction of modern technologies to increase soil fertility, development of diversified farms, training of new generation farmers requires.

For example, in recent years in Uzbekistan, the area of water-intensive crops such as cotton and rice has been reduced, and instead of cereals, vegetables and melons and vineyards are being expanded. The growing need for fresh water in our daily lives is making many people think. At such times we are forced to look for various other reserves and opportunities. One such opportunity is the different ways of using rain and snow water.

This is because statistics show that rain and snow can fall at a height of 10 cm to 80 cm per  $m^2$  per year in the world.

If the slope of a hill or foothills relative to the horizontal plane is about  $45^0$ , it is theoretically justified that the amount of water collected on the slope is a few percent less. This can be seen in the form of the following geometric view.

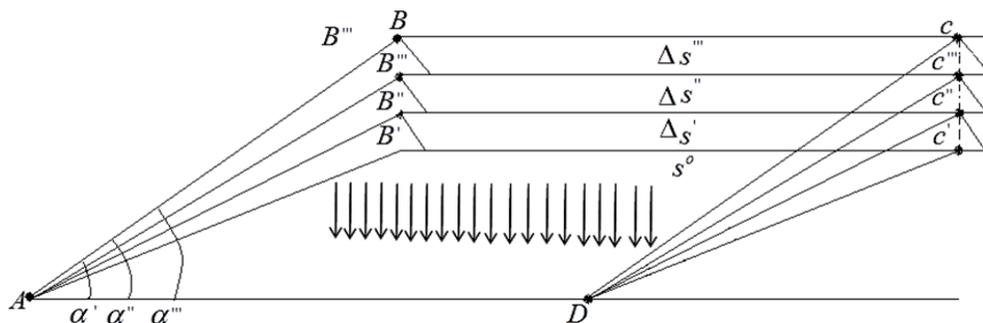

Figure 2 Shapes of different angular slopes

According to the long-term data of the Andijan regional center of hydrometeorology, the average annual amount of rain and snow water is  $0.24 m^3$  per  $1 m^2$  of horizontal flat land.

If we imagine the slopes of a hill or foothills in the form of a right angle, it can be described as follows (Figure 2). If the ABCD in Figure 2 is a sloping surface, then the surface  $A_1 B_1 C_1 D_1$  will be the surface in the horizontal plane.

Assuming that the angle of inclination of the hill or foothills is  $45^0$ , assuming  $\cos = 45^0$  in the triangle ABB, it is known that at  $\cos = 45^0$  its value is 0.705. It can be seen that if the slope of a

hill or foothills is 450, then in such places the amount of water collected in the horizontal plane of 1 m<sup>2</sup> is 0.24 x 0.705 = 0.17 m<sup>3</sup>. That means 170 liters. That is, mathematical expressions confirm that rain and snow water accumulates 30% less than on a flat horizontal surface with a slope of 45<sup>0</sup> degrees. [12]

It can be seen that the larger the slope angle of the hilly sloping area, the lower the accumulation of rain and snow water relative to the horizontal flat ground.

Therefore, in order to effectively collect rain and snow water on the slopes, it is advisable to place the reservoirs so that rain and snow fall vertically on the surfaces.

The volume of the annual accumulated rain and snow water storage tank should be calculated based on the amount of rain and snow water that averages 1 m<sup>2</sup> per year, based on perennial statistics at the site.

$$\begin{aligned} \alpha' &= 0; & S^0 &= AB'C'D \\ \cos \alpha' &= \sqrt{\frac{AB''C''D}{ABCD}}; & S' &= AB''C''D; & \alpha' &= 35^\circ \\ \cos \alpha'' &= \sqrt{\frac{AB'''C'''D}{ABCD}}; & S'' &= AB'''C'''D; & \alpha'' &= 40^\circ \\ \cos \alpha''' &= \sqrt{\frac{AB'C'D}{ABCD}}; & S''' &= ABCD; & \alpha''' &= 45^\circ \end{aligned}$$

If we express the surfaces of slopes on a horizontal flat surface and at different angles through their perimeters, then we can write the following expression.

$$\begin{aligned} S' &= S^0 + \Delta S'; & \cos \alpha' &= \frac{S^0}{S'} = \frac{S^0}{S^0 + \Delta S'} = \frac{1}{1 + \Delta S'} \\ S'' &= S^0 + \Delta S' + \Delta S''; & \cos \alpha'' &= \frac{S^0}{S''} = \frac{S^0}{S^0 + \Delta S' + \Delta S''} = \frac{1}{1 + \Delta S' + \Delta S''} \\ S''' &= S^0 + \Delta S' + \Delta S'' + \Delta S'''; \\ \cos \alpha''' &= \frac{S^0}{S^0 + \Delta S' + \Delta S'' + \Delta S'''} = \frac{1}{1 + \Delta S' + \Delta S'' + \Delta S'''} \end{aligned}$$

$$BB'CC' = 1 + \Delta S' + \Delta S'' + \Delta S'''$$

If the variable is expensive  $\Delta S' + \Delta S'' + \Delta S'''$

If we denote them by  $\beta$ , then  $BB'CC' = 1 + \beta$

is equal here  $\beta = 1 + BB'CC'$

As a result, the application of manure juice along with rain and snow water improves soil fertility and reclamation. Due to the establishment of intensive almond and pistachio farms on the farms located in the foothills of the country, the effective use of snow and rain water plays an important role in mitigating water shortages.

Based on the natural climatic conditions of the regions of the country, in order to save water on high-yielding, disease-resistant, fast-ripening varieties, to introduce modern technologies to increase soil fertility, in 2014-2018 in Andijan region 59.8 hectares, in Fergana region 22 , 2 hectares, 332 hectares in Namangan region, a total of 414 hectares were introduced for irrigation.

The effect of irrigation on snow and rainwater collected in the accumulator device for lemon seedlings grown in greenhouses was also studied.

In the Address of the President of the Republic of Uzbekistan Shavkat Miramonovich Mirziyoyev, special attention was paid to the reform of the agricultural management system, the introduction of advanced technologies for the rational use of land and water resources. Another important issue was the instruction on the importance of using water-saving irrigation technologies.

The first of these opportunities is the efficient use of foothills, where there is no water supply, and the second is the organization of the collection and efficient use of snow and rainwater, even on horizontal plains.

Of course, among these measures to prevent water shortages, which are of concern to the entire world today, the introduction of a storage device for the collection of snow and rainwater on the ground will help to solve the problem, at least in part.

At the same time, lemons are widely grown in Uzbekistan from citrus crops. Lemon, which is a perennial evergreen plant in our climate, can be grown only in greenhouses, creating an artificial environment.

Although it costs a lot to grow a lemon in a greenhouse, it can produce an average of 200-250 fruits per tree when grown in a trench. Experiments have confirmed that 400-500 lemons can be grown on trees irrigated with rain and snow water from each ball of seedlings grown in greenhouse conditions. One of the conditions required for a regular harvest of lemons is that the growing conditions meet the requirements of the variety. One of the most important of these is the plant's need for water.

Experiments have shown that Meyer, Pervenets, Uzbekistan and Willi Frank varieties of lemons are very suitable for growing in a greenhouse. For good growth and yield of lemons, the optimum soil moisture should be 70-85% of the marginal field moisture capacity (BFWC) Lemon seedlings of 3.5-4.0 sots grown in the same conditions at home were planted in 3 rows, from February to November 2018, the middle row of lemon seedlings with rain and snow water, the outer row of lemon seedlings with drinking water from 2 l to 5l per irrigation period. irrigated drip to.

The cost-effectiveness of the results of this experiment is presented in Tables 1-2.

### The effect of water given for irrigation on lemon seedlings

**TABLE 1**

	When irrigated with drinking water.	6	65	1,5	
November	When irrigated with snow and rain water	6	100	1,5	
	When irrigated with drinking water.	6	65	1,5	
Total					359000 x 25 =8.975.000

Of course, the number of irrigations depends on weather conditions and the condition of the plants. In our experiments in 2018, lemons in greenhouse soils averaged 1 time in February, 2 times in March, 3 times in April and May, 4 times in June, 4-5 times in July and August, 2 times in October and 2 times in November, drip irrigated, During these periods, fertilizer juice was given 5–6 times.

**Relevance of the topic:** Today, the reproduction of forest fruits and products plays an important role in ensuring an abundance of food. Based on the natural climatic conditions of the regions, the introduction of modern technologies for the creation of high-yielding, disease-resistant, fast-ripening varieties suitable for these conditions, water-saving, increasing soil fertility. In this context, the topic can be considered relevant.

**Objective:** To study the improvement of soil erosion protection and structure through the creation of almond and handon pistachios, spruce and various intensive orchards, applied to mountain and foothill slopes, and to study in depth the agronomic techniques of planting and cultivating handon pistachios for forestry production. development of scientific conclusions and recommendations.

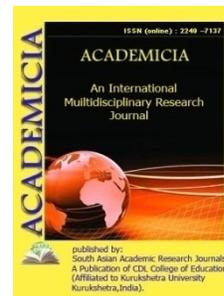

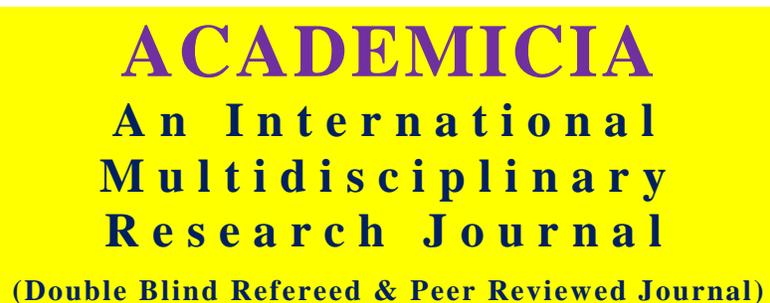

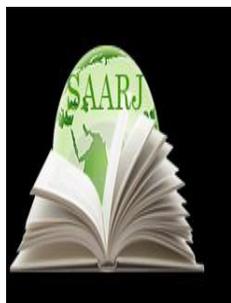

**The main tasks of the work** are to prepare and sow the seeds of pistachios for planting, to plant pistachios in the plantation method, to study the characteristics of pistachios and their transition to the phenological phase of flowering, crop formation, yield. , Placement of 8x10 m, ie to achieve 200 to 120 trees per hectare; -placing trees in the scheme 6x6 and 6x8 m (300-200 bushes) with a slope of 11-15 °; The aim is to place in the scheme -4x6 and 6x6 m (400-300 trees) when the slope is 16-20 °. Fruit seedlings placed on all slopes is to use the method of irrigation with snow and rain water collected in the accumulation device.

## IN CONCLUSION

our research has confirmed that the collection and use of snow and rainwater can be used not only in the foothills, but also in the cultivation of fruits and vegetables and various flowers grown in existing greenhouses in the conditions of farms

UZBEKISTAN

### ABSTRACT

*This article analyzes the works of Shukur Kholmiraev, lingvo-conceptual features, the specificity of the concept of "life and death", the stylistic expression of the concept of "good and evil". The discussion of the artist's works of art is useful for the development of language theory, language culture, describing the figurative and valuable aspects of personal-authorial concepts. It should be noted that the uniqueness of the Uzbek language among the Turkic languages is also in the richness of the lexical layer of words, phrases and translations. In this example, the following stylistic methods formalize the imaginative aspects of the concept under study: metaphor (take deposit-phrase), metonymy (passing your age; piety-combinations).*

**KEYWORDS:** *Lingvopoetics, Concept, Lingvokonceptuality, Lingvoconceptology, Personal-Author Concept, Opposite Polar Concept.*

### INTRODUCTION

In linguistics, with the growth of research and studies on the analysis of the language of the work, the interest in the literary text is gaining ground in the work done in the lingvopoetic, lingvoculturological and lingvoconceptological aspects. The personal-author's concept of the writer plays an important role in the creation of any perfect work of art. The concept of personal authorship is closely connected with the environment in which the artist lives.

Personal-authorial conceptual environment is considered as a mental education, consisting of a typical unit of understanding the importance of the experience stored in human memory, concepts in lingvoculture as an embodiment of the writer's personal worldview. Based on his

conceptual environment, the writer incorporates the subtleties of his work into his work and is determined to create his own ideal.

The writer's ideal is beauty, which appears as a natural and aesthetic beauty, but the tragedy is hidden under the influence of ugly, comic events. It relies on national and universal interests and interests. The writer's aesthetic ideal blends in with the positive character's aesthetic ideal. Society, people cannot live without example, that is, they need the ideal like water and air. Obviously, there is no art without an aesthetic ideal. But the aesthetic ideal is not a fixed size or boundary, but a writer must have it. The magical logic possessed by the writer is unique to each literary genre.

One of the main trends in modern lingvoconceptology is the study of personal-authorial concepts, which is the pursuit of concepts by writers and poets who reflect in their works the socio-political life of a particular language culture in their works. can be explained.

In particular, Shukur Kholmirzaev is considered a true fan of Uzbek writers, but so far no work has been created on the analysis of the author's personal-author's concept. The discussion of the artist's works of art is useful for the development of language theory, language culture, describing the figurative and valuable aspects of personal-authorial concepts. The personal-author's concept of the Uzbek language, which uses the opportunities of the Uzbek language wisely and attractively, bringing to the level of art the effective, concise and simple appearance of words in their works, as in the form of live communication, indicates the existence of unlimited possibilities.

Shukur Kholmirzaev's works make a special impression on the reader with their versatility and simplicity of language. Through the language of the author's work, the reader is thrilled to be exposed to the same environment. The author's personal-author's conceptual environment also plays an important role in this. His *"life and death"*, *"good and evil"*, *"hard work and laziness"*, *"righteousness and crookedness"*, *"wealth and poverty"*, *"hatred"*, *"loneliness"*, and *etc.* It is advisable to analyze the polar concepts from the linguistic side by psycholinguistic and lingocognitive. When we talk about the study of the personal-authorial conceptual environment of the artist, we note that he does not have a work that covers the whole of his work or the main periods.

In a literary text, the author's goal is to make an aesthetic impression on the student or reader, while in a non-fiction text, the author's main goal is to have a communicative effect on the student or reader. In other words, while the content and expression of a particular piece of information is primary in a non-fiction text, such information is not primary, but the idea that is to be conveyed in that medium is the aesthetic expression of the idea.

Based on the above, we need to focus on the opposite polar concepts. In the author's story "Smile", the concept of "life and death" is expressed by the author with a variety of colorful, contradictory concepts of the lives of the protagonists, which, in addition to their own and figurative meanings, it is also important in that it is expressed through the compounds. For example - *Jalil himself is also in front of the departure. Pain with a tumor. He knows. The doctors hid for a long time. But Jalil was afraid that he would lose weight.* (Sh.Kholmirzaev's story "Smile". T., 2020. p. 110). In this example, the unit "before leaving" indicates that the protagonist's life is meaningful, interesting, anxious, rich in the ups and downs of life, the end of his youth, his life, knowing that the protagonist of the work is suffering from an incurable

disease, that no one has ever lived with this disease, that he will die in the last moments of his life, that there is no other way. covering meanings such as. Also, different aspects of this life and death consensus from other forms of death also embody such concepts as helplessness. The conceptual aspects of the concept of *"life and death"* analyzed in the example are formalized by the following stylistic method: metonymy.

There is also the concept of *"life and death"* in the story, which means that the protagonist loses his meaningful, good and bad, adventurous, hungry and full days. For example, *I've lived my life to the fullest. Who are my peers left? Yes,.....he is Mumin. He is two or three years older than me. His heart is whole! Yes, his whole heart, - father Jalil began to think – he is different from me, to evil.....there's no death! Yes, let him live. Still, the world is not superior.*( this story, page:111). From the above example, it can be seen that the author strengthened the protagonist's interest in life, his superiority over the attitude to death, even in the last moments of his life through his thoughts. The contradictory polar concepts of *"life and death"* are evident in the speech of the protagonist. *"It simply came to our notice then. Let him live, too"*, it means the contradictory concepts of life, the meaning of continuing to live. In the protagonist's concluding remarks, the phrase *"the world is not superior"* is put to an end, with the concept of death implying that no one can live forever. In these examples, too, attempts have been made to reveal the imaginative aspects of the concept under analysis through stylistic methods such as metaphor (*no matter how superior to the world*), (*to evil does not have death*).

*-It is so. Now, neither action! While waiting until the deposit matures. The Shokir laughed warmly. – Your age has passed and you have become a righteous man.* (Sh.Kholmiraev's story "Smile". T., 2020. p. 114). In this example, too, we can see that the concepts of *life and death* are based on conflicting polarities. The notion that the protagonist confesses to death while he is still alive, that he is preparing for death, and that he feels that the life he has created, whether with constant pain or not, is coming to an end (sometimes in the concept of acknowledging this fate can be found) is an indication that Jalil still has a place in life by expressing the idea that he has become pious in old age, as expressed by his son Shokir. It should be noted that the uniqueness of the Uzbek language among the Turkic languages is also in the richness of the lexical layer of words, phrases and translations. In this example, the following stylistic methods formalize the imaginative aspects of the concept under study: metaphor (take deposit-phrase), metonymy (passing your age; piety-combinations).

*- "Yes, where?"- Mumin shouted and staggered closer to Jalil. - Orzikhoja sent me,- whispered Jalil.- "As long as we're alive".*(Sh.Kholmiraev's story "Smile". T., 2020. p. 120). In this example, too, the concept of *life and death* is based on a contradictory polarity. The protagonists of the work try to reveal the concept of life, which is the opposite of the concept of death, through the living lexical unit, through the unit of keeping alive the state of the person to be captured. The mission set by Orzikhoja was to shed light on the concept of life through the personal author's concept of the life of the Kuyun Korboshi, who was sentenced to death only in front of a crowd, so he had to be kept alive and taken to the village alive. In this example, the following stylistic method formalizes the imaginative aspects of the concept under study: metaphor (to keep alive).

Throughout the author's work, we can see the approach of the concept of *"life and death"* based on the specific Uzbek national mentality. Readers are also drawn to the fact that each word is

conveyed to the reader in the context of real life. For example, - *what punishment is worthy of the Kuyun? - **Death! Death!** – they said they were afraid. Orzikhoja asked Kuyun again, - Why did you fight again? - The Kuyun said, - .....For freedom..... - People! - cried Orzikhoja. - What's the punishment for a Kuyun? .....**Death, death! The Kuyun was shot here.*** (Sh.Kholmirzaev's story "Smile". T., 2020. p. 125). The above example also involved the lexeme of death, the basic linguistic meaning of which is the use of the concept of death as a punishment for wrong doing by a particular person as a result of the influence of another, another person or event, and this situation expresses the notion as a punishment for the deeds he has done, rather than simply the end of his life. Furthermore, it is not uncommon for a writer to go straight to death knowing that a tortoise would be sentenced to death, but he justifiably expressed it by saying that there were good reasons for it. The fact that the concept of death is carried out by shooting, which is one of the types of punishment, also indicates that the concept of death was used as a punishment. In this example, it can be seen that the concept of death is expressed in lexical units, not in stylistic means.

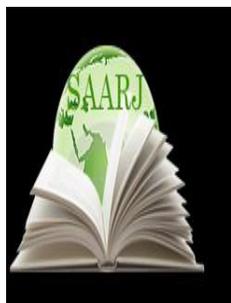

- *You're a boy, Jalil, - he said..... - I know that... **It could shoot you too.*** (Sh.Kholmirzaev's story "Smile". T., 2020. 124-p). In this example, the concept of death and life is expressed in terms of a unit that can shoot at the opposite pole, in which the notion of death can be pointed out. The uniqueness of the author's personal authorship concept served to reveal different aspects of the same concept of death. While in this example an attempt was made to reveal the imaginative aspects of the concept under study through the phenomenon of stylistic metaphor (can shoot), the means of parallelism from lingvopoetic means was very appropriate and served to convey emotionality. Because in the vocabulary of the Uzbek people there are many such cases. In this example, not only the concept of death but also the concept of the opposite pole of good and evil is emphasized. In the play, the writer portrays a character who does not turn away from evil through the unit that the writer can shoot, saying that the Mumin does not wish good to his friend or companion. In his personal authorship, the author reveals that the concept of death parallels the concept of evil.

*The Mumin has changed a lot since coming from Babatag. He shouted, - Go this way, go that way! - he said. **Then he went on to seduce him. As they approached the first village, he looked at Jalil: - Do you see what it's like to hold a press? - he said. Jalil sighed and said, - You didn't catch him. - The Mumin stopped. - Or are you? - ..... - You tied it.*** (Sh.Kholmirzaev's story "Smile". T., 2020. 124-p). In this example, Jalil's speech embodies the concept of good, while Mumin's speech embodies the concept of evil, which is considered to be the opposite of good. Such notions, which are part of the author's concept of personal authorship, show that they are widely used in the depiction of reality. The concept of evil served to reveal the concept of evil as the character's speech gradually shifted from positive to negative. Of the stylistic tools of the Uzbek language, metaphors and metonymic phenomena are used appropriately.

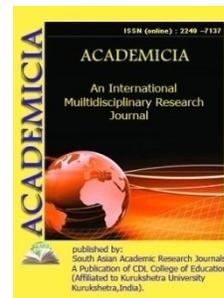

In short, in the works of the writer Shukur Kholmirzaev, the concepts of life and death, goodness and evil, enumerated from the opposite poles of the individual author, are the direct nominators of the concept of life and death and the concept of evil and goodness using stylistic means of the word such as metaphor, metonymy.

### ABSTRACT

*The Law of the Republic of Uzbekistan "On Freedom of Conscience and Religious Organizations", adopted on May 1, 1998, is the main normative legal document regulating relations with religious organizations in the Republic of Uzbekistan. Religious tolerance means the peaceful coexistence of representatives of different religions, regardless of the presence of dogmatic differences between them. Every person, being free to practice his faith, must acknowledge that others have the right to do so. The centers of world trade, culture and science were located here. A huge impetus to their prosperity was given by the tolerance, hospitality, kindness, respect for another culture and religion characteristic of our people from time immemorial.*

**KEYWORDS:** *Coexistence, Regardless, Conscience, Hospitality, Kindness,*

### INTRODUCTION

The purpose of this article: to show that Tolerance is a sign of civilization, high spirituality and culture. I want to remind you that tolerance is the most important ideal of Islam, and Islam has always stated and confirmed the fact of the coexistence of different civilizations, religions, peoples and cultures.

The development of each country, its place in the world community, first of all determines how strong peace and harmony are in it, how strong the spirit of tolerance is. The policy of Uzbekistan, which is one of the centers of Islamic culture, is built primarily on the basis of interreligious and interethnic harmony. Respect for other cultures, languages, beliefs and traditions has been transmitted as a spiritual value from generation to generation for many

centuries. Tolerance, in its broadest sense, has several dimensions. Of these, religious is of particular importance. Interreligious tolerance in our region has a long history, that is, it is a deep tradition for Uzbekistan.

An important source of peaceful coexistence of nations and nationalities on the land of Uzbekistan is based on the special mentality of the Uzbek people. What is the basis of the specific features of the mentality of the people? This is, first of all, the historical experience of the people, formed over the centuries, the system of customs and traditions.

“It should be noted that“ the majority of the people of Uzbekistan prioritize not their personal well-being, but care for the health and well-being of their families, relatives, relatives and neighbors. This is the highest spiritual value of a person. Our people never put themselves above other nations, showed due respect to other nations, representatives of other confessions. ”

This feature of the mentality of the Uzbek people has been formed over many centuries, when representatives of distinctive cultures and civilizations lived on the ancient and fertile land of Uzbekistan, which contributed to the formation of a special mentality of our people, distinguished by kindness, peacefulness, openness, breadth and generosity of soul. Here it is necessary to dwell briefly on the very term "tolerance". “Tolerance” is a concept widely used in various spheres of social life and scientific activity, such as politics and political science, sociology, philosophy, and theology. The Latin word "tolerare", meaning "to endure", "to endure", is mainly used to express the patient attitude of one person to the views and worldview of another.

Religious tolerance means the peaceful coexistence of representatives of different religions, regardless of the presence of dogmatic differences between them. Every person, being free to practice his faith, must acknowledge that others have the right to do so. As the antonym of religious tolerance, religious intolerance appeared and as a consequence - religious fanaticism and extremism.

In recent years, the media have tried to impose the stereotype of religious intolerance in Islam. Islamophobia is an extremely dangerous phenomenon, contributing to the reinforcement of the myth of Islam as a religion that has become an ideal ground for terrorism.

To eradicate Islamophobia, it is necessary to clarify the essence of Islam as a religion of peace, goodness and tolerance. Islam is a religion of tolerance, the origins of which originate in the Koran and the life practice of the Prophet Muhammad. A tolerant attitude towards dissent is not a thesis introduced into Islam from other faiths and ideologies. This is not a tribute to Western democracy, which recognizes pluralism at its most extreme. Muslims respect followers of various confessions because social relations in Islam are based only on the principle of justice and mercy.

Islam claims that all religions have a common source - the religion of Abraham - and makes its acceptance morally obligatory for conscientious followers of Moses, Christ and Muhammad. Muhammad decisively rejects his claim to be the first herald of Islam. “He legitimized for you in religion what He commanded Nuhu (Noah), and what We inspired you in revelation, and what We commanded Ibrahim (Abraham), Musa (Moses) and Isa (Jesus):“ Confess your religion and do not disagree about it. ”

"The truth is from your Lord. Whoever wants, let him believe, and whoever does not want, let him not believe. "

Shortly before his death, the Prophet Muhammad read his last sermon during the Hajj. It is known as The Last Sermon. This was an important instruction for the followers.

"All humanity is from Adam and Eve. An Arab has no superiority over a non-Arab in piety and good disposition. Know that every Muslim is a brother to a Muslim and that Muslims are one brotherhood. "

The ideas of peace and tolerance, respect for a person, regardless of belonging to any race, nationality, position in society, the principles of compassion and peaceful coexistence with other cultures and religions are the main values of Islam from the very beginning of its inception.

Tolerance, as the basis of intercultural and interfaith dialogue, the foundation of a tolerant society, has always occupied a key place in the Islamic political worldview. One of the hadiths says that once an amazing incident happened to the Prophet. The body of the deceased Jew was carried before him. The Prophet stood up, the companions were surprised and said: "This is the body of a Jew." The Prophet said, "Isn't he a man?" He continued to stand until the funeral procession was out of sight. And there were many such examples in the life of the Prophet. He is a role model in building relationships with people.

The Messenger of Allah said to Ashaj Abdu'l-Quais: truly, you have two qualities that Allah Most Loves and values: one of them is gentleness (meekness, kindness, prudence), the other is tolerance (endurance, tolerance, waiting)

Through the manifestation of these qualities, a person becomes closer to the Lord of the worlds.

1. "Softness" - as the absence of pressure and rough insistence.
2. "Tolerance" - as the ability to come to terms with those qualities or actions of people with whom you fundamentally disagree.

The Islamic religion widespread in Central Asia in the 8th century, in contact with local ethical norms, national traditions and rituals, local culture and way of life, took root in the form of the Hanafi madhhab, known for its tolerant teachings.

Islam considers freedom of religion as an inalienable right of a person with consciousness and will. The tolerance of the Muslim religion in relation to other religions is proved by the fact that in the Arab Caliphate, as well as in the Ottoman Empire, the attitude towards non-Muslims was quite tolerant. The population of the conquered countries either converted to Islam, or continued to profess their faith, but paid a special tax (jizya) and were not full subjects of the caliph. Islam denies religious centralism and does not strive for a world dominated by one religion: "And if your Lord had willed, he would have made people a single people. And they do not cease to disagree, except for those whom your Lord has mercy on. For this he created them. "

The Republic of Uzbekistan is a sovereign democratic state of a secular nature. This understanding is enshrined in the main law of the state - the Constitution of the Republic of Uzbekistan, which says: "Religious organizations and associations are separated from the state and equal before the law. The state does not interfere in the activities of religious associations" (Article 61).

The Constitution also states that "All citizens of the Republic of Uzbekistan have the same rights and freedoms and are equal before the law, without distinction of sex, race, nationality, language, religion, social origin, beliefs, personal and social status" (Article 18), "Freedom of conscience is guaranteed for everyone. Everyone has the right to profess any religion or not to profess any. Compulsory inculcation of religious views is inadmissible" (Article 31).

The Law of the Republic of Uzbekistan "On Freedom of Conscience and Religious Organizations", adopted on May 1, 1998, is the main normative legal document regulating relations with religious organizations in the Republic of Uzbekistan. This law develops and clarifies constitutional norms on freedom of conscience and religious organizations.

On the territory of the republic, 2,238 religious organizations belonging to 16 different confessions carry out their activities, of which 157 are Christian organizations, 8 Jewish communities, 6 Bahá'í communities, one Hare Krishna society, one Buddhist temple, as well as the Interfaith Bible Society of Uzbekistan. Believers freely celebrate their religious holidays. Every year, "Eid al-Adha" and "Ramadan-hait" are celebrated on a larger scale among Muslims, "Easter" and "Christmas" - among Christians, "Passover", "Purim" and "Hanukkah" - among Jews. On religious holidays, representatives of various confessions visit each other and take part in their celebration.

Every year believers make pilgrimages to holy places - Muslims to Saudi Arabia, Christians to Russia, Greece and Israel, Jews to Israel. More than 90 percent of the population of the republic professes Islam, about 4 percent - Orthodoxy, the rest are representatives of other confessions. To harmonize relations between the state and religions, a special body, the Committee for Religious Affairs, functions under the government of the republic. The system of religious education in Uzbekistan includes the Tashkent Islamic Institute, 9 madrassas, Orthodox and Protestant seminaries. All these educational institutions bring up a spiritually rich generation in the spirit of interreligious and national harmony, interfaith tolerance. The International Islamic Academy of Uzbekistan has been established on the basis of the Islamic Academy of Uzbekistan and the Tashkent Islamic University.

The International Center of Imam Bukhari operates in Samarkand. During the years of independence, not only Muslim shrines, but also dozens of churches, synagogues and houses of worship were built and restored. These include Orthodox churches in Tashkent, Samarkand, Navoi, a Catholic church and a Buddhist temple in Tashkent, and the Armenian Apostolic Church in Samarkand and Tashkent.

On December 21, 2017, at the initiative of Uzbekistan, the UN adopted the resolution "Enlightenment and Religious Tolerance" to ensure peace, tranquility and religious tolerance.

The resolution confirms the active support of the religious and educational initiatives of the President of Uzbekistan, our people and the international community. The Resolution "Enlightenment and Religious Tolerance", aimed at solving such acute problems of today worrying the world community as terrorism, extremism, violence, intolerance, promotes science and education, fair and tolerant attitude towards others and a policy of peacefulness.

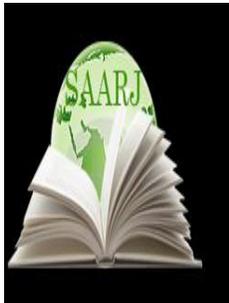

An analysis of the 38-year activity of extremist organizations around the world shows that only in 7% of cases the activities of radical groups were terminated through armed intervention, in

40% - through political negotiations. The main purpose of this document is to help ensure the rights of all citizens to receive education, eradicate ignorance and illiteracy.

An adherent of Islam will be so tolerant, how deep is his faith, how wide is his awareness of its teachings, how strong is his will to relentlessly follow all the precepts of his religion. Today in Uzbekistan strong interethnic harmony reigns, which has deep historical roots. For thousands of years our fertile land has been at the crossroads of the Great Silk Road. The centers of world trade, culture and science were located here. A huge impetus to their prosperity was given by the tolerance, hospitality, kindness, respect for another culture and religion characteristic of our people from time immemorial. There has always been a multilingual speech in our region, churches of various confessions have functioned, the traditions and customs of many peoples have peacefully coexisted and developed.

**ABSTRACT**

*When it comes to the factors that lead to divorce from marriage, it all comes down to young people's perceptions of the family and the issues surrounding it. It is necessary to try to solve the problem together, not to leave the tip of the iceberg in the hands of government agencies or parents. A married couple should be independent in all aspects of their self-sufficiency and reasoning, and should feel responsible not only for their own interests but also for the fate of their child. I want to comment on these through this article.*

**KEYWORDS:** *Divorce, Material Deprivation, Sex Life, Government, Family Code, Crime, Conflicts.*

**INTRODUCTION**

In recent years, some of the unhealthy vices of our people - family divorces, various conflicts, unhealthy family environment, depression, need, crime, the number of troubled, disabled, defective families and divorces are a serious concern.

In our opinion, the unhealthy environment in families, the emergence of conflict situations, divorce are the main reasons for the following factors:

- Psychological factor - a difficult psychological environment in the family, lack of mutual understanding, constant conflicts in the family, parental interference in the life of a young couple, alienation of young couples, indifference to each other, etc.;
- Social factor - alcoholism, infertility, poor health of the husband or wife, etc.;
- Spiritual and moral factor - long-term extramarital affair of one of the spouses, etc.;

- Economic factors - unsatisfactory living conditions, financial difficulties, unemployment, inability of the land to provide for the family, loss of contact with the family of one of the couples who went abroad as a labour migrant, non-payment of debts, etc.

One of the most common types of divorce claims in court practice is the incompatibility of characters between husband and wife.

It is natural for the character of two people to be incompatible. It is important to minimize the possibility of families breaking up under such pretexts.

To do this, a husband and wife who want to get married need to learn more about each other. Without trying to speed up the wedding day, it is important to first understand that it is a rewarding endeavour to test themselves in every area (community behaviour, eating culture, etc.). It is important to understand that in order for a family to be strong, it must never make hasty decisions. That is, it is advisable for the future husband and wife to communicate more and longer so that they can better understand each other.

In particular, in the civil case on divorce of the plaintiff H.A. against the defendant X.X, which was considered by the Fergana Inter district Civil Court on July 9, 2019, the plaintiff H.A. filed a lawsuit in court, upheld the claim in court on July 12, 2008. legally married, has three minor children from a joint marriage, incompatible personalities, family disputes, loss of mutual trust, love, has not lived with the defendant since June 2016, alimony on the basis of a court decision to support the child he asked the court to divorce him, testifying that he was charged, that there was no property dispute between them, that there was no possibility of rebuilding the family, that he married another woman in 2018 without a legal marriage and that he was living well in his next marriage.

X.X, who was questioned as a defendant in the trial, denied the claim and got married on July 12, 2008, had 3 minor children from their marriage, their personalities did not match, family disputes, mutual trust and love were lost. Therefore, he asked the court to dismiss the claim, stating that he had not lived with the plaintiff since June 2016. That alimony had been collected on the basis of a court order for the maintenance of his child, that there was no property dispute between them, and that the family could be restored.

The court, having examined all the circumstances relevant to the case, heard the testimony of the parties, examined the actual circumstances that led to the initiation of the claim, and found it necessary to satisfy the claim on the following grounds.

According to Article 41 of the Family Code of the Republic of Uzbekistan, if the court finds that it is no longer possible for the husband and wife to live together and maintain the family, they shall divorce them.

It was established that the parties were legally married on July 12, 2008. They have three children, Fatimahon and Zuhrakhon, born on July 12, 2009, and Akmaljon, born on April 3, 2014. The parties have not lived together since June 2016.

There is no property dispute between them. The plaintiff provided his wife and children with housing, i.e. apartment 40, 41a S.Temur Street, Fergana, was presented to Akhadjonov Akmaljon Akbarjonovich on April 25, 2017. Alimony was collected in court for the maintenance of his

child. Marital relations 3 years ago completed. The plaintiff has been legally married to another woman. The court's decision of November 10, 2016, rejected the parties' claim for divorce.

According to the court rulings of November 21, 2018 and March 6, 2019, the parties were given 2 to 3 months to reconcile. The Women's Committee of Fergana city, the reconciliation commission of Fergana city 46 "Oqariq" MFY, the imam of the mahalla took measures to reconcile the court was told that it was not possible to save the family.

The court examined the state of affairs in the case and concluded that there was no way to restore the family in the future, that the family was completely ruined, and that in such a case the claim should be upheld.

In addition, there are cases when marriages are marginalized, i.e. the husband has a higher education, and the wife has a secondary education, or vice versa. Therefore, it is necessary to eliminate this situation as much as possible.

In addition, the unpreparedness of married girls for marriage also leads to the breakdown of the family in the future.

There are cases when a woman's inability to cook after marriage, inability to keep the house clean, and inability to take care of her hygienically also lead to the breakdown of families. These cases are recorded in lawsuits and are reflected in court hearings.

Unfortunately, women get married at the age of 16 or 17 without having enough knowledge about the laws of life, that the family is a sacred place, and that it should always be kept clean and undamaged: the number of divorces among young families is increasing day by day; problems in obtaining general secondary special education (leaving many classes after marriage, not continuing to study) and violation of the requirements of the law on compulsory general secondary special education; leading to an increase in juvenile delinquency.<sup>1</sup>

The organization of marriage preparation classes for young people studying in the upper grades will help to prevent the above cases, at least in part.

When considering divorce cases, it is often the case that disputes arise as a result of unjustified interference by other persons in the marital relationship between the couple.

On the part of the husband, the mother-in-law's regular interference in the couple's personal affairs, her attempts to transfer her dominance to the bride, her attempts to separate the son from the bride, or the frequent repetition of the son's jealousy of the bride lead to gradual family breakdown. In addition, the mother-in-law's vague statement about "choosing a mother or wife" for her son also leads to family breakdown.

It is also the wrongdoing of in-laws who are married or divorced, and the inappropriate treatment of brides, in particular, that leads to the end of the relationship between the couple.

It is the fact that the wife and the mother sometimes unjustifiably express their views on the relationship between the couple and their family members. Their own views often do not give good results.

In practice, in cases like the above, the husband and wife who apply for divorce say that the relationship is good, they only go to court under the pressure of their parents, and they intend to continue the family relationship, they are forced to live in secret from their parents. Of course, in

such cases, the courts try to rectify the situation by summoning the perpetrators to court to take measures to restore the family. However, it is not always possible to do this.

It is also unfortunate that strangers try to misrepresent the husband or wife with all sorts of words, misinterpret events in the husband's (wife's) life with incomprehensible intentions, and try to change the minds of others in a negative way is calculated. In such situations, the couple is not always able to stand on their own two feet in their independent thinking. They hastily, without question, conclude that "now the family is broken."

However, one of the tasks of the current family law is to prevent any person from arbitrarily interfering in family matters, to ensure that family members can exercise their rights without hindrance and to protect these rights.<sup>2</sup>

It is necessary to explain more and more regularly and in meetings with women in the mahallas that the various rumours and unreasonable interference in the relationship between the couple will one day lead to the breakdown of the couple's family, orphans and an increase in the number of troubled families.

Although it is very difficult, it is important to make people aware that solving problems in the family is a personal matter for the husband and wife, and that it is not a good habit for a person to interfere in their affairs from the outside. Of course, this process pays off over the years, not a day or a month.

Another factor that can lead to divorce is financial insecurity in the family. Life does not always go the same way, of course, even in material matters.

There are also cases when a person who is unable to provide for his family is sued, claiming that he is the main cause of the family's breakdown. In such cases, an attempt is made to explain that the temporary difficulties will pass, that the financial support of the family is not only the duty of the husband, but also the financial and spiritual support of the family is the joint responsibility of the couple.

One such case in court practice was heard by the Fergana Inter district Civil Court on 20 February 2019, which upheld the claim of the plaintiff A.N. against the defendant A.S. as the plaintiff in the Court session on 10.01.1983. that they were legally married, that they had three children during their marriage, that they had not lived together since 1995, that the defendant did not respect her and her family members, that they had quarrelled over household failures and left their parents' house for six months; lost respect, and therefore the family broke up, married in Russia in 1997, brought his wife home in 1998, had 2 children from his second marriage, earlier in 2002 his claim was rejected, the defendant first demanded a husband, then a house, He built her a one-room house he stated that the defendant's claims had increased after the filing, that the family had not been restored even during the period given for reconciliation, and that there was no property dispute between the defendant and the plaintiff.

A.S., who was questioned as a defendant in the trial, denied the claim, arguing that he had been legally married to the plaintiff on 10.01.1983, that they had three children during their marriage, that they had not lived together since 1996, that the plaintiff had been irresponsible to the family, He was imprisoned, suffered a lot, endured insults, was forced to go to his father's house, the plaintiff's claim was rejected in 2002, the plaintiff agreed to divorce only if he settled his house, and the family was not restored during the reconciliation period. , asked to drop the claim.

The court, having examined all the circumstances relevant to the case, heard the explanations of the parties, examined the actual circumstances that led to the initiation of the claim, and found it necessary to satisfy the claim on the following grounds.

The parties have not lived together since 1995 due to disagreements. In 2002, the Fergana Inter district Civil Court ruled that the plaintiff's claim for divorce was rejected. The court ruling of August 20, 2018, set a six-month deadline for the parties to reconcile. According to the statement of the parties, it was not possible to restore the family during the given period.

The women's committee and neighbourhood civic assemblies in the respective area presented findings confirming that it was not possible for A.N. to restore his family with A.S.

As explained in paragraph 16 of the Resolution of the Plenum of the Supreme Court of the Republic of Uzbekistan dated July 20, 2011 No. 06 "On the practice of application of legislation by courts on divorce" and in accordance with Article 41 of the Family Code of the Republic of Uzbekistan. It must be satisfied only if it is determined that they can no longer live together and that it is impossible to maintain it because the family is completely broken.

The court ruled in favour of the plaintiff in considering the inability of the parties to restore the marriage, the unwillingness to restore the family, the impossibility of their further cohabitation and the complete failure of the family, the failure to restore the family even during the conciliation period, and the plaintiff's remarriage found it necessary to levy a state duty of 300 per cent of the minimum wage in favour of the state.

The regulation of family relations is based on the principles of mutual resolution of internal family issues, upbringing of children in the family, care for their well-being and maturity, protection of the rights and interests of minors and disabled family members.<sup>3</sup>

There are also cases where a wife earns more money than her husband, which in some ways leads to family breakdown.

In such cases, it is considered expedient for the prospective couple, who wish to get married, to get married after they have accumulated the funds that can support the family, at least in part, in the future. To do this, parents, the community and other members of the community need to be taught to live independently after their children grow up, and to take independent steps after they have grown up, bypassing all aspects of financial well-being. Of course, spiritual education must be constant. Only then will the young husband and wife feel independent living, and feelings of responsibility, commitment, aspiration for life, survival and appreciation of the family are formed. The reason is that many parents, instead of leaving their children financially to support their husbands and wives at a time when their families are on the verge of collapse, say, "I'll find you a new girl and marry you" or "you've been in our house for so many years." We can take care of it ourselves. The spiritual encouragement that is intertwined between them is to some extent the cause of the family's failure. In such cases, parents should encourage husbands and wives to take steps to reconcile the family, try to reduce the number of orphaned children, refrain from making all sorts of gossip about the failure of one family, and encourage parents to work together or, if necessary, both need to be nurtured.

It should also be noted that as a result of temporary disputes between husband and wife, many women apply to the court for alimony in a very short time before the divorce, in order to provide for their children. It is unfortunate that this situation is supported by the woman's parents. As a

result, this situation is considered to be one of the factors that lead the husband or his family to conclude that the wife has no desire to restore the family and break up the family.

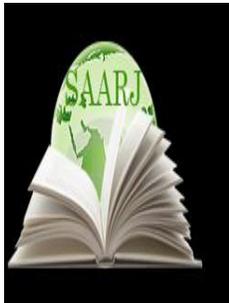

The weakening of sexuality in the family is also one of the causes of marital discord between couples. A sharp decline in sexual intimacy between couple can slowly lead to infidelity. To avoid such unpleasant situations, of course, both husband and wife should try to eliminate their shortcomings in this matter as much as possible. To do this, it is necessary to establish the practice of using the advice of a sexologist. It is also necessary to take seriously the teaching of sex culture to boys and girls approaching puberty. This is because in many cases, the unpreparedness of a married couple or one of them for sexual life can lead to the breakdown of families. As a result, one of the parties betrays the other.

Such cases are common in court practice. It is unfortunate that the husband and wife are unable to reconcile for trivial reasons, and are indifferent to the fate of the children in the middle, and hastily go to court with a petition for divorce.

For this reason, the district holds regular roundtables and meetings on the concept of marriage in cooperation with women's committees and "Family" Research and Practice organisations at public gatherings, higher education institutions, academic lyceums and secondary vocational colleges to teach young people how sacred the family is. It would be expedient to take in-depth measures to increase the responsibility for marriage in the future and to carry out a comprehensive explanatory work on state policy and legislation in this area.

### ABSTRACT

*Humanitarian ideas such as the recognition of the uniqueness and values of human life, the right of the child to development, the guarantee of satisfaction of educational needs are reflected in a number of normative and legal acts adopted by the Government of the Republic of Uzbekistan and internationally. In particular, in our country, serious attention is paid to the education of children with developmental problems in the national spirit, mental, moral, physical development for social life at the level of independent citizenship. Therefore, in order to restore the health of children with developmental problems, improve their education, and consistently reform the social protection system, a number of measures are being planned and successfully implemented in the state programs adopted each year to address these issues. In this article I would like to describe important aspects of cooperation in the inclusive educational process.*

**KEYWORDS:** *Education, Development, Inclusive Process, Cooperation, Sick Children, Adaptation.*

### INTRODUCTION

A number of positive developments in the field of education in recent years are closely linked with the integration of activities in various areas in addressing the fate of children with developmental problems. Early diagnosis of abnormalities in child development, rehabilitation of the consequences of the problem, pedagogical assistance to children with early and early developmental problems, the development of models for their adaptation to secondary education remain among the pressing issues on the agenda.

To date, the issue of effective implementation of inclusive education for employees of the special education system is on the agenda as the most thought-provoking issue.

The scale of work in this direction is gradually increasing in Uzbekistan. Currently, a number of projects have been implemented in various regions of the country for several years in cooperation with the Ministry of Public Education and a number of international and non-governmental partner organizations. The analysis of research conducted within the framework of these projects shows that the experience of the program on inclusive education in educational institutions of the country shows the advantages of this method in ensuring human rights, in particular, the rights and freedoms of children:

- The rights of children with special educational needs to development in their families and communities are ensured;
- The participation of children with special educational needs in the educational process is ensured;
- Increased interest in life through the right of the child with special needs in education to be in the community of healthy peers;
- Children in need of special attention in education began to feel that they were among others.

The most remarkable aspect of the work done in this regard is that positive changes have taken place not only in the lives and minds of children with disabilities, but also in the minds of healthy children who are educated together with them. That is, healthy children began to treat children with disabilities not as they treated sick children, but as friends who were experiencing specific development.

However, despite the positive results in inclusive education institutions, a number of challenges have begun to be faced. These problems have been identified for a number of reasons. In other words, in addressing all issues related to the involvement of children with special needs in social life, without separating them behind the walls of special educational institutions, at first glance, they face completely different issues that are not directly related to this main issue. Most importantly, it is necessary to provide these children with the necessary aids, radically change and equip secondary schools, as well as to create special scientific and methodological literature for teachers, to train specialists, so that children with special needs in education can adapt to general education.

Another socially important issue in the success of inclusive education is the issue of mentality.

For many years, society has been dominated by the idea that children with developmental disabilities should be educated in special institutions, and that it is difficult to allow them to be educated together with normally developing children. It will take a long time of patience to change public opinion to solve this problem. After all, the idea that a child with developmental disabilities has the right to free education, like all children, should be instilled not only in himself, but also in those around him (peers, parents of normal children, and, above all, the institutional community).

We also believe that the introduction of inclusive education should be based on the idea that the family is the most effective place for the development of a child with special needs, as well as the fundamental right of the child to be at home.

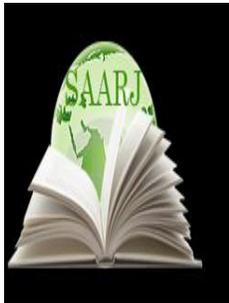

Since the quality of education and the availability of school conditions are key factors in solving the problem, rather than the child's abilities, the inclusive institution should identify the following at the beginning of its activities:

- Every child has the right to education in a secondary school;
- The conditions for the child should be adapted to his capabilities, not to his shortcomings;
- Corrective assistance should also be provided for the child's full education;
- In order for the child to successfully adapt to the process in the institution, it is necessary to have the joint influence of adults and peers around him;
- Attention should be paid to both the quantitative and qualitative composition of children in the class or group;
- Teachers of educational institutions should have a comprehensive understanding of this area;
- It is necessary to pay attention to ensuring the participation of all children in the organization of the educational process;
- It is important that the environment in the institution is adapted to the capabilities of children in all respects.

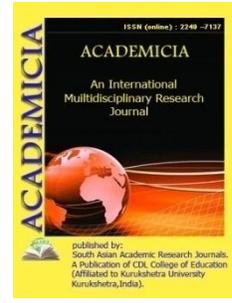

The idea of "From inclusive schools to inclusive society" should be considered only as an important factor in ensuring the freedom of the child in need of special assistance in each education, the right to be in the family, to grow up in their own home and neighborhood, to receive equal education. We can achieve the current implementation. It is enough for us to carry out enough joint activities.

### ABSTRACT

*This case reflects the life of an entrepreneur. Entrepreneurship is the most powerful term which is imperative across the world. The progress of any country depends on entrepreneurship. Hence, entrepreneurship is inevitable and indispensable. Entrepreneurship includes more essential things such as initiative, creativity, innovative ideas, understanding the customers and competitors, satisfying the customers, know the market and a lot of uncertainties and challenges. Entrepreneurship can be classified into large and small businesses. Now a day's small scale business plays a vital role to accelerate the country's growth. As India's population is vast with a different culture, wherein small scale business predominantly plays a major role. Moreover, small scale businesses satisfy the customer needs, bring more innovations, highly competitive, good quality and variety of products and services, specifically focus on rural areas, create more entrepreneurs, employment and support their livelihood. This case talks about one such entrepreneur who is running the hotel and his entrepreneurship strategies. I have described more details about the hotel and the business model in this case. It is a small hotel named "UBM HOTEL". Last decade, if Customers wants to have non-veg food, UBM hotel would be their first and foremost choice. This case described the quality of the products, goodwill of the business, customer service, loyalty to the customer and ethics in business.*

**KEYWORDS:** *Customer Service, Entrepreneurship, Loyal To The Customer, Goodwill Of The Business, Business Ethics*

*This case is solely developed for the students' purpose for classroom discussion. The case is developed based on secondary sources. The case does not indent to illustrate either effective or ineffective management or Managerial situation.*

## INTRODUCTION

### Background of the Hotel

UBM hotel is small in size and which is being called (NAMMA VEETU VIRUNTHU). It is located in a small village near Seenapuram, en route of Perundurai to kunnathur in the Erode district of Tamilnadu, India. The owner of this hotel is Mr. Karunaivel. In 1992-93, Karunaivel's family started a canteen at saw-mill in their village. When he started his business, the very first day he got the order for the food. As he was very happy to deliver the food, he had a great shock. He was asked to provide the food for the canteen employees at less cost (almost 50% less) than the prepared cost of the food. Though he felt sad, he wanted to satisfy the people through his food service as he loved his business. He took it on the positive side and continued the business. After a few days, some other issues had come, eventually, he was not able to continue the business at the saw mill. As he loved the hotel business intensively, he did not take any other business. He introspected again and again. Eventually, after six years, he decided to set up the hotel at his home itself.

UBM hotel was started in the year of 1998 by Mr. Karunaivel and Ms. Swarnalakshmi as a vegetarian mess. The hotel is located on the road, people were commuting for their daily and business purposes, government officials were passing through on the road would stop and have food. Gradually, the hotel became famous; people started coming from around 20 to 25 km to have the food. In the course of time, the UBM hotel was famous for both Veg and Non-veg. Gradually customers started liking the taste of the non-veg food of UBM hotel. UBM's Non-Veg food holds the upper hand than Veg food. On account of the high demand for non-veg food, propelled the hotel to Non-veg diners. Mr. Karunaivel said his family is meant for giving good hospitality to people. Mr. Karunaivel grew up being fed with a variety of delicious food at home. His grandparents thought that nobody visiting our house would go back hungry which was passed to my parents thus we have been following the same in our life.

Surprising aspects of UBM hotel, it serves food only for lunchtime, whereas normal hotels were serving food three times a day. The hotel got customers from nearby places, districts, and states as well. Totally more than 20 different varieties of Non-veg items were served there, all the non-veg items were unlimited. A very interesting factor is Karunaivel & Swarnalakshmi both are vegetarians who gave Non-veg feast to the customers every day. All the non-veg items were prepared by the owner's own experience.

### Infrastructure

UBM hotel is located in a small place, the hotel did not have any big infrastructure. The front portion of the home was converted as a hotel. Normally, now a day's in the hotel business, a high volume of money to be spent on infrastructure like A.C, tables, chairs, menu cards, parking space, attractive ambiance all those things are inevitable, whereas UBM Hotel did not have those things. In fact, the hotel did not bother with those stuffs. In fact, the UBM hotel is set up in the

thatched roof, tables were set up in the cement stone with plastic chairs. Maximum 20 people can sit simultaneously and the rest of them have to wait outside under the shadow of the trees where chairs were put up by the roadside for the customers to wait and small family lounge is also there. At lunchtime, the entire hotel area is surrounded by swanky cars parked outside the hotel; customers are curiously waiting and getting drool in their mouths to have food.

### **Customers**

Nowadays the customers' objective is to go to the hotel is different from the earlier period. Now the customer preferences to choose the hotel based on the location, infrastructure, Parking space, Time, Air condition than food which is pretty common in today's hotel business. Generally, every place has its own culture and taste pertaining to food. UBM hotel served the food at par with the culture of the region. Mr. Karunaivel understood customer preferences well. As he was keen on customer satisfaction, he had a practice that customers have to make an appointment for lunch through phone prior come to the hotel. Based on the total count, food will be prepared. Since customers were coming from faraway places, he ensured that all customers must have food and avoid overcrowding as well. Hence, he has been following the procedure of getting an appointment before coming to UBM. On weekdays and weekends around 50 and 100 plus people respectively visit there. Mr. Karunaivel received calls for the food from many states for appointments; Customers were coming from all across Tamilnadu and other states nearby like Bangalore, Kerala. In some interesting cases, people have visited UBM from other countries as well. Some famous celebrities visited the UBM hotel were Tamil Director Mr. Sandana Bharathi, Mr. Pandiarajan and his family, Tamil actor Mr. Prabhu and his family, National award lyricist Mr. Vairamuthu, Tamil comedian Mr. Mayilsamy, Actress Ms. Kajal Aggarwal and other celebrities. Recently Belgium couple had visited the hotel and enjoyed the food; they told that never had such kind of food anywhere else. Generally, the Erode district in Tamilnadu is meant for agriculture, surrounded by farmlands that are famous for shooting. Whenever a shooting happens in nearby places, the shooting unit visited the UBM for food.

### **Quality of the Food**

Karunaivelu and his wife Swarnalakshmi are much particular in food preparation. They used to check the quality of ingredients, which is being used for cooking. Mr. Karunaivel said the appointment is made either a day before the customer arrives or morning on the day. Based on the appointment, he checked and bought fresh and quality meat from the butchers every day. UBM believes, "Taste, quality, and authenticity is one thing which can't be compromised anymore. The recipe for each dish, which has been modified to cater to making non-veg dishes is a gift passed on from our elders. He gave clear instructions on making the masala pastes and mixes for the food. Since quality is the most important criterion, meat isn't kept in the refrigerator at any circumstances. They did not use any of the readymade spice powder which is available in the market. They ground all masalas in grinding stone as traditionally on a daily basis which is very special in UBM. Mr. Karunaivel's wife is a sole cook; she put utmost care in the quality of the food and taste. Once the preparation is over with the meticulous plan of Mr. Karunaivel, the taste of the food is checked by him, after that food will be served to the customers.

**Service**

First and foremost once customers entered the hotel, they are welcomed by Mr. Karunaivel and asked to be seated politely based on the crowd for having the food. Big plantain leaf around 2.5 feet is put for serving the food to all customers. His intention was to provide the home atmosphere to each customer while they were having food. That may be the reason; one big single plantain leaf is put for the whole family members wherein all the dishes were served to the entire family. In fact, this brought the old culture which was being practiced by the ancestors in front of our eyes. For individuals and friends, who were interested to have the food from the different plantain leaf, they served the food individually on smaller leaves. UBM had a clear practice that food was served to the customer only by Mr. Karunaivel and his wife; no other people were allowed to serve the food to the customers. While serving the food, he was wearing a pure white shirt and dhoti and his wife wore starched cotton saree, sacred ash on her forehead, warm smile with high positive energy which portrayed the culture of the region and resembled the state of a mother while serving the food. The motto of his business is, every customer must be considered as a family member, therefore he ensured that complete customer satisfaction while customers were leaving from the hotel. At times, when customers were not much aware of the variety of dishes and their benefits, he explained very passionately and told the advantages of those dishes. As the food is unlimited, he encouraged the customers to have more food and insisted them to ask furthermore in the father's stature. He had spent a good quality of time with each and every customer. Though the crowd was high, he never urged any customer in order to manage the crowd. Since money was not a primary concern, he took only limited orders every day to satisfy the customer. At times any vegetarian comes; he satisfied them as every day at least enough vegetarian food was available for few people to pass through.

**Variety of Food**

In plantain leaf salt was kept first followed by one bottle of mineral water is kept, after that small quantity of rice then non-veg dishes started to be served one by one which included mutton, Chicken, Quail, Duck, Egg, Turkey, Fish. Mutton dishes which included blood poriyal, intestines, mutton masal, aattu kaal varuval, liver fry, thalai curry and nalli. For those who prefer poultry, there's chicken biriyani, chicken kolumbu, varuval, pepper chicken, crumb fried drumstick and masal; quail roast, turkey varuval, pigeon masal. Seafood lovers have fish fry, fish kolumbu and uppu kandam, with biriyani, rasam, curd and payasam. After the food, customers were served ice cream and betel leaf. Generally, Mr. Karunaivel told that, once those items were served, immediately customers said "enough" but he said that "kindly take the food very slowly so that you can have more food and enjoy this". After the food, if customers wanted to take rest for a while, chairs and small wooden cots were put under the trees.

**Public relation**

Mr. Karunaivel strongly believed that serving food to the people is a gift of God by which we can directly associate with people's hearts. Since Mr. Karunaivel runs the business not only for the profit motto, he gave more attention to customer satisfaction, good service, quality of food, goodwill of the hotel. Generally, UBM hotel did not have any advertisements, websites, everything through word of mouth. New customers were generated through existing customers. Information about the hotel was rapidly passed from existing customers to their network; eventually, they tend to visit the hotel. It's possible for him to flourish his business to a great

level and start as many as branches with ease, but he was not interested. During the interview, “he said categorically that people who are hungry and need quality food, they have to be satisfied. Customers are the great ambassadors; as long as the quality is there we don’t want to run behind the customers, a customer will follow us”. It’s precise that, he never concentrated on the advertisement or any other promotional activities. As customers were coming from faraway places, it was recommended to see the Facebook page to know about the venue of the hotel, testimonials, photos, and ratings which were mentioned much clear about the hotel information to the customers.

## Testimonials

### Virundhombal!

1. Eating at UBM Namma veetu saapadu has been in my bucket list for a long time, after seeing photos and reading reviews. And we decided to go there while on our visit to Coimbatore for Sukanya's wedding. We called them and made reservation a day before. Today, we hired a zoomcar and while on our way we asked them if they would accept card, and they answered in negative. But we had already come a long way from Coimbatore by then. With the demonetization effect, a few ATMs on the way and all were closed and we were not able to get from petrol bunks too. We planned to go there, have lunch and hunt for ATMs then as it was already 2:30 PM.

We went there and told them we did not have enough cash and that we would withdraw n give. He simply said, "saapdunga modhala, kaasu daana, enga poyida poringa, apparam paathukalam"(Eat first, and we'll discuss this later, do not worry).

Lunch started with 2 huge banana leaves, with one leaf for 3(Like the banana leaf in senthil's comedy where one can lie on that). He said, "rice dan side dish" while about to start serving. Few quantity of rice, but the non veg varieties were infinite, including chicken, mutton, fish, pigeon, Turkey with a number of options in each, including raththa poriyal, thala kari that I lost track on the number of dishes. Their chicken, fish fry was among the bestest. Everything was cooked properly, making justice to the hotel name. Lunch ended with a complimentary ice cream.

After lunch, we literally wiped our wallets, still we were short of the total amount. And the man was like, "paravala magane idu podum, varuthapada venam," and after taking pics, "muzhusa thodachitinga nu solringa, selavuku iranooru venuma?"

A heavy lunch in a heavenly place, worth a 80 kms drive. A paradise for non vegetarians.

P.S: The hotel is run by an elderly couple, both being vegetarians.

### *Authentic and tasty non veg food*

2. Homely environment, very nice couple.. Primarily had chicken, mutton and fish dishes..the food was awesome..if you are a non vegetarian and love food, you should definitely try this once. worth the money and wait.. Don't forget to reserve ahead.

### *Gastronomically Surprised*

3. The hotel in itself is very non descriptive but the story begins after that. The meal that is served is epic.7-8 types of chicken. 3-4 types of mutton. Egg, Veggies, fish, Rice , biriyani. Food quality is very good although quite spicy. The hospitality extended is beyond par. Superb set of

hosts actually make your lunch worthy of it. We travelled from bangalore just for the lunch and boy o boy we were so happy after this. Please call them up and inform about your visit. Must go place. Meal cost is 550 per person

4. Good food. More over awesome people. Hospitality was great. They treat you like their own family members. They Invest at least 10 mins on each person.

5. These are homemade food and they don't have any servers to serve us. They do it by their own. My suggestion is to go on a weekday and the food is worthy than 500Rs. I rate it 5/5, just for their passion towards service.

## CHARACTERISTICS OF SPEECH CORRECTION OF CHILDREN WITH INTELLECTUAL INSUFFICIENCY

**Mamajonova Najminso Maxmudjonovna\***

\*Lecturer,  
 Department of Defectology,  
 Kokand State Pedagogical Institute named after Muqimi,  
 UZBEKISTAN

### ABSTRACT

*This article describes in detail the specifics of speech correction for children with intellectual disabilities. In addition, special attention is paid to the organization of correctional education for children with intellectual disabilities in cooperation with special preschool institutions and families of children with intellectual disabilities.*

**KEYWORDS:** *Children With Intellectual Disabilities, Speech Defects, Cognitive Processes, Preschool Special Education Institutions, Correctional Classes, Education, Upbringing.*

### 1. INTRODUCTION

In the world, the social and legal protection of childhood in practice is divided into several categories, which exist in the specific complex conditions of children and are therefore the least protected part of any developed society. Among them, mental activity lags behind development that there is also a separate group of children with developmental disorders of sensory, motor, emotional and volitional aspects. These children's life activities and ability to work will be limited by themselves. Educational, correctional and correctional work with such children from pre-school age is very effective. In general, a lot of normative and legal documents have been signed to radically reform my pre-school education system. Including:

On December 29, 2017, the President of Uzbekistan Shavkat Mirziyoyev signed a decree "On measures to further improve the system of preschool education in 2017-2021". As a result of implementation of complex measures defined by the decision, the following will be achieved:

- Ensuring high quality pre-school education, radically improving the preparation of children for quality school, the introduction of alternative programs in the educational process;
- Organize 6,100 short-term groups as an alternative form of preparing children for school;

- Organize the preparation of children aged 3-6, who are not covered by preschool education, and their parents for school education by providing them with methodological manuals;
- Expand the network of pre-school educational institutions through 50 new constructions and reconstruction of 1167 existing institutions and overhaul of 983 existing ones;
- Reduce parental fees by 30% in rural preschools;
- Increase the coverage of children in preschool education by 1.5 times.

## 2. Main part

The effective implementation of the program will be under the constant control of government agencies through systematic monitoring of the implementation of the indicators set out in it.

The implementation of the resolution will ensure an integral and step-by-step development path to further reform the system of continuing education in the country as one of the main priorities of state policy.<sup>1</sup>

To achieve these goals, a variety of educational, pedagogical and correctional work is being carried out with children with intellectual disabilities of preschool age. It is stated in all special literature that the correction of their cognitive and speech defects should be based on a system of correctional work. In this regard, cooperation with the family is also important in the upbringing of a child with a developmental disability, especially a mentally retarded child. A speech pathologist should not only bring up a child with developmental disabilities in a special institution, but also work with his family. The defectologist should provide psychological assistance to the child's family and instruct the child's parents on how to organize the upbringing. It is important for a specialist involved in working with a mentally retarded child to understand the characteristics of his or her family situation in order to help the child closely, but it should be noted that parents do not take their children with disabilities to specialists because they are ashamed to take it out. Lack of communication with the outside world is a serious obstacle to the speech development of mentally retarded children. In mentally retarded children, there is an underdevelopment of higher forms of cognitive activity, superficiality of thinking, slow development of speech and qualitative specificity, impaired verbal control of behavior, incomplete emotional-volitional sphere. Late speech development is characteristic of mentally retarded children. Strong lag is observed in the period before the speech. If congestion occurs normally in infants from 4 to 8 months of age, in mentally retarded children it occurs between 12 and 24 months of age (I.V. Carlin. M. Strazulla.)

According to M. Zeeman, the first words appear in children with mental retardation at the age of 3 years. Studies by IV Carlin and M. Strazulla show that the first words appear in such children between the ages of 2.5 and 5 years. (Normal development of the first words in children is from 10 to 18 months).

Significant retardation of speech development in mentally retarded children is reflected in the emergence of expressive speech. In this case, the interval between the first words and the phrase is longer than in normal children.

Specific aspects of speech development in mentally retarded children have been studied by many authors in the psychological aspect (V. Petrova, M. Pevzner, I. Carlin, M. Strazulla, S. Borel, Mezonni, Schlezinger, M. Zeeman and others. ).

Speech disorders in mentally retarded children have been studied by speech therapists M.Khvatsev, R.E.Levina, G.A.Kashe, D.I.Orlova, M.A.Savchenko, E.F.Sobottovich, R.I.Lalaeva, K.K.Karlep. According to these studies, 40-60% of children in the primary grades of secondary school have obvious deficiencies. According to M.E. Khvatsev, G.A. Kashe, the number of children with speech defects in the first grades of the secondary school is quite high.

There is a lot of research being done on how to effectively develop a child's speech and how to fully contribute to the social development of this child, how to organize the work on speech development of preschool children with intellectual disabilities. .

Here are some suggestions on how to improve the speech of children with intellectual disabilities:

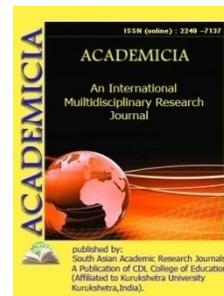

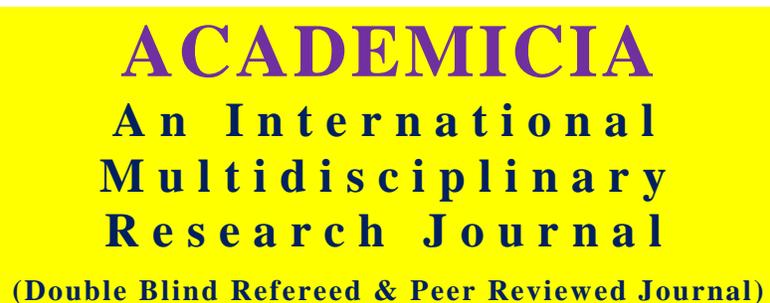

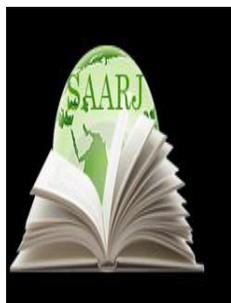

- The choice of teaching methods in speech development classes should be such that they effectively help the mentally retarded child to gain a deeper understanding of existence and to develop speech and thinking;
- All opportunities should be used to activate speaking skills;
- increasing children's vocabulary based on the development of their interest in objects and events in the world;
- It is advisable to follow the following requirements when using visual aids in the educational process. The picture chosen should be clear, interesting, colorful and large for all children.

### 3. CONCLUSION

By expanding the speech capabilities of mentally retarded children, their thinking is formed, because the cognitive processes are inextricably linked with speech, which at the same time allows children to develop speech and develop imagination, to solve problems of acquainting them with the environment. As a result, it is easier for mentally retarded children to integrate into society.

## NAMES OF THE ANIMALS USED IN ALISHER NAVOI'S POEMS

**Nodira Alisherovna Abduvaliyeva\***

\*Teacher of Fergana State University,  
UZBEKISTAN

### ABSTRACT

*In this article, the names of animals used in the works of the great poet, their semantics, the frequency of animal names used in the devons of "Khazoinul-maoniy" and a number of thematic groups are presented.*

**KEYWORDS:** *Nature, Ornithonyms, Ankabut, Chugs, Anqo, Butterfly, Propeller, Snake, Fable Art, Sayd, Suyi, Qaqnus, Oshyon.*

### INTRODUCTION

Fiction helps an individual find his or her place in society. This process takes place through reading the works read, drawing appropriate conclusions from them, being influenced by the artistic word, purifying the heart, enjoying the virtues that are pleasing to one's relatives, and most importantly, self-improvement through works of art. It is necessary to "pay tribute to the memory of our ancestor Alisher Navoi, to study his sacred heritage, to pass it on to our younger generation." There are endless aspects of studying the works of Alisher Navoi. By studying them, the reflection of the environment, language, culture and social life of the poet's time emerges.

The term animal refers to terrestrial, winged, reptile, aquatic creatures. In the narrow sense, the term refers to the mammalian family, while in the broad sense, it refers to the entire animal kingdom, in direct opposition to the plant kingdom.

Zoonymic units are the object of study of onomastics as a noun and semantics as a cognate noun. The meaning of the term zoonim is broader than that of an animal lexeme. During the historical period of the Uzbek language, 337 words belonging to the animal world were used, and these names are mentioned in the annotated dictionary of Alisher Navoi's works. From them, 76 are the names of livestock, 71 are the names of livestock, 94 are the names of birds, 9 are the names of reptiles, 48 are the names of wild and wild animals, 41 are the names of small animals and beasts, 6 are the names of aquatic animals, 12 the names of legendary animals. Our linguists

divide the words belonging to the animal world into such names as the names of livestock, the names of wild animals, the names of reptiles, the names of birds.

Fauna and flora play a key and important role in the Turkish lexical layer of the Uzbek literary language dictionary. Words belonging to this layer are characterized by the fact that they are active lexical units, expressing necessary and vital concepts and ideas. In the modern Uzbek literary language there are the following semantic groups of zoonyms in the Turkic lexical layer: names of animals, birds and poultry, names of their members, names of insects, ants.

It is well known that when it comes to this or that creative potential, the focus is not on what it depicts, but on how it is portrayed. Alisher Navoi, comparing the lexical possibilities of the Persian and Turkic languages in his work "Muhokamatul-lugatayn", noted that all Persian-Tajik waterfowl are called "murgobi", in Uzbek there are about 70 of them, and gave some examples of their names.

We were able to determine the frequency of use of 18 lexemes from the names of animals, birds and insects used in Alisher Navoi's "Khazoin ul-Maoniy". This can be expressed as a table.

№	Lexemes	Frequency of use of lexemes in devons (Collection)				
		In Garoyibus-sig'ar(GS)	In Navodirush-shabob(NS)	In Badoyiul-vasat(BV)	In Favoyid uk-kibor(FK)	Total
	<b>Name of the birds</b>					
1	<i>Bird</i>	75	70	74	100	309
	<i>Bulbul</i>	108	71	62	61	304
2	<i>Spider</i>	5	2	1	2	10
3	<i>Peacock</i>	7	2	2	4	15
4	<i>Chugz</i>	9	6	7	12	34
5	<i>Pigeon</i>	5	6	10	5	26
	<b>The name of the legendary birds</b>					
6	<i>Anqo</i>	5	3	1	2	10
	<b>Name of insect</b>					
7	<i>The butterfly</i>	2	1	2	1	6
8	<i>Parvona</i>	32	23	25	37	127
9	<i>Fly</i>	8	3	0	2	13
	<b>Reptiles</b>					
10	<i>Snake</i>	12	6	2	4	24
	<b>Swimmers</b>					
11	<i>Fish</i>	5	6	0	2	13
	<b>Name of domestic animals</b>					
12	<i>Donkey</i>	3	2	2	0	7
	<b>The name of the wild animals</b>					

13	<i>Deer</i>	11	2	4	4	21
14	<i>elephant</i>	5	3	4	1	13
15	<i>fox</i>	1	2	1	1	5
16	<i>Lion</i>	0	1	0	0	1
17	<i>duiker</i>	2	1	0	1	4

The **bird** lexeme serves to express metaphorical meaning in ghazals. The combination of the *soul bird* has the meaning of analogy on this basis. For example:

*O'qi rashkidin erur ko'ksum aro ko'nglum qushi,*  
 [My soul bird in my chest melts from jealousy arrow]  
*Ul kabutarkim, qabaq ichinda qilg'ay iztirob(GS).*  
 [It is a pigeon and it suffers in the cage]

The dog lexeme has a special significance in mystical poetry. As a symbol of fidelity, the nights for the divine lover carry the notion of a faithful companion.

*Itiing hisobig'a kirgan hisob vaqtida,*  
 [At the time of the account entered into the dog's account]  
*Agarchi jurmi erur behisob, emas mahsub. (GS)*  
 [If I don't walk so much I am not beloved]  
*O'yqunga moni' agar bo'lmasa ul ko'y ichra,*  
 [If it doesn't interrupt my sleep by that melody]  
*Yugurub itlar ila kecha tong otquncha huray. (NS)*  
 [I will bark and run among dogs until sunrise]

The following example illustrates the condition of the Sufi more impressively. To do this, the poet uses the associative signs of the word dog. That is, bone and gnaw bring lexemes into the text.

*To'rt ayog'lanib iting xayli aro men majnun,*  
 [I am a beloved as I am running by four legs like a dog,]  
*Gar kesak otsang o'pay, gar so'ngak otsang ko'muray. (GS)*  
 [If you throw wodge I will kiss, if you throw bone I will gnaw]

In the poet's work, the snake lexeme is chosen as the standard of comparison. It is often compared to the hair of a yarn. The poet used this lexeme in the form of a snake.

*Yilon kebi, ne ajab, ganj asrag'an kishining*  
 [Like a snake, what a strange, grief-stricken man],  
*Hamesha komida gar zahr erur, tanida shikanj. (GS)*  
 [There is a poison inside him, thorn in his body]

*Dunyo arusi zulfini tutqan ne ogah faqrdin,  
 [World's bride holds her ringlet being aware of poor,]  
 Ganj istamas ulkim, **yilon** tutmoq bila xursand erur. (GS)  
 [She doesn't want grief, she makes her happy by catching snake]*

In the following example, the poet reveals the art of fables (reality comparable to a natural phenomenon) through the word snake. The lover's snarling at the sight of a snake is likened to a bird screaming at the sight of a snake. The state of love is compared to a natural phenomenon. This is to increase the visual impact and convey the lyrical protagonist's experiences in a simple way. For example:

*Ko 'ngullar nolasi zulfung kamandin nogahon ko 'rgach,  
 [Wail of souls when they see your ringlet accidentally,]  
 Erur andoqki, **qushlar** qichqirishqaylar **yilon** ko 'rgach. (GS)  
 [Like a birds' chirping when they notice a snake]  
 Yana zulfung buzug 'luq soldi ko 'nglum xonumoninda,  
 [Also, your ringlet break my soul]  
**Yilon** andoqki solg 'ay qo 'zg 'olon qush oshyoninda. (NS)  
 [Like a snake, make a revolt in birds' nest.]*

In the following example, too, the poet used the lexeme of fish to create another form of parable art. My heart was pounding with red tears, let's look at the verse that says, as if seeing blood in a river and understanding a fish wound:

*Ko 'ngul chokin ko 'zumda ashki rangin elga fosh etti,  
 [My eyes' seam makes my heart griefts to people]  
**Balig'** zaxmini fahm aylarlar el daryoda qon ko 'rgach. (GS)  
 [People notice fish's injury when they notice blood in river]*

This is exactly what is repeated in the following example. Only here did the lexemes change places. Now the word sayd, not fish, serves to express this notion. Only then does the local concept occur in the sense of land.

*Ko 'zum qon yosh to 'kar, netib ko 'ngul zaxmin yashuraykim,  
 [My eyes drop blood tears, how can I hide my soul griefts,]  
 Toparlar yerda zaxmin **sayd** qonidin nishon ko 'rgach. (GS)  
 [It is noticed injury when they it is find blood]  
 Junun ermas **kiyiklar** suhbatlari dermen manga shoyad,  
 [I said that it is not insane deer's talk to me but]  
 Bir o'q tekkay g'alat, ul qoshi yo garmshikor o'lg'ach. (GS)*

*[A strange arrow stabs, that eyebrows or attractive die]*

In many places the names of plants and animals are used together. For example, in the bytes where the word nightingale is present, the word flower or flowerbed is definitely present. In the following verse, the poet is interpreted as a subject who plucks the feathers on a nightingale's wing, likening the petals to a flower.

*Gul yafrog 'i tirnog 'lar erur bu chaman ichra,*

*[Leaf of the flower is a Neal in this flower garden,]*

**Bulbul** *paru bolini yulub bergali barbod. (GS)*

*[Those nails are bulbul's feather and chirp.]*

The animal lexeme used in the poet's poems is combined with the word water, which is not understood in the literal sense we understand today, but in the lexical sense of the word, i.e. in the sense of "water of life":

*Soqiyo, ber o 'tki, kul qilg 'ay vujudum xirmanin,*

*[Drinker, give me fire, it makes my heart ash,]*

*Aylaman hayvon suyinkim, aylagay ihyo, pisand. (GS)*

*[His eyes resurrect like the water of life]*

The lexeme of the donkey is also used in the composition of the proverb quoted in the ghazal, and in such examples the irony is felt. The poet used this lexeme to remind the exemplary thought in the vernacular in order to reinforce the analogy. As a result, we can see that the word is used in the same place. The poet finds it necessary to use a wise phrase in this context, which prefers straw to halva for a donkey.

*Or etar pashminadin ablah tilab zarrishtani*

*[The poor man prefers a warm woolen garment over a golden thread, and is ashamed of a golden thread]*

*Kim, eshak halvoni andoqkim somon ko 'rmas laziz. (GS)*

*(For a donkey, straw is more precious than halva)*

*Soqoli shayxi riyoiyg 'a garchi keldi harom,*

*[The beard is also haram for hypocrite sheikh]*

*Vale kularga eshak bo 'iniga kerak g 'ujg 'ov. (BV)*

*[It's like tying a donkey's tail around its neck]*

Based on the examples, it can be said that the use of the word elephant in the bytes where the word mosquito is used is mainly seen as one of the ways to form an antithesis in the byte. As a result, the words fly and elephant become the object of comparison in ghazals. It is noteworthy that the poet also used half-and-half adjectives in relation to this lexeme in the text to show the weakness of the fly:

*Bu turfaki, daf'ini yarim pashshag 'a qo 'ydung,*

*[Surprisingly, you put all your task into a weak fly]*

Har **pil** nihodeki sanga qildi takabbur. (GS)

*[The elephants were arrogant towards you]*

**Yarimchuq pashsha** nishi bila ojiz qilursen,

*(You are intimidated by a small, weak mosquito bite)*

Nechakim **pil** yanglig‘ qaviydur xasmi bebok. (NS)

*(It was as if a few elephants were frightening the enemy)*

In the following example, a fly and a legendary angolan are chosen as the opposing units.

Ko ‘rguzub chun domi zulfu donai xol aylabon,

*[Underneath her hair, she slowly showed the grains on her face]*

Bulbulu qumri demonkim, **pashsha to anqoni** sayd. (FK)

*[I became like a fly hunter, not a nightingale]*

In the following examples, a contextual antonym is formed between a lion and an ant, a lion and a deer, a lion and a fox using the lion lexeme:

Gar **sherdurki, mo‘rcha** yo ‘qtur hisob anga,

*[They do not call an ant a lion]*

Kim topmadi ko ‘zi bu yobon gardidin sharaf. (BV)

*[No one is honored with tears]*

Fano yo ‘li **kiyikni** ayla sayd, **sher** ersang

*[If you are a lion, hunt a deer on the path of fano]*

Ki, dahr jiyfasini jo ‘stujo ‘ qilur **itlar**. (FK)

*[Dogs are also search deadly in the world]*

Junun zanjirida oshiq yonida hiylagar zohid,

*[He who dies in the presence of a stranger and a poor lover is a deceiver]*

Kishi ko ‘rsa tasavvur aylagay **sher** ollida **tulku**. (NS)

*[Anyone who sees this imagines a fox walking in front of a lion]*

Tilar ko ‘nglum qushi **anqodin** o ‘tsam nari yuz vodiy,

*[my heart longs to cross the valley like a bird]*

Munungdek sayr etarga qofdin ortuq sabotim bor. (GS)

*[I have more strength and endurance than a mountain on such a trip]*

Alisher Navoi skillfully used linguistic materials on all layers and lexical groups of the Uzbek vocabulary in his works, highlighting the diversity of artistic and methodological potential of our language. Therefore, in his works one can also find poetic symbols and images of the most

ancient lexical layer of our language. The ornithonyms used in the works of the poet can be divided into the following groups according to this aspect.

1. In the works of Alisher Navoi, bird names were widely used, which performed various xii lexical-spiritual-methodological-semantic functions in connection with the poet's artistic intention.
2. The language of the poet's works and the modern Uzbek literary language and its dialects have ornithonyms with the same form and meaning: nightingale, tuti, goose, peacock, etc.
3. Ornithonyms not recorded in modern Uzbek literary language: chugz, uqob, bum.
4. The use of bird names in the works of Alisher Navoi in the lexicon of the Uzbek literary language with certain phonetic changes: chubchuk-chumchuk, crane-crane, kabudtar-kabutar-kaptar, karchigay-korchigay.
5. Legendary bird names used in the works of the poet: Qaqnus, Humo, Anko, Simurg.

This type of description can open a wide range of historical and etymological study of ornithonyms, their place in the vocabulary of our language and the study of their semantic nature on the basis of direct written and oral materials.

Similarly, in the lexicon of the poet's works, along with real bird names, we have witnessed the active participation of mythological bird names, which are symbolic symbols in our imaginary imagination, in both prose and verse. For example, through the ornithonyms Qaqnus, Humo, Anko, Simurg, he used the poetic analysis of a particular situation of a lyrical hero or event, as well as a vivid reflection of an epic reality.

Anqoni kishi qachon qilur yod,

[When people thought that anqo is strange for them,]

Ul lahzani bulbul etsa faryod.

[It would be the time that bulbul cries.]

Anqo is a legendary bird, there is no evidence that anyone saw him. The peoples of the ancient East, including the Uzbek people, are the patrons of the protagonist in legends, fairy tales and epics. It is invisible to the human eye, its wings and feathers are made of gold and silver, and it is described as fiery. There is an opinion among our people that "Anko" is happiness, fortune, the bird of the state, and whoever is overshadowed, will be happy.

Anqo is an Arabic word that means a bird that has a name but it is not real. It is noted that it is used in two senses:

- a) It has a name, a legendary bird that does not exist;
- b) Anything that doesn't exist in the world.(UTIL.1-volume,42p)

Humo is a Persian word meaning "bird of happiness". The semantic scope of the humo ornithonymy includes the semantics of "happiness" and "luck".

Humoyi ishrating madum ekinmu,

[Isn't your happiness in love with the humo bird]

Boshing‘a soya solgan bum ekinmu?

[Isn't that the shadow of happiness on your head?]

The word qaqnus is an ornithonym denoting the name of a legendary bird. According to popular belief, this legendary bird had three hundred and sixty holes in its beak, each of which emitted a musical sound in a unique tone. That's where the beautiful melody of Qaqnus sings comes from.

Bo‘yla Qaqnusga bu sifat tovu,

[If the squirrel has the quality of a peacock-like kindness]

Hamnavolig‘ aro bo‘lib ma‘yus.

[attracts along with the melancholy melody]

Sometimes the poet does not overlook the anomalies in the world of birds. These aspects help the creator to strengthen the image of the situation. For example, the poet tried to describe the state of the peacock, in which the owl left and took the place of the ruin in its place, in a byte beginning with the word non-introductory.

*G‘ayrkim, mahv o‘ldiyu sensen buzug‘ ko‘nglum aro,*

*[Surprising, you are in my heart as soon as invader of my heart died]*

*Chug‘z itib, tovu er tutmish ajab vayronadur. (GS)*

*[The owl left and made the ruined peacock's place]*

In ghazals, along with each zoonym or ornithonym, their specific behavior or character is also present in the byte. For example, in the text in which the word dog is present, verbs such as hurmoq and chase, otmog (kesak) are involved. In texts composed with the participation of a bird lexeme, lexical units such as fly, wing, and nest are involved spontaneously. The lexeme of fish is used in conjunction with water. The word devastation is always present in the bytes in which the owl is present. In the bytes in which the spider is present, the words bond and narrow are present. Through this, beautiful specimens of the gazelle were created.

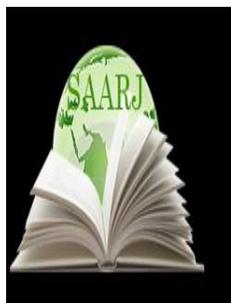

## CONCLUSION

In short, Alisher Navoi skillfully used linguistic materials on all layers and lexical groups of the Uzbek vocabulary in his works, highlighting the diversity of artistic and methodological potential of our language. That is why his works also use poetic symbols and images of the most ancient lexical layer of our language.

### ABSTRACT

*The article describes the essence of the colorimetric scale method based on the spectra in the new RGB color model of visual determination of beer color index. The development of such a new rapid colorimetric scale method of visual determination of beer color index; the introduction of a new colorimetric method for determining the color of beer for customs examination; The practical significance of the results of the study is explained by the fact that the newly developed rapid colorimetric method for determining the color index of beer will serve to increase the efficiency of certification bodies, customs and other analytical laboratories. It is noted that the rapid colorimetric method, which allows to determine the color of beer, has been introduced into practice by the Agency "Uzstandard" standardization, metrology and certification, which allows for rapid and high-quality analysis of beer products.*

**KEYWORDS:** *Beer, Chemical Composition Of Beer, Physical And Chemical Indicators Of Beer, Color Indicators Of Beer, Light-Colored Beer, Dark Beer, RGB Color Model Spectra, Colorimetric Scale.*

### INTRODUCTION

Organoleptic and physicochemical parameters play a key role in determining the brand status of beer. According to the real standard, beer is a low-alcohol, frothy cool drink, mainly produced in light and dark beers. Depending on the amount of initial extract, beers are divided into the following groups.

**Light colored beers**

10% light beer  
 11% light beer  
 12% light beer  
 13% light beer  
 14% light beer  
 15% light beer  
 16% light beer  
 17% light beer  
 18% light beer  
 20% light colored beer

**Dark colored beers**

12% dark beer  
 13% dark beer  
 14% dark beer  
 15% dark beer  
 16% dark beer  
 17% dark beer  
 18% dark beer  
 20% dark beer  
 21% dark beer

Depending on the processing, it is divided into pasteurized and unpasteurized beers [1; 4-p; ].

The following is used for brewing:

- 1) Beer barley malt caramelized malt or thermally processed beer malt.
- 2) Drinking water (GOST 2874-82).
- 3) Xmel (GOST 21947-76).
- 4) Hmel extract, seemingly briquetted hmel or granular hmel must be approved by the Ministry of Health of the Republic of Uzbekistan.
- 5) Unsalted raw materials: barley (GOST 5060-86), rice flour (GOST 6292-70), corn flour (GOST 6002-69); sugar (GOST 21-78), sugar, malt extract [2; 4-17 –p.].

According to the literature, the taste, color, odor, clarity of beer is considered its organoleptic characteristics and is crucial in determining the quality of beer, which depends on the type of raw material used, the quality (amount of malt extract, barley malt used for beer or fodder, production method, technological modes).

According to the requirements of the standard, each beer has its own characteristic taste, aroma and aroma, and there should be no additional tastes and odors. With the exception of dark and caramel beers, all breweries are required to be clear and transparent. Beer should be stored in a dark room, in the temperature range 2-12 °C. When quality beer is poured at 10-12 °C, it should gradually release CO<sub>2</sub> gas bubbles, forming a compact, stable foam on the surface of the container.

Depending on the recipe and brewing time, there are three types of local beers:

- Light and dark;
- Hungry special and dark special;
- Hungry is divided into original.

In Uzbekistan, many light-colored beer products are produced, such as "Kibray", "Sarbast", "Almalyk", "Zarafshan", "Sherdor", "Pulsar", "Golden Autumn", "Fergana Special", "Fortuna". As a result of economic reforms carried out in the country in recent years, positive changes have

been made in the infrastructure of the food industry, and joint ventures have been established with a number of foreign investors.

The technology of preparation of light and dark varieties of beer differs by a number of physicochemical parameters, energetically light beers provide 1700-2200 kJ / kg, dark beers 3400 kJ / kg.

Tables 1 and 2 below show the organoleptic and physicochemical characteristics of light-colored beers "Zarafshon", "Sherdor", "Fortuna", "Shifobakhsh Fortuna" and dark-colored "Barkamol" selected for research.

Table 1 shows that the organoleptic characteristics of beer must meet the following requirements and norms [3; 17-550-p,].

**TABLE 1 ORGANOLEPTIC CHARACTERISTICS OF BEER**

№	Indicator name	Description and norm
1	Appearance	A clear, clear liquid without additives and sediments
2	Foam	Beer poured into a clean cylindrical glass bottle with a height of 105-110 mm and a diameter of 70-75 mm at a temperature of 12 ° C from a height of 25 mm (distance from the bottle or barrel to the top of the bottle) should form a compact foam and emit SO <sub>2</sub> gas, and meet the following specifications need: <i>High quality beer poured into a bottle.</i> <i>Foam height</i> <i>the content of dry matter in the original juice is not less than 35 mm in beer up to 13%;</i> <i>Above 13% and not less than 40 mm; Foam stability 4.0 min. not less.</i> <i>Bottled beer</i> <i>The height of the foam is not less than 20 mm.</i> <i>Foam stability is not less than 2.0 min.</i> <i>Beer in a barrel</i> <i>The height of the foam is not less than 15 mm.</i> <i>Foam stability is not less than 1.5 min.</i>
3	Taste and aroma	With no added odors and flavors, the hmel flavor and aroma of xmel have the pure taste and aroma of a fermented malt drink.

Physicochemical parameters of beer include: alcohol content (%), actual extract content, initial extract density, acidity, color, CO<sub>2</sub> (%) content, pH index, etc. (they are determined by chemical methods and using physical instruments).

Prior to chemical analysis, the gas in the beer is released at room temperature (by pouring from container to container). Opaque beers are filtered.

Determination of the color index of beer based on GOST is based on the comparison of the color of beer with iodine solution. [9]

In addition, TN Volkova suggested that the color of beer can also be determined by the method of comparison to the mixture of equalizers.

R.A. Kolchaeva, G.A. Ermolaeva highlight the existence of a colorimetric method for determining color. To do this, the prepared beer is poured into a washed cuvette, the optical density of which is measured and calculated relative to the density of distilled water [4; 16 -134 - p].

**TABLE 2 ORGANOLEPTIC CHARACTERISTICS OF LIGHT AND DARK BEER DRINKS**

№	Indicator type	Beer type	Characteristics and norms
1	Appearance	Light colored beer	A clear liquid with no external additives, no sediment
		Dark beer	A brown liquid with no external additives, no sediment
2	Foam	Light colored beer	Beer poured into a cylinder with $\varnothing = 70-75$ mm, $h = 105-110$ mm forms a compact foam that does not break for 1.5-3 min at a height of not less than 20 mm at 12 °C.
		Dark beer	Beer poured into a cylinder with $\varnothing = 70-75$ mm, $h = 105-110$ mm forms a compact foam that does not break for 1.5-3 min at a height of not less than 20 mm at 12 °C.
3	Taste and aroma	Light colored beer	Hmel should have a malt taste and smell with sourness
		Dark beer	It should have a malt taste and smell with hmel sourness as well as a small amount of caramel taste

**TABLE 3 PHYSICOCHEMICAL PROPERTIES OF VARIOUS BEER DRINKS**

Indicator type	Beer varieties				
	Zarafshon	Sherdor	Fortuna	Shifobaxsh Fortuna	Barkamol
Alcohol content, %	2,7±0,5	3,4±0,1	4,4±0,2	2,8±0,2	2,8±0,5
Actual extract amount, %	5,3±0,2	5,4±0,2	5,0±0,2	4,2±0,2	5,4±0,2
Initial slurry density, dry matter content, %	10,5±0,2	12,0±0,2	14,0±0,2	11,0±0,2	11,0±0,2
Acidity (NaOH solution with 1 mol / dm <sup>3</sup> per 100 cm <sup>3</sup> of beer, cm <sup>3</sup> )	2,2±0,5	2,5±0,5	2,9±0,7	2,7±0,3	2,3±0,5
Color index (1 mol / dm <sup>3</sup> of iodine solution per 100 cm <sup>3</sup> of water, cm <sup>3</sup> )	1,0±0,5	0,9±0,3	0,8±0,3	0,8±0,2	4,5±0,5
CO <sub>2</sub> content, %	0,30±0,05	0,30±0,05	0,33±0,05	0,30±0,05	0,33±0,05

As can be seen from Table 3, the content of alcohol in light-colored beers is 2.2-4.6%, the amount of real extract is 4.0-5.6%, the density of the initial slurry, the amount of dry matter is 10.3-14.2%, the acidity is 1, 7-3.6 conventional units, color index 0.6-1.5 conventional units, carbon dioxide content is in the range of 0.25-0.38%, dark beer alcohol content is 2.3-3.3%, real extract content 5.2-5.6%, initial slurry density, dry matter content 10.8-11.2%, acidity 1.7-2.8 conventional units, color index 4.0-5.0 conventional units, the amount of carbon dioxide was in the range of 0.28-0.38%, and the main major difference was found in the color index.

The light-colored beer has a delicate xmel bitterness, followed by a light taste of malt extract. Dark beers, on the other hand, have a distinct malt taste and aroma and are sweeter.

According to B. Bamfort and other scientists, the fullness of taste is one of the important indicators of beer. Taste completeness is provided not only by dextrans and melanoids, but also by other substances that affect the taste organs. Such substances include nitrogenous substances and the bitter substances of hmel, and the substances mixed with the bitter substances of hmel form complex taste complexes. Pentosans, ethyl alcohol, high alcohols, esters, glutamic acid, and some amino acids also affect taste completeness. Melanoids also affect the taste completeness of dark beers. The fact that beer is saturated with CO<sub>2</sub> also affects its taste completeness. The CO<sub>2</sub> in the beer must be chemically bound and slightly dispersed and slowly separated. Only then will the beer have a fresh, delicate taste. The taste of beer is also affected by the degree of dispersion of colloids in the extract, and as the dispersion of xmel substances increases, the beer acquires a bitter taste. Temperature also has an effect on the taste, causing a change in the colloidal system in the beer. Excessive drop in temperature also spoils the taste, and such beer becomes tasteless, dry. Suitable temperature for consumption is 8-12 °C [5; 7-15-p].

Color and transparency are the most important organoleptic indicators. In some scientific literature, color and transparency are the first organoleptic indicators that characterize the quality of beer. The color of beer is reddened by melanoids, some substances of barley (flavin, carotene), red pigment - flobafen, which is a product of oxidation of the additives of hmel. Light-colored beers have a light golden-yellow color. This color indicates that they have a delicate, delicate taste. The color index of light beers is 0.5-3.0 ml compared to 0.1 n J<sub>2</sub>, while the color index of dark beers is 3-8 ml. In any case, the beer should be transparent and the beer should sparkle and shine when viewed through the bottle.

Beer turbidity can be determined using the visual and nephelometric method (Tseys). Blurring of light-colored beers begins quickly. In addition to biological turbidity, there are physicochemical turbidity, protein turbidity, glistening turbidity, velvet tar and oxalate turbidity. The most dangerous of these is the protein turbidity, which is known after it is poured into a bottle.

The malt production process is divided into the following technological stages:

1. Grain cleaning and sorting;
2. Grain freezing;
3. Grain production;

These 3 processed grains can be called semi-finished or raw malt. Raw malt is a confectionery product, ready for the production of alcohol. But in the production of beer, the malt is dried. The purpose of drying is that the malt accumulates odors and dyes, and it can be stored for a long

time. Dried malt is the main raw material for beer production. So beer malt is barley that is harvested, then dried.

Some studies have found that the final temperature in the preparation of dark malts is higher than that of light malts. The final temperature does not exceed 105 °C. Otherwise many enzymes will break down. During drying, amylolytic activity is reduced by 30-40% in light-colored malts and up to 70% in dark-colored malts. High temperature resistant  $\beta$ -amylase is activated. In the dry state, proteolytic enzymes do not degrade even at 100°C. Acid-forming enzymes (phytase, glycerophosphatase, nucleotidases) are rapidly broken down [6; 20-21 p].

The composition of malt determines the chemical composition of the finished product. The average chemical composition of malt is as follows (relative to dry matter): starch 57% reduction sugar 4%, sucrose 5%, dissolved pentosans 1%, insoluble pentosans and hexosans 9%, cellulose 5.5%, nitrogen-fixing compounds 10%, non-coagulated nitrogen compounds 2.5%, oils 2.5%, minerals 2.5%. It also contains small amounts of inositol, dyes, additives and bitter substances. Enzymes include amylophosphatase,  $\alpha$ -amylase,  $\beta$ -amylase, proteinase, peptidase, cytase, and phytases.

Light malt extract contains 65-72% maltose, while dark malt extract contains 59-65% maltose. One more important indicator is the determination of amylolytic activity. Amylolytic activity refers to the formation of sugars under the influence of  $\beta$ -amylase. Amylolytic activity is determined using two types: the Lintner method and the Vindish-Kolbach method.

Barkamol beer is the first dark Uzbek beer obtained by adding sugar cooler to the technological regime of light-colored beer, which is added to the range of Uzbek beer and is highly valued by consumers for its unique appearance, smell and taste [7; 97 p].

Experiences of world brewing practice show that dark beer is gaining success in the consumer market with its demand. Therefore, the creation of the basis for the production of dark beer in Uzbek brewing, certification of dark beers and the introduction and classification of commodity codes used in international economic relations are among the current issues [8; 102-107 p].

The traditional standard for determining the color index, which is one of the main indicators in the classification and certification of beer varieties - iodine solutions (according to GOST 12789-87, the color index is a conventional unit of consumption of 0.1 mol / dm<sup>3</sup> of iodine solution in 100 cm<sup>3</sup> of water until the color of beer. instead) using the colorimetric scale method proposed by us saves time and reagent. This uses a colorimetric scale on the finished paper, which reflects the unique color units that cover the color characteristics of beer varieties.

For the preparation of a colorimetric scale, the RGB (red-red, green-green, blue-blue) color model of the spectra in the range of 0-255 units of iodine in 0.1 mol / dm<sup>3</sup> of iodine solution added to 100 cm<sup>3</sup> of water to match the color of beer The following scale, corresponding to the color index of beer, was prepared and recommended for use in practice in determining the color index of beer.

In the proposed colorimetric scale method, a color scale standard was placed on one side of a 10-chamber test tube, and a sample of beer was taken from the test tubes and the indicator in the cell corresponding to the color on the colorimetric scale was determined.

RGB	1	2	3	4	5	6	7	8	9	10
RK	0,1- 0,5	0,6- 1,0	1,1- 1,5	1,6- 2,0	2,1- 2,5	2,6- 3,0	3,1- 3,5	3,6- 4,0	4,1- 4,5	4,6- 5,0

Note: RK is the color index (the amount of iodine solution with a concentration of 0.1 mol / dm<sup>3</sup> consumed when added to 100 cm<sup>3</sup> of distilled water until a color corresponding to the color of beer is formed)

Light colored beers include beers corresponding to 1-5 units of RGB (0.1-2.5 units according to the amount of iodine solution with a concentration of 0.1 mol / dm<sup>3</sup> consumed when added to 100 cm<sup>3</sup> of distilled water until a color corresponding to the color of the beer is formed);

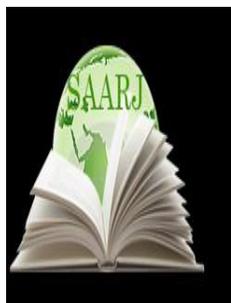

Dark beers include 5-10 units of RGB (2.6-5 units of iodine solution with a concentration of 0.1 mol / dm<sup>3</sup> consumed in 100 cm<sup>3</sup> of distilled water until a color corresponding to the color of the beer is formed).

Color index should be one of the main indicators in the certification of beer varieties.

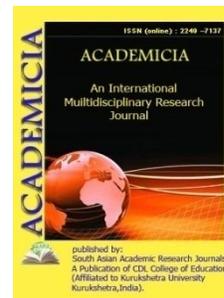

As a result of the research, a new colorimetric scale standard was developed and recommended to certification bodies for practical use, which allows to reduce the cost of chemical reagents in the process of certification of beer products and save time in laboratory testing. The Uzstandard Agency has also introduced a rapid practice of determining the color index of beer for use in foreign economic activity.

## EFFECTS OF DEEP CULTIVATION BETWEEN COTTON ROWS ON PLANT ROOT SYSTEM

**Komiljon Komilov\***

\*DSc. Of Andijan Agriculture and Agri-technologies Institute,  
 UZBEKISTAN

Email id: komilov1@inbox.ru

### ABSTRACT

*The result of the research have been scientifically proven to be the best agro technology for the formation, growth and cultivation of high-quality cotton yields by differentiating inter-row cultivation in the conditions of old irrigated and original soils of Andijan region.*

**KEYWORDS:** *Depths Of Inter-Row Processing Of Cotton, Irrigation Regime, Agrophysical And Agrochemical Features Of Soil, Growth And Development, Root System, Productivity.*

### INTRODUCTION

When growing high-quality cotton in Uzbekistan, deep loosening of cotton rows (chisel up to 23-25 cm) plays an important role. Because as a result of the application of this agronomic measure, the agrophysical, agrochemical, agrobiological and water properties of the soil layer 23-25 cm, where the cotton root system is most numerous, will change for the better.

This agrotechnical measure was carried out on most cotton fields without any scientific basis, and cotton growers based on the conclusions "the more processing (cultivation, chisel) of cotton is applied between the rows, the better", loosening deeper between the rows continued until the cotton reaches 50% flowering. Therefore, in our research we examined the optimal amount and duration of deep cultivation or chiselling between rows of cotton.

In our view, the theoretical basis for deep softening of cotton row spacing is as follows:

- In the process of maintaining soil moisture, preparing the soil for sowing, sowing seeds, watering seeds, inter-row cotton cultivation, after watering, the equipment enters the field at least 4 times. As a result, the density of the 0-25 cm layer increases, in which the cotton root is more widespread, the porosity decreases, and a somewhat unfavorable soil environment is created for optimal growth and development of the cotton root system.

According to scientific evidence, although small roots (callus) grow from a damaged or cut area of a cotton root, this root cannot fully restore its function (1).

**Research method.** Based on the foregoing, we conducted field experiments in the following order in the conditions of the ancient irrigated initial gray soils of the Istikbol Dalasi farm in the Kurgantepa district of the Andijan region in order to determine the effect of deep cultivation or chiselling between rows of cotton.

Option 1. All surface treatments (cultivation) were carried out to 14-16 cm, no deep treatment was carried out (control).

Option 2. Cultivation was differentiated into several rows: the first 17-18 cm and the second 14-16 cm.

Option 3. Differentiated processing of row spacings, deep 23-25 cm loosening (chiseling) before weeding

Option 4. After cultivating the rows, a deep loosening of 23-25 cm was carried out.

Option 5. Cultivation was differentiated into several rows in period of weeding was done deep softening (chiseling) to 23-25 cm

In the experiment, the options were placed in four repetitions, and the parts in a row. Observations, calculations, determinations made in the course of research were carried out on the basis of "Methodology of field experiments" (2007), B.A. Dospekhova "Methodology of field experiments" (1983) of the former research institute of cotton growing.

The soil of the experimental field is original (typical) gray, irrigated from time immemorial, the mechanical composition is medium sand, humus level of the processing layer is 1.2 percent. Groundwater is located at a depth of 10-12 meters above the ground. Cotton was irrigated at a rate of 70-70-60% of the border field moisture capacity.

**Research results.** The main nutritional organ of cotton is the roots and leaves. The root system reacts with the products of photosynthesis of minerals and organic matter in its nutrient field to synthesize complex substances: nucleoproteins, energy-rich phosphorus compounds, various biocatalysts, growth stimulants, etc., delivering them to the surface of the cotton.

Since the activity of roots takes place in the soil environment, in order to optimize this activity, it is necessary to take measures to improve its agrophysical, agrochemical, biological and water properties in order to optimize the soil environment in which they are distributed.

Based on the above, the studies provided an in-depth analysis of the root system, number, and range of distribution of the cotton plant in the soil layers. This is because it is natural for the side roots to be damaged and cut during the processing of cotton row spacing.

The research initially identified the formation of a root system at the beginning of the cotton application period (Table 1).

According to the data, in the conditions of the original gray soils from the seed stage of cotton - in the period before weeding, the main root is 15.2-55.5 cm long. The number of lateral roots is 41.0.

**TABLE 1 FORMATION OF COTTON ROOT SYSTEM AT THE BEGINNING OF THE APPLICATION PERIOD**

Option №	Stages of development	Length of the main root, cm	Number of primary lateral roots, pcs	Spread width of lateral roots, cm
1	Seed leaves	15,2	16,3	4,2
2	1-2 petalsleaves	26,4	32,2	11,5
3	3-4 petalsleaves	41,3	37,7	29,1
4	Weedingperiod	55,5	41,0	42,3

The lateral roots of the cotton spread sideways to 42.3 cm during growth and development. It is necessary and necessary to take this into account when deep processing between rows of cotton.

Deep tillage of 23–25 cm between cotton rows will undoubtedly have a negative effect on its root system, as shown in Table 1. In particular, the ability to trim the lateral roots of cotton begins at the stage when the plant forms 3-4 petals. The implementation of this agronomic measure during the formation of 1-2 petals in cotton leads to a sharp decrease in damage or pruning of the root system.

In the course of the study, the study of the next development of the cotton root was carried out at the beginning of the flowering-fruitlet phase of the plant. In this case, the working depths between the rows of cotton were carried out according to the experimental method (table 2).

In particular, in the 1st option, where the spacing of the cotton rows was regularly shallow, not deeply loosened, a single cotton root produced 17 primary lateral roots. As a result of deep tillage between the rows, the number of primary side roots increased by 5-9.

**TABLE 2 EFFECT OF COTTON ROW SPACING DEPTH ON ROOT SYSTEM AT THE END OF THE DEVELOPMENT PERIOD (0-40 CM)**

Option №	Number of primary lateral roots, pcs	Cut from it, pcs	The volume of a plant root, cm <sup>3</sup>	Weight of a plant root, g
1	17	4	11,8	8,543
2	18	6	8,5	8,523
3	26	4	14,1	10,201
4	24	4	12,8	9,771
5	20	10	9,8	8,307

It should be noted that in our research, cotton was damaged during the processing of row spacing, forming a covering tissue (callus) in the incision, the wound was closed, the callus and a little above it appeared 2-3 young small roots, reaching a length of 2-4 cm. just In short, it was found that the cut primary side roots could not restore them to their original shape, length, size.

This is evidenced by the size and dry weight of the root system. Consequently, deep processing between the rows of cotton during the period of mowing of the plant revealed a lot of damage to the plant root system (10 pieces), a plant root volume (9.8 cm<sup>3</sup>) and low weight (8,307 g).

In the research, it was found that the number of primary lateral roots was 26-24 when the cotton was softened by 23-25 cm before and after weeding, and only 4 lateral roots were cut or damaged during cultivation. In addition, the volume (14.1–12.8 cm<sup>3</sup>) and weight (10,201–9,771gr) of a plant root were observed to be higher than in options 1,2 and 5 of the experiment.

This, of course, has also affected the growth and development of cotton in the experiment. In particular, control variant cotton increased by 84.1 cm on 1 August. In option 3, it increased by 88.2 cm, and in option 5 by 82.3 cm. So, when the plant produces 4–5 leaves between rows of cotton, and deep processing at the stage of mowing, the side roots are cut, causing damage.

The periods of deep processing between the rows were evident in the cotton yield of the cotton. In particular, 32.2 c/ha of cotton was harvested from Option 1 (control), 36.8 c/ha from Option 3, and 35.5 c/ha from Option 4. Only 33.5 c/ha was harvested from the next option 5.

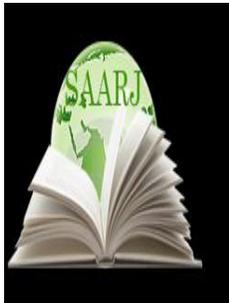

### CONCLUSION

Under the conditions of ancient irrigated, original gray soils of Andijan region, the primary lateral roots of cotton develop mainly in the 0-30 cm layer. It is desirable to carry out deep tillage (23-25 cm) between rows of cotton or chiseling until uniformity, the number of primary lateral roots is on average 26, during pruning the cutting or damage of lateral roots is sharply reduced.

The size and weight of the root of a plant will be higher than if the cotton was not deeply plowed between rows or this agronomic measure was carried out during the weeding period. As a result, high-quality raw (36.8 c/ha) is grown from cotton.

### **ABSTRACT**

*Education officials often point out that the upbringing and education of a child depends directly on the family - parents or relatives. Although officials emphasize the importance of the role of parents in children's development, in reality very few take their opinions and voices into account. It is important for every parent to recognize that their child is an "expert" and that their goal is to be directly involved in curriculum development and to conduct joint research to study their children's needs, and I would like to highlight this topic in this article.*

**KEYWORDS:** *Education, Mentally Retarded Students, Parents, Harmonization, Maturity, Intelligence.*

### **INTRODUCTION**

The family, the upbringing of children in the family, the upbringing of parents and children with disabilities, the relationship to children with disabilities has been one of the most pressing issues since the early days of human society. As human society develops, the importance of this problem is growing. Because the achievements of mankind are assimilated more in the family environment, in the upbringing of parents and children with disabilities, in the system of relations with them, than in any other social institution and system of relations, in the form of traditions, spiritual heritage from generation to generation. Therefore, the future of this or that society, people, nation depends in many respects on the education in this family. To do this, it is necessary to achieve a healthy, spiritually strong growth of the child in the family. The relationship between the problems of the family today and the preparation of the younger generation for independent living, or rather, the education of the future head of the family is a

topical issue of today. In this sense, it is the responsibility of parents and the general public to prepare young people for such a responsible task as family life, housekeeping, household chores, to cultivate in them the qualities of "man" and "woman", to form the etiquette of mutual relations, to teach them what is the love of a mother, the care of a father, the gratitude of a child, and the need to follow them in life. The preparation of mentally retarded students for marriage, as well as the healthy youth of our society, is important for the development of our society.

Modern development requires each person to correctly understand the situation, draw conclusions, moral purity and emotional endurance, to be strong and active in all spheres of life in our society. It is known that the family establishes shapes and develops such social, emotional, moral and other qualities of the person. What our future looks like depends on the young people we are raising today. The family is the foundation that carries out such a huge task and creates material and basic wealth. The family, as the primary social unit of society, has a complex structure, and in its activities the needs and abilities of family members reflect not only the goals and objectives of various activities, but also educational activities. The vitality of his complex and multifaceted activity is twofold:

- First of all, it is a small part of society, a sign that reflects and reflects social changes. Based on this, family upbringing should be considered as one of the main parts of social upbringing.
- secondly, it should not be overlooked that the complex and multifaceted activities of the family and its functions and the social activity of the structure depend on its functions, lifestyle, social activities of family members, the relationship of all their interests and needs.

The most important thing for the methodology and methodology of family nature is the harmonization of its relevant aspects, i.e. the harmonization of educational tasks, the identification of the specific features of the family and the existing opportunities.

In the analysis of the structure and functions of the family, it is once again clear that it is the social and spiritual core of society. Therefore, the family must have a clear space, a foundation, and it is necessary to regulate the relationships between people, to form in young people moral qualities, physical maturity and mental intelligence. The peculiarity of family upbringing is that it not only ensures the general and emotional development of the individual, but also enhances the existing capabilities and moral maturity of the individual by transmitting the qualities of parental kinship to mentally retarded children. The main task is to teach and advise the mentally retarded child not only on the experience of adults, but also on the lifestyle of the family, the environment, the profession of the parents, the family. The main spiritual relations of the members play. The research of scientists dealing with the problems of family and family upbringing focuses on the current division of the family and the active level of parents in the upbringing of mentally retarded children.

The complexity of family upbringing is that each family is a unique world, a unique sub-organization of society, which manifests its own characteristics in the work of upbringing. That is why it is inconvenient and difficult to generalize the forms and methods of family upbringing and give any recommendations to it. The richer, more faithful, and more educated parents are, the more they raise their children in a highly developed way. They nurture not only counsel, encouragement, reward, punishment, conversation and storytelling, exchange of ideas, but also personal examples, auxiliary school work with mentally retarded students, involving them in labor activities. Participating in the activities of mentally retarded students in the secondary

school is the most effective way to influence them educationally. If mentally retarded children are treated with great interest by the parents in the lessons, a friendly relationship will be established between them. Mentally retarded children learn the criteria of interaction from their parents, brothers and sisters, what is good and what is bad, what is good and what is bad? They have a clear idea about the students. In addition, the family unites people of different ages in terms of experience and profession. The richer the family members' life and life experiences, cultural levels, the closer they are to mentally retarded children, and the more likely they are to cultivate the interests of mentally retarded children. Society is also interested in the development of young people who are physically strong, morally clean, hardworking and cultured. Therefore, even if the family itself strives for it, society imposes demands and obligations. Here, the goals and aspirations of the family and society form a mutual integrity.

The rise of the general, cultural information levels of parents and the determination of social activity lead to a change in the nature of school and family relations. If the school respects the family upbringing uses its riches that is the upbringing of parents on the basis of prestige, personal example and positive emotions. Then parental fatherhood becomes a great force, a criterion for ensuring the effectiveness of upbringing. The ultimate goal of the family and the content of the actions are to prepare mentally retarded children for future labor activities in accordance with the norms of universal behavior. In addition, attention is paid to their ideological, political, cultural and educational interests. In this regard, it should not be forgotten that the upbringing in different families is different. If the roommates in the family are older people, if they are enjoying the bread of labor, if there are human beliefs, then the young people raised in such a family will grow up to be worthy people in their lives.

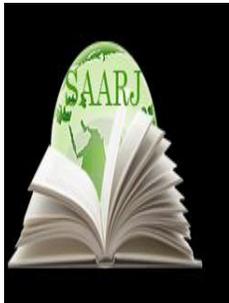

The prestige and personal example of parents and adults in the family is a determining factor in the effectiveness of educational influence. At the same time, the consistent and harmonious nature of the educational impact, the natural assimilation of experiences in the family community, their sensitivity to the activities of the individual due to their kinship and mutual trust, attitude and love, emotional clarity in communication are intelligent and defines the main features of upbringing in servant families. Educational effectiveness is determined by the work of mentally retarded children in the family, their active participation in the household, as well as family living conditions. It can be seen that in families living in a private home, domestic labor is clearly defined in the traditional way, depending on the age and sex of mentally retarded children. Collaborative work to educate mentally retarded students are to monitor their reading and extracurricular activities, to increase their interest and love for work, and to organize their leisure time properly. Involvement in useful types of work is one of the most pressing issues today.

In conclusion, the reputation and personal example of the parents and the adults around the child in the family have an educational impact on the preparation of mentally retarded swimmers for the family. Therefore, mutual love, trust, consequences, attention, mutual respect, emotional, expressive relationships in the relationship play an important role in preparing mentally retarded students for the family. Diligence, loyalty, devotion, and the ability to work diligently for the family are also important for students with intellectual disabilities. Explain to mentally retarded students from an early age that the family is sacred, that parenting is a responsibility, but that life is meaningful, that being a father, being a mother is a heavy responsibility. The following characteristics of family activities: living conditions and environment, cultural opportunities,

field of activity, family relations, civic attitudes have a direct impact on the process of raising children. The level of pedagogical culture of parents is also of great importance. Deficiencies in family upbringing are the result of poor relationships between parents and children: excessive rigidity or excessive love of the child, lack or insufficiency of control, low level of parental culture, lack of marriage, they set a bad example, and so on. In order to overcome the difficulties in family upbringing, the society is constantly improving the system of educational and labor communities, labor and moral education, improving the organization of public services and leisure with the support of children's institutions, schools and the community and enhances the pedagogical culture.

### ABSTRACT

*This article shows the essence of the concept of differentiation, forms and types of differentiated instruction and studied their significance in the training of future teachers college. Also in the article studied the types of differentiated instruction on general and special abilities, interests, aptitudes, projected profession, including the levels of differentiation.*

**KEYWORDS:** *Differentiation, Differentiation Of Education, Variability, Types Of Differentiation, Differentiation Level, Elective Differentiation, Internal Differentiation, Degree Of Differentiation*

---

### INTRODUCTION

In preparing professional teachers for future careers, special attention should be paid to the differentiated education of students. Differentiation is derived from the Latin word *differentia*, which means “difference, division”.

The concept of differentiation in the pedagogical dictionary is interpreted as follows: differentiation of education is a method of organizing the learning process, which takes into account the individual-typological characteristics of the individual (abilities, interests, inclinations, characteristics of mental activity). Differentiation is characterized by the formation of a group of students in which the elements of the didactic system differ. The concept of differentiated system has a narrower meaning. A differentiated system is an education that takes into account the individual typological characteristics of the learner.

The need for differentiation stems from the differences that exist in humans. If the classroom system does not differentiate the learning process, its effectiveness will vary. There are elements of practical and speech-logical thinking among students of different ages, which are manifested

at different levels. Some students with logical thinking are well versed in the natural sciences and have no interest in the humanities. At the same time, there are students who are well-developed figurative thinking, emotional, but do not like the exact sciences.

Differentiation of education allows to organize the learning process taking into account the individuality of the individual, requiring all students to master the content of education. The learning process brings the student as close as possible to the desire to learn in the context of differentiation.

An important aspect of the educational process is the comprehensive, mental, emotional, volitional development of the student.

The purpose of differentiated education is to ensure the maximum development of each student's abilities, to meet the need for knowledge, and so on.

Although this concept has been used for many years in the psychological and pedagogical literature, the content of education is still the subject of much debate. In the analysis of the literature, we have focused on the interpretation of the psychological and pedagogical theories of great scientists on the concept of "differentiated education".

Many works are devoted to this problem, which shed light on the general and specific aspects of the problem. We have reviewed studies that have studied this problem in detail. It is noteworthy that a number of scholars have confused the concepts of differentiation and individualization. Advocacy for this or that term occurs as a result of more traditionalism or conciliation in pedagogy. Individualization is understood as the highest and boundary variant of differentiation, and the learning process is organized not in groups, but on the basis of the characteristics of each individual student. Let's look at some of them:

1. In understanding the differentiation and individualization, the individual characteristics of the person are considered as the main link (V.P.Barabash, I.Unt, N.M.Shaxmaev).
2. Differentiation of education is the formation of a balanced self-assessment in students, taking into account the volume and complexity of the tasks offered to them (E.Yu.Kirillova, N.V.Promotova).
3. Differentiated learning is differentiated assignments (G.D.Glaser) that involve providing students with a certain amount of learning aid (information cards).
4. N.Roganovsky proposes to divide into two stages: preparation and the main stage, the tasks of the preparatory stage - the formation of students' interests. At the main stage, compulsory subjects and elective subjects of students are determined, and these subjects are studied at the general cultural and higher level.

The concept of variability is common in the modern pedagogical literature and is sometimes confused with differentiation. If changes in the content of education are specific to differentiation and individualization, then variability is understood to mean changes in the personal qualities of the learner and the teacher. Therefore, the concept of variability is much broader. Therefore, there is no need to compare these concepts.

In the literature studied, many authors refer to the cases in which differentiation is manifested as differentiated forms of education, the manifestations of which are generalized and realized at different levels.

Types of differentiation are determined based on the individual-typological characteristics of the learners to be taken into account.

Generally, the following types of differentiated education are distinguished: general and special abilities, interests and aptitudes in relation to the intended profession. At the heart of the division are individual-typological features that allow students to be divided into groups.

In V.I.Shakhov's research, along with ability-based differentiation, disability-based differentiation is also emphasized. Without distinguishing these types of differentiation, we believe that differentiation based on general ability implies a general level of ability of students, that their low level of ability is the basis for differentiation based on incompetence [1].

Changes in educational paradigms, the placement of the student's personality in the learning center has led to an increase in the role of human psychological characteristics in differentiation, in particular the separation of a group of students with strong and weak nervous system, memory type, level of voluntary memory development and other characteristics.

Differentiation takes place at different levels. Ronald De Grot, for example, distinguishes three levels of differentiation. Microsat 1 is the formation of separate groups within a group as a result of different approaches. This level of differentiation is sometimes referred to as a group within a group. Mezo surface 2 is a college level, where differentiation is carried out within a separate group, specialty and direction within the educational institution. Macro level 3 is the differentiation between groups in which different types of colleges are created. Levels 2 and 3 constitute external differentiation [1].

The classification of differentiated forms of education is extremely convenient for the analysis of the differentiated content of a particular educational institution.

Thus, in this article, we have tried to analyze in a certain way the manifestation of the observed differentiation in the practice of foreign and domestic educational institutions.

In-depth study of individual subjects and specialized groups are a common form of differentiation according to students' interests. Such groups are formed by students whose interests are clearly expressed in vocational colleges.

Specialized groups are formed from students who want to enter higher education institutions. They take special courses and subjects close to their chosen specialties.

It is not advisable to form specialized groups in the 1st year. In addition, academic work should be planned according to the interests of students, not their abilities. At the same time, the main aspect in specialized groups is that students' interest is further enhanced if the program material is relied on rather than deepened.

Flexible content groups include students with a high level of education. When such a group reaches the age of 14-15, they show interest and tendency to knowledge, and by this time the group has formed a community, a form of mental activity.

Elective differentiation is a form of differentiation according to students' interests, which allows them to study a number of subjects on a selective basis. Elective subjects do not include basic subjects. The selected disciplines expand and deepen the knowledge and interests of students, and this process can take place in the humanities, natural sciences, mathematics.

In the process of organizing electronic differentiation, each student can choose a certain number of subjects and special courses. Groups specializing in admission to higher education institutions are a form of differentiated education based on a student's planned profession. They are organized in preparation for admission to selected higher education institutions in 2-3 courses.

Selection for such groups is conducted by the college. Vocational-oriented subjects are taught by teachers of higher education institutions. The peculiarity of such groups is that they include professionally oriented courses in the field of educational disciplines.

Currently, there is a lot of distribution of students based on the level of their common characteristics, which mainly takes into account the intellectual development of each student, and this division is called group differentiation.

The most common form of group differentiation is the performance of tasks by students with varying levels of complexity. In this case, the complication may be due to the need to engage the material covered, to communicate with different parts of the subject. The task can be complicated by complicating the types of work, increasing creativity in its execution. For example, in the simplest form, students are asked to read a specific paragraph in a textbook, to tell it, to emphasize the main idea, and in the more complex form, students are asked to make questions, plan, and in a more complex form, read the paragraph and write an annotation and review.

Among the differentiated tasks, tasks in different areas are common, including those that address knowledge gaps and identify existing knowledge in the learner. A teacher-to-student criterion that facilitates assignments to group differentiation forms (dividing a text or exercise into independent parts), a written recommendation task (for example, showing a sequence of actions), working with preparatory exercises (each preparatory exercise is a phase of basic exercise), visual drawing, you can add work with drawing.

While completing the task with the help of a standardized aid, the student receives the necessary recommendation envelope and voluntarily uses it or not. In this case, the norm of assistance is determined by the student.

Intra-class differentiation according to the general abilities of students is a level differentiation (A.N.Orlov and V.M.Monakhov). The authors base this on the fact that the content of educational material is always designed to the maximum level in the learning process of students [2, 3].

Each student has the right and opportunity to determine the level of mastery of the subject under study. The only requirement is that they must master the level of their choice and not be below the required level. The teacher explains the teaching material well enough above the minimum level. In doing so, the teacher clearly indicates the content of the learning material that the student must master and the results that must be achieved.

Thus, not only the intellectual ability but also the interests of the learner are taken into account in level differentiation.

It is a form of internal differentiation that also serves as a group work of students on the model of full mastery of knowledge. The model of full mastery of knowledge requires a clear definition of the goals of educational activities, that is, what students know, what they can do, what values are

formed in the process of learning. In this case, it is especially important that the goals are of a technological nature, that is, that their achievements can be verified and accurately evaluated. After a particular topic material is studied and tested at the level of the basic content, the class is divided into two: the first group, which masters the topic, with which the study material is studied in detail and in depth. The second group is a group of students who have not mastered the topic, with whom additional training will be conducted.

In the second group, after retraining, they work on developing skills that have not been adequately mastered. Those in the first group can be involved in this process as consultants, assistants. In this way, the differentiated learning in this model focuses on determining the nature of the student group activity after the final control on the results of mastering a specific fragment in the learning material.

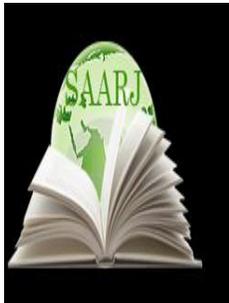

Internal differentiation is often determined by the general ability levels of students, but in practice other types are also manifested: for example, internal differentiation based on special ability, which is the manifestation of artistic, musical and other abilities in the performance of a given task. Intra-class differentiation is also based on the individual-psychological characteristics of students.

In short, differentiated education is an educational process organized taking into account the individual-psychological characteristics of students. Differentiation of education requires the organization of the teaching process aimed at ensuring that all students master the content of education, taking into account the individual characteristics of students. In a context of differentiation, the learning process should be as focused as possible on the learning processes, needs, and individual characteristics of the learners.

The types of differentiation depend on the individual-typological characteristics of the learners being considered. Traditionally, types of education differentiation have been distinguished according to general and specific abilities, interests, aptitudes, and chosen profession. Differentiated education is based on individual-typological features that allow students to be divided into groups.

**ABSTRACT**

*This article provides recommendations for organizing practical training to improve the quality of higher education. At the same time, the effectiveness of the methodological service depends on the quality of staff and the need to adapt the goals and objectives of the educational institution, based on the requirements of social order, to the qualification requirements of future professionals. In particular, the stages of "Pionino" technology and the content of the work carried out at these stages are given.*

**KEYWORDS:** *Higher Education, Innovation Methods, Non-Traditional Teaching Methods, Professional Competencies, Piano Technology, Innovative Environment.*

**INTRODUCTION**

The content of the professional activity of future specialists in the field of deaf pedagogy is directly related to the work on the speech of deaf and hard of hearing children. Students become acquainted with these tasks during classes on methods of teaching native language to deaf and hard of hearing children. The effectiveness of mother tongue teaching to deaf and hard of hearing children is directly related to the consideration of the individual characteristics of each student. Preparation of students for the use of individual approach begins in the process of lectures and practical classes. Differential (stratified) and individual approach in the system of special education, which has a correctional-compensatory and developmental character, is aimed at correcting the existing problems in children, the prevention of possible secondary problems. In addition, an important feature of mother tongue lessons is that it teaches students ways to reform certain qualities by encouraging self-expression, self-assessment, and equipping them

with the skills and competencies needed not only to survive among healthy people but to actively and effectively participate in various relationships. In schools for deaf and hard of hearing children, lessons and individual lessons designed to develop students' speaking skills are a key form of the pedagogical process.

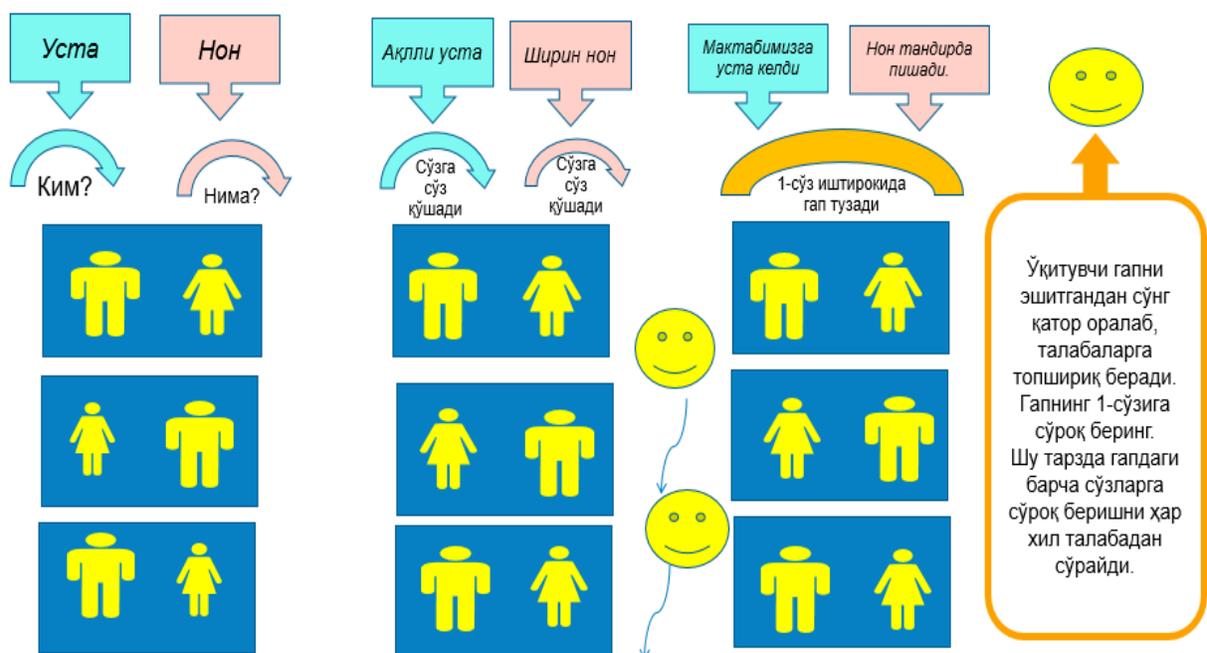

The main direction of preparation of the future specialist for professional practice is methodologically correct organization of lessons and correctional lessons in special boarding schools. Therefore, in the process of teaching the module "Special methods of teaching the native language" we conducted experimental work to achieve effective preparation of students for professional activities through the use of a number of interactive methods and educational technologies. Here are examples of interactive methods and educational technologies used in these experiments, as well as their didactic potential.

### 1. Piano technology.

Based on this technology, the training is organized in small groups. At the same time, assignments are given in a systematic way on the lines available in the classroom. Several variations of this technology on the topics of practical training have been applied in practice.

#### 1<sup>st</sup> option:

"Who?" "What?" the task of thinking of the words that answer the question is given. Row 2 students add words to the spoken word. The students in row 3 form a sentence in the presence of the first spoken word. After the teacher hears the sentence, the students go through the lines and give assignments. Question the 1st word in the sentence. In this way, he asks a different student to question all the words in the sentence. The following diagram is shown on the screen to explain to students the use of this method in the practice of teaching the deaf mother tongue.

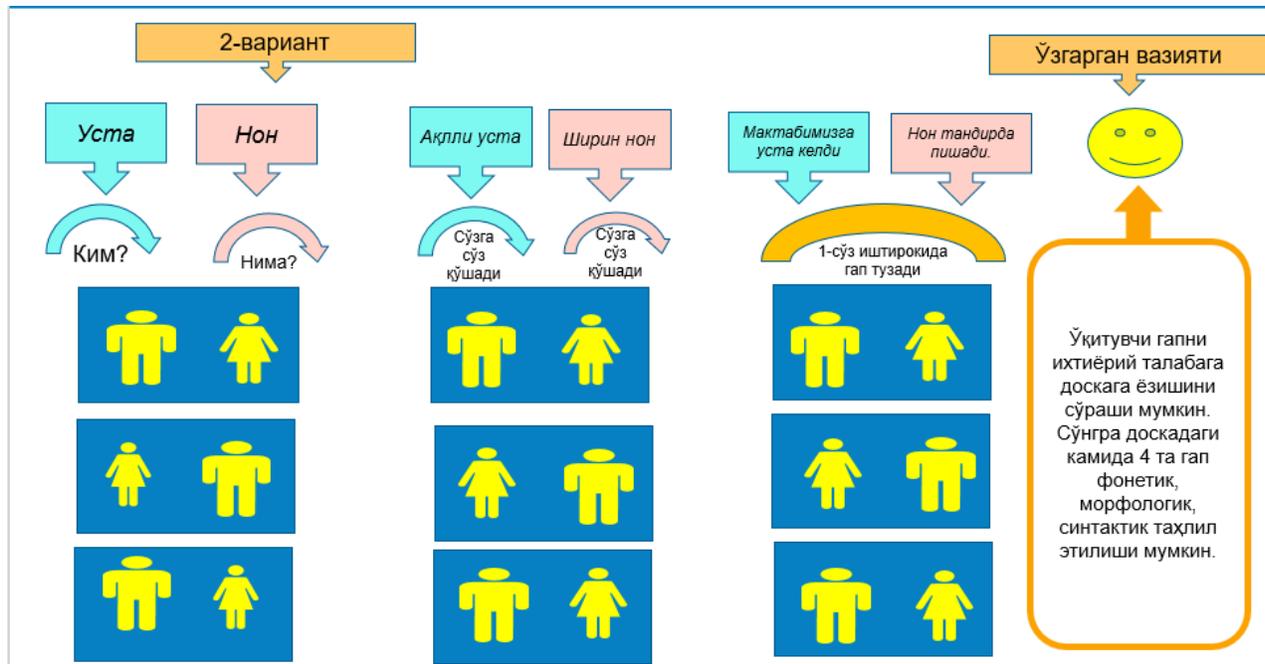

**2<sup>nd</sup> option**

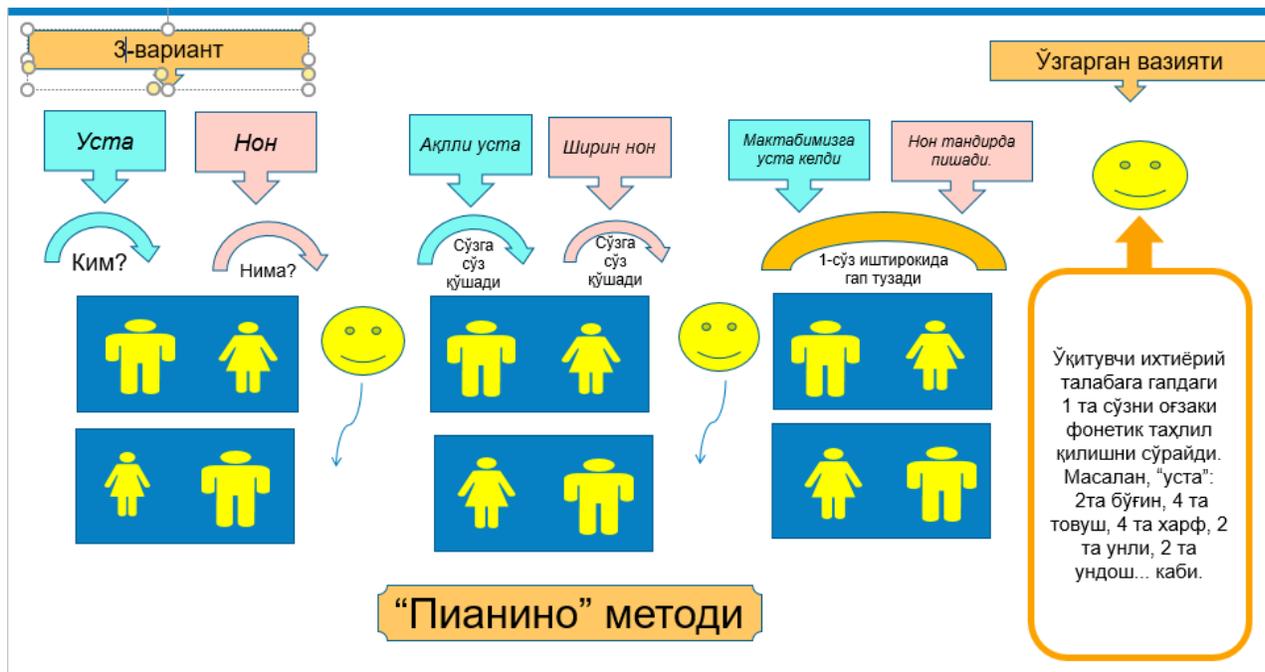

In Option 2, pupil thinks of words that answer the question in the first line "Who?", "What?" Line 2 adds a word to the word. Line 3 forms a sentence in the presence of a word. A changed situation is then presented, i.e. the teacher can ask any volunteer to write the sentence on the board. Then at least 4 sentences on the board are analyzed syntactically, morphologically. In addition, students were recommended to write words on the basis of special spelling rules and in accordance with the rules of calligraphy. As a result, students have the opportunity to master the methods and ways of teaching students the rules of writing in the primary grades. In particular, the following methods of acquiring writing skills were selected as a separate task:

The following diagram is displayed on the screen:

### 3<sup>rd</sup> option

The following technologies for effective teaching of mother tongue to deaf and hard of hearing students of students of deaf pedagogy were effectively used in the course of lectures and practical training of the module. The use of this technology in deaf education is methodologically convenient and interesting for students.

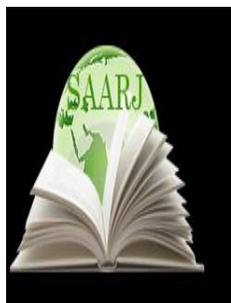

In conclusion, it can be said that the role of practical training in the effective organization of the module "Special methods of teaching the mother tongue" is great, because in the process of

practical training students are organizationally and methodologically prepared for future professional activities. The issues discussed during the practical training will strengthen the theoretical information provided in the report. Therefore, special attention should be paid to ensuring the active participation of each student in the lessons.

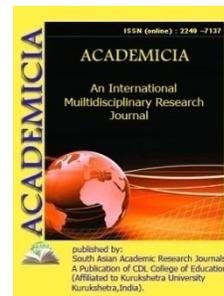

In practical training, priority should be given to educational technologies based on interaction. Practical training on modules in higher education institutions is a group, group training. When an atmosphere of kindness and mutual trust prevails during the course for students, they feel free, are not afraid to ask questions that are not clear, and as a result have the opportunity to fully master the field. Because a mistake made in any exercise will be corrected and major problems that may occur in future professional activities will be prevented.

## DYNAMICS OF DEVELOPMENT OF BAKHSHI SCHOOLS IN THE SOUTHERN REGIONS OF UZBEKISTAN

**Khakimov Arif\***

\*Teacher of the Department of Music Education,  
 TerSU Faculty of Art History,  
 UZBEKISTAN

### ABSTRACT

*This article discusses the dynamics of development of Bakhshi schools in the southern regions of Uzbekistan. In this day and age, when it is necessary to further develop and refine the unique treasury of baxshichi created by our ancestors and passed on to future generations, teaching the art of baxshik as a science in all systems of education meets educational standards. The tasks of creating news and training manuals remain relevant.*

**KEYWORDS:** *Folklore, Songs, Epics, Legends, Legends, Baxshi, Heritage, National Values, Music.*

### INTRODUCTION

Uzbek folklore has an ancient history. Even before the advent of writing, the people created various examples of their songs, epics, legends and stories. Folklore is a product of oral creativity, created orally at different stages of human history, passed down orally from generation to generation, from teacher to student, and passed down to us. One of the suppliers of these masterpieces to the public is the great poets, akyns and khalfas.

In this day and age, when it is necessary to further develop and refine the unique treasury of baxshichi created by our ancestors and passed on to future generations, teaching the art of baxshik as a science in all systems of education meets educational standards. The tasks of creating news and training manuals remain relevant.

It was a responsibility to restore our national values, to find and revive the treasures of our national musical heritage. The art of baxshi was revived, grew and developed in a short period of time. Bakhshi schools were restored. The participation of poets and poetesses in all public events and national holidays across the country has been ensured. Folklore festivals, baxshi

competitions were organized. As a result, epic and national performance among the people further developed, professional performers emerged.

### **Main part**

Many bakhshis living in the southern regions of Uzbekistan are associated with the Sherabad school of epic poetry. Shernazar Beknazar oglu, a well-known representative of this school who lived in the second half of the 19th century and the beginning of the 20th century, raised a number of students. Mardonaqul Avliyoqul oglu, Umir Safar oglu, Normurad baxshi, Ahmad baxshi, Nurali Boymat oglu, Mamatrayim baxshi, Boriboy Ahmad oglu, Yusuf Otagan og Dozens of epic writers like 'li join this school and several epics have been written from them.

When we look at the repertoire of these bakhshis, we encounter the relatively lower stages of epic writing, the less developed forms of artistic thinking. Surkhandarya and Kashkadarya bakhshis in the southern regions of Uzbekistan are in constant contact with each other, and many of them are connected with the Sherabad bakhshis school. Some of the epics in the repertoire of the representatives of this school, such as "Golden Pumpkin", "Brown Merchant" are not found elsewhere. The repertoire of Sherabad school bakhshis is based on the epics "Alpomish" and "Gorogly". There are more than forty epics in the Gorogly series. More than a hundred Gorogly epics have been written by folk singers. The category includes the following epics: "Birth and childhood of Gorogly", "Zaydinoy", "Yunus pari", "Misqol pari", "Gulnor pari", "Girdob", "Sinsuluv pari", "Mrs. ", "Golden Pumpkin ", "Territory of Avaz ", "Khushkeldi ", "Sentence of Avaz to Death ", "Balkhuvon ", "Nurali ", "Malla Savdogar ", "Nurali's Youth ", "Ravshan ", "Jahongir ", "Erogli" and others.

According to the narrators, "Erogli" is the last epic of the series, which depicts the old age of Gorogly and his disappearance on Mount Sulduzi. Although Gorogly is given a long life - 120 years, he will not die, but will disappear on the legendary Mount Sulduzi. According to the legends, the beloved fairies Yunus and Misqal promised to gorogly that when you grow old, we will not erase your name, we will tell your friend. The fairies do not die, they land on the bakhshis and suck the words of Gorogly into them, so the bakhshis are also the sons of Gorogly. Due to such beliefs, the epic "Erogli" was widely known, but singing as widely as other works was not a picture among the poets. That's why we couldn't write the perfect version. Some of its unfinished versions are preserved in the Surkhandarya Bakhshi in the southern regions of Uzbekistan. The epic "Shahidnoma" written by M.Afzalov in 1945 from the son of Yusuf Otagan from Surkhandarya, which is still considered to be relatively complete, did not perfectly retain all the features of the epic "Erogli" in the repertoire of bakhshis. . If the epics of the Gorogly series come together, there are about half a million poetic and prose lines, which testify to the high creative genius of our people living in the southern regions of Uzbekistan. The epics of the Gorogly series are an epic that describes the life of the people, their life and dreams, their hopes and realities, their moral aesthetics and social views.

Alpomish, Gorogly, Avazkhan, Beva Barchin or Barchin beka, Avazning tug, which have been repeatedly tested, decorated and polished at the Sherabad school of epic poetry in the southern part of Uzbekistan. Dozens of epics, such as "Malishi savdogar", "Kuntugmish", "Nurali", "Hasankhan", "Oltin zucchini", "Avaz va Oyzaynab", "Oyparcha", "Zarnigor" as a rare and rare specimen has taken a firm place in our literature. For this, we should be grateful to our ancestors, our people, whose hard-working poets and poetesses are his clever and truthful children, whose

memory is long-lasting, mature and sharp. There is no doubt in our minds that the folklore of our distant ancestors, which has survived the waves and trials of many generations and brought us to the present day, is our priceless treasure.

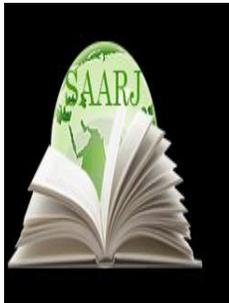

On November 1, 2018, the President of the Republic of Uzbekistan signed a decree "On the preservation and development of unique examples of the Uzbek national art of baxshi and epic poetry, its widespread promotion, respect and attention to this type of art in the hearts of the younger generation. On holding the International Festival of the Art of Bakhchisarai "with the aim of strengthening the ties of friendship and brotherhood between different peoples, creative cooperation, further expansion of cultural and spiritual ties on an international scale" The resolution became a state-level policy document and guide for the development and dissemination of the art of Uzbek epic poetry around the world.

### CONCLUSION

In summary, this article analyzes the history of the art of baxshi in Uzbekistan, the analysis of the historical roots of baxshi in Uzbek folklore, the importance of baxshi schools in Uzbekistan, the life and work of baxshi schools in the southern regions of Uzbekistan. the role of the work of the bakhshis who lived and worked on the ground in the bakhshi schools, the teaching methods in the bakhshi schools were explained step by step.

**ABSTRACT**

**Introduction:** Universities are the academic institutions which facilitate the students and mould to prepare them to work in the world of work. Academics and curricula directly support to achieve the goal of universities. Meanwhile non academic employees are part and parcel to support mainly for the administrative activities to achieve the overall vision of the universities. It is disputable that the nonacademic employees also behind the success of the development path of the universities. The Job satisfaction is the key ingredient that leads to recognition, income, and promotion, the achievement of other goals that lead to a feeling of fulfillment and Organizational citizenship Behavior. Organizations could not prosper without their members behaving as good citizens by engaging in all sorts of positive behaviors. So there is a need for identify how job satisfaction affect on organizational citizenship behavior.

**Objective:** The aim of the paper is to study the impact of job satisfaction on Organizational Citizenship Behavior (OCB) among the nonacademic employees of national universities in the Eastern province of Sri Lanka. **Methodology:** This is an explanatory study among 260 non academic employees working in Universities, using a structured questionnaire based on simple random sampling method. **Findings:** It was found that job satisfaction is one of the factors for determining the Organizational Citizenship Behavior (OCB) and the relationship was shown to be significant. When the employees are satisfied with their job only they will extend their extra activities and would be committed towards organizational success. If the employees are found with organizational citizenship behavior, it is no doubt any organization would be in running very smoothly without any obstacles in the path of achieving the organizational vision. Findings

*of this research effort could enable organizations to re think or reshape their job satisfaction system in order to achieve their desired organizational goals.*

**KEYWORDS:** *Job Satisfaction, Organizational Citizenship Behaviour (OCB), Non-Academic Employee*

## INTRODUCTION

Organizational Citizenship Behavior (OCB) is referred as set of discretionary workplace behaviors that exceed one's basic job requirements (Bateman & Organ, 1983). They are often described as behaviors that go beyond the call of duty. Organizational Citizenship Behaviors (OCBs) are a special type of work behavior that are defined as individual behaviors that are beneficial to the organization and are discretionary, not directly or explicitly recognized by the formal reward system. These behaviors are rather a matter of personal choice, such that their omissions are not generally understood as punishable. OCBs are thought to have an important impact on the effectiveness and efficiency of work teams and organizations, therefore contributing to the overall productivity of the organization (<http://en.wikipedia.org>).

Successful organizations have employees who go beyond their formal job responsibilities and freely give of their time and energy to succeed at the assigned job. Such altruism is neither prescribed nor required; yet it contributes to the smooth functioning of the organization.

Job satisfaction involving cognitive, affective and evaluative reactions or attitudes states it is "a pleasurable or positive emotional state resulting from the appraisal of one's job or job experience". Job satisfaction is a result of employees' perception of how well their job provides those things that are viewed as important (Fred Luthans 2004). Job satisfaction describes how content an individual is with his or her job. Job satisfaction has been defined as a pleasurable emotional state resulting from the appraisal of one's job an affective reaction to one's job and an attitude towards one's job.

The job satisfaction which in turn has a significant influence on employees' absenteeism, turnover, and psychological distress. Individuals with higher levels of job satisfaction demonstrate decreased propensity to search for another job and a decreasing propensity to leave. The job satisfaction is very important to all employees. Without job satisfaction the employee can't work properly. When the employees are satisfied their jobs, then only he/she likely to work. The Job satisfaction is the key ingredient that leads to recognition, income, and promotion, the achievement of other goals that lead to a feeling of fulfillment and Organizational citizenship Behavior. So there is a need for identify how job satisfaction affect on organizational citizenship behavior. The job satisfaction is one of the major determinants for organizational citizenship behavior.

Hence, this research aims to identify the empirical relationship between OCB and JS among the sample of non academic employees in Universities in the Eastern part of Sri Lanka.

### Objectives of the Study

- To identify major determinants of the organizational citizenship behavior.
- To find out how the Job satisfaction impact on the organizational citizenship behavior.

This research was attempted to examine to how job satisfaction positively impact the organization citizenship behavior. Findings of this research effort could enable organizations to re think or reshape their job satisfaction system.

## **LITERATURE REVIEW**

### **Organizational Citizenship Behaviors (OCBs)**

OCB is very popular construct in organizational behavior introduced with both a dispositional/personality and job attitudes theoretical foundation. Organ (1983) defines OCB as “individual behavior that is discretionary, not directly or explicitly recognized by the formal reward system, and that in the aggregated promotes the effective functioning of the organization.”

The personality foundation of these OCBs reflects the employee’s predisposition traits to be cooperative, helpful, caring, and conscientious. The attitudinal foundations indicate that employees engage in OCBs in order to reciprocate the actions of their organizations. Motivational dimensions, job satisfaction, and organizational commitment and job involvement clearly relate to OCBs. More important to OCBs, however, is that employees must perceive that they are being treated fairly, that the procedures and outcomes are fair. A number of studies have found a strong relationship between justice and OCBs. It seems that procedural justice affects employees by influencing their perceived organizational support, which in turn prompts them to reciprocate with OCBs, going beyond the formal job requirements.

Besides being extra-role or going beyond “the call of duty,” other major dimensions are that OCBs are discretionary or voluntary in nature and that they are not necessarily recognized by the formal reward system if the organization

Recent research also examines antecedents such as job attitudes that account for loyalty OCBs, personality that accounts for service delivery OCBs, customer knowledge and personality that jointly predict participation OCBs, and relationship quality and relationship context as antecedents of person-and task-focused interpersonal citizenship behaviors.

Obviously, all these different types of OCBs are valuable to organizations and, although they frequently go undetected by the reward system, there is evidence that individual who exhibit OCBs do perform better and receive higher performance and evaluations. In addition, OCBs do relate to group and organization performance and effectiveness. However, as with job satisfaction and organizational commitment, there is still some criticism of the conceptualization and research on OCBs, and more research is certainly warranted. For example, a recent study found that OCBs do influence organizational outcomes rather than the other way around and another study has begun to analyze the influence of gender on the performance of OCBs. Today’s managers would be very wise in trying to enhance not only job satisfaction and organizational commitment, but also pro social, organizational citizenship behaviors of their employees (Fred Luthans 2004).

### **Job Satisfaction**

Job satisfaction as involving cognitive, affective, and evaluative reactions or attitudes and states it is “a pleasurable or positive emotional state resulting from the appraisal of one’s job or job experience.”(Locke E.A. 1976). Job satisfaction is a result employees’ perception of how well

their job provides those things that are viewed as important. It is generally recognized in the organizational behavior field that job satisfaction is the most important and frequently studied attitude.

Although theoretical analyses have criticized job satisfaction as being too narrow conceptually (Andre Bussing et al 1999), there are three generally accepted dimensions to job satisfaction. Job Satisfaction is an emotional response to a situation. As such, it cannot be seen; it can only be inferred. Job Satisfaction is often determined by how well outcomes meet or exceed expectations. For example, if organizational participants feel that they are working much harder than others in the department but are receiving fewer rewards, they will probably have a negative attitude toward their work, boss, and/ or coworkers. They will be dissatisfied. On the other hand, if they feel they are being treated very well and are paying equitably, they are likely to have a positive attitude toward the job. They will be job-satisfied.

There are a number of factors that influence Job Satisfaction. For example, one study even found that if college students' majors coincided with their jobs, this relationship predicted subsequent Job Satisfaction (Mary Ann M. Ferico and Terry A. Beehr 1992). They are the work itself, pay, promotion, supervision, work group, and working condition

In summary, most organizational behavior, scholars as well as practicing managers would argue that job satisfaction is important to an organization. Some critics have argued, however, that this is pure conjecture because there is so much we do not know about the positive effects of satisfaction. On the other hand, when job satisfaction is low, there seem to be negative effects on the organization that have been documented. So if only from the standpoint of viewing job satisfaction as a minimum requirement or point of departure, it is of value to the organization's overall health and effectiveness and is deserving of study and application in the field of organizational behavior.

## **RESEARCH METHODOLOGY**

This research was an explanatory study. The investigation of the study was the cross sectional correlation examination. The study design was the survey method using a structured questionnaire as the research tool and unit of analysis was done with the individuals. The likert scale was used for the statements attained for the variables ranging from strongly disagree to strongly agree.

The research was conducted among a sample of 260 non academic employees of the Universities in the Eastern Province using simple random sampling method. The SPSS 16.0 student version statistical software has been used to analyze the data. And the correlation and regression analysis were done mainly to test the hypothesis.

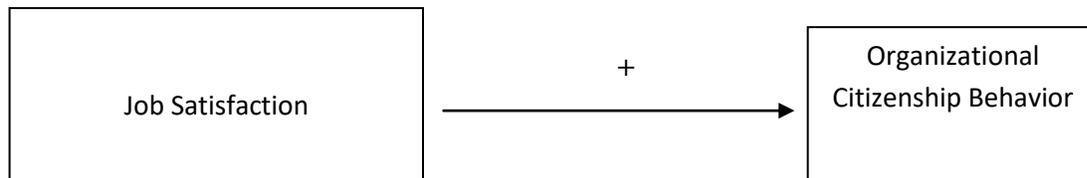

### **Research Framework**

The model developed for the present study includes the constructs related to OCB and Job satisfaction.

Thus, the conceptual model for this research is as follows;

Independent Variables

Dependent Variable

Hence, the following hypothesis was developed.

H1: Job satisfaction is positively related to organizational citizenship behavior

### Measures

This study is intended to examine the hypothesized relationship between job satisfaction as independent variable and OCB as dependent variable.

#### Measuring job satisfaction

The job satisfaction has been operationalized as the degree to which a non academic employee is satisfied with his /her job. The Job satisfaction was measured the work itself, pay, promotion, supervision, work group, working conditions. That is, to what extent an non academic employee in university has satisfaction on his/her job. Hence, the job satisfaction is a highly qualitative aspect, which has been taken in to a scale to analyze quantitatively. The job satisfaction is evaluated by a developed scale under the following dimensions.

Job Satisfaction represents several related attitudes. Through the years five job dimensions have been identified to represent the most important characteristics of a job about which employees have affective responses. These are:

1. The work itself: The extent to which the job provides the individual with interesting, tasks, opportunities for learning and the chance to accept responsibility.
2. Pay: The amount of financial remuneration that is received and the degree to which this is viewed as equitable vis-à-vis that of others in the organization.
3. Promotion opportunities: The chance for advancement in the career in the organization.
4. Supervision: The abilities of the supervisor to provide technical assistance and behavioral support.
5. Coworkers: The degree to which fellow workers are technically proficient and socially supportive.
6. Working conditions: The degree to which an employee is willing to work in a work setting condition (clean, attractive surroundings, hot, noisy surroundings, for instance).

Thus, 32 question items were developed to measure the 06 dimensions of this variable on a five point scale that varies from strongly disagree to strongly agree.

#### Measuring OCB

Organizational citizenship behavior also was measured the altruism, conscientiousness, courtesy, civic virtue, sportsmanship. Every variables includes dimensions, each dimension has number of indicators to investigate the sample of population. Developed questionnaire by (Podsakoff, et al. 1990).

1. Altruism (e.g. helping out when a coworker is not feeling well), Altruism refers to behaviours that are voluntary. For example, being cooperative, helpful and other instances of extra-role behaviour, which helps a specific individual with a given work related problem (Podsakoff, MacKenzie, Moorman & Fetter 1990).
2. Conscientiousness (e.g. staying late to finish a project), Conscientiousness refers to the extent of behaviours to which someone is punctual, high in attendance and goes beyond normal requirements or expectations.
3. Civic virtue (e.g. volunteering for a community program to represent the firm), Civic virtue consists of those behaviours that are concerned with the political life of the organization (e.g., attend meetings, engage in policy debates, and express one's opinions in implementing a new policy).
4. Sportsmanship (e.g. sharing failure of a team project that would have been successful by following the member's advice), Sportsmanship describes those individuals who tolerate the annoyances that are inevitable in the workplace a set of behaviours that demonstrate tolerance of less than ideal conditions at work without complaining and
5. Courtesy (e.g. being understanding and empathetic even when provoked). Courtesy refers to behaviours that are directed to the prevention of future problems, which is different from altruism because altruism is helping someone who has a problem, while courtesy is helping to prevent problems, performing thoughtful or considerate gestures towards others

#### Reliability Analysis of the Questionnaire

A reliability analysis was done to check the inter item consistency reliability. The Cronbach's Alpha was measured. Accordingly, the Cronbach's alpha reliability coefficients of the independent and dependent variables were obtained. Accordingly, the alpha value for job satisfaction and OCB showed a good reliability. Also the reliability coefficients of the dimension of these two variables were obtained as follows:

The work itself is 0.828, Pay is 0.764, Promotion is 0.682, Supervision is 0.820, Work group is 0.771, Working conditions is 0.757, Altruism is 0.821, Conscientiousness is 0.832, Courtesy is 0.671, Civic virtue is 0.732, and sportsmanship is 0.765. All constructs display good internal consistency.

#### **Descriptive measures:**

#### **Descriptive Statistics**

	Mean	Std. Deviation	N
OCB	1.9229	.38253	260
Job Satisfaction	2.0103	.31741	260

(Source: Survey Data)

OCB has a mean value of 1.92 with the standard deviation of 0.38 and job satisfaction has a mean value of 2.01 with the standard deviation of 0.317. These shows the non academic employees are less satisfied with their jobs and show lesser organizational citizenship behavior.

### Correlation of Job satisfaction with OCB

Observing the correlations of independent variable-JS with the dependent variable- OCB, there is a positive correlation of ( $r = 0.477$ ,  $p = 0.000$ ) and significant at 0.01 level. Mean time, the correlation between the f JS with the dimensions of OCB derived as follows; where  $p = 0.000$  and significant at 0.01 level.

Altruism- 0.487, Conscientiousness-0.339, Courtesy-0.297, Civic virtue-0.392, sportsmanship-0.273. Accordingly the employees who are highly satisfied show greater altruism, conscientious, and civic virtue than courtesy and sportsmanship.

### Correlations

		Altruism	Conscientiousness	Courtesy	Civic Virtue	Sportsmanship	OCB	Job Satisfaction

OCB	Pearson Correlation						1	.477*
	Sig. (2-tailed)							.010
	N						260	260

\*. Correlation is significant at the 0.05 level (2-tailed).

(Source: Survey Data)

**Regression**

The overall model explains the fit for the research.  $R^2$  in the table given below shows this aspect. This coefficient is a measure of how well the regression equation fits the data. Here, we have the  $R^2$  is 0.143, hence, the regression equation apparently have a perfect fit with the data. So, we can predict our dependent variable (OCB) with the independent variable (JS). Here,  $P = 0.000 < 0.05$ . So the model is significant and model exists.

**Model Summary**

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.477 <sup>a</sup>	.241	.221	.36316

a. Predictors: (Constant), Job\_Satisfaction

**Coefficients<sup>a</sup>**

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	.733	.382		2.132	.040
	Job_Satisfaction	.451	.176	.473	2.677	.010

a. Dependent Variable: OCB

At first, if we consider the constant variable in the equation. Its values;  $P = 0.000 < 0.05$ , hence, significant to model. Job satisfaction is considered;  $P = 0.000 < 0.05$ , hence, it is significant to the model and explain the dependent variable.

Hence, the following Model fit equation is derived.

$$OCB = 0.733 + 0.451 JS$$

**Hypotheses Testing**

The most common policy in statistical hypothesis testing is to establish a significance level, denoted by  $\alpha$ , and to reject  $H_0$  when the  $p$  – value falls below it. When this policy is followed, one can be sure that the maximum probability of the type I error is  $\alpha$  (*Policy: when P-value is less than  $\alpha$ , reject  $H_0$* ) Here, the hypotheses are tested at 5% confidence level ( $\alpha = 0.05$ ).  $P$  values are denoted ‘Sig.’ in the above Table.

The following table shows the rejection and acceptance of the hypothesis.

Variable	Hypothesis	P - Value	$\alpha = 5\%$	$H_0$	$H_A$
JS with OCB	$H_0, H_1$	0.010	0.05	Reject	Accept

Source: Survey Data

$H_0$  = no association between Job satisfaction and OCB.

$H_1$  = There is an association between Job satisfaction and service OCB.

The  $p$  value is for variable JS is 0.010.

Since  $p \text{ value } 0.010 \leq \alpha$ , so the null hypothesis is rejected and the alternative hypothesis is accepted as the  $P \text{ value } < \alpha$ . Therefore we statistically conclude that there is an association between Job satisfaction and OCB.

Hence, this means there is a positive relationship between JS and OCB. Also the result in correlation table (Correlation coefficient = 0.477;  $p=0.000$ ) support this hypothesis. Thus, the attitude of job satisfaction is a predictor of OCB of the employees.

According to the findings the 24.1% of the OCB is determined by job satisfaction and there is a positive correlation between job satisfactions OCB.

## CONCLUSION

Organizational Citizenship Behavior is a result of the employees satisfied their work. The OCB has been measured by the altruism, conscientiousness, courtesy, civic virtue and sportsmanship. These variables have number of dimensions and indicators to measure OCB broadly. The study has been done on the non-academic employees of universities in the Eastern Province. For the evaluation purpose the mean, correlation, regression and standard deviation has been used.

We first hypothesized a significant relationship between job satisfaction and organizational citizenship behavior, based on theory and extent literature that supports such a relationship. The relationship was shown to be significant, and  $H1$  was supported ( $0.010 \leq \alpha$ ). Hence, this means there is a positive relationship between JS and OCB. Also the result in correlation table (Correlation coefficient = 0.477;  $p=0.000$ ) support this hypothesis. Thus, the attitude of job satisfaction is a predictor of OCB of the employees.

All employees are fulfilling their responsibilities stated in their job descriptions. In this way the non academic employees in the selected universities also fulfill their responsibility. But, organizational citizenship behavior comes who are the employees satisfied overall factors determining the job satisfaction. So, this study attempted to identify the relationship between job satisfaction and OCB. As far as the non academic employees of the selected universities are seen less satisfied with their job and accordingly show less organizational citizenship behavior. Work overload, less salary, negative attitude of the supervisors and coworkers are some them. However most of the employees are satisfied with their working condition. And most of them are dissatisfied with recently implemented finger print system to control employee attendance as they face stress and anxiety during their working period.

## Recommendations

The work itself, pay, supervision, and work group were not highly satisfied to non academic employees. Therefore management should consider the following matters and they can improve their employees' job satisfaction.

- Improve and consider the employees' work contents.
- Improve the payments (Salary revision should be done at the University Grand Commission (UGC) level and other benefits of employees.
- They should redesign their promotion system.
- Create positive attitudes among superiors as well as subordinates.

- They should create a friendly manner relationship among the employees.
- Maintain a flexible work schedule by means of introducing flexi-working hours.

According to the findings the 24.3% of the OCB is determined by job satisfaction. There are another factors also determine the OCB. Therefore future researchers find out other factors and can do good research.

When the employees are satisfied with their job only they will extend their extra activities and would be committed towards organizational success. If the employees are found with organizational citizenship behavior, it is no doubt any organization would be in running very smoothly without any obstacles in the path of achieving the organizational vision.

## ISSUES OF FORMATION OF IDEOLOGICAL IMMUNITY IN THE MINDS AND HEARTS OF YOUNG PEOPLE

**F.f.n. Primova Fotima Abdurahimovna\***

\*Associate Professor,  
 Philosophy and National Idea,  
 Tashkent State Technical University,  
 UZBEKISTAN

### ABSTRACT

*The formation of ideological immunity does not mean forcing the same Foya into the minds of people, but the separation of ok-kora in people, cultivating the qualities of vigilance and awareness against harmful Foya. Where there are interests, there will inevitably be aspirations for the realization of imaginary, impure interests. The social sciences play an important role in cultivating ideological immunity in young people. Formation of beneficial immunity is an important criterion for the effectiveness of educational work.*

**KEYWORDS:** *Youth Consciousness, Ideological Immunity, Society, Globalization, Spiritual-Educational*

*It should be clear to all of us that in the so-called "information age" of the XXI century, no state or society can live around an iron wall. At the same time, it is not right to sit idly by saying that the situation is like this, and in response to such threats, we must also take the necessary measures without being naive.*

**Islam Karimov**

### INTRODUCTION

At a time when the world is undergoing profound changes in the geopolitical, economic and social, information and communication landscape, the debate between different ideologies is sharpening, we all know that the struggle against thought, against idea, against ignorance is more important than ever is1.

In this era of rapid globalization, first of all, we must form ideological immunity in the minds and hearts of our youth (lat. Immunitatis - to be free from something), to educate our motherland in the spirit of love, rich history, devotion to the sacred religion of our ancestors. Immunity is a medical concept and is the body's ability to protect itself from various diseases. Ideological immunity, on the other hand, ensures ideological inviolability in society. The main and first element of ideological immunity is knowledge. Of course, it is natural for our young people to study a lot, to study themselves, to go through various life trials, and as a result, our young people's worldview expands, they can express their views on the processes around them, trust the words of different "storytellers" and do not follow them. As our President said, "Let our young people become people who have a deep understanding of their national identity, as well as the world, and keep pace with the times. That is when the ignorant fanatics

"Even ideas that are completely foreign to us, which reject the notion of morality, cannot influence them."

Given today's ideological attacks and their negative consequences, one of our main priorities is to nurture individuals who can stand up to them. With this in mind, the Resolution of the President of the Republic of Uzbekistan dated August 25, 2006 No PQ-451 "On increasing the effectiveness of the national idea and spiritual and educational work", special attention is paid to strengthening the ideological immunity of our society. Ideological immunity is not only the transmission of spiritual, educational, socio-political, aesthetic and legal knowledge to our youth, but also the formation of skills to respond to ideological struggles, the events of globalization, to respond to unhealthy ideas in the form of "mass culture". and educating mentally healthy young people who understand that the consequences of such influences do not lead to good results. That is why ideological immunity is divided into two threats; a) the threat of external information against the ideas aimed at the realization of such sacred values as the development of the Motherland, peace, social cooperation, interethnic harmony, religious tolerance, the perfect man, which embody the meaning of our ideology; b) be directed to an internal threat in the form of ideas, thoughts and actions aimed at ultimately self-harm to the Motherland, its compatriots.

The processes of life themselves show that some states and some political centers today are trying to focus on the human mind and heart. The main weapon of such political forces is the "idea", and the most important target is the young people who are simple, confident, the owners of our future, who do not yet fully understand the world. Of course, this is natural, because the main driving force of our society, our state, is the youth. Although such ideological propaganda does not work in the short term, it is natural that the young people who are affected will grow up and serve their people, not for their country, but for the benefit of "swindlers". The Marquis de Sade, a French writer known for promoting the idea of immorality, said of the dependence of nations on ideology: "We will continue to fight for world domination, intensify wars, and kill French soldiers in almost every corner of the globe. and the boots do not necessarily rot. If we can spread our morality to other countries, especially to the East (or rather, because De Sad's works are mainly focused on immorality) in books and other ways like mine, and turn it into a way of life for those peoples, the whole world will fall under our feet. we will succeed ..."

We have noted a number of positive aspects of the globalization process above, and at the same time, a number of challenges are emerging as a result of globalization. One of them is related to

the upbringing of young people, their moral and spiritual outlook. The negative effects of globalization on the education of young people can be explained as follows:

First, as a result of the high development of information technology, the penetration of the Internet, mobile phones, telecommunications and various information publications. The “values” offered by these means often alienate our youth from our national values, in other words, lead to the formation of specific “rootless individuals”.

Second, the prevalence of different forms of “popular culture” among young people. These are mainly manifested in dress, hobbies, leisure, tastes, attitudes to national values. "Popular culture", which embodies the values of Western culture, causes such defects in our youth as Western individualism, egocentrism, nihilism, apathy, obscenity and violence, indifference to national values and social interests.

Thirdly, there are cases of imitation among young people, blind adherence to Western ideals. At the same time, it is not difficult to see that the moral and spiritual patterns of behavior prevalent abroad are engulfing the minds of our youth through movies, fashion and various advertisements. As a result, young people are becoming more accustomed to spending time in front of a computer than watching books, watching movies of different genres with shallow content.

We want to illustrate the extent to which ideological interaction is effective in the following example. That is, at the height of the Cold War between the former Soviet Union and the West in the late 1970s, a Pentagon general said, "Yellow cubs did not benefit from V-52s (strategic bombers armed with nuclear bombs) in the fight against the USSR." . However, in the collapse of the USSR, American blue jeans are more useful than V-52s ”1.

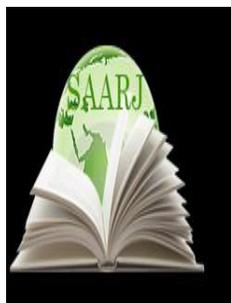

It is of great scientific and practical importance to find new mechanisms that serve to form ideological immunity in our youth. As long as ideological immunity is instilled in the minds and hearts of members of society, especially young people, it will not be easy to capture the minds and hearts of people in our society and members of our society will not succumb to foreign ideas. We all know that the development of a society depends on the scientific, professional, socio-political, moral, aesthetic perfection of the individuals and social groups that make it up. It is especially important that people understand themselves and consciously perform the tasks they face. In this sense, the socialization of the human person, in which the formation of a national mentality, requires that we feed the direction and content of human life with ideological immunity and never be indifferent to what is happening around us.

In his book, the President emphasizes: “It should be clear to all of us that where indifference and indifference prevail, when the most pressing issues are left to selfishness, then spirituality becomes the weakest point. Conversely, where vigilance and zeal, high intellect and contemplation prevail, spirituality becomes a powerful force ”1.

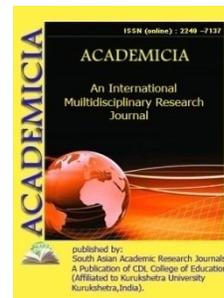

The Eastern world is distinguished by its unique values, such as sincere humanity among people, respect for the great, respect for the small, in contrast to the Western world, not individualism, but collectiveness. You and we and none of us must not allow our spirituality, based on such universal values, to be lost as a result of various influences. If we do not bravely go through these negative processes and keep our identity, our history, our sacred religion clean, we will not be able to be worthy heirs to our ancestors.

### ABSTRACT

*The article describes the peculiarities of the organization of work with climatic conditions in the construction of architectural structures, the topology of climatology and the architecture of urban construction. His ability to learn about climate protection is reflected in the article. The article discusses climate analysis using architectural ready-made climate indicators.*

**KEYWORDS:** *Microclimate, Composition, Topology, Convection, Conduction, Radiation, Humidity, Evaporation, Hygiene, Construction, Economics, Aesthetics.*

---

### INTRODUCTION

Architectural climatology studies the relationship between the architecture of buildings and urban structures and climatic conditions. An architect who has a complete idea of these connections will be able to create the artificial environment created during the design process, taking into account the climatic conditions of the construction site as much as possible.

Architectural climatology is closely related to the typology of architectural structures, general climatology, hygiene, construction physics, economics, aesthetics.

The climatic typology of architectural structures enriches the architect with the knowledge, methods and tools necessary to improve the environment, protect man and his surroundings from heat and cold, as well as the experience of regulating the microclimate accumulated over the centuries.

Climate protection means: displacement methods (horizontal orientation, air exchange or protection of the environment from the wind, use of various levels of the open environment, roofing, lawns, lawns, orchards). ), engineering equipment (heating, cooling, air exchange, etc.)

The climatic typology of residential buildings is of greater importance than the climatic typology of other types of buildings. Because a person spends most of his time in a building.

**Main part**

Architectural climatology provides the architect with detailed information about the climate of the design district, climatic factors, their changes over time and methods of climate analysis.

Household hygiene helps to understand the changes in the physical and spiritual functions of the human body, the maintenance of the external environment and the microclimate in the building.

Knowledge of economics (construction, operation, operating costs, socio-economic efficiency) helps the architect to choose a rational solution in all respects.

The mechanism associated with aesthetics, including the theory of architectural composition, has not been fully explored in conjunction with climatic architecture. However, there are categories of such architectural compositions, and the architect always takes into account the climate when choosing them. These include the creation of architectural space, volumetric solutions of different levels of springs, stickiness and orientation, plastic solutions of surfaces with different levels of splitting, texture, color solutions, etc.

Thus, architectural climatology is much more scientific disciplines, but these are independent of climatology does not prevent it from becoming an architectural science. The most important basic climatic factors in architectural design consists of: horizontal when the weather is clear and cloudy, and solar radiation falling on vertical surfaces in different directions; temperature factors - the coldest and hottest day of the month, the absolute minimum, maximum and average maximum for the hottest month of the month, the daily or five-day cold days in the coldest period of winter; Humidity factors - humidity, absolute, average daily, monthly water vapor pressure, amount of precipitation, etc .; wind direction, average directional velocity, maximum and minimum velocities (m / s), etc. k.As a result of the passage of large air masses over the land, there is a tendency for the top layer to heat up evenly. Climate analysis in architectural design is general goes into privacy.

The architect uses ready-made climate indicators, analyzes the climate, assesses the conditions of the latitude, determines the area where construction is planned, assesses the seasons and each climatic factor. In assessing the microclimate, the architect studies the landscape, the terrain, the direction of the wind, the calculation of insulations. The above may not be sufficient for a complete analysis, so it is necessary to use the basics of geodesy at construction sites.

Since the architectural environment is created for man, the architect must know the requirements of the human body to the environment.

Extremely hot - when the external environment is unable to actively absorb heat, cold - if more heat is absorbed by the environment than the heat produced by the body, heat is transmitted to the external environment by the following factors: a) by convection, a) by convection; ) by evaporation of moisture.

External protection devices, engineering equipment must fully meet the microclimate conditions of the environment (optimal temperature, humidity, air circulation, etc.). Home microclimate requirements man

It depends on the adaptation, the climate and the seasons of the place, the character of the person, the clothes, the health of the person, the age and so on.

In winter, the temperature in residential buildings should be 18-20 oC, in the north 21-22 oC, in the southern districts 17-19 oC, in summer the temperature in residential buildings in the climatic districts is 23-24 oC, in the southern districts 25-26 oC, in refrigerated rooms It should be 26 oC.

Some microclimate parameters and their combination together have a direct impact on the choice of architectural solutions. Air temperature is the main criterion in the environment, without which it is difficult to estimate other parameters. The effect of temperature on surfaces depends on the selected material, for example floor devices. Depending on the material of the floor, "cold" is made of large heat-absorbing materials, stone, marble floors are more suitable in countries with hot climates, in temperate northern regions it is advisable to use "warm", ie wooden floors. The space-creating architect must correctly interpret and evaluate the wind, which is more important than air temperature and humidity.

**TABLE 2.1. HYGIENE REQUIREMENTS FOR THE HEATING SYSTEM OF RESIDENTIAL BUILDINGS IN DIFFERENT CLIMATIC REGIONS**

indicator	seasons	climatic regions			
		I	II	III	IV
air temperature, S	Winter	21-22	18-20	18-19	17-19
	Summer	23-24	23-24	25-26	25-26
humidity,%	Winter	30-45	30-45	35-50	35-50
	Summer	35-50	35-50	30-60	30-60
wind speed	Winter	0,08-0,10	0,08-0,10	0,08-0,10	0,08-0,10
	Summer	0,08-0,10	0,08-0,10	0,1-0,15	0,1-0,15
Receiver of devices	Winter	21	18	18	18
internal surfaces temperature	Summer	26	26-27	28	28

In winter, the temperature in residential buildings should be 18-20 oC, in the north 21-22 oC, in the southern districts 17-19 oC, in summer the temperature in residential buildings in the climatic districts is 23-24 oC, in the southern districts 25-26 oC, in refrigerated rooms It should be 26 oC.

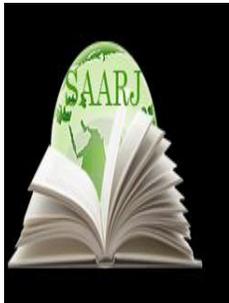

## CONCLUSION

Some microclimate parameters and their combination together have a direct impact on the choice of architectural solutions. Air temperature is the main criterion in the environment, without which it is difficult to estimate other parameters. The effect of temperature on surfaces depends on the selected material, for example floor devices. Depending on the material of the floor, "cold" is made of large heat-absorbing materials, stone, marble floors are more suitable in countries with hot climates, in temperate northern regions it is advisable to use "warm", ie wooden floors. The space-creating architect must correctly interpret and evaluate the wind, which is more important than air temperature and humidity. For example,

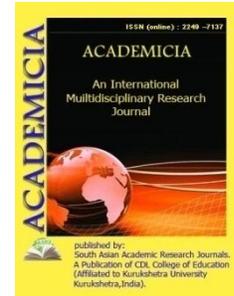

at 30 oC, even the weakest wind (2-3 m / s) does not allow a person to move freely in the open air. Such winds have a significant cooling effect when the air temperature is around + 5 oC to + 20 oC. At temperatures above 20 oC, air humidity plays a key role. Moisture makes it difficult to evaporate in the air, and only the wind cools the body. Increasing the air temperature from 19 oC to 29 oC reduces the corresponding air humidity from 50 to 70 to 30 to 50%. If the humidity does not decrease, then ventilation and aeration in space will be the first priority.

## LEGAL FUNDAMENTALS OF CITIZENS 'SELF-GOVERNMENT BODIES

**Mamadieva Nilufar Khalilovna\***

\*Head Lecturer,  
 Department of Philosophy and National Idea,  
 Tashkent State Technical University  
 UZBEKISTAN

### ABSTRACT

*In Uzbekistan, the neighborhood is an example of citizen self-government. The neighborhood has become a place where Uzbeks live and work with a common goal to promote the development of a historically formed society. It has been a sacred place that reflects the way of life, psyche, social life of the Uzbek people, passing down its national traditions, customs, moral and spiritual values from generation to generation.*

**KEYWORDS:** *Fundamentals Of Law, Citizens, State, Society, Local.*

### INTRODUCTION

In recent years, large-scale reforms have been carried out to further strengthen the legal framework of our national statehood, to establish the rule of law in society and to make our country one of the developed democracies. In particular, the "Concept of further deepening democratic reforms and development of civil society in the country" of the President of the Republic of Uzbekistan dated November 12, 2010 identified strategic directions for addressing the above issues, raising reforms to a higher level and its implementation in the coming years. In addressing the important tasks of the state, the President further democratized the government, further developed and strengthened the branches of government, including parliament, enhanced the role of political parties, deepened judicial reform, improved electoral legislation, media development, civil society. institutions have also put forward a number of important legislative initiatives aimed at further deepening democratic reforms and liberalizing the economy.

Today, the role of the state as the main reformer, ie to initiate and coordinate reforms, to ensure the rule of law, to pursue strong social policies, to implement political, economic and social reforms based on the principles of gradual and consistent reform. consists of. The role of citizens'

self-government bodies is important in a strong civil society. The law "On citizens' self-government bodies" has created an integrated system of self-government in the country. Such a social structure, which is rare in any country in the world, is characterized by its democracy and consistent governance. As President Islam Karimov said, "... as people's political will, political culture, and political activity increase, it is necessary to gradually transfer state functions to non-governmental organizations and citizens' self-government bodies. In this regard, it is important to increase the prestige and status of self-governing bodies and communities, to give them more rights. " Indeed, today we are witnessing the positive results of the transfer of some functions of the state to local self-government bodies. In other words, these bodies are convincingly fulfilling a number of state responsibilities in the field of social protection, economic issues, cultural and educational spheres, and environmental protection.

Citizens' self-government bodies are also a great social school in increasing the political activity of citizens. At the same time as the liberalization of public administration, it is necessary to improve the functioning of such a structure, to critically review the existing legislation. For example, Article 17 of the Law of Uzbekistan "On Citizens' Self-Government Bodies" provides for the establishment of the Council of Elders of Uzbekistan and local coordination councils in the country, but such the councils were formed as a non-governmental non-profit organization and duly registered, i.e. they were given the status of a legal entity. Under current law, non-governmental non-profit organizations do not have the authority to coordinate the activities of government agencies and citizens' self-government bodies.

Decrees of the President of the Republic of Uzbekistan, which are the legal norms of self-government of citizens, are the source of this right. These sources include, for example, the Decree of the President of Uzbekistan of March 5, 1996 "On additional measures to improve the organization of markets and the quality of services to the population", December 10, 1996 "On state support of families with children." "On further strengthening of support", April 23, 1998 "On support of citizens' self-government bodies", January 13, 1999 " on increasing the role of citizens' self-government bodies in providing social assistance to the population "and others.

Article 105 of the Constitution of the Republic of Uzbekistan defines the status of citizens' self-government bodies, the conditions of elections, and the powers of order. In towns, villages, and auls, and in their mahallas, citizens' assemblies are self-governing bodies that elect a chairman and his advisers for a term of two and a half years. The procedure for electing local self-government bodies, the organization of their activities and the scope of their powers shall be determined by law. So, in what order are the chairmen and activists of the citizens' assembly, whose powers are enshrined in law, elected? If we take into account the fact that elections will be held in the republican mahallas in November and December this year, it is clear that this issue is even more urgent. On October 6, 2003, the Council of the Oliy Majlis of the Republic of Uzbekistan adopted a resolution "On the organization of elections to citizens' self-government bodies." The resolution instructed the chairmen of citizens' assemblies to "assign to district and city khokimiyats" organizational skills and high prestige and respect among the population, the tasks facing citizens' self-government bodies, including public authorities. to assist in the selection of candidates for the positions of chairmen of citizens' assemblies and their advisers from among those who are able to solve the tasks related to the gradual transfer of some of their powers.

In order to ensure the implementation of this decision, the selection of people who will be able to work in the new conditions is in full swing in the neighborhoods. As noted in the concept of "neighborhood of the XXI century", a person elected as chairmen (elders) of citizens' assemblies, as a rule, has a higher education, organizational skills, experience as a leader, sufficient knowledge, patriotism, to have a high reputation and respect among the people, to be enterprising and able to work in the context of the ongoing reforms in the country. It is clear that the person to be elected chairman of the mahalla must be one-sided and have a higher education. Candidates for the chairmanship of the mahalla assembly are selected by the mahalla working groups. The working group in the neighborhood consists of 5-7 people and is determined by the heads of the streets and villages of the neighborhood. They are accountable to the district commission (working group), not to the mahalla administration. According to the established procedure, the mahalla commission, with the help of the citizens of the mahalla, identifies two or more candidates, conducts interviews with them, and obtains the opinion of the population about those candidates. After making a decision, a special questionnaire for each candidate is filled out, and then they are submitted to the district commission with a photo of the candidate.

Local governments are an integral part of the system of representation in terms of their election and their official positions only as representatives of the local population. Their economic and social activities are of great importance to the population. Municipalities will have to deal with bureaucracy compared to other parts of the state apparatus. All these qualities make elected local government one of the values of democracy. According to Alexis de Tocqueville, local self-government is a political institution that is a school not only for politicians, but for all citizens in general. The potential of this institute is so high that it creates conditions for wide participation of citizens. Self-government is also an important factor in shaping elements of political culture. Ultimately, the work of these bodies ensures the overall stability and flexibility of the political system.

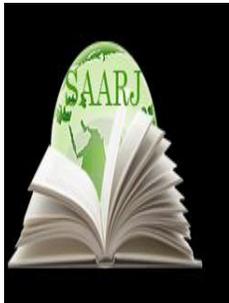

Article 3 of the European Charter of Local Self-Government, adopted by the European Union on 15 October 1985, defines this concept as follows. Local self-government bodies are said to be responsible for the ability to manage and carry out the majority of public affairs within the framework of the law, based on the interests of the local population. These rights are exercised by councils or assemblies of members elected in free, secret, equal, and direct general elections. Councils or assemblies may have reporting bodies or executive bodies. These rules do not preclude appeals to citizens' assemblies, referendums, or other forms of direct citizen participation as permitted by law.

Enhancing the role of local self-government in society and public administration is one of the important directions of the ongoing reforms of the government and parliament of our country. One of the priorities and tasks of the Decree of the President of the Republic of Uzbekistan "On the establishment of the Republican Commission" for the development and implementation of the "Year of Prosperous Neighborhood" (December 16, 2002) is as follows is represented by:

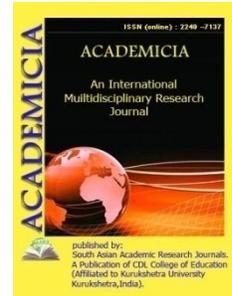

Identify the role and place of the community as the most important structure in the system of citizen self-government; to develop and implement specific measures that will create the necessary conditions for the institution to take its place in the state and public power and system. There is no doubt that the active participation of citizens in local self-government and political decision-making will play an important role in fulfilling this role of civil society.

### ABSTRACT

*Currently, there is no single classification of factors impeding innovative and entrepreneurial activity in higher educational institutions (universities). Determining the factors inhibiting the development of innovative and entrepreneurial activity in universities is a priority task of managing the formation and implementation of this activity. In this context, the article explores the importance of factors impeding the development of innovative and entrepreneurial activities.*

**KEYWORDS:** *Innovation, Innovative Entrepreneurship, Respondents, Blocking Factors, Management Personnel, Experts, Comparative Assessment.*

### INTRODUCTION

Definitely, the priority task of managing the formation and implementation of this activity is to identify factors that impede the development of innovative and entrepreneurial activity in Higher Education Institutions (universities). However, today in Higher Education Institutions (universities). There is no uniform classification of factors impeding innovative entrepreneurship.

For instance, K. Davis divides them into three types: economic, social and personal [1]:

- **Economic** - innovative and entrepreneurial activity, risks, unemployment, loss of part of wages, declination of social status, labour intensity and reduction of progressive wages;

- **social** - unwillingness to adapt to the new socio-psychological environment in the team; an attempt to maintain conventional social ties; fear that the new social situation will result in less satisfaction with work; dislike persons who introduce external interference and innovation in personal affairs, engage in entrepreneurship; the weakness of personal participation is dissatisfied with the insignificant personal role in the introduction of innovations and is convinced that any innovations are useful only for the organization, and not for staff;

- **personal** - perceive modern working methods, criticism as a personal insult; Fear that the skills acquired will remain unnecessary and will be compromised by professional pride; Confidence that innovation always leads to increased specialization, increased monotony of work and reduced self-esteem as a participant in the labor process; unwillingness to spend effort on training, training; fear of uncertainty due to a lack of understanding of the nature and consequences of innovation and entrepreneurship.

According to A.V. Ignatov, the situation with the introduction of innovations can be considered as a change in the agreement between the employer and the employee [2].

From this point of view, the employee and the organization enter into at least two types of contracts:

- Official agreements establishing mutual duties and obligations, while the management of Higher Education Institutions (universities) can quickly adapt personnel to new innovative changes;

- Informal agreements between the employer and the employee on the basis of an oral agreement, which are generally of an evaluation nature.

It is under the necessity of taking into account economic, social, personal (psychological) factors, as well as official and informal ties confirms the variety of important reasons that impede innovation and entrepreneurial activity at the university and requires detailed research. The study confirmed the presence of unused reserves of the higher education system to increase innovation and entrepreneurial efficiency.

To identify factors impeding innovation and entrepreneurial activity in Higher Education Institutions (universities), we had used the theoretical and methodological research and developments of Belyatsky, A.V. Ignatov, M.V. Petrovich, R.S. Sedegov [3] and others, we created a survey (questionnaire). We worked out the questions of the questionnaire by dividing them into organizational, economic, social and personal factors. In our opinion, today the management in Higher Education Institutions (universities) requires the introduction of organizational factors of information and technological system.

As a result of the questionnaire, based on the data obtained, generalized results were obtained for two groups of respondents - managers of 279 people (45%) and specialists - 341 people (55%). Also, on the basis of arithmetic, variance and standard indicators, the opinions of both groups of questionnaire participants on all questions studied were evaluated and divided into colors.

During this study, the methods of conducting questionnaire surveys, probability theory and mathematical statistics, economic analysis, modeling and forecasting, economic and

mathematical modeling, actual and comparative analysis and painting and expert assessments were used. To ensure the completeness of the results, various means of mathematical statistics were used. It should be noted that these methods of collecting and processing information were used when obtaining the results of questionnaire requests, in particular, when assessing the degree of significance of factors that impede innovative and entrepreneurial activity in Higher Education Institutions (universities).

Identification and development of factors impeding innovative entrepreneurial activity in the Higher Education Institutions (universities). In the survey, each respondent was offered an assessment of the level of negative impact on innovative entrepreneurial activity at the Higher Education Institutions (universities) from 0 to 5 points in accordance with the following classification:

5 points - the factor has a very strong influence;

4 points - the factor has a good influence;

3 points - the factor has less influence;

2 points - the factor has very little influence;

1 point - the factor has no effect at all.

As a result of this part of the study, both groups of survey participants assessed the significance of factors impeding innovation and entrepreneurial activity in the Higher Education Institutions (universities), and divided these estimates into colors according to the average arithmetic value in the case of variance and averaging.

In the process of determining the importance of factors impeding the development of innovative and entrepreneurial activity in Higher Education Institutions, a comparative analysis of the first 10 factors, highly appreciated by managers and specialists, will make it possible to fully assess the situation (Table 1). For example, economic, social and organizational factors have been chosen by managers and professionals as a more significant factor, indicating shortcomings in sources and financing mechanisms for innovation and entrepreneurship in higher education.

**TABLE 1 COMPARATIVE ASSESSMENT OF THE IMPORTANCE OF FACTORS IMPEDING INNOVATIVE ENTREPRENEURIAL ACTIVITY IN THE HIGHER EDUCATION INSTITUTION (UNIVERSITIES) BASED ON MANAGERS AND SPECIALISTS.**

Managers		Specialists	
Color	Factor	Color	Factor
1	Lack of appropriate materials and technical base ( scientific laboratory)	1	Overemployment of teachers (non-compliance with the standards of students coming to one teacher ), high educational burden
2	Overemployment of teachers (non-compliance with the standards of students coming to one teacher ), high educational burden	2	Lack of appropriate materials and technical base ( scientific laboratory)
3	Teachers engage in scientific activities	3	Inability to implement the results of

	solely for the purpose of obtaining a degree and academic title.		elaborate developments
4	Indifference to innovation and development in the region	4	No clear, streamlined phased implementation plan
5	Lack of trained (innovative and entrepreneurial) staff	5	Lack of trained (innovative and entrepreneurial) staff
6	Uncertainty of material benefit and fear of risk	6	Lack of an atmosphere to support innovation and entrepreneurship
7	Fear of losing the available state, striving to not disturb self-quietness	7	Lack of motivation of continue activities after receiving a degree and academic title
8	Lack of organizational, technological and information support	8	Lack of a mechanism for sharing experiences in innovation and entrepreneurship
9	Lack of a distinct leader in innovation and entrepreneurship	9	Managers pay great attention to technical, organizational standards, leaving employees unattended
10	There is no desire to study new things, work on yourself	10	Fear of increased work (research, concerns of business practice, etc.)

It should be noted that both managers and specialists agree in determining factors of high importance. For example, of the 40 criteria presented by us, 4 factors from the top ten are defined on both sides, 2 are very close to each other in meaning. Only the degree of significance of individual factors varies among managers and specialists. For example, if the "Lack of an appropriate material and technical base (scientific laboratory)" was determined by the leaders as paramount, then on the part of specialists it took second place. Specialists raised to the first level the factor "Excessive employment of teachers (non-compliance with the standards of students coming to one teacher), the size of the educational burden." This factor ranks second in the lead. This choice is logical, and, indeed, for conducting scientific research, if there are enough educational laboratories. We do not have enough scientific laboratories, technology parks, small innovative enterprises. At the same time, the increase in the educational burden of our professors-teachers limits the time to engage in scientific, innovative and entrepreneurial activities. These two economic factors (the indicator "norms of students coming to the same teacher" also refers to the economy) still indicate that the financing of science remains secondary (the educational process comes first). These circumstances should be under the special attention of the leadership of entrepreneurs and higher organizations and require the introduction of mechanisms that create the conditions for the development of innovative entrepreneurial activity.

The next factor restraining the development of innovative and entrepreneurial activity (3rd place), according to managers, is "the fact that teachers are engaged in scientific activities only for the purpose of obtaining a degree and academic title", according to specialists "It is not possible to implement the results of elaborate developments". The fact that teachers cannot engage in innovative and scientific entrepreneurial activities with the assignment of a degree and academic title, nothing more than reality, confirms the opinion of specialists about the

significance of the effectiveness of this factor: "Lack of motivation of teachers to continue their activities after the assignment of a degree and academic title" (7th place). Both of these factors are related to each other, and, indeed, after the professors have achieved a certain achievement in the scientific field, there are rarely cases of continuation of their scientific results in innovative or entrepreneurial activities. It is important for teachers to introduce motivational mechanisms for continuing innovative and entrepreneurial activities. To continue creative activity, it is advisable to improve the mechanisms of their motivation and after achieving a certain achievement. The "impossibility of implementing the results of elaborate developments" indicates the weakness of linkages between manufacturers and scientists in the field of innovation, as well as the imperfection of the developing infrastructure and implementing mechanism. We will analyse the factors that support these problems.

In 4th place in its importance, the leaders had the factor of "indifference of teachers to innovation, the development of the region," and the specialists, the leadership recognized "the lack of a clear, orderly phased implementation plan." These opinions of managers and specialists, at first glance, contradict each other: leaders are hindered by the indifference of teachers to the innovative development of the regions, teachers' object, while experts say that the management does not have a plan to implement such participation as a barrier. In terms of increasing participation in regional development, there is a relationship between these two factors. Indeed, it is important for contemporaries to take part in the socio-economic development of the territory where they are located with their innovative achievements, which is one of the basic principles of the University-3.0 concept. Therefore, in order to increase the participation of teachers in this process, it is necessary to develop specific plans, taking into account the problems and needs of industrial enterprises located in the region for innovation.

Representatives of both groups equally appreciated the importance of the factor "Lack of trained (innovative and entrepreneurial) staff," which took 5th place. This competition requires the adoption of measures to form the composition of scientific and pedagogical personnel (masters) who have the skills to train a team of scientists in scientific entrepreneurship and engage in innovative entrepreneurial activities.

Another important factor constraining the development of innovation in an educational institution, according to managers, is "Uncertainty of material benefit and fear of risk" (6th place), and, according to experts, the 6th place is occupied by "Lack of an atmosphere for supporting innovation and entrepreneurship in the team." Indeed, teaching professors are not entrepreneurs, they can do science, but do not have commercialization skills. Any entrepreneurial activity involves risk, which is a great obstacle to innovation and entrepreneurship. In Higher Education Institutions, it is advisable to prepare faculty for entrepreneurship, create structures that commercialize, and introduce mechanisms to support innovation.

The choice of the factor "Fear of losing the available state, striving to not disturb self-quietness" (in 7th place according to the leaders) also confirms the above conclusion. The lack of the desire of scientific and pedagogical staff to receive additional income on the basis of scientific activity is an important social problem of an educational institution (the satisfaction of faculty only with a month paid from the budget may indicate the presence of corruption elements). Therefore, the

Higher Education Institutions requires the formation and development of an atmosphere, a culture that supports the commercialization of its science.

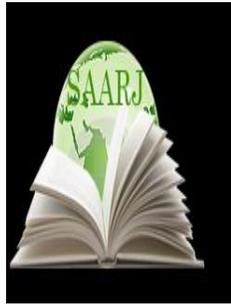

The factor impeding innovation and entrepreneurial activity in the Higher Education Institution (university), which occupies the 8th place, according to manager's point of view, is the "Lack of a mechanism for sharing experience in the field of innovation and entrepreneurship." It is necessary to improve the mechanisms of information exchange between higher educational institutions in the field of innovation using modern information technologies, the practical introduction of a single information base, strengthening cooperation with educational institutions of foreign countries and the development of the activities of relevant structures.

In addition, "Lack of a distinct leader in innovation and entrepreneurship", " Managers pay great attention to technical, organizational standards, leaving employees unattended," " There is no desire to study new things, work on yourself," " Fear of increased work (research, concerns of business practice). This choice of managers and specialists is also close to each other.

All the criteria presented in the questionnaire survey have a negative impact on innovation and entrepreneurial activity at the university. In the context of managers - "Fairness in relation to persons offering innovation and entrepreneurship," "Misjudgment by management of the level of preparation of the team for innovation," in the context of specialists - "Consider innovations useful only for the Higher Educational Institution, unprofitable for the employee," "Teachers have innovative entrepreneurial achievements in educational activities. It should be noted that both managers and specialists at a low level chose the influence of factors related to material benefits. Perhaps this is due to an increase in the salaries of employees of the Higher Education Institution and satisfaction of interests in scientific activities.

### ABSTRACT

*This article describes about composites and how to get them. Elements and materials in their pure state do not have the required properties, such as strength, ductility, corrosion resistance or heat resistance. Therefore, by combining them, the desired properties can be obtained by formulating alloys and composites. The composite material can be prepared by adding the required elements according to the desired property.*

**KEYWORDS:** *Composite, Matrix, Mixture, Filler, Temperature, Cermets.*

### INTRODUCTION

The advent of the composites as a distinct classification of materials began during the mid-20th century with the manufacturing of deliberately designed and engineered multiphase composites such as fiberglass-reinforced polymers. Although multiphase materials, such as wood, bricks made from straw-reinforced clay, seashells, and even alloys such as steel had been known for millennia, recognition of this novel concept of combining together dissimilar materials during manufacture led to the identification of composites as a new class that was separate from the familiar metals, ceramics, and polymers. We now realize that this concept of multiphase composites provides exciting opportunities for designing an exceedingly large variety of materials with property combinations that cannot be met by any of the monolithic conventional

metal alloys, ceramics, and polymeric materials. The advent of the composites as a distinct classification of materials began during the mid-20th century with the manufacturing of deliberately designed and engineered multiphase composites such as fiberglass-reinforced polymers. Although multiphase materials, such as wood, bricks made from straw-reinforced clay, seashells, and even alloys such as steel had been known for millennia, recognition of this novel concept of combining together dissimilar materials during manufacture led to the identification of composites as a new class that was separate from the familiar metals, ceramics, and polymers. We now realize that this concept of multiphase composites provides exciting opportunities for designing an exceedingly large variety of materials with property combinations that cannot be met by any of the monolithic conventional metal alloys, ceramics, and polymeric materials.

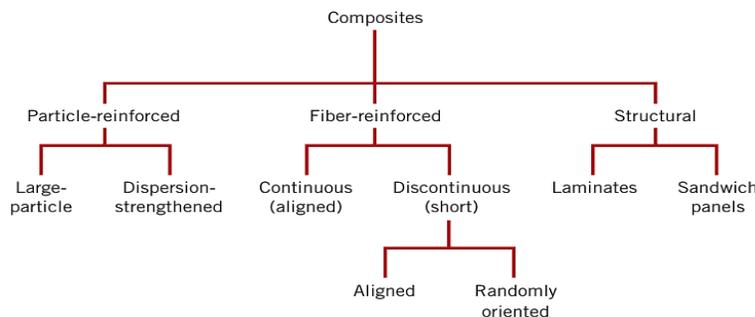

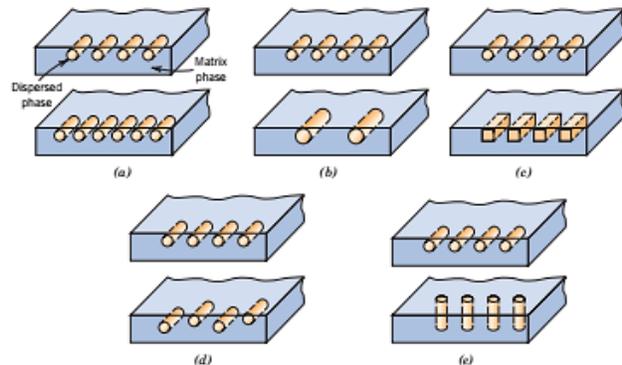

### Methods and objects of research

Material property combinations and ranges have been, and are yet being, extended by the development of composite materials. Generally speaking, a composite is considered to be any multiphase material that exhibits a significant proportion of the properties of both constituent phases such that a better combination of properties is realized. According to this *principle of combined action*, better property combinations are fashioned by the judicious combination of two or more distinct materials. Property trade-offs are also made for many composites. Composites of sorts; these include multiphase metal alloys, ceramics, and polymers. For example, pearlitic steels have a microstructure consisting of alternating layers of -ferrite and cementite. The ferrite phase is soft and ductile, whereas cementite is hard and very brittle.[1]

The combined mechanical characteristics of the pearlite (reasonably high ductility and strength) are superior to those of either of the constituent phases. A number of composites also occur in nature. For example, wood consists of strong and flexible cellulose fibers surrounded and held together by a stiffer material called lignin. Also, bone is a composite of the strong yet soft protein collagen and the hard, brittle mineral apatite. A composite, in the present context, is a multiphase material that is *artificially made*, as opposed to one that occurs or forms naturally. In addition, the constituent phases must be chemically dissimilar and separated by a distinct interface. In designing composite materials, scientists and engineers have ingeniously combined various metals, ceramics, and polymers to produce a new generation of extraordinary materials. Most composites have been created to improve combinations of mechanical characteristics such as stiffness, toughness, and ambient and high temperature strength. Many composite materials are composed of just two phases; one is termed the *matrix*, which is continuous and surrounds the other phase, often called the *dispersed phase*. The properties of composites are a function of the properties of the constituent phases, their relative amounts, and the geometry of the dispersed phase. *Dispersed phase geometry* in this context means the shape of the particles and the particle size, distribution, and orientation; these characteristics are represented in Figure 1. One simple scheme for the classification of composite materials is shown in Figure 2, which consists of three main divisions: particle-reinforced, fiber-reinforced, and structural composites; also, at least two subdivisions exist for each. The dispersed phase for particle-reinforced composites is equiaxed (i.e., particle dimensions are approximately the same in all directions); for fiber-reinforced composites, the dispersed phase has the geometry of a fiber (i.e., a large length-to-diameter ratio). Structural composites are combinations of composites and

homogeneous materials. The discussion of the remainder of this chapter will be organized according to this classification scheme.[2]

**Figure 1.** Schematic representations of the various geometrical and spatial characteristics of particles of the dispersed phase that may influence the properties of composites: (a) concentration, (b) size, (c) shape, (d) distribution, and (e) orientation.

**Figure 2.**  
A classification scheme  
for the various  
composite types

Some polymeric materials to which fillers have been added are really large-particle composites. Again, the fillers modify or improve the properties of the material and/or replace some of the polymer volume with a less expensive material - the filler. Another familiar large-particle composite is concrete, which is composed of cement (the matrix) and sand and gravel (the particulates). Particles can have quite a variety of geometries, but they should be of approximately the same dimension in all directions (equiaxed). For effective reinforcement, the particles should be small and evenly distributed throughout the matrix. Furthermore, the volume fraction of the two phases influences the behavior; mechanical properties are enhanced with increasing particulate content. Two mathematical expressions have been formulated for the dependence of the elastic modulus on the volume fraction of the constituent phases for a two-phase composite. These *rule-of mixtures* equations predict that the elastic modulus should fall between an upper bound represented by

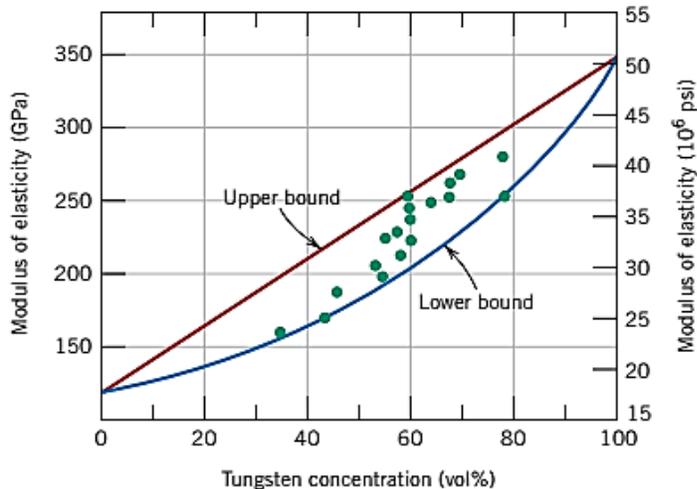

$$(1) \quad E_c(u) = E_m V_m + E_p V_p$$

and a lower bound, or limit,

$$(2) \quad E_c(l) = \frac{E_m E_p}{V_m E_p + V_p E_m}$$

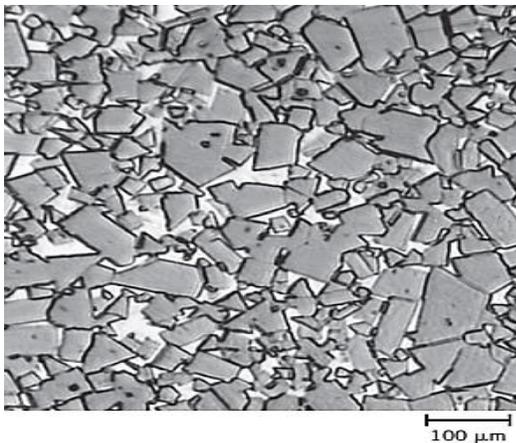

In these expressions,  $E$  and  $V$  denote the elastic modulus and volume fraction, respectively, whereas the subscripts  $c$ ,  $m$ , and  $p$  represent composite, matrix, and particulate phases. Figure 3 plots upper- and lower-bound  $E_c$ -versus- $V_p$  curves for a copper-tungsten composite, in

which tungsten is the particulate phase; experimental data points fall between the two curves. Equations analogous to (1) and (2) for fiber-reinforced composites are derived.[3]

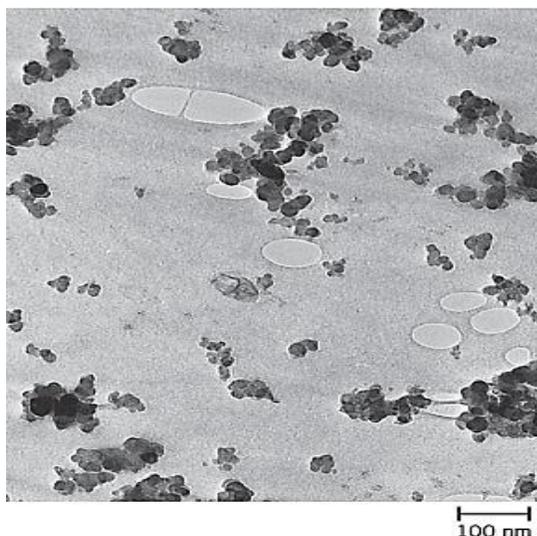

**Figure 3.** Modulus of elasticity versus volume percent tungsten for a composite of tungsten particles dispersed within a copper matrix. Upper and lower bounds are according to Equations 1 and 2; experimental data points are included.

Large-particle composites are used with all three material types (metals, polymers, and ceramics). The **cermets** are examples of ceramic–metal composites. The most common cermet is cemented carbide, which is composed of extremely hard particles of a refractory carbide ceramic such as tungsten carbide (WC) or titanium carbide (TiC), embedded in a matrix of a metal such as cobalt or nickel. These composites are used extensively as cutting tools for hardened steels. The hard carbide particles provide the cutting surface but, being extremely brittle, are not themselves capable of withstanding the cutting stresses. Toughness is enhanced by their inclusion in the ductile metal matrix, which isolates the carbide particles from one another and prevents particle-to-particle crack propagation. Both matrix and particulate phases are quite refractory, to withstand the high temperatures generated by the cutting action on materials that are extremely hard. No single material could possibly provide the combination of properties possessed by a cermet.[4] Relatively large volume fractions of the particulate phase may be used, often exceeding 90 vol%; thus the abrasive action of the composite is maximized. A photomicrograph of a WC–Co cemented carbide is shown in Figure 4.

**Figure 4.** Photomicrograph of a WC–Co cemented carbide. Light areas are the cobalt matrix; dark regions, the particles of tungsten carbide. 100x.

**Figure 5.** Electron micrograph showing the spherical reinforcing carbon black particles in a synthetic rubber tire tread compound. The areas resembling water marks are tiny air pockets in the rubber. 80,000x.

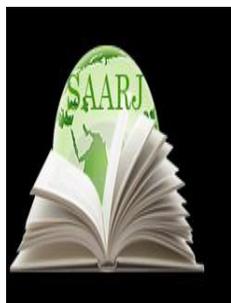

Both elastomers and plastics are frequently reinforced with various particulate materials. Our use of many of the modern rubbers would be severely restricted without reinforcing particulate materials such as *carbon black*. Carbon black consists of very small and essentially spherical particles of carbon, produced by the combustion of natural gas or oil in an atmosphere that has only a limited air supply. When added to vulcanized rubber, this extremely inexpensive material enhances tensile strength, toughness, and tear and abrasion resistance. Automobile tires contain on the order of 15 to 30 vol% carbon black. For the carbon black to provide significant reinforcement, the particle size must be extremely small, with diameters between 20 and 50 nm; also, the particles must be evenly distributed throughout the rubber and must form a strong adhesive bond with the rubber matrix. Particle reinforcement using other materials (e.g., silica) is much less effective because this special interaction between the rubber molecules and particle surfaces does not exist. Figure 5. is an electron micrograph of a carbon black–reinforced rubber.[5]

## CONCLUSION

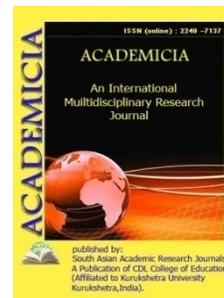

In conclusion, it should be noted that the current rapidly developing era of innovation requires the use of more reliable and cheaper raw materials. Therefore, this article describes in detail the methods of obtaining a material with desired properties in composite form by connecting the elements together.

### ABSTRACT

*Raman spectra were obtained in molybdates with the structural type of pure shellite -calcium molybdenum and with an impurity of neodymium: 1.1 at %, at room temperature. Based on the data obtained, a correlation diagram of group frequencies for CaMoO<sub>4</sub> and CaMo<sub>4</sub>: Nd crystals was compiled. In the frequency range 843 - 884 cm<sup>-1</sup>, full-symmetric stretching vibrations  $\nu$  B-O appear, bending vibrations  $\delta$  O-B-O corresponds to the region 319–793 cm<sup>-1</sup>, in the region 793-827 cm<sup>-1</sup>, mixed bending and stretching vibrations appear. In the CaMoO<sub>4</sub> crystals with Nd impurity, a significant change is observed in the low-frequency region of the spectrum; maxima appear at frequencies of 108 and 202 cm<sup>-1</sup>, apparently, these modes cause a displacement of the molybdenum atom. Second, in the frequency range 330 to 800 cm<sup>-1</sup>, the combination lines disappear in the impurity crystal, which is observed in a pure crystal of calcium molybdenum.*

**KEYWORDS:** *Raman Spectra; Calcium Molybdenum Crystal; Deformation Vibrations; Stretching Vibrations*

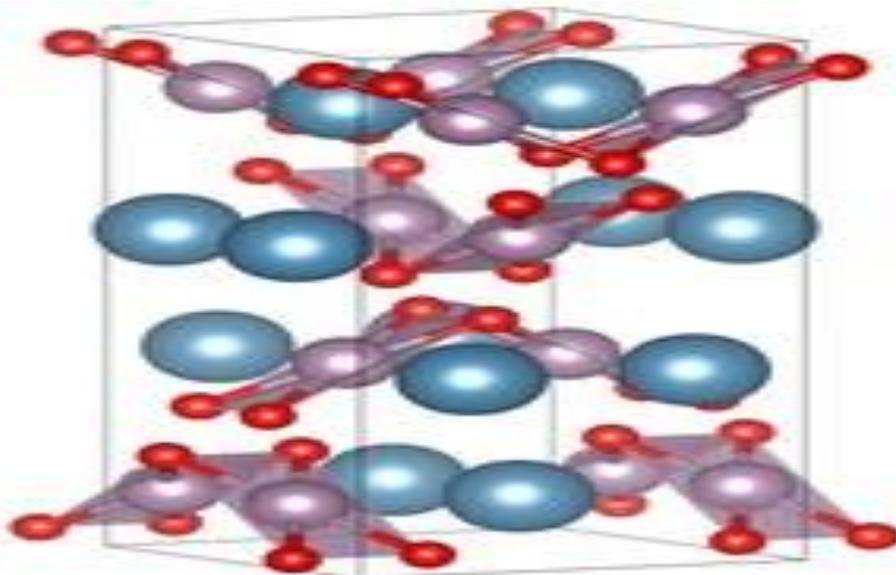

### INTRODUCTION

#### EXPERIMENTAL TECHNIQUE

Registration of the Raman spectra was carried out with the help of the automated spectrometer DFS-52, which is a double monochromator with two diffraction gratings 1800 lines/mm. The excitation source was argon laser LGN-503 with a wavelength of 488 nm at a power of 1 watt. All measurements were performed at 90<sup>0</sup>-geometry of the scattering of polarized exciting light and a temperature of 20<sup>0</sup>C. In the experiment, we used chemically pure substances, which were subjected to additional vacuum distillation. Errors in the determination of the bandwidth and the relative position of the bands were  $\pm 0.3$  cm<sup>-1</sup>.

## RESULTS AND DISCUSSIONS

Molybdenum crystals represent a wide class of materials already used in laser physics, acousto-optics, and chemical industry. Single crystals of molybdates of calcium, strontium, gadolinium, lead, etc., doped with neodymium ions, are used as an active medium in solid-state lasers [1]. Single crystals of molybdates with a shellite structure type are promising for use as an active medium for a laser; on the other hand, there is a numerous family of compounds with large variations in composition and structures crystallizing from perovskite and are unique models for studying imperfect crystal structures of crystal lattice dynamics. One of the methods for studying the structural features of compounds, the nature of chemical bonds and the dynamics of the crystal lattice is vibrational spectroscopy-Raman scattered light (RS). These studies are of great applied importance since it is the imperfections of the crystal structure and defects that often largely determine the physical characteristics of crystals. The class of molybdenum is the most promising in terms of physical parameters than nitrite iodates.

**Figure 1.**The unit cell of a crystal  $\text{CaMoO}_4$  [1].

In the class of molybdenum, there are dozens of different compounds with different structures of scattering spectra. This paper discusses the results of Raman scattering in pure calcium molybdenum with an impurity of neodymium. It should be noted that the Raman spectra in impurity crystals have been little studied and are associated with the difficulties in growing single-crystal samples.

Investigations of the Raman spectra - calcium molybdenum (pure and with an admixture of neodymium: 1.1 at%) were carried out on an improved automated installation based on DFS-52, in the frequency range from 80 to 1000  $\text{cm}^{-1}$  [2], it should be noted that the processing the results obtained on the modernized spectrometer are quite convenient, since formed as a database. The  $\text{CaMoO}_4$  crystal, the central  $\text{MoO}_4$  ion occupies the position of the  $T_d$  point group, while the ion itself, as in a solution, practically retains the geometry of a regular tetrahedron [3]. The vibrational spectra of molybdates mainly contain bands of the  $\text{MoO}_4$  group. In the Raman spectra of calcium molybdates, according to the selection rule [4], 13 modes are active ( $3A_g+5B_g+5E_g$ ).

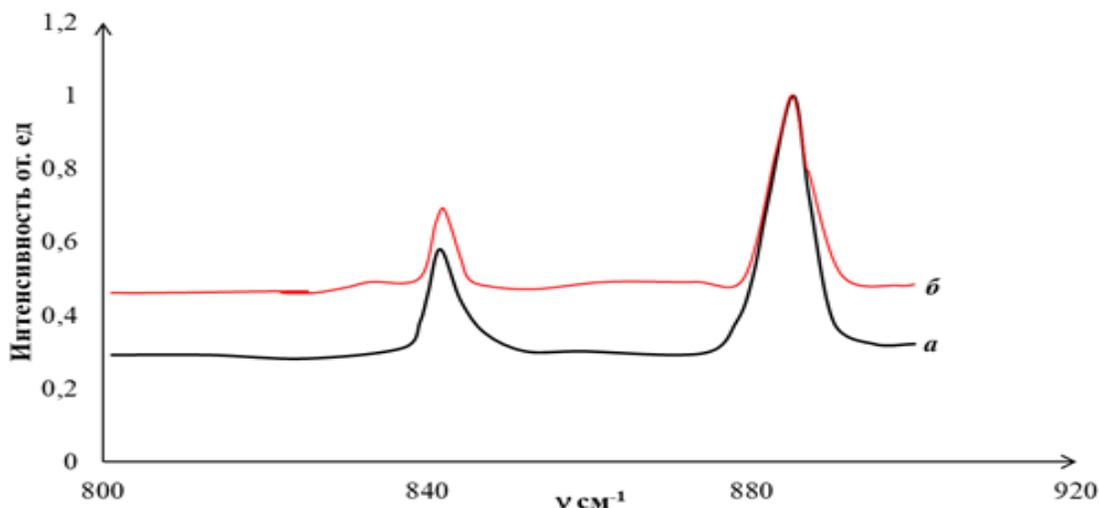

In the Raman spectrum, out of 13 active in Raman vibrations, five bands were observed for pure calcium molybdate, and eight bands were observed in impurity crystals with neodymium (see Table 1). The most intense Raman line in the  $\text{CaMoO}_4$  crystal ( $884 \text{ cm}^{-1}$ ), for the impurity  $\text{CaMoO}_4:\text{Nd}$  ( $844 \text{ cm}^{-1}$ ), corresponds to the symmetric valence mode. The appearance of a larger number of bands in the spectrum of the crystal is due to the influence of the forces of interaction between ions and the dynamics of their vibrations. These unpolarized and polarized Raman spectra are presented in the table. 1, and Fig. 2 (a, b), Fig. 3 (c, d), from which it can be seen that in a wide frequency range of the spectrum (from  $100$  to  $900 \text{ cm}^{-1}$ ), sufficiently intense maxima with frequencies  $\nu_1$ - $\nu_8$  are found.

**TABLE 1. UNPOLARIZED AND POLARIZED RAMAN SPECTRA**

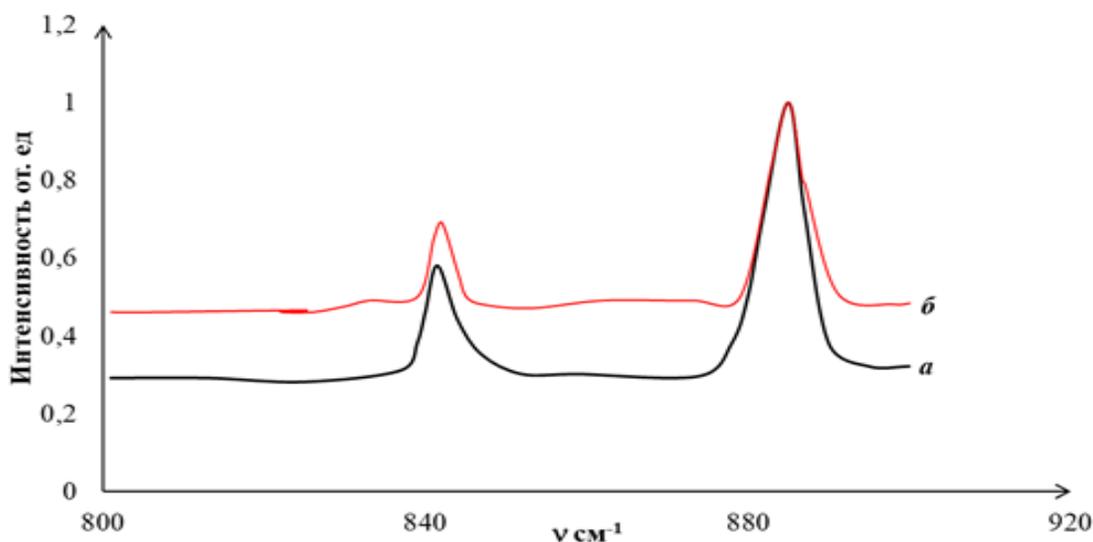

Sample	Scattered light polarization	Maximum frequency $\nu$ ( $\text{cm}^{-1}$ )							
		$\nu_1$	$\nu_2$	$\nu_3$	$\nu_4$	$\nu_5$	$\nu_6$	$\nu_7$	$\nu_8$
$\text{CaMoO}_4$		109	-	325	365	-	-	843	884
	⊥	112	-	327	364	793	827	843	884
$\text{CaMoO}_4+\text{Nd}+3$		108	202	319	-	-	-	845	876
	⊥	108	203	326	-	-	-	845	876

Based on the data obtained, a correlation diagram of group frequencies for  $\text{CaMoO}_4$  and  $\text{CaMoO}_4:\text{Nd}$  crystals was compiled. As you can see from table 1 and 2 and fig. 3 in the frequency range  $843$ - $884 \text{ cm}^{-1}$ , fully symmetric stretching vibrations  $\nu$  B-O appear, bending vibrations  $\delta$  O-B-O corresponds to the region  $319$ - $793 \text{ cm}^{-1}$  in the region  $793$ - $827 \text{ cm}^{-1}$ , mixed bending and stretching vibrations appear. It should also be noted that the displacement in the region of lower values of the lower boundary of the stretching vibration frequencies of  $\text{MoO}_4$  tetrahedra with a simultaneous increase in the frequencies of bending vibrations is due to the presence of interaction between molybdenum atoms and oxygen atoms of the neighbouring tetrahedron. The asymmetric bridging group Mo-O-Mo implements symmetric and antisymmetric stretching vibrations, associated with the components of the triple-degenerate stretching vibration of the tetrahedron.

Table 1 shows that in crystals of  $\text{CaMoO}_4$  with an impurity of Nd, a significant change is observed in the low-frequency region of the spectrum, maxima appear at frequencies of  $108$  and  $202 \text{ cm}^{-1}$ , apparently, these modes cause a displacement of the molybdenum atom. Second, in the frequency range  $330$  to  $800 \text{ cm}^{-1}$ , combination lines disappear in the impurity crystal, which is observed in a pure crystal of calcium molybdenum. The obtained Raman spectra of the  $\text{CaMoO}_4:\text{Nd}$  crystals indicate a significant effect of the Nd impurity on the ordering of the structure and, accordingly, on the anharmonism of the crystal lattice vibrations [5-7].

### ABSTRACT

*In this paper, the effect of phyto tea tincture on lipid metabolism in the mitochondria of the liver of animals with hepatitis was observed. The liver occupies one of the central places in lipid metabolism. Under the influence of heliotrin, the study of lipid metabolism in the liver helps to study the mechanisms of origin of hepatitis. Therefore, in studying the mechanism of action of heliotrin on the liver of animals, we aimed to determine the extent to which lipids in liver tissue change. The amount of lipids in the liver of adult rats fluctuates between 4.8-5.3%. Phyto tea tincture has been found to bring lipid levels in the liver mitochondria of animals infected with heliotrinous hepatitis closer to those in the liver mitochondria of healthy animals.*

**KEYWORDS:** *Liver, Heliotrin, Mitochondria, Lipids, Phyto Tea, Free Fatty Acids, Neutral Glycerides, Waxes, Phospholipids, Glyceroglycolipids, Oxillipids, Sterols*

### INTRODUCTION

Nowadays lipids are interested increasingly by scientists. Lipids include free fatty acids, neutral glycerides, waxes, phospholipids, including glyceroglycolipids, oxillipids, sterols, and more. Lipids have three main functions: first, lipids are the most important components of cell membranes; second, lipids are important bioeffectors that control intercellular interactions and intracellular biochemical reactions, as well as various physiological processes taking place in the body; third, the form of metabolic fuel.

### Main part

Triacylglycerides make up 30-40% of total lipids in the liver, phospholipids 55-60%, cholesterol and other fractions 5-10%. Phospholipids (phosphatides), which are part of lipids, form various fractions and include phosphoric acid, high molecular weight saturated and unsaturated fatty acids, alcohols (glycerin, inositol, sphingosine) and nitrogenous bases choline, ethanolamine, serine, etc.). Phospholipids make up less than half of the lipids in an animal. The intensity of phospholipid metabolism in most adult animals, other fractions of lipids are higher than that of glycolipids and cholesterol. In addition, phospholipids, together with proteins, form complex lipoprotein complexes, the importance of which is very high for the organism.

It was found that the amount of lipids in the liver increased by 9.9% half months after the introduction of heliotrin into the body of rats. One month later, the increase in lipid levels reached 18.6%. As the duration of the experiment increased, the increase in lipid levels also accelerated: at 1.5 and 2 months, it increased by 29.9 and 38.5%, respectively. Hence, the effect of heliotrin increases the amount of total lipids in the liver.

Fifteen days later, the amount of phospholipids in the liver tissue of animals receiving heliotrin decreased by 13.5%. As the amount of heliotrin delivered to the body increased, the decrease in the amount of phospholipids in the liver accelerated. If the decrease in phospholipid content in 1 month of the experiment was 21.2%, in 1.5 and 2 months it was 32.4 and 42.9%, respectively. Thus heliotrin reduces the amount of phospholipids in the liver, and this process is accelerated in accordance with the increase in the introduction of heliotrin into the body.

Cholesterol plays an important role in the normalization of various physiological and biochemical processes in the tissues and cells of the body. The amount of cholesterol in the liver is 250-350 mg%. It is important to detect an increase or decrease in the amount of cholesterol in the liver when heliotrin is ingested. First, it was found that the introduction of heliotrin into the body leads to a sharp increase in the amount of cholesterol in the liver, and secondly, the increase in cholesterol depends on the amount of heliotrin introduced into the body. In the 0.5, 1, 1.5th month of the experiment increase in cholesterol in the liver at 2.0; 2.55 and 2.92 times, respectively. Thus, the introduction of heliotrin into the body increases the amount of cholesterol in the liver, and in accordance with the amount of heliotrin injected, this process is accelerated. The liver plays a central role in the metabolism of fatty acids in the body. The amount of fatty acids in the liver fluctuates around 1.8-3.6%. Fatty acids that enter the liver undergo various changes to form fatty acids that are suitable for the formation of certain lipid fractions. In the liver, fatty acids participate in three carbon cycles and rapidly oxidize to carbon dioxide and water.

The introduction of heliotrin into the body led to an increase in free fatty acids in the liver. 0.5, 1st, 2nd and 3rd moths of the experiment, The amount of free fatty acids in the jaw at was 18.9; 32.3; 45.1 and 45.7%, respectively. Hence, liver toxicity of heliotrin leads to an increase in the amount of free fatty acids.

It has been found that the introduction of phyto-tea into the body of animals infected with heliotrin hepatitis gradually normalizes lipid metabolism in liver tissue. It was found that the amount of lipids in the liver was slightly reduced compared to the lipids in the liver of control rats after administration of phyto-tea for 2 months to 0.5 months in the body of hepatitis rats. If the amount of lipids in the liver of control rats increased by 30.9% compared to that in healthy

animals, it increased by only 18.6% in animals receiving phyto-tea. The continued introduction of phyto-tea into the body of heliotrin rats further accelerated the decrease in the amount of lipids in the liver tissue, and this process intensified in accordance with the continuation of the experiment. When phyto tea was introduced into the body of hepatitis rats, the amount of lipids in the liver increased by only 6.5% compared to the norm in 1 month (and by 41.0% in rats without phyto-tea), which was equal to that in healthy animals at 2 months. At the same time, the amount of lipids in the liver of animals without phyto-tea increased by 37.4% compared to the norm.

**The effect of phyto-tea on the quantitative change of lipids in the liver of hepatitis rats (M ± m, n = 10 – 12).**

Samples	Duration of the experiment, in months

%	198,3	158,1	126,3

The introduction of phyto-tea into the body of animals with hepatitis led to an increase in the amount of total phospholipids in the liver, equal to the levels in the liver of healthy animals. In the 0.5th, 1st, and 2nd months of the experiment, the total phospholipid levels in the livers of control animals were 31.3 compared to those in healthy animals; 37.6 and 43.2%, respectively, while in rats receiving phyto-tea these figures were only 16.6; Decreased by only 18.1 and 4.5%,

respectively. The results show that when phyto-tea is administered to the hepatitis organism for 2 months, the amount of total phospholipids in the liver is equal to that in healthy animals.

A decrease in the amount of free fatty acids in the liver was also found as a result of phyto-tea treatment of hepatitis animals. The amount of free fatty acids in the liver of controlled animals is 74.3, 76.6, 64.7% respectively compared to healthy animals in the 0.5<sup>th</sup>, 1<sup>st</sup> and 2<sup>nd</sup> months. In the hepatitis-infected animals, it is increased by only 47.1, 39.1 and 19.6%, respectively. The results show that when Fitochoy was given to rats with hepatitis, a decrease in the amount of triglycerides in the liver was also observed.

The amount of triglyceride in the liver of control animals was it increased by 75.1 and 80.9% compared to the norm in the 0.5<sup>th</sup>, 1<sup>st</sup> and 2<sup>nd</sup> months, while it is treated with phyto-tea it increased by only 17.5 and 12.5%, respectively. In 2 months of the experiment, the amount of triglyceride in the liver of control animals increased by 70.9% compared to the norm, while in animals receiving phyto-tea it was equal to the norm. Phytochoy also significantly reduced the amount of cholesterol in the liver of animals with hepatitis. If, the amount of cholesterol in the liver of control animals was 29.8, 37.0 and 21.7% against the norm respectively in the 0.5<sup>th</sup>, 1<sup>st</sup> and 2<sup>nd</sup> months of the experiment, when treated with phyto-tea it is increased by only 9.3, 7.0 and 5.1%, respectively.

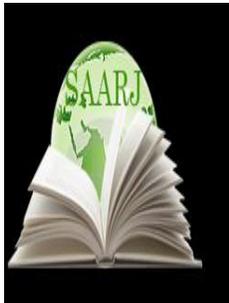

## CONCLUSION

Phyto tea approximates the amount of lipids in the liver mitochondria of animals infected with heliotrinous hepatitis to the level in the liver mitochondria of healthy animals. Phyto tea gives a positive result in liver injury with heliotrin. It is therefore recommended to use this herbal tea in liver injury.

## REGULATORY POSSIBILITIES OF ECO-AESTHETIC THINKING

**Niyozov Sobirjon Sodiqovich\***

\*Teacher of Department of National Ideology and Spirituality,  
 Karshi State University, UZBEKISTAN

### ABSTRACT

*The article provides a philosophical analysis of the formation of eco aesthetic thinking and its regulatory capabilities. Eco-aesthetic thinking is studied as a social philosophical phenomenon. As well as objective and subjective factors form eco aesthetic thinking. In addition, individual aspects of eco aesthetic thinking are revealed. One of the important points in the article analyzes the regulatory capabilities of eco aesthetic thinking in solving global environmental issues.*

**KEYWORDS:** *Eco-Aesthetic Thinking, Regulatory, Objective And Subjective Factors, Individually, Ecology, Beauty, Aesthetics, Globalization, Rule, Artistic, Aesthetic Learning Of The World.*

### INTRODUCTION

The formation of an aesthetic attitude to nature based on the ecological consciousness and culture of society is a complicated social process. At the same time, it is crucial to generalize the historical experience of restoring the natural ecological balance of the biosphere, to organize practical activities to protect the natural environment, on the other hand, to express the spiritual and aesthetic attitude to nature in realistic artistic images and creative use of its means earns. In this article, we provide a philosophical analysis of the problems of the formation of eco-aesthetic thinking and the rational use of its regulatory potential, which are of global importance today.

The spiritual phenomenon of aesthetic perception and artistic expression of ecological reality reflects the most general and objective laws of nature protection. This law, in turn, determines the ecological or anti-ecological nature of the relationship between the system "nature-society - man-art", and expresses the status of the subjective factor in the impact of art on ecological existence, the objectivity of its formation and the integrity of its functions.

The influence of a person's ecological consciousness and culture on the formation of an aesthetic attitude to nature ensures their universality, expediency, and realism of possibility for all areas. To determine their functional role involves, on the one hand, the areas of influence of aesthetics

on conservation activities, and, on the other hand, the improvement of methods and tools for creating eco-aesthetic values. In general, optimistic, pessimistic, skeptical, realistic, fatalistic and other approaches to environmental problems have led to different attitudes in works of art and philosophical ideas. This issue is summarized in the article by Indian writer Robindranath Tagore, entitled "*The Content of Literature*" which states that "*the external world affects our consciousness and creates another world in it. While this world is full of colors, images, and sounds created by the outside world, our perceptions of good and evil, as well as our fears, surprises, sorrows, and joys, is closely connected with it, its various external expressions depend on our treasure in the spiritual world*". [1; 36]

Harmony and the beauty of nature, determines the essence, content, forms and methods of expressing an aesthetic attitude to it. Because the functional role of ecological consciousness and culture in the formation of an aesthetic attitude to nature acquires a social character in connection with the emotional-emotional reflection of objective reality. "*If we define this phenomenon in the example of fiction or monumental art, they are the objectified human spirit in the form of creatively mastered, idealized and materialized images of nature and things by man*" [1; 36].

It should be noted that harmony in nature, ecological balance has always been the object of artistic expression and artistic change. That is, the artistic "*transformation*" of the object by the artist, the re-creation - shows the indirectness of the aesthetic function of art. However, the direct role of the individual in the formation of an aesthetic attitude to nature in the process of aesthetic influence on nature on the basis of ecological consciousness and culture is the basis for explaining its necessary, objective connection with aesthetic consciousness.

Based on the above and, in general, the functional role of environmental consciousness in the development of aesthetic attitude to nature, *firstly*, provides a spiritual basis for artistic expression of socio-historical practices of the individual, social units and society aimed at protecting the natural environment, *secondly*, determines the laws, trends and prospects for the development of aesthetic attitudes to nature, *thirdly*, creates ideological methods and tools that rationalize and construct the eco-aesthetic activity of the individual; *and fourthly*, to generalize and systematize the experiences of works of art created in the history of aesthetic attitudes to nature and pass them on to future generations. Moreover, the current level of ecological consciousness and culture, formed as a result of the aesthetic approach to nature, is a qualitatively new level of experience acquired in the course of its historical development.

The regulatory function of the aesthetic attitude to nature is the opportunity to "*materialize*" and realize the spiritual potential, intellectual potential, aimed at preserving human life and future through the protection of nature. Moreover, "*both ecological consciousness and culture, as well as the activity of their aesthetic realization and the methods of this activity, are subject to the laws of dynamic development of social practice*" [2; 132]. That is, the socio-historical activity, nature and functional significance of the individual in the eco-aesthetic direction is also an objective phenomenon, as it arises from the need to meet the needs of human life, the prospects of human civilization. The application of this objective law depends on the way of thinking, the level of development of the human factor. But in any case and situation, its objectivity does not exclude aspects of subjectivity, but rather requires it. In addition, in a given historical period, especially in the context of exacerbation and globalization of environmental problems, any activity based on the ecological consciousness and culture of the individual, including the

aesthetic attitude to nature, needs integrated research to substantiate the rational organization of nature conservation.

In addition, the regulatory function of the ecological consciousness of the individual, consisting of organizing, managing and controlling nature protection activities through the formation of an aesthetic attitude to nature:

- 1) *Improving the methods and means of reflecting environmental practices in idealized artistic images;*
- 2) *Generalization of the historical heritage, social and ecological experiences created in the history of ecology in artistic images;*
- 3) *It is necessary to pay attention to the selection of ecological aesthetic values, preservation of traditions, creative development and further improvement.*

The main task for this is to find and realize the possibilities of combining the objective conditions and subjective factors of the transfer of ecological consciousness and culture to the "aesthetic being". The main problem in the implementation of these tasks, in our opinion, is to change the intellectual potential, status and character of the human factor in accordance with reality, which ensures the development of ecological consciousness and methods of aesthetic thinking of culture. It is no coincidence that the special literature on modern philosophy and eco-aesthetics recognizes the process of human transformation and assimilation of nature in artistic images as an opportunity to understand oneself as a person in a particular ecological space.

The aesthetic approach to nature, as an integral part of the culture of a society, is based on the need for ecological information to be delivered to its objects by its subjects. In this case, the relevance of the content and form of the transmitted information to the state of existence and development trends of the ecological entity is of particular importance. In general, *"in the process of the influence of the ecological consciousness and culture of the individual on the nature and direction of the aesthetic attitude to nature, special functional directions and features of artistic information, art genres and types are formed [3; 45]"*. The universal criterion that determines their relevance to environmental reality depends on the effectiveness of the methods and means of expressing the aesthetic attitude of man to nature in artistic images, works of art and its transmission.

At the same time, the aesthetic attitude of the individual to the phenomenon of ecological consciousness and culture has an individual character, expresses its socio-ecological essence in artistic images and transforms it into a sphere of spiritual life through special methods and means. On the other hand, the individual, on the basis of ecological consciousness, culture, aesthetic experience, "artistically changes" the ecological landscape of the world, demonstrates its functional significance and defines its main tasks.

*"The influence of ecological consciousness and culture on the formation of an aesthetic attitude to nature is a complex dialectical process, reflected in the artistic images that generalize the historical experience of mankind in nature conservation" [4, 46]* in which the proportionality of artistic images to real ecological reality does not deny its relative independence, instead reflects the functional harmony of object and subject. In other words, the aesthetics of ecological consciousness and culture combine other forms of social consciousness within the framework of

nature conservation goals. In turn, the priority of the aesthetic perception of the ecological being has the status of a law and will not lose its status in the future.

There is a dialectical contradiction between the purpose, possibility, means and outcome of the formation of the aesthetic attitude of the ecological consciousness to nature, that is, the aesthetic attitude to nature can reflect the ecological situation, the problem relatively perfectly in artistic images, but fully reflect all aspects of ecological consciousness can not be pushed. Because the individuality of ecological consciousness is related to the activities of a particular individual, social boundaries are highly relative, changeable, and conditional.

In the process of transformation of ecological consciousness into a subject and object of personal aesthetic experience, a form of culture, there is a constant contradiction between conservative - old and progressive - new, real reality and artistic reality, scientific theory and social practice. At the same time, it takes some time to change the psychological beliefs formed in the mind by transforming the individual's ecological consciousness and culture into the masses through aesthetic means, literary genres, and art forms.

The relative independence of the expression of ecological attitudes to nature from artistic reality, in particular, lags behind, on the one hand, is the result of the fact that the existing socio-political system cannot be completely free from the voluntaristic ideological influence. Contrarily, in the process of globalization of ecological consciousness and culture, new contradictions arise in the integration of national and regional values, which are related to the elimination of certain contradictions between the unifying subject and the object of integration. In general, the management of the system of social contradictions has a direct impact on both the ecological consciousness and the development of methods of its aesthetic expression, depends on the harmonization of interests in this area.

The need to overcome these contradictions in the ecological existence of society depends not only on the formation of ecological consciousness and culture's aesthetic attitude to nature, but also on the development of its other spiritual, moral, socio-political foundations. In other words, *"the possibility of integrating ecological consciousness and forms of social consciousness of culture should be considered as an opportunity for its own development"* [5, 16]. As the aesthetics of ecological consciousness increases, new directions of ecologicalization of other forms of social consciousness, such as ecological-legal consciousness, ecological-economic consciousness, ecological-political consciousness and other forms of consciousness and their institutional system are essential. This, in turn, ensures the integrity and structure of the subjective factors that influence the expression of environmental consciousness and culture through aesthetic means. Indeed, in the expression of the individuality and sociality of ecological consciousness, the materiality and spirituality of ecological culture, both artistic and aesthetic images, technique, technology, design aesthetics are one of the important criteria in assessing the ecology of forms of social consciousness. Because aesthetic values that do not meet the emotional, spiritual and moral needs of man in relation to the protection of nature are far from any social consciousness and activity. Therefore, the analysis of the results of the aesthetic approach to nature in the direction of ecological forms of social consciousness is the basis for the formation of a relatively complete picture of the ecological landscape of the world. In other words, any science and social consciousness "expresses in common the scientific teachings about

the ecological landscape of the world. Ultimately, their integration creates a holistic ecological picture of the world [6, 49].”

The manifestation of the ecological consciousness and culture of society as a result of aesthetic thinking is the activity of creating and developing the spiritual ecological values of human creativity. The effectiveness and social significance of this activity corresponds to the level of understanding of the needs of nature conservation, because the satisfaction of certain needs is a law of conscious human activity. Also, both the intensity and scale of the assimilation of the results of the aesthetic approach to nature will depend on the development of methods of transforming them.

Ensuring functional coherence between the elements of this system stems from interests such as the choice of the object of eco-aesthetic values, the definition of adequate methods and tools, the reliance on methodological pluralism, and the identification of development trends and prospects. More precisely, the aesthetics of ecological consciousness is manifested in connection with the need to create artistic images of nature and the possibilities of its mastery. In turn, this connection ensures the integrity of the global ecological landscape in general, and its relevance to the global eco-aesthetic goal in particular.

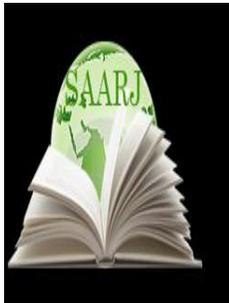

The needs and interests of society's aesthetic attitude to nature are the driving motive and the main driving mechanism of the development of ecological consciousness and culture. Accordingly, the ability of an individual's ecological consciousness and culture to define an aesthetic relationship to nature serves to accomplish specific tasks set by society in any historical period. For this reason, its functions have been interpreted differently at different times in accordance with the priorities of environmental issues.

*In conclusion*, as a socio-spiritual phenomenon, the aesthetic attitude to the ecological being, in essence and character, is a necessary component of the ecological activity of the individual. In determining the map of the ecological landscape of the world, the nature of reality, eco-aesthetic thinking is the main criterion and indicator for the history of development and its periods of aesthetic attitude to nature. It also covers the possibilities of ecological consciousness and culture to form an aesthetic attitude to nature, methods and means of its expression. There is a correlation between the aesthetic attitude to nature and the level of development of ecological consciousness and culture, one of which stimulates the development of the other. The potential of ecological consciousness to integrate other forms of social consciousness functionally universalizes the aesthetic attitude to nature.

### ABSTRACT

*Online shopping has become a way of life for most of the Indians especially working women. Indian online market is estimated to grow 3.5 times to touch 175 million by 2020. Main reasons of growing preference for online shopping are internet penetration, increasing number of e-tailors (online retailers), ease of shopping, flexibility in delivery, increasing purchasing power etc. According to Gizmobaba's report online transaction of women has doubled in past two years. As per one Google study, it is expected to drive 25 per cent of the total organized retail sales in India by 2020 and is expected to reach \$60 billion in gross merchandising value. This study is an attempt to analyse online buying pattern of India women based on primary data. The study provides detailed analysis of various factors impacting the online purchase decision and most preferred e-tailors. The study provides recommendations to online sellers based on insights obtained by customers.*

**KEYWORDS:** *Online Shopping, Indian Women, Internet Penetration, E-Tailors*

### INTRODUCTION

#### Use of Women's Fashion Shopping System

Women's fashion shopping system is the Simplest & easiest shopping system. It is a fully featured website and shopping system that bends over backwards to give you the flexibility you need to run your online store. The basic concept of the application is to allow the customer to shop virtually using the Internet and allow customers to buy the items and articles of their desire

from the store. The information pertaining to the products are stores on an RDBMS at the server side (store). The Server process the customers and the items are shipped to the address submitted by them. The details of the items are brought forward from the database for the customer view based on the selection through the menu and the database of all the products are updated at the end of each transaction.

### **What is Women's fashion Shopping system?**

The online shopping is a form of electronic shopping store, where the buyer can shop through online with the help of computers, mobile phones, etc.,. There is no intermediary service. The sale and purchase transaction is completed electronically and interactively in real-time. The development of this new system contains the following activities, which try to develop on-line application by keeping the entire process in the view of database integration approach. User gets its email id and password to access their account. **Administrator** of Shopping Cart System has multiple features such as Add, Delete, Update shopping Items.

### **OBJECTIVES**

- To make the shopping easier and comfortable.
- To serve the customers without wasting their precious time.
- To reach the products to the customer's address with great care.

## **CHAPTER II**

### **SYSTEM ANALYSIS**

System analysis is the process of gathering and interpreting facts, diagnosing problems and using the information to recommend improvements on the system. It is a problem solving activity that requires intensive communication between the system users and system developers. System analysis or study is an important phase of any of the system development process. The system is viewed as a whole, the inputs are identified and the system is subjected to close study to identify the problem areas. The solutions are given as a proposal & it is reviewed on the user request and suitable changes are made. This loop ends as soon as the user is satisfied with the proposal.

#### **2.1 EXISTING SYSTEM**

1. Visiting the shop manually and choosing the available product item by the customer is the current system of shopping.
2. User must go to the shop and select the products.
3. It is difficult to identify the required product.
4. Description of the product is limited.
5. It is a time consuming process.
6. Not in reach of distant users.

## 2.2 PROPOSED SYSTEM

In the proposed system customer need not to go to the shop for purchasing. He can order the product as he wishes to buy it through the application in his Smartphone itself. The shop owner will be the admin of the system. The shop owner can also appoint the moderators whom will be helping the owner in managing the customers and product orders. The system also recommends the system of home delivery for purchasing a product.

### DRAWBACKS

There are many problems in existing systems like:

- Time and speed
- Man power
- High cost
- Security
- Maintenance
- Accuracy
- Storing
- Records might get lost or be insufficient due to manual errors.
- Maintaining and managing data is very costly and time consuming, because there are many documents that have to be maintained by each branch and copies have to be transferred to relative branches.
- Transfer of information within the branches is costly and time consuming.

### FEATURES OF PROPOSED SYSTEM

- Manual work has to be reduced and result to be received quickly.
- Increase security, speed, storing and accuracy.
- The audiences have to face only one person at the booking counter for obtaining the reservation.
- Managing and maintaining data becomes easier and cost effective due to very high amount
- and reliability of storage space available in the proposed system.
- It provides support for queries throughout all the branches at any given time at a very
- high speed, saving a lot of time
- The system has been developed under PHP as a Front-End and MySQL as a Back-End.
- When a customer cancels the order, the customer will be notified.
- The status of a product delivery(i.e., from dispatching a product till delivery) will be
- Transparent to the customer.

## CHAPTER III

### SYSTEM SPECIFICATION

#### ◦ HARDWARE CONFIGURATION

The hardware is the places where all the information and data are stored permanently. So hardware must be reliable and cost effective. The hardware must suit the application and development. It is fast enough to complete and does all the jobs execution.

<b>Processor</b>	<b>: Dual Core</b>
<b>RAM Capacity</b>	<b>: 2 GB</b>
Hard Disk	: 700 GB
Mouse	: Logical Optical Mouse
Keyboard	: 104 Keys
Monitor	: 16 inch
Mother Board	: Intel
Speed	: 2GHZ
Floppy Disk Drive	: 100 MB

### 3.2 SOFTWARE SPECIFICATION

The software is an application or to use for the development of the proposed system. It includes

Operating System	: Windows 2007
Software used	: WAMP server 2.2
Front End	: PHP
Backend	: MySQL

#### Front End: PHP

PHP is an open source server-side scripting language designed for Web development to produce dynamic Web pages. It is one of the first developed server-side scripting languages to be embedded into an HTML source document rather than calling an external file to process data. The code is interpreted by a Web server with a PHP processor module which generates the resulting Web page. It has also evolved to include a command-line interface capability and can be used in standalone graphical applications. PHP can be deployed on most Web servers and also as a standalone shell on almost every operating system and platform, free of charge. PHP was a competitor to Microsoft's Active Server Pages (ASP) server-side script engine and similar languages, but gradually received better acceptance is now installed on more than 20 million Web sites and 1 million Web servers. Notable software that uses PHP includes Drupal, Joomla, MediaWiki, and WordPress.

PHP is free software released under the PHP License, which is incompatible with the GNU General Public License (GPL) due to restrictions on the usage of the term PHP. While PHP originally stood for Personal Home Page it is now said to stand for PHP: Hypertext Preprocessor, a recursive acronym. PHP is a general-purpose scripting language that is especially suited to server-side web development where PHP generally runs on a web server. Any PHP code in a requested file is executed by the PHP runtime, usually to create dynamic web page content or dynamic images used on Web sites or elsewhere. It can also be used for command-line scripting and client-side graphical user interface (GUI) applications. PHP can be deployed on most Web servers, many operating systems and platforms, and can be used with many relational database management systems (RDBMS).

Most web hosting providers support PHP for use by their clients. It is available free of charge, and the PHP Group provides the complete source code for users to build, customize and extend for their own use. PHP acts primarily as a filter, taking input from a file or stream containing text and/or PHP instructions and outputting another stream of data; most commonly the output will be HTML. Since PHP 4, the PHP parser compiles input to produce bytecode for processing by the Zend Engine, giving improved performance over its interpreter predecessor.

Originally designed to create dynamic Web pages, PHP now focuses mainly on server-side scripting, and it is similar to other server-side scripting languages that provide dynamic content from a Web server to a client, such as Microsoft's ASP.NET, Sun Microsystems' JavaServer Pages, and mod\_perl. PHP has also attracted the development of many frameworks that provide building blocks and a design structure to promote rapid application development (RAD). Some of these include CakePHP, Symfony, CodeIgniter, Yii Framework, and Zend Framework, offering features similar to other web application frameworks.

The LAMP architecture has become popular in the Web industry as a way of deploying Web applications. PHP is commonly used as the P in this bundle alongside Linux, Apache and MySQL, although the P may also refer to Python, Perl, or some mix of the three. Similar packages are also available for Windows and OS X, then called WAMP and MAMP, with the first letter standing for the respective operating system. PHP is used as the server-side programming language on 75% of all Web sites whose server-side programming language is known, and PHP is the most-used open source software within enterprises. Web content management systems written in PHP include MediaWiki, Joomla, eZ Publish, SilverStripe, WordPress, Drupal and Moodle. All Web sites created using these tools are written in PHP, including the user-facing portion of Wikipedia, Facebook, and Digg.

About 30% of all vulnerabilities listed on the National Vulnerability Database are linked to PHP. These vulnerabilities are caused mostly by not following best practice programming rules: technical security flaws of the language itself or of its core libraries are not frequent (23 in 2008, about 1% of the total). Recognizing that programmers make mistakes, some languages include taint checking to automatically detect the lack of input validation which induces many issues. Such a feature is being developed for PHP, but its inclusion in a release has been rejected several times in the past.

There are advanced protection patches such as Suhosin and Hardening-Patch, especially designed for Web hosting environments. PHPIDS adds security to any PHP application to defend against intrusions. PHPIDS detects attacks based on cross-site scripting (XSS), SQL injection, header injection, directory traversal, remote file execution, remote file inclusion, and denial-of-service (DoS)

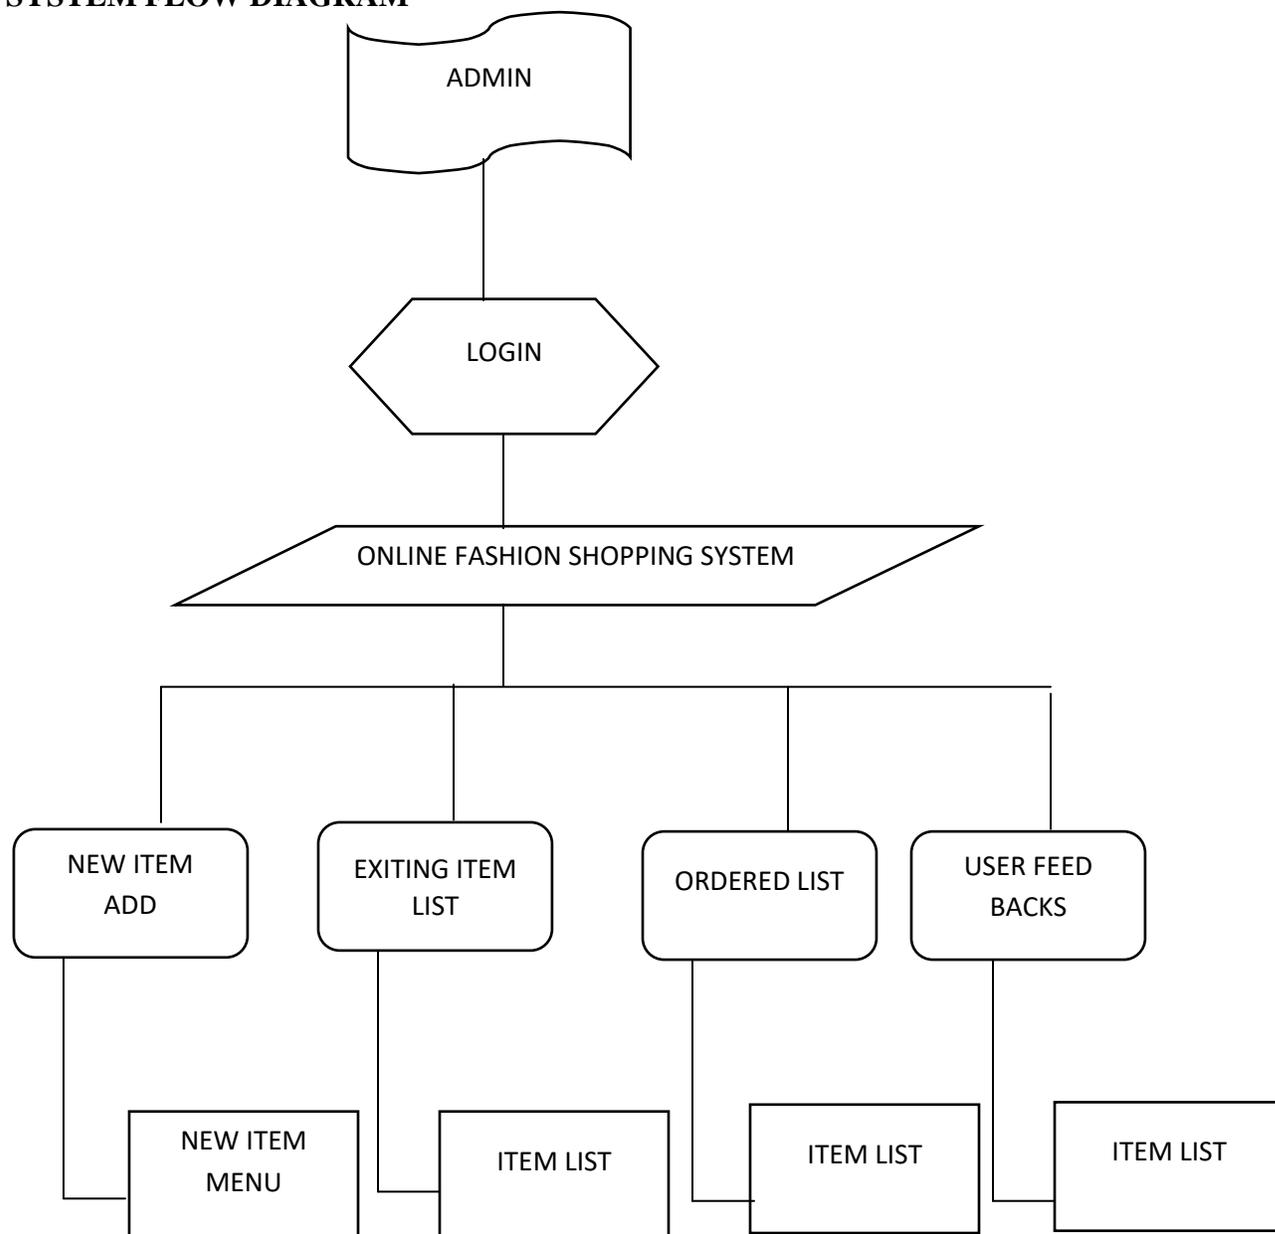

### **Back End: MySQL**

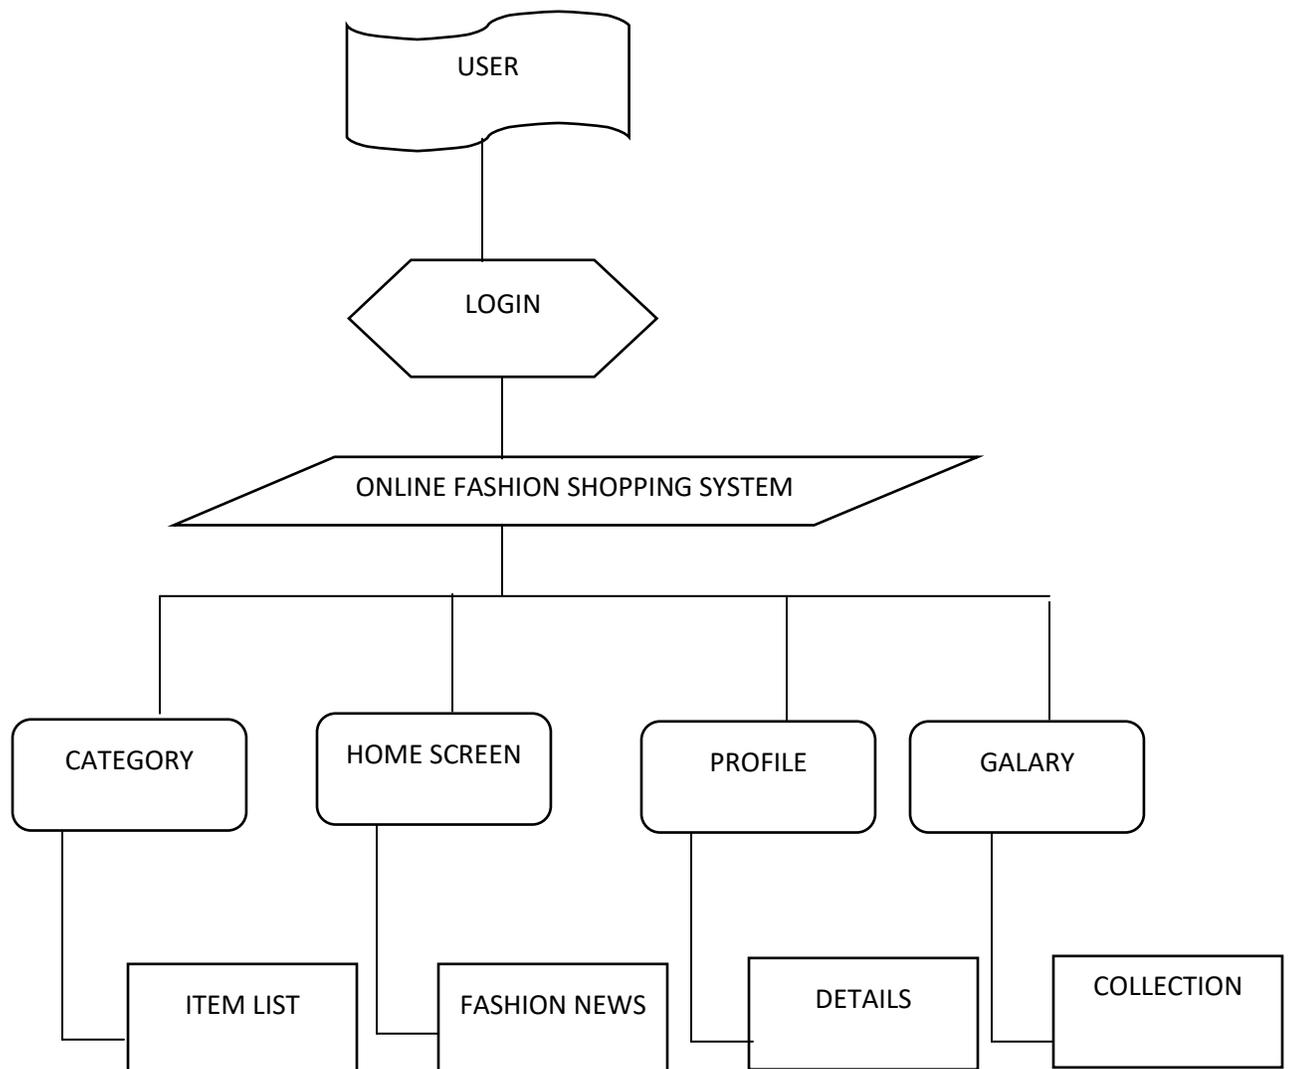

MySQL is a database system used on the web. Basically, a MySQL database allows you to create a relational database structure on a web-server somewhere in order to store data or automate procedures. MySQL is also an open source in that it's free and falls under the GNU General Public License (GPL). Chances are, if one is getting own web-page or already have one –host supports MySQL and PHP. They are generally associated with (though not limited to) Unix/Linux based servers. Interacting with a MySQL database is a little weird as you don't have the tried and true WYSIWYG interface that something as easy as Microsoft Access affords.

When creating tables, one has to create either it by using SQL Statements, or by using another open-source tool available online called PHP My Admin.

PHP My Admin gives an easy-to-use interface that allows you to create tables and run queries by filling in a little bit of information and then having the tables created for you. This is good if one is either lazy, or don't feel like bothering with big and complicated SQL Statements. In comparing MySQL to Access one is going to have a truckload of differences. While MySQL isn't exactly tough to tackle (once the tables are created – one is pretty much done with it), it's capabilities extend far beyond that of Microsoft Access when dealing with speed and reliability. It's simply a better system – and it should be. Microsoft Access (as much as I love it) is only a desktop database system. And while a limit of 10-20 concurrent Microsoft Access users is fine for most small organizations – when one has got a webpage getting 10,000 hits a day, they need something that can handle all of those queries efficiently.

MySQL tables also have the luxury of using “real” data types. To have a text field that can hold over four billion characters, use the LongText data type. To hold many characters and be case-sensitive use the LongBlob data type. Need to store numbers from 0 to 18,446,744,073,709,551,615 then use the BigInt data type. Indeed, 18 quintillion is a big integer.

**CHAPTER IV****SYSTEM DESIGN****4.1 SYSTEM FLOW DIAGRAM**

#### 4.2 DATA BASE DIAGRAM

The Database Management System (DBMS) consists of a collection of interrelated data and a set of programs to access the data. The collection of data usually referred to as database.

The primary goal of DBMS is to provide an environment that is both convenient and efficient to use in retrieving and storing information.

#### TABLE STRUCTURE

**Table name : admin**

**Primary key : id**

Field name	Data type	Description	Size
id	Varchar	User ID	50
Pwd	Varchar	Password of the user	50

**Table name : category**

**Primary key : cat\_id**

Field name	Data type	Description	Size
cat_id	Int	Category id	10
category	Varchar	Category name	50

**Table name : Items****Primary key : item\_id**

Field name	Data type	Description	Size
item_id	int	Item ID	10
catg	int	Category number	10
Subcatg	int	Sub Category number	10
Img	Varchar	Image address	50
Item no	Varchar	Item number	50
Price	int	Price of item	10
Desc	Varchar	Item description	100
Info	Varchar	Information of the item	100
dat	date	Posted date	10

**Table name : FDFK (Feedback of form)****Primary key : Contact\_id**

Field name	Data type	Description	Size
Contact_id	int	Contact ID	10
name	varchar	User name	50
Phone no	Int	Phone number	10
email	Varchar	Email id of user	50
subj	varchar	Subject of the message	50
Mesg	varchcar	Feedback message	200

## PROFILE:

**CONTACT DETAILS & FEED BACK FORM****CHAPTER V****SYSTEM TESTING**

The common view of testing held by users is that it is performed to prove that there are no errors in a program. This is extremely difficult since designer cannot prove to be one hundred percent accurate. Therefore, the most useful and practical approach is with the understanding that testing is the process of executing a program with explicit intention of finding errors that make the program fail.

Testing has its own cycle. The testing process begins with the product requirements phase and from there parallels the entire development process. In other words, for each phase of the development process there is an important testing activity. Successful testing requires a methodical approach. It requires focusing on basic critical factors:

- Planning
- Project and process control
- Risk management
- Inspections
- Measurement tools
- Organization and professionalism

**TEST PLAN**

Before going for testing, first we have to decide upon the type of testing to be carried out. The following factors are taken into consideration:

- To ensure that information properly flows into and out of program

- To find out whether the local data structures maintains its integrity during all steps in an algorithm execution
- To ensure that the module operate properly at boundaries established to limit or restrict processing
- To find out whether error - handling paths are working correctly or not
- To find out whether the values are correctly updated or not
- Check for validations

### **UNIT TESTING**

Unit or module testing is the process of testing the individual components (subprograms or procedures) of a program. The purpose is to discover discrepancies between the modules interface specification and its actual behavior. In our system each module namely

- Login module
- Theatre information module
- Reservation module
- Contact us module
- Audience module must be tested independently for validation.

### **VALIDATION TESTING**

Validation testing provides the final assurance that software meets all functional, behavioral and performance requirement. The software once validated must be combined with other system elements. System testing verifies that as elements combine properly and that overall system function and performance is achieved

### **INTEGRATION TESTING**

Integration testing is the process of combining and testing multiple components together. The primary objective of integration testing is to discover errors in the interfaces between the components. In our system each of the modules mentioned above, are tested for checking the integration between them, after each of them are tested individually.

## **CHAPTER VI**

### **SYSTEM IMPLEMENTATION**

System implementation is the important stage of project when the theoretical design is tuned into practical system. The main stages in the implementation are as follows:

- Planning
- Training
- System testing and
- Changeover planning

Planning is the first task in the system implementation. Planning is deciding on the method and the time scale to be adapted. At the time of implementation of any system people from different departments and system analysis involve. They are confirmed to practical problem of controlling various activities of people outside their own data processing departments. The line manager

controlled through an implementation co-ordinate committee. The committee consists of ideas, Problems and complaints of user department. It must also consider,

- The implementation of system environment.
- Self-selection and allocation for implementation tasks.
- Consultation with unions and resources available.
- Standby facilities and channels of communication

## CHAPTER VII

### CONCLUSION

Project entitled “**Women’s fashion Shopping system**” is used for maintaining fashion store details effectively and accurately.

The basic concept of the application is to allow the customer to shop virtually using the Internet and allow customers to buy the items and articles of their desire from the store. The information pertaining to the products are stores on an RDBMS at the server side (store). The Server process the customers and the items are shipped to the address submitted by them. The details of the items are brought forward from the database for the customer view based on the selection through the menu and the database of all the products are updated at the end of each transaction.

Online shopping is a form of electronic shopping store where the buyer is directly online to the seller's computer usually via the internet. There is no intermediary service. The sale and purchase transaction is completed electronically and interactively in real-time. The development of this new system contains the following activities, which try to develop on-line application by keeping the entire process in the view of database integration approach. User gets its email id and password to access their account. **Administrator** of Shopping Cart System has multiple features such as Add, Delete, Update shopping Items.

### ABSTRACT

*Aerial parts of Delphinium rugulosum Boiss were subjected to hydrodistillation and the obtained oil was analyzed by GC and GC-MS. Fifty compounds were identified representing 92.51% of the total oil, and the main compounds were found to be 3-methyl-2(5H)-furanone (25.99%), methylsulfonylmethane (11.55 %), 3-methyl-3-butene-2-ol (4.54 %), 3-methyl-3-butene-2-ol (3.61%), and car-3-en-2-one (2.71%).*

**KEYWORDS:** *Delphinium L, Delphinium Rugulosum Boiss, Essential Oil, GC/MS Analysis, 3-Methyl-2 (5H)-Furanone.*

### I. INTRODUCTION

The genus *Delphinium* L (Ranunculaceae) comprises approximately 350 species all over the world. There are about 173 species in China [1], and 22 species in Uzbekistan [2]. Many chemical compounds, mainly involving C<sub>18</sub>, C<sub>19</sub>, and C<sub>20</sub>-diterpene alkaloids [3-6] and flavonoids [7], have been identified from *Delphinium* plants. The genus *Delphinium* is the most important medical plant species in the world. Example, it is used in folk medicine for the

treatments of rheumatism and neuralgia for a long time. The diterpenoid alkaloid and its derivatives identified in this plant exhibited cytotoxic activity against lungs (A549), vincristine-resistant nasopharyngeal (KB-VIN), prostate (DU145), and triple-negative breast cancer (MDA-MB-231) cancer cell lines [10, 11]. A detailed analysis of the essential oil extracted from the aerial parts of *Delphinium rugulosum* Boiss were studied for the first time.

## II. MATERIALS AND METHODS

### 2.1. Plant material

The aerial parts of the *Delphinium rugulosum* Boiss were collected in Uzbekistan, Namangan province (Western Tian Shan mountains, Chatkal Range, elevation 800-1000 m) in July 2018 and was identified by Dilmurod Makhmudjanov, who worked in Kunming Institute of Botany, CAS. A voucher sample of the species was mounted and deposited in National herbarium of Institute of Botany of the Uzbekistan Academy of Sciences under number DM0371.

### 2.2. Isolation of Essential oil

The composition of the essential oil did not differ significantly from the aerial part of the plants (dry plant mass 150 g), which was extracted by hydrodistillation method within 3-4 hours. Prior to GC-MS analysis, the essential oil was dehydrated with  $\text{Na}_2\text{SO}_4$ , and stored in a tightly sealed vial at 4°C (TABLE 1).

### 2.3. GC/MS analysis

The resulting essential oil was analyzed on the Agilent 5975C inert MSD/7890AGC gas chromatography-mass spectrometer. The components of the mixture were separated on an Agilent HP-INNOWax quartz capillary column (30m×250µm×0.25µm) at the temperature range: 50°C (1 min) - 4°C / min to 200 °C (6 min)-15 °C / min to 250 °C (15 min). The injection volume was 1.0 ml and the mobile phase ( $\text{H}_2$ ) flow rate was 1.1 ml/min. EI-MS spectra were obtained in the  $m/z$  range of 10-550 a.e.m. The components were identified by comparing the characteristics of the mass spectra with the data of electronic libraries (W9N11.L) and comparing the retention indices (RI) of the compounds, determined with respect to the retention time of the mixture of n-alkanes ( $\text{C}_9$ - $\text{C}_{24}$ ).

**TABLE 1. CONSTITUENTS OF ESSENTIAL OIL FROM *D.Rugulosum* IN % (GC-MS)**

Compounds	RI	%	Compounds	RI	%
Hexanal	1074	0.18	2,4,6-Trimethyl-3-cyclohexene-1-carboxaldehyde	1613	0.57
4-Methyl-3-penten-2-one	1122	0.15			
1-Butanol	1131	0.19	4-Methyl-3-(2-methyl-2-propenyl)-2(5H)-furanone	1615	0.77
$\text{X}_1^*$	1175	2.49			
(E)-2-Hexenal	1207	0.28	Isovalerianicacid	1652	0.48
2-Hydroxy-3-methylbutanoic acid	1208	0.36	Benzylisoamylether	1657	0.26
			3-Methyl-2(5H)-furanone	1683	25.99

			Total:		92.51

RI is the retention indices of a constituent over an HP-INNOWax column; \*Unidentified compounds and compounds identified only by mass spectra.

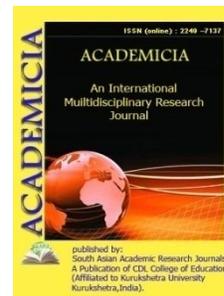

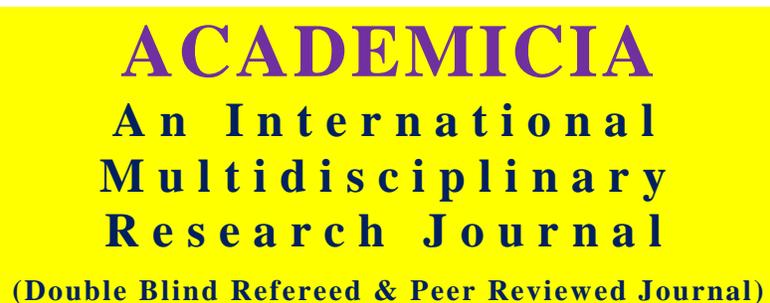

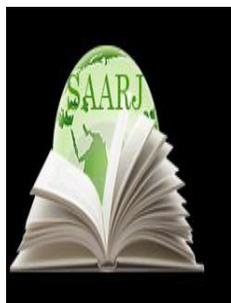

### III. CONCLUSIONS

As a result, 50 compounds were identified in the essential oil of *D. rugulosum* (92.51 % total oil). The most common components are 3-methyl-2(5H)-furanone (25.99%), methylsulfonylmethane (11.55 %), 3-methyl-3-butene-2-ol (4.54 %), 3-methyl-3-butene-2-ol (3.61%), and car-3-en-2-one (2.71%). The essential oil with the highest content is 3-methyl-2(5H)-furanone (25.99%) in *D. rugulosum*. This study is interesting for that furanone and its derivatives have been widely used in biotechnology and medicine against tumour cells [8, 9].

NamSU, Namangan, UZBEKISTAN

### ABSTRACT

*The article analyzes one of the most relevant approaches in modern pedagogy - personality-oriented. An individual approach in the upbringing of students is a purposeful system of pedagogical actions and relationships that maximally takes into account the age and socio-psychological characteristics of each student for the purpose of the comprehensive and harmonious development of his personality.*

**KEYWORDS:** *Cultural Linguistics, Sociolinguistics, Competencies, Personality-Oriented Approach, Linguistic Personality, the Continuous Education System*

### INTRODUCTION

In Uzbekistan, particular importance is attached to the development of linguistic and cultural competence in the system of continuous education.

A personality-oriented or individual approach in the upbringing of students is a purposeful system of pedagogical actions and relationships that maximally takes into account the age and socio-psychological characteristics of each student for the purpose of the comprehensive and harmonious development of his personality. There are several reasons for the lack of attention to individual learning:

- as practice shows, traditional forms of education are not designed for an individual approach to teaching and upbringing;
- The second reason is psychological. It is necessary to overcome the psychology of the collective and turn to each student as a person, an individual;

- the third reason is the regularities of the upbringing process since in upbringing there is no direct dependence of the results of upbringing on the upbringing influences, the teacher is "more accustomed" to refer to the collective than to each separately [1-8].

We consider the role and place of student youth and determine their place in public life. Therefore, we are interested in various types of work with students, taking into account their individual characteristics, psychological differences, and creative potential.

For all the evidence, the problem we have named has not yet found its psychological and pedagogical solution: methodological techniques, specific forms of work, the use of advanced pedagogical technologies in an individual form of education - these are topical issues of modern pedagogy[5-10].

In world practice, special attention is paid to the development of the intellectual potential of students, the formation of skills in working with information and the formation of information and analytical potential, the improvement of technologies for working on linguacultural material and socio-cultural competence in the learning process, focused on the individual personality of each student.

## **MATERIALS AND METHODS**

Inattention to individuality also gives rise to defects in "human formation", contradictions in the behaviour and consciousness of people, negatively affects interpersonal communication. In Uzbekistan, particular importance is attached to the development of linguistic and cultural competence in the system of continuous education.

A personality-oriented or individual approach in the upbringing of students is a purposeful system of pedagogical actions and relationships that maximally takes into account the age and socio-psychological characteristics of each student for the purpose of the comprehensive and harmonious development of his personality.

In the pedagogy of higher education, unfortunately, there is still a directive style of upbringing students, which often leads to formalism and mistakes.

Studying the personality of students is important, first of all, from the standpoint of real life. It is known that the individual characteristics of people have a deep and varied impact on social groups, and thus on society as a whole, the level and nature of the organization, the productivity of collective activities, interpersonal relations.

Traditional "inattention" to individuality and gives rise to defects in "human formation", contradictions in the behaviour and consciousness of people has a negative impact on interpersonal communication.

The second reason is psychological. At the psychological level, reactions, attitudes, assessments, people's attitudes to the same fact, phenomenon, event are always varied. These differences in attitudes and attitudes of people affect human behaviour and personality manifestations. Since the true object of pedagogical work is precisely the relationship of a person, their knowledge and consideration are necessary[11-13].

The third reason is the patterns of the upbringing process. In upbringing, there is no direct dependence on the results of upbringing on educational influences. The breadth and dynamism of

the student's connections and relations with the surrounding subject and social environment should be a constant object of pedagogical knowledge and correction.

The individual characteristics of students should be studied jointly by all teachers in contact with all students. Such a kind of pedagogical "council" will provide complete, reliable information and unity of action for all teachers.

The general program for all teachers is the principle of personality study: purposefulness, comprehensiveness, dynamism, systematic city and consistency, the study of personality inactivity and a team, educating the character of personality study.

Students have always occupied and still occupy a specific place in the social structure of society. This specificity is determined by the following differences.

First, the defining function of students in society and the characteristics of their leading activities. The goal of students is to prepare for professional work, educational activity is leading - individually in nature and characterized, first of all, personal. And not social significance.

Secondly, the unity of the way of life. In our country, universities are concentrated mainly in urban centres, with the majority (about 75%) of students living in hostels. The unity of orientation (mastering the chosen speciality), the unity of the life of students determine the ways and forms of their life.

Thirdly, the age-related psychological characteristics of students. Small life experience, a certain psychological and social immaturity, breadth of interests, emotionality of orientations are just some of the components of the special psychological appearance of the majority of today's students, which is also characterized by incompleteness and dynamism.

The value orientations of the majority of students are characterized by a low degree of consistency of components. If at the cognitive and emotional level, the first place is occupied by speciality training, independent work, then at the behavioural level, the first place is occupied by orientations related to age characteristics - entertainment and communication. The task is to optimally coordinate the various components of students' value orientations, taking into account that intensive, diverse in content communication at the student age is necessary for polishing many socially and professionally significant personality traits.

A wide range, diversity of students' interests is often characterized by superficiality rather than depth [1]. In the dynamics of the orientation and interests of students from 1 to 4 years of bachelor's degree, two trends are observed: humanitarianization and professionalization. The communicative and artistic orientation significantly increases, the focus on sports activities (not in special sports departments) decreases and, unfortunately, the cognitive and labour orientation remains almost unchanged. As for the professional orientation, according to the data of sociologists [2], only about half of the students note a stable inclination and conscious self-affirmation in their chosen profession.

A certain inadequacy is characteristic of the models of life chosen by students, for attitudes towards themselves, towards other people, as well as towards the main types of activity.

The process of a student's personality formation over the years of study at a university is complex, requiring the longest attention from the researcher of the educational process, leading teachers and especially curators of academic groups.

The personality-oriented approach to the education of students is carried out in a team and, above all, through a team. This is the dialectic of these fundamental concepts.

During the years of study at the university, a student is a member of various social associations (academic student group, scientific and labour associations of students, associations of the extracurricular educational process, reference communication groups, etc.). When asked in what types of activities collective relations were formed, the majority of students of Namangan State University indicated extracurricular activities and only 10% of the respondents noted educational. More than half are not satisfied with the relationships in the group, the content of communication with fellow students. Only 28% of the surveyed students rated their academic group as friendly and close-knit.

It is known that only groups of the highest type - collectives - have a formative principle on the personality. And the fact that a significant part of academic groups is at the initial or intermediate stages of the development of the team reveals the weakness of the educational impact on the individual and opens up prospects for the work of psychologists and teachers.

A personality-oriented approach to the educational and cognitive activity of students, the minimum need for business cooperation and interaction in educational activities, often mismatched individual goals of students complicate the process of forming a team of a student group. An individual approach to the education of students is closely related to a rational approach (from consciousness to behaviour), from an emotional approach (from emotions to consciousness and behaviour), from an activity approach (from activity, behaviour to consciousness). At the same time, it is necessary to comply with several conditions for active education, namely: versatility, unity, continuity, grading, gradualness, mediated by the individuality of all educational influences.

In the process of education, the main educational force is the educated person himself. The result and condition of education is self-education, apart from which it is impossible to solve any educational problem. The connecting link between education and self-education is a socially valuable activity.

## **CONCLUSION**

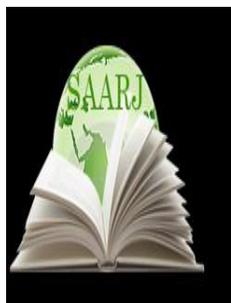

At the stage of meaningful training and consolidation, timely changes in the tactics of communication between the teacher and the students are very important, taking into account the possibility of the emergence of emotional "satiety" with constant and intense contacts between the teacher and students. Trust in students, emphasis on self-control and self-regulation is important for the growth of their consciousness, independence of behaviour, for the activation of self-education.

The qualities and behavioural skills that are being formed should subsequently be manifested in different situations, in different environments. To do this, it is necessary to expand the student's types of activity, give him complicated assignments, and include him in various activities. This will make it possible to deepen and accelerate the process of consolidating the skills and qualities being formed, to make them stable personality traits.

**INTRODUCTION**

The first written evidence of Ustrushona refers to the works of ancient Greek historians about the military campaigns of Alexander the Great. Most of these sources claim that seven cities built during the reign of the Iranian king Cyrus, and these cities associated with each other, rebelled against Alexander. Relatively quickly reaching the Syr Darya River, Alexander built the city of Eskhata (suburb) Alexandria, where he soon became a military base for his army [1]. Arrian writes that at that time an uprising broke out in seven cities of Ustrushan, declaring its independence - disobedience to Alexander. Alexander again has to subjugate them. According to sources, Alexander, who destroyed five cities in two days, turned to Kiropol, the largest city of "river barbarians". When he could not quickly break the resistance of good defensive fortifications and thousands of military defenders, he showed personal courage and, with a small group, burst into the city and ruthlessly avenged the rebels. Cyropol itself was destroyed by 8,000 indigenous people [2].

Having destroyed six cities, Alexander is heading for the seventh city - Mamaken. According to Quintus Curtius Rufus, "the Mamakens are determined not to surrender the city. Having promised that their lives would be saved if they surrendered, Alexander sent 50 cavalry and soldiers to the embassy in the city. The townspeople respectfully meet the ambassadors, observing all the rituals, and then all 50 horsemen who quickly fall asleep under the influence of hospitality and booze indulge in the sword. Furious, Alexander immediately attacked, and when the attack was unsuccessful, he ordered generals Meliogre and Perdicca to besiege the city. Never before has a city been so heroically besieged. Alexander himself received a severe stone blow to the head, was injured and lost consciousness. A lot of people think he's dead. However, when he regains consciousness, he continues the siege even more harshly and cruelly.

The city of Mamaken was dug up from under the defensive walls, and only after part of the wall collapsed did the Macedonians break into the city. The city will be conquered and destroyed. "[3]

Events such as the outbreak of an uprising against the Greek invaders at an agreed time, the gathering of Saki armies behind the river and, finally, the simultaneous uprisings of resistance movements led by Spitamen in Marakand, are inextricably linked, undoubtedly played out by the leaders of nomadic tribes [4]. According to N.N. Negmatov, the inhabitants of Kiropol, Gaza, Bagi, Kurkat, Sabat, Shavkat and Khovost, located on the plains of Ustrushna, were rebelling against Alexander [5]. According to A.A. Gritsina, "one of the cities that rebelled against Alexander was Xantep (Sobot)" [6]. The information mentioned above about the historical events of antiquity BC in Ustrushna has come to us. In the following long historical written sources of that period, there is no information about Ustrshon.

## MATERIALS AND METHODS

In the works of medieval Arab historians, Ustrushana was described by geographers as "a farm oasis with flat deserted thickets of rust." Ibn Haukal writes: "There are no rivers and lakes in Ustrushna, but its fields, pastures and villages flourish and are rich in various foods [7]... The largest city in the Ustrushan language is called Bunjikat. It includes the following cities: Arsubonikat, Kurkat, G'azak, Fag'kat, Sobot, Zomin, Dizak, Nujkat, Harqona. These are the cities of Ustrushana. The main city inhabited by rulers was Bunjikat, where the male population was about ten thousand people. Its buildings are built of cotton and brick "[7]. The historian noted that there are rustaks in each of the above cities, and also spoke about the rustaks of Bashog'ar, Masxo, Barg'ar, Farg'ontom, Mink, Baskan and Isbikat, whose cities did not exist [8]. According to N.N. Negmatov, the Rustaks in the lowland part of Ustrushana were called Bunjikat, Sabat, Zaamin, Fagnan, Nuikat and Harkana, and the Rustaks in the mountainous part were called Norka, Asbanikat, Biskar, Bangam, Vakr, Shagar, Mashar, mash, Masha, Burasha. The socio-political, cultural and economic life of Ustrushonan, which is referred to in the sources as a prosperous agricultural region, was greatly influenced by livestock farmers located in the surrounding steppes. Turkic cattle-breeding tribes that lived in Ustrushna and its environs, which in ancient times were called Saks, are called Oguzes in medieval sources. Abu Nasr al-Utbi gave information about the battles between the Emir of Samarkand Abu Ibrahim Muntasir and Karahanid Elahan [9], and also wrote about the left bank of the Middle Syr Darya, cattle breeds living on the northern and western borders of Ustrushna, and their connections with agricultural (Ustrushana). Ibn Haukal said: "The back of this city (Zaamin) faces the mountains of Ushrusan, and the front faces the land of Guz. This is a flat steppe without mountains. "[7]

N.N. Negmatov also notes that in the IX-X centuries. Oguz migrated along the northwestern borders of Ustrushna, Mirzachul steppes and Syr Darya [10].

At all times in Ustrushna, the relations of the peasant population with the livestock population were active, and this played an important role in the connection between the agricultural oases of Central Asia and the vast steppes of Eurasia. The extent of this influence can be analyzed on the basis of burial materials studied in the region related to animal husbandry [11].

When studying the monuments of Ustrushon in the territory of modern Tajikistan, the orientalist A.M. Belenitsky, O. Smirnov, the famous architect V. Voronin, in particular, is an academician of the Academy of Sciences of Tajikistan, the head of the complex archaeological expedition of Northern Tajikistan N.N. Negmatovs did a great job. Also E. Saltovskaya, S. Sh. Marafiev, T. Belyaev, A. Bilolov and architect S. Khmelniisky concern, anthropologist P. Scientists such as Kiyatkina also devoted their many years of scientific activity to the study of the history of this region.

Northern Tajikistan conducted a comprehensive archaeological expedition, along with the culture of urban planning, also conducted studies of monuments of the history of animal husbandry and scientifically analyzed archaeological finds based on ancient and medieval sources. N.N.Negmatov was the first to give a detailed description of the history of Ustrushona from antiquity to the 10th century [12]. Such studies continued consistently in later periods. Graves belonging to livestock farmers in Ustrushon are especially common in the Uratop and Khojand regions. The Khujand-Ustrushon detachment and the Comprehensive Archaeological Expedition of Northern Tajikistan (CAENT) found that the graves of the material culture of livestock breeders were located in three groups in the Tagayak-Langar valley of the New Region. These are the cemeteries of Karnaitop, Miskintop and Nomsiztepa, located on the eastern side of the village of Yakhton. (2.5 km west of Oratepa). Several mounds were found in the vicinity of the villages of Navgand, Kemkol and Degmay near Nov, more than 20 in the village of Yantak and 30 single and group mounds on the northern slopes of the Mongolian Mountains [13].

The Tepai-Pirmukhammat cemetery, three meters high and 45 x 30 m in diameter, was discovered in the eastern part of the village of Shakhristan, Uratopinsky district. It records bodies buried in the tomb from north to south, and material sources (ceramics and metal objects) dating back to the beginning of the century (5.10 bodies). Scientists have found that corpses have been stored in this monument since ancient times, most of which date back to the 9th-12th centuries.

A burial mound dating back to the early Common Era was also excavated at Havotag, north of Uratepa, and a large amount of hand-made hum, red ocher mustard and a red ocher goblet were found next to the corpse. From the village of Khojai Sof, located on the slopes of the Turkestan mountains in the Ganch region of the Khodjent province, there are rich material sources in ancient tombs, and the bodies are buried in graves with fire [14].

A.K. Mirboboev studied the Kurkat crypts (graves) of the 3rd-7th centuries in the New district of the Khojent region. They are shaped like artificial caves and have been found to have two different structures. The first one is not divided into separate parts. The second is a vestibule, and Dakhma's rooms are separate. Up to 58, 172, 182 human bones are recorded in each of these drachmas [15, 16]. According to T.P. Kyatkina, the skulls of corpses in these sagans were also examined, and with their help, reliable data were obtained on the anthropological structure of the region's population. Middle tombs of the 2nd-4th centuries AD have been investigated at the

Maidonisay cemetery, located in the northern foothills of the Kalai-Kakhkahi (Shahristan) [17]. T. Kyatkina determined that the anthropological structure of the corpses recorded here was a Caucasian mesobrahikran. A.K. Mirboboev studied 19 middle and Lahad graves in the IV-VI centuries AD at the Langari-Khojien cemetery, located southwest of the village of Chorku, Isfara region. In them, the bodies were buried separately and together, from north to south, head to the south, on the ground and in sagans (coffins). Eleven tombs of the 2nd-1st and 1st-3rd centuries BC were discovered by this archaeologist near the nearby village of Tangai-Surkh.

E. D. For many years Saltovskaya studied the Dashti-Asht cemetery, located on the right bank of the Syr Darya on the slopes of the Kurama and Karamazor mountains. The cemetery stretches 12-15 km from east to west and 6-7 km from north to south. It is noted that there are more than 500 buildings and tombs here.

The tombs are made up of a small pile of stones. At the bottom of the heap is an oval or semi-rectangular burial chamber, unevenly filled with stone. In it, the bodies were buried separately, in pairs and groups, lying on their backs, elongated, sometimes bent, and placed on a smooth stone on their heads, facing from north to south. He dated the period of the tombs to the VI-IV centuries BC, and the buildings - to the I-II centuries, VI-VII centuries [19].

The author divided these tombs into three groups according to their structure and described each of them. On the territory of ancient Elak, by the Angren River, 5 km west of the Tyrkashtepa fortress, there is the Chugzhanskoye cemetery. From here, 17 buildings and 8 tombs were explored. All tombs are in the form of a stone box, located at the bottom of the embankment and almost in the centre. They were stolen in antiquity. B.A. Litvinsky also dated the formation of these tombs from the 3rd-2nd centuries. BC. until the 5th-6th centuries. A.D. [20]. dating back to the Middle Ages (X-XII centuries) were discovered and studied [21, 22]. Dozens of burial mounds in the Isfara region have also been studied, such as Isfara I, Karabakh, Surkh, Chorku I, Chorku II, Vorukh cemetery, Vorukh stone cemetery, Keke and many material sources in them. Their periodic date is established from the II century BC to the VI-VII centuries AD. A brief description of some of the work that has been carried out so far in the Ustrushona area allows us to imagine the scale of archaeological research and scientific results. If we add to this research conducted in the Uzbek part of Ustrushna, it will become even clearer how important the region is between agricultural oases and nomadic steppes.

## CONCLUSION

The monumental materials listed above, studied and recognized by the wide scientific community, are important for studying the history of the shepherds who lived in the area. The listed and individually or grouped mounds, some of which have been studied by archaeological excavations, testify to the high authority of livestock breeders in the vast expanses of Ustrushna, associated with vast steppes. In ancient times and the early Middle Ages, shepherds seem to have had a great influence on the socio-political and cultural life of the agricultural oases of Ustrushna.

### ABSTRACT

*This article discusses the problem with proteins and how to solve them. Solving the protein problem is one of the main tasks of the peoples of the world. It is grown from animals and plants. Vegetable protein is 3-5 times cheaper than animal protein and accounts for 55% of the protein produced today. In particular, soybean protein contains more than 10 amino acids, which are 2.5 times richer in protein than wheat grains, and 3.5 times higher than corn grains, and superior in quality to other plants. Soybean flour is used to make meat, valuable soybean milk, protein isolate, soy dietary fibre, and more than 100 protein-rich foods. Shade also increases soil fertility. Tuber bacteria in their roots accumulate from 100 to 150 kg of biological nitrogen in the soil, enriching the soil with nitrogen.*

**KEYWORDS:** *Protein Problem, Vegetable Protein, Soil Fertility, Legumes.*

### INTRODUCTION

In the Action Strategy of the Republic of Uzbekistan for 2017-2021, the issues of modernizing agriculture, as well as all sectors, the placement of high-yielding crops rich in nutritious vitamins and proteins are clearly spelt out. The main goal is to use our vast untapped domestic potential in agriculture to stockpile quality food, bread, meat, eggs, milk, fatty foods, wet and dried fruits, all types of vegetables so that our people can live in a healthy and prosperous environment. environment. ...

“For a person to lead a healthy and productive life in a normal way, his body must be provided with adequate nutrients and quality protein necessary for proper metabolism, health promotion and prevention of various diseases, slowing the ageing process and prolonging life. The nutritional value of the food consumed depends on the level of protein in the composition. Proteins are complex, high molecular weight nitrogen compounds composed of amino acids. Proteins in the human body perform vital functions such as plasticity, energy (energy source), catalytic, control, regulatory and protective functions. In this regard, along with food, the most important for human life is the consumption of essential amino acids, vitamins, minerals, trace elements and other substances that are not spontaneously formed in the body.

## **MATERIALS AND METHODS**

According to M. Nazarov, K. Mirzazhonov, O. Ibragimov, S. Isaev (2014), planting crops richer in protein will solve the problem in two ways, namely, first of all, to make up for the deficiency of protein and humus in soil and nitrogen. Protein is made up of carbon, hydrogen, oxygen, nitrogen, sulfur. In living cells, there is no protein-free metabolism, the source of energy in the body is sharply reduced, less than 16% of the nitrogen in protein cannot support the viability of protoplasm, physiological and biochemical processes do not occur in the body of living plants without nitrogen, the process of photosynthesis changes radically. Nitrogen forms the basis of a living cell and is part of the protein, which is the most important part of protoplasm. This means that the growing plants will be fully supplied with nitrogen, which will provide livestock with nutritious, vitamin-rich feed, hay and quality feed. That is, nitrogen, which is a vital substance in nature, becomes food for other organisms, “animals” of people and intermediate consumers, as well as rudimentary organisms. The human body needs 20 amino acids, four of which pass from the animal kingdom to humans alone - an evolutionary process that continues for millions of years. According to experts, the daily protein requirement of the world's population is 700 thousand tons, which on average is 95-100 grams per capita for more than 7 billion people.

It should be noted that for normal biological processes in the human body, it is necessary to consume 90-100 grams of protein per day, which releases 4 kcal of energy per gram, as a result of which haemoglobin is formed in the blood, providing oxygen (O<sub>2</sub>). Deterioration of quality leads to deep diseases.

This leads to a violation of the biological regime in the body. From the results of scientific research, many of our scientists know that the importance of protein in providing livestock with complete feed, feed and compound feed was recognized above.

By analyzing the amount of protein (seed and stem) contained in wheat, Lard, corn, soy, potatoes, and other crops that have high yields on earth, you can see that the soybean plant is an effective crop from all sides. It can be assumed that the protein content in soy is up to 52 percent, fat-up to 26 percent (Table 1).

It is no secret that currently the amount of protein grown from the animal and plant world is not enough for our consumers. In particular, for animal husbandry, there is also a deficit of protein (protein) by 2-3 times. This means that it is now becoming obvious that it is difficult to meet the protein needs of the population and domestic animals with wheat protein alone (on average, 10-17% protein). However, in increasing the amount of protein, especially vegetable, the plant world is of great importance. About 60 percent of the protein consumed by people around the world is provided by cereals. Of course, it is possible to significantly increase this amount in the

length of service, the main goal of our article is also aimed at increasing the amount of valuable protein that can be enriched with types of crops, Healy varieties, seeds, plants with high levels of protein in the body. The product of these cultures is easily digested, they will not contain cholesterol, which is difficult to digest in the human body.

**TABLE 1. INFORMATION ON THE MOST COMMON FOOD CROPS IN WORLD AGRICULTURE**

№	Crops name	Area, mln, ha	Total harvest, ml. tons	Chemical composition of the plant, %				Feed unit
				Amount of protein		The amount of oil	Amount of carbohydrates	
				in seeds	in stem			
1	Wheat	250	857,5	octo.17	1,2	2	68,7	117
2	Rice	153,5	592,8	jyu.18	01.фев	0,26	79,36	122
3	Corn	137,5	596,4	aug.14	2,4-3,6	04.02.2005	68-78	130
4	Potatoes	19,5	368,1	1,2-3	0,2	1	23,7	108
5	Soy	113	220,64	45-52	13,2	15,5-25,5	20	138
6	Peanut	26,4	44,9	26-28	nov.19	48-50	21	112
7	Peas	10	30	19-30	11.mar	04.jyu	46-60	121

Based on the above analysis, we need to plant more crops, especially those that are characterized by high protein consumption in the composition of food-giving crops. The selected cereal grain crop should be such that it will improve both soil fertility and provide a grain crop rich in high and nutritious proteins. It is known that the dog of leguminous cereals contains more vitamins and microelements than all grain crops, which are important for the human body as well as for the ration of livestock. One should not be mistaken in choosing the types of crops to be planted. Unfortunately grown in the following years, clay quality does not meet the required level, gluten is low, protein is lacking, soil fertility is decreasing from year to year. Its seeds belong to a group of expensive crops, due to the content of 50% protein and 25-28% fat. Also, soybean retains in its composition all the irreplaceable amino acids that are found in animal protein. Therefore, soybean protein can be obtained from milk, yoghurt, cottage cheese, cheese, sausages, environmentally friendly quality butter, egg powder (containing lecithin substance). Bread products prepared with the addition of soy flour do not quickly harden, and they remain soft for 4-5 days, and bread baked with the addition of soy flour is twice as nutritious. From soybeans, more than 100 different products are prepared, which are necessary for the national economy today. Soybeans are environmentally friendly, quality and at the same time relatively inexpensive raw materials used in the food industry. It has been found that the composition of the remaining porridge product contains 14 different amino acids, after separating the purest oil used in cheap, food from soybean cereal in oil factories.

The substances contained in this waste response are recommended as a feed rich in amino acids for chicks for 3 days. When soybeans are fed in poultry farms, the quantity and quality of eggs obtained from them increases. Soybean protein is also used in sericulture as a feed. For example, in Japan, silkworms are fed up to five times a year. At the same time, liquid pastes are prepared

from soybean protein and they feed on silkworms. The main purpose of the above analysis is that increasing the area of shadow crops in the soil climate creates great economic opportunities. Also in our country, soybean cultivation is widely established, increasing the fertility of agricultural land, providing food industry enterprises with valuable raw materials that ensure the cultivation of cheap and affordable valuable protein substances that lie in a significant internal reserve. The above suggestions and recommendations can be interpreted based on the following examples. In this area, the Samarkand entrepreneur Khurshed Rasulov produced 2 types of soy protein for processing soy; the production of soybean fibre is one of the most important works in the Republic. During his visit to the Samarkand region in 2018, President Shavkat Mirziyoyev gave instructions on processing soy oil and spoke about its health benefits. On March 17, 2018, Shavkat Mirziyoyev, while familiarizing himself with economic projects in the Okdarya district, presented a project for soybean processing to local entrepreneur Khurshed Rasulov.

At the first stage, the soy peel is separated, and this will be feed for bred cattle. In the next stages, soybean extract is purified using a special technology. The soybean protein is then isolated and separated from the nutrient fibres.

At the final stage, liquid soy is sprayed onto a special device in the form of a funnel. Liquid soybeans falling into the funnel, where the high-temperature air is sprayed, looks like a powder and falls. At the final stage of the process, the product is placed in bags. Soybean protein isolate and dietary fibre are both powdery, meaning they look the same. You can tell why these products are being used. Soy protein isolate is mainly the base of meat products and is added to sausages and sausages. Taking this into account, today soybeans are grown in the country on about 20-22 thousand hectares. This, of course, keeps today's oil-fat companies running smoothly. In general, we have internal capacities to sow not 20 thousand hectares, but 200-300 thousand hectares across the country. This plant is also one of the most important crops in terms of increasing soil fertility.

According to academician M.V. Federov, 40 kg of peas, 100 kg of moss, beans and lupine, soybeans - up to 150 kg of biological nitrogen are accumulated in the soil per hectare during the growing season. Depending on the protein content of soybeans, there are 138 feed units per 100 kg of grain, and grain, sorghum and stems are cheap and nutritious protein feed for livestock and poultry, which contributes to their rapid fattening. Soy protein is 3-5 times cheaper than animal protein and is close to animal protein in taste and aroma. The use of soybeans in the world food industry is very wide, and the development of this technology began in our country. In particular, in several countries of the Far East, the main national dishes are soy milk, soy cheese and other soy products. Soy protein easily binds to water and fats and forms stable compounds. Today, the decline in soil fertility of agricultural lands, the use of large amounts of mineral fertilizers and toxic chemicals, soil pollution with various harmful substances, especially heavy metals, deterioration of land reclamation and unsuitability for agriculture are becoming a global problem. Because today the only source of satisfaction of the growing demand for food is products grown on agricultural land.

Thus, one of the main ways to maintain and improve the ecological state of the soil, reduce the harmful effects of toxic chemicals used in agriculture on people, is the transition to organic agriculture by planting soybeans, while providing nutritious and high-quality protein for the growing world population. ... today one of the urgent tasks for meeting the demand for

substances. Today, the growing area of protein-rich crops such as soybeans, lupines, beans, peas, alfalfa, alfalfa, etc. is one of the few solutions to the problem of incoming protein. With pleasure, we can give an example of a plant of a different shade. According to scientific sources, soy has been known to mankind for thousands of years, but this is one of the newest discoveries in world agriculture. This plant has attracted the interest of American and Chinese scientists and farmers back in the 70s of the last century. As a result of planting in very large areas, it began to spread very quickly to neighbouring countries and regions. Many characteristics of soybeans were mastered by the Americans in the bottomless desert savannas of South America.

As a result, the quality of the grain grown has changed the way of life, and the changes in the soil have attracted neighbouring farmers. This can be compared to the development of the deserts of Central Asia in the 50s and 60s of the last century and the significant expansion of the vast plains of the USA and Canada in the late 19th century. The expansion of shady areas has enriched farmers in Brazil and Argentina, especially in the hinterland, which has radically changed the face.

As a result of planting soybeans in areas where until recently nothing was grown, large agro-industrial clusters of the meat and dairy industry were created, specializing in soybean processing and feeding large horned animals. According to experts, in the next decade, global demand for soybeans will grow by more than 20 percent.

As a result, sales of soybeans on the world market exceed those of wheat.

In recent decades, soybeans have become the leading agricultural crop in terms of absolute growth in acreage. The average reader will find soybean a cheap substitute for animal protein. It is used to improve the composition, colour, odour of various food products, to obtain foam, jelly and emulsions. With the help of soy, the problem of today's production of high-grade vegetable protein is solved. In India, China and other developed countries with a population of more than one billion people, Japan, Korea, Indonesia, the USA, Vietnam, Brazil, the human body's need for protein are satisfied only by soy. Its various varieties contain up to 52% of dietary protein, up to 26% of easily digestible unsaturated fats, biologically active substances and vitamins. Straw contains 4-5 percent protein and up to 5 percent fat. Soy protein contains more than a dozen amino acids, which are 2.5 times more than in wheat and 3.5 times more than in corn. It is also possible to produce various products from soy waste, including building boards, fabrics, artificial fertilizers.

In addition to processing soybeans as a technical crop, it is widely used as the main raw material in the soap, lacquer, paint and varnish, textile, chemical and industrial industries. But most of the soybeans grown worldwide are used for animal feed, not in the food industry. It should be noted that soybeans can be one of the most important crops in increasing the productivity of irrigated, desert, steppe and rural lands of the republic. The above information about the soybean plant is very convincing, including the expansion of its arable land in the country, the cultivation of soybeans, such as Agrobioxolding LLC in Yangiyul district of Tashkent region, Yunusjon Ahli LLC in Akdarya district of Samarkand region. and the creation of agricultural enterprises and diversified clusters specializing in processing is necessary today. Winter wheat is planted on 1.3 million hectares of irrigated land in the country. We would secure our protein supply by placing legumes such as soybeans on about 30-40 percent of this area.

At the same time, legumes grown as a secondary crop are a source of nitrogen enrichment in the soil, and bacteria are retained in the shade, which accumulates full nitrogen in their roots, which can absorb 78% of free nitrogen from the air.

## CONCLUSION

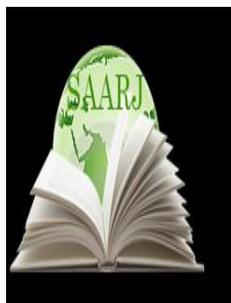

Thus, soybeans, lupine, beans, peas, moss, alfalfa and other legumes in our conditions are useful crops for the soil. They are an important enrichment after alfalfa and are crops that should be planted in rotation. The share of alfalfa stalks in the total sown area of the country is 1-1.5%, and the share of legumes is only 2%. The urgency of overcoming this negative situation only by expanding the acreage for leguminous crops remains. From year to year, the amount of humus in the soil of the country's irrigated lands is significantly reduced.

In conclusion, in order to restore soil fertility and regularly improve it, placing the crops mentioned above at least 30-40% as repeat crops after winter wheat in irrigated areas also provides some solutions to problems such as protein deficiency.

**ABSTRACT**

*In addition to oil reserves, which are hydrocarbons from our natural resources, the Republic of Uzbekistan also has a large number of gas fields that process hydrocarbon gases from natural and oil refineries, of which liquefied domestic gas, propane solvents are necessary for the national economy and consumption. , the gradual reduction in the import of valuable products and reagents, such as ethane, which is used as a cooling gas, and the full provision of our own production in the near future remains an urgent problem today. Modern requirements determined within the framework of the international standards "Euro-4" and "Euro-5" oblige the production of such energy carriers for internal combustion engines, in which the residual sulfur content should not exceed 10 and 1 ppm, respectively. Consequently, the organization of work based on the study of obtaining fuel by the compounding method with improved environmental and operational performance is a necessary and relevant direction today [5].*

**KEYWORDS:** *Hydrogen-Containing Gas (HCG-Hydrogen-Containing Gas), Zeolites And Absorbents, "Dry Gas", Inert Gas (Nitrogen).*

**INTRODUCTION**

One of the most important characteristics of a catalytic reformer is maintaining a specific process standard for the production of hydrogen gas, which plays a central and important role in the production of hydrotreaters, hydrocracking, catalytic cracking and other catalytic process units. Catalytic reforming is the most widely used process in the world and is part of a series of

chemical processes designed to increase the octane number by increasing the number of aromatic hydrocarbons in gasoline products to increase their resistance to detonation [6].

The most effective methods for obtaining unsaturated hydrocarbons are the processes of the first group - high-temperature decomposition processes, which are considered in this work [7].

### Main part

One of the important factors is maintaining the moisture content in the circulating hydrogen gas at a level of 10-30 ppm (1 ppm-0.00001%). As a result of the aromatization reaction, in addition to hydrogen, the catalytic reformer also produces saturated light hydrocarbons, hydrocarbon gases such as methane, ethane, propane, which are widely used in the economy and industry.

**Moisture properties in a gas containing recycle hydrogen in a reformer system.** Moisture in HCG is key to the activity and selectivity properties of the catalytic reforming catalyst. In this regard, it has two different roles:

- catalyst activation
- water - active participation in chlorine balance

Moisture in HCG is controlled in parallel with chlorine since the chlorine concentration on the catalyst surface depends on the  $H_2O/Cl$  ratio, the chlorine concentration increases.

Humidity in the HCG is controlled by supplying water (steam condensate) to the system, i.e. if it is low, it is supplied, if it is high, the HCG is drained. Typically, the humidity is 5 - 10 ppm (0,00005,-,0,00010%). Of course, the water content of the feedstock (hydrogenate) must be taken into account in compliance with this rule. The moisture content of HCG is constantly measured and controlled and maintained at a level of 20-25 ppm. Violation of this standard adversely affects many of the quality indicators of the device:

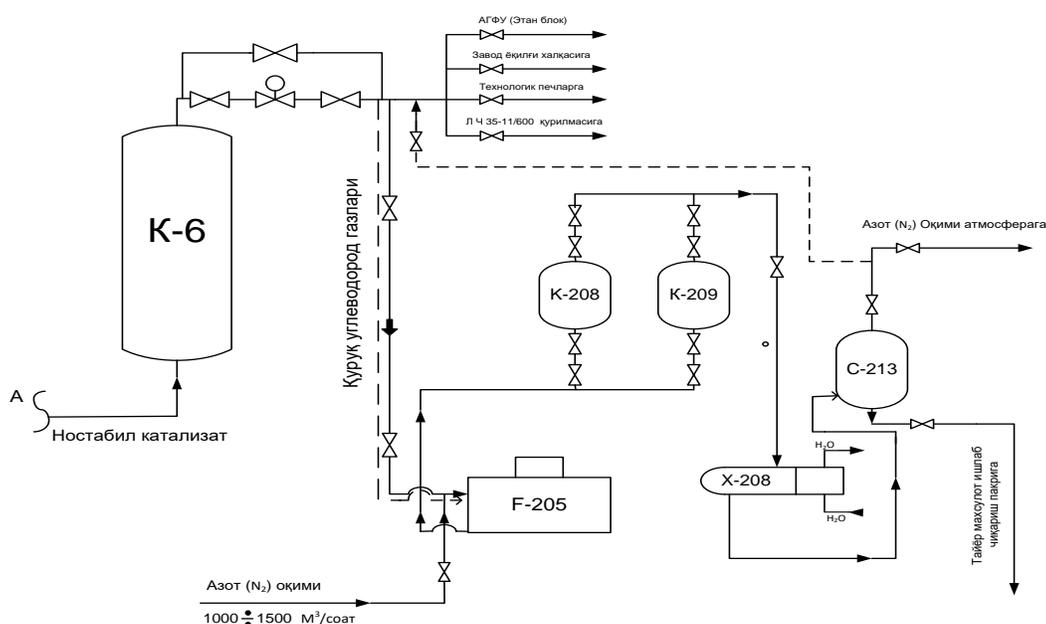

- a) As a result of excessive gas drying: - leads to a decrease in chlorine reserves in the first reactor - a decrease in chlorine content in the gas - and increase in methane content in HCG - a decrease in the octane number of the catalyst (finished product). Moderately dry gas indicates a very low water content in the feed. In this case, it is necessary to increase the amount of water (condensate) supplied to the system, but this increase can also lead to an increase in hydro cracking in the process.
- b) Excessive increase in humidity in gas:
  - Increase in chlorine content in VTP,
  - Decrease in chlorine content in the catalyst of the first reactor,
  - Increase and decrease in chlorine content in the catalysts of subsequent reactors,
  - temporary increase in HCG, - reformat (catalyst)) leads to a decrease in octane number.

From the above bases, it is understood that the humidity of HCG greatly affects the quality of the product, the active operation of the catalyst, while conducting the process in accordance with the standards. Therefore, to maintain humidity in the HCG at a normal level, the role of gas drying is large if the humidity increases. Drying absorbers are used for gas drying.

The current demand for highly purified nitrogen  $N_2$ , which is 0.2% oxygen  $O_2$ , which is more expensive to produce in the existing gas drying system and needs to be purchased from neighbouring enterprises, took advantage of this process. The need for cheap and convenient schemes is growing day by day.

After separation of gaseous (HCG) and liquid hydrocarbons from the C-7 separator, the drying adsorber enters K-208 or K-209 from below, and moisture is absorbed in the zeolite layers. The compressor pre-suction separator is moved to C-9. In the s-9 separator, liquid hydrocarbons that have partially passed through the K-208 or K-209 adsorber are drained (drained). "Dry" HCG is compressed by compressors and returned to the system when the pressure increases. The process continues. As a result of HCG passing through the NaX zeolite layer located in the K-208 or K-209 absorbers, excess moisture is retained due to the adsorption process, and the dried HCG is returned to the system at normal humidity levels. This process continues until the humidity becomes normal. A layer of zeolite saturated with moisture, i.e. liquid hydrocarbons, is used until it loses its ability to retain moisture. Then the backup adsorber is started, and the saturated adsorber is stopped for drying.

**Scheme 1. System block of reforming**

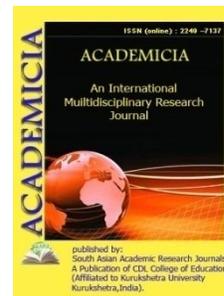

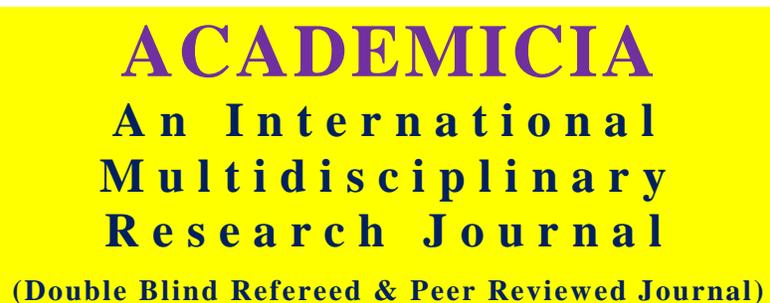

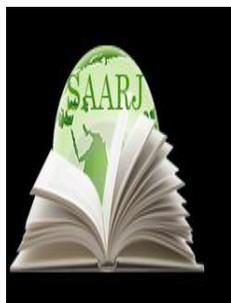

## DESCRIPTION OF THE TECHNOLOGICAL SCHEME

The description of the drying scheme for zeolite is as follows: Inert gas from the "Azot" enterprise - nitrogen  $N_2$  with a content of not less than 99.02% and oxygen  $O_2$  not more than 0.2%. Nitrogen from 1000  $Nm^3/h$  1500  $Nm^3/h$  in the cylindrical furnace F-205 with a flow rate of  $Nm^3/h$ , the temperature gradually rises and is transferred to adsorbers K-208 or K-209. The temperature of nitrogen gas rises from 250 °C to 3000 °C. In turn, the layers of zeolite inside the adsorber are gradually dried. Drying process: steps such as raising the temperature, drying, storing in a warm environment, cooling, take at least 5-7 days. During this time, 1500  $Nm^3/h$  of gaseous nitrogen is consumed, which in total is 216000  $Nm^3$ . The two desiccant adsorbers use 432,000  $Nm^3$  of nitrogen gas. From an economic point of view, this requires a large investment.

Stabilization of unstable catalyze in catalytic reforming units, i.e. separation of light hydrocarbon gases such as methane, ethane, propane and butane - stabilization column K-6, if the exhaust gases are used to dry the zeolite, valuable nitrogen will be saved. The composition of gases supplied as raw materials to furnaces, fuel rings of the plant, technological equipment LCh-35-11/600 or AGFU (ethane block), enriched in hydrocarbons and increases the production of catalyzing, the main product, which reduces its cost.

## ECONOMIC SECURITY AND SOCIAL PROTECTION OF THE POPULATION IN THE CONDITIONS OF THE GLOBAL PANDEMIC IN UZBEKISTAN

**Jumaqulov Zamir Islomovich\***

\*Associate Professor,  
Fergana State University, Fergana,  
UZBEKISTAN

### ABSTRACT

*The article describes the measures taken in Uzbekistan to ensure economic security and social protection in the event of a pandemic, based on the essence of economic security and its principles.*

**KEYWORDS:** *Pandemic, Economic Security, Stability, Economic Interest, Economic Security Strategy, Economic Growth, Economic Potential, Economic Crisis.*

### INTRODUCTION

Ensuring economic security is important for any independent state. The urgency of ensuring economic security is also characterized by the fact that the national economy is able to provide normal living conditions for the population, provide it with sustainable resources, and realize the interests of the national state. In particular, the one-sidedness and dependence of the economies of the young independent states, as well as the low standard of living of the population, pose a social threat and negatively affect security. Economic security belongs to different subjects of the economy, which include: individual citizens; private enterprise, business; state enterprises; National economy; state. In the internal economic sphere, security is associated with natural, technical, economic, infrastructural, social, micro and other factors of macroeconomic development, as well as with internal capabilities that protect against the consequences of various instabilities, internal and external threats. Security in the foreign economic sphere is characterized by the country's competitiveness in the world market, the stability of the national currency, and the country's financial condition. The most important issue of ensuring the economic security of the young independent states that are part of the world economic system is the achievement of the country's economic independence. In them, in particular, the economic reforms being carried out in Uzbekistan will radically change the geopolitical situation in the

country, its place in the modern world economic system. The reforms affect the mechanisms of motivation, interests, the economic activity of people, business entities. Reforms also affect the material base of production, changes in the structural structure of the economy, scientific and technical potential, and ensuring economic balance. This shows that the problems of economic security are inextricably linked with the goals, strategy and priorities of economic reforms.

## **MATERIALS AND METHODS**

In the transition period, the strategy of the economic security of the state is primarily aimed at maintaining and improving the standard of living of the population, ensuring social and political security, interethnic harmony, preserving the foundations of the constitutional order and building a solid system of national values and interests. Indicators representing the lower limit of the state of the socio-economic system are used as the principles of economic security. When indicators fall below this limit, threats to the economic system arise; they can lead to malfunction, degradation of this system. To determine this limit and its quantitative size, you must do the following:

- study the basic conditions of the national economy and the functioning of the economic system and determine the indicators that characterize them;
- to identify the factors leading to the crisis and instability of the national economy;
- assessment of conditions, factors and opportunities for the emergence of various crises, dangerous situations;
- identify ways to prevent threats to security and stability.

It is also important to predict the costs required to compensate for losses from various economic threats and adverse events. As a result, it will be possible to compensate for damage from emergencies, to assess and timely formulate resources aimed at ensuring sustainable socio-economic development. In this regard, it is necessary to distinguish between the concepts of compensation resources and compensation potential. Compensation resources in their content mean insurance, reserve, reserve resources. The compensatory potential is reflected in the stability of the country's economy to crises, its ability to prevent and overcome, the ability to restore the stability and sustainability of the socio-economic development of economic processes. Compensating capacity refers to the ability of the national economy, any sector of the national economy, or any specific region to recover from natural disasters.

Compensation options include:

- material resources of production and non-production nature;
- special reserves by region;
- Possibility of additional vehicles required for the delivery of material resources to the places of crises, accidents;
- additional reserve capacity (especially in the energy sector), as well as technical equipment required for large-scale rehabilitation work;
- provide social assistance to the population and maintain a reserve potential for the formation of social stability of the population.

Compensation opportunities are also characterized by financial reserves, insurance system, international aid and charitable foundations opportunities, health system mobility, retraining and

other factors. The following elements of the country's economic system are subject to economic security:

- the country's macroeconomics;
- regional and sectoral economics;
- the economic interests of the family and the individual.

In the context of a global pandemic, failure to take appropriate social and economic measures based on effective mechanisms can lead to stagnation of enterprises, higher unemployment, lower-income and savings and, as a result, lower GDP, slower economic growth and increased poverty. possible.

According to the International Monetary Fund (IMF) baseline forecasts to stop the spread of the coronavirus pandemic in the first half of this year and a gradual recovery in economic activity from the second half of the year, the global economy is expected to contract by 4.2% in 2020.

At the same time, the economic recession amounted to 6.1% in developed countries (including the United States -5.9%, eurozone countries -7.5%) and developing countries -1%, as well as in Russia -5.5% and in Kazakhstan -2, five%. In Uzbekistan, economic growth is projected at 1.8 percent [6].

According to the public relations service of the Center for Economic Research and Reforms under the President of the Republic of Uzbekistan, the average number of unemployed in Uzbekistan before the pandemic was about 1.35 million, while during the pandemic the number of unemployed was about 2 million. In addition, about 550,000 labour migrants in Uzbekistan were unable to leave to work in other countries. [1].

From the above, we can say that in the face of uncertainty about the level and duration of the impact of the coronavirus in many countries, a number of ongoing economic measures are being taken. In accordance with them, international organizations also make important decisions.

As in all countries of the world, the global pandemic has affected the economy of Uzbekistan. For this reason, many countries around the world are developing large-scale local stimulus programs to prevent a sharp economic downturn that could lead to a deep recession in the global economy.

In this regard, in order to strengthen social protection of the population and ensure economic stability in the fight against the spread of coronavirus infection in the Republic, the President of the Republic of Uzbekistan "On additional measures to support the population, industries and enterprises during the coronavirus pandemic", Resolution PF-5996 "On further measures to support the population and business during the coronavirus pandemic" and additional measures to provide financial support to the population in need of social protection and assistance during the coronavirus pandemic. Resolution No. PF-6038 "On Measures" is an important document in the correct organization of work in this area. According to the Center for Economic Research and Reforms under the President of the Republic of Uzbekistan, over the past period, more than 500 thousand business entities and more than 8 million citizens received about 30 trillion UZS were provided with benefits and preferences. Such large-scale state support was provided in March through the creation of the Anti-Crisis Fund in the amount of 10 trillion. UZS and many other measures are taken. In particular, the Anti-Crisis Fund of the Ministry of Finance currently spends 5.3 trillion UZS, of which 746 billion UZS were allocated for coronavirus infection,

1,741 billion UZS - for social support and 641 billion sou UZS ms - for social support. The cost of supporting the industry amounted to 2 trillion 166 billion UZS.

The total cost of all measures taken to support the population, economic and business sectors during the coronavirus pandemic is 62.6 trillion UZS (more than 6.13 billion US dollars) (more than 10% of the GDP of the Republic of Uzbekistan).

## RESULTS AND DISCUSSION

In a pandemic, any state develops its own models based on its economic capabilities. State support is very important in the fight against a crisis in which not only subsidies or direct payments, but also tax cuts or exemptions in the first place. The state incurred most of the economic and financial costs, which was done in order to minimize the damage to the economy, primarily small and medium-sized businesses, during the epidemiological instability. The economy allocated \$ 2.3 trillion. Sums of tax benefits, 3.6 trillion soums - from the Anti-Crisis Fund. The scale of this assistance will be difficult to perceive for people not directly related to business. But it's true that the mayor saved a lot of jobs and stopped working. It takes into account that small and medium-sized enterprises produce 54% of the country's GDP and provide 76% of jobs, take measures to support it. A great deal of work has been done to stimulate employment, preserve jobs and income. Special:

- About 230 thousand unemployed were provided with temporary work at the expense of the Public Work Fund;
- More than 33,000 low-income families were employed through a subsidy mechanism for the development of private land and the creation of agricultural cooperatives;
- About 3000 labour-intensive construction projects for business development;
- 20 thousand unemployed received unemployment benefits.

As a result of the ethics measures, 374,000 people were provided with work and permanent income for three months. At the same time, material assistance was provided to 27 thousand unemployed for 10 billion soums. For social support of the population, especially low-income families, such attraction of the unemployed to paid public works, 279.6 billion soums were allocated. The number of recipients of social benefits increased from 595 thousand families to 723 thousand families or 21%. In 2020, the volume of loans issued within the framework of family business development programs to create new jobs and increase citizens' incomes amounted to 4 trillion rubles [5].

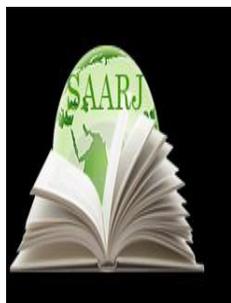

Based on recent decisions taken by our government, from July 1 this year, Uzbekistan has introduced a new system of registration of self-employed people. At the same time, individuals working in the informal sector of the economy are given legal status, and their income is not taxed.

## CONCLUSION

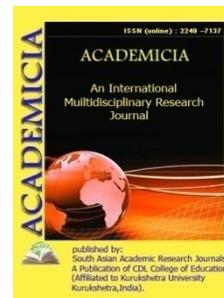

The experience of Uzbekistan in socializing the population during the coronavirus pandemic is primarily used to provide targeted assistance to the vulnerable, available resources to support economic activity and employment and, accordingly, income. This will ensure the stability of all sectors of our national economy in the post-pandemic period, as well as increase competitiveness through the introduction of benefits, incentives and initiatives.

## STUDY OF PROPERTIES AND METHODS OF CARBON-CONTAINING RAW MATERIAL ACTIVATION

**Karabayeva Muslima Iftixorovna\***

\*Assistant of the Department of Chemical Technology,  
 Fergana Polytechnic Institute,  
 Fergana, UZBEKISTAN  
 Email id: muslimaxon1990@mail.ru

### ABSTRACT

*Currently, one of the main problems is the purification of wastewater from organic industrial waste and the production of environmentally friendly adsorbents. With the development of industrial production of activated carbon, the use of this product is steadily increasing. Active carbon is used in many chemical engineering processes. In addition, waste gas and wastewater treatment are mainly based on adsorption by active carbon. Only activated carbon can meet the ever-increasing requirements for the purity of our drinking water. This work examines the study of the properties and methods of activation of carbon-containing raw materials. Also the advantages of using technology based on the adsorption of organic substances on activated carbon.*

**KEYWORDS:** *Activated Carbon, Adsorbent, Carbonation, Peat, Coal, Anthracite.*

### INTRODUCTION

Previously, active coal was usually taken as an amorphous type of carbon. Due to Hofmann's X-ray diffraction analysis [1,2], active coal is currently classified as a group of microcrystalline carbon species. The chemical confirmation of the graphite structure of active coals is the possibility of forming compounds. For the first time, Fredenhegen [3] was able to obtain alkali metal compounds with graphite, and Ruff [4] received fluorinated graphite. Activated coals can be attributed to carbon macroporous adsorbents, which are a class of high molecular weight porous carbon materials having a developed specific surface area and having the ability to efficiently and selectively absorb molecules of substances of various chemical nature from gas, steam-gas and liquid. Carbon adsorbents differ significantly from other highly porous materials, such as coke, pumice and graphite, in the content of micropores and supermicropores. Carbon

black, due to its small particle size, has a higher specific surface area (up to 100 m<sup>2</sup>/g) and relates to carbon nanoporous adsorbents.

## MATERIALS AND METHODS

One of the most important indicators of all types of carbon adsorbents is their porous structure [5]. Theoretical bases of adsorption on carbon adsorbents were developed by academician M. M. Dubinin. The proposed and justified model of the porous structure of carbon adsorbents [6] allows us to get an idea of the idealized pore structure of absorbing carbon materials. There are steam-gas and chemical methods for activating carbon-containing raw materials. In foreign practice, both activation methods using zinc chloride, sulfuric acid, and alkali sulfides as an activating agent are developed equally. This is because chemical methods allow us to obtain adsorbents with strictly specified parameters of the porous structure and high adsorption properties [12]. Activated carbon is usually obtained from peat, brown coal, hard coal, anthracite, wood material, waste paper production, leather industry and animal substances. They can also be made from the shells of coconut and other nuts [7]. At fat-and-oil plants where Pharmacopoeia edible oils are obtained, the shell of fruit seeds is a multi-tonnage waste. For the production of activated carbon, the most interesting is the shell of apricot seeds, peaches, plums, and walnuts. Their advantages are low cost, transportability, environmental friendliness, and high prevalence in the Central Asian region [8]. In practice, many different adsorbents are used for different purposes. Preparing them for use may differ. First of all, the adsorbent must be activated for this process.

To activate carbon-containing raw materials, carbonation of solid organic materials is carried out, followed by oxidation of the resulting raw coal with air oxygen, water vapour, carbon (IV) oxide or other activating reagents at a temperature of 700-1000 °C. As a result of this activation, part of the organic material burns out, and the remainder turns into coal, which has a developed porous structure and therefore has a huge internal surface. The structure of activated carbons consists of packages of flat layers formed by condensed hexagonal aromatic rings of carbon atoms. The dimensions of their planes are in the range of 1-3 nm. The orientation of individual planes in carbon microcrystallites is often disturbed, and individual layers are randomly shifted relative to each other, while not always maintaining a mutual parallel arrangement (zones of amorphous carbon) [11-13]. During the activation of coal, water vapour and carbon dioxide diffuse into the pores of the carbonized material and enter into oxidation reactions. In this case, first of all, the least dense part of the material of the amorphous carbon zone is oxidized to gaseous products, resulting in the formation of pores of irregular molecular size. Due to the low density of amorphous carbon, the burning of a relatively small mass of it leads to the appearance of a fairly significant volume of such pores. In the next stage of activation of the coal is partially burnt-out plane of the condensed aromatic rings in the carbon crystallites. In this case, slit-like pores are formed, both between the walls of the crystallites and in the body of the crystallites themselves. Thus, activated carbons have a developed porous structure, which is characterized by the pore size. The use of technology based on the adsorption of organic substances on activated carbon has the following advantages over other cleaning methods:

- the ability to eliminate almost all odours from air emissions;
- the device of adsorption filters necessary for the adsorption of organic substances on activated carbon does not require large capital expenditures;

- the adsorption of organic substances on activated carbon does not cause uncontrolled chemical reactions that lead to the formation of chemicals other than those contained in the original air stream;
- activated carbon itself is a biologically and environmentally inert substance and does not have a negative impact on the company's personnel and the environment;

in some cases, the spent activated carbon (saturated with organic substances and having lost its adsorption capacity) can be reactivated and reused for cleaning[13].

## CONCLUSION

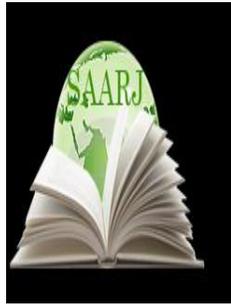

Thus, the properties and activation methods of carbon-containing raw materials used in many processes of chemical technology, such as waste gas and wastewater treatment, have been studied based on literature data from world studies.

The results of this work are one of the examples that a very fruitful and promising area of research that can arise at the junction of the chemistry of high-molecular materials and the activation processes of carbon-containing raw materials.

## PROBLEMS OF PRESERVATION, PROTECTION OF HISTORICAL AND CULTURAL MONUMENTS IN UZBEKISTAN (1980- 1990s)

**M. F. Rasulov\***

\*Senior Lecturer,  
 Department of World History, Fergana State University,  
 UZBEKISTAN  
 Email id: rasulov.2791@mail.ru

### ABSTRACT

*Purpose of the study: to highlight the problems of protection, restoration and use of monuments of history and culture in the Republic of Uzbekistan, which has survived to this day in 1980-1990. The main task: to determine the reasons for the tragic damage to historical and cultural monuments at the last stage of the Soviet era; to study the forms and methods of using historical and cultural monuments during the period of Soviet power and to identify their features. The object of research: monuments of history and culture, preserved in the Republic of Uzbekistan to this day. The subject of research: issues of preservation, repair and restoration of historical and cultural monuments, their use in 1980-1990.*

**KEYWORDS:** *Historical And Cultural Monuments, Architectural Monuments, Archaeological Sites, Historical Centres.*

### INTRODUCTION

Preservation, conservation and restoration of historical and cultural monuments and architectural monuments in the world, prolonging their life and passing them on to future generations remains one of the most important problems in the world. This process demonstrates how relevant it is to scientifically study ancient architectural monuments and preserve them as a cultural heritage of human civilization. International organizations such as UNESCO, ICOMOS (The International Council on Monuments and Sites), ICOM (International Council of Museums) work on the preservation and protection of historical and cultural monuments in various countries around the

world. However, the current armed conflicts in some regions of the world, the human factor, as well as natural-climatic and man-made influences have a negative impact on the preservation, repair and restoration of historical and cultural monuments, their use. All this requires the attention of the international community to this problem. After the independence of Uzbekistan, the focus on national values and cultural heritage has risen to the level of public policy, and attitudes towards them have changed. In particular, comprehensive reforms are being carried out in the field of preservation, restoration and conservation and use of historical and cultural monuments. Preservation and protection of historical and cultural monuments (architectural structures, archaeological sites, etc.) preserved in the territory of the Republic, their use in the development of domestic and foreign tourism and for cultural and educational purposes requires a special scientific approach.

Decree of the President of the Republic of Uzbekistan "On additional measures for the construction, restoration, reconstruction and overhaul of objects of special social, cultural and historical significance" (September 10, 2018, No. F-5361); "On approval of the concept of further development of national culture in the Republic of Uzbekistan" (November 28, 2018, No. PP-4038); Resolutions "On measures to radically improve the activities in the field of protection of tangible cultural heritage" (December 19, 2018, No. PP-4068) and "On protection and use of cultural heritage sites" (October 9, 2009, O'RQ - 228); The Law of the Republic of Uzbekistan "On protection and use of objects of archaeological heritage" (October 13, 2009, No. O'RQ-229), the Cabinet of Ministers of the Republic of Uzbekistan This dissertation serves to a certain extent in the implementation of the tasks set out in the regulations "On measures" (July 21, 2014, VMQ-200), as well as other regulations in the field.

## LITERATURE REVIEW

The study of architectural monuments and buildings on the territory of Uzbekistan and the creation of the first scientific works in this area began mainly in the second half of the 19th century. It would be advisable to conditionally study the scientific literature on this topic in three groups. The first group includes studies created in Tsarist Russia and during the Soviet era. The reason the literature of these two periods is included in one group is that almost all the scientists of the colonial period also worked under the Soviet regime, and their research was published in the Soviet editions. Preliminary research in this area was carried out by N.I. Veselovsky [1,2], V.V. Bartold [3], V.L. Vyatkin [4,5], B.N. Zasiptkin [6-8], D. Nechkin [9], II Umnyakov [10], V.A. Shishkin [11,12], A.Yu. Yakubovsky [13], M.E. Masson [15-18]. Among the studies created during the Soviet period and devoted to the problems of historical and cultural monuments: G.A. Pugachenkova [19], L.I. Rempel 20-22], N.B. Nemtsova [23-25], A. Khakkulov [26], P. Works of Sh. Zokhidov [27], I. M. Azimov [28], M. A. Salimov [29], F. M. Ashrafia [30], IV Isroilova, KS Kryukova [31] and others.

Also, in V.A. Nielsen [32], Yu.R. Rakhmatullaeva [33], I.M. Azimov [34], R. Seitova [35] some problems associated with the study and preservation of historical and cultural monuments in Uzbekistan. studied. After Uzbekistan gained independence, the works of G.A. Pugachenkova, N.B. Nemtsova, A. Khakkulova, P.Sh. Zokhidova, M.K. Akhmedov on the problems of protecting historical and cultural monuments [36-41]. At the same time, the studies of Mirzaev M.A., Islamkhodzhaev Kh.S., Abrieva A.R. are also devoted to the problems of historical and cultural monuments in the republic [42-44].

The works of foreign researchers in the study of historical and cultural monuments of the republic and their presentation to world science are also remarkable. These include studies by such scientists as A.A. Bennigsen, S.M. Gorshenina, Frederic Baupertuis-Bressan, Claude Rapin [45–48].

It should be noted that in the works of the French Soviet scientist A.A. Bennigsen, covering mainly the religion of Islam and Muslim life in the USSR, also contains information on the state of mosques and madrassas, which make up the bulk of the architectural monuments of Uzbekistan.

## **MATERIALS AND METHODS**

In 1980-1990, a lot of work was done in Uzbekistan to protect, preserve and repair ancient monuments. For example, from 1920 to 1980, 240 architectural monuments were preserved and restored [49]. In 1970, in connection with the celebration of the 2500th anniversary of the city of Samarkand, with the participation of UNESCO, several architectural monuments were repaired. In 1977, the "Architect" association carried out restoration and repair of monuments for 2 million 983 thousand rubles (the funds of Soviet times were then nominated in rubles), in 1979 - 5 million 926 thousand rubles, and 1980 - 6.5 million rubles. work is planned. According to the association, in 1979, the collapsed dome of the Taki Telpakfurushon mosque in Bukhara and the Bibi Khanum mosque in Samarkand were restored. The Tillakori Mosque, part of the Registan ensemble, was covered with a blue dome, and the interior was decorated with gold and restored to its original state. The Blue Dome Mosque in Shakhrisabz has been repaired. Also, in the hall and madrasah of Nadir Devonbegi in Bukhara (now this building houses the Museum of the History of Ceramics of the Bukhara Museum of Art and Architecture - R.M.) Hasanmurad Kushbegi and Otamurod Kushbegi madrasahs were also renovated. At present, the Institute of Archeology of the USSR Academy of Sciences has compiled an archaeological map of the Kashkadarya region. It includes over 500 ancient monuments. From 1979 to 1980, the Uzbek Institute for the Preservation and Repair of Cultural Monuments, Research and Design conducted research and design work on more than 50 architectural monuments of Uzbekistan. Among them are the Bibikhanim madrasah in Samarkand, the Ulugbek madrasah, the Kalon Mosque in Bukhara, objects in the city-reserve of Ichan-Kala and others [50].

On August 12, 1980, the CPSU Central Committee adopted a resolution "On the publication of a collection of historical and cultural monuments of the peoples of the USSR." Based on this decision, on September 8, 1980, the Central Committee of the Communist Party of Uzbekistan and the Council of Ministers issued Resolution No. 604 on the publication of a collection of monuments. In accordance with the order of the Central Committee of the Communist Party of Uzbekistan and the Council of Ministers dated September 17, 1980, No. 164 "P" in 1981 in Samarkand and Namangan regions, in 1982 in Andijan, Jizzakh, Syrdarya regions, in 1983 in Bukhara region and on monuments history and culture of the city. measures to prepare for publication in the form of a collection. This order states that in 1979-1980 the monuments of the Tashkent region and the city, Fergana, Surkhandarya, Kashkadarya and Khorezm regions were prepared in volumes [51].

G. Pugachenkova, L. Mankovskaya, P. Zokhidov, Z. Khakimov and many other art critics took an active part in this work. They also took an active part in the preparation of the book "Masterpieces of Central Asian Architecture", published at the initiative of UNESCO. On

September 19, 1980, in Tashkent, UNESCO celebrated the 1000th anniversary of the birth of the great scientist Abu Ali ibn Sino. In preparation for the anniversary in Bukhara, 40 architectural monuments were repaired, statues of the scientist were installed in Tashkent and Afshan. 1 million 446 thousand rubles were spent on this work. The government commission, created by order of the USSR Ministry of Culture No. 417 of August 25, 1980, approved 20 monuments as "excellent" and 20 as "well-repaired". However, at that time in Bukhara, there were 329 architectural monuments protected by the state, of which only 1/8 (12.2%) were repaired.

At the same time, certain work was done to identify and compile lists of architectural monuments in need of repair or conservation. According to the plan of the Ministry of Culture of the USSR for 1982, the Bukhara Special Research and Repair Workshop (GSIR) was allocated 1 million 70 thousand rubles, of which 585 thousand rubles - from the republican budget [54].

At the meeting of the Collegium of the Ministry of Culture of the USSR on March 25, 1982, a report of the Bukhara Regional Department of Culture on the implementation of the USSR Law "On the Preservation and Use of Historical and Cultural Monuments" was heard. The report says that 714 monuments were taken under state protection in the region, including 329 architectural monuments, 259 art monuments and 126 archaeological monuments. Another 20 monuments were recommended for inclusion in the list of monuments of union significance, 274 monuments of republican significance were taken under state protection. Registration records of 379 monuments and photographs of 143 monuments were created, mainly in the city of Bukhara and regional centres of the region [54].

The archival documents also recorded cases of damage to historical and cultural monuments. One of these documents says that part of the wall of the Starobukhar fortress was demolished, the mausoleum of Abdulkhalik Gijduvani in Gijduvan was destroyed, and arbitrary construction work was carried out in the protected areas of the Chor-Bakr and Bahauddin complexes. In 1983, on the occasion of the 1200th anniversary of the birth of the great mathematician and astronomer Muhammad Musa al-Khorezmi, large-scale renovation and improvement works were carried out in the Khiva historical and architectural museum-reserve of Ichan-Kala, a bronze statue of the scientist was installed. By the 2000th anniversary of Tashkent (celebrated in 1983), the mausoleums of Kaldirgochbi (XIV century), Yunuskhan (XV century), Sheikh Khovandi Tokhur (XVIII century), the architectural complex Hasti-Imam (Khazrati Imam), Said Abdul Kasim (XVIII century) were repaired ) restored madrasah, complex Hayrabad Eshan (XVIII century).

Also, by the decision of the government of the republic in 1982, the historical centres of Samarkand, and in 1983 the historical centres of Bukhara were transformed into a state historical and architectural museum-reserve (in 1968 the Ichan-Kala part of Khiva was transformed into a museum-reserve - R.M.). The analysis of the given data shows that in 1980 there were 7056 monuments of history and culture in the country under state protection and in 1980-1983. Only 54 (0.8%) architectural monuments were repaired. When the work is divided by city, the following situation is observed: 40 monuments in Bukhara, 4 in Samarkand, 6 in Tashkent, 3 in Khiva, 1 in Shakhrisabz. In the tenth five-year plan (1976-1980), the Main Directorate of Scientific Production of Cultural Monuments planned to carry out repair, design and survey work in the amount of 24 million 64 thousand rubles, in fact, work for 26 million 943 thousand rubles. This is twice as much as was done in the ninth five-year plan. In the tenth five-year plan, the

number of restored monuments exceeded 140, of which 80% were built in the last 3 years, i.e. 1978-1980 [55].

However, in many cases, these monuments are of poor quality due to poor-quality repairs, and the repairmen are indifferent to their work, therefore, some architectural structures are in a worse condition than before. Worst of all, the inimitable and elegant elements of the monuments have been irreparably damaged. In Samarkand, several unique monuments of the Soviet era, including the mausoleum of the tsars, were demolished, and the gravestones were stolen. The mausoleum of Nuriddin Basir, a unique monument of the XIV century Qutb Chakhordakhum (Samarkand), was blown up. The mausoleum of Abdulkhalik Gijduvani in Bukhara was levelled overnight with the help of bulldozers under the pretext of "atheistic" education. However, the monument was under state protection. In Tashkent, the Mysterious Mosque near Chorsu has been completely demolished.

Part of the fortress wall of the old city of Bukhara was demolished, the mausoleum of Abdulkhalik Gijduvani in Gijduvan was destroyed, and the Chor-Bakr and Bahauddin complexes were arbitrarily built in the protected zones. Many monuments in Bukhara that were damaged by the 1976 and 1984 Gazli earthquakes were damaged due to poor repairs. As a result of the 1984 earthquake, the fortress wall of the Ark collapsed. However, then the wall was repaired. Head of the Institute of Art History Kh.Abdusamatov in a letter to the head of the Main Directorate of Scientific and Production Production of Cultural Monuments FMA Shrafi ODSP-13 (Directorate of Joint Construction Ventures), if the canal is built, the ancient cities of Shurab-Kurgan and Kampirtepa, which are considered unique archaeological complexes, will be under the threat of flooding [58].

Foreign Minister Ashrafi will send a letter to the party committee of the Surkhandarya region regarding this situation. In response, T. Mengliev, the secretary of the regional party committee, said that measures were being taken to protect the monuments of Shurab-Kurgan and Kampirtepa, orders were given to the ODSP-13 [58].

However, as a result of the illegal activities of the city of Termez, ODSP-13 and PMK-2MZR (moving mechanized column - RM), a certain part of the old city was demolished and the Kampirtepa fortification system was damaged [58].

The military also contributed to the destruction of historical monuments. For example, military unit 2099, located near the city of Termez, used the old city as a training ground. The training was carried out here, trenches of different depths were dug. The fort was destroyed by the military, and construction work was carried out there.

The fact that the economy of Uzbekistan is mainly focused on the production of raw materials, the agricultural sector, and the cotton monopoly also led to the destruction and demolition of many monuments. First, the increase in the gross cotton harvest was carried out extensively. As a result, millions of hectares of new land were reclaimed to expand cotton fields, resulting in the destruction of many archaeological sites that have not yet been explored or fully explored. According to the Institute of Archeology of the Academy of Sciences of the Republic of Uzbekistan, until 1960 there were about 30 thousand archaeological sites in the country. By the 1980s, their numbers had dropped to 9,000, or 70 per cent, as a result of degradation and erosion that increased arable land. By the mid-1990s, there were only 5 391 such monuments (18 per cent). For example, in 1977, only in the Ellikkala region of Karakalpakstan, there were 253

fortress monuments, and by 1990 only 28 (11 per cent) ruins survived. The rest were introduced into cotton fields as fertilizer and converted into cotton fields. The Bronze Age monument Boyrachitepa was ploughed up and turned into a cotton field on the territory of the Ok Oltin collective farm in the Altynsai district of the Churkhandarya region. Here, about 20 hectares of the Kyzyltepa monument of the 10th-5th centuries BC are completely ploughed up. and melons are planted.

As a result, the defensive walls, street squares and residential buildings of the ancient city were destroyed. Surprisingly, the monument to archaeologists has been under state control since 1971.

Another example is the ruins of the ancient city of Budrach on the lands of the Akhunboboev collective farm in Denau district. In the Middle Ages, it was one of the cultural centres of the Chaganiyansky region. However, for several years this monument turned into farmland. The state of the world-famous monument Dalvarzintepa was also deplorable. During this period, private buildings on the eastern side of the monument gradually expanded. The city-fortress was turned into a cemetery. It is known that cotton is the most water-intensive plant. This required the construction of many reservoirs and irrigation facilities in the country (by the mid-1980s, the country had 23 reservoirs, 900 irrigation systems and 92 hydraulic structures [62]).

This led to a sharp decrease in the water level in the Aral Sea and, as a consequence, to a deterioration of the ecological situation in the republic. Tons of toxic salts rising from the dry surface of the Aral Sea have caused not only human health but also erosion and destruction of monuments. While the monuments have been eroded by the release of toxic salts from the Aral Sea from above, the rise in water levels as a result of over-flooding of the cotton fields from below has damaged and even destroyed them. Around 2,500 years old, Termez, the Namuna collective farm and the Termez state farm are expanding their cotton fields and groundwater levels have risen as a result of irregular irrigation. As a result, the monument remained in the swamp, and in some places, even small puddles appeared, which washed out the cultural layer and led to its disappearance. Also, a cattle shed was built on the site of the monument. As a result of the Soviet government's decision to raise cotton production in Uzbekistan to the level of state policy, archaeological sites were razed from the ground and turned into cotton fields to fulfil the cotton production plan. For example, in 3 cisterns in the villages of Maimanakh and Kamashi of the Ulyanovsk (now Mirishkor) district of the Kashkadarya region, these cultural objects were damaged and destroyed due to the storage of chemicals. A farm has been built on the territory of the Shulluktepa archaeological site, located on the territory of the Udarnik collective farm in the Kasan region. The construction of the road was carried out by a detachment of DSU-4 (Road Construction Department - R.M.) Karshistroi in Truptepe, a national monument of the collective farm named after V.I. Ulyanov.

From the second half of the 1980s, a new phase of destruction of religious and Islamic monuments began, associated with the atheistic policy of the Soviet state. By the decision of the Bureau of the Central Committee of the Communist Party of Uzbekistan dated July 9, 1986, it is recommended to remove 62 religious buildings and places of worship from under state protection [64].

On the basis of this recommendation, the Central Committee of the CPSU on August 18, 1986, adopted a Resolution "On the fight against the influence of Islam" [64].

In accordance with this decision, 61 mosques built in the late 19th - early 20th centuries on the territory of the republic will be excluded from the list of monuments protected by the state as religious rites. At that time, there were more than 300 buildings for religious rituals in the country, including 82 in the Kashkadarya region, 80 in the Bukhara region, 47 in the Samarkand region, 21 in the Surkhandarya region and 17 in the Andijan region [64].

Although most of these buildings were listed on the state, they remained in an empty (abandoned) dilapidated state, and some were used as warehouses for an enterprise or farm. There are times when some mosque buildings have even been used as prisons. For example, the Odin Mosque in Karshi (14th century) and the Kazi Kalon Madrasah in Margilan (19th century) were used as prisons.

On November 12, 1986, the founding conference of the USSR Cultural Foundation was held in Moscow. The purpose of the foundation was to preserve historical, architectural and cultural monuments, to preserve the historical appearance of ancient cities. It was noted at the conference that the public is concerned about the fate of monuments in the Yaroslavl region, in particular, the Kizhi and Solovetsky monasteries, but there is no mention of the monuments of Uzbekistan built ten or even hundreds of years ago. However, in 1987, only in the Bukhara region, 603 monuments were taken under state protection and registration, of which 293 are architectural, 100 archaeological and 210 monumental works of art. By category, 24 monuments are union, 244 are republican, 335 are local. Two architectural monuments, the mausoleum of Ismail Somoni and the Kalon minaret, are included in the UNESCO World Heritage List.

In the 1980s, there were 250,000 monuments in the Union, 190,000 of which were registered by the state and protected by law. In Uzbekistan, 7,056 monuments of history and culture are under state protection. As a result of the ideological approach to the protection and preservation of historical and cultural monuments, many monuments were not taken under state protection, and even those on the list were ignored in many cases. This led to the destruction of many archaeological and architectural monuments. For example, part of the ancient monument of Oktepa (5th century) in Tashkent was turned into a city dump after the 1966 earthquake. As if that weren't enough, most of it was set aside for construction. The area of the old town has been reduced to almost 100 hectares.

Almost 50% of the surviving 50 hectares of construction boom were 15-20 meters high "mountains" of rubbish. As of September 1, 1989, there were 9,310 inactive monuments in the country, of which only 6366 (or 70%) were transferred under state protection. If in 1980 the state list included 7,056 monuments [64], then by 1989 690 monuments were excluded from the state list. In the early 1990s, a letter was sent to the Supreme Soviet of the USSR on behalf of the USSR People's Deputies with a request to preserve the monuments of Bukhara.

Among them, Academician A.D. Sakharov, poet R. Khamzatov, cosmonaut V. Tereshkova.

However, this letter was ignored.

## RESULTS

In the period from the 1980s until the republic gained independence, the attitude towards historical and cultural monuments manifested itself in two directions:

- In addition to the human factor, the natural and ecological situation (the harmful effects of the Aral Sea, rising groundwater levels, earthquakes) also played an important role in the problems of protection, preservation and restoration of historical and cultural monuments. In addition, in addition to the protection, preservation and restoration of historical and cultural monuments by the relevant authorities, other organizations (agricultural, construction, trade and cooperative organizations, production associations, military units, in some cases by relevant organizations) themselves) caused great damage to the monuments;
- In the first half of the 1980s, the command and control system reached its peak. During this period, the state bodies responsible for the protection and preservation of historical and cultural monuments, as well as for all spheres of the cultural and educational life of Uzbekistan, acted on the basis of strict orders and instructions from the centre. Ancient monuments, especially architectural structures, were alienated from their content and their use for other purposes increased. However, since the second half of the 1980s. the command and control system became somewhat loose. The first steps have been taken to restore national culture, national values, historical memory, awareness of the identity of the people. Most importantly, the attitude towards the cultural heritage and the ancient monuments that are part of it began to change. Over the years of "reconstruction", as a result of the non-transparency of the government, shortcomings of the state policy in relation to cultural heritage, protection of monuments, shortcomings in repair and restoration work, mistakes were revealed. As a result, measures were taken to eliminate the problems.

## CONCLUSION

Along with mistakes and shortcomings in the preservation, protection and use of historical and cultural monuments of the last quarter of the last century, there are also positive shifts. For example, many historical and cultural monuments in Khiva, Bukhara, Samarkand and Tashkent were renovated in connection with the birthdays of Muhammad al-Khorezmi, Abu Ali ibn Sino, the 2500th anniversary of Samarkand and the 2000th anniversary of Tashkent. At the same time, significant work has been done on the problems of scientific repair of monuments. For example, art historians and architects G.A. Pugachenkova, M.A. Salimov, F.M. Ashrafiy, P.Sh. Zokhidov, I.V. Isroilov, K.S. Kryukov, I. Azimov in their research, paid special attention to the problems of scientific repair of cultural monuments.

**ABSTRACT**

*Transgender community in India characterizes acute Mental Health decline as they experience harassment, discrimination to blatant verbal, physical, and sexual assault, including beatings, rape, and even homicide. This cast out population facing extreme social exclusion losses it's self-esteem and voice, demands policies and processes that validate their experience, knowledge. This study aims to aid this community by exploring their mental health complexities through the survey method and support their echoes for support and social inclusion through creating awareness. This study is based on the transgender community form three different localities in Chennai, India.*

**KEYWORDS:** *Transgender Community, Survey Method, Mental Health, Social Awareness, Social Inclusion*

**INTRODUCTION**

According to the 2011 census, there are about 4.44 lakh transgenders in India, and they are grouped under the male census which considerably affects the accuracy of the data (Sawant, 2017; Sinha, 2019). Experiencing extreme social exclusion, this community has only 25 percent of the Right to education quota which has to be shared with other disadvantaged groups (Rajkumar, 2016). Even though the Supreme court of India has passed the Transgenders Right bill, in 2014 undergoes huge modifications over the years affecting the applicability of the law’s full capacity (Knight, 2019). But, in 2014, the Indian constitution also criminalized begging affecting the survival of this community leading to increased engagement in sex work resulting in complex health issues (Lyons, 2018; Sinha, 2019). Even though the transgender community holds a huge role in the culture and religion the Indian state has failed to recognize this community as the third gender until now. Respected in the pre-colonial era, this community is

now called by various derogatory terms and are seen mostly begging and sex work (Sawant, 2017).

Thus, this community which was once celebrated in the Indian culture is now an oppressed and marginalized group. This cast out community facing extreme social exclusion losses its self-esteem and voice demands policies and process that validates their experience, knowledge (Etmanski et al., 2014;Rajkumar, 2016; Snarch, B., 2004;). These over-researched transgender community in India are rarely portrayed or less prioritized in the state's law, policies and they need research which is more accessible to them, actionable, sustainable and cater to their then and now needs (Graham, 2014; Greene et al., 2009 ). This research project adopted the survey method to engage with the voices of the transgender community on their experiences with the society and the awareness of the general community on social acceptance of the transgender community.

### **Background of the Study**

Around 55,000 children were identified as transgenders by their parents, who are disowned by their family and community making them vulnerable to sex trafficking, harassment, and acute poverty (Sawant, 2017; Sinha, 2019). Transgender individuals claim to be uncomfortable with their biological sex and assigned gender role and for this community, gender reassignment surgery, hormone therapy, and gender role changing allow them to feel "right," or "natural." And to afford such expensive reassignment surgery, they are mostly engaged in begging and commercial sex work due to lack of acceptance and job opportunities. This community characterizes acute Mental Health decline as they experience harassment, discrimination to blatant verbal, physical, and sexual assault, including beatings, rape, and even homicide. And most assaults against transgender persons are never reported to the police. A link between these experiences and mental health disorders, such as Post Traumatic Stress Disorder (PTSD), is widely suspected but has not been adequately documented. This study intended to develop an understanding of the issues of the transgender community's mental health, relationship of transgenders with the general society, and assess the level of social acceptance towards them.

### **Methodology**

This research project adopted the close-ended survey method to understand the patterns of livelihood, and mental health problems of the transgender community and to assess the level of acceptance of the transgender community amongst the general public. Descriptive design was used to analyze and describe the data gathered through charts and tables to show the causal relationship. Descriptive design is used in researches which aims to accurately describe a population and its characteristics (Dulock, 1993). And the recruitment of sample used to measure the mental health complexities and the social isolation faced by the transgender community was snowball sampling method. This sampling technique was used since this community was distrustful of the outside research and academy. The sample size to study health issues of transgenders was 30 transgender respondents from Saidapet, Zafar Khanpet, Namashivayapuram. Most of this community live in slums on the banks of the river Cooum, an unhygienic and unhealthy environment. The geographic location can prove to be the first cause of their health problems. However, the study revealed this reality of housing was realized concerning the difficulties they face in acquiring a job or a rented house anywhere across the city. This leaves them with no other option but to live as groups in different slums where the other marginalized

small group of people accommodates them. The second set of data to measure the social acceptance of the transgender community was collected from 50 respondents from the general society through a convenience sampling method in the same localities Saidapet, Zafar Khanpet, Namashivayapuram.

### General Profile of the Participants

Participants	Community	Respondents*	Age	Literacy level**
Transgender (Survey A)	Saidapet	11	18-20 = 7 21-30=3 31-40 =1	6 <sup>th</sup> -10 <sup>th</sup> grade = 7 10 <sup>th</sup> to 12 <sup>th</sup> grade= 2 College = 2
	Zafar Khanpet	9	18-20 = 5 21-30=3 31-40 =1	6 <sup>th</sup> -10 <sup>th</sup> grade = 8 10 <sup>th</sup> to 12 <sup>th</sup> grade= 1 College = 0
	Namashivayapuram	10	18-20 = 7 21-30=3 31-40 =0	6 <sup>th</sup> -10 <sup>th</sup> grade = 9 10 <sup>th</sup> to 12 <sup>th</sup> grade= 1 College = 0
General Society (Survey B)	Saidapet	25	20-30=5 31-40 =10 41-50=10	Undergraduate = 10 Postgraduate=15
	Zafar Khanpet	15	31-40 =10 41-50=5	Undergraduate = 7 Postgraduate=8
	Namashivayapuram	10	31-40 =5 41-50=5	Undergraduate = 4 Postgraduate=6

\*Number of respondents interviewed in each community.

\*\*Literacy level represents the year of study completed by the respondents at the time of the interview.

Source: Field data.

### Respondents' characteristics:

Transgender community for Survey A -

- Community - 36.66 % of the respondents are from Saidapet, 30% of respondents are from Zafar Khanpet and 33.33 % are from Namashivayapuram.
- Age continuum - 63.33% belong to the age bracket of 18 – 20, 30% to 21-30 age bracket, and 6.6 % to 30-40 age bracket.
- Literacy level – 80 % of respondents have 6<sup>th</sup> – 10<sup>th</sup> grade of education, 10 % have a literacy level of 10<sup>th</sup> to 12<sup>th</sup> grade, and 6.6% holds a college degree

General community for Survey B -

- Community – 50 % of the respondents are from Saidapet, 30% of respondents are from Zafar Khanpet and 20 % are from Namashivayapuram.
- Age continuum – 10 % belong to the age bracket of 20 -30, 50 % to 31-40 age bracket, and 40 % to 41- 50 age bracket.

- Literacy level – 42 % of respondents hold an undergraduate degree, and 58 % holds an undergraduate degree

### Participants

Survey A- The recruitment of transgender participants from each community was voluntary. The participants were compensated for their time and food was provided. The data collection was done in a safe space, identified by the community.

Survey B -The recruitment of the general community participants from all three locations was also voluntary. The data was collected at the comfort of the participant's house and their time was also compensated through gift cards.

### Data analysis

The survey was initially constructed in consultation with the available academic literature and experienced academicians. Survey A which was administered to the transgender community was divided into three sections they are demographic details, mental health complexities, and societal acceptance experience. Survey B was administered to the general public had two sections they are demographic details and social acceptance of the transgender community. The survey was administered through paper and the answers were recorded by the respondents. This was later translated, coded, and analyzed by the academic researcher. The quotes representing the themes emerged during the informal dialogue between the academic researcher and the participants. The quotes were documented and produced herewith their consent. The data gathered from the transgender community on social acceptance and the metal health complexities and was grouped under two themes. And the data gathered was also grouped under one main theme.

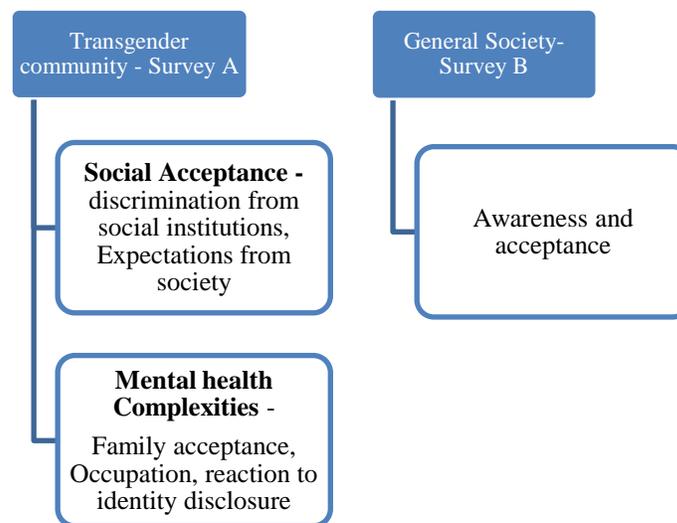

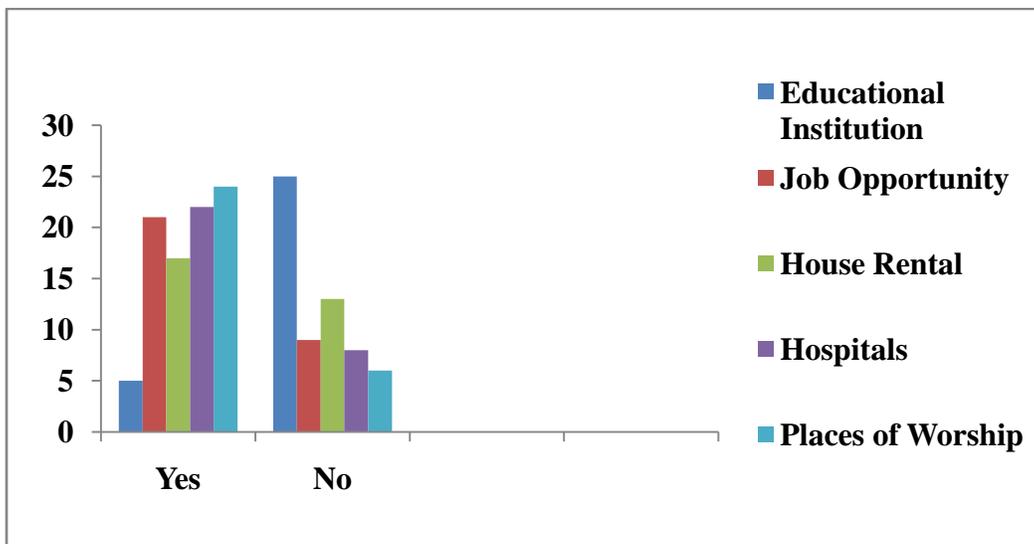

Figure 1 – Themes of the study

### Major Findings

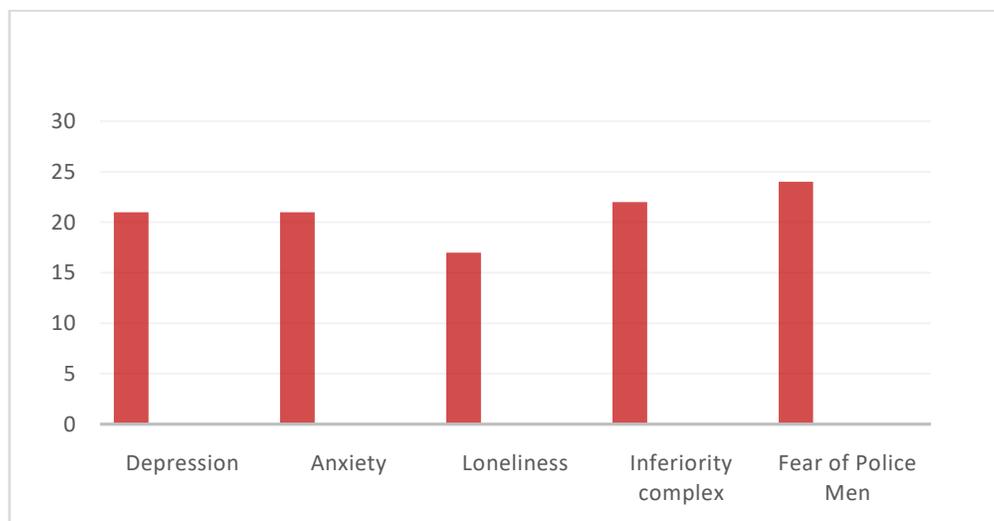

**Survey A** -The Survey A, which was administered to the transgender community from Saidapet, Zafar Khan pet, Namashivayapuram. The findings from the data were analyzed and grouped under two main themes Social acceptance and Mental Health Complexities. Social acceptance and mental health have a cyclical effect on each other.

**Table 1 - Discrimination experienced in Social institutions**

*“Everyone fails to understand us for who we are. We are more than what happens in the bedroom and stop defining us through our appearances. But appreciate our courage for being truthful to you and ourselves. Accept us, not because we hold equal rights as you do, but foremost we are also human beings” - Anonymous respondent 4#*

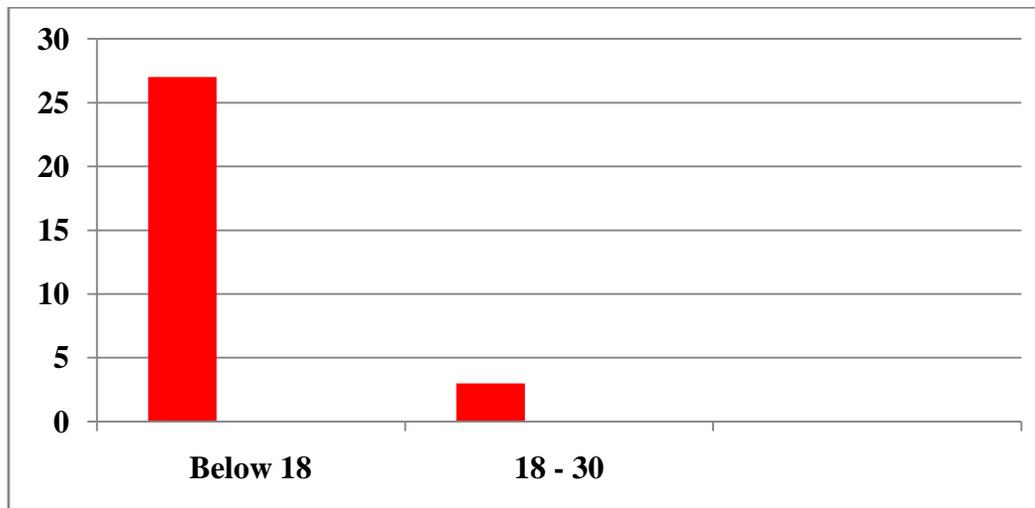

Table 1 summarises the range of discrimination faced in social institutions like an educational institution, Job opportunity, house rental, hospitals, and place of worship. The social acceptance and discrimination faced are high in Worship places, employment, and access to housing. When analyzed against the need for social acceptance by the transgender community from society, 85 percentage of the respondents stop discrimination against them and seeks respect from society. And 25 percent of the transgender community recorded that they have lost hope or expectations from the general community.

**Table 2 – Mental Health complexities experience**

*“I suffer from acute depression and inferiority complex, but I am afraid to seek treatment for the fear of discrimination. And, I cannot afford medications or treatments as I survive from the income, I earn through sex work. My family disowned me, and I was refused employment. Here I am, what choice do I have?” - Anonymous respondent 11#*

Table 2 represents the data relating to the mental health complexities experienced by the transgender community respondents. 18 of the respondents are involved in Sex work for survival and 7 are employed in Nongovernmental organizations. And 25 transgender community participants responded that they are still not accepted by their immediate family members.

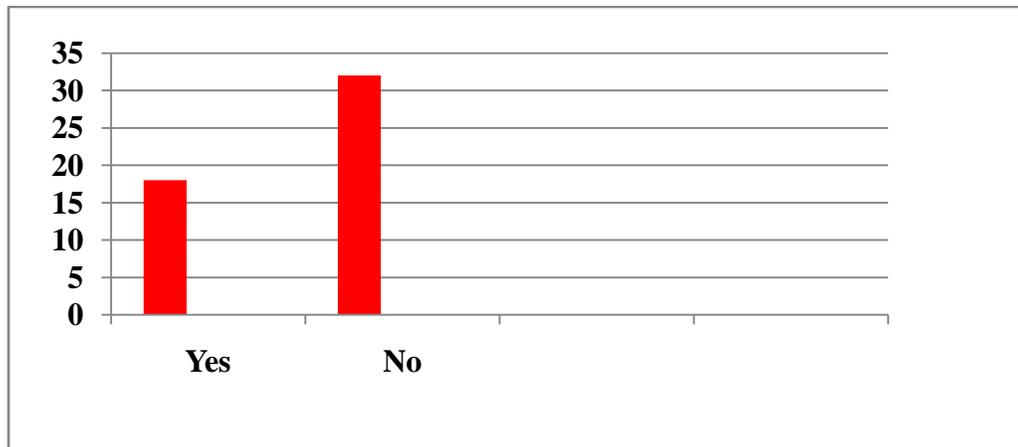

**Table 3 - Age of realizing Sexual Identity**

*“I regularly try to connect with my family and send them money even if I go hungry. All I want in return is five minutes with them. I hope it will happen one day and I look forward to that day; after all, I am still their child” - Anonymous respondent 2#*

The above table 3 provides information on the realization of the sexual identity among the transgender community. 27 respondents came out to their families before the age of 18 and 22 participants responded that this was discouraged and frowned. 5 respondents ran away from their house for the fear of public social exclusion.

**Survey B** -The Survey B was administered to the general community from Saidapet, Zafar Khan pet, Namashivayapuram. The findings from the data were analyzed and grouped under one main theme acceptance of the transgender community.

**Table 4- Will you accept a Transgender in your family?**

*“They are a curse to the family. It is against God’s creation. If it is my child, I will kill him/her and myself” - Anonymous respondent from the general community 3#*

The above table indicates the acceptance level of a transgender as a family member and 32 of the respondents reacted negatively to the posted question. But, when questioned about the awareness of the transgender community, 35 respondents reacted positive and only 15 lacked any awareness.

#### **Awareness creation and Knowledge dissemination**

From the interaction with the target group, these major findings arrived, and these played a key role in the determination of the action plan to disseminate the findings through street theatre, a Gram Sabha- talk show on social acceptance of transgenders among the students. And as a part of this project, the researcher was more focussed on creating awareness and removing stigma against the transgenders in the society. Keeping this in mind, when approached by the researcher, a team of five student volunteers obtained permission to perform street theatre on at The Film and Food Fest conducted by the Tamil Nadu tourism department. The audiences were moved by the efforts of the volunteers resulted in appreciation and donation for the welfare of the transgender community.

The second initiative was, the Gram Sabha, moderated by Mr. Karthikeyan, the clinical psychologist. Dr. Meenakshi Sundaram & Dr. Fatima Vasant, Retired Principal, MSSW were the panelists in the discussion which attracted student participation from various city colleges like MSSW, MCC, MOP. This discussion with the Transgender helped the participants to understand various issues revolving around the transgender community. The fundamental problem put forth by transgender is that they are not accepted as a part of the community at large was debated, discussed, and accepted by the participating audiences. The session included Screening of Documentary on “Transgender”, slogan writing & signature campaign for social acceptance. The success of the event was measured by the overwhelming participation of the students and also their interests in promoting products made by transgender during college festivals. This program was telecast as a part of “JannalukkuVeliye” in Makkal TV and was aired in MOPCRS at the frequency 107.8 Mhz.

### **Continuing Conversations**

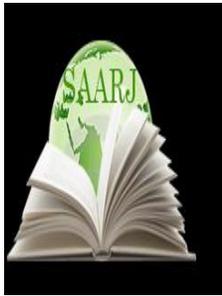

Ms. C was only 15 years old when she was disowned by her family and banished from her small village because she is a transgender. She reached Chennai and sought help from the Saidapet transgender community for safety and survival. Even though an expert in coding, she started begging for survival since she was rejected admission in schools because of her gender identity. Being a transgender in India costs them their families, homes, health, educations, and jobs. To pay for their transitions, many of these young transgenders sell their bodies to afford the treatments and decent life. The vast majority of transgender people are unemployed affecting their health (Rajesh, 1999). And this transgender community whose voice has been stolen needs respected research characterized by a reciprocal relationship and validate their experience and needs. Their sensitive culture and values have been misrepresented misconstrued and often sensationalized by the researchers and the state lawmakers (Snarch, B., 2004). They are often eluded from the important decision-making processes concerning their well-being and addressing social inequities. An important focus and outcome of this project were to support disseminate the findings and creating awareness among the general public; but also, to develop skill and capacity building for an alternate source of earning development (Castleden and Garvin, 2008). As the majority of these community members were denied employment and education, they were involved in sex work or begging and they are poverty-stricken due to their low earning capacity (Lyons, 2018; Rajkumar, 2016). Since each community's needs and wants are different, the researcher has to recognize and acknowledged the need of the local community (Loiselle et.al, 2014; Odhiambo, 2020)

This study was time and finance bound; thus, the participants were conveniently selected, and the findings were generated only from a small group. The data gathered from 30 transgender community in Chennai and 50 general community cannot be generalized to the entire transgender population of India. However, the revelations emerged from the study will help the social work fraternity in India who are working for the development and the social inclusion of the transgender community. The available literature and policies for the transgender community showcase the need for studies concerning this community specific to their mental health and social acceptance. This would help in the development of further socially inclusive policies, programs, and health services for the transgender community in India.

### ABSTRACT

*In accordance with this task, in teaching technologies should be changed: not just mastering knowledge, but the ability to filter out the necessary information, process it in the right way, and develop creative thinking in general. In fact, assessing the quality of education is a scientific task that requires the development of one's own scientifically grounded methodology, and verified methods. In this case, responsibility arises not from accountability, but from openness and transparency. At the same time, the procedures for assessing educational results become the weapon of the teachers themselves. Too many of them make assessment procedures extremely costly and does not leave schools the opportunity to assess those indicators that are especially significant for a given locality or culture.*

**KEYWORDS:** *Extremely, Accountability, Transparency*

### INTRODUCTION

Education is one of the most important social benefits. The education system plays an important role in a person life, and one spends a lot of time for acquiring it (especially a child, teenager, young man). The quality of educational results and the quality of life of students, both in the learning process and in subsequent years, depend on the conditions in which the educational process is carried out.

Assessment of the quality of education is a scientific task that requires the development methodology, verified methods, and ambiguous research problem with a deep understanding. It is proposed to consider the quality of education as a multidimensional phenomenon: in the philosophical and socio cultural, content-technological, value-worldview, communicative,

structural and organizational directions. The combination of these areas allows us to designate an integral system for assessing the quality of education.

Defining the quality of education is an ambiguous research problem that requires deep understanding. The solution to this problem is of a practical nature, since existing system for assessing the quality of education in secondary schools is fragmented and is based on quantitative, often formal indicators, such as the number of teachers with the highest qualification category, student performance, availability and correctness of paperwork, compliance with safety regulations, and others. In fact, assessing the quality of education is a scientific task that requires the development of one's own scientifically grounded methodology, and verified methods.

The quality of education is a phrase, the meaning of which is defined by two terms: education and quality. Education can be considered in several aspects: philosophical and socio-cultural, content-technological, value-world outlook, communicative, structural and organizational. Consequently, the quality of education can also be considered in all the listed aspects. The quality of education is a multifaceted phenomenon that requires measurement in the direction of several vectors.

In the philosophical and socio cultural aspects, education is viewed as a phenomenon of an epoch-making historical scale, at the level of extreme values, it is thought of as matrices that form the image of civilization and society [1]. Education is seen as the transmission of culture in the broadest sense. Accordingly, quality education is an education that is inextricably linked with culture, conveys knowledge, values, relationships that help to form society. To answer the question about the quality of education, it is necessary to make measurements in the following directions:

1. To what extent education reflects the culture of society, in what relationship culture and education are: does education correspond to culture? Does education a part of culture, or do education and culture contradict each other?
2. What is the place of the institution of education in the socialization of the individual? Can it compete with other institutions of socialization, with the exception of the family?

Let's try to analyze the quality of education in the proposed areas. The modern education system is in crisis. If we talk about the relationship between the socio-cultural development of society and education, then at present there is a gap between education and culture associated with global changes. Firstly, we can include the globalization of the world community, the integration of knowledge, and national economies. Secondly, the spread of information technologies, as a result of which the interaction of cultures, values, knowledge becomes more dynamic. The student is required to be able not only to assimilate knowledge, but to understand their huge flow, the ability to think critically, the ability to cognize, and others. Accordingly, the main task of quality education is not just to form certain knowledge, but to teach one to navigate in modern information. In accordance with this task, in teaching technologies should be changed: not just mastering knowledge, but the ability to filter out the necessary information, process it in the right way, and develop creative thinking in general. And modern education is aimed at a simple transfer of knowledge, and memorization. The crisis in this direction is aggravated by the fact that new values and worldview are adopted by the new generation, and the generation of teachers

brought up within the framework of the value system that has existed for a long time that adheres to the old worldview.

If we talk about the place of education in the socialization of the individual, then there is also a certain weakening of the role of education. It is connected with the fact that new social institutions have appeared that claim to transmit knowledge and cultural experience. Traditionally, socialization has taken place within the family and school.

### **Several volunteer groups act as stakeholders:**

**1. Students and teaching staff as direct participants in the educational process.** Students' needs are related to education, personal and social development. The needs of the teaching staff are associated with the self-realization of teachers, as well as with their development as professionals.

**2. Family, parents of students.** The family is one of the main consumers of the educational services provided by the school. The social order of parents is expressed in what parents generally expect from a child attending school, what, in their opinion, should be the content of education, the content of upbringing, in what form it can be implemented, what additional services may be in demand, and others.

**3. Institutions of primary, secondary, and higher professional education.** The social order of vocational education institutions is expressed in the requirements for school graduates as potential applicants and as future students.

**4. Economy represented by potential employers.** The social order of institutions from employers is expressed in the requirements for school graduates as potential employees.

**5. State.** The social order of the state is expressed in the requirements for school graduates as citizens of the country, and members of society.

In a situation where education is focused on fulfilling a social order, i.e. exists within the framework of the socio-centric model, quality education is education that maximally satisfies the social order of each of the groups - participants in the educational process, while not contradicting the interests of any of the named groups. Accordingly, the main vector for measuring quality is the satisfaction of each of the groups of social customers. The content of this vector for measuring the quality of education depends on the content of the social order.

The quality of education in secondary school is a whole complex of parameters and includes several areas. Each direction corresponds to a certain aspect of education:

**The first direction** is the parameters related to the understanding of education in a broad philosophical and socio-cultural context. This group includes, firstly, the ability of education to broadcast the existing culture, and secondly, the ability of education to occupy a leading position (following such a social institution as the family) in the socialization of the individual. From this position, education is experiencing a deep crisis associated with the gap between culture and education, as well as the weakening of the role of education in the transmission of cultural values.

**The second direction** is associated with the understanding of education in the content-technological aspect. This group includes parameters that reflect the correspondence between the

type of personality that is formed by education and the model that is characteristic of education. Currently, the prevailing socio-centric model of education, focused on the social order. Therefore, here it is possible to single out as a quality standard the formation of a personality that most closely matches the social order of each of the groups of participants in the educational process.

**The third direction** is associated with the understanding of education in the value-worldview aspect. The parameters that characterize the quality of education are the presence and quality of upbringing, the formation of values, worldview in the learning process. At present, the resumption of education within the school is taking place; the question of the content of education has been raised.

**The fourth direction** is related to the understanding of education in the communicative aspect. The parameters for measuring the quality of education are related to the parameters of communication. The modern school seeks to establish feedback between the participants in communications, to the open nature of relations.

**The fifth direction** is associated with the understanding of education as a specific organizational structure. The parameter for measuring the quality of education will be the effectiveness of education as an organization from the standpoint of management. In the modern school, there is an attempt to decentralize management by involving participants in the educational process in management.

The state system for assessing the quality of education which currently exists affects only on some aspects of the quality of education: the structural and organizational aspect, as well as the implementation of the state social order (the presence of certain knowledge, skills and abilities among schoolchildren, academic performance, compliance of educational programs with the state standard, and others.) Accordingly, in these areas, quality measurement techniques are the most developed. Measurement of the quality of education in other areas is often absent. Therefore, the task of creating an integral methodologically verified system for assessing the quality of education remains urgent.

Apparently, the intensity of discussions on this issue has reached a stage today when it becomes necessary to “clear up” the terminology and disclose those contexts that arise in connection with the implementation of certain approaches to assessing the quality of education, and we are trying to solve this problem in this article.

1. We do not discussing here the question of what is the content of the criteria for assessing the quality of education, just we will analyze what to consider as a good quality and what is bad. We will be interested in procedures and approaches to measuring the quality of the results of the work of the education system, and not in the question, for example, which results are more important. From this position, it does not matter whether we are talking about obtaining certain knowledge, abilities and skills or about the formation of abilities as the goals of education. This approach significantly distinguishes the proposed angle of view from recent discussions, which have focused mainly on the discussion of criteria for assessing quality. Our attention to forms and procedures is explained not so much by the fact that we are indifferent to quality criteria, but by the fact that, from our point of view, the procedures and approaches to quality assessment set the most important institutional context of the reform, to a large extent form the very results that then are evaluated.

2. We distinguish between a possible quality assessment system (quality management) and a system that ensures certification of individual students. From this point of view, all kinds of testing services (uniform examinations) should not be equated with quality assessment services. Their data, of course, should be used in assessing quality, but the direct identification of the totality of individual educational results, measured by standardized procedures, with the quality of the education system seems to us inappropriate.

3. We discuss the assessment of the quality of education in relation to a decentralized and variable education system. In a homogeneous centralized system, quality assessment tasks are posed in a completely different way, since the process is strictly regulated there.

What is the purpose of quality assessment? All above are about quality assessment, and it is a good desire to improve the quality of education. However, as often happens in social systems, the implementation of a tool designed to achieve a good goal leads to very contradictory results. Therefore, it is increasingly common to hear that quality assessment is needed so that (especially in a decentralized system) government can receive timely and reliable information about how the system works, how effectively budget funds allocated to education.

Let's pay attention on the problem of improving the quality that is being discussed, as the problem of providing higher authorities with information, the problem of monitoring the activities of educational institutions. This is clearly a substitution of goals. This substitution is extremely remarkable, since it reflects the difference in approaches. Recognizing the independent importance of the task of providing governing bodies with control information, we implicitly identify the quality of the work of educational institutions with the degree of administrative control. The solution becomes itself in the end.

We emphasize that we do not argue with the need to move information flows from the bottom up, but the task of ensuring this movement is subordinate secondary. It makes sense only in the context of the general task of improving the quality of the work of real teachers and school principals.

Thus, we emphasize that, from our point of view, the goal of creating a quality assessment system is to create conditions for improving the quality of education through increasing the flow of information about educational outcomes and relevant factors.

We also emphasize that for all the indisputability and even triviality of this statement, many projects for creating quality assessment systems are not really oriented towards the above goal as verifiable and achievable.

The modern history of education provides two fundamentally different approaches for assessing the quality of education in decentralized educational systems, and let's consider them below.

**Assessment as a test.** In one case, a quality assessment is needed by higher authorities to assess how the subordinate schools are performing. In this approach, a set of indicators and assessment procedures are developed at the top and applied in a standard and "inevitable" way to schools. In fact, this scheme implements not the idea of responsibility, but the idea of controllability.

**Assessment as a mechanism for dialogue and self-development.** An alternative is the approach in which the main consumers of information about educational results are the direct participants in the educational process - teachers, students and their parents. In this case,

responsibility arises not from accountability, but from openness and transparency. At the same time, the procedures for assessing educational results become the weapon of the teachers themselves. In this approach, the core of the quality assessment system is the methodological work to provide schools and teachers with new means of assessing the achievement of educational goals, new means of dialogue with the extracurricular community. The undoubted advantage of the second approach is that the process of collecting information about the quality of education is at the same time a process of development of the teacher and the school institution itself. Thus, the modern idea of management as learning is realized.

It is argued that decentralization already gives schools a lot of freedom, so in order to maintain a balance freedom must be limited through quality assessment procedures. Although, here formal considerations lead to a logical error: it is overlooked that the goal of decentralization is to strengthen independence at the level of educational institutions, therefore, the main task of assessing quality in a decentralized system is to strengthen this level at which really effective decisions are made.

**Finding a balance between control and dialogue.** Comparing these approaches, we consider complete administrative control or complete abandonment of administrative control. We emphasize the need for a balance in which it is clear that the most important driving forces for high quality education are independent and competent teachers, independent and self-governing schools, dialogue between parents and schools, dialogue between schools and the educational policy department. At the same time, one must understand that behind these approaches lie two different educational philosophies:

**In the first case,** general education is understood as the sphere of investment of state funds for the implementation of state priorities.

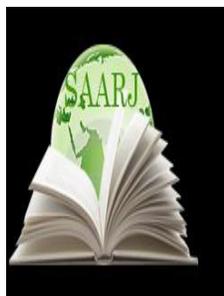

**In the second case,** on the one hand, general education is rather viewed as a service sector; on the other hand, as a sphere of free creative action by teachers and school collectives.

In the first case, the tool for maintaining the system is accounting, control, and direct management. In the second case, such tools are open communication channels and professional development.

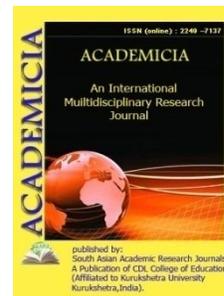

The question of the scope of quality assessment also includes the question of the number and structure of a set of indicators by which an educational institution or system is assessed. Too many of them make assessment procedures extremely costly and does not leave schools the opportunity to assess those indicators that are especially significant for a given locality or culture. On the other hand, random selection of indicators reduces the heuristic value of information. Apparently, the principle of compiling such sets should be reasonable minimum.

**ABSTRACT**

*Analysis of the content of publications on the problems of organizing distance learning shows that, despite the fact that distance learning has already become a part of our life, a significant part of the research in this area is associated with higher education. However, it is quite obvious that there is a category of schoolchildren for whom the creation of a distance learning system in accordance with the principles of flexibility, mobility, interactivity, etc. is almost the only way to receive education with full inclusion in the process of interaction with other subjects of learning.*

**KEYWORDS:** *Interaction, Flexibility, Mobility, Interactivity*

**INTRODUCTION**

Currently, a teacher must be able to form, using information technology, an educational environment that provides an appropriate level of learning, to model individual trajectories of learning and development of students, as well as his own path of professional growth. One of such technologies used in the learning process is distance learning technologies.

Distance educational technologies based on the use of information and communication technologies are confidently included in the practice of many educational institutions of various forms and levels. Since one of its main features is independence from the geographic location, from the distance between the teacher and the student, it was called distance (derived from the English distance - distance, distance), i.e. learning at a distance.

In the state educational standards one of the main roles is assigned to distance education. Distance education is a new, modern technology that makes learning better and more accessible.

The orientation of the learning process to individual characteristics and needs becomes more effective with the active use of innovative teaching technologies based on the methodologically sound use of information and communication technologies: from building a lesson using electronic educational resources to implementing individualized distance learning. Analysis of the content of publications on the problems of organizing distance learning shows that, despite the fact that distance learning has already become a part of our life, a significant part of research in this area is associated with higher education. However, it is quite obvious that there is a category of schoolchildren for whom the creation of a distance learning system in accordance with the principles of flexibility, mobility, interactivity, etc. is almost the only way to receive education with full inclusion in the process of interaction with other subjects of learning.

One of the advantages of distance learning is the real opportunity to take into account the individual characteristics of students and their educational needs in the organization of the educational process, in particular, independent work of students and creating a situation of success for each student.

Currently, distance learning for schoolchildren is proposed to use

- When studying basic courses of various academic disciplines;
- In the learning process within the framework of additional education (elective courses and special courses in various disciplines);
- In extracurricular activities (network Olympiads, quizzes, tournaments for schoolchildren);

Mathematics as an academic discipline has great opportunities for the implementation of distance learning, since the use of computers makes it possible to strengthen the applied and practical orientation of the mathematics course and creates conditions for the implementation of an individual approach at a qualitatively new level. The need for the integrated use of distance and traditional methods for teaching mathematics is due to the active introduction of distance educational technologies into the school educational process, the widespread use of computer methods in the study of mathematical disciplines that provide additional opportunities (computational, graphic, reference and informational) for improving and intensifying the learning process.

Numerous didactic and methodological studies by G.R.Akramova, V.P. Bepalko, Z.Kasimova, E.S. Polat, I.V. Robert et al. Show that the use of modern information technology (SIT) in the learning process provides the necessary conditions for the development of cognitive activity of students. Theoretical problems and practical issues of using computers in teaching mathematics in secondary and higher education are solved in the works of N.S. Anisimova, L. Borevsky, Sh.Samarova, E.I. Kuznetsova, N.Tosheva, G.N. Skobeleva, E.V. Skrylnikova, E.K. Henner, etc. The main attention in these works is paid not only to the issues of creating electronic educational tools with a methodology for their application, but also to the design of the information and communication environment in which these tools will be embedded. The analysis of these works shows that electronic teaching aids and computer training programs can be used to implement both distance and traditional approaches to learning.

As a result of the analysis of the theory and practice of distance learning for schoolchildren, it can be noted that it is necessary to solve the following issues: how to organize teaching mathematics, which increases the level of mastering of educational material and the level of

independent activity of students; what should be the content of educational material implemented by means of distance learning, and what criteria should be used to select it; how to organize independent work of students, taking into account their cognitive needs in the context of the complex application of distance and traditional teaching methods; what distance technology is advisable to use as the basis for distance learning for schoolchildren; what means of teaching and means of interaction between the teacher and students are the most effective. At the same time, it is the integrated application of distance and traditional teaching methods that has great prospects for the implementation of an individual approach to teaching mathematics in higher and secondary schools, while when implementing only traditional teaching methods, the individual characteristics of students and their educational needs are not fully taken into account. ...

Distance learning serves as a mechanism for the development of universal educational actions (methods of action) of students; implementation of education and socialization programs for students. The quality of distance learning is achieved through the development of universal educational actions, personal, meta-subject and subject educational results in students.

Benefits of distance education:

- Higher adaptability to the level of basic training and abilities of trainees, health, place of residence, etc., and, accordingly, better opportunities to accelerate the process of obtaining education and improve the quality of education;
- improving the quality of the educational process by focusing on the use of automated training and testing systems, tasks for self-control, etc .;
- prompt updating of the methodological support of the educational process, tk. the content of teaching materials on machine carriers is easier to keep up to date;
- Accessibility for students of "cross" information, since they have the opportunity, using computer networks, to refer to its alternative sources;
- increasing the creative and intellectual potential of students through self-organization, striving for knowledge, the ability to interact with computer technology and independently make responsible decisions;
- pronounced practicality of training (students can directly communicate with a specific teacher and ask questions about what interests them most of all).

The means of new information technologies provide students with a variety of modern teaching aids. In addition to traditional teaching aids and abstracts, students are offered:

- Computer training programs;
- Electronic teaching aids;
- Computer systems for testing and control of knowledge;
- Electronic directories;
- Educational audio and video materials;
- Information materials.

The listed means are able to improve the quality of teaching, accelerate the study, assimilation of educational material, control of knowledge.

Distance learning is based on pedagogical technologies of multi-tempo learning, independence in self-education of schoolchildren in various educational areas, a combination of various forms and methods of interaction between teacher and student.

Experience of working with students has shown that distance learning is quite effective in the following cases:

- Implementation of projects and research works;
- Work with frequently ill children;
- Work with gifted children.

The main feature of distance learning for children with poor health is the emphasis on independent work of students, which causes the greatest difficulty for schoolchildren. Therefore, it is important to create conditions for the formation of a culture of mental work in them:

- studying the material in small portions;
- Concise and clear instructions for handling materials and completing assignments;
- Involvement "on their side", as assistants and allies of the parents of students.

However, it should be borne in mind that distance learning presupposes a careful selection of educational material, its coordination with the state standard of educational content and requirements for entrance examinations to universities, a multilevel structural organization of educational material.

The personal and meta-subject results of education among students in distance learning are revealed through the system of activities of the teacher - mentor and student using technologies of the distance learning system. They include ways to implement the content of training provided by the curriculum, which is a system of forms, methods and teaching tools that ensure the most effective achievement of the goals.

On the portal of a unified environment for educational institutions' access to the services of electronic and distance learning systems, any schools, colleges and universities can request the creation of their own copy of the electronic and distance learning system for use in their educational process. It is absolutely free and will improve the quality of training in an educational institution. The organization of the distance learning system is carried out on the basis of the free Moodle platform.

In terms of the level of provided opportunities, Moodle compares with well-known commercial distance education systems, at the same time it compares favorably with them in that it is distributed in open source code - this makes it possible to "sharpen" the system for the features of a particular educational project, and, if necessary, embed it into it new modules.

The effectiveness of teaching students in the educational information space depends on many reasons, but the most important thing is the following: monitoring the quality of teaching students in the information space created by the teacher. Moodle allows you to control the "attendance", the activity of schoolchildren, the time of their study in the network. The teacher

can create and use any grading system within the course. All marks for each course are stored in a summary sheet. An important feature of Moodle is that the system creates and stores a portfolio of each student: all the work handed over to him, all the teacher's grades and comments to the work, all messages in the forum.

## BORROWED PLANT NAMES IN THE LEXIS OF BUKHARA OGHUZ DIALECTS

**Allaberdiyev Alijon Avezberdievich\***

\*PhD. Senior Lecturer,  
Department of Uzbek Language,  
Navoi State Pedagogical Institute,  
UZBEKISTAN

### ABSTRACT

*The article provides a comparative analysis of the plant names expressed through Persian-Tajik words in Oghuz dialects of Bukhara region with other Uzbek dialects and Turkic languages. The lexis of the region is explained by comparing phonetic variants of the plant names.*

**KEYWORDS:** *Dialect, Historical Etymology Of Words, Phonetic Version, Lexical Layers, Comparison, Synonymic Line*

### INTRODUCTION

The lexical layer of the Persian-Tajik languages existed in the lexicon of Oghuz dialects of Bukhara (Uzbekistan) differs by its diversity and richness from other Uzbek dialects. Genuinely, there is no any language or a dialect that does not contain words taken from other languages as the process of borrowing words is one of the essential needs for language existence.

According to Professor M. Mirzaev, the weight of Persian-Tajik lexical units in the bilingual dialect of Bukhara region is much higher and more diverse than in the monolingual Oghuz and Kipchak dialects<sup>1</sup>.

Two brotherly nations - Uzbeks and Tajiks have shared the same territory for centuries and lived in the equal economic, political and cultural conditions. The close relationship between these two nations has historically been evolved. The tradition of socio-cultural and literary interrelationships has led to the emergence of many linguistic commonalities in the vocabulary of their languages. In addition, the lexicon of both nations has enriched with the new lexical units in the field of household lexicon and special terminology<sup>2</sup>.

Due to the fact that the representatives of the Bukharian Oghuz dialects lived side by side with the Tajik-speaking people for centuries, in addition to their Turkic vocabulary, a number of lexical units borrowed from Persian-Tajik language naturally appeared in their language and began to be actively used in everyday life. The fact that the lexical units denoting plant names in the region came from the Persian-Tajik languages might also give rise to some speculations as historically Persian-speaking population lived in some villages of the districts belonged to Oghuz dialect. Although few villagers today speak pure Oghuz dialects, they claim that historically the roots of the origination of their ancestors traces to the Persians. For example, still we can observe a number of Persian customs and traditions in the way of life and folk customs of the population living in Tot, Shurabad, Kunduk and Tojikent villages. From this evidence it can be noted that a mixture of Turkish and Persian populations in the region created the modern lexicon. In our work, we conducted a comparative analysis of the conceptual implications of plants and their associated Persian-Tajik lexical units with Uzbek dialects and some other Turkic languages.

*кади* 1. *pumpkin* For example: *Худэгэ шүкүр, шу йыл кәдимыз мол-көл болли* (Asajam, Olot district). 2. *A household item which is made from pumpkin*, for instance, *Кәдының ичиндә севзы тохум бәр, оны элыгел, хэзыр экәмыз* (Qoravul, Jondor district). 3. *A small dish for nas or nasvai* (Uzbek chewing tobacco). To cite an example: *Сәдық кәдыңны бер, быр нәс этыйын* (Khafizobod, Romitan district). A comparative analysis of Bukharian bilingual dialects is as follows: *каду//кәды (pumpkin). Палавкаду//палавкәдъ//эшкәдъ, нәнкаду// нәнкадъ, тәмшәкаду//тәмшәкәдъ* (M. Mirzaev, 122). This lexical unit is given in the following forms in the dictionary of Uzbek folk dialects: *каду//кадъ* (Samarkand, Bukhara), *//кәде* (Kashkadarya), *//кәди* (Khorezm), *нәскәде, тәмшә кәде, дәсмәл кәде, кәди бичәк* (Kashkadarya) etc. (Dictionary of Uzbek Folk Dialects, 137). “Uzbek Folk Words in Kashkadarya” dictionary the word *кади (pumpkin)* is expressed in the following ways (Чироқчи) 1. *Pumpkin* 2. *A special rag bag used for curdling yogurt or kefir and milking a cow* (Chiroqchi), *кадичак* is a dish for curdling yogurt or kefir (Qorakhitoy). The following lexical units related to the word *кади* are also available in Kashkadarya: *кадибав* (Dekhkonobod) is a thread to tie the rag bag used for water, milk and curdling yogurt. *Кадибоғ* (Chambil) is a thread of rag bag, a fiber used for threading a rag bag. *Кадипечак* (Denov) is a pastry made by adding pumpkin between the dough. *Кадисомса* (Karshi) is a type of savoury pastry stuffed with pumpkin. *Кадихўр* (Qamashi) is a person who likes to eat and cook pumpkin. (T. Nafasov 134). In Karakalpakstan dialects the word *кади (pumpkin)* is used in various ways as well: *сәлләкәди// маркәди* (Beruniy) is a type of pumpkin called by local people as *anjir pumpkin*, *дасмал кәди* and applied to name the pumpkin used for washing the dishes, *шәңгил кәди* (water pumpkin) is a type of a mug used for drinking water, *алмакәди* and *наскәди* are the types of pumpkin, *чилиmkәди* is a sort of pumpkin used for keeping a smoking chillum, *палавкәди* is a quality sort of pumpkin, *сукәди* is pumpkin used for keeping water, *дәстәркәди* is a big pumpkin, *кәдибәрәк* is dumplings made from pumpkin, *кәдишорва* is a type of soup made with pumpkin, *кәдигәммә* is a type of savoury pastry stuffed with pumpkin etc. (Ishaev, 119). In the Uzbek literary language, the word *кади* relates to the Persian-Tajik languages and is considered to be dialectal, and in the literary language it has a meaning of pumpkin. (Explanatory Dictionary of Uzbek Language, vol 1, 358). Also the word *каду (pumpkin)* was very popular in Uzbek classical literature (Resources of Classical Literature, 171): for example, *каду* has been used to denote pumpkin, a dish used for water, a kind of small neck bag made from pumpkin and used by qalandars (wandering ascetic Sufi darvishes) for collecting money; *кадуамруд* is a round-

shaped pear; *каду качкул* a widespread small bag among beggars made from pumpkin and used as a pocket for collecting money from people (Dictionary of Navoi Literary Works, 299); In Turkmen language there are several types of pumpkin such as *хайван кәди, нас кәди, палав кәди, сув кәди, даш кәди, сүртеч кәди//десмал кәди, гара кәди, алма кәди, сары кәди* etc.<sup>3</sup>. This word has a number of variations in different languages such as *аскәди, палаўкәди* in Karakalpak (Russian-Karakalpak Dictionary, 1028), *ашкәди//ашкеди* in Kazakh dialect (Kazakh Ancient Turkic Dictionary, 50), *каду* in languages belonging to the Iranian group (Urdu-Russian Dictionary, 734), *каду* in Dari language (Dari Dictionary, 207), *каду* (Voskonyan, 720), *каду* (Russian-Tajik Dictionary, 771) and *кеди* in Kurd language (Russian-Kurd Dictionary, 248) etc.

*чәңгәләк* is a *cotton boll* or *protective case of cotton*. For instance: *Пәхтә чәңгәләгы қыштә мәлләрә зор йем боләдыр* (Qozon, Qorakul district); *Пәхтә чәңгәләгы күнжәрә, кепәк билен өкүзлеры сәмыз етәды* (Ojiayron, Olot district). This lexical unit is expressed in different forms in various Uzbek dialects i.e., *чаңалоқ* (South Khorezm), // *чаңгалақ* (North Khorezm), // *чаңгалоқ* (Bukhara) in the meaning of *cotton boll* or *cotton protective case* (Dictionary of Uzbek Folk Dialects, 293), *чангалоқ* (Karshi) means waste from cottonseed meal (T. Nafasov, 338). A comparison of the word *чәңгәләк* in various Uzbek dialects is as follows: *чаңгалақ* in Turkmen language (Turkmen Dictionary, 738), *чангалоқ* (*a cotton boll*) in Persian-Tajik, (Tajik-Russian Dictionary, 437), *шаңгалақ* (*a pit of fruit such as pitches and apricots* etc.) in Kazakh dialects (Kazakh Ancient Turkic Dictionary, 330), *чанқалақ// чаңгалақ* (*cotton-stalk*) in Uzbek dialects of Karakalpakstan etc. (Ishaev, 169).

*худрәйи* 1. *Wild plant*; a plant that crowds out without being planted. For example: *Бәр, бу пәмәдурны иймә, у худрәйи гәгәрән* (Arabkhona, Qorakul). 2. *A child without a father or whose father is unknown*. For example: *Сениң қызың худрәйи доғын, ҳәзыр дылы быр қарыш* (Tutonkora, Olot district) A comparative analysis of the word *худрәйи* in various Uzbek dialects is as follows: this word is used in various senses in the language of Uzbek classical literature: *худройлығ* in the meaning of *stubbornness, obstinacy, arbitrariness* etc. (A. Karimov, 2, 113), *худройлиқ* (*self-will, stubbornness*) (Resources of Classical Literature, 461), *худрӯ//худрӯй* means *wild* or *wild plant* (Short Dictionary of Navoi Literary Terms 310), *худроӣ* defines *a person who is willful and stubborn* (Kh. Nazarova, 161), *худроӣ* describes *a self-will, obstinate and acerbic person* (Resources of Classical Literature, 363), in the Dictionary of Navoi's Literary Works the word *худрӯ//худрӯй* relates to the Persian-Tajik origination which means *self-grown, wild* etc. and the word combination *гули худрӯ* has a meaning of *a wild flower*. *Худроӣ* is also interpreted as *stubborn, stubborn, arbitrary* and the word *худройлиқ* as *stubbornness, arbitrariness* etc. (Dictionary of Navoi's Literary Works, 665). In Khorezm dialects the word *худрайи* (Urgench, Khiva) is interpreted as *careless, light-hearted* or *laid-back* (Khorezm dialects, 93). Yusuf Jumanazarov explains the combination *худрәйи қавынни* which is widespread in Hazarasp dialect as *a local melon* and notes that the origin of the word *худрәй* is still unknown (Issues of Turkology, 133). The word *хумраӣ* was also widely used in Turkmen classical literature in the meaning of *a person who doesn't listen to anyone and does everything in his/her own* (Short Dictionary of Turkmen Classical Literature, 255). In Tajik language the word *худрӯй* means *wild* and *self-grown* (Russian-Tajik Dictionary, 215), in Persian language the word *хӯдроӣ* or *хӯдроӣи* has synonymic notions such as *self-will, stubborn* etc. and the word *хӯдрӯ* has meaning of *wild* or *self-grown* (Rubinchik, 1, 578). The expressions *a person without a father* or *a child whose father is unknown* in Persian-Tajik languages are given with the words

*гайирникоҳ, ҳароме* (Russian-Tajik Dictionary, 554) and *валадизино* (Rubinchik, 2, 707). Apparently, in Oghuz dialects of Bukhara the word *худрэйи* has an extended meaning and this lexical unit began to express the meaning of *born out of wedlock*. In Uzbek literary language, this meaning is expressed with the words *валад, валад зино, ҳароми, ҳаромзода* (Explanatory Dictionary of Uzbek Language, Vol 1,171).

The word *тоҳум* means *seed*. For example: *Кэдиниң ичиндэ севзи тоҳум бэр, элыгел бүгүн севзини экали* (Solo qorovul, Olot district); *Шу йил қовуның тохмыны элмэштирэмэн, қовун тохмымың ҳеммеси эттүришэк болли* (Yoshbotir, Olot district). In Uzbek folk dialects, this lexical unit is also used in the sense of *egg* (South Khorezm, Kashkadarya), *seed* (Lexis of Uzbek dialects, 204), *seed used for crops* (Chirakchi) and *grain for sowing seeds* (T. Nafasov, 301). In the speech of local Uzbeks from Mangit and Khojayli districts, the word expressions *тухум // туқум тәбарик* stand for *relatives* or *relations* (Ishaev, 161). A comparative analysis of the word *тоҳум* is as follows: the forms of *туқым // туқум // тухум* are very popular in Kipchok and Oghuz dialects, but *// тухъм* is used mostly in Korluk dialects in the meaning *relations* and *relatives* (Dictionary of Uzbek Folk Dialects, 382). The words *тухумы тәж* in Oghuz dialects of Khorezm, *тәхум ми:ч* in Turkmen language, *түхмә тож* in Persian-Tajik languages are exploited in the meaning of *generation* (Turkmen Dictionary, 656; Rubinchik, vol 1, 359). The word *туқым* stands for both words *seed* and *generation* (Russian-Karakalpak Dictionary, 888) and the word expression *туқымлық бийдай* expresses *grain seed* (Russian-Karakalpak Dictionary, 919) in Karakalpak language, in Kazakh language the word *тухым* has a meaning of *seed* (Kazakh Language Dictionary, 302), in Turkish language the word *тоҳум* means *seed* and the word expression *тоҳумлук бугдай* is used in the meaning of *grain seed* (Russian-Turkish Dictionary, 824), in Tajik the words *тухм, тухмӣ* are used for denoting *seed* (Russian-Tajik Dictionary, 1003), in Persian language people use the words *тохм, тохмә* in the meaning of *seed, grain* and *egg* (Rubinchik, 1,359), Tatar word *орлык* stands for *grain seed* (Russian-Tatar Dictionary, 565) and *йомырка* for the word *egg* (Russian-Tatar Dictionary, 724). In the Dictionary of Classical Literature the word *тоҳум* is referred to the word with Persian-Tajik origin. In the past the words *тухм (seed, egg), тухма (generation, seed), тухмиёна (the seed of one of the herbal plants)* (Dictionary of Navoi Literary Works, 618), *тухмийона (drug seed, healing seed)* (Short Dictionary of Navoi Literary Terms, 283), *тухм (seed, egg)* (Kh. Nazarova, 148), *тухм (relatives or relations)* (Resources of Classical Literature, 333) were widely used in the active vocabulary of Uzbek people.

The word *зэмэррық//зэмэрық* means *mushroom* or/and *fungus*. For example: *Йэмгыр йэгэннэн соң, бэхэр вэхты йэвэндэ зэмэрық бемен чықей* (Bikach, Olot district); *Зэмэррық терын, элэвдэ биширдик* (Kuvacha, Qorakul). In Uzbek folk dialects, the word also occurs in the form of *замарық* (Northern Khorezm) or *// зама:рық* (Southern Khorezm), meaning *mushroom* or *fungus* (Dictionary of Uzbek Folk Dialects, 109; F. Abdullaev, 45; Ishaev, 107). A comparative analysis of the word *зэмэррық//зэмэрық*: this word has a number of varieties and forms in different languages, for example, *замаррық* in Karakalpak language (Russian-Karakalpak Dictionary, 169), *замаррыкъ* in salir, arsari dialects of Turkmen language (Short Dialectological Dictionary of Turkmen Language, 87), *зәмбә* in Tatar language (Russian-Tatar Dictionary, 117), *мантар* in Turkish (Russian-Turkish Dictionary, 160), *кәмелек* in Turkmen language (Dictionary of Turkmen Language, 396), *занбўруғ* in the meaning of *mushroom* in Tajik language (Russian-Tajik Dictionary, 190) and *заморуғ // саморуғ* with the same meaning in

Persian language (Rubinchik, vol 1, 764; vol 2, 256). In tajik language the word *занбӯруғ* is a common name for an edible agaric, but the word *саморӯғ* stands for an inedible or poisonous agaric (Tajik-Russian Dictionary, 150; 339). In Bukharian Uzbek vocabulary the lexical unit *гөвәләк* has the conception of a *mushroom* (f.ex: *Йәмгыр йәгды – гөвәләк дүшди* (Denov, Olot district). We believe that this lexical unit is a phonetically modified form of the word *кәмелек*, which means *mushroom* in Turkmen language.

*нэзбой* // *нэзвой* in the meaning of *basil* – a tropical aromatic annual herb. For example: *этыздә дүрли-дүрли нэзвойлә экилен* (Katta bayot, Olot district). The meanings of basil in Uzbek folk dialects are expressed in a number of ways i.e., *нэзбой* (M.M. Mirzaev, 128) // *назвай* (Khorezm) // *нэзвэй* (Kashkadarya) // *назбай* (Khujayli, Kungiro) // *назвай* (Turtkul, Beruniy, Mangit) // *назвайгүл* (China) etc. (Dictionary of Uzbek Folk Dialects, 189; Ishayev, 140; B. Juraev, 144; T. Nafasov, 195). The lexical units *нозбӯй* // *нозбу* in Persian and Tajik languages stand for the word *basil* (Russian-Tajik Dictionary 43; Rubinchik, 2, 606). When we compare the words in different languages we may find out several variations and forms of the word *basil* such as *райхан* (Kazakh Dictionary, 251), *туран уты* (Russian-Tatar Dictionary, 655), *феслеген* // *базилик* (Russian-Turkish Dictionary, 31) and *назбай* // *рейхан* (Turkmen Dictionary, 463, 562) etc.

*зәрдалы* // *зердалы*// *залдары* means *apricot tree* and its *fruit*. For example: *Жықжыққа зәрдалының үстүнә гелип сейрәп хич ухләтмидир* (Kharoba, Peshku district). This lexical unit is found in Uzbek dialects in the following forms: *зәрдалу*//*зәрдалъ* (M. Mirzaev, 118) used in the meaning of *fresh apricot*, *зәрдалы* in the Lower part of Kashkadarya in its genuine meaning of *apricot* (A. Shermatov, 92). However in the Resources of Classical Literature this lexical unit is referred to the Persian-Tajik languages: for instance, *зәрдолу* (Short Dictionary of Navoi Literary Terms, 97; Dictionary of Navoi's Literary Works, 245; Kh. Nazarova, 48). In the Explanatory Dictionary of Uzbek Language the word *зәрдоли* is presented as the word with Persian-Tajik origin, but relating to the dialectal words with the meanings of an *apricot tree* or its *fruit* (Explanatory Dictionary of Uzbek Language, vol 1, 300). In Persian and Tajik languages the word *зәрдолу* shares the same meaning (Tajik-Russian Dictionary, 151; Rubinchik, vol 1, 759). Through the comparative analysis we may come across with numerous forms of this word in different languages: *ерик* (Russian-Karakalpak Dictionary, 14), *эрик* (Russian-Turkmen Dictionary, vol 1, 30), however in Kirach dialect of Turkmen language it has a form of *зерда:лы* and in Khasar dialect it takes another shape as *зәрдалы* (Short Dialectological Dictionary of Turkmen Language, 89), *өрек* (Russian-Tatar Dictionary, 15), in Turkish language the word has two expressions such as *кайусу* (*apricot* and *apricot tree*) and *кайусу ағачы* (*apricot tree*) etc.

*шывыргэны* is a *raisin type of grape; the grains are small, seedless, dark black in color, and the name of the vine or the branch that bears such fruit*. For example: *Шывыргэны йәхишы хәсыл берәды, уннән зор мейизи хәр йылы элмән. Шывыргэныгә дым көп қәрәш кәрәк* (Kukkuз, Olot district). *Шъбърганъ* is a black, round sort of grape which usually grows in summer (F. Abdullaev, 114). The name of this sort of grape is related to the name of the place *Шибиргон* // *Шибаргон*, located in the northern part of Afghanistan. The suffix *-и* occurs in words borrowed from other languages and serves to create adjectives that express a relation to a place, for example, *шибиргони*//*шивиргони*, *кәшмири* etc.

*йәкдәнә// йәгдәнә* is a sort of grape with a large bunch of fruit with few seeds but productive and sweet. For example: *үзүмиң йәхишысы йәкдәнә боләды* (Chovurchi, Qorakul). Consisting of two Tajik words *йак* (як) and *дона* (seed, grain) (one, the only) this grape variety has been famous for its quality and uniqueness.

*ҳилвой* is *mint*, a temperate plant with aromatic leaves and small mauve flowers. For example: *Отызә бәрып ҳилвой, нәзвәй, йорынжә әлигелиң, гәк сәмсә биширжәк* (Bikach, Olot district). This word is expressed as *пудинә* in dialects of Kashkadarya and Samarkand and in Bukharian bilingual Uzbek dialects it has other variations such as *ҳулбӯй//ҳулвӯй* (M. Mirzaev, 145; Dictionary of Uzbek Folk Dialects, 223). In Osh and Jizzakh it has the form *ҳилвә* and in Namangan region as *ҳулвә* a variety with a slight phonetic change. All the lexical unites mentioned above are the same as Tajik *пудина, ҳулбӯй*. In the Tajik language, the words *пудина, ҳулбӯй, наъно* create a synonymic line (Russian-Tajik Dictionary, 506). As comparative analysis of these word shows there are a number of other variations of *ҳилвой* in different languages. For example: *жалбыз//нозбай* (Russian-Karakalpak Dictionary, 449), *бәтнек* (Russian-Tatar Dictionary, 280), *нане* (Russian-Turkish Dictionary, 418), *нарпыз* (Russian-Turkmen Dictionary, vol 1, 588), *наъно* (Tajik) (Voskanyan, 283) etc. *Ҳилвой* in Uzbek is called as *ҳилви, чӯл ялпизи* (desert mint). There is some evidence that Avicenna (Ibn Sina) on page 295 of volume 2 of his *Canon of Medicine* names mint as *наъно* and presents two types of this plant: garden mint and desert mint (Uzbek Literature and Art, №52, 2014, p 1). In sarik, solir, arsari and southern yomut dialects of Turkmen language *mint* is given as *пидене*, in anev dialect as *пидинә*, in nukhur dialect as *пудинә* (Short Dialectological Dictionary of Turkmen, 148).

*шывыт* means *dill* – a type of herb which has aromatic threadlike foliage. For example: *Шорвә, уншыгә шывыт сәлсәң, бу о:қәты йәхишы гәрип иймиз* (Pichoqchi, Olot district). In Uzbek dialects it has the forms *шывыт// шувыт//шебит* (Urgench, Khiva, Khonqa) (Dictionary of Uzbek Folk Dialects, 314; F. Abdullaev, 103). The word *dill* has several variations in other languages that is *ауқатқа салынатугын ийисли шәп, укроп* in Karakalpak (Russian-Karakalpak Dictionary, 1044), *шәет//туран уты* in Tatar (Russian-Tatar Dictionary, 655), *дереўту* in Turkish language (Russian-Turkish Dictionary, 945) and *шубит//укроп* in Turkmen language. In Uzbek-Russian dictionary, the word *швид//шивит* is described as specific to a dialect as well as in the five-volume explanatory dictionary the word *шивит* is referred to Persian dialects (Uzbek-Russian Dictionary, 561; Explanatory Dictionary of Uzbek Language II, vol 4, 567). In taka and akhal dialects of Turkmen language the word *шивит* also means *dill*, but in Persian and Tajik languages they are used as *швид* (Voskanyan, 736) and *шубит* (Russian-Tajik Dictionary, 1143).

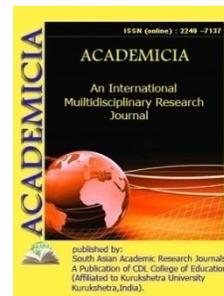

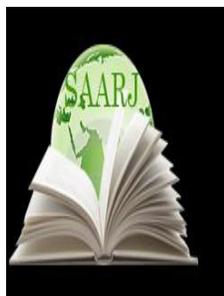

The word *әптәппәрәс//әптәппәрәс* means *sunflower*. For example: *әптәппәрәсләрымыз гәз дегмәсын хеммәсы бехәтә гәгәрыптыр* (Vokhim, Qorakul district); *әптәппәрәсымыз йәхишы хәсыл бермәды* (Qaroli, Jondor district). In Shakhrisabz (Kashkadarya) the word *әфтәбнәрәст* has two meanings: 1. *Sunflower*. 2. *Type of embroidered ornament* (T. Nafasov, 213). In one of the Bukhara dialects the word *әфтәбнәрә* means *sunflower* (Dictionary of Uzbek Folk Dialects, 37), but Tajiks use it as *офтәбнәрәст* (Russian-Tajik Dictionary, 1004). *Офтәбнәрәст* has the concept of *sun-loving* in Tajik (Rubinchik, 103), when the word *sunflower* is expressed with the word *тӯхмә* and the word combination *тӯхмә шәкастан* means *sunflower lightning* (Voskanyan, 623). In Turkmen dialects of Karakalpakstan the word *а:нта:нмәрез* is applied for describing *double-faced, rascal* and *cheating* people (Short Dialectological Dictionary of

Turkmen Language, 23) and *гүнебақар* is used to denote *sunflower* (Turkmen Dictionary, 216). This word has different variations in some other languages as well: for example, *айғабазар* in Karakalpak (Russian-Karakalpak Dictionary, 702), *айгичегу // гүнебакан* in Turkish language (Russian-Turkish Dictionary, 642) and *көнбагыш* in Tatar (Russian-Tatar Dictionary, 564) etc.

From all the above it can be seen that most of the borrowed words in Bukhara Oghuz dialects have become vital lexical units for the representatives of those dialects. It is not known whether these lexical units are loaned from Persian-Tajik or borrowed from other languages. They seem like native words for local people as they have already interpenetrated to the daily usage.

## CATALOG OF TRAINING TASKS FOR TRAINING SPECIAL ENDURANCE OF YOUNG GIRL HANDBALL PLAYERS

**A.K. Ibragimov\***

\*Associate Professor,  
Faculty of Physical Culture,  
Head of the Department of Interfaculty Physical Culture and Sports,  
Bukhara State University, UZBEKISTAN

### ABSTRACT

*In the study, a catalog of motor (training) tasks was developed, aimed at the education of special components of endurance, manifested in playing competitive activity among young handball players (girls). It was assumed that the progressive growth of sports-technical and physical readiness of young and young female handball players in teams of potential reserve, high efficiency of competitive activity and indicators of its effectiveness will be achieved in the conditions of building the microstructure of training in the form of motor tasks, corresponding to their training effects to the load of competitive exercises.*

**KEYWORDS:** *Handball, Youth Sports, Women's Sports, Girls Handball Players 16-17 Years Old, Motor (Training) Task, Heart Rate - Heart Rate, Cardiac Monitors "POLAR".*

### INTRODUCTION

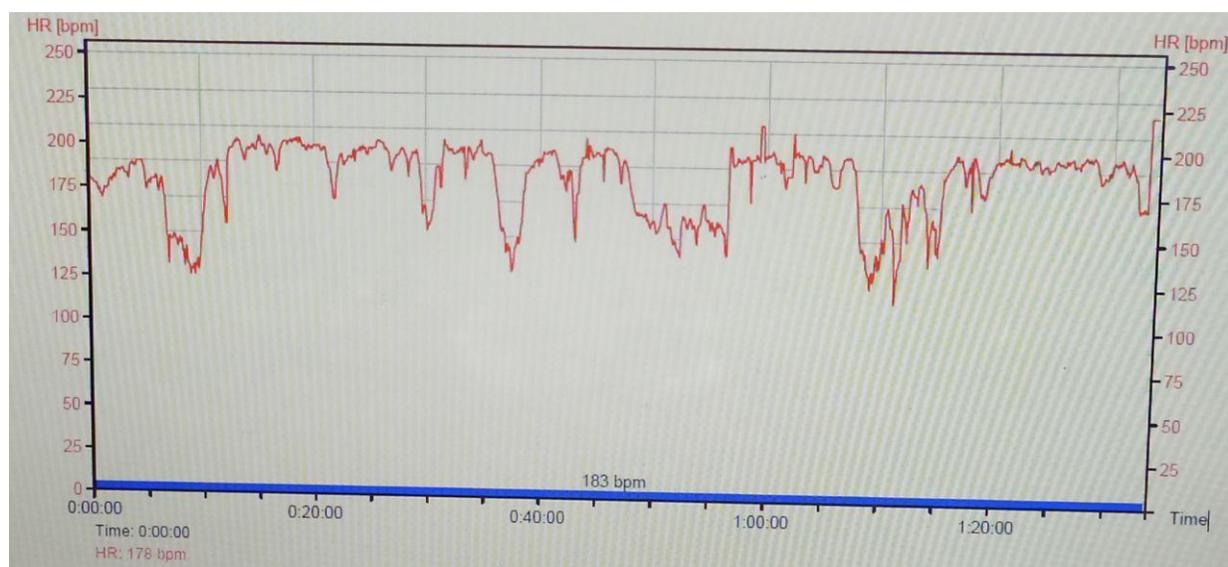

Modern views in the construction of sports training for young and qualified athletes are associated with the allocation of primary structural and functional units of the organization of motor activity, called motor (training) tasks [1,2]. The selection of such tasks in the training activity of young and qualified handball players should take into account the specialization of the functional reactions manifested in competitive activity [3]. At the same time, in the practical activity of novice coaches, due to the insufficient number of scientific and methodological recommendations, sometimes training tasks are solved that do not ensure the growth of sports, technical and physical fitness, since the composition of exercises, methods of their implementation, parameters of loads in their influence do not correspond to competitive effects [3]. By virtue of this fact, the study set a goal - taking into account the specifics of functional reactions manifested in the game competitive activity of girls-handball players, to develop a

catalog of training tasks that would ensure the growth of the leading sides of the preparedness of young athletes of 16-17 years old, and, first of all, special components of endurance [ 4].

The analysis of the internal load in terms of heart rate in the conditions of the Championship of Uzbekistan was carried out using the POLAR Team System.

## RESULTS OF STUDIES

Studies conducted during the Championship of Uzbekistan among girls aged 16-17 [5] showed that in the most intense games of the finals, about 80% of the active time of the competitive game takes place in the pulse range of a large (161-180 beats / min) and high intensity load ( from 181 bpm and above). Figure 1 shows the pulse curve reflecting the intensity of physical actions in the final game for the 3rd place with a 1 point loss to one of the most productive players in the match and the competition as a whole.

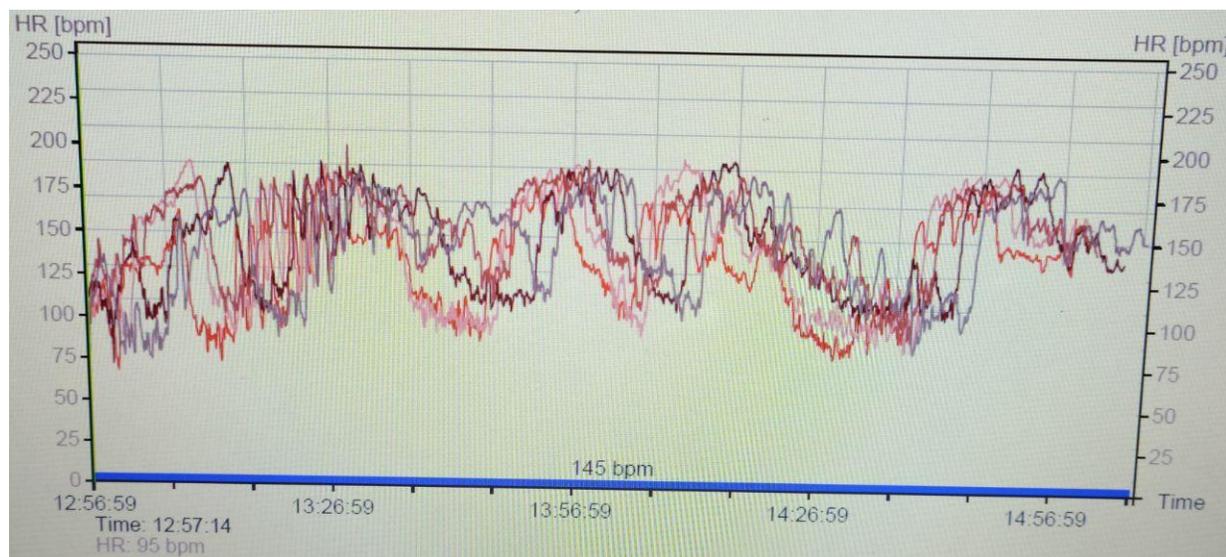

Person	RazzokovaMarjona	Date	16.02.19	Heart rate average	183 bpm		
Exercise	05020401	Time	16:29:35	Heart rate max	221 bpm		
Sport	Running	Duration	1:33:40.0				
Note				Selection	0:00:00-1:33:40(1:33:40.0)		

Figure 1 - Heart rate dynamics of a player in the final match of the Championship of Uzbekistan among girls aged 16-17

As a comparative example, Figure 2 shows the dynamics of heart rate for a number of players during a training session. The structure of the training consisted of the following scheme of sequential tasks: warm-up running and running tasks along the diagonal; stretching exercises - stretching; passing the ball in pairs along the court with the goal attack, back - a 2 × 2 game; Exercise in passing the ball with 3 versus 6 defense throughout the entire court; throws in pairs from medium and long distance; 6 × 6 game with repetition of tactical interactions; free throws;

6 × 6 game with personal protection throughout the court; free throws. Despite the fact that high-intensity exercises were used in this training, the general parameters of the load differ significantly from the competitive ones. So, in the high-intensity zone, the players were 12.8% of the training time, in the high-intensity zone - 24.6%, in the medium-intensity zone - 22.8%, in the low-intensity zone - 39.8%.

Figure 2 - Dynamics of players' heart rate during a training session

Thus, in the training process, up to 60% of active time actually falls on work in the zone of moderate power (medium and low intensity), which hardly meets the requirements of effective

competitive activity. The analysis of pulse curves made it possible to compile a catalog of motor tasks, in which the value of the load was determined according to the point system. Intensity gradation the load was determined: insignificant - heart rate - 114–120 beats / min, 1–2 points; moderate - heart rate - 126-132-138 beats / min, 3-4-5 points, respectively; average - heart rate - 144–150–156–162 beats / min, 6–7–8–10 points, respectively; large - heart rate - 168–174–180 beats / min, 12–14–16 points, respectively; submaximal and maximum - heart rate - 185-192-198beats / min, 20-24-32 points, respectively. For example, one training session used pulse response exercises with 192, 174, 137, 186, 150 bpm, which corresponds to 25, 14, 5, 21, 7 points, i.e. a total of 73 points. Naturally, the next or previous trainings had different total scores, for example, 96, 112, 64, 82, etc. Thus, summing up the normalized cost of the load, we get a value that characterizes both an individual training session and the training stage as a whole. By determining the overall total assessment of the load at each stage, it is possible to compare these stages with each other in quantitative terms using a single indicator. In the course of the research, a catalog of motor tasks aimed at developing special game endurance was developed, including 4 clusters [1, 2, 4]: I Cluster - heart rate up to 135 beats / min. The intensity is low to moderate. The orientation is aerobic. Education of flexibility, strength. Exercise is mostly not specialized, simple. The magnitude of the load is from 1 to 5 points. Motor tasks: a set of stretching exercises; set of exercises ORU; even running; about-preparatory jumps; jumping from a place in pairs; recovery swimming; strength exercises on simulators. Cluster II - heart rate 136–160 bpm. Average intensity. Orientation, mixed aerobic-anaerobic. Education of special endurance, strength. Exercises mostly specialized, simple and complex. The value of the HR load is –144, 150, 156, 160 beats / min, 6, 7, 8, 9 points. Motor tasks: free throws - "picked up and threw"; free throw in pairs; medicine ball passing in place and in motion; dribbling with two balls in place and in motion; passing in motion in pairs, alternately with two balls; dribbling in pairs, holding the hand, one pulls the other player behind him, both dribble the ball; "Jerking" with a change in the direction of movement, stopping with "stomping" ("dance"); dribbling the ball with a change in direction, with transfers followed by an attack; jump in pairs in series of 10; going to the right and left, a jump throw after a step; hitting the ball on the backboard; "Handball" cross, shuttle with throws from different distances.

III Cluster - heart rate 161-180 beats / min. The intensity is great. Orientation, mixed aerobic-anaerobic. Education of special endurance, strength, speed-strength qualities. The exercises are mostly specialized and complex. The value of the heart rate load - 162, 168, 174, 180 beats / min, 10, 12, 14, 16 points. Motor tasks: playing with a "shuttle"  $5 \times 4$ ,  $6 \times 6$ ; two-sided games without pressure; game  $1 \times 1$  on two gates; game  $5 \times 3$ ,  $6 \times 5$ ,  $4 \times 4$  on two shields; double-sided games with periodic use of pressure; "Repeated" jumps; running on segments of 300, 400, 600 m.

IV Cluster - heart rate from 181 and above beats / min. The intensity is submaximal and maximum. The orientation is anaerobic. Education of speed, speed-strength abilities. The exercises are mostly specialized and complex. The value of the heart rate load is 185, 192, 198 beats / min, 20, 24, 32 points, respectively. Motor tasks: varieties of "eights" - narrow, wide, with catching up, followed by a game of  $5 \times 2$ ; the game  $6 \times 3$ ,  $6 \times 6$ ,  $6 \times 5$  with access to the "fast break"; exercises in fast break  $6 \times 1$ ,  $6 \times 2$ , etc.; shuttle running with or without dribbling from front to back; game in a numerical advantage  $6 \times 1$ ,  $6 \times 2$ , etc.; playing with pressure throughout the court; control and qualifying games using substitution.

Thus, in our study, the parameters of the training load were determined on the basis of the relationship between heart rate, the nature of energy supply and the predominant orientation of tasks when solving certain pedagogical tasks. In general, the value of the training load characterized the degree of influence of certain exercises performed by the player on his body. The catalog clusters also took into account the indices of specialization, complexity and orientation of training loads [5]. The predominant fulfillment of motor tasks from one cluster of the catalog allows achieving a certain intensity in the load, programming the general functional effect, while clear parameters of the training load in terms of the duration of the task, its repetition, the duration of rest are provided by the standard reactions of the body. The inclusion of tasks from various clusters will help us regulate the dynamics of the increase in the load, and their vertical ordering will provide an opportunity to take into account the individual reactions of the body of athletes-handball players.

## CONCLUSION

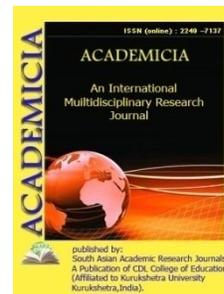

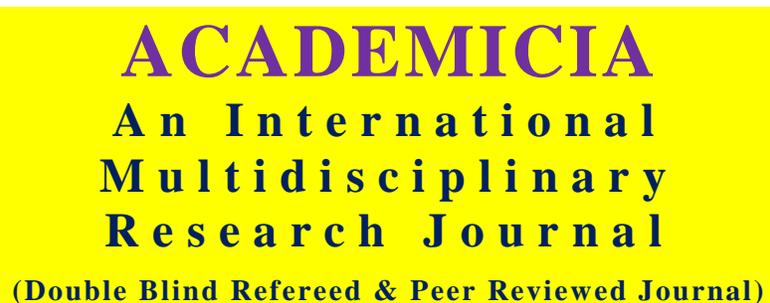

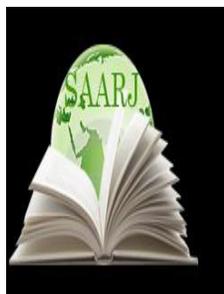

When planning training sessions, it is recommended to use the catalog of complexes-tasks according to the training effect indicators - the heart rate. For exercises with a low load, choose tasks mainly from cluster I (heart rate - up to 135 beats / min), from the middle - the second (heart rate - 136–160 beats / min), from the big one - from the third (heart rate - 161–180 beats / min), with the maximum - IV cluster (heart rate - 181 and above). Summing up the assessment of the load in points, you can get a normalized value that characterizes both a separate training session and the training stage as a whole.

## METHODOLOGY OF APPLICATION GAMES IN THE TRAINING OF YOUNG ATHLETES

**Mehridin Junayduloevich Abdullaev\***

\*PhD, Physical Culture Faculty,  
Bukhara State University,  
UZBEKISTAN

### ABSTRACT

*This article scientifically analyzes and substantiates the methodology of using movement games in the development of physical and psychological training of 10-12-year-old athletes in the primary training group. In movement games, the physical and mental components are closely intertwined, not only taking into account the formation of children's ability to work as a team, the ability to fight for the common good with other children in the team, but also through active action.*

**KEYWORDS:** *Initial Preparation Stage, Strength, Agility, Endurance, Agility, Physical Training, Psychological Preparation, Ability To Communicate.*

### I. INTRODUCTION

Today, the popularization and development of physical culture and sports has become one of the important directions of the world community. In this regard, the role of children's and youth sports is of particular importance [1]. The role of physical, technical-tactical, psycho physiological, intellectual training in attracting talented children to the chosen sport, in developing their sports skills is invaluable. The rapid development of sports is one of the important aspects of the development of children's and adolescents' sports today. One of the most important tools for the development of children's sports is action games.

Research in the world has studied the formation and development of motivation of young athletes for sports, the optimization of training loads, taking into account their anatomical-physiological, psycho physiological and age characteristics.

## II. LITERATURE REVIEW

At the initial stage of preparation, the means and methods of rational formation of movement training in the selected sport, a methodology for developing their motor qualities, taking into account the sensitive periods of children, have been developed. Numerous studies have been conducted on the problems of qualifying sports, determining the importance and effectiveness of mobile games in maintaining the contingent in their sports clubs [3,4,5,6,7,8,9]. Improving the system of application of movement games in the physical and psychological training of young athletes is now considered a solution to the initial stage tasks.

Of course, today in the field of theory and methodology of children's and adolescent sports a lot of research has been conducted on the adaptation of the system of training of adolescent athletes to modern requirements.

V.G.Nikitushkin, K.T.Shakirjanova, E.R.Andris, R.Q.Qudratov, A.N.Normurodov, M.S.Olimov, T.S.Usmonkhodjaev, V.P.Filin, S.S.Tajibaev and others, in their research works and sources, emphasize the importance of movement games in the targeted development of physical and psychological training of adolescent athletes engaged in primary training [3,4,5,6,7,8,9].

## III. Analysis

As a result of the analysis of the scientific and methodological literature, methodological recommendations for improving the methods of using movement games to increase the effectiveness of training of young athletes, the development of physical qualities and psychological training of trainees are not sufficiently developed.

**The aim of the study** was to improve the methodology of using movement games in improving the physical and psychological fitness of young athletes.

### Research objectives:

- To determine the correlation between the indicators by studying the age-specific dynamics of physical and psychological training of athletes;
- To determine the content and direction of the method of stratification and application of movement games in the training of young athletes;
- To determine the effect of the level of physical fitness on psychological fitness in athletes aged 10-12 years;
- improving the use of movement games in the training of 10-12-year-old athletes in the initial stage of training.

**The object of the study** was the training process of young athletes.

**The subject of the study** was the use of movement games in increasing the effectiveness of training of young athletes.

The work used the analysis of scientific and methodological literature, pedagogical observation, pedagogical testing, instrumental methods, psychological testing, pedagogical experience and methods of mathematical statistics.

A pedagogical experiment was conducted to test the effectiveness of the developed authoring method, which focuses on the development of physical and psychological abilities of children aged 10-12 years.

The results of experiments to determine the level of physical fitness of children aged 10-12 years in primary education are presented in Table 1.

The general level of physical fitness of adolescent athletes is as follows: the average result in running 30 m in 10-year-old boys was  $6.8 \pm 0.2$  s, in 11-year-olds -  $6.7 \pm 0.2$  s, the development of speed quality in athletes of this age compared, the reliability of the statistical differences between the indicators is  $p > 0.05$ .

The analysis of the results of the dynamics of physical fitness of 10-year-old athletic boys is as follows.

At the beginning of the study, the average performance of the control group was  $6.8 \pm 0.2$  in the 30 m run (s), the average of the experimental group was  $6.7 \pm 0.3$ , and the reliability of the statistical differences between the indicators was  $p > 0.05$ .

At the end of the study, in the 30 m run (s), the average performance of the control group was  $6.5 \pm 0.7$ , the average performance of the experimental group was  $6.1 \pm 0.4$ , and the reliability of the statistical differences between the indicators was  $p < 0.05$ .

When 3x10 m moxibustion running control tests were taken to determine the level of agility quality development, at the beginning of the study, the control group had an average of  $9.0 \pm 0.4$ , while the experimental group had an average of  $8.8 \pm 0.3$ , statistical differences between the indicators. reliability  $p > 0.05$ .

At the end of the study, the mean of the control group was  $8.7 \pm 0.6$ , and the mean of the experimental group was  $8.3 \pm 0.5$ . The results show that in the experimental group, the rate of increase in agility quality improved by 0.4 seconds, the reliability of statistical differences between the indicators  $p < 0.05$ .

In the 60 m running control test, at the beginning of the study, the mean value of the control group was  $9.6 \pm 0.3$ , the mean value of the experimental group was  $9.4 \pm 0.7$ , and there was no reliability in the statistical differences between the values -  $p > 0, 05$ .

**TABLE 1 DYNAMICS OF PHYSICAL FITNESS OF 10-YEAR-OLD ATHLETIC BOYS**

T/p	Indicators Running 30 m (s)	CG	EG	t	p
		$\bar{x} \pm \sigma$	$\bar{x} \pm \sigma$		
1	3 × 10 m moxibustion Running (s)	<u>6,8±0,2</u>	<u>6,7±0,3</u>	<u>0,45</u>	<u>&gt;0,05</u>
		6,5±0,7	6,1±0,4	2,41	<0,05
2	Running 60 m (s)	<u>9,0±0,4</u>	<u>8,8±0,3</u>	<u>0,48</u>	<u>&gt;0,05</u>
		8,7±0,6	8,3±0,5	3,21	<0,05
3	Throwing a filling ball (1 kg) (meters)	<u>9,6±0,3</u>	<u>9,4±0,7</u>	<u>0,48</u>	<u>&gt;0,05</u>
		9,4±0,8	9,1±0,9	2,32	<0,05
4	Long jump from a standing position (sm)	<u>5,2±0,3</u>	<u>5,3±0,4</u>	<u>0,87</u>	<u>&gt;0,05</u>
		5,6±0,9	6,1±0,7	2,39	<0,05
5	Leaning forward while standing (sm)	<u>157,2±2,2</u>	<u>158,4±4,1</u>	<u>0,94</u>	<u>&gt;0,05</u>
		162,1±2,4	168,4±1,3	3,39	<0,001

6	Pulling on a horizontal bar (times)	$5,7 \pm 1,2$	$5,9 \pm 1,1$	$0,94$	$>0,05$
		$6,8 \pm 1,4$	$7,9 \pm 0,45$	$3,39$	$<0,05$
7	6 minutes of running (m)	$3,5 \pm 0,6$	$3,2 \pm 0,8$	$1,15$	$>0,05$
		$4,0 \pm 0,7$	$4,4 \pm 0,7$	$1,89$	$>0,05$
8	Indicators	$855,5 \pm 10,3$	$845,8 \pm 4,5$	$1,12$	$>0,05$
		$865,5 \pm 10,3$	$900,4 \pm 7,2$	$3,21$	$<0,001$

At the end of the study, the mean of the control group was  $9.4 \pm 0.8$ , the mean of the experimental group was  $9.1 \pm 0.5$ , and the results showed that the rate of increase in agility quality in the experimental group improved by 0.3 seconds. The statistical differences are reliability -  $p < 0.05$ .

Filling ball throwing (1 kg), (meter) control tests were taken to determine the advanced level of strength physical quality of the trainees.

#### IV. DISCUSSION

At the beginning of the study, the mean of the control group was  $5.2 \pm 0.3$ , the mean of the experimental group was  $5.3 \pm 0.4$ , and there was no reliability in the statistical differences between the indicators -  $p > 0.05$ .

At the end of the study, the mean of the control group was  $5.6 \pm 0.9$ , while the mean of the experimental group was  $6.1 \pm 0.7$ . The results show that the rate of increase in strength quality in the participants of the experimental group increased by 0.5 m, there is a reliability of statistical differences between the indicators -  $p < 0.05$ .

Long jump (sm) According to the results of the control test, the average score of the control group at the beginning of the study was  $157.2 \pm 2.2$ , the average score of the experimental group was  $158.4 \pm 4.1$ , there is no reliability in the statistical differences between the indicators -  $p > 0.05$ .

The mean of the control group at the end of the study was  $162.1 \pm 2.4$ , while the mean of the experimental group was  $168.4 \pm 1.3$ . The results show that the growth rate of the long jump control test in the experimental group increased by 0.6 m, there is a reliability in the statistical differences between the indicators -  $p < 0.05$ .

According to the results of the upright bending (sm) control test adopted to determine the quality of flexibility, the average score of the control group at the beginning of the study was  $5.7 \pm 1.2$ , while the average score of the experimental group was  $5.9 \pm 1.1$ . equal, the reliability of the statistical differences between the indicators  $p > 0.05$ .

According to the results of the 6-minute running (m) control test obtained to determine the development of endurance quality, the average score of the control group was  $855.5 \pm 10.3$  at the beginning of the study, while the average score of the experimental group was  $845.8 \pm 4.5$ . there is no reliability in the statistical differences between the indicators -  $p > 0.05$ .

The mean of the control group at the end of the study was  $865.5 \pm 10.3$ , while the mean of the experimental group was  $900.4 \pm 7.2$ . The results show that in the experimental group, the growth rate increased by 0.35 m, there is a reliability in the statistical differences between the indicators -  $p < 0.05$ .

The study also examined the effects of movement games on the psychological preparation of young athletes.

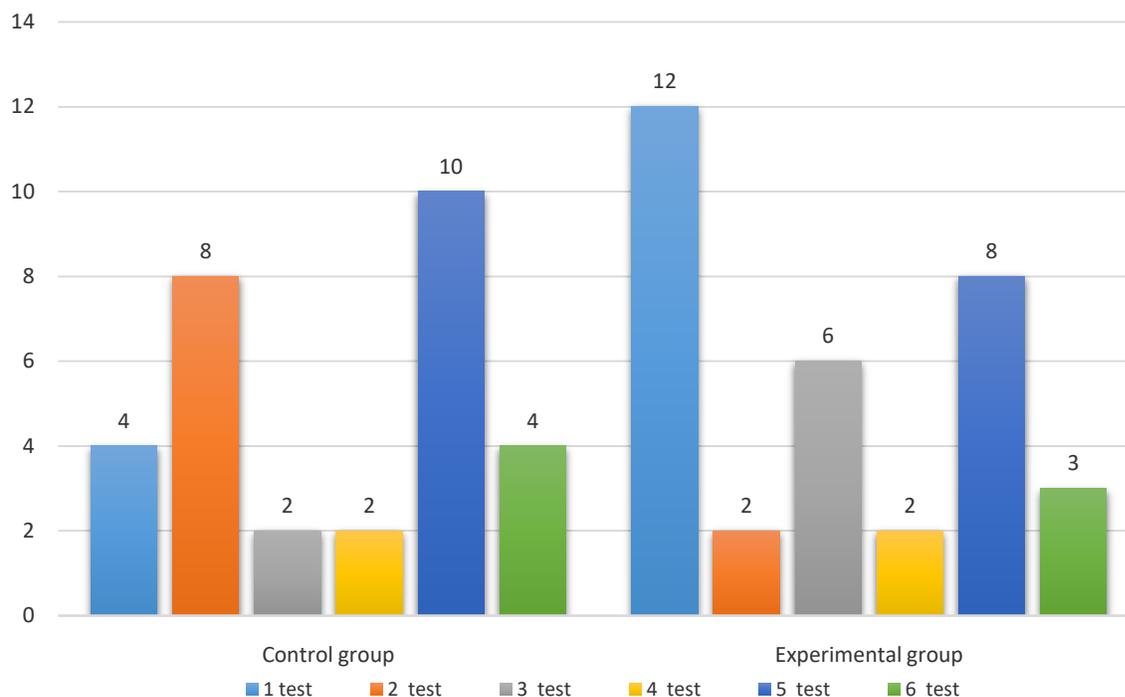

It should be noted that the ability to communicate in young athletes is a complex process, which is manifested in children in a variety of interactions and begins to form in the simple social motives of behavior.

During the experiments (at the end of each of the three stages), the level of demonstration of children's ability to communicate was clarified and timely adjustments were made to the selection of play materials.

Analysis of the results of pedagogical experiments in control and experimental groups during the test showed that there were some changes in children's ability to communicate. Observations on children in kindergarten were performed on test maps to be completed by teachers.

In consultation with each other, educators assessed the level of children's ability to communicate with other children and adults, the level of development of the quality of will, the manifestation of skills and abilities to successfully perform various activities. Based on the comparison of the initial, intermediate and final results, data were obtained that allow to draw a final conclusion about the level of development of children's ability to communicate.

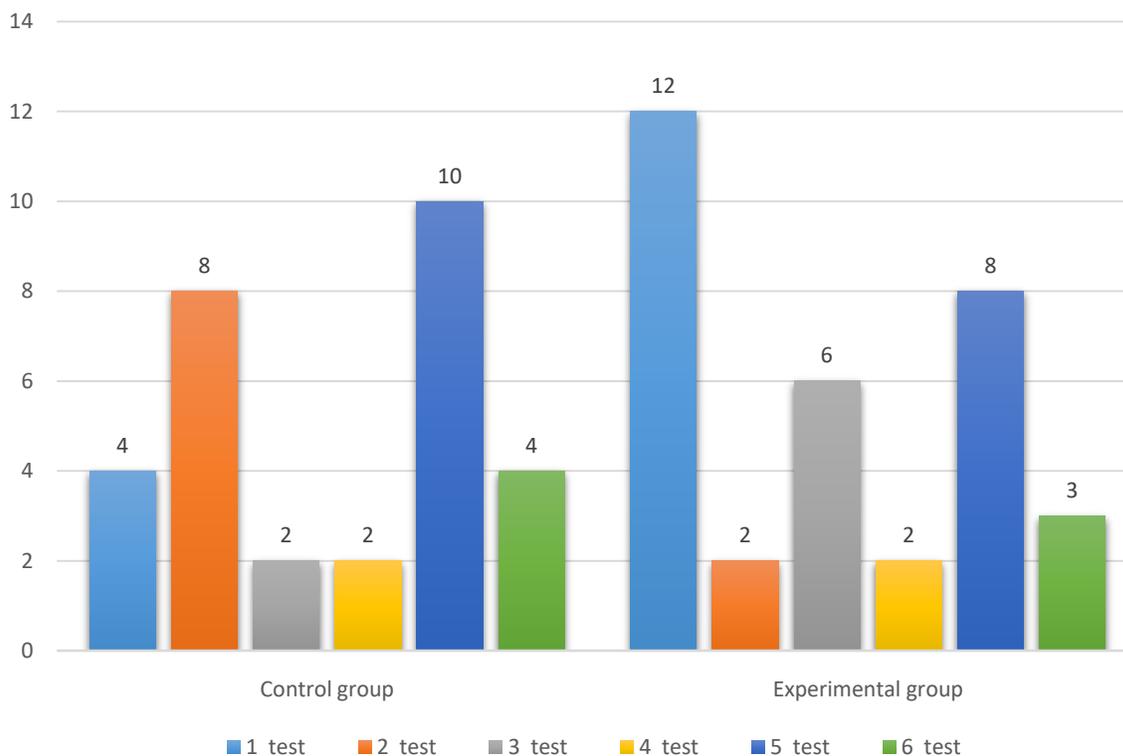

In the period before the implementation of pedagogical experiments, the average value of external indicators of children's ability to communicate in the experimental group was assessed with 3.29 points, while in the control group it was noted that this indicator was 3.33 points. These results are the "average" level for the value of the indicator being analyzed. During the experiments, a smooth increase in the value of this indicator was observed in both groups (picture 1).

### Picture 1. Developmental ability of 10-year-old athletes to communicate during pedagogical practice (%)

Thus, in the first stage of pedagogical experiments, it was noted that 70% of children in the experimental group formed stable stable friendly relations with their peers. If there was a short-term periodicity in the interactions at the beginning of the experiments, a negative change in this indicator was noted in 25% of children, and at the end of the experiments it was found that the value of this negative indicator decreased to 16%. Negative situations in relationships are characterized by short-term manifestations, which are accompanied by an increase in children's willingness to participate in joint play activities.

According to the results of the test to determine the development of children's ability to communicate during the experiments [8], the control group on the psychological test "Monitoring of communication activities" showed that the boys in the experimental group received 4% after pedagogical experience. 12% (see picture 1). According to the results of this test, the results of the girls in the control group were 4%, and the results of the athletes in the experimental group were 12% (see picture 2).

### Picture 2. Developmental ability of 10-year-old athletes to communicate during pedagogical practice (%)

In the 10-year-old boys in the primary preparation stage, the control group scores on the Peer Comprehension test were 8%, the experimental group scores 15% (see picture 1), and the control group scores 4%. The results obtained are 12% (see picture 2). The reason why boys and girls in TG have a high level of understanding of their peers is because of the movement games that we

have categorized and applied to the learning process. This situation once again confirms the correct and purposeful stratification of movement games in accordance with the psychological characteristics of children engaged in athletics.

The most important thing in sports is to perform the tasks given by the coach in a timely manner. As a result of the movement games we used in our study, 2% of the boys in the control group and 6% of the boys in the experimental group tested the ability to “understand the tasks of the activity to be performed” (see picture 1). 4%, 6% results were recorded in the experimental group (see picture 2).

The mutual friendliness of the participants is important during the sessions. We observed that 10% of the boys in the control group and 13% in the experimental group scored on the “Children's Perceptions of Expressing Peer Relationships” test, which was considered important by the participants (see picture 1). It was also found that the results of this test were 4% in the control group of girls and 6% in the experimental group (see picture 2).

According to a study of 10-year-old athletes in the psychological control test "Child's perception of the relationship to adults", the control group showed 4% of boys, the experimental group - 7% (see Figure 1), the control group - girls. 5%, the experimental group recorded a result of 7% (see Figure 2). This is due to the fact that the organization of movement games and the movement games used in the training of young athletes are properly selected, and the norms and intensity of their application are properly developed by us.

The coach's direct supervision of the movement during the training session also helped to increase the performance of 10-year-old athletes in the psychological control test "Children's perceptions of adult attitudes".

## **V. CONCLUSION**

The results of the conducted experiments allow to come to a number of general conclusions and final conclusions.

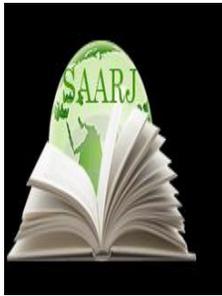

In movement games, the physical and mental components are closely intertwined, not only taking into account the formation of children's ability to work as a team, the ability to fight for the common good with other children in the team, but also through active action. The ability to target energy resources, the formation and development of skills and abilities of physical activity.

Compared to other methods currently used in practice, this method of experimentation has been shown to be highly effective, ensuring the harmonious development of children's ability to interact with physical development when applied to the pedagogical process in sports educational institutions.

## PROFESSIONAL COMPETENCE OF THE SPECIALIST IN PHYSICAL CULTURE

**Farhod Fazliddinov\***

\*The Faculty of Physical Culture,  
 Bukhara State University, UZBEKISTAN

### ABSTRACT

*The article discusses the professional and psychological competence of a teacher, the role of the readiness of a specialist in physical culture and sports, generalized algorithms of pedagogical activity, the tasks facing a specialist in physical culture and sports, as well as research methods and levels of professional and psychological competence achieved within the framework of existing educational practice ... In particular, you cannot learn to maintain discipline in the gym or on the playground without going through teaching practice.*

**KEYWORDS:** *Teacher Competence, Professional And Psychological Competence Of A Specialist, A Specialist In Physical Culture And Sports, Mastering The Basic Algorithms Of Pedagogical Activity.*

### INTRODUCTION

The professional and psychological competence of a teacher in the scientific and methodological literature is characterized as a unity of theoretical, practical, psychological readiness for the implementation of pedagogical activities. In the field of higher education, the main educational value is professional and psychological competence, which ideally implies a specialist's possession of the entire set of cultural, including purely professional, samples known to date in this area of human activity. In accordance with this approach, the professional-psychological competence of a specialist is characterized as his readiness to implement various algorithms of pedagogical activity, and the formation of professional-psychological competence should be considered as the main task of higher pedagogical education [1; p.180]

... It seems to us that in the structure of professional and psychological competence of a future specialist in physical culture and sports, it is necessary to highlight the main types of activities of a specialist [2; p.17]:

- Information and orientation;
- Modeling;
- Mobilization;
- Translational;
- Control and assessment;
- Analytical;
- Corrective.

To carry out these types of professional pedagogical activity, it is necessary to form the following components of the readiness of a specialist in physical culture and sports:

- Operational and technological;
- Scientific and theoretical (cognitive);
- Psychological (motivational-value).

Such an approach to determining the structure of the professional and psychological competence of a future specialist in physical culture and sports allows not only to implement a systemic and interdisciplinary approach to solving a complex and multifaceted question about the possible content of the professional and psychological competence of a future specialist in physical culture and sports, but also to determine levels of mastering the algorithms of pedagogical activity.

Generalized algorithms of pedagogical activity, in fact reflecting the functional content of the content of the concept of "professional and psychological competence of a future specialist in physical culture and sports", admit further reduction to a set of algorithms called pedagogical abilities, and "this reduction has a significant pragmatic meaning, primarily in terms of isolating those pedagogical abilities that can be developed in other (non-pedagogical) types of activities (educational and cognitive, etc.). In accordance with this approach, it is quite permissible to consider information-orientational activity as a set of its individual algorithms. It is also clear that this skill can be acquired (in fact, it is acquired) outside the framework of the information-orientational activity of a specialist [3; p.279]. At the same time, mastering by the subject of most of the algorithms of mobilization activity is simply impossible outside the framework of this activity. In particular, you cannot learn to maintain discipline in the gym or on the playground without going through teaching practice. As you know, within the framework of the existing educational practice of training future specialists, the broadcast of algorithms, the success of the development of which, in principle, cannot be verified outside the framework of the pedagogical activities carried out in the course of students' pedagogical practice, during which, for obvious reasons, the student does not carry out the named activity, but its imitation (good or bad is another matter). The above allows, in our opinion, to determine the qualitative basis of the next levels of mastering the algorithms of professional activity of a future specialist in physical culture and sports [4; p.864]:

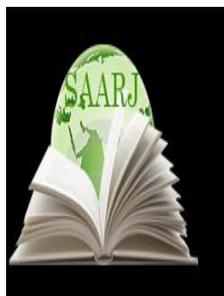

1. Content-personal, achievement, which presupposes the formation of the necessary knowledge and mental abilities necessary for the implementation of the algorithms of pedagogical activity, in the absence of the practice of using this algorithm.

2. Scientific-theoretical, an achievement that presupposes the formation of the necessary knowledge and skills to perceive, analyze information, make decisions and model activities in specially created pedagogical situations.
3. Simulation and activity, an achievement which presupposes the successful mastering of algorithms of pedagogical activity within the framework of certain models of pedagogical activity (pedagogical practice).
4. Professional-activity, the achievement of which involves the development of algorithms of pedagogical activity in the framework of the professional activity of a specialist in physical culture and sports. The specified structure allows us to understand the sequence of mastering the basic algorithms of pedagogical activity. And to determine the levels of professional and psychological competence achieved within the framework of existing educational practice.

## THE IMPORTANCE OF EDUCATIONAL METHODS IN THE ORGANIZATION OF PHYSICAL EDUCATION

**M.Yu.Gafurova\***

\*Teacher,  
 Bukhara State University,  
 UZBEKISTAN

### ABSTRACT

*The article focuses on teaching students physical activity in physical education classes, the formation of physical movement skills and abilities, as well as the widespread use of modern teaching methods and principles in physical education classes.*

**KEYWORDS:** *Physical Education, Play, Training, Skills, Abilities, Movement, Education.*

### INTRODUCTION

The main task of physical education is to teach physical movements and to form the techniques and tactics of sports movements. Physical education classes focus on teaching students physical activity and developing physical movement skills and abilities. Also, technical and tactical training skills in sports in accordance with the school curriculum are formed in the process of physical education in students.

The age, gender, and level of physical fitness of the students are taken into account when organizing physical education activities. In physical education and sports, teachers and coaches need to fully engage all students in physical activity. Modern methods and principles of physical education are widely used in the educational process. Among the teaching methods in physical education, oral, practical, demonstration, game and competition methods play a key role. In physical education, the oral method is used in the form of oral explanations, conversations, questionnaires, questions and answers, and feedback on exercises and movements. Physical education teachers and sports coaches also develop the ability to give commands to themselves and their participants. In a practical style, physical education teachers demonstrate the exercises and physical movements to the students in practice. Students repeat the physical activity. In the process of practical performance, students develop physical skills and abilities. Teachers provide methodological advice and guidance on how to correct mistakes and shortcomings in the

performance of exercises and movements. The exhibition will feature videos and films on the formation of techniques and tactics of physical activity and sports, as well as presentations. Posters, stents, posters and demonstrations will be made. In such a style process, athletes receive methodological advice and guidance on the development of technical and tactical training physical qualities. The style of play is widely used in the organization of physical education activities for primary school students. However, it can be widely used in games for students of all ages. Games are a great way to help students develop physically, healthily, and develop the physical and vital movement skills and abilities they need. During the games, children will have fun with their free behavior, ingenuity, desire to perform new actions, and independence. Physical activity in games has an unbalanced effect. Students are active during the games according to their physical fitness and physical ability. A wide range of games can be used in general and special training of athletes. Competitive style organizes competitions in the process of physical education of students. The competition demonstrates the development of technical and tactical skills and physical qualities in sports. Athletes' general and special training will be assessed. The assessment of general readiness takes into account the level of intellectual, moral, spiritual and volitional readiness of students. The assessment of special training takes into accounts the skills and abilities of students to master the techniques and tactics of sports movements. Their physical qualities are also determined by the degree of development of the qualities of strength, endurance, speed, agility and flexibility. Competitions can take the form of competitions in sports, assessments of general physical fitness, tests. Sports competitions are also organized in the form of mass sports holidays. There are many different ways to do this exercise. The turn-by-turn method is when one student completes one exercise and the second student begins the exercise, followed by the third student. This method is usually used in the first stage of training. In the group method, one student completes one exercise and the other student completes the exercise. In some cases, alternating exercises are used. It can be said that in this method, students can do one exercise on their own or another task at the same time. Practical work uses methods of organizing frontal, group and individual lessons. The essence of the frontal method is that all students are involved in one task at a time. It is used to introduce students to new material and to learn simple exercises, as well as to improve well -mastered exercises. Its advantage is that it allows students to engage in movement activities, ie to achieve a high intensity of the lesson. The frontal method requires careful preparation for the lesson, the organization of student work, precise control of the teaching process, the ability to provide the necessary auxiliary exercises. When students are divided into groups, it is important to look at their physical fitness. The group method provides a wide range of opportunities to develop students' independence, increase their activity, and organize competitions for the successful solution of the tasks set for the lesson. This method is more suitable for high school students and can be used throughout the lesson. In some manuals, the method of circular exercises is distinguished independently. However, in the organization of student activities, it is partially included in the group.

Each method has different effectiveness when it comes to teaching students based on age, gender, level of preparation, and the number of students in the class. Such training increases the volume and productivity of physical activity. Most classes are held in a natural environment. The teacher creates a variety of situations, which in turn increases the interest in the lesson. It is known that in order to cultivate physical qualities, it is necessary to set high standards for the body, that is, to perform the exercises to the level of fatigue. In this case, the control is created

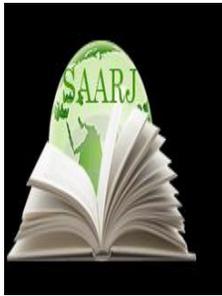

during the training. Often in control classes, some students learn more than in the classroom. The spirit of mutual support in the classroom has a positive effect on this. Each session will have elements of teaching, supervision and exercise.

### ABSTRACT

*The formation of personality culture has a great importance in the system of training future physical culture teachers. The following article deals with the development of personal and professional qualities of the future teachers and their pedagogical culture; paid attention on the country's leadership to the problem of the formation of the foundations of physical culture in youth; as well as interest in physical education and sports. The author emphasizes the importance of developing a culture of communication among future specialists. The requirements for the personality of modern teachers and their professional activities have been determined.*

**KEYWORDS:** *Physical Culture, Professional And Personal Qualities, Healthy Generation, Cultural Heritage, Communicative Culture, Pedagogical Ethics, Pedagogical Cooperation.*

### INTRODUCTION

Transformations of the socio-economic and socio-cultural spheres of life in Uzbekistan during a pandemic period have had a great impact on pedagogical science and practice, on the process of training specialists. In the life of society, many questions arise that only creatively active and critically thinking people are capable of solving. In the Law of the Republic of Uzbekistan "On Education", one of the main tasks is to create conditions for the development of a creative personality based on universal values, national and world culture.

The National Program for the Training of Personnel of the Republic of Uzbekistan defines the main directions for improving the system of training future teachers. The program on

pedagogical disciplines in higher educational institutions provides for the solution of problems related to the formation of the professional and personal culture of public education workers. The transition of education in the country to new paradigms requires not only innovative approaches to the effective development of students, but also the improvement of the methodological base of this process. Including the words of our president in the resolution: "Creating a healthy lifestyle in our society, creating favorable conditions for the population, especially the younger generation, for regular physical culture and mass sports, strengthening confidence in the will, strength and capabilities of youth through sports competitions, courage and patriotism, devotion to the Motherland ... Excellence, as well as large-scale work aimed at the systematic organization of the selection of talented athletes among young people and the further development of physical culture and mass sports".<sup>1</sup> The program is based on the requirements for the organization of pedagogical communication, focus on the sustainable development of the personal and professional qualities of a future specialist, and especially pedagogical skills. Pedagogical education has been assigned the task of forming a professional culture as an important factor and guarantor of the successful professional activity of future teachers, since without mastering the art of pedagogical communication and without the teacher's creativity, it is impossible to effectively solve educational problems. The formation of professional qualities of teaching staff is associated with the development of pedagogy of communicative culture, and for future teachers of physical education, given their specificity, also with ethics and aesthetics. Programs for training pedagogical personnel for teaching and educating a new generation recommend increasing attention to national and universal values; reforming the education system is associated with the modernization and improvement of the content of education, the selection and development of new pedagogical technologies and, most importantly, with the creation of a methodology for upbringing a harmoniously developed personality. In this direction, for the upbringing, development and improvement of the individual are being developed. Mechanisms of influence on students, including various types of extracurricular activities.

The priority task of the public education of the Republic of Uzbekistan is considered to be the revealed physical capabilities of pupils, students and their physical development, and for this it is necessary to form strong foundations of physical culture among young people. Physical culture is an important personality trait and a powerful factor in its development. This idea has national and national - historical roots, which are laid down in Folklore, Folk Pedagogy, works of eastern thinkers, modern Pedagogy.

The problem of spiritual and physical development is of particular importance for the modern education system. A healthy generation is the main concern of the leadership and government of independent Uzbekistan, therefore, the formation of physical culture of students, the training of young specialists in physical education are elevated to the "level of state policy".

In the works and speeches of the President of the Republic of Uzbekistan Sh.Mirziyoyev, the need to educate a physically healthy young generation is constantly emphasized and, in particular, attention is paid to the training of highly professional, knowledgeable specialists in this field through the organization of extracurricular activities, the use of advanced technologies and innovative approaches of new techniques and means learning.

The National Program for Personnel Training defines measures to create the necessary conditions for protecting and strengthening the health of students and their physical development.

In the Law of the Republic of Uzbekistan " Issues on Education" [1, p. 12-14] also considers the development of physical potential of pupils (students) and the formation and their foundations of physical culture. The state educational standard establishes the obligation not only for students to obtain historical and theoretical knowledge about physical culture and their explanation, but also to master knowledge of ethics and aesthetics in the field of sports. The state standard determines not only the circle of knowledge, but also the rules of the basic spiritual and moral qualities of the individual. So this, in turn, requires the organization of an effective educational process. The formation of motives and needs for self-improvement (physical), the development of interest in physical culture and sports is associated with aesthetic development. This provision is enshrined in the national training model. The main components of the model are: personality as a subject and object; the state and society are guarantors of personnel training; continuing education is the basis for training qualified personnel; science-producer and consumer. Highly qualified specialist personnel; advanced technologies, including information technology tools, contributing to the training of personnel; production (educational institutions) - the customer of high-quality trained personnel.

The goal of continuous education (pedagogical) is the all-round development of the personality, its spiritual enrichment, the formation of an intellectually - creative professional-creative, socially active, communicative - activity specialist. In particular, in the formation of physical culture, physical education, one should rely on the richest cultural heritage.

In the national program for the improvement of teaching staff, the main emphasis is on improving their culture. The program notes that in order to form a pedagogical culture among future specialists, it is necessary "to develop and introduce a new generation of educational and methodological complexes, provide didactic and informational support of the educational process, prepare an educational and methodological base, and introduce advanced pedagogical technologies".

In the state educational policy of Uzbekistan, special attention is paid to the development of a culture of communication at all levels and, above all, a culture of professional communication. An interpersonal and mass culture of communication is increasingly being established in society. In this regard, in higher educational institutions, especially in the pedagogical direction, an obligatory condition should be the effective formation of the professional culture of communication of future teachers.

Serious attention is paid to the communicative competence of teaching staff in the state educational policy.

The tasks of modern teacher education, taking into account the new values, are as follows:

- Reliance on conceptual - educational areas, goals and objectives enshrined in the National Program for Personnel Training;
- Updating, improving, modernizing and creating programs, textbooks, manuals and recommendations;

- The formation of a pedagogical culture on a scientifically grounded structural and content basis.

The implementation of these tasks is associated with the professional and personal training of future specialists and, in particular, with the development of intellectual and creative, activity and social and communication skills, the formation of their professional culture - pedagogical communication. Pedagogical education has been given the task of high-quality preparation of future teachers for pedagogical activity through the formation of a communicative culture.

Scientists - teachers of Uzbekistan in their works emphasized the importance of developing the communication skills of future teachers in the formation of their professional culture.

In particular, M. M. Davlatova asserts: "One of the most important social qualities of a modern person is the communicative quality as a factor of communication. Interpersonal communication relations in society are the demands of the times".

According to S. Kh. Faizulina opinion, there are various directions of personality development. It does not mean the unification of forms of communication and relations in society. Communicative culture finds its expression in relation to wildlife, society, science and art, in tolerant interpersonal relationships. A communicative culture is based on a positive attitude, aesthetic content and sincere, and open feelings.

The profession of a teacher is characterized by such properties as organizational skills, communication, research skills, a desire for scientific and cognitive activity [5, 80 p.]. Among the professional and personal qualities of a teacher, you can turn off: observation, hard work, discipline, diligence, responsibility, purposefulness, perseverance, firmness in decisions, conviction, desire for self-education and self-improvement, general and pedagogical culture, humanity, decency, honesty, objectivity, attentiveness to principles, kindness, respect for people, high morality, patience and endurance, sincerity, optimism, the ability to negotiate, the need for communication, self-criticism and others.

The main requirements for a teacher as a professional are general development, education, general and communicative culture, creativity.

In the teacher's activities, it is necessary to show humanism, pedagogical tact, restraint, self-control, sincerity of feelings, caring for their pupils, fairness (in assessments of characteristics), a sense of humor, a cheerful character, a positive emotional attitude, understanding and respect for the personality of each student.

Professional - pedagogical culture requires a teacher to:

- Full return of creative forces and professional and personal abilities in the organization of the educational process;
- Establishing cooperation in educational and cognitive activities, pedagogical management and control;
- The results of professional and educational activities.

In the general pedagogical culture, the communicative culture plays an important role. Professional and communicative activity of a teacher, including a teacher of physical education,

in the modern educational system is considered as an important factor in improving the quality of professional training.

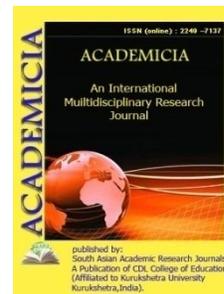

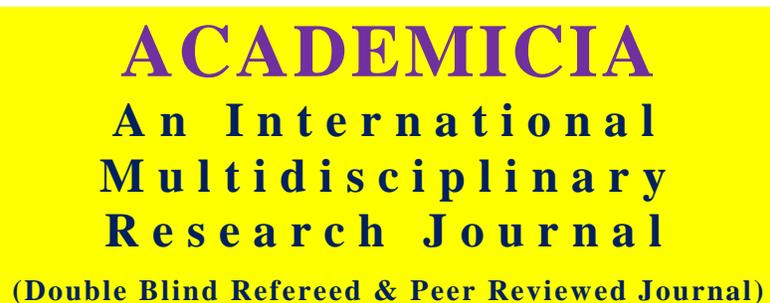

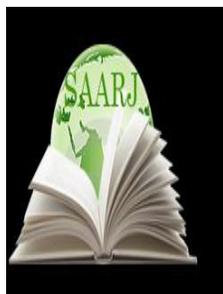

The substantial components of physical culture are historical and theoretical knowledge, sports, physical education, hygiene and regimen, control of one's body and body, health-improving measures.

Thus, the teacher's physical culture has a unifying and social orientation and is part of the teacher's professional and personal world.

Future physical education teachers are called upon to form physical communication culture among schoolchildren, using special technologies, innovative methods and modern means, and most importantly, a professional culture based on pedagogical ethics and pedagogical communication: rules, norms, regulations, content, technologies are all important for establishing contacts and mutual understanding.

## STRUCTURE OF SPECIAL AND COMPETITIVE TRAINING STAGES OF JUDOISTS

**Sh. Sh. Mansurov\***

\*Teacher,

Email id: sh.sh.mansurov@mail.ru

### ABSTRACT

*The article discusses the structure of the stages of special and pre-competition training of judokas in the process of judo micro-cycles, planning and exchange of load training sessions of different sizes and directions.*

**KEYWORDS:** *Competition, Microcycle, Training, Special, Sports, Loading*

### INTRODUCTION

In the planning of pre-competition trainings, in most sports, the targeted distribution of loads within the microcycles of the special and pre-competition training stages is a topical issue. During the training there is an opportunity to combine the types of exercises, their load, the description of the rest after training, the number of sessions, different sizes and directions of loads, as well as the rate of return of the microcycle process. Therefore, the structure of microcycle training in the special and pre-competition stages of training of qualified judokas can be quite different (variation).

In the special and pre-competition training stages of qualified judokas, with the help of microcycle training, the personal potential of athletes is widely used to eliminate the factors that negatively affect the mental state of athletes, increase the effectiveness of training. Hence, the main task of microcycle training is to identify the situations necessary to increase the effectiveness of the training effect and to develop their details.

The duration of microcycle training is variable (microcycle system) weekly and bi-weekly.

In the modern system of sports training processes, weekly microcycles are widely used, which are adapted for the general exercise, rest and recovery of athletes. In practice, therefore, more

weekly microcycles are used, but there are cases when weekly microcycles do not adequately meet the requirements of modern training.

They are limited only by the requirements of work skills and leisure processes.

Therefore, the content and system (structure) of the microcycles of special and pre-competition training stages are flexible, and the growth (dynamics) of changes during the training stages requires special tasks of the sports training process (8,29).

Experiments in this area have many years of research work, and previous research has shown the need for a year-round training process. The work in practice is devoted to the development of general principles of planning, continuity, coherence, compatibility, and so on. Later, in planning the training processes of microcycles, more attention was paid to the issue of the structure of microcycles.

According to a number of authors, in the process of training highly qualified athletes during the special training phase of sports training, before the start of the competition (10-12 days before the competition) it was found necessary to reduce the load and maintain a high level of intensity.

According to S.I. Gerasimov, the recovery process of the body after high-level loads can take up to a week - ten days, but after low-level loads, it usually lasts from a few minutes to several hours. According to the research of Yu.V. Verkhoshansky, G.S. Tumanyan on the types of loads, it is expedient to divide the loads in sports judo into 5 groups: large, significant, medium, variable and low.

The description of the above-mentioned loads, the application of which to a certain extent in terms of the size of the load, has been emphasized in several research studies.

In particular, it was introduced to perform weekly exercises with high, small and medium-sized loading exercises, followed by alternating exercises designed to lift the load again.

Nevertheless, there are differences of opinion among experts on the content of microcycles.

A number of authors recommend the following variants of microcycles.

In some microcycles, the first day of training is to improve the technique of individual movements and techniques (average load), the second day is rest, the third day is physical training through sports and gymnastics, the fourth day is rest, the fifth day is judo. -militation (large load), on the sixth day - rehabilitation activities of athletes (baths, saunas, massages, etc.), on the seventh day - rest is recommended. In the analysis of this variant of the structure of microcycles, we can see that the total volume of training loads is so high that it gradually increases.

According to the above authors, when planning the training of athletes, it is important to take into account the creation of conditions for the full recovery of the athlete's body between training cycles. Analyzing the opinions of other experts, it is shown that the total volume of loads on the microcycle is much higher, and athletes should take an active rest, enjoy the rest. On other microcycles, it is recommended to use a variety of exercises that help to gradually increase the load.

At the heart of the content of such microcycles is the use of special training in combination with training through general physical training.

But different views on the structure and content of microcycles reflect differences in the size and direction of training loads.

These differences suggest that, according to different authors, the different use of tools in different directions and sequences on microcycles in training planning has yielded the desired result. In addition, many sports experts emphasize the need to pay attention to the number of exercises in which the microcycles are carried out with large and small loads. Based on the views of the authors, it can be concluded that the structure of microcycles is affected by various factors, so the replacement of work with rest is of particular importance and should be based on the laws of fatigue and recovery in the body.

It should be noted that in order to increase the efficiency of microcycle planning, it is necessary to take into account and study the response of the athlete's body to loads of different sizes and directions with a targeted direction. To do this, you need to perform the following tasks when planning the training process:

- Determining the intensity of training when the body's ability to work;
- To determine the overall effect of the volume of loads in different directions on the body in several sessions;
- The use of small and medium loads to accelerate the recovery process of athletes in cases of reduced ability of judokas to work.

From the above, it can be concluded that in the process of judo micro-cycles there are no clear recommendations on the planning and exchange of load training sessions of different sizes and directions.

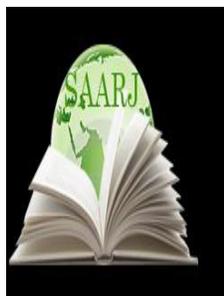

Therefore, there is a need to identify the main issues of this problem and to study the results of inspections in other sports.

## METHODS OF DEVELOPING ENDURANCE IN STUDENTS THROUGH THE USE OF FOLK GAMES IN PHYSICAL EDUCATION CLASSES

**A. R. Nurullaev\***

\*Teacher,  
Bukhara State University,  
UZBEKISTAN

Email id: abduhamid.nurullayev@mail.ru

### ABSTRACT

*The article discusses the development of endurance in students through the use of folk games in physical education classes, as well as the development of physical qualities of students through games using general pedagogical methods in the classroom.*

**KEYWORDS:** *Physical Education, Folk, Play, Lesson, Pedagogue, Education, Teacher, Student, Endurance.*

### INTRODUCTION

The first stage of primary education and general secondary education in the country is organized in the form of I-IV grades. The goal of primary education is to develop the talents, abilities and skills, sensitivity and interests that are present in every child, qualities such as a positive moral outlook, acceptance, national and civic duty and feeling. One of the tasks of primary education is to determine the pedagogical skills, scientific and methodological abilities, comprehensive maturity, high morality of the teacher, and vital factors such as age, strength, needs, readiness, ability and environment of children.

Finding ways to prevent the child from getting tired and stressed, incorporating play tools into the content of the lessons, ensuring that each lesson serves to protect the health, mental, spiritual and physical well-being of the child, the young generation is beautiful, polite, sensitive, intelligent, smart and to be brought up as disciplined, highly cultured, nationally proud, to cultivate in them the necessary qualities such as patriotism, inter-ethnicity, a sense of civic duty.

The following is taken into account when choosing a game:

1. Where and in what form the lesson will be held.

2. Tasks for physical education.

3. Another important element to consider when choosing a game is the part of the lesson.

4. The conditions of the playground and the availability of equipment to solve a pedagogical task.

5. The use of movement games in combination with other means of physical education in physical education classes, in which they correctly determine their place among other exercises.

Preparing for the game is methodologically correct, the creative thinking of the players, the development of their organizational skills is very important in the complete solution of training tasks, and, finally, in increasing the effectiveness of training.

1. First of all, you need to prepare the place and the necessary equipment for the game.

In order to teach students cleanliness, tidiness and hard work, all game preparation work should be done with them. A variety of equipment is used to conduct many action games: flags, colored ties, sticks, balls, and more. Equipment should be colorful and in sufficient quantity, size and weight to suit the strength of the players and tastefully crafted. For the lesson to be effective, the equipment must be kept ready in specially designated areas. It is advisable for players to take an active part in keeping the equipment clean, distributing it to the participants and collecting it. Equipment is distributed to players after the purpose and mission of the game have been explained.

2. Spending and proper placement of players on the field is also a big factor in the outcome of a training session. Therefore, when explaining the game, players should be placed on the field so that the educator can hear and see well. At the same time, of course, the content of the game should not be overlooked.

Players cannot be purged against the sun or other light sources. Because at such times, players do not see the leader, and as a result may not understand his instructions. In turn, the educator should also look at all the players during the explanation.

Elementary students think primarily through imagination. That's why they tend to play more, move more physically. Game classes are common in the classes that are currently being organized. Because absorbing the knowledge given to a young child through games seems more fun than memorizing the dry rule and using continuous exercise.

Play plays an important role in a child's life. Experiments show that through play, children gain knowledge about the environment, various objects. Organizing the educational process using a form of play allows you to achieve the intended goals.

The game also has an educational value, because in this process the students interact, as a result of which their behavior, positive qualities in the culture of behavior are formed and formed.

Game. Under this concept there is a universal meaning of the universe. She is a constant companion of children, an inexhaustible source of positive emotions such as cheerfulness, cheerfulness. However, play should not be seen as just fun for children. The role of play in children's lives is a bit broader. Our ancestors, great scholars and famous educators considered children's play as a tool that plays a very important role in the education of the younger generation. From a very young age, a human child looks around carefully, sees the brightness of

colors, listens to a symphony of sounds. It marvels at the variety of things around him, thinks about them, asks adults questions, or seeks an answer to that question himself.

What does it take for a child to live a happy, joyful and meaningful life? How can a child evoke a variety of emotions early, stimulate the development of his mind, increase his speech, increase his literacy, make his presence pleasant, attractive and meaningful? The answer is one: GAME!

Moving games are used as an auxiliary tool in training sessions. Because the game increases the interest of the participants, gives them pleasure, provides faster recovery of work skills. They forget about fatigue due to the game, as a result of which endurance skills are also formed and they perform the exercises carefully.

The activity of the students during the game also depends on how the teacher prepares for the game.

All action games have a complex effect on the bodies of the participants. That is why games should be viewed as an exercise that has a general physical effect.

In short, the Uzbek people had their own national customs and traditions. In fact, our people have always paid serious attention to the harmonious formation of young people. Since that time, national folk games have been widely developed. These games have been very helpful in helping the younger generation grow up to be physically strong and healthy.

**Abstract**

*Gallbladder cancer may affect on the individual's life as well as their family and caregiver's life. The gallbladder cancer is more evident in North Indian region as compare to South Indian region. The carcinoma of GB is more prominent in women as compared to men. Poor lifestyle, including unhealthy diet pattern and physical inactivity may cause various types of cancer, especially gallbladder cancer. Most cancer survivors are facing financial, emotional, psychosocial problems during diagnosis and treatment. Most of the patients has lack of awareness about the disease, its causes and consequences; What to do? /Where to approach for*

*assistance and treatment? They struggle with trauma, anxiety, fear of disease, transportation problems, or financial issues during the cancer treatment. The role of social worker may play an important role to deal with such problems, as the social worker is well qualified and trained to tackle these problems in the actual situation. The article outlines the prevalence of gallbladder cancer in India and the lifestyle as a risk factor as well as the role and practice of social work in the epidemiology of gall bladder cancer are also underlined.*

**KEYWORDS:** *Cancer, Gall Bladder, Lifestyle Factors, Social Work Practice.*

## INTRODUCTION

Cancer is a 'chronic disease' which does not merely affect the life of cancer patients, but also their family members and caregivers.<sup>1-2</sup> Cancer patients along with their family members confronts the psycho-social and socio-economic problems. They have also experienced various types of challenge at the time of initial diagnosis (for example, fear, anxiety, depression, and trauma-related problems) and during cancer treatment (for example, out of pocket expenditure, indebtedness, transportation, stigma and so on).<sup>2-3</sup> Apart from the expensive treatment, patients also have lack of awareness and knowledge about the disease, treatment, side effects, and its consequences.<sup>3</sup>

According to World Health Organization (WHO, 2020), cancer recognized as the second leading cause of mortality in the world after the cardiovascular diseases with the estimation of about 9.6 million deaths in 2018.<sup>4</sup> GLOBCAN 2018 data showed that about 11, 58, 208 new cancer cases diagnosed, nearly 7, 84, 821 people died with cancer and almost 22, 58, 208 people were living with cancer in India.<sup>5</sup> Gallbladder cancer is a rare type of cancer that has risk factors in multi-factorial nature with usually no symptom at an early stage.<sup>6</sup> These are gene variants (female sex, age, gallstone, ethnicity, congenital developmental abnormalities and personal or family history of gallstone), environmental condition (geographical location and chronic bacterial infection) and lifestyle behavior (obesity, diabetes, sweeteners and consumption of alcohol).<sup>6-7</sup> According to American Cancer Society (2020), gallbladder cancer is often found at an advanced stage when the malignancy spread outside the gallbladder.<sup>8</sup> It is estimated that 1 out of 5 gallbladder malignant cases will be diagnosed at the early stage. Hence, there is a limited scope of curative treatment and least survival rate among gallbladder cancer patients.<sup>6, 8 & 9</sup>

Bray et al. (2018) illustrated that there was approximately 219,420 new cases of gallbladder cancer and 165,087 deaths (70, 168 males and 94,919 females) due to this disease in the world in 2018. About 122,024 females reported high incidence of gallbladder cancer in comparison to 97,396 males with gallbladder cancer.<sup>10</sup> South America (Chile, Bolivia and Columbia), South Asia (India, Pakistan, Nepal, Bangladesh and Bhutan) are considered to be regions with high incidence of gallbladder cancer. East Asia (Korea and Japan) and Central Europe (Slovakia, Poland and Czech Republic) have a moderate incidence of gallbladder cancer. South and Central Asia (Sri Lanka, Maldives, Yemen, Afghanistan, Tajikistan, Turkmenistan and Uzbekistan) have recorded low incidence of gallbladder cancer. Certain ethnic communities, such as Hispanics, American Indians, Mexican Indians, Alaskan natives and Asian Indians are at more risk of developing gallbladder cancer than any other ethnic groups.<sup>11</sup>

The incidence of gallbladder cancer is highly found among the Indian population as compared to other countries.<sup>11-12</sup> The study of Dutta et al. (2019) found that the young population is more affected with this disease as compared to other developed countries.<sup>11</sup> Approximately 25,999 new cases of gallbladder cancer and 19,676 deaths due to this disease in India.<sup>13</sup> The northern and northeastern regions have a high incidence of gallbladder cancer like Bihar, Uttar Pradesh, Assam, Orissa and West Bengal. As per Indian Council of Medical Research, ICMR (1990-1996), the incidence of Gallbladder cancer per 100,000 populations is 10 times more in North India as compared with south India.<sup>14-15</sup> Nearly 4.5 cases per 100,000 populations in men and 10.1 cases per 100,000 in women are frequently prevalent in the northern India.<sup>16</sup>

The interdisciplinary team of healthcare professionals that encompass oncologists, pathologists, psychologists, medical social workers, dieticians, nurses, pharmacists and etc., are playing significant role in the domain of Oncology.<sup>17</sup> Because cancer survivors are not only confronted with physical symptoms but also have other issues like financial, personal relationships and occupation.<sup>18</sup> The physical activity, proper diet, abstains from alcohol and tobacco in any form considers as the effective facet of a healthy lifestyle and can bring some improvement in the health of cancer survivors. However, again its impact varies from person to person on the basis on cancer type and stage.<sup>19</sup> The medical social workers may play a vital role in solving issues faced by cancer survivors and their caregivers.<sup>20</sup> Kellie Bramlet (2015) describes the concerns of cancer survivor, such as financial losses (loss of jobs and indebtedness), acceptance of the disease, traveling problems, telling the disease to loved ones, support of good health schemes, etc. The social worker is providing the service of counseling in regard to reduce their anxiety, stress, and other related issues.<sup>21</sup> They may handle cancer patients' problems like psychological, social, emotional, and financial with the role of facilitator, referral, liaison and counselor. They are trained in pre & post-discharge counseling, as well as discharge planning, collaboration, documentation, follow-ups, referrals and approaching health schemes.<sup>20</sup>

**Aims of the Paper:** The paper was focused on the prevalence of gallbladder cancer in Indian sub-continent with the description of lifestyle factors responsible for this disease among individuals. The paper also contoured the role and practice of social work in the epidemiology of cancer, including gallbladder cancer in India.

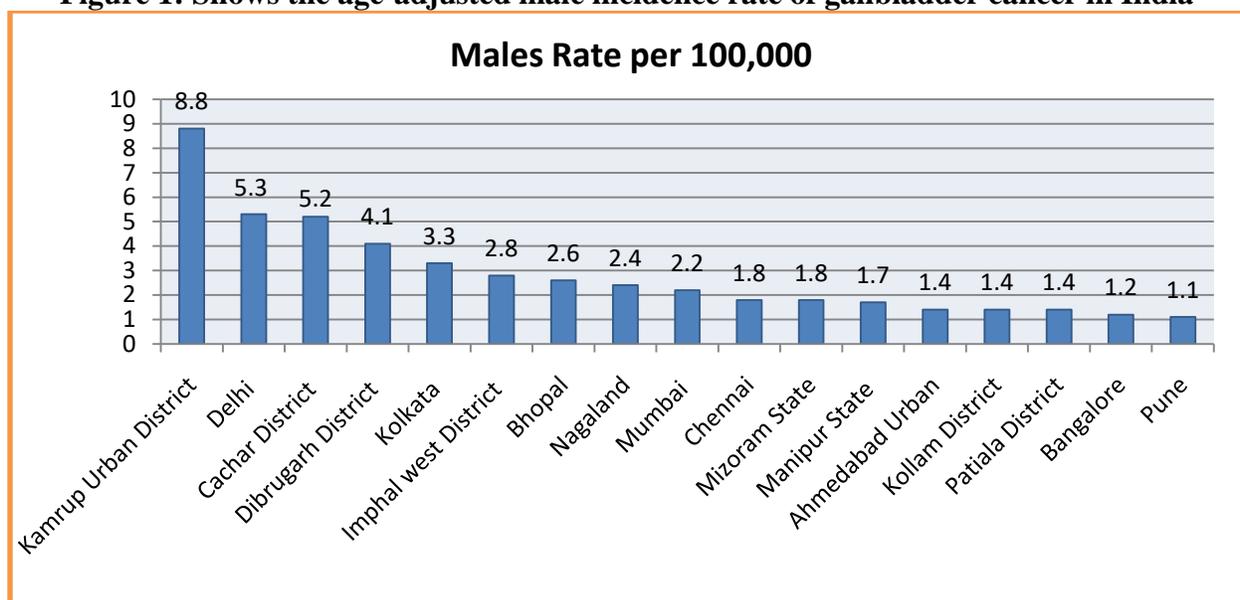

**Methods and materials:** This paper is based on the review of secondary data composing of published and unpublished literature associated with gallbladder cancer, lifestyle and medical social worker. Databases of Google search, Google scholar, ResearchGate, PubMed and websites like WHO and ICMR were widely searched. Keywords, such as 'cancer', 'gallbladder cancer', 'Incidence', 'medical social worker', 'lifestyle', 'problems & issues', 'cancer survivor and their family members' 'in India' were used. Those retrieved studies that were applicable for research objective and written in the English language were selected and analyzed.

**Results and discussions:** The results and discussions were composed of three sections. The first section dealt with the demographical profile of patients suffering from gallbladder cancer in India. The second section discussed life style as a risk factor in the development of gallbladder cancer. The last section encapsulated the intersection of social work practice in the area of cancer, including gallbladder cancer and lifestyle. Tables and graphs were employed to illustrate the demographical distribution of gallbladder cancer. The results and discussions are as follow:

### A. The demographical distribution of gallbladder cancer in India:

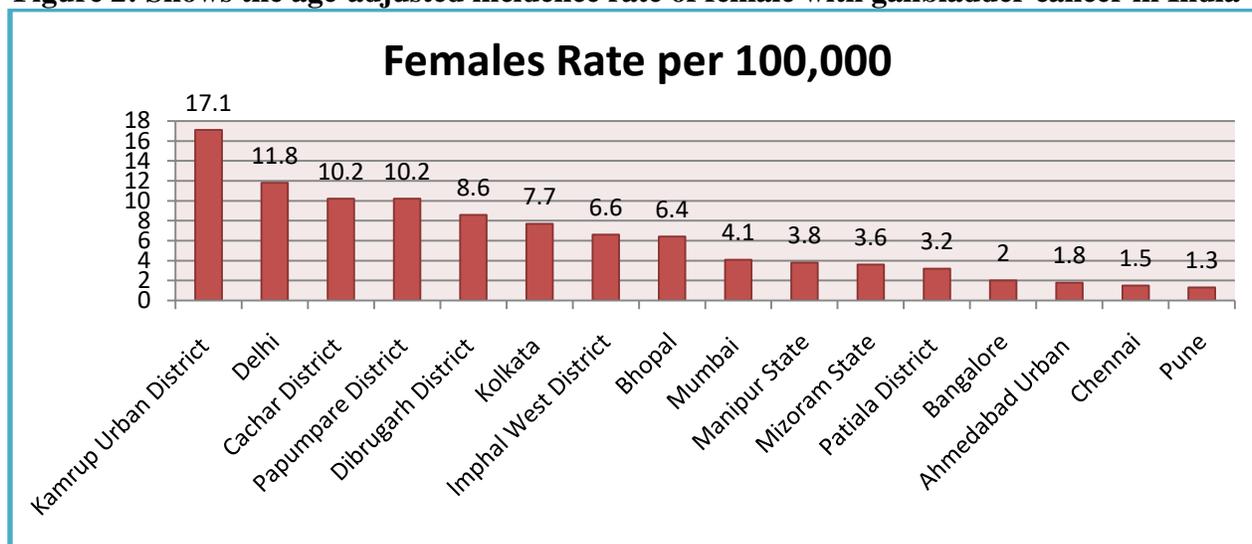

The incidence of gallbladder cancer is escalating in India, particularly in north and east northern regions and women. For example, the average age-adjusted rate among women has risen from 6.2 per 100,000 populations in the period of 2001-2004 to 10.4 per 100,000 populations in 2012-2014. <sup>11</sup> Dubey et al. (2018) studied demographic characteristics, risk factors and clinical profile of 68 patients with gallbladder cancer (15 males and 53 female) belonging to the north and northeast regions in India. Gallbladder cancer cases were geographically distributed, such as Uttar Pradesh (29.41% cases), Bihar (20.59% cases), Delhi (20.59% cases), Uttarakhand (10.29% cases), Jharkhand (4.41% cases), Madhya Pradesh (4.41% cases), Punjab (5.89% cases) and Jammu (4.41% cases). Nearly 33.82% and 32.35% of respondents belonged to the age group of 41-50 years and >60 years with the median age of 51.8 years. More than 83.82% respondents diagnosed with cancer at the advanced stage (third and fourth stage) with 73.47% of respondents had metastases in the fourth stage. <sup>12</sup>

**Figure 1: Shows the age-adjusted male incidence rate of gallbladder cancer in India**

Source: NCDIR-NCRP, ICMR (2016)<sup>22</sup>

ICMR report (2012-2014) showed the geographical distribution of gallbladder cancer among males, for example, the highest incidence of age-adjusted gallbladder cancer among males in the district of Kamrup Urban (8.8/100,000) as a comparison of Pune (1.1/100,000). <sup>22</sup> (see figure 1).

**Figure 2: Shows the age-adjusted incidence rate of female with gallbladder cancer in India**

Source: NCDIR-NCRP, ICMR (2016)<sup>22</sup>

As per ICMR report (2012-2014), females were reported highest incidence of age adjusted of gall bladder cancer as compared to males. For example, Kamrup urban district comprised of (17.1/100,000) females and (8.8/100,000) males.<sup>22</sup> (see figure 2) Kumar et al. (2006) studied the demographic variables and lifestyle impact on gallbladder cancer among 328 patients diagnosed with this disease, comprising of 75 (22.87%) males and 253 (77.13%) females in Varanasi, India. About 61.59% of respondents belonged to the age group between 41-60 years. The cancer cases reported higher among 264 (80.49%) respondents living in rural areas and 200 (60.98%) respondents having low socioeconomic status. Around 66.77% of female respondents were multi-parous (give birth to more than two children). The lifestyle had also influenced increasing gallbladder cancer. There were nearly 315 (96.03%) respondents who consumed mustered oil (60.63% of respondents brought open as compared with 25.39% used homegrown and 13.97% used sealed pack. Respondents used water source through different sources, such as hand pump 219 (66.77% respondents) as a comparison of tap water (22.26% respondents) and well (10.98% respondents). About 89.63% and 62.19% of respondents consumed milk and non-vegetarian food.<sup>23</sup>

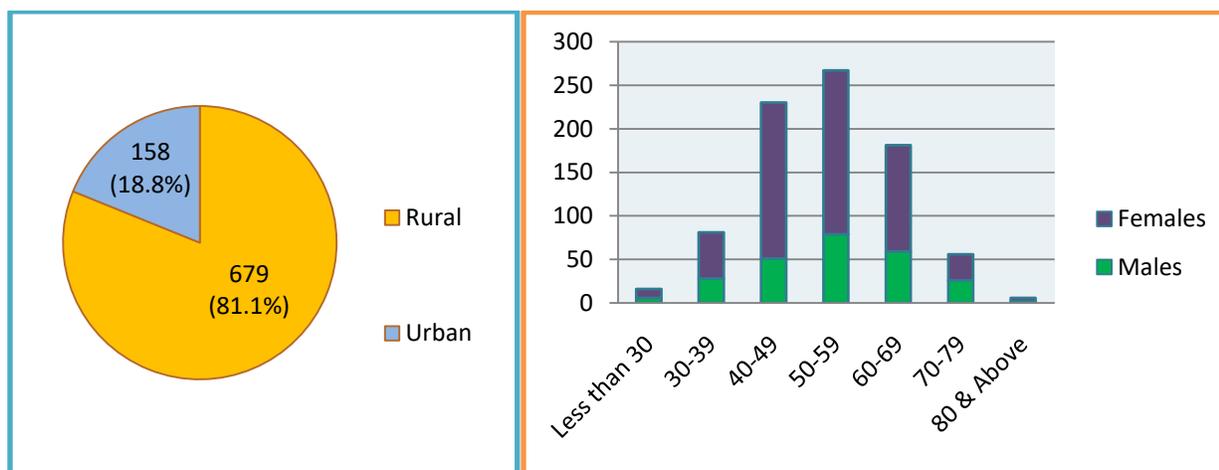

**TABLE 1: DEMOGRAPHICAL DISTRIBUTION OF GALLBLADDER CANCER SURVIVALS IN BIHAR, INDIA**

Regions	Year 2014 (n)	Year 2015 (n)	Year 2016	Total
Central districts	93	158	181	432
East districts	41	67	83	191
North districts	60	93	125	278
South districts	23	48	77	148
West districts	33	89	120	242
Total	250	455	586	1291

Source: Madhawi et al. (2018)<sup>24</sup>

Madhawi et al. (2018) conducted a study among 1291 gallbladder cancer patients from the period of 2014-2016 (3 years) that Hospital Based cancer registry registered, the Regional Cancer Centre in Bihar. **Table 1** displays the geographical distribution of gallbladder cancer in diverse regions, such as Central, East, North, South, and West. The incidence of gallbladder cancer was highly prevalent in the central district in three years, i.e. 33.46% out of total incidence. The central districts, predominantly Panta (208 cases) and Vaishaisli (75 cases) had a high incidence of gallbladder cancer. Districts with a high soil level of arsenic content were associated with the prevalence of gallbladder cancer.<sup>24</sup>

**Figure 3: The distribution of Gallbladder cancer in the North-east India**  
Rural-urban distribution      Age-wise prevalence in males and females

Source: Bhagabaty et al. (2014)<sup>25</sup>

Bhagabaty et al. (2014) conducted a study among 837 cases from a database of cancer registry from January 2011 to December 2012 in Guwahati, Assam, India. The study comprised of 251 (29.9%) males and 586 (70.0%) females with a median age of 50 years. A total of 79 males and 188 females diagnosed with gallbladder cancer between the ranges of 50-59 years of age. The median age in males was 54 years and in females was 50 years. The rural areas had the highest prevalence of gallbladder cancer, as per 81.1% (679) cases in rural areas in comparison of 18.8% (158) cases in urban areas of northern east regions. (See figure 3) Nearly 65.1% respondents belonged to Hindu religion, 45.5% of respondents were illiterate and 71.9% of respondents were diagnosed with gallbladder cancer at stage IV. The results showed that variables, such as female, age and rural regions were at a higher risk of gallbladder cancer. There was a need of study in the area of identifying possible risk factors in gallbladder cancer through the investigation of environmental condition, lifestyle and infective agents.<sup>25</sup>

Kumar et al. (2006) suggested alertness and careful clinical examination while the clinician was taking routine history of a patient, for example multi-parous, low economic status along with the rural areas as this tended to consume water from hand pump, the consumption of mustered oil, especially open which had a possibility of adulteration with some carcinogens.<sup>23</sup> Early detection and improvement in survival could be possible through careful evaluation of patients and health education.<sup>12</sup> Further Suraj et al. (2019) encapsulated that socio-demographic variables, such as age, gender, class, place of residence, etc. might influence the patient level delay in the treatment

of cancer. Rural residence with other variables like lack of education, low socio-economic status, poor access to medical care and lack of awareness could be responsible for the migration to tertiary healthcare center of cities. This further lead to economic burden, work overload in hospital, limited use of healthcare infrastructure, delay in investigation and treatment which can be a cause of delay in treatment and non-compliance of treatment.<sup>26</sup>

#### **A. The impact of lifestyle in the progression of cancer, especially gallbladder cancer**

O'Brien (1995) defined lifestyle as a choice within a constrained context which was determined by the position of social structure, such as class, gender and ethnicity.<sup>27</sup> Lifestyle is a way that is used by people, group and nations on the basis of specific geographical condition, economic, political, cultural, religion and texts. It incorporates day to day behavior and functions of a person in job, activities, recreation and diet.<sup>28</sup> There is an intersection of lifestyle and health or wellness. The act of choice promotes physical, emotional, mental, and social wellbeing.<sup>27</sup> Unhealthy lifestyle can be defined as poor diet, smoking, alcohol consumption, drug abuse, self medication, consumption of fast food, physical inactivity, misuse of technology, addiction to mobile phones, sleep latently and so on. Unhealthy lifestyle can be resulted in sleeping disorder, stress, depression, a side effect of drugs, obesity, cardiovascular diseases, cancer, asthma, type 2 diabetes and reduce life expectancy.<sup>28</sup> Lifestyle and dietary habits are considered an important factor in the progression of gallbladder cancer.<sup>29</sup>

Rai et al. (2004) considered a variation of dietary pattern from north to south in India in the progression of gallbladder cancer, for example, the consumption of high fat diet and wheat in the north in comparison of rice food in the south responsible for the high incidence of gallbladder cancer in the northern region. Related factors, such as low fiber, fruit and vegetable intake; high calorie, fat and cholesterol intake; consumption of sugar and red meat; high body mass index and obesity increase the risk of gallbladder cancer.<sup>30</sup> Certain food choices may also increase the risk of gallbladder cancer, such as mustard oil, sucrose-rich soft drinks or juices, spices (chili pepper both red or green, Hungarian hot pepper, fried food, fast food etc.<sup>31-32</sup> Shukla et al. (2008) highlighted that past history of smoking, tobacco chewing, smoking, alcohol consumption and other lifestyle factors might increase the risk of gallbladder cancer and gallstone. The consumption per day and year of consumption is the major concern in tobacco chewing, smoking and consumption of alcohol.<sup>33</sup>

Overweight and obesity is a condition of consuming more calories and less physical activity.<sup>34</sup> The physical activities comprise activity during work, in transport and leisure time in a week that means 150 minutes of moderate-intensity physical activity or 75 minutes of vigorous-intensity physical activity or both achieving at least 600 meter per minutes.<sup>35-36</sup> In the study of Anjana et al. (2014), the physical activity of around 14227 individuals was assessed from four regions of India-Tamil Nadu (South), Maharashtra (West), Jharkhand (East) and Chandigarh (North). Nearly 66.8% respondents of Chandigarh were physically inactive (<600 meter minutes), followed by Tamil Nadu (60.0%), Maharashtra (55.2%), Jharkhand (34.9%). The respondents from rural areas and males were more active than urban and female.<sup>36</sup>

The sedentary kind of lifestyle is associated with obesity, which further associated with other significant diseases, such as gallstone, type 2 diabetes and cardiovascular diseases.<sup>34</sup> As per Everhart (1993), obesity is a major cause of developing gallstones among individuals. Both men and women may increase the risk of gallstones in early age. Around 10 % men and 20 % women

are expected to develop the problem of gallstone.<sup>37</sup> The prevalence of gallstone is one of the risk factors for gallbladder cancer, i.e. between 0.5% - 3% of patients having gallstone disease have a chance of developing gallbladder cancer in future. Nearly 80% of gallbladder cancer cases have a history of gallstone disease.<sup>29</sup> The study of Vitetta et al. (2000) showed that the gallstone disease was one of the risk factors in the development of gallbladder cancer among people. The median age of 78.5 (77-81) years and the majority of women were diagnosed with gallstones and also with gallbladder cancer as compared to men.<sup>38</sup>

Unhealthy lifestyle (fried and fast/junk food, smoking, alcohol, tobacco, physical inactivity and sedentary lifestyle) and risk factors, such as obesity can be modified with the intake of fruit and vegetable (Rai et al., 2004), regular exercise, yoga (Malhotra et al., 2017) and abstinence from tobacco, smoking and alcohol (Shukla et al., 2008).<sup>29, 30 & 33</sup> Awareness among the general public about the side-effect of an unhealthy lifestyle and risk factors may play an effective role in reducing the incidence of gallbladder cancer.<sup>29</sup>

### **Significance of Social work practice in cancer and lifestyle:**

The work of social work professionals is receiving an acknowledgement at international level in the sphere of providing care and resolving issues of cancer patients as well as in the area of developing knowledge.<sup>39</sup> The function of socio-psychological care is performed through screening, evaluation, assessment, counseling, discharge planning, financial support referral and advocacy.<sup>40-41</sup> Numerous Studies in various countries like United states, Sweden, etc. (Kennedy, 1996; Messner, 2006; Zebrack et al., 2008, Yarlagaadda et al., 2015; Abbott, 2017; Lilliehorn et al., 2019; Verulava et al., 2019) described the role of social work professionals in the arenas of oncology, such as clinical, collaborative, discharge planning, documentation and program support.<sup>42-48</sup>

In India, the role of social work professionals is also enhancing day by day in the domain of oncology due to the increase in cancer cases and burden in healthcare facilities.<sup>49-50</sup> Hermann (2016) recognized the role of social workers in providing holistic healthcare services to cancer patients with the coordination of the multi disciplinary team. Along with counseling of the cancer patients, they can also coordinate with physicians in the treatment of cancer patients.<sup>51</sup> Correspondingly Suraj et al. (2019) also delineated the function of social worker within the multidisciplinary team in the initiation and completion of cancer treatment. Social work professionals could practice interventions like counseling, planning, guidance, financial assistance, management of advance cases and care of cancer patients and their families. Others practices, such as conjoint use of social and musical therapy, research, liaison with NGOs and CSR, and activities related with prevention of cancer could be utilized.<sup>50</sup>

Sirohi (2014) elucidated three approaches of social work professionals, such as education, delivery services and research in the context of providing quality healthcare services to cancer patients.<sup>52</sup> Das and Dey (2016) described the functions of oncology social work professionals at three levels- cancer patients at the micro level, their families at the mezzo level and community at the macro level. Activities, such as registration, data collection, counseling, casework, using therapies, financial assistance, referrals and rehabilitation are practiced at micro level. Practices like counseling, group work, using therapies, support, family adjustment and awareness are practiced at mezzo level. Functions, such as awareness, screening camps, street play and

community organization are performed at the macro level.<sup>53</sup> The professional of social work could perform functions related with pain management and prevention.

Chan and Dickens (2015) also discussed the lifestyle management of oncology social work practice, such as healthy diet, weight management, increase physical activity, behavior modification and stress management, which can influence the progression of cancer, improve the survival rate and reduce the risk of reoccurrence.<sup>54</sup> Townsend et al. (2010) explained the function of social worker in the Cancer Nutrition Rehabilitation (CNR) program at the McGill University Health Centre. Under this program, services, such as information, education, treatment and support in the area of diet, exercise and rehabilitation are offered to cancer patients, along with addressing their needs. Social work interventions covered supportive counseling, caregiver support, information on resources (for example, financial and transportation), referrals for community based home support services and co-facilitation of patient and caregiver support groups. Apart from dealing practical needs of cancer patients, the social worker also dealt with patients' emotional difficulties, such as coping with illness.<sup>55</sup> Medical social workers (MSW) can act as an educator, counselor, and trainer for the prevention of lifestyle diseases, including cancer.<sup>17, 56</sup> They can also function in the context of reducing the burden cancer through the conduct of community awareness program on the modification of habit, such as abstain of tobacco use and improving the lifestyle.<sup>57</sup>

Despite of above mentioned roles of medical social worker (MSW), there is a lack of understanding among the general public as well as healthcare professionals about their 'roles specified and roles allocated to them' in the context of healthcare and prevention. Apart from this, lack of support, misconception as well as lack of awareness about the duties of social workers and improper utilization of MSW's as a resource are identified as barriers.<sup>49</sup> There are major concerns in the functions of social workers, like a shortage of staff, lack of knowledge and training, inadequate educational background of medical social worker, insufficient healthcare infrastructure and lack of professionalism. These barriers and concerns highlight the need of professional development measures, such as recruitment of skilled and required manpower, organization of training, liaison with welfare agencies, etc. could improve the current scenario.<sup>58</sup>

## CONCLUSION:

There is an uneven socio-demographic distribution of gallbladder cancer in India with high incidence in north and east-northern region, female gender, age (above 40 years of age) and rural areas. Gallbladder cancer as a rare cancer is a multi-factorial and frequently diagnosed at an advanced stage with no symptom at an early stage. This is responsible for poor outcome and limited scope of curative treatment. The lifestyle factor is an emerging cause of gallbladder malignancies. Lifestyle behaviors (such as unhealthy diet and lack of physical activity), obesity and gallstones are considered as risk factors in the progression of gallbladder cancer. These factors can be modified with the consumption of fiber, vegetables and fruit daily, increase physical activity (exercise, brisk walk, cycling etc.) and abstain from smoking, tobacco and alcohol. The general public should be aware about the effectiveness of the healthy lifestyle in the reduction of gallstone disease and gallbladder cancer through different measures of awareness. Social work professionals could play an important role in the awareness campaign on related risk factors of gallbladder cancer. Trained and skilled social workers should be employed to perform

their role, such as counseling, planning, guidance, financial assistance and care of cancer patients and their families.

**ABSTRACT**

*This article provides a brief overview of the integrated oil sludge disposal technology, starting from the study of the characteristics of the sludge and physico-chemical bases of process and ending with the results of practical recommendations for the feasibility study for construction of a pilot plant disposal of sludge. In this regard, the main task is to develop an ACT-a control structure for a technological system consisting of hydrocyclones operating in a system of parallel and opposite flow directions. An engineering calculation of the hydrocyclone, which is a key element of the technological system, and a mathematical model of the process are developed.*

**KEYWORDS:** *Oil Sludge, Hydro Cyclone, Utilization, The Liquid Phase, Heat Capacity, Hydrodynamics, Density, Mixture, Mechanical Additives, Solid Phase.*

## INTRODUCTION

Analysis of the methods for separating oil sludge from the object under study shows that an economical, technically effective separation method is the separation of fractions present in the oil sludge under the action of centrifugal force. In this regard, the main task is to develop an ACT control structure for a technological system consisting of hydrocyclones operating in a system of parallel and opposite flow directions. An engineering calculation of a hydrocyclone, which is a key element of a technological system, and a mathematical model of the process have been developed.

In the process of separating oil sludge according to the proposed technological system, the movement of flows is organized in parallel and opposite directions. It is very difficult to separate the oil sludge into three phases that contain a very fine particulate system. This is due to the fact that very fine particles often leave together with the liquid phase. Therefore, in this work, the problems of mathematical modeling of the separation of oil sludge containing only very small particles, only into 2 phases, are solved.

Modeling of a technological process is the collection of information characterizing the process and the formation of an automatic control system on its basis. The most common type of simulation is the development of differential or linear equations to classify the required steps in a process. Currently, calculations are carried out on the basis of specific programs to determine the parameters affecting the process, for the organization of optimal control of the technological system. In this context, in this study, we used an interconnected three-stage system to develop a mathematical model that fully represents the process of separating oil sludge:

- development of a mathematical description of the investigated object;
- selection of a method for solving a system of mathematical equations and its introduction in the form of a simulation program;
- to determine the similarity (adequacy) of the model to the object.

When developing a generalized mathematical model of the technological process, the input and output parameters of the investigated device were determined: heat capacity, temperature coefficient, diameter of the tangential inlet of the cyclone, product velocity, product flow rate, pressure of sludge entering the cyclone, installation of tangential pipe 0 on the cylindrical part of the cyclone. 0873 glad.

In the proposed technological system, analyzes were carried out on the phase of oil sludge in two stages. For this purpose, the issues of increasing the separation efficiency based on the provision of parallel and sequential flow direction were considered. When developing a mathematical model for separating oil sludge, it is advisable to first develop a mathematical model of the mixing process in order to form a normal system. We considered it expedient to consider the hydrodynamic structure of currents in devices operating under the action of centrifugal force as a model of ideal mixing. It is known that the hydrodynamic structure of phase flows in a cyclone can be considered as a model of ideal mixing.

### 1. Mathematical model of a mixer for solvents and oil sludge:

We consider the hydrodynamic structural flow of liquid-solid-phase systems as a model of ideal mixing. As a result of intensive mixing of oil sludge entering the mixer, the concentration of the liquid system changes per unit of time. If we analyze the change in concentration in terms of the amount of solid particles present in a liquid system, the resulting concentration relative to the solid decreases over time. To express this law, we assume that the input and output parameters are as follows.

We express the amount of liquid, mixture, liquid phase and temperature change contained in the oil sludge and released from the device together with solid particles by the following differential equation

$$\frac{\partial a}{\partial \tau} = \frac{1}{\tau_{av}} (a_T^{ent} - a_m^{ext}) \quad (1.1)$$

here:  $\tau_{av}$  - average residence time of the solid phase in the working chamber, C;  $a_T^{ent}$ ,  $a_m^{ext}$  - concentration of the liquid phase in the solid phase, %;

The average residence time of the solid phase in the working chamber is represented by the following equation:

$$T_{av} = \frac{m_M}{G_M + G_l} \quad (1.2)$$

here:  $m_M$  - is the amount of mixture in the working chamber. In turn, this size is equal to:

$$m_M = V_M \rho_M \quad (1.3)$$

here:  $V_M$  - the volume of the mixture in the working chamber;  $\rho_M$  - mixture density. In this case, equation (1.2) looks like this:

$$\tau_{av} = \frac{V_M * \rho_M}{G_M + G_l} \quad (1.4)$$

$$\tau_{av} = \frac{V_{o.s.} * \rho_{o.s.}}{G_{o.s.} + G_s} \quad (1.5)$$

$G_o$  - pure oil consumption at the outlet, kg / hour;

$G_{o.s.}$  - the amount of oil sludge in the apparatus, kg / hour.

The mathematical expression for changing the concentration of mechanical additives in a mixture can be expressed by the following differential equation:

$$\frac{\partial a_M}{\partial \tau} = \frac{1}{\tau_{average}} * (a_T^{ent} - a_m^{ext}) \quad (1.6)$$

After making changes with the following expression,

$$G_j^{ent} = G_j^{ent} + (1 - a_M^{ent}) * G_M \quad (1.7)$$

We'll have

$$V_M * \rho_M * \frac{\partial a_M}{\partial \tau} = G_M * a_M - (G_l^{ent} + (1 - a_M^{ext}) * G_M) * a_M^{ext} \quad (1.8)$$

$a_M^{ent}, a_M^{ext}$  - respectively, the inputs and outputs of mechanical additives.

The mathematical expression for the rate of change in concentration in the liquid phase can be expressed as follows:

$$V_M * \rho_M * \frac{\partial a_M}{\partial \tau} = G_j^{ent} * a_j^{ent} + G_m^s * a_m^s - G_j^{ext} * a_j^{ext} \quad (1.9)$$

taking into account expression (1.8)

$$G_m^s = (1 - a_m^s) * G_j \quad (1.10)$$

After the changes, we will have the following

$$V_M * \rho_M * \frac{\partial a_M}{\partial \tau} = G_j^{ent} * a_j^{ent} (1 - a_j^{ent}) + G_m^s * a_m^s (G_j^{ent} (1 - a_j^{ent}) * G_{m.m}) \quad (1.11)$$

The change in temperature in the liquid phase is represented by the following differential equation:

$$\frac{\partial Q}{\partial \tau} = q_m + q_j^{ent} + q_j^{ext} \quad (1.12)$$

here:  $q_m$  - the amount of heat entering the mixture;

$q_j^{ent}$  - the amount of heat entering the liquid phase;

$q_j^{ext}$  - the amount of heat carried by the liquid phase.

The amount of heat entering the mixture is determined as follows:

$$q_m = G_m * c_m * t_m \quad (1.13)$$

here:  $c_m$  - specific heat of the mixture;

$t_m$  - mixture temperature.

The amount of heat entering the liquid phase is as follows:

$$q_j^{ent} = G_j^{ent} * c_j^{ent} * t_j^{ent} \quad (1.14)$$

here:  $c_j^{ent}$  - specific heat of the liquid phase;

$t_j^{ent}$  - liquid phase temperature.

The amount of heat transferred by the liquid phase:

$$q_j^{ext} = G_j^{ext} * c_j^{ext} * t_j^{ext} \quad (1.15)$$

Taking into account expression (1.8), the final equation can be written as follows

$$q_j^{ent} = (G_j^{ext} + (1 - a_j^{ent}) * G_m) * c_j^{ext} * t_j^{ext}, \quad (1.16)$$

here:  $c_j^{ext}$  - specific heat of the liquid phase at the outlet of the mixer;

$t_j^{ext}$  - temperature of the liquid phase at the outlet of the mixer. Taking into account expressions (1.13), (1.15), (1.16), equation (3.16) takes the following form:

$$V_j \rho_j c_j \frac{dt_j}{dt} = G_m c_m t_m G_m^{ent} c_m^{ent} t_m^{ent} - (G_j^{ent} + (1 - a_m^{ent}) G_m) c_j^{ext} t_j^{ext} \quad (1.17)$$

**2. Mathematical expression of the process in a hydrocyclone:** We use a typical ideal mixing model to express the hydrodynamic structure of flows in a hydrocyclone. In this case, the change in the amount of quenched liquid can be used from the differential equation of the following form.

$$\frac{\partial G_j^{ext}}{\partial \tau} = -\frac{1}{\tau_{av}} (KG_{m.j}^{ent} - G_j^{ext}), \quad (1.18)$$

here:  $\tau_{av}$  - average residence time of product particles in the hydrocyclone;

$K$  - hydrocyclone separation factor;

$G_{m.j}^{ent}$  - the total amount of mixture and solvents entering the hydrocyclone;

$G_j^{ext}$  - the amount of liquid phase leaving the hydrocyclone.

The average residence time of particles in a hydrocyclone is determined by the following equation:

$$\tau_{av} = \frac{V_m \rho_m}{G_m} \quad (1.19)$$

The concentration of the condensed mixture at the outlet of the hydrocyclone is also expressed as follows:

$$\frac{da_j}{dt} = -\frac{1}{\tau_{av}} ((-K)KG_{m.j}^{ent} - G_j^{ext}) \quad (1.20)$$

The change in the concentration of mechanical additives in the liquid phase can be expressed by the following differential equation:

$$\frac{da_j}{dt} = -\frac{1}{\tau_{av}} * (a_{m.j}^{ent} - a_j^{ext}) \quad (1.21)$$

here:  $a_{m.j}^{ent}$  и  $a_j^{ext}$  - the concentration of mechanical additives in the liquid phase at the inlet and outlet of the hydrocyclone, respectively.

The change in the temperature of the liquid phase in the hydrocyclone can be expressed by the following differential equation:

$$\frac{dt_j}{d\tau} = -\frac{1}{\tau_{av}} (t_{m.j}^{ent} - t_j^{ext}) \quad (1.22),$$

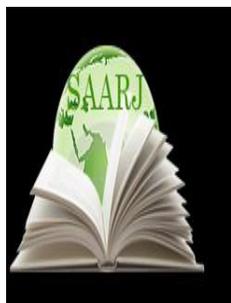

here:  $t_{m.j}^{ent}$  - the change in the temperature of the liquid phase in the hydrocyclone can be expressed by the following differential equation:

$t_j^{ext}$  - temperature of the liquid phase at the outlet of the hydrocyclone.

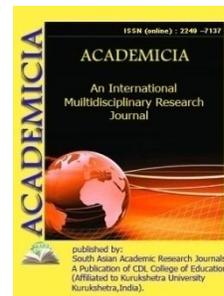

Based on the above equations, a complete dynamic mathematical model of the process of separating oil sludge in the field of centrifugal forces is built. In this model, a static mathematical model of the process is built and an algorithm for its solution is developed by making the necessary changes in the shape.

### ABSTRACT

*This article reveals about a special methodology of teaching students of the Mining Faculty to communicate in English which is scientifically substantiated. In the research, it is discussed that methodological recommendations for teaching the ability to communicate in a foreign language developed during the experimental test can be applied in other conditions of teaching English as a language of international communication.*

**KEYWORDS:** *Professional Communication, Non-Linguistic, Curriculum, Full-Fledged, Substantiated.*

### INTRODUCTION

The stabilization of the socio-economic situation in the country, the development of international relations between Uzbekistan and the countries of near and far abroad require from the educational system the formation of a specialist who has the skills of professional communication with representatives of other cultures.

Knowledge of a foreign language is currently not only prestigious, but also necessary for a specialist of any profile.

The study of a foreign language in a non-linguistic mining university is a stage in the practical mastery of the language, the specificity of which can be defined as a special additional learning "in accordance with the nature of subsequent professional activity" [1], within which it is assigned the role of a secondary means of written and oral communication [2]. In other words, in the practice of teaching a foreign language, the principle of a professional orientation dominates, which is consistently implemented in the selection of educational material for classes and

teaching methods that form professionally significant actions and operations for a future specialist [3].

At the same time, when teaching a foreign language in non-linguistic universities in Uzbekistan, there is a contradiction felt by many teachers and students between the understandable need to prepare for future professionally-oriented communication in a foreign language and the insufficient level of motivation for its implementation during the period allotted for this by the program - on I-II courses of a non-linguistic mining university. A similar problem is typical for other countries, where teaching a foreign language is conducted within the framework of the native culture [4]. As a consequence, teaching a foreign language in non-linguistic universities "is associated with special difficulties for the student and teacher" [5]. Various researchers and practicing teachers are trying to solve them in their own way, while all attempts are essentially aimed at finding ways to increase the motivation for learning a foreign language. A large number of works are devoted to the motivational reserves of actually professionally oriented communication in a foreign language, carried out both with the help of oral and speech activities, and with the help of communicative reading activities.

Serious reasons for the low effectiveness of training are the lack of demand for a foreign language in the practical activities of specialists in mining sciences; lack of modern teaching aids; insufficient development of a number of important issues of teaching and organization of the educational process in a foreign language, taking into account the specifics of universities and mining faculties, the lack of teaching materials and manuals adequate to the goals and conditions of education.

Aim of the study is to develop a scientifically grounded special methodology for teaching students-miners to communicate in English and to determine the main parameters of the foreign language communicative competence of future miners, necessary and sufficient for full-fledged communication in English.

To achieve this goal, it was necessary to solve a number of particular research problems:

- To study the degree of readiness of students of the Mining Faculties for foreign language personality-oriented communication in English in the context of international competitions;
- To identify the reserves of increasing students' motivation to learn a foreign language;
- to consider the behavioral, emotional and motivational features of mastering a foreign language by students-miners; to develop extraordinary forms of organization of teaching English in relation to the specifics of the mining faculties;
- substantiate the competence-based approach to teaching communication among students as the most relevant;
- To identify and substantiate the peculiarities of one of the components of the content of education - mining-oriented topics;
- To develop a textbook based on the theory of frames, the purpose of which is to teach students-miners to communicate in English "English for Miners";
- To experimentally test the effectiveness of the textbook and methods of teaching communication in English in the conditions of the mining faculty.

The hypothesis of the study, which determined its entire course, is formulated as follows: the mastery of the foreign language communicative competence by students-miners in the specified parameters will be more effective if the organization of training is changed so that oral communication on mining topics that arouse the personal interest of students is dominant in it. Teaching communication among students of the Mining Faculty on a mining-oriented topic is more effective in a dynamically changing topic.

## **METHODS**

For the first time, an attempt was made to substantiate mining-oriented topics as a component of the content of teaching a foreign language, and also the idea of teaching foreign language communication through educational communication on mining-oriented topics was substantiated; the expediency of the selection of linguistic (lexical, grammatical) material, necessary and sufficient for the needs of intercultural communicative activity of graduates of the mining faculty, has been proved;

- Theoretically substantiated non-traditional organization of training, content in the form of a frame grid of mining topics;
- formulated the distinctive features of the communicative activity of athletes, which have a number of characteristic features, including: laconic, athenatic, emotional, factual;
- developed and systematized exercises and tasks for teaching communication in English in accordance with the theory of frames, aimed at developing communicative competence within limits.

To solve the set tasks, the following research methods were used:

- a substantive analysis of the requirements and curriculum for the training of specialists - future miners, as well as curricula in general professional disciplines;
- functional-content (linguistic-statistical, subject) analysis of the texts of authentic articles published in journals and materials of scientific and mining conferences in the specialty in English;
- testing (lexical and to identify the level of proficiency in reading skills) of 1st year students in order to establish the initial level of foreign language proficiency for training at a university;
- conducting a teaching methodological experiment; qualitative and quantitative analysis and evaluation of the obtained experimental data.
- conducting a teaching methodological experiment; qualitative and quantitative analysis and evaluation of the obtained experimental data.

The scientific novelty of the research lies in the fact that a new type of classification of the array of disciplinary publications has been developed according to the purpose of the sources included in it; revealed the specifics of professionally oriented communication in a foreign language at the lexical level; detailed the concept of "subject competence"; describes the conceptual apparatus of professionally oriented communication of specialists - miners, which is the basis of the corresponding professional and industrial picture of the world

The theoretical significance of the work lies in the theoretical analysis of professionally-oriented communication in a foreign language from a sociolinguistic standpoint and the identification of its main characteristics; in detailing the structure of the concept of "subject competence"; in the development of the theoretical foundations of the teaching methodology for professionally-oriented communication in a foreign language and the actual methods of teaching communication for students - miners.

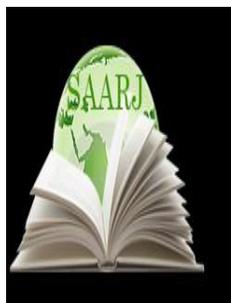

The practical value of the study lies in the fact that it presents a theoretically grounded and experimentally proven methodology for teaching professionally oriented communication in English to students - future miners, which has a positive effect not only on mastering a foreign language, but also on the process of professional socialization of a student in the whole. A frequency dictionary of the sublanguage of the texts of mining articles was compiled, containing the characteristics of mining enterprises / companies, a methodological classification of terms for teaching vocationally-oriented communication in the mining sphere was carried out, a lexical minimum of training was formed. A new topic has been developed for teaching professional-oriented communication in a foreign language for students - future miners. An educational text library was formed based on the texts of authentic mining-technological articles, a classification of the texts included in it was developed and a sequence of work with them was proposed. Educational texts are included in the system of professionally and communicatively significant tasks. The developed methodology can be used in teaching professionally oriented communication in English in mining universities at engineering faculties, in creating textbooks and materials for teaching professionally oriented communication in a foreign language.

## CONCLUSIONS

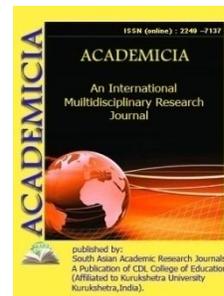

1. The process of teaching professionally oriented communication in a foreign language contributes to the professional socialization of trainees by including them in real professionally meaningful communication using a foreign language, the possibility of which is provided by the texts of authentic articles and a system of professionally and communicatively significant tasks.
2. Training in professionally-oriented communication in a foreign language is carried out by informing as a process of communicating unknown information about known professionally significant objects, taking into account the subject competence of the students, which contributes to increasing the pragmatic value of training.
3. The process of teaching professionally oriented communication in a foreign language makes up for the deficit of foreign socio-cultural professionally significant knowledge as part of the subject competence of trainees, where it is also proposed to include universal knowledge and knowledge that reflects the specifics of the professional and industrial culture of the native country.
4. Teaching professionally oriented communication in a foreign language is focused mainly on teaching professionally oriented reading as the main form of professionally oriented communication in a foreign language in the conditions of the native culture. Oral speech is used as a teaching tool for vocational reading.

### ABSTRACT

*The copolymers of acrylonitrile and acrylic acid are synthesized for the first time by trithiocarbonate-mediated reversible addition-fragmentation chain transfer polymerization in DMSO at a content of comonomers in the reaction mixture of 40%. Various regimes of acrylic acid introduction into the reaction are tested. This makes it possible to synthesize copolymers with close average composition and different unit distribution in a chain. It is shown that, with an increase in the fraction of acrylic acid in the copolymer, the contribution of the ionic mechanism of cyclization grows, which is favorable for widening the temperature interval of cyclization and decrease in the intensity of heat flow.*

**KEYWORDS:** *Acrylonitrile, Acrylic acid, DMSO, Copolymers.*

### INTRODUCTION

Over several decades, there has been an active search for new methods of producing high-strength carbon fibers with the use of precursors based on acrylonitrile (AN) copolymers. On one hand, just using PAN precursors, high-modulus and high-strength carbon fibers were obtained; their parameters were much better than the characteristics of fibers based on pitch and cellulose precursors. On the other hand, the strength of carbon fibers based on PAN precursors is still far from theoretical values because of the presence of defects and admixtures.

Reasons behind the appearance of defects may be, in particular, distortions of the molecular structure of polymer chains: terminal groups of macromolecules, branchings, and heterogeneity of macromolecules with respect to MW and composition.

Attempts to apply various variants of controlled polymerization for the synthesis of narrowly dispersed PAN have been made since the early 2000s and persist up to now. The use of stable nitroxide radicals for this purpose was not a success, since the process was inhibited and short oligomers were formed. The use of atom-transfer radical (ATR) polymerization was proven to be more promising, although in the first studies only oligomeric products with  $M_n \approx 10^4$  were synthesized. The results of many publications in this field are reviewed in. One of the drawbacks of this technique concerns the use of metal compounds able to affect the properties of a PAN precursor during heat treatment.

Acrylonitrile (99%) and acrylic acid (>99%) purchased from Acros were purified via distillation according to the standard technique. AIBN was recrystallized from ethanol and stored in the dark at  $-30\text{ }^\circ\text{C}$ ; anhydrous potassium persulfate (PPS, >98%) purchased from Aldrich was used as received. Prior to RAFT polymerization, a solution containing the desired amount of the initiator

(AIBN or PPS) and RAFT agent (CTC-1, CTC-2, or BTC) in DMSO was prepared. Then AN and AA were added; the total mass concentration of the comonomers in solution was 40%. The molar ratio of AN : AA was 98 : 2, 95 : 5, 93 : 7, and 90 : 10.

In the ampoule synthesis, acrylic acid was poured into the obtained solution and the resulting solution was poured in 5-mL ampoules that were connected to a vacuum setup and outgassed to a residual pressure of  $\sim 5 \times 10^{-3}$  mmHg. The ampoules were sealed and placed in a thermostat heated to  $80\text{ }^\circ\text{C}$ , and the reaction mixtures were polymerized for 24 or 48 h. Afterwards, the ampoules were cooled in liquid nitrogen and opened and the contents was diluted with DMSO. The final solution was precipitated under vigorous stirring into water and washed first with water and then with methanol on a filter, and the polymer was dried in vacuum.

When polymerization was carried out in a 100-mL three-neck flask equipped with an overhead stirring device with an anchor-type stirrer, acrylic acid was introduced continuously during the synthesis over the specified time. A BYZ-810 syringe pump was used for AA dosing; the feed rate of AA was 0.16, 0.32, and 0.63 mL/h over 12, 6, and 3 h of polymerization, respectively. The prepared solutions were poured into the flask, purged with argon (99.99%) for 15 min, closed, and immersed in a bath heated to a certain temperature. At certain times, the reaction solution was sampled to determine the conversion, molecular weight characteristics, and composition of the copolymers. When polymerization was completed, the reaction mixture, if necessary, was diluted with DMSO and precipitated into excess water and the copolymers were filtered, washed with water, and dried at  $60\text{ }^\circ\text{C}$  until a constant mass was achieved.

**TABLE 1. EFFECT OF SYNTHESIS CONDITIONS ON THE YIELD AND MOLECULAR WEIGHT CHARACTERISTICS OF THE COPOLYMERS**

11		1.0	5	48	60.6	21.0	1.19
12		0.5	1	48	38.1	56.8	1.30

One of the important characteristics determining the properties of AN copolymers as a carbon fiber pre-cursor is the chemical composition of the copolymer. In terms of thermo-oxidative stabilization processes, the incorporation of a comonomer with the acidic group into the chain causes a change in the mechanism of cyclization : along with the radical mechanism typical of the AN homopolymer, the ionic mechanism is realized. As a consequence, the temperature interval of cyclization widens and the intensity of heat release is reduced. This increases the degree of cyclization and, as believed, has a beneficial effect on further carbonization.

The films cast from the synthesized copolymers were studied by DSC in the dynamic regime in an inert atmosphere and in air. Figure 1 presents the thermo grams of the copolymers measured under an inert atmosphere. It is seen that the thermo grams are asymmetric and the asymmetry becomes more pronounced as the copolymer is enriched in AA units. At a content of AA of 2 mol %, a shoulder is observed in the low temperature region along with the main peak. With an increase in the fraction of AA units in the copolymer, the intensity of the shoulder grows, while the intensity of the main peak declines. If the AA content is above 7 mol %, the shoulder is transformed into a peak. The total heat flow corresponding to the temperature of the maximum of the peak decreases with increasing fraction of AA.

The temperature interval of cyclization initially sharply widens as the fraction of AA grows to 5 mol %, and then it continues to widen but not so distinctly (Table 2).

Fig. 1. Thermograms measured at a heating rate of 10 °C/min under inert atmosphere for the AN-AA copolymers synthesized in the presence of CTC-1 and AIBN at 80 °C. Molar ratio of AN : AA = (1) 98 : 2, (2) 95 : 5, (3) 93 : 7, and (4) 90 : 10; [CTC-1]<sub>0</sub> = (a, b) 5 × 10<sup>-3</sup> and (c) 1 × 10<sup>-3</sup> mol/L; [AIBN]<sub>0</sub> = (a, b) 1 × 10<sup>-3</sup> and (c) 5 × 10<sup>-4</sup> mol/L; the time of polymerization is (a) 24 and (b, c) 48 h.

The latter is related to a higher reactivity of AA in copolymerization with AN in the organic solvent, which leads to its rapid consumption at the initial stages of the process.

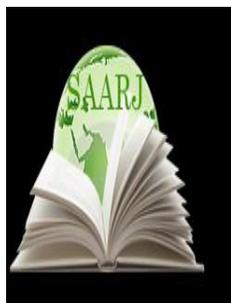

Thus, it is demonstrated for the first time that the narrowly dispersed AN-AA copolymers can be synthesized by RAFT polymerization in DMSO. It is shown that the RAFT mechanism is realized both at the instantaneous introduction of the comonomers into copolymerization and at the dosed introduction of AA into the reaction mixture. In the latter case, the copolymers with different distribution of units in the chain are formed.

The thermal behavior of the copolymers is influenced not only by their composition but also by the character of monomer distribution in the chain.

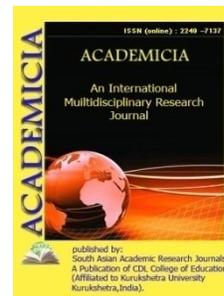

Our studies made it possible to propose a new way to control the properties of the AN-AA copolymer during its heat treatment, namely, combination of the RAFT mechanism with the dosed introduction of the comonomer in polymerization.

**ABSTRACT**

*Abdulla Aripov (1941–2016) is a poet who raised Uzbek poetry to a new level. His first collection of poems, Dwarf Star, was published in 1965 and has become a unique feature of Uzbek literature. The poet's poems are based on an in-depth artistic analysis of life events. They cover a wide range of realities of life and focus on the contradictions in it. More than sixty books by Abdulla Aripov have been published in the past. He is the author of the poem of the national anthem of Uzbekistan. Abdulla Aripov's poems and epics have gained a reputation as a perfect example of philosophical poetry. They show the struggle between good and evil and draw a deep generalization with a deep philosophical meaning. The poet's poems attract attention with their unique approach to social reality and reveal new aspects of the mysteries of the human heart. Abdulla Aripov translated into Uzbek the work of the great Italian poet Aligeri Dante "Divine Comedy" from the treasury of world literature, samples of poems of famous poets such as A.Pushkin, N.Nekrasov, T.Shevchenko, L.Ukrainka, R.Khamzatov, K.Kuliev. . Abdulla Aripov's poetry collections have been published in Russian, Turkish, Tajik and Uyghur. His work has a special place in modern Uzbek literature.*

**KEYWORDS:** *Abdulla Aripov, Uzbek Poetry, Social Life, The Human Heart, The Struggle Between Good And Evil, Comparison, Artistic Analysis, Philosophy, Conclusion.*

**INTRODUCTION**

Abdulla Aripov has shown in practice that philosophical thought is always in the spotlight, that the words of a true poet have a special weight in this regard, and therefore no one can be equal to the poet in the field of fame. . He was very popular not only in our country, but also in the sister

countries. Many walk without knowing the name of the governor or minister of the district or province where they live. But everyone knew Abdulla Aripov, when he said "poet" everyone imagined him at first, millions of people were his fans, martyrs of his poetry, thousands of people memorized his poems, at official events across the country, Independence Day, Navruzcelebrations, institutions, enterprises, of course, his poems were recited at home gatherings, and now everyone is involuntarily excited when the national anthem of Uzbekistan is played at international sports competitions, the Olympic Games, the official visit of heads of state. Kindergarten children know that the words of the national anthem were written by Abdulla Aripov. Foreigners also acknowledge that the Uzbek national anthem is the most meaningful, resonant and influential in the world.

Abdulla Aripov became famous as a philosopher and poet. He showed that a real poet is a philosopher and a sage by presenting poetry that is different and higher than that of his predecessors, such as Fitrat, Cholpon, Hamza, Ghafur Ghulam, Oybek, Hamid Olimjon, MaqsudShaykhzoda, Mirtemir. He entered the literature with a thin collection of poems called "Little Star" and suddenly became a bright star of Uzbek literature. In each of his poems, he assured everyone that the words of others, no matter how meaningful, were not equal to the words of the poet, and did not have the same power of influence as his own. The poems of the author of "Little Star" prove that the influence of the words of the original poet never fades, that the boundaries of space and time are insignificant for his lofty poetry. Over the past period, Abdulla Aripov's poems have not left anyone indifferent. They immediately attracted the attention of all, provoked controversy, and those who threw stones at the poet's poems were suddenly discredited, and their jealousy and malice were clearly felt. Each poem of the poet revealed to the readers an unprecedented splendor of words and introduced new aspects of its meaning. Therefore, everyone - the leaders of the country, officials at various levels, ordinary people, those who traveled the world, those who did not go beyond the village, the village, paid special attention to his work, his personal life. That is why businessmen who live with the worries of the masses, selfish ambitious people who do not tire of setting the world on fire for personal gain, swindlers who eat the money of the mosque, bribes, greedy people who preach about faith, resurrection, heaven and hell, truth and justice, various categories of mischief-makers struck themselves in the shadow of the poet's fame. The poet, on the other hand, took the words and circumstances of those around him as the subject of his poem. It added vitality and variety to his poetry. It is obvious that every poem by the author of "Little Star" has a deep vital basis. He reveals that poetry has become a natural need for him to breathe, showing that he is a word artist who has taken the habit of being able to derive a deep meaning from any event in life, from what he sees, from what he hears, from what is said in his place, and in his poems -feeling, expressed feelings very simply, clearly and impressively. That is why the doors of Abdulla Aripov's poetry are always open for everyone. His poems are of interest to both lovers of classical literature, fans of Western literature and modern fans, fully satisfying the needs of all. Everyone who appeals to the poet's poems will surely receive spiritual nourishment. The beauty of his poetry penetrates the hearts of different categories of people and frees their souls from dust. Because this poetry embodies the universal feelings of all peoples of the world.

Any poem by Abdulla Aripov can prove that he is a philosopher-poet. For example, in his poem "Fate": // Never see with the eye // How a tree and a nail grow. // Hatred also grows more and more slowly, // Freedom that does not give in to your good feelings. // My child, you control it

too, // It's like cutting a tree and a nail "(Oripov A. Sun station: Poems, articles, conversations, translations. - Tashkent: "Sharq", 2010. - 384 p. - p. 95 ).

Abdulla Aripov's poems can fully meet the high standards of world poetry in terms of form and content, philosophical meaning, accurate reflection of real life, artistic color. Those who have read the originals of the poems of the world's most famous poets side by side with the poems of this Uzbek poet will surely be convinced of this. The author of the collection of poems "Little Star" always looks at the events of life with a deep look typical of sages. In his poems, the feelings and thoughts of the lyrical hero are very impressively expressed, in the lines the words are polished in different colors and resonate with the tone that reaches the layers of the soul. The poet draws attention to the fact that there is an organic connection between things and events that many do not pay attention to, and derives a deep philosophical meaning from them that no one could have imagined. This is one of the peculiarities of his work. The poet, unlike other creators, reveals the puzzles of human nature, the complexity of interpersonal relationships, with an uncanny ingenuity. For this purpose, he compares things that no one could have imagined. For example, as in the poem "Fate": "It can never be seen with the naked eye // How a tree and a nail grow." At first glance, there seems to be no resemblance, no closeness between the tree and the nail. But both the tree and the nail grow. So, there is a similarity between them. The poet's meticulous gaze, his supernatural ingenuity, informs everyone of this fact. "Fate" sounds like the words, advice and teachings of the wise poet and enriches the minds of people, the tone of his words suddenly captivates the hearts and makes people think involuntarily. Because the deep thoughts expressed in the polished lines of the poem suddenly pull the human consciousness into its whirlpool. At this time, everyone begins to think about his all animas, he feels that some emotions are bothering him, that some change is taking place in his spirit. Anyone who reads Abdulla Aripov's poems can clearly feel not only the poet's life, but also the breath of the turbulent, tumultuous period in which he lived, and he thinks that there are more people who suffer and suffer than those who live in this world. And involuntarily the poet becomes interested in his poems, and when he reads them he realizes that they are a treasure trove of meanings. Because the wise poet has a lot of meaning even in the simple things around him, it shows that every living soul lives in a whirlpool of anxiety, sorrow, joy and happiness. The great poems of the poet, such as "Uzbekistan", "Spring", "Wind of my country", as well as small quatrains have a deep meaning. Each time it is read, new meanings are understood from them. The passing years, the winds of time blowing violently, the storms of social life, the change of ideology, politics cannot destroy the content of the poet's poems. On the contrary, each generation finds solace in the poet's poems, answering the questions that torment him. Because the poet, with his supernatural intuition, senses with the wisdom of the sages the condition of the people of all times, their moods, what worries and worries their hearts. It is obvious that the history of the centuries, the events of the present day have flowed through the sensitive heart of the wise poet and given meaning to his poems. The poet emphasizes in his poems that the human heart is a treasure of mysteries, that it is an incomprehensible and incomprehensible mystery, and proves that the power of the hidden meaning in the heart of the Word, its power of influence, is revealed in the poetry of wise poets. Such poems, on the other hand, reveal the secular and spiritual worlds of people of all ages. That is why Sheikh NizamiGanjavi says: "Even if everyone writes, the word hurts, // The word opens the two worlds" (Sheikh NizamiGanjavi. MakhzanulAsror: Doston. - Tashkent: "Kamalak" Publishing House, 2016. - 216 p. - Page 67). In Abdulla Aripov's

poems, words have more and wider meanings in various dictionaries. The fact that a word has a deeper meaning than it is used in everyday life and rises to the level of wisdom is called a "point.

Violent, ambitious, honorable people will threaten, threaten and try to keep their word. Because their behavior, their nature is dominated by mad anger, cruelty, haste, arrogance, the tendency to show off their power. The wise, on the other hand, convey the truth that everyone needs to know in a calm, gentle, gentle, gentle way. In Abdulla Aripov's poems, a soft, gentle, ironic tone prevails. Everyone who reads and listens to this poet's wise poems will feel that the word art is the necessary nourishment for the human soul, and that the poet's heart is the strongest melody, that every change in nature and society strikes and resonates with him. not to be left out, and to prove once again that he is able to express a new idea even in the simplest, trivial things, that a true poet is wise, that it is a sign of talent to choose the most influential words and express his opinion intelligibly.

Abdulla Aripov's poems are also notable for their variety of themes, and they are a bright proof that talented people are never indifferent to the events of nature and society, the distant past and the present. The diversity of themes in the poet's poems means that for literature, including poetry, all events of life, people's behavior, attitudes, changeable nature, and their interrelationships can be a source, a material, an object. In the poem "Village Evenings" (2009): "The burden of the sun at the ends of the poplars, // Where does the infidel come from? and the lines prove that the poet's words are based on impressive analogies, beautiful adjectives, eye-catching phrases. Abdulla Aripov's poems show that the Uzbek language is a rich language, which has the ability to effectively express all the events of life, a variety of human experiences and feelings. At the same time, they say that the art of speech, in particular, poetry as a kind of rhythmic speech, embodies a variety of musical tones, that the original poem is a phenomenon of the heart, that it evokes passionate feelings, experiences in the poet's heart. reminds us that The poet's poems evoke the idea that words have different meanings, when they are used in their proper place, their meanings are revealed, the power of influence increases, and each word is adapted to express a different situation. Abdulla Aripov's poems differ from the poems of other poets not only in their meaning, but also in the perfect form of poetic speech, the musicality of their words, the resonance of their rhymes. Every writer is always envious of the great skill of the wise poet in this regard. Abdulla Aripov's rhyming art can be an example for all poets. His small quartets, as well as his translations from the works of other poets, can be a vivid proof that the whole artistic beauty and resonance of the poem is due to the influence of rhyme. Due to the weakness and disability of the rhymes of many poets, their poems seem to be just a ridge of simple words. Abdulla Aripov's poems, in contrast, are based on meticulous, moving and resonant, dark, full rhymes. These kinds of rhymes exaggerate the content of the poem and increase their impact. It is obvious that paying special attention to rhyme in the poem is one of the important features of the poet's work. The poet reveals new facets of the subject and interprets them in an unexpected way, which is the focus of his poems, which are based on pleasant rhymes. Each poem by the author of the collection "Little Star" consists of three parts. That is, first a certain idea is put forward and attention is paid to it. In the following lines, this idea is expanded and developed on the basis of various comparisons, and on its basis an unexpected conclusion is drawn. The poem "Baho" is a clear example of this: "If you look at the human race, // Their appearance is very similar. // But if you look at his life, // It's a completely different character. // One is wise, the other is ignorant, // One is foolish, one is angry. //

Someone is like a caravan, // Someone is like a dragonfly. // Never believe in the image of a man, // Not everyone you meet can be. // Ajibulfaterurtundkishigoho, // Maybe the curiosity is full of sorrow. // We live, regardless of someone, // Joys and sorrows that pass. // This is life, often without knowing the truth, // People who value each other”(Ibid., P. 183).

In most of the poet's poems, the tone of rape prevails. But it is clear that this depression is not due to despair, but to love of life, hatred of people, but to the fact that the poet is fed up with the jealousy, arrogance, insincerity, character, and other flaws of his character. The poet's poems, such as "Baho", are important in that they draw attention to human mysteries, give a correct idea of life, mean that interpersonal relationships do not consist of celebrations, weddings, and that real poets are wise teachers who warn people of the realities of life. In this sense, Abdulla Aripov is one of the creators of literature, a talented poet, a writer who lives as a sage who explains the essence of life events to people. Because in his poems the deep meaning of life events is very impressively expressed through simple, understandable words. No one can express people's behavior, attitudes, relationships in such a light and lively language as this poet. In his poems, deep philosophical thought is intertwined with the beauties of poetic speech. Not only the poet's poems, but also his comments in articles and conversations show that he was one of the smartest and wisest men of his time, and that such people were critical of social life and interpreted events in detail. If we look at the work of Abdulla Aripov in chronological order, we can see that the philosophical content of his poems is constantly expanding and deepening, and at the same time, the sounds of lamentation and rape are growing in them. Such features of the works are directly related to the author's worldview and character. Abdulla Aripov said, "Coming into this world, I was disappointed in many things in life. Because I saw that what is called justice is relative. I saw something like, "I'm a native of CharkhiKajraftor." However, I am very grateful for today, for gaining independence. Our President, our people valued me and raised me to the level of a Hero. These are very important statements. But from a spiritual point of view, if it's raining all around, doesn't that mean I'm all dry when I'm under an umbrella? There are still people who overshadow our great deeds, who do not wish the best for their people, who always think of themselves! Does your blood boil after that, or not? How can you call them my people ?! They are not the people, they are the ones who claim to be the people on behalf of the people. These are the anthrax wounds of his people. When I see these, I burn. He says, "My people, my people," and when he sits on the bench, he plunders that people. Becomes a licensed thief. The people are in the fields, the people are at work, but those in the mood for crowds are still on the edge of the pile”(Ibid., P. 240).Describing the biography of Alexander Sergeyeovich Pushkin, N. Chernyshevsky spoke about his character and features of his poems, noting that this great Russian poet wrote his first poems under the influence of the English poet Byron: "At that time, the whole of Europe was delighted with Byron's works. Since Pushkin was very young at the time, it is not surprising that he too became obsessed with these Byron works. Man's character is formed gradually, due to his marital experience, which is why Pushkin wrote a work under the influence of Byron for several more years after "Captivity of the Caucasus." Byron is a very sad poet. Pushkin's Byron-influenced poems reflect this grief in part, but Pushkin's grief is much slower than that of the English poet, for this grief was, in fact, contrary to Pushkin's nature. He was an open-minded poet”(Chernishevsky NG Selected Literary-Critical Essays. - Tashkent: Uzdavnashr, 1956. - 452 p. - p. 65).It turns out that the work of each artist is based on his experiences, and Abdulla Aripov's poems reflect the uprisings in his inner world, the events he observed in life. Despite the fact that the content, tone, articles and comments of his poems have

won the love and respect of the leaders of the country, this wise poet, like all honorable people, did not neglect the attention and recognition, and held his dignity in high esteem. For example, such a meaning is understood from the poem "Baho". His other poems, like this one, are concise in form and extremely comprehensive in content. In the poems of the poet it is evident that he expressed the pains, sufferings, demands and desires of his affective heart. Such a feature determines the general content of the poet's work. An example of this is the quartet "Strange": "You say, don't care about small things, // Always walk higher than them // It's getting taller than that, // I'm dizzy, it's amazing!" (Oripov A. Solar station. - p. 57). The poem "The Interlocutor" reinforces this idea: "I wish I could meet such a person: // Even if your age and career are not equal, // Of course if you are equal. // I wish I could meet such a person, // Speaking of which, the place is typical of yorons. // Let's say: is there life in the stars, // Which drug is suitable for which of us. // I wish I had such an interlocutor, // If they didn't irritate each other. // When one has an eye, the other has an eyebrow, // If gossip does not interfere with the conversation" (Ibid., P. 99). It is a great pleasure for everyone to do their job properly. Abdulla Aripov writes the poem. Such poets are very rare in the field of literature. Their poems are so mature in form and content that no one can find flaws in them. Anyone who seeks flaws, shortcomings, flaws in Abdulla Aripov's poems will torment himself in vain. Some of the works of most writers are quite accurate, and this is considered a success in their work. Abdulla Aripov's poems are a success not only for him, but for all literature. Like "Mother Planet", "Face to Face", "Choosing Munojot ...", "Harmony of the Years", "Wind of My Country", "Spring", "Sarob" ("My Thoughts") by the author of the "Little Star" collection. one who reads his poems side by side with the poems of other poets will certainly draw such a conclusion. Surprisingly, some of the words and phrases in the poems of the author of the collection "Little Star" are very popular, especially as the last line is surprising as an unexpected conclusion. The conclusion in this poet's poems, unlike that of the other writers, is as striking as a sudden explosion. Because in this last line, the comments in all the verses of the poem are wonderfully combined. That's why it looks like a fragment. Although this line is full of sorrow, it is full of pain, but for some reason it is pleasant, the person feels as if he has found something new. Then the question arises as to what is left of the days, months, years that have passed involuntarily. Because in the poems of the poet, such as "Test", many people's feelings: "The silkworm also has a soul, // But when it dies, it is strange. // I can't be in the army of Khazan, // How many springs have turned yellow. // Even if I did it from the heart, // They came back to suffer, unfortunately. // From the sky like a bullet-riddled crane // No feelings fell to the ground. // Goodness is not someone's property, // The sun is the same for everyone though. // Fate for some reason left me alone, // Sent me more trials. // Once upon a time I loved the world to the fullest, // I would even bow my head to a leaf. // Now I regret it all, // I shed tears for my past love" (Ibid., P. 126). Such pleasing thoughts in the poet's poems are as thought-provoking and sad as wisdom. For example, the reader can see the poet's vitality in the lines "How many springs have turned yellow" in "Test", "Even if I do it from the heart, // Unfortunately, they came back to suffer", "For some reason fate left me alone, // He sent me more tests". just like Alexander Pushkin, he realizes that he is "trying to enjoy the pleasures of life," but that his restrained desire is not fully satisfied. Abdulla Aripov's creative heritage attracts attention with the diversity of the themes of his poems, as well as with the presence of many poems about the poet. It can be said that the subject of poetry has not been addressed in Uzbek literature as much as Abdulla Aripov. Unlike most writers, he is able to find words and phrases that inspire poetry and give an impression to the mind. It is a pleasure for the

poet to weave words. In the face of Abdulla Aripov's poems, it is clear that the language of other poets is poor, shallow and shallow. The rape in the poet's poems, such as "Even if I do it from the heart // Unfortunately, they returned," "For some reason fate left me alone, // Sent me more trials," is a characteristic of honorable people, and this wise poet held his dignity in high esteem. , it is clear in every poem that everything he encountered in his life had a profound effect on his sensitive, delicate nature. People are always interested in the personality of such a wise poet as Abdulla Aripov, whose poems are full of wisdom. He wants to know what his character was like. Because the poet's reflections on the riddles of human nature, the complexities of social life are interesting and thought-provoking. The poems of this poet will never leave people indifferent. The weight of the poet's poems shows that he felt the divinity of the word, its magic, its charm, his life, his whole being. It is no exaggeration to say that Abdulla Aripov is a poet. Because his poems about poetry, poetry, poetry, like his poems on other topics, are based on deep thought, clear metaphors that are interconnected. "The Creation of a Poet," interpreted as "my mother's poetry," or "a joke," can only be written by an artist who has a deep understanding of poetry and cannot imagine his life without it. Abdulla Aripov in his poems on the same subject expressed his passion for poetry. In these poems, it is pointed out that there is an inexplicable connection between the poet and the poem that people cannot comprehend through logical observation. In his poems on other topics, Abdulla Aripov seems to have a high imagination that no one else can rise, and the divine connection with poetry is felt in every poem, which gives freedom to his thoughts and wise depth to his thoughts. His poems, which are full of philosophical content, lead people to think, to observe. This allows them to understand the truth, to know what the purpose of life is. The poet's rape in search of truth, his grief over the deep-rooted flaws in his marriage, moves, albeit for a moment, into the heart of the poet. Because he said: "Evil, various vices unite, // Hands and nations flee from each other. // Honesty, kindness, perseverance, // I don't know why, life! // Thought is evil to man, // The people of Nechuk are evil to man. // Neither the earth nor the sky will answer it, // neither the Buddha, nor Zoroaster, nor the Bible, nor the Qur'an. From such poems, which form the basis of the poet's work, it becomes clear that Abdulla Aripov was a wise and philosophical poet. In his poems, such as "My Mother's Poetry" and "The Creation of the Poet", he is proud of the fact that he came to this world, became a poet, gained the attention of the people, and finished the poems that took place in people's hearts. In his poems on other topics, the poet emphasizes that God has given everyone life, food, ability, education, and a sacred duty, such as not to waste it. Abdulla Aripov's poems differ from those of other poets in that they have a deep philosophical thought and in this respect surpass them. The thoughts of the author of the collection "Little Star" are based on the comparison of contradictory things, such as good and evil, love and anger, joy and sorrow, envy and jealousy, to show the connection between them. This distinctive aesthetic form not only enhances the impact of his poems, but also exaggerates the philosophical thought in them. In the poet's subjective experiences, which are translated into poetry, the thoughts that pass through the minds of many are reflected. Many of Abdulla Aripov's poems and quatrains are similar to the rubai of the great thinker Umar Khayyam (1048–1122) in terms of their philosophical content. Oriental thinker Umar Khayyam shared the facts he understood about life: "I have been deceived, I exist in the world, // I am amazed at what I have found in life. // I went this way, but I didn't understand, // What's the point of coming and going? " (Umar Khayyam. Rubaiyat. - Tashkent: Publishing House of the Central Committee of the Communist Party, 1981. - 152 p. - p. 97). // At the end of time, he will come to the ground and say, "If someone memorizes, that is Iqbal."

These four quartets of the author of the collection "Little Star" sound the most appropriate answer to the question of the Eastern thinker, which is astonishment and surprise.

The rape of life in the poems of Eastern sages such as Umar Khayyam and Mirza Bedil is not due to their despair or suffering in life, but to the fact that philosophical poets want life to be more beautiful and people to be more spiritually mature. Abdulla Aripov's influential heart has also suffered from jealousy, envy, insincerity, lack of evidence, fraud, deception, and deception in human relations. He said that he had suffered a lot from such inhumane behavior, which was deeply rooted in his life: "Listen, this will be an eternal sound, // Gado's enemy will be gado. // Until the two bow down to each other // In the middle, this world will end." In this quartet, the wise poet reinforces the meaning and impact of the ancient proverb, "Gado's enemy will be Gado." The Arabs, the Japanese, the British, and the Germans all agree that the idea put forward in this quartet is the same. Because the poet did not simply state that gado is the enemy of gado, but made a deep analysis of this fact in a concise, concise analysis. In the quartet, in general, the conclusion is very impressively expressed in all the poems of the poet. This means that Abdulla Aripov's poems are deep in content and poetically perfect. The poet analyzes the event in more detail than other writers. His poems and epics are a vivid example of the boldness of Uzbek literature in the analysis of life events. The fact that the deep philosophical conclusions in his works are based on deep generalizations also means that Abdulla Aripov raised Uzbek poetry to a new level. The artistic study of the events of life, their comprehensive approach, and the presentation of an unexpectedly deep generalized philosophical conclusion seem to be the main features of the poetry of the wise poet. The feeling of sadness and coercion in the poet's poems stems from his high ideals, dissatisfaction with the existing social life, the difficulty of calling some people human, the selfishness of some people, the dominance of selfishness and selfishness in nature. In his poems, Abdulla Aripov expresses his thoughts on man and the world, and at the end of the poem he expresses his attitude to the event with great passion. In this respect he can be an example to all writers, ahead of all poets. Many people, by their very nature, always strive to do good deeds that benefit others. There will always be many such people in every stratum of society. Life, on the other hand, grows and changes because of the presence of people who try to do good to others and share love. Abdulla Aripov's poems focus on this eternal process that reigns in life and the fact that man was created by nature to strive for goodness. For example, in the poet's poem "Talpinish": "Clouds to the mountains, // Birds to the meadows. // The valleys rush to the river, // The rabbits rush to the desert. // If a person strives for mercy - // This is the reward, this is the repentance, this is the faith" (Ibid., P. 45). For in the heart of one who longs for someone's love, for one who longs for someone, good desires are aroused, he hates hurting others, deliberately hurting someone, he rejoices when he benefits someone, and he rejoices when he eases someone's problem. In this poem, the poet is a man of faith, a man who has a feeling of kindness and longing for love in his nature. As long as one's actions are based on kindness, he will be rewarded, and the kindness of such people to someone, and the pursuit of someone's kindness, is as good a deed as prayer. Because the purpose of prayer is the best feeling in the heart, to strengthen aspirations, he says. The content of such poems by Abdulla Aripov is interpreted by everyone and understands their meaning. But everyone immediately notices that the murmur of life, the rape of people's indifference, swells in the poet's work. For he says in the poem "The Weak Banda": "Light is the mystery of this world, // I'm still going without knowing. // There are definitely worlds in the sky, // Maybe they are more mature than us, they are brighter than us. // But there, too, there are helpless slaves like me // It is clear that there are

weak slaves” (Ibid., P. 45). There are many poems of this tone in the collections of the poet. The large number of people who are ready to commit any kind of fraud for their own benefit, the corruption, the greed of those who are not ashamed of greed, and the plundering of public funds by officials are boiling the blood of every conscientious person. The rape of the poet stems from his grief and suffering at the sight of such vices rooted in social life. Abdullah Qadiri is also saddened by the humiliation of marriage, and in the novel "Last Days" he writes with pain and sorrow that cursed people, unworthy of the name "human", like to brag about their murders and evils. When Homid told Sadiq that he had to kill Otabek, he said, "He was about twenty-two years old, with yellow skin, red eyes playing and burning like an owl's eye, a snub-nosed face, and the more his forehead grew outwards, the more his face went inward. This young man is like a creature created prematurely. "Without thinking, he said, "I have placed two so far, what will he do if he passes to the third?" (Qodiriy A. Past Days: Historical Novel. - Tashkent: Literature and Art Publishing House, 1974.- 400 p. - p. 184). And Mual, Sadiq's companion, said, "Your deeds are worthless in the face of my deeds." degrades him (Ibid., p. 246). Abdulla Qodiri, Abdulla Qahhor, Abdulla Aripov revealed the flaws in the marriage not because he hated someone, but because he wanted to get rid of them. They did the right thing as patriotic, humane creators in depicting the negative states that dominate people's behavior, attitudes, relationships. The ideas put forward in the works of these great artists show that progressive, conscientious people always want life to be better, and people to live in kindness, cooperation and harmony. The call of poets, writers, and philosophers to eliminate misleading situations influences people's worldviews and behavior and encourages them to do good deeds. Although their ideas about the struggle for justice and truth do not suddenly change the current situation in society, they attract many people. People who are in the spotlight, especially poets and writers, follow what they say about truth, justice, honesty, and so on. If they act contrary to the law, people's sense of truth, justice, diligence will disappear on their own, and the ideas of humanity will not be able to be applied to society. In such a place, people who do the work that most people do for a living become the seed of the ankle. When poets and writers who speak of honesty, truth, religion, and conscience are flattering, honorable, and ambitious, people openly say, "They say different things, but their deeds are different hypocrites," and do not respect them. This is very natural. In his poems, Abdulla Aripov pays serious attention to such puzzles of social life and is seen as a person who dreams of the common happiness and suffers a lot from various vices rooted in marriage. Therefore, no matter what the mood, no matter what the situation, the poet feels in his poems that he saw the feelings of his time when he was suffering from the shortcomings of his life. Because the poet realistically embodies the scenes of our national life, expresses the views of our people on honesty, justice: "The groom says: - Father, give me a blessing, // The groom is the right guy. // Father says: - Honesty is good, but // Such people can't earn a living." (Aripov A. Sun station: Poems, articles, conversations, translations. - Tashkent: "Sharq", 2010. - 384 p. - p. 96). In this poem "Truthfulness" Abdulla Aripov draws attention to the fact that everyone approaches the issue from their own point of view: the groom says to the girl's father, "The future groom is a very good guy." He insists that this quality of the young man will surely delight the girl's father. Instead of being happy, the girl's father worries, "Such people can't make a living." Because the father knows that in life most people do not follow the law, swear falsely, bear false testimony, do not turn away from any atrocities for money, fraudsters do not allow honest people to do the right thing, they suffer a lot. The intention of the suitor is correct. But the father approaches the issue from the point of view of marriage. So he can't be blamed. Such wise

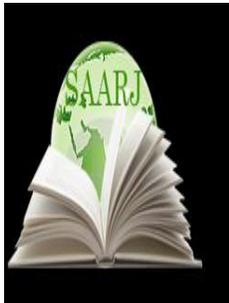

poems of the wise poet put one in such a difficult situation and make one think. Because he analyzes life events from an unexpected point of view. In the poem "Truthfulness", the poet does not justify criticizing the groom or the father. It is up to each individual to draw his or her own conclusions about the current state of our lifestyle. Because a lawyer, no matter how corrupt, greedy, or greedy, never writes laws that protect against bribery, extortion, aggression, theft. Poets and writers do not justify such vices, which, no matter how pianist, unproven, swearing, arrogant, honorable, degrade human dignity. If "Truthfulness" and other poems of the poet are compared with the poems of other writers, it becomes clear that other artists have a more superficial view of the realities of life, and the author of the collection "Little Star" goes deeper into it. The subtle intricacies and mysteries of life's events can be seen not by all, but by the wise.

Figurative expressions in "Bahor", "Oylarim" or the anthem of Uzbekistan can be found only in Abdulla Aripov's bisot. The fact that the poet's poems and epics have a deep meaning and a vivid image becomes clearer with each reading. Everyone agrees that they are written in a clean, lively language. In these poems, it is clear that the poet is saddened by the flaws in life, the behavior of people, selfishness, selfishness, self-respect, ambition, insincerity in relationships. Over the years, it has become clearer that the poet expresses his feelings and experiences artistically. Because in his poems, based on high ideals, the focus is on the exemplary virtues of man. The existing realities of life and the inner anguish of the lyrical protagonist seem to be the two wings of the poet's poetry, his epics. Therefore, the reader, the listener imagines the whole mental state of the lyrical hero in the poet's poems. Because the poet, as a person who has seen the great life and analyzed the events in it, infuses into his poems the clear signs of the period. It can be said that Abdulla Aripov's poems and epics are the culmination of Uzbek poetry in the last quarter of the XX century - the first quarter of the XXI century. Therefore, it is often acknowledged that the author of the collection "Little Star" is a poet who raised Uzbek poetry to new heights. Therefore, it would be a sin to accuse the poet of modernity, to insult him by supporting his poems dedicated to the "Fortress of Salvation" or Navruz. Because everyone lives in a certain period, is subject to the social conditions in it, reckons with the dominant policy. Everyone is struck by the flaws of the time and space in which he lived. Abdulla Aripov's poems and epics are masterpieces that show the mysteries of the human world and the contradictions of social life. From his poems, epics, articles, and conversations, Abdulla Aripov seems to have been wisely thought out and created to end the poem. His poems show that his hobby is to observe life for this purpose, to write what he has seen, witnessed and heard, to compare and contrast contradictory events and draw conclusions on this basis. And everyone has their favorite thing to do, their favorite style of work, and he can't help but talk about what he likes, whether it's a place or not. Abdulla Aripov strives for an artistic analysis of life events, a unique approach to reality and a profound philosophical conclusion. This is evident in each of his poems. The poet's unique poetry, based on an in-depth artistic analysis of the contradictions of life, shows that he devoted his life to literature, that man saw his heart as the main object, the main theme of literature. Therefore, the work of this wise poet is one of the most important historical events in the life of our people. Uzbek literature has long been proud of Abdulla Aripov's poetry. Because his beautiful poetry, which is full of wisdom, is much higher than the praise and confessions that have been said about him so far.

**INTRODUCTION**

Gender issues in the modern world have become the subject of active discussion and study. In his message on 8 March 2018, United Nations (UN) Secretary-General Antonio Guterres noted that achieving gender equality, empowering women is the unfinished challenge of our time and the greatest human rights challenge. He emphasized that “a turning point has come in the history of women's rights protection”, as now the issue is given “as much attention as never before”, that the empowerment of women is included in the list of the 2030 Sustainable Development Goals. “...investing in women is the most powerful way to improve lives locally, in businesses and across countries”. “The participation of women makes peace agreements stronger, societies more resilient, and economies more dynamic. And where women are discriminated against, we often face ... devastating consequences for all” [1].

**THE MAIN FINDINGS AND RESULTS**

All international instruments dealing with human rights issues emphasize the need to include a gender approach in the observance and assessment of the policies of the UN member states on the effective implementation of the policy of equality between women and men and the

empowerment of women, including all measures to prevent and combat all forms of discrimination against women.

To ensure the de facto equality of men and women, the UN invites all its members to include the principle of equality between men and women in their national constitutions or legislation and to ensure, with their help, the practical implementation of all forms of gender inequality, discrimination against women, and takes special measures aimed at preventing and protecting women from violence based on gender, race, skin color, language, religion, political or other opinion, national or social origin, membership of national minorities, property status, birth, sexual orientation, gender identity, age, health status, disability, family position, migrant or refugee status, or on other grounds.

Specific recommendations to states for the practical elimination of inequality between men and women at the present stage are reflected in the UN Convention on the Elimination of All Forms of Discrimination against Women (CEDAW), which has essentially become a program of action in this area. Currently, the importance of gender equality for development is recognized one of the key elements of any development agenda, including the Monterrey Consensus, the Doha Declaration, the Addis Ababa Action Agenda and the 2030 Agenda for Sustainable Development.

The Monterrey Consensus (Adopted by the International Conference on Financing for Development March 18-22, 2002) Monterrey, Mexico, emphasized that the primary goal of tackling financing for development worldwide is to eradicate poverty, achieve sustainable economic growth and promote sustainable development as we move towards inclusiveness. and a gender-sensitive global economic system. The main focus areas are: poverty eradication and job creation, gender equality policies, ... the empowerment of women [2].

The Doha Declaration (Adopted by UN General Assembly Resolution 63/239 of 24 December 2008) Doha, Qatar, reiterated: “equality between men and women is a fundamental human right, a fundamental value and a matter of social justice; it is essential for economic growth, poverty reduction, environmental sustainability and development effectiveness. We reiterate the need for gender mainstreaming in the formulation and implementation of development policies, including financing for development policies, and dedicated resources to this. We pledge to step up our efforts to fulfill our commitments to gender equality and the empowerment of women” [3].

The Addis Ababa Action Agenda of the Third International Conference on Financing for Development (Addis Ababa Action Agenda), Addis Ababa, Ethiopia, 13-16 July 2015 also declared gender mainstreaming as the main goal, including targeted action and investments to develop and the implementation of all financial, economic, environmental and social strategies. Because “gender equality, women's empowerment, and women's full and equal participation and leadership in the economy are vital to achieving sustainable development and significantly accelerating economic growth and productivity” (paragraph 21). It also recognizes the “essential role of women as producers and traders” (paragraph 90) and the importance of promoting “the equal and active participation of women in domestic, regional and international trade.” The need to strengthen “evidence-based policies and applicable legislation, as well as targeting transforming measures to promote gender equality and the empowerment of women and girls at all levels, ensure equal rights, access and opportunities for women to participate and lead in economic life, and eliminate gender-based violence and discrimination in all its forms” [4].

In addition, the 2030 Agenda contains over 80 gender-sensitive indicators, including a specific goal of gender equality. Of the 169 SDG targets and 232 SDG indicators, UN-Women has identified 38 targets and 53 indicators as gender-sensitive (UN Women, 2017). The issues of ensuring equality between women and men and the empowerment of women are also relevant for Uzbekistan. The Republic adopted the laws “On guarantees of equal rights and opportunities for men and women”, “On the protection of women from harassment and violence”, providing for comprehensive support of women, the Commission of the Republic of Uzbekistan on ensuring gender equality began its activity, and under the Senate of the OliyMajlis - the Committee on women and gender equality. The focus is on ensuring gender equality and ending all forms of discrimination and violence against women and girls.

Gender equality means that women and men enjoy the same rights and opportunities in all spheres of society, including economic participation and decision-making, and when the different behaviors, expectations and needs of women and men are valued and met equally. To measure gender equality or gender inequality, global indices and rankings have been developed by country.

To assess the level of gender equality, since 1995, the United Nations Development Program (UNDP) has introduced the Gender Equity Index. The index measures a country's achievements in terms of gender equality across three main indicators: Reproductive Health, Civil Rights and Opportunities, and Labor Market Opportunities. Based on the results for 2018, the Index covers 190 UN member states [5]. In 2010, the United Nations Development Program introduced The Gender Inequality Index, which reflects inequalities in opportunities for achievement between men and women in three dimensions: reproductive health, empowerment, and the labor market [6].

In 2006, the first report of the World Economic Forum (WEF) Global Gender Gap was published on the gender equality gap in the global community. Since then, the WEF has published annually reports devoted to finding ways to eliminate inequality in the position of men and women in public practice and in the family. In early 2019, the WEF published a report on four main indicators: participation in the economy and position in the labor market, including the pay gap and career opportunities; availability of education; life expectancy and infant mortality rate; involvement in politics. According to this study, women in Iceland have the most opportunities in these areas, which has ranked first in the gender equality ranking since 2009. The top ten includes Norway, Sweden, Finland, Nicaragua, Rwanda, Namibia, the Philippines, New Zealand and Ireland. Uzbekistan took 64th place in the ranking of gender equality [7].

Women are the worst in Yemen, Pakistan, Iraq and Syria The 2018 Gender Inequality Report includes data for 149 countries, with 106 countries participating in all studies since 2006. The Global Gender Inequality Index stood at 68% in 2018, with the greatest gains in health and education, with global intermediate scores of 96% and 95%. At the same time, the gender gap in the economic and political spheres remains significant - 59% and 22%, respectively. According to the WEF, no country has achieved equality between men and women. Seven countries have come closest to gender equality, which have reduced the gender gap by 80 percent or more. These are Iceland, Norway, Sweden, Finland, Nicaragua, Rwanda and New Zealand. Even in those countries that succeed, the intermediate gender inequality index in the political sphere is at the level of 50-60%, with the exception of Iceland, where it is 67%. Among the post-Soviet

countries, the best situation is in the Baltic countries, Belarus and Moldova. The countries of the Caucasus and Tajikistan are characterized by the largest gender gap among the post-Soviet countries. At the bottom of the ranking are Yemen (49.9%), Pakistan (55.0%), Iraq (55.1%), Syria (56.8%), Chad (58.0%) and some others. Azerbaijan and Armenia, along with India and China, are ranked last in the world according to the value of the gender inequality index in health, mainly due to the disturbed (in favor of boys) sex ratio at birth. Of the 144 countries that participated in the studies in 2017 and 2018. 55 countries have moved further away from achieving gender equality. Uzbekistan and Turkmenistan did not participate in the study. In early 2019, a World Bank report was published: "Women, Business and the Law 2019: Decade of Reforms" based on an analysis of changes in eight indicators: pay, employment, running your own business, asset management, wages, employment, running, retirement benefits, freedom of movement, marriage and children at 187 states over the past decade. The main problem, according to the report, remains the participation of women in politics (the ratio of men and women in parliament, in ministerial positions, at the head of state). Women hold only 18% of ministerial positions in the world, and only 17 countries have women at the head of state or government. Economic power also largely remains in the hands of men - women account for 34% of managers [8].

According to the ILO, 2 billion men and 1.3 billion women were employed globally in 2018. In relative terms, just over 45% of women were employed in 2018, while the employment rate for men was over 71%. At the same time, as noted, in a global survey, 70% of women said they want to work. There are only 27% of women in leadership positions [9]. This figure has hardly changed over the past three decades. In every fifth country, girls do not have the same inheritance rights as boys.

In the report of the Organization "UN Women": "Progress of the world's women in 2019-2020: families in a changing world", which considers the current situation with women's rights in different countries, it is noted that researchers have noted positive trends. A World Bank (2019) report shows that over the past ten years, 131 countries around the world have undertaken 274 reforms to introduce such legislative changes that aim to increase gender equality. In particular, 35 countries during this period have implemented anti-sexual harassment laws in the workplace, which have protected nearly two billion more women than they did a decade ago, the age of marriage has risen worldwide, the birth rate has decreased, and women have achieved a higher level of economic autonomy. Fathers have increased their use of parental leave, especially in countries where incentives exist, such as "father's quotas", which provide the father with a "take it or lose it" part of parental leave [10]. The authors of the report examine the economic decisions made by women at different stages of their working life. Six countries - Belgium, Denmark, Latvia, Luxembourg, France and Sweden - scored 100 on the Women, Business and the Law index, which means they provide men and women with equal legal rights in the areas studied. Ten years ago, none of these countries scored 100 points, which means that over the past ten years they have all carried out certain reforms. Among the countries with the highest scores, France has achieved the greatest success, with an index score in that country that rose from 91.88 a decade ago to 100 thanks to the enactment of an anti-domestic violence law, criminalization of sexual harassment in the workplace and introduction of paid parental leave [11].

More women on the planet are going to school today than ever before. If in 2000 82.2% of girls of primary school age around the world were enrolled in school, then in 2015 it was already

90.3%, which is almost the same as the indicator for boys at 91.9%. However, experts predict that 15 million girls today will never get this opportunity. The problem is especially acute in African countries, where 48.1% of adolescent girls and 25.7% of girls of primary school age are out of school. For young men and boys of the same age, the indicator is 43.6% and 21.7%, respectively [12].

These facts show how the world is slowly moving towards realizing the full potential of women. According to the authors of the WEF study (2019), at the current rate of change in the Index, global gender equality will be fully achieved only in 99.5 years. Overall, Western Europe will take 54.4 years to achieve full gender equality, North America 151.4 years, and Eastern Europe and Asia 107.3 years. The general index of global gender parity was estimated by the WEF at 69% percent. At the end of 2019, almost complete equality was achieved in the categories of "health care" (97%) and "education" (96%). The situation is worse in politics (25%) and economics (58%). The indicator on the economy has declined recently. Experts believe that it will take 257 years for global gender equality in this area. This is due to the fact that few women work in professions where wages are growing significantly, for example, in the technological field [13]. The situation was further exacerbated by the COVID-19 pandemic, which has affected millions of people around the world. The UN Population Fund technical review (UNPF, 2020) notes that the pandemic exacerbates existing gender inequalities between women and girls. Globally, women constitute 70% of the health and social sector workforce, so special attention needs to be paid to creating appropriate and non-discriminatory working conditions, as well as to ensure that their sexual and reproductive health is protected and psychosocial needs are addressed. During a crisis, women and girls may be at greater risk of all forms of domestic violence, including by intimate partners, due to increased family tensions [14].

As UN Secretary-General António Guterres (2020) highlighted in his report, the COVID-19 pandemic affects everyone, everywhere, exacerbating existing inequalities, has devastating social and economic consequences for women and girls, and could reverse the limited progress made in gender equality. and the protection of women's rights [15].

To restore lost progress:

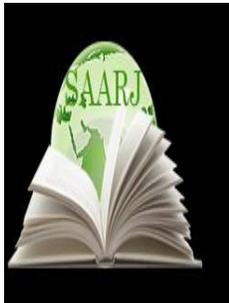

- Women should be given the role of leaders with equal representation and equal decision-making authority.
- Measures to protect and stimulate the economy should be targeted at women.
- It belongs to expand the social protection system.
- Unpaid care work must be recognized and valued as a vital contribution to the economy.
- take urgent action to protect women from violence and expand support services.

## CONCLUSION

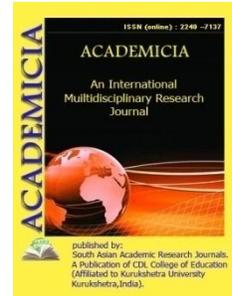

The analysis shows that in order to eliminate any forms of gender-based discrimination, support the empowerment of women, achieve gender equality, changes in laws are required, secondly, their implementation in practice, thirdly, persistent political will, constant efforts on the part of women and men, and changing entrenched cultural norms and attitudes in society.

### ABSTRACT

*The article examines the features of the formation and development of settlements on the territory of Uzbekistan. The significance of territorial, historical, social and economic-geographic factors influencing the development of settlements, including cities, the possibility of creating modern settlements will be studied. In order to support the views and conclusions presented in the article, the number of settlements in the country's regions, their role and importance in the territorial distribution of the country's population are shown in tables and diagrams.*

**KEYWORDS:** *Settlements, The Great Silk Road, Ancient Cities, Historical Factors, Territorial Factors, Economic System, Territorial Distribution Of The Population, Urbanization, Classification.*

### INTRODUCTION

The urban system in Uzbekistan has a long history. The Great Silk Road, founded in the II century BC, led to strong trade, cultural and social ties between the ancient states of Europe and Asia, and the territory of Uzbekistan served as an important center of these relations. Thus, caravans from both continents influenced the economic life and socio-cultural development of the population in this region. The development of settlements, especially cities, was associated with the functioning of this trade route until the Middle Ages. The emergence of large cities on the territory of Uzbekistan dates back to the second millennium BC. The oldest cities are formed in the middle and lower reaches of the Amu Darya and Sir Darya rivers. The history of the region's great powers goes back thousands of years. The lifestyle, ethnic, linguistic and religious

composition of the region's population has also changed over time. Therefore, social development in this region is not going in one direction, as in other regions of the world, but is very unstable; crises are growing and constantly changing. The same can be said about the development of cities in the region, architecture, urban planning, its role in the development of society.

While recognizing that there are many ancient cities in the region, it is important to note that new cities and new urban planning principles have emerged in the twentieth century. During this period, the role of cities in the system of transport, industry and settlement began to increase and served as the basis for the industrial development of the countries of the region. Therefore, in the geographical classification of cities in the region, it is advisable to pay attention not only to their territorial location, but also to their historical, political and socio-economic significance. Therefore, the description of the cities of Uzbekistan can be historical, geographical, and socio-economic.

## **MATERIALS AND METHODS**

The development of settlements in Uzbekistan is associated with the improvement of the economic system. In ancient times, the formation of irrigated agriculture in the fertile valleys of the Amu Darya and Sir Darya basins led to the emergence of a system of villages and cities. Caravan services and trade links along the Great Silk Road increased the number and scale of cities. During ancient and medieval times, Central Asia was home to some of the most developed cities in the world.

The origins of urban planning in Uzbekistan go back to ancient times. Ancient Greek historians have written extensively about cities in prehistoric times. Historical sources about the campaigns of Alexander the Great also contain information about the rich cities of Khorezm and Sogdiana. The early middle Ages were the heyday of urban development and urban economy in Uzbekistan. Along with the ancient cities known to us, such as Samarkand, Bukhara, Tashkent, Urgench, the settlements, which are now small towns or even villages, have played an important role in the economic and social development and settlement of the region. For example, Varakhsha in Bukhara, Chust in Namangan and others.

Geographic study of the cities of Uzbekistan was widespread during the early middle Ages and the Eastern Renaissance. In particular, al-Khwarizmi in his book "Surat ul-Arz (Map of the Earth)" gave the geographical coordinates of many cities. Historians such as Jaykhani and Balkhi have also described the cities of the region. Abu Raykhan Beruni in his books "Osor ul Bakiya" (Monuments of the past) ", "Geodesy" gave a geographical description of cities and villages in the region. In the book, "Ziji Jadidi Koragoniy" Ulugbek gives the geographical coordinates of 570 cities.

In the middle Ages, Zakhiriddin Muhammad Babur, with his work "Boburnoma", made a significant contribution to geography, as well as to many other sciences. Babur places great emphasis on precision and detail in country descriptions and highlights wonderful details. He gives a very interesting and detailed description of the cities he visited, especially in Uzbekistan. In these images, the image of Andijan and Samarkand is of particular importance. For example, archaeologists learned from the descriptions of Bobur, from which side of Samarkand to look for the remains of Ulugbek's observatory. From various historical sources and archaeological sites, we can learn about the cities that were once of great importance in the region. For example, the

city of Otrar was located near the modern city of Taraz and was a major center on the Great Silk Road before the Mongol invasion.

Because the economic system and culture of the region are based on agriculture, there were no significant changes in the process of urbanization in the territory of Uzbekistan before the Russian occupation of Turkestan. Because of the establishment of Russian power in Turkestan, the development of railway transport and industry began. As a result, cities with a special purpose were built. The main functions of these cities are railway stations and administrative and housing complexes. For example: the cities of Kagan in the Bukhara region, Turtkul in the Republic of Karakalpakstan (called Petro-Aleksandrovsk during construction), Bakht (Velikoalekseevsk) in the Syrdarya region. Large settlements have been built, such as Angren in Tashkent, Fergana (Skobelev) in the Fergana region and a number of other small cities of transport and industrial importance. The growth of industry in the former Soviet Union also led to a change in the territorial distribution of the republic's population in accordance with the formation of industry and transport. The location and development of settlements depends on these factors.

Because of the growth of industry in Uzbekistan, there have been significant positive changes in the distribution of the country's population between urban and rural areas. That is, the city's population grew rapidly. If in 1897 18.8% of the population of Uzbekistan lived in cities, then in 1926 this figure increased to 22%, in 1940 - 24.5%, in 1959 - 33.6%, in 1970 - 36.6%. It reached 41.2% in 1979 and 40.7% in 1989, and since 2009, the share of the urban population was 51.7%. However, in recent years, the urbanization process has slowed down, so by the beginning of 2020, the urbanization level in the country will be 50.5%.

**TABLE 1 PERIODIC RATIO OF URBAN AND RURAL POPULATION IN UZBEKISTAN**

years	Population (thousand people)		average annual growth%		Urbanization level %
	city	village	city	village

Factors affecting the development of settlements on the territory of Uzbekistan now are population growth, expansion of agricultural sectors, development of industrial enterprises and transport. The successful development of the desert in the second half of the 20th century expanded the irrigated area and formed a new system of settlements. Accordingly, the expansion of the agricultural sector is still seen as a factor influencing the formation of new settlements in these areas.

The development of urban settlements is accelerating due to the growing importance of industry in the economic system. Consequently, as the foundations of the economic, social and political development of cities and towns in Uzbekistan grew during the twentieth century, cities in Uzbekistan also grew rapidly.

In 1926, there were 27 cities and 19 villages in Uzbekistan, and in 1991 - 123 cities and 104 villages. After the government's decision in 2009 to grant the status of urban settlements, the number of 119 cities has reached 199, the number of cities - 1080, and the number of villages - 10 865. In recent years, some changes will occur in these figures.

Source: UzR. Data from the State Statistics Committee.

In recent years, much attention has been paid to the regional development of settlements in our country. To improve the living standards of the population, to ensure all amenities, land plots are allocated; modern housing is being built in cities and villages. This process emphasizes the relevance of studying the proportional formation of the settlement system in the regions.

**TABLE 2 INFORMATION ABOUT SETTLEMENTS IN THE REGIONS OF THE REPUBLIC OF UZBEKISTAN**

regions	Number of cities	Number of towns.	Number of villages.
Republic of Uzbekistan (general)	120	1067	10996
Including:			
Republic of Karakalpakstan	12	26	1131
Areas:			
Andijan	11	79	455
Bukhara	11	68	1467

Fergana	9	197	1021
Khorezm	3	56	549
Kashkadarya	12	117	1041

Source: UzR. Data from the State Statistics Committee.

The figures in the table show that the number of cities in the regions exceeds 10 in Tashkent, Kashkadarya, Samarkand, Andijan and Bukhara, including the Republic of Karakalpakstan. The least urban settlements are in the Jizzakh, Navoi and Khorezm regions. The figures for the number of settlements show that more than 100 are located in the Fergana, Kashkadarya, Namangan and Surkhandarya regions. Fergana region is recognized as the region with the largest number of cities in the country. We see that the highest rates for rural settlements are in the Samarkand and Bukhara regions, where there are more than a thousand villages. In other provinces, the number of rural settlements is much higher.

Data on the number of settlements serve as the basis for a comparative analysis of changes in geopolitical conditions, economic and social development of regions, prospects for the development of settlement systems in regions. At the same time, the ratio of the number of settlements makes it possible to draw conclusions about the population size, density and methods of economic management in the regions.

Territorial differences in the distribution of the population in a country are reflected in factors such as the process of urbanization, the use of natural resources, history and the positive impact of natural conditions on economic development. Naturally, given the natural conditions and agro climatic features of Uzbekistan, one can imagine a high population density and a large number of settlements in intermountain valleys, river deltas and oases, where irrigated agriculture has been developed since ancient times. Accordingly, with the resettlement of the population in the country, in many respects, factors such as historical and natural conditions have a positive effect on economic development. During the twentieth century, cities became industrial centers, where constant population growth, the discovery of many mineral deposits, the development of

transport, as well as the development of deserts created new settlements, the use of natural resources and the process of urbanization.

The formation of settlements depends on the geocological conditions of natural areas, the specifics of the use of settlements in areas such as deserts, hills, mountains and foothills, or on the use of natural and artificial irrigation systems. Differences in the territorial distribution of the republic's population, population size and density of regions depend on the factors listed above.

**TABLE 3 DISTRIBUTION OF THE POPULATION OF THE REPUBLIC BY REGIONS

Source: UzR. Data from the State Statistics Committee.

As you can see, the most densely populated areas of the country are areas where people have been engaged in agriculture for a long time. At the same time, the regions located in relatively recently developed territories, in particular the Jizzakh region, are in last place in terms of population density, but this does not apply to large desert territories such as Navoi, Bukhara or the river. Karakalpakstan, because the desert part of the Jizzakh region has already been developed and the economic activity of the population is fully formed. Thus, the study of population settlement systems, as well as the relationship of the natural environment in the plains, in the mountains and foothills, reveals the specific aspects of the characteristics of local settlements.

## CONCLUSION

By classifying, we can conclude that the population systems on the desert, hilly, mountainous and foothill plains, natural conditions and access to natural resources in these settlements and, consequently, the formation of the economic system, the impact of the population on the environment.

At the same time, the classification of settlements in economic zones and their constituent regions according to the location of settlements in natural zones is of great scientific and practical importance. After all, the consistency of the way of life of the population with the rational use of available natural resources will remain one of the main criteria that determine the economic and social development of our country.

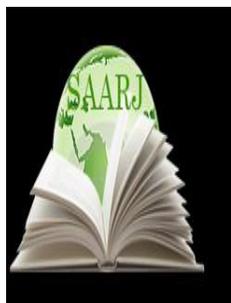

The number and territorial share of areas within the regions can indicate the location of settlements in areas belonging to the regions of the republic in terms of natural territories, first, in general.

Therefore, the description of settlements in Uzbekistan, in accordance with natural conditions, can be divided into separate regions, such as mountains, foothills, plains, deserts, oases. Depending on the size of such territories in the regions of the country and their importance in the formation of the economic system, conclusions can be drawn about the features of the formation and development of settlements.

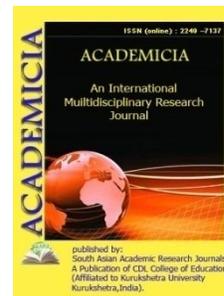

It was noted that in different natural zones the way of life of the population is formed by natural conditions. Although some regions, such as the Fergana Valley and almost all districts of the Tashkent region, are located in mountainous and foothill regions, the development of regions, the development of settlements and the economic structure of the population are the basis for their differentiation.

**ABSTRACT**

*In The Brief Course of the CPSU (b) which is written on the instructions of Stalin, the science of history was also politicized in connection with Marxist fanaticism, painting of truth and the adherence to ideological repression. The issues of strengthening and intensifying the material and technical base of cotton growing, expanding the area under crops, complex mechanization, chemicalization and irrigation have been covered in the scientific works of historians and economists. On the other hand, it has been reported that thousands of cotton picking machines were picking cotton in the field, but even they did not go out into the fields. This in itself led to distrust of the leadership to the administration among the population. Thus, comprehensive study of the history of cotton policy in Uzbekistan and its consequences is required being investigated the study of the sources of this topic by foreign historiography. In our view, the time has come for a separate and special study of the question of the historiography of agriculture cotton growing and its main branch.*

**KEYWORDS:** Cotton, Cotton Picking Machines, Methods, Mechanization, Chemicalization, Ideological Process, Research

**INTRODUCTION**

If we look at the level of study of the historical past of the problem, many scientific works have tried to cover the cotton policy of the Soviet government and a number of large scientific collections, works, monographs and dissertations have been created.

However, in most of these, the study of the consequences of the direct Soviet regime's cotton policy is poorly covered. In fact, this direction of historical thinking has not yet been formally promoted as an independent object of scientific knowledge. The scientific literature which

describe the Soviet policy on cotton can be divided into two periods. The first period includes the Soviet system in 1900-1991 and the second period includes the years of independence of Uzbekistan. The first period is divided into three stages:

- 1) 20-30 years of the XX century
- 2) 1940-1985
- 3) The second half of the 80's and the beginning of the 90's

The first stage of the first period was the turning point in the life of Turkestan and Uzbekistan in the early twentieth century. At this time, the difficult socio-economic problems were solved and old economic life was replaced by a socialist society and communist ideological-class pressure. In the literature that published in these years, the state of the cotton problem was studied in detail, the events of the Soviet period were criticized and as well as the methods and techniques of the problem of cotton growing became a tool of state policy.

### **THEORIES**

In The Brief Course of the CPSU (b) which is written on the instructions of Stalin, the science of history was also politicized in connection with Marxist fanaticism, painting of truth and the adherence to ideological repression. However, despite the fact that large works were interpreted as "alien to the theory of Marxism-Leninism," the historians described as "misinterpreted the principles of Soviet society," and the authors were not "free from bourgeois views or written in Leninist (methodological) ways." After gaining independence, due to this, the works that were banned in the 20-30's of the XX century served in the scientific research of the dissertation. In our view, it would be wrong to evaluate historical articles and books equally which were written in the 20's and 30's in illuminating the historiography of the problem. It should be taken into account that they cover different ideas, styles and events differently. Scientific research met with a serious opposition during the years of Stalinist repression. The use of archival documents is banned or controls are tightened. The periodicals did little more than praise the Stalinist leadership. The historical literature was created in the second stages, the Soviet regime covered the dominant ideological processes in society in 1940-1985. Scientific researches, works and articles on the history of cotton growing can be divided into three groups at this stage. The first group (from the 1940's to the mid of 1950's) includes works that have had a negative impact on the discovery of historical truth in scientific research due to the further intensification of administrative command. Therefore, works researched on agriculture were written in an unbiased manner during these years, in which the coverage of facts and events was ideological. Also, due to the system of improving the quality of cotton (selection) and increasing its fertility, only scientists of the Uzbek Cotton Research Institute have tried to produce more than 200 varieties and cotton varieties were renewed 20 times in 1929-1991. <sup>(1)</sup>

### **SCIENTIFIC RESEARCHS**

A team of historians, economists and agricultural specialists who participated in writing of another monograph managed to collect a wide range of materials on the history of cotton growing in the republic. <sup>(2)</sup> But objective views and opinions on cotton monopoly were almost non-existent. Scientific research intensified <sup>(3)</sup> and the successes and shortcomings of cotton growing were highlighted from the second half of 1950's to 1980's. It was especially important in the history of cotton growing from 1965 until 1985. The issues of strengthening and intensifying

the material and technical base of cotton growing, expanding the area under crops, complex mechanization, chemicalization and irrigation have been covered in the scientific works of historians and economists. At the same time, this research has been taken to a new approach to the problem of being studied in a new interpretation. The works of compatriots and foreign researchers who covered the cotton policy of the Soviet government after the October coup also have a special place in the historiography of the problem. It was Luigi Silippo from Italy who called the Soviet government's agrarian policy during the "military communism" is a "terrorist policy" which was directly against the peasants, while Charles Bouvet said that "the NEP was not only politically stagnant, but in some ways depressing." Walter Pinter notes that the land-water reform in 1921-1922 was rather than implementation of the Communist Party's agrarian program, it was "a temporary means of achieving the neutrality of local peasants, a reform that never had an effect in some districts." The American researcher M. Rivkin wrote in his book "Russia in Central Asia" <sup>(4)</sup> that "this reform, which began in 1921 and then lasted until 1925-1929, did not bring practical results and did not live up to expectations." It is true that it was a means of freeing oneself from all relations with past. <sup>(5)</sup> Among the representatives of foreign historians are O. Kerow, H. Seton-Watson, J. Wheeler, Richard Pierce, Frank Ecker, W. Kulski, Demosthenes Naku, Lord Walston, Boymirza Hayit, and others noted that Uzbek farmers preferred individual farming because they did not want to be deprived of fertile land, so they understood the importance of collectivization, and those who resisted were deported and punished. <sup>(1)</sup> The Soviet government's policy of achieving cotton independence not only made farmers in Uzbekistan stop growing food crops and thus made Uzbekistan dependent on grain and foodstuffs imported from Russia, but also the Soviet government's policy in the cotton sector was not only a means of supplying raw materials to central enterprises. A. Park <sup>(2)</sup> and V. Kolarz <sup>(3)</sup> noted in their works that Uzbekistan was economically colonized. "Although grain supplies from Russia's central regions to Central Asia have increased and become more efficient, the region is still dependent on the Soviet Union for food," Dinerstein said. However, he noted that the communists, who "were adamant about expanding the cotton fields, were hypocritical to the Uzbek people". <sup>(4)</sup> E. Allworts <sup>(5)</sup> added that, for these reasons, the Soviet cotton policy did not differ from the measures taken by the tsarist administration. Jean-Paul Ru said, "The Muslim republics of Central Asia are being severely exploited by the Soviet authorities, because in the USSR, cotton growing, in general, is based on the experience gained in Turkestan. It is noted that Uzbekistan has developed a unilateral economic policy that was adapted to the monopoly of cotton and the uncontrolled, ruthless use of rich mineral resources. Thus, comprehensive study of the history of cotton policy in Uzbekistan and its consequences is required being investigated the study of the sources of this topic by foreign historiography. In our view, the time has come for a separate and special study of the question of the historiography of agriculture cotton growing and its main branch. Under gaining independence, there was a turning point in the study of the history of cotton growing during the Soviet era. Nowadays, there is an opportunity to study to some extent the aspects of scientific knowledge of cotton monopoly in Uzbekistan and its consequences. But at the same time, despite the fact that the literature created has a certain scientific significance, the issue under study remains problematic. The source bases of the research topic and the level of historiography show that cotton monopoly has been mentioned in the above-mentioned works and scientific researches in some chronological years. The only exception is the monograph "Testimony and Lessons of History." It has a small section on the Soviet policy in the cotton industry. However, this monograph and M. Saribaev's research work

do not fully answer all the questions. Therefore, in all periods of the Soviet regime and all aspects and peculiarities of the cotton policy of the center require further clarification and in-depth study.

Dozens of decisions taken by the Uzbek government to further improve the work in the sector and increase the efficiency of mechanization of cotton growing have not been fully implemented. (2) One of the main reasons for this is the shortcomings in the introduction of technical advances into production. For example, 14XV-2.4 cotton picking machines, 24 years cotton tractor trailers, 21 years car semi-trailers, 20 years T62-1 diesel machines, 36 years S-242 pumps have not been modernized in 16 years. 37 scientific papers were put forward by the "Soyuzkhlopok" Scientific Production Association, but only 6 of them have been put into practice. Another aspect of the problem is that the introduced machines and mechanisms were often sent to farms without malfunction. For example, SXU-4 machines, which can replace different types of equipment was introduced into production in 1984 and 10,000 of them were distributed to farms. But only 2,000 of them worked.

Another example is the VKS-1 device designed to uproot weeds. Picking cotton with machines reduces manual labor costs by 25-30 percent, and the cost is 2.4 times cheaper. In practice, the collection of raw cotton that spilled on the ground after machine harvesting fell by 1.2 times. One of the main reasons for this is that cotton pickers are lagging behind demand. To rectify this shortcoming, 90 machines were tested between 1948 and 1985. Another issue is 300 candidates and 20 doctoral dissertations have been written on these problems. However, the machines were unable to correct the 10-25 percent spillage of cotton (6 percent by state standard) during the operation (2). It should be noted that, the plant has been guaranteeing its own equipment only since 1983. According to these issues, if the car brakes down, a determination was made in accordance with the message sent by the farm within fifteen days and a repairing period was given within the next fifteen days. Therefore, the production capacity of many machines was below the established norm and their year-round operation was 20-23% by the machine-tractor fleet. In particular, farms spend 675 million soums annually for repairs and operation of machine-tractor fleets. Including 77% of tractor diesel and 72% of agricultural machinery equipment, only 82% of agricultural repair and maintenance services were satisfied in 1980. Out of 627 rare equipment, only 308 were produced. They involved 1,125 plants under 38 ministries. (5) From which factory was it possible to get spare parts in time for a car that broke down during the season? This is a consequence of the planning method. As a result, the machines worked inefficiently. In fact, 45-50% of farms did not have maintenance, only 10-12% of tractors and 12-15% of agricultural machinery did not participate in field work. (1) The center's standards for paying for machine-picked cotton adopted in 1964 which created a mismatch. Because the first, second and third harvest cotton with the machine was accepted as the first grade. Some of the leaders, who used this skillfully, engaged in fraud and even handed over the cotton that came out of the shoveling machine as a machine picker. However, manual pickers were forced to pick cotton that fell to the ground under rain and snow by the end of the year.

On the other hand, it has been reported that thousands of cotton picking machines were picking cotton in the field, but even they did not go out into the fields. This in itself led to distrust of the leadership to the administration among the population. Ordinary people knew that it was all a lie, whether they made promises to strengthen communist society and improve tomorrow's life.

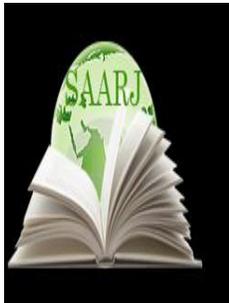

Over the years, people have developed such a trait that they are no longer interested in the quality of the product. There was a situation where they closed their eyes, closed their mouth and tried to carry out the plan in devious ways if possible. As a result, the cotton fiber delivered in 1971-1982 decreased by 7.8% or 26.33% compared to 1970's. Due to the decrease in fiber output, 865 mln. soums (1 million 161 thousand tons) of raw materials were lost. In total, 471,000 tons of fiber were not produced in 1982. (2)

## CONCLUSION

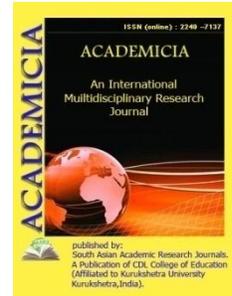

When cotton was picked by machine, the yield of the first grade fiber was 12-24% higher than that of hand-picked cotton. That is why the fiber of hand-picked cotton was 63-75%, which met the industrial demand. As a result, the more cotton is picked on a faulty machine, the lower the fiber was output. Second, picking cotton at least five times on a machine did not justify itself. Third, it required additional funding and the land was compacting, also it was affecting its properties. In general, the technology of machine picking of cotton used in those years did not fully justify itself. Therefore, the mechanization of mechanical cotton picking in 1983 was 35%, in 1984 - 30%, in 1985 - 40%, or 0.5% less than in 1971. This situation did not change in 1986-1989. Thus, the reforms in the mechanization of cotton growing did not justify themselves at all. This is due to the fact that the preservation of administrative-command methods in management, the disproportion in the organization of labor and its payment have led to negative situations. The ability of farms to operate was limited, and there was only a policy of increasing gross output or tonnage. Second, the relationship between the agricultural sector and other sectors of the economy has led to injustice. Third, one-sidedness in the use of scientific and technological advances has undermined its effectiveness. Fourth, the frequent changes in decisions and plans have directly and indirectly hampered the implementation of goals and objectives and the above shortcomings have led to stagnation in this area as well.

### ABSTRACT

*The article presents an analysis of the state of effectiveness of applied sociological research. State and development of applied sociological research. Its role in the personnel management system. A description of the research work is given. Analysis of the main directions of applied sociological research in production. The article also emphasizes the importance of applied sociological research in the development of society.*

**KEYWORDS:** *Efficiency, Management, Sociological Imagination, Society, Social Community, Social Institutions, Institutional Approach, Human Consciousness, Chain Of Events, Sociological Research, Structure Of Society, Socio-Economic Processes.*

### INTRODUCTION

Applied sociology is a special type of knowledge that represents a set of models, techniques, methods and procedures of research, social technologies, the purpose of which is to provide customers with recommendations for practical application in order to achieve economic and/or social effect. Its role in the personnel management system is currently extremely high. In Soviet times, the role of personnel services was limited to maintaining personnel documentation and reporting. But since the 1990s, the role of personnel services has changed significantly [1. 1].

According to the researchers, a Manager of any rank should devote about 30% of their working time to research [2. 1.]. The main goal of the work of sociologists in the personnel service in solving personnel issues is to create conditions for the most complete implementation of the human factor, so the object of research of the sociologist is a social system that has such qualities as complexity and versatility.

At present, a significant part of applied specialists abroad work in the field of business, although the possibilities of applied sociology are not limited to firms, but can be implemented in organizations of any field of activity. Consulting with sociologists and ordering sociological research is a common practice when making management decisions. Thus, the sociologist is involved in management activities, which leads to better decisions in personnel policy and more efficient use of human resources.

The sociological component of the methodology of management activity and decision-making in the country is social engineering, the essence of which is defined as an integrated approach to the study and change of social reality, based on the use of an engineering approach and high-tech technologies[2.2.].

O. A. Urzha figuratively notes, speaking about social engineering, "it is the bridge that connects "sociology" and "management"[3.87-97.].

Note that in American sociology, in addition to social engineering, the term "clinical sociology" is used, the task of which involves practical intervention in an object in order to solve certain social problems. But if the social Clinician deals with ordinary employees and uses in-depth interviews as a method of analyzing problems, the social engineer works mainly with the upper echelon of power.

Practical implementation is preceded by a comprehensive sociological study, in which various methods are used: (1) analysis of documents, including internal documentation (professional and qualification composition of staff, gender and age composition, labor productivity indicators, loss of working time, staff turnover and other indicators of human resources statistics); (2) non-standardized interviews (free conversation) with middle and senior managers; (3) interviewing ordinary employees in the workplace; (3) standardized interviews (with pre-prepared questions and answers) with lower-level managers.

Sociologists use already developed and tested tools, adapting them to the needs of a particular organization. This adaptation of the methods is necessary because the quality of the collected information may be significantly lower for a different sample than that provided by the ready-made methodology. Social engineering uses developed tools and methods called "social technologies".

The idea of standardizing methods is one of the oldest and most widespread ideas in empirical sociology. Social technology, in fact, is a certain sequence of actions that leads to the achievement of a goal. It describes who performs the work and what kind of work, in what order, on what site, how often, and what you need to get as a result of each action. It is assumed to choose such actions and procedures that allow you to achieve the goal with the lowest economic and time costs. This standardization makes it possible to make optimal decisions[4.20-25.].

There are two ways to use social technologies. The first is when there are developed technologies and it is necessary to build a situation at the enterprise (or find such an enterprise) in which they will work. The second is when there are no ready-made developments, but there is a socio-cultural situation that determines the activity of the sociologist. In this case, the sociologist needs to construct such developments and samples that would work in this situation. Construction of social technology is the ability to understand the social process and present methods of its regulation in the form of separate sequential operations and rules, guide the process of its

implementation, and periodically update it to meet new requirements. That is, in the first case, there is a question of designing the situation for existing developments, in the second-about designing developments for the existing situation.

What are the main directions of applied sociology in production? Sociologists, together with other specialists, solve the following issues: conducting sociological monitoring; stabilizing labor collectives; forming and changing the composition of collectives; socio-psychological adaptation; prevention, removal of social tension, conflicts; creating a favorable socio-psychological climate; evaluating the qualities of leadership personnel; ensuring the selection and placement of personnel; analysis of leadership styles; solving problems of employee participation in management and co-ownership of property; improving the organization of work; developing incentives and motivation of employees. The experience of sociologists of a crisis enterprise in assessing the situation and justifying the organization's personnel management program in a crisis, developed based on the results of sociological research of personnel, is interesting. In this case, special attention was paid to the issue of creating a favorable socio-psycho.[2. 3.].

It should be noted that the question of the place and role of social technologies in production is not clear. They have not only supporters, but also opponents. Proponents of these technologies believe that using standard techniques (social technologies) can improve the effectiveness of factory sociology. Opponents believe that social technologies are modeled on technologies used in material production, which makes them ineffective in solving social problems.

The implementation of the results of sociological research in practice and the use of social technologies is one of the most difficult problems, which may be due to the low sociological literacy of managers and employees. Customers of research are organizational leaders, they are not always aware of the possibility of their use. Insufficient sociological culture of employees often leads to a barrier between them and sociologists. Then the recommendations of sociologists, even the most effective ones, are rejected immediately. It is possible to note not only the low sociological literacy of managers, but also the low quality of personnel management in General.

Implementation of practical recommendations is generally the task of managers, not sociologists. The sociologist is not able to implement his recommendations independently. Even if the sociologist is a "friend" and not invited to conduct research, he does not have sufficient authority to implement his recommendations, and is not able to be responsible for management decisions that are related to the implementation of recommendations. This is the responsibility of the management, who can ignore the conclusions from the research altogether or use them as they see fit with goals that are far from the original goals.

The effectiveness of innovations is largely determined by the extent to which employees of functional services and managers of the enterprise participated in the development of decisions and recommendations based on sociological research. The sociologist develops projects of management decisions, but his awareness of the Affairs of the team is often less than that of production workers. Practitioners are more "down-to-earth" in business and better feel the unmanageability of a number of situations. The sociologist is prone to idealized measures. Hence the need for close cooperation of the sociologist with representatives of other production

services. Often the goals of the sociologist and the enterprise do not coincide, if the sociologist is more focused on science than on production.

There are often situations when the recommendations of a sociologist are even harmful to the organization, as a result of which there may be an increase in social tension. The following professional shortcomings reduce the effectiveness of sociologists-practitioners:

1. Lack of knowledge of the specifics of production, which leads to the inability to give qualified recommendations of an applied nature.
2. Inability to formulate research goals and features of specific methods in terms that are understandable to employees of the enterprise. The sociologist must take into account the level of training of the recipient of his recommendations.
3. Inability to quickly establish contacts with various employees of the company.

In the sociological market, there is still such a problem as reputational risks associated with opinions about the dependence of research results on the customer or the owner of the company, which undermines the credibility of research [5. 12-15]. In order for social technology to be successful, we need to conduct preliminary work in the following areas. The first is to identify attitudes to innovations related to social technologies. If service employees and, first of all, their managers are in opposition to the new case, the innovation will not be implemented or will not have the desired effect. In such situations, the primary condition is to reduce the opposition, and this often requires a change in the management of services, which is beyond the competence of the sociologist

The second necessary action is to identify the consequences of implementing social technologies, including identifying groups of employees whose positions will be affected or changed to some extent. A variety of difficulties and obstacles can be identified. In the literature, there is an example of how the implementation of the technology for helping beginners failed due to the fact that there was no concern for the stable part of the team. Elementary attention to newcomers was perceived by "old" employees as a manifestation of discrimination: "Why do we have to take care of them when no one is taking care of us?" [6. 3.].

Thus, the most important issue to consider when talking about research, social technologies, and projects is their effectiveness. The problem of efficiency distinguishes between economic and social effects. They are interrelated, since the implementation of social reserves allows you to increase the efficiency of production, increase efficiency compared to costs. The purpose of sociological research in the organization is to improve performance indicators related to the human factor, such as productivity growth, reduction of staff turnover, loss of working time, and improvement of product quality.

The social effect of research, such as an increase in job satisfaction, attitude to work, and improvement of the socio-psychological climate, ultimately also has an economic effect, since it leads to a decrease in negative trends in the personnel management system. Together, such research, properly conducted, makes the organization more cost-effective and competitive. Methods of sociology, "embedded" in the management system, provide a higher quality of management decisions, including contributing to the improvement of human resources. However, we must not forget that sociology does not replace the management system, since it depends on managers to take into account the recommendations of sociologists.

Although the public utility of the social Sciences is unlikely to be questioned, the measurement of their social effectiveness is associated with some theoretical problems, without solving which the construction of an adequate measurement system is hardly possible. The two main problems in this regard are: the difficulty of separating basic social research from applied research, and the categorization of its results in terms of public utility

It is noted, in particular, that most social research has both fundamental and applied elements. Thus, V. Smith points out that in many cases social research is both fundamental in the sense that it sooner or later turns out to be the basis for subsequent research, and applied in the sense that it is focused on solving specific issues or is carried out in the interests of a specific customer. On this basis, the author concludes that the division of aggregate investments in the social Sciences into categories of fundamental and applied research is "a fruitless task» [7. 2.3.].

The main effects of social research are determined by their ability to stimulate institutional change. At the same time, Rattan understands institutions very broadly: they are not only "rules of behavior that regulate patterns of relationships and actions", but also "decision-making centers", which include public authorities, businesses, and families [8. 15.]. Institutional changes are understood as the destruction of old institutions and the creation of new ones, as well as changes in their functioning. These transformations can create new sources of revenue and reduce the cost of conflict resolution. It is progress in the social Sciences that has allowed, according to Rattan, to move from the slow trial-and-error improvements of previous eras to the deliberate use of social science knowledge to design and induce institutional innovation.

In modern sociological science, the institutional approach takes a dominant position in the description and study of social reality and changes in it. Institutionalism as a methodology can be used to analyze various social phenomena that occur in society and are determined by its institutional structure and system. Sociological institutionalism, as noted by P. V. Panov, assumes that institutionalization is based on a collective understanding of social interactions, which is actualized by individuals in the process of interactions, i.e. this is about the cultural dimension of the institutionalization process [9. 12.].

Social activity can manifest itself in the reproduction and transformation of social order. The key issue in this part of the study is institutional transformation, which is considered by scientists from various methodological positions, according to which one can make certain forecasts and conclusions about changes in social reality and its individual aspects.

First of all, it is necessary, of course, to define the concept of a social institution, which has its own history of development in sociology, starting from the very beginning of the institutionalization of sociological science.

In modern science, this paradigm is also known as neoinstitutional, based on the recognition as a creative and changing institutional order of the power of individuals as rational actors who, in a situation of uncertainty, establish certain "rules of behavior" that sharply limit the set of alternatives available to contractors and reduce uncertainty. It is these "rules of the game" that form the basis of social institutions, or social institutions are a set of formal rules, informal restrictions, and mechanisms for their enforcement.

T. I. Zaslavskaya defines a social institution within the framework of a neoinstitutional approach as an integral and stable set of formal and informal "rules of the game", i.e. principles, norms,

attitudes, methods of control, incentives and sanctions that regulate systems of roles and statuses, patterns of behavior and types of social practices in various spheres of human activity. [10.15-16].

Adding to the above story about the paradigms of the institutional order information that the third paradigm approach-social constructivist was formed mainly on the ideological attitudes of M. Weber, whose name is associated with the interpretive tradition in the development of sociology and the consideration of the social, including the institutional order as a social construct that does not exist objectively, but only in social interactions, we will designate the commitment to the second - neoinstitutional approach in defining social institutions and their study in modern reality, while agreeing with the fact that the basis for the formation and institutionalization of new social institutions in modern society are "free from coercion communications", which often come into conflict and contradiction with their prototypes-traditional social institutions with which they co-exist in the same social space.

The process of social transformation and institutionalization of new forms of social life and behavior is based on this mechanism. This is especially true for transformational societies, which include modern society. The basic basis for understanding the transformation process is the position that the transformation society is dominated by the rejection of the old and there are no generally acceptable, consolidating models of the future. In turn, the distinctive features of this process are the following:

- focus on changing the essential features that define the social nature or societal type of society;
- gradual and relatively peaceful nature of the transformation process;
- the fundamental dependence of the results of this process on the actors of transformation; at the same time, the influence is exerted not only by the activities and behavior of the ruling elite, but also by mass social groups;
- the important role of natural factors in transformational processes, weak manageability, and lack of resolution of the principal outcomes of these processes;
- the inevitability of a long period of anomie, which is caused by the rapid collapse of old institutions in comparison with the creation of new ones.

Transformation differs from other processes often used in describing dynamic changes in modern society (Westernization, modernization, etc.) in the depth and scale of social processes that create a situation of uncertainty in social development, the vector of development of which, as well as their effectiveness, is poorly predictable.

Also of interest is the opinion of I. A. Batanov, according to which transformation differs from development, evolution and other changes in that during transformation these changes are clearly qualitative, non-additive, complex, and in most cases irreversible, and they lead to fundamentally new properties of the system under consideration, a fundamentally new understanding of the processes under consideration[11. 33.].

Thus, we proceed from the definition of transformation, according to which this process is characterized by a significant change in the societal system, qualitative changes in the system-forming elements, multi-vector nature and a relatively high rate of their implementation, as well

as an increased influence of subjective factors. As we can see, in this definition of V. V. Lokosov, the key indicators of the transformation process are the systemic nature of changes; the absence of a clearly progressive, positive orientation of these changes; relatively fast rate of change and increased role of subjective factors in transformation [12. 23.].

The complexity, inconsistency and weak predictability of transformation processes is explained by the fact that the development and functioning of political, economic, cultural and other social institutions are influenced by traditional guidelines, mental programs that are embedded in the fabric of modern value systems, affect the solution of political, economic and social problems, the success or failure of social transformations, and the containment of social disorganization processes.

In other words, in the era of transformation, collapsing traditional values, norms and patterns of behavior in the course of socio-cultural dynamics continue to affect social life, coming into contact with new values, orientations, norms, which generates contradictions and conflicts in the social development of society as a reflection of contradictions between the subjects of the transformation process-carriers of fundamentally different values and orientations.

Individual practices of transformation subjects direct the vector of transformation in a certain direction, set the pace of its intensity and key trends in development. According to the concept of T. I. Zaslavskaya, these forces that guide and shape the transformation process are called the social-transformational structure of society. The analysis of this socio-transformational structure of society allows us to determine the nature of transformational transformations, their progressive or degraded orientation in the course of social reconstruction, and, on this basis, to draw a conclusion about the quality of society and its innovation and reform potential as the readiness of society to self-development in the conditions of transformation, to update the institutional order and institutional practices. In fact, the future of society depends on this potential [10. 34.].

The basis of the transformational potential of society are values, attitudes, norms, patterns of behavior and ideals that regulate social activity and behavior of individuals in society. Undoubtedly, the axiological factor is the most important in the course of institutional transformations, which is why scientists are very interested in the problem of value transformation of citizens over the past period of post-Soviet transformations.

The analysis of these works allows us to state that the problem of forming a hierarchy of values of citizens is one of the most controversial in modern Russian sociology, since the vector of value transformation of society has changed many times over the past twenty years, and at the moment experts determine its trends in a significant increase in traditionalist attitudes and value orientations among citizens, which is most likely caused by, negative results of the entire post-reform period and low rates of economic growth with growing social inequality and social injustice.

The study of the institutional system in the era of transformation should be carried out taking into account a number of factors that are of fundamental importance for the Republican society. These are factors caused by socio-cultural, ethno-cultural, regional and socio-economic features of the development of society, which reflect the civilizational specifics of the country, its institutional space and order. Accordingly, the historical uniqueness of society, which consists in the functioning of its main social institutions, becomes the basis for the process of institutional

transformations, which actualizes and justifies the use of a neoinstitutional approach to the study of institutional transformation of society as appropriate for these positions.

Within the framework of the neoinstitutional approach methodology, social institutions are considered as dynamic structures in the space of which traditional and modern institutional values constantly interact, which ultimately leads to the emergence of new types of institutional relations by reducing the effectiveness of the previous ones, which no longer correspond to the changed social reality. This is the mechanism of institutional evolution, but its course and effectiveness are determined by the institutional past of society, its institutional matrix, which, as experts note, does not change dramatically, even in the era of global and large-scale transformations.

It all depends on how adequate the cultural code of society turned out to be innovations, its value and mental foundations, since individual actions of individuals, considered as an independent force of the transformation process, contain the values of the established socionormative system, symbolizing a certain social order, its mental structures

The functional nature of social institutions is their mission to ensure stability and predictability of social life by reducing the degree of social uncertainty, and therefore this nature changes very reluctantly, difficult, conflict-ridden, often with devastating consequences for society. However, although informal norms and rules embedded in the institutional system are extremely slow to change compared to formal ones, they still change under the influence of transformational forces, when the need for innovation is recognized in society.

It is useful to use the concept of social construction developed by G. V. Osipov as the basis for the formulation of evaluation categories of the social effect of applied social research, which is understood as scientific activity aimed at creating desirable social realities and preventing negative developments. The algorithm of social construction includes six stages: 1) setting a social goal; 2) identifying a social problem; 3) analyzing the factors of the problem situation; 4) theoretical solution of the problem; 5) building a model for solving the problem and 6) practical implementation of the solution (recommendations) [13. 54-62.].

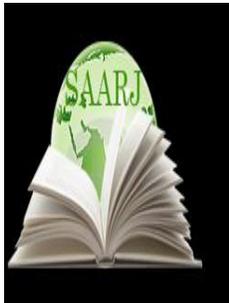

As you can see, the algorithm is a system in which each next step follows logically from the previous one and is almost impossible without it. The implementation of the entire algorithm can be considered as a completed solution to a social problem and can be accepted as the highest criterion for the social significance of applied social research.

Thus, the importance of the neoinstitutional approach to the study of the institutional transformation of society lies in the fact that it shows the dependence of the institutional system and its development on the historical trajectory of society, the history of its institutional development (in science, this theory is called path dependence).

## LEGAL BASIS OF RELIGIOUS EDUCATION IN THE REPUBLIC OF UZBEKISTAN

**Firuz Tuygunovich Rashidov\***

\*Senior Lecturer of the International Islamic Academy of Uzbekistan,  
 Independent Researcher of Tashkent State Law University,  
 UZBEKISTAN

### ABSTRACT

*This article is devoted to the concept of education in the Republic of Uzbekistan, the concept of religious and secular education, the law and foundations of education, the possibilities of religious education, the analysis of the legal foundations of religious and secular education, as well as issues that need to be addressed in religious education.*

**KEYWORDS:** *Education, Science, Knowledge, Religious Education, Religious Values, The Combination Of Secular And Religious Education, Continuing Education, Compulsory Education, Denomination, Qualified Personnel.*

### INTRODUCTION

By the 21st century, science has developed at an incredible pace. It is a product of the human desire to acquire knowledge and apply it in life. The foundation for the development of the world's leading countries is also the result of investment and focus on education and knowledge.

Although the study of science and the application of its results in life is a requirement of the times, the daily work of mankind over the centuries has become a value that has become faith, and the owners of knowledge are always revered.

Science is rapidly evolving in a competitive environment as a healthy struggle between people, communities and public organizations with different points of view and approaches. The state sponsors development, creates conditions and provides opportunities.

Article 41 of the Constitution of the Republic of Uzbekistan guarantees that everyone has the right to education, free general education is guaranteed by the state, and school work is under state control.

The Education Law recognizes the principle of the secular nature of the education system and considers education as a systematic process aimed at providing students with in-depth theoretical knowledge, skills and practical skills, as well as at the formation and development of their general educational and professional knowledge, skills and abilities give a description [1].

### **The Main Findings and Results**

The right to education is guaranteed to all, regardless of gender, race, nationality, language, religion, social origin, beliefs, personal and social status, the right to education: development of educational institutions; support of innovative activities in educational institutions and implementation of curricula with the use of innovative technologies; organization of part-time (full-time) and part-time (part-time, evening, distance) education; training, retraining and advanced training of personnel; free general secondary, secondary special education and primary vocational education; provides for the right of citizens who have studied in the family or through independent study, as well as persons who have not received general secondary education, to pass the certification in the form of externship in accredited public educational institutions [2].

Uzbekistan is a multinational and multi-confessional country, and general secondary education in the country is conducted in seven languages. Conducting general secondary education in local languages guarantees the observance of languages, customs and traditions of all nationalities and ethnic groups living in the country, guaranteed by the Constitution, and creates ample opportunities for their development.

If we analyze the words “education”, “knowledge”, “science”, they are similar in meaning.

According to the Uzbek dictionary, the word “education” (Arabic –“teaching”, “knowledge”, “information”) is the process of education, the formation of skills and abilities, the main means of preparing a person for life and work [3. 27].

In the second volume of the dictionary, in the explanation of the word “science” (science - Arabic knowledge; science; theory) knowledge acquired through study and research, analysis; ability is information [4. 195].

In practice, the word “science” means more fundamental research, in-depth study and analysis of a source, as well as when applied to the study and analysis of religious sources, the word education differs in that it focuses on teaching a particular science or its sections to certain age categories based on standards set by the state.

The teachings of the holy religion of Islam also make it obligatory to acquire knowledge, saying, “Scholars are the heirs of the prophets.” Knowledge is a virtue in this world and an honor in the hereafter. The first word in the first verse of the Qur’an is “Iqra” - the word “read”, and Islamic teachings encourage people to learn.

Muhaddiths and commentators, who have been known and popular in the Islamic world for centuries, have also dedicated their lives to the study and propagation of science..

The famous jurist Abu Lays Samarkandi said: “It is obligatory for every Muslim to learn as much as he knows the ablutions, prayers and other rulings of the Shari’ah and what is necessary in his life”. [5]

Secular and religious education in the Republic of Uzbekistan is based on certain normative documents, which define its specific requirements and procedures.

In particular, the Law on Education distinguishes seven types of education, which include:

Preschool education and upbringing; general secondary and secondary special education; professional education; higher education; postgraduate education; retraining and advanced training; extracurricular education. These types of education are organized in the prescribed manner on the basis of state educational standards.

In preschool institutions, groups can be categorized by age or non-age group. While non-state preschool institutions accept children from one year old, public preschool institutions accept children from three to seven years old.

General secondary education shall be organized continuously in general secondary education institutions from the age of seven and shall be compulsory for eleven years [2].

The education system in the Republic of Uzbekistan is separated from religion, and the inclusion of religious subjects in the curriculum of the education system is not allowed. The right of citizens of the Republic of Uzbekistan to secular education shall be ensured regardless of their attitude to religion [6].

The separation of religious educational institutions, organizations and associations from the state means that they exist as a separate institution in civil society. Therefore, their role and relationship in their interactions with the state and other civil society institutions will need to be explored, studied, and identified.

Religious education activities are regulated by the Regulations on licensing the activities of religious educational institutions of the Cabinet of Ministers of the Republic of Uzbekistan dated March 1, 2004 and the Regulation on state registration, re-registration and liquidation of religious organizations in the Republic of Uzbekistan. In order to carry out activities in the field of religious education in accordance with the requirements of the Charter: Mandatory compliance with the legislation of the Republic of Uzbekistan; organization of teaching religious subjects in accordance with the educational concept, curricula and programs agreed with the Committee on Religious Affairs under the Cabinet of Ministers of the Republic of Uzbekistan; to educate minors against their will, against the wishes of their parents or guardians; war in the educational process, violence, proselytizing and any missionary activity, violation of national security and socio-political stability, legal and moral foundations of society, civil peace, interethnic and interreligious harmony, misinformation about Uzbekistan and the destruction of its historical, cultural and spiritual riches. not to put; to organize the teaching of religious subjects by persons who have the relevant religious information and the permission of the relevant central body for the management of religious organizations and their periodic certification; and the use of duly licensed literature published abroad.

The Resolution of the Cabinet of Ministers of the Republic of Uzbekistan dated August 23, 2003 “On the provision of social assistance and benefits for the further improvement of spiritual and educational work in the field of religion” provides for the introduction of educational standards, curricula and students of Islamic institutions and secondary specialized Islamic schools. Given that they receive religious and secular education in accordance with accepted state standards, diplomas issued to graduates of these educational institutions are recognized as a state

---

educational document, and graduates are given the right to continue their education in the state system of higher education.

Currently, 16 religious confessions are officially registered in the country (15.10.2020), and the number of religious organizations is 2295. Currently, there are 10 Islamic secondary schools (2 for girls), 3 Higher Islamic religious educational institutions, 1 Russian Orthodox Church and 1 full Evangelical Christian seminary [7].

A statement signed and notarized by at least one hundred citizens of the Republic of Uzbekistan under the age of eighteen, who are the head of the central governing body of a religious organization and initiators of the creation of a religious educational institution in accordance with the Regulations on State Registration, Re-registration and Liquidation of Religious Organizations; a notarized act of the meeting of the authorized governing body of the central governing body of a religious organization, containing information on the creation of a religious educational institution, the approval of its charter and the election of governing bodies, as well as the charter of a religious educational institution; The Bank has the right to carry out activities on the basis of a license registered by the Ministry of Justice of the Republic of Uzbekistan after the submission of a payment document confirming the payment of the state duty in the amount of twenty times the basic calculation.

Education in religious educational institutions is allowed in general secondary education on a continuous basis, after general secondary education, which is compulsory for eleven years. Private religious education is limited by law, and religious education institutions are required to teach secular subjects in accordance with state educational standards and requirements established in the Republic of Uzbekistan.

The desire for religious education among the public is high, and the current coverage of religious education does not meet the needs of the population. This creates a need for young people and various segments of the population to receive religious education in unauthorized (cells), as well as in various religious educational institutions in foreign countries. The diversity of religions and denominations, the high incidence of ideological use of religion in some foreign countries, leads to the emergence of views in the religious worldview of young people that are alien to the ancient religious values.

At the same time, there is a misunderstanding of the essence of pure religious values, susceptibility to various alien ideas, misunderstanding of the balance of world and religious relations in society, inability to integrate into society through deep devotion to religion and disregard for existing values.

Analysis of current events in the world and in our country, the socio-political situation requires an increase in the efficiency of activities in the field of religion and education and the creation of an integrated system for training qualified personnel.

Based on these requirements and needs, on April 16, 2018, the Decree of the President of the Republic of Uzbekistan "On measures to radically improve the activities of the religious and educational sphere" was adopted.

The decree established the International Islamic Academy of Uzbekistan, a leading educational and research institution: to form the consciousness of young people on the basis of in-depth study of the rich cultural heritage of our ancestors, who specialize in religious and secular

education and have made an invaluable contribution to Islamic and world civilization; raising public awareness, especially among young people, about the nature and purpose of destructive alien ideas that equate religion with violence and bloodshed; creating an atmosphere of intolerance in society towards ideas that are alien to our national and religious values; to further increase the sense of involvement and participation of representatives of the religious and enlightenment sphere in ensuring tolerance, mutual respect, kindness, peace and harmony in society, the stability of the socio-spiritual environment; strengthening information and analytical activities aimed at early identification and prevention of factors that may threaten the stability of the social and spiritual environment and freedom of religion in our society in the context of globalization;

Priorities have been identified, such as improving the quality of education based on the development of a combination of religious and secular knowledge, the creation of an integrated system of training, retraining and advanced training of qualified personnel in the field of religion and enlightenment [8].

### **CONCLUSION**

Based on the research carried out, we consider it appropriate to put forward the following proposals and conclusions in order to further improve the interaction between the state and civil society institutions, to achieve the expected results through the coordination of religious education:

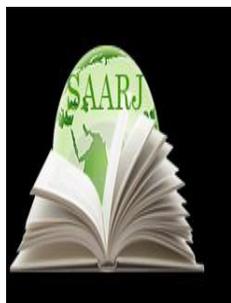

- 1) unification and harmonization of normative documents related to religious education;
- 2) to include in the law on education norms related to the regulation of religious education, taking into account the fact that the programs of 15 religious educational institutions of different denominations include secular sciences on the basis of state standards;
- 3) To further enhance the status of the International Islamic Academy of Uzbekistan as the only higher education institution in the country specializing in both religious and secular education, the study of religion from a scientific point of view and to harmonize the educational standards of all religious institutions through the academy;
- 4) It is necessary to improve the preparation of educational and popular literature that reflects national and religious values, provides educational, pedagogical and developmental skills to a wide range of readers, including students.

Indeed, in Uzbekistan, which is connected to the world social network and is increasingly integrated into the world community in all spheres, it is possible to educate the young generation in the spirit of national, religious and universal values, develop civil society institutions and ensure the country's future.

### ABSTRACT

*The main point of this article is to gain a deeper understanding of the fields of color and painting, to improve people's skills in color selection, a deeper interpretation of working with color, as well as to address the history of colors, to give a broader understanding of their nature, to explain the unique ways of artists, the main task of this article is to develop the ability to distinguish colors, to perceive color situations and to use them purposefully, to firmly define the names of colors in the Uzbek language.*

**KEYWORDS:** *Artist, Handicraft, Miniature, Painting, Fresco, Swamp, Silk Fabric, Cotton Fabric, Royan, Tumor, Onion Peel, Mulberry Peel, Rooster.*

### INTRODUCTION

All objects and elements in nature are made up of different color-scattering mass substances. Humanity is formed around these colors, sees it, studies and enriches it. That is why a person is an artist according to his character and work. In the last century, questions about color have come to the attention of a scientist who seeks as an independent science. The great painters and theorists of the past were Checcino Chennini (1400s), Leon Battista Alberti (1404-1472), Piero della Francesca (1416-1492), Leonardo da Vinci (1452-1519), and Giorgio Vasari (1511-1574)., Gianpaolo Lomatsoo (1539-1600), Albrecht Dürer (1471-1528), Francisco Pacheco (1564-1654) wrote about their research on painting. Newton (1642-1727) and M. Lomonosov (1711-1765) were also great scientists who It has long been known that colors are associated with magical properties and attributes. Traditional notions of color have been developed in many cultures. Some of them have been inherited and interpreted in a way that is unique to human development.

In addition to expressing aesthetic meaning in arts and crafts, colors have been used in cosmology to characterize the celestial sphere of the universe, and even to define diagnostic and therapeutic approaches in medicine. In our opinion, color is more or less reflected in the attitude as a source of information. Because everyone changes something in their life and creates something new. But people make this change in different ways, in different characters, in different colors. If someone makes it more beautiful, more beautiful, more pleasant, more comfortable than before, someone will do the opposite. The main reason for this is that someone feels the shape, the color well, someone doesn't. People see and analyze a variety of shapes, colors, and objects in nature and in life that are beautiful, beautiful, pleasing, delicate, comfortable. Because people's artistic knowledge and skills in terms of shape and color are different in different ways. Such knowledge and skills are instilled in a person from a very young age, even in infancy.

In Central Asia the doctrine of color has long been associated with the use of miniatures, paintings and frescoes on the walls, panels. Because the art of painting required the ability to choose colors and prepare them. Therefore, each student was first required to prepare colors and memorize their names. Shu bilan bir qatorda boshqa turdagi kasb – hunar egalari ham o'zlari tayyorlagan mahsulotlarga rang berishda yashash tarzidan, millatidan, urf – odatlaridan qolaversa, an' analaridan kelib chiqib, rang tanlashgan hamda ranglarni nomlashgan. In Central Asia were used special mineral dyes. Iron sulphate was used to make black paint. In order to be more resistant in light pomegranate peel was added to the the paint . Sometimes natural dyes were used to dye the fabric: the leaves or stems of the birch and the red berries of the black birch. The color they form is still unknown<sup>1</sup>. In this scientific article, we will scientifically study the work of artisans who have worked to create such ancient colors. Craftsmen make their products according to the needs of the market. For example, Tadjibayev Hakimjon was born in Namangan, Namangan region, and grew up in a family of craftsmen. His style differs from other styles by its uniqueness in the traditions of Namangan embroidery. H. Tajiboyev uses the methods of color preparation of his ancestors for embroidery, mainly red and swamp, yellow silk and cotton fabrics. According to him, this is due to the traditional embroidery of Namangan in the last century. The master dyeing technology of colored yarns has been carried out in a natural way and made colors from natural dyes. This process took a long time. According to the artisan, the dyes can be obtained from all types of plants. In particular, the tumor, onion peel, mulberry peel, rosemary and other plants<sup>2</sup>.

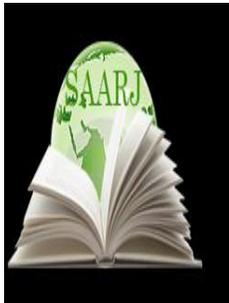

M. Kashgari's information about other artistic paints used in the XI century especially interesting. It is formed from siri-pink, from copper oxide-green, and from cinnabar-red. Undoubtedly, these paints were used in various paintings (murals, pottery, manuscript decoration). Without exception, some of them were used in fabric decoration<sup>3</sup>.

The ancient name of the color is "royan"<sup>4</sup>, and almost all colors are named after this plant. According to the master, by watching the colors in the finished products, not only in Uzbekistan, but all over the world, warm colored products attract more attention of young people, while cold colors are popular with people over 40 years old he said. The master emphasized that if one liked more red, yellow and orange colors, it considers they will be westerners and colors will emphasize the warm. We no longer use the colors we used 6 years ago. We used to use dark colors, but now we use some calm colors<sup>4</sup>.

As a result of our study, the tones of the paints and their naming in the Uzbek language have not been considered in detail. So when we talk about color, we use the names of things that exist in nature, flowers, plants, and so on. For example, velvet, jade, almond, fire, orange or grass, and so on. However, these types of conditional names often do not allow for a clear idea of the shades of color. Therefore, in order to get acquainted with the properties of paints, it is better to study them in groups. The symbol which represents the names of colors like that is one is red, one is blue, and the third is purple, and so on, is called a color tone. Color is an important factor not only in observing the environment, but also in human memory. That is why it is important to pay attention to the exact naming of colors, as they can be seen as a source of certain information. Although artificial dyes have become an integral part of our lives, the authors of the article believe that using the given information and dyeing methods to produce environmentally friendly, natural, healthy and marketable products, the authors of the article would have achieved their goals.

**ABSTRACT**

*This study examines differentiated instruction and preschoolers' numeracy skills acquisition in Rivers South-East Senatorial District. Three research questions and three hypotheses guided the study. The study was anchored on the theory of learning by Lev Vygotsky and the theory of multiple intelligent and learning style by Howard Gardner. The study adopted quasi-experimental design. 2,684 respondents comprising of 2346 preschoolers in the transition class in the 1166 public early childhood education centres in Rivers South-East Senatorial District of Rivers State constituted the population of the study. A total of 61 preschoolers constituted the sample for this study. Checklist was used as instrument for data collection for this study, A validated instrument tagged "DIM (Differentiated Instructional Model) and TIM(Traditional Instructional Model) was used. The instruments were validated by 3 experts while the reliability of the instrument was established using Kuder Richardson (K21) test method to obtain a reliability coefficient value of 0.86. Mean and standard deviation were used to answer the research questions. Analysis of Covariance (ANCOVA) was used to test the hypotheses at 0.05 alpha level. The findings of the study established that there was a significant mean gain in the acquisition of numeracy skills in terms of number sense, measurement skills using differentiated instruction in Rivers south-East Senatorial District. Based on the findings of the study, it was concluded that the differentiated instruction was more effective than the traditional instructional model in terms of enhancing the number sense, measurement skills and geometry skills of the pupils. This was evident in the mean gain of the preschoolers. Caregivers should strive to employ*

*differentiated instructional model in preschool centres for the purpose of helping preschoolers effectively developed in their numeracy skills.*

## INTRODUCTION

The National Policy on Education (2004) states that preschooler education is a starting point for a child's development and the key foundation of the Nigerian Educational system. The aim of National Policy of Education is to bring out the genius inherent in every individual and to provide an environment that facilitates personality development. It is in the realization of the tremendous opportunities which early childhood education can offer that the Federal Government of Nigeria has specified the 5 goals of this level of education in the National Policy on Education (1981). The 5<sup>th</sup> goal states that learners should be taught basic academic skills. Example: teaching the rudiments of numbers, colors and shapes through play. This play is achieved through differentiated model.

Numeracy is the skill and ability to reason and apply simple numerical concepts while numeracy skills acquisition is the extent a child can comprehend fundamental arithmetic's like addition, subtraction, division and multiplication. For example, if a child can understand simple mathematical equations such as  $6-3=3$ , then one would be considered possessing at least basic numerical knowledge. Numeracy education is aimed at children being able to make connections between numeracy skills and their daily environment, acquiring basic skills, understanding simple mathematical language and applying it in practical situations, reflecting on their own numeracy skills activities and checking results, searching for simple connections, rules, patterns and structures, describing investigative and reasoning strategies in their own words and using these strategies. Many pupils experience numeracy anxiety. Much of this stems from a "one-style- fits- all approach" to teaching. Traditionally, approaches to teaching numeracy have focused on traditional teaching methods, with a limited range of teaching strategies. This has made the same learners not to perform very well in number sense, geometric skills and measurement skills.

Most pupils learn best, however, when surrounded by movement, objects and sound, others need to work with their peers, some need demonstrations and applications that show connections of numeracy to other areas and others prefer to work alone, silently, while reading from a text (Moran, Kornhaber, & Gardner, 2006; Smith, 2002). Curricula goals may be similar for all pupils, methodologies employed in a classroom must be varied to suit the individual needs of all children. But the learners are deprived of all these as a result of teaching model used by the caregiver. This has made the learner not to be active in learning number sense, measurement skills and geometric skills. The type of teaching methods adopted is very important pertaining to whether instruction is pupils-centered, appropriate for pupils' level of development or supportive of their needs Wentzel, (2002) and this suggests a thorough understanding of child development. Moon, Mayes, & Hutchinson, (2004) indicated that there are three main factors within caregivers control that significantly influence pupil achievement: professional characteristics, teaching skills, and classroom condition. Caregivers who prioritize classroom condition and positive pupils-caregiver interaction are successful not due to their knowledge or expertise but due to

their rapport between themselves and pupils Hughes, (1994). This suggests classroom interaction influences numeracy teaching and learning. Therefore caregivers need knowledge of skills in classroom and behavior management Thibodeau& Hillman, (2003) for effective teaching. The problem is what effects these teaching methods/ strategies have on the numeracy skills of pupils presently in Rivers South-East Senatorial District in Rivers State? So this study intends to find out the effects of differentiated instruction and numeracy skills acquisition in South-East senatorial district in Rivers State.

According to Tomlinson (1999), caregivers in differentiated classrooms use time flexibly, call upon a range of instructional strategies, and become partners with their pupils. Educators are diagnosticians, prescribing the best possible instruction for their pupils. Differentiation suggests that all learners can achieve and be appropriately challenged within any classroom. One knows that children have basic needs that must be met before learning can occur. According to Prince and Howard (2002), children need not only to survive but also to thrive. In a differentiated classroom, fear is removed and children are free to take risks in their learning. By developing lessons appropriate to pupils' readiness levels, interest, and learning profiles, caregivers will be able to create prior knowledge and pupils experiences outside of the school environment which will empower pupils to ask questions and share their opinions because they already have knowledge or interest in the topic. With modifications made to lessons, pupils are challenged at appropriate levels to eliminate frustration and boredom. Maslow (1998) emphasized that before higher level needs are even perceived, lower level needs must be satisfied. But it is not so in Rivers South-East Senatorial District.

According to Tomlinson (2001), differentiation calls on a caregiver to realize that classrooms must be places where caregivers pursue their best Understandings of teaching and learning every day, and also to recall daily that no practice is truly best practice unless it works for the individual learner classrooms are currently filled with pupils who have huge differences in their readiness, interests, cultural backgrounds, prior knowledge, and learning profiles. Looking at a typical Classroom and the ability levels within it, one can say that caregivers who do not differentiate teach only a fraction of their pupils. We know that is not the plan of any caregiver; however, without the proper tools, differentiation does not take place.

With the No Child Left Behind legislation, early childhood centers and government have not been able to look at pupils differently in order to develop their skills in numeracy especially in the aspect of number sense, measurement skills and geometric skills. Instructional strategies that are the components of a differentiated classroom that would help in this transition are not provided. In some cases government could not analyze the pupils and see the different readiness levels, interests, and learning profiles and act accordingly. It is these differentiated classrooms that need to be studied to provide empirical data to the field of education to make this reform happen in Rivers South East Senatorial District.

For the Purposes of this study, differentiated instruction is an approach whereby the caregiver uses research based instructional and organizational practices in the teaching and learning process. In a differentiated classroom, the caregiver plans and carries out varied approaches to content, process, and product in anticipation of and response to pupils' differences in readiness, interest, and learning needs. Hall (On-line, 2004) stated, "To differentiate learning is to recognize pupils' considering their background Knowledge, readiness, language, preference in

learning, interests, and to react responsively”. Differentiated instruction suggests that caregivers can design lessons to tap into the interests and readiness of their pupils. You can challenge all learners by providing materials and tasks on the standard at varying degrees of scaffolding, through multiple instructional groups, and with time variations. Further, differentiation suggests that caregivers can craft lessons in ways that tap into multiple pupils interests to promote learners interest in that standard”.

Differentiated instruction allows caregivers to vary the ways in which pupils work alone or in groups, auditory or visual means, or creatively to further enhance pupils learning. A differentiated learning differs from a traditional learning in many ways. Most importantly, in a differentiated learning, more than one way to complete a lesson exists for any given topic. These lessons are designed around the needs of the learner. A lesson plan is not created for each learner, rather, lessons are planned for the readiness, interests, and learning profiles of the group.

The traditional classroom, in which one lesson is designed to meet the needs of all Learners, is failing our pupils, as such classrooms where caregivers think they are using Differentiated instruction but are not. According to McTighe (2006) Caregivers attempt to differentiate learning by giving struggling learners less to do than other learners and by giving more advanced pupils more to do than other learners. It is not helpful to struggling learners to do less of what they do not lay hold of, nor is it helpful to advanced learners to do more of what they already understood before they began the task. It is likely that the “more” or “less” approach to Differentiated instruction occurs when we lack clarity about essential outcomes and thus meaningful basis from which to differentiate. As educators, one must insist on changes that will benefit all learners. This study will examine classroom practices that support differentiated instruction with the purpose of determining if differentiated learning methods have an effect on preschoolers’ academic performances. There are three components of the curriculum that can be differentiated to meet pupils’ needs: content, process, and product.

The content is what the caregiver wants each pupil to know by the end of the unit. The process is the way in which the caregiver designs activities to ensure the pupils learn the content. The products are what the pupils create to demonstrate their understanding of the content. Products vary as pupils are given choices on how to demonstrate their mastery of the content. A lesson can be differentiated in many ways to best meet the needs of all learners. The most common ways that differentiation occurs is by readiness, interest, and learning Profile of each pupil. If based on pupil readiness, lessons would be designed to Challenge pupils at all levels of the achievement spectrum - the high, middle, and low level learners. A lesson organized around interest gives pupils a choice on how they learn the lesson. Pupils may be placed into groups based on a variety of ways including learning styles, interests, or choice, or they may work independently to complete the assignment. For example, if the concept of “air” is taught in class, some pupils may be interested drawing a diagram explaining the concepts. Other pupils may be interested in designing an experiment. They use water in containers and blow it using straws to produce bubbles. Pre-school handbook (2008) blowing water to produce bubbles shows learner that there is presence of air in water. Pupils would have choices as to how to demonstrate their knowledge of the concept. The caregiver can control the choices by creating a choice chart where students select their preferred way to demonstrate understanding of the topic.

A lesson designed to meet the learning profile of pupils would take into consideration the way in which the pupils best process information and ideas, and ways in which learning style, gender, culture, and intelligence preference influence the pupils. Caregivers need to recognize and understand if a pupil is a whole-to-part, part- to-whole learner; likes to work in silence, groups, independently through written expression, speaking, and so on. It is important that pupils also understand their learning strengths so they can make the appropriate choices within the classroom. The caregiver would accommodate for differences in how pupils learn so optimal learning can take place. According to Merrill (2002), most effective learning environments start with a meaningful problem that provides the focus for four phases of instruction: Activation of existing knowledge including skills, Demonstration of new knowledge, Application of new knowledge, and Integration of new knowledge into the learner's world. Many instructional strategies comprise a differentiated classroom. Differentiated instruction should not be examined as an instructional strategy by itself; it is an environment of learning created in a classroom by using best practices in teaching, learning, and lesson design. By breaking down the term "differentiated instruction" and understanding the components of what comprises a good lesson design, the misinterpretations will be removed so caregivers can develop a clear understanding of what differentiated instruction is. This understanding of the concepts of differentiated instruction will allow caregivers to recognize how best practices come together and are key functions in a successful differentiated classroom.

Differentiated instruction is the compilation of the best practices in teaching and pupils learning theories and practices that support learner's performance. Pre-assessment is an important tool to assess pupils' readiness. Pre-assessment data allows the caregiver to create lessons and activities that are appropriate for the pupils, no matter what level they are performing. Learner's background data are taken into consideration when planning. Caregivers need to understand that the prior knowledge with which pupils enter their classroom is based on many factors such as cultural background and family opportunities. The "how" must be based on best practices in instruction and student learning such as readiness, interest, learning profile, choice, and learning styles of the pupils. The product, which is some form of assessment of the content, also revolves around the readiness, interests, choice, flexible grouping and learning profile of the pupil. Adapted from Hall, (2004) these six variables, along with pre-assessment, became the independent variables studied in this research.

Pre-assessment is important to assessments the pupils' skills in number sense, geometry skills and measurement skills so as to know where to place them in the same groups if differentiating by readiness. Pre-assessment informs the caregiver of the pupils' readiness, interests, and background knowledge they bring to the topic. If the numeracy skill acquisition, lesson should be differentiated base on interest, the caregiver looks for ways to engage pupils in the learning by allowing them to study with concrete materials they can see with their eyes. Whatever it is that pupils would like to learn more about, differentiated instruction for interest would allow them to do this.

To differentiate instruction in response to learning profile, the caregiver could address many things including learning styles, pupil's talents, and intelligence profiles. A pupil's learning profile takes into account his or her innate strengths (Multiple Intelligences), how he/she learns best with external stimuli (Learning Styles), and how he/she intakes new information, such as trying to see the big picture or taking in new information in small part. To differentiate this

numeracy skills acquisition by learning profiles, the caregiver could create a learning environment with flexible spaces for the learner to work. Some pupils could count their number on their desks, some on the floor; some may want to work alone, others with peers. Learning profile also takes into account how a learner learns, such as part to whole or whole to part. In this numeracy skill acquisition lesson, the caregiver may need to present the lesson in two different ways to help pupils draw meaning to what they are solving. Some pupils need to see the big picture and what the meaning of the number is before they begin counting, while others need to take it part by part and develop their own meaning. Either way it is presented, the pupils can draw conclusions to their counting and develop a better understanding of the number sense, geometric skills and measurement skills.

Flexible grouping allows for the movement of pupils between groups, which is unlike ability grouping, where pupils remain in fixed groups based on their ability. Flexible grouping is not based only on readiness. A flexible group for counting could include the caregiver placing pupils in groups in a variety of ways. For instruction, the caregiver could place in a group pupils who are having problem with one particular skill in number sense, geometry skills and measurement, so they could receive extra help in that area. For class work, pupils could be grouped based on learning style as to how they want to complete an assignment, such as demonstrating and understanding number sense. Some may want to create a poster on numbers, shapes. The intent of the flexible grouping is to give pupils a wide range of experiences based on their learning needs, not only their abilities. The study therefore seek to ascertain the mean difference interns of acquisition of numeracy skills using differentiated instruction

### **PURPOSE OF THE STUDY**

The main purpose of this study is to determine the mean difference in acquisition of numeracy skill acquisition of preschoolers' in public Early Childhood Centers in River State South-East Senatorial District. Specifically, the study sought to:

1. Determine the mean difference in the acquisition of number sense between preschoolers taught using differentiated instruction and those taught using the conventional method in Rivers State South-East Senatorial District.
2. Ascertain the mean difference in the acquisition of measurement skills between preschoolers taught using differentiated instruction and those taught using the conventional method in Rivers State South-East Senatorial District
3. Find the mean difference in the acquisition of geometry skills between preschoolers taught using differentiated instruction and those taught using the conventional method in Rivers State South-East Senatorial District.

### **RESEARCH QUESTIONS**

The following research question served as guide for the conduct of this research study.

1. What is the mean difference in the acquisition of number sense between preschoolers taught using differentiated instruction and those taught using the conventional method in Rivers State South-East Senatorial District?

2. What is the mean difference in the acquisition of measurement skills between preschoolers taught using differentiated instruction and those taught using the conventional method in Rivers State South-East Senatorial District?
3. What is the mean difference in the acquisition of geometry skills between preschoolers taught using differentiated instruction and those taught using the conventional method in Rivers State South-East Senatorial District?

### HYPOTHESES

**H<sub>01</sub>:** There is no significant mean difference in the acquisition of number sense between preschoolers taught using differentiated instruction and those taught using the conventional method in Rivers State South-East Senatorial District.

**H<sub>02</sub>:** There is no significant mean difference in the acquisition of measurement skills between preschoolers taught using differentiated instruction and those taught using the conventional method in Rivers State South-East Senatorial District.

**H<sub>03</sub>:** There is no significant mean difference in the acquisition of geometry skills between preschoolers taught using differentiated instruction and those taught using the conventional method in Rivers State South-East Senatorial District.

### METHODOLOGY

The pretest-posttest quasi-experimental design was used. This design was used because it was not possible to randomize the classes as this would have led to the disorganization of the classes.

The population of the study comprises of 2,346 preschoolers in the transition class in the 1166 public early childhood centres in Rivers South-East Senatorial District of Rivers State, constituted the population of the study (Rivers State Universal Basic Education Board, 2018/19). 61 pupils were used as the sample for the study. Checklist was used as instrument for data collection in this study. It is tagged "DIM (Differentiated Instructional Model) and TIM (Traditional Instructional Model). The instrument is divided into two parts: (Section A and B) section "A" deals with respondents' age, sex and class. The items under this section sought information on personal data of respondents such as Sex, age and class. Section "B" contains statements based on the question derived. The reliability of the instrument was ascertained using Kuder Richardson (K21) to obtain a reliability value of 0.86 which made the instrument reliable. The instrument measured the number sense, measurement skills and geometry skills of the preschoolers. This formed the components of the numeracy skills acquisition. The questionnaire was in form of a checklist used to rate the preschoolers on the acquisition of the numeracy skills on a 4-point scale. Data gathered from this exercise were collected and statistically analyzed. Mean and standard deviation were used to answer the research questions whereas Analysis of Covariance was used to test the hypotheses at 0.05 alpha

### RESULTS

**Research Question 1:** What is the mean difference in the acquisition of number sense between preschoolers taught using differentiated instructional model and those taught using the conventional method in Rivers State South-East Senatorial District?

**TABLE1: MEAN GAIN IN THE ACQUISITION OF NUMBER SENSE ACQUISITION SCORES OF PRESCHOOLERS TAUGHT USING DIFFERENTIATED INSTRUCTIONAL MODEL AND THOSE TAUGHT USING THE CONVENTIONAL METHOD**

Strategy	N	Pre-test	SD	Post-test	SD	Mean Gain
		Mean		Mean		
<i>TIM</i>	31	7.52	2.06	11.32	1.92	3.80
<i>DIM</i>	30	33.00	8.62	48.33	9.49	15.33

Table 1 showed that the mean gain in the number sense of preschoolers taught using Traditional Instructional Model (TIM) was 3.80 while preschoolers taught using Differentiated Instructional Method (DIM) was 15.33.

**Research Question 2:** What is the mean difference in the acquisition of measurement skills between preschoolers taught using differentiated instructional model and those taught using the conventional method in Rivers State South-East Senatorial District?

**TABLE 2 :MEAN GAIN IN THE ACQUISITION OF MEASUREMENT SKILLS PERFORMANCE SCORES OF PRESCHOOLERS TAUGHT USING DIFFERENTIATED INSTRUCTIONAL MODEL AND THOSE TAUGHT USING THE CONVENTIONAL METHOD**

Strategy	N	Pre-test	SD	Post-test	SD	Mean Gain
		Mean		Mean		
<i>TIM</i>	31	14.35	1.84	22.74	2.77	8.39
<i>DIM</i>	30	51.07	5.26	71.40	8.30	20.33

Table 2 showed that the mean gain in the measurement skills acquisition of preschoolers taught using Traditional Instructional Method (TIM) was 8.39 measurement skills difference while the preschoolers taught using Differentiated Instructional Model (DIM) was 20.33.

**Research Question 3:** What is the mean difference in the acquisition of geometry skills between preschoolers taught using differentiated instructional model and those taught using the conventional method in Rivers South-East State Senatorial District?

**TABLE 3: MEAN GAIN IN THE ACQUISITION OF GEOMETRY SKILLS PERFORMANCES CORES OF PRESCHOOLERS TAUGHT USING DIFFERENTIATED INSTRUCTIONAL MODEL AND THOSE TAUGHT USING THE CONVENTIONAL METHOD**

Strategy	N	Pre-test	SD	Post-test	SD	Mean Gain
		Mean		Mean		
<i>TIM</i>	31	8.74	3.02	15.67	2.74	6.93
<i>DIM</i>	30	27.13	4.41	46.13	8.35	13.00

Table 3 showed that the mean gain in the geometry skills acquisition of preschoolers taught geometry using Traditional Instruction Method (TIM) was 6.93 while the preschoolers taught using Differentiated Instructional Model (DIM) was 13.00.

**H<sub>01</sub>:** There is no significant mean difference in the acquisition of number sense between preschoolers taught using differentiated instructional model and those taught using the conventional method in Rivers State South-East Senatorial District.

Table 3 shows that there is a significant difference in the geometry skills acquisition mean scores of the preschoolers taught geometry using the differentiated instructional model (DIM) and those taught with conventional method (TIM) ( $F_{1, 58} = 6.048, p < .05$ ). Therefore, the null hypothesis 3 was rejected at .05 level of significance.

## DISCUSSION OF FINDINGS

The findings of the study revealed that Preschoolers taught with differentiated instruction performed better in number sense than preschoolers taught with traditional instructional model. Preschoolers taught with differentiated instructional model performed better in measurement skills than preschoolers taught with traditional instructional model. Preschoolers taught with differentiated instruction performed better in geometry skills than preschoolers taught with traditional instructional model. In line with the National Policy on Education that learners should be taught basic academic skills. Example: teaching the rudiments of numbers, colors and shapes through play. This play is achieved through differentiated instruction.

The hypothesis 1 was interested if there is a significant mean difference in the acquisition of number sense between preschoolers taught using differentiated instruction and those taught using the conventional method in Rivers State Senatorial District. The table shows that there is a significant difference in the number sense acquisition mean scores of the preschoolers taught number sense using the Differentiated Instructional Model (DIM) and those taught with conventional method (TIM) ( $F_{1, 58} = 47.714, p < .05$ ). Therefore, the null hypothesis 1 was rejected at .05 level of significance. The findings of this study is consistent with an earlier study. According to researchers and the results of several meta- analyses (Ellis, 1993; Karp & Voltz,

2000; Swanson, 2001) using a combination of direct instruction and differentiating strategies has a greater positive effects than either method alone".

The hypothesis 2 state that there is a significant mean difference in the acquisition of measurement skills between preschoolers taught using differentiated instruction and those taught using the conventional method in Rivers State Senatorial District. The table shows that there is a significant difference in the measurement skills acquisition mean scores of the preschoolers taught measurement using the Differentiated Instructional Model (DIM) and those taught with conventional method (TIM) ( $F_{1, 58} = 5.988, p < .05$ ). Therefore, the null hypothesis 2 was rejected at .05 level of significance. The findings of this study is consistent with an earlier study. Levy (2008) stressed that by using Differentiated instructional strategy, educators can meet all individual students' needs and helps every student meet and exceed established standards.

Finally, hypothesis 3 sorts the significant mean difference in the acquisition of geometry skills between preschoolers taught using differentiated instruction and those taught using the conventional method in Rivers State South-East Senatorial District. The table shows that there is a significant difference in the geometry skills acquisition mean scores of the preschoolers taught geometry using the differentiated instructional model (DIM) and those taught with conventional method (TIM) ( $F_{1, 58} = 6.048, p < .05$ ). Therefore, the null hypothesis 3 was rejected at .05 level of significance. This is in line with the observation made by Anderson (2007) stipulates that Differentiated instruction integrates constructivist learning theories, learning styles, and brain development with research on influencing factors of learner readiness, interest and intelligence.

## CONCLUSION

Based on the finding of the study, it was concluded that the differentiated instruction was more effective than the traditional instructional model in terms of enhancing the number sense, measurement skills and geometry skills of the pupils. This was evident in the mean gain of the preschoolers in the experimental group which was higher than that of their control counterparts in the three variables measured. The males outperformed their female counterpart over measurement and geometry skills acquisition whereas the female outperformed their male counterparts over number sense acquisition. However, the observed differences in the measured variables were not statistically significant.

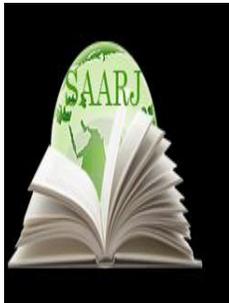

## RECOMMENDATIONS

Based on the finding of the present study, the following recommendations were made:

- Caregivers should try to adopt Differentiated Instruction in the teaching of numeracy skills, so as to advance the number sense, measurement skills and geometry skills acquisition of the preschoolers.
- Preschoolers should be engaged in learning using differentiated instruction irrespective of their gender to minimize the existing gender-inequity in mathematics teaching and learning.
- Caregivers should try to access the readiness, interest and the learning profile of the preschoolers with the use of differentiated instruction and not with traditional instruction.

### INTRODUCTION

The supreme rulers had made great efforts to establish the governing system and expand the territory of the country since the Kokand Khanate was established. This process, in turn, required a large number of irregular and regular troops to protect the territory of the country and to ensure its security. Moreover, the unstable situation within the khanate itself required a greater focus on the army. These measures aimed at increasing the number of troops repeatedly could not save the country from the complex political events. The solution to the problem largely depended on the level of armament of the army and the modern-day weaponry. One can answer the questions such as how the weapons of the army were developed and how advanced they were in the Kokand Khanate, according to sources and archival documents of the time.

It should be noted that at first, the arms of the Kokand army consisted of simple firearms and cold weapons, as in other Central Asian khanates. The basis of these weapons was daggers, swords and spears made by local masters. These weapons, usually made by local masters, are usually inherited from father to son.

Among the artisans and craftsmen of the Kokand, craftsmen had great reputations and respects. Two kinds of swords were made by local craftsmen, the first of which was bent, moon-shaped, and the second was in the correct shape. The moon-shaped sword was widespread in the army of the khan, and these types of swords were light and sharp, allowing for precision to strike. Because of this quality, it was superior to the European swords [1.15]. Swords were made of animal horns, ivory and trees. Sword sheaths were usually made of wood and covered with metal in three parts. Qualitative swords were made in 15 days, whereas swords with low quality were ready for 3-5 days [2.217]. Weapon, sword and spear weapons were not produced in homogeneous amount. In the course of military expenditures, the production of such weapons had increased several times. The demand for such weapons was much higher than their actual availability. It should be noted here that the importance of cold weapons - swords, the importance of spear and soldiers' protective armor, helmets, shields had decreased after the proliferation of small arms, as seen in the other khanates of Central Asia in the Kokand army, in the end of the 18<sup>th</sup> and early 19<sup>th</sup> centuries. In the 19<sup>th</sup> and 20<sup>th</sup> centuries, Russian E. K. Meyendorf noted that some of the soldiers in Bukhara had "a small armor, an iron helmet and a shield made of oxen skin" [3.144] and the Kokand army was not an exception. When the Merk Castle of the Kokand Khanate was captured by Russian troops in 1862, the following weapons were seized: 2 cannons, 2 falconets, 82 rifles, 3 shields, 1 armor, 24 fighters, 113 swords [4.211].

The Kokand rulers had been trying to recruit British, Afghan and Turkish specialists since the beginning of the nineteenth century with the aim of reorganizing the army according to modern requirements, improving its military tactics and skills. They also tried to equip the khanate army with European weapons.

In particular, the Khan of Kokand sent to Sultan Said as ambassador to Turkey to ask Sultan Abdulaziz to give four pieces of cannon, pistols, and Turkish military uniforms [5.10]. These reforms were also carried out by Hudoyorkhan. In this regard, it is written in "Aziziy history": "The Hudoyorkhan has brought many good rifles from Islambul and increased the number of soldiers and cannons and he found good masters and increased rifles and pistols. [6.15]

The archive documents on the manufacture of weapons by foreign experts were also preserved. A merchant named Ismail wrote about that he saw a number of French and British people were engaged in armaments in the Kokand and also witnessed 12 European copper cannons during his stay in Tashkent in 1860 [7.105]. There is also information that one of the military commanders of the Turkish Sultan sent Zamonbek, a man known for weapons and military science to Yakubbek who was military servant of Kokand in 30-40 years of 19<sup>th</sup> century [8.100].

Information on the purchase of rifles manufactured abroad for the Khan's army was obtained from the archive of Kokand khans of the 1970s, local historians and also in the works Russian tourists in the Kokand Khanate. In particular, one of the archive documents informs us about that Azizkhoja had been given money to buy a European rifle by Mullah Muhammad [9]. The archives document also states that the Azizkhoja bought a European rifle (a french bow) for this money.

The increase in the number of troops in the Kokand Khanate naturally led to an increase in demand for weapons. This requirement was not always met by foreign arms. Not only were imported weapons from abroad priceless, but there was also a lack of specialists in training and maintaining them.

Therefore, the Kokand rulers had tried to satisfy the army's need for weapons with weapons made by local craftsmen. The main focus was on manufacturers of various weapons. An analysis of the history of the Kokand khanate suggests that there were several types of weapons for the army. Most military-related workshops (guns, ammunition, cold weapons, artillery equipment) belonged to the Khan and his family members [10.206]. Although the production of weapons in Central Asia had been around for thousands of years, due to the lack of knowledge and technical view in the khanate, the European science and technology revolution was virtually unknown. As a result, in almost all areas of the khanate, it also led to the preservation of medieval traditions in the production of weapons. This was the case with all the weapons makers in the khanate. There were two types of guns gun manufacturer workshops. In the first type, workshops produced rifles, and in the second - European rifles.

In Central Asia, rifles were widely used as weapons of war and hunting by the end of the 16th century [11.21]. The rifle was one of the first firearms that was popular in the army of the Kokand Khanate since the 18th century.

The lightning bolted through the stone. The author of the 19th century, I.Paramonov, wrote in this regard: "The main part of their guns are rifles. Table of this type of weapons was mainly made in Europe. Most of the majority were from India. There were also tables made by local craftsmen, but their quality was very low. The device for ignition was all made by local craftsmen. They used special tool to create comfort for themselves while shooting [12.218].

The caliber of rifles were different. Some rifles had fitted with handcuffs, some did not. The number of locked rifles and pistols in accordance with European standards also gradually increased in the army of the Kokand Khanate [14].

Rifle workshops were located in different cities and regions of the khanate and were supplied by the khanate as mentioned above [15.312-313]. The city of Namangan was distinguished by the production of weapons, that was, rifles. Rifles were mainly imported from Russia [16.66-67]. In Andijan, a European-style rifle workshop was built, where guns and other weapons were repaired [17.207]. V.Velyaminov-Zarnov believed that rifles made by khan masters did not meet the requirements [18.207]. The analysis of the data presented above shows that there were no large rifle manufacturers in the Kokand Khanate. At the same time, spare parts for the production of rifles, similar to those made in Europe, were imported from Russia and elsewhere via India and Afghanistan, suggesting that the khan's workshop served as a assembly shop. Of course, by the middle of the 19<sup>th</sup> century, the involvement of many foreign experts in the field of weapons production had a positive effect on the quantity and quality of rifles in the army. It should be noted that the weapons manufactured in the khanate were sold not only to the khan's army, but also to the people living in the neighboring areas. Most of the rifles used in Kazakh for hunting and fighting were made in the Central Asian khanates [19.22]. The Kyrgyz people received firearms, shotguns and other weapons from the Kokand khanate. These weapons, manufactured in Kokand, could be seen transporting more and more weapons to the country, especially for the Kyrgyz [20.8].

Trappers, guerrillas, riflemen, spearmen, armor-dwellers lived in Kokand, Uratapa and Margilan. A special brick workshop was also operating in Kokand during the Hudoyorkhan (1865-1876). Gunpowder was produced in Margilan, in the village of Chaykent in Andijan, in regional centers. Gunpowder is manufactured not only at government-owned enterprises but also in private

workshops. The quality of the powder produced in the Kokand khanate was contained in the archive documents of 1860: "The quality of the powder of the Kokand was very poor. It contained a lot of coal and moisturized quickly. If you took some of it into your hand or paper, black dust will remain in your hand [21.258]". As you can see, the quality of powder made in the khanate was in poor quality. But there was enough gunpowder in the army. The following archival information confirms that there is enough gunpowder in the army. It was noted that 32.5 pounds of gunpowder was found when Tokmak's fortress, which belonged to the Kokand khanate, invaded in 1860.

It is worth noting here that the keeping place of gunpowder in the castles was very secretive. The special entrenchment were dug by the criminals sentenced to death and then executed [22.341].

The formation of an improved army in the khanate and the establishment of numerous fortresses along the state boundary contributed to the formation of artillery units. There were also workshops producing cannons in order to meet need of artillery units. In archive of Kokand khanate in seventies of 19<sup>th</sup> century, there were workshops listed as "Tubbana" and "Ishkhanai Tombona" [23]. These workshops were well-organized to produce cannons and accessories for them. Based on the archive data, these workshops can be classified into the following types: Kernel Workshop "To'brizon company"; workshops for gunpowder and nucleus, workshops for rifle pipe cleaning equipment and banners (pipe cleaning equipment) workshops; workshops for cannons situated in the Tashkent of Kokand Khanate, Kokand city and Andijan.

The cannons used in the army of the Kokand Khanate could be in two types. The first was a large caliber, which can be used to protect the castle, and second was a "jaloir" used in field battles, it was a small-caliber. This is confirmed by archival data. Some khanate cannons were said to be difficult to carry to move from one place to another, and some Kokand cannons were very easy to carry [24.320-330].

Kokand cannons were made of copper and cast iron. Most of the cannons were made of copper and cost to the khanate. Archives of the 1960 and 70s show that, in some cases, copper items were collected from the citizens and used for cannons to provide the army with the canon [25.86].

This indicates that the need for cannons in the khannate's army was not in proportion to the extraction of natural resources necessary for their production.

Large-caliber castle cannons were used mainly in defense. In military cases, some carried on horses while others by camels. They were used on the battlefield. V.Velyaminov-Zernov wrote about usage of Kokand cannons on the battlefield: cannon called "yazali" shot only to one side" [26.230].

The nucleus fired from the cannons were prepared with hard iron and in some cases, lead. The nucleus was created as follows. Small iron slices were covered by hard iron. Stone could be sometimes put into the center of the nucleus. The center of some of the nucleus was perforated. When it was fired, it flew loudly, and it played a major role in shattering enemy troops. The original nuclei were not explosive. The production of explosive nuclei was then put in place [27]. The cannons made by the Kokand masters did not meet modern requirements. This conclusion was supported by the opinions of the Russian military. In addition, there was no sturdy base and

device to find a target that allowed them to move their cannons without moving. Kokand artillery can be described as primitive” [28.258].

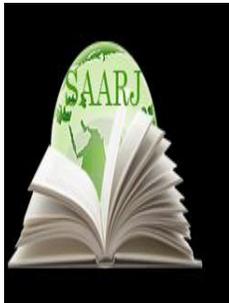

As mentioned above, military reforms had led to the invitation of many foreign experts to the khanate, the introduction of modern procedures in the army, and the improvement of weapons. Perfection was particularly evident in the field of artillery. Production of cannons by British specialists arriving via Kabul in the Kokand workshops enhanced further the combat capabilities of the artillery during the Mallakhan period [29.254]. The improvement of the army of Kokand khanate, including artillery, was also confirmed by Russian military officers and military personnel. The Siberian Corps General Gosfort, in his report of 6 June 1855, described the improvement of the Kokand army: "Kyrgyz, foreigners, and military experts sent by the Turkish Sultan during their (Kokand) camp stated that they saw the introduction of modern procedures in the army" [30.91]. Positive changes in the Kokand army were also confirmed by General M. G. Chernyaev's statement to the top commander after the capture of Chimkent Castle: "We were surprised to see explosive nuclei. According to the information I have obtained, it is European who is producing cannons in Tashkent" [31.178] - General M.G. Chernyaev, who captured Niyazbek Castle in May 1865, said in his report: Weapons had been improved. "there were weapons such as the cannons at the same quality as our cannons, as well as the rifles the same as ours" [32.275]. It is clear that the measures taken by the supreme rulers have brought their results, albeit in part. However, we should not conclude that there were few cannons before the arrival of foreign experts. Although, it did not meet the quality requirements of the Kokand cannons, it is quite quantitative. In particular, archival documents of 1854 show that there was a cannon workshop and at the time of the reference there were 17 cannons in the center [33.169]. According to the same period of time, Andijan also had a large arms factory, which produced 5 cannons per year [34]. Due to various wars and military actions, the Kokand khanate had lost most of its weapons. In particular, as a result of the invasion by the Russia to khannate frontier fortresses and large border towns, many soldiers and material things were taken as bait. It consisted of 39 cannons, 1,500 rifles, large quantities of gunpowder, lead, and 1,910 pounds of flour, 3,200 pounds of corn, and 224 horses [35.39]. Such losses did not adversely affect the military power of the khanate. Because of the absence of railways and limited access to water transport in the Kokand Khanate, as in European countries, carts were used as the main means of communication and transport during the military operations. Archives also confirm that the weapons and supplies needed for the Kokand army were carried in carts. One of these documents is dated 1871, when money was separated to Bahti Muhammad for paying the carts loaded with guns which should have been delivered to the gatekeeper Mulla Abdujalil Vodil [36]. According to archival documents, in some cases the footslogger unit in the Kokand khanate was transported by carriages from one place to another [37.306]. In both cases, it is stated in the documents that the transportation was paid for. This information indicates that they may use a rental service for a vehicle.

Despite government attention to the supply of weapons and material needs for the army, the absence of large arms manufacturers in the khanate, the lack of modern scientific and technological achievements in the production of weapons, however, the fact that the entire production process was based on manual labor in existing workshops, as well as all other Central Asian khanates in the production of weapons, led the Kokand khanate to fall behind. This, in

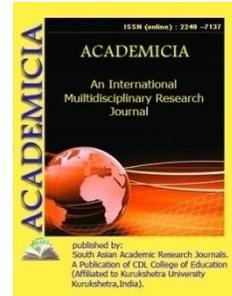

turn, has a negative effect on the Khan's army against the aggression of the Russian army, and is one of the factors that led to the liquidation of the Kokand Khanate by Russia.

 UZBEKISTAN

### ABSTRACT

*The article provides insights into the role of culture and art in educating young people in the spirit of patriotism. Legal documents aimed at realization of creative and intellectual potential of youth were analyzed. At present, increasing the level of reading in our country, raising the culture of reading is given great importance... But there is also talk of the fact that many of our children are away from the book and spend most of their time on social networks". A person needs creative thinking, regardless of what field of activity he is engaged in. In the process of finding a solution to a particular question or issue that has arisen, creative thinking is manifested, and the solution of the problem suddenly or unexpectedly "burst" appears.*

**KEYWORDS:** *Youth, Socialization, Art, Culture, Creativity, Creativity, Innovation, Social Lift.*

### INTRODUCTION

The fact that our young people are rightfully able to take responsibility for the future of our motherland and are becoming the decisive force of today and tomorrow gives us pride and pride. It is necessary to bring to a logical conclusion our extensive work in this area, in particular, our national programs on education and training.

In the first volume of the National Encyclopedia, patriotism is given the following tariff: patriotism — the expression of love and loyalty of people to their native land, to their own understanding. Patriotism is a universal feeling, one of the spiritual values that has been common to all people, people, nations, polished for centuries. Historically, patriotism is also a set of feelings that have been improved in the process of social development of people in connection with the fate of their homeland, the struggle of the people for inviolability and independence of the territory in which they live. This is manifested in the pride of the past and destiny of the

motherland, in the protection of its interests. It is also not surprising that the love of the motherland is from faith[1].

Along with the breadth of the scope of opportunities, it is also the fact that the information space is full of diverse ideas, views, technologies for its promotion, factors influencing social consciousness and thinking that are focused on different goals and interests. Therefore, it is one of the topical issues of today that fill the gaps in the minds, minds and minds of our young people, our children, by protecting them from foreign and harmful influences, by directing their inner world towards perfection. “When we say why, we cannot ignore the formation of our children on the basis of some questionable, harmful information, not on the basis of our world and national literature, whose consciousness, worldview has been tested for centuries, a treasure of high spirituality”[2].

At the beginning of all such noble deeds, of course, our teachers and mentors, who have enough knowledge and skills, even more precisely, school education is the main one. Because eleven years of the child's life pass in school, this is not a little time, but the most productive and responsible period for the education and upbringing of a person is the school period. And the need to absorb human qualities from youth is known to all of us. “At present, increasing the level of reading in our country, raising the culture of reading is given great importance... But there is also talk of the fact that many of our children are away from the book and spend most of their time on social networks”. As our compatriot noted, it is very sad that our young people are not reading books. The problem of raising our children to the book is that, above all, literature requires qualitative renewal in teaching. In the readers, love for the book is formed only after they know the secret of the read book. Literature education is not only the opinion of the reader youth, but also the educational process that has been committed to the formation of their feelings, hearts, the world of emotions.

Today, the youth of Uzbekistan is known to the world with their enthusiasm, talent and high thinking. Their achievements clearly demonstrate the potential and strength of our country. Therefore, it is important that the head of our state continues, consistent, practical system activity is established in the bright manifestation of the independence generation's happy life and talent. We know in which country the more talented, dedicated and creative young people, the more socio-economic development there is. The state, thinking about its future, paves the way for creative activity in all spheres of social life. In this place, it will be worthwhile to study the psychological and spiritual aspects of this issue in order to comprehensively understand the creative activity and the creative process. Any kind of creativity cannot be imagined without creative thinking. Creative thinking evristics (Latin “evrica” – I'm finding, I'm exploring) is exploring. Evristics deals with the methods and legalities of creative activity and the organization of the creative process. The root of heuristics goes back to ancient Greek philosophy. From ancient times, Greek scientists, then our ancestors of thinkers, too, motivated people to contemplate, creativity and creativity. Evristics is a branch of science that closely interacts with such disciplines as psychology, physiology of higher nervous activity, cybernetics. When a person searches for the answer to a particular question that has arisen, solves the tasks set by himself, when new judgments and concepts appear in his consciousness, in such cases, creative thinking begins to manifest itself.

The strategy of innovative development of the country is closely connected with the effective use of scientific and technical potential created in it, embodying the fate of the future generation, the state and people's interests on the basis of the educational system. The prestige of any state in the world community is determined by its intellectual perfection. Article 42 of the Constitution of the Republic of Uzbekistan "everyone is guaranteed the land of scientific and technical creativity, the use of cultural achievements. The state takes care of the cultural, scientific and technical development of society", [4] states.

Talented, self-sacrificing creative youth plays an important role in the socio-economic development of the country. In order for young people to be able to expose the problem, to study it comprehensively, to observe the causes and consequences of the problem, to think independently about the problem, to analyze the various possibilities of solving the problem and to find the best way to solve it, it is important to develop creative thinking and creativity in them. A person needs creative thinking, regardless of what field of activity he is engaged in. In the process of finding a solution to a particular question or issue that has arisen, creative thinking is manifested, and the solution of the problem suddenly or unexpectedly "burst" appears. In this process, a qualitatively new material or spiritual value is created. The creative capacity of a person is manifested in creativeness, that is, creativity, a tendency and a quest for thinking new ideas. The creative process requires knowledge, experience and talent from a person, as well as enthusiasm, perseverance, endurance, mindfulness, accuracy. Joint creative thinking and creativity are the guarantee of scientific success.

Factors that hinder creative thinking and creativity:

1. Distrust of creative potential, fear of failure. This process interferes with the imagination, creative thinking, initiative of the creator. Some creators do not allow to be sluggish in the implementation of their ideas and bring to the end what they have started.
2. Self-criticism, low evaluation of its own scientific potential. There must be a balance between talent and self-criticism. Low self-assessment leads to a creative barrier. A person learns from his mistakes, mistakes call him a novelty and creative thinking.
3. Laziness, laziness, laziness. Today it is possible to model any experience based on computer technology, in all conditions for the creator, but there are no Berunids, Ibn Sina, Forobids, Khorezmids, Bukhariids, Termizids. However, the great thinkers did not stop from striving, searching, reading-learning, creativity, despite the hardships and difficulties.
4. The desire to immediately find a solution to the problem that arose in the creative process, the silence of thought, the inability of thinking to "bend". If the creative person follows the traditional way of thinking, three to the creative barrier, as a result of the silence of thinking, "thought" does not come.

It is known from history that theater as a center of culture and enlightenment plays an important role in the formation of human artistic and creative thinking in the life of society. Among the young people of developed countries, negative views, such as "information attack", "mass culture", the internet and the like, going from to various social networks, are one of the issues that many people are thinking about, the extent to which theatrical art plays a role in the fullness of young people on an increasingly popular stage. Therefore, many effective works are being carried out in our country in order to pay special attention to the importance of theatrical art in

the education of young people and to further raise their love for this kind of art. In particular, the president of our country Shavkat Mirziyoyev defined a number of tasks within the framework of “five important initiatives to raise the spirituality of young people, to organize their free time meaningfully, to launch works in the social, spiritual and educational spheres on the basis of a new system”. At the very beginning of the five initiatives, the tasks associated with increasing the interest of young people in art, in particular, in theatrical art, the emergence of talent were established, and the task was set to establish an additional 1,5 thousand circles under the district, city cultural centers, secondary educational institutions, among which were youth theater studios and “youth clubs”. After all, it is our supreme goal to create an ideological immune system in relation to various foreign ideas in them and to educate a harmonious generation of thoughtful contemplation, through a wide propaganda of theatrical art among young people, the formation of love for art, art, showing our historical, great figures, heroes of our time, raising respect for our history, our nationality. Today, 38 theaters and several theater studios operate in our country, of which 14 are intended for young people and children. These theatre halls are working with the purpose of increasing the youth's love for art and art, Motherland, formation of creative thinking through the performing works.

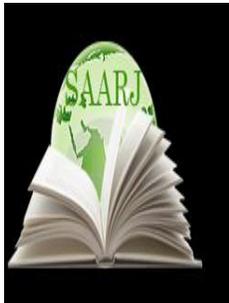

In this regard, Uzbekistan offers to develop the International Convention on the rights of young people – a general international legal document aimed at the formation and implementation of youth policy in today's rapidly developing conditions of globalization and information and communication technologies.”[5] at the invitation and initiative of President Shavkat Mirziyoyev, the Council of Heads of SCO member states adopted a “joint appeal of SCO Heads of state to young people”. By the present time, countries such as South Korea, Turkey, Iran, India, with the help of the film industry, managed to achieve greatness of their history, national pride, spread the name of the country to the world. Unfortunately, the film industry of Uzbekistan has lagged behind development. As a result, it became necessary to introduce the world community to increase the image of the country, opportunities of the film industry, the rich cultural heritage of Uzbekistan, the beautiful nature of filming on its territory. The Cannes International Festival, which was considered the largest forum of the world filmmakers, was considered an important area in the realization of this goal. For this reason, on the basis of the support of the Youth Union of Uzbekistan on May 8-18, 2018, the young filmmakers of our country participated in the 71-Cannes International Film Festival in France, organizing the first national pavilion “Uzbekistan”. In the process of carrying out its work, the National Pavilion reached agreements with about 20 advanced film companies, distribution organizations, state cinematographic institutions, film producers and directors of International Film Festivals. The participation of young filmmakers from Uzbekistan at the International Film Festival, which serves the development of the national culture of peoples at the international level, in turn, plays an important role in promoting the high level of implementation of the state policy on youth and the great attention paid to young people in our country. In item 33 of the resolution of the president of the Republic of Uzbekistan dated July 18, 2017 № pp-3138, special instructions were given on the production of modern art films of a high level, which have a positive impact on the education of young people.[6] In accordance with this task, the Council of young filmmakers of the Youth Union of Uzbekistan and the Center for the development of cinematography jointly with the Ministry of Internal Affairs and the national television company of Uzbekistan for the first time produced a full-length national feature film Scorpion, which fully complies with world standards. It is planned that the film will focus on one of the most important

factors that cause an increase in crime among young people – the family environment, which will encourage its healthy formation and serve to create the image of heroes of our time. On a global scale, culture and art are used as the greatest means of propaganda, a weapon of propaganda.

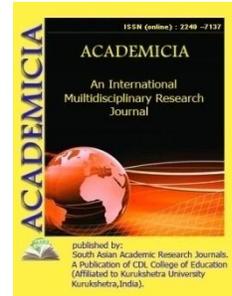

In conclusion, it is worth noting that on the basis of reforms in various areas of culture and art, the ceremony of patriotism, loyalty to national values and universal values is one of the effective means of implementation of state policy on youth in our country.

**ABSTRACT**

*The article examines some theoretical and methodological issues of the problem of innovative culture in the light of the challenges of our time. The effectiveness of the innovative activity of social actors is largely determined by the state of the so-called innovative climate of society, which, in turn, depends on the nature of the attitude towards innovations on the part of the main social groups, on the part of different generations. One of the most developed modern applied scientific disciplines is innovation management, understood as a body of knowledge and a system of actions aimed at achieving the competitiveness of the created innovations. In a historically short period of time, before the final result of innovation asserts itself, selection occurs either due to the distorted interests of the majority ("false consciousness", ideology), or due to the imposed interests of those who have power and are able to suppress any claims from adherents of alternative (innovative) norms and values.*

**KEYWORDS:** *Innovation, Innovative Ecodynamics, Norms Of Innovation, Efficiency Of Innovation, "New" And "Old" In Innovation, Systematic Approach To Innovation.*

**INTRODUCTION**

An innovative culture is knowledge, skills and experience of purposeful preparation, integrated implementation and comprehensive development of innovations in various areas of human life while maintaining the dynamic unity of the old, modern and new in the innovation system; in other words, it is a free creation of the new in compliance with the principle of continuity. A person as a subject of culture transforms (renews) the natural, material, spiritual worlds and himself around him in such a way that these worlds and the person himself are more and more fully imbued with human meaning, humanized, cultivated, i.e. more and more fully acquire the features of the universal cultural trinity of Truth, Goodness and Beauty.

The very concept of "innovation" first appeared in the scientific research of cultural studies (primarily German) in the middle of the 19th century and meant the introduction (infiltration) of some elements of one culture into another. At the same time, it was usually about the introduction of European methods of organizing production and life in traditional (archaic) Asian and African societies. In the 20s of the last century, the patterns of technical innovations (innovations) began to be studied. Later (in the 60s and 70s), a special interdisciplinary area of scientific knowledge began to take shape - innovation. Innovation specialists use the accumulated data of various sciences - engineering, economics, sociology, psychology, acmeology, technical aesthetics, cultural studies, etc. One of the most developed modern applied scientific disciplines is innovation management, understood as a body of knowledge and a system of actions aimed at achieving the competitiveness of the created innovations.

Innovation today is the science of what technologies for creating new things should be (in the broad sense of the word) and what are the social, technical, economic, psychological and other prerequisites that ensure an increase in the effectiveness of such innovative technologies.

It is a generally accepted fact that modern post-industrial civilization is associated with a radical turn in the system of relations "man - production", namely, with the fact that the modern economy is becoming more and more innovative. Among other things, this means that material and material factors of production cease to be the main ones, because become obsolete every 5-6 years. Tools of labor, machines, machine tools, various kinds of equipment are changing right before our eyes. An additional impetus to this process is given by the large-scale informatization of production and the entire life of society. The main factor in the renewal of production and increase in its efficiency is the person, his knowledge, skills, experience, creativity.

In this regard, the entire social organism undergoes sharp transformations, and the division of societies according to socio-economic, technological or socio-political criteria is replaced by the classification of social systems with "fast" or "slow" economies. "Fast" economies are based on innovation, on the principle of uniqueness, originality. Imitation, repetitions here, as a rule, do not have public recognition, and are often simply condemned. "Slow" economies are stably traditional and inertial. Here, changes are usually implemented haphazardly and within the framework of existing traditions. In the East, for example, if someone wanted trouble, they said: "May you live in an era of change!"

At the same time, we note that innovation and tradition are interrelated sides in the development of production, science, technology, economics, art, etc. In a broad cultural context, traditions can (and should!) Be regarded as a necessary condition for any development. A society that has lost its traditions, its historical memory ceases to develop, degrades, since the connection between generations is interrupted and marginalization (from French *marginal* - edge) of large social groups and other destructive processes occur. On the other hand, society cannot exist without changing.

Thus, the unity of innovation and tradition, which is fixed in the general cultural principle of continuity, is the most important prerequisite for social progress. The connecting link in such a dynamically changing unity are those elements of culture that we habitually attribute to the modern - modern science, modern technology, modern economics, etc. It is in this sense that we can talk about the main task of innovative culture as a task to achieve a kind of innovative "ecodynamics", i.e. the search for the optimal (in concrete historical terms) balance between the

old (past, "classics"), modern (present, "modern") and new (future, "futurism"). And since the threshold of innovative susceptibility for the old, modern and new is not the same, insofar as the innovative "section" of this multidimensional space in the given concrete historical parameters (social, economic, political, technical, religious, informational, etc.) leads to an uneven change in the energy potential of each of the interdependent elements of this triad. In other words, any innovation as a kind of normative (cultural) deviation provokes the rejection of the old, the mobilization of the modern expansion of the new. At the same time, however, the preservation of the identity of the sociocultural system as a whole is possible precisely as such a triune interdependence, i.e. integral interdependence. But the archaic or, say, "fantasy" only correspond, ie coexist on the periphery of this ecumene.

At the same time, it is obvious that in each specific case, innovation associated with the necessary negation of previous norms and rules begins with the manifestation of creativity, originality, a departure from existing generally accepted traditions. Naturally, such abilities are possessed by selected members of society, the so-called "minority". However, with the help of various means of suppression, strict social control, censorship, all sorts of prohibitions, legislative obstruction, etc. the conservative (and sometimes aggressive) part of society may prevent the wider social community from recognizing or initially accepting innovations. Here, one of the main questions is the question of the selection criteria or selectors adopted in a given culture, which do not allow some innovations to spread, and allow others to break through. It is reasonable to assume that the most important selection criterion, acting on large time intervals, is the objectively expressed interests of the majority of members of society. But, as you know, the majority can often be mistaken, and even quite willingly. In a historically short period of time, before the final result of innovation asserts itself, selection occurs either due to the distorted interests of the majority ("false consciousness", ideology), or due to the imposed interests of those who have power and are able to suppress any claims from adherents of alternative (innovative) norms and values. A textbook example from the history of science in this regard is the persecution of supporters of the development of genetics and cybernetics in our country in the middle of the last century. Academician Dubinin was then accused of "running some kind of fly with public money" (meaning his experiments on studying the mechanisms of heredity in the *Drosophila* fly), instead of working on the problem of increasing the number of cattle. And cybernetics was not called anything other than "bourgeois pseudoscience". According to the famous American philosopher and sociologist R. Merton, a certain degree of deviation from existing norms is **functional** (in a positive sense) for the basic goals **of all** major social groups. Innovation that has reached a certain critical level may result in the formation of new institutional patterns of behavior that will turn out to be more adaptive than the old ones. If innovations break through all filtering mechanisms and gain wide public acceptance, the phase of their diffusion begins. Here you can observe several options for further development or, conversely, regression of innovation:

- a) the so-called "compensation" can occur when the initial innovative changes cause **negative feedbacks** that seek to reduce the importance of innovations, or even completely destroy them by means of counter-reform;
- b) "overcompensation" can also occur when the resistance to the introduced innovation is so great that the compensatory mechanism reacts too strongly and seems to be "overfilled"; not only preserves the existing state of affairs (status quo), but also finally changes the given structure in a

direction opposite to that assumed by the innovators. This retaliation is called the "boomerang effect";

c) changes caused by the introduction of innovation can be limited to a given local area (production, science, technology, etc.) without any consequences for other spheres of social life

d) there are situations when some initial innovations in any area lead to random transformations of a certain limited number of components in other related socio-cultural subsystems; this gives the existing social (economic, political, spiritual) space a chaotic character; there are some modifications in its various fragments, but ultimately it remains unchanged;

e) finally, the most important option for the development of innovation is the systemic enhancement of changes due to the action of positive feedbacks, or "second cybernetics" ("snowball?"); here, the initial innovative changes entail a chain of successive shifts in other components of the already mega-system and without the direct participation of the initiators of the innovation up to its complete transformation. This often happens in the field of technology: for example, with the invention of the car, airplane, conveyor production, computer, the very way of life of millions of people is radically changed.

The ironic R. Musil, the author of the satirical novel "A Man Without Properties" (1942), was convinced that a quill pen was written in German better than a steel pen, and a steel pen was better than a fountain pen. When the dictaphone was "improved," he believed, they would stop writing in German at all. The complete innovative displacement, most likely, also has three stages: the "steel pen" and even the "fountain pen" still remain adequate means of "writing in German", but the "dictaphone" turns out to be an absolutely foreign neoplasm in the organic matter of German "writing", as, incidentally, and German "reading": the era of the "dictaphone" can no longer authentically read what is written with a "goose quill". The dynamic impulse of the innovative culturalistalt ("classic-modern-futurum") is reconstructed as institutional, i.e. formalized and extra-institutional, i.e. abnormal, segments of social space. The radicalism of such a reconstruction is determined by the levels of institutional and non-institutional tolerance of society to innovative deviations, as well as the degree of conjugation of these levels. Obviously, restoration (as well as overcompensation or "boomerang effect") is also revealed as a consequence of the sharp dissonance of various social fragments. Normal innovation presupposes precisely the necessary and sufficient similarities and differences between them. In this case, the socio-cultural fringe (for example, argot, slang, underground, etc.) on the sharp bends of the historical spiral either plunges into archaism, or breaks into the modern cultural background with some exoticism (the latest example of such a "cultural innovation": thieves "Everything by!" on the T-shirts of young people demonstrating in support of the president).

Today it is generally accepted that cultural deviations, even if committed secretly and deliberately as asocial, constitute a necessary functionally significant link in the chain of innovative changes. Moreover, there may come a time when the majority begins to openly accept cultural deviations (especially if the "violators" are successful), and when, as R. Merton aptly remarked, "these lucky crooks become role models". But if the apology of the postmodern pastiche turns out to be all-pervading, and the social structure and social institutions become fragmented to a scattering of incompatible puzzles, then the dam of modernity overturns, the classics, like Atlantis once plunged into the abyss (to the extra-institutional "intellectual bottom"), and the entire innovative culture with its "novosti" "How the self turns into a kind of

infantile-nudist (barbaric, plebeian)“ holiday of disobedience ”with balloons, video clips,“ fan fingers ”,“ geshefts ”, soap operas, etc.

“Syndrome of novelty” (novelty, by all means) and its countless quasi-surprises (counterfeit products) are one of the most common types of innovative pathology, and its bearer is a kind of mutant of postmodern acculturation, the tragedy of which is permeated by its impossibility of “entering the tradition ”, Which he (like a respectable modernist) secretly desires from others and from himself.

The effectiveness of the innovative activity of social actors is largely determined by the state of the so-called innovative climate of society, which, in turn, depends on the nature of the attitude towards innovations on the part of the main social groups, on the part of different generations. As a rule, innovation leads to an increase in conflict in society, which, in turn, inhibits the introduction of innovations. This phenomenon is designated as the innovative inertia (incapacity) of society.

At the same time, the following tendency is noted in the attitude of society towards the so-called "epoch-making" innovations: the shorter such an innovation is in time, the more resistance it meets. Therefore, the innovative culture here is manifested in the fact that such changes are carried out evolutionarily, gradually.

The world of innovation is not limited to technology and technology. Improving management, for example, is also carried out through the introduction of innovations. What all these changes have in common is that they are a renewal activity, i.e. transformation of someone else's activity.

The main constituent (driving) contradiction of this world is the contradiction between the "old" and the "new", and the attitude to this contradiction, according to the just remark of N.F. Fedorov, expressed almost a hundred years ago, is essentially an attitude towards progress itself with all the ensuing philosophical, political, moral, economic and other consequences.

Although by themselves, objectively, the categories of “old” and “new” are not axiologically loaded, in a specific sociocultural context they are perceived precisely from the side of their value, forming the very need for either the new or the old.

Recognizing that, in general historical terms, the contradiction between the old and the new is fixed mainly in the New Time, one should, at the same time, note the tradition of his philosophical reflection going back centuries.

It should be noted that the “new” and “old” are considered exclusively as dynamic (historical) categories. In the socio-historical context, the contradiction between the old and the new is revealed as the relationship between the past, present and future.

The new often undergoes various metamorphoses. So, it can mimic the old or use other forms of "conspiracy", the varieties of which are determined by the functions that the new carries in itself. In the modern history of Russia, for example, an unnamed voucher privatization (an obvious element of "shock therapy") mimicked a social program designed to ensure the growth of the welfare of the majority of the country's population (a well-known economist and politician publicly equated the cost of one voucher with the cost of two Volga cars) ...

The very need for something new as a sociocultural phenomenon is a relatively young formation, which is characteristic of the new European rationalistic (scientific) consciousness in its difference from religious and mythological consciousness.

There are at least two points of view on the problem of the relationship between the new and the old, their main social functions.

According to one of them, the need for something new is socially destructive and represents a random fluctuation, while the main regularity of social development is traditionalist continuity.

Conversely, opponents of this point of view believe that it is the need for the new that is the source of self-movement of social systems. Conclusions of modern systemic studies are consistent with this view: systems strategically oriented towards stability, harmony, etc., sooner or later are doomed to stagnation. Specific scientific studies of the problems of innovative culture also reveal a very wide range of concepts, views and interpretations.

So, for example, in the theory of culture, there is a point of view according to which innovation in art is the so-called "secondary processing", i.e. exchange between the realm of the valuable and the non-valuable. An example is avant-garde art precisely as a secondary processing of archaic and primitive art, which in the era of the Renaissance and Enlightenment was in the realm of invaluable. In other words, innovation acts as a rejection of traditional answers and a search for a new answer in the priceless one (see B. Groys).

This interpretation echoes the understanding of innovation offered by the famous Italian philosopher A. Meneghetti. He believes that a genuine ("free") innovator can only be an individual who has completely "eliminated the system from himself" and thereby gains the opportunity to use any "system" as a means, as if it were simply a typewriter, those. such an individual would be a person of the so-called "Mephistophelean" type. And this "innovator" can achieve a completely new social, economic, political or technical goal not just with new means, but with a new application of old means.

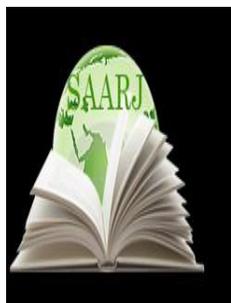

In innovatics, it is the innovation system that is considered as a systemic object, which includes: 1) material and intellectual resources of innovation - "input"; 2) the created innovation - the goal ("exit"); 3) the market, which is the external environment for the innovative system and determines the very need and parameters of the created innovation ("feedback").

**In conclusion**, it should be specially noted that in the theoretical analysis of innovation systems and the rationalization of their functioning, the following logical substitution should be avoided in every possible way: the use of a systematic approach in the study of innovation does not mean that this activity is in all cases a system itself, especially in some its completed form. The system-forming category that integrates a certain set of elements into an integral innovation system is the concept of "new", understood as a relation (thing, property) that marks the transition of a measure that determined the qualitative specificity of the previous (pre) system. Therefore, by the way, interrelated elements of the innovation system in the strict sense can only be those that carry this characteristic (ensuring the transition of the measure) as essential. Therefore, no other elements (things, properties, relations) can be included in the structure of the innovation system as such. They can only coexist in it along with the actual basic elements that ensure its systemic quality (novelty). According to the fundamental systemic principle, a particular innovation system includes only those elements, the connections between which within

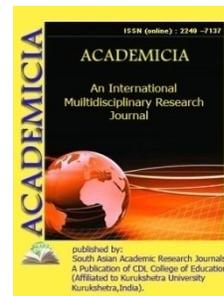

this system are essential, and also fundamentally more stable and more interdependent than the connections between these elements and any non-systemic formations (things, properties, relations). Simply put, these must be elements that provide the necessary integrity of the system. As already mentioned, in our case (in the context of increasing the culture of innovation), we are talking about ensuring the harmonious integrity of the old, modern and new.

### ABSTRACT

*This article discusses the history of the use of innovative pedagogical technologies in the educational process, its emergence, stages of development and the application of pedagogical technologies in the educational process. Here is also describe the international evaluation programs, ways of application, PISA, TALES, TMMSS, PIRLS and ERMA EGMA, which can achieve high efficiency in teaching proses in our country.*

**KEYWORDS:** *Innovative Technologies, Educational Process, Didactic Materials, Techniques, Applications, Foundations, Process.*

### INRODUCTION

It is widely accepted today that to learn English as second or foreign language, a person should set himself to the task of acquiring a huge amount of the lexicon of English. In addition, research studies in corpus linguistics point out that the language which is used in speech and writing covers a high proportion of pre-fabricated language therefore, foreign language learners must develop a good foreign language vocabulary in order to grasp what they hear and read and to express themselves fluently and appropriately.[1,3]

We know the emergence and development of a technological approach to the educational process has a long history. From the history of our educational institutions, from the research of our scientists, it is clear that the development of this approach to the educational process can be divided into three stages:

- Experience and knowledge gained by humanity, which is carried out only by the teacher, is given to the student only through the teacher;

- Textbooks and handbooks are published. There are didactic materials to help the teacher;
- Teaching technologies are in content, which is technical means for teachers and students, teaching machines have been added, the concept of programmed education has emerged. New approaches are emerging to help increase the effectiveness of education.

The technological approach to the problem of increasing the efficiency of education appeared in the 30s of the XX century. During this period, the concept of "pedagogical technique" appeared in the specialized literature and it was considered as set of methods and tools aimed at clear and effective organization of teaching.

Nowadays, UNESCO has published the Bulletin of "Pedagogical Technologies" of the International Bureau of Education since 1971, and the Russian Federation has been publishing the journal "School Technology" since 1997.

In accordance with the Presidential Decree of March 1992, selection of entrants to higher education institutions of the Republic by means of tests and the introduction of pedagogical tests in education system were the first. Special research has begun on the problems of pedagogical technology. The essence of pedagogical technology, its definition and role in the field of pedagogical education was first explained in 1993 by N. Saidakhmedov in the journal "People's Education". Significant work has been done in our country in this direction. The Journal of Educational Technology is being published. There are also scientific articles on the implementation of pedagogical technologies in many scientific and methodological journals, such as "People's Education", "Pedagogical Education", "Education" and others.

## **MATERIALS AND METHODS**

As well as, a lot of scientists are conducting effective research on the theoretical foundations of pedagogical technologies and their application in practice. Of these, the research work of J.Yuldashev, R. Juraev, U. Nishonaliev, M. Saidakhmedov, B. Farberman, K. Ishmatov, H. Abdugarimov, K. Zaripov, T. Nazarova deserves special mention. The analysis of scientific research conducted in Uzbekistan shows that today in the Republic the study of the theoretical and practical foundations of pedagogical technologies, their potential and their application in the educational process are considered to be measures of national importance. Some kind of experts recognize that pedagogical technology is a requirement of the times, as well as a new modern direction, and recommend its application in the educational process with the introduction of national features, the second group of experts to avoid the crisis in education. and emphasize that the only way to increase the effectiveness of education is to use pedagogical technologies and create its perfection or to ensure that they give the desired results even in different. Experts of the third direction argue that pedagogical technology is a prerequisite for the evolution of education, its theoretical and practical foundations, the creation of mechanisms to adapt to market relations, the need to look at education as the main policy. At the same time, there are a number of issues that need to be addressed in this area.

Today, new forms are used to assess the quality of education worldwide. Extensive use of international student assessment programs is being implemented in the field of education in our country. It is important to organize and compare existing foreign assessment programs, to develop an appropriate national assessment system that can meet modern requirements in cooperation with international educational institutions. Generally, the students did not seem to

believe in memorization; in accordance with their beliefs, they responded, negatively to rote memorization strategies. They most focused on guessing, dictionary strategies and activation strategies. The results suggest that learners employ a wide range of vocabulary learning strategies other than rote learning strategies.

The beliefs of acquiring vocabulary in context, learning vocabulary and putting it into use and, oral repetition, extended dictionary, dictionary looking, visual encoding strategies were highly correlated with vocabulary size test. But on the other hand, memorization strategies, guessing strategies in wider context, dictionary comprehension, dictionary looking-up, self-initiation, usage oriented note-taking, using word lists and activation strategies were not highly correlated with vocabulary size test.

The secret to vocabulary learning may include helping students see the relevance of strategy use in learning foreign language vocabulary, introducing them to the strategies used often by proficient vocabulary learners and most important encouraging them to develop their own effective strategies for learning.

Comprehensive study of Uzbekistan's participation in international education quality assessment programs and ensure its participation in these programs;

1. Development of a National Program for Assessment or Monitoring of the Level of Knowledge of Student Youth Based on International Experience;
2. Considering the implementation of various foreign programs that teach English in schools, taking into account the publication of the most advanced results of scientific achievements and literature in English.
3. To define the qualification requirements of the specialists responsible for education in preschool educational institutions by specific criteria and to establish by law that they are fully responsible for the general education of children;
4. Determining the maximum and minimum indicators of the number of students in groups and classes in preschool and general secondary education, based on the methods tested in international practice;
5. Organize specialized classes in each school for 8-9 year olds, identifying gifted children in primary grades using psychological tests.

Based on the above requirements, the Resolution of the Cabinet of Ministers of the Republic of Uzbekistan dated December 8, 2018 on measures to organize international research in the field of education quality assessment in the public education system established the National Center for International Research on Education Quality Assessment under the Cabinet of Ministers. Special training is required to participate in international research. The role of the media in the transition to each new process is much higher.

## **DISCUSSION**

Therefore, high results can be achieved through advocacy work in the media by experts in the field. In this process, science methodologists, inspector methodologists, professional development system, school administration, science teachers, parents and students are also required to be active.

In this process, the following work should be done:

1. Science methodologists provide teachers with complete, accurate, and uninterrupted information about international assessment programs;
2. The content of school lessons should focus on preparation for research;
3. It is required to organize and hold competitions, festivals and various events;
4. Teachers, on the other hand, are constantly analyzing student results,
5. Traditional control structures should be gradually transformed into new molds;
6. Changes and additions to the curriculum in the system of professional development,
7. Involvement of skilled teachers in research under the international evaluation program;
8. To acquaint teachers with the literature of foreign scientists,
9. At the end of the course to take practical work in accordance with the assessment programs;
10. Advocate for international assessment programs among parents and the public;

It is known that all the areas related to education need to work together. Strengthening the creative environment between the school teaching staff and students, improving the work of methodological associations, discussing internal results in the pedagogical council, ensuring the integration of the science teacher in the teaching process can also help to increase the image of the international assessment program.

Let's take a look at the following international assessment systems currently used around the world.

1. PIRLS tests
2. PISA
3. TMMSS
4. TALIS
5. EGRA and EGMA

PIRLS (Progress in International Reading Literacy Study) is an international study that aims to identify and evaluate the characteristics of primary school students in countries with different education systems that lead to different levels of achievement. Of course, such research is of great importance for workers, scientists, Methodists, teachers, parents and members of the public in the field of public education.

These studies were coordinated by the International Association of Educational Institutions (IEA).

The PIRS project is organized to determine the level of development of reading ability of 4th grade students. According to international experts, the foundation is laid for success in the further education of schoolchildren in primary school. Countries such as Hang Kong (571), the Russian Federation (568) and Singapore (567) lead the PIRS survey for 3 periods (2001, 2006, 2011).

Kazakhstan first participated in this project in April 2016. The number of participants was 10,256, of which 4,925 were 4th grade students, including 4,925 parents of 4th grade students, 234 primary school teachers, and 172 principals. On December 5, 2017, the UNESCO Board (Paris, France) announced the results of more than 50 countries participating in PIRS-2016. The international research PIRS-2016 XEA encyclopedia provided the best curricula and unique information materials on the experience of developing young students' reading ability. Participation in the PIRS provides an independent and objective assessment of the level of fluency among primary school students in Uzbekistan. In addition, the openness and integration of education in Uzbekistan will ensure the integration of the world's leading education systems into the international community. Preparations for the PIRS study have also begun in our country. The printing of textbooks and notebooks for special primary school students is being carried out in stages.

PISA - The main goal of this program is to test the level of literacy of 15-year-old students on the basis of various tests based on fluency, mathematical literacy and natural sciences. The program was launched in 1997 and has so far involved 78 countries. PISA is held every 3 years and each time the emphasis is on a certain science. In 2000, emphasis will be placed on reading literacy, while in 2021, emphasis will be placed on mathematical literacy.

There are 4 different test methods used in these tests:

1. One-answer tests;
2. Multiple answer tests;
3. Tests with short or detailed answers;
4. The reader's opinion on the solution of a problem.

TMMSS countries are widely used in the education system. The TMMSS program is organized by the International Association for the Evaluation of Educational Achievements (IEA), which identifies the quality, level, attitudes, and interests of 4th and 8th grade students in mathematics and social sciences. It is conducted once every 4 years. This study, similar to the PIRS study, will conduct additional surveys among school administrators and teachers to identify key factors that hinder science. This makes it possible to compare education standards developed in that country with those in other countries. According to the 2015 TMMSS survey, the education systems of the United States, Singapore, Hong Kong, the Republic of Korea, Japan, Russia, and the United Kingdom have the highest rates. It should be noted that in these countries, special attention is paid to the development of high-tech, industrialization and high-level development of specific sciences, in which students work on a little more than the key talents and abilities, and the number of students in groups and classes does not exceed. A similar practice exists in the United States. Since 1999, the number of students in groups in educational institutions has been set at 16, given that a single teacher has the opportunity to educate 16 children in a 40-minute lesson.

TALIS- (the Teaching and Learning International Survey of Leaders and Teachers Organizing the Teaching and Learning Environment and Educational Working Conditions in Educational Institutions). This study was first conducted in 2008 with the participation of 24 countries. The second phase was held in 2013 and was attended by 3 countries. The Russian Federation also participated in the study this year. In 2018, 46 countries became participants in the TALIS

presentation. The essence of the study is to conduct a survey with teachers and school leaders. The survey with the principal mainly included opinions on school management, teacher performance appraisal, school environment, and satisfaction with their work in a multicultural environment. The survey of teachers showed that there are different areas of professional development, the whole teaching activity, the implementation of teaching activities in a particular classroom by the teacher and the positive interaction with the school community. It should be noted that TALIS is the only community of inquiries that focuses on the organization of the learning environment and the work process of teachers in the educational institution.

EGRA (leakage) and EGMA (mathematics) - this study will help to improve the performance of primary school students and identify gaps in the learning process. This rating system is used in more than 70 countries around the world.

The development and gradual implementation of the draft international evaluation program EGRA and EGMA. EGRA and EGMA international assessment programs are being implemented in the public education system of the Republic of Uzbekistan in cooperation with USAID.

To achieve effective results through the above international assessment programs, students are also required to study diligently. Continuous development, active participation in social relations in society, the flow of fiction outside the textbooks, the creation of a personal library at home, helping peers with disabilities, effective use of information sources (computer, telephone, television, Internet), extracurricular activities to participate in science, sports and art clubs, to be able to apply theoretical knowledge in practice. In the process of this activity, the parent should create an environment that stimulates and motivates the child to learn.

## CONCLUSION

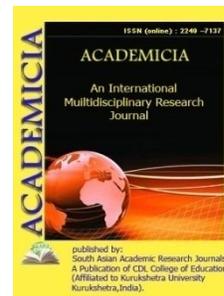

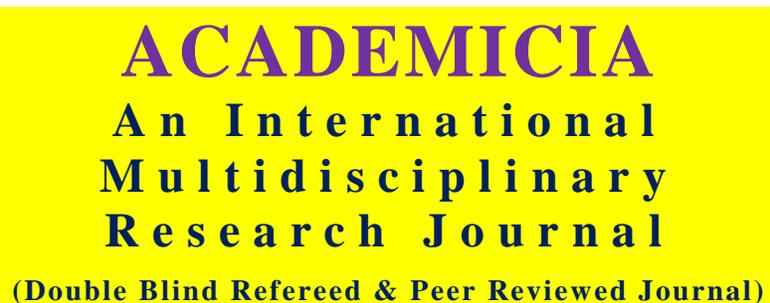

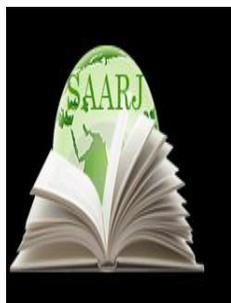

In general, the lack of participation of such international programs in the assessment and monitoring of the education system in our country or the lack of a National Program for assessing or monitoring the level of knowledge of students, the quality of the level of mastering a subject by regions and the scope of work. Limiting the opportunity to go and carry out appropriate reforms. Also, the fact that the level of education in primary and general secondary education is lagging behind the pace of reforms may lead to a shortage of qualified personnel in the near future.

In this regard, we consider it appropriate to implement the following recommendations: Monitoring and evaluating knowledge is both a motivating tool for the reader and a tool to motivate them to work more on mistakes. Therefore, this system needs to be further improved in our country. This way it requires educators to work on them less. Every citizen should be able to take a responsible approach to the development of the children of the next generation as high-potential, cultured, spiritual, broad-minded people. Students are also encouraged to learn material in greater depth than they might otherwise have done, and to think of creative ways to convince the teacher that they have mastered the required material. Oftentimes people will feel that they are getting nowhere when a student simply wants to speak about their job, their cat, or even their favorite things! Since they usually are the ones paying for it, they will argue that they can have the right to do this. Naturally, this is true. If they want to talk incessantly about their pet, then simply incorporate that into the whole lesson. The more they talk, the better their English will become!

In conclusion, Uzbekistan is also successfully working on the introduction of innovative pedagogical technologies in the teaching and educational process. The creation of their theoretical and practical foundations has become a state.

### ABSTRACT

*This article is devoted to the transformation of the national culture of the Russian Diasporas in Uzbekistan on the example of wedding ceremonies. This is the first comprehensive study of the Russian wedding in Uzbekistan. The basis of the study consists of such methods as: personal observation, oral survey – conversation and standardized survey – a specially developed socio-psychological, ethnographic questionnaire (SPEQ) for this study; written survey – a semi-open socio-psychological questionnaire (SPQ) specially developed for this study.*

**KEYWORDS:** *Russian Diaspora, National Culture, Wedding, Transformation, Uzbekistan.*

### INTRODUCTION

The history of the Russian diaspora in Uzbekistan dates back to the second half of the 19th century. For many decades, Russians have played an important role in the implementation of the most important social, economic, political, scientific, educational and cultural programs. After the proclamation of independence, the majority of Russians adopted Uzbek citizenship.

Russians in Uzbekistan are one of the largest ethnic minorities in the country along with Tajiks and Kazakhs, one of the largest Russian diasporas outside modern Russia.

The Russian Cultural Center (RCC) operates in Uzbekistan, which was registered on March 2, 1994 by the Ministry of Justice of Uzbekistan. It is a non-governmental, non-profit public organization. The main direction of its activity is strengthening friendly relations of the Russian people with others, careful preservation and development of traditions, values, spirituality,

language, customs of the Russian people (Kak jivyotsya russkim v stranah Central'noi Azii, Kak jivyotsya russkim v Uzbekistane, Russkii kul'turnyi centr g. Tashkenta).

In modern life, cultural traditions play an essential role. Being an extremely flexible cultural phenomenon, traditions perform the complex function of linking the present with the past (Chistov 1983: 16, Budina and other 1982: 39).

Considered one of the cultural traditions of Russians are wedding rituals.

There are three successive stages in the wedding ceremony of the Russians:

- 1) Pre-wedding, which included matchmaking, “sgovor” (engagement), “smotriny” (*miai* – house inspection), bachelor and hen parties, ritual bath for the bride and groom before the wedding and various ritual actions on the bride's territory;
- 2) Collecting the wedding train, the groom's arrival for the bride, meeting the young at the parents' house, bringing the dowry, ceremonies after the first wedding night. The wedding feast took center stage;
- 3) Post-wedding, covered the second day of the wedding feast and rites and ceremonies aimed at introducing the young to the family and the husband's home, and visits of the young to the next of kin.

With all the variability of the rite, its general structure remains unchanged, including the following main components:

- matchmaking;
- *miai* (*smotriny* – “looking at yards”, “looking at a place”);
- engagement – *sgovor*, *rukobitie* (announcement of the decision about the wedding), *zapo* (*propoi*) (joint feast);
- *vytie* (preparation for the wedding day);
- bachelorette / bachelor party;
- wedding transportation (train);
- wedding ransom from the slavs;
- wedding (*venchanie*);
- partying (*gulyanie*);
- wedding feast.

During its existence, wedding rituals have undergone continuous changes, especially intensively in the 19th – early 20th centuries. Already at that time, among the Russians of Central Asia, certain elements of the wedding were a rather rare occurrence or generally dropped out of the wedding ritual. Many of the existing wedding ceremonies have lost their original meaning and, as a rule, were interpreted from the standpoint of existing family relationships. Wedding folklore has also undergone significant changes. A.F. Mozharovsky wrote in 1857 that “perhaps one century will not pass, as wedding songs will sink into eternity, leaving behind only memories from books” (1875). This even took much less time.

The distance of Russians from their homeland isolated them, and already at the end of the 19th and the beginning of the 20th centuries changed the traditional wedding ceremony even more significantly. Many Slavic peoples who came to these lands, that is, all the “old-timers” (they settled here until 1917) associated themselves with the Russian people, for all Russian was the

main language, and despite the fact that the culture of this population was so saturated with Ukrainian elements, that researchers-diasporologists unanimously considered this “a natural consequence of the predominance of the Ukrainian element among the immigrants” (Brusina 2001: 133). This element has become so accustomed to Russian culture that nowadays Russians do not distinguish them, even Ukrainian is mistaken for their culture. This can also be seen in wedding ceremonies of Russian. At present, however, the bulk of the more than five million Russian population of Central Asia are not “old-timers” who arrived in the region before 1917, but migrants from several “waves” caused by important historical events in the USSR in 1930s-1970s (Dubovickii).

At the same time, there is a further reduction in the wedding ritual, the combination of certain structural elements of the wedding and wedding terms. Thus, our study (SPQ) among the Russian diasporas in the city of Tashkent (68% of women, 32% of men) showed that the majority of Russians (79,6%) either rarely observe or do not observe national wedding ceremonies and customs at all. Only 20,4% of Russians often or always observe national wedding ceremonies (Figure 1).

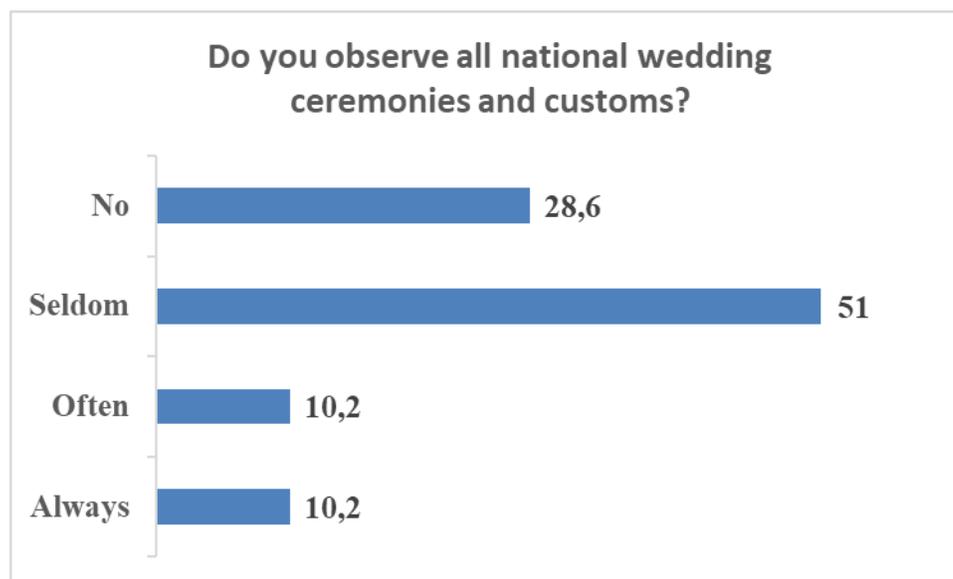

Figure: 1. Observance of national wedding ceremonies of Russians in Tashkent

Thus, “sgovor”, “rukobitiye”, “propoy” (“zapoy”) that used to be separate wedding acts are carried out simultaneously and are designated by any one of these terms. The duration of the wedding has decreased. Many rituals have disappeared irrevocably. Many actions are performed in a simplified form, often acquiring a comic, playful character.

The number of active wedding participants has dropped significantly. The wedding is seen as a purely family celebration. Ubiquitously among the Russian diasporas a variety of ritual food at a wedding has given way to the consumption of ordinary dishes.

It should be noted that it is the national elements in the traditions, including wedding ones, that distinguish Russian culture from others. It is interesting to note here that the Russians themselves

are neutral (59,2%), calm (2%) and even positive (8,2%) towards the disappearance of some rituals and customs. Only 26,5% of Russians are opposed to the disappearance of rituals (Fig. 2).

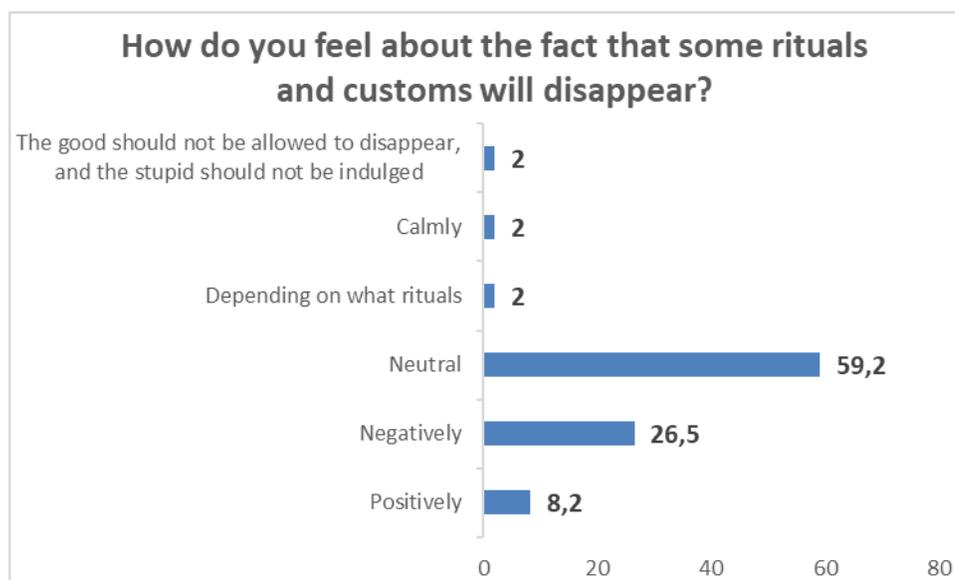

Figure: 2. The attitude of the Russians in Tashkent to the disappearance of some national customs and rituals

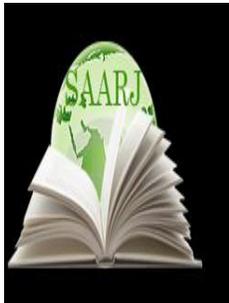

It should be noted that the old traditions, although they have undergone changes, they continue to live in villages of Russia. And the Russian diasporas in Uzbekistan have a completely different situation, they have developed a kind of peculiar wedding ceremony, in which there is more European than traditional Russian. Here the rituals of all European diasporas have united, and something has developed – one whole. Of course, they have their own distinctive features.

Through the assimilation of Western values, the cultural globalization of the wedding ceremonies of the Russian diasporas in Uzbekistan is taking place. At the same time, it stimulates the emergence of new values, as a manifestation of a new spiritual revolution taking place on the basis of this new system of values. The danger of such consequences for culture draws the attention of E.U.Baydarov. He notes that no one can say about such a culture: "This is my culture." "In this way, no one's culture is built, it has no subject, no one is responsible for it" (Baidarov 2010). Therefore, a play wedding ritual can be anything: spiritless, low-quality, destructive ... And if this culture is nobody's, then no one is obliged to master it, develop and improve its components, including play wedding rituals. Most of them today are stereotyped, fragmentary, conventional, and poor in content (Reprinceva 2019). The modern game wedding ritual ceases to fulfill its essential function: "inscribing a person into the world, giving meaning to a person's life and being" (Baidarov 2010).

In general, the 20th century in Uzbekistan can be called the period of the formation of wedding traditions among the Russian diasporas. A rare wedding now does without the traditional loaf, veil, and exchange of rings. For most, traditional wedding rituals have become more of a theatrical performance than a belief in their meaning, but still these wedding traditions continue to exist, being an integral part of Russian culture.

**ABSTRACT**

*This article provides a comparative analysis of the socio-political, cultural life of the Bukhara Khanate in the 16<sup>th</sup> century and the influence of the Shaybanid dynasty on the development of pedagogical thought at that time. In particular, in the Bukhara khanate of the 16<sup>th</sup> century, the pedagogical foundations of development in science, art, culture, education and other areas during the reign of the Shaybanid dynasty were presented.*

---

**INTRODUCTION**

If we look at history, we can witness that the 16<sup>th</sup> century began with great changes in the socio-spiritual and political life of the Bukhara Khanate. The Timurid dynasty, which ruled Movarounnahr and Khorasan for 137 years, was later replaced by the Shaybanid dynasty.

The Shaybanid period left an important mark on the history of Uzbek statehood. In particular, on the way to the restoration of the Shaybanid state, Muhammad Shaybanikhan reunited the Uzbek tribes that had disintegrated after the death of his grandfather Abulhairkhan. As a result of long struggles, in 1480 he managed to restore the Uzbek state. In particular, Muhammad Shaybanikhan's ability to combine the culture of nomadic tribes and the cultural achievements of Central Asian cities ensured the success of his victorious marches.

## LITERATURE REVIEW

We all know that in the 14<sup>th</sup> and 15<sup>th</sup> centuries, thanks to the activities and efforts of a mature statesman, a skilled commander, patron of science and culture Amir Temur and the Temurid princes, a large and strong state in Monarounnahr and Khorasan achieved cultural heights. Unfortunately, in the life of a large country that had achieved and developed a unique scientific renaissance, by the end of the 15<sup>th</sup> century, internal conflicts and disputes for the throne had begun. As a result of long-lasting wars, people's lives and lifestyle have become much more aggravated. Cultural development, on the other hand, came to a slow halt.

It is noteworthy that Muhammad Shaybanikhan managed to restore the completely disintegrated Timurid empire and turn it into a single centralized, socially, economically, politically and culturally developed country. Thus, after the Timurids, Samarkand and Bukhara, the cultural centers of Movorounnahr, became the centers of science again as a result of the efforts of the Shaybanid dynasty.

## MAIN PART

According to an analysis of a number of historical sources, since almost all of the Shaybani rulers were knowledgeable and enlightened people, at the same time they were not only supporters of scientific progress but also its patrons. They did not lose the rich scientific heritage and traditions of cultural life created by the Timurids, but, inspired by the Timurids, saw themselves as the followers and successors of this culture and made a worthy contribution to its development. A vivid example of this can be found in the information of the historian Kamoliddin Binoi that even in 1494-1500, the Ulugbek Observatory was erected in the foothills of the Kuhak, on the banks of the Obirahmat stream, without any damage. This information is also in line with Bobur's statement that he saw Mirzo Ulugbek's observatory at the top of the blue hill, which contained the instruments needed to compile a star chart. Thus, these data indicate that the instruments of the Ulugbek Observatory were preserved in the 16<sup>th</sup> century. Therefore, the idea that the observatory was looted and destroyed after Ulugbek's death (October 25, 1449) does not correspond to historical sources [1]. It is also noted in many historical sources that the Shaybanids renovated many buildings and structures left over from the Timurid period and gave them the spirit of a new era.

In particular, during one of the travels of Abdullakhan II, one of the founders of the culture of the Bukhara Khanate in the 16<sup>th</sup> century, he saw the following words inscribed on a minaret on the top of a mountain in the west of the Karaganda region (now Kazakhstan): "History of 793 in a sheep year, in the middle of the summer, Temurbek, the sultan of Turan, marched with two hundred thousand allies to the land of Tokhtamishkhan for revenge. When he got here, he built this tower to be a sign. God bless us inshallah. God bless the man. May God remember us in pray!". So, these inscriptions were the words of memory engraved on the rock of the tower built by Amir Temur on the mountain during his march against Tokhtamishkhan. Abdullakhan II prayed to the name of the Great Amir Temur and was inspired by him and he himself built a tower similar to this one on the opposite side, and engraved the following: "Whoever steps on this address, let remember us with a blessing!". Many historical sources testify that the construction of Amir Temur began, but a number of unfinished buildings, mausoleums, mosques and madrasas, khanakas and residential buildings were restored, repaired and completed by a representative of the Shaybanids, Abdullakhan II.

In particular, the construction of the mausoleum of Ahmad Yassavi, one of the priests of Sufism, began during the reign of Amir Temur and its completion is associated with the name of Abdullakhan II. We can cite many historical examples like this.

Based on the above ideas and comments, we would like to focus on the life and work of some of the Shaybani rulers, who played an important role in the cultural development of the 16<sup>th</sup> century, to better understand the highly developed scientific and pedagogical environment of the Shaybanid state. In the 16<sup>th</sup> century, the influence of the representatives of the dynasty was especially important in the highly developed fields of architecture, science, culture, literature and art, as well as in the development of secular and religious sciences. In particular, the founder of the Shaybanid dynasty laid the cornerstone of 16<sup>th</sup> century culture, Muhammad Shaybanikhan was from the Shaybanid dynasty of Uzbek descent and was the grandson of Abulhairkhan, the founder of the Uzbek state in Dashti Kipchak.

### **THEORETICAL BACKGROUND**

Shaybanikhan conquered Bukhara in 1499, Samarkand in 1500, Khorezm in 1505, and Herat, the capital of Khorasan, in 1507 [2]. He was as famous as Amir Temur as a patron of science and culture. Hasankhoja Nisori, in his work “Muzakkiri Ahbob” (“Memory of Friends”), wrote about the Shabani rulers and said that Muhammad Shaybanikhan, who started the culture of the Bukhara Khanate in the 16th century, came to Bukhara in search of knowledge, it is said that he was a very pious man, praying and living in the tombs of Hazrat Bahauddin, the founder of the Naqshbandi sect[3]. Nizamiddinjoha Mir Muhammad Naqshbandi, the grandson of Khojai Buzrugvor, also served for some time and became a murid.

Nizamiddinjoha Mir Muhammad Naqshbandi tells Muhammad Shaybanikhan that there was a divine prophecy about him, that he would not leave this country, that there was a hint that he would do great things in this country if he was lucky and destined [4].

Following the prophecy of that prophecy, Shaybanikhan established his empire in a large area from Turkestan province to Khorasan for 12 years, turning them into economically, socially, politically and culturally strong and prosperous regions.

According to the historian Hasankhoja Nisari in his book “Muzakkiri Ahbob” (“Memory of Friends”), Muhammad Shaybanikhan was a man who mastered many fields of science. He also had a high level of faith and attention to many poets in the field of poetry. He always brings together a lot of interesting and accurate information about the fact that he gathered scientists and held scientific talks. Muhammad Shaybani focused on attracting many historians, poets and scholars to his palace. In particular, Kamoliddin Binoi, Muhammad Salih, Mullo Shadi, Fazlullah ibn Ruzbekhon created and finished their works in his palace.

After the conquest of Herat by Muhammad Shaybanikhan, his portrait painted by the artist Kamoliddin Behzod has survived to the present day. The remarkable aspect of the painting is that it was the writing tools in front of the khan, which indicate that the ruler was interested in science and enlightenment and loved to write [5].

According to historical facts, Muhammad Shaybanikhan was educated in the madrassas of Movarounnahr, where he had close ties with the Temurids for many years. He was also in constant communication with scholars and writers and guided the creative mind as someone well acquainted with the history of culture. He himself is a head of state who has made a name for

himself as a skilled poet and scholar in history. Muhammad Shaybanikhan's close contact with the enlightened people in the centers of Mawarounnahr made him also a brilliant scholar of his time. Especially the years he lived in Bukhara left an indelible mark on his life.

## RESULTS

In particular, he was educated in Bukhara by Mawlana Muhammad China, one of the best readers of the Qur'an [6]. According to a number of historical sources, he was fluent in Turkish, Arabic and Persian and became known as a well-known artist of his time. According to A. Kandaharov, one of the scholars who studied the socio-cultural life of the Bukhara khanate in the 16th century, Shaybanikhan gathered around Mullo Shadi, Muhammad Salih (1455-1534), Rezbehon Isfahani (1457-1530), Binoi (1453-1512) he himself is engaged in creation.

Among the creators of his time, he was known as Shahbakht, Sheboni, Shohibek, Shoybok, Shaybani, a poet who wrote ghazals and rubais. He is one of the first in his poems the cities of Movarounnahr and we will not be mistaken to say that he is one of the poets who praised beautifully. His poems about famous cities such as Samarkand and Bukhara are especially praiseworthy.

For example:

*Jannati ma'vo degan bog'o Samarqand elim,*

*Nafsari a'lo degan obi Samarqand elim,*

or writes about Bukhara as follows:

*Bir zayolim bor ko'ngilkim pirmu vafoiy atayin*

*Ul Buxoro sharida Ka'ba tavofin aylayin.*

His famous book "Bahr al-hido" (Sea of Hidayat) (1508) written in Uzbek and Persian languages has survived to the present day and is preserved in the Manuscripts Fund of the Republic. There is also a book of Shaybanikhan's teachings dedicated to his son Temur Sultan in 1507-1508 (1507-1508) (the only copy of which is now preserved in Turkey).

While studying this theme, R.G.Muqminova, a talented historian who defended her doctoral dissertation on "The struggle between the Temurids and Shaybani for Movarounnahr" (candidacy) and "Samarkand and Bukhara 16<sup>th</sup> century handicrafts" in 1972, wrote a lot about Shaybanikhan's personality and activity. we can witness that it provided valuable information. H.Wamberi, one of the most famous historians of the time, wrote that he was not a savage who could do whatever he wanted, as he was influenced by his Iranian enemies. For example, he had great respect for the clergy of his time, even as a child, and carried a small library with him on all his travels, and like Timur, he was reportedly involved in constant debates.

He also objected to Judge Ikhtiyar and Muhammad Yusuf, the descriptors of Herat, about some verses of the Qur'an[7]. According to many researchers, Shaybanikhan himself was involved in the creation of historical works. In particular, he was directly involved in the writing of a unique source written in Uzbek ("Turkish") – "Tavorihi guzidayi nusratnoma". The author of "Shaybaniynoma" Muhammad Salih highly appreciates the poetic works of Muhammad Shaybanikhan and describes him as a highly educated person. Shaybanikhan, who wanted to be recognized as a poet close to the Timurid society, ordered to hang the papers with his poems in

crowded places. Shaybanikhan followed the Sunni trend in Islam, calling himself “Imam az-Zaman and Khalifah al-Rahman” and contrasting Sunni Islam with Shiism, which was designated the state religion by King Ismail Safavi of Iran, declaring it the religion of the Shaybani state. Also, during the reign of Sheibanikhan, the prestige of the Uzbek language in historical and literary literature increased.

## CONCLUSION

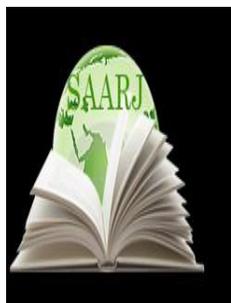

In particular, on the basis of the khan’s order, many works in Persian and Mongolian script were translated into Turkish [8]. Therefore, it is important for us to further study and study the culture of the Shaybanids, who have achieved the highest cultural environment and the development of historical thinking, as a dynasty, as an integral part of the history of Uzbekistan. It also creates new opportunities for the discovery of the content of the history of pedagogy through the use of the life and work of the Shaybani rulers and their pedagogical ideas in the education system among the younger generation today.

### ABSTRACT

*The article describes the spirituality of a person, which is reflected in his language, in his beautiful speech. Language is the great wealth of a nation, its priceless treasure, inexhaustible property. Because it embodies the history of the people, its cultural and spiritual heritage, customs and traditions. Therefore, we need to preserve our native language, enrich it and pass it on to future generations.*

**KEYWORDS:** *Uzbek Language, Education, Central Asia, Upbringing, Friendship, Interethnic Harmony, Mutual Cooperation, Universal Values.*

*Language Is Not Only A Means Of Communication, But Also Culture, Customs, Way Of Life, The History Of A Nation.*

---

### INTRODUCTION

To love a language means to love it, to love a nation and to appreciate it. The way of life, customs and culture of any people are reflected in its language. It is no coincidence that language is the mirror of the nation. The centuries-old rich history, ancient and multifaceted culture of our people were formed under the influence of the Uzbek language.

On October 21, 1989, the Uzbek language was given the status of the state language. The Constitution of the Republic of Uzbekistan legally establishes the status of the Uzbek language. After the adoption of the law on the Uzbek language, all government documents were kept in Uzbek, and newspapers and magazines began to appear in Uzbek. After the adoption on September 2, 1993 of the law "On the creation of the Uzbek alphabet based on the Latin language", our country developed in all directions, and it became important to take a worthy place in the world communication system. Therefore, the number of people interested in the Uzbek language and its study abroad has increased. There are more than 5600 languages in the

world, of which only 200 are accepted as the state language. The presence of the Uzbek language among them shows how pure, perfect, significant and attractive it is. Therefore, our task is to convey the beauty and purity of our native language to future generations.

Literature, history of Uzbekistan is among the ancient, rich world heritage, worthy of study. When covering this interesting topic, which has not been deeply studied, let us dwell on the historical features of the formation of the Uzbek language.

Few territories have experienced so many vicissitudes of fate, so many wars, invasions, bloody troubles and internecine clashes, as the region of modern Uzbekistan. Situated at a crossroads, on the one hand, between the northern and southern parts of Asia, and on the other, between China and Europe, Uzbekistan since ancient times has served as a collision point for the most diverse ethnic groups and arena for the activities of the greatest Asian conquerors. Cyrus, Alexander the Great, Genghis Khan, Timur and Nadir Khan, not counting many other lesser known, but equally unbridled and greedy oriental despots, passed with their hordes along and across this country, leaving behind streams of blood, devastated fields and piles of smoking ruins. The intervals between wars and invasions were rare and short; barely under the influence of peaceful conditions, the sprouts of the development of creativity began to appear, as new hordes of nomads seized the area, sweeping away on their way and turning the blooming oases into dead deserts. This is how the centuries and millennia passed in the struggle of the nomads with an incomprehensible and hated sedentary population, in the struggle between barbarism and comparative education. The fate of the Central Asian population is, however, of outstanding interest not only for the tragedy of the events taking place here, but also for their importance for the formation of a rich literary heritage and language.

The history of the formation of the Uzbek language is closely related to the history of the development of ethnic groups inhabiting the territory of Central Asia. Its formation was influenced by wars, as a result of which there were changes in the ethnic composition of the peoples inhabiting various Central Asian regions.

If we consider the territory of modern Uzbekistan, then historically it developed in such a way that life developed around oases. This is due to the sharply continental climate of this region and the lack of water. The oases of Tashkent, Bukhara, Khorezm, as well as the Fergana Valley and most of the ancient state of Sogdiana were also inhabited by Turkic-speaking ethnic groups. In ancient times, Uzbekistan for a very long time was inhabited mainly by the Eastern Iranian so-called Sogdians, they spoke the Sogdian language. The Sogdian language is the language of the East Iranian group of Iranian languages, spoken in the Zarafshan valley, as well as in the Sogdian colonies along the so-called "Silk Road".

During this period from III-VI, nothing influenced the changes in the linguistic communication of the peoples inhabiting this region. Even the 150-year rule of the Greco-Macedonian army, which was the result of the conquest of part of the Asian expanses by Alexander the Great, did not affect the change in the ethnic composition and the colloquial and written speech of Asians who spoke Sogdian.

Later, until the VIII century. many tribes came to the Central Asian lands from the Center, Semirechye, and the East. They were Turkic-speaking, as a result of which they were mixed with the local population. The Sogdians living in the valley of the Zarafshan River, who spoke the Sogdian dialect of the Iranian branch of languages, occupied small areas within the Turkic

settlements surrounding them. They gradually lost their ethnic isolation, entered into marriage with the daughters of the Turks, or, conversely, passed off their daughters for the Turks, gradually losing their dialect and replacing it with the Turkic one. New Turkic-speaking tribes, who came to this land more and more, consolidated their influence and form of communication. Due to the fact that the Turkic tribes inhabiting the Central Asian regions led mainly a nomadic lifestyle, the coming rulers (Mongols, Persians, Arabs) of constantly changing states in this historical period could not have any influence on the form of communication and the ethnic composition of the local population. The mutual influence of the Turkic tribes of this area, their culture, language, customs was very strong.

At the beginning of the VIII century. Central Asia submits to the Arabs. At this time, Arabic speech became the official form of communication. But for the nomadic Turkic tribes that lived on this vast territory and lands of present-day Kazakhstan, colloquial, everyday communication remains the former colloquial speech of various Turkic tribes. The advantage of the Sogdian language is that at that time religious literature was actively developing in it. Basically the Arabic language only influenced the spiritual part, the Quran and the writing of spiritual literature.

Mixing of the ancient Iranian population with the Turkic tribes in the period from X to XV centuries. led to the gradual formation of the Uzbek ethnos proper. This process intensified markedly during the period of the Mongol conquest of Central Asia (XIII century). The huge state founded by Genghis Khan did not remain united and indivisible for long. Soon after his death, strife broke out. Between the nomads - the Mongols, who carried out weeds on the arable lands of the sedentary population, and the latter there was constant enmity, serious clashes took place. At the same time, the conversion of the khans to Islam and their addiction to the Muslim culture aroused the discontent of ordinary pagan Mongols. Over time, a significant number of Mongols converted to Islam and, submitting to the influence of local culture, became zealous champions of it. With the abdication and Muslimization of the southern parts of Turkestan in the Mongol era, new terms appeared: Mogulistan (the country of the Mongols) to designate the northern part of Turkestan, where the Mongols prevailed, Uzbekistan (the country of Uzbeks) to designate the western parts of northern Turkestan.

As a proper name, the anthroponomy "Uzbek" is found in the works of Nisaviy Juvayni and Rashid ad-din (XIII century). Rashid ad-din writes that the king's son Uzbek was the son of Mingkudar, the grandson of Bukal, the seventh son of Jochi (it is necessary to explain who it is). It should be noted that Uzbek khan was the khan of the Golden Horde and nomadic Uzbeks were not his subjects. Uzbek khan in the XIV century. contributed to the rise of Moscow with his patronage to the princes Yuri Danilovich (whom his sister Konchak was married to), Dmitry the Terrible Ochi, Ioann Danilovich (who, in 1328, gave a charter for the great reign) and Semyon the Proud. In the middle of the XIV century. the ethnonym "Uzbek" became a collective name for the entire Turkic-Mongolian population of the Eurasian steppes.

From the end of the IX century. the territories of modern Uzbekistan were ruled by representatives of the Samanid dynasty. The language of the court, the state apparatus and literature was the New Persian language (Farsi Dari), which gradually replaced Sogdian from communication. The language of science was still Arabic. During this period, the so-called Old Uzbek or Chagatai language (named after the second son of Genghis Khan) was formed. Old

Uzbek language (XIV-first half of the XIX century). At the beginning of the XIV century. the Uzbek language began to function independently. This can be traced already in the works of the poets Sakkaki, Lutfi, Durbek, written in the XIV century, in which the linguistic peculiarities of the Karluk-Uyghur groups that took part in the formation of the Uzbek people are increasingly manifested. At the same time, in the languages "Muhabbat-name" and "Taashshuk-name" we find some peculiarities of the Oghuz, and in the "Khosrav va Shirin" - of the Kypchak languages. - the language of the works of A. Navoi and M. Babur, such dialect elements are almost absent. It is interesting to note that the works of Lutfi, Sakkaki, Durbek and others, written in the early periods of the functioning of the Old Uzbek language, more reflect the features of the living spoken language of the Uzbeks. This language is well understood by our contemporaries. Alisher Navoi improved this literary language in his works, enriching it with Arabic and Perso-Tajik language means. As a result, a kind of written literary language was formed, which for several centuries served as a model, a standard for writers and poets. Only in the XVII-XVIII centuries. in the works of Turda, Abdulgazy and Gulkhani, this literary written language was somewhat simplified and close to a living spoken language.

At the beginning of the XX century. the modern Uzbek language was created on the basis of the Fergana dialect. From the middle of the 19th century, when Uzbekistan entered the Russian Empire, the Uzbek language was influenced by the Russian language.

In the XX century. in Uzbekistan, three alphabets have changed. In 1929, the Arabic script, which was traditional at that time, was replaced by the Latin alphabet. These changes are associated with the revolutionary events of 1917. Having received the opportunity to openly express their thoughts, many educators of the Asian peoples of the former Russian Empire became interested in raising the issue of the need to replace the alphabet and switch to the Latin script. Soon after intense debate in the early 20th century, the Romanization movement became official government policy. "The transition to the Latin script is of great importance - it breaks the wall between the European and Muslim cultures, creates a rapprochement between the West and the East," said A. Mikoyan in 1925 at a conference on the transition to the Latin alphabet.

However, already in 1940, the Latin alphabet was replaced by the Cyrillic alphabet adapted to the Uzbek language. The transition to the Latin alphabet symbolized not the choice of a more convenient graphic system in my opinion, but the rejection of all Russian (the Cyrillic alphabet is just a particular), this is an attempt to get closer to the Turkic-speaking world on a new basis. Moreover, relations with Turkey were in their prime, giving rise to hope for an improvement in the economic situation, the development of national science, culture and art. It can be said without exaggeration that the change of the alphabet was to some extent a gift presented to Turkey. Another important reason was that the transition to the Latin alphabet made it obviously impossible to return to the Arabic script, which was actively pursued by adherents of the Islamic way of life.

During the perestroika period in Uzbekistan, as in other republics of the Soviet Union, a movement for national self-determination and identity began. To strengthen the identity of the Uzbek people in the country, on October 21, 1989, the Law "On the State Language" was adopted. This document secured the status of the only state language for the Uzbek language. After that, it became possible to create an institute for the study of vocabulary, phonetics, morphology of Uzbek, and study its sections. After the adoption by Uzbekistan of the Law "On

the State Language", awareness of its national identity, many terms and international words were revised. The ordering of terms, ensuring their identity, the selection of words that most accurately express new concepts in modern life is important. If the work on changing the terms does not follow certain norms, scientific justification, then confusion can arise. So, for example, the literal translation of the word "Tayyoragoh" from Uzbek into English means "a nest of iron birds". So at one time the Airport was called in Uzbek, but such a term did not "take root" in live conversational communication, and such borrowed words as "Airport" are one of the ways of modern development of Uzbek.

In 1993, it was decided to abandon the current alphabet at that time in favor of the Latin script. However, unlike Azerbaijan and Turkmenistan, the Soviet Cyrillic alphabet continues to be used even at the official level, coexisting with the Latin alphabet. At the same time, the Uzbek Latin alphabet, adopted in 1995, is actually a transliteration of the Cyrillic alphabet, which differs from all other Turkic Latin characters. The Arabic alphabet prevails among the Uzbeks of Iran, Afghanistan, Pakistan and China

In the modern world, about 27 million people speak Uzbek. In Uzbekistan, it is the state language, partly Uzbek is spoken in other neighboring Central Asian states of Kazakhstan, Kyrgyzstan, Turkmenistan, Afghanistan and the Xinjiang Uygur Autonomous Region of the People's Republic of China. At the last census in 1989, there were about 24.8 million Uzbeks (the third largest ethnic group after Russians and Ukrainians), of which about 24.8 million named Uzbek their native language; there are about 1.8 million Uzbeks in Afghanistan. The population in Central Asia is growing rapidly, and the figures from the last census have already increased significantly. Taking this into account, it can be concluded that the Uzbek language is one of the largest Turkic languages in the world, along with Turkish and Azerbaijani.

During its formation, the Uzbek language absorbed elements of many languages and literary traditions. The complex and interesting history of the region gave rise to an original language created on the basis of the Iranian Sogdian language and the language of the nomadic Turkic tribes of the Eurasian steppes. The Uzbek language has a large number of Arabisms, which it borrowed through the Perso-Tajik languages. The influence of the Russian language is especially worth noting. In the last 20 years in the Russian language, there has been a discrepancy in the graphic design of words created according to the same model and having the same components.

The Uzbek language has passed a difficult path; various historical conditions influenced its change and development. The way of life of the people cannot be compared with the ethnic group. It is known that part of the Arabs in ancient times led a nomadic lifestyle, while the other part led a sedentary and urban lifestyle. The same applies to the Iranian-speaking peoples. The Turkic-speaking peoples are also no exception. Research in this area allows us to conclude that, firstly, the ancient Turks were the original inhabitants of Central Asia and were part of the indigenous autochthonous population of the region; secondly, part of the ancient Turks initially led a sedentary agricultural lifestyle and took a direct part in the creation of the most ancient urban civilizations of Central Asia. The historical and ethnic successor of this ancient sedentary agricultural Turkic-speaking stratum is the bearer of one of the oldest literary forms of the Turkic language, the modern Uzbek people. The formation of various dialects of the Uzbek language took place depending on changes in the ethnic composition of the population of Central Asia.

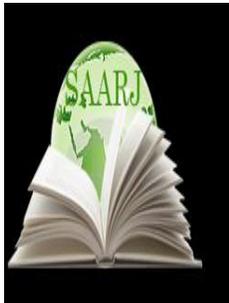

Today, our contemporary poets also create works that reflect the richness of the Uzbek language and its greatness. Because a nation with great literature also has a great language. A person's spirituality is reflected in his language, in his beautiful speech. Language is the great wealth of a nation, its priceless treasure, inexhaustible property. Because it embodies the history of the people, its cultural and spiritual heritage, customs and traditions. Therefore, we need to preserve our native language, enrich it and pass it on to future generations.

In the recent congratulatory message from our President on the occasion of Independence Day, the most important direction in this regard was the development of our native language, which is a symbol of our national statehood and identity, with a special emphasis on large-scale celebration of the language holiday in high spirits. As the head of the country said, with God's help, this year on October 21 we will celebrate the Day of the Uzbek language on a large scale throughout the country. We should be proud that today the Uzbek language, the Uzbek nation and the Uzbek people are recognized by the world society.

In conclusion, I would like to emphasize that we must, must preserve our native language, increase its prestige, pass on its beauty and purity to generations and contribute to its spread in the world. "If the language is alive, then the nation lives." If we glorify the beauty and richness of our language to the world, our nation will become brighter and our unity will become stronger.

### ABSTRACT

*The article presents the information on the research into the works of contemporary Uzbek poets. The creations of Rauf Parfi and Shavkat Rakhmon have their own inimitable artistic-esthetic value. The ideological - esthetic impressiveness of the poems is seen in the musicality and sounds harmony of the poems.*

**KEYWORDS:** *Sounds Harmony, Musicality, Euphonic Means, Alliteration, Assonance, Sounds Repetition, Rhetoric Question, and Rhythm.*

---

### INTRODUCTION

Pretending that the melodics and a flight of sounds in the poetic works are related to the literary genesis, we should say that the poems were created by the rhythm and various musical instruments.

There are some notions as “phonics” and “euphony”, which is used to identify the sound harmony in the contemporary literary criticism, while “phonics” (from Greek phonikos- sound) is a branch of poetics, which studies the sound structure in the literary speech [1:470].

According to A.Sabrdinov: “The musicality is revealed through a sound and words repetition, compositional circles and chains, anaphoric and epiphoric repetitions, rhyme and metre” [2:137].

The Uzbek poetry of the Independence period as the artistic-esthetic phenomenon has been increased to the new level, bringing readers to the deep reflections, awakening the intellectual arguments and profound analyses of the different layers of the word meaning [3:116]. The musicality has an important role in the ideological-esthetic impressiveness of the Uzbek poetry of the period of Independence. In this regard it is appropriate to mention here Leo Ozyorov’s remark: “The word in a poem cannot be regarded as the paper wrapping the thought and feelings.

The thought and feelings in a poem develop through the word and reach the heart of the readers through the harmony of the melody, rhythm, rhyme, musicality and sounds flight"[4:163].

The bright example of it can be the first sonnet of the collection "Siyavush" by Rauf Parfi, where the poet reveals the evil intrigues fed by the flesh of truth. Proceeding with the same theme in the second sonnet the poet strives to increase the melodics and musicality of the poem:

Тириклик синчини – авом тинчини,  
 Синдирдинг – кўксимнинг синиқларини.  
 Эрларнинг сиртини, аёл ичини  
 Булғатдинг – сувларнинг тиниқларини.  
 (You broke into pieces  
 The frame of reality - the peace of the folk.  
 You agitated men's tranquility, troubled women's hearts,  
 Made dirty the calm waters.)  
 Қаламдан ўч олдинг, сўзини ўйдинг,  
 Сенинг кўлингдами ойнанинг ажали?!  
 Отанинг тийғи-ла ўғилни сўйдинг,  
 Санчилди отага ўғил ханжари, - [5:256]  
 (Put your revenges into the paper,  
 Is it in your hands the death of moon?!  
 Father's humility killed the son,  
 Son's blade was jobbed into the father.)

The place of euphonic means as alliteration and assonance is peculiar in the impressiveness of the thought. The unique melodics emerges by a repetition of "c" an "u" sounds in the lines. The sound "u" is repeated 48 times, while the sound "c" 9 times. The musicality coming from the sonority of the sounds repetition expresses the doleful imagery of the century. According to professor B.Karimov there are also some features in the consonants which make the person feel. Indeed, each sound has in its nature a hidden sense [6:70]. Therefore, the word *нечун* through several repetitions intensifies the dramatic effect of the thought and feelings.

Нечун юракда тош, кўзларда хузун,  
 Нечун?! Хўрланган инсонлар фарёди?-  
 Нечун? Нечун ёлғоннинг умри узун?  
 Нечун? Тирилмасми ўтганлар ёди?  
 (Why hearts turn in stone, sorrow in eyes,  
 Why?! There are yells of humiliated folk?-

Why?! Why falsehood lives forever?  
 Why?! There is no memory of the dead folk?)  
 Нечун иймонини сотиб яшайдир,  
 Нечун куллигидан беҳабар ҳар кул,  
 Нечун зулм яшар, зулм ошайдир?!  
 Ҳақсиз оламоннинг тириклиги шул. [5:256]  
 (Why live and sell the faith,  
 Why the slave cannot realize his slavery,  
 Why is there a tyranny, which in constant rise?!  
 This is a destiny of the crowds of people live in injustice.)

The questions emerging from the repetition of the word «*нечун*» (why) are dramatically intensifying, exposing the merciless struggles for the throne, the blood of innocent people, pitiful supplications of the people and their woes.

A.Sabrdinov truthfully remarks that Rauf Parfi is a master of creating enigmatic pictures, compelling us to think, to ponder, to realize the hidden sense in the poetic lines [7:40].

The interrogations emerging from the repetition of the word «*нечун*» fulfill the task of completeness of the thought. The poet masterfully uses the rhetorical question in illustrating the problems about the freedom of the motherland in the heart of the lyric hero, the freedom of the person, the struggle against the colonizers, which sounds along with the spiritual parallelism and leaves without a response.

Наҳот, иймон ўчган, топталган ҳуқуқ,  
 Наҳот, бу миллатнинг қаҳрамони йўқ,  
 Наҳот, бу миллатнинг шоири йўқдир?!  
 (Can it be really true that the folk does not have rights?  
 Can it be really true that the folk does not have heroes?  
 Can it be really true that the folk does not have the poets?)

The poet realizes the wretched state of his folk and implants his spiritual sufferings into the repetition of the word «*наҳот*» (can it be really true), which has the sense of sorrow and astonishment. From the first look, some of the mosques of those times defend the human rights. The poets of those times sang about the dreams of people. However, it was not enough to awake the nation. Showing just five or six faithful people and write the poems to tell that the nation subsisted was tantamount to betraying the nation. The poet could not endure that condition. That is why he put so many questions. Being used for interrogating, the style of repetition forms the unique meaningful rhythm and provides the feelings with a sound musicality. The sign for the prosperous future and hope can be felt in the questions.

One more poem “Captive of faith...” by Rauf Parfi shows the deep thoughts of a lyric hero by the musicality:

1. Ай иймон асири, виждон тутқуни,
2. Қисматда бор экан бу ваҳшат, зўрлик,
3. Кўзингда умиднинг сўлгин учқуни,
4. Кўксингда инончининг имдоди шўрлик.
5. Кечалар босриқдинг тушда, рўёда,
6. Кундузлар бошингда синди калтаклар.
7. Ҳақ билур, сен ҳақсан, ҳақсиз дунёда,
8. Сендан хабар олсин ҳурлар, малаклар.
9. Сенинг юрагингни коинот билсин,
10. Сенга кулиб боқсин осмоннинг кўзи.
11. Қаттол Ахриманнинг бағрини тилсин.
12. Сабр-тоқат берсин Ҳақиқат сўзи,
13. Озод дунёларнинг хабари келсин.
14. Қошингга бир келсин Биру бор ўзи. [5:269]
1. Hey, the captive of faith, prisoner of conscious,
2. In our destiny the tyranny we have,
3. The dying spark in your eyes,
4. And the pitiful sorrows.
5. You have a nightmare nights and days,
6. You have suffered from canes, beaten on your head.
7. The truth knows you are right in the injustice world,
8. Only the angels will be on your side.
9. The universe will know your soul,
10. The sky's eye will smile at you.
11. While the butcher torments Akhriman.
12. Let the God give you patience,
13. Let the hearsays come about the free worlds.
14. Let the Sole creator come to you even once.

The poet, who regards himself as a captive of faith «иймон асири» and a prisoner of conscious «виждон тутқуни», shows his sorrows and dying spark in his eyes by the fricative sounds of *а, й, и, у* and the repetition of *р, д, т, к, з, қ* т.

The unique rhythmic formed by the repetition of “*с, х*” sounds in the second verse of the poem presents the impressiveness of the idea. The professor N.Rakhimjanov truthfully states: “Rauf Parfi shows his attitude to the word, artistic creation and literary process. In particular, he is famous in the national literature of XX and XXI centuries for the artistic culture. Furthermore, the views of Rauf Parfi are important to the world classical literature, the history of literature and the art of word of today and future.” [8:195]

The phonetic parallelism shows the unique style in order to tie the poetic meaning with the musical harmony in the lines of sonnet by Rauf Parfi:

(1) он-ир-иж-он-ун

- (2) ис-ат-ан-ат-ўр  
 (3) ўз-ум-ўл-уч-ун  
 (4) ўк-ин-нг-им-ўр  
 (5) еч-ар-ос-иқ-уш  
 (6) ун-уз-ош-ин-ал-ак-ар  
 (7) ақ-ил-ур-ақ-ақ-ун  
 (8) ен-ан-ар-ол-ин-ур-ар-ал-ак-ар  
 (9) ен-инг-ин-ил-ин  
 (10) ен-ул-оқ-ин-ос-он-ўз  
 (11) ат-ол-ра-ан-ағ-ри-ил-ин  
 (12) бр-лқ-ат-ер-ин-ақ-иқ-ат  
 (13) од-ун-ар-ар-ел-ин  
 (14) ин-ир-ел-ин-ир-ор-ўп

The sound quantity of the abovementioned poetic lines can be shown in the following table:

The order of the lines	1	2	3	4	5	6	7	8	9	10	11	12	13	14
The number of sounds	14	20	15	14	18	16	14	15	14	17	14	13	16	17

The number of sounds in the second, fifth, tenth and fourteenth lines is increasing, which is related to the climax in the feelings of a lyric hero. The real intention of the poet in the poem is the alliteration of the vowel and consonant in the line «Қаттол Ахриманнинг бағрини тилсин», where the plosive consonants endue the musical flight. In the result of it the combination of the sounds *қа-то-ах-ри-ман-ба-ғри-тил-син* causes the emerging of the musical flight with the harmony of the sounds *т-л-ни-нг-ни. ...*[9:69]

The poem “Tell, my ailing nightingale” by Shavkat Rakhmon is full of repetitions of the lines, where an ailing poet depicts his love to his native land.

1. Айт, эй, хаста булбулим,  
 Ўшга қачон етамиз?  
 Tell, my ailing nightingale,  
 When Osh will we reach?
2. Яшил боғлар сарғарди,  
 Мағиз бўлди узумлар.  
 The leaves turned yellow,  
 The grapes became dried.

3. Ох, вой, мунча йўл оғир,  
Булбулим...  
Oh, how the road is wearisome,  
My nightingale...
4. Улкан соат ўртасида  
Мадорим йўқ юрмоққа.  
It is beyond all bearings  
to go and go.
5. Қашқирлар даврасида  
Судраламан турмоққа.  
Trudging along  
Amongst the wolves.
6. Шунда қолиб кетсам гар  
нетамиз?  
If it continues,  
What I shall do?
7. Абадият оралаб  
Ўшга қачон етамиз?  
When shall we reach Osh  
Through the ages?
8. Қорли тоғлар бағрида  
Бегим – Ўшим кўринди,  
Султон – Ўшим кўринди ...[10:373]  
In the mountains foothills  
My Lord -my Osh is seen,  
My king – my Osh is seen...

In the third verse of the poem

Ох, вей, мунча йўл оғир,  
Булбулим...

and the fifth verse,

Қашқирлар даврасида  
Судраламан турмоққа.

lastly, in the seventh verse

Абадият оралаб  
Ўшга қачон етамин?

the peculiar rhythmic musicality is seen.

The disappointment and sorrow reach the climax in the following line:

Шунда қолиб кетсам гар  
нетамин?

The gist, plot and composition of the poem can be observed in the following:

1. Хаста булбул – Ўшга етмоқ.
2. Яшил боғлар сарғарган – узумлар мағиз бўлган.
3. Йўл оғир.
4. Улкан соат – юрмоққа мадор йўқ.
5. Қашқирлар давраси – туrolмаслик, судралмоқ.
6. Шунда қолиб кетмоқ.
7. Абадият оралаб – Ўшга етмоқ.
8. Қорли тоғлар – Бек, султон Ўш.

The following table shows the sound quantity of the poetic lines:

1	2	3	4	5	6	7	8
20	16	15	17	14	19	17	19

As it is seen from the table, the quantity of the sounds is increased in the first, sixth and eighth verses, where the poor state and feelings of the hero are shown by the sonority of the sounds.

Moreover, it serves to illustrate the kindness and love of the lyric hero to his motherland, who is far from it, in the alien lands. The gradual change of melody in the description of the glorifying the Motherland is shown by the increase of the number of sounds.

In this regard, we can cite the expression by Ulugbek Khamdam that “Creating of the musicality is not in the word, but in the feelings” [11:86].

The lines «Қорли тоғлар бағрида Бегим – Ўшим кўринди, Султон – Ўшим кўринди» provide the the artistic-esthetic value. The poet’s love to his Motherland is vividly seen in the comparison.

It is important to mention the remarks by professor B.Karimov: “The creator expresses his esthetic ideals and the artistic thoughts by the symbols taken from the nature.” Every poet has inimitable images which show their poetic world... We can frequently see the image of the “mountain” in the poems by Shavkat Rakhmon... “The crystal snow of the mountains” is seen in his poems... This esthetic event in the creations of Shavkat Rakhmon has its own spiritual-

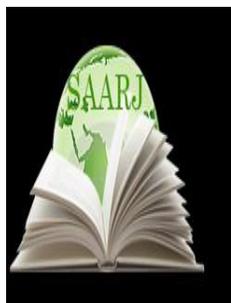

psychological grounds. I believe that the poet has seen the white mountain, has lived with the mountain and has breathed with the mountain from his birth... These psychological grounds transacted into his poems, put on the literary garment and turned into the live image of the mountains” [12:121-122]. Thus, the musical harmony acquires a considerable magnitude as his mountains. This can't be realized by other phrases. So, the author used all the possibilities of languages in creating image and turned semantical signs into artistic codes. He devoted himself conventionally and associated images through antonyms.[13:46].

## CONCLUSION

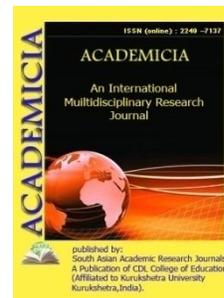

In conclusion, we should say that the alliteration, euphonic means, the types of repetitions in the works of the contemporary Uzbek poets Rauf Parfi and Shavkat Rakhmon create musicality and sound harmony to provide with the artistic-ideological impressiveness.

### ABSTRACT

*Form of connection, area, degree mobility and availability has importance. For cotton plant but not the absolute size the content of phosphorus. The losses of phosphorus are especially significant at erosion fine – dispersion able mineral and organic-mineral particles and organic substance, which structure contains basic weight of connections of the given element. The experiences were spent carried from 1999 to 2003 yy. In three times repetition according to field techniques and vegetal experiences, which are published in a public and press. The results of the analysis of mechanical structure and sand of Central Fergana where were carried experience up to a beginning of a field experience are given in the table 1, from which it is visible, that the sand are poor by nutritious elements.*

**KEYWORDS:** *Fixing, Colloids, Electro-Kinetic, Microorganisms Accessible Mineral Fertilizer, Erosion, Mobile, Total Forms, Concentration, Soil Solution, Lignin, Dung.*

## INTRODUCTION

In field conditions the experiences on revealing dynamics(changes) of growth of the mobile forms of phosphorus on a background of mineral fertilizers, 40 T/of the dung 60 T/of the lignin in un planned sand are carried out (spent) during cultivation of a cotton plant. The purpose and technique of researches [1].

The phosphoric fertilizers which have been brought in to soil of Central Ferghana, are exposed to significant transformations, therefore vary their assimilability and solubility It occurs as a result of various chemical, physical, physic-chemical and microbiological processes proceeding in soil applying of the various forms of fertilizers [2].

The fixing of phosphorus in soil occurs basically calcium and magnesium, to the less degree by aluminum and iron. Besides, phosphorus is fixed by microorganisms using it during vital activity, the microorganisms transform mineral phosphorus to in organic, inaccessible to plants. After dicing off of microorganisms the organic phosphorus again passes in to mineral form. The total contents of phosphorus in soil cannot serve as a decisive criterion of soil fertility. For an estimation, it(him) not absolute sizes of the contents phosphorus matter, and form of connections, in which he is, degree of their mobility and availability for xiionna THHica [3].

For normal growth and development, it is important not only contents of nutritious elements in general, but also character of sea-seasonal dynamics (changes) of these elements in soil, necessity for nutritious substances in the various periods of life of plants is cipferent. Dynamics (changes) soil phosphorus can depend on a number (line) of the factors, including concentration of electrolyte in a soil solution. The quantity of phosphorus can be defined (determined) by character of a surface soil colloids and by their electro-kinetic peculiarities, which can change not only for a long time, but also for the short period, especially in summer, when in soil vital activity of microorganisms is most intensive, the physics-chemical processes and chemical reactions caused by change of water and thermal modes of ground are quickly made. Water soluble forms of phosphoric fertilizers during applying them in to soil are strongly absorbed by soil. The fixing phosphates depend on a type of soil, temperature both and its degree of humidifying and forms of phosphoric fertilizers! Applying phosphoric and phosphorus-containable fertilizers considerably increases the contents of assimilable phosphorus in soil, thus sharply improves a phosphoric feed (meal) of plants [4].

The regular application of mineral fertilizers raises the contents of the total and mobile forms of nutritious elements in irrigating soil and increases their solubility. The strong influence on the contents of phosphorus in soil renders (with) erosion. The losses of phosphorus owing to erosion, as a rule, are proportional to losses of soil in account on unit of the area [5].

The losses of phosphorus are especially significant at erosion fine – dispersion able mineral and organic-mineral particles and organic substance, which structure contains basic weight of connections of the given element. By researches is established that the general (common) contains of phosphorus changes on a soil structure in a smaller measure, than hummus and nitrogen. Therefore, as against organic substance and soil nitrogen, the difference in the contents of the general(common) and mobile forms of phosphorus in connection with of soil a degree erodiness cover in arable layer in all soil is more thickly less expressed [6].

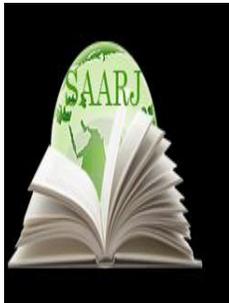

The small contents mobile phosphates in erodible soil results in the well –known fact about high efficiency of the raised (increased) doses of phosphorus fertilizers on the majority washed off and Bbmyrax soil differences of all basic types and subtypes irrigating soil. Phosphorus is the scarcest nutritious element in irrigating conditions of plants and consequently agrochemical control is especially important of applying of phosphoric fertilizers in a combination to others and the study of receptions differential application of phosphoric fertilizers in view of security of soil deserves the most serious attention. The establishment of dynamics (changes) mobile phosphates in planned hilly –barkhan sand depending on norms of fertilizers has the large practical meaning (importance) for correct and their most effective use. These researches in conditions of sand of Central Fergana hornet bun carried out before.

Results of researches: Experience on study of dynamics (changes) of the mobile forms of phosphorus has bun investigated by us in conditions of field experience in territory of Ahunbabaev region of the Fergana area under the circuit, where at cultivation of cotton plant on planned barkhan sand of Central Fergana the raised (increased) norms of mineral fertilizers and dung, lignin are used. The experiences were spent carried from 1999 to 2003 yy. In three times repetition according to field techniques and vegetal experiences, which are published in a public and press. The results of the analysis of mechanical structure and sand of Central Fergana where were carried experience up to a beginning of a field experience are given in the table 1, from which it is visible, that the sand are poor by nutritious elements. Humus almost is absent nitrogen, phosphorus and potassium contains in insignificant quantities (amounts). It is necessary to note that according to the content water-soluble salts concern to KaTeropHKaunsalted and midsoles, category where dense rest 0,388–0,482% contain. From given it is visible that applying under cotton-plant Kr/ra at 0–50. Agrochemical researches on study of seasonal dynamics (changes) of mobile phosphates in sand show that in conditions planned hilly-barkhan sand with increase of norm used nitric, potassium, phosphoric fertilizers the contents of mobile phosphorus at 0–30 sm a layer of sand raises. In spring, when cotton-plant had 2–4 present sheets, after applying phosphoric fertilizers in norms 105, 140, 175kg/ra, contents of mobile phosphorus in sand on depth 0–50 sm tab.2. Has increased with 1,4–2,3 up to 10,3–12,5 Mr/kg, in variant 4 and 5 where are brought in addition in according 40 T /ra dung, 60T / ra lignin in the quantity(amount) of the mobile forms of phosphorus grows up to 11,8–15,1 Mr / kg of sand. The same law in change of the contents mobile phosphates in sand is marked by us in phases burdening, flowering and in the end vegetation of the cotton plant per all years of researches. The contents of mobile phosphorus in sand depending on norms of the applying fertilizers under cotton plants (average for 1999–2003y.y). Conclusions: In the whole greatest quantity (amount) of mobile phosphorus in sand is fixed in variants with entering on a background of mineral fertilizer, where are applied 40T/ ra dung and 60T/ ra lignin. By the end of cotton vegetation, the contents it(him) is sharply reduced, that is explained carrying odit of phosphorus to plants cotton by the temperature factor and decrease(reduction) of biological activity of microorganisms. Proceeding from above stated it is possible to recommend by the farmer, which rises of a cotton plant on the planned sand entering, N200–250, P205140–175, K20100–125 in combination with 40 T/ra dung or 60T/ra lignin.

## THE IMAGE OF A CREATIVE PERSON IN THE POETRY OF ERKIN VOHIDOV

**Guzalkhan Mukhammadjonova\***

Docent, PhD, Associate,  
 Fergana State University Fergana city,  
 UZBEKISTAN

### ABSTRACT

*The article is devoted to the comparative- typological character, analytic learning of creative person, as well as, history and classification of creative person's character. The article is analyzed spiritual-mental life, peculiar nature, creativity and self-sacrifice, patriot features of creative person's character as an example of E.Vakhidov image in literature. Creative skill of character E.Vakhidov is featured by the epistolary and dairy style of different statement, mental portrayals in poems, means and methods of creating character.*

**KEYWORDS:** *Creative Skill Of Character, The Ideological- Fictional Wish Of Creative Person, Fictional- Conceptual Approach, Mental Portrayal, Aesthetic Ideal, Character Of Poem, History Of Creative Person, Historical Character, Imaginary Character, Fictional-Conceptual Approach, Image Of Spirituality Historical Truth, Psychological Analysis.*

### INTRODUCTION

People always lives in the midst of the need to learn and teach. The destiny of humanity is to study the meaning of life. That is how people was created by nature. It is always interesting and relevant to try to understand the essence of life, to understand oneself in this world, to discover one's own "I". While this need is unique to each person, it has a significant power, especially in a creator whose heart is sheltered by a sense of spiritual freedom.

The development of a society, its perfection depends on people who have strong desire learn and have discovered something for themselves and for society. The main contribution to this is made by creative people. "The birth, development and existence of an artist are a social phenomenon in itself. Because the reality concerning the life of the society and the people is concentrated and centered like the echo is returned to the outside - to the society and the people themselves"[1, 3]. As a result of the Creator's always vigilant, sensitive and sensitive heart, restless contemplation,

works are born that evoke drowsiness in the heart. These works have been influencing human thinking and consciousness for years and sometimes centuries, and have had an impact on the spirituality of generations and the development of society. In other words, the works that are the result of spiritual struggles on the path of self-realization, in turn, open the way to new, new addresses in the path of self-consciousness of the new generation. "Art is the enlightenment of the mind. This is enlightenment that illuminates the consciousness and destiny of the people and the country," said Khurshid Dostmuhammad. As an artist who was able to illuminate not only his own heart, but also the hearts of the people Erkin Vahidov's work has a special role in Uzbek literature.

In the works of writers and poets, the appeal to the image of a creative person is mainly due to the need to understand the "I". Whether this image is a historical figure or a textured image, in both cases the same aspect has a certain degree of commonality in them. In the process of creating the image of a historical figure, the expression of identity on the basis of the discovery of the creative "I" is indirect, while in the artistic texture of this work is carried out directly. One can see the author's own spiritual world more vividly in it. In the image of historical figures, the two creators, the author and the historical figure, are combined.

From time immemorial, the existence of divine power in poetry has been noted in literary sources, in the scientific literature. A number of studies on the study of poetry have not clarified this issue and still remain a mystery (perhaps will not be understood at all). Folk poet of Uzbekistan Erkin Vahidov also has his own views on poetry, the magical world of poetry, the poet and the fate of poetry, the qualities of a poet. There are dozens of poems on the same theme in the poet's work. In particular, "Poet", "Poet's soul", "To the teacher Habibi", "To young poets", "Alisher Navoi's ship", "To the Afghan poets", "Poetry", "Letter to the poet", "Poor poets", "Poet and critic", "About poets" that reflect the poet's spiritual world, dreams, sorrows, and descriptions of the poet. In fact, these poems were the poet's attempts to understand and express his identity.

"Erkin Vohidov is an artist who can fully express himself in every poem. Consequently, important feature of a truly individual style is expressing oneself in poetry. From this point of view, any poem or story of the poet illustrates the creator as a selfless child of his folk and nation"[2, 479].

Over the years, the poet's need to understand his identity led to the birth of a great work, the epic "Rebellion of Spirits"("Ruhlar isyoni"). "Rebellion of Spirits" is the lifelong, most attractive and most truthful work of Erkin Vahidov, written at the age of 42-43, when he was an educated poet and brought together all the courage, talent, wisdom ..." [3, 122].

E.Vakhidov prepared mentally for the epic for years. The poet's rebellious views on the current system, the voice of his heart on the path to freedom and liberty, resonated for years. This can be seen in the example of the synchronized lines in the poet's series of poems.

Elga faqat shodlik hadya etarman,  
G'amni o'zim bilan olib ketarman.  
Aytsam, ko'tarolmay nogoh zaminning  
Mehvari uzilib ketsa netarman.

**(English:** The poet tells the people that he wants only good for his folk and take the people's pain and sorrow with him to the eternal world. If he tells the people about his grief, he can say that even the earth can get out of its axis due to the burden of grief).

These lines of the poet resonate "If you are a poet, your heart will be a sacrifice to the people", to the content of "The legend of devotion". Knowing that giving happiness to the people is the highest duty and happiness is the life meaning of the lyrical hero. As a poet, living with the grief of the people, enjoying happiness and bright days for the humans, being a shield to him is the concept of the poet's life.

In the works of E.Vakhidov the image of the poet is created on the example of Navoi, Habibi, Chustiy, Mirtemir, H.Sharipov. In this way, the poet illuminates the creative personality through historical foundations. One chapter of the epic is called "The Poet's Heart". The poet's poem of the same name was written in 1968.

Shoir qalbi go'yo anor, she'ri uning sharbati,  
Bo'lmas ekan she'r ahlining o'z qalbiga shafqati.  
Tinmay ezar, ezar uni, ammo shoir biladi –  
Piyolasi to'lgan kuni paymonasi to'ladi.

**(English:** The poet's heart is an example of a pomegranate. This pomegranate juice is a poem. The poet has no compassion for his own heart. It is hard, but the poet knows that the moment he recites his poems, his life is over).

The image of the pomegranate is common in the literature, including in the poems of Uvaysi, Fakhriyor, Rauf Parfi, and it mainly represents a heart full of pain. E.Vakhidov expressed in a wonderful analogy that the poet's poems are created from the blood of the heart, that it is the poet's destiny to live by torturing himself and torturing his heart.

E.Vakhidov's poem "Poet" (1968), dedicated to Husniddin Sharipov, is reminiscent of the introduction of the epic in essence, narrative style.

Boshqalar o'z dil dardini  
Boshqalarga to'kadi.  
Shoir dardi yuragining  
Tublariga cho'kadi.

**(English:** When people relieve their pain by telling people, the poet keeps his pain in the depths of his heart. The poet reflects the essence of these two verses in the introductory part of the epic. A person who has a sympathetic friend relieves his pain by telling him. The misfortune of the loneliness sinks to the bottom of the soul).

The ideas in the preface of the epic are much polished, poetically thorough, devoid of tautology, and emotionally saturated. From this we can see that the poet's feelings, the style of narration, were polished and perfected from poem to poem.

The poet describes poetry as follows: "The magic of poetry is in fact a mystery. It is a miracle that man has reached the places he has not reached by thinking, emotionally. Perhaps this is why

poets are likened to saints, and it is not surprising that there is a little truth in this"[4, 219]. E.Vakhidov is a creator who believes in words and has a great love for poetry. He sings of this faith and love, both in poetry and in his literary-critical views. Poetry is an incomparable divine power for him to discover addresses he has not thought of.

Poetry and the canonical requirements of poetry has been at the center of debate among philosophers and scholars throughout the works. In particular, in N.Bualo's work "The Art of Poetry" the poet is happy with tears and a smile. He finds a way in his poem, co-operation"[5, 259]. He thus acknowledges that the basis of poetry is emotions, emotional experiences. Also in the following verses, the poet describes the divine power of poetry in such a folk way.

Axir shoir shoirmi agar

Bir yurakni eritolmasa. (Shoirda maktub)

(**English:** After all, a poet is a not a poet

Unless melts hearts).

The phrase "melting the heart" is the highest form of emotional impact. It is through this single phrase that the poet expresses the important requirement and the criterion of the poem. After all, the basis of the poem is the lyrical experience.

The creator has his own inviolable world. Psychologists point out that the nature of the creators is dominated by such aspects as loneliness, self-awareness, thirst for manhood, rebellious individuality.

The ancient Greek philosopher Plato said that a person who is able to feel poetry can understand the essence of philosophy. From this point of view, artistic-conceptual views in poetry are especially expressed on the basis of emotional harmony. The influence and charm of the creative pen is also appreciated by the fact that it is powered by the poetic enlightenment, intelligence, thoughtfulness, pride and amazement in its essence.

It is known that any national artistic thinking lives in the vastness of universal artistic creation and breathes its air. It is natural that the image of the artist reflected in the samples of each national literature as well as reflects the general qualities of a true artist. E.Vakhidov is a creative person who perfectly develops his national artistic thinking about the creative person in the realm of universal creativity. The quartet, the emotional experiences and sufferings expressed at the level of the possibilities of lyrical poetry grew and acquired a lyro-epic scale characteristic of the epic. The form expanded, the weight of the content increased. But some interpretations in the epic are reminiscent of the poet's earlier poetic verses. The similarity between the tone of the poems and the epic, the weight structure, the flow of emotions is obvious. Therefore, we can conclude that in the heart of E.Vakhidov, the pain of creativity and ingenuity, its sufferings had been refined and diversified over the years in the trials of life and time. The epic "Rebellion of Spirits" is a great product of the poet's suffering. The poet described the mental suffering he had endured over the years by being Bengali poet Nazrul Islam in this epic.

Literary critics such as U.Normatov, Y.Solijonov, U.Hamdani have remarkable opinions on the epic, its compositional features, polyphonic image in Uzbek literature. We want to think about the common protagonist of the epic the Bengali poet Nazrul Islam, the poet's "I", another historical figure in the work - the image of commonality, creativity and destiny.

All the realities and emotional experiences in the epic revolve around a historical figure, Nazrul Islam. In the play, "the author Nazrul Islam, on the pretext of courage, devotion, tragic fate, the poet, in general, the role of the artist in life, civic duty, as well as humanity, devotion, thirst for freedom"[6, 27]. In it, the poet puts forward his views on the nature of the creative people, their fate, the responsibility of the creator. The author states about his protagonist: "If the task of a writer-poet was simply to describe the life and adventures of a person, there would be no easier profession in the world than writing. The creator must artistically analyze the life and destiny of his protagonist, and on this pretext, he must express his observations and observations about his life. The fate of my hero, Nazrul Islam, offers very good opportunities in this regard"[7, 357]. According to this, we see the harmony of the views of both poets, the creative "I" and the artistic image.

Every artist has his own "I" in his work. In this sense, it can be said that the image of a child in the epic "Nido" is Erkin in a role of the child-free retrospective, while in the "Rebellion of Spirits" is a "poet Erkin." Nazrul Islam's suffering, thoughts, and pain of freedom are in fact an expression of the poet's questions and sufferings in the depths of his heart, the freedom of his people. It is because of this pain that he deeply understands Nazrul's pain and is able to express it vividly.

"Creation is a rebellion of person to understand his personality, place, dignity in the infinite universe"[8, 20]. In this regard, the poet Nazrul Islam ("Both devotion and rebellion are in your blood") and the poet E.Vakhidov ("The nature of talent from creation is rebellion") share the same views and ideas. E.Vakhidov discovers the dialectic of the poet's heart from the poet's point of view.

True talent cannot be imagined without devotion and pain. In this regard, the poet looks at history. Referring to historical figures, he seeks the root of the pain. In the tragic words of Rudaki, Navoi, Bobur, in the tragedies of Pushkin, Lermontov, Mashrab, Nasimi, the issues of creative destiny in the struggle for freedom and justice are covered. "The trust of poets is freedom". This is the happiness of the poet and poet of this kind never dies.

"After the writer analyzes the life event, he has a certain attitude towards it. This attitude will be his satisfaction. It is on the basis of this satisfaction that he feels an event"[9, 66]. But often at the heart of this contentment lies a protest against injustice, the cruelty of the creator towards himself. Because the creator looks at the being in relation to his ideal, the ideal world and the ideal person, evaluates it on the basis of the principles of goodness, however life is full of contradictions and complexities. Also, accepting this concept is always painful for an impressive, fiery poet.

In E.Vakhidov's works the burning heart, rebellious lyrical "I" is always awake. In our opinion, the rebellious spirit of the lyrical "I" is the main feature of the poet's work. In this sense, the poet's work is polyphonic. The intensity of emotions, sharp observations, discussion of the external and internal world of the lyrical protagonist, intellectual diversity are characteristic features in the interpretation of a creative person. The rhetorical questioning and repeated reference to the art of rhetoric in these interpretations is characteristic not only of the epic "Rebellion of Spirits" but also of a number of poems of the poet.

The qualities of reverence for poetry as ihram in the poet's poems are in harmony with Mirtemir's views. "Ka'bamsan - poetry is my noble ihram," said Mirtemir. He uniquely continues the

---

tradition of logic in this poem by Mirtemir. Creative and literary-critical views on "Shoiru She`ru Shuur" testify to the fact that E.Vakhidov understood poetry as a great world. This world has its own rules, values and traditions. Even in the tradition between teacher and learner.

Nafosat yurtiga posbon bo`l, o`g`lon,  
 Tili shamshir, ko`ksi qalqon bo`l, o`g`lon.  
 Avvalo, shoir bo`l, undan ham avval  
 Shu yurtga o`g`lon bo`l, o`g`lon bo`l, o`g`lon.

( **English:** Be the guard of the land of the word art, man,  
 Sharpen your tongue like sword, be selfless, man.  
 First of all, be a poet, even before that  
 Be a man to this country, be a man, be a man).

Poetry is a heavy responsible and honorable position. Even before poetry, E.Vakhidov emphasizes three times to be a worthy man for his country. This call is not only for men, in which the word man is used in the sense of courage, selflessness, honesty, high courage, which applies to everyone who knows himself as a real person. The poetic repetition in the last verse provided musicality, melody, which is an important element of poetry, while serving to reinforce meaning..

The poet's works of the 60's cover a wide range of social tragedies, such as the lack of purpose of the generation in terms of courage and strength ("Wish"), entanglement and indifference ("Bong urish"), deprivation of human feelings ("Iron Geniuses"). Literary critic U. Hamdam admits in his research that this gave rise to a thematic direction that can be called "human landscapes"[10, 150].

Along with E.Vakhidov's poems recognized as intellectual lyrics, the poem "Steel" is a product of belief in the power of poetry and the art of speech.

U dastavval oybolta bo`ldi,  
 So`ng zambarak bo`lib quyildi.  
 Qilich ham u miltiq va nagan,  
 U bomba ham bo`lib portlagan.  
 Lekin olgan jahonni faqat  
 Pero bo`lib quyilgach po`lat.

(**English:** He was originally an axe,  
 Then it was poured into a cannon.  
 Became sword, a rifle and a nagan,  
 It also exploded as a bomb.  
 But only, Steel can get the world

After turning into a pen.

“Finally, by the twentieth century, this steel came into literature as a pen, especially poetry. When we talk about steel in literature, it means that the subject is different, the artist's artistic and aesthetic perception of the world is different. This peculiarity can be explained by the social mood of the poet in the form of artistic thinking.

L.S.Vygotsky, emphasizing that "art is a catharsis"[11, 201], meant involvement in art, spiritual changes in the moments of creation. At the heart of art, the whole content of creation lies the concept of beauty, creativity. This means that the path to spiritual purification is opened through creation. A creative person differs from others by his creative thinking, his emotional perception of being. In this sense, it is an important pictorial object of fiction, which is essentially anthropology.

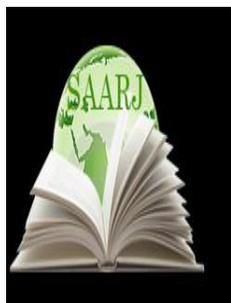

In conclusion, it can be said that through the image of a creative person, new opportunities are opened up to fully reflect the most delicate, contradictory aspects of society and human relations. From this point of view, the following peculiarities of E.Vakhidov's work become clear:

1. In the poetry of the poet, the issue of creativity and creative psyche takes a leading place as a motive. He gradually improved during the poet's creative years and became perfect in the epic "Rebellion of Spirits".
2. Among the lyrical heroes of E.Vakhidov the image of the devoted, free-spirited poet deserves special attention. It is a means of self-awareness. In these interpretations, the polyphonic image predominates. In poetic speech, methods such as the art of tazad (antithesis), takrir (repetition), rhetorical interrogation were important factors in expressing the same psyche. The study of these aspects will inevitably provide important information for literature. After all, a poet devoted to his people will never die, his poems will be immortalized as they acquire new meanings and aspects in the minds of people for years and centuries.

### ABSTRACT

*The article provides a study of the influence of anthropogenic, technogenic factors on the accumulation of heavy metals in the soils of the Fergana region, especially in the subsoil. Since the greatest accumulation of harmful substances in the air accumulates in the soil, and plants absorb them, at least in part, that is, with air-precipitation-water basins, rivers-irrigation water-soil circulation occurs. Many years of field experiments have shown that when phosphorus fertilizers (superphosphate) are taken 3-4 times more, an increase in nitrogen is observed due to a sharp decrease in fluoride content. Especially grown on cotton leaves and stems.*

**KEYWORDS:** *Degradation, Migration, Buffer, REM, Heterogeneous, Homogeneous, Phytotoxin, Accumulation, Intersect Oral, Innovation, Epidemiology.*

### INTRODUCTION

In the Resolution of the President of the Republic of Uzbekistan PQ-29-16 of 2017 on measures to further, improve the system of local waste management, a large-scale work on the organization of clusters being carried out. However, it was noted that the industry does not have modern innovative and information communication technologies that allow to assess the real sanitary and environmental situation in the country.

It is known that the naturally soil and water pollution does not have a negative impact on humans and animals, plants, because through precipitation, various compounds and substances in the air are returned to the soil. Since the greatest accumulation of harmful substances in the air accumulates in the soil, and plants absorb them, at least in part, that is, with air-precipitation-water basins, rivers-irrigation water-soil circulation occurs. This means that more than a hundred substances and chemical compounds that fall into the soil over the years of irrigation eventually fall into the soil and degrade it. This substance is understood as an indicator of the degree of harm to human health. Sometimes PDV (temporary substance multiplication) is also used in enterprises.

This standardization is based on 4 key indicators. These are: translocation (harmful substance in the soil is absorbed by the plant), migration - through the air (from the air), migration - through the water and general sanitation (reduction of the bioactivity of the harmful substance due to self-cleaning of the soil). It is especially important to know the soil-plant and the relationship of the plant to the poison. It is necessary to know the soil-plant relationship of toxins. Toxins are determined on the basis of several factors: soil-plant relationship and migration. The main issue is the speed of action of the toxicant and the plant's response to it. The process of migration of toxins in the soil depends entirely on the type of soil, the coverage of the topsoil with vegetation and the amount of humus, the water regime of the granulometric composition, the temperature factor, and so on. For example, lead moves faster in soil than cadmium, because a complex solution of lead combines with humic acids 150 times more than an antiquated complex. Lead and mercury are located in the surface layer of the soil (10 cm). Ancient copper and zinc, mercury and lead, which move up to 30 cm, can penetrate only 3-8% to a depth of 30-40 cm (I.Ilin, L.Stepanova.L, 1990).

The migration of heavy metals in plants takes place in the following order: root-stem-leaf-seed-fruit-end. Even the amount of heavy metals in the root exceeds the top by 500-600 times, which means that the root has a greater chance of protection (buffering). (Table 1.)

Distribution of lead in wheat by mg / kg mass relative to dry mass I.Ilin, L.Stepanova (1990)

The lead dose is mg / kg	In black soil			Graysoil	Ingra soil		
	Accumulation phase		When fully cooked		Accumulation phase		At the base of full cooking
	root	leaves		root	leaves		
0	4,1	3,5	0,6	0,7	5,9	3,9	0,4
50	13,0	3,6	0,5	0,7	47,0	3,8	0,4
100	21,0	3,6	0,5	0,5	81,0	4,8	0,5
500	127,0	6,0	0,7	0,9	7130	16,0	1,1
1000	238	9,0	0,7	0,7	12500	33,0	2,8
200	440	22,0	1,9	0,9	32400	76,0	5,0

Among the herbaceous plants, in terms of tolerance, the plants are as follows: Poaceae (legumes), Fabaceae (legumes), Chenopodiaceae (legumes). For example, high levels of lead

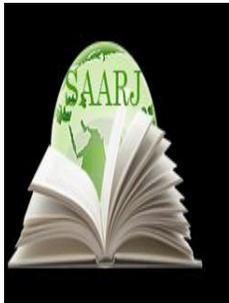

(Rb) accumulate in plants. Resistance to antiquity in plants is as follows: tomato-oat-salad-meadow-pea-spinach. Different fungi can accumulate large amounts of Hg, Se, Cd, Cu, Zn elements in their body.

A heavy metal limit allowable concentration has not yet been sufficiently developed for soil because the soil solution has a more heterogeneous system than others (homogeneous in water and air). The reason why it is difficult to study the ecological condition of soils (soils) and its assessment is not clear is that they have different attitudes towards phytotoxins. We can tell this from the data found for the topsoil by various scientists.

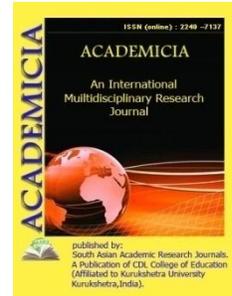

Many years of field experiments have shown that when phosphorus fertilizers (superphosphate) are taken 3-4 times more, an increase in nitrogen is observed due to a sharp decrease in fluoride content. Especially grown on cotton leaves and stems. Absolutely not added in the phosphorus-free variants in the experiment, remained unchanged even when given at 50kg / ha (50, 100, 400 kg / ha). However, an increase in fluoride was observed at 400 kg / ha. This situation was also noted in 1992 by F. Ashurmetova. It has been noted that substances that accumulate in soils pass through the lower layers as a result of irrigation.

### ABSTRACT

*When analyzing and comparing the reliability of products, it is necessary to evaluate the numerical values of reliability when calculating reliability, increasing the likelihood of correct operation of the system and determining the timing of repair, as well as in technical and financial calculations.*

**KEYWORDS:** *Probability Of Failure, Average Performance To First Failure, Poisson's Equation, Distortion Flow Parameter, Performance Before Distortion.*

---

### INTRODUCTION

#### Reliability indicators of electronic devices

##### General characteristics

In the previous chapter, reliability metrics are only reliability metrics that determine quality. They provide complete information on reliability, but do not take all numerical values for product reliability. When analyzing and comparing the reliability of products, it is necessary to evaluate the numerical values of reliability when calculating reliability, increasing the likelihood of correct operation of the system and determining the repair time, as well as in technical and financial calculations.

Reliability indicators can be divided into four groups:

1. Reliability indicators for calculating the failure characteristics of electronic devices;
2. Indicators of longevity;
3. Indicators characterizing the possibility of maintenance and repair;
4. Complex indicators characterizing the invariability and maintainability of the product. Non-destructive probability - repairable and non-repairable.

Device performance

1. indicators of the reliability of electronic devices for calculation.
2. For products,  $R(t)$  indicates that the probability of intact cuts is not available as a general indicator.
3. It is defined as follows:

$$P(t) \approx \frac{N(t)}{N_0}$$

where  $N(t)$  is the number of undamaged products in the last range:  $t$ ,  $N_0$  - the number of products that work without interruption during the initial time interval.

Example:  $t = 1500$  часов Нет = 200,  $N(t) = 190$

Determine  $p(t)$ .

Ehim

When calculating the non-destructive characteristics of non-repairable products, two more indicators are used: the intensity of wear (hazard) and the mean time to first failure.

Decomposition rate (hazard) ( $\lambda$ ) is the amount of spoiled food per unit time to the average amount of spoiled food.

This is expressed as follows:

where  $N(t)$  - number of non-purchased products in the last range:  $t$ ,  $N_0$  - number of products that run smoothly during the initial time interval. Example: Dano:  $t = 1500$  time Нет = 200,  $N(t) = 190$  Determine  $p(t)$ .

$$\lambda \approx \frac{\Delta n}{N_m \Delta t}$$

$$N = \frac{N_i + N_{i+1}}{2}$$

$\Delta t$  is the number of products that are running smoothly over a period of time.

$N_i - \Delta t$  - the number of products running without interruptions at the beginning of the time interval;

$N_i + 1$  - the number of products that work without failures at the end of the time interval;  $\Delta n$  is the number of products damaged over time;  $\Delta t$  - time interval during which violations are detected; Example: 1600 products worked  $\Delta t = 200$  failed in 200 hours. Determine the intensity of the violation.

$$\lambda \approx \frac{\Delta n}{N_{\dot{y}.m} \Delta t} = \frac{100}{1500 * 200} = 3,3 * 10^{-4} \frac{1}{\text{coam}}$$

The wear rate fully describes the quality of the elements, which is determined by the tests or the products used. Operating time to one breakdown Average time to first breakdown of four non-repairable products. This is expressed by the following expression:

$$T = \frac{\sum_{i=1}^n T_i}{n}$$

Where  $T_i$  is the time of operation of  $i$ -elements before destruction,

$$T = \int_0^{\infty} P(t) dt, \quad T = \frac{1}{\lambda}$$

When investigating the reliability of the system, the following probability distribution law is used; usage time, rate, Relle, Gamma - Weibun, etc. The most common law is the time of use (operation). For this law, the intensity of distortion is constant  $\lambda = \text{const}$ .

In practice, the following equation is used to determine the probability of failure-free operation (taking into account  $T_m$ ):

Here is the base of the natural logarithm;  $t_p$ -processing time to perform its function during this time without breaking the product type.

This equation is called the law of reliability of processing time (Poisson distribution).

This law shows that the probability of correct operation decreases over time along a logarithmic curve.

Example:  $t_p = 160$  hours,  $t_{sym} = 2000$  hours. Determine the likelihood that the product will operate without damage.

$$P(t) =$$

$$\text{Example: } P(t) = e^{-t_p / T_{sym}} = e^{-160 / 2000} = 0,9231$$

In addition to the probability of trouble-free operation, breakdown current flow rates ( $\bar{\omega}$ ) and pre-failure characteristics are also used to describe and calculate the breakdown characteristics of products to be repaired.

Breakdown current ( $\bar{\omega}$ ) is the average number of failures of the repaired products over the time (taken during the construction). It is defined by the following expression:

$$\bar{\omega} = \frac{\Delta n}{N_0 * \Delta t}$$

When calculating  $\bar{\omega}$ , the repair of the damaged product in time  $t$  is taken into account. Then  $N_0 = N(t)$ . Wear Time ( $T$ ) is the average run time of products being repaired from failure to failure. It is calculated using the following expression:

$$\text{Four} = \frac{\sum_{i=1}^n T_{\dot{y}pmi}}{n}$$

Here Four is the mean time before the i-product fails; n is the number of signaling products. It is defined by expression four:

$$T = \frac{\sum_{i=1}^n T_{ij}}{m}$$

Here  $T_{ij} - i$  is the average time of correct operation of the product between  $j - 1$  and  $j + 1$ ,  $m - i$  is the number of product failures. Example: Let the first product run for 200 hours without breakage, then have it repaired. Let him work 100 hours before the second break, 80 hours before the third, and 100 hours before the fourth. Let the second product run 250 hours before the first failure, 120 hours for the second, 150 hours for the third, and 100 hours for the fourth. Determine performance before both products fail.

Solution: the average processing time of each product before breakage is calculated using the formula

$$\text{Four}_1 = (200 + 100 + 80 + 100) / 4 = 120 \text{ hours}$$

$$\text{Four}_2 = (250 + 120 + 150 + 100) / 4 = 155 \text{ hours}$$

will be.

$$T = \frac{\sum_{i=1}^n T_{\dot{y}pi}}{n} = (120 + 155) / 2 = 137,5$$

The operating time before the required breakdown is determined by the formula.

### ABSTRACT

*The present study is made an attempt to analyze the problems faced by the women entrepreneurs and to examine the government schemes and remedial measures initiated to encourage and support women entrepreneurship in India. Women entrepreneurship means women or group of women who initiate, organize and run a business enterprises. Women entrepreneurship has been identified as an important catalyst for economic growth. The entrepreneurial activities undertaken by women are contributing significantly to the economic development of the country. For the study purpose, information is gathered from secondary sources such as research articles, websites, e-journals, other published reports and Newspapers, etc.*

**KEYWORDS:** *Women Entrepreneur, Women Entrepreneurship, Economic Growth, Economic Development.*

### INTRODUCTION

Government of India has defined women entrepreneurs as an enterprise owned and controlled by a women having a minimum financial interest of 51% of the capital and giving at least 51% of employment generated to women.

In the olden days, the woman had to do the housework, and the idea of the business was only a dream. She had to limit her dreams and aspirations within the four walls of the house, having neglected in the society. It was always the women who were disadvantaged in relation to decision -making and access to all resources and opportunities. But, now the time has changed

They came out of the four walls to participate in all kinds of activities. Educational attainment of girls and women have contributed to the women empowerment.

Today, we can see women participation in politics, business, law, science and technology, etc. Literacy, education and awareness have played a very important role in creating an enabling environment for entrepreneurship. However, when we look at the Indian business, only 14% of Indian businesses run by women. They often face problems in setting -up their own business firm, scale-up and sustain. Therefore, it is imperative to encourage and support women entrepreneurship among women by increasing awareness, by providing education, entrepreneurial training, introducing government schemes, and initiating remedial measures to encourage and support women entrepreneurship in India.

### **LITERATURE REVIEW**

This section deals with the analysing the earlier studies relating to the current topic.

Women are considered as weaker sex and always made to depend on men folk in their family and outside, throughout their life .The Indian culture made them only subordinates and executors of the decision made by other male members, in the basic family structure (Goyal&Prakash, 2011).Women face difficulty in initiating their own ventures due to several challenges, such as lack of education, experience and training, and socio-cultural restrictions. Further, women seem to be overwhelmed by house-hold responsibilities, limited spatial mobility and restricted access to resources, which makes entrepreneurship all the more difficult for them (Raghuvanshi, Agrawal Ghosh, 2017).Even though we have many successful women entrepreneurs in our country, but still have a male dominated culture there are many challenges which women entrepreneurs face from family and society (Franco&Selvakumar,2016).Women have three kinds of obstacles to innovative entrepreneurship-the contextual obstacles like educational choices, traditional views and stereotypes about women, science and innovation. In economic obstacles substantial investment, less credible financially than men. Soft obstacles like lack of access to scientific and general business networks, lack of business training, role models and entrepreneurship skills, specific obstacles for women entrepreneurs include suitable education ,lack of experience ,access to finance and absence of role models. Women still represent a minority, when it comes to starting new firms or being self-employed (Raizada). Women have to face challenges from all sides especially in a country like India in which traditions are deep rooted in the society and where the sociological set up is a male dominated one. They survived and succeeded in this cut throat competition with hard work, diligenceand willingness to take risk (Parameshwar, 2020).

### **RESEARCH GAP**

From the analysis of literature review, it is found that the earlier studies were majorly focused on the problems and challenges faced by the women entrepreneurs. But, only few studies focused on the problems faced by the women entrepreneurs in recent days in India and also the government schemes, remedial measures initiated to improve women entrepreneurs in India - in detail. Hence, present study is intended to study the problems of women entrepreneurs in recent days and various government schemes and remedial measures initiated to encourage and support women entrepreneurship in India.

### **METHODOLOGY**

The present study is based on the secondary sources of data are used. Secondary data are collected through various published e-journals, research articles, magazines, websites, published reports, etc.

### OBJECTIVES OF THE STUDY

- To identify the various problems faced by the women entrepreneurs in recent days in detail.
- To conceptually analyze the various government schemes and remedial measures initiated to encourage and support women entrepreneurship in India.

### PROBLEMS FACED BY WOMEN ENTREPRENEURS IN INDIA

Women plays a significant role in the economic development and growth of any country by venturing into business and creating more and more job opportunities. There may be various problems and challenges a woman has to undergo to get into the world of business and to become a successful entrepreneur. The problems of women entrepreneurs in India are as follows.

- **Conflicts between home and business:** The business success always depends upon the support extended by the family members. Woman's family obligations bar them from becoming a successful entrepreneurs in developing country like India.
- **Lack of assistance and training:** Appropriate assistance and training is required in implementing the business idea, identifying initial financial sources for establishing and expanding business.
- **Lack of finance:** Finance is regarded as the life-blood of any business enterprises. The women entrepreneurs always suffer from inadequate financial resources as they are lacking personal identification and generally do not possess property in their own name. Hence, women entrepreneurs are unable to access to the external funds due to their inability to provide tangible security. Therefore, women entrepreneurs in India always find difficulty in raising funds for their new business venture.
- **Lack of Motivation:** Lack of family support, heavy household responsibilities, lack of finance, low level of education, etc. demotivates the women folk to engage in business operations and running a business concern.
- **Low Risk –Taking Ability:** Since, women in country like India are economically not independent, they have a low ability to take risks, which makes them unsuccessful in business as risk –taking ability is very much essential to become successful entrepreneur.
- **Male-Dominated Society:** Even though our constitution has given equal rights to both men and women, women are not treated equal to men. They are not free to take up their own decision and are always looked down upon as weak and incapable in all respects.
- **Absence of Family Support:** In developing country like India, women hardly get proper family support to start any kind of enterprise as they are required to perform their traditional role as house wives and heavy household responsibilities leave a demand on women especially those in rural areas who have more children .Therefore, they always feel that business is not a place meant for them.
- **Lack of Managerial Skills:** It is hard to believe but women are still not treated equal to man in our society. They do not have access to men dominated networks due to discriminating attitude played in the society. Therefore, they do not possess managerial skills and experience equal to male entrepreneurs.

- **Lack of Practical Knowledge:** Women do not possess practical knowledge especially those who are in rural areas as they have got limited exposure to the outside world .Besides, It is always difficult for them to focus on one area and devote much time in business for building networking with the other successful women entrepreneurs to get practical guidance and knowledge.
- **Lack of Societal Support:** In a developing country like India, the perception is that entrepreneurship is an appropriate career choice only for men and not for women. The cultural and religious beliefs in some part of the country is not allowing women to get into business .Besides, male members think that it is a big risk financing the ventures run by women.
- **Lack of Awareness:** Many women entrepreneurs are unaware of the various financial assistance in the form of incentives, loans, schemes etc. by the private and the government institutions in the financial sector.
- **Severe Competition:** Since, women are not economically independent have to face severe competition for marketing their products with male dominated industry. Moreover, In the cut-throat competitive market, a lot of capital is required for regular advertisement of their product to withstand in the market. Hence, such a competition ultimately results in the liquidation of women enterprises.

### GOVERNMENT SCHEMES FOR WOMEN ENTREPRENEURS

Generally, woman hesitate to enter into business .Firstly, because of lack of support from the family side. Secondly, lack of financial support .Since, the prospective woman entrepreneur finds difficulty in raising funds for their new business venture, the government formulated various schemes for women entrepreneurs .They are as follows.

1. **Bharatiya Mahila Bank Business Loan:** This scheme is launches for offering business loans up to 20 crores to women who wish to start their own businesses .Under this scheme, the loans are to be repaid in seven years.
2. **Annapurna Scheme:** This scheme offers loans up to 50,000/- rupees for financing women to establish a food catering unit. The interest rate depends upon the market rate and the concerned bank. The loan amount can be repaid in 3 years.
3. **Stree Shakti Package:** Itis a unique scheme run by theSBI, aimed at supporting entrepreneurship among women by providing an interest rate concession of 0.5 percent, if the loans amount exceeds 2 lakhs. An enterprise should have more than 50 percent of its share capital owned by women to make use of this scheme.
4. **Dena Shakti Scheme:** This scheme aimed at providing loan to those women entrepreneurs in the fields of agriculture and allied activities, retail trade, micro credit, education, housing and retail and small business enterprises at a concession of 0.25 percent rate of interestup to loan amount Rs 20 lakhs.
5. **Orient Mahila Vikas Yojana Scheme:** This scheme provides capital for women starting small scale businesses .Women can get loans starting from Rs.10 Lakhs to up to Rs 25 lakhs and the repayment to be made in 7 years period. Under this scheme no collateral is needed.
6. **Udyogini scheme:** This scheme is launched to provide subsidy loans and business training to women entrepreneurs, who are involved in Agriculture, retail and similar small businesses are eligible for loan up to 1 lakh under this scheme.

7. **Cent Kalyani Scheme:** This scheme offers loans up to Rs.1 crore for women business owners in multiple areas such as SMEs or agricultural work or retail trading .Under this scheme, collateral is not needed to obtain the loan amount. The loan amount can be used for meeting capital expenditure and working expenses.
8. **Mahila Udyam Nidhi Scheme:** This scheme offers financial assistance of up to Rs 10 lakh to set up a new small -scale venture .It promotes upgrading and modernization of existing projects. The repayment period for the loan borrowed is 10 years.
9. **Mudra Yojana Scheme for Women:** This scheme is launched by the central government

For providing financial support to women who wish to start a new business or expand the existing business. Under this scheme, loan amount between Rs.50, 000 to Rs.50 lakhs are sanctioned. It has three plans like Shishu, Kishore and Tarun.

- a) **Shishu-**Under shishu plan, loan up to Rs.50000 can be obtained for new businesses with interest 1% per month and to be repaid in 5 years.
- b) **Kishore-** A loan amount from Rs.50, 000 to 5 lakhs can be borrowed for well established businesses.
- c) **Tarun-** Under this plan, women entrepreneurs who wish to expand their existing business can get loan amount from Rs.5 lakhs to 50 lakhs.

#### 10. **TREAD (Trade Related Entrepreneurship Assistance and Development) Scheme:**

Under this scheme, credit, training, development and counselling extension activities related to trades are provided.

### REMEDIAL MEASURES

Along with the government schemes, some of the remedial measures that can be undertaken to promote women entrepreneurship in India are as follows.

- **Financial Assistance:** Financial cell should be opened in various financial institutions for providing easy finance to prospective women entrepreneurs at a concessional rate of interest.
- **Marketing Co-operative:** The women should be advised and encouraged to set-up their own marketing co-operative as it will be able to eliminate the middlemen ,while making their purchase of necessary inputs for production and selling their products to the end-users.
- **Education and Creating Awareness:** Educational and awareness programmes should be undertaken to make the environment for women entrepreneurs more friendly and courteous by changing the societal attitudes towards them. In addition, a proper steps should be taken to make women aware of financial and technical assistance available to them under various government and non-government schemes.
- **Training and Skill Development Programmes:** In order to create self -confidence among the young prospective women entrepreneurs training and skill development programmes should be organized, to inculcate entrepreneurial knowledge and skills in them .In addition ,good hygienic crèches, transport facilities should also be provided to attract more and more prospective women entrepreneurs to the training center.
- **Entrepreneurial Motivation at College Level:** Generally, women do not show interest in entrepreneurship due to several reasons. Therefore, there should be a coordinated effort among the educational institutions, government departments and the business world to

motivate and inspire the girls at the college level itself to dream to become job creators rather than job seekers by adopting entrepreneurship as a career choice.

- **Simple Legal Formalities:** The concerned departments and government agencies have to make an effort to simplify the procedures, formalities, rules and regulations, etc. with regard to registration procedures of the women entrepreneurs.
- **Seminars and Conferences:** International, national level industrial exhibitions, seminars and conferences should give a platform to the young prospective entrepreneurs to have interaction with other successful and experienced entrepreneurs to get guidance and entrepreneurial knowledge.
- **Self Help Groups of Women Entrepreneurs.** The prospective women entrepreneurs should be advised to set-up their own self-help group to mobilize resources and to raise capital funds, for starting their new business ventures.

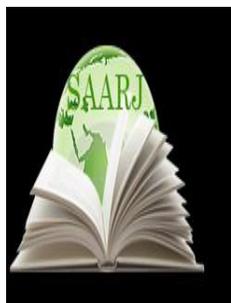

## CONCLUSION

Women entrepreneurship have significantly contributed to the economic development of the country. Unlike earlier days, today women are not confined to the four walls of the house. They are treated equals to men. In fact, educational attainment of the women made them self-reliant and dare to dream to become job creators rather than job seekers .Today women participation can be seen in almost every field such as politics, education, science, information technology, banking, communication, etc. but unfortunately, only few percentage of women's participation can be noticed and majority are still not able to find their own place in the society by starting up their own enterprises and becoming a successful entrepreneur due to several entrepreneurial problems and challenges a woman need to face at the beginning of any business venture. In this direction, the government has already launched various schemes and policies to financially support and encourage women entrepreneurship in India. Yet, in addition to that it is essential to take up some of the remedial measures for helping the prospective women entrepreneurs to come out of all the problems and challenges that they have to confront with while getting into a new business venture.

**ABSTRACT**

*A number of derivatives of pyrazolyl-p-ferrocenyl-phenolyl-urea have been synthesized and investigated their biological activity. Newly obtained compounds were fully characterized by spectroscopic (IR and NMR). Single crystal X-ray structure analysis were undertaken on two compounds. Determined the growth-promoting activity of the compounds [4- (pyrazolyl- (p-ferrocenylphenoxymethylene)] (II), N, N'-hexamethylenebis - [(p-ferrocenylphenyleneleoxymethylene) -4- (pyrazolyl-1,1') - urea] (III).*

**KEYWORDS:** *Derivatives Of Heterocyclic Compounds, Synthesis, Biological Activity, Pyrazolyl.*

## INTRODUCTION

The currently intensively evolving chemistry of acetylene derivatives of pyrazolyl-p-ferrocenyl-phenolyl-urea compounds are in attention of many international researchers, both in Uzbekistan and abroad [1-5]. This is connected, on the one hand, with the rich possibilities of the various chemical transformations in acetylenepyrazolyl, p-ferrocenylphenolyl, urea groups in the molecules of organic compounds, and, on the other hand, with the properties of the most organic compounds valuable for practical use with the above-mentioned groups.

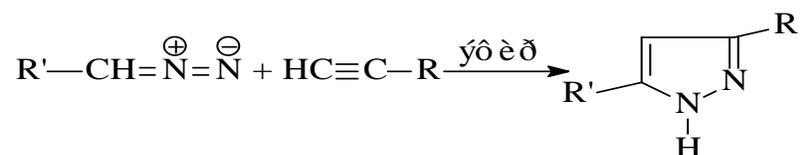

There are many examples where the introduction of pyrazole and urea groups led to the appearance of various physiological, pharmacological and biological activity, as well as the ability to inhibit metal corrosion, form complex compounds, polymers, and many others. The further development of pyrazolyl-ferrocene-phenolylureas, and especially their various derivatives, is an extremely urgent task of the XXI – XXII centuries. In this work, to determine the reactivity of a triple bond, intermolecular cyclization reactions were carried out, where rare substituted pyrazoles of the preparation were obtained (1).

## MATERIALS AND METHODS

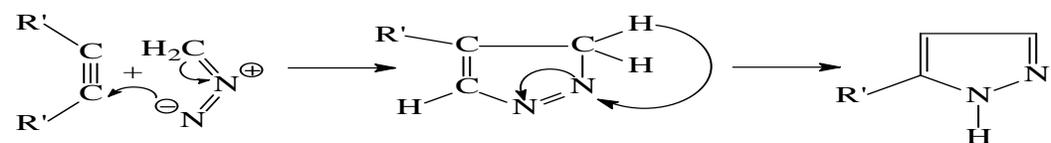

To synthesize pyrazole derivative used organic compounds, such as diazomethane, hexamethylenediisocyanate, dimethylformamide. Synthesized compounds are analyzed with IR-spectra,  $n^1$ -NMR spectra methods.

## RESULTS

Reactions in organic synthesis involving a triple bond allow us to develop simple methods for obtaining valuable bioavailable, from a biological, pharmacological point of view, nitrogen-containing five-membered heterocyclic compounds, such as 1,2-pyrazoles, pyrroles, thiophenes, 1,2,3-triazoles, containing various heteroatoms. Based on the foregoing, we synthesized previously unknown compounds containing various heteroatoms, a triple bond in order to obtain various functional five-membered heterocycles with potentially very high pharmacological and biological activity. The cyclic addition of aliphatic diazo compounds to acetylenes with the formation of pyrazoles is called the Pehman reaction [6-10].

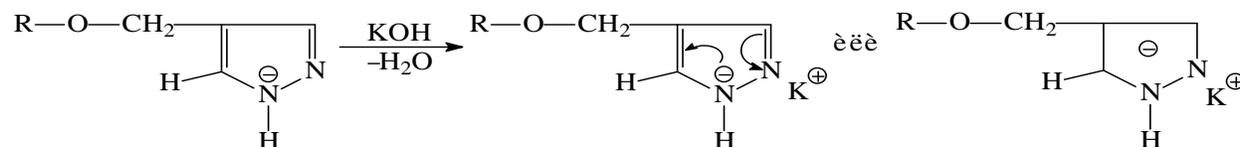

1,2-pyrazole can be synthesized on condensations of the triple bonds with diazomethane by the mechanism of synchronous cyclic addition with the participation of the bipolar structure of diazomethane.

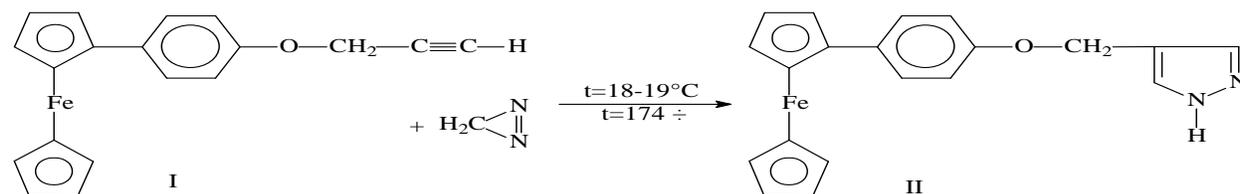

Synthesis (1) was carried out in the presence of sodium ethylate in anhydrous ethyl alcohol at a temperature of 80-85 ° C for 3.5-4.0 hours. Thin layer chromatography on Al<sub>2</sub>O<sub>3</sub> (benzene: ethanol = 15: 1) was used to isolate the product. The resulting compounds (1) is an orange crystalline substance. In addition to elemental analysis, IR and <sup>1</sup>H-NMR spectroscopy were used to prove the structure. The IR spectrum of compounds (1) contains absorption bands characteristic of the –C≡C– bond in the region of 2128 cm<sup>-1</sup>, for the ≡C – H bond in the region, 3285 cm<sup>-1</sup> for C – O – C in the region of 1245–1260 cm<sup>-1</sup>, the frequencies in the region of 1008 and 1110 cm<sup>-1</sup>, as well as in 2878 cm<sup>-1</sup>, are evidence of the presence of ferrocene free of substituents on the cyclopentadienyl ring. In the <sup>1</sup>H-NMR spectrum, a sharp singlet at 3.92 ppm corresponds to the equivalent proton of the unsubstituted cyclopentadienyl ring of ferrocene, triplets of irregular shape at 4.27 and 4.46 ppm match rings. The shift of these signals to weak fields is due to the influence of the ring current of the phenyl radical, the signals in the region of 6.7-7.6 ppm. represent a typical picture of the spectrum of p-substituted phenyl, with the proton adjacent to the ferrocene fragment resonating at 7.26 ppm, and the remaining protons at 6.84 ppm. For the spectra of all compounds, the commonality of the C<sub>5</sub>H<sub>5</sub>FeC<sub>5</sub>H<sub>4</sub> – C<sub>6</sub>H<sub>4</sub> – O– fragment should be noted; in addition, a doublet at 4.61 ppm is present in the spectrum. and triplet at 2.34 ppm. the latter corresponds to the signal of acetylene protons shifted to a strong field under the influence of anisotropy of the triple bond. The splitting of the acetylene proton signal into a triplet is due to the spin-spin interaction of the –O – CH<sub>2</sub>– group. The spin-spin interaction constant of 2.5 Hz corresponds to the usual value for long-range interactions in acetylene derivatives. In turn, the signal –O – CH<sub>2</sub>– protons at 4.61 ppm split into a doublet.

The hydrogen atom at the heteroatom is relatively easily replaced by a metal (Ag, Mg, K, Na, Li, etc.). Pyrazole forms salts with metals turning into an anion having aromatic properties:

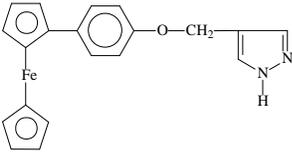

The synthesis of the pyrazole derivative (II) was carried out by the interaction of compounds (I) with diazomethane according to the following reactions:

The structure of the synthesized compound was confirmed by elemental analysis and IR, <sup>1</sup>H-NMR spectroscopy. Physico-chemical parameters are given in table 1.

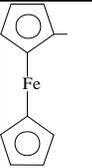

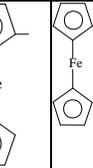

**TABLE 1 PHYSICO-CHEMICAL PARAMETERS OF COMPOUNDS (II)**

Structure	Yield, %	M <sub>p</sub> , °C	R <sub>f</sub>	Formula	M <sub>M</sub>	Elemental analysis, %	
						Calculated	Found

	93,4	103-104	0,71	C <sub>20</sub> H <sub>18</sub> N <sub>2</sub> FeO	357,65	N 7,83	N 7,68
---	------	---------	------	--	--------	-----------	-----------

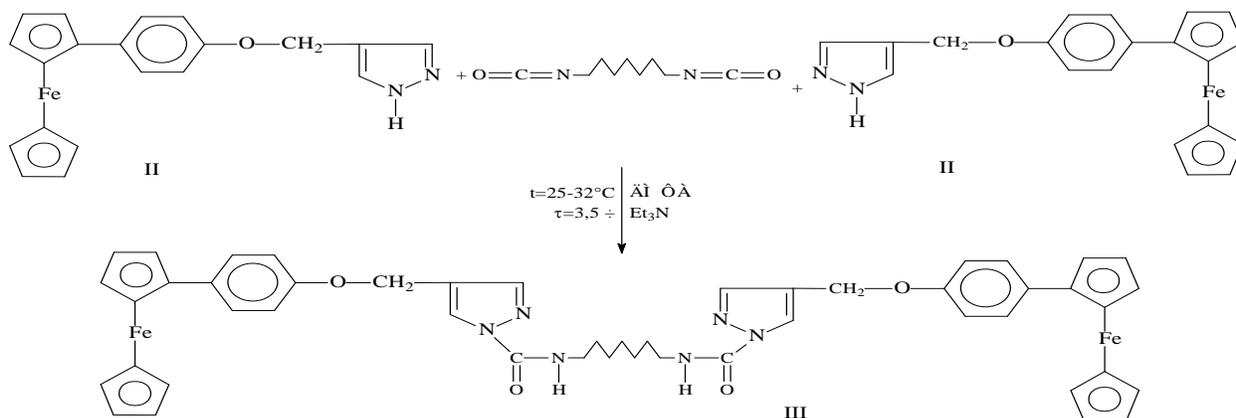

In the IR spectra, characteristic absorption bands are observed in the region of 1010, 1110, and 2878 cm<sup>-1</sup> due to stretching vibrations of the monosubstituted cyclopentadienyl ring of ferrocene. The aromaticity of the cycle is preserved, but the ability to electrophonic substitution at carbon atoms decreases sharply. At the same time, the presence of lone pairs in heteroatoms increases the likelihood of an electrophilic attack on nitrogen, contributing to tautomeric transformations and the formation of quaternary salts. In determining the reactivity of these heterocycles, the mutual influence of the lone electron pairs of heteroatoms and the  $\pi$ -electron sextet of the ring is even more important, 1,2-pyrazoles exhibit weak acidic properties. Thus, reflecting the achievements and current level of work in the field of chemistry of derivatives of heterocyclic systems, they convincingly show and prove that in studies of recent years, methods for the synthesis of heterocyclic esters of 1,2-pyrazole or 1,2-pyrazoline have been actively developed. The rings of 1,2-pyrazole (or 1,2-pyrazoline) are extremely stable and many of its derivatives can be distilled without decomposition and melting. These IR spectra of compounds (II) are given in table. 2.

**TABLE 2. IR SPECTRA OF COMPOUNDS (II)**

CompoundNo.	IR spectra, $\nu$ cm <sup>-1</sup>						PMR spectra, $\delta$ , ppm			
										
II	1236	1613, 1121, 925	1605	2878, 1010- 1110	2860	3413	3,92	doublet 4,61 triplet 2,34	7,26	4,61

**The interaction of compounds (II) with hexamethylenediisocyanate**

Hexamethylenediisocyanates are among the compounds possessing extremely super high reactivity. Secondary amines with heterocyclic groups containing N – H bonds have the highest reactivity with respect to the isocyanate [11-14]. We obtained derivatives of pyrazolyloferrocenylphenolyl-urea by the interaction of hexamethylenediisocyanate with the compound (II) at room temperature according to the scheme:

The synthesis was carried out in dimethylformamide medium at room temperature of the reaction medium 25-32 ° C for 3.5 hours. It should be noted that the new environmentally friendly derivatives of bis-urea (III) were obtained in the form of a whitish-silver powdery substance (III), with rather high yields, without waste. Physico-chemical characteristics of the component (III) are given in table. 3.

**TABLE 3. PHYSICO-CHEMICAL CHARACTERISTICS OF THE COMPONENT (III)**

Structural formula	Yield, %	M <sub>p</sub> , °C	R <sub>f</sub>	Formula	Elemental analysis, %		M <sub>M</sub>
					Calculated	Found	
					N	N	
	92,3	198-199	0,77	C <sub>48</sub> H <sub>48</sub> Fe <sub>2</sub> N <sub>6</sub> O <sub>4</sub>	9,50	9,38	883,694

Compounds were purified by recrystallization from ethyl alcohol. The identity of the compound (III) was established by TLC on "Silifol" plates.

The following systems were used as eluents:

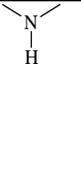

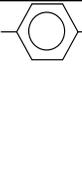

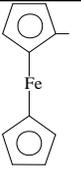

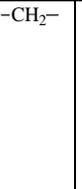

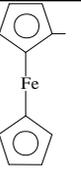

System 1 :CHCl<sub>3</sub> : CH<sub>3</sub>OH : HCOOH = 10 : 0,6 : 0,1

System 2: HCOOH :CH<sub>3</sub>COCH<sub>3</sub> : CCl<sub>4</sub> = 0,6 : 5,0 : 0,5

The structure of bis-{N, N'-hexamethylene bis-[(p-ferrocenyl phenyl-oxymethylene) -4-(pyrazolyl-1,1')] urea} (III) is confirmed by the data of elemental analysis, as well as IR and n<sup>1</sup>-NMR spectroscopy. In the IR spectrum of compound (III), there is a wide absorption band in the region of 1716 cm<sup>-1</sup>, typical for  $\text{—}\overset{\text{O}}{\parallel}{\text{C}}\text{—}$  groups, and an absorption band in the region of 1613

cm<sup>-1</sup> corresponds to absorption of  $\text{—}\overset{\text{O}}{\parallel}{\text{N}}\text{—}\overset{\text{O}}{\parallel}{\text{C}}\text{—}\overset{\text{O}}{\parallel}{\text{N}}\text{—}$  bond, a strong absorption band in the region of 3411 cm<sup>-1</sup> is characteristic of N – H groups (table. 4).

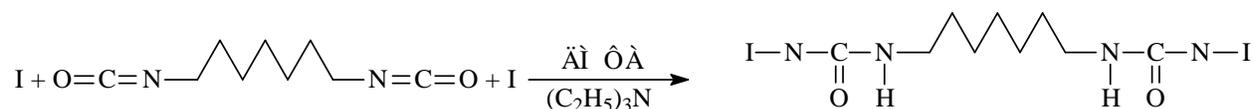

TABLE 4. IR AND  $^1\text{N}$ -NMR SPECTRA OF THE COMPOUND (III)

Compound No	IR spectra, $\nu$ , $\text{cm}^{-1}$								$^1\text{N}$ -NMR spectra, $\delta$ , ppm				
									1-6 -CH <sub>2</sub> -	2-5 -CH <sub>2</sub> -

After the laboratory method of obtaining compound (III), purification was performed by TLC, and elemental analyzes were determined, and IR spectra were recorded. The task was to develop technologies for the preparation of the compound(III), which is an urgent task of modern organic, bioorganic and chemistry of physiological activity. Our method of compound (III) preparation consists in nucleophilic addition (AN) of a pyrazole derivative to hexamethylenediisocyanate at a temperature of 28-52 ° C in the presence of a solvent and a catalyst (base), filtration, drying at a temperature of 148-150 ° C. In the process of obtaining the compound (III), gaseous and solid waste is not formed, and the catalyst after numbering is used in the following operations. The final finished compound (III) is a whitish-silver powder with a melting point of 198-199 ° C, soluble in DMF, DMSO, dioxane, nitrobenzene and other organic compounds.

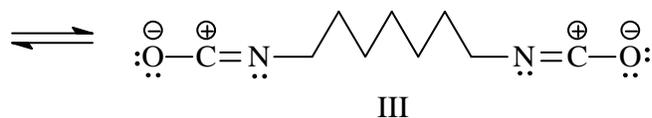

### Description of the technological process and its scheme

A non-waste method for producing a growth stimulator of industrial plants involves the synthesis of N, N'-hexamethylenebis - [(p-ferrocenylphenylene-hydroxymethylene)-4-(pyrazolilo) urea] by the reaction of hexamethylenediisocyanate with the compound (II) 4- [pyrazolyl- (p-ferrocenylphenetime) ] in the presence of a catalyst base  $(\text{C}_2\text{H}_5)_3\text{N}$  and a universal solvent of dimethylformamide:

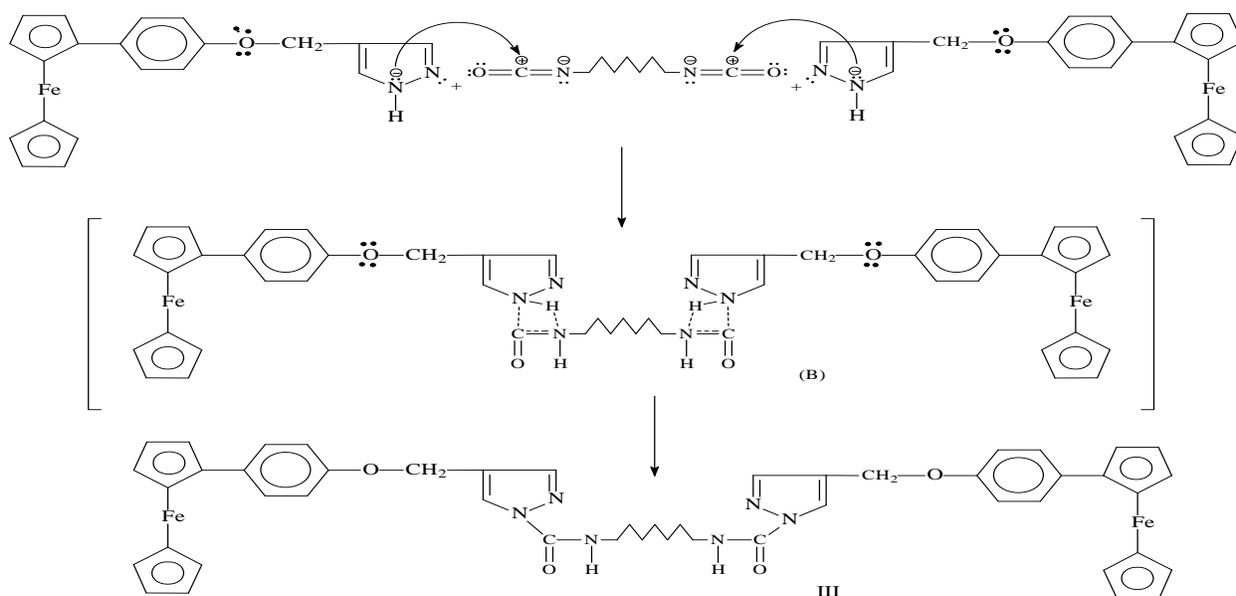

The chemical behavior of N, N'-hexamethylenediisocyanate is most fully consistent with such a distribution of electron densities in the  $-\text{N}=\overset{\oplus}{\text{C}}=\text{O}$  group, which is described by the conjugation of the following structures:

Nitrogen and oxygen in the  $\text{--}\overset{\ominus}{\text{N}}\text{=}\overset{\oplus}{\text{C}}\text{=}\overset{\ominus}{\text{O}}$  group carry mainly a negative charge and have electron-donor and electrophilic attacks. In some cases, diisocyanates can also play the role of electrophilic agents. The reactions of nucleophilic addition with the participation of oxygen and nitrogen containing substances are most typical (characteristic) of them. The "HN" pyrazole group, having a free electron pair, attacks the electrophilic center in the hexamethylenediisocyanate molecule with the formation of intermediate process (B), which regroups into bis-ureas.

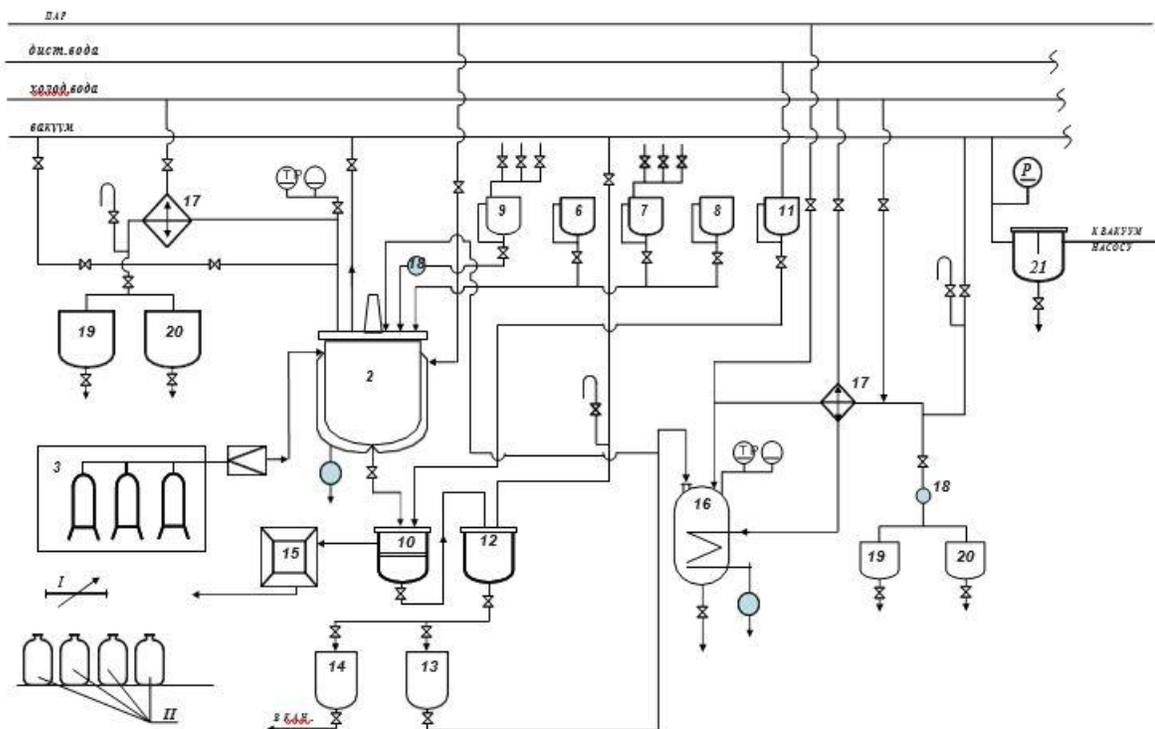

### Description of the technological process for the production of N, N'-hexamethylenebis - [(p-ferrocenylphenylene-hydroxymethylene) -4- (pyrazolilo) urea].

The technological scheme of production of N, N'-hexamethylenebis - [(p-ferrocenylphenylene-hydroxymethylene) -4- (pyrazolilo) -ureas] is shown in Figure 1.

Operational amounts of compounds of the pyrazole derivative GMDI, DMF and TEA are loaded into the R<sub>6</sub> reactor from the E<sub>1</sub>-E<sub>3</sub> tanks. The mixture was stirred at room temperature 26-52 ° C for 4.0 hours. Precipitated whitish-silver crystals are filtered off in an F<sub>7</sub> filter. A mixture of DMF and a catalyst base (C<sub>2</sub>H<sub>5</sub>)<sub>3</sub>N or pyridine is collected in a container E<sub>8</sub>. The final reaction product and snow-white silvery crystals are dried in a drum dryer - T<sub>9</sub>, then sent to a crusher D<sub>10</sub> and screened on a C<sub>11</sub> vibrating screen. The finished product is packaged in plastic barrels with a capacity of 20-200 dm<sup>3</sup>. We need to emphasize that during the process of obtaining N, N'-hexamethylenebis - [(p-ferrocenylphenylene-hydroxymethylene)-4-(pyrazolilo) urea], the reaction of the interaction of hexamethylenediisocyanate with a pyrazole derivative proceeded without emission of harmful harmful gases (CO, NO, Cl<sub>2</sub>, HCl, HCN, H<sub>2</sub>S, CO<sub>2</sub>, etc.). The synthesis technology was carried out in DMF at a temperature of 28 ° C to 52 ° C for 4.0 hours.

It should be noted that ecologically pure waste-free new derivatives of N, N'-hexamethylenebis - [(p-ferrocenylphenylenyl-hydroxymethylene) -4- (pyrazolyl) urea], whitish-silver powders with rather high yields were obtained.

**Figure 1. Technological scheme for the production of hexamethylenehexamethylenebis - [(p-ferrocenylphenylenyl-hydroxymethylene) -4- (pyrazolilo) -urea]**

1-scale; 2 reactor; 3-nitrogen frame; 4,5-capacity; 6,7,8,9-mernik; 10-nutch filter; 11-distillation of water; 12,13,14,19,20-collections; 15-dryer; 16-distillation cube; 17-capacitor; 18-look lamp; 21-trap.

To study the reactivity of the N – H reaction center, the {N, N'-hexamethylenebis - [(p-ferrocenylphenyloxymethylene) -4- (pyrazolyl-1,1') urea] center} we carried out rare reactions: N, N'- dinitrosation, N, N'-dichlorination and N, N'-dialkylation.

## EXPERIMENTAL PART

IR spectra of substances were recorded on a Perkin-Elmer Spectrum-65 instrument (in the range of  $400\text{--}4000\text{ cm}^{-1}$ ). The purity of the obtained compounds was controlled by thin layer chromatography on standard Silufol UV-254 plates in benzene: alcohol systems (2: 1); benzene: 1.4 - dioxane = (3: 1); Spots on the chromatograms were detected by iodine vapor.

$^1\text{NMR}$  spectra were recorded on a VARIAN MR-400 instrument with an operating frequency of 400 MHz

The elemental composition was determined on Perkin-Elmer-2400 analyser.

Melting point measured on Buchi apparatus.

### 1. Synthesis of p-ferrocenylphenol (I) propargyl ester

In a flask equipped with a reflux condenser, 27.8 g (0.1 mol) of p-ferrocenylphenol, 23.8 g / mol of fresh distilled bromide propargyl, 30 g of calcined potassium carbonate and 350 ml of anhydrous acetone as solvent were placed, the reaction mixture was heated in a water bath at a temperature of 90 ° C for 8 hours and left overnight. The mixture was filtered, the product was removed from the filtrate with ether. After evaporation of the solvent, the precipitate was recrystallized from benzene. Yield (I) - 87.8% (of theoretical),  $R_f = 0.68$ . TLC: benzene: ethanol = 15: 1: [2].

Found, %: C – 68,87; H – 5,04; Fe – 19,96

Calculated for  $C_{16}H_{14}FeO$ , %: C – 69,10; H – 5,03; Fe – 20,10

### 2. Synthesis of [4- (pyrazolyl- (p-ferrocenylphenoxymethylene)) (II)

3.2 g (0.011 mol) of p-ferrocenylphenolpropargyl ether previously dissolved in 200 ml of sulfuric ether are added to a conical flat-bottomed flask, then 1.0 g (0.025 mol of a freshly prepared diazomethane solution in 30 ml of sulfuric ether are poured in small portions). the mixture is placed in a dark, dark place at a temperature of 18-19 ° C. The mixture is left for 8-9 days and as the yellow color of the diazomethane solution disappears, new portions are added until the triple bond with the ammonia solution of monochlorine reacts negatively. copper stand, after which the solvent was evaporated, the product is purified by TLC on alumina in the system benzene: hexane (1: 4), the desired product is a crystalline solid with melting point 103-104 ° C [2]  $R_f = 0,71$ .

Found, %: C – 66,89; H – 5,01; Fe – 15,44; N – 7,68;

Calculated for  $C_{20}H_{18}FeN_2O$ , %: C – 67,06; H – 5,03; Fe – 15,60; N – 7,82

### 3. Preparation of N, N'-hexamethylenebis - [(p-ferrocenylphenylene-hydroxymethylene) -4- (pyrazolyl-1,11) urea] (III)

7.35 g (0.02 mol) of 4-pyrazolyl- (p-ferrocenylphenoxymethylene) is placed in a three-necked flask equipped with a reflux condenser, a stirrer thermometer, 20 ml of triethylamine, 30 ml of DMF are added at a temperature of 42-45 ° C with stirring 1.7 g (0.011 mol) of hexamethylenediisocyanate dissolved in 10 ml of DMF are added dropwise. The reaction mixture is stirred for 3.0 hours at a temperature of the reaction mixture 48-52 ° C after time, the contents of the flask are transferred into a beaker, water is added. The precipitate was washed with TLC. After drying, a slightly colored powder is obtained with a yield of (III):

8,24g (92.3% of theoretical);  $M_p = 198-199^{\circ}C$ ;  $R_f = 0,77$ .

Found, %: C – 65,21; H – 5,33; Fe – 12,51; N – 9,38;

Calculated for  $C_{48}H_{48}Fe_2N_6O_4$ , %: C – 65,18; H – 5,43; Fe – 12,64; N – 9,50;

### 4. Synthesis of N, N'-dinitrozo, N, N'-hexamethylenebis - [(p-ferrocenyl-phenyl-hydroxymethylene) -4- (pyrazolyl-1,1 ') - urea] (IV)

In a three-necked flask equipped with a reflux condenser, thermometer, stirrer, 8.84 g (0.01 mol) of N, N'-hexamethylenebis - [(p-ferrocenylphenyloxymethylene) -4- (pyrazolyl-1,1 ') urea] (Iii) dissolved in 100 ml of formic acid. With constant stirring at a temperature of 0-4 ° C, 0.5 g of

sodium nitrite is added in portions in excess over 3.5-4.0 hours. After the end of the reactions, the contents are poured into a liter jar, 250 ml of cold water are added, and a precipitate begins to precipitate. The precipitate was filtered off, washed with benzene and dried. The identity of N, N'-dinitroso, N, N'-hexamethylenebis - [(p-ferrocenylphenylphenoxy)methylene] -4- (pyrazolyl-1,1') urea] was established by TLC on "Silifol" plates. Yield (IV) - 85.4% (of theoretical)  $M_p = 240-241^\circ\text{C}$  (decomp.).

Found, %: C - 61,08; H - 4,79; Fe - 11,77; N - 11,91

Calculated for  $\text{C}_{48}\text{H}_{46}\text{Fe}_2\text{N}_8\text{O}_6$ , %: C - 61,16; H - 4,88; Fe - 11,86; N - 11,89

### 5. Synthesis of N, N'-dichloro-N, N'-hexamethylenebis- [p-ferrocenyl-phenyl ilyloxymethylene] -4- (pyrazolyl-1,1') - urea] (V)

In a three-necked flask equipped with a reflux condenser with a chlorine calcium tube, a stirrer, a thermometer, 8.84 g (0.01 mol) of N, N'-hexamethylenebis [p-ferrocenylphenyloxymethylene), 60 ml of  $\text{CCl}_4$ , 25 g of wet alumina are placed 6.0 g of calcium hypochlorite are added dropwise at a temperature of  $40^\circ\text{C}$ . for 1.0 hour. Then the reaction mass is left for 24 hours, filtered off, the residue is washed with ether and alcohol. It is dried and N, N'-dichloro-N, N'-hexamethylenebis- [p-ferrocenylphenyloxymethylene) -4- (pyrazolyl-1,1') urea] is obtained. The yield of compounds (V) is 8.69 g (90.6% of theory);  $M_p = 159-160^\circ\text{C}$ .  $R_f = 0,71$ ;

Found, %: C - 60,37; H - 4,78; Fe - 11,64; Cl - 7,34; N - 8,71

Calculated for  $\text{C}_{48}\text{H}_{46}\text{Fe}_2\text{Cl}_2\text{N}_6\text{O}_4$ , %: C - 60,45; H - 4,83; Fe - 11,72; Cl - 7,45; N - 8,81.

To prove the structure of N, N'-dichloro-substituted (III), elemental analysis was performed with silver salts ( $\text{AgNO}_3$  solution);

### 6. Synthesis of N, N'-disodium substituted compounds (III)

8.84 g (0.01 mol) of compounds (III) are added to  $\text{CH}_3\text{ONa}$  (from 0.031 g / mol Na and 30 ml abs.  $\text{CH}_3\text{OH}$ ). The mixture is stirred for 2 hours at a temperature of  $20^\circ\text{C}$  and 2 hours at a temperature of  $40^\circ\text{C}$ , the precipitate is filtered off, washed with abs.  $\text{CH}_3\text{OH}$  to give the product (IIIa). Yield (IIIa) - 7.6 g (82% of theory):

### 7. Synthesis of N, N'-diisopropyl substituted compounds (III)

7.6 g (IIIa) are placed in 25 ml of DMF, 3.5 ml (0.02 mol) of isopropyl iodide are added dropwise with stirring. The mixture is stirred for 10.0 hours while heating in a boiling water bath, cooled and poured 25 ml of water, the precipitate is separated, recrystallized from 30% alcohol, dried and obtained (VI) with a yield of 87.5% (theoretical).  $M_p = 133-134^\circ\text{C}$ .  $R_f = 0.76$ ;  $MM = 967.7$ ;

Found, %: C - 66,85; H - 6,09; Fe - 11,45; N - 8,51

Calculated for  $\text{C}_{54}\text{H}_{60}\text{Fe}_2\text{N}_6\text{O}_4$ , %: C - 66,96; H - 6,20; Fe - 11,54; N - 8,68.

## DISCUSSION

To determine the growth-promoting activity of the compounds [4- (pyrazolyl- (p-ferrocenylphenoxy)methylene)] (II), N, N'-hexamethylenebis - [(p-ferrocenylphenylenyloxymethylene) -4- (pyrazolyl-1,1') - urea] ( III) the tests were carried out

in the laboratory of the Institute of Plant Chemistry of the Academy of Sciences of Uzbekistan under laboratory conditions, the seeds of vegetable crops and cotton served as biotests.

The experiments used cucumbers of the Uzbekistan-740 variety, TEMP tomatoes and the medium-fiber cotton of the S-6524 variety. The preparations were dissolved in DMF and used by the method of presowing seed lock for 18-20 hours.

The concentrations of preparations (II) and (III) were used - 0.1; 0.01; 0.001; 0.0001 and 0.00001%. The repetition of experiments is 4-fold. The counts were carried out by measuring the length of the stem and root of 10-day-old seedlings of cotton. It was noted that all preparations tend to stimulate the growth of the root systems of young seedlings, both vegetable crops and cotton.

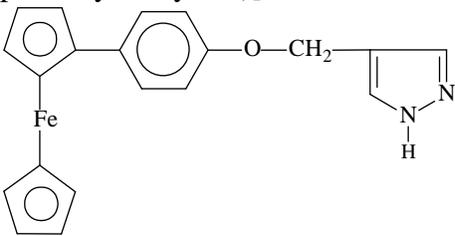

Primary screening was performed according to the method of Yu.V. Rakitina. This method allows you to quickly determine the degree of physiological activity of new chemical compounds, which is detected by stimulation or inhibition of the length of the roots and the length of the stems of the part. The preparations were tested by the method of seed hardening in solutions of various concentrations, followed by germination in Petri dishes. Control seeds were soaked in distilled water. Each series of experiments is accompanied by control.

In control variants, only a pure solvent is added to the nutrient medium.

The result of the experiments is recorded 3, 5, 7 and 10 days after inoculation (tab. 5-7)

Table 5

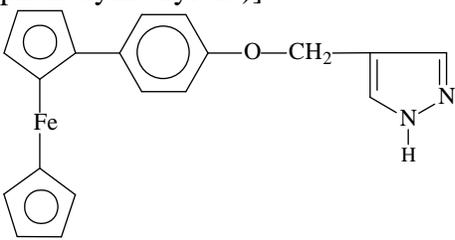

The effect of the compound (II) on the germination of seeds and the growth of seedlings of cotton varieties "C-6524"

Experiments	Concentration, %	Germination, %	Cotton	
			Root growth %	Stem growth, %
Compound (II)				
Control-water	6/0	80,0	100,0	100,0
[4-(pyrazolyl-(p-ferrocenylphenoxy)methylene)] 	0,1	85,4	117,6	112,3
	0,01	89,6	121,4	115,6
	0,01	93,4	159,6	134,7
	0,0001	91,3	147,4	129,5
	0,00001	86,4	128,3	117,8
"Roslyn" - (famous)	0,75-1,0	81,5	103,3	102,6

Comparative tests also show that the test compound (II), i.e. the derivative [4-(pyrazolyl-(p-ferrocenylphenoxy)methylene)] from 7.5 to 75000 times lower concentration of our preparation showed higher growth-promoting activity than the Roslyn compound currently used in many agricultural sectors of Uzbekistan. The compound (II) showed biological activity on cotton

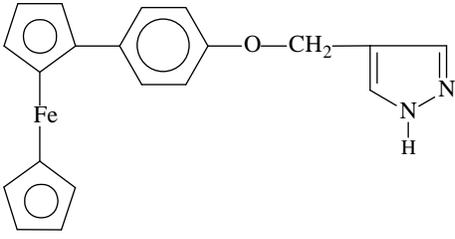

culture, at a concentration of 0.00001% (75,000 times diluted) it stimulated root growth of 128.3% and a stem growth of "117.8 higher than the control and the well-known compound Roslin" (concentration 0, 75-1.0%)

**TABLE 6 THE EFFECT OF THE COMPOUND (II) ON THE GERMINATION OF SEEDS AND THE GROWTH OF SEEDLINGS OF TOMATO VARIETIES "TEMP"**

Experiments	Concentration, %	Germination, %	Tomatoes	
			Root growth, %	Stem growth, %
Compound (II)				
Control-water	6/0	70,0	100,0	100,0
[4-(pyrazolyl-(p-ferro-cenyl-phenoxy)methylene)] 	0,1	79,3	119,7	130,3
	0,01	82,4	128,3	135,4
	0,01	86,7	147,6	138,3
	0,0001	84,3	138,6	127,4
	0,00001	82,0	141,3	116,8
«Roslin» – (famous)	0,75–1,0	72,2	101,7	104,3

The compound (II) on tomatoes, similar to previous cultures, showed a very high biological 141.3% at a concentration of 0.00001% (even 75,000 times diluted)

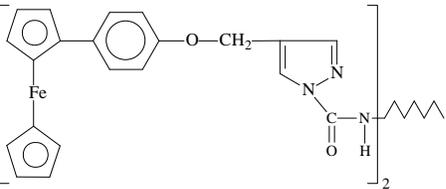

**TABLE 7. THE EFFECT OF THE COMPOUND (II) ON THE GERMINATION OF SEEDS AND THE GROWTH OF SEEDLINGS OF CUCUMBERS VARIETIES "UZBEKISTAN-740"**

Experiments	Concentration, %	Germination, %	Cucumbers	
			Root growth, %	Stem growth, %
Compound (II)				
Control-water	6/0	100,0	100,0	100,0
[4-(pyrazolyl-(p-ferro-cenyl-phenoxy)methylene)] 	0,1	100,0	109,4	112,7
	0,01	100,0	114,5	116,6
	0,01	100,0	128,6	119,3
	0,0001	100,0	143,7	124,4
	0,00001	100,0	157,4	133,8
«Рослин» – (известный)	0,75–1,0	100,0	104,4	102,3

The compound (II) for cucumber cultures also showed biological activity, at a concentration of 0.00001% (i.e., 75,000 times diluted). The root growth was promoted by 157.4%, slightly lower than the stem growth by 133.8% higher than the control and the well-known compound Roslin (concentration 0.75-1.0%). Thus, the low-toxic ( $LD_{50} = 5975$  mg / kg) compound (II) showed

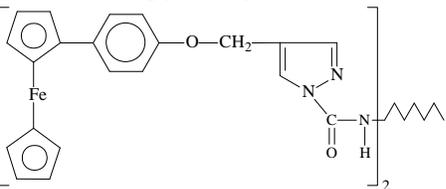

high biostimulating properties on the seeds of tomato, cucumbers and cotton at 0.00001% concentration. The results of the determination of the growth-promoting activity of the compound N, N'-hexamethylenebis - [(p-ferrocenylphenyl)phenyleneoxymethylene] -4- (pyrazolyl-1,1') urea (III) are presented in Table. 8-10

**TABLE 8. THE EFFECT OF THE COMPOUND (III) ON THE GERMINATION OF SEEDS AND THE GROWTH OF SEEDLINGS OF COTTON CULTIVAR "C-6524"**

Experiments Compound (III)	Concentration, %	Seedgermination after 5 days, %	Germination on day 10, in%	
			Cotton	
			Root, %	Stem%
Control-water	6/o	100,0	100,0	100,0
N, N'-hexamethylenebis - [(p-ferrocenylphenyl)phenyleneoxymethylene] -4- (pyrazolyl-1,1') - urea 	0,1	100,0	111,7	118,3
	0,01	100,0	127,4	124,5
	0,001	100,0	133,7	126,3
	0,0001	100,0	146,4	129,7
	0,00001	100,0	153,3	131,4
«Roslin» – (famous)	0,75–1,0	100,0	101,3	102,6

The compound (III) on cotton culture showed biological activity at a concentration of 0.00001% (diluted 75,000 times) stimulated root growth of 153.3%, and the stem growth of 131.4% was higher than the control and the well-known compound Roslin (concentration 0.75 -1.0%). The compound (III) on tomatoes, similarly to previous cultures, showed very high biological activity, where root growth was observed at 118.6%, and stem growth was 111.3% at a concentration of 0.001 (even 750 times diluted).

**TABLE 9. THE EFFECT OF THE COMPOUND (III) ON THE GERMINATION OF SEEDS AND THE GROWTH OF SEEDLINGS OF TOMATO VARIETIES "TEMP"**

Experiments Compound (III)	Concentration, %	Seedgermination after 5 days, %	Germination on day 10, in%	
			Tomatoes	
			Root, %	Stem, %
Control-water	6/o	50,0	100,0	100,0
N, N'-hexamethylenebis - [(p-ferrocenylphenyl)phenyleneoxymethylene] -4- (pyrazolyl-1,1') - urea 	0,1	57,3	108,5	106,4
	0,01	54,4	114,7	109,6
	0,001	67,8	118,6	111,3
	0,0001	60,5	114,5	110,4
	0,00001	58,6	111,4	106,5
«Roslin» – (famous)	0,75–1,0	51,6	101,8	98,4

**CONCLUSION:**

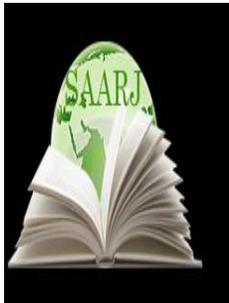

The compound (III) also showed biological activity on a cucumber culture at a concentration of 0.001% (i.e. 750 times diluted). The root growth was increased by 118.6%, and the stem growth was 111.3% higher than the control and the well-known compound “Rostlin” (concentration 0.75–1.0%).

### ABSTRACT

*This article is aimed at analyzing verbalization of the concept of "time" in English language by means of idioms and English quotations. It briefly describes the importance and the role of the concept "time" in language system. In this article, idioms and a wide range of quotations that verbalize deep meaning of concept “time” in English language are explained, as well as including lexical and semantic meaning of them. As the result of the study, English quotations which define significance and common features of concept “time” in world image of the speakers of English are presented.*

**KEYWORDS:** *concept, quotations, analysis, meaning, time, verbalization*

### INTRODUCTION

Concepts act as structural and substantive factors of the conceptual device of personality and provide a process for processing data that reflects subjective human reveal in according with categories and classes that are formed in society. Concepts and a conceptual systemic problem, which is the main object of study of cognitive linguistics, is to study the conceptual system of linguistic units at the modern stage of linguistics, and to master a new area of linguistics .Concepts act as components of our awareness of the world and our knowledge of the environment. In linguistics, concepts are studied on the basis of lexical units and paremias, with less emphasis on phraseological units. Phraseological expressions more clearly reflect the dominant features of the concept. Similarly, verbalization of the concept “time” is also based on lexical units, phraseological units, paremias, quotations, sayings and special phrases which

express the notion “time”. Time is the indefinite continued progress of existence and events that occur in an apparently irreversible succession from the past, through the present, into the future. It is a component quantity of various measurements used to compare the duration of events or the intervals between them, and to quantify rates of change of quantities in material reality or in the conscious experience. Time has long been an important subject of study in religion, philosophy, and science, but defining it in a manner applicable to all fields without circularity has consistently eluded scholars. This article indicates a group of time idioms and a great deal of various quotations that explains the meaning and importance of concept “time” in a w exact and deeper way.

### Analysis of time idioms

Anidiom is a figure of speech established by usage that has a ze5 not necessarily deductible from those of the individual words. Idioms are neat little expressions that may not always make sense literally but are commonly understood by the culture where they are used. Similarly, given idioms based on time are able to express the importance of the notion “time” in English language. They are indicated below with their meaning and examples.

**About time.** This phrase is used to convey something that has happened was overdue. For example: it’s about time for the wedding to start, let’s run to the church. Otherwise, we will be late.

**Abreast of the times.** This idiom has the following meaning:

The word abreast means attainment or awareness and this idiom is used when speaker asks to be informed about news, development or progress of something. Another meaning is being modern, up-to-date in fashion or something as in ideas.

**Against time.** The idiom has such meaning: an effort to finish in a given time. This expression is utilized in the situation in which someone has to do something very quickly because there is not much time. E.g. It was a race against time to find a cure for the disease.

**Ahead of time.** This idiom has following meaning: at an earlier or previous time, in advance or beforehand. E.g. She read the report *ahead of time* to prepare for the meeting.

**Behind the times** .This expression is used in the situation when people do not aware of current ideas or events happening in present time and it has coming meaning: not having or showing knowledge of current ideas or styles, out dated, old-fashioned. E.g. The entire country is *behind the times* when it comes to protecting the environment.

**Do time.** This idiom has following meaning: to be in a prison for a period of time, to serve all or part of a prison sentence. E.g. **He has been** doing time **in a federal penitentiary.**

**Gain time.** This expression has following meaning: if you do something in order to **gain** time, you do it in order to give yourself enough time to think of an **excuse** or a way out of a **difficult** situation or to cause something to be delayed so that more time is available to do what is needed. E.g. His lawyers are delaying the trial to **gain time** to prepare their defense.

I hoped to gain time by keeping him talking.

**Lose no time.** The meaning of this idiom is given below: if you say that someone loses no time in doing something, you are emphasizing that they act quickly in order to benefit from a situation.

E.g. Officials have lost no time in expressing their concern and grief over this incident.

**Pass the time of day.** This expression has such meaning: greet somebody and have a short conversation with them about things that are not very important. E.g. I don't know any of the neighbors very well, only just enough to pass the time of day.

### **Analysis of time quotations**

A quotation is the repetition of a sentence, phrase, or passage from speech or text someone has said or written. They are often utilized as a literary device to represent someone's point of view. A quotation consists of several words but under it lies deep meaning of something that a speaker actually said. In the process of analysis, it is found out that time quotations outline importance, value and the role of time in people's lives. A majority of people use these quotes as an inspiration or as guidelines for improving their time management. This part of article illustrates a wide range of quotations about time in English languages which are non-identical from each other. They are given below:

#### **"Time is money"-Benjamin Franklin.**

As for this famous saying, it refers to the concept of opportunity cost. This means, each choice you make has its cost, and delays (as a choice to not take action) usually lead to decrease in output.

#### **«The key is in not spending time, but in investing it» - Stephen R. Covey.**

This quotation has the following meaning: people spend time on useful and useless things, but if they call it "investing", they will definitely invest it in something that has value and importance for them. So, people should choose their goals wisely so that time they spend on their goals becomes an investment, not an expense.

#### **"Lost time is never found again"- Benjamin Franklin.**

This quotation has such meaning: you cannot keep today's hour for tomorrow – we all know that, but still tend to procrastinate. The time is a scarce resource, and if it is wasted, it cannot be recovered later. This is why mindful planning and work on productivity are so important.

#### **"Regret for wasted time is more wasted time."-Mason Cooley**

With this quote, Cooley explains to the readers that dwelling on events in the past, they are missing the present and consequently neglecting the future. Regret would not be a waste of time if it was used to reflect and learn a lesson. However, most people continue to regret for things for a long period of time and try to find a way to change the past, which is not possible to do.

#### **"Time is what we want most, but what we use worst"-William Penn**

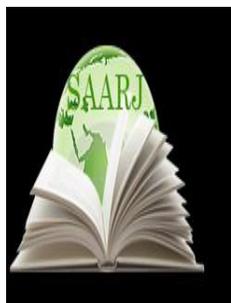

This quote has the following meaning: our life is made up nothing but time. We think that we have too much time and waste it not knowing its importance. The only truth is that nobody knows exactly how much time they have got in this world.

#### **"A man who dares to waste one hour of time has not discovered the value of life"- Charles Darwin**

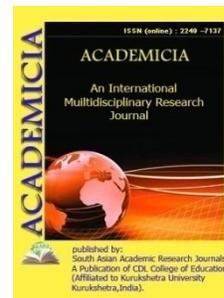

The meaning of this quotation is in the coming lines: time is priceless thing for everyone and hence it should be used very wisely and positively because it has only one cycle and moves on in one direction. The value of time is quite high because it is impossible to get time back as the lost time is never found again. The person who is not aware of the this mentioned above doesn't know the value of time which means that person wastes his time not knowing its importance. This proverb indicates the clarification of importance and merit of the notion "time" and we get from here such understanding that we should appreciate our time.

**CONCLUSION:**

From the data given above, we can understand that time is a complex and multifaceted phenomenon, which has always been controversial for science and philosophy. Being a basic concept, the concept of “time” is widely and variably represented in both idioms and quotations of the English language. English languages rich in idiomatic expressions and quotations of the phenomenon “time” and they are able to express the deep meaning and significance of it in a deeper and more understandable way.

## CREATION INSTRUCTIONAL DESIGN OF THE LESSON AS AN ELEMENT OF THE INNOVATIVE EDUCATION

**Mukhayo Jumaniyozova\***

\*Associated Professor,  
 State World Languages University,  
 Philosophy in Pedagogy of the UZBEKISTAN

### ABSTRACT

*This article dedicated to use Instructional Design in teaching school subjects. In this article depicted the concepts of Instructional Design, its specific features, advantages and different approaches. There is given instructions and methodological advices on developing Instructional Design of the lesson taking into consideration the opportunities both teacher and student. Here is given a few words about new trends in Teacher Training System – “Mentor School” and implementing it basing on the elements of Instructional Design for developing teaching and learning materials.*

**KEYWORDS:** *Implementing, Instructional,*

### INTRODUCTION

Defining as a process of designing learning materials the concept of Instructional Design – is the systematic logical development of instructional specifications using learning and instructional theory to ensure the quality of instruction. It is the entire process of analysis of learning needs and goals and the development of a delivery system to meet those needs. And also the development process of instructional materials and activities accepted as a design of the lesson basing on the evaluation of all instructions of teacher and learner activities.

The phrase “Instructional Design” came from English origin and it means as following: the word **Instruction** means educational, instructional and learning and the word **design** means 1) idea, plan; 2) aim, goal; 3) project, draft, graphic, construction. According to the view of A.Yu.Uvarov the Instructional Design is the concept defined systematic development process of drafting, developing, evaluation and using learning materials for the purpose of providing the effectiveness of Education.

During the process of **Instructional Design** knowledge base Model based on the specific course syllabus is formulated. At the same time, as a result of Instructional Design systematic order of main, minor and additional goals have been effected which should be set up in each steps of education.

**Instructional design** - is a systematic process of usage modern teaching methods and tools for the purpose of achieving expected pedagogic results through educational activities stimulating knowledge and skills of learners taking into consideration the aims of target group and subject basing on clear instructions. Instructional design can be defined as a technology of learning materials developed with the help of the tools new information technology which provided quality and effectiveness of Education.

The people who developed learning courses and course materials basing on Instructional Design are called Instructional Designers.

Instructional Designers as a mentor teacher should draw specific attention to the following:

- Analyses of target group (to analyze general needs of course participants or learners group).
- Analyses of expecting results.
- Analyses of learning materials and its arrangements by order.
- To choose learning types and teaching tools.
- To define the methods which are used during the teaching process.
- To elaborate the methods of evaluation.
- To elaborate the methods of designing learning materials.
- To make methodological support for learners on digest of learning materials.
- To edit developed learning materials.
- To evaluate the effectiveness learning during the process education.

Given systematic order identified typical activities of the teacher during the process of developing learning materials.

While elaborating Instructional design of the lesson, first should take into consideration the general characteristics of potential students, their needs and prior knowledge and skills. And also during the process of elaborating Instructional design of the lesson and preparing learning-didactic materials which are used at the lesson special attention is drawn to widely use of multimedia tools and information communication technology.

Lately, despite publishing lots of manuals, guidelines, scientific articles on using multimedia technologies at the lesson in the scientific-pedagogic literatures, they are not widely used in the process of education. The reason for this is not only the lack of electronic textbooks and manuals but the luck of skills of teachers on using information communication technologies.

Basing on the demands of market economy unification of curriculum and subject syllabi, National Education Standards and creating methodologic provision, developing scientific-practical basics of systematic and integrated subject syllabi of uninterrupted education, to

achieve widely use of didactic methods which are inspired students and pupils to be active and think critically, implementing modern pedagogic technologies and advanced experience into the process of education, to organize effective independent learning and the problem on formulating social-active person in the Educational organizations should be solved positively.

Creation of electronic learning tools on all school subjects are widened the opportunities on using information-communication technologies in teaching these subjects, enlarge the effectiveness of achievements of students on the relevant subjects. In turns it demands from teachers to renew their knowledge and skills appropriately according to the demands of time. For effective using of Information-communication technology teacher should gain the knowledge and skill on developing Instructional design of the lesson.

It is known that the multimedia technologies considered methodological, theoretical and practical bases of formulating information culture both teacher and student. Analyses proofed that with the help of one computer and a multimedia projector can design the process of learning in the maximum level. The most typical way of this is to prepare presentation of the lesson with the help of the program Power Point and through this can provide the effectiveness of the lesson. This is an Instructional design, which should help designing learning materials, developing Lesson Plans, using and evaluating, effective organization of the learning process for the purpose of systematizing and making in order the knowledge and skills given to the students.

The preparation process of demonstrative materials using the program Power Point they can be depicted in slides. The slides include themselves any chosen texts, pictures, moving maps, voice, chronologic tables, graphic images. The depiction opportunities of objects in different colours and views draw students' attention. During the process of presentation teacher provides completeness of any information through giving additional notes. Another convenience of using slide version of the lesson is that it is printable. Before starting the lesson, if the teacher distribute printed version of the slides as handouts, during the lesson children are able to write their own ideas and comments in the special place allocated in the paper. It is very easy way to remember the information which is not given in the textbook and connect it with the next lesson.

As a result of systematic preparation of slides and using them at the lesson teacher can compose his own electronic resource library.

Teachers should avoid writing long sentences in the slides which are used at the History lesson. This can be weakened the influence of slides. It's expedient to use pictures, graphics, maps and tables concerning to the learning topic for organizing independent work and preparing creative tasks of the students. At the History lesson it is possible to use data, information, encyclopedias, virtual museums, the maps on geographic and historic themes, pictures, drawings, animations, texts, dynamic and statistic depictions of information, images with voice (recorded voice, music and etc.)

For working with the tools of information technologies History teachers should have the following practice: They can

- make action plan and technological map;
- prepare materials regarding to the lectures and practical work;
- make methodological instructions assessment questions;

- analyze the results of progress;
- edit contents of the lectures;
- Imagine animating actions concerning to the topic in a dynamic vision.

Through above mentioned students are able to gain the following skills:

- to transfer the information to the text form or vice-verse;
- to formulate questions and feedback on discussing topic;
- to plan their own learning style.

To use electronic version of the didactic materials open the way to enlarging the opportunities of the learning process, making this process more effective and vary and raising the students interest in learning. While using modern computer technologies the teacher have chance to formulate, create and develop set of didactic materials appropriately to the abilities of the class, according to the preparation level of students. They can include tests, control works, cards and questionnaires in the set of developed materials. Such kind of activities is demanded from teacher new approaches to their professional career.

Introducing modern technologies is not limited teachers' activities basing on educational tools in the process of teaching, but it causes to change their roles and objectives and also make professional career perfect.

Teachers practice on using computer technologies, using the opportunities of computer for explaining new learning materials, methodological preparation for the lesson, searching and systematizing new information, preparing didactic materials, formulate their skills on organizing learning process basing on computer technologies and helps accomplishing effective and qualified Instructional design of the lesson through this.

### **Effectiveness of the implemented activities in Uzbekistan**

At present time in Uzbekistan specific state policy have been carried out on equipping Educational establishments with modern computer and information communication technologies. For example, the resolution PR - № 117 adopted by the President of Uzbekistan on August 8, in 2005 “ On additional action plan about developing Information-communication technologies”, President’s Order PO - № 3080 on May 30, in 2002 “On developing computerization and implementing Information-communication technologies” and resolution № 202 “On deeply developing computerization and implementing Information-communication technologies” adopted by the Cabinet of Ministry of the republic of Uzbekistan in 2002, June 6 and also “State National program on developing school education from 2004 to 2009.” Basing on the tasks above mentioned government documents during the period of 2005 – 2009 totally 3355 schools equipped with modern computers, the number of schools which have been equipped latest version of computers consist of 5343 or 55% comparing to the total number of schools.

During the period of implementing the State program “A Year of Harmonized Developing Generation” paid great attention to solve the issue ondeveloping of the education sphere especially strengthening its material-technical bases, building new Educational establishments and equipping them with modern equipments.

As a result of implementing the national program on preparing specialists and State national program on developing school education 1536 academic lyceums and colleges, about 9000 secondary schools and more than 1800 sport halls have been built or reconstructed.

For the purpose of ongoing and systematic renewing and on systematically reequipping with modern computer techniques, laboratory equipments, furniture's and school tools and saving them in great demand and also effective using this opportunity completely new system – special fund has been established under the Ministry of Finance.

During this period developed the preparation system of specialists, in 50 directions of Bachelor Degrees and in 74 specializations of Muster Degrees to be made unification and new classificatory of specialization on Higher and Secondary Special Education have been introduced in the area of Higher Education

Under the State program “A Year of Harmonized Developing Generation” in 2010 560 Leading Cluster Schools equipped with 13 500 computers cost almost 6 million US dollar. More than 750 village schools equipped with modern laboratory and multimedia tools. 1500 village school teachers provided with 3400 personal computers cost 13 million US dollar.

At the moment almost all, especially more that 12 000 Educational establishments, scientific and cultural organizations connected with Educational portal which is included more than 25 thousand learning materials and resources. This is very important for giving opportunities on widely implementing methods of Distance Learning and providing young learners and youth with other information-communication services.

Together this activities regarding to introduce modern information communication technology, numeric and wide formatted telecommunication, the Internet not only to school, lyceum, collage and higher educational establishments but to each family are being intensified these days. Especially widely strengthening and developing modern communication and information technologies have been served one of the scales of development of our society and country for showing its prosperity.

In 2005 in the Public Education system of the Republic of Uzbekistan “The strategy of introducing information-communication technology to the school education” was worked out and according to this strategy set of computers which have been equipped not only used at the Computer lessons but they should effectively used teaching other subjects and also appointed the directions on creating multimedia learning tools and resources. Basing on this for the secondary schools according to the requirements of the State Education Programs the activities on developing highly qualified and effective multimedia materials and electronic teaching literature and manuals are being implemented.

Under the system of the Ministry of Public Education Coordination Council on introducing information-communication technologies has been established and under the Ministry “Center for ICT Content Development in Education” has been founded. The main goal of this center is to implement information-communication technology into the process of education, create content of multimedia programs, develop, localization and publication and introducing developed electronic educational resources to the process of Education.

Up today electronic version of 119 school subjects have been created and posted to the Internet based Education portal by the staff of the Center.

During the period of 2009 – 2010 complete connection of local set “Ziyo NET” all schools have an opportunity the only online Education information connections for teachers effective information exchange opportunities have been created. The process of publication and introduction advanced experience of advanced teachers; possibilities of modern information technologies have been fastened. As a result appropriate conditions for the students on gaining perfect and effective knowledge according to the requirements of State Education Standards have been provided.

### **Introduction of Instructional Design to the system “School of Mentoring”**

“School of Mentoring” is one of the national traditional Systems on getting education and it is a specific form of Education which has been successfully passed through the test of years. These days the form of Mentoring developed with the help of new approaches and is being introduced to the Teacher Training System.

In our country changing and renewing education programs taking into consideration to the modern achievements of science and technology, economy and culture, modernization of Education, its reconstruction according to the content have been implementing.

Nowadays rapid development of the society, outstanding innovations in science demands teachers to enrich and enlarge their knowledge and skills regularly. Basing on this by the Ministry of Public Education regular based system of “School of Mentoring” has been established.

According to this for the purpose of developing and strengthening of the Teacher Training System, completely reform and renew this system on requirements of the time at the Educational establishments the policy of “Organizing ongoing teacher training as the method of “School Mentoring” has been identified basing on Charter. According to this Charter experienced and advanced teachers who created their own school on conducting lessons and supporting young teachers through sharing experience and have high professional skills have been chosen through contest based and formed the list of Mentor teachers.

The method of “Mentoring” has differed from other type with its specific features like individual approach, and also flexibility, practicality in the process of learning. The main advantage of this form of Retraining is the chance of teachers for choosing appropriate Mentor teacher according to their needs. The identification and appointment of the content and teaching methodology of the program on the method of “Mentoring” is made of by the Mentor teacher. This gives a chance organizing Retraining for young teachers basing on the results of Monitoring

According to the above given requirements about 4000 Mentor teachers (Instructional Designer) have been chosen and created the list of Mentor teachers and also developed programs regarding to the activities on working with young Mentee teachers

As to this programs for working in the “Mentoring System” Mentor teachers should take into consideration the following activities:

- To conduct analyses on Mentees activities;
- Characteristics of Mentees: capabilities, interests for learning, knowing the topic beforehand, identify the general outlook;

- Psycho-social characteristics of the Mentee: interest, disposing to learning, identifying the attitude to the subject;
- Biologic characteristics of Mentee teachers: should clarify the age, specific characters of elaborating (visual, audile, and sensor), general health, cultural and linguistic opportunities.

Taking into consideration above mentioned characteristics help Mentors to choose teaching materials for Mentee.

It is known that the Mentees come to the Mentor according to the different reasons. Even the Mentees say that their main goal is to gain new knowledge or get acquainted with new colleagues; they have their own goals and needs. For example, using different methods for working with students have got a new job, develop their skills. If they are not able to get appropriate answers for their needs, mostly such kind of Mentees will stop coming at the Mentors despite not expressing their satisfaction less. For this reason it's very important to clarify if there is any needs for recommended method or not. Besides Mentor should identify previous and post knowledge of Mentees, that is what they know before the course and what they must learn after the course and what kind of knowledge they need.

For working with Mentees it is very important:

- to conduct analyses on personality of Mentee;
- to put clear goals and objectives on working with Mentees;
- to choose right pedagogic strategy for working with Mentee;
- to choose learning materials for Mentee, to make and develop the program;
- to evaluate the needs of Mentee;
- to make a right choice of working steps with Mentee;
- to develop the pedagogic process basing on the needs of Mentee.

Usually it is right to develop clear methodological approach for each Mentee.

As to evaluating the needs on working with Mentees help to understand the level of knowledge and skills, what kind of methods Mentees use during the process of their work, what the mentee want to know and how they want to get knowledge and what Mentor should do for this.

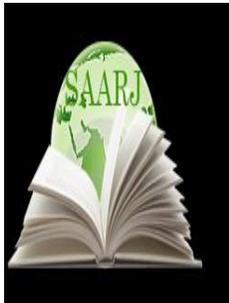

### **CONCLUSION:**

In conclusion we can say that putting the method of "Mentoring" into practice help the teachers who work in the system of Public Education to strengthen the features of competence and serve improving the quality of education. The method of "Mentoring" is a new approach which served to increase the effectiveness of teaching and learning in future.

It is known that the last years there have been exemplary reforms which made a good store on raising moral ability of our youth and nation for building up to date equal world huge implemented activities according to its capacity and content in the field of Education. Of course, there is a specific role of the "Mentoring school" on putting into practice of these reforms.

Presents the findings and practical recommendations.*

**KEYWORDS:** *Real Sector, Private Sector, Economic Modernization, Asian Development Bank, Foreign Credit, Foreign Investments, Commercial Banks.*

**INTRODUCTION**

Modernization of the economy of our country, its effective structure to have a structure and thereby achieve sustainable economic growth one of the important conditions for the development of our country and the well-being of the people is calculated. To achieve these goals, the International Monetary Fund (IMF), the IMF Special Funds, International Bank for Reconstruction and Development (IBRD), International Development Association, International Finance Corporation, European Recovery and Development Bank (EBRD), the European Union's regional currency and credit Scientific electronic journal "International Finance and Accounting". financial institutions, European Investment Bank, Islamic Development Bank, Asia development banks primarily the rapid development of the real sector of the economy has been supporting our republic in every possible way. This article is about some aspects of the partnership.

Interaction of national economies in the context of deepening reforms increasing dependence, competition in global markets and financial and economic increasing instability, increasing the

stability of countries encourages finding ways to ensure sustainable economic development. Ready with high added value in the real sector in order to produce products, develop sustainable industries aimed at increasing the share of deep processing industries in raw materials structural changes in the economy ensures a stable market position. The problem of low stability of industries in general is preserved. The main products of the processing sector domestic production costs to the world average price level approaching, the average world for some product types higher than the price. This trend is material technology and energy is determined by the fact that the share of costs remains high.

Based on these goals, modernize the economy. In this context, it is important to support real sector enterprises is coming. Because in the process of private and real sector development, the state's internal. There is a lack of financial resources, loans from international financial institutions the demand for attraction is growing. International finance to date. The importance of international financial institutions in relations is high. International financial institutions have large financial resources and large powers. These organizations form the basis of global financial and credit relations. International cooperation with financial institutions is not only a major investment for the country to the economy, but also to global financial relations also gives you the opportunity to have a place and a voice. Production in support of real sector enterprises modernization, expansion of cooperative ties, strong cooperation domestic demand for domestically produced goods incentives are special. Accordingly, The President of the Republic of Uzbekistan signed a decree "On support of enterprises of the real sector of the economy. Decree No. 4058 of 28 November 2008 on the Program of Measures [1]. Among the important measures are all of the local manufacturing enterprises less than 20% of the cost of production due to efficient use of resources the task of ensuring their competitiveness by reducing the amount of non-existent we can see that.

Today in our country not only the public sector, but also the private sector. Uzbekistan to attract international capital to the sector Agreements with a number of financial institutions in the banks of the Republic foreign credit lines were opened on the basis of Private sector financing through them is being done. The following is a list of major international financial institutions. Private and real assets of the Asian Development Bank in the Republic of Uzbekistan as an important source of investment in the development of sectors indicates. The following is not used in the development of innovation in the industry opportunities are available: in the total volume of industrial products sold the share of innovative products is 2.8%. High-tech product in the total volume of industrial production the share of production in 2011 was 10.8%. This is industrial is lower than in developed countries (less than 30-35 percent) it's not) [2].

The country's industry in ensuring the stability of the national economy takes the lead. Therefore increase the sustainability of the country's industry and the following measures to ensure sustainable growth. It is necessary to do:

- improvement of technological processes and raw materials, materials and cost reduction by reducing energy consumption by 10-15% reduction and reduction of production costs, reducing the share of energy consumed in industry by at least 30% [3];
- level of capacity utilization and industry increase in cocktail productivity by 6-7% per year, use and non-production cost reduction, staff optimization;

- Spirituality in large enterprises operating in the industrial sector and accelerating the renewal of obsolete means of production, further modernization of production facilities, and has been successfully tested at the level of world standard requirements in enterprises accelerated introduction of modern technologies;
- effective diversification of production and traditional export of industries (oil and gas industry, non-ferrous metallurgy, agriculture) processing of products, including cotton) innovation in deepening resource recycling apply;
- High capacity of science with the participation of small business and private entrepreneurs financing innovation in existing, high-tech projects Creating a fund;
- Attracting investments in large enterprises and high-tech effective international innovation to support product exports creation of mechanisms for cooperation;
- Improving the efficiency of financial activities of enterprises: industry financial managers and managers of the enterprises of the sector increase training levels [5].

Firms have a wide range of economic relationships, including raw materials and performs calculations related to the purchase of materials, sale of finished products. Also the state budget, finance, banking, insurance and creditors. They are scheduled to be held accountable. The implementation of the deadline, adherence to financial discipline is great important. When it comes to solvency, the firm is overdue sufficient funds required to meet payment obligations or Understanding the shortcomings is understood. Enterprises in a market economy it is important to be able to pay, and this is what he needed in a timely manner determines the ability to repay debts. Enterprise balance sheet data based on the state of solvency. For this, debt obligations with the funds required to repay the enterprise comparable. An enterprise's competitive strategy is a business approach and customer engagement initiatives in the enterprise market is a struggle to strengthen the position. In the market competition can be compared to war. Injuries to opponents in this war, may be damaged. Only the best strategy will win. The company's competitive strategy is short of offensive and defensive actions long-term tactical and long-term actions. Competitors firm with the onset of a serious counter-attack against the superiority he had created begins to slip. The firm is second to retain its position must carry out a strategic attack.

In short, in today's practice, international financial institutions are diverse lending, including financing the real sector of the economy operations. Alternative international finance cooperation with organizations is not only a huge investment for the country to the economy, but also to global financial relations also gives you the opportunity to have a place and a voice. Therefore, the expansion of cooperation with international financial institutions is for each country is one of the most important issues. Based on the above considerations, the activities of real sector enterprises on increasing the role of international financial institutions in financing

The following scientific proposals and practical recommendations are formed:

First, the transparency of real sector enterprises, information transparency. As a result, international financial institutions are real the importance of direct financing of sector enterprises earns.

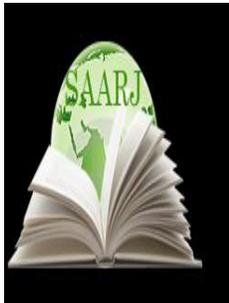

Second, the export potential of real sector enterprises in the economy. This is due to the timeliness of foreign currency loans allows it to be returned. It also speeds up the lending

process. Third are the real estate companies organization of international securities transactions in foreign currency by need The result is international finance through the circulation of securities. Opportunity to attract financial resources from institutions to real sector enterprises occurs.

Based on the above, it can be said that the enterprise a comprehensive study and scientific approach to ways to increase sustainability is one of today's demands. Corporate stability is economic freedom, political stability, legal based, institutionalized environment. These factors enterprise as a result of conducting marketing activities in the market on the basis of to achieve the level of profitability of the economy and to meet the full supply and demand you will have to make every effort to learn. Because the stability of an enterprise depends on many factors, the enterprise key performance indicators that characterize economic activity econometric analysis of the laws of dependence on variables can be determined by.

### ABSTRACT

*The article discusses the features of socialization of preschool children in educational and cognitive activities. Educational and cognitive activity of preschool children is a child-driven or independent cognition of children, stimulated by adults, aimed at creating the prerequisites for educational activities in the process of mastering the sociocultural experience of cognition.*

**KEYWORDS:** *Socialization, Educational and Cognitive Activity, Preschool Children.*

### INTRODUCTION

The problem of socialization of preschool children is one of the basic problems in pedagogy and psychology, since its success determines the individual's ability to fully function in society as an

active subject. The degree of socialization determines how harmoniously developed the preschooler will be, assimilating at the initial stages of the socialization process the norms and attitudes necessary to become a full-fledged and equal member of his social environment.

The change in the pedagogical impact from the one-way influence of “teacher-child” to a more multifaceted and voluminous interaction in the system of “child-adult-peers” presupposes the establishment of a new psychodidactic paradigm in preschool education. The recognition of it as the only true one at the level of the state standard of education brings profound constructive changes in the activities of a preschool educational institution.

## **MATERIAL AND METHODS**

New educational programs for a preschool educational institution are aimed at the comprehensive development of the child on the basis of special, specific types of activities inherent in preschool children. That is, in practice, we will get a more versatile approach, welcoming the maximum exploitation of innovative and active methods of pedagogical interaction, more individualized and aimed at revealing the own potential of each child.

One of the external factors determining the content and form of socialization of preschool children is educational and cognitive activity.

From the standpoint of the personal-activity approach in pedagogy and psychology (L. S. Vygotsky, A. N. Leontiev, I. A. Zimnyaya, I. S. Yakimanskaya), the basic conceptual provisions of personality development at various stages of ontogenesis (L. S. Vygotsky, D. B. Elkonin, BC Mukhina, L. I. Bozhovich), modern concepts of psychological and pedagogical support (M. R. Bityanova, E. I. Kazakova, E. A. Kozyreva, T. I. Chirkova), reflecting the main essential characteristic of a personality-oriented humanistic paradigm of modern education, the pedagogical is accompanied These children of preschool age are considered as a continuous process of creating the conditions for the effective self-development of a person. One of the important components of social experience is the experience of mastering ways of working. The method of activity (including educational cognitive) is a combination of social and social skills, with the help of which a significant practical result is achieved [1, p. 43].

## **RESULTS AND DISCUSSION**

However, with the pedagogical support of the socialization of preschool children there are a number of professional difficulties. The contradiction is expressed, on the one hand, in understanding the need for organizing pedagogical conditions for the successful socialization of preschool children, on the other hand, insufficient knowledge of the various ways of pedagogical support of this process in educational and cognitive activities. Also significant and objective is the difficulty of the process of socialization and the need for its pedagogical support, associated with the controversial nature of the process of growing up of a preschool child [3, p. 53].

Educational and cognitive activity of preschool children is a child-driven or independent cognition of children, stimulated by adults, aimed at creating the prerequisites for educational activities in the process of mastering the sociocultural experience of cognition. In defining the concept of “educational and cognitive activity in a preschool institution” we relied on the research of modern scientists T. M. Babunova, T. N. Babaeva, D. A. Gogoberidze, HA Gorlova, T. N. Doronova, HA Korotkova, N. Y. Mikhailenko, N.E. Razenkova, and others.

The organization of pedagogical support of educational and cognitive activities of children includes the goal-setting stage - setting and adoption of educational and cognitive tasks by children; organizational and activity - the implementation of the children's plan (project), the implementation of mental and practical actions provided for and arising in the process of solving educational and cognitive tasks; creation by the teacher of the necessary conditions for this; reflective stage - an assessment of the effectiveness of educational and cognitive activities, consisting of three steps: self-esteem by each child, collective joint or mutual assessment, pedagogical assessment.

Educational-cognitive activity in its content and type is so diverse that it can be distinguished: in form (collective and individual); by methods of implementation (artistic - music, drawing, dancing; creative; technical creativity - modeling; collecting), by emotional tension (dedication, a feeling of joy and satisfaction of needs; always carried out in free time or in the period after a high level of fatigue, as a forced rest during the period of intensive work), according to the physiological orientation (helps to restore physical strength).

Educational and cognitive activity of preschool children is represented by a combination of four interconnected components: targeted, focused on creating the conditions for the formation of experience in the activities of children, mastering the methods of cognition and the basic premises of educational activity; meaningful, determining the focus of activities on satisfying the need for knowledge, the formation of the leading competencies of the child, the formation of the primary experience of educational and cognitive activity; procedural, reflecting the interaction of the teacher and children at each stage of the cognition process; effective, suggesting the necessary changes in the level of development of educational and cognitive activity.

A feature of cognitive interest is its ability to enrich and activate the process not only of cognitive, but also of any human activity, since the cognitive principle is in each of them. In labor, a person, using objects, materials, tools, methods, needs to know their properties, to study the scientific foundations of modern production, to understand rationalization processes, to know the technology of this or that production. Any kind of human activity contains a cognitive principle, search creative processes that contribute to the transformation of reality. Any activity a person inspired by cognitive interest, performs with great passion, more efficiently.

The cognitive activity of a child of preschool age is characterized by an optimal relationship to the activity performed, the intensity of assimilation of various methods for positive achievement of the result, the experience of creative activity, and the focus on its practical use in their daily lives. The basis of a child's cognitive activity in experimentation is the contradiction between the existing knowledge, skills, acquired experience of achieving results by trial and error and new cognitive tasks, situations that arose in the process of setting the goal of experimentation and its achievement. The source of cognitive activity is overcoming this contradiction between the acquired experience and the need to transform, interpret it in their practical activities, which allows the child to show independence and creative attitude when completing the task.

The guidance of the development process of non-standard thinking of children by the educator is realized through the use of various methods and techniques of activating the intellectual sphere of the child [2, p. 25].

In older preschool age, cognitive development is a complex complex phenomenon, including the development of cognitive processes (perception, thinking, memory, attention, imagination),

---

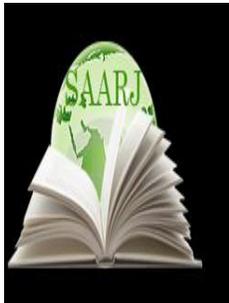

which are different forms of the child's orientation in the world around him and regulate his activities in himself. It is known that by the senior preschool age the possibilities of initiative transformative activity of the child are noticeably increasing. This age period is important for the development of a child's cognitive need, which finds expression in the form of search, research activity aimed at discovering a new one.

### CONCLUSIONS

Cognitive activity is understood not only as a process of assimilation of knowledge, skills, but mainly as the search for knowledge, the acquisition of knowledge independently or under the pedagogical support of an adult, carried out in the process of humanistic interaction, cooperation, co-creation.

## INTRODUCTION

In the 21st century, global education has been recognized as a key factor in ensuring sustainable development and has been identified as a priority in the international education concept until 2030, which is to encourage quality education and creative abilities. It requires the development of early childhood artistic education, the development of ethnographic education through social and cultural traditions. In particular, it should be noted that the 2001 UNESCO Universal Declaration on Cultural Diversity and the Istanbul Declaration of 2002 highlight the ethnographic education as the basis for cultural diversity and the guarantee of sustainable development.

Socio-economic, spiritual and educational changes that are taking place at the present stage of development of society, radical reforming the education system, its complete eradication from past ideological ideas and failures, at the level of developed democracies. The need for increased efficiency through the training and training of highly qualified personnel that meet ethical and ethical requirements. According to the Regulation on Preschool Education in the Republic of Uzbekistan, a child receives preschool education in the family and in preschool. On this basis, it is important for staff working in preschools to establish and maintain family relationships. Preschool education should be based on the principles of collaborative pedagogy, which is based on a humanistic and creative approach to education.

## MATERIAL AND METHODS

One of the most important tasks of preschool education, according to the requirements of the state requirement of preschool education, is the artistic, aesthetic and speech development of children. The state requirements of preschool education emphasize the need for acquaintance with book culture, children's literature, and understanding by ear texts of various genres of children's literature. And also, it involves the development of the prerequisites of value-semantic perception and understanding of works of art (verbal, musical, visual), the perception of fiction and folklore.

The relevance of the problem at the socio-pedagogical level is determined by the order of society. Despite the obvious importance and indispensability of reading, a decrease in interest in the process of reading and perceiving a book, in our time, is observed all over the world. Teachers and psychologists associate these trends with globalization, the widespread availability of electronic audiovisual media, the development of television culture, social networks and the entertainment industry. It is believed that precisely these factors determine the crowding out of reading as a previously irreplaceable source of socially significant information, and a decrease in its cultural prestige. Here we must take into account that the modern child of preschool age already initially exists in an information-rich environment, generated not only by print media, but also by various electronic devices.

## RESULTS AND DISCUSSION

A great contribution to the study of the problem of reading interest was made by such scientists as: Ya.A. Comenius, K.D. Ushinsky, L.N. Tolstoy, Kh.D. Alchevskaya, N.A. Rubakin, A.V. Zaporozhets, N.S. Karpinskaya, M.M. Konina, D.B. Elkonin. M.V. studied the main problems directly related to the reading interest of children. Sobolev, N.K. Krupskaya, G.I. Bogin, L.G. Zhabitskaya, V.A. Levin, M.M. Rubinstein et al. Scientists such as: I.A. worked on the problem of perceiving a work of art by preschool children. Winter, N.N. Svetlovskaya, M.I. Okorokova, N.G. Morozova, O.I. Nikiforova, B.G. Umnov, E.L. Goncharova, T.I. Grisik, Z.A. Gritsenko, L.M. Gurovich, N.E. Dobrynina, O.S. Zhukova, I.N. Timofeeva and others.

Consider the definition of reading interest of preschool children in the works of scientists N.N. Svetlovskaya defines the reading interest of younger schoolchildren as a personality trait, which is determined by the reader's motives that encourage him to turn to books, and a system of knowledge, skills that enable him to realize his motives with the least expenditure of time and energy in accordance with social and personal need "[3, p. 185].

In modern pedagogical science, O. V. Chindilova described the optimal level of development of the reading culture of preschoolers: the child's culture of communication with the book (the presence of ideas about the book and its purpose, value attitude to the book, the formed ability to observe, study the book, choose the book of interest); the culture of reading perception (emotional reaction to reading, including imagination in the reading process, aesthetic perception of a literary text, the ability to find value and cognitive meanings in a read); the presence of age-related theoretical and literary knowledge [5, p. 85].

Analyzing the interpretations of the concepts of "reading interest" and "reading culture of preschoolers", we proceed directly to the notion of reading the notion of reading interest in preschool children. Summarizing the foregoing, we believe that the reading interest of preschool children should be understood as the presence of external and internal motives of the child that encourage him to turn to books, the steady interest of children in the process of listening, quasi-reading, and emotionally-colored retelling of a read, and heard artistic text.

In this regard, we believe that for the effective organization of work on the formation of reader interest in preschool children, we need to understand and create psychological and pedagogical conditions that will help this process, and thereby ensure a positive experiment. We suggested that the motivation of children to read by means of socially significant partnership will be significant in the formation of the reading interest of preschool children. Let us consider this condition in more detail. One of the functions of preschool educational institutions is considered to provide a basis for the embodiment of the comprehensive development of the child. It should be emphasized that educational institutions, taking into account their material, technical, economic, staffing, are not always ready to guarantee a high-quality process of socialization of a preschool child, and cannot provide sufficient motivation for children to learn new information from different angles and forms of activity . As a result of this, it is necessary for the kindergarten to involve other auxiliary, educational resources and the necessary reserves in the upbringing process. One of these reserves is considered an event of socially significant partnership.

Having a clear idea of the nature, content and forms of motivating children to read by means of socially significant partnership requires an appeal to the definition of the concepts of "motivation" and "socially significant partnership". Having studied various approaches to the

study of the concepts of “motive” and “motivation” by domestic and foreign psychologists, we noted the most significant points that made it possible to conclude that all definitions of motivation can be reduced to two main groups:

1. The definition of motivation given by O.S. Vikhansky and A.I. Naumov, as a set of internal and external driving forces that prompt a person to activity, set the boundaries and forms of this activity and give it a focus focused on achieving certain goals [1, p. 287].
2. Also in psychology, motivation is seen as a process and a dynamic education. In the framework of this approach, the most accurate is the definition of M.Kh. Mescon, M. Albert and F. Hedouri: motivation is the process of motivating oneself and others to work to achieve personal goals and organization goals [4, p. 538].

At the same time, it is important to note that A.K. Markova (characterizing the attitude to the activity itself), external motives are called social and internal motives are cognitive (we will consider this classification in the future) [2, p. 45].

These motives, in the context of our research, deserve special attention, since they are an important basis for self-education, self-improvement of the child’s personality and will be most suitable when creating psychological and pedagogical conditions for the formation of reading interest in preschool children.

These motives express such needs as: a desire to acquire knowledge in order to be needed by society, a representation of the need to learn something new, a sense of responsibility. The arguments of the socially significant partnership are that the child wants not only to contact and interact with peers, but also tries to understand, explore the methods and forms of his own partnership and relations with the teacher, friends and other adults.

## CONCLUSIONS

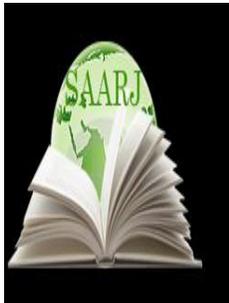

In the process of interaction with social partners who work in the library sphere, artistic creation, printing, the child develops a motivation for learning the book. Forms of socially significant partnerships may include:

1. Educational excursions to the library and printing house, mass media.
2. Educational activities in the community of parents of pupils of preschool educational institutions to familiarize the child with the book. Organization of cross-booking and exhibition of favorite books in kindergarten groups.
3. Research activities of the process of virtual excursions to the world museums of books and printing. Based on the foregoing, we conclude that it is necessary to introduce activities. Preschool educational institutions of psychological and pedagogical conditions for motivating the reading interests of preschool children by means of socially significant partnership.

### **ABSTRACT**

*One of the five priorities of the Action Strategy for the Development of Uzbekistan for 2017-2021 is aimed at further development and liberalization of the economy. This article discusses ways to increase the efficiency of insurance companies by expanding insurance services at the current stage of economic development.*

**KEYWORDS:** *Strategy Of Actions, Insurance Services, Investment, Innovation, Infrastructure, Modernization.*

### **INTRODUCTION**

The large-scale reforms being carried out in our country today are being carried out on the basis of well-thought-out plans and programs. Therefore, each development program covers all important aspects of the socio-economic life of the republic in order to achieve concrete results. Most importantly, it is able to ensure the well-being of our people. The positive assessment of this prudent policy by many influential international organizations, foreign investors, major financial institutions, experts from partner countries creates the basis for the establishment of new mutually beneficial relations.

At the same time, consistent measures are being taken in our country to ensure the full implementation of the adopted programs, further clarification of strategic goals and timely resolution of problematic issues. In particular, we all know that President ShavkatMirziyoyev has adopted important decrees, decisions and instructions on the accelerated development of the country and pays great attention to its implementation.

It is known that on February 7, 2017, the Decree of the President of the Republic of Uzbekistan "On the Action Strategy for the further development of the Republic of Uzbekistan" was signed. This decree approved the Action Strategy for the five priority areas of development of the Republic of Uzbekistan for 2017-2021, which is dedicated to the issues of more rapid development of the country for the next five years, and today it serves as a program in all areas.

It should be noted that one of the five priorities of the Action Strategy for the Development of Uzbekistan for 2017-2021 is aimed at further development and liberalization of the economy. The goal is to continue institutional and structural reforms to strengthen macroeconomic stability and maintain high economic growth, increase the competitiveness of the national economy, accelerate the modernization and development of agriculture and reduce state participation in the economy. to stimulate the development of small business and private entrepreneurship, complex and balanced socio-economic development of regions, districts, cities, to achieve the active attraction of foreign investment in the country's economy and regions by improving the investment climate.

In modern economic conditions, when the risk of natural, man-made, economic and social risks increases, there is a growing need for an effective insurance business that protects the property interests of citizens and organizations, as well as socio-economic stability in the country.

The current stage of economic development is characterized by a number of features, the most important of which is instability. An unstable economy is a state of an existing economic system whose development is unstable and it is difficult to predict the future state of its elements. The peculiarity of this type of economy is the formation of special conditions for the operation of enterprises, the most important of which are the availability of many options for the further development of events and the chaos of processes that determine the functioning of the economic system.

There are two groups of economic instability factors that affect the competitiveness of companies: internal (unemployment, inflation, public budget deficit, development of new technologies and their introduction into the economy, etc.) and external (political events in the world, the global economic crisis, global integration processes, etc.) ).

In classical economic theory, a firm's competitiveness is understood as the real and potential opportunities available in the current environment to design, produce, and sell goods that are more attractive to the consumer in terms of price and non-price features than their competitors' goods. Leading local economists understand competitiveness as a multifaceted economic category, which should be considered in the following aspects: competitiveness of goods, enterprises, economic systems (industries, complexes, integrated structures, regions, clusters). In the context of economic instability, the basis of competitiveness is innovative competition, the main task of which is not to squeeze the opponent out of the positions he occupies, but to strive to be ahead of him in a new, more promising position. At the present stage, the company's competitive advantages include traditional economic features that reflect modern realities: technical leadership, leadership in opening new markets and changing old ones, accurately predicting the direction of changes in consumer tastes and o The desire to turn it into their own products and so on. Competitiveness is formed under the influence of factors at the macro and micro levels.

Consider the competitiveness of companies whose activities are related to the provision of insurance services. This sector with great potential is not properly developed in the domestic economy. In addition, the insurance market has its own characteristics that significantly affect the competitiveness of insurance companies. An additional factor influencing this is the ongoing process of concentration of insurance capital of insurers in Uzbekistan. One of the factors that increase the level of competition in the insurance market of Uzbekistan is the inflow of foreign investment in existing and newly established insurance companies in Uzbekistan. Factors hindering the development of insurance companies include: underdeveloped infrastructure of the insurance market; poor quality of corporate governance; underdeveloped reinsurance market; lack of highly qualified specialists, etc. The active efforts of companies in increasing the competitiveness of insurance companies in Uzbekistan play a leading role, and government support is reflected in creating conditions for their effective development.

To increase competitiveness, insurance companies need to ensure effective systematic management of competitiveness. System management involves the formation of specialized internal management structures of the type of coordination, development and implementation of long-term and medium-term strategies, programs and plans to increase competitiveness, as well as targeted use of regional opportunities and factors to increase competitiveness.

In this case, given the possibility of applying the method of similarity, we consider it appropriate to apply a systematic management of competitiveness in insurance companies. A systematic approach to managing the competitiveness of insurance companies allows us to consider the generality of all external and internal factors that affect their performance.

Another way to increase the competitiveness of insurance companies in Uzbekistan is to develop insurance programs for public-private partnerships. In modern economic conditions, it is important to establish a dialogue between business and government, for which the most effective form of interaction of these economic entities is public-private partnership.

Public-private partnership (public-private partnership) is understood as a public legal partner on the one hand, and a private partner on the other hand, based on the pooling of resources and risk sharing, which is legally formalized over a period of time and carried out under a public-private partnership agreement ... attracting private investment in the economy, ensuring the availability of goods, works and services by public authorities and improving their quality. The following risk groups of public-private partnership projects are distinguished: political risks (changes in legislation; changes in economic policy, etc.); economic risks (non-payment, increase in construction costs, increase in operating costs, credit and currency risks, etc.); innovative risks (probability of loss of resources and funds, etc.); environmental risks (negative impact on the environment; damage to human health).

Insurance is a common and most widely used method in the risk management practice of public-private partnership projects. Insurance of public-private partnership projects will bring real financial benefits to the partners, as well as affect the willingness of enterprises to invest in the modernization of infrastructure in Uzbekistan. In this, the state plays an important role, formulates certain requirements for insurance and sets a minimum risk package.

It should be noted that the use of systematic management and a systematic approach to competitiveness in the development of development strategies in insurance companies can affect their competitiveness in the market. Increasing competitiveness is also possible only through the

implementation of innovations through the development and introduction of new insurance products. An example of such an innovation is the introduction of insurance programs for public-private partnership projects.

The superior development of voluntary insurance involves activating the work of market participants to improve the relationship between consumers and providers of insurance services and achieving a high level of quality of such relations. "Interaction" is the essence of a voluntary insurance relationship. In modern conditions, the main way to increase the effectiveness of interaction between consumers and providers of insurance services is to work on the formation, maintenance and strengthening of consumer confidence in insurance and insurers. Trust, as a form of expression of interest, is the result of practical consideration of the interests of consumers and insurers in the insurance transaction. Therefore, it is necessary to influence the level of trust through professionally organized work to identify and take into account their interests in insurance relationships. To ensure strategic success in the development of domestic insurance, first of all, it is necessary to solve the problem of increasing the role of the insurance market infrastructure by changing the quality of market relations that make up its composition.

Currently, the activities of insurance intermediaries in Uzbekistan, especially insurance brokers, face serious problems. In turn, the unresolved nature of these problems remains a serious obstacle to the healthy development of domestic insurance in general.

The analysis of modern market relations has shown that insurance intermediaries, which represent only insurers in the market, and independent insurers, which have the ability to represent both insurers and insureds in insurance transactions need intermediaries.

It is necessary to take a number of legislative measures to improve taxation to stimulate the activities of insurance intermediaries, expand its reproduction base and increase its sustainability. In particular, the exclusion of the activities of insurance intermediaries to protect the interests of insurers or insureds from the scope of value added tax (VAT), taxation of insurance intermediaries on the basis of actual cash receipts for tax purposes it is necessary to give the ability to calculate.

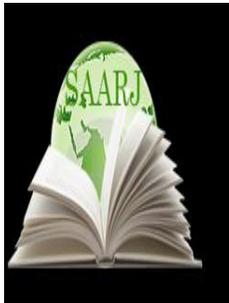

In general, the improvement of insurance and tax legislation in this area will help to activate the main productive forces of the domestic insurance market and will become an important factor in the development of real insurance in our country.

Information technology support in the promotion of insurance services. At present, information technology does not play an important role in consumer insurance services in Uzbekistan. Automation of various business processes of insurance companies to improve the quality of service, ensure "information transparency" of business and "symmetry" of information for consumers, maximize personalization of relations with insurers and purchase costs and helps attract new insurers by lowering the cost of services by reducing processing costs.

### ABSTRACT

*The article discusses the features of professional self-development of a future teacher in the context of personality-oriented pedagogy. Professional self-development is a process of integration of external professional training and internal movement, personal development of a person and can act in various forms. In this process, professional space is one of the areas of personalization. The importance of subject technology in professional self-improvement of a student is shown.*

**KEYWORDS:** *Teacher Education, Professional Self-Development, Professional Self-Improvement, Primary School Teacher, Pedagogical Thinking.*

### INTRODUCTION

Improving the quality of teaching in terms of implementing anthropocentric vectorization of the educational process at a university required the development of a pedagogical strategy and tactics for translating into life a specific educational institution a theoretical model for optimizing personal development in professional self-improvement.

### MATERIAL AND METHODS

I.F. Isaev and E.N. Shiyanov, exploring the problems of teacher education, the goals of teaching activity are associated with specific motives that are adequate to the needs that are realized in it, and this explains their leading position in the hierarchy of needs that make up the important characteristics of the personality of the teacher. To these needs, scientists include: the need for self-development, self-realization, self-improvement and development of others. The dynamics of the images “I am the real”, “I am the retrospective”, “I am the ideal”, “I am the reflexive”, “I am the professional” determines the level of personal and professional development of the teacher. The high level of this development is characterized by the convergence of the parameters “I - ideal” and “I - real”, forming phenomena and norms of a humanistically oriented professional and pedagogical culture [2, P. 51].

## RESULTS AND DISCUSSION

The humanistic parameters of pedagogical activity, acting as the “eternal guiding lines of the teacher”, make it possible to fix the level of discrepancy between the existing and the proper, the reality and the ideal, stimulate creative overcoming of creative gaps, cause a desire for self-improvement and thereby determine its meaning-life self-determination.

The ability to pedagogical thinking, which is divergent in nature and content, provides the teacher with an active transformation of pedagogical information, going beyond the boundaries of the time parameters of pedagogical reality. Developed intelligence allows it to learn not individual individual facts and phenomena, but to study and comprehend pedagogical ideas, theories of teaching and upbringing. Reflexivity, humanism, future orientation and a clear understanding of the means necessary for professional self-improvement and development of the personality of the pupil are characteristic features of the teacher’s intellectual competence.

The teacher’s self-awareness not only contributes to the formation of an integrative image “I am professional,” but also to the construction of a certain theoretical model that influences the solution of individual, professional problems associated with the realization by the teacher of my creative capabilities. This implementation, in turn, brings the individual satisfaction from the activity, allows you to achieve the appropriate level of creativity in the work. Developed pedagogical thinking refracts knowledge and methods of activity through the prism of its own individual professional pedagogical experience and helps to find the personal meaning of professional activity. The latter requires the teacher a high degree of activity, the ability to manage, regulate his behavior in accordance with the arising or specially set tasks, encourages him to manifest an innovative style of pedagogical activity [2, P. 54].

In the process of such preparation, the developing learning potential is emphasized, the value of search activity and didactic goals of a high cognitive level are updated, the personal and professional readiness of the teacher for flexible, tactful interaction with students is developed, the main motive of innovative activity is formed - professional interest in combination with self-realization and development orientation children.

Professional self-development is a process of integration of external professional training and internal movement, personal development of a person and can act in various forms. In this process, professional space is one of the areas of personalization. In the research of V.A. Slastenin, D.Yu. Anufrieva, M.I. Kryakhtun is justified that professional self-development consists of two components: external conditions (which are created by certain positions) and internal abilities (they are mastered by the teacher himself), which suggest the presence of: a)

needs - in updating, in development, in self-knowledge, in understanding of one's actions ; b) goals, c) means [8, S.365-366]. Personal and professional are parts of a single process of teacher's professional self-development, including three structural components: reflective, regulatory, and a component of developing interaction. Moreover, personal space is "responsible" for a person's individuality, and professional space is responsible for involving a person in a sociocultural context.

Analyzing the features of creative self-development of the personality of students as a component of professional and pedagogical culture, I.A. Sharshov highlights his professional orientation. Professional and creative self-development of the student's personality is considered by the author as the creative self-development of his personality in the educational process of the university, providing further creative self-realization in professional activities. Moreover, the author emphasizes that self-realization, based on self-knowledge and mechanisms of self-organization, includes the processes of self-determination, self-actualization, self-improvement, self-expression, self-affirmation, etc. [4, p. 45].

For practical purposes, it is important that these processes as part of self-education are not isolated, because they have common foundations in the form of using organizational forms of professional training of a student, ensuring his systematic work on himself in the form of reliance on the internal goals and positions of the personality, its value orientations in professional activities, possession of information about the image and essence of the profession, necessary to determine the meaning and direction of professionally-creative self-realization..

The technology of personality-oriented learning, which is forming today, involves a change in the nature of management, personal positions of both the teacher and students, the formation of new meanings for the organization of the educational process, based on the principles of interaction, cooperation, help, inspiration, attention to the formation and development of the student's personality, pedagogical culture of future specialists in the education and upbringing of primary school children as the goal of professional self-improvement. In the context of its implementation, the teacher not only transmits educational information, but also organizes the dia- and polylogical development of professionally significant information by students, discussing facts, issues, problems related to the importance, organization, methodology and technique of self-improvement of their professional skills that students are interested in. Acting as a teacher-manager and director of training, the teacher offers students the minimum necessary set of teaching aids.

The effectiveness of the implementation of subject teaching technology depends not only on the identification and use of a set of rational teaching methods for orienting students towards a professional ideal and the consistent implementation of organizational and pedagogical conditions that optimally contribute to the formation of a need for professional self-improvement, but also on the means of instruction through which an operational direct and feedback between teacher and student.

Textbooks and teaching aids, providing a comprehensive educational program developed in space and time, perform the function of guiding the cognitive activity of students, implement the concept and strategic line of training, in accordance with the curriculum, determine the content of the subject and act as the foundation for building a didactic training system for this subject. The content of textbooks on pedagogy (V.A. Slastenin, I.F. Isaev, A.I. Mishchenko, E.N.

Shiyanov, P.I. Pidkasisty, I.P. Podlasov, S.A. Smirnov, A.D. Soldatenkova, I.F. Kharlamova and others) and teaching materials, we aim future elementary school teachers to improve their own professional pedagogical culture.

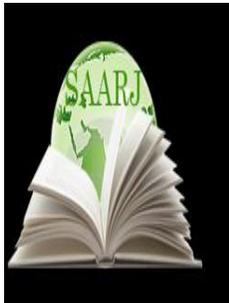

The monographs of V.I., capacious and deep in understanding the mastered psychological and pedagogical realities Andreeva is brought to a new level for Russian pedagogy, the development of the processes of progressive self-movement of the personality of the teacher and student. The author focuses the pedagogy course on the creative self-development of the student - the future teacher, included in the innovative processes of the school. Valuable, in our opinion, is the shift in emphasis in teaching the “Pedagogy” course from the subject to the anthropological aspect, aimed at self-education, self-education, self-development of a person [1, vol. 1, P.431]. The strategy of creative self-development is determined, on the one hand, by the needs for professional self-improvement, and, on the other hand, by the degree of awareness and self-knowledge of their strong and weak professional and personal qualities. The author pays special attention to the issues of self-development of the teacher’s methodological culture, which he considers as continuous work on himself.

## CONCLUSIONS

Theoretical and methodological points put forward by scientists and we use recommendations as necessary in our empirical analysis of the array. In these studies, it is important for us to search for resolution of contradictions between external structures that provide training for the future teacher and professional development of a person, which is mainly the result of his or her own internal movement, self-development, when. Professionalism becomes a value for his / her personality and requires a clear understanding of the means necessary for professional self-improvement.

**ABSTRACT**

*In this article was considered the methods of scientific research which are the main criteria of development the branches of the machine-building industry. In our opinion, the research work carried out by Us is expedient to be carried out according to the subject-fundamental method that seeks to explain phenomena, facts and processes. The practical application of these studies can give, in the future, a significant economic effect. . The result of the implementation of such works is the creation or improvement of means and methods of manufacturing (consumption) products.*

**KEYWORDS:** *Scientific Research (SR), Apply Work, Fundamental Work, Applied Work.*

**INTRODUCTION**

The modern machine-building industry of the Republic is developing on a large scale. This requires a direct relationship between production and science, that is, it requires the introduction of innovative scientific achievements into industry.

We were motivated to write this article by the situation that at present many articles published in various journals are purely informational. This article written by Us on the methods of conducting research work will give an opportunity to conduct scientific research in the future, understanding and studying the scientific aspects of the problems of the machine-building industry.

The classification of scientific research carried out at machine-building enterprises is important for developing a strategy for the development of science, solving issues related to scientific assessment, promising scientific directions for planning and financing work, determining the contribution of fundamental and other research to solving production problems.

Currently, research work can be carried out in four areas:

- Research work;
- Experimental design work;
- Work on the provision of technical assistance;
- Works and services to third-party organizations and capital construction.

Considered by us, this work refers to research work. Therefore, it is being carried out and carries a search, theoretical and experimental character. Exploratory work makes it possible to identify new principles of using the laws of enterprise development for scientific and technological progress. Determination of goals and principles for the development of enterprises and the industry as a whole. Search works are of both a wide profile and a narrowly focused one for solving particular issues. The reports on search calculations should contain reviews and recommendations on the possibility of using the results obtained in a specific area of mechanical engineering.

Theoretical work is carried out in order to obtain systematized information on a specific scientific problem. Such work ends with the preparation of reports, reviews and recommendations characterizing the current state of the problem, as well as the prospects for its development.

Experimental works are carried out to check theoretical calculations and conclusions obtained in the process of performing theoretical works, and also serve to obtain experimental data for the subsequent development of prototypes or models. As you know, these works, as a rule, come to the end with the manufacture of experimental samples with carrying out all the test cycles.

By the nature of the results obtained, scientific research is divided into three groups:

1. Fundamental work.
2. Search work.
3. Applied work.

Fundamental is work, during the performance of which there is a characteristic of new phenomena and patterns of development of a production enterprise. They reveal fundamentally new ways of progress in technology, economics and organization of production. In our opinion, the research work carried out by Us is expedient to be carried out according to the subject-fundamental method that seeks to explain phenomena, facts and processes. The practical application of these studies can give, in the future, a significant economic effect.

The purpose of prospecting work is to find fundamentally new ways of research and the creation of new technology. They are based on already known theoretical developments and ideas, although in the course of searches these ideas may be revised. This group should also include works of a generalizing and informational nature, research on forecasting (direction of development) spheres of application of new regularities and phenomena of development of production, work on forecasting the directions of development of science and technology. When performing prospecting works, the obtained positive results and conclusions can be used in

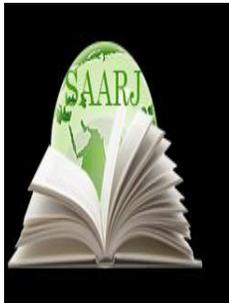

scientific research works of an applied nature. Applied work is directly aimed at creating new or improving existing means and methods of production.

The immediate results of these works are of a very specific nature and are issued in the form of reports, technical documentation of experimental and prototypes. The result of the implementation of such works is the creation or improvement of means and methods of manufacturing (consumption) products. This group should also include the preparation of instructions, technical specifications, guidelines, works that summarize informational character, the preparation of forecasts of changes in individual parameters of equipment and other means.

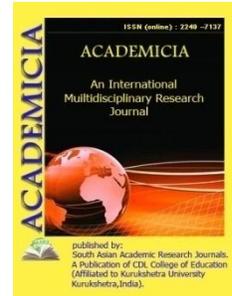

The methods of research work outlined by us in the future will serve as the main criteria for the all-sided development of the engineering industries of our Republic.

## CALCULATION OF TECHNICAL AND ECONOMIC INDICATORS OF THE USE OF SOLAR PARABOLIC CYLINDRICAL INSTALLATION

**Ergashev S.F\*; Mamadiyeva D.T\*\*; Oripov A\*\*\***

<sup>1,3</sup>Fergana Polytechnic Institute,  
 UZBEKISTAN

### ABSTRACT

*The article analyzes the methodology for calculating the technical and economic indicators of solar parabolic cylindrical hot water supply systems of industrial and municipal enterprises. Formulas are given for determining the specific annual productivity, the specific saving of the equivalent fuel, as well as the payback period for capital costs, since the economic effect of its use is determined only by the fuel economy.*

**KEYWORDS:** *Solar Parabolic-Cylindrical System, Technical And Economic Indicators, Payback Period Of Capital Costs, Thermal Performance, Fuel Economy.*

### INTRODUCTION

Currently, some progress has been made in the development and practical application of solar installations, but they are still expensive, which hinders their use on a large scale. Therefore, one of the main tasks in the development of practical developments in the use of solar energy is the creation of solar power plants with acceptable technical and economic characteristics. This requires constant improvement of existing installations, as well as the creation and careful research of more perfect options for various design schemes.

Research carried out in recent years has shown that one of the promising, potentially and economically competitive areas of solar energy utilization is the creation of solar installations based on parabolic cylindrical collectors. The energy obtained in such installations can be used in agriculture and communal services, industry and in everyday life for various purposes, including for heat supply, obtaining cold, generating electricity using a steam turbine cycle or in devices for direct energy conversion [1, 2, 4].

To determine the technical and economic indicators of a solar parabolic-cylindrical installation, it is necessary to assess the expected productivity and its change during the year.

As you know, the performance of a solar parabolic trough installation depends mainly on its operating temperature, which, in turn, is determined by the level of solar radiation. The thermal performance of the experimental module of a solar parabolic-cylindrical installation, depending on the operating temperature and on direct solar radiation, was carried out in works [1, 2, 4.5, 6 and 7].

The specific annual productivity of the installation, referred to 1 m<sup>2</sup> of the mirror surface, was estimated by the formula

$$q_{year} = q_{\tau} \cdot \tau_{year}$$

where,  $q_{\tau}$  - is the hourly specific productivity of the installation at an average flux density of direct solar radiation (we take  $E_0 = 700 \text{ Wt} / \text{m}^2$ ) and at its required operating temperature;

$\tau_{200}$  the probable number of hours of operation of the installation per year (taking into account the possibility of using the installation in the southern regions of the CIS, the measurement limit is assumed to be 1500 - 3000 h).

According to the specific annual productivity of the installation, it is possible to calculate the specific economy of the equivalent fuel from the use of the power module of the solar parabolic-cylindrical installation according to the formula:

$$m = \frac{q_{200}}{\eta_{\kappa} \cdot 7000 \cdot 10^3}$$

where, m - specific fuel economy in tons of fuel equivalent / m<sup>2</sup> per year;

$\eta_{\kappa} = 0,45$  - fuel efficiency factor in decentralized and individual boiler houses;

7000 is the heat of combustion of the equivalent fuel in kcal / kg.

The calculation results are shown in Table 1.

As you know, the economic effect of the introduction of new technology is estimated by comparing the reduced costs for the proposed and existing options.

Specific annual productivity of a solar parabolic-cylindrical installation and specific annual fuel economy [1, 5]

Installation hours per year	At an operating temperature of up to 100 ° C with a flow receiver		At an operating temperature of up to 300 ° C with a heat pipe as a receiver	
	Performance KWh / m2	Savings Fuel T eq / m <sup>2</sup>	Performance KWh / m2	Savings Fuel T eq / m2
1500	504	0,138	304,5	0,085
2000	672	0,183	406	0,111
2500	840	0,230	508	0,139
3000	1008	0,275	809	0,166

Since the possibilities of using a solar parabolic-cylindrical installation are very wide (the production of steam, combustible water, and dry air for use in industry, agriculture and utilities, etc.), the assessment of the economic effect by comparing the reduced costs is an independent problem. Therefore, the calculation of the technical and economic efficiency of using a solar parabolic-cylindrical installation was carried out by us according to the payback period, when the economic effect of its use is determined only by fuel economy.

The payback period of the installation can be determined by the formula:

$$C_o = \frac{K_{UD}}{q \cdot Z_T}$$

where,  $K_{UD}$  - specific capital costs, rubles /  $m^2$ ;

$q$  - specific fuel economy per unit area of the concentrator, t.e. /  $m^2$ ;

$Z_T$  - specific closing fuel costs.

New capital costs attributed to 1  $m^2$  of reflective surface of the solar parabolic plant (specific capital costs) are determined using the current price lists and instructions.

The results of calculating the specific capital costs for a solar parabolic-cylindrical installation are presented in

**TABLE 2..TOTAL CAPITAL EXPENDITURE REFERRED TO 1 M<sup>2</sup> OF REFLECTIVE SOLAR PARABOLIC SURFACE**

	Name of expenditures	The cost sum / $m^2$
1	Mirror aluminum	52 500
2	Steel structure: a) profile aluminum b) ferrous metals c) expenses for the manufacture of metal structures - wages of production workers and expenses for the operation of equipment according to the manufacturer's data	15 000 36 000 150 000
3	Heat receiver - heat pipe a) a pipe made of IX18H10T steel b) mesh made of IX18H9T steel c) wire made of steel 18IX20H13 d) glass pipes e) costs of manufacturing and assembly of the receiver	150 000 22 500 5 000 15 000 450 000
4	Flow-through heat receiver: a) aluminum pipe, $d_H = 100$ mm b) thermal insulation materials c) the cost of manufacturing and assembling the receiver	35 000 30 000 300 000
5	Rotation mechanism: a) worm gearbox Ch - 63 b) planetary gearbox P-01 c) disc clutch	650 000 750 000 150000

	d) electric motor RD = 10	74000
	e) building materials for the foundation	200000
6	Installation	150 000
7	Unaccounted for, 5%	550 000

Total:

a) With flow-through receiver 3588000

b) With a receiver - heat pipe 3784500

As can be seen from Table 2, the total capital costs attributed to 1 m<sup>2</sup> of the reflective surface of a solar parabolic trough installation are 3588000 sum / m<sup>2</sup> and 3784500 sum / m<sup>2</sup>, respectively, for an installation with a flow receiver and a heat pipe receiver (at prices for 2020).

If the cost characteristics of the installation are recalculated for the cost of 2020 from the sum in US dollars (at the rate of 1 \$ = 1000 sum, taking into account the annual inflation of the dollar 4%) it is \$ 3731.0 and \$ 3935.0

Assuming that in the case of mass industrial production of such installations, the value of specific capital investments can be halved, for calculating the payback period, we take the value of specific capital costs \$ 1865.5 / m<sup>2</sup> and \$ 1967.5 / m<sup>2</sup>, respectively, for an installation with a flow-through receiver and a receiver - heat pipe.

The results of calculating the timing of a solar parabolic-cylindrical installation, depending on the operating temperature and the duration of the installation are shown in Table 3.

**TABLE 3. PAYBACK PERIOD FOR SOLAR PARABOLIC PLANT**

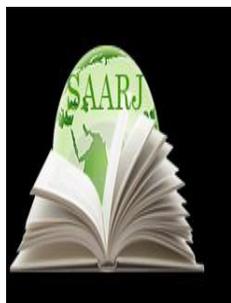

Installation hours per year	Payback period, year	
	At operating temperatures up to 100 <sup>0</sup> C with a flow-through receiver	At an operating temperature of up to 300 <sup>0</sup> C with a heat sink - a heat pipe
1500	8,25	14
2000	6,22	10,5
2500	5	8,5
5000	4,1	7

Thus, the payback period of the installation is mainly determined by the number of hours of operation of the installation (i.e., the number of sunny days per year), as well as its operating temperature and is for  $\tau_{\max} = 5000$  h,  $T = 100^{\circ}$  C and  $T = 300^{\circ}$  C about 4 and 7 years, respectively.

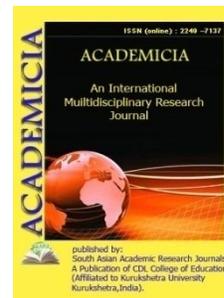

Results of studies of the dependence of the specific cost of mirror concentrating systems  $C_m$  (cost per unit of overall area, sum / m<sup>2</sup>) and the weight coefficient  $K$  (the ratio of the weight of the concentrator (without the mass of the reflecting surface) to the cube of its effective diameter, or  $K = P / D^3$  on the accuracy of the base and support for domestic foreign concentrators is most fully given in the works of Sh.I. Klychev / 7 /).

### ABSTRACT

*The article describes the features of the introduction of corrosion experience on rod pumping units. In the formulation of the study, the operational demonstration of underground equipment of rod pumping units on a high-water well stock was increased. The drought of oil and gas fields is also affected by intensive corrosion of underground (pumping and compressor pipes (tubing), rods, casing strings) and ground (discharge lines, collectors) equipment and pipelines, significant well bonds, high mineralization of reservoir platoons and the presence of aggressive gases in them.*

**KEYWORDS:** *Corrosion, Rods, Pumping Units, Collector, Pipeline, Metal, Destruction, Cracks, Protection, Coatings, Steel.*

## INTRODUCTION

Development of technical and technological solutions to improve the operational performance of underground equipment for rod-type pumps installations on a high-water well stock. At present, a significant part of Uzbekistan's large fields is at a late stage of development, characterized by a high water content of well production, which is on average 77-83%.

Corrosion - spontaneous destruction of metals and alloys as a result of chemical, electrochemical or physico-chemical interaction with the environment. Destruction due to physical reasons is not corrosion, but is characterized by the concepts of "erosion", "abrasion", "wear". The cause of corrosion is the thermodynamic instability of structural materials to the effects of substances in the environment in contact with them.

Example-oxygen corrosion of iron in water:

Iron hydroxide is  $\text{Fe}(\text{OH})_3$  and is what is called rust.

In everyday life, the term "rusting" is more often used for iron alloys (steels)- corrosion of iron and its alloys with the formation of corrosion products consisting of hydrated iron residues. The definition of corrosion does not apply to non-metallic materials. When applied to polymers, there is a concept of "aging", similar to the term "corrosion" for metals. For example, the aging of rubber due to interaction with air oxygen or the destruction of some plastics under the influence of precipitation, as well as biological corrosion. The rate of corrosion, like any chemical reaction, depends very much on the temperature. Increasing the temperature by 100 degrees can increase the rate of corrosion by several orders of magnitude [1].

During the operation of rod deep pumping units, especially when the water content of well production is more than 82%, the rod column is subjected to the combined action of corrosion processes and increased alternating loads, which leads to corrosion fatigue of the metal [2].

The corrosion resistance of metal contributes to the development of intercrystalline and transcrystalline cracks (along grain boundaries), which destroy the metal from the inside [3,4]. The development of a crack goes, the main cheek, at the moment when the metal structure is under load. Since the corrosive medium has free access to the open power of the metal, it also penetrates deep into the metal, intensively destroying the surface cracks [5,6].

The description of the use of SHSN in the highly watered Fund of the Bukhara-Khiva region shows that the number of breaks in the column of rods occurs in the estuary zone. This fact is one of the reasons for the need to study electrochemical corrosion of the rod column material, where a gas-liquid mixture with a predominance of plastic water, which is a strong electrolyte, is exposed as a corrosive medium, while chemical analysis of reservoir waters in the Bukhara-Khiva region shows the predominance of ions in the composition: chlorine, calcium and carbonates. According to the available data, for a more detailed study of the problem of electrochemical corrosion of metals, the analysis of factors capable of Danish corrosion in conditions of similar applicable rod borehole pumping units is carried out [6].

As a result of research, it was found that despite the corrosion resistance of structural materials, which is one of the most important factors affecting the increase in the strength of structural

products, the problem of corrosion protection of offshore oilfield and hydraulic structures cannot be economically solved only by selecting special resistant steels.

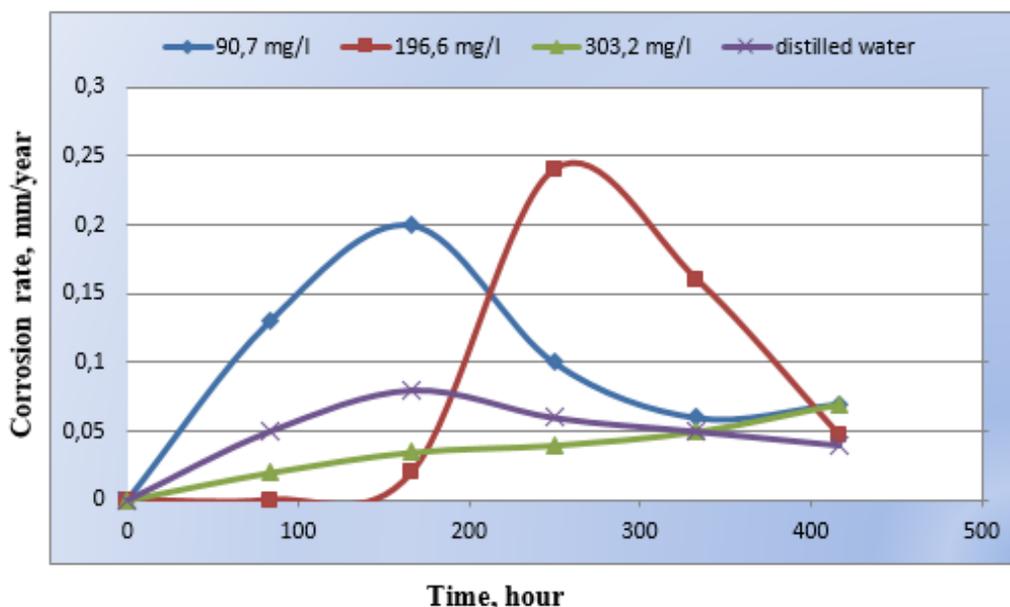

The main methods of combating corrosion include the application of metal and non-metallic protective coatings, as well as electrochemical protection of metals, while non-metallic coatings that have proven themselves in the industry have become widely used [2]. As a result of the analysis of corrosion processes occurring on offshore platforms the following facts were revealed:

- 1) the corrosion resistance of low-carbon and carbon steels is almost the same;
- 2) the corrosion resistance of some low-alloy steels in the atmospheric zone is 24-42% higher than in article 3;
- 3) the corrosion rate of tested low-alloy steels in the periodic wetting zone differs slightly from carbon steels;
- 4) in the underwater zone, non-motor low-alloy ones stop corroding twice as slowly as St. 3;
- 5) rafts X13, X17, DN-46 and DI-47 showed high corrosion resistance in the zone of the sea atmosphere, austenitic chromium-Nickel steels in the zone of periodic wetting, and chrome-Nickel steels in the underwater zone.

Counting the experience on the cathodic reaction of oxygen reduction, as the main corrosion-controlling electrode process, may increase the service life of metal structures of weapons operating under cyclic voltage [7].

However, the main ones are water solutions of mineral salts or pure brines that do not contain a solid phase. When they are used, due to a complex of reasons, the permeability of the productive reservoir decreases, and irreversible, uncontrolled colmatation of the pores of the productive reservoir by solid particles often occurs [2,7].

Sodium chloride is compatible with most of the reagents used in oil production. However, when using methanol, cationic, anionic and nonionic surfactants, polyacrylamide, and polysaccharides, there is a risk of incompatibility. For methanol, the risk of incompatibility is associated with the process of salting out, i.e. separation of the solid phase from solutions when they are mixed. Methanol is highly soluble in water, as a result of which its addition to aqueous solutions of sodium chloride leads to the "Binding" of part of the water and the release of a solid precipitate of sodium chloride from the resulting mixture. This process can also occur when mixing cationic, anionic and nonionic surfactants, if the product forms of surfactants as carrier liquids include water-soluble organic substances, lower alcohols (methanol, ethanol, propanol, etc.), ketones (acetone, etc.), etc. Mixing solutions of polyacrylamide and / or polysaccharides with sodium chloride can also lead to salting out of solutions of solid precipitation of polymers, since sodium chloride is better soluble in water than polymers. Upon contact with solutions of sodium chloride or calcium chloride corrosion inhibitors, the effect of reducing the effectiveness of inhibitors is possible, since sodium chloride dissociates in water into sodium ions and chloride ions. The latter, due to their relatively small size, can easily penetrate under the film of a metal corrosion inhibitor and cause pitting (pitting) corrosion even under the film of a corrosion inhibitor [7].

**Figure 1. Effect of the concentration of chlorine ions on the corrosion rate**

As can be seen from figure 1. at a chloride concentration of more than 200 mg/l, the corrosion rate is lower than in water with zero concentration. Since then, after 200 hours of observation, the rate of corrosion increases, while the other two curves, with a chloride concentration of more than 100 mg/l, have passed their peak and are declining [2,5]. It can be seen from the work that at high concentrations of chlorine ions and prolonged action of ions from day to day, crust concentrators appear, capable of a sharp increase in the corrosion destruction of metal.

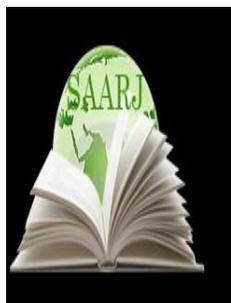

Corrosion of equipment in waterlogged wells is an electrochemical process that occurs mainly with oxygen depolarization. Well equipment is divided into 3 categories depending on the degree of wear and tear. In the case when the average annual replacement of pipes and rods is no more than 20% of the entire length of the well string, it is referred to the first category. This category includes weakly corrosive wells that have a service life of equipment corresponding to depreciation.

In wells, the corrosion rate does not exceed 0.4-0.5 mm / year. With an average annual replacement rate of pipes and rods, 25-50% of the total length of the well string belong to the second category, having a corrosion rate of about 1.0-1.2 mm / year. The third category is characterized by wells with intense corrosion and an average annual replacement rate of pipes and rods above 50%. In these wells, the rate of corrosion processes is more than 2-3 mm / year.

### ABSTRACTS

*The article gives scientifically grounded recommendations on the preservation, processing of fruit and vegetable products. There are scientifically sound proposals and recommendations on existing problems and solutions in the system. Application of advanced technologies of cultivation, introduction of modern methods of processing and storage of products in the sustainable development of fruit and vegetable production. It had known that dried fruits and vegetables go through a series of technological processes until they reach the consumer in the form of finished products. Analysis show that the existing drying methods in the drying process of fruits and vegetables have an efficiency of 60-70% development is a topical issue in the field*

of agricultural processing. IR convective drying ensures the preservation of vitamin C and carotenoids in particular. In the study of acoustic IR - convective drying process of vegetables, parameters such as acoustic and heat flux density, radiation, wavelength and speed, product thickness affect the processing time and product quality. Based on the thermoradiotic analysis of carrots, an IR generator with a maximum wavelength of  $1.1 \mu\text{m}$  of radiation is selected because vegetables are more efficient in their permeability and absorption under the influence of a wavelength of  $1.1 \mu\text{m}$ . Previous studies show that when the thickness of the product is 3 - 4 mm, the air velocity is 4 sm. The process is slower because the air speed is small. If it is high, the dried product will fly away [1].

**KEYWORDS:** Physicochemical Properties, Storage And Processing, Dehydration, Farms, Energy Consumption

## INTRODUCTION

A comparison of ultraviolet and convective drying when the air is constantly driven to the surface of the material shows that ultraviolet drying is faster when the acoustic flow rate is consistent with the constant air flow rate because the boundary layer thickness for acoustic flows is smaller than the hydrodynamic boundary layer. In order to make the Kadini IR-convection drying process more efficient, experiments had carried out under acoustic conditions. The study is conducted in the following order:

- a) IR - convective drying method with pre-acoustic treatment in pulsed mode.
- b) IR convective drying method without acoustic treatment.

Acoustic processing is carried out at a frequency of 6000 Gts for 3 minutes, in which the pumped air velocity formula is equal to the specific load formula (Fig.1). As can be seen from the graph, the drying time of pumpkin product is 3.5 hours, and the resulting humidity is 19 - 20%. Drying time during acoustic treatment is 4.5.

When drying the squash by acoustic processing, the drying rate is  $0.37 [\% / \text{min}]$ , Wkr, meaning when the point Wpdl = 31%, at which time it is  $0.21 [\% / \text{min}]$ , as Wqol = 41%.

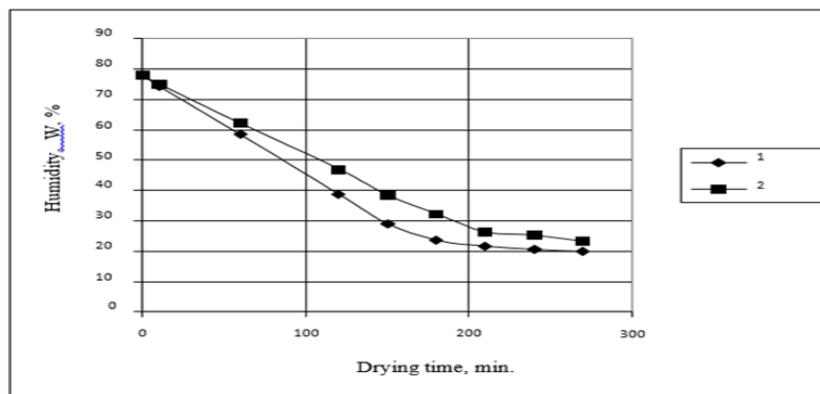

Fig.1. Use of different energy streams when drying the product:

1. at  $f = 6000$  Gts. drying of the instrument by acoustic treatment for  $t = 3$  min;
2. Drying without initial processing.

Influence of different types of energy flows on the drying process:

The basics of thermodynamics and a number of studies show that the importance of the drying process tends to equilibrium  $W_p$  at each point of the wet product. We studied how the moisture content of a melon product changes over time. The results of the experiment showed that the intensity of the process in drying the pumpkin product decreases as it approaches the resulting moisture. The equilibrium state is 0.

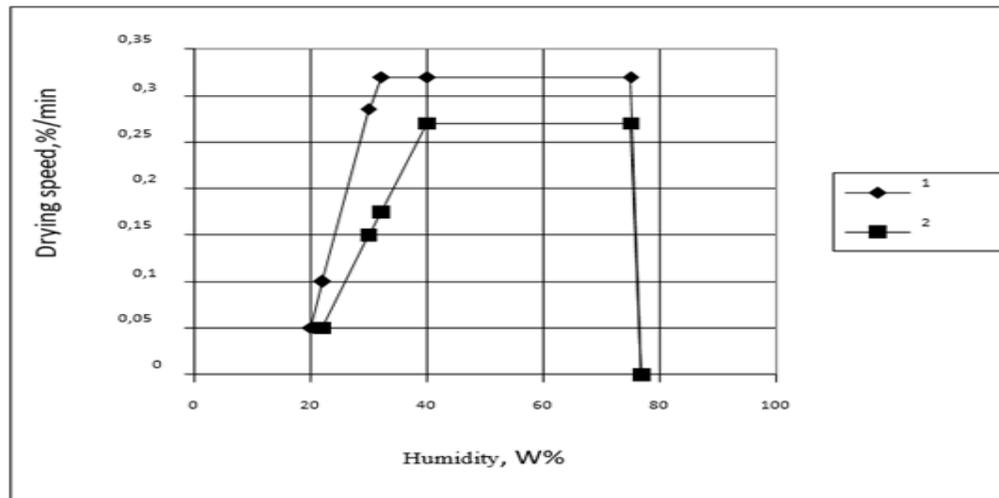

Fig.2. Use of different energy streams when drying the product:

1. at  $f = 6000$  Gts. drying of the instrument by acoustic treatment for  $t = 3$  min;
2. Drying without initial processing.

In this regard, the change in humidity of the product is in the form of a curve in Figure 1.2.

As a result of the analysis of this line, an event (point B), which means that the material heats up at the beginning of the process, i.e. when the humidity drops, plays an important role. The change in moisture content of the melon at a constant drying rate has a characteristic indication that it depends on the thickness of the layer.

For example, when the drying rate is constant, the layer thickness will be  $W = 27\%$  for 140 minutes at  $b = 4$  mm,  $W = 31\%$  for 150 minutes at  $b = 6$  mm, and residual moisture  $W = 34\%$  for 190 minutes at  $b = 8$  mm. As the layer thickness increases, the drying time increases to 30 - 50 minutes  $q = 1500$  W / m<sup>2</sup>. The temperature of the product is 65 - 720 C. The effect of product thickness on drying on its moisture content during drying:  $Q = 2,0$  kW/m<sup>2</sup>

$$1: \delta = 4 \text{ mm} \quad 2: \delta = 6 \text{ mm}, \quad 3: \delta = 8 \text{ mm}$$

In acoustically treated specimens (curve 2), the moisture content of quince fruit drops to 27% in 135 min, and in untreated specimens (curve 1) to 30% in 180 minutes. While drying, the temperature at  $q = 1.5$  kW / m<sup>2</sup> is 67 C. The effect of specific load on the drying process was also studied. An increase in specific load extends the duration of the drying process. The above

method of drying can also be used for drying pears. Drying time is 4 hours. The drying resistance of many agricultural products plays an important role in determining the initial components of the products, as well as the preservation of their structural mechanical properties [2]. The studies varied the process parameters in the following range: acoustic vibration frequency  $f = 5000$  to  $700$  Gts, loading from  $4$  to  $8$  kg / m<sup>2</sup>, air temperature from  $50$  to  $650$  C, acoustic processing duration from  $2$  to  $4$  min. until. These threshold values were selected based on the conducted experiments. Analysis of the literature shows that the main parameters of the drying process are constant speed  $N$  drying coefficient  $K$  and critical humidity  $W_{kr}$  based on experimental results developed a method of drying carrots for different values of heat flux density and loading [3].

The process was studied by a mathematical design method in order to obtain a mathematical expression representing the drying rate and the relationship of the relative humidity of the product to the factors affecting the process. The experimental plan of the factors with physical dimensions and in dimensionless views is given in the table. Based on the results of the experiment, the average value of the drying rate constant  $N$  in the first period of the process was expressed for  $N$ , the drying coefficient  $K$  in the second period of the process, and the critical humidity  $W$ . The obtained bonds fully describe the combined acoustic IR-convective drying of carrots and allowed to calculate  $W_{kr}$ ,  $N$ ,  $K$  with an error of up to 5%.

$$W_{kp} = 48,3 - 4,625 x_1 - 0,125 x_2 + 2,875 x_3 + 1,375 x_1 x_2 +$$

$$+ 1,375 x_2 x_3 - 0,125 x_1 x_3 + 0,875 x_1 x_2 x_3$$

$$N = 0,97 + 0,088 x_1 + 0,01 x_2 - 0,0362 x_3 - 0,0412 x_1 x_2 -$$

$$- 0,0287 x_2 x_3 - 0,00375 x_1 x_3 - 0,0212 x_1 x_2 x_3$$

$$K = 0,91 + 0,0925 x_1 + 0,05 x_2 + 0,0175 x_3 + 0,02 x_1 x_2 +$$

$$+ 0,015 x_2 x_3 + 0,0025 x_1 x_3 + 0,01 x_1 x_2 x_3$$

Analysis of the experimental results shows that maximizing the duration of acoustic processing, loading and the supplied air temperature will result in non-uniform drying of the product, while minimizing the value will result in complete drying of the product.

When not acoustically treated, the air temperature does not affect the drying rate  $N$ : the coefficient  $K$  increases by 6.7%, the critical humidity decreases by 1.04 times, and when the acoustic treatment in pulsed mode, the drying rate increases by 10%, the coefficient  $K$  increases by 12.7% and humidity increases by 1.2 m. An increase in the heat flux density from  $0.8$  to  $2.5$  kW / m<sup>2</sup> has very little effect on the  $W_{kr}$ ,  $N$ ,  $K$  values (table 1).

№	Indicators	$\tau$ , мин	$x_1$	$t_b$ , °C	$x_2$	$\sigma$ , кг / м <sup>2</sup>	$x_3$
1	Maximum	4	+1	65	+1	8	+1
2	Minimum	2	-1	50	-1	3	-1
3	Average	3	0	57	0	5	0

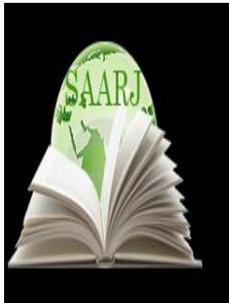

One of the main indicators of a dried product is its moisture content and it determined by the method of drying. This method is widely used and it is based on the fact that the product under test loses moisture at atmospheric pressure at a temperature close to 100 C or at a much lower temperature under vacuum. Along with water vapor, volatile substances such as alcohol, ether, ammonia, carbon monoxide are also lost during drying. When heated, volatile briquettes are formed from non-volatile substances as a result of a chemical process. Bonds that are less stable on drying oxidized by oxygen in the air. To accelerate the loss of moisture from the product, it is recommended to mix the weighed product with washed and sufficiently heated quartz sand in order to increase the evaporation surface, as well as to prevent the formation of crusts that prevent drying [4].

### **CONCLUSIONS**

The factors influencing the drying of fruits and vegetables during scientific research had aimed at continuous control of moisture during dehydration and improving the quality of the product. The process of growing and canning seasonal fruits and vegetables that are edible and beneficial to human health studied theoretically.

## RE-THINKING ADULT BASIC EDUCATION FOR RURAL DEVELOPMENT IN NIGERIA

**Ephraim Wordu\***

\*PhD,

Department of Curriculum/Instructional Technology,  
 Faculty of Education Ignatius Ajuru University of Education,  
 Port Harcourt, Rivers State NIGERIA

### ABSTRACT

*This study critically examines adult basic education for rural development. It shows that the curricular of basic education is fraught with implementation problems. The study advocates a re-invention of the war against indiscipline (WAI) to curb cultism and its menace and promote discipline and moral rectitude in rural communities. This is seen as an essential contribution of adult basic education for rural development. This is because the war against indiscipline WAI strategy can erase from the society undesirable behaviours, such as cultism and its menace. The study concludes that education is interwoven with social policy and that adult education must be viewed in relation to social, economic, political and way of life of the society in which it is carried out.*

**KEYWORDS:** *Rural Development, Adult Basic Education, Indiscipline, Cultism And Its Menace.*

### INTRODUCTION

Among many challenges in rural development, the most dangerous is cultism and its menace. This situation is alarming in rural areas. Cultists and their activities constitute the greatest threat to life and property. Cultism and its menace is traceable to the larger society. Asuru (1997) asserts that there has been unduly militarization of the society, manifesting in armed robbery, terrorism, thuggery and assassinations. In addition, inter-cult conflict is prevalent, leading to killing of opponents and innocent citizens. Other social vices in rural areas include kidnapping, stealing, rape, forceful initiation of youths into cult, election rigging and disrespect for values and norms. Majority of cultists are young adults some are married and raising children thereby transmitting cultism to future the generations. The Nigerian society has become a decadent

society. Adult basic education can address this situation. It has the capacity to deal with and adapt to changing situations. It is the panacea to many challenges confronting rural dwellers reflecting their circumstances. Against this background this study examines adult basic education for rural development.

### **Recent Challenges in Rural Areas**

In rural areas there are slight changes in socio-economic conditions due to improvement in infrastructure such as, road networks, school and markets. In spite of these, there are new challenges. Asuru (1997) asserts that there has been unduly militarization of the society, leading to armed robbery, terrorism, thuggery and assassinations. A major consequence of these changes is cultism. There is an unprecedented rise in indiscipline. Self-discipline have eroded from the social fabrics of rural communities. Respect for other's rights and dignity is negated. Cult membership have progressively increased, between two to four cult members can be found in a household.

### **Menace of Cultism in Rural Communities**

The menace of cultism in rural communities has been a course of concern to rural inhabitants, security agents, government and society at large. Inter-cult and intra-cult attacks have led to the death of many youths and innocent citizens. This often involves the death of parents of cultists. Causality level, death toll and properties lost are alarmingly on the increase (Robert-Okah, 2003).

Menace of cultism also includes rape, armed robbery, kidnapping, stealing, and thuggery. Cultists operate with sophisticated fire arms, axe, knives and charms. During inter-cult attacks, gun shots are fired against opponents or in the air sometimes lasting for a week or month. This causes fear, and often leads to illness among rural dwellers.

Cultists operate mostly in the bush/farm lands to carry out their fetish activities in preparation for an attack. This affects normal farming activities as people are afraid to go to work. Cultists also attack people in day time in the form of killings, armed robbery, kidnapping, stealing and rapes. This affects people's day to day activities resulting in hunger, unemployment, and sometimes in a total dislocation of the social system because no real activities can be carried out in an environment in which life is insecure.

### **What is Rural Development?**

Rural development may be defined in terms of change in the economic sphere. Such definitions are too narrow, as rural developments must embrace not only the economic but also social and political dimension of the social system. Therefore, Loder milk et al (1981) cited in Akinola, Mojuyinola and Folaranmi (2002) defines rural development as a process of planned social, political and economic change in rural and urban social structure and provision of adequate incentives, and services to help rural people achieve higher level of living, knowledge and skills.

The Common Wealth Secretariat (1980) sees rural development as a comprehensive mode of social transformation which acknowledges that national development must involve all elements of the population. It seeks to introduce a more equitable distribution of resources and incomes within a society and to integrate the rural, poor and the vast majority of the population into the national economy.

Implicit in these definitions is the aspiration for a better standard of living for the masses in rural areas. This suggests improvement in their quality of life, peace and stability in the rural communities. Emphasis is on empowerment, capacity building and democratic participation of citizens. It requires not only access to both human and material resources but also, their effective utilization to improve themselves (Obasanjor&Mologunje, 1991).

### **Adult Basic Education for Rural Development**

Adult basic education for rural development is the home of literacy. It also requires acquisition of life skills, ethical and moral values as well as computational and communicative abilities. Adult basic education for rural development is designed to enable the rural population overcome the restraints of their social and physical environment.

The physical environmental challenges mostly concerns environmental degradation. Social constraints may arise from political, social, economic or cultural spheres of life such as population, explosion, hunger, health problems, illiteracy, conflicts, and indiscipline among others. Adult basic education for rural development equips its learners to resolve these problems.

This context reflects the environmental and socio-economic condition of the area concerned. It is functional and constantly adapts to changing situations, whether in the social, political, economic or cultural life of the community (Ebuara and Udida, 2006). Learning outcomes transcend economic to embrace social aspect such as behavior. Learning must not take place in well standardized classroom. Learning involves wider contexts and favours physical environment. Team/group learning method is practiced. The curriculum reflects the needs of individuals and their locales.

### **Concept of Adult Basic Education**

Adult basic education is a component of basic education concerned with the adults. Adult basic education, according to universal basic education policy (2014) could be defined as educational programmes for acquisition of functional literacy, numeracy and life skills as well as moral and ethical values for adults aged 15 years and above; special programmes for nomadic population; out-of-school, non-formal programmes for updating the knowledge and skills of drop-outs from the formal school system; and non-formal skills and apprenticeship training for adolescents and youths who have not benefited from formal education.

Adult basic education, according to UNESCO (2000:222) is seen as:

...all forms of organized education and training that meet the basic learning needs of adults, including literacy and numeracy as well as the general knowledge, skills, values, and attitudes that they require to survive, develop their capabilities, live and work in dignity, improve the quality of their lives, make informal decisions and continue learning.

### **Basic Education: Secondary School Curriculum**

The national curriculum for junior secondary school (Basic 7-9) is a list of subjects which every child and adult should offer and, which should form the basis of teaching and learning at these levels. These are as follows: English language, mathematics, integrated science, agricultural science, social studies, civic education, business studies, introductory technology, one Nigeria

language (Hausa, Yoruba, or Igbo) computer education, creative art, and fine art. This curriculum does not reflect the dynamism of the society. It is fraught with implementation problems. Hence, the curriculum is incapable of curbing cultism and its menace.

### **The Way Forward**

We can employ War Against Indiscipline (WAI) strategy to address cultism and its menace in rural communities. War Against Indiscipline is related to our everyday living which in turn requires learning. In view of the fact that the curricular of basic education does not address the prevailing situation in rural communities, we can employ the war against indiscipline (WAI) to promote adult basic education in rural areas.

The war against indiscipline popularly known as WAI is a scheme introduced in March, 1984 under the military dictatorship of General MohammaduBuhari/Brigadier TunderIdiagbon. WAI is a campaign against all acts of indiscipline the especially in public spaces. WAI seeks to instill discipline in the public and promote social order, morality, civic responsibilities nationalism. The objectives of WAI according to FRN (1984) were:

1. To maintain public orderliness, such as queuing for services;
2. To encourage women on child upbringing;
3. To promote environmental sanitation,
4. To instill the spirit of patriotism
5. To promote the culture of hard work and
6. To eradicate economic sabotage and corruption

These objectives of WAI have the potentialities to transform cultists thereby creating a peaceful and hitch free environment in rural communities. Transforming the behavior of cultists can be equated with the welfare of individuals and communities in rural areas. The war against indiscipline is responsible for the moral up rise and increased level of discipline witnessed during military regime of General Buhari/Brigadier Idiagbon.

War against indiscipline is enforced and implemented through the machinery ofWAI brigade. This is a para-military outfit. They operate in all states and local government areas in the country. They see that all criminal and indecent behaviours are tackled. They also prevent street loitering and careless abandonment of children by their parents. They ensure that peaceful atmosphere prevails.

The WAI brigade has been disbanded and re-invented as neighbourhood police and exists in some states of the nation. It is not yet in every state and local government areas. For success in curbing cultism and its menace, they should be made to operate in every community in the country. They should be considered public servants and remunerated as such. They should be trained. Logistics and other needs required for success should be considered important.

### **Importance of Literacy**

The importance of literacy can be seen against the high proportion of illiterate persons and their inability to participate effectively in the social, political, economic and cultural development off self and community in rural areas. Specifically literacy contributes to sustained agricultural growth. This is the condition for development to thrive in rural sector. This is because literacy provides farmers opportunities to acquire basic skills, including how to learn and continue

learning, which can bring improved agricultural practice, improved income as well as participation in decision-making of local level (Kazeem and Tayo, 2017).

Literacy is a liberating force. Many rural dwellers are afflicted by various social and economic forces. When these persons acquire the basic skills of reading and writing, in a functional contexts that enables them not only to read the word but also the world, they gain understanding of the social and economic relationships that hinder their personal and community development, thereby liberating themselves.

Literacy is vital to changing people's attitudes in line with the mission and goal of building a more sustainable society. Literacy helps to equip them better to participate in decision-making that adequately and successfully addresses environment and development issues (Kazeem and Tayo, 2017).

Literacy helps in mobilizing and stimulating people to engage development responses. Most rural dwellers neglect to participate in government plans and programmes for lack of understanding of their importance in their lives and community. Literacy makes them understand the benefits derivable from such plans and programmes.

According to Kazeem and Tayo (2017: 255-256) Gray (1990) six values of literacy are as follows:

1. Literacy helps to meet many of the practical needs of daily life.
2. Literacy helps in improving the standard of living by obtaining valuable printed information in relation to health, sanitation, health, selection and preparation of food, childcare and home management.
3. Literacy increases economic status through engaging in vocations, which require knowledge of reading and writing.
4. Literacy enables one to take part in many individual and group activities that involves reading and writing, which helps them to gain social prestige.
5. Literacy helps individual to learn about his community and to adjust to his environment.
6. Literacy enables individual to meet his/her civic obligations such as voting.

### **Policy Implications**

Future policy thrusts in Adult Basic Education for Rural Development (ABERD) should consider discipline and how to encourage it as an integral part of this education. It should also consider how to strengthen the link between adult basic education and rural employment because as some writers have said idle hands are the devils workshops.

There is decline in literacy training in adult basic education programmes. Therefore, literacy should be emphasized in future policy on adult basic education. Literacy apart from being a human right has been seen as "a sine qua non for social, economic and political growth among other development indices (Anyanwu 1998 cited in Sanum, 2015).

### **CONCLUSION**

The study shows that in spite of broadening of the secondary school basic education curriculum to encompass other areas of knowledge considered relevant to the needs of the Nigerian society cults and their activities continue to grow, which has affected the well being of the society. The war against indiscipline is the best strategy to address this pitfall in the society. It can therefore

be concluded that education needs to be complemented by social policy. The social fabrics of the society are interrelated and affect each other.

Adult education needs to be viewed in the light of the social, economic, political and cultural realities in society. It must be used to enable the society meet its needs in various contexts. This often demands looking beyond the classroom for solution.
