Host M. Tojiboeva also uses direct questions. But it adds an Addendum to almost every question. For example, *"This decision also pays attention to the support of representatives of the sphere. Please tell us how you feel about their support. From this decision, what other additions did you intend to make?"* Another aspect of the show should also be paid attention to the studio setting. In the old style, a Studio was used, without showing a live audience in cold colors. And in the middle, the staff displayed on the monitor did not look very good because the lamp was placed incorrectly. In cases where the monitor was not used in the Studio, it would be more appropriate to indicate the name of the show there in large print. Because the monitor was never used during the display.

In the program "Exclusive conversation"<sup>10</sup>, which is broadcast on the TV channel "Culture and education", GulmiraMusadzhonova addresses russian journalist Alexey Denisov with direct questions. – *"What is interesting and important to you about history, the past?", "Should television encourage the viewer to think or is its task just to please the audience sitting in front of the screen with infotainment shows?"*

The peculiarity of the show is that it is always filmed in different places. But the aspect that unites them is the simplicity of the conversation place and in a classic style. Over a cup of coffee, a journalist talks with his interlocutor about the field in which he works. The reason for using the word exclusive in the name of the show is the expression of interlocutors from among famous, foreign-speaking foreigners or compatriots. You don't always watch conversations with them through TV screens. This is also its exclusivity. Extra information about the interlocutor in the show, no attachments are given. This applies directly to questions. The more she listens, the fewer questions she asks. The image of the host is also specific. She does not use makeup, does

not make up, it often manifests itself in loose hair and wear dresses of classic style. In addition, the journalist does not make contact with the audience during the show, she literally gets to the place and the environment in which she interviews. She doesn't say hello to the audience or say goodbye to them. In the show, the main focus is on the interlocutor.

In addition, in many interviews and conversations, the journalist does not know the meaning of his word, using many words "wasted". This makes it difficult for the audience to perceive them. For example, a simple question starts with long sentences, but when it comes to the end of the question, the question arises whether the journalist needed such a long "introductory" part. For example, in the program "Traffic Light",<sup>11</sup> which is broadcast on the TV channel "Uzbekistan", the host and author Nazima Vohidova talks with the actress Nargiza Abdullayeva. The presenter begins the introductory part with a few longer sentences. When talking in the car, without getting a full answer to the question, looking at the words of the interlocutor, she translates it to a completely different topic. Looking in the mirror when the actress was small, feeling like a famous actress, imagining microphones from a pen and saying that she was training, the journalist addresses the question: *"Didn't it interfere with your studies?" Some of my teachers hurt my heart,* " the respondent says. – *"Maybe they want you to be better, to study well?"*, - the conversation is being conducted in a different direction. In the process of answering this question, the beginner is again distracted by the conversation, saying: *"Oh, a traffic light. Green light, Nargiza, you have always been lucky in the field of art, in which your path is open."* Starting a conversation on one topic during the conversation, the presenter leads the topic in a completely different direction and distracts the audience from the main topic and the first question asked. This interferes with the perception of the essence of the conversation. – *"Were there any artists in the family? How did your parents see it? We have the first red light, Nagisa,"* said the narrator during the interview. In one sentence, there are 2 questions and one information about the external situation. In this case, the imagination of the viewer and the interlocutor is distracted by a red light. In general, this situation is observed throughout the conversation.

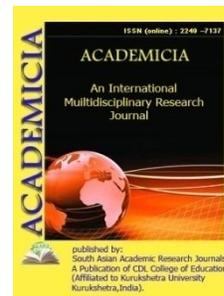

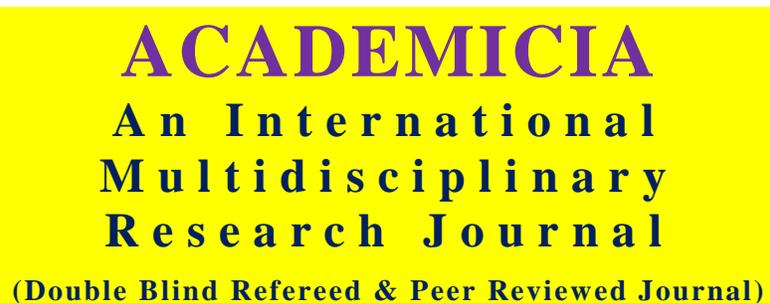

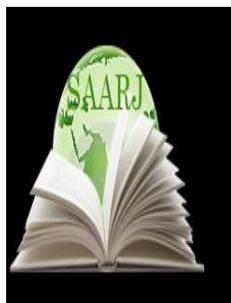

## CONCLUSIONS

In addition, when studying interviews broadcast on Uzbek television, a certain pattern of questions was observed in them. In this case, we are referring to words or sentences that are repeated in questions, but rather focuses on uniformity in the structure of questions. One of these techniques, which is most often used, is that the journalist, when asking a specific question, tries to clarify it more precisely because of the interrogative pause of the interlocutor. The host understands the other person's pause as a sign that they don't understand the question. Questions structured in this way are not always successful. These questions can serve to some extent as proof of the journalist's ignorance. But the purpose of any question, in our opinion, should be aimed at getting important, interesting information from the interlocutor.

### ABSTRACT

*In order to clarify the role of the prostacyclin-thromboxane system (PTS) in the development of acute circulatory disorders in the early postoperative period after coronary artery bypass grafting, its condition was studied in 56 patients with coronary artery disease. In patients with the development of vascular insufficiency and shock, a decrease in the level of thromboxane in the blood was revealed, while in patients with arterial hypertension, increased concentrations of thromboxane in the blood were determined in the absence of changes in the level of prostacyclin. There were no significant differences in the content of prostacyclin and thromboxane between the groups of patients with an uncomplicated course of the postoperative period and with the development of complications such as heart failure and hypovolemia. It was found that the factors influencing the state of PTS in patients after CABG surgery are: the duration of artificial circulation, blood loss during surgery, the number of platelets in the blood, hypocapnia. The factors influencing the platelet aggregation ability are: the duration of artificial circulation, the number of platelets, the degree of "emptying" of the alpha granules of platelets, the functional state of the PTS.*

## INTRODUCTION

### RELEVANCE OF THE STUDY

The intensity of the processes of coagulation-fibrinolysis in the early postoperative period, the risk of thromboembolic complications, on the one hand, and bleeding, on the other, and, finally, the possibility of developing varying degrees of circulatory disorders in operated patients dictates the need to study the systems that regulate these processes.

According to the literature, the prostacyclin - thromboxane system (PTS) is one of the leading systems of neurohumoral regulation, which determines both the state of central and peripheral hemodynamics and platelet-vascular hemostasis [2, 3, 4, 6, 9]. Prostacyclin has a powerful antiaggregatory and vasodilating effect [4, 5, 7, 9]. Thromboxane, on the other hand, is a platelet aggregation stimulator and vasoconstrictor [3, 6, 7, 9]. A finely balanced ratio between prostacyclin and thromboxane in normal conditions ensures optimal rheological properties of blood, volumetric parameters of blood flow, general and regional hemodynamics [3, 7, 8, 9, 11, 12].

It is relevant to study the state of PTS in patients with coronary artery disease (CHD) who underwent coronary artery bypass grafting (CABG) under artificial circulation (CI). Operations on the "open heart" among surgical interventions occupy a special place. As a result of the impact on the body of a complex of factors, such as extensive surgical trauma, hypothermia, hemodilution, the use of the IR method, "artificial hemophilia", multicomponent anesthesia, etc., patients after surgery develop complex disorders in the hemostasis and hemodynamic system, requiring maximum tension of regulatory mechanisms for maintaining homeostasis.

Purpose of the study: In order to elucidate the role of PTS in the development of acute circulatory disorders, we studied its condition in 56 patients with coronary artery disease after coronary artery bypass grafting (in the early postoperative period).

### MATERIAL AND RESEARCH METHODS

The work is based on the data of examination of 56 patients with ischemic heart disease, angina pectoris of exertion and rest, who were operated in the department of heart surgery of the Scientific Center of Surgery of the Russian Academy of Medical Sciences.

All examined patients were male. The patients' age is 30-65 years. The average age is  $50.64 \pm 0.94$  years. According to the severity of the disease, all patients were assigned to the III and IV functional class (FC) according to the New York classification of cardiologists.

All examined patients in the preoperative period received basic drug therapy with drugs of the nitroglycerin series, tranquilizers, antiarrhythmic drugs, cardiac glycosides, and potassium preparations were prescribed according to indications.

42 patients underwent coronary artery bypass grafting of 2-5 coronary arteries, 11 - coronary artery bypass grafting + mammary coronary artery bypass grafting, 3 patients - coronary artery bypass grafting in combination with resection of the left ventricular aneurysm. All operations were performed under cardiopulmonary bypass with non-pulsating blood flow using the standard technique of hypothermic perfusion with a decrease in the temperature in the esophagus to 27 degrees. and the creation of hemodilution with a decrease in hematocrit up to 25-30%. All patients underwent multicomponent general anesthesia using muscle relaxants.

A set of methods was used to examine the patients. It included: a study of the state of PTS, platelet hemostasis, central and peripheral hemodynamics, acid-base balance and blood gas composition.

The examination of patients was carried out on the eve of the operation - in the morning, on an empty stomach, at the end of the operation, 3 and 18 hours after the operation.

The state of PTS was assessed by the content in the venous blood plasma of stable metabolites of prostacyclin and thromboxane - 6-keto-PGF<sub>1a</sub> and TxB<sub>2</sub>, determined by radioimmunoassay using commercial kits of the Institute of Isotopes of the Hungarian Academy of Sciences. Blood samples were taken from the cubital vein into refrigerated polypropylene tubes containing the prostaglandin synthetase inhibitor indomethacin (20 µl / ml) and 6% EDTA (20 µl / ml blood). The plasma was separated by centrifugation at 3000 rpm and 4 ° C for 20 min. Plasma was stored at -20 ° C until radioimmunoassay.

Platelet hemostasis was studied by the aggregation properties of platelets and the reaction of platelet release by β-thromboglobulin, determined by radioimmunoassay using commercial kits from Amersham (England). The aggregation properties of platelets were determined according to the V.R. Born method using the ELVI-840 device.

To assess the state of central and peripheral hemodynamics and the clinical course of the early postoperative period, we analyzed in all patients the indicators characterizing the activity of the cardiovascular system, acid-base balance and blood gas composition.

Depending on the clinical course of the early postoperative period, patients with an uncomplicated course of the postoperative period and with the development of acute circulatory disorders were identified.

In 44 patients in the early postoperative period, at certain stages of observation, complications such as heart and vascular failure, arterial hypertension, hypovolemia, shock and bleeding were noted. We have analyzed the state of PTS in these most common complications after CABG at all three stages of observation in the early postoperative period.

## RESULTS AND DISCUSSION

Indicators of the content of metabolites of prostacyclin and thromboxane in the blood and the functional properties of platelets in patients with acute circulatory disorders in the early postoperative period are presented in Table 1.

As can be seen from the data presented in the table, the most pronounced disorders in the PTS state due to changes in the thromboxane link of the system are observed in patients with complications such as shock, vascular insufficiency, and hypertensive syndrome. Low concentrations of thromboxane, significantly differing from those in patients with an uncomplicated postoperative course, were identified in shock and vascular insufficiency. The content of thromboxane in blood plasma in shock is 50.8%, and in vascular insufficiency, 37.7% lower than the values obtained in patients with an uncomplicated course of the postoperative period. In hypertensive syndrome, high levels of thromboxane in the blood plasma were revealed, significantly exceeding its content in patients with an uncomplicated course of the postoperative period.

**TABLE NO. 1 THE CONTENT OF 6-KETO-PGF1A AND TXB2 IN THE BLOOD AND THE INDICATORS OF THE PLATELET HEMOSTASIS IN PATIENTS AFTER ASC SURGERY WITH DIFFERENT VARIANTS OF THE COURSE OF THE EARLY POSTOPERATIVE PERIOD**

Studied indicators	Clinical course of the postoperative period					
	Uncomplicated course	Arterial hypertension	Vascular insufficiency	Shock	Heart failure	Hypovolemia
6-keto-PGF1A (pg/ml)	401.0±31.1	317.1±32.6	368.1±1.6	493.2±59.1	405.7±77.7	417.8±49.8
TxB2(pg/ml)	326.7±20.5	494.5±58.3*	203.5±48.2	160.6±33.6*	318.4±34.0	380.4±49.4

TxB2/number of blood clots.pg/thousand blood clots.	2.28±0.17	3.89±0.67*	1.96±0.59	2.57±0.33	2.97±0.37	3.06±0.63
Quantity platelets(thousand/ml)	153.1±9.9	119.4±12.5*	133.5±19.1	73.2±5.77*	123.4±12.5	170.6±15.8
Speed aggregations platelets(mm/min)	11.8±0.78	8.0±2.51	10.8±1.68	7.0±1.3*	10.9±2.49	12.18±1.49
B-thromboglobulin(ng/ml)	183.6±11.7	180.4±17.3	201.8±33.8	222.0±23.3	161.7±23.04	164.8±21.01

\* -  $p < 0.05$ , \*\* -  $p < 0.01$  - significant differences in comparison with the uncomplicated course of the postoperative period

Thus, the content of thromboxane in the blood of patients with arterial hypertension and vascular insufficiency differ significantly from each other. These states are opposite in nature and have diametrically opposite values of thromboxane in the blood.

The content of prostacyclin in the blood plasma in patients with acute circulatory disorders did not have significant differences compared to the same indicator in patients with an uncomplicated postoperative period.

Thus, we have established significant changes in the level of the thromboxane metabolite in patients with the development of such complications as shock, vascular insufficiency and hypertensive syndrome, which led to an imbalance between the levels of prostacyclin and thromboxane. In shock and vascular insufficiency, the ratio of prostacyclin-thromboxane significantly exceeded the values obtained in patients with an uncomplicated postoperative course. In patients with arterial hypertension, a significant decrease in the ratio of prostacyclin-thromboxane was noted. It should be noted that the changes in the state of PTS are unidirectional

with such complications as vascular insufficiency and shock. With these complications, there was a decrease in the content of thromboxane in the blood plasma, which determined a unidirectional shift in the equilibrium between prostacyclin and thromboxane towards the prevalence of the prostacyclin metabolite.

The most pronounced changes in the PTS state were observed in patients with shock. The level of TxB2 during the development of this complication was significantly lower than the values obtained in patients with an uncomplicated course of the postoperative period, which led to an imbalance between the studied hormones towards the absolute predominance of prostacyclin. In our study, it was found that the low thromboxane level in patients with shock is due to prolonged cardiopulmonary bypass and significant blood loss during surgery, and also, probably, by the fact that platelets with a high thromboxane synthesizing ability are selectively consumed during disseminated intravascular coagulation, which is a constant attribute of shock of any etiology. High levels of prostacyclin in relation to the number of platelets were noted in patients with shock, who, along with other factors, are actively involved in the compensatory-adaptive response of the body in response to a stressful situation. By preventing platelet aggregation and exposing fresh platelet thrombi to disaggregation, prostacyclin, possibly, prevents the formation of microthrombi in the microcirculation system in patients with shock.

There were no significant differences in the content of prostacyclin and thromboxane between groups of patients with an uncomplicated course of the postoperative period and with the development of complications such as heart failure and hypovolemia.

Correlation analysis in patients with arterial hypertension revealed a direct relationship between systolic blood pressure and total peripheral vascular resistance on the level of thromboxane (correlation coefficients 0.672 ( $p < 0.05$ ) and 0.673 ( $p < 0.05$ ), respectively, and an inverse relationship between systolic and mean arterial pressure on the level of prostacyclin, which confirms the pathogenetic role of these hormones in the development of arterial hypertension.

In patients with vascular insufficiency, a positive relationship was established between the value of diastolic pressure and the level of thromboxane (correlation coefficient 0.638).

Thus, disorders in the PTS state in patients in the early postoperative period are accompanied by changes in vascular tone. A decrease in the level of thromboxane and a shift in the ratio of prostacyclin-thromboxane towards the prevalence of prostacyclin are accompanied by a decrease in vascular tone, while an increase in the level of thromboxane and a decrease in the ratio of the ratio lead to arterial hypertension.

In our work, we analyzed the factors affecting the state of the PTS and the platelet link of hemostasis.

It was found that the longer the EC, the lower the level of ThB2 and the lower the number of platelets in the blood, the more reduced the aggregation ability of platelets and the higher the level of  $\beta$ -thromboglobulin in the blood.

The levels of metabolites of prostacyclin and thromboxane were inversely related to the number of platelets in patients after CABG surgery: the lower the number of platelets in the blood, the higher the level of the studied hormones relative to their content, and vice versa.

It was determined that the fewer platelets in the blood, the lower the platelet aggregation and the higher the level of  $\beta$ -thromboglobulin in the blood. A negative correlation was found between the indicators of platelet aggregation and the level of  $\beta$  - thromboglobulin.

It has been established that blood loss during surgery exceeding 1000 ml leads to a decrease in the level of metabolites of prostacyclin and thromboxane in the blood.

The level of prostacyclin in the blood is significantly affected by the violation of ventilation processes in the lungs. In our work, it was found that hyperventilation of the lungs, leading to hypocapnia, increases the level of prostacyclin in the blood. This is consistent with the data of a number of studies (10, 11), where it was also found that hyperventilation of the lungs, leading to hypocapnia, promotes the synthesis of vasodilatory PGs, in particular prostacyclin.

Considering that one of the main functions of PTS is the regulation of the functional state of platelets, a study was carried out of the relationship between the levels of prostacyclin, thromboxane and the aggregation capacity of platelets. The established negative correlation (correlation coefficient 0.64) between the ratio of 6-keto-PGF1A / platelet count and platelet aggregation ability suggests that the factor contributing to a decrease in platelet aggregation properties in patients after CABG is an increase in prostacyclin level relative to platelet count.

Thus, we have established that the factors influencing the state of PTS in patients after CABG surgery are: the duration of artificial circulation, blood loss during surgery, the number of platelets in the blood, hypocapnia.

The factors influencing the platelet aggregation ability are: the duration of artificial circulation, the number of platelets, the degree of "emptying" of the alpha granules of platelets, the functional state of the PTS.

Thus, on the basis of the above, it can be concluded that PTS makes a significant contribution to the establishment of the body's adaptive response in response to surgical trauma. An increase in the level of prostacyclin and thromboxane relative to the number of platelets is an important compensatory-adaptive response of the body, aimed at ensuring the adequate functioning of the hemostasis and hemodynamic system. Imbalances between the levels of prostacyclin and thromboxane in patients after CABG are accompanied by disorders of vascular tone and hemostasis.

The study of the state of PTS in patients on the first day after CABG surgery expands the understanding of the pathophysiology of the early postoperative period and makes it possible to develop tactics for the treatment of disorders in the state of the platelet level of hemostasis and hemodynamics, based on the analysis of changes in the regulatory factors of the hemostasis system and hemodynamics.

## CONCLUSIONS

1. Coronary artery bypass grafting in patients with coronary artery disease causes a significant increase in the level of prostacyclin and thromboxane relative to the number of platelets with a simultaneous decrease in the rate of platelet aggregation and an increase in the level of  $\beta$  - thromboglobulin in the blood compared to preoperative levels.
2. In patients in the early postoperative period after CABG with the development of vascular insufficiency and shock, a decrease in the level of thromboxane in the blood was revealed, while

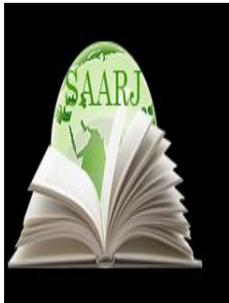

in patients with arterial hypertension, increased concentrations of thromboxane in the blood were determined in the absence of changes in the level of prostacyclin.

3. Significant differences in the content of prostacyclin and thromboxane between groups of patients with an uncomplicated course of the postoperative period and with the development of complications such as heart failure and hypovolemia were not revealed.

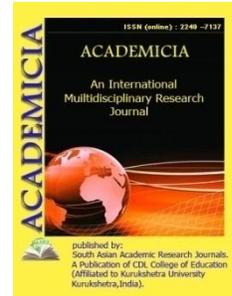

4. It has been established that the factors influencing the state of PTS in patients after CABG surgery are: the duration of artificial circulation, blood loss during surgery, the number of platelets in the blood, hypocapnia. The factors influencing the platelet aggregation ability are: the duration of artificial circulation, the number of platelets, the degree of "emptying" of the alpha granules of platelets, the functional state of the PTS.

## THE PHENOMENON OF HOMONYMY IN AVIATION TERMINOLOGY

**Rano Turaevna Ergashova\***

### ABSTRACT

*The types of terms are characterized by extreme complexity in terms according to the form and meaning. The fact that these terms are consciously developed in contrast to spontaneously formed and consumed words, that they are the product of the creativity of individuals as opposed to social ones, and that experts rely on similarities in different fields in naming their research objects plays an important role. This leads to such phenomena as polysemy, polyfunctionality, synonymy, and homonymy. The article describes the differences polyfunctional terms among the terms of aviation. Also it enlightens that homonymy is a universal phenomenon for almost all layers of language, units of varying complexity in terms of structure and semantics. In general, the connection between the meanings of such terms is characterized by certain attenuation from the connection between the meanings of the polysemantic terms and the tendency towards homonymy.*

**KEYWORDS:** *Homonymy, Polysemantic, Aviation Terms, Phenomena, Meaning, Complexity, Semantics, Language System, Connection, Polyfunctional, Lexicon.*

### INTRODUCTION

In world linguistics, homonymy is studied not only as an important theoretical issue related to the basic unit of language - the establishment of word boundaries, but also as one of the complex issues of practical lexicography. By the end of the twentieth century, the science of linguistics had risen from the empirical to the theoretical stage. Synonymy and polysemy are legitimate phenomena for languages, while homonymy is evaluated as a random phenomenon. In fact, homonymy is also one of the immanent and necessary laws for the language system. Hence, homonymy is a legitimate phenomenon of the language system, enriching the lexicon and

grammar of languages. It should be noted that homonymy is a universal phenomenon for almost all layers of language, units of varying complexity in terms of structure and semantics.

### MAIN PART

Much work has been done in Uzbek linguistics on the nature and function of terms, ie their lexical-semantic, grammatical features, differences of terminological lexicon from the general lexicon. Taking into consideration above, we make comments on some lexical-semantic, grammatical features of aviation terms. The term is a clear linguistic expression of a concept belonging to a field or network of social activity. Some terms may also be general for closely related industries or networks. This indicates that there is a certain relationship between those industries or sectors. For example, lexemes such as *body*, *wing*, *nose*, *tail* are used in the literary language in their own sense, while in aviation terminology their meaning is limited and they represent only one concept related to this field. It is clear that if the term-related field or network is not clearly imagined and taken into account, it will be difficult to limit the concept to be understood from it.

The lexeme “*свеча*”–*candle* is used in the common language to mean “*a rod that serves as a light source, with a wick inside*”, and in aviation it means “*the part of an internal combustion engine that emits electric sparks and burns the fuel mixture*”. The specificity of people's understanding and imagination will have to be clearly reflected in the terminology of a particular field. In such a case, in order to express the concept clearly, the means of expression belonging to the field itself are used as an auxiliary tool. It can be seen that the concepts can be of a relatively general nature as well as of a specific nature. In terms, this concreteness must be fully and clearly reflected. But the generality of the concept should not be understood as being equally relevant to all areas. The boundary between a word and a term is also determined by this. The fact that the term refers to an industry or network ensures its accuracy. This is one of its main features. But the word field should not be understood in a narrow sense, that is, only in terms of science and technology or culture. The term is scientific. This is explained by the clarity of the concept being scientifically expressed. When defining a term, its relevance to a particular field becomes clearer, and the difference from common words is also evident. Terms lack emotionality and expressiveness. Some suffixes, which express emotional-expressive meaning, lose their function in terminology and create a term that is an expression of a clear concept. For example, in the Uzbek aviation terminology, there is no emotionality in the suffixes *-chi*, *-li*, *-lash* in terms such as *shturmchi*, *qo‘sh qanotli*, *bombardimonchi*, *tormozlash*. Apparently, these suffixes served not as an evaluator of the term, but as a constructor of the term as an expression of a new concept.

### RESULTS AND DISCUSSIONS

It is well known that some words in a language have many meanings. The ambiguity of words is a legitimate phenomenon in the general lexicon and is the richness of language. When terms are ambiguous, they complicate the exchange of ideas, hindering the development of terminological vocabulary. The word can be used in a different sense in each context. For the term, the text is not taken into account. It remains an expression of a concept in a particular system. The main criterion is that the term acquires a single meaning in science, technology, in general, in some area of human activity or in areas close to it. But people interpret the meaning of the term differently. Some say that its sign of monosemanticity is associated only with the text, i.e., it has

only one meaning in the text. The term usually means the same concept in any text. [Tursunov U., Muxtorov J., Rahmatullayev Sh.1992. P- 124]Some say that in order for a word to be a term, its scope must not be limited to one area, but its meaning must be limited, that is, words and phrases that are clear and stable expressions of a particular concept cannot be terms. [Mamatov N. 1976, p- 68] However, most terminologists associate the monosemantic nature of a term with a single terminological system or areas that are close to each other. In fact, it becomes a meaning within a terminological system, whether it deviates from it or becomes a word. So, these features of the term allow it to be described as such. The term is a means of expression that corresponds to a concept in the system of concepts related to science, technology, culture, art, production, and a particular field of human activity in general. The term is specific to the national language. It is applied written the same. Terms are conditional, that is, the word or phrase that has become a term conditionally performs this function, that is, its content is formed within a terminological system, from which it can change. It is also an element of communication as a simple word. This task is, of course, limited, within an area or network. A truly exemplary term is always synonymous in a terminological system. Whether its function is increased, it becomes either polysemantic or homonymous. When there is a certain semantic connection, polysemantic, when the semantic connection is broken, homonymous terms appear. When a term mainly refers to concepts related to the terminology of different fields, the semantic connection between the two concepts becomes unnoticeable. Because when people in one field think, they don't even think about the concept of the other field. Hence, the formal equality in some terms follows from this. The phenomenon of formal equality in terminology is called homonymy. Homonymous terms occur mainly as the same expression of different concepts and things in a particular language terminology. Almost all of the homonymous terms were polysemantic words, which were used to express different concepts in the terminological lexicon. For example: *bosim*-pressure, *aloqa*-contact, *gabarit*-gauge, *stabilizator*-stabilizer, etc. Homonymous terms occur mainly as a logical continuation of polysemantic words. But because they belong to different fields, the connection in meaning disappears. Words such *asuchuvchi*, *gorizont*, *elevator*, *shturmovik*, *raketa* are polysemantic words in literary language, while in terminological lexicon they are homonyms.

Because, on the one hand, they are related in meaning, on the other hand, they belong to different terminological systems. That is, it is only a form in the terminological system. We think that the differences between homonymous words and homonymous terms are as follows:

1. Homonymous words belong to different word families. In homonymous terms, however, there is always a noun-equestrian feature.
2. While homonymous words are used to give an emotional tone in the process of speech, to provide ideological height, artistic decoration and attractiveness in literary works, homonymous terms create special terms in terminology.
3. If there is a general literary language for homonymous words, it is a terminological lexicon for homonymous terms.

Hence, the phenomenon of homonymy is a semantic process that has its own character in terminology and gives rise to special terms.

The phenomenon of homonymy in common language should never be confused with the phenomenon of homonymy in terminology. We know that in a number of terminological systems, lexical-semantic term formation has been and continues to be used effectively.

In the enrichment of the terminology of various fields, the formation of terms by this lexical semantic method plays an important role. For this reason, many terms can be found on the basis of commonly used words in various fields. This is an indication that terminological vocabulary is in constant contact with common vocabulary. This connection is of a two-sided nature, in which just as some words undergo lexical-semantic changes and become a term, the term also loses some of its features and becomes a common word. Usually, the term becomes clear and unambiguous in its field, and when it goes beyond its field, this feature disappears or becomes a member of another field of terminology. Therefore, when words in general use in a field of terminology, they acquire a specific concept in this field, that is, their meaning is limited, and also it is specialized.

In literary language, there are phenomena such as semantic migration, expansion, narrowing. The meaning of a word or term changes under the influence of these factors and contributes to the development of terminology. When a term is formed by the lexical-semantic method, not all of the meaning shifts are equally involved.

In Uzbek terminology, there is a situation in which household terms, human organs, natural phenomena can be transferred to another field, just as the term has become a term due to the name change. As a result, a term expresses different meanings in different fields and in turn creates interdisciplinary homonymy in terminology. Homonymy is a widespread phenomenon. In defining homonymy in language, first of all, the independent lexical meaning (semema), then the form (uniformity in writing) is taken into account, and in distinguishing homonymy from polysemy, the thread, chain between the sememes of the lexeme is broken or preserved. However, in terminology, especially in interdisciplinary homonymy, the connection between two lexemes or terms is preserved to a certain extent, i.e. the meanings they express are completely unbroken.

The concept of homonymy plays an important role in many scientific fields, such as terminology, logical semantics, and semiotics, and is a natural generalization of a particular linguistic concept. Homonymy is a graphical and (or) phonetic representation of words (lexemes, word combinations) that have different meanings.

Homonymy is the end point of the expression of polysemy - a phenomenon that is equally specific to common literary language and terminological systems.

There is a continuous "exchange" of lexical units between terminological systems and a common language: words of a common literary language lose some of their properties and become terms, while terms become units of a common language. Terminological processes are the source of the formation of homonyms in different terminological systems. Terminological homonymy differs from this phenomenon in the vocabulary of the general literary language. In scientific language, we encounter the phenomenon of homonymy, and it is the result of semantic change of the word, because "polysemy is diverse and becomes homonymous"[Reformatskiy A. A.1967. p-88]and so on.

Terminological homonymy differs radically from general literary language for the following reasons: "Terminology uses only one type of homonymy"[Danilenko V. P. 1977. p-72], "... homonymy in relation to terminology can only be described as an intersystem phenomenon: either to these terms of different terminological systems or to common literary language words lexical-semantic terms that have become relatively homonyms "[Shurigin N. A. 1997. P-167].

---

The essence of homonymy is not clearly explained in the scientific and linguistic literature. Scholars in the field have taken different approaches to the assessment of terminological homonymy. A. Bulakhovsky calls homonymy a disease of the tongue; [Bulakhovskiy L. A. 1954] L. A. Novikov considers the relations of words that are uniform in form and unrelated in meaning to be chaotic and exclusive; [Novikov L. A. 1982, p-272] In A. A. Reformaty's understanding, "homonyms are the indifference of things that should be different in any case". [Reformatskiy A. A. 1996, p- 536]

Homonymy and polysemy are integral attributes of simple, natural language, enriching the general literary language by expressive means. Many researchers believe that homonymy cannot be accepted in a scientific context, and some even consider it dangerous.

V.V. Vinogradov, D.E. Rosenthal, M.I. Fomina, and some other researchers describe homonymy as a phonetic and grammatical randomness of linguistically unrelated linguistic units. Homonymous words, in the opinion of these linguists, are primarily characterized by their independent comparison with one or another phenomenon of reality, so there is no associative conceptual-semantic connection between them, which is characteristic of different semantics of polysemantic words. In the realization of the lexical meaning of homonyms, their interference is excluded [Vinogradov V. V. 1960. № 5. p. 3-17].

As a result of the semantic division of a word, homonymous terms become lexical units with different meanings belonging to different terminological fields, losing the invariance of their internal forms. The lack of independence of the term within the system, its interrelationship with the term field is one of the main criteria for distinguishing homonyms: homonyms can be homonymous only if they belong to different fields, the problem of polysemy and homonymy outside network terminology loses all meaning [Tatarinov V. A. 1996. P-311].

There are lexical units in aviation terminology that have homonyms, and let us focus on an analysis of them:

a) in the general literary language interpreted by metaphor:

*elevator*- 1) a vertical conveyor (general consumption) with mechanical equipment for receiving, transporting, cleaning, drying, sending large quantities of grain; 2) a holding device for suspension of a turntable during bypass operations (in aviation);

*gorizont*- 1) a clear line of communication between heaven and earth (common use); 2) the plane of horizontal movement of the angle at any level (in aviation);

*uchuvchi*- 1) Adjective form of the verb *uchmoq* (in general literary language);

2) Aircraft controller, driver specialist (in aviation).

Such words of the common language, becoming a term, retain only the "phonetic shell", the meaning of the word changes completely, the semantic derivative is based on the semantic transmission of the horse on the basis of formal logical relations:

b) in other terminological systems: *stabilizator*- 1) A device that automatically keeps a process, e.g., an electric current or voltage, flat. TV stabilizer (in industry); 2) The fixed part of the tail wing (in aviation), which provides longitudinal stability and control of the samolyot;

*shturmovik*- 1) In Nazi Germany: a member of the Nazi organization (in the field of history); 2) a warplane attacking ground targets from a small height; such aircraft pilot (in aviation);

*raketa*- 1) a projectile that rises to the sky when the charge inside burns, is used to signal in military operations and to illuminate the necessary places(military); 2) jet propulsion aircraft (in aviation);

*radiolokatsiya*- 1) a branch of science and technology engaged in the detection and location of objects on land, water and space by radio engineering;2)Distant objects, e.g., airplanes, etc. k. methods and means of locating, detecting, and distinguishing the location of radiographs returned from them (in aviation);

*radiator*- 1) in the heating system of buildings: a heating device (in construction) consisting of cast iron, steel, ceramic pipes, in which hot water or steam circulates; 2) Device for lowering the temperature of coolant or oil in an internal combustion engine (in aviation).

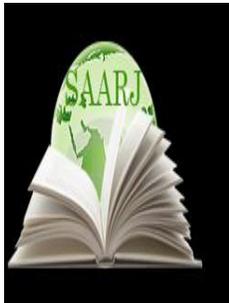

## CONCLUSION

Taking into consideration homonymy is a branch of lexicology, it plays an important role not only as theoretical issue belongs to the basic unit of language which forming of word boundaries, but also as one of the sophisticated issues of practical lexicography. Homonymy in aviation is the result of the semantic formation of a sign, the fragmentation of the meanings of a polysemous word, the loss of the transition parts of the whole.

**ABSTRACT**

*Outstanding bard Komiljon has been living and will live in our souls with his music and songs forever. Indeed, everything may have already been said, all articles may have already been written about this bard of singers since. Whenever, when you try to write something about him, it is certain, you discover his new feature for yourself.*

**KEYWORDS:** *Shepherd, Distant Melodies, Otaniyozokhund, Khushsoat*

---

**INTRODUCTION**

The versatile artist, People's honoured artist Komildjon Otaniyozov was one of the artists who made a great contribution to the development of Uzbek music. It is no exaggeration to say that in the video and magnetic tapes of his performance, maqom songs, suvora, dastaans, songs are still loved and listened to by our art-loving people. Whenever we speak about famous *Khorezm Lazgisong*, we remember the unforgettable image of Komildjon Otaniyozov.

The famous exhortation songs "*Ayrima*"(Stay with), "*Ko'ring*"(See), which promote purity, sincerity and courage, and the song "*Til*"(Language) about the need to learn foreign languages with Avaz Otar's ghazal have been revered among the best examples of Uzbek music for many years. The song by *Podachi*(Shepherd's song), which is considered to be important for its educational significance and is popular among the people, is characterized by a philosophy of life, human devotion, and the glory of the country. We often observe the harmony of poetry and music in the creation of such vital works. Most surprisingly, the author of the text of this song was Komiljon Hafiz himself. Komiljon Otaniyozov's father Otaniyaz Akhund Niyazi (1844-1928) was one of the prominent representatives of the Khorezm literary environment in the late XIX and early XX centuries. "Otaniyaz was known as a poet, musicologist, calligrapher and translator. Akhund Niyazi's talent was recognized in his time."<sup>1</sup>

Of course, the son of such a rare talent could not have been unaware of poetry. In addition, Komiljon Otaniyazov's wife Imsinoy Polvonova (people respected her as 'ana' means granny) also practiced poetry, and undoubtedly served as a huge wing for the musician's flight in the world of art.

The playwright Kamil Avaz expresses warm thoughts in honor of Komiljon Otaniyazov in his pamphlet 'Distant Sounds'. "He was a mature singer, a man of knowledge, a man of high culture, who, in addition to the lexical meaning of Arabic and Persian words in the dictionaries, he shared his views on the meaning and place of words in *ghazal*, and could argue over a letter of some words. To cut in short, he was a man of delightful talk."

In 1952-55, Komiljon who have already gained fame and studied at the Tashkent State Conservatory and toured the world for travel concerts. During one of such tours to India, the song "Hello to the people of India" by him claimed of great popularity.

One of Komiljon Otaniyazov's little-known features is that he was able to record six and a half of Khorezm's makoms on audiotape. This rare audio recording is currently stored in the Golden Fund. In addition, the teacher was a great help to the young Matniyaz Yusupov, who in 1950-60 felt the threat of the disappearance of the Khorezmmakom songs and tried to preserve them for future generations. Matniyaz Yusupov "studied the notes of Khorezmmakom songs from Matpanoota, Madrahim Sheroziy, Khojikhon Boltaev, Komiljon Otaniyazov, Abdusharif Otajonov and other teachers, and first published it in one volume, then in 1980 in three volumes."<sup>2</sup>

Komiljon Otaniyazov's sense of patriotism has already attracted the attention of the leaders of our country. In particular, when the First President spoke about Khorezmian music, he always reminded of the famous phrase in "Podachi's song" (Shepherd's song): "Heaven gardens of abroad cannot replace a single thorn of my motherland for me." In 2016 current president of Uzbekistan Shavkat

Mirziyoyev who was once a performer of his function focusing on the point said: "If we create a modern creative center named after Komiljon Otaniyazov in the region and a beautiful garden in it, if we allow our talented young people to come here and study the secrets of literature and art, cinema and photography, it will be a brilliant job." In order to preserve and promote the immortal memory of Komiljon Otaniyazov, a luxurious garden creative talents center was established along the Shovot Canal. It is safe to say that this beautiful garden has become another gift for our art-loving people on the birthday of Hafiz (The Bard).

In accordance with the initiative decision of the President to widely celebrate the 100th anniversary of Komiljon Otaniyazov in 2017, various competitions were held at the regional and national levels. The best songs and melodies of the bard were performed in these contests. Since the beginning of the year, large public concerts have been organized all over Khorezm region. The participation of honored artists of Uzbekistan Rahmatjon Kurbanov, Ogabek Sobirov, Azamat Otajonov in the concert program added a special charm to the content of concerts and contests. More than 50 singers and musicians, young male and female dancers from Uzbekistan, neighboring Tajikistan, Turkmenistan and Karakalpakstan took part in the jubilee contest. The final stage was held in July 2017 in the park named after Komiljon Otaniyazov in Shovot district. The winner of the Gran-Pre, the singer Nabijon Khudaiberganov was recognized by the jury, and the audience supported them with heartfelt applause.

The senior lecturers of the Department of Music Education of Urgench State University BotirRakhimov, KomiljonAbdirimov, RustamBoltaev, SamandarKhudaiberganov, DoniyorbekObidov established a public fund "Music and Fine Arts" named after KomiljonOtaniyozov. (2013) The purpose of this public fund is to increase the place and role of music and fine arts in the education of the younger generation, to awake their love for the Motherland through the demonstration of creative abilities. A number of books dedicated to KomiljonOtaniyazov have been published under the auspices of the Foundation.

A group of people from different fields, who appreciate the creative art of KomiljonOtaniyozov, did a great job to please the spirit of the bard with their creative works. In particular, the sculptor of Uzbekistan, academician of the Academy of Arts of Uzbekistan, master painter AtakhonAllaberganov masterfully embodied the statue of the teacher. In addition, a novel by playwright KurbanMuhammadrizo dedicated to KomiljonOtaniyozov, a collection of songs by SamandarKhudaiberganov 'Hush soatedi' (Pleasant Hours were) and several dozen of books were published.

We can guess from the fact that all the composers have contributed to the multifaceted work of the singer KomiljonOtaniyazov, his life did not end, on the contrary, he was immortalized in the depths of our hearts with his songs. If this is the case, then it would be marvelous that the articles and poems about Komiljon are still being copied on paper, leaving a mark on the minds of the people of the pen.

The classic song "Nigora", created and performed by one of the outstanding people of his time, Komiljon Otaniyazov, is one of the hundreds of songs born in the Fergana-Tashkent local style with great skill. Although the doyra style of the song belongs to this local style, one can feel the Khorezm melody and moans from the very beginning of the melody. After all, Komiljon Otaniyozov's performance always has a unique Khorezmian musical dialect.

The classical song "Nigora" composed by Komiljon Otaniyozov to the ghazal of the classic poet Furkat has a special position in the creative repertoire of the hafiz. Here we can see how twin miracle are words and music together. The introductory part of Nigora's song begins with a slightly quieter melody. The melodious voice of the hafiz harmonizes with the melody of the music. Every sound of the instrument is loud and clear. If we pay attention to the words of the text, Hafiz's love for his lover is overflowing. At first, it is said that the beloved is intoxicated with love, sick, but the lover does not care about him at all. In our opinion, despite the fact that Furkat's ghazal is dedicated to this divine love, this song has a special meaning in the performance of Komiljon Otaniyazov. Because when you hear it, you get the impression that the hafiz is performing for the person he loves. The features of professional performance in singing will catch your attention. Words are emphasized at the beginning of the sentence, and at the end it ends with diminuendo in the language of music.

## Part 1

## Nigora

Furqat g'azali

M.M. ♩=95-100

Ni-go - ro xas -  
 - ta-lik ko'per - di man - da Ne-tay kim yo'q  
 e-rur bir rahim san - da Ko'n-gul qon bog -  
 - la-di mo nan - di bul - bul A-yo ey g'un -  
 - cha-lab qil sang - chi han - da

With the beginning of each new part, the power of words begins to show its beauty in the way of the definition of a friend. In the second part, which begins with "Not like your teeth ..." Sometimes he tells her that her teeth are more than the jewels of the state of Oman, and sometimes he tells her that her lips are unique in the rubies of the ancient land of Yemen. But after this meeting, he says, his body stops bowing to him.

## Part 2

Tu-shing - ga o'x sha-masum  
mo ning mingdur - ri La-bing - dek la' l yo'q mul-ki Ya man -  
- da O' shal kun bir ko' rib ra' no yu zing - ni

## Part 3

The third part tells about his thoughts that he thinks and speaks about her everywhere in the hope of meeting her. At the same time, it is natural for us to understand that the lover is in love.

Ja - mo - ling vas - fi - ni yo zib ni - go - ro  
O' qur - man o'l - tu - rub har an - ju man - da

## Part 4

In the fourth part of the climax, the young man's condition is compared to that of a cauldron wandering in hope, and in the climax, which begins with "Kulah is in my head ..." one can clearly feel Komiljon Otaniyazov's excited moan, which is not repeated in any of his previous songs. It is compared to the painful sighs of a true lover. This oil feels like the tempo of the work has accelerated a bit. In fact, the fact that the song is coming to an end and the climax has been removed makes us understand it that way.

In the concluding part, the lover also tells about the conditions of the previous lovers and tells Furkat not to worry so much that his sweetheart does not seem not to love him.

### ABSTRACT

*Sunflower is the main source of vegetable oil for technique. The main way to increase the yield of sunflower is to cultivate modern early maturing varieties that are adapted to the soil conditions of the region for each region. This scientific article develops the basic elements of the technology of cultivation of oilseed sunflower as a secondary crop of high yields from fast-ripening varieties. Planting sunflower as a secondary crop after wheat has led to increased yields when planting times are used correctly. Depending on the number of seeds in a basket and the time of sowing their weight, it is proved that the number of seeds in the basket increases when the sowing period is repeated in the second decade of June.*

**KEYWORDS:** *Sunflower, Repeat, Crop, Term, Oil, Variety, Yield, Early Ripening, Past Tense, Farm Characters, Seed, Seedling, Productivity, Basket.*

### INTRODUCTION

Sunflower oil is mainly used in food. It is whitish yellow, clear, semi-dry (iodine number 119-144), the seeds contain 29-56% fat and 15% protein. The oil contains up to 62% of biologically active menolic acid, vitamins A, D, E, K, phosphatides. Sunflower oil is rich in linoleic and oleic, unsaturated fatty acids. Such oils are close in quality to olive oil.

Sunflower oil is used in the manufacture of margarine, mayonnaise, canned fish and vegetables, confectionery, lacquer, soap. 25-50 kg / ha of honey is obtained from sunflower.

16-22% of sunflower seeds are husks and seed husks are used in the production of hexose and pentose sugars. Ethyl alcohol and feed yeast are produced from hexose sugar, and furfural, which is used to produce plastics and synthetic fibers, is obtained from pentose. From 1 ton of sunflower seed husk is obtained 32 liters of ethyl alcohol or 100-150 kg of feed yeast, replacing 100 kg of glycerin. 0.1 fodder unit per 1 kg of husk, and 10 g is digestible protein. A basket of sunflowers is also a good food for livestock. The empty basket left after the separation of sunflower seeds contains 5-5.5% fat, 6-8% protein, 0.7-0.8 fodder unit per 1 kg of flour basket, and contains 38-43 g of protein. Feed pectin is produced from the basket.

When planting sunflower as a secondary crop, it is important to make efficient use of lands vacated by autumn cereals, to set planting dates correctly, to develop and introduce methods of intensive land use to harvest crops several times a year.

### **The degree to which the problem has been studied**

When newly created intensive varieties of sunflower are planted without irrigation, high yields can be obtained when planted in the following seedling thickness:

- In the southern steppe - 40 thousand / ha,
- In the northern steppe - 50 thousand / ha,
- In the forest steppe - 55-60 thousand / ha.

For hybrids, it is recommended to increase the seedling thickness to 10-15 thousand / ha, and sowing an average of 4-6 kg of seeds per hectare is considered effective [3].

Sunflowers are planted in rows 60, 70 cm width. The planting of low-growing (0.8-1.2 meters in height) early ripening varieties with a thickness of 70,000 bushes per hectare gave good results. The sowing rate of oilseed sunflower seeds is 5-10 kg per hectare, 35-40 kg for silage, 6-7 cm for sowing, 8-10 cm for light soils [2, 4].

M.Amanova noted that at the Uzbek Botanical Research Institute, when the seeds of "Jahongir" variety were sown on March 20 (air temperature 10-12<sup>0</sup>C), the time from germination of the first seeds to germination of grass (75%) took 16-18 days, on April 5 (weather temperature was 16-18<sup>0</sup>C) and 7-9 days when planted [1].

According to M. Lukov and other scientists, the best time for repeated sowing of sunflower is in Samarkand region - 5, Navoi region - 10, Kashkadarya region - 15, Surkhandarya region - until July 20. "Jahongir", "Rodnik", "Sur", In the scheme of sowing of varieties "KK-1", and hybrids "Krasotka", "Sambred-254", "Luchaferul" 70-25 cm, thickness 57.1 thousand bushes / ha, line "Sam Agricultural Institute 20-80" 70x30 cm. It is advisable to plant at a thickness of 47.6 thousand bushes / ha. [7].

### **RESEARCH CONDITIONS AND METHODS**

Experiments were conducted in 2015-2017 in the conditions of typical sierozem soils of the experimental field "Center for Innovative Developments and Consulting in Agriculture" of Tashkent State Agrarian University. In the experiment, 4 varieties of sunflower "Jahongir", "Rodnik", "Dilbar" and "Navruz" were sown on June 20, July 1 and July 10.

Placement, calculations and observations of field experiments “Methods of conducting field experiments” (5), stem height of sunflower varieties (at all stages of development), number of leaves per bush, basket weight, number of seeds in basket and their weight, 1000 seed weight, leaf surface (A.A.Nichiporovich, 1963), [8] was determined by the effect of the feeding area.

Productivity was reduced to 12% and purity to 100% by grinding separately for each variant. The obtained data were analyzed mathematically according to the instructions of B.A.Dospekhov (1985) [6].

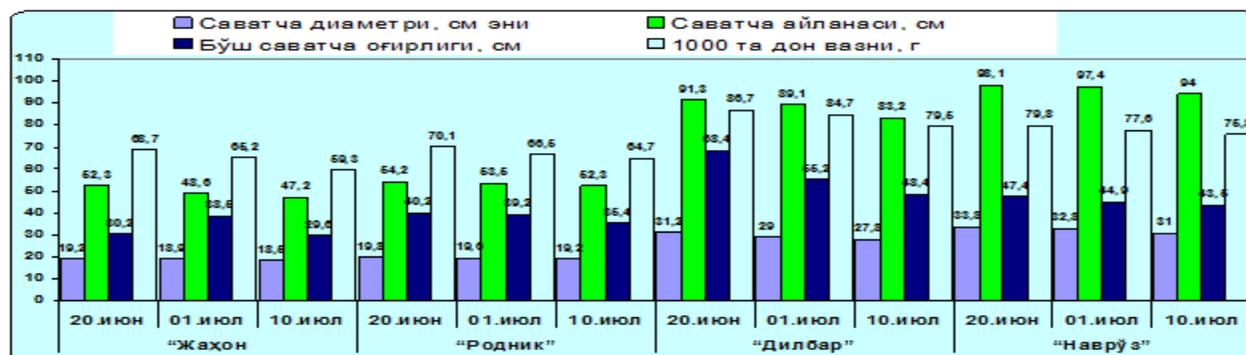

## RESULTS

According to the study, the diameter of the baskets of the control variety "Jahongir" was large at the time of sowing on June 20, 19.2 cm, the diameter of the baskets was slightly reduced to 18.9 cm on July 1 and 18 at the time of planting on July 10. It was found to have a diameter of 5 cm. During the same sowing period, the diameter of the baskets of Rodnik was 19.8, 19.6 and 19.2 cm, and 0.6, 0.7 cm larger than the baskets of Jahongir. The influence of sowing dates on the development of baskets in the Dilbar variety was positive, and they were found to be larger than in the Rodnik and Jahongir varieties. In the early period, it was found to be 31.2 cm when planted on June 20, 29.0 cm in the second period planted on July 1, and 27.8 cm in the third period planted on July 10. This variety was 12.0 cm, 10.1 cm and 9.3 cm larger in terms of diameter than the baskets of the control variety “Jahongir”. The diameter of the baskets of the Navruz variety has been studied experimentally.

It was found to be larger than Jahongir, Rodnik and Dilbar varieties, 33.8 cm in the sowing period on June 20, 32.8 cm in the sowing period on July 1 and 31.0 cm in the third period. The baskets of this variety are 2.6 cm, 3.8 cm and 3.2 cm in diameter compared to the Dilbar variety. The diameter of the baskets was 14.0 cm, 13.2 cm and 11.8 cm compared to the Rodnik variety and 14.6 cm, 13.9 cm and 12.5 cm respectively in terms of sowing time compared to the Jahongir control variety (Table 1).

The weight of the baskets from the counted plants was weighed and the total weight of one basket was determined. It was found that planting times have a positive effect on the weight of the baskets.

In the control variety “Jahongir” at the time of sowing on June 20, the total weight of one basket averaged 85.5 g,

Picture 1. Effect of sowing dates on harvest elements of sunflower varieties

the weight of the empty basket was determined to be 30.2 grams after purchase. At the time of sowing on July 1, the total weight was 86.8 g and the weight of the empty basket was 38.5 grams, and at the time of sowing on July 10 it was 66.4 grams and the weight of the empty basket was 29.6 grams.

In the experiment, the baskets of the "Dilbar" variety were large, with a large number of seeds and weight. The average total weight of one basket when planted in early June 20 is 148.4 g and the weight of an empty basket is 68.4 g, 128.8 g when planted on July 1 and 55.2 g when planted in an empty basket, and an empty basket is 118.8 g when planted late July 10. The weight of the basket was 62.9, 42.0 and 52.4 grams, and the weight of the empty basket was 38.2, 16.7 and 18.8 grams, respectively, compared to the control variety "Jahongir". The total weight of the basket was 45.3, 37.5, 43.9 grams and the weight of the empty basket was 28.2, 16.0 and 13.0 grams, respectively, compared to the variety "Rodnik".

The average weight of one basket when planted in early June 20 is 123.0 g and the weight of an empty basket is 47.4 g, 113.5 g when planted on July 1 and 44.9 g when planted in an empty basket, and 98.7 g when planted on July 10. and the weight of the empty basket is 43.5 grams, the total weight of the basket is 37.5, 26.7 and 32.3 grams and the weight of the empty basket is 17.2, 6.4 and 13.9 grams, respectively, in terms of sowing time compared to the control "Jahongir" variety was heavy. In contrast to the "Dilbar" variety, the total weight of the basket was 25.4, 15.3 and 20.1 grams, while the weight of the empty basket was 21.0, 10.3 and 4.9 grams, respectively.

Depending on the number of seeds in a basket and their weight at the time of sowing, the increase in the number and weight of seeds when the sowing period is repeated in the second decade of June was brought.

In the experiment, the yield elements of Dilbar and Navruz varieties were close to each other and higher than those of Jahongir and Rodnik varieties. When Dilbar was sown in early June 20, it averaged 922.7 seeds per plant and weighed 80.0 grams. At the time of sowing on July 1, there were 868.9 seeds, weighing 73.6 grams. Late on July 10, 865.4 seeds were sown, weighing 70.4 grams. The number of seeds of this variety and their weight increased by 117.8, 128.1 and 244.8 pieces and weighed 24.7, 25.3 and 33.6 grams, respectively, according to the sowing period of the control variety "Jahongir". Rodnik variety was 25.4, 85.4, 254.9 more than the sowing period and weighed 17.1, 21.5 and 30.9 grams.

At the time of sowing on June 20, the Navruz variety had an average of 951.0 seeds per plant and weighed 75.6 grams. In the second period, there were 884.0 seeds, which weighed 68.6 grams. During the third sowing period, there were 728.2 seeds and its weight was 55.2 grams. The number of seeds of this variety and their weight increased by 146.1, 143.2 and 107.6 seeds and weighed 20.3, 20.3 and 18.4 grams, respectively, according to the sowing dates of the control variety "Jahongir". According to the sowing period of Rodnik, the number of seeds increased by 53.7, 100.5 and 117.7, and the weight was 12.7, 16.5 and 15.7 grams. According to the sowing period of Dilbar variety, the number of seeds increased by 28.3 and 15.1, and on July 10 it decreased by 137.2 and weighed 4.4, 5.0 and 15 grams. The Navruz variety weighs 79.8 grams when sown early on June 20, 77.6 grams when sown on July 10 and 75.8 grams when planted late July 10 formed. It can be seen that a decrease of 2.2 and 4.0 grams was observed in late sowing periods compared to early sowing.

Delays in planting sunflowers have led to an increase in undeveloped seeds in the middle of the baskets. In the Jahongir control variety, underdeveloped seeds accounted for 10.0% of the June 20 sowing period, compared to 12.0% when sown on July 1, leading to an increase of 2.0% of undeveloped seeds in the middle of the basket. When sown late on July 10, undeveloped seeds were found to be 12.9%, an increase of 2.9% and 0.9% compared to early sown periods.

**TABLE 1 EFFECT OF SOWING DATES ON HARVEST ELEMENTS OF SUNFLOWER VARIETIES**

№	Varieties	Sowing dates	Basket diameter, cm,	Basket circle, cm	The total weight of a basket with grain, gr	The weight of empty basket, gr	Productivity of a plant		Undeveloped seeds, %	The weight of 1000 pieces of seeds, gr
							Seeds number, piece	Seeds weight, gr		
1	Jahongir (st)	20.06	19,2	52,3	85,5	30,2	804,9	55,3	10,0	68,7
2		01.07	18,9	48,6	86,8	38,5	740,8	48,3	12,0	65,2
3		10.07	18,5	47,2	66,4	29,6	620,6	36,8	12,9	59,3
4	Rodnik	20.06	19,8	54,2	103,1	40,2	897,3	62,9	9,6	70,1
5		01.07	19,6	53,5	91,3	39,2	783,5	52,1	11,0	66,5
6		10.07	19,2	52,3	74,9	35,4	610,5	39,5	12,4	64,7
7	Dilbar	20.06	31,2	91,3	148,4	68,4	922,7	80,0	4,8	86,7
8		01.07	29,0	89,1	128,8	55,2	868,9	73,6	5,4	84,7
9		10.07	27,8	83,2	118,8	48,4	865,4	70,4	6,0	79,5
10	Navruz	20.06	33,8	98,1	123,0	47,4	951,0	75,6	5,2	79,8
11		01.07	32,8	97,4	113,5	44,9	884,0	68,6	6,0	77,6
12		10.07	31,0	94,0	98,7	43,5	728,2	55,2	6,8	75,8

In the Dilbar variety, the underdeveloped seeds in the baskets were found to be very low compared to the experimental varieties Jahongir, Rodnik and Navruz, and almost closer to the Navruz variety. Seeds that did not develop during the June 20 sowing period accounted for 4.8%,

led to an increase in undeveloped seeds in the middle part of the basket by 0.6%, up from 5.4% when planted on 1 July. When sown late on July 10, underdeveloped seeds were found to be 6.0%, an increase of 1.2 and 0.6%, respectively, compared to early sown periods.

Among the varieties, the percentage of undeveloped seeds in the baskets in terms of sowing dates in the Dilbar variety was found to be 5.2, 6.6 and 6.9% lower than in the Jahongir control variety, and 4 percent lower than in the Rodnik variety. 8, 5.6 and 6.4%, respectively, and 0.4, 1.2 and 0.8%, respectively, compared to the variety of "Navruz".

The study found that in all varieties, the percentage of empty seeds in the middle of the basket increased as the sowing period was delayed.

It was found that the weight of 1000 seeds of Dilbar variety was heavier than that of Jahongir control variety, Rodnik and Navruz varieties. At the same time, it was heavier than the Jahongir variety in terms of sowing dates; 17.0, 19.5 and 20.2 grams. In the following order in relation to the variety of "Rodnik"; 6.6, 18.2 and 14.8 grams. For the variety of "Navruz" in the following order; It weighed 6.9, 7.1 and 3.7 grams.

The highest yield of sunflower varieties was in the control variety "Jahongir" in early June 20 (25.2 c / ha). At the sowing period on July 1, the yield was 21.7 c / ha, a decrease of 3.5 c / ha, and at the late July 10 sowing period it was 16.6 c / ha, compared to the early sowing at 8.6 c / ha and on July 1. a decrease of 5.1 c / ha was observed compared to sowing (Table 2).

The Rodnik variety yielded 28.6 c / ha when sown in early June 20. At the time of sowing on July 1, the yield was 23.5 c / ha, a decrease of 5.1 c / ha, and at the time of sowing on late July 10 was 17.8 c / ha, compared to early sowing was 10.8 c / ha and on July 1. a decrease of 5.7 c / ha compared to sowing.

In the Dilbar variety sown in early June 20, the seed yield was 36.5 t / ha. At the sowing period on July 1, the yield was 33.2 c / ha, a decrease of 3.3 c / ha, and at the end of the sowing period on July 10 was 29.7 c / ha, compared to the early sowing of 6.8 c / ha and on July 1. a decrease of 3.5 c / ha compared to planting.

When sowing the Navruz variety in early June 20, the seed yield was 34.5 c / ha. At the time of sowing on July 1, the yield was 30.9 c / ha, a decrease of 3.6 c / ha, and at the time of sowing on late July 10 was 24.8 c / ha, compared to the early sowing of 9.7 c / ha, and On July 1, there was a decrease of 6.1 c / ha compared to sowing. According to the results of the study on total yield was higher in all sunflower varieties when planted in early June 20, and the total yield decreased when sowing was delayed by 10 and 20 days. Among the varieties used in the experiment, the highest total yield was observed in the variety "Dilbar", compared to the control variety "Jahongir" - 11.3 c / ha; It was 7.9 t / ha higher than Rodnik and 2.0 t / ha higher than Navruz. Yield of conditioned seeds was higher in Dilbar and Navruz varieties than in Jahongir and Rodnik varieties. Both varieties were found to have the same amount of conditioned seeds, but the Dilbar variety was found to have 0.4, 0.6 and 0.8% more sowing seeds than the Navruz variety. In all the varieties studied in the experiment, it was observed that the conditioned seeds were higher in the period sown in early June 20.

The kernels were extracted from the sunflower seeds and the kernels were found to come out of the husk. According to the table of pistachio kernels, 74.0% of the pistachio seeds were sown on

June 20, 76.0% less on July 1 and 75.2% later on July 10. 1.2% more and 0.8% less than the early planting periods.

TABLE 2

№	Varieties	Sowing dates	The output of conditioned seed,%	Seed yield, c / ha	The output of kernel,%	The rate of oil content of seed,%	Oil output, kg / ha
1	Jahongir (st)	20.06	90,0	25,2	68,5	58,6	1475
2		01.07	88,0	21,7	71,3	58,4	1267
3		10.07	87,1	16,6	69,4	58,3	968
4	Rodnik	20.06	90,4	28,6	72,0	59,4	1699
5		01.07	89,0	23,5	75,3	59,2	1391
6		10.07	87,6	17,8	73,3	59,0	1050
7	Dilbar	20.06	95,2	36,5	74,0	59,8	2183
8		01.07	94,6	33,2	76,0	59,5	1975
9		10.07	94,0	29,7	75,2	59,4	1764
10	Navruz	20.06	94,8	34,5	73,8	58,6	2022
11		01.07	94,0	30,9	76,0	58,5	1808
12		10.07	93,2	24,8	74,9	58,3	1446

NSR<sub>05</sub> = 0,71 ц/га  
S<sub>x</sub> = 2,66%

According to the timing of injuries, the yield of pistachio kernels in the Dilbar variety was higher than in the control variety Jahongir, Rodnik and Navruz. In this case, compared to the control variety of "Jahongir" on the timing of convictions, the following sequence of pistachio kernels was more; 5.5, 4.7 and 5.8%. In relation to the variety of "Rodnik" in the following order; 2.0, 0.7 and 2.1%. For the navigation variety of "Navruz" in the following order; 1.2, 0.9% more.

A study of pistachio kernel yields found that in all sunflower varieties, kernel yields were high during the July 1 planting period and decreased when planting dates were delayed.

The oil content of sunflower seeds was determined by the YMR oil analyzer AMV-1006 and the following results were obtained: When sowed the control variety "Jahongir" in early June 20, the oil content in the seeds was 58.6%, and delays in solutions had no significant effect on seed oil content. It was found to be 58.4% when planted on July 1 and 58.3% when planted on July 10. This pattern was observed in all varieties and periods of experience. It was found that the amount of oil in the seeds of Dilbar and Rodnik varieties is almost the same as in the seeds of Jahongir and Navruz varieties. However, the oil content of Dilbar seeds was higher than that of all experimental varieties. At the same time, in the period of early sowing on June 20, 1.2% compared to the control variety of "Jahongir", 0.4% compared to the variety of "Rodnik" and 1.2% compared to the variety of "Navruz". 1%, 0.3%, and 1.0%, and 1.1, 0.4, and 1.1%, respectively, when planted late July 10.

According to the verified dates, the amount of oil extracted from one hectare of land was determined, and 1475 kg / ha of oil was extracted from the control variety "Jahongir" sown in early June 20. It was found that 1267 kg / ha of oil can be extracted when planted on July 1 and

968 kg / ha when planted on late July 10. It can be seen that when sunflower is planted as a repeat crop as early as possible after the autumn grain crop, the amount of oil extracted from it will be higher than that planted late.

1699 kg / ha of oil was extracted from Rodnik variety planted on June 20. It was found that 1391 kg / ha of oil can be extracted when sown on July 1 and 1050 kg / ha when sown on late July 10. 2183 kg / ha of oil was extracted from "Dilbar" variety planted on June 20, and the amount of oil per hectare was higher than other experimental varieties. It was found that when sown on July 1, 1975 kg / ha and when sown on late July 10, 1764 kg / ha of oil can be extracted. The "Navruz" variety is also close to the "Dilbar" variety for oil production per hectare. It was found that it is possible to extract 2022 kg / ha of oil when sown on June 20, 1808 kg / ha when sown on July 1 and 1446 kg / ha when sown late on July 10 when planting near Rodnik and Jahongir.

The amount of oil obtained from the variety "Dilbar" was higher than the control navigation "Jahongir" in the following order: 708, 708 and 796 kg / ha, compared to the variety "Rodnik" 484, 584 and 714 kg / ha, and "Navruz" were 161, 167, and 318 kg / ha higher than the variety.

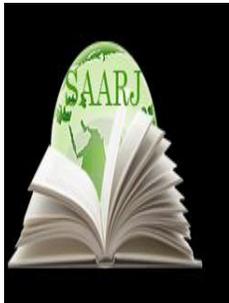

## CONCLUSIONS

Yields of sunflower varieties varied depending on the sowing period, and the highest yields were observed in the Dilbar variety (36.5 c / ha), 11.3 c / ha in the Jahongir compared to control variety, 7.9 c / ha in the Rodnik variety, and was 2.0 c / ha higher than variety of Navruz.

During the sowing period on June 20, the oil content of seeds in the variety "Dilbar" was 1.1-1.2% higher than other varieties studied in the experiment and late sowing, and oil yield per hectare was 204-1346 kg / ha more.

### ABSTRACT

*Folklore has always influenced written literature. In written literature, elements that arose under the influence of folklore are called by experienced scholars by different names. In the literature of this period, we see the most beautiful examples of folklore, in particular, in the works of such artists as Dilshod-Barno, Anbaratin, Muqimi, Makhmur, Zavki, Furkat. This literary folklorism, that is, the customs and traditions of our people, national values, the unique use of folklore elements in the work of poets, is a traditional process in written literature, which not only ensures the national identity of the work, but also affects its meaning and art. The article analyzes the influence of folklore on the literature of the 18th - 19th centuries, the phenomenon of folklore in literature.*

**KEYWORDS:** *Folklore, The Influence Of Folklore On Written Literature, The Phenomenon Of Folklore, Literary Folklorisms, Image, Motive, Artistic Interpretation.*

### INTRODUCTION

Samples of folklore used in written literature are studied under the term “folklore”. As Professor B. Sarimsakov rightly admits, “all folklore material included in an artist’s work for a specific purpose should be considered not as folklore but as folklore, because it will be processed by the artist” [1. 39].

In the literature of the late XVIII-XIX centuries. Plots, motives, folklore images, means of artistic expression were widely used, and it is advisable to study all of them within the framework of “folklorism”. At the same time, in our classical literature, including the literature of the studied period, there are materials related to various traditions, beliefs, ideas, superstitions, traditional views of our people, which, in our opinion, are ethnographies”.

It is known that in our language there are words denoting the names of various customs, rituals, traditions and rituals, and this lexical layer in linguistics is called “ethnography”. Ethnography of the Uzbek language A.Juraboev[2], N.Mirzaev [3], Z.Husainova [4], Y.Bobojonov[5] studied to a certain extent by scientists such as. In addition, a dictionary of ethnography of the Uzbek language by linguist N. Mirzaev was published [6].

In linguistics, the birth of a person, the ceremonies from the time of his chilla to his death, their names, animistic, totemistic, fetishistic and Islamic beliefs, the names of various customs, rituals and traditions among the people, are associated with folk views, beliefs and imaginations, lexical units are referred to by the term “ethnographic lexicon” or “ethnography”. In our opinion, traditions, rituals, superstitions, ancient ideas, the expression of religious views in literature related to the way of life of the people should also be distinguished as a separate species. Although the materials related to such folk art and rituals used in the literary text belong to the group of folklorism, we propose to call them a special form of folklore - “literary ethnographisms”. U.B. Dalgat proposed to call the texts in the written literature, which reflect the interpretation of customs, rituals, numbers and rituals specific to the life of the people, as an “artistic-ethnographic context”[7. 54]. In our opinion, in linguistics, lexical units related to people's way of life, customs, and beliefs are classified as “ethnographies”, as well as interpretations of folk lifestyles, rituals, customs, traditional views, and beliefs used in the text of written literature, ethnography”. The term “ethnopoetics” is also used in the literary criticism of the Turkic peoples in relation to the expression of national and ethnic values in fiction. In particular, the mythologies in the works of Tuvan writer Stepan Sarig-ool, such as “Agar-Sandan tree”, “Aldyn-kys” (“Golden Girl”), “The Adventures of Angyr-oola”, relate to folk lifestyles, beliefs and artistic thinking. Literary critic T.Kh. Ochur, who analyzed the plates, writes that “ethnopoetic features predominate in modern Tuva prose” [8. 13].

### **Main Part**

The active use of ethnography in the written literature of the 19th century is one of the common features not only of Russian, but also of other peoples, including Uzbek literature. Because at the end of the XVIII - XIX centuries in Uzbek literature there were many “folk books” based on epic plots of folklore, folk epics, legends and legends, the growing interest of poets in folklore, national traditions, customs and ceremonies, folk views observed. In this process, in the works of such poets as Dilshod-Barno, Anbaratin, Muqimi, Makhmur, Zavki, Furkat unique “ethnographic literary contexts” - artistic details that reflect the way of life, lifestyle, ethnic culture and national identity began to appear.

In fact, the names of customs, traditions and ceremonies, as well as the various customs and rituals that exist among the people, are also examples of folk art in the broadest sense. The centuries-old folklore heritage of the people also includes a wide range of life values associated with rituals and customs, lifestyle, national psychology and psyche. Writers and poets, who use examples of folk art as folklore, use ethnographic values, which are widespread and traditional among the people, for various poetic purposes in order to accurately reflect the realities of life. We believe that the term “ethnography” should be used to refer to artistic images and details related to various concepts that reflect the peculiarities of the way of life, ethnography and national psychology of such a people. Although the term is widely used in linguistics, it has not yet been used in literature.

Since ethnographies are inextricably linked with the life and work of the people, this phenomenon is relevant to folklore. Just as the elements of folklore used in the written literature are defined by the term “Folklorism”, in the literature of the late eighteenth and nineteenth centuries it is expedient to study as “ethnographic” works of folklore or details of folk art that reflect the environment, customs and rituals of that time.

When we read Muqimi’s works, we see that the tradition of “wearing blue” associated with the mourning ceremony of our people is artistically reflected as follows.

It is known that according to the tradition of our people, grieving families wear special clothes until the anniversary of the death of the deceased or the anniversary of his death. Often wearing blue is a sign of mourning. According to ethnographer K. Nasriddinov, in Kashkadarya, mourners are mostly blue and white, and when asked why, they said, “It has to do with the spirit of the deceased who went to heaven, so blue is a sign of mourning” [9. 92].

In fact, the properties of “blue” as the color of mourning clothes have long been known to our people. Even medieval written sources, including “Kutadgu Bilig”, say that blue and green are signs of mourning [10. 131].

Probably for this reason, there is a curse among the people “wear blue dust”, which also refers to the death of the person to whom the curse is addressed. Candidate of Philological Sciences F. Eshbaeva writes, “A type of Uzbek folk curse is associated with color, in which the curser expresses his attitude to his opponent through colors. A characteristic feature of color curses is that not all existing colors are used in the same way, but mainly colors associated with the human psyche and ancient customs and rituals [11. 85].

The color blue has become symbolic because it expresses the color of the clothes worn during mourning ceremonies. Muqimi, on the other hand, used the phrase “to wear blue” to create a poetic image associated with a particular mental state of the lyrical hero.

Muqimi’s works reflect many of the traditional customs, traditions and way of life of our people.

## CONCLUSION

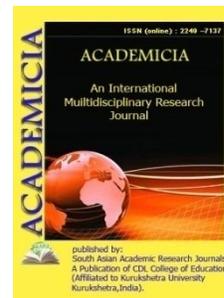

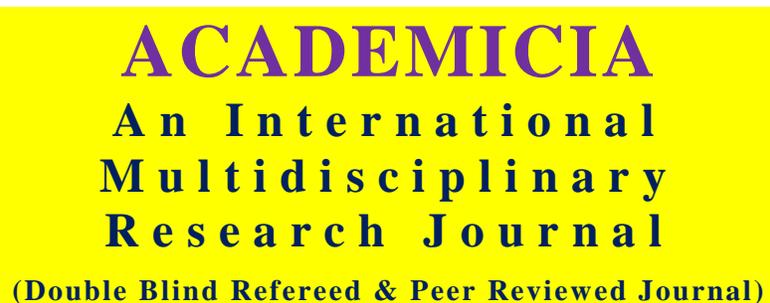

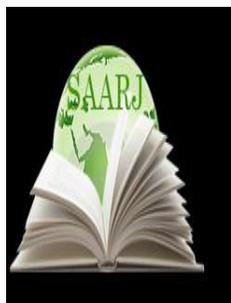

In a word, folklore, consisting of a poetic interpretation in a literary text of customs, rituals, various rituals, holidays, as well as religious views, beliefs, and various traditions associated with the imagination of the nation, embodying the national mentality of the people, is called “literary ethnography” is appropriate.

The term “literary ethnography” is the name of one of the peculiar forms of folklore, a poetic phenomenon specific to all genres and types of written literature. The artist provides the presentation of the literary text in its state as an ethnographic context, using literary ethnography in his work. The essence of these national values is more convincingly and naturally expressed in the realities of life, which are described in the context of the deep expression of the means of literary ethnography. In classical literature, in particular, the peculiarity of the literature of the late eighteenth and nineteenth centuries is also reflected in the effective use of literary ethnography by poets. In particular, in the works of Dilshod-Barno, Muqimi, Furkat, Ogahi, Muhayyir and other poets, various customs of our people related to weddings and mourning ceremonies, the symbol of the threshold, eye contact, salt, hair, dog views, new moon, stop the flood, rituals associated with the repulsion of the wolf, fasting, Eid and the holiday of Navruz

have found their unique poetic expression. Such “ethnographic literary contexts” are an important poetic tool that determines the nationality of the work, as well as the way of life, lifestyle, ethnic culture and national identity of the people.

### ABSTRACT

*The article examines and analyzes the formation of terms and their composition in the history of Uzbek linguistics, differences in the application of terms and their interaction, the position of the terms of Uzbek linguistics in the language. In our opinion, linguists should take into account the fact that when applying this term, the suffixes are attached to the end of the word and take into account the features of their integration, completion in meaning. At the same time, it is noted that among them there are relatively few three books that correspond to dictionaries and encyclopedias in terms of literature.*

**KEYWORDS:** *The History Of Linguistics, Word Composition, Word Form, Suffix, Sign, Consonant, Word-Building.*

### INTRODUCTION

The development of terms is an inextricably linked process with the rise of society, prosperity of economic, technical, science, art, literature and other spheres, the growth of the literary language. Because every new concept that has emerged finds its reflection even in the language. At the present time, when science, mining and technology have developed incomparably, the scope of terms is endlessly broad and diverse. The current term is basically the science and technical language, and almost 90% of the new words in the spoken languages are scientific and technical terms. Therefore, terminology has become one of the important factors in the development criteria of national languages, the interaction and convergence of languages.

Preliminary research conducted within the framework of the science of terminology. Conducted by Lotte, the great scientist, who recognized the world as the father of terminology science, developed the scientific foundations of technical terminology in 1931-th year. After that, in

1934-th year E. K. Drezen, in 1934-th year. A. Vinokur in 1986 works of reformists dedicated to terminology were published. We can admit that all these studies are the foundations of the science of terminology, because on the basis of this work, the theory of the science of terminology was developed. On the basis of these works, the main directions of terminology research were also defined: A. A. Reformatsky (1986), B. N.Y. Goloven (1981), N. P. Kuzkin (1968), L. A. Kapanadze (1965) and others refer to the status of terminn, O. S. Akhmanova (1990), V. P. Kaprovich (1978), R. Y. Gabrin (1991) , B M. Leychik (1986), V. D. Tabanakova (1998), E. N.Y. Properties of the term content of Tolikina (1970) and others, A. S. Gelt (1991) relationship of terminology and nomenclature units, M. V. Oganisyan (2003), O. V. Dovbish (2003), S. V. Saxneevich (1998) issues of terminology translation, Z. M. Polyutina (2002) terming applied civilized approaches.

After several researches on terminology and nomenclature, by the end of XX century lexicographic bases of terminology began to be created, that is, a number of linguists worked on the development of the taxonomy of terms, categorizing them and bringing them into the composition of the dictionary. As a result of this, a number of terminology dictionaries saw the world face. Zoonyms, Repko, Barishnikova, Bulakov floronyms separately from each other, Manerko Artikov, Grebulskaya, Khalikova, Maskovichit - political terms, Turushkova sociology terms, Konovalova, Saxneevich, Burnistrova, Rahimberdiyev economic terms, maksimenko, Ivanenko legal terms Wolfbeck, Ivanov, Oganisan medical terms, Quartich anthroponyms those who have learned. In addition, such areas as technological terminology, terminology of mass media, commercial, scientific literature, terminology of bureaucracy, architecture, military sphere, music, philosophy, theater, sports, terminology of relations, geography, Mathematics, Geology, Mining, translation lingvo-didactics, terminology of dialectology were also studied in depth by scientists. Even later, many scientists conducted research on industrial terminology.

In addition to the foregoing, we can see that the terms belonging to the field of linguistics have been studied much more deeply. It is known to us that scientific and applied research on linguistic terms was conducted by Akmanova (1966, 1990), Vasileva (1998), Guishiani (1986, 1990), Golovin (1976), Kulikova (2002), Petrosyants (2004), Podolskaya, Slyusarova (1983, 2000), Shelov (1998) and others. In recent years, scientific practical work on linguistics has also been published, among which we can name the works of Nikulina (1990), Utkina (2001), Emelyanova (2000), Vermeer (1971), Zakharenkova (1999), German (1990), Golovkina (1996), etc.

If we pay attention to the above list of scientific works, we can observe that the terms in these are rarely used in roman, german and Slovak languages. That is why the study of terms related to the socio-humanitarian sphere, including philosophical, cultural, moral, aesthetic, religious, linguistic and especially literary, remains one of the pressing issues.

There are reasons why we are counting among the most relevant exactly the terms of literature. First of all, the field of literary science itself is considered to be a bisyor science, whose issues are waiting for a rich solution to many problems. Secondly, the literature review also has a direct relation to the study consistency and development of literary terminology. With the solution of existing problems in literary terminology, the problems that exist in literary science also find their solutions. Thirdly, the problems and problems of literary terminology relate not only to the field of literature, but also to the fields of culture, history, ethnography and etymology, and if the

issues in literary science are resolved, a huge contribution will be made to the development of both these disciplines.

According to Petrosyants, now there are more than 70 dictionaries, encyclopedias and reference books on the subject of linguistics on earth. At the same time, it is noted that among them there are relatively few three books that correspond to dictionaries and encyclopedias in terms of literature. This situation indicates that the terms of literature have not been sufficiently studied and that the information on them is not a system [5; 11].

Chris Boldy is a well-known English literary critic, linguist scientist and has a number of world-famous scientific works that further enhance the personality of the scientist in the scientific field. His Concise Oxford Dictionary of Literary Terms, which we have taken as an object of research, was published by the Oxford University Press publishing house back in 1991, when the first marotaba was published in 1990. After that, in 1996, a new volume was re-published. In 2001, the second edition, which we chose for our work, was published. This is the dictionary Chris Boldy's "The Concise Oxford Dictionary of Literary Terms" that is, the main purpose of compiling "a brief glossary of literary terms was to comment on rarely encountered terms that were difficult to understand rather than to interpret everyday encountered terms. In the dictionary, the terms are given in alphabetical order, the flour contains more than 1000 terms. This dictionary does not imply being a guide for literary criticism or literary conceptions or cataloging all the literary terms in use but rather illuminates more than a thousand terms that cause doubts or confusion to the reader in the process of reading a piece of literature or in the course of a literary criticism debate. Boldy prefers to drop several types of terminns instead of bringing the book to the level of encyclopedic excellence. For example, in the usual language, the three are: anagram, biography, cliché, understandings as you see: detective story, psychological criticism, and broad meaningful categories representing General conceptions: art, belief, culture, etc. The dictionary also includes terms that have been adopted from foreign languages, which are important in itself, and they are mainly derived from Latin, italian, Greek, German, Russian, Spanish and Japanese, and accordingly their pronunciation is also mentioned separately. As already mentioned above, the narration of literary terms is closely related to the narration of the art, mining and language of literature of the same nation.

Given in Chris Boldy's "Brief Explanatory Dictionary of literary terms", the term 1060 refers to 118 terms that somehow came into being without mastering other languages. According to the description that Chris Boldy himself gave in return for the book, this book covers not only the simple terms that are encountered in literary studies every day, but also the terms that not everyone can understand, which are not so common. Therefore, most of the 1060 words given are assimilated into English literature by the methods of transliteration and transcription, and among them there are also three very many of the terms of ancient Greek, Latin and French literature. In the process of interpretation of terms, their origin and literary history are inextricably linked with the science, but this science also requires knowledge related to the science of culture, lexicology and translation again. As can be seen from the tables, we can see that most of the terms explained by Chris Boldy in the "brief Explanatory Dictionary of terms in literature" are fully mastered in English, although among the terms explained, We can see that there are terms that have been mastered somehow from a foreign language. Most of them constitute words related to genres, and all of the Japanese terms, for example, explained in the dictionary, are considered to be genres in Japanese poetry. As an explanation of this, we can say

that the influence of French literature has always been enormous in English literature, since the majority of the terms of the mastered layer are the terms related to French literature, that is, 57% of the terms of the total mastered layer. These two peoples have co-developed with each other in the fields of culture, history, art and art literature. The terms belonging to German literature are also more common in comparison with other terms, which make up 19% of the total. This is because we can bring the commonality of German and English. The formation and takomili of literary terminology is inextricably linked with the development of vocabulary art and literary studies as well as the literary language. Chris Boldy's famous "The Concise Oxford Dictionary of Literary Terms" that is, the main purpose of compiling "a brief glossary of literary terms" was to comment on rarely encountered terms that were difficult to understand, rather than to interpret everyday encountered terms. The terms in the dictionary are arranged alphabetically, this dictionary contains 1060 terms, and 118 of them are considered to be terms that are mastered from other languages, that is, in any case, from other languages.

In Uzbek linguistics, the views on the word and its suffixes, the naming of these phenomena, have a long history. Since Mahmud Qoshg`ariy refers to the word about the word and the phenomena associated with its composition in the work «Devonu lug`atit turk», The original (core), huruful Ma'ani (affiks), ilhaq (addition), sig`a (word form), kayfiya (word forms), 'alama (sign), ismu jam ' (plural), Al-Vahid (unity), Ishtaq (word legalization), mushtaq (made), bina (word legalization), I'rab (variation) like used several linguistic terms. The scientist called Turkic suffixes "Ziyadat" (increments), such as space, time, instrument-making names – g`u, which forms an integral part of the command verb - ma, and named each of them (the sound of speech and the sign of the sound on the note, in the range of auxiliary, connecting, loading) with the term "letter" [1].

In the work "Attuhfatuz zakiyatu fillug`atit turkiya" (a unique line about the Turkic language (Kipchak language)), the composition of the word is also mentioned in the context of the same traditions, without continuation of the harf (suffix), belgi, alomat (suffix), harfi jar (suffix), zamon zarfiy (consonant), makon zarfiy (consonant), hol (consonant), marfu (consonant in the sentence indicating the state of the foul maf'ul), maf'ulunbih (agreement of the proceeds), maf'ulunlah (agreement of the proceeds), maf'ulaaah (agreement of the proceeds), maf'ulmaa (agreement of the joint), it uses the terms conditional custom (conditional declination suffix-SA) [2]. Since both these works were written in Arabic, the terms of Arabic linguistics were used. Although they explained it based on Turkic- Arabic gram mathematics, those who correctly understood the laws specific to the Turkic language in their time and left valuable information about the Turkic languages in their works.

## **THEORETICAL BACKGROUND**

At the end of XIX and beginning of XX centuries, Uzbek enlighteners spoke about the spelling and grammar of the Uzbek language, relying on the information given in the structure of our ten-century sources and historical dictionaries. We see that the terms of Arabic linguistics, such as the original (core), sig`a (word form), ismi jam ' (plural), harfi i'rab (addition), sign (addition), harfi jar (addition), maf'ulunbih (agreement), odot, are used in many places in articles, lessons or training programs written during this period. This is also the case in Usmonli Turkish, Tatar linguistics. For example, the Usmonli Turkish scientist M.Abdulkadiriyy divides words into categories such as "ism, sifat, zamir, fe'l, odot" in his "Qavoidi lisoni turkiy" [3]. The scientist

introduces the auxiliary, predicate, agreed-upon suffixes, word-building suffixes (in general, consonants) that connect to the category” odot “and give him the following definition”: odot does not express an independent meaning, but with the help of other words, they testify to private meanings " [3, 43-B].

"Odot" is an original Arabic word, meaning belonging as a component, an instrument [4]. Hence, the Usmonli Turkish linguists called auxiliary words, consonants, as well as some modal words with the term “odot” in Arabic grammar. Because they do not have an independent meaning, they just enter words and phrases into a relationship with each other, add additional meaning to the composition of words.

Uzbek educators also followed the traditions of Arabic linguistics, such as Turkish and Tatar linguists, in drawing up their first school lessons. In 1919 in the work “ways of agreement” dedicated to the spelling of the Uzbek language, Uzbek linguist Fitrat thought about the agreed additions, interrogative additions (- mi), form-forming additions (-dek,- day,- cha), and called them with the term “odot” as Usmonli Turkish linguists [5]. In the spelling lesson called “Bitim yo`llari” (Writing paths), compiled by Elbek in 1921, the term “extra” is used in this place: “the addition does not mean anything to the person in solitude, as is said in the words:-da,- ga,- ga,- dan,- ning,- ni,- dir [6, 17-B].

The additional term is first Tatar linguist G. Ibrahimov in the lesson “Tatar sarfi” (Tatar consumption), which established in 1913, it was used in the form of a suffix, and the scientist was able to distinguish the agreed suffixes from other suffixes by giving them the same name (his contemporaries J. Validiy and recommended to be called “taqilmalar” (knocking) (1919).

Hence, the term “supplement”, which was used by Tatar linguists, was introduced from the Uzbek side into Uzbek linguistics, and in the beginning, it was used only in the sense of a consonant suffix, later, in general, was added to the composition of the word and began to be used in the sense of writing consonants. From the above points, we can conclude that the additional term appeared in the language and applied was based on the meaning of the Arabic word “odot” as a component and began to be used in the sense of the present tense from the 30s. In our language, different terms were used irregularly until this term was stabilized. For example, in the case of” spelling basics “[9, 9-B], the plural suffixes are called the term” quote; sharequote; In his articles on linguistics, Elbek used the terms” lie “(the term” “is translated from “kicks”), which were defined by the Tatars based on the greek, as well as “additional”, “sign” (the sign is translated from the Arabic “sign”) [10].

## MAIN PART

In the methodological manual called “Boshlang`ich maktab ona tilisi”, which Elbek formulated for teachers, terms such as “jurnoq”, “tirkalgich” are also three: “Jurnoq, a new plan on trailers, magazines of derivative words, their changes, as well as their writing” [11, 10-B]. This work of Elbek is a Kazakh poet and writer. It was an approximate translation of the manual of the same name by M. Jumabayev, and during the translation, the linguist tried to adapt it to the Uzbek language. And the above words are Kazakh, A.Boytursunov used the term “tirkalgich” in his lessons” the consumption of the Kazakh language “in the meaning ofiksiks, and ”jurnoq " in the meaning of the word-building suffix [12]. In Uzbek linguistics, because these phenomena are still different and do not have exact terms, Elbek uses them in his way. The term “jurnoq” was also used in the sense of supplement in some articles published later. For example, “so we

decided on this and we said that the old cockroaches (suffixes) do not pay attention to the turbulent effect on the heel at the end of the nose Masdar itself" [13].

N. Hakimov, E.D. Polivanovs name the consonants with the terms "tutashma"(type) [14, 13-B], taking into account the characteristics of their conjugation into independent words, or their connection with the word, depending on the characteristics that make up their meaning and use them parabolically: "with the root word, there is a pressure (ascent)on the consonant (type):" houses", "as in the case of fathers" [14, 48-B].

And some linguists used the term "complement" in Tatar linguistics both "complement" and "supplement" to refer to suffixes (this term was borrowed from the Russian term "okonchanie"). For example, "so far, representing the quality - lik,- liq in place-li in full...,- let be kept in the meaning of the full name" [11]. In our opinion, linguists should take into account the fact that when applying this term, the suffixes are attached to the end of the word and take into account the features of their integration, completion in meaning. However, none of these terms could be placed in the language. Because these terms express a certain set of properties of the suffixes. For example, the term "type" can be used about the suffixes that are searched and stressed. But other additives do not perform the function of Turing. The term "complete" can be used about the suffixes that are attached to the end of the word. But about such suffixes as no-, bo-, be -, which come at the beginning of the word, this term will not be supported.

Inclusion in the composition of the word is a feature inherent in all consonants. Therefore, the term "extra", introduced by the Elbek into Uzbek linguistics, quickly became popular, and it has been used in our linguistics without exceptions until now.

When referring to the term "additional", it is also necessary to stop about the term "agreed" and the terms that are used to it in an alternative way.

At the beginning of the 20th century, some Turkic linguists, who started to study on a scientific basis, regarded the linguistic attachments as an equal phenomenon to the "erobs" in the Arabic language. For Example, A. Fayzhan writes that "by the question of the end of names from another section of the questions, we recommend that each of those customs names is derived from the meanings of those customs names adjacent to the different customs" and lists the type of error such as foil (shogird), muzof (shogird), Ma'ful ba (shogirdni), maf'ul ma (shogird), maf'ul Mina (shogirdan), maf'ul fia (shogirda). Usmonli Turkish linguist Ahmadjon Rahim, Tatar linguist Shavqiy Bekto`ra also explains the conciliatory suffixes on the basis of erob, but they do not mention these suffixes a. Not with the term "erob", like Fayzhon, but with the Turkish term "tartar letters" (this term is borrowed from the Arabic term "harfe jar" ) and the terms "to be" [16, 9-B].

## DISCUSSIONS

Some linguists, however, introduced the Russian-language padej directly into the Turkic language, who invented new terms such as "patience", "sgibanie", "flexia", "sklonenie" for their agreed additions based on such meanings as "bukma", "bukilma", "siqilma", "egilma" of the term padej, and also met criticism for the good of this. Uzbek linguists a. A.Fayzhon, A. Rahim, Sh. Bekto`ra they tried not to make several mistakes, given the influence of other languages, such as bettors. Therefore, Elbek notes the agreement in the lesson" writing paths "simply with

the term" extra". Fitrat and Q. Ramadans in their lessons used the term sign (translation of the Arabic sign) in this place.

In some linguistic articles published during this period, the agreed attachments are referred to as "eroblar" [17, 51-B] and "annotation attachments" [18, 31-B ] in the Usmonli Turkish language.

N. Hakim recommended to Uzbek linguists to use the term "proceeds" in this place, promoting and promoting these terms through his numerous articles. The term "tushum" is a translation of the word padej in Russian, and in the 1911-the year the Tatar linguist G.Nugaybek calls the agreements as receipts and indicates their six types, such as at receipts (general agreement), traction receipts (traction agreement), berov receipts (departure agreement), migration receipts (receipt agreement), output receipts (exit agreement), position receipts (position agreement). Hence, the proceeds from the combination of "agreement of receipts", which is currently used in the Uzbek language, are formed based on this word kalka, meaning that the soy originated based on the term padej.

## CONCLUSION

In 1918-the year the Tatar linguists M.Kurbongaliev and X. Badigiys use the word "gelishik" as a term in place of the word "kelishik", and this name was acceptable to all, and they were accustomed to the use of the term "kelish" at once (even now this term is used in Tatar linguistics) [19, 43-B].

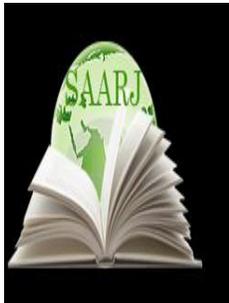

Since 1928, in Uzbek linguistics, the term "arrival", which was introduced into the system by Tatar scientists, began to be used, and since 1932 it has been changed in the form of "advent" [20, 94-B].

Thus, in 20-30-is Uzbek linguistics effectively influenced the process of formation as an independent science of Tatar linguistics, the application of many of the above terms of Tatar linguistics in Uzbek linguistics is vivid evidence of this.

### ABSTRACT

*The article describes the basic principles of using the concept of pedagogical technologies in the teaching of "Technology" in secondary schools. The main factors that increase the effectiveness of education are the introduction and effective use of teaching and laboratory equipment in the educational process, the use of methods such as explaining the content of educational materials with the help of visual aids. A number of researchers and pedagogical scientists of the country are studying the introduction of pedagogical technologies in the educational process, and express their positive views. An essential approach is an important factor in justification. It also envisions a synergistic approach to the generalization of the natural, social, and human sciences. The principle of understanding culture (conformity to the development of cultural life).*

### INTRODUCTION

In accordance with the laws of the Republic of Uzbekistan "On Education" and "On the National Training Program", the work on radical improvement of educational work in educational institutions of the country is gaining momentum. In particular, great attention is paid to the improvement of teaching methods, the search for new ones and their effective use. Nowadays, along with the term methodology, the term pedagogical technology is widely used in the educational process. Of course, there are similarities and differences between these terms. The common denominator is that both terms refer to the process of educating. At the same time, methodology is understood as a set of recommendations for the organization and conduct of the

educational process, pedagogical technology is considered as a set of measures that renew the professional activity of the teacher and guarantee the final result in education. This suggests that pedagogical technology can be seen as a new area of methodology based on teacher-learner interaction. In general, the word "technology" has been used in science since 1872 in connection with the development of production and technology. "**Technology**" is a Greek word, "techne" is a combination of the words "skill", "watch" and "logos" - "concept". The term "**Technology**" was originally used in the field of manufacturing to refer to the processing of materials, semi-finished products, and the ways in which they change their composition, properties, appearance, preparation, and field of application. There are the following definitions of the term technology:

- A set of methods for processing raw materials, materials, semi-finished products in the production process, the state of preparation, properties, shape (Political Dictionary, 1989);
- the task of technology as a science is to determine the most efficient and economical production processes in all respects and to follow the laws of physics, chemistry, mechanics and other in order to use them in practice (from the encyclopedia);
- activities that allow to achieve the end goal and change the field of activity (NS Stefanov);
- a set of processing, situational art, skills, abilities and methods (VM Shepel);
- Rules of organization of activity and means of its implementation (VV Guzev).

The idea of technologicalization of education first appeared in the United States and Western Europe at the beginning of the last century, in order to reform the education system of that time, to increase the effectiveness of education and social activism. caused by efforts to create the conditions. This idea is explained by the introduction of technical means in the educational process in the 30s, the term "educational technique" or "pedagogical technique" and the collection of methods and tools that help to organize lessons accurately and effectively. interpreted as 'index'. The main factors that increase the effectiveness of education are the introduction and effective use of teaching and laboratory equipment in the educational process, the use of methods such as explaining the content of educational materials with the help of visual aids. By the 1950s, however, there was a growing emphasis on the use of technical means in the educational process, with the emphasis on providing more information to learners through the use of technical means, and on individualizing teaching. As a result, the organizational aspects and directions of "educational technology" have been substantiated to some extent, and some clarifications have been made in the work of "technologicalization" of the educational process. The emergence of programmed learning in the early 1960s, or the work being done to organize the learning process on the basis of programmed learning, expanded the concept of 'technology'.

**Descriptions of new pedagogical technologies.** Thus, until the 1970s, pedagogical technology was considered to be the implementation of the learning process by technical means. In 1970, the Japanese scholar T. Sakamoto described "teaching technology as a field of knowledge related to the guidance system that ensures the acceptability of teaching." NF Talizina, a Russian researcher, said: "The essence of pedagogical technology is to identify rational ways to achieve the set learning objectives"; I.Y. Lerner: "Pedagogical technology - requires the expression of a convincing, comprehensible and identifiable goal through the learning outcomes reflected in the actions of students"; VP Bepalko said, "Pedagogical technology is a project of the process of forming a student's personality that can guarantee pedagogical success, regardless of the skill of the teacher." There are many such examples. Here are some of them. In particular, about the

essence of pedagogical technology, IP Pidkasistiy: "Didactic a specific area of research and didactics that defines the nature of the optimal system and principles developed for the deployment of processes "; VA Selastyonin: "A solid scientific project designed to ensure the success of the pedagogical movement"; BT Likhachev: "A set of psychological procedures, organizational and methodological tools that determine the specific set and location of the form, method, method, way and educational means of the teaching (learning) process"; MV Clarin: "Systematic set of all personal, instrumental and methodological tools used to achieve pedagogical goals and the order of their implementation"; A. Kushnir: "The optimal way to solve pedagogical problems in certain situations"; VV Yudin: "Specific activities aimed at achieving a clear result"; IP Volkov: "Description of the process of achieving the expected result", VM Manakhov: "PT is a well-thought-out model of pedagogical activity of students and teachers to design, organize and conduct the learning process by creating the necessary conditions for them"; GK Selevko: "It is a certain generalization that includes the content of all the definitions of different authors (sources)"; I.P.Volkov: "A description of the process of achieving planned learning outcomes.

UNESCO has defined the PT as "a consistent method of creating, implementing and defining all the processes of teaching and learning in technical and human factors and through their joint efforts, aimed at accelerating the forms of education."

*Innovation* - English "innovation" - innovation, introduction of innovation. Innovative pedagogical technologies are new methods used in educating young people.

**Types of educational technology:** 1. Pedagogical technologies (teaching technologies, educational technologies, communication technologies); 2. Independent educational technologies.

**Learning Technologies:** It is the expression of conscious activity aimed at acquiring the set of knowledge, skills, and competencies that people need to live, thrive, and function. As a result of training, a person is provided with the necessary knowledge and in the future will be able to receive different levels of specialized information.

**There are two types of training technologies:** a) vocational training technologies. Develops a person's interest in discipline, will and specialization. Educational technologies aimed at meeting the comprehensive demand for specialists are technologies aimed at the implementation of psychological and pedagogical conditions that are rapidly adapted to the cooperation of teacher and student; b) person-centered technology. Intellectual and emotional-motivational development of students on the basis of person-centered technology, the formation of knowledge and professional skills, the value of the educational process as an approach, to increase activism, self-awareness and the formation of independence.

**Development of introduction of new pedagogical technologies in practice in our republic.** During the years of independence, great changes have taken place in the field of education in our country. In particular, on the basis of the Laws "On Education", "On the National Training Program" State educational standards, basic curricula, many textbooks and other manuals were created, and being created. A number of researchers and pedagogical scientists of the country are studying the introduction of pedagogical technologies in the educational process, and express their positive views. In particular, BL Farberman, one of the pedagogical scientists of the republic, spoke about the essence of pedagogical technologies: "A unique approach to the

educational process; pedagogical expression of socio-engineering thinking, the image of technocratic consciousness transferred to pedagogy, a certain standard of the educational process"; N. Saidakhmedov: "The process of influencing students in certain conditions and consistency with the help of teaching aids and the formation of pre-defined qualities in them as a product of this activity"; UN Nishonaliev: "Didactic goal, to achieve the required level of mastery, pre-design of the educational process" – who tried to express. From the above, it is clear that although the concept of pedagogical technology is defined differently by different researchers, their ultimate meaning is the same, that is, today the concept of pedagogical technology in teaching students, educating them is a set of methods and tools used to activate their cognitive activity in the educational process, as well as a system that determines the order of their implementation. Simply put, the new pedagogical technology answers the question of how and in what ways teaching can be effective. New pedagogical technologies are based on the interaction and interaction of teachers with students. Creating a situation of psychological unity in the classroom, ensuring that each student (learner) to express their personality, their abilities, to find unique ways of communicating with them, managing their initiative depends on the professionalism of the teacher. The teacher must be able to adjust his didactic methods and organizational forms in order to reach the heart of each student. As a result, not only the teacher but also the students themselves can contribute to the activation of students in the classroom. In this case, first the excellent students, then the other students tell how they did the teacher's task and encourage the rest of the students to be active. The management of pedagogical technology is that it has the ability to plan the educational process, diagnose it, analyze the results and make corrections. This achieves the expected results from education, which means the effectiveness of pedagogical technology. It should be noted that in recent years in the country conducted serious scientific and pedagogical research on the introduction of pedagogical technologies in the educational process. As a result, a number of PhD and doctoral dissertations, monographs and other manuals were published in this field. These include the first published literature in this field, including O. Rozikov and others. "Educational technology" (T.: Teacher, 1999), M. Ochilov "New pedagogical technologies" (Karshi: Nasaf, 2000), "Technologies of biological education" by J. Tolipova and AGafurov (T.: Teacher, 2002), "New pedagogical technologies (theory and practice) by N. Saidakhmedov. T.: Finance, 2003), manuals of J.Yuldoshyev and S.Usmanov "Fundamentals of pedagogical technology" (T.: Teacher, 2004), U.Tolipov and M.Usmonbaeva "Pedagogical technology: theory and practice "(T.: Science, 2005), the textbook "Application of pedagogical technologies "(T.: Science, 2006) and other similar literature. Recently, a lot of such publications have been published, and now there is a need to keep a separate record (card file).

Some of the work being done in this area is also discussed at scientific and practical conferences held in many educational institutions of the country, focusing on theoretical and practical issues of using pedagogical technologies. Magazines and newspapers in the field of education in the country also cover the work in this area. Although a number of positive steps have been taken in our country on the use of pedagogical technologies, and some experience has been gained, there are some problems in this area. First of all, it should be noted that the concept of pedagogical technology and the idea of its use has not yet become the intellectual property of all educators. As a result, pedagogical technologies are poorly used in the teaching of private subjects, and the general experience gained in the use of pedagogical technologies is slowly being introduced into the teaching of private subjects. The development of educational technologies is also very slow.

In the current educational process, using computer technology, slides, virtual lectures, multimedia are shown in the classroom. This, in turn, requires the development and implementation of methodological, organizational, sanitary and hygienic rules, requirements for the creation and use of such screen applications. In addition, terms such as "Modern technology", "New pedagogical technology", "Pedagogical technology", "Teaching technology", "Educational technology", "Non-traditional method" are widely used in teaching. In special cases, these terms have specific meanings. For example, "Pedagogical technology" is a general name, "Educational technology" is its scientific direction, and "Teaching technology" is its practical direction. The rest are derivative terms. To summarize, these terms can be said to be active (or activated) methods of teaching. Because no matter how these terms and names are pronounced, they are based on the issue of educating students and activating their upbringing. Thus, the following conclusion can be drawn:

*Pedagogical technologies (PT)* is a field of knowledge with the help of which in the third millennium the state will make radical changes in the field of education, the activity of teachers will be renewed, students will be systematized formed.

*Educational technology (TT)* is a holistic process in a clear sequence, a pedagogical process that is goal-oriented, pre-designed, and guaranteed based on the needs of the student.

We believe that a positive solution to these problems is an important factor in improving the future effectiveness of education, and, consequently, in educating a harmoniously developed generation and mature professionals.

**The relationship of the subject** "Innovative pedagogical technologies in the teaching of technology" with other disciplines. The study of the course "Innovative pedagogical technologies in the teaching of technology" includes the theory and history of pedagogy, methods of teaching labor education, pedagogical skills, psychology, theory and practice of building a democratic society, philosophy, logic, ethics, spirituality, It is carried out in conjunction with such disciplines as the history of Uzbekistan, youth physiology and hygiene [14, P.29].

**Principles of pedagogical technology.** It is known that any pedagogical technology is based on the principles that develop the subject and should be aimed at educating the student's personality. At the heart of pedagogical technology theory is the leader of the educational process, as well as teachers and students who are both the subject and the object of the process. Therefore, the interaction between these subjects, the interaction, their interactions with each other must be able to meet the most modern requirements. To do this, the teacher, first of all, the requirements for the organization of the educational process, the principles of organization and management of education, ways, methods that serve the mental and physical development of the student, with it to cooperate, to direct it to reading and learning, to organize the personal activity of the student, to communicate with them, to jointly solve problems and disagreements arising in the organization of pedagogical activity, to be creative in the classroom, creating a business environment, should be armed with methods that allow accurate and accurate assessment of student performance. Knowing the basic principles of pedagogical technology and their essence will give us a clear idea of the process. Therefore, we would like to discuss below the basic principles of pedagogical technology and their essence. While pedagogical technology has general didactic principles, it also has the following specific principles.

*The principle of integrity, integrity.* This principle reflects two aspects: a) the unity of education, upbringing and personal development; b) pedagogical technology has a definite, rigid system (*the concept of "systemicity" here means both the process of teaching a particular subject and the general educational process*).

The principle of *fundamentality*. This principle expresses the advantages of studying the sciences in different directions (blocks) depending on the object of study, its internal nature and characteristics. The disciplines are categorized into natural, social, and humanities. Each subject has information for it, which is considered the "core", "core", and this information (information) is the study of the basics of science by the individual, a specific specialty. Independent knowledge acquisition serves as a basic concept in the way of expanding the acquired knowledge. This substantive approach also allows for the use of interdisciplinary features in the training of specialists in a particular field. Combining academic disciplines in specific areas reduces stress on a person's memory, as well as increases the power of thinking, promotes the emergence of thinking. In the 80s of the twentieth century, the organization of the educational process was interpreted as the provision of students with a little information (knowledge) in the existing disciplines, while in the 90s, the organization of this process was recognized as a process of creating favorable conditions for the acquisition of new information (knowledge) on a specific, specific science. An essential approach is an important factor in justification. It also envisions a synergistic approach to the generalization of the natural, social, and human sciences. The principle of understanding culture (conformity to the development of cultural life). This principle was introduced by the German pedagogue A. Disterveg in the XIX century and has not lost its relevance to this day. The principle of cultural understanding implies that students are educated according to the level of cultural development of the social society. In the last century, the level of knowledge and skills of the teacher was recognized as a leading factor in ensuring the effectiveness of education, but today, due to the high level of knowledge, potential and skills of the teacher, success is possible. It is clear to everyone that It is important to take into account the capabilities of modern science and technology, in particular, computers, multimedia, as well as the social and economic development of society. Now we want our specialists to have "in-depth knowledge of the specifics of the field (or direction), theoretical and practical knowledge in this area, to be able to perform certain activities, to solve specific tasks in a timely manner and to achieve certain results." we must be able to prepare for the conditions of leading market relations.

*The principle of humanization and humanization of educational content.* Although both concepts have the same lexical meaning (Greek humanus - humanity, humanitas - humanity), each of them has its own meaning. the inclusion of the social sciences (history, cultural studies, sociology, psychology, philology, etc.) in the list of disciplines, and the concept of humanization means a positive approach to the individual and his activities. In other words, humanization is the process of organizing activities based on respect for the human factor, its dignity, honor, rights and duties in the process of relations between man and society. and for its perfection (development) "is a process of activity. In designing the educational process, every teacher should adhere to this principle, or in solving problems related to their specialty, it is desirable to pay attention to its compatibility with the interests of society. The educator no longer governs the activities of students in an authoritarian way, but humanizes the educational process on the basis of adherence to the ideas of educational cooperation, or in other words, ensures the observance

of the principle of humanization of education. This, in turn, leads to the formation of a highly spiritual person.

*The principle of teaching and research, research and teaching.* This principle serves to illuminate the following two aspects: 1) every teacher in educational institutions should conduct research involving students in their field of science; 2) The teacher develops educational technology, tests it in practice, observes and makes adjustments, that is, he studies the educational process.

These two aspects of the teaching process are important, as they provide a basis for improving the professional and pedagogical skills of teachers and preparing students for future careers.

*The principle of continuity of education.* The principle is that students acquire professional qualities that will improve over the course of their lives. It is impossible to give a person the knowledge that will help him for the rest of his life, because the existing knowledge changes and becomes richer every five to ten years. Thus, this principle means that the teacher pays attention to the organization of independent learning in his work, to create conditions for students to learn independently from the education provided by the pedagogical leadership.

*The principle of an active approach* based on the didactic connection between theory and practice. In didactic theory, the concept of knowledge is interpreted in two different ways: a) the knowledge that students need to acquire; (b) knowledge acquired by them and applied in the course of practical activities, which has become a personal experience. Knowledge is only strengthened through practice, so it is important to develop students' ability to apply theoretical knowledge in practice. Knowledge that has no practical application will soon be forgotten. These are the basic principles of pedagogical technology. The organization of pedagogical activities in accordance with them will improve the pedagogical skills of the teacher, the acquisition of intellectual and moral qualities of students, as well as the development of personal experiences.

**Criteria of pedagogical technology.** Forms, methods, methodological systems of education are formed in the form of special methodologies, which in the process of improvement develop into technology. The technology is universal and can be implemented by any professional, at the same level and with the same goal. The main difference from the methodology is that the methodology consists of a set of teaching methods and ways that are convenient for a particular person. The method depends on the knowledge, skills, abilities, personal qualities and temperament of the teacher. This can be seen by comparing the difference between programmed learning technology and methods of intensive teaching of different special subjects using different didactic tools. On this basis, the main criteria of the technology can be defined as follows: 1. Relying on a certain scientific basis, concept; 2. Systematization, logical interdependence of the educational process and its components; 3. Effectiveness, ensuring the achievement of educational standards, the required level of time, effort and resources; 4. Possibility of reproducibility by others [14, P.77].

The first step in creating a technological process of education with guaranteed results was programmed education, created in the 60s. This will create a detailed program with a clear sequence of all the tasks that the student must complete until they have mastered it. The program should ensure that each student acquires the level of knowledge and skills intended for educational purposes. The teacher and the student are informed about the process of mastering. The student can achieve the main goal almost without mistakes by completing a series of

---

logically connected short tasks. This technology allows you to fully control the learning process. In this case, a logically connected short sequence of tasks creates an algorithm for the learning process. The organization of student and teacher activities on the basis of such an algorithm guarantees the achievement of the intended purpose. Such an organization of the educational process can now be called a full-fledged pedagogical technology.

Pedagogical technology defines the system of organizing the influence of teachers on students and trainees in the implementation of professional and pedagogical goals. Pedagogical technology allows to organize pedagogical activity on the basis of specific goals and to control its technologicality. The system of pedagogical technology ensures the clear realization of pedagogical goals. The main feature of the technological system is to ensure the achievement of the expected result. To do this, the tasks to be performed at each stage of achieving the main goal, the exact modules or algorithms of the tools and methods required for this are created. In the non-technological system (special methods), the expected result is not guaranteed.

While pedagogical technology is based on rational scientific criteria, intuitive knowledge is also important in its further development. In this sense, technology is in a sense comparable to art. Because art is based on intuition, and technology is based on science. But many fields of activity begin with art and end with technology. Then it all starts again. These cases can also be observed in the development of pedagogical technology. Pedagogical practice built in accordance with science is pedagogical technology. Consistent practical activities of learners and educators in the educational process, which lead to the formation of pre-defined qualities, can be considered as pedagogical technology. Pedagogical technology (or educational technology) is simply and primarily about how and to what extent a learner or learner performs in the educational process. Consistent practical activities that enable students to master the material being studied can be educational technology.

### ABSTRACT

*Uzbekistan is a country in Central Asia with an emerging economy with great human capital, an openness to micro-investments, and a high encouragement of small and medium businesses. Small and medium enterprises represent 70 percent of the economic landscape and 78 percent of the employment rate in the country. However, small and medium size enterprises are facing many challenges such as the high interest rates and complicated loan requirements. Similarly, many Muslim citizens in Uzbekistan with a capital in hand, are facing difficulties in dealing with banks in terms of investment activities due to the interest rates involved. Therefore, this study attempts to explore the opportunities and to propose the necessary steps and procedures towards implementing an Islamic banking and finance system in the Republic of Uzbekistan. In order to do that, 7200 responses were collected from individuals, business enterprises and banks in the form of survey questionnaire to analyze their willingness to use Islamic Finance products and services. During the survey, which was conducted in the first half of this year with the cooperation and financial support of the UNDP office in Uzbekistan and Republican Training Center for Entrepreneurship Principles under the Chamber of Commerce and Industry of Uzbekistan it was found that the majority of individuals and companies, because of their*

*religious belief, go for Islamic financial products, while bankers claim that the demand for Islamic financial services is strong as the country's population is predominantly Muslims.*

**KEYWORDS:** *Islamic Finance, Islamic Finance Products and Services, MSME Sector*

## I. INTRODUCTION

Islamic banking system refers to a banking system in which all financial activities are carried out based on Islamic laws. It has similar purpose and operations as the conventional banks, that is, to facilitate the flow of money within the economy for boosting economic activities. However, unlike conventional banks, the principles of governing Islamic banks are mutual sharing of risk and profit between parties while ensuring justice and fairness in any transaction and business operation. The success of Islamic Financial Institutions drew the attention of many conventional banks. This had led numerous conventional banks to launch their Islamic banking windows in many countries. In 2015, the number of Islamic banking windows of conventional banks has risen to 350, which is almost equal to total number of Islamic banks world-wide (Dr. Azmi, 2015). Pakistan Bangladesh, GCC countries, and many others who had implemented Islamic banking and finance within their jurisdictions, started reaping the fruits from the growth and success that Islamic Financial Institutions (both commercial and social institutions) have achieved.

Last couple of years, the Government of Uzbekistan has initiated ambitious economic reforms. One of the measures taken is to make easier for private companies to gain access to lines of credit for their business expansion (World Bank, 2019). This is mainly to confront the increasing unemployment problem in the country, which stood at 5.5 percent in 2019. According to OECD (2017), small and medium enterprises in Uzbekistan account for 78 percent of employment. Yet, they are having a hard time meeting their financing needs through conventional banks (ADBI, 2018) due to the following matters:

- i) the long list of documents set by banks to consider for the loan issuance;
- ii) collateral and guarantee requirements;
- iii) financial illiteracy;
- iv) high interest rates;
- v) Religious reasons, which restrain Muslim entrepreneurs from fulfilling their financing needs with conventional banks.

In case of (v), Uzbekistan is facing a lack of banking and financial institutions operating based on the principles of the Islamic financial system (Imamnazarov, 2019). Due to these reasons, ADB (2019) stated that around 64 percent of SMEs have to rely on self-financing, that is using their savings or borrowing from their families and friends. This certainly indicates the inefficiency of the current banking system of Uzbekistan in meeting the financing need of MSMEs.

Bangladesh, with 89.5 % of Muslim population, was once considered among the less developed and poor nations. However, during the last decade, Bangladesh's economic growth rate accelerated from 5.57 % in 2010 to 7.9 % in 2018. According to the study of Solaiman,

Safiullah, and Rana (2012), Islamic banks made a substantial contribution in Bangladesh's economic growth in terms of making loans easily available to various private enterprises including MSMEs. Nowadays, Islamic banks account for 24 % market share of Bangladesh's banking sector (UNDP, 2019). In Uzbekistan, where more than 90 % of population comprises Muslims, there is an immense potential for introducing Islamic financial institutions. The presence of Islamic Finance could play a crucial role in boosting economic activities of MSMEs and reducing the cost of financing.

In lieu of acknowledgment and identification of the country's financing needs as stated above, the paper at hand aims to study the determinants of Islamic Finance opportunities to finance MSMEs in Uzbekistan.

## II. POTENTIAL ISLAMIC FINANCE INSTRUMENTS THAT CAN BE USED FOR OPERATIONALIZING UZBEKISTAN'S BANKING SECTOR.

### 2.1. Partnership Specific Islamic Contracts:

**Musharakah:** According to Usmani<sup>1</sup> (1998) the term Musharakah in Arabic means sharing<sup>2</sup>. The basic tenet of Musharakah contract is similar to a partnership contract in English law, wherein two or more partners come together to form an enterprise by pooling in funds, materials, and/or intellectual property. In the case of Uzbekistan, musharakah at the banking level can be used for project financing, particularly in financing mid and long-term projects or financing any joint venture where the arranging bank acts as a partner to the project or joint-venture and earns a profit at the rate determined at the time of concluding the financing contract with a customer. At the capital market level, Musharakah is extensively used in the equity market. The underlying stocks in the equity market must be Sharia- compliant. Apart from the equity market, Musharakah contract is also being used in the bond market in the form of Sukuk.

**Mudarabah:** Mudarabah is a unique way of partnership facilitated in Islamic finance, wherein one partner provides all the funds required to start a business and the other partner invests those funds in a profitable venture through efficient and effective management. In the case of Uzbekistan, Mudarabah in the banking level can be used in mobilizing deposits from the customers. Based on the Mudarabah arrangement Islamic banks act as Mudaribs whereas customers as Rab al-mal. The profit will be shared based on the pre-agreed ratio. Mudarabah is mainly used for investment accounts or term deposit accounts for deposit mobilization. Besides, it has also been used in project financing and facilitating a letter of Credit (LCs). Similarly, in Capital Markets, Mudarabah can be used in structuring sukuk. Under this arrangement, investors who buy sukuk certificates would become rabb al-mal whereas the company management would be mudarib.

### 2.2. Sale-Based Islamic Contracts

**Murabaha:** Murabaha is a sale-based contract. Under this arrangement, a seller buys a Sharia-compliant asset based on buyer's specifications which the seller would sell by adding some profit to the cost of the asset acquisition. The payment may be done either on spot or it may defer to the future date as per the mutual consent of the seller and buyer. At the banking level, this contract is predominantly used in home financing by banks. The Islamic bank buys the property based on the specifications given by the customer in the application form. Islamic banks would then sell the property to the customer at the mark-up price (cost + profit). The payment will be deferred

and usually be paid on a monthly basis for the period as mutually agreed by the consenting parties. Apart from this, Murabaha is also being used for personal loans, credit cards, project financing, letter of credit (LC), auto finance, long-term financing for businesses in terms of buying heavy machinery, working capital, etc. Similarly, in the Capital Markets Murabaha could also be used in structuring sukuk for large companies and government. These entities could use Murabahasukuk for financing long term projects.

**Ijara** (Islamic Lease): Ijara means renting a tangible asset. It is similar to conventional lease, however, the underlying asset in Ijara must be Sharia-compliant and be capable of generating usufruct. Ijara is predominantly used by Islamic banks for facilitating auto finance. Apart from this, it is also being used for financing farmers for buying agriculture-related equipment and tools, non- agricultural business entities in financing the purchase of heavy and expensive machinery and equipment. In Capital Markets, Ijara based sukuk is the predominant ones in the sukuk market.

**Istisnah:** According to Usmani (1998), “Istisna is the second kind of sale where a commodity is transacted before it comes into existence. It means to order a manufacturer to manufacture a specific commodity for the purchaser (pp. 135).” The price will be fixed at the beginning of the contract along with the detailed product specifications. Islamic banks mainly use Istisna for financing construction, manufacturing, project financing and for such contracts that are based on build operate and transfer of underlying asset. In Uzbekistan, Banks may adopt Istisna for financing new housing or office places as such constructions are quite well developed in the country. In Capital Market level, Sukuk structuring also includes Istisna. Istisna based sukuk is predominantly used for undertaking big projects like construction of roads, metro stations, flyovers, dams, etc.

**Salam:** It is a form of forward agreement where a seller promises to deliver certain goods to a buyer at a future date in exchange for a full price paid in advance. Salam agreements can be widely used in agriculture. For example, farmers would sell future harvest by entering into a Salam agreement.

**Wakalah:** Wakalah refers to a contractual agreement wherein a person (generally known as an agent) is appointed as a legal representative of another person, who undertakes all permissible activities as stated in the Wakalah contract. In return, the agent will be paid a fee as agreed by the contracting parties. In practice, Wakalah is predominantly used in conjunction with other Islamic financial contracts like Musharakah, Mudarabah, or Ijara. However, it has also started being used as a standalone Sharia contract for structuring sukuk or deposit-based instruments. Concurrently, Wakalah can also be used as deposit instruments by Islamic banking institutions. Under this agreement an Islamic bank acts as an agent and invest the funds collected from its customers for a period stipulated in the contract. The Islamic bank charges a certain fee while the profit will be shared among the Wakalah deposit holders as per the %age stipulated in the contract. The above discussed Wakalah based Islamic financial products will be well suited to Uzbekistan’s contest and can extensively be used in increasing the public participation in the banking sector.

### PART III. METHODOLOGY

Studying and analyzing population perception representing various social sections, banks, and businesses was considered important. The primary objective of this study was to evaluate

residents' priorities and demand for Islamic financial institutions, along with the challenges they face when addressing their financing needs through established financial institutions (formal and informal). Structural and content-related questionnaires for individuals and companies are identical, whereas banks are different.

The survey questionnaire consists of four sections, covering demographic information, access to finance, opportunities for Islamic finance, where knowledge of Islamic financial system and products was tested by respondents followed by insurance industry. Only key figures are presented. A quantitative methodology was introduced to gather relevant data as survey questionnaires and interviews. In total, 7200 responses were collected with the help of the Republican Training Center for Entrepreneurship Principles. From that, 2,235 responses from corporate bodies, 27 from bank headquarters, and 4938 responses were from public (individuals). Using Google forms and SurveyMonkey sites, survey questionnaires were disseminated.

#### **Part Iv. Assessment Of Opportunities And Needs For The Implementation Of Islamic Finance Instruments In Uzbekistan Through Survey**

##### **i. Demography of the respondents**

Study findings revealed that 47% of individual respondents were aged 31-45, while 44% were aged 18-30 years. 42% had higher education, 36% had only secondary education. 25 % of the respondents were state employees, while 21% were private employees.

Similarly, most businesses responding to the survey are 18.66 % from Tashkent Area. Their organizational structure consisted primarily of 44% limited liability corporations, 18% private companies and 16.5% individual entrepreneurs. 64% Small Businesses, 25% Micro Businesses, 10% Big Companies. 26% of these businesses were engaged in manufacturing, 17% in services, 22% in commerce and 13% in construction. 41% of these companies' annual gross profits was less than 100 million UZS, 37% of them made between 100 million and 1 billion UZS, and only 4% made more than 10 billion UZS. Comparably, most of the responded banks (24 banks) were located in Tashkent Area, while 3 other banks are in Fergana Valley. Twenty banks are joint-stock commercial banks, five are private banks and two are international banks. This information can say us that the future customers of Islamic financial services will be mainly individuals with higher education and limited liability corporations.

##### **ii. Access to finance**

40 % of companies and 31% of individuals used formal channels for acquiring loans. The main aim of obtaining a business loan was to buy equipment, automobiles or special machinery (50%), working capital and trade (34%), and agricultural ventures (11%).

For those seeking a bank loan, 53% received consumer loans, and 28% received mortgage loans. 60 % of companies and 68 % of citizens reported not using bank loans. A fundamental problem for businesses and individuals was non-compliance with conventional loans with Islamic norms. This led them, despite business need, to discontinue and close credit lines. High interest rates, complex terms and conditions are other factors.

##### **iii. Opportunities for Islamic Finance**

**Knowledge of Islamic Finance System:** 40% of businesses and 37 %of individuals stated that they had basic knowledge of IF principles; while 50 % of individuals and 52 % of businesses

defined Islamic Banks as “Islamic Banks have similar services as their conventional peers, only IBs must be asset-based and interest-free in nature”.

Overall, among 36 % of businesses, 7.41% of banks and 4% of individuals said Uzbekistan's population had a deep knowledge and understanding of IF institutions while 31% of businesses, 67 % of banks, and 49 % of individuals had mere general understanding and knowledge. 22% Banks could not evaluate population awareness of Islamic Finance.

Unlike companies (14%) and individuals (16%), banks (54%) are aware of government attempts to introduce Islamic Finance in Uzbekistan. Only 32% businesses and 28% individuals heard or knew about the Takaful Islamic insurance scheme, including the latter, 44% businesses, 74% individuals, and 71% banks are willing to use Takaful once introduced in the country.

**Knowledge of Islamic Finance Products/ Services:** Both individuals and businesses were asked if they were aware of and fully understood Islamic finance products/ financing methods. Ijara (leasing) is the most known Islamic finance products among both group of participants followed by Mudarabah agreement. Salam, Istisna, and Sukuk were the least known financing agreements by respective participants.

When they convene operations in Uzbekistan, 61% of companies and 75% of individuals are prepared to opt for Islamic financial institutions. By comparison, 35% of businesses and 22 % of individuals reported that their choice in selecting a particular institution would depend on the cost and quality of the services provided by Islamic financial institutions, while only 3 % said that they would not be interested in the services provided by Islamic financial institutions due to lack of knowledge and awareness. 47% of companies and 55 % of individuals have argued that they will not be very concerned even though Islamic financial instruments are highly priced as the primary concern is to comply with Islamic values in their financial affairs. On the contrary, just 22% of companies and 19% of individuals hold opposing views as their primary concern will be the high cost of Islamic financial instruments.

**Banks** are also of the opinion that in the case of IF's implementation in Uzbekistan, due to the high population request for IF goods, there is a high possibility (81% of banks) for the attraction of financial capital from the population to savings or partnership agreements. By comparison, 15 % of banks (4 banks) showing the opposite opinion that opportunities are low as demand is low, while 4 % says there is no opportunity as there is no demand in the market. Upon further investigation on which types of Islamic finance products/ financing instruments will be more effective in promoting entrepreneurship in the country, 81 % bankers stated Musharakah and Mudarabah as they are based on partnership, followed by Murabaha (66 %) and Ijara (66 %) (Refer to table 1)

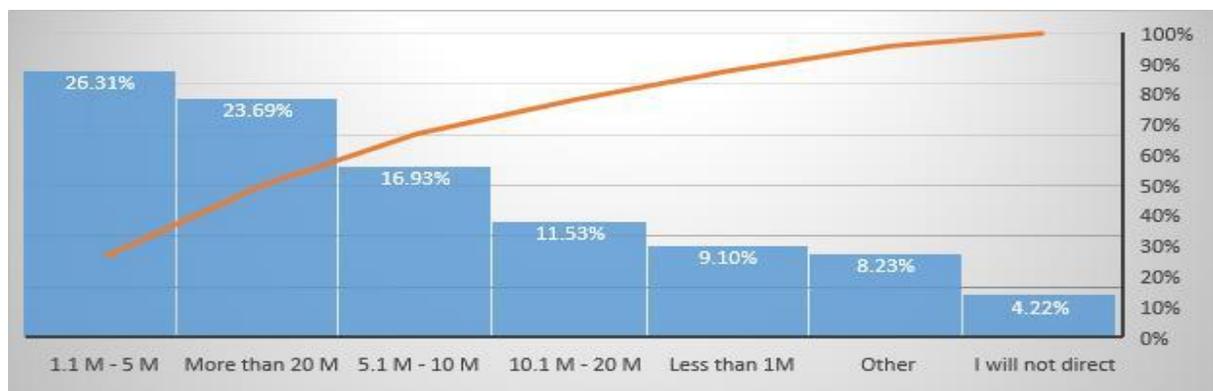

**TABLE 1: ESTIMATION OF EFFECTIVE IF PRODUCTS IN THE MARKET**

What type of Islamic financial products will be the most effective in Uzbekistan and why?	Banks	
	Numbers	%
Musharakah and Mudarabah because they are based on partnership	22	81.48%
Murabaha because it gives opportunity to purchase goods by deferred payment scheme	18	66.67%

Ijara because it is similar to leasing which is already widely use in the country and therefore it will be easy to implement	18	66.67%
Salam, because it allows advance payment in agriculture, which is very helpful to farmers	11	40.74%
Istisna, like Salam gives opportunity for advance payments in project financing and construction, considering fast-growing construction industry and high demand	11	40.74%
Sukuk, because it gives opportunities for capital markets development, which is consistent with the government policy	12	44.44%
I don't know	0	0%
<b>Total</b>	<b>27</b>	<b>100%</b>

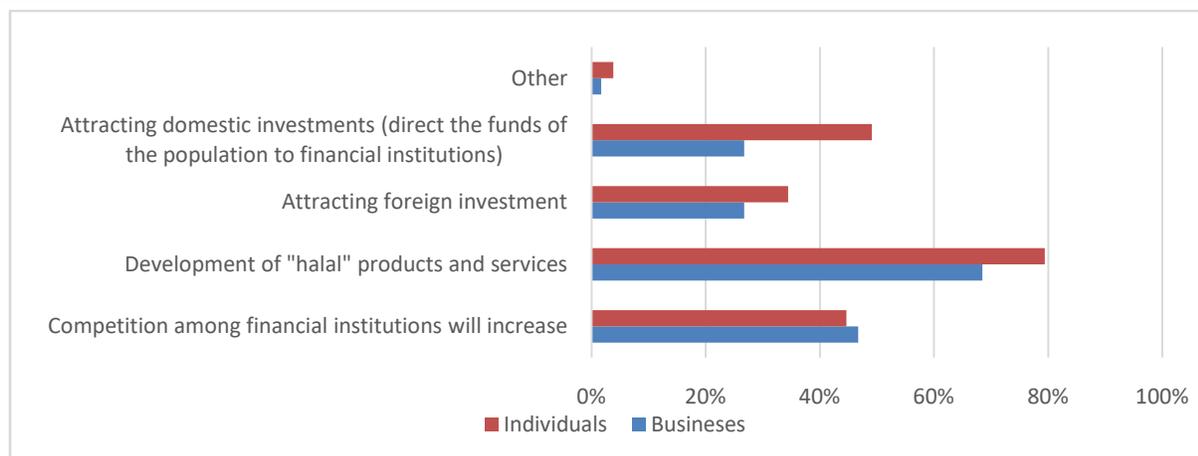

**Amount of funds to direct to IBs:**44% of businesses and 42% of individuals said they would direct their funds for savings or cooperation with Islamic banks in the implementation of Islamic Finance in Uzbekistan, while 26% of businesses and 36% of individuals would prefer not to. Furthermore, 26.31 % of people are able to pay money for Islamic savings or partner deposits as seen in Figure 1.

**Figure 1: Amount of funds to direct to IBs (all amounts are in UZS).**

Furthermore, in case of development of Islamic Finance system in the country, 79 % of individuals and 68 % of businesses believe that it will impact the development of “halal” (permissible) products and services in the market, while 45 % individuals and 47 % businesses are of opinion that IF will increase the competition among financial institutions in the country as described in figure 2. Nevertheless, 47 % of enterprises and 58 % of individuals held to be pessimistic about the possibility of Islamic banking and finance implementation in Uzbekistan, saying that responsible agencies paid little attention to this area. Other factors included competitiveness, lack of experts, lack of knowledge, etc.

**Figure 2: The impact of implementing and developing IF system in Uzbekistan**

### Capacity to introduce Islamic Finance system in Uzbekistan

In this section, Banks were asked if they would support Islamic finance including the establishment of Islamic banks in the country. All 27 banks stated they would fully support the opening of Islamic banking in Uzbekistan. Some banks commented as “yes, we will support as almost 90 % of the population are Muslims and there is a high demand from businesses”. 67 % of banks considered that implementation was very necessary because it would increase competition among financial institutions, the market for “halal” products and services would develop, and more investments would come from Muslim countries. 26 % of banks considered it as a good option to establish because individuals and entrepreneurs need to be offered a variety of new products and services. In contrast, 2 other banks (7.4 %) think that opening one or two Islamic banks is enough due to a low demand, or even opening an Islamic window will cover the market need. Upon further investigation pertaining to introducing IF system in the short term 44 % of banks are in the opinion that commercial banks have no enough opportunities but they are ready to develop this system, while 44.44 % are in the opinion that they know the main principles of how IF system works but it is not sufficient to launch it. Table 2 summarizes the results.

**TABLE 2: CAPACITY TO INTRODUCE ISLAMIC FINANCE SYSTEM IN UZBEKISTAN**

Do the banks have enough capacity to implement the Islamic banking in the short term period?	Numbers	%
Yes, we have enough trained professionals to start our business in this field	3	11.11%
Yes, though we have limited knowledge about how IB operates but we welcome to open it	12	44.44%
We know only the basic principles of Islamic banking, but it is not enough to start activity in this area	12	44.44%
We have no specialists who have the necessary knowledge and skills in this sphere	0	0.00%
<b>Total</b>	<b>27</b>	<b>100.0%</b>

#### IV. RECOMMENDATIONS

Part four (4) of the paper aims to analyze the responses collected from banks, individuals, and businesses. The following recommendations are derived based on the above analysis.

- I. It is necessary to introduce an Islamic Banking law and make necessary amendments to relevant legislative and regulatory documents including the Civil code, the Tax code, and the Banking law. To implement these changes, the Government shall establish a working committee, which will consist of specialized lawyers with international experience and technical assistance team from international organizations like IsDB and IFC.
- II. Until appropriate legislative documents and regulation on Islamic Banking is adopted, certain Islamic finance instruments like Ijara, Musharakah, Mudarabah, and Murabaha should be piloted and exercised by non-banking leasing and investment companies. Special amendments are required in relevant laws which would enable non-banking Islamic leasing and investment companies carry out such operations. In addition, these non-banking financing institutions shall also be empowered to accumulate funds from general public.
- III. An Islamic Finance Council should be established to assist in developing the Islamic banking and financial system in Uzbekistan. The Council should include representatives from the Banking Association of Uzbekistan, commercial banks, government agencies, the Muslim Board, international financial institutions (including the Islamic Development Bank, the World Bank/IFC, etc.), Capital Markets' Development Agency, other business and finance community representatives.
- IV. Islamic Banking and Financial System Development Fund should be established under the Council with the following main functions:
  - Conducting research and studies on developing Islamic banking and finance infrastructure in Uzbekistan and proposing recommendations to the Council;
  - Attracting funding from various sources (including the private sector) to develop the Islamic financial system;
  - Coordinating the activities of all types of Islamic financial institutions operating in Uzbekistan (without duplicating the powers and responsibilities of the Central Bank or other government institutions);
  - Promoting Islamic finance and banking to increase financial literacy of the population. Publishing books and manuals of internationally renowned scientists and specialists on Islamic Finance in Uzbek and Russian;
  - Conduct training and collaborating partnership with Islamic Finance institutions (Imamnazarov, 2018), national and international stakeholders for enhancing capacity-building initiatives. Collaborating with institutions and business schools to encourage and facilitate course offerings in Islamic finance, economics, and banking.
- V. A Strategic Plan shall be adopted for developing Islamic finance in Uzbekistan which includes the following:
  - Enabling Policy Environment for legal, regulatory, supervisory, liquidity management framework, taxation regime, and financial accounting & reporting framework;

- Establishing Sharia Governance and Compliance which will focus on standardization and harmonization of Islamic finance law practices, and products/services. Moreover, it is vital to establish proper dispute resolution mechanism to address conflicts that could arise between Islamic financial institutions and customers. For this purpose, the Government shall make necessary provisions in its judiciary system to refer Islamic financial law pertaining to dispute resolution in all the matters of Islamic financial institutions operations;
  - Awareness and Capacity Building which will be made through coordination and collaboration amongst internal and external stakeholders, enhancing awareness about Islamic finance, and building capacity of the stakeholders;
- VI.** Based on the Strategic Plan, an action plan shall be structured by stating the list of activities, the timeline, and respective responsible bodies.
- VII.** Ease of licensing requirements for establishing Islamic Finance institutions or any such company that intends to offer Islamic finance services.

### **CONCLUSION:**

This study recommends incorporating Islamic financial system (formal and informal institutions) to the current financial system and fill in the financing gap existing in Uzbekistan. MSME sector faces many challenges in funding their business while traditional and formal financial institutions fail to meet their financing needs. Combination of formal and informal financial institutions, which is part and parcel of Islamic financial system, has high potential in funding the balanced growth in Uzbekistan. The success of Islamic financial institutions in peer countries like Indonesia and Bangladesh is commendable and worth adopting and incorporating its best practices.

### **LIMITATION AND FUTURE DIRECTION:**

The study has number of limitations which also open the door for future research avenues. Firstly, due to the lack of literature related to the area of current study pertaining to implementation of Islamic finance in Uzbek financial system, the present paper can be considered as a potential area for the new line of future research. The current paper is hoped to assist the academicians, practitioners, and researchers with its findings for their future studies in the same area. Another limitation is that the present study has strictly focused on the quantitative method, it is recommended that in order to obtain a deeper understanding regarding the opportunities for implementing Islamic finance in Uzbekistan, a mix method research can be considered. It is hoped the new study will be developed to obtain a deeper understanding of the current topic with the help of current study. Thirdly, instead of collecting data from banks' headquarters only, new research can focus on the perception of bank managers including branch managers to understand their openness for implementing Islamic financial services in the country.

The article analyzes methods for determining the degree of penetration of various polymer materials of automobile cartridges.*

**KEYWORDS:** *Polymer Material, Material Waste, Phosphogips, Kaolin, And Metal Powder Rubber, Lacquer, Paint, Glue, Asbestos, Glass*

---

**INTRODUCTION**

As you know, polymer materials have many different, but widely used in industry, polymer materials include rubber, lacquer, paint, glue, asbestos, glass, etc. The rigidity, lightness of polymers, that is, the thermal and protective resistance of plastics, the high insulating characteristics, especially the good technological and operational properties, necessitates the use of them not only in place of metals but also as necessary materials.

## Materials

It consists of polymer materials (high molecular compound), which are separated into natural and artificial varieties.

It has a high property of reducing friction in materials created based on polymer materials. Only then the materials will be able to ensure that the coefficient of friction in the friction without oil is less than 0,1.

Their significant advantages are corrosion resistance in different environments, lightness in the technology chapter, low noise when processed.

There is a drawback of polymer materials, not looking at the said advantages: in the influence of temperature and pressure, it is determined that the constructive dimensions are unstable, the mechanical strength is low, it quickly wears out, it can withstand a polished fracture.

The development of polymer materials is constantly increasing, the areas of their use are increasing. Most of the car parts are currently made of polymer materials. Therefore, the study of the technology of obtaining automotive details from polymer materials with printing is a topical issue.

The properties of polymer materials depend on the composition and amount of substances added to them. You can get even pre-determined compounds of different properties by changing the amount of these substances. The water-resistance of many plastics, the ability to resist the influence of many aggressive substances and petroleum products are their most important positive properties. Chemical achievements allow you to get plastics that can work both at low temperatures and at high temperatures. Since many plastics have a good electrical insulator (dielectric), they can be used in the preparation of tractors, electric equipment of cars. The fact that the heat is not resistant to it, but also changes its properties over time, that is, the tendency to wear is a drawback of plastic.

Currently, there are a number of Joint-Stock Companies and companies that produce details for cars from polymer materials. Most of the details in these enterprises are obtained by the method of pouring polymer materials with pressure on molds.

"UzKoram" is a closed type Joint-Stock Company. Currently, the joint venture has a production capacity of more than 200.000 complete bumpers, instrument panels, and door fittings per year. The painting department has the ability to paint the bumpers and the color of the body of the cars in the department.

"Uz-Tong Hong Ko" joint venture. At this enterprise, seats from the polyurethane foam polymer are being prepared for all the atoms produced in the JSC "GM-Uzbekistan".

Insulation wires of automobile electrical parts are produced at joint ventures" andijonkabel " and "UZ-Kodj".

At the above-mentioned enterprises, the acuity of raw materials for the production of products is brought from foreign countries.

It is known that now "Shurtangaz" village is located in the Karshi desert (Kashkadarya region, Guzar district) in the south-western part of the Republic of Uzbekistan and restored on the basis of "Shurtangaz" condensate deposits. The annual capacity of the enterprise is 3.9 billion. as a

result of the processing of cubic meters of raw gas, it is intended to produce the following products: 100 thousand tons of compressed gas; 100 thousand tons of gas condensate; 1,5 thousand tons of sulfur granule. Currently, the enterprise is on the eve of establishing the production of polypropylene. It is a very important and urgent issue to set up the preparation of the plastic details of the light and trucks produced by ourselves from these local polymers, as a result of which there will be no need for raw materials imported from abroad and the foreign exchange will be saved.

The complexity of the moving processes in the automotive parts and components, their reliable performance, the durability, and corrosion resistance of the details ensure its long-term performance. The deflection is one of the parameters of distortion, which is most often encountered in the car details. Prevention of cracking further increases the reliability indicators of the car. After the car manufacturer becomes unusable, it is necessary not only to repair it but also to analyze the processes that occur in them before the car breaks down, making the right conclusions, first of all, reduce the cost and also save the technical resource of the car.

As an object of research, polymers - polyethylene, polypropylene, polyamide, and epoxy resin (Ed-20), from which the details of modern cars are prepared, are obtained.

Methods for studying the deviations of materials and an improved micro tribometer were selected by the author.

To study the working conditions of polymer wetting materials used in automotive friction parts, to research their ingestion under different conditions, and to develop scientifically assimilated recommendations for the introduction of automotive detail preparation from local polymer materials.

To study the working conditions of the polymer wetting materials used in the friction parts of the vehicle, to study their ingest under different conditions and to introduce the preparation of automotive details from local polymer materials, to determine the factors affecting the physical and mechanical properties of the polymer materials and to look for ways to reduce their inversion.

At present, the service of cars is increased can not imagine our lives without them. In the process of using the vehicles, it's a lot of mechanisms is ingested on account of friction, resulting in a slowing down of its work activity. To know the reasons for such deviations, it is necessary to study the laws of friction of materials.

Along with this, the use of polymer materials and their compositions to reduce the weight of cars, preparing their details, saving their metals is growing steadily.

As you know, polymer materials have many different, but widely used in industry, polymer materials include rubber, lacquer, paint, glue, asbestos, glass, etc. The rigidity, lightness of polymers, that is, the thermal and protective resistance of plastics, the high insulating characteristics, especially the good technological and operational properties, necessitates the use of them not only in place of metals but also as necessary materials. It consists of polymer materials (high molecular compound), which are separated into natural and artificial varieties.

It has a high property of reducing friction in materials created based on polymer materials. Only then the materials will be able to ensure that the coefficient of friction in the friction without oil is less than 0,1.

Their significant advantages are corrosion resistance in different environments, lightness in the technology chapter, low noise when processed.

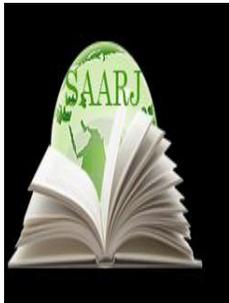

There is a drawback of polymer materials, not looking at the said advantages: in the influence of temperature and pressure, it is determined that the constructive dimensions are unstable, the mechanical strength is low, it quickly wears out, it can withstand a polished fracture.

## CONCLUSION

The properties of polymer materials depend on the composition and amount of substances added to them. You can get even pre-determined compounds of different properties by changing the amount of these substances. The water-resistance of many plastics, the ability to resist the influence of many aggressive substances and petroleum products are their most important positive properties. Chemical achievements allow you to get plastics that can work both at low temperatures and at high temperatures. Since many plastics have a good electrical insulator (dielectric), they can be used in the preparation of tractors, electric equipment of cars. The fact that the heat is not resistant to it, but also changes its properties over time, that is, the tendency to wear is a drawback of plastic.

**ABSTRACT**

*The article examines the process of developing the practical and professional competencies of students majoring in economics in higher education through the study of probability theory and mathematical statistics. Mathematical sciences studied by students of economics and their composition, goals and objectives are analyzed. National and international studies in this area have been analyzed. Probability theory and the concepts of mathematical statistics are presented in a way that is understandable to future economists in an understandable language, in an interesting way, based on a practical-professional approach. Examples are given that will increase students' interest in the subject using challenging situations that future economists may face in their future careers.*

**KEYWORDS:** *Probability, Statistics, Random Event, Teaching, Math, Probability Calculation.*

**INTRODUCTION**

As you know, the subject "Probability Theory and Mathematical Statistics" consists of interrelated sections "Probability Theory" and "Mathematical Statistics".

Probability theory is a mathematical science that studies random experiments, that is, the laws of unpredictable experiments. Mathematical statistics is a mathematical science that draws general conclusions about random events or processes based on data obtained from the observation of these events or experiments.

At present, the subject "Probability Theory and Mathematical Statistics" is taught in various bachelor's degree programs in higher education institutions of Uzbekistan, as well as in "Higher

Mathematics", "Mathematics", "Applied Mathematics" and similar disciplines. In addition, secondary schools are taught as departments of mathematics, as well as a separate section of academic lyceum textbooks.

Methodological, pedagogical and psychological aspects of preparation for professional activity in the process of teaching probability theory and mathematical statistics in the Republic: by A.S.Rasulov, Y.Abdullaev, N.M. Soatov; The importance of studying probability theory and mathematical statistics and improving the pedagogical possibilities and methods of teaching, the general structure of probabilistic-statistical knowledge, improving the interrelationships between different mathematical disciplines: I.M. Gaysinskaya, H. Ochilova, J. Kudratov, D.V. Manevich, M.Tojiev, U.X.Xonqulov; organization of practical-professional teaching of mathematics, formation of experience of solving practical-professional problems based on mathematical methods: studied in detail by J.Ikramov, U.S.Begimkulov, D.N. Ashurova, O.G. Gaimnazarov and others. Issues of improving the theoretical and scientific basis of professional competence and assessment of strategic learning objectives on the basis of adequate criteria were discussed and researched by R.K. Juraev, N.A.Muslimov, A.R.Khodjabaev, U.I.Inoyatov, K.T.Olimov, Sh.E. Kurbanov.

The results of research and analysis show that there are no recommendations for the classification of economic-professional problems and methods of solving each of the classified forms, professional development of future economists, mathematical modeling based on probabilistic-statistical methods and its scientific and pedagogical basis, importance and The incomplete disclosure of opportunities and the fact that the country's higher education institutions have now moved to a credit-modular system of education, and similar factors require the study of the development of professional competence of students in economics through the study of possible statistical content.

**Main body.** In the field of economics of higher education institutions from the 2020-2021 academic year began teaching such subjects as Applied Mathematics 1 (APPMAT16), Applied Mathematics 2 (APPMAT26), Statistics (STATIS6), Introduction to Econometrics (INTECON6) on the basis of credit-module system.

Applied Mathematics 2 is taught according to the curriculum approved by the Protocol No. 3 of August 14, 2020 of the Coordinating Council of Educational and Methodological Associations in the field of higher and secondary special, vocational education. This subject is taught in the following areas: 5230100-Economics (by industries and sectors), 5230200-Management (by industries and sectors), 5230600-Finance and financial technologies, 5231300-Budget control and treasury, 5230900-Accounting and auditing (by industries) ), 5230800-Taxes and taxation, 5231400-Statistics (by industries and sectors), 5231200-Insurance, 5231600-Human resource management, 5232300-Regional economy, 5232200-Econometrics, 5232400-Economic security, 5234100-Digital economy (sectors and by industries), 5230400-Marketing (by industries and sectors), 5230400-Marketing (advertising), 5230202-Management: tourism business management, 5233600-Trade (by types), 5232500-Logistics (by directions), 5230700- Banking and audit, 5231100-World economy and international economic relations (by regions and types of activities), 5231900-Corporate governance, 5330200-Information systems and technologies (by industries and sectors) internal), 5610200-Organization and management of hotel industry, 5610300-Tourism (by areas of activity). The subject is taught in the 1st year in the 2nd semester

for a total of 180 hours, including 32 hours of lectures, 36 hours of practical training, 4 hours of certification and 108 hours of independent study. This subject consists of 6 credits.

The purpose of teaching science is to learn the basics of mathematical concepts applied in all areas of economics. We know that problems in economics are first translated into the language of mathematics and then from mathematical language into algebra. As a result, their algorithms are created to solve economic problems. One of the modern methods of solving problems in the economy is "machine learning", which mainly uses the libraries of the Python programming language "numpy", "pandas", "matplotlib", "sclearn" in the analysis of large databases. These libraries are based on the concepts of linear algebra, analytic geometry, mathematical analysis, probability theory, and mathematical statistics. In the analysis of statistical data, the same can be said about the software package "Stata". The course consists of sections on linear algebra, analytic geometry, mathematical analysis, probability theory, and mathematical statistics.

Tasks of science:

- To study the role of mathematics in economics;
- be able to solve simple problems related to linear algebra, analytical geometry, mathematical analysis, probability theory and mathematical statistics;
- be able to apply mathematical methods appropriate to the type of problem;
- teaching logical thinking;
- Teaching to create a mathematical model of economic problems.

Although Applied Mathematics 2 is a new subject in the curriculum, its sections and topics are the main sections of mathematics, especially Probability Theory and Mathematical Statistics.

The topics of this section are given in the sample science program as follows:

Topic 1. Events and their probabilities.

The subject of the theory of random events and probabilities. Statistical definition of the probability of an accidental event. The sum and multiplication of events. The rule of adding probabilities.

Topic 2. Space of elementary events.

Axioms of Probability Theory Science. The classic way to calculate probability. Geometric definition of probability.

Topic 3. Freedom of events and the simplest formulas.

Conditional probability. Free events and the rule of multiplication. Absolute probability and Bayes formulas.

Topic 4. Bernoulli scheme and limit theorems.

Bernoulli scheme. Binomial probabilities. Laplace's local and integral theorems. Poisson's limit theorems.

Topic 5. Random quantities and their distribution laws.

The concept of random quantity. Discrete random quantities. Binomial and Poisson distribution laws.

Topic 6. Random quantities in general. Distribution function.

Probability distribution function. Properties of the distribution function. Laws of distribution of continuous random quantities. Flat distribution in cross section. Normal distribution.

Topic 7. Numerical characteristics of random quantities.

Mathematical expectation of discrete and continuous random quantities. Dispersion of discrete and continuous random quantities. Mathematical expectation and variance properties.

Topic 8. The law of large numbers and the central limit theorem.

Chebyshev inequality. Chebyshev's theorem. Bernoulli's theorem. Central limit theorem.

Topic 9. Elements of mathematical statistics.

Empirical law of distribution. Variation series. Polygon and histogram for the variation series. Point and intermediate assessments.

Topic 10. Elements of correlation theory.

A two-dimensional random quantity. Functional and random connections. Correlation correlation, correlation moment correlation coefficient.

The following basic and additional literature is recommended in the sample science program for teaching these topics and for students to study independently:

1. PrasannaSahoo, Probability and Mathematical Statistics, Department of Mathematics, University of Louisville, KY 40292 USA 2013.

2. Andronov A.M., Kopytov E.A., GringlazL.Ya. Theory of probabilities and mathematical statistics. ISBN5-94723-615-X, Peter, 2004.

It will be useful to explain the above topics to students of economics in the process of theoretical and practical training through problem situations and their solutions that will be needed in their professional activities. However, for the use of probability theory and mathematical statistics in practice, there are approximately the following standard questions about the calculation of probabilities in many literatures:

-The box has 10 details, 4 of which are painted. 4 details were taken for the risk. Find the probability that all the details obtained are painted;

-5% of the balls in the container are red and 15% are blue. Find the probability that a single ball taken from the container is not blue;

- 8 out of 25 transistors in the box are invalid. Optionally the transistor is removed and checked. Find the probability that the resulting second transistor is invalid;

-Find the probability that the Coat of Arms will fall on at least one of the two coins;

-Find the probability that the sum of the points scored in two games is 9.

In such cases, the condition of the matter is not only a little boring, but also of little practical importance. In fact, even though such issues later become the basis for larger practical problems, probability theory and mathematical statistics can initially give students the impression that they are engaged in unnecessary activities such as coin tossing, hasty throwing.

Prospective economists need to use information from Probability Theory and Mathematical Statistics in practical lessons that may interest or motivate students to study the subject. It is advisable to give new questions that reflect the teacher's personal approach. Giving the same questions to everyone is also less self-justifying.

For example, the following questions can be asked:

Interesting issues:

1. Find the probability that the word TULANMIRZA will appear again when the letters in the word TULANMIRZA are randomly changed (let everyone write their name instead of TULANMIRZA).

2. The letters TULANMIRZA are written on 10 balloons in the first box, and the letters NISHONOV are written on 8 balloons in the second box. When you get 3 balls at risk from the first box and 2 balls at risk from the second box, find the probability that it is possible to form the word ROMAN from the letters on the balls. find the probability that it is possible to form a word that makes sense out of the letters above, i.e., let the student create a problem and work on it himself).

3. The 11 balloons in the box have the letters CORONAVIRUS written on them. Find the probability that the word VIRUS is formed on the balls when 5 balls in a row are taken from the box.

4. Barcelona and Real Madrid football clubs are equally strong teams. Find the probability that Barcelona will win 4 times in their 4 match against each other.

5. In the TV show "Omad Show" there are 40 lanes on the drum, in each round 5 of them will be a car and the remaining 35 lanes will be awarded a certain amount of money as a prize. Each round involves three participants, and each of them, in turn, can spin the drum and continue spinning the drum without picking it up if the winning win is a car, stopping the game or winning if the winning streak falls. Whether or not a participant receives a prize, that prize is removed from the drum and replaced by an arrow to the right. If the arrow falls on subsequent turns, then the win on its right side is taken into account. Participants will be given up to three chances. If the participant cannot win the car even after three spins, he will have to take the prize money that fell on the last spin. The teleplay consists of three rounds, and in each round the winnings on the drum are returned to the original state.

A. Find the probability that at least one participant in one round wins the car.

B. Find the probability that the car will be swallowed in each round.

Career-oriented issues for future economists:

1. One of the most difficult problems in studying the market is that consumers refuse to answer questions or if the survey is conducted in residential areas, they are not at home at this time. If the respondent (respondent) is at home, the probability of answering the questions is 0.94 and the

probability that he is at home is 0.65. Evaluate the percentage of completed questionnaires based on this information.

2. The probability that a company building terminals for airports will enter into a contract with country A is 0.4, and the probability of concluding a contract with country B is 0.3. The probability of concluding an agreement with both countries is 0.12. What is the probability that a company will enter into a contract with at least one of these countries?

3. Some large stores (supermarkets) have a hidden "electronic eye" to determine the number of customers entering it. If two customers enter the supermarket in a row, the "electronic eye" has a probability of accounting for the first of them is 0.98, the probability of accounting for the second is 0.94, and the probability of accounting for both is 0.93. Find the probability that the device will account for at least one of the two customers who come in series.

4. The firm's marketing department is conducting a survey to find out what consumers think about a particular type of product. In the study area, 10% of the population consumes the products the firm is interested in and is able to make assessments based on them. The firm randomly selects 10 people from the population in the study area. How likely is it that at least one of them will be able to reasonably evaluate the product?

5. An employee of the credit department knows that 12% of companies that have received a loan from the bank have gone bankrupt and will not be able to repay loans for at least 5 years. He also knows that 20% of all borrowers have gone bankrupt. If a customer of a bank goes bankrupt, find the probability that he or she will not be able to repay the debt to the bank.

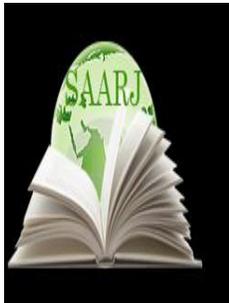

## DISCUSSION AND CONCLUSION

Assignment of such questions during the lesson and for independent study after the lesson will increase the students' interest in this subject and develop the skills to apply it in their future activities.

## IMPACT ON ECONOMIC GROWTH DUE TO DECLINE IN CRUDE OIL PRICE IN OMAN – A STUDY OF YOUTH PERCEPTION

**Dr. Lenin Kumar Nooney\***

\*Assistant Professor,  
 Department of Business Studies,  
 Nizwa College of Technology,  
 Sultanate of OMAN

### ABSTRACT

*The main objective of the study is to know the opinion of students regarding economic growth in Oman due to decline in crude oil price. Data was collected from 424 students using a structured questionnaire. Chi-square test was used to analyze the relationship between gender, specialization and level of education with opinion of students. The findings of the study shows that Female students have positive opinion that government will normalize budget deficit than male students, majority students have a positive opinion that government will increase taxes and Male students have slightly positive opinion that decline in crude oil prices brings more investment in oil sector than female students. Over all it can be concluded that Female students and diploma students have an optimistic opinion about the economic growth in Oman.*

**KEYWORDS:** *Economic Growth, Oil Prices, Decline, Perception*

### 1. INTRODUCTION

With production of less than 1 million b/d of oil, the Sultanate of Oman has less oil and gas reserves compared to its GCC neighbors, except Bahrain. Since the sharp drop in oil prices in the second half of 2014, the government has taken bold steps to increase revenues from non-oil sources. These include turning to debt markets for the first time (it sold \$2.5 billion in bonds on June 8) and taking on some reforms such as subsidy cuts, reduced benefits for public sector workers and increased fees. Furthermore, they introduced a royalty on telecom operators, a “fair tax” on Liquefied Natural Gas (LNG) exports, and an increase in royalties paid for mineral exploitation. Oman has recently approved a 35 % tax on petrochemical firms and increased taxation on liquefied natural gas companies. The change will see taxes on LNG firms increase from 15 to 55%. Reforms in 2015 include the doubling of the price of gas for industrial users.

The World Bank estimates that \$10 billion in revenues were lost in 2015, and the new budget projects a deficit of 16.8% of GDP in 2016. Government subsidy spending is expected to fall by 64 % in 2016, as local fuel prices are brought in line with global prices. The deregulation of petrol prices began in mid-January 2016, with diesel and petrol prices increasing by up to 33%. An increase in the corporate income tax rate from 12 to 15%, as well as the removal of the tax exemption for the first OMR 30,000 of taxable earnings, has been approved by the Shura Council and a GCC-wide VAT has been agreed upon. Other measures to boost non-hydrocarbon revenue include: revising electricity and water tariffs for commercial and industrial users; and increasing fees for government services including licenses and labor cards, vehicle registration, real-estate transactions and land allocation. The following table shows the GDP growth of Oman.

**TABLE 1: GDP GROWTH OF OMAN FROM 2012 TO 2016**

Years	GDP Annual Growth Rate	GDP in USD Billion	Average Annual OPEC Crude oil prices
2012	11.5	76.7	109.45
2013	2.8	78.9	105.87
2014	4.6	81.03	96.29
2015	-14.1	69.83	49.49
2016	-5.1	66.29	40.68

## 2. LITERATURE REVIEW

Several empirical studies have focused on developing oil-exporting countries. According to Mehrara (2008), an oil boom would release foreign exchange constraints and would stimulate economic performance for oil-exporting countries from both supply and demand sides. Furthermore, the government would follow expansionary fiscal policy and would use such money to finance its development and infrastructure which will induce investment, consumption and economic growth (Emami, 2012). However, such positive effect could be weakened by real exchange rate appreciation which leads to the contraction of tradable sectors and so the country will be under the risk of the Dutch disease. In addition, when oil prices decrease governments are not able to adjust their current spending immediately.

Pieschancon (2009) used a vector autoregressive (VAR) model to assess the impact of oil prices on government revenue, government purchases, tradable and non-tradable output, transfers, private consumption and the real exchange rate for Norway and Mexico over the period 1980-2006. He found that fiscal policy is the most responsive policy to oil prices and he argued that this is the main transmission channel through which the degree of exposure of the economy to oil price volatility is determined.

Cologni and Manera (2013) consider the role of the government and its reallocation process in the economy through fiscal policy. They address the effects of oil shocks and the expansionary fiscal policy on the business cycle of GCC countries (Oman, Kuwait, Bahrain, Saudi Arabia, UAE and Qatar) by using the real business cycle model. Results revealed that the negative impact of oil shocks on private output, capital and employment can be more than offset by the

positive effects of oil shocks on government revenue and expenditure. This fact causes a shift of productive factors from the private sector to the public sector, thus government employment and output both expand causing a boost in the total output.

DiDomenico and Bonnici (1996) recommend measuring both student expectations and perceptions in order to expose expected versus perceived quality gaps. In the view of this study, service quality is a product of lecturer calibre and skillfully using teaching methods that deliver satisfying learning experiences. This does not mean student perceptions should be the sole consideration for defining appropriate teaching methodology and lecturers 'characteristics. Instead, service gap analysis should aid the identification of areas in teaching and learning that need modification.

Liu (2010) investigated students' use of different social media tools and their attitudes and perceptions towards these tools. The author sought to identify the knowledge and trends of using 16 social media tools that included Facebook, Wiki, YouTube, Bulletin Board, LinkedIn, Blogs, Twitter, Podcasts, Virtual Worlds, RSS, StumbleUpon, Netlog, Delicious, Digg, Plurk, and Jaiku. The study results revealed the top four reasons why students use social media tools. As reported, 85% use such tools for social engagement, 56% use them for direct communications, 48% use them for speed of feedback/results, and 47% use them for relationship building; however, fewer than 10% of the students mentioned using social media tools for academic practice

### **3. Objective of the research**

The objective of the study are;

1. To know the opinion of youth on impact of economic growth.
2. To generate idea regarding whether government would normalize budget deficit.
3. To identify whether investment in oil sector increase.
4. To determine the impact on exports and imports.

### **4. RESEARCH METHODOLOGY:**

This study employed a quantitative research design based on a survey method through questionnaires. The survey method employed in this research because it is an efficient way of collecting information from a large number of respondents. Besides that, this method is easy to administer and cheaper to conduct.

Population selected for this study is Nizwa College of Technology. Out of 5380 population, sample size of 424 students were selected at randomly from the three academic departments. The age group of the respondents ranged between 18 to 25 years old.

The main research instrument of this study is a questionnaire. The researcher has used the 5-points Likert scale which was Strongly Agree, Agree, Neutral, Disagree and Strongly Disagree was used for the following:

- a. Perception about improvement in Oman economy with decline in crude oil price.
- b. Decline in crude oil prices helps government to normalize budget deficit.
- c. Decline in prices of crude oil will bring more investment in oil sector.

d. Decline in prices of crude oil will increase exports.

e. Decline in prices of crude oil will increase imports.

Descriptive analysis was used to interpret the data collected. Chi-square test was used to analyze the relationship between gender, specialization and level of education with opinion of students.

## 5. Data analysis

**TABLE 2: PERCEPTION ABOUT IMPROVEMENT IN OMAN ECONOMY WITH DECLINE IN CRUDE OIL PRICE**

Gender	Strongly Agree	Agree	Neutral	Disagree	Strongly Disagree	Total
Male	58 (26)	110 (49)	16 (7)	34 (15)	6 (3)	224
Female	50 (25)	114 (57)	12 (6)	22 (11)	2 (1)	200
Departments	Strongly Agree	Agree	Neutral	Disagree	Strongly Disagree	Total
Business	34 (26)	68 (52)	8 (6)	18 (14)	2 (2)	130
Information Technology	22 (29)	44 (58)	4 (5)	5 (7)	1 (1)	76
Engineering	52 (24)	112 (51)	17 (8)	34 (16)	3 (1)	218
Level of Education	Strongly Agree	Agree	Neutral	Disagree	Strongly Disagree	Total
Diploma	58 (27)	113 (53)	15 (7)	26 (12)	1 (0)	213
Advanced Diploma	26 (22)	64 (55)	7 (6)	15 (13)	5 (4)	117
Bachelor	24 (26)	46 (49)	4 (4)	16 (17)	4 (5)	94

(The values given in parentheses are percentages)

It can be understood from Table 1 that 26 percentage of the male strongly agree and 49 percentage agree that decline in crude oil price will improve Oman economy. Thus 75 percentage of male have shown a favorable opinion. Whereas 25 percentage of the female strongly agree and 57 percentage agree that Oman economy will improve with decline in crude oil price. It shows that 82 percentage of female have shown a favorable opinion. Based on the gender opinion it is clear that female students have shown more favorable opinion than male students that decline in crude oil price will improve Oman economy.

On the basis of departments, 78percentage (26 strongly agree and 52 agree)of business department students, 87percentage (29 strongly agree and 58 agree)of information technology student and 75percentage (24 strongly agree and 51 agree)of engineering students have a positive opinion about improvement in Oman economy even with the decline in the crudeoil prices.It is

clear that information technology student have more positive opinion that decline in crude oil price will improve Oman economy than business and engineering students.

On the basis of level of education, 80percentage (27 strongly agree and 53 agree) of diploma students, 77percentage (22 strongly agree and 55 agree) of advanced diploma students and 75 percentage(26 strongly agree and 49 agree) of Bachelor students believe that even with the decline in crudeoil prices the economy of Oman will improve. It shows that diploma students have more optimistic opinion that decline in crude oil price will improve Oman economy than advance diploma and Bachelor students.

Based on the above findings the following hypothesis are tested:

$H_0$  (G): There is no significant relationship between gender and the opinion with respect to improvement in Oman economy with decline in crude oil prices.

$H_1$  (G): There is a significant relationship between gender and the opinion with respect to improvement in Oman economy with decline in crude oil prices.

$H_0$  (Dpt): There is no significant relationship between departments and the opinion with respect to improvement in Oman economy with decline in crude oil prices.

$H_1$  (Dpt): There is a significant relationship between departments and the opinion with respect to improvement in Oman economy with decline in crude oil prices.

(LoE): There is no significant relationship between level of education and the opinion with respect to improvement in Oman economy with decline in crude oil prices.

$H_1$  (LoE): There is a significant relationship between level of education and the opinion with respect to improvement in Oman economy with decline in crude oil prices.

To analyze the relationship between gender, specialization and level of education with opinion about improvement in Oman economy with decline in crude oil prices chi-square test is used. It is found that there is no significant relationship between gender and opinion on economy's improvement due to decline in crude oil prices (p value 0.35), departments and opinion on economy improvement due to decline in crude oil prices (p value 0.58) and there is no relationship between opinion on economy improvement due to decline in crude oil prices and level of education (p value 0.46).

**TABLE 3: INCREASE IN PETROL PRICES SHOULD HAVE BEEN TAKEN FEW YEARS BACK (5 TO 10 YEARS)**

Gender	Yes	No	Total
Male	148 (66)	76 (34)	224
Female	132 (66)	68 (34)	200
Departments	Yes	No	Total
Business	89 (68)	41 (32)	130
Information Technology	50 (66)	26 (34)	76
Engineering	141 (65)	77 (35)	218
Level of Education	Yes	No	Total

Diploma	148 (69)	65 (31)	213
Advanced Diploma	64 (55)	53 (45)	117
Bachelor	68 (72)	26 (28)	94

(The values given in parentheses are percentages)

It is observed from table 2 that 66 percentages of the male and female students equally have the opinion that petrol prices increase should have been taken few years back.

On the basis of departments, 68 percentages of Business Students, 66 percentage of Information Technology students and 65 percentage of Engineering students have the opinion that petrol price increase should have been taken few years back. It can be concluded that Business students showed slightly favorable opinion that petrol prices increase should have been taken few years back than Information Technology and Engineering specialization students.

On the basis of level of education, 69 percentage of the Diploma students, 55 percentage of the Advanced Diploma students and 72 percentage of Bachelor students have the opinion that petrol price increase should have been taken few years back. It is clear from the above table that Bachelor students have more optimistic opinion that petrol prices increase should have been taken few years back than Diploma and Advanced Diploma students.

Based on the above findings the following hypothesis are tested:

$H_0$  (G): There is no significant relationship between gender and the opinion that petrol prices increase should have been taken few years back.

$H_1$  (G): There is a significant relationship between gender and opinion that petrol prices increase should have been taken few years back.

$H_0$  (Dpt): There is no significant relationship between departments and opinion that petrol prices increase should have been taken few years back.

$H_1$  (Dpt): There is a significant relationship between departments and opinion that petrol prices increase should have been taken few years back.

$H_0$  (LoE): There is no significant relationship between level of education and opinion that petrol prices increase should have been taken few years back.

$H_1$  (LoE): There is a significant relationship between level of education and opinion that petrol prices increase should have been taken few years back.

Chi-square test results shows that there is no significant relationship between gender and the opinion that petrol prices increase should have been taken few years back (p value 0.98) and departments and the opinion that petrol prices increase should have been taken few years back (p value 0.77). But there is significant relationship between the opinion that petrol prices increase should have been taken few years back and level of education (p value 0.008). Bachelor student are more opinionated than other students.

**TABLE 4: DECLINE IN CRUDE OIL PRICES HELPS GOVERNMENT TO NORMALIZE BUDGET DEFICIT**

Gender	Strongly Agree	Agree	Neutral	Disagree	Strongly Disagree	Total
Male	36 (16)	95	76 (34)	4 (2)	13 (6)	224

		(42)				
Female	28 (14)	96 (48)	56 (28)	14 (7)	6 (3)	200
Departments	Strongly Agree	Agree	Neutral	Disagree	Strongly Disagree	Total
Business	17 (13)	59 (45)	40 (31)	10 (8)	4 (3)	130
Information Technology	10 (13)	38 (50)	24 (32)	3 (4)	1 (1)	76
Engineering	36 (17)	98 (45)	68 (31)	3 (1)	13 (6)	218
Level of Education	Strongly Agree	Agree	Neutral	Disagree	Strongly Disagree	Total
Diploma	36 (17)	91 (43)	72 (34)	7 (3)	7 (3)	213
Advanced Diploma	19 (16)	56 (48)	29 (25)	4 (3)	9 (8)	117
Bachelor	8 (9)	48 (51)	31 (33)	4 (4)	3 (3)	94

(The values given in parentheses are percentages)

Table 3 reveals that 16 percentages of males strongly agree and 42 percentage of the males agree that government will normalize budget deficit, whereas 14 percentage of the female strongly agree and 48 percentage of female agree that government will normalize budget deficit. Based on gender it can be concluded that female have positive opinion that government will normalize budget deficit.

On the basis of departments, 13 percentages of Business students strongly agree and 45 percentages of Business students agree that government will normalize budget deficit. In case of Information Technology students 13 percentages strongly agree and 50 percentage agree that government will normalize budget deficit. Whereas for Engineering students 17 percentage strongly agree and 45 percentage agree that government will normalize budget deficit. It shows that majority of the students in the three departments have a favorable opinion that the government will normalize budget deficit.

On the basis of level of education, 17 percentage of the Diploma students strongly agree whereas 43 percentage of Diploma students agree that government will normalize budget deficit. In Advanced Diploma it shows that 16 percentage of students strongly agree and 48 percentage of students agree that government will normalize budget deficit. Bachelors shows that 9 percentage of the students strongly agree and 51 percentage of the students agree that government will normalize budget deficit. It can be concluded that, majority of the students in three education level have optimistic opinion that government will normalize budget deficit.

Based on the above findings the following hypothesis are tested:

$H_0$  (G): There is no significant relationship between gender and opinion that government will normalize budget deficit.

$H_1$  (G): There is a significant relationship between gender and opinion that government will normalize budget deficit.

$H_0$  (Dpt): There is no significant relationship between departments and opinion that government will normalize budget deficit.

$H_1$  (Dpt): There is a significant relationship between departments and opinion that government will normalize budget deficit.

$H_0$  (LoE): There is no significant relationship between level of education and opinion that government will normalize budget deficit.

$H_1$  (LoE): There is a significant relationship between level of education and opinion that government will normalize budget deficit.

It is found that there is a significant relationship between gender and opinion that government will normalize budget deficit (p value 0.01). Whereas there is a no significant relationship between departments and opinion that government will normalize budget deficit (p value 0.11) and level of education and opinion that government will normalize budget deficit (p value 0.23).

**TABLE 5: GOVERNMENT DECISION ON FISCAL POLICY (TAX POLICY)**

Gender	Increase in Taxes	Taxes Remain Same	Decrease in Taxes	Total
Male	137 (61)	59 (26)	28 (13)	224
Female	114 (57)	48 (24)	38 (19)	200
Departments	Increase in Taxes	Taxes Remain Same	Decrease in Taxes	Total
Business	73 (56)	28 (22)	29 (22)	130
Information Technology	46 (61)	20 (26)	10 (13)	76
Engineering	132 (61)	59 (27)	27 (12)	218
Level of Education	Increase in Taxes	Taxes Remain Same	Decrease in Taxes	Total
Diploma	130 (61)	53 (25)	30 (14)	213
Advanced Diploma	64 (55)	28 (24)	25 (21)	117
Bachelor	59 (63)	28 (30)	7 (7)	94

(The values given in parentheses are percentages)

It can be revealed from table 4 that, majority (61 %) of the males have the perception that government will increase taxes, whereas 57 percentage of the female students have the perception that government will increase taxes. It can be concluded that majority have a positive opinion that government will increase taxes.

On the basis of departments, 56 percentage of Business students, 61 percentage of Information Technology students and 61 percentage of Engineering students have the opinion that government will increase taxes. On the basis of departments it can be concluded that majority of the students have favorable opinion that government will increase taxes.

On the basis of level of education, 61 percentage of the Diploma students, 55 percentage of the Advanced Diploma students and 63 percentage of the Bachelor students have the opinion that government will increase taxes. Based on level of education also majority of the students have favorable opinion that government will increase taxes.

The following hypotheses are tested:

$H_0$  (G): There is no significant relationship between gender and opinion regarding government decision on fiscal policy.

$H_1$  (G): There is a significant relationship between gender and opinion regarding government decision on fiscal policy.

$H_0$  (Dpt): There is no significant relationship between departments and opinion regarding government decision on fiscal policy.

$H_1$  (Dpt): There is a significant relationship between departments and opinion regarding government decision on fiscal policy.

$H_0$  (LoE): There is no significant relationship between level of education and opinion regarding government decision on fiscal policy.

$H_1$  (LoE): There is a significant relationship between level of education and opinion regarding government decision on fiscal policy.

Statistical result shows that there is no significant relationship between gender and opinion regarding government decision on fiscal policy (p value 0.18), departments and opinion regarding government decision on fiscal policy (p value 0.14) and no relationship between opinion regarding government decision on fiscal policy and level of education (p value 0.33).

**TABLE 6: DECLINE IN PRICES OF CRUDE OIL WILL BRING MORE INVESTMENT IN OIL SECTOR**

Gender	Strongly Agree	Agree	Neutral	Disagree	Strongly Disagree	Total
Male	62 (28)	65 (29)	53 (24)	41 (18)	3 (1)	224
Female	46 (23)	60 (30)	40 (20)	48 (24)	6 (3)	200
Departments	Strongly Agree	Agree	Neutral	Disagree	Strongly Disagree	Total
Business	30 (23)	39 (30)	30 (23)	29 (22)	2 (2)	130
Information Technology	22 (29)	22 (29)	14 (18)	16 (21)	2 (3)	76
Engineering	55 (25)	65 (30)	49 (22)	45 (21)	4 (2)	218
Level of Education	Strongly Agree	Agree	Neutral	Disagree	Strongly Disagree	Total

Diploma	58 (27)	66 (31)	44 (21)	41 (19)	4 (2)	213
Advanced Diploma	33 (28)	25 (21)	27 (23)	30 (26)	2 (2)	117
Bachelor	16 (17)	35 (37)	24 (26)	18 (19)	1 (1)	94

(The values given in parentheses are percentages)

Table 5 depicts that only 57 percentage (28% strongly agree and 29% agree) of the male students have opinion that decline in crude oil prices brings more investment in oil sector, whereas 53 (i.e. 23 strongly agree and 30 agree) percentage of female have the same opinion. Based on gender opinion it shows that male have slightly positive opinion than females that decline in crude oil prices brings more investment in oil sector.

On the basis of departments, it is clear that 53 percentage of Business students (23% strongly agree and 30% agree), 58 percentage of Information Technology students (29% strongly agree and 29% agree) but in case of Engineering students 55 percentage (25% strongly agree and 30% agree) have the opinion that decline in crude oil prices brings more investment in oil sector. It can be inferred that Information Technology students have slightly favorable opinion than business and engineering students.

On the basis of level of education, is shown that 58 percentage of diploma students (27% strongly agree and 31% agree), 49 percentage of advance diploma students (28% strongly agree and 21% agree), whereas in bachelor students it is 54 percentage (17% strongly agree and 37% agree) have the opinion that decline in crude oil prices brings more investment in oil sector. Overall it shows that diploma students have optimistic opinion than advanced diploma and bachelor students.

The following hypothesis are proposed and tested:

$H_0$  (G): There is no significant relationship between gender and opinion regarding that decline in crude oil prices brings more investment in oil sector.

$H_1$  (G): There is a significant relationship between gender and opinion regarding that decline in crude oil prices brings more investment in oil sector.

$H_0$  (Dpt): There is no significant relationship between departments and opinion regarding that decline in crude oil prices brings more investment in oil sector.

$H_1$  (Dpt): There is a significant relationship between departments and opinion regarding that decline in crude oil prices brings more investment in oil sector.

$H_0$  (LoE): There is no significant relationship between level of education and opinion regarding that decline in crude oil prices brings more investment in oil sector.

$H_1$  (LoE): There is a significant relationship between level of education and opinion regarding that decline in crude oil prices brings more investment in oil sector.

Chi-square result shows that there is no significant relationship between gender and opinion regarding that decline in crude oil prices brings more investment in oil sector (p value 0.16), departments and opinion regarding that decline in crude oil prices brings more investment in oil

sector (p value 0.99) and no relationship between level of education and opinion regarding that decline in crude oil prices brings more investment in oil sector (p value 0.22).

**TABLE 7:DECLINE IN PRICES OF CRUDE OIL WILL INCREASE EXPORTS**

Gender	Strongly Agree	Agree	Neutral	Disagree	Strongly Disagree	Total
Male	40 (18)	76 (34)	97 (43)	9 (5)	2 (1)	224
Female	32 (16)	82 (41)	64 (32)	16 (8)	6 (3)	200
Departments	Strongly Agree	Agree	Neutral	Disagree	Strongly Disagree	Total
Business	23 (18)	51 (39)	45 (35)	8 (6)	3 (2)	130
Information Technology	10 (13)	31 (41)	31 (41)	3 (4)	1 (1)	76
Engineering	39 (18)	77 (35)	84 (39)	14 (6)	4 (2)	218
Level of Education	Strongly Agree	Agree	Neutral	Disagree	Strongly Disagree	Total
Diploma	45 (21)	75 (35)	83 (39)	8 (4)	2 (1)	213
Advanced Diploma	19 (16)	46 (39)	40 (34)	9 (8)	3 (3)	117
Bachelor	8 (9)	38 (40)	40 (43)	7 (7)	1 (1)	94

(The values given in parentheses are percentages)

It can be examined from table 6 that, 18 percentage of male have strongly agree and 34 percentage have agreed that decline in prices of crude oil will increase exports. In case of female, 16 percentage strongly agree and 41 agree that decline in prices of crude oil will increase exports. It shows that female have optimistic opinion than male.

In case of departments, 18 percentages of Business students strongly agree and 39 percentage agree that decline in prices of crude oil will increase exports. 13 percentage of Information Technology students strongly agree and 41 percentage of agree that decline in prices of crude oil will increase exports. 18 percentage of Engineering students strongly agree and 35 percentage agree that decline in prices of crude oil will increase exports. It shows that Business students have slightly positive opinion than Information Technology and Engineering students.

In case of level of education, 21 percentage of diploma students strongly agree and 35 percentage agree that decline in prices of crude oil will increase exports. 16 percentage of advanced diploma

students strongly agree and 39 percentage of agree that decline in prices of crude oil will increase exports. 9 percent of bachelor students strongly agree and 40 percentages agree that decline in prices of crude oil will increase exports. It shows that diploma students have favorable opinion than advanced diploma and bachelor students.

The following hypothesis are tested:

$H_0$  (G): There is no significant relationship between gender and opinion about decline in prices of crude oil will increase exports.

$H_1$  (G): There is a significant relationship between gender and opinion about decline in prices of crude oil will increase exports.

$H_0$  (Dpt): There is no significant relationship between departments and opinion about decline in prices of crude oil will increase exports.

$H_1$  (Dpt): There is a significant relationship between departments and opinion about decline in crude oil prices brings more investments in oil sector.

$H_0$  (LoE): There is no significant relationship between level of education and opinion about decline in prices of crude oil will increase exports.

$H_1$  (LoE): There is a significant relationship between level of education and opinion about decline in prices of crude oil will increase exports.

Test result shows that there is no significant relationship between gender (p value 0.05), departments (p value 0.95) and level of education (p value 0.11) and opinion that decline in prices of crude oil will increase exports.

**TABLE 8: DECLINE IN PRICES OF CRUDE OIL WILL INCREASE IMPORTS**

Gender	Strongly Agree	Agree	Neutral	Disagree	Strongly Disagree	Total
Male	35 (16)	88 (39)	90 (40)	9 (4)	2 (1)	224
Female	30 (15)	74 (37)	68 (34)	22 (11)	6 (3)	200
Departments	Strongly Agree	Agree	Neutral	Disagree	Strongly Disagree	Total
Business	18 (14)	55 (42)	44 (34)	10 (8)	3 (2)	130
Information Technology	12 (16)	25 (33)	33 (43)	5 (7)	1 (1)	76
Engineering	35 (16)	81 (37)	81 (37)	17 (8)	4 (2)	218
Level of Education	Strongly Agree	Agree	Neutral	Disagree	Strongly Disagree	Total
Diploma	36 (17)	85 (40)	73 (34)	17 (8)	2 (1)	213

Advanced Diploma	10 (9)	45 (38)	53 (45)	6 (5)	3 (3)	117
Bachelor	18 (19)	32 (34)	32 (34)	10 (11)	2 (2)	94

(The values given in parentheses are percentages)

Table 7 shows that 16 percentage male strongly agree and 39 percentage of agree that imports will increase with decline in crude oil prices. 15 percentages female strongly agree and 37 percentages agree that imports will increase with decline in crude oil prices. On the basis of gender it is clear that both the genders have almost favorable opinion.

In case of departments, 14 percentages of Business students strongly agree and 42 percentage agree that imports will increase with decline in crude oil prices. 16 percentage of Information Technology students strongly agree and 33 percentage agree that imports will increase with decline in crude oil prices. 16 percentages of Engineering students strongly agree and 37 percentage agree that imports will increase with decline in crude oil prices. On the basis of specialization it is clear that Business students have positive opinion than Information Technology Students and Engineering students.

In case of level of education, 17 percentage of diploma students strongly agree and 40 percentage of students agree that imports will increase with decline in crude oil prices. 9 percentage of advanced diploma strongly agree and 38 percentage of student agree that imports will increase with decline in crude oil prices. 19 percentage of bachelor students strongly agree and 34 percentage of student agree that imports will increase with decline in crude oil prices. It shows that diploma students have optimistic opinion than advanced diploma and bachelor students.

The following hypothesis is tested:

$H_0$  (G): There is no significant relationship between gender and opinion about imports will increase with decline in crude oil prices.

$H_1$  (G): There is a significant relationship between gender and opinion about imports will increase with decline in crude oil prices.

$H_0$  (Dpt): There is no significant relationship between departments and opinion about imports will increase with decline in crude oil prices.

$H_1$  (Dpt): There is a significant relationship between departments and opinion about imports will increase with decline in crude oil prices.

$H_0$  (LoE): There is no significant relationship between level of education and opinion about imports will increase with decline in crude oil prices.

$H_1$  (LoE): There is a significant relationship between level of education and opinion about imports will increase with decline in crude oil prices.

On the basis of test there is a significant relationship between gender and opinion about imports will increase with decline in crude oil prices (p value 0.03). There is no significant relationship between departments and opinion about imports will increase with decline in crudeoil prices (p value 0.92) and there is no relationship between level of education and opinion about imports will increase with decline in crude oil prices (p value 0.16).

**TABLE 9: SALARIES IN PUBLIC AND PRIVATE SECTORS WILL INCREASE WITH THE DECLINE INCRUDEOIL PRICES**

Gender	Increase	Same	Decrease	Total
Male	90 (40)	61 (27)	73 (33)	224
Female	102 (51)	40 (20)	58 (29)	200
Departments	Increase	Same	Decrease	Total
Business	66 (51)	29 (22)	35 (27)	130
Information Technology	33 (43)	16 (21)	27 (36)	76
Engineering	92 (42)	58 (27)	68 (31)	218
Level of Education	Increase	Same	Decrease	Total
Diploma	101 (47)	53 (25)	59 (28)	213
Advanced Diploma	52 (44)	30 (26)	35 (30)	117
Bachelor	40 (43)	19 (20)	35 (37)	94

(The values given in parentheses are percentages)

It is observed from table 8 that 40 percentages of the male students have the opinion that salaries in public and private sectors will increase with the decline in crude oil prices. In case of female students, 51 percentages have the same opinion. On the basis of gender it is clear that female students have a favorable opinion than male students.

On the basis of departments, 51 percentages of Business students, 43 percentage of Information Technology students and 42 percentage of Engineering students have the opinion that salaries in public and private sectors will increase with the decline in crude oil prices. It is clear that Business students have a positive opinion than Information Technology and Engineering students.

On the basis of level of education, 47 percentage of diploma students, 44 percentage of advance diploma students and 43 percentage of bachelor students have the opinion that salaries in public and private sectors will increase with the decline in crude oil prices. It is clear that diploma students have an optimistic opinion than advanced diploma and bachelor students.

The following hypothesis are tested:

$H_0$  (G): There is no significant relationship between gender and opinion about salaries in public and private sectors will increase with the decline in crude oil prices.

$H_1$  (G): There is a significant relationship between gender and opinion about salaries in public and private sectors will increase with the decline in crude oil prices.

$H_0$  (Dpt): There is no significant relationship between departments and opinion about salaries in public and private sectors will increase with the decline in crude oil prices.

$H_1$  (Dpt): There is a significant relationship between departments and opinion about salaries in public and private sectors will increase with the decline in crude oil prices.

$H_0$  (LoE): There is no significant relationship between level of education and opinion about salaries in public and private sectors will increase with the decline in crude oil prices.

$H_1$  (LoE): There is a significant relationship between level of education and opinion about salaries in public and private sectors will increase with the decline in crude oil prices.

On the basis of statistical test there is a no significant relationship between gender and opinion about salaries in public and private sectors will increase with the decline in crude oil prices (p value 0.05). There is no significant relationship between departments and opinion about salaries in public and private sectors will increase with the decline in crude oil prices (p value 0.39) and no relationship between level of education and opinion about salaries in public and private sectors will increase with the decline in crude oil prices (p value 0.44).

## 6. FINDINGS

1. Diploma students have more optimistic opinion regarding improvement in Oman economy due to decline in crude oil price than advanced diploma and Bachelor students and also there is no significant relationship between gender (p value 0.35), departments (p value 0.58) and level of education (p value 0.46).
2. Majority of the students in three different education level have optimistic opinion that government will normalize budget deficit. Hypothesis test showed that there is a significant relationship between gender and opinion that government will normalize budget deficit (p value 0.01).
3. Diploma students have optimistic opinion that decline in crude oil prices brings more investments in oil sector than advance diploma and bachelor students. Chi-square test showed that there is no significant relationship between gender (p value 0.16), department (p value 0.99) and level of education (p value 0.22) with opinion that decline in crude oil prices brings more investments in oil sector.
4. Business students have positive opinion that imports will increase with decline in crude oil prices than information technology students and engineering students and there is no significant relationship between gender (p value 0.05) department (p value 0.95) and level of education (p value 0.11) with opinion that decline in prices of crude oil will increase exports.

**7. CONCLUSION:** It can be concluded from the study that students are having an optimistic opinion that Oman economy will improve even with decline in crude oil prices, they are also optimistic that taxes in near future will increase and also have positive opinion regarding increase in salaries in both the sectors. It is evident that Oman economy is affected because of decline in the crude oil prices. Oman government is taking necessary steps to improve the economy by exploring other sources of revenues through tourism, fisheries, infrastructure, and service sector. Oman government is also considering value added tax and cutting down the subsidies to consumers.

### ABSTRACT

*The purpose of the article is to develop theoretical, methodological and software for automated teaching and learning. The problem of optimizing pedagogical activity is associated with the solution of the issue of providing it with information. This makes it possible for students to freely use the means of information communication and the skillful use of every cognitive Internet network and the information contained therein will have a positive impact on improving the quality and content of education.*

**KEYWORDS:** *Didactic Processes, Informatization, Computer Curriculum, Motivation, Cognitive, Information Technology Of Teaching, Modern Means Of Communication, Computer Technology.*

---

### INTRODUCTION

In the period when science, technology and technology are developing in high pictures, education plays an important role in bringing a person to a comprehensive age, in which the formation of qualities inherent in perfection and a qualified specialist takes place. Many advanced educational technologies are used in the didactic processes carried out in higher educational institutions that train specialists in the technical direction. These technologies are

aimed at improving the quality of further strengthening and mastering the knowledge, skills and skills of students. This in turn necessitates the effective use of modern means of communication in their educational activities. Effective use of modern communication tools as a didactic tool in the educational process serves as an important factor in improving the quality of education. In modern conditions, according to all the possibilities of the educational process, it is required to develop the personality, socialize and educate in it the abilities of independent, critical, creative thinking.[4]

In the didactic process, in combination with traditional forms of education, distance learning technologies are widely introduced. This makes it possible for students to freely use the means of information communication and the skillful use of every cognitive Internet network and the information contained therein will have a positive impact on improving the quality and content of education. Enriching educators with faultless methods leads to an increase in the level of mastering of educators. To do this, the rational organization of the lesson process is required by the educator to increase the interest of the educational community, to encourage their activity in the educational process, to divide the educational material into small pieces, to use interactive educational techniques in the opening of the educational content and to independently perform practical exercises for the educators.

In the organization of meaningful and quality educational process, it is important for educators to be able to use a wide range of information sources, namely information and communication technology opportunities, information and resource centers, e-learning resource bases, local and foreign educational, methodological and scientific literature. The fulfillment of the tasks set before the educational system, the assimilation of students independently of the educational materials, the stimulation of their professional growth, the upbringing of creative activity in them, in many respects, will depend on the educator. They are also required to be able to prepare at a high level, be able to make decisions independently, be able to choose between a lot of data to perform the specified tasks and be able to process this information. The educator should also understand that self-education is necessary not only for the student, but also for himself, to facilitate his work, to communicate with students who can think independently, to enrich his knowledge. Along with this, the interaction of the educator with the students in the educational process, the formation of their confidence in independent education, the ability of the educator to show that they are using new pedagogical technologies, leads to positive results, which are expected to lead the lectures in a limbo, that is, not limited only to the provision of information, but also in a[3]

The use of computer as a means of teaching in modern conditions of organization of learning process in tertiary institutions of technical orientation has significant impact on teaching styles and organization of learning process in general. The rational use of computer technology makes it possible to increase the effectiveness of the learning process. This is achieved primarily through the use of effective methods of providing information, the individualization and automation of the learning process.[5]

Informatization of the society is an increasingly process for the production, processing, storage and dissemination of information technology, especially knowledge. The new information technology of education allows to solve a number of fundamentally new didactic problems: the study of phenomena and processes in micro and macrodunia, within the framework of complex

technical and biological systems based on modeling; in fact, it becomes the basis for the study of various physical, chemical, biological and social processes that occur at a very high or very low speed. It allows the introduction of laboratory work into the educational process with the use of very expensive computer models, sometimes unique equipment is not available to educational institutions. Without the use of new information technology in education, sometimes such laboratory work can not be carried out in practice.[1]

Intellect the need for education and pedagogy in modern means of accelerating the activities, among which the most important place is occupied by computer technology. The problem of optimizing pedagogical activity is associated with the solution of the issue of providing it with information. There is a need for rapid updating of educational information in connection with the dynamics, systematic updating of the content of the subject under study, which affects the relationship between the subject and the subject of science.

The tools of teaching in computer affects the organizational forms of education, the functions of the teacher and student and the teaching technology. The implementation of their capacity in the conditions of information and educational environment activities will lead to the change in organizational forms and methods of previously established teaching, the emergence of new teaching methods based on the use of computer science methods and tools.

At present, a specific situation has arisen in the field of education and pedagogy: the possibilities of computer are huge, but there is no serious impact on the mass practice of education corresponding to these basic capabilities. One of the reasons for this phenomenon is that, despite the existence of concerted developments, didactic foundations of information technology in teaching require systematic justification.

Until now, many issues of the creation and use of computer training programs have not been addressed. In particular, it is necessary to solve a set of issues related to the development of a holistic psychological and pedagogical concept of computer education, for example: the formation of motivation and cognitive interest in learning, the establishment of a pedagogical based computer dialogue, the combination of individual, group and collective forms of training, the activation of cognitive activity, the rapid organization of the problem of effective implementation of computer facilities as a teaching tool in the educational process requires solution.

Creates prerequisites for the wide introduction of educational informatization, psychological and pedagogical work into practice, provides the transition from the mechanical assimilation of knowledge based on the ability to independently acquire new knowledge; allows to increase the level of the scientific character of the experiment, its methods and organizational forms are closer to the methods of experimental research of the subjects under study; provides[2]

There is a known conflict between the need for a systematic approach to the analysis of the process of automation, the one sided approach that dominates education as an integral system in informatization, theory and practice, they are basically the only individual (technical, didactic, cybernetic, etc.) tools of educational informatization.) related to the analysis of opportunities.

On the other hand, the implementation of computer aided learning process is interrelated with the development of the teaching system in general for each learning course. This solves the following tasks: to determine the need for the use of computer; to determine the level of

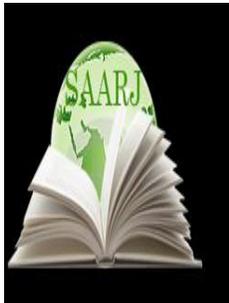

computerization of the learning process; to identify the functions assigned to the computer; to develop a computer manual in accordance with the information and methodological recommendations of teachers and methodists.

The analysis of literature indicates the need to substantiate the principles of creating an automated educational and methodological complex from the point of view of a systematic psychological and pedagogical approach and information approach. In addition, it was noted that the methods of using computer learning aids have not been adequately developed, there is little practical experience in assessing the impact of computer on the effectiveness of the learning process.

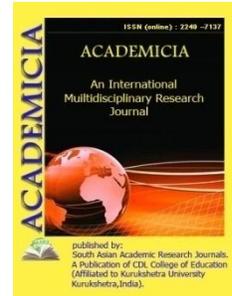

Thus, the relevance of the topic of the article is due to the need to create complex computer training programs and methods of their application that meet the psychological and pedagogical requirements imposed on them and ensure the effectiveness of the educational process.

### ABSTRACT

*The article reveals the historical stages of personality education and the course of this process in the current information society, the role of the book, information in general. Therefore, in the study of the phenomenon of reading, it is important to study in logical harmony the general development of the individual as well as the achievement of a professional professional goal. That is, the desire for good or evil in the human soul can not exist in advance, but they are ways that are chosen throughout life. Therefore, all individuals will have the same opportunities first in the head.*

**KEYWORDS:** *Personality, Upbringing, Book, Information, Socialization, Perfect Person, Read Culture.*

### INTRODUCTION

Personality is one of the central concepts of many socio-humanitarian Sciences. In particular, according to traditionally formed theories in philosophy “personality”:

- 1) Nature is the product of all that is created by God or society, which must not only realize its own and strive to change it (an adaptable person);
- 2) an infinitely active creator (self-creator) who changes his way of life or manages his conditions of life and his imagination about himself);
- 3) the development is interpreted as a self-formative person (a person who develops new subjects, is formed by activity and manifests his experiences in the subject) through the activity of a subject, the activity of which depends on the external object.

In psychology, "personality" is a set of mental characteristics, processes, relationships that distinguish one subject from another, inherent in it. The possibilities of the subject for a psychologist are different, because the innate and later acquired characteristics of people have their own peculiarities. Individuality manifests itself in the non-repetition of the biological and social characteristics of a person, turning it into the unity of any group or association in action .tiradi

Although these ideas have to some extent influenced the formation of the concept of a person in sociology, their specific concepts are used only within the framework of narrow-line theories. In a broad sense, in sociology "personality is the product of a set of social characteristics inherent in a person, social development and involvement of an individual in the system of social relations through active activity and communication". Accordingly, it is important to pay attention not to the socialization of the individual as a whole, but to the cases of its socialization through a clearly defined cultural socialization, in particular, the phenomenon of education, reading.

Therefore, in the study of the phenomenon of reading, it is important to study in logical harmony the general development of the individual as well as the achievement of a professional goal. According to Reykovsky, the content of the social dimension of the formation and development of a person is the perception of people as a part of society of himself. The basis of this understanding is two important aspects: individualization and identification.

"In individualization, the image of a social scientist, consisting of different objects (individuals), is formed: this process leads to the formation of the system "I – they" in the subject. And the identification, on the contrary, is to remove the boundary between objects and form an individual "I" that is similar to or compatible with others.

It follows that the individual is formed in the influence of the processes of individualization and identification. Here it should be noted that if some of the cultural values lead to individualization, others participate in the identification.

Since it has an individ social character, it is formed as a person on the basis of the conditions that arise as a result of the existing social technological and spiritual development and, in turn, determines the development in all directions.

Proceeding from the above, it is necessary to recognize two interrelated processes that determine the formation of a perfect person in society: the process of harmonization of individual relations by society and the process of establishing social relations by a person in this society. Personal relationships are understood by a person as economic, socio-political, spiritual, etc. relations that are assimilated in all aspects of social and cultural life. This relationship is manifested in the desire of the individual to become a perfectly developed personality. It is this spirit that motivates him to read, to develop himself.

Historically, people's approaches to the process of obtaining information and knowledge are also diverse. In our opinion these are:

1. Historical-traditional direction
2. Humanistic direction.
3. Existential direction.

4. Synergistic direction.

5. Direction based on information technology.

1. Supporters of the historical-traditional direction emphasize the importance of the book in the formation of the culture of reading.

One of the discoveries of great importance in the social, cultural and historical development of mankind is undoubtedly the creation of the book. With this discovery, mankind was able to overcome such dimensions as space and time. Thanks to the books, we learn about the lifestyle, thoughts, worldview of our ancient ancestors, about the events that took place in different eras and territories.

Books have gone a long way before coming into their current form. A few thousand years ago, the ancient Babylonians, Assyrians and other peoples of the ancient world used ceramic tiles as books. In China, however, the first books were written on plates made of bamboo trees. Later, the Chinese invented writing on May, and in the I century BC, writing on paper.

One of the cradles of ancient culture the texts of the first book in Egypt were carved into stone fragments. Later papyrus was invented. In the second century BC Pergamum (now the Turkish city of Bergam) created a new product for writing from the skins of animals – Pergamum(pergament). One of the examples of the high culture of the peoples of the East is the book "Avesto", too, it is known to many that it was originally written from 12 thousand calf skins.

In the Middle Ages, they learned to fold sheets of parchment or papyrus four times, bringing them to the shape of a laurel (Greek "quaternary"). Books created by combining several such notebooks were called "codex". At the time of the book's arrival in its current form, the codexes were the first step.

Even in Central Asia, the ancient art of book production – calligraphy was widely developed. Especially during the period of the cultural upsurge – the period of the Temurids, the production of world-famous paper was established in Samarkand and a whole school of writer was established. Books copied at the Academy of Fine Arts of the grandson of Amir Temur, Muslim Mirzo, were high samples of the art of calligraphy .

Various texts were first carved into wood, and then on paper it was originally used in China in the V – VII centuries of BC, and by The X century in Europe. In 1444 year, Ioagann Gutenberg invented the publication of books, as it seems now.

The publication of cheap books from the XV century led to the adoption of education, the use of books and other publications in all spheres of social life led to a rapid increase in the level of literacy of the population compared to previous periods.

2. The representative of the humanistic direction in modern psychology A.Maslou believes that conscious efforts, consisting in the formation and development of oneself in man, are an important factor of human perfection . As a person learns the social essence, he defines the scientific view of the individual about the spirit of self-activity as the basic concept of the hierarchy theory of the natural need of an individual for activities. That is, according to his teaching, in the psyche of every person there will be a desire for self-activity, and that is exactly

this spirit is the force that develops the personality. Society, however, provides or restricts the free development of this spirit, which is pre-existing in every person.

3. Representatives of the existentialist direction, not recognizing the pre-existence of any phenomenon in the human psyche, but recognizing their formation only in the course of life, deny these views. In particular, Sartre also denies any pre-existing influence on the human psyche, focusing the main attention on the creation of man himself. It is believed that all events in life: sin, fear, depression, as well as trust, freedom, responsibility and love do not all fall on the head of a person, but are the result of his chosen choice and activity.

Existentialists, in the course of studying the problem of good and evil, deny the approaches of Humanists. That is, the desire for good or evil in the human soul can not exist in advance, but they are ways that are chosen throughout life. Therefore, all individuals will have the same opportunities first in the head. Only as a result of the influence of life circumstances, institutions of society, a person can be good or bad, just or cruel. As long as the society is interested in the upbringing of a perfect person, it is necessary to actively conduct this work, in particular to use the fruits of education and reading, which is of great importance in human education.

4. Now there is an attempt to change the technocratic consciousness. They are manifested in theories that reflect ideas about synergism, globalism and self-activity of the individual. In sociology, it is understood that the industrial-technocratic model brought civilization to a state of crisis, new approaches are being developed. The new model draws attention to the fact that the proportions between material and spiritual values, technical and humanitarian knowledge, the social ecology and ethics of self-expression are reflected. Here, the development of man and his individuality is declared a high value.

The idea of synergism implies the harmony of interests and goals of the individuals, social groups, associations and the general public, as well as the functions of social institutions. The essence of this doctrine is an expression from the call to the fact that new technologies are subordinated to a person, his interests, do not exploit nature. High technologies allow a person to free his creative potential, avoid stereotypes and stereotypes, in which he must awaken a high spiritual and creative spirit. Instead of technocratic consciousness, the formation of a new type of Information-environmental consciousness is also implied.

Industrial enthusiasm, which determines the further development of society, as a way out of the technocratic cycle, is motivated by the processes of self-realization and improvement by each individual, as well as the mastering of bio-and psycho-correction techniques aimed at creative manifestation. In this process, the phenomenon of readership, undoubtedly, goes to the previous places.

Another negative impact of modern information technology on humanity is manifested in the way it generates gross secondary illiteracy in humans. In contrast to illiteracy or primary illiteracy, which means not knowing both simple reading and writing, in secondary illiteracy, a person can not fulfill the stronger demands of reading and writing in one action, and naturally these individuals do not participate in the process of reading. And the means of access to information, such as television and radio, also cause an increase in the level of secondary illiteracy.

The results of sociological studies conducted in developed countries, in particular in Germany, show that secondary illiteracy occurs mainly in childhood, more precisely in primary classes. In this country, 30 percent of eighth-graders find it difficult to read and write in their native language.

As the results of special sociological studies testify, there are emotional stages of the development of such abilities as seeing, speaking and reading, there are specific "developmental stages", and it is possible to develop the above abilities in the openness of these "passages". Conversational ability "threshold" is ten years old, reading ability "threshold" is defined as "interruption" at 13 – 15 years of age.

The possibilities of reading abstract, imagination (fantasy) and creative opportunities, decision – making, reading and absorbing abilities all the roots of which are connected with the above biopsychological process.

Every member of any society that wants to have an excellent information system and make use of it is bound to have the above qualities. Having noted that today young people are skillfully using modern information technologies, it would have been the same if they had directed this process to spend a simple time, to engage in various computer games, or to acquire knowledge of the unlimited possibilities of the global network, and to collect useful information, and not to the entertainments of the internet.

5. In the direction of information technology based, it is based on the modern type of information retrieval, which is widely developed today. Information, which is a legal process that indicates that socio-cultural and moral purposes are developing in accordance with the dynamics of information technology, determines the cultural development of modern society. The validity of the processes of development, distribution and resignation of data in this interconnection is of urgent importance.

At the end of the second millennium and the beginning of the third millennium, mankind entered the information age. The role of information and knowledge in all spheres of life: education, production, economy, culture, in short, in all spheres is increasing. In the developed countries of the West and the East, however, intellectual goods are more profitable than production goods. Under such conditions, a new era puts before humanity its new demands.

As the role of information in the life of man and society increases, the issue of the formation of information culture becomes relevant. To do this, first of all, it is necessary to content the information culture of the individual. The information culture of an individual is a set of information outlook and knowledge systems and skills that provide an independent purposeful activity of an individual to effectively meet his or her needs for information using both traditional and new information technologies.

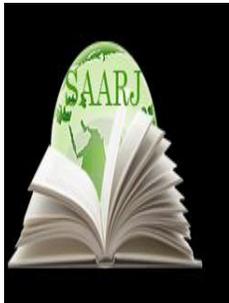

The need for the formation of information culture of an individual today puts before educational and Information-Library institutions tasks that can not be delayed. Because, now both the economy, production and service management will also depend on knowledge based on information.

It is gratifying that the reforms carried out in our country in a planned manner for the informatization of society, the wide application of information technologies in the activities of

information and library institutions, the introduction of new changes will create the ground for full-fledged stewardship of these tasks.

**Abstract**

*The author of the article argues that the geographical position of Sogd has determined important historical prerequisites for the development of the region and the formation of features of economic activity and lifestyle of the population. Geographic conditions, in turn, also influenced the development of socio-economic ties and trade between peoples. The natural-historical, geographical and climatic conditions of ancient Sogd led to the emergence of one of the earliest agricultural cultures in this region. The article examines the process of constant mutual influence of agricultural and nomadic cultures, in particular, on the example of the peculiarities of the climate and the geographical position of the region, changes are proved in various historical periods of material culture and the economic type of the population.*

**INTRODUCTION**

Uzbekistan is a country of ancient civilization and rich culture, embodied in written sources and in monuments of material culture, testifying to the original and centuries-old history. On the territory of Uzbekistan, Sogd-Sogdiana is especially distinguished, mentioned in the oldest parts of the Avesta as GavaSuguda, and in written sources of Alexander the Great's campaigns to Sogdiana, with the capital center Marakanda. On the territory of Samarkand Sogd, there are more than 3000 monuments, which were the ruins of cities, settlements, fortresses, castles of the

agricultural population, as well as in the foothill areas there are numerous burial mounds of nomadic herders. All the above-mentioned archaeological sites, being cultural heritage, are included in the golden fund of the historical past of the peoples of Uzbekistan. In the Republic of Uzbekistan, great attention is paid to the study of its historical heritage.

Sogd, located in the center of the Central Asian interfluvium and being an important historical and cultural region, played an important role in the formation and development of transcontinental trade routes. Here, one of the earliest agricultural cultures arose, enriched thanks to close ties with the steppe tribes, located in vast areas, ranging from the Syr Darya and Aral steppes to the Urals in the north and Altai in the northeast.

Close ties and constant mutual influence of agricultural and nomadic cultures are felt in all historical periods and are reflected in the material culture of these regions.

### LITERATURE REVIEW

Considering the degree of study of the topic, it is necessary first to dwell on the works of the authors Gulyamov Ya.G., Askarov A.A., Islamov U.I., Isamiddinov M.Kh., Rtveldze E.V. [7,9,24], in which data on the emergence of irrigated agriculture in the lower reaches of the Zarafshan and data on the primitive culture are presented, the origins of the urban culture of Samarkand Sogd are determined. In the works of Bartold V.V. [3,4], devoted to historical geography and individual historical periods, shows the interaction of cultural traditions in the context of the direct influence of the geographic environment on the lifestyle of the population. In the works of Karmysheva B.Kh., Mukhamedzhanov A.R., Petrov Yu.M. [11, 16, 18] and other authors show the climatic and weather conditions of the region, reflecting the economic and cultural interaction of the peoples of Sogd with neighboring and distant regions. Also, separate works and compositions of the ancient authors Strabo, Herodotus, Arrian, Quintus Curtius Rufus [25,2,13,14] require special attention, in which the historical aspects of ancient Sogd are revealed, issues of material culture, economic ties and geography are considered. The works used and a number of others make it possible to carry out a comparative analysis of sources and their data, and thereby provide information proving economic development and a certain type of employment of the population of ancient and ancient Sogd.

### RESEARCH METHODOLOGY

The methodology for writing this article is based on the principles of independence and the concept of a civilizational approach to the historical process. Also, speaking about the methodology of the article, I would like to emphasize that we have used the methods of selection and classification of material, comparative analysis of the facts, opinions and conclusions, as well as the method of historicism and objectivity. The principle of historicism and objectivity made it possible to study the historiography of the issue in its specific diversity.

**Analysis and results.** The earliest mention of Sogd is in the Avesta. The source notes that the Sogdians are a sedentary, agricultural population - gava "selenis", "rural districts" and "Sugda", "Suguda" - "Sogdian settlement" - designation of all or part of Sogd [History of Uzbekistan ..., 1984. - P . 28-29]. In the "Ghats" there is also a message where you can get an idea of the nomadic tribes who lived "in the northern belt of the earth", who act here as the religious enemies of Zarathushtra and his community. The leaders of the nomadic tribes were called by the

term "Kawi". Later, the same term passes into the Sogdian language and means "ruler, king" [Livshits VA, 1963. - P. 141].

At the same time, in the tenth "Yashta", dedicated to Mithra, one can also obtain geographical data about ancient Sogdiana, where "high mountains with abundant pastures serve for caring for livestock, where deep lakes with billowing waves stretch, where deep wide rivers rush boiling. - Sogdian Gavas [Livshits V.A., 1963. - P. 148].

The most ancient reports about the nomadic peoples surrounding Sogdiana are from Herodotus. Talking about the events that followed the victory of Cyrus over the Median king Croesus, he reports: "On the path of Cyrus lay Babylon, the Bactrian people, the Sakas and the Egyptians ..." [History of Uzbekistan ..., 1984. - P. 36]. With this message, Herodotus emphasizes what strength and power the Saki had in the middle of the 1st millennium BC. and indicates that the Saka tribes lived in the basin of the Syr Darya river, the Fergana Valley, the vast steppes of Kazakhstan.

So, according to the ancient written sources, nomadic pastoral tribes were located along the borders of Sogdiana. This is also confirmed by ancient historians of a later period.

According to their data, the border of Sogd passed from the south along the Amu Darya, and from the east - along the Syrdarya. In particular, Claudius Ptolemy writes that the border of Sogd in the south runs along the Oks (Amu Darya) and the Caucasus Mountains (meaning the Badakhshan Mountains, which are sometimes called the Indian Mountains), in the north the mountains "Oks", "Scythia", in the east the river Yaksart and Mount Comed are considered the borders between the Sogdians and the Scythians [P'yankov IV, 1965. - pp. 35-50; Pyankov I.V., 1971. - S. 68-79].

Studying written sources and numismatic data, E.V. Zeimal also comes to the opinion that the border between Bactria and Sogdiana passed along the Amu Darya [Zeimal E.V., 1978. - pp. 192-214].

According to Quintus Curtius Ruf, the territory of Sogd, in addition to agricultural oases, also included huge steppe and desert areas. In particular, he notes that "Sogdiana is a country, mostly deserted: vast uninhabited places stretch about 80 stades wide. And in the forward direction this country is huge [Quintus Curtius Rufus, 1961. - S. 61]. Compared to other historians of the ancient world, Quintus Curtius Rufus describes the nature of Sogdiana more.

Arrian also has data on the borders of Sogdiana. In particular, he notes that "in the north, Sogd bordered on the land of the Saks, in the northeastern part, this border passed along the Yaksart River [Arrian, 1962. - P. 137].

Among Arrian's messages, the most valuable is that "the border of Sogdiana passes with the Scythian desert in the immediate vicinity of the Politimet River and not far from Marokand."

So, almost all ancient historians unanimously include the territory between the Amu Darya and the Syr Darya in Sogdiana. At the same time, as evidenced by the archaeological work carried out first by E.V. Rtveladze, and later by the Uzbek-French expedition on the Derbent defensive wall, near the Iron Gate, it was built in the II-I millennium BC, and after the creation The Kushan Empire, it turns into a defensive wall between the latter and Sogdiana [Rtveladze E.V.,

1986. - pp. 34-39. Rakhmanov Sh.A., 2005. - S. 132-144; Rakhmanov Sh.A., Rapen K., 2002. - S. 45-49].

Since the borders of Sogd were in direct contact with the steppe areas, and the population of the oases was always in close contact with the population of the steppe, the two peoples formed close traditions and customs. Proceeding from this, another ancient historian Strabo writes that “the way of life of the Sogdians and the Bactrians was similar, but at the same time did not differ much from the way of life of the nomads [Strabo, 1964. - p. 488].

If in the Kushan period the territory of Sogd narrows down to the south and the south is written about Sogd, basically the Zarafshan valley is understood, only in some sources the territory of the Kashkadarya valley is also included [Isamidinov M.Kh., 2002. - pp. 4-5].

Studying the ethnographic data of the Kitab oasis in the XIX, early XX centuries. B.Kh. Karmysheva notes that “the natives of Shakhrisabs considered themselves “Suguti” - Sogdians” [Karmysheva B.Kh., 1960. - pp. 47-59].

Other medieval sources, in particular Yakubi, the valleys of Kashkadarya, Zarafshan include Sogd. At the same time, at the end of the 19th - beginning of the 20th centuries, the territory of Sogd narrowed to the limit. At the same time, historically and culturally, the territory of Kashkadarya Sogd (South Sogd), Bukhara Sogd (Western Sogd) and Samarkand Sogd (Central Sogd) have always been included in the common territory of Sogd with the capital city of Samarkand.

Thus, territorially, Sogd mainly included the valleys of Zarafshan and Kashkadarya, the main steppe areas, mountains and foothills.

The Zarafshan Valley is located in the center of Central Asia and is surrounded by high mountains on three sides. Only from the west, from the north-west and south-west it is surrounded by steppe areas. In the north-east, it borders on the Turkestan and Pamir-Alai mountain systems. In particular, from the north there are the Chumgar, Gobdintov, Nurata mountains, Acts and Korats mountains. From the south, the valley is surrounded by the Zarafshan mountain systems, which include the Chakalikalon, Karatepa, Zirabulak-Ziyoviddin mountains, from the south-west it is surrounded by the Sandikli steppe and from the north-west by the Kyzylkum mountains [Akramov Z.M., 1961. - p. 32].

At the foot of these mountains, there are large and small adyrs. In these adyr and foothill regions, in spring and in the first half of summer, abundant meadows grow, which are excellent food for livestock.

The Zarafshan River flows in the center of the valley, originating from the glaciers in the eastern part of the Turkestan-Alay mountain system.

The Zarafshan River itself played an important role in creating the relief of the central and lower parts of the valley. With the exit to the plain, it becomes wider. The width of the valley here reaches 35-40 km, and in some places even more. 7 km north-east of Samarkand, the Zarafshan river is divided into two branches: the northern one - Akdarya and the southern one - Karadarya, forming the Miankal island, which is 100 km long and 10-12 km wide.

At the confluence of the Akdarya and Karadarya, the valley expands somewhat again and reaches 18-20 km. And to the west, the valley gradually narrows and its width in the area of the

city of Navoi does not exceed 8-10 km. In this area, the Kenimekh oasis separates from the valley, wedging into the steppe in the northwest direction. Its width reaches 3-4 km [Mukhamedzhanov AR, 1978. - P. 22].

Coming out of the Khazar gorge, the river flows into the lower part of the valley, to the southwest and forms a cone-shaped Bukhara oasis, bordering from the north and west with the lands of ancient irrigation, covered with sands adjacent to the Kyzyl Kum. Chulimalik, Kyzyltepa and Kuyumazar adyrs adjoin it from the east, and the Karshi steppe from the south. 25 km below Yakkatut, the Zarafshan-Karakuldarya river forms its lowest fan-shaped oasis with the same name [Mukhamedzhanov AR, 1978. - P. 2-22]. A.R. Mukhamedzhanov was able to establish that the Zarafshan River in the Neolithic period still flowed into the Amu Darya through Mahandarya.

At the same time, according to ancient sources, at the beginning of Hellenism, Zarafshan did not reach the Amu Darya and was absorbed by the sands [Strabo, 1964. - p. 484]. Arrian also writes about this [Arrian, 1962. - P. 138].

The valley of Kashkadarya from the north is surrounded by the Zarafshan mountain system, in particular, Zirabulak-Ziyovuddin, the western borders pass through the low plateaus Zharkok, Muborak and Dengizkul. From the southern and southwestern sides, it adjoins the Karakum desert through Zanzhirlikum. On the east side it is surrounded by the Gissar, and on the southeast - by the Baysun mountains.

For the valley, the most important source of water is the Kashkadarya River, 332 km long. Its total collection area is 8750 sq. Km [Kashkadarya region, 1959. - P. 94]. It begins in the Gissar mountains at an altitude of about 3000 m in the form of a small mountain river, which at the exit to the valley turns into a fairly large artery. At present, all water is used for irrigation of the Karshi oasis.

As a result of archaeological research of the ancient channels of Kashkadarya, 2-3 km from the southern and eastern shores of Lake Paikend, covered with sand dunes, at five points were discovered monuments of the Neolithic period, and at ten points in the southern part of the lake, along Arni - a monument of the end of the Bronze Age [Mukhamedzhanov A .P., 1978. - S. 50; Gulyamov Ya.G., Islamov U.I., Askarov A.A., 1966. - S. 194-196].

This confirms that Kashkadarya, even in the Neolithic and Late Bronze Age, poured its waters into the Zarafshan River. At the confluence of the Kashkadarya in Zarafshan, there is an archaeological site of Kumsultan dating back to the ancient period, which indicates that in the era of Hellenism and antiquity, Kashkadarya also reached Zarafshan itself [Mirsoatova S.T., 2017. - P. 80].

On the territory of Eastern Kashkadarya, a plain strip is distinguished, bordered on two sides by adyrs: Karatepinsky, Mirakinsky in the north, and Yakkabag, Guzarsky in the south, foothill and mountainous regions. In the lower reaches of the Kashkadarya, the Karshi oasis is surrounded by steppe strips, and in the west by the Karakum.

Plain territories, oases of the Zarafshan and Kashkadarya valleys have been the main agricultural regions since ancient times.

The soil cover is formed by loess loams and gray soils, and loess-like rocks at the foot of the mountains are the products of weathering of bedrock rocks washed off the slopes and deposited at the bottom by temporary streams. The soils are fertile. The flora is a part of the South Turkestan ephemeral and ephemeral regions, mainly in the form of meadow-like vegetation. Among them there are a lot of camel thorns, wheatgrass, wheatgrass. In particular, meadow-sierozem and sierozem soils were widespread in the Kashkadarya region [Kashkadarya region, 1959. - P. 94]. In the foothills, mountainous light-brown soils, calcareous, clayey or loamy, predominate, suitable for the development of rainfed agriculture and pasture cattle breeding [Omelchenko A.V., 2003. - P. 8].

The climate in the Samarkand, Bukhara and Kashkadarya regions is pronounced continental, manifested in sharp fluctuations in meteorological elements both in the off-season, and in the annual and daily variations.

The annual amplitude varies differently in individual years, and its maximum value over the entire observation period was 32.4 ° C in 1934, from -7.2 ° C in January to 25 ° C in July. The amplitude of the absolute minimum and maximum temperatures is 68 ° C, from -25.7 ° C in January 1883 to 42.3 ° C in July 1972 [Petrov Yu.M., 1982. - P. 47].

In these parts, the irregularity of precipitation is characteristic throughout the year, and significant variations in the annual amount are determined by the maximum precipitation in March-April and the minimum in June-August.

Winters are moderately mild. With an average long-term temperature of 1.5 ° C. Only in some years are severe cold weather observed, associated with the penetration of Arctic air masses.

“A severe winter was in Maverannahr in 885-886, when the Amu Darya near Farab froze to a considerable depth and the army of the Khorasan ruler crossed the river on the ice. In 921-922. cold winters were observed in Samarkand and Khorezm. The Amu Darya was frozen in some places to the bottom, and in the lower reaches the ice thickness reached 17 quarters ”[Voeikov AI, 1957. - p. 11]. Another source reports that in 1003 the Samanid Muntasir with a detachment of 700 infantry and cavalry crossed the Amu Darya on the ice at Dargan in late autumn [Vyatkin V.L., 1896. - pp. 30-37, 40-41].

In summer, “... the temperature of the soil surface in open areas rises to 68-74 ° C” [Petrov Yu.M., 1982. - P. 73]. Precipitation in July does not fall every year: 36 times in 100 years. They are insignificant and average only 1 mm.

Describing the events associated with the campaign of Alexander the Great, ancient authors left fragmentary written evidence about the weather and the climate of the whole Sogd. “... the heat of the summer sun ignites the deserts,” writes the historian Alexandra, “when they start to burn, a continuous heat scorches the entire space. Then the haze from the excessive heat of the earth blocks the light, and the plains become like a vast and deep sea. The night hike seemed not very difficult, as the dew and morning cold brought relief. However, the heat begins at sunrise and dryness absorbs all moisture in nature ... ”[Kvint, 1963. - P. 265, 267, 301].

Such a sharply continental climate determined the flora of both the Zarfshan and Kashkadarya valleys, and the foothill, mountainous and steppe regions.

The abundance of spring rains (March-April) enables rapid growth of pasture plants in adyr and steppe zones. In adyr and foothill zones, due to good favorable weather, dry wheat gave a good harvest. And in Samarkand and, in the upper Kashkadarya, there were a lot of rainfed lands and, judging by written sources, they got a good harvest here. Suffice it to recall Ibn Hawqal and al-Mukaddasi, who noted the possibilities of the Abgar Rustak rainfed lands, where there was no artificial irrigation. "There are more villages in Abgar than in other volosts. Ibn Haukal assured that in a productive year the products of Abgar fields can feed the entire population of Sogd"[Bartold V.V., 1963. - P. 145].

This suggests that in favorable years, i.e. rainy, the area where dry wheat was sown gave a good harvest [Isamidinov M.Kh., 2002. - S. 15-30]. The meadows of the adyr and steppe zones were in the same condition. Until now, in favorable climatic years, the local population mows grass to feed livestock in winter.

Considering that in the era of antiquity the climate of Central Asia was relatively mild and humid, then the conditions for the development of cattle breeding, and especially for distant pasture cattle breeding, were favorable here. Suffice it to recall the historians Alexander, who described the wooded area of Basist, located not far from Samarkand or Bazair (according to Quintus Curtius Rufus), where Alexander killed a lion with his own hand in one of the largest reserves near Samarkand [Arrian, 1962. - p. 123].

The historians of Alexander, when describing the battle of the Macedonian soldiers in Ustrushan, tell about the vast and dense thickets of tugai along the banks of the Politymet [Arrian, 1962. Quint, 1963].

Studying the climate of Samarkand, Yu.M. Petrov comes to the conclusion that "in the wooded mountains near the present village of Agalyk (20 km from Samarkand), mountain goats were found. The northern slopes of the mountains between Shakhrisabz and Samarkand as early as the 8th century. AD were covered with vast and dense forests [Petrov Yu.M., 1982. - P. 10].

In the Late Neolithic and Bronze Age, the climate was relatively humid. The aridization of the climate of Central Asia and Kazakhstan and the formation of severe xerothermal conditions close to modern ones began at the turn of the 3rd-2nd millennium BC.

A significant change in temperature could be observed by changing the direction of large rivers. In particular, the Amu Darya flowed into the Caspian Sea in the Lower and Middle Pleistocene, and Zarafshan and Kashkadarya served as one of the major tributaries. Suffice it to recall Herodotus that the Araks (Amu Darya) at the mouth is divided into 40 branches, one of which flows into the Caspian Sea from the east, and the rest into swamps and lagoons. Or Aristobulus in the III century. BC. wrote that the Amu Darya waters along the Uzboy channel reach the Caspian Sea, and the Yaksart (Syrdarya) is connected by a channel with the Amu Darya [Bartold V.V., 1965. - p. 101].

Strabo gives a similar point of view: "... the Caspian Sea does not represent a special sea, different from Meotida," he concludes from the fact that "Tanais flows into Meotida. From the very Indian mountains, from where the Oaks and some other rivers flow, the Yaxart flows out and, like those rivers, flows into the Caspian Sea, this is the northernmost of all these rivers ..."[History of Uzbekistan ..., 1984. - P. 173].

As mentioned above, in the lower reaches of Kashkadarya, near its confluence with Zarafshan, there are monuments of ancient times (Kumsultan), and in the lower reaches of Zarafshan beyond the Varakhshinsky massif there are monuments of the middle of the 1st millennium BC. (Bashtepa group of monuments - Urtatepa, Chektepa, Kushkirtepa) and monuments around Kanimekh (Kumrabad, Arabon-I, Arabon-II and Chordar).

In the course of exploration work in this region, it was established that at present the mountain rivers do not reach Kumtepa, Koytepa, Balandtep, Yarkutantep, Galatep and other monuments located somewhat lower from the mountain system. At the same time, these monuments could exist only in the presence of water from mountain rivers.

In this part of the Zarafshan mountains, in particular, on the Karatepa ridge, there are absolutely no glaciers from which water could flow in hot weather. Currently, in this part of the mountains there are several dry beds of mountain rivers, which only during large mudflows receive water, and the rest of the time they are fed from several springs. In particular, in the upper parts of Sazagansay and Tavakbulak, there are permanent spring waters.

Irrigation facilities located to the west of Koitep also testify to the significant degree of watering of mountain rivers in the era of the Early Iron Age and the era of antiquity. These structures are large and long dams for collecting rainwater from mountainous and foothill areas. Part of the ancient drainage system is presented between Koytepa and the village of Eski Angor. It was built perpendicular to the direction of the mountain river beds.

The dam collected the waters of mountain rivers and then the water flowed along a saddle-shaped hollow, forming a deep ravine in its lower course (near the village of Parchakara). The stone cylindrical seal of the Nameless Tepa with the image of a running wild goat, into which an arrow flies, and a fantastic animal with bull horns, whose tail is raised, and a rider (?) Sits on its back [Isamidinov M.Kh., 2002. Fig. 92 (photo), Fig. 93 (drawing)].

Despite the fact that the climate of these areas was relatively humid, it did not differ much from the modern climate. All the same in adyr and non-irrigated steppe lands in late May and early June, the grass begins to turn yellow, i.e. burns out due to extreme heat. Until some time, this dried grass is the main food for grazing livestock. But, it never provided grazing for large numbers of livestock. Therefore, cattle breeders had to migrate up to the meadows of mountainous regions, or to the north, northeast, to the steppe regions, where the climate was relatively cool.

Continental climate, low rainfall, large temperature fluctuations between summer and winter, or day and night, a small number of cloudy days, such phenomena are also observed in vertical climate change. If in the summer on the flat areas there is a heat of 45-50 ° C, then there is still snow in the upper reaches of the mountains.

In the foothills of the cultivated lands, fields, gardens, villages are gradually replaced by a strip of dry adyrs, densely crossed by ravines, streams and rivers. Even higher is the zone with steppe vegetation, further. Closer to water sources, there are juniper forests, alpine and subalpine forests.

In the delta areas and river valleys, tugai prevail, where meadow-bog, meadow, meadow-saline, saline and sandy plants are represented. In places where the groundwater is close to the surface, there are abundant reeds, kuga, kirk bugin, yulgun, tal, etc. All these plants have always been the

main food for animals. Especially cane, which is not only an excellent building material, but also a good feed for cattle.

A desert landscape begins on the northern outskirts of Sogdiana. These areas are suitable for grazing sheep and post camels all year round. Here feather grass, zhusan, kiyak, solyanka, biyurgun, kokpek are preserved on winter pastures.

## CONCLUSION/RECOMMENDATIONS

Since ancient times, nature and natural conditions have themselves dictated the conduct of this or that method of economy. If in the central regions of Kashkadarya or Zarafshan it was possible to conduct an agricultural economy, then in the intermediate regions, between irrigated fields or in the steppe belts, a semi-settled, cattle-breeding and agricultural economy developed. They were mainly located closer to agricultural areas.

In general, it is customary to attribute the presence of several economic and cultural types to the Central Asian-Kazakhstani historical and cultural region: sedentary arable farmers (with irrigation) and pastoralists, semi-sedentary pastoralists-farmers and, finally, nomads and semi-nomads - pastoralists of the steppes.

In winter, cattle were sheltered in deep valleys, and in summer they were grazed on alpine pastures. The migration routes were determined by the presence of wells and water sources along the way. In the mountains, distant pasture, nomadic, pasture, stall-pasture-yailag cattle breeding developed [Karmysheva B.Kh., 1960. - S. 45-60].

Such a geographic environment, climatic conditions created the economic structure of pastoralists, adapted for the mountain-valley method of migration and south-north - along the latitudinal direction, i.e. in search of grasses and pastures, the nomads moved to the north and northeast.

All these data indicate that in the era of antiquity, the climate of the territory of Sogdiana and Central Asia as a whole was relatively mild, somewhat humid and abundant in water. Judging by the theme that on the banks and lower reaches of the mountain rivers Djama, Sazagan, Ilansay and Tersaksay there are monuments from the middle of the 1st millennium BC. and antiquity, this indicates that these mountain rivers were relatively abundant and, before the construction of long, main canals, were the main sources of water for agriculture in these regions.

So, both on the territory of Sogdiana and its surroundings there were favorable climatic and natural conditions for the development of agriculture and cattle breeding.

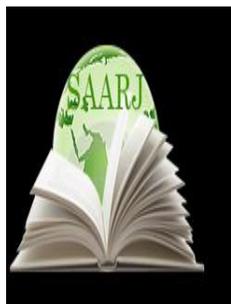

All these physical and geographical features played a very important role in the formation of archaeological complexes, both sedentary and pastoralist population in different parts of Sogdiana and adjacent territories.

## PEDAGOGICAL VIEWS OF ABU NASR FARABI

**Uralova Odina Ravshanovna\***

\*Senior Teacher,  
 Department of General Pedagogy JSPI,  
 UZBEKISTAN  
 Email id: uralova@jspi.uz

### ABSTRACT

*This article provides detailed information about the life and creative legacy of the great scholar Abu Nasr Farabi. The important ideas of education put forward in the works of the scientist were analyzed, the role of the scientist in the development of Eastern pedagogy, the attitude to the didactic significance of his works were expressed.*

**KEYWORDS:** *Farabi, Education, Upbringing, Happiness, Bliss, Virtue, Intellect, Intelligence, Didactics, Pedagogy.*

### INTRODUCTION

The rich philosophical and didactic heritage of Eastern scholars has long been one of the leading sources in the education of human spiritual maturity. As the head of our state Shavkat Mirziyoyev noted: “Abu Rayhan Beruni and Abu Nasr Farabi, Khoja Ahmad Yassavi and Bahauddin Naqshband, Alisher Navoi and Abay Kononbaev, Oybek and Mukhtor Avezov, Gafur Gulom and Sabit Mukanov and many other famous scientists, poets and thinkers’ heritage is our common wealth. We must preserve and enrich this spiritual heritage, which is full of ideas of humanity and goodness.”

Indeed, we always feel the need for the example of adults, we learn and teach. In this regard, the unique scientific and enlightenment heritage of the great thinker Abu Nasr al-Farabi plays an extremely important role. Throughout his creative career, the scientist conducts important research on the education of a harmoniously developed person, the formation of a perfect society, and creates the most important works in this regard.

In his works, the scholar thinks about the importance of education, what to pay attention to, the methods and techniques of education. Socio-educational views such as "The City of Noble People", "On the Achievement of Happiness", "Ihsa-al-Ulum", "The Origin of Science", "On the Meanings of the Mind" has served as an important source of directions. Therefore, the deep study and promotion of Farabi's rich spiritual heritage, especially his works of a pedagogical nature, will always remain relevant.

### **THE MAIN PART**

It is known that Abu Nasr al-Farabi made great scientific contributions to all areas of natural, scientific and social knowledge and made a great contribution to the development of medieval science. He left behind a very rich scientific and spiritual heritage. The scientist creates immortal masterpieces in philosophy, music, philology and various other fields of natural, scientific knowledge. Although Farabi in his work has taught how to conduct education in an organic unity, he emphasizes that each of them has its own place and character in the development of man.

According to Farabi's interpretation, in order for a person to be happy, he or she must be a team leader who can make them happy. He is the ruler of the noble city, by nature: 1 - to be healthy and not to have any difficulty in carrying out his duties; 2 - delicate in nature, intelligent; 3 - strong memory, 4 - sharp mind, 5 - eloquent speaker, 6 - eager for knowledge, 7 - not afraid to eat, drink, have sex with women, but to be able to control himself (from gambling or other games) pleasure - far from enjoyment, 8 - love of truth and truth, righteous and truthful people, hate lies and liars, 9 - self-esteem and modesty, 10 - not chasing the material world, 11 - just, 12 - firm, steadfast, emphasizes the importance of being bold, courageous. Farabi wants to see these qualities in every mature person.

Farabi divides people in his noble community into groups according to different characteristics. At the same time, he says, it is necessary to pay attention not to the religious sect, nationality, race of people, but to their natural features, abilities, mental abilities, cognitive skills. In his booklet *On the Ways to Happiness*, he writes, "The task of the state is to lead people to happiness." It is achieved through knowledge and good morals. Farabi says the state should be ruled by a mature person; that is, the one who governs the community must be fair, wise, able to follow the laws and create laws, foresee the future, and care for others [3].

Farabi in his book "On the Achievement of Happiness" also expressed important ideas about the order of learning knowledge. He emphasizes that the science that needs to be known first is the study of the fundamentals of the universe. After studying it, it is necessary to study the natural sciences, the structure of natural bodies, their shape, their knowledge of the sky. He then goes on to say that in general, the science of living plants and animals is studied. According to the All-Knowing, man cannot attain perfection alone. He will need to be in touch with others, their support or relationship.

In his philosophical views, Farabi pays very serious attention to the issue of education. In his opinion, it is extremely important that the educational process is organized by an experienced pedagogue, a teacher. Because not everyone can know happiness and things on their own. He needs a teacher for that.

Farabi says this can be achieved by getting education right. Because purposeful education makes a person both mentally and morally perfect, in particular, a person knows the rules of nature and society correctly and behaves properly in life, treats others properly, follows the rules of society. He believes that the main task of education is to bring up a mature person who can meet the requirements of society and serve that society.

In Eastern pedagogy, Farabi was the first scholar to describe education and upbringing. Education means teaching a person, giving theoretical knowledge on the basis of explanation; education is the teaching of theoretical qualities, norms of behavior and practical skills necessary to master a certain profession, says the scientist.

Abu Nasr al-Farabi stated: "Education means the unification of theoretical qualities between peoples and cities, and education means the unification of innate qualities and practical professional qualities between these peoples."

In fact, education is just a matter of words and teaching. Tarbiyaesa is the study of practical work by experience, that is, the work of this people, this nation, which consists of practical skills - action, devotion to the profession.

In his pamphlet *On What to Know Before Studying Philosophy*, Farabi describes the extent to which anyone who begins to acquire theoretical knowledge should be morally clean: let the lust for perfection remain.

This can be achieved by purifying behavior not only verbally but also in reality (practice). Then it is necessary to purify the nafs, the soul, the spirit, which protects one from error and misguidance, and which begins to understand the path of truth (the speaker is the speaker, in the sense of thinking).

Farabi means moral qualities such as knowledge, wisdom and prudence, conscientiousness, humility, putting the interests of the majority first, truth, striving for spiritual heights, justice. But the most important of these qualities is that everyone should be knowledgeable and enlightened. This is why Farabi sees the concept of morality as an ethic based on reason, inextricably linked with reason. From this we see that Farabi interpreted morality not only as an expression of moral norms, but also as a result of human mental activity.

Another of Farabi's leading pedagogical works is the pamphlet *On the Meanings of the Mind*, in which the author analyzes the problem of the mind and tries to justify the important role of the science of logic in his teaching about the mind. He noted the commonality between the science of logic and grammar: "The relation of logic to reason is like the relation of grammar to language. Just as grammar educates people's speech, so the science of logic corrects the mind to guide thinking in the right way."

Farabi also became famous as a great medieval musicologist with his multi-volume work, *The Great Book of Music*. He illuminated the science of music theoretically and practically, and regarded music as a means of promoting human morality and strengthening health. His legacy in the field of music is significant in the history of music culture.

Farabi's views on the ways, methods and means of education are also valuable in the rich pedagogical heritage. In this regard, the scientist puts forward the following doctrine: In man, beautiful qualities are created in two ways - through education and upbringing. While education

combines theoretical qualities, education combines innate qualities - theoretical knowledge and practical skills, moral qualities. He says that education through words and learning is done through practical work and experience. When both are combined, maturity is manifested, but this maturity depends on the extent to which one has learned knowledge and practical skills.

Farabi says that if the theoretical foundations of all disciplines are studied in education, spiritual and moral rules, etiquette will be studied in education, and professional skills will be formed.

This highlights the need for this important task to be accomplished by experienced educators using a variety of teaching methods. The scientist intends to carry out educational work in two ways:

When it comes to "practical qualities and applied arts (professions) and the habit of getting used to doing them", this habit is formed in two ways: the first is the formation of a habit with the help of satisfying words, provocative, inspiring words, skills, enthusiasm, revenge is converted into action.

The second way (or method) is the way of coercion. This method is applied to stubborn, stubborn urbanites and other desert peoples. Because they are not the ones who are zealous with the word as they please. If any of them embark on the study of theoretical knowledge, his virtue will be good. Such people should not be coerced unless there is a desire to acquire professions and fine arts. Because the purpose of educating the people of the city is to bring them up as virtues and turn them into artists.

The scientist put forward methods of motivation, habituation, and coercion in education. Both methods ultimately aim at the full development of man.

## CONCLUSION

It is clear from Farabi's works that the main direction of the scientist's research is the study of the structure, psyche, material and spiritual world of man as a mature philosopher he seeks to study and interpret mental processes in relation to the mental, moral, spiritual development of man. That is why in his works he pays great attention to such processes as perception and mental cognition, thinking, and in connection with other mental processes about them, such as memory, imagination, attention, emotion, will, ability, skill, cognition of personal qualities speaks. Recommends ways to form and develop these personal qualities in moral maturity, in the educational process.

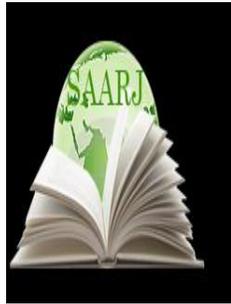

In short, Farabi's pedagogical teaching is based on the philosophical view that the formation of the perfect man, the essence of man is social, that is, only in society, in the process of interaction.

The interrelationship of both mental and moral upbringing plays an important role in human development. It is noteworthy that the teaching methods, pedagogical theories and recommendations recommended by Farabi have not lost their relevance today.

### ABSTRACT

*In this article, the basics of the Law on “The unities of struggle and the contradictions” in the dialectics of Jalaluddin Rumi and other aspects are analyzed. Here, also other aspects of the Rumi dialectics through the concept of “conflict” are covered. On the basis of the article, a comparative analysis of the Rumi dialectics with the Western dialectics occupies an important place. These parallels in it are analyzed in harmony with the modern dialect of philosophy. The article plays an important role in highlighting the interaction of eastern and Western philosophies. The main conclusions in this article show that the primacy of the dialectics of the connection of the divine spirit and the human consciousness in the philosophical views of the Rumi is discernible.*

**KEYWORDS:** *Dialectics (General Attachment), Conflict (Relation Of Differences), The Law Of Struggle And Unity Of Contradictions (Internal And External Adjectives And Conflict Of Separate Objects), The Divine Spirit (Absolute View Of The Absolute Idea), Agnosticism (Object And Sub-Agnostic Views), Heuristics (Simple Explanation Of Things), The Basis Of The World (Motion).*

---

### INTRODUCTION

At the end of the first awakening period (9 – 10<sup>th</sup> centuries) in the world, that is In the 11–13<sup>th</sup> centuries, sufiism gives rise to a specific rise to Uzi. Sufi sects such as Yassaviya, Qadiriya, Kubravia, Shazilia, Rafaiya, Sukhravardia, Mavlaviyya come into existence. During this period, scientists such as Omar Khayyam, Al- Ghazzali, Abdulkhalik Gijduvani Muhyiddin Ibn Al-

Urabi and Jalaliddin Rumi lived and worked. In the same period, the philosophical foundations of mysticism in the East are laid new eyes. In the history of the peoples of the East, the analysis of these vital and divine truths is a period widely spread by scientists. Especially important in this direction are the ideas in the works of Jalaluddin Rumi. In the works of Jalaluddin Rumi, the dialectical connection of events, motifs, forms – windy, contradictions and changes are analyzed in depth. At present, six works of scientists have reached. The most important of them is “Masnaviyi-ma’naviy”, which was written in Farsi in years 1259-1269.

The book is a truly “Encyclopaedia of Sufism”, consisting of 6 daftar 25730 baytes, more than 270 stories and 70 percent Qur’anic verses commentary. (1.2007. P.5 ). the influence of Yussuf Khamadani’s ideas is initially observed (Relations of Allah and human (2.2018. P.30).

But in “Masnavi...” while” the stories in the manner of sermons separated into pieces by some lyrical retreats are cited (the stories are interrupted in certain places, the poet’s attitude to the issue raised in the story is explained, then again those tales are continued, such places are expressed in different forms of human values, the idea of loving life and being active in it). The main conflict in these proverbs is between the inward and the outward, the content and the form. The contradictions between these elements are based on various life events”(1.2007. P.5). In this regard, it is worthwhile to give brief explanations about the existence, essence, interdependence, conflict and change of philosophical concepts in the works, etc.

## MAIN PART

In brief, dialectics is called “the art of arguing” in ancient Greek. Then this concept begins to be interpreted as a philosophical system, which implies the general attachment of what is in existence – phenomena. The groundbreaking dialectics of tolerance is a scientific worldview system that is constantly evolving without becoming a hardened dogma. During his evolution, he has gone through several interrelated stages and has grown from simple antique dialectics to now highly developed dialectics. In it, the system of “thesis – antithesis – synthesis” in the fundamental content of Hegel is a logical end to a certain level of dialectical evolution.

At that time, many ancient scientists deeply understood the importance of dialectics in understanding the world and the place of man in it. Those who support different methods of understanding and covering the truth in it. The same methods have been used in dialogues and maevtics Kump kullanılmış Bolsa in ancient times, especially much in the Middle Ages, the euristics in Europe. When knowing the world and understanding the truth, it is worth considering that in Jalaluddin Rumi there is a multiplicity of methods of comparison, as well as exactly these methods of dialectics. In it, the concept of being takes the main place. The whole is a holistic system, consisting of a unit of different substrates. The content of the being is reflected in the directions of his attitude. And the directions of the relationship are the following phrase:

- the emergence of borli from lack is a form of the beginning of the injury of the olam and it is the beginning of the course of relations;
- if the process of absorption occurs as a result of the transition from being and not being (regressive process), the emergence and development occurs when going from being to being (progressive process);
- the decline of the process of ascent in existence towards the absence and, conversely, the ascent from the absence to the presence is a general dialectic of the development of the scientist.

In the development of existence, the dependence on the universe is the source and strength of action that carried it forward. In philosophy, dependence is the fact that two concepts deny each other, while each others is Bolsa, in logic, one of the two contradictory things is definitely wrong, and in them there is a wedge load. In both cases, they are isolated by the concept of general contradiction (contraception), but as a basis, they are all different from each other anyway. This is a bit different from dialectics and formal logic.

In ancient times, the concept of conflict was isolated by Geraklit. In it, the allogism of the movement “donkey, which prefers gold”, is a simple but perfect example definition given to the conflict.

The problem of contradictions in the Middle Ages N.Kuzansky and D.Bruno. It is believed that it was isolated by the Brunos as a “system of minimum and maximum contradictions”.

The interpretation of the concept of conflict rises to its highest peak in German classical philosophy. And this is due to individual details on the conflict.

I.Kant interprets the problem of contradictions through “pure mind antinomy”. It is revealed that the composition and form of antinomies for the first time differ from the composition and form of formal logic.

I.Fichte and Shelling, who developed Kant ideas, basically analyzed the features of the conflict. As a result, they see the “creative” power of the conflict as the priority.

The essence of the concept of contradictions in Hegel is much broader coverage. In it it will be possible to note the following specifications:

- Conflict thing-the internal state of events (internal conflict – this thing is in conflict with the rational progressive specifications contained therein in the internal negative minus aspects of the phenomenon). In Mavlaviyya, this is the conflict between “nafs and patience”. Because of the natural - inspirational quality of nafs, patience is divine-inspirational quality;
- Logical conflict-the absolute is in the relationship between the soul and the mind as a conflict. For the whole life of Man, the absolute spirit manifests itself as a process of self – realization in this human consciousness. In Mavlaviyya, this is observed as a relationship between " God and reason". And in this case, the priority of irrationalist conciseness is noticeable (later this is G.Vetter and K. Popper are reflected in the idea of “the relationship of allogism and irrationalism”);
- In Hegel: Essence “A” can not be in essence without “A” at all. But they can be added to each other, passed on and will not exist without each other. In Mavlaviyya, this is observed in the “manifestation of the spirit in different worlds, interrelated in different contradictions” (link of deterministic bases);
- Conflicts occur as a process of interchange of events (Energy Exchange, metabolism and information exchange) – something in the universe. This is observed in the attitude to the “thing - its neighbor in events” in the Mavlaviyya stream;
- Contradictions in the universe are cash. This is evident in the contradictions of the predicate on the basis of what is in the universe – in phenomena and in human relations;

- the thing is that the external contradictions of phenomena are manifested as “separate poles”. Although the poles of contradictions are different, there will certainly be some kind of commonality that connects them (although the world religions are different, the level of humanism in all of them is the main criterion);

-In Hegel, the schematic expression of the conflict is: “originality – difference – difference – contradictions – basis” (2. fil. wikiading. ru. 3. www. boksit.ru > filitext 4. dik.academic.ru > dik nsf > ru wki 5. ponjatija. ru > taxonomy > term 6. studfile net > preview > paje). Here the originality returns to its first base, that’s to “absolute”.

The struggle against dependence and the conundrum of unity are the most basic laws of dialectics. Because any action occurs as a result of interdependence. Since these are the living conditions of the matter, it means that contradictions are the basis of the life of the world. Proceeding from this, it becomes possible to account for the fact that the unity of contradictions of actions in the derived form.

How many things and phenomena in existence are different, no matter what kind of variety they are similar, even if in terms of some kind of divergence between them. Hence the difference is a figurative concept of different aspects of things and phenomena. The discrepancy is divided into “significant” and “non-significant” types of discrepancies, and this will necessarily be related to the degree of discrepancies (7. 1991. P.120–125).

It happens that people live in a stable society, where there is less mutual conflict, their ideas differ little from each other, and therefore the head hurts. These Goyas in science are called “conflictology” (conflict studies, Logos-education). They are the causes of the origin of the confluence, the ways of preventing them are about to become dizzy (1. 2007. P.5)

In the East, the “Supreme spiritual world of Allah” is compared with the “Natural basis of existence”, and they contradict each other. As a result, there is a conflict of “Inward” and “Apparent”. In it, the divine permission is defined as the primary basis. The deviation of the people towards the requirements of theocratic propaganda in relation to the correct organization of economic relations in here causes relatively negative consequences in the socio– economic development of society (8. 1978. P.170–185 ). And this is the basis of social revolutions of development in society.

And Rumi was the first to express his thoughts about the interdependence, interconnectedness, interacting with each other, the development of dialectics (from simple to complex development and their transition to each other, the existence of the unity and struggle of all worlds), from particle to Universe. In his works, mawlono argues on hundreds of issues such as imagination and contemplation, the emergence of human thought, the influence of existence on consciousness, the existence of consciousness, the signs that determine the existence of Man, the deception of man, false assumptions and true knowledge, experience and analysis, partial and whole and, concreteness and abstract, true qualities and man. These indicate that the ideas of Sufism are in their essence a system of thoughtful philosophical, religious orifical views (1. 2007. P.5).

And Rumi was the first to express his thoughts about his interdependence, connection, attraction with each other, about the development of dialectics (from simple to complex development and their transition to each other, the existence of a unity and struggle of opposites in the whole

universe), from particle to Universe. In his works, Mavlana argues on hundreds of issues such as imagination and contemplation, the emergence of human thought, the influence of existence on consciousness, the existence of consciousness, the signs that determine the existence of Man, the deception of man, false assumptions and true knowledge, experience and analysis, partial and whole, concreteness and abstract, true qualities and man. These indicate that the ideas of Sufism are in their essence a system of thoughtful philosophical, religious enlightened views

Two contradictory things in one heart can not settle, can not agree. Since the soul is a century to the pleasures of the world, Islam will continue to move away from its glory and glory and go downhill. As a result, the status of Islamic comfort is ruined and secular pleasure becomes administrator and prosperous in prosperity. After all, “Two contradictory things will not combine in one place”.

**If someone asks:** “The children of Adam (alayhissalam) are hot and cold, profit and loss, hunger and thirst, they do not like each other in the way of satisfying the dreams of greedy Nafs air, such as nudity. Once this is within the natural desires, will not any of them be able to fully achieve Islamic reality?”

**Answer:** May Allah succeed. You should know that eating, drinking, dressing, marrying and fasting are in accordance with religion if it is at the level of need and does not contradict the realities of Islam. When religious affairs, Shari’ah duties and Islamic arches become a place of comfort for a Muslim, these natural desires will be satisfied at the level of the need if the exquisite tastes appear obscene and tasteless according to his Islamic idea. If it were possible to spend the day without the pleasures of the world, a person would have known that it was a necessary motivation for himself. But a person eats, sleeps and perseveres with the exertion of his earthly dreams in the face of the necessity for the continuation of his physical life, tolerates the bitter juice of carnal pleasures. Because body - is an asset entrusted to savings and is a bathhouse that performs of religion and Sharia functions. The body is not as Tuban as it is not preferred by religion to the goose’s horse and Haji’s camel. In the case of jihad and Hajj, the right to feed a horse and a camel is one of worship and religious practices, and even more preferable is obedience and closeness to the Haqq to feed the body that fulfils the Shari’ah and religious rules (1.2007. P.5 – 6).

The law of contradictions (in logic) is a law that shows that two opposing views can not be right at the same time and in the same proportion. The object relationship between objects and phenomena in the process of correct thinking dictates that one thought in the human brain can not be used in two meanings at the same time. This is one of the inseparable properties of Innate thinking and genuine discussion. The law of conflict requires not to allow two contradictory opinions about one subject at a time, without denying the conflict of views against the dependent in the development of thought, that is, time, the predicate refers to one-unit in terms of proportion. For example: the rain can not be called harmful or useful at all, it is harmful for certain plants in a certain period, it can be useful in another cycle. Violation of the law of conflict leads to confusion and erroneous conclusions in thinking (1. 2007. P.5)

Mavlana expresses specific thoughts about the **conflicts** between religions: “The idea is one, even if the roads are different and divergent. After all, you do not see how many roads lead to the Kaaba. Who is from Byzance, who is from Damascus, who is from Iran, who is from China and someone else is going to leave from India and Yemen. If we feed on the roads, there are great

differences. If we look at the goal, the idea, then they are all in One Direction. The work here is very glorious. Because in this there is no understanding, no. When you come to the Kaaba, you will find the quarrels on the roads, the fighting squabbles destroyed. Because no matter what they say to each other on the road, they understand that with their arrival in the Kaaba their goals are one.” Mavlana continues his opinion about the goals and aspirations of people in this world, there are many ways to achieve the goal, but denies the contradictions, noting that their destination is one. Religious conflicts are in different ways, that is, in form. When the intersection of these roads leads to the Kaaba, the purpose of all is clear, the essence is opened, and when understanding the essence, conflicts are eliminated.

*“If the contradiction is in peace, the product is life,*

*If the contradiction fights, the product is death”*

According to Jalaluddin Rumi, the total internal conflict and development in nature, growth and maturation, some miracles of the Soul also exist in man. The understanding of the ore, names, power and essence of the Lord who created the universe and man is also realized by the study and understanding of the properties of the human spirit. Therefore, the spirituality in the universe and in the little Olam man is always in conflict. The great astronomical scientist Ali Qushchi in his “Muqaddima”(consisting of three chapters: geometry, geometry, summed up materials of Natural Science) everything in nature is simple and complex, divided into celestial bodies and Earth bodies. The celestial bodies the world of stars and the Earth’s bodies also appeared from four elements (water, fire, air earth). Everything and the body is divided into simple and complex parts. They occur in one circle simply, in another circle in a complex. They are constantly in motion, in mutual conflict. The world that surrounds us is made up of material things, they are made of simple and complex. It is said that in themselves there is a manifestation of dependence, conflict and mutual coexistence.

If a person left without knowledge, he would burn, would not stay. Accordingly, since the price of existence is possible without knowledge, ignorance is a Matlub (desired, sought- *Translated.*). Knowledge is also desired from the cause of knowing Alah. So it turns out that both are assistants to each other, and all the contradictory things are also one. Day and night are considered both contradictory and assistant. Because if the night was permanent, no work would come to the field. The presence of a constant daytime harms some of the human organs, and on the contrary, the presence of a constant night is the same. But these things do not contradict each other, do not do the same thing. There is nothing in the world that only if it is bad or only good.”When we had a discussion with the Gentiles, they said, “there are two gods: one creates good and the other creates evil.” We answered: show you one good without evil, that we may confess the two gods who created evil and good. This is impossible” From this it can be seen that the creator is the only one. Allah says, “Do they not think that they are resurrected on the day of their glory-the day when the worlds are standing before the Lord of the worlds?”

*Sorry, Not Find Your response,*

*Allah forbid you.*

*Do not think that anger contradicts love,*

*Two is one thing, do not act separately (9. 2007. P. 56.)*

The law of “struggle and unity of the contradictions”: Beautiful and ugly (great Universe) Akbar and Asgar (small Universe), unconscious and Hell, Night and day, strong and weak, good and evil, kindness and anger these concepts are against each other, but these are contradictory, they are contrary to each other. Uniqueness creates a single whole.

*Picture of suprat Ichra ask yourself,*

*But actual picture of the greatest yourself (9. 2007. P.56)*

Mawlono points out that in this bayt there is another being and one more being. The desire to remove the contradictions from the middle, that is, to know the absolute truth, but the impossibility of achieving it, constitutes the essence of the Roman poetic dialect of Jalaluddin. Absolute, even so its difference from the traditional mysticism of the caregiver that within possible to know the truth.

Rumi as a great thinker writes, analyzes and studies about world contradictions, the mutual vobasticity of contradictions (“unity of contradictions”), the interrelationships of substances that exist in the billions of forms shamoyil in the world, the interrelationship of transition-evolutions, the interchange of matter from particle to Universe, the causes of life and death (“reconciliation”, “reconciliation”, “Battle” of death – contradictions), body and Soul, Man and Allah. In “Masnavi” 690 hadiths were given a rumor comment. Even before our eyes, the glorious scholar of the word science, Orif man, who brought the doctrine of mysticism to the peak of pride, is an almighty genius poet. From simple anecdotes, proverbs make extraordinary philosophical-Sufi meanings, thoughtful contemplation goes from circle to circle, from level to level. He notes that “the Qur’an has three different layered meanings, and he consistently understands those meanings”.

The poet’s attempt to acquire absolute, identity with the Spirit, to dissolve himself in it, was an attempt to know his true essence, in his own words, the divine truth. But the absolute with the second person of one person; unless the fostering mixture is achieved, the knowledge of the truth is also relative. The conflict between identity and non - identity remains, therefore, the aspiration to eliminate it.

*Look though it’s dark, humanity,*

*Live long flower orchard inwardly of the inner.*

“One thing or two that did good and evil?” they asked. Answer: “there must be absolutely two things according to which they are in a state of debate. Because a person can not be in opposition to himself. In this regard, evil does not depart from good. The good is to leave this evil. If there is no evil, then it is also impossible to throw it away. If there was no reason to do evil, there would be no rejection of good either. So, the foil (done, performed - Translator) is not two, but one. The benefit is not known until something is bluish. The bad speak of the good of the Orif, in fact, which worsened the Orif. The Orif is removed from the deterioration. “With the contrary of the appliances will be known”” Orif says,” My enemy is not the enemy of my enemy who has made me worse, but the enemy of my enemy who has made me worse. “I’m happy. But around me there is a wall on which the top is covered with thorns. Looking from the outside, they do not see the flower bed inside, but their eyes fall on the Thorns above the wall, making it worse. But flower orchard does not find any harm from this. The harm of deterioration is the self of the

person who has worsened. Because he is moving away from the flower orchard with his words”.  
(10.2017. P.140)

Therefore, Mustafa said, “I am a lot of laughing and a lot of killing” (Hadis). That is, he does not kill anyone with anger. There are only two things for humanity either wants or not. Absolutely reluctance is inherent only in Allah. Of course, a person wants one of two, because that desire motivates him to find what he does not have. Allah Almighty said To Bayazid: “O Bayazid! what do you want?” he ordered. Bayazid said that I want nothing to be desired. It turns out that a person wants either a flour or a bun. Wanting nothing is inherent only in him (10.2017. P.140)

A bird flew into the meadow. And there the Hunter put a trap, sprinkled a pinch of wheat, he himself lay on the edge, hiding among the grass.

The bird came and began to fly around it. It seemed strange to him that a man was hiding in a such a poppy:

- Who are you? Why are you hiding, what are you waiting for in such a hunting place? Do not you see wild animals? - he asked.

- I'm a hermit. I shook the skirt to the world. In the same remote place I feed on grass-oats and live in this way, - said the man. The bird asked the man a few more questions, the man answered. Finally, the bird was able to see its prey.

- What are these?

- These are the savings of an orphan who does not like me at all.

- I'm very hungry, if you let me eat from this and feed my winter, because from this I need. If necessary, even eating losh (Lesh) is a dispute.

- These people left a deposit because they believed in me, it is a sin to eat the orphan's right.

But the bird was incredibly hungry, insisted strongly:

“O Pious man, let me eat from this and feed my blood,” he said.

- You thought yourself a fatva about necessity. If this is not the case in reality, you will be sinful. Even if it is necessary, but be careful, it is better to avoid the Haram.

The bird did not tolerate excess, with great appetite jumped and began to eat the cereal. One or two grains were stuck in a trap without enamel. To get rid of while typists in the soul craze, self -

:

- The case of the one who deceived the falsifiers ‘ spells will be ruined.

The man who heard these words told him:

- This is the punishment worthy of those who have eaten the orphan's property unjustly and covered their eyes with greed, - he said. (11. 435-6.)

At first glance, the effect of this story seems to be weaker. Before our eyes, a person who has set traps for birds and who speaks volumes is ravaged. But MawlanaRumi briefly goes through the important things he wanted to say among the description of the event. From the language of the hunter, who introduced himself as a “pious”, he gives a definition with an analogy to the life of the world:

“Children enjoy the game, but in the evening they are dragged out of their hands and taken to their homes. Since the young boy is interested in the game, he takes off his shirt, cap, shoes. And the thief will come and hang them. The child is so given to the game that his clothes do not even remember. He will not leave the game even if he enters late, he will not dream of returning home” In this regard, mavlana reminds the content of the verses of the Qur’an: “The Life of the world consists of only one game”(An’am, 32, Ankabut, 29, Muhammad, 36). “If you were, you were given the game, you threw your clothes on the shoulder, now you’re scared. Find your clothes from the darkening, do not take away your time in futility with rumors (idyllic words).” In the same place, Rumi shows the peculiarities of repentance:

*Find the bunny with the comb without the eyebrow darkening,*

*Do not waste your day ruined...*

*Control the repentance, follow the correctness*

*Take the meat and the grain from the thief.*

*Repentance tulpori wonderfully tulpor erur,*

*In the dialect, the Hunter rises to the Fortune.*

*Asra tulporingni, thief nogahon*

*Nihon as if he had taken the whole, not stole.*

From the bird’s tongue to the one that stands between the bushes and claims to be hermit, reminds that it is better not to do so:

*The bird said: so desolate intercostal,*

*Tarahhub is not welcome in Ahmad’s religion.*

*Like tarahhub was banned by Rasul,*

*Though shalt not bid at this newness, O virtuous(12. 2010. Issue 8)*

Unless any conflict is resolved positively in a timely manner, regardless of where the situation is from, there will be negative consequences.

His views on the “unity of the world from the conflict, the expression of the mutual battle” in the ideas of the Rumi helped to establish the dialectical method, according to the German philosopher Gegel. It is natural that those who have learned philosophy from Hegel and Marx, Shopengauer and Kant, Nisshe and Freud read Rumi and say that it is all said that we have already(12. 2010. P. 8).

## CONCLUSION

Proceeding from the above information, it will be possible to note the following points of view in the birth of views on the conflict in mavlaviyya:

- As a stream of any doctrine, mavlaviyya certainly has its own system of religious – philosophical views.
- In the “Allah – Univers relationship” in mawlavia, Allah is the first and the occurrence of the universe takes place in the form of Emanation;

- The attitude of “Allah – man” in mawlaviana is in apparent and genuine forms, and the effect of “fatalism” is felt in it;

- In mawlaviana, the influence of the idea of “the other” on the doctrine of “the return of the absolute idea to itself” in Hegel is evident;

And in mawlaviana, the idea of “the interior is in the interior” is felt by the influence of agnosticism on the foundations of “something in itself”. One of such comments belongs to the pen of the American Orientalist scientist Devin Davis, according to which Hussein Khorezmi (1368-1435) was the first review book with the name “Javahir ul-Asror and zavahir ul-Anwar” (“The jewel of secrets and the glow of light”). (13.1966. V. 2. –P. 820-839.).

It is written in this work that in 1430-1431 years only three notebooks were interpreted, because this is the last treatise of Hussein Khorezmi.

The poet Alisher Navai’s “Majolis un-nafais” tazkira, Mavlana Husayn Abulvafa Khorezmi’s disciple in Zahir science and apprentice is in inner science. Rumi’s Masnaviyi ma’naviy” and “Qasidai Burda”, famous in the Islamic world, are finished with a deliberate interpretation of the Khorezm Turkish language. Morals and virtues deserve the high status of mysticism;

- The idea of growing “from particle to Universe” in mawlaviana has to some extent influenced the formation of the idea of dialectics “from simple to complex” (14. 1983. C. 69);

-In the comments on the concept of “contradictions” in mawlaviana, the priority of mainly “internal contradictions” aspects is considered;

-The expression of primary and secondary differences in the interpretations of the concept of “difference” in mawlaviana is priority;

-In mawlaviana: the Moon and the sun; day and night; Heaven and earth; right and wrong; benefit and harm; darkness and light; struggle and victory; absence and being; body and soul; so deeply and comprehensively illuminated that we call Rumi the man who laid the foundation of the foundation of philosophy freely (15.2019 – 4).

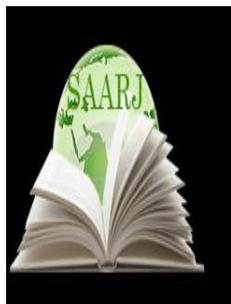

The views of Jalaluddin Rumi have been of great importance in the medieval culture of Movarounnahr (16. TEST.Engineering @Management. Features of Material Culture of Bukhara.2020.6). Especially Rumi’s views on nature, society, the existence of Man have a positive impact on the ideas of hurphicry in the country (17. International Journal of Psychosocial Rehabilitation, Vol. 24, Issue 08, 2020 ISSN: 1475-7192 Received: 02 Jan 2020 / Revised: 12 Feb 2020 / Accepted: 17 Mar 2020 1996 Reflection of the “Law of unity and struggle of contradictions” in the dialectic of Jalaluddin Rumi Ashurova Marhabo Sayfulloyevna )

For some reason, mawlaviana is in the system of philosophy – religion (18.1991. P.–5- 671) as a specific doctrine occupies an important place in the development of world civilization, and Jalaluddin Rumi has its own unique place among the great philosophers.

## THEORETICAL APPROACH TO THE ESSENCE OF SPIRITUAL EDUCATION IN YOUTH EDUCATION

**Abdukarimov N. A\***

\*Jizzakh State Pedagogical Institute,  
 UZBEKISTAN

### ABSTRACT

*The article describes the theoretical aspects of educating young people in the spiritual spirit at the current stage of development. The stages of development of knowledge and thinking, the formation of a healthy worldview, spiritual and moral education in the education of young people are also discussed in detail. The role of spiritual education in the elimination of neglect and delinquency, crime among young people is shown.*

**KEYWORDS:** *Youth, Spirituality, Education, Harmoniously Developed Generation, Spiritual Propaganda, Society, Knowledge, Higher Education Institutions, Skill, And Idea.*

### INTRODUCTION

Spiritual education is crucial in the life of any society and country. A country that is not sufficiently engaged in educating the younger generation, every member of society, in general, will face stagnation and ultimately crisis. One of the urgent problems is to bring the personnel trained in educational institutions to the level of developed countries in terms of intellectual, spiritual and moral level.

Today, the acquisition of modern professions by young people, the use of information and communication technologies, etc. are fully implemented in the educational process. Attention to the upbringing of the younger generation is one of the most important areas of state policy. Youth is our future. What our future holds depends on how we raise our children. In this regard, it is the main task of every family, educational institution to make them educated, wise and, of course, happy. When the knowledge and thinking of the people is high, there is all-round progress. The first President of our country I.Karimov has repeatedly acknowledged that

development is impossible without the development of spirituality, emphasizing that "strengthening and developing the spiritual spirit of the people is the most important task of the state and society in Uzbekistan."

The standard of living of any country is determined by the general level of the people living in that area. This requires young people not to succumb to the mood of peace and indifference, to train them as necessary personnel for a developing country. However, it should be noted that in some cases, there is a lack of control and delinquency among juveniles, and even the commission of crimes. In order to overcome these situations, it is necessary to raise the level of legal culture and political culture of young people. Scholars have argued that "there can be no legal culture without legal knowledge".

### **THE MAIN PART.**

There are also children among the youth who have a difficult upbringing and do not attend classes regularly. Everything stems from idleness and negligence. Therefore, there is a need to prevent crime and delinquency among young people, to coordinate the activities of businesses that provide services via the Internet, computers. According to the first President IA Karimov, "our ancient ancestors developed a whole set of moral requirements for a perfect man, in modern language, an Eastern code of ethics. In the heart of man there must be an unforgiving rebellion against impurity, impurity and injustice.

In this regard, the Ministry of Public Education, the Ministry of Internal Affairs, the Center for Secondary Special and Vocational Education of the Republic of Uzbekistan, the Center for Spirituality and the Enlightenment Center, the regional branches of the Youth Union of Uzbekistan, coordinate the activities of local Internet networks and computer service providers, monitor compliance with the law, and strictly limit the presence of minors in such institutions during classes and at night.

It is no secret that in some Internet cafes and computer clubs in some places there are posters, pictures, sites, movies that contradict our national spirituality, promote militancy, cruelty and shamelessness. This has a negative impact on the minds of minors and is one of the main reasons for the increase in delinquency among them. The buildings where some such facilities are located do not meet the requirements. The conditions in it have a negative impact on the educational process of young people.

A threat to spirituality is a threat to our identity and our future. Under the guise of "popular culture" such threats as moral depravity and violence, the spread of ideas of individualism, egocentrism, and, if necessary, enrichment, thousands of years of traditions and values of peoples, disregard for the spiritual foundations of life do not bother any conscious and enlightened person. So, spirituality is the most basic criterion that defines a person's humanity.

A spiritual person must constantly be free from vices and fight against them. This is a very important issue for the upbringing of young people. In society, the ruthless struggle between good and evil, virtue and evil, good and evil, enlightenment and ignorance will continue. When goodness, goodness, and enlightenment are enhanced at a high level, of course, it triumphs over evil, vices, wickedness, and ignorance. Thus goodness brings goodness, goodness gives birth to goodness. "Of all the creatures created by Allah, the most mature and miraculous is man. The task entrusted to man is to beautify the Earth, to make it perfect, to strive for perfection.

Bringing up a healthy generation does not mean physical health, but the upbringing of a person who has matured in the spirit of Eastern morality and universal ideas. That is, the upbringing of a spiritually, intellectually and physically harmoniously developed generation is not only a national need, but also a matter of national importance. It is a noble goal for all fraternal peoples born and raised in the land of multi-ethnic Uzbekistan. It unites national and universal values, the best traditions of our rich spiritual heritage and emerging new traditions, and it becomes a powerful factor of education.

As the reforms in the field of youth education are becoming the most pressing issue of today, the problem of our future, the projects aimed at large-scale work in this area are being brought to the public's attention. At present, great attention is paid to the activities of mahallas in educating young people. The positive influence of community elders and activists, advisers on religious enlightenment and spiritual and moral issues of citizens' assemblies, who make a significant contribution to the transformation of this unique structure into a self-governing body, is growing.

One of the urgent tasks before us today is to bring up a new generation of young people with such high knowledge and practical skills, who can find their way into the human heart and gain the trust of the people, to protect the Motherland, to be loyal, fair, honest and polite. The most important thing is for young people to live on the basis of high spirituality and the rule of law, to develop their unique human qualities such as loyalty to their country, justice, honesty, courage, bravery and a culture of behavior. "One of the most important tasks is to instill in citizens, especially young people, a deep sense of the Motherland, to serve it faithfully, to constantly care for its future. The deeper the duty and responsibility of the nation, the Motherland, the spirit of the ancestors, the deeper the national consciousness, the higher the national pride, the more creative ideas will appear."

The role of the family is invaluable in ensuring that our young people perform the duty of service to the people with honor and gain the knowledge, skills and experience necessary to gain the trust of citizens. Based on today's requirements, it should be noted that qualified personnel, in any case, serve the people, to perform their duties with honor, to gain the trust of citizens, to become qualified professionals, to become spiritual, mental, spiritual, legal, political, ideological, physical, reach maturity they are required to have the qualities of initiative, organization and dedication.

## CONCLUSION

This is because an important factor in the educational process is the achievement of cooperation between educators and coaches, as well as representatives of public structures, who are engaged in the formation of human qualities, knowledge, practical skills and experiences of young people. Violation of these requirements in the educational process, failure to take advantage of the above-mentioned factors and opportunities, of course, leads to various negative consequences. Because spiritual and moral education forms in young people such qualities as honesty, purity, duty, conscience, nobility, devotion.

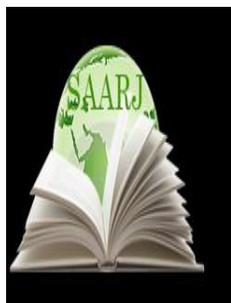

Cultural moral education as a broad concept affects all aspects of human activity. Cultural and moral education in all spheres: in production, in life and in the family. In his spare time, he regulates people's behavior and human relations. Cultural and moral education, unlike other forms of social consciousness, performs economic, political and spiritual functions. It plays an important role in strengthening society and directing people to a common goal. Spiritual moral

education is a unique way of knowing the world, regulating people's behavior in terms of good and evil.

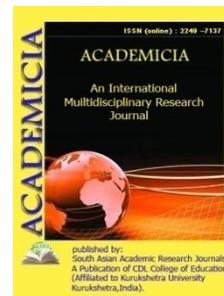

In conclusion, it should be noted that morality, which is an integral part of spiritual education, is the basis of spiritual education. In general, to bring up young people in the spirit of patriotism, to be worthy generations of our ancestors, to form in the minds of emerging professionals a sense of readiness to constantly contribute to the development of our country, and therefore to support the aspirations and practical actions of selfless people are our highest goals.

## USE OF INFORMATION AND COMMUNICATIVE TECHNOLOGIES IN STUDYING FOREIGN LANGUAGES

**Ortikova Ezoza\***

\*Jizzakh State Pedagogical Institute,  
 UZBEKISTAN

### ABSTRACT

*This article is about using information technology and communicative technology in learning foreign languages. It discusses various information and communication technologies that are becoming more diverse and are being intensively used in the field of education and in universities as well. Currently, distance learning is practiced among university students who, due to illness or other problems, cannot attend the full-time education system. This is a great learning aid. Students receive all assignments by e-mail and complete them, and at a certain time take exams remotely.*

**KEYWORDS:** *Information Technology, Communicative Technology, Intensification Of Training, World Community, Science And Technology, Educational Problems, Distance Learning.*

### INTRODUCTION

Currently, in the age of computerization, there are various information and communication technologies that are becoming more diverse and are being intensively used in the field of education and in universities as well. The improvement and application of information and communication technologies require intensification of training, as well as modern forms, methods and means of training. Now much attention is paid to the study of foreign languages in Uzbekistan, which seeks to take a worthy place in the world community, as our people strive to see their future in harmony, peace and cooperation with foreign partners, conclude agreements in various fields of science and technology, for the sake of the prosperity of our Homeland. Now in the modern world, English has become the language of use and application in all areas of science, technology, education, culture, has become the language of international communication in the world. Therefore, at present, teaching a foreign language relies on the latest forms of organizing training, finding and using modern techniques with an orientation towards verbal

communication, relying on advanced pedagogical technologies and new developments in the creation of educational - methodological complexes in foreign languages, the use of which leads to the ultimate goal when teaching foreign languages - this is the development of colloquial speech, communication. Modern teaching of foreign languages requires solving educational problems, goals, teaching methods that accelerate the process of mastering and using a foreign language, which will ensure its solid assimilation with an output to verbal communication, determining the levels of learning, from levels A to C, when teaching foreign languages, it is necessary to rely on customs, traditions of the country whose language we are studying, i.e. it is necessary to become closely acquainted with the country's geography. This will greatly facilitate the assimilation and speed up the work when translating various texts.

### **THE MAIN PART**

Since, only knowing everything about the country, the translator will be able to convey to the reader the accuracy of the translation from the original. Often, sometimes funny stories are obtained during translation, since there are not many word matches that convey correctly the translation of words from one language to another. This puts translators in a difficult situation. Currently, distance learning is practiced among university students who, due to illness or other problems, cannot attend the full-time education system. This is a great learning aid. Students receive all assignments by e-mail and complete them, and at a certain time take exams remotely. This type of training allows students to feel like full members of society, and successful passing of tests and exams instills in them the confidence that there are no obstacles, everything can be overcome in this life, you just have to want to, with distance learning there are problems like the creation of new methods and technologies, meeting the telecommunications environment of communication. At the same time, there are problems associated with the fact that the teaching staff does not have the required level of knowledge in information and communication technologies. At the same time, they are responsible for a huge amount of work on the development of electronic resources, which include electronic textbooks and training programs. When working remotely, it happens that students work better with new forms of education, in comparison with teachers.

As the teachers write [Toshpulatov MA, Paizieva MT, and Obidov A. from TUIT in their article "Features of the use of information and communication technologies in the educational process of the university." Collection of reports JizPI "Current state and prospects for the use of information technology in management" ... .. Distance learning as an educational technology can be easily integrated into any form of education. But considering the opportunities that it provides, based on the experience gained, we can conclude that when introducing distance learning in universities, distance education should serve as the basis. The level of use of the latest network technologies in the learning process determines the "watershed" that runs between traditional correspondence and modern distance learning.]

Hence, we conclude that distance learning is one of the forms of training at a university, but of course the best training is a full-time training system, when there is live communication between a teacher and a student. A very important role for university teachers is played by advanced training courses at the Uzbek State University of World Languages, in the Republican Scientific Information Center, where teaching is carried out by highly qualified teachers who intelligibly and clearly explain all the subtleties and nuances of modern requirements for languages that meet

international standards and requirements. ... We are grateful to the University, its teachers, that in two months of study, we have learned a lot, new, especially in independent work. But since the main training is carried out in the traditional form "teacher - student", and communication with the teacher brings the best result in the learning process, it brings the best results in assimilation. Such communication cannot be fully replaced by communication with a computer. But there are cases when teachers have to study repeatedly, online, i.e. do it remotely. It also gives lectures on all subjects that need to be mastered and pass the assistance in all six blocks of training, pass pedagogical practice, portfolio, and at the end pass weekend tests and defend the final work. This greatly facilitates the work and study of teachers who are retrained. Thank you all for this opportunity. Let us now consider the possibilities of the educational process through the introduction of information and communication technologies. Information technology and a computer are a tool for their implementation, are powerful means of intensifying the educational process. But we must not forget that such an intensification is achieved only with a certain organization of the educational process. The computer is not only a technological device that provides mechanization of individual procedures of the educational process, but also one of the equal components of the didactic system along with its other links, goals, content, forms and methods of teaching. All these links of the educational process are interconnected, and changes in one of them entail changes in all others. Therefore, the introduction of computerization into the educational process entails changes in all other components, the number of which corresponds to the number of students, does not mean the achievement of the goal of computerization, but is only the beginning of it - the beginning of the system of restructuring the entire teaching technology.

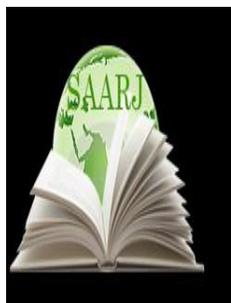

## CONCLUSION

Information technology, multimedia and a computer are powerful means of improving the educational process, since they are used to implement and assimilate educational material, which increases the process of assimilating educational material several times.

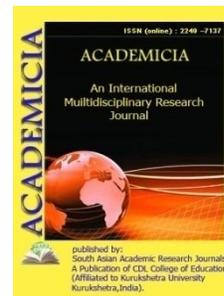

Everyone knows that the ultimate goal of learning a foreign language is communication, i.e. communication in a foreign language of all levels, we will focus on gaming technologies when teaching foreign languages. Gaming technologies are a natural occupation of students, where they must speak a foreign language as much as possible, and this contributes to the emergence of students' interest in the subject and the learning process becomes more effective. Gaming technologies increase the motivation of learning and the interest of students in the subject, create an atmosphere of creative cooperation, actualize the personality of the student, foster a sense of self-esteem in students, give them a sense of creative freedom and, most importantly, bring joy, satisfaction and self-affirmation. The use of gaming technologies in the classroom allows you to transfer knowledge to students in the most interesting form. Game activity as an element of the lesson can be applied at any stage of the lesson. In the classroom, role-playing games, competition games, intellectual games are often held, which students really like, because here individual abilities of students are revealed, where they show their knowledge and skills, and also learn from each other something new, i.e. enrich their knowledge.

## DIFFERENT METHODS OF TRANSLATING PHRASEOLOGICAL UNITS FROM ONE LANGUAGE INTO ANOTHER

**S. Sadikova\***

\*Teacher

Jizzakh State Pedagogical Institute,  
 UZBEKISTAN

### ABSTRACT

*Phraseological units are quite complicated phenomenon from the point of view of translation. Characteristically they have figurative meaning and consist of the lexemes, which meanings cannot be deduced from the meanings of separate words. Hence, the central problem of the translator is to find the phraseological unit in the text and to produce an adequate target text corresponding to the stylistic norms of the source text. Primarily, the one should start the translation from the context analysis to interpret the meaning of each phraseological unit correctly.*

**KEYWORDS:** *Phraseological Unit; Pivotal Component; Translation Techniques, Methods Of Translation.*

### INTRODUCTION

Although the theory of translation began to form as an independent philological science in our country in the 1950s, the practice of translation mainly has a history of more than a thousand years. One should not conclude that it developed without a theory for more than a thousand years. There are many scientific, historical, political, religious, philosophical and fiction books that have been translated by specialists in this field from Arabic, Persian, Hindi, Azerbaijani, Turkish and Russian into our language, adhering to certain translation ideologies that have been adopted and followed throughout centuries. The importance of studying linguistic translation makes it known that the translator does not refer to intuition when translating a text.

### THE MAIN PART

The founder of the Uzbek linguistic translation Gaybulla Salomov described translation as follows: "Translation is a theoretical and creative process, consisting of a combination of

relevant scientific works and deep philological knowledge with inspiration, great talent and intuition, continuous vocabulary". Translation means friendship, brotherhood and cooperation of different peoples, it is a tool that serves to expand economic, scientific, cultural and literary relations between them. Translation accelerates the process of interaction between different peoples and the interaction of literature. Thanks to the translated works, there is a chance to enjoy the masterpieces of world literature.

Translation is a necessary tool for improving languages, accelerates their development, increases and improves vocabulary. Translation enriches the spiritual life of a person, reveals the potential of the native language. Thanks to translation, the reader's thinking is sharpened and enriched in new ways with ideas and concepts. Translation serves to create new relationships and attitudes in society. Translation has a positive effect on the spirituality and culture of different nations.

It is well known that when translating phraseological units and idioms from one language to another, there are specific conversion problems. This is typical of linguistic units, speaking of this feature, the Russian linguist S.I. Ojegov writes the following: "Idioms are not literally translated, which is their main feature. Consequently, the content of idioms is unusually broad and is a means of expression and accepts all the traditional events of the language. "

From the above, it is clear that the author's focus is on idioms. In the translation of these units, depending on the semantic nature of the language, it is necessary to know the social, historical and cultural linguistic features.

L.A. Bulakhovsky describes the translation of idioms as follows: "Idiomatic units of a word are represented in a particular language as a whole and in one sense and are specific expressions, as a rule, without a clear translation into other languages, and in translation requiring a similar stylistic coloration" 2. Therefore, translating idioms is a very complex process, it is argued that the search for alternatives to these expressions depends on the high skill of the translator.

Idiomatic units in the Uzbek language are distinguished by their world of unexpected colors, images, comparisons, as if drawn by an artist. In the fund of the Uzbek language, we can find wonderful fairy tales, proverbs that were included in the dialect by the creative Uzbek people. Like other world languages, the Uzbek language is rich in phraseological units connected with the names of animals. Phraseological units of this language are distinguished by emotional expressiveness, sensitivity, diversity and complexity. For instance: битимгасотиболаманми, итлагангадойдек, илонёғиниялаган, бўринингкўзиниқўрган, иткунинибошигасолмоқ. Proceeding from mental considerations and culture, you can find alternatives to phraseological units of the English language in the Uzbek language. Given the fact that the function of translation consists in the need to completely translate information into another language using a language tool, then when translating phraseological units it is necessary to produce an adequate translation, since phraseological units are found in different versions.

Phraseological units play a large role in the development of the language, the enrichment of these linguistic synonymous lines in the native language, in fact, translation creates a wide range of opportunities for the development of skills. For example, when viewing phraseological units or animalistic units in both languages, both compatibility and incompatibility are observed. In this case, the natural result of translation properties will of course depend on the skills of the translator.

Naturally, each linguist uses his own style of translation. For example, V.G. Gak in the translation of phraseological units is as follows.

**Let's look at the methods:**

1. Descriptive style. In this case, the phraseological units of the language in another language are free, translated by independent phrases. In this style, the lexical meaning of phraseological units is mainly given. In the figurative construction of expressions, the translation does not provide an internal form, a clear picture of the animal world, that is, the translation of phraseological units from one language into another language occurs without changing the meaning, only the components may differ.

In addition, one phraseological compound can have more than one meaning in another language.

2. Translation with compatible variants - does not mean translation of phraseological units of one language into a second language with free, independent phrases, but rather translated through several phraseological variants, where components and meaning are replaced by the corresponding component and meaning of the second language. The translation comes from the contextual meaning, some stylistic differences are also acceptable.

3. Equivalent. In this case, the phraseological unit of the same language will be translated through a specific equivalent version in the second language. When translating, the meaning of the context is not considered important, but the available equivalent in the translated languages.

Let's give examples of the above methods. According to the first method, some sayings or proverbs are translated without changing the component and meaning.

For example wolf in sheep's clothing- қўзичоқтерисиниёпинганбўри (be careful with this kind of people, they can be dangerous)

The wolf may change his coat, but not his disposition – бўриниқанчабоқма,

тозибўлмайд. (a person's character is difficult to change or fix)

greedy as a wolf – буридайоч, (to be very hungry)

The above examples are translated from English into Uzbek does not include major changes.

Some phraseological units differ in some components while retaining the meaning of the original: to put one's head in the lion's mouth – арриуйигабошинисуқмоқ, both options mean risk, but in the Uzbek translation, instead of the snake of the English version, the wasp is taken in the Uzbek version.

Translation with joint variants comes from the context, for example, the phraseme Part and parcel is translated as a basic part of something, but the literal translation will sound like a part and a premise. In this case, translation from the context is appropriate.

An equivalent translation has an exact version in both languages.

For instance: «To lose one's head» into Uzbek is translated as “Ақлинийўқотибқуйди” this means that a person cannot adequately perform an action.

“To gain a time”-“Вақтданютмоқ” take time to do something

“To bear in mind”-“Миядасақламоқ” means not forgetting, to remember something

“To watch the step”-“Қадамини уйлаб босмоқ” means to be careful when doing any action.

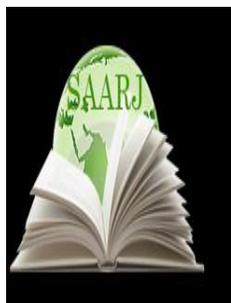

### CONCLUSION

Therefore, as can be seen from the translations of the above phraseological units, certain expressions in one language are translated into another language using different methods, and we have also witnessed what can be translated into a second language using simple phrases.

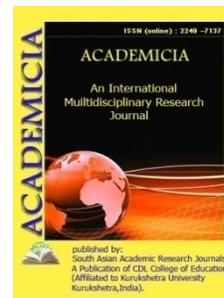

Lexical variation in the translation of phrases occurs depending on the creative freedom of the translator, as well as on the linguistic nature of languages. In both cases, although one of the components of the phrasal verb is replaced by the lexical variant, the phrasal object remains unchanged and the content is consistent.

**EXPRESSION OF TEMPORALITY AND LOCALITY THROUGH NOUN  
 LEXEMES IN MAHMUD KASHGARI'S "DEVON"**

**Rozikova Gulbakhor\***

\*PhD, Associate Professor,  
 Ferghana State University,  
 UZBEKISTAN

Email id: gulbahor.rozikova@mail.ru

**ABSTRACT**

*Noun lexemes expressing time and place used in "Devonu lug'otit turk" of Mahmud Koshgari are analysed in this article. "The elements of the world around us and their various signs, which are reflected in the human mind, are expressed in his language through special linguistic means, in particular, through lexemes.*

**KEYWORDS:** *Lexeme, Noun Lexeme, Temporality, Locality, Thesaurus.*

**INTRODUCTION**

Mahmud Kashgari's "Devonu lug'otit turk" is a common monument for all Turkic peoples. The work covers words from all spheres of social life, the analysis of which on the basis of different lexical-semantic groups allows to draw theoretical conclusions about the first periods of the history of the Uzbek language. Devon also actively uses noun lexemes to express the concept of space and time, and this article is devoted to the study of such lexemes.

**METHODS**

In this study, the methods of classification, description, semantic-stylistic, comparative-historical, component analysis were used.

**RESULTS AND DISCUSSIONS**

Things and events in existence are inextricably linked and form a certain system. The activation of each member of the system is closely related to space and time. F. de Saussure stated: "If we had imagined that language existed only in a unit of period, in time (i.e., man lived alone for centuries) without the masses speaking it, time would not have an effect on language and no

change would have taken place in language. And, conversely, if the language-speaking masses were to be thought of as timeless (that is, when human life came to a standstill), the effect of social phenomena on language would not be observed” (F. de Saussure, 1933). Hence, the influence of time and space is of great importance in the life of language. While temporality was previously studied as a grammatical tense, it is now being studied at the lexical level as a major phenomenon of national culture.

In Mahmud Kashgari's “Devonu lug'otit turk” lexemes meaning period and time are used and the meaning of time is expressed by synonymous lexemes such as *öd* (time, period, I, 50)<sup>1</sup>, *oğur* (time, I, 56), *коч* (time, phase, I, 220), *jāp* (time (in Oguz, 221), *özlāk* (period, time, I, 87). The lexeme *чәрик* in the work was used in the meaning of “time, phase of everything” (in Oguz, I, 261).

Time-meaning lexemes used in the work can be divided into the following groups:

1. The duration of an event that occurs and of things measured through centuries, years, hours, minutes, etc., is an objective event with such a measure (OTIL, I, 448). “Time equal to one-twelfth of the astronomical year - the period of the Moon's orbit around the Sun once, the unit of measurement is a period of 30, 28, 29 or 31 days” is called as *a:j* (month; time, period of 30 days, I, 73).

Our ancestors had their own annual account before the Arab conquest. An account based on a muchal account is one of such year accounts. This type of calculation has long been used by Turkic peoples, including the Uzbek, Kazakh, Uighur, Chinese, Turkmen and Mongol peoples, and has been used in written sources, documents, to determine or record the date of various events. (Ashirboev, 2006) We learn about its history from Mahmud Kashgari's “Devon”. According to him, the Turks drove twelve different animals to the very large body of water in the Ila River, naming the twelve years by the names of these twelve animals, depending on how the animals crossed the water. The first animal to cross the water was a mouse – *сичған јілі*. That is why the beginning of the year is called by its name, and the word year is added and called as *сичған јілі* – the year of the mouse. After the mouse, animals crossed the water in the following order and their names became the names of years: *уд јілі* – the year of cow, *барс јілі* – the year of tiger, *тавишган јілі* – the year of rabbit, *нәк јілі* – the year of crocodile, *јілан јілі* – the year of snake, *јунд јілі* – the year of horse, *қој јілі* – the year of ship, *бијин јілі* – the year of monkey, *тақағу јілі* – the year of hen, *им јілі* – the year of dog, *тоғуз јілі* – the year of pig. After reaching the pig, the count starts with the mouse. “The year we wrote this book was the year of snake in the month of Muharram, four hundred and sixty-six (466). This year, when the four hundred and sixty-seventh year comes, the *јунд јілі* - the year of the horse enters. The calculation is done in the order indicated by me” (I, 234).

Similarly, the names of the moon are used in Arabic in cities. Nomadic and non-Muslim Turks call the months by four seasons. Every three months are run under the same name. That's how they know the year will pass. For example, in the first spring after Navruz, it is called *оғлақ aj*, and then *улуг (great) оғлақ aj* because the moon will be big at this time. The next one is called *улуг aj*, because this month is in the middle of summer, during which time there is an abundance of milk, hunting and land. We did not consider it appropriate to say them all because these names were rarely used (I, 235).

2. The interval, part of the exchange of this objective event in minutes, hours, days, years, etc. (OTIL, I, 448). In Devon, “the part of the day from sunset to sunrise, from evening to dawn”, as in modern Uzbek literary language, *тўн* (night, evening, I, 230), “the part of the day from sunrise to sunset” *кўн* (day, daylight, I, 305) and by the word *кўндўз* are used.

3. A period of time, a phase, set for a purpose or used for a purpose, in a continuous and consistent exchange of hours, days, months, years, etc. (OTIL<sup>2</sup>, I, 449). The seme of “The time of transition from night to day, the time of the end of the morning, morning” is expressed by the lexeme *эртä* (early, morning, morning time, I, 101) the seme of “the period of sunrise, morning, early morning” is expressed by *таң* (morning, I, 130), “time after sunrise” is expressed by *қушлуқ* (Oguz, I, 314), “half the day is over” is expressed by *öjlä*, in the Kipchaks *özlä* (noon, I, 94), “the period between sunset and night, evening time” is expressed by *ахшам* (evening; evening time; sunset, I,89)

4. A definite time of day, month, year, etc.; season, period. The seme “cold season of the year after autumn” is expressed by the lexeme of *қйи* (winter, I, 130) as in modern Uzbek literary language, while the semantics of “the hottest season of the year between spring and autumn” is expressed by *жај* (summer, I, 130), “the season between summer and winter season” is expressed by the lexeme *кўз* (autumn, I, 223).

5. The time when a work is done and enters into the judgement of habit. In Devon, the word *тўрк* is used to mean “the interval of time when something, event, incident, etc. occurs or will occur”, which is interpreted as follows: *тўрк* is a word used in the sense of time, which means the middle of the ripening of all fruits (I, 237): *тўрк ўзўм өдї* – grape ripening time (I, 237); *тўрк қујаш өдї* – the middle of the day (I, 237).

In short, the study of time-meaning lexemes used in Devon serves to clarify the perceptions of our ancestors about time.

“The elements of the world around us and their various signs, which are reflected in the human mind, are expressed in his language through special linguistic means, in particular, through lexemes. That is, there are certain lexemes that take place in the lexical system of each language, in the semantic structure of which the local sema occupies a central place, in which case the local sema is considered the central sema. Such lexemes are lexemes adapted to express locality. In modern Uzbek, there are a number of lexemes that express local meaning, such as o’rin, joy, makon, qishloq, shahar, ovul, o’lka, in which the local sema is the central sema, and this sema is the common sema uniting in the local area”. (Qurbonova) Similarly, lexemes, the local sema being the central sema, are widely used in Mahmud Kashgari's “Devonu lug’otit turk”, a unique manuscript of the 11th century. In the work, the word “känd” means “city” (I, 233)<sup>3</sup>. The word also means "village" in the language of the Oguzs and those close to them, and in the eyes of many Turks it is a "city", so they call Fergana “*өзкәнд*” - "our own city" and Samarkand “*сәміз кәнд*” – “fat city” for its size. The author also gives information about the use of “*сәміз кәнд*” as Samarkand in the Persian language. (I, 233-234). The following example confirms that in the 11th century the word “*кәнд*” was also used in the sense of "fortress": *бәг кәнд әгірсәдї* - bek wanted to surround the fortress. (I, 208).

Similarly, the word *улуш* is used in Chigils to mean “village”, but means “city” in the language of the people of Bolasogun and the Arguns living near them, so it is said that the city of Bolasogun is also called as *Қуз улуш* (I, 61). In Devon, the word *қаршї* with a local sema is

interpreted in one place as "palace" (I, 180) and in another as "royal palace" (I, 284). This word is used in "Qutadg'u bilig" in the form of a pair word *сарой қарши*. In Devonu lug'otit turk, the word *орду* is defined as "the city where the king lives; o'rda." Therefore, Kashgar is called *Ордуканд*, the city where kings live (I, 101).

In the modern Uzbek language, the word "maydon" is used for an "open land near the yard, a garden or a small garden, a backyard; generally open land or arable land which means a place intended for an action, an event, or a place where such an action takes place" (OTIL, 2, 527). In Devon, the word *қўму* is used instead of the word "maydon" in the modern Uzbek literary language. In the Moscow edition, the word is given in the form of *кōмū*, which means "roof" (I, 188).

Lexemes with local semantics used in Devon can be divided into the following groups:

1. Local lexemes denoting human habitation: in the work it is emphasized that the pair word *эв барқ* is always used together, not alone, and that it means "house and yard", "dwelling" (I, 235). The word *эв*, which has a local sema, is also used in the Old Turkic language in the form *эб*, meaning "home." The word *Алачу* means "alajuq; shelter, tent, hut" (I, 109). The Thesaurus Dictionary of the Uzbek Language also states that it is "кара, чайла." (OTIL, 3,107). Similarly, the word *кәпәрй* is said to be a "tent" in the Turkmen language, but in the eyes of the nomads it is a "winter house" (I, 299).

It is noted that the meaning of "tent" is used in such variants as *чатір*, *чачір* as well as *шатір* in Kujo language (I, 273), and *јашір* in Oguz (I, 273). In Devon, the Turkic word *түркүн* is interpreted as "place of people, tribal gathering, house of parents" (I, 295). The interpretation of the lexeme *чїт* in the work as "a tent made of reeds or plants with thorns" (I, 219) shows that this word is also related to the place where people live.

Localization is also expressed in secondary names formed by derivation. Such local lexemes are formed on the basis of a word-formation model of a particular language using special constructive tools. In the Uzbek language, such lexemes are formed with the help of suffixes such as *-zor*, *-iston*, *-goh*, *-lik*. (Qurbonova) In the language of the Karakhanid period, affixes such as *-лағ*, *-лік*, *-луқ* were used to form local lexemes. For example, like *туруғлағ* (accommodation, I, 329), *кїшлағ* (wintering place, I, 308), *кїшлік* (winter house; everything prepared for winter, I, 314), *қонуклуқ эв* (banquet house, guest house, hotel, I, 332).

The work also contains a number of other local semantic lexemes related to people, such as *кэрәм* ("basement" (I, 268) in the language of the Upper and Lower Chinese, *түнәк* (dungeon, prison (barsagancha) I, 274)). In "Devon", the word *түнәрик жәр* means "a dark place".

The word is also used to denote the meaning of "grave" on the basis of the semantic "darkness": *түнәрик* (*әр түнәриккә кирді* – a man entered the grave, I, 321), the word *тублу* (I, 288) also means "grave".

In the work, the word *кәбір* is interpreted as "liquor store, tavern" (I, 239). The editors of "Devonu lug'oti-t-turk" suggest that the word "kibitka" in Russian must be derived from this word *кәбір*. () In the work, we can meet words like *фурхан* (temple), *қарғу* (a tower-shaped building built on the highest ground to avoid the danger of the enemy, a place to light a fire to signify all rapid armament with the appearance of the enemy, I, 285), *сатма* (gardener's

scaffolding, I, 289), атіч (a deep place where children play walnuts, I, 55), and чумушлук (toilet, I, 331) that have the meaning of locality.

2. Local lexemes related to geographical objects: Lexical units with local meanings, such as valley, pass, gorge, mountain, ridge, road, etc., occupy a significant place in the work. For example, *cizpa* (gorge, valley in the Oghuz language, I, 283), *apm* (pass, I, 48), *öz* (gorge, mountain valley, I, 50), *qir* (flat mountain, ridge, I, 222), *act* (narrow road, narrow street in Chigil language, I, 48), *ybyz* (hard land), *yj ybyz* (low and desert land, I, 57), *ämiz* (border between two ravines, I, 57), *буқач apt* (a pass that is difficult to cross, I, 276), *алін* (round and high side of the mountain, I, 70), *тыруз* (fortress in the mountains, abode (I, 250), *тармұт* (hills and valleys of the mountains, I, 301), *бөктіp* (high and low lands in the mountains, I, 303), *талғиқ* (the place where mountains meet, I, 307), *јахшақ* (rocky place on the mountain tops, I, 311), *қадрaқ* (bent, ravine areas of the mountain), *ашақ* (foot of the mountain, I, 63), *узy* (hill, top, the city of argus is also called үзүкәнд I, 76), *үжүк* (in Oghuz language height, hilly places, I, 75), *özi* (in Chigil language, a wide road between two mountains, I, 78), *apғy* (between two mountains; the lands between Tiroz and Bolasogun are also called Apғy. Because it is between two mountains, I, 103), *қадрaқ* (corners of the rocks I, 219), *сәкрік* (places to jump on a mountain, I, 316), *әзизлік* (height, hill, I, 119), *азрiш* (the beginning of a split road, I, 83), *жол* (road, I, 132) *күткі* (soil pile, hill, I, 288), *таблук* (cracked land, I, 310), *әртiк* (walking path, I, 87), *опрi* (deep (burnt place), I, 102), *үжүк жәp* (sandy place, which sinks when it is stepped on by foot because of the abundance of water and other things, I, 75), *оңур* (cave 81), *қарқағ* (grassless and waterless place, arid I, 309), *отруғ* (island I, 84). "Mountains, plains, lowlands, hills, flat mountains, hills, ridges, valleys and ravines are the landforms of the earth's surface." (Islomov)

3. Local lexemes related to water structures. The following lexemes used in the work can be included in this group: *Кižir* (the shore of sea, stream, valley. The edge of anything is also called like this (I, 252), *түшүргү* (the place where the smaller water joins the river, the place where the mill water enters the river I, 323), *сүндiрi* (sea, I, 325), *сувлағ* (waterway, place where cattle drink water, I, 308), *қапчaқ* (place where water (stream) networks meet, collide, I, 313), *оғруғ* (crossing, breaking of the stream: *тағ оғруғi* - the place of breaking of the mountain, I, 84), *әрпim* (whirlpool, the place where the water whirls, I, 90), *алiш* (place where water flows into the pool, I, 60).

4. Local lexemes denoting the place where the plant grows include *бурдуз* (field, garden, orchard, I, 304), *тарiғлағ* (crop field, I, 329), *қабaқлiк* (a place or field where pumpkin grows I, 331), *қағунлук* (melon field, I, 332), *кәбәзлiк* (cotton field), *чәчәклiк* (a place where flowers grow I, 334), *тәрәклiк* (a place where poplars grow I, 334) *әрүклүк* (a place where peach trees grow), *сөкүтлүк* (place where the willows grow, I, 335) and others.

5. From the local lexemes associated with birds we find the word *қушлағ* (a place where birds are numerous, where they are hunted, I, 309).

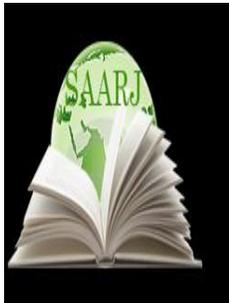

6. Local lexemes meaning the place where products are stored are also used in the work in a significant amount, such as *отунлук* (a place where wood is stored, I, 125), *тарiғлiғ* (grain warehouse, I, 330) // *тарiғлiғ* (grain storage, I, 331), *бузлук* (ice-storage place, I, 309), *үзүрлүк* k (place where millet is placed. When the last sound “kof” is soft, it means “owner of millet”),

*таварлик* (treasure, place of various goods, I, 331), *опу* (trench dug for the storage of wheat, turnips, and other things, I, 77).

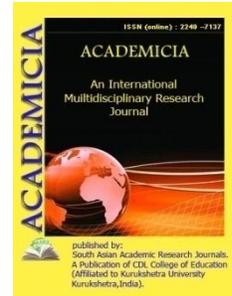

7. Local lexemes denoting the place where products are made: *tämiplik* (place where iron is melted and iron is removed, I, 333), *käpälik* (place where flour is made, bran is made, I, 334) and etc.

### ABSTRACT

*In the article issue of "lost generation", which is reflected in the E.M.Remark novels, has been investigated. This problem was studied by the example of the writer's novels "All Quiet on the Western Front" and "Three Comrades". Since a more extensive and in-depth study of works on the topic "the Lost generation" will serve as the basis for new results and materials in the field of comparative literary studies, this article is of urgent importance. From the article it is aimed to study the issue of interpretation of "lost generation" in the artistic literature on the example of Remark works. A scientific analysis of the artistic interpretation of war men through the novels "All Quiet on the Western Front" and "Three comrades", the classification of the features of the images of the "front soldier" and "former soldier" are the main tasks set before the article. On the issue posed in the article H.Kleyn, M.Parvanova, O.Pokhalenkov scientific materials of such researchers as were used. In the process of the analysis, examples from the artistic text of the works are presented, opinions are proven. At the end of the article, the results obtained through the analysis were summarized.*

**KEYWORDS:** "Lost Generation", The Novel, "All Quiet On The Western Front", "Three Comrades", Image, Interpretation.

### INTRODUCTION

One of the topical issues is the study of the direction "lost generation" in modern literature on a scientific basis. This direction, which was formed in Western literature in the first quarter of the XX century, is important in the comparative study of works on the topic of war. In comparative literature, there is not much scientific research carried out on the works created on the theme of

the first World War, exactly in the direction of the "lost generation". This problem is addressed by the well-known German researcher H.Kleyn also noted: "in modern comparative literature, works on the theme of the first World War have not been studied extensively enough" [1,17]. By studying the works of western writers on the theme of the first World War, it is possible to take a step to a new stage in the field of scientific research of the Uzbek military prose, further enriching the issues of comparative literature. In particular, the study of the novels of the German writer Erich Maria Remarque about the "Lost Generation" is in good effect in this regard. Various scientific studies have been conducted on the issue of the interpretation of the "lost generation" in the creation of Remarque. In particular, the issues of motivation, image and interpretation, expressed by the writer in his works on this topic, M.Parvanova, O.Pokhalev, A.Matveev it was studied in detail by such researchers. Including M.Parvanova focuses her main attention on the expression of motivations in Remarque novels in her monograph, which came out in Germany in 2003-th year. The researcher notes the study of the process of generating motivations using symbolic images, elements of symbolism in Remarque works as one of the main objectives of the work [2, 11]. Russian researcher O.Pokhalev Remarque's novel "All Quiet on the Western Front" ("Im Westen nicht Neues") divides the life of the protagonist in the work into 3 stages, comparing it with another German writer Arno Zweig's novel "Fatherland without a father" ("Vaterland ohne Väter"): 1) moving away from people; 2) front past; 3) rebirth [3, 110-111]. These stages are arranged on the basis of the processes in the consciousness and psyche of the heroes. In general, the theme of the war in the creation of Remarque, the image of the "lost generation" takes the leading place. In particular, the direct front-line past of representatives of the "Lost generation" forms the basis of the novel "All Quiet on the Western Front" ("Im Westen nicht Neues"). In this novel of the Remarque, the image of the tragic circumstances on the battlefield is reflected, the changes that have arisen in the minds, psyche of the heroes, who have seen the horrors of the front with their own eyes, teenager thrown into the battlefield. The following short sentences, which are listed at the beginning of the novel, serve as the author's preface: "This book is neither an accusation nor pardon. It is simply an interpretation of the dream about a generation that was died from the very beginning of the war, although it survived the lily of the arrow, but became victims of this war." (*"Dieses Buch soll weder eine Anklage noch ein Bekenntnis sein. Es soll nur den Versuch machen, über eine Generation zu berichten, die vom Kriege zerstört wurde – auch wenn sie seinen Granaten entkam*) [4,2]. From the initial sentences, brief information is provided about the content of the work. During the events of the work, this small information is described as living life landscapes through artistic images. The tragic fate of the younger generation, who took part in the war, is described by the example of the fate of several typical images: Boymer, Kropp, Muller, Tyaden, Leyer, Kemmerix, Katchinsky. These heroes dream of sacrificing life for Homeland, not winning or becoming a hero, but quickly returning to their homes, to a peaceful life. At this time, these heroes are described in a situation where they lost their spiritual appearance in the influence of war, became people devoid of high dreams or goals. However, they nevertheless managed to preserve their human qualities to some extent. They realize the original truth as soon as the war itself. The following points from the language of the work, the protagonist Paul Boymer, are evidence of this: "they were still writing articles, speaking speeches; and we could see that the portable hospital soul was surrendering. They still have no higher blessing than to serve the motherland, ayuhannos said; and we knew that the horror of death was stronger than it... we fell from the it to the whirlpool of a terrible loneliness, now we need to find ourselves the way out of this

whirlpool." (*Während sie noch schrieben und redeten, ashen wir Lazarette und Sterbende; – während sie den Deinst am Staate als das Größte bezeichneten, wußten wir bereits daß die Todesangst starker ist... Wir waren plötzlich auf furchtbare Weise allein; – und wir mußten allein damit fertig werden*) [4,12]. In this small fragment, the attitude of the younger generation to the war process is expressed. It also reflected the conflict between the younger generation sent to war and the representatives of the government who sent them to the front. The ruling circles, which are supposed to be "they", are shown as the main cause of the tragedy of young people in the front. This is also important with the feature of exposing sentences. In this way, the novel "All Quiet on the Western Front" reflects the visions experienced on the front of young people who were deceived by the ruling circles and sent to war, their attitude to war and the evolutions in their minds. The novel is told from the language of the protagonist Paul Boymer. Paul's past reflects the experience of a whole generation involved in the war. Boymer and his friends are described as young people whose worldview has changed as a result of the war, thinking about life as old people. The longer the hero lives in the war, the more he hates and suffers from such a life. Also in this novel is described a "cliff", which appeared due to the war between the two generations. The writer assesses the beating as an injustice committed against the younger generation. This attitude of the author is expressed through the experiences of the heroes. The concept of "enemy", which the author interprets, requires special attention in this novel. A.Pokhalenkov, focusing on this issue in his candidacy dissertation, which he chose in 2011, emphasizes that from the very first stage of Remark's creation, he emphasized the notion of the enemy: "in Remark's creation, both "military enemy" and "ideological enemy" appearances are reflected in the novel "All Quiet on the Western Front", one of the first major works "[5,11]. In the novel, When Paul Boymer and his friends talk about enemies, they mean their high-ranking leaders, and not the soldiers on the other side. The heroes of the work see their bosses much worse than the Franks, who are "military enemies". Especially important in this regard are the images of Kantorek and Khimmelshtoss. Kantorek is a school teacher, Boymer and his classmates, among which the whole school brought up teenage boys in a chauvinistic spirit, under false patriotism ideas, personage, who supplied young soldiers to the front through ideological propaganda. And khimmelshtoss is a small officer who teaches them military exercises before sending these "trained" young people to the front. In the novel, Kantorek and Khimmelshtoss are interpreted as typical representatives of the state, which mobilized German youth for war. But the attitude of the young soldiers who saw the war to them is described in a negative way. They often remember Kantorek and have a critical attitude towards him. They beat khimmelshtoss by the moment. In the ninth chapter of the novel, the meeting of the soldiers with the Kaiser is described. Here in the process, thoughts about the war, which were told from the Katchinsky language, determine one of the main ideas of the work: "...true, but it should be taken into account that we are ordinary people. In France, too, there are a lot of workers, craftsmen and petty servants. But did any French locksmith or kosibi attack us? No such work will be solved in the government office. I did not meet any frantic until I got here, they did not see German either. Just like us, no one asked them." (*...Richtig, aber bedenk doch mal, daß wir fast alle einfache Leute sind. Und in Frenkreich sind die moisten Menschen doch auch Arbeiter, Handwerker oder kleine Beamte. Weshalb soll nun wohl ein französischer Schlosser oder Schuhmacher uns angreifen wollen? Nein, das sind nur die Regierungen. Ich habe nie einen Franzosen gesehen, bevor ich hierherkam, und den moisten Franzosen wird es ähnlich mit uns gehen. Die sind ebensowenig gefragt wie wir*) [4,150]. For Katchinsky, all soldiers are victims, regardless of their

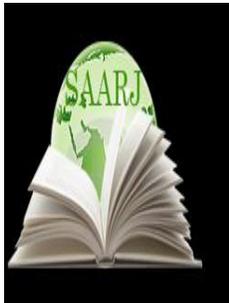

origin and where they are. While the Remark describes the tragic fate of German youth in the war, the problem raised in the novel is interpreted as a global problem not only of the German people, but of all the nations involved in the war, of all mankind. Remark's novel "Three comrades" also depicts various destinies and characters who took part in the first World War, striving to find their way in life after the war. The writer tells about the rather grown-up representatives of those soldiers in the novel "Three comrades", when a soldier of teenage age in the novel "All Quiet on the Western Front" describes the life of a young man directly on the front. The game explains what happened ten years after the war. However, the heroes of the work could not get rid of the negative impact of the war. In the images of their spirituality, their relationship with society, this is clearly expressed. In the dialogue, actions of the heroes of the work, in the comments of the protagonist Robert Lokamp, the characteristics characteristic of the "lost generation" are clearly visible. Heroes such as Robert Lokamp, Otto Kester, Godfrid Lents are considered images of generalization of people who have lost their faith in any ideas and ideologies, who consider the laws of society meaningless and useless, and artistic reflection of the characteristics inherent in people of 20-30-ies. They are people with their own etiqod and worldview, even if they are described as "little people" who have not found their position in society. In the following sentences from the language of the novel's protagonist Robert Lokamp, the character and spirit of the heroes are reflected: "We wanted to fight against all that has been committed to our past – against forgery and selfishness, greed and cruelty; we remained tolerant and did not believe anything other than our close friend, the sky that never deceived us, tobacco, trees, ..." (*Wir hatten marschieren wollen gegen die Lüge, die Ichsucht, die Gier, die Trägheit des Herzens, die all das verschuldet hatten, was hinter uns lag – wir waren hart gewesen, ohne anderes Vertrauen als das zu dem Kameraden neben uns und das eine andere, das nie getrogen hatte: zu den Dingen – zu Himmel, Tabak, Baum und Brot und Erde...*) [6,71]. In this passage, the definition of the hero to that period and society was also expressed.

In the novel, details such as various sketches about the social life of that period, in particular economic hardship, unemployment, confusion in people and the loss of confidence in the future, are explained by the image of Jesse. He is described as follows in the game: "...he is afraid of being unemployed and lives in constant danger. If he is expelled from work-that's all. He was forty-five years old. No one can hire a person at this age. Earlier it was not so, the fallen man could again stand on his feet, and now the layman is doomed to lifelong unemployment." (*...der Mann hatte ständig Angst, seinen kleinen Posten zu verlieren. Dann war er fertig. Er war fünfundvierzig Jahre alt. Niemand nahm ihn mehr, wenn er einmal arbeitslos wurde. Das war das Elend – früher sackte man langsam ab, und es gab immer noch wieder Möglichkeiten, hochzukommen –, aber heute stand hinter jeder Kündigung sofort der Abgrund der ewigen Arbeitslosigkeit*) [6,30]. Through this image, the social problems of the era and their impact on the life, psyche of man are expressed. Deprived of family happiness, peace and well-being, this personage is a typical image of people who became victims of a difficult life and environment in the post-war period. Among the heroes of the novel, The image of Ferdinand Grau stands out separately. He is a personage who, looking at the photo of the deceased people, draws a portrait of them and makes a living through it. Grau could have been a mature artist or philosopher in other contexts. His worldview, characteristic of the Creators, his deep philosophical orientation to various aspects of life are described separately. Remark claims that the war through it also had a negative impact on the fate of the creators. The image of Grau is reflected in the post-war era as a typical representative of talented artists who suffer in a spiritually disturbed environment,

have not found their way and place. The image of Valentine Gauzer also has a distinctive feature. This hero is a personage who survived death because of a happy coincidence in the war, received a great inheritance after the war, spends his time drinking only in cafes and restaurants. This hero has more opportunities than the rest of the personages to change his life on the positive side, but he also does not live with high goals and sublime ideas, like other images in the work. The presence of such a mood in the psyche of all the heroes of the work is their common feature. This is also an important aspect inherent in the heroes of the "Lost Generation". Well, the theme "lost generation", in which the negative complications of the first World War are described in the work of Erich Maria Remarque, is the leading one. It is desirable to classify the images in these works as follows. 1) soldiers fighting on the front. For example: Boymer, Tyaden, Muller, Katchinsky and etc. ("All Quiet on the Western Front"); 2) former fighters who returned from the war, but live under the negative complications of this war. Ex: Lokamp, Kester, Lents, Gauzer ("Three comrades"); 3) people of different categories whose life was in ruins because of the negative consequences of the same war, even if they did not participate in the war. Ex: Grau, Xasse. ("Three comrade"). All these heroes are united by the characteristic of suffering from a negative complication of the war.

**MOMINJON TASHKIN'S EXPRESSIONS OF OLD SCHOOL  
 EDUCATION IN THE WORKS OF LIFE**

**Shergoziyeva Gulnozaxon Adahamjonovna\***

\*Doctoral Student,  
 Andijan State University,  
 UZBEKISTAN

**ABSTRACT**

*This article describes the social, cultural and educational life of the early twentieth century, the events that took place during this period, and views on the root causes of these events. The work on marriage attempts illuminates the views of the old school education of this period with evidence.*

**KEYWORDS:** *Marriage Attempts, "Memory Novel", Jadid, Korpa Mahdum, Old Age Science, Old School, Student Science, Hashar.*

**INTRODUCTION**

In the history of Uzbek literature, there are not many works that reflect the cultural and educational life of the early twentieth century and provide information about the events that took place during this period. Mominjon Tashkin narrates her experiences in her book, *Trying to Get Married*. This work by Mominjon Tashkin is called the *Novel of Memory* in recent scientific researches. In it, the author tells as much as possible about his childhood, adolescence and adulthood. Mominjon Tashkin, as a literary scholar, journalist and Jadid representative of his time, like other Jadid writers, tried to describe the old school and madrasa education, the state of science of teachers and students, the backwardness of the old school system, the superstitious people and the new madrasa, the new way of life. through them, to put it mildly, in order to exemplify at least a little of the ignorant and ignorant people.

Mominjon Tashkin says that as a child he was educated in the old way and had no idea about the new school. Therefore, he remembers studying in an old-fashioned school. In the ancient school, "Zahidkhan Qori, nicknamed Korpa Makhdum, began his studies as a teacher, and the style of dress, which was very suitable for a dusty school where the teacher worked a little, and the flaws in the character of the people of Turkestan at that time.

"Some school children, who had in their nature many of the old patients of Turkestan, and who had black eyebrows and black eyes like a red apple, had fewer than the edges of their eyes," he said. In this play, Mominjon Tashkin describes in detail the social, political, cultural and educational life of the time, from the teaching methods to the appearance of the old schools. The old school has a capacity of 30-40 students in a kindergarten that can barely accommodate 25 people. It is clear from the author's description that those who read the Qur'an do not understand its meaning, do not feel what they are reading, and blindly organize themselves: We lived on horses and carts. We would throw our balls at each other, beat up our parents and grandparents, ride on each other's shoulders and necks, scatter school dust, and make noise and riots. According to the modern times of our school, gymnastics (educational body) was the same, and the east was the same. "[2] When he had a teacher, he would shout, shout, and shout, "Chorkitob, someone Sofi Allah," "Sabot-ul-Ojizin," "Maslak-ul Muttaqiyn," Khoja Hafiz, Navoi, Fuzuli, Bedil, "Quran, Haftiyak, and small suras." -the vibrations flow, and these shouts flow only because they are afraid of the teacher's staff and sticks, which allow the reader to clearly imagine the state of the student's science of these times. According to Boz Mominjon Tashkin, the students were acquainted with the works of Sofi Alloyar, Navoi, Fuzuli, Bedil, Khoja Hafiz. To whatever extent, they have studied the works of the above-named writers. Not only is this education unsystematic, they have learned it in a complicated way. Moreover, "The situation, which is called the science of old age, was so bad that it was left to the different purposes of the madrasa teachers at the same time. In fact, reciters in Islam have memorized all the surahs of the Qur'an and are considered to be the ones who recite them, but by being knowledgeable, we can see how greedy the people of that time were and how they used this knowledge in a hypocritical way. "Even though this is a conspiracy in the Islamic world to buy the Qur'an during Ramadan and to spend time on food, there were some interesting beliefs among Muslims about it," he said. A person who is a reciter of the Qur'an will have a higher rank than the great scholars.

To achieve such an honor, to praise his father for being a good man for his son, he wanted his father to be a qori, to try for three or four years in this arduous work and to do nothing, and to say that his life was wasted: and took his son as a qori, Kob was a good man! My father wanted me to be a qori in order to get the compliment, and my teacher was determined to do the same. [4]!"

Although they did not organize anything, his teacher, like all schoolteachers, took him to the garden yards and used him for a few days under the name of hashar, which neither the parents nor the mullahs could say a word against. For the time of the author's life, the school was not a sacred place of learning, a place of learning, but a place where a child feels sad when he grows up, and a little like a prisoner in childhood. Behind this "old age" he ate a lot of sticks and fled to faraway places, recalling the hardships he experienced: Kob's sticks were broken, his back was cracked, but I couldn't take advantage of a penny mania, a baby. One day I escaped from this school prison, where a heavy freedom that I could not lift was lost and my life was wasted. When I left school, I was 12 or 13 years old, I was illiterate and illiterate, and I was very dry. "[5]

This is just one example of the life of the old schools and student sciences of the late nineteenth and early twentieth century's. As Mominjon Tashkin remembers his school years as a child, his method embodies a vivid picture of the ancient schools of the early twentieth century. The hard work of the people of that time in mastering the profession of greed and hypocrisy under the guise of old age, and the fact that six- or seven-year-olds are engaged in hard work instead of

learning, are evidence that most teachers are dishonest and do not follow the flow of knowledge. According to this work of Mominjon Muhammadjanov, due to the social environment of this period, in accordance with the requirements of the time, mullahs had to master the science of old age in order to live a good life in the future and become a respectable person. However, the marriage system states that the education system and procedures of that time did not achieve this goal: "Although we started this work as a long-suffering and great tool of tama with 6-7 children, we tried for 3-4 years and could not achieve anything. our lives have been in vain." [6]

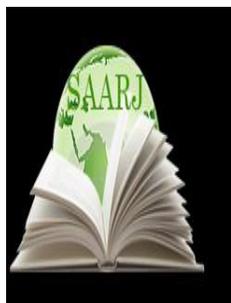

One of the reasons for this is that the ancient schools were both economically and spiritually backward. It is known that until the beginning of the XX century, people who graduated from madrasas in mosques, those who were interested in education, opened schools in their homes, in special buildings of the neighborhood and called them schoolchildren. There was no official curriculum for the old schools, and after learning the Arabic alphabet, the main focus was on reciting and memorizing the surahs of the Qur'an and teaching the works of great poets. The author's primary education was in such circumstances.

For centuries, the local schools, which brought up great scholars and thinkers, and included them in the ranks of scientists, were completely cut off from world development for the last 3-4 centuries, and the education system was in disarray. The fanatics who distort the laws of Islam and the verses of the Holy Qur'an are, moreover, colonialists. Conditions had exacerbated the situation. Therefore, as described in the play, encountering situations had become commonplace at that time.

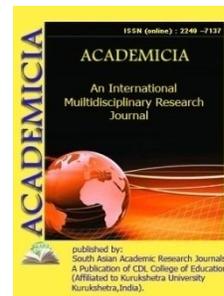

According to Korina, M. Tashkin's work *The Ways of Marriage in the early twentieth century* gives the reader a vivid picture of the ancient schools and madrasas and the social landscape of the period. This is the peculiarity of the work.

## ISSUES OF EXPANSION OF TERRITORIAL PARTICIPATION IN THE CONTROL OVER THE IMPLEMENTATION OF LAWS

**Ruzimat Juraev\***

\*Doctor of Political Sciences,  
 Namangan State University,  
 UZBEKISTAN

### ABSTRACT

*The issues of implementation of the laws adopted today and control over the state of their execution are becoming an integral part of the legislative process. After all, in the process of controlling the implementation and enforcement of laws, the need to improve them or adopt new laws is determined. "Unfortunately, - the President of Uzbekistan Sh. Mirziyoyev noted – at the moment, the impact of laws on the effectiveness of reforms is quite noticeable. Their role in the direct regulation of social relations remains low"[1]. Elimination of these shortcomings sets the task of ensuring the implementation of laws in places, as well as further the control of the parliament and the public, including territorial communities.*

**KEYWORDS:** *Implementation, Unfortunately, Enforcement*

### INTRODUCTION

The law, which does not have a mechanism of implementation and the necessary social economic conditions, does not yield as much as expected, practically remains in motion. As a result, the subjects of the legal attitude are deprived of the opportunity to exercise their rights and protect their interests as prescribed by law. This leads to reverse negative consequences [2]. The implementation of laws and the control over their implementation confirm that their entry into the competence of local authorities and self-government bodies is one of the pressing issues of improving their activities in this regard.

In the practice of Uzbekistan and other countries, laws are implemented by the head of state, the government, ministries, local authorities through the adoption of legal acts, that is, under the law. The self-governing bodies of citizens also have the authority to establish public control over the execution of laws[3]. This means that local authorities and self-governing bodies of citizens

participate in the adoption of legal acts aimed at their execution in the implementation of laws and carry out it in the form of control over the compliance of subordinate acts with the laws. But today, the participation of local authorities and citizens in the implementation of laws, including the development of under-law documents, as well as the lack of efforts to establish public control, territorial participation plays an important role in the effective implementation of mass policy in general.

The stage of implementation of laws according to the proposed model of mass policy-making in the European Union[4]: understanding the factors for achieving the intended goal; assessing opportunities; setting responsibilities; selecting the means; harmonizing; covering the actions for the responsible. These activities provide for the involvement of the general public, including local authorities and self-government bodies of citizens, in the adoption and implementation of legislation. After all, in order for the right to serve to prevent deviations in social development by supporting social communicative relations, it is necessary to apply the intermediary rules aimed at ensuring the participation of citizens in the process of applying the right. The legitimacy of the law is ensured by the means of democratic food, thanks to which the concept of deliberative democracy, developed on the basis of communicative understanding of law, can be the basis of solving problems in law[5].

Today, various models of relations between the subjects of the political network have been developed. Conflicts of these relations can be attributed to other models of systemic regulatory regulator [6]. The normative regulatory model of power and business cooperation consists of various norms that regulate the conduct of people in political life, in particular, setting their own requirements, turning these requirements into decisions and the processes of their implementation [7]. From the above, the unification of the laws and the adoption of legislative acts, subordination to general rules plays an urgent role. The difference of subsoil documents from laws is that they are aimed only at regulating issues within the framework established by the relevant law. It is thanks to this that the powers of local authorities and citizens self-governing bodies to implement the laws require them to engage in the preparation of all subsoil documents. After all, in Article 101 of the Constitution of Uzbekistan, it is established that local authorities shall implement the laws of the Republic of Uzbekistan, decrees of the president of the Republic of Uzbekistan, decisions of the higher bodies of state power, participate in the discussion of issues of Republican and local significance[8]. But both in the legislation and in practice of Uzbekistan, the failure to fulfill this requirement sufficiently can be cited as a situation that negatively affects the effective implementation of laws.

In Uzbekistan, like other countries, the government plays a key role in the implementation of laws. In Article 1 of the law "On the Cabinet of Ministers of the Republic of Uzbekistan" it is established that the Cabinet of Ministers the government of the Republic of Uzbekistan - is the executive authority that ensures the effective activity of the economy, social and spiritual sphere in the Republic of Uzbekistan, the laws of the Republic of Uzbekistan, the decisions of the Oliy Majlis due to this, ensuring the participation of territories in the adoption of decisions and orders of the Cabinet of Ministers is of urgent importance.

According to paragraph 18 of the regulation of the Cabinet of ministers, issues for consideration in the Cabinet of Ministers can be entered by members of the Cabinet of Ministers, Heads of state and economic management bodies, chairman of the Council of Ministers of the Republic of

---

Karakalpakstan, khokims of regions and Tashkent city, and in exceptional cases their first places[10]. The introduction of issues for consideration in the Cabinet of Ministers by the chairman of the Council of Ministers of the Republic of Karakalpakstan, the governors of Regions and Tashkent City is an important form of regional participation. But the lack of information about such participation indicates that it is not actively used. However, such a norm allows to enter into the Cabinet of Ministers issues related to the implementation of laws in their territories through the relevant governors of the councils of people's deputies.

In Uzbekistan, general information is given to the population on the issues introduced in the Cabinet of Ministers not only by the governors, but also by members of the government. In practice, there is not enough importance attached to the development of government decisions, nor to the implementation of them, nor to the issues of population involvement. For example, in the main provisions of the Cabinet of Ministers' decrees of the president of the Republic of Uzbekistan, the organization and control over the execution of decisions and orders of the Cabinet of Ministers[11], in the standard document on the organization of proceedings and execution control in the apparatus of ministries, state bodies, agencies, corporations, concerts, associations, companies and other central institutions

Maintaining a public policy, ensuring the legality of the acts under the law that are being adopted, is not only a decision-making process of citizens, but also requires the participation of Buckley in any activities of the government, that is, to ensure awareness. For example, in 1976, the US Congress adopted a separate law "on transparency in the authorities". In accordance with this law, in addition to some exceptions, mainly related to national insecurity and inviolability of personal life, it was established that government meetings should be held in an open order for the public. It was determined that the state bodies should inform the general public in advance about the upcoming meetings, their agenda and conduct public records on the results of the meeting. In addition, a group of government officials, who gather to make decisions, has given a comprehensive definition to the concept of "Assembly" of this law so that their meetings do not make excuses that they are informal[13]. Such experience is available in a number of foreign countries, and the issues of its use in the CIS countries are studied in detail[14].

At the same time as the adoption of legislation, a departmental approach to their monitoring process or an approach only from the point of view of the interests of a particular social group should be strictly adhered to the transparency print-out in order to prevent them from taking precedence over the interests of society, human beings. It should be noted that the involvement of non-profit organizations, political parties and other interested organizations in the process of monitoring legislation in the formation of civil society is of great benefit. Participation of various political parties and other public associations, social groups in the implementation of legislative monitoring plays an important role in ensuring public participation in the legislative process. Ultimately, the democratic situation formed in the Republic allows to take into account the public opinion in the laws by publishing it in the press, embodying the interests and will of different social strata[15].

Along with the normative legal acts of the government, there is also the need to attract the general public to the development and adoption of projects of legal acts of some individual character. Because with such documents, programs with the implementation of the law, that is, important tools for the organization of management, are approved. They constitute a set of

resources, performers, scientific-research, production, socio-economic, organizational-economic and other activities related to the periods of implementation aimed at ensuring the effective economic, environmental, social and cultural development of the state. These programs are aimed at achieving the goals set by state bodies, solving important economic and social problems.

Although the development and implementation of state programs is considered to be one of the tools widely used in public administration, some criticize the software approach and Vex its inefficiency. In practice, however, it is necessary to critically approach and improve the forms and methods of developing and implementing programs, and not the programming approach. Because the programming style of public administration allows to concentrate the available opportunities for solving a particular problem, to unite the aspirations of all interested organizations and involve the population in this process, set specific goals and develop a strategy designed for the far off.

In general, only higher and central authorities in Uzbekistan annually develop and implement more than 150 state programs. This situation shows that the method of programming is widely used in public administration and the need to further enhance the participation of citizens in the development and implementation of state programs. It is also a direct link to the formation of criteria and measures for assessing the participation of citizens in the adoption, implementation of laws and underground attacks of the law. This process is recognized in jurisprudence as the study of the effectiveness of legislation kiss [16], its implementation meal is not sufficiently formed [17]. However, the evaluation is a set of methods and means of measuring, studying the results of which are aimed at improving the public policy or programmes implemented[18]. The legislative evaluation meal will serve to conduct a mass policy, giving them the opportunity to regularly improve.

Evaluation of laws according to the proposed model of mass policy-making in the European Union[19]: control (observation)/obtaining explanations; comparison of the results achieved and sought; conclusion; the implementation of measures for the introduction of amendments, depending on the need. It can be seen that effective control over the implementation of laws allows to correctly assess the results achieved, compare them with the results achieved and, if necessary, introduce amendments to them. Due to this, it is of urgent importance to clarify the assessment measures for the implementation of laws, to expand the participation of regions in this process.

Evaluation activities are generally divided into specific types, forms and stages, and it is clear that the formed monitoring system, that is, is a phrase from the collection, transmission and analysis of necessary information. Evaluation: 1) to evaluate the process of implementation; 2) to evaluate the results achieved; 3) to evaluate the consequences; 4) to evaluate the types of economic efficiency, while the evaluation research is divided into the types of scientific and traditional research[20]. Scientific research makes it possible to obtain complete and objective information.

The above types, styles and forms of evaluation together constitute the content of political communications. After all, the institutionalization of political activity of political communication is based on the expression of information exchange (information development, transmission, its understanding and interpretation) in the interaction of subjects of the political process in order to

---

give it a new meaning and increase its legitimacy[21]. Due to this, the assessment is used in various processes, including at all stages of decision making, including in the implementation of political and administrative control. In turn, in the implementation of political or administrative control, parliamentary hearings of assessments, hearings of reports of officials and other traditional forms of reporting are used.

Today, control over the execution of laws is carried out by several organizations. The leading role of the parliament among these organizations indicates the development of parliamentary control, that is, its relevance in this process. President of the Republic of Uzbekistan as Mirziyoyev noted, "... life itself dictates the introduction of the procedure for examining the actual situation in cities and districts and introducing the report of the relevant leaders into the discussion of the session of the councils of people's deputies in order to form an effective framework of parliamentary and public control"[22]. In carrying out these tasks, public policy-making, including territorial participation, Serves development.

The French researcher B.Shantebu believes that even historically the legislative function came from him, noting the importance of the supervisory functions of the parliament[23]. The task of control in the practice of world parliamentarism is manifested differently and it reflects the uniqueness of the state system and the mutual ratio of its institutions[24], the questions of polls and parliaments, the work of committees and commissions, parliamentary hearings, distrust votum, rebuke, impichment, etc. it is carried out in the form of larvae[25]. As can be seen in the example of Uzbekistan and Russia, parliamentary control is the control over the execution of laws of federal and subjects of the federation on the basis of spheres of activity, control over the activities of the government of the Russian Federation and executive authorities of the regions; parliamentary financial control; control over observance of human rights; control over

Prof. A.Saidov gives the following definition of parliamentary control on the basis of an analysis of the concept of parliamentary control from different points of view: "parliamentary control – a set of measures aimed at checking the effectiveness and implementation of the current laws and checking the strict compliance of the activities of executive authorities with the legislation and norms of law, as well as measures Prof S.Odilkhuaeva, emphasizing that it is possible to strengthen functional relations between representative bodies of different levels with the help of legal, organizational and supervisory forms, and that today the councils of the Senate, people's deputies and their permanent commissions have sufficient powers, adequately criticizes their lack of full use of these methods. In his opinion, the legal form of cooperation is carried out through the adoption and strengthening of norms that have legal meaning in them[28].

Cooperation between representative bodies can be interpreted as a return link in the modern political process. Due to the slowdown in such relations, the political system is leading to the loss of social support[29]. However, in the social management system, control itself is an important type of return link, through which the subjects of power receive information about the current situation, the execution of decisions[30]. It should be noted that the establishment of effective return relations, on the one hand, affects the quality of decisions in the system of state bodies, since bilateral communication is a motivation for political action, on the other hand, increases the capacity of communication participants in the performance of the functions of state power entrusted to them[31]. In this regard, control is becoming one of the urgent issues of establishing irreversible relations, that is, modern political communication.

Parliament's powers aimed at controlling the activities of the government also serve to keep it in full swing and balance. From this point of view, a separate law "On parliamentary control" was adopted in Uzbekistan. Particular attention is paid to the control of government activity in the activities of the Parliament of Uzbekistan, work is being carried out to clarify and further strengthen the legal position of the institute of parliamentary inquiry, which is widely used in the parliaments of developed countries, to reflect in the legislation such control methods as parliamentary investigation, impeachment[32]. But often after a strong control-analysis work conducted, data on monitoring and analysis carried out on the execution of decisions are not made available to the general public[33].

At present, the accountability of the executive power before the legislative power is defined as one of the indicators of the "second generation" of public administration, that is, latest[34]. As noted by the head of our state "... On the basis of the system introduced by the first president of our country, when the respected speaker of the legislative chamber and the chairman of the Senate arrive at the places, the heads of local authorities, prosecutors and internal affairs should pay special attention to the extent to which they carry out their duties, the problems of thinking the population, how they

Improvement of the implementation of the powers of public control of meetings of citizens in the implementation of parliamentary control, in general, the implementation of laws, is of paramount importance. The study of the activities of the meetings of citizens shows that the activities of the exercise of public control on them are not well organized. For example, the reference on the results of the study of the implementation of the law of the Republic of Uzbekistan "on self-government bodies of citizens" in the region of Syrdarya indicates that public control over the execution of laws and other legislative acts, as well as their decisions at the meetings of citizens is quietly established[36].

Also, work on listening to the information of prosecutors of the self-governing bodies of citizens is not sufficiently tolerated. It is known that in accordance with the fifth part of Article 5 of the law of the Republic of Uzbekistan "On prosecutor's office" adopted in the new edition on August 29, 2001[37], prosecutors of regions, Tashkent cities, districts and cities and prosecutors equated to them inform the relevant councils of people's deputies, and, if necessary, the self-governing bodies of citizens about this norm creates the necessary legal basis for the prosecution authorities to attract the general public to control over the execution of laws by ministries, state bodies, departments, self-government bodies of citizens, public associations, enterprises, institutions, organizations, governors and other officials[38].

Even at meetings of citizens, hearing the information of prosecutors serves to ensure legitimacy in the relevant territory and increase the effectiveness of combating crime. Because, in addition to ensuring transparency of the activities of state bodies to hear the information of the prosecutor's office, the attention of the citizens' self-governing bodies serves to focus on topical issues, public activity and control.

In establishing public control over the execution of laws, it is of particular importance that the meetings of citizens hear reports of the heads of district, city and regional authorities on issues entering into the sphere of activity of self-governing bodies of citizens in every quarter of the year. But the implementation of this authority is also not well established at the meetings of the majority of citizens. As the head of our state noted, on the basis of the principle of "Justice is the

rule of law", we shall continue our work aimed at respecting the law in our society and feeling of intolerance to the cases of violations. To do this, it is necessary to make extensive use of the opportunities of the neighborhood first[39].

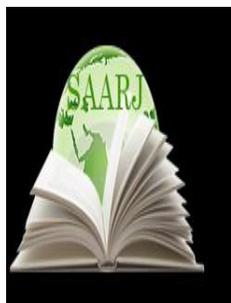

In conclusion, the adoption of laws and subcommittee documents as a continuous and interrelated process makes it possible to conduct a mass policy, that is, to involve various actors, including territories, in this process. Such a process serves to raise the role of the parliament in the implementation of state power and to estimate the practical participation of territories in this process. In turn, territorial participation leads to the harmonization of universal, territorial and individual interests in the decision-making process.

### INTRODUCTION

Education in a narrow sense refers to the concept of teaching. But it is not only the process of training in various educational institutions, but also the process of mastering information in the family, production and similar fields.

Education embraces knowledge and education, pursues the goal of developing the power of the Republic in the field of intelligence and science, forming a harmonious free person in all respects, realizing his or her activity before society, family and the state. Therefore, it is also considered a priority sphere.

As we know, regardless of gender, language, age, race, national origin, religion, social origin, type of service, social status, residence, how long the hag lives in the territory of the Republic of Uzbekistan, equal rights in obtaining knowledge are guaranteed[1].

Education is declared a priority in the field of social development of the Republic of Uzbekistan.

The main principles of public policy in the field of education as follows[2]:

- The fact that education and training are of a humane, democratic character;
- Continuity and consistency of education;
- General secondary, as well as secondary maxis, compulsory vocational education;
- Secondary maxsis, the direction of vocational education:
- The choice of study in the academic lyceum or vocationalcollege;
- The fact that the educational system is of a secular character;
- Openness of education for all within the framework of state educational standards;
- differentiated approach to the selection of educational programs;
- To be educated and to be gifted talent;
- Harmonization of state and public administration in the educational system.

Educational activities include the following:

a) The acquisition of information about the necessary characteristics of the universe for the successful organization of a certain type of experimental and practical activity (the product of this process is knowledge);

b) Mastering the methods and means by which these types of activities occur (the product of these processes will consist of skills);

C) To choose the right way and method in accordance with the intended purpose and condition of the issue, as well as to master the methods of using the specified information for control (the product of this process will consist of qualification).

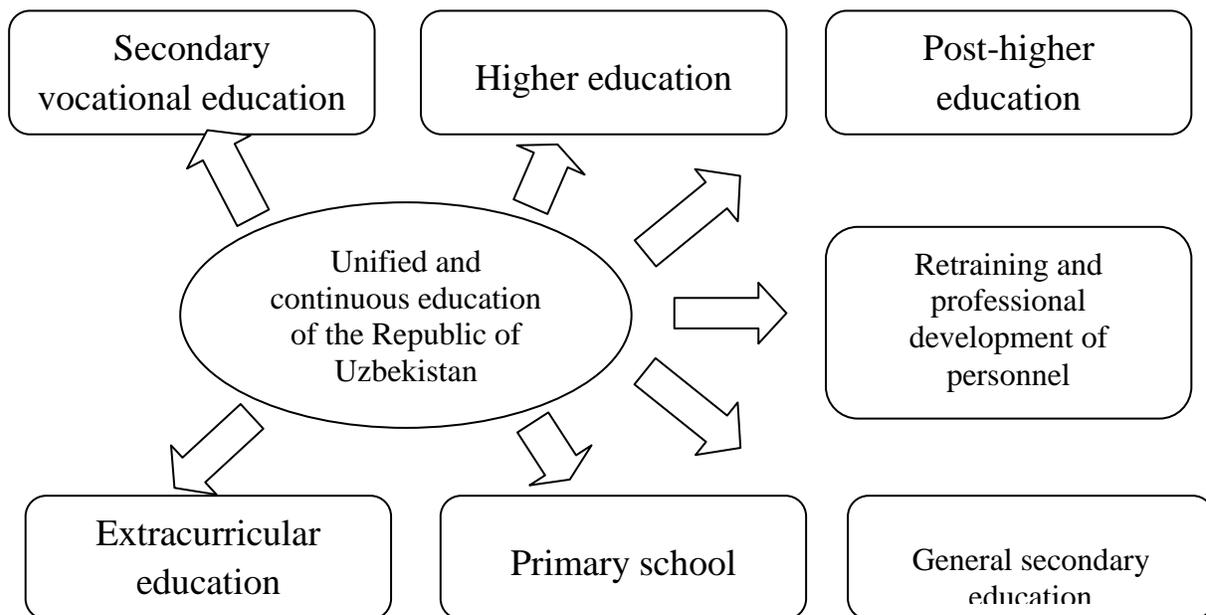

- State and non-state educational institutions implementing educational programs in accordance with state educational standards;

- Scientific-pedagogical organizations carrying out the necessary research work for the functioning and development of the educational system;

- State bodies of government in the field of education, as well as enterprises, institutions and organizations under their management. The education system of the Republic of Uzbekistan is unique and holistic. Education in the Republic of Uzbekistan is carried out in the following ways:

- Pre-school education;
- General secondary education;
- Secondary vocational education;
- Higher education;
- education after higher education;
- training and retraining of personnel;

- extracurricular education.

**1-picture. Education system of the Republic of Uzbekistan[3].**

The general management of the educational system is carried out by the Cabinet of Ministers. In addition, the Cabinet of ministers directly manages the branches of a separate higher education institution, Tashkent Islamic University, as well as International famous foreign universities (MSU, Westminster University, etc.).

The competence of the Cabinet of Ministers of the Republic of Uzbekistan is as follows:

- carrying out a unified state policy in the field of education;
- To lead the state educational management bodies;
- Development and implementation of educational development programs;
- establish procedures for the creation, reorganization and abolition of educational institutions;
- Determination of the procedures of accreditation, pedagogical and scientific personnel attestation of educational institutions;
- granting permission to educational institutions of other countries to provide education on the territory of the Republic of Uzbekistan;
- to establish the procedure for recognition of educational documents of foreign countries in accordance with the legislation and establish an equal-power;
- setting state educational standards;
- Determination of educational documents of the sample of the state and the order of their issuance;
- specify the order of admission to educational institutions and the amount of state grants;

- Appointment of rectors of state higher educational institutions;
- establish the procedure for transferring those who receive education from one accredited educational institution to another;
- other powers stipulated by the legislation.

General secondary education system. The purpose of general secondary education is to provide participants with systematic knowledge, skills and qualifications of the foundations of science necessary for the functioning of cultural and household, various spheres of the national economy, as well as to create the opportunity to receive special education (vocational, technical, secondary, higher).

In Uzbekistan there is a compulsory, free, general secondary education, the duration of which is 9 years, divided into primary (1-4 - school classes) and secondary (5-9 - school classes).

Primary education is aimed at the formation of the knowledge and skills necessary for obtaining a general secondary education, the basics of literacy. Children in the first class are accepted from the age of 6-7 years. Primary education is compulsory, free and compulsory in Uzbekistan. This means that all children who have reached school age go to general or special (children with disabilities and children behind development) primary school. Involvement of children in primary education is 100% of children of appropriate age. When the child finishes primary school, he must have gone to reading, writing and counting skills.

The reader is immersed in elements of theoretical thinking, the skill of managing the learned actions. It is also given the knowledge of the culture of speech, the basics of personal hygiene, a healthy lifestyle and behavior in society. The quality and trailing of teaching subjects varies in primary school, depending on the type of school and the conditions of teaching. All first-graders of the school are provided with free textbooks and teaching aids. 1-9-th grade students from low-income families since 1996 are provided with educational equipment and winter clothes every year from the account of the state budget.

The organization of primary and secondary education in Uzbekistan is directly related to each other. Each secondary school carries out general secondary education at both levels. This will ensure the full accounting of graduates in primary school and continuity in the overall secondary education system. General secondary education contributes to the development of the necessary volume of knowledge, the ability to think independently, laying the foundation of organizational skills and practical experience, choosing the initial professional direction and the next step of education.

Although general secondary education is a logical continuation of primary education, it differs according to its structural quality and method of teaching. General secondary education provides for the desire, interest and abilities to determine the social status of the participant, the formation of his personality. The student receives systematic knowledge on science in secondary school. In the educational process, a wide range of worldview formations and creative thinking abilities arise. By getting acquainted with the rich spiritual and cultural heritage of the people, the child evokes a sense of care for the surrounding world.

The secondary school provides students with a wide range of opportunities for independent study of school subjects. The component of secondary education includes compulsory and additional

components. Mandatory component is determined by the state educational institutions and determines the minimum required level of preparation of the participant. Its success is guaranteed by the secondary educational institutions. This component is determined on the basis of the order of the state and society, the interest and demand of the individual. Additional component is determined based on the needs and abilities of the participant, the level of material and technical and personnel management of the school, the requirements for the social economic development of the territory.

The volume of additional educational tasks is distributed on the basis of the norms established by the Ministry of education of the people. The educational work of the school is carried out through educational programs, approved by the Ministry of education of the people's Republic, a basic plan of education and general secondary education. General secondary education is carried out through the on-going study and the on-day attestation of graduates. Graduates are awarded state attests, and those who have achieved exceptional success are awarded preferential attests. Participants who independently mastered the general education program will be given the right to pass certification in accordance with the external procedure in accordance with the regulations on external approved by the Ministry of Education.

Secondary vocational education. Secondary special education is a form of vocational education, the main purpose of which is the training of organizers and job managers in the first tier of production, assistants of specialists of the higher category, such specialists as technical, agronomists, primary school students, feldsher, dentist, concierge, who independently perform a certain type of work that requires high qualification and skills. Among the specialists of secondary special education are ballet, circus artists, some artistic specialists, for whom a high stage of professional training is required. Secondary special education focuses on the development of practical and theoretical knowledge in general secondary education as well as vocational qualifications and skills in a particular field. Compulsory secondary vocational education (SVE), which is designed for three years are an independent view of the system of continuing education. It is carried out on the basis of the "Law on education" and "National program of Personnel Training" of the Republic of Uzbekistan.

Secondary vocational education is compulsory from 2009 year, graduates of the general Secondary school choose the direction of study – academic Lyceum or vocational college, according to their wishes. Secondary vocational education provides both vocational education and knowledge in general education in a specific direction so that graduates can find their place in the labor market. On the basis of general secondary education, each graduate can choose either a college of vocational education or an academic lyceum in the direction of study. Secondary vocational education is carried out in the daytime in two directions in academic lyceums and vocational colleges.

In addition to vocational education, vocational colleges also provide secondary special education, such as academic lyceums, which allow to continue further or continuing education, or to engage in work in the specialty without it.

The academic lyceum is a three-year secondary special-purpose educational institution, aimed at increasing the level of the students' knowledge in accordance with the state standard of Education, which is directed on the basis of their opportunities and interests, deepening. In academic lyceums, students voluntarily choose the direction of education - humanitarian, natural

Sciences. Academic lyceums are opened at higher educational institutions and, according to the rule, the main attention is paid to the involvement of qualified students in the educational process of the lyceum, if necessary, to create conditions for the use of lyceums in the fields of experience, libraries of the higher educational institutions.

Academic research institutions are also involved in the focused, deepened educational process in the lyceum if necessary. In such cases, work is carried out in accordance with the permission of the Ministry of Higher and secondary specialized vocational education.

Vocational colleges are an educational institution that provides secondary special and vocational education, in which they receive education for three years. In accordance with the state educational standards, general secondary education and deepening vocational education are taught and qualification is formed in the college. College graduates can gain one or more professions on the basis of their orientation.

For professional colleges, guardians from enterprises or institutions developed by the acting bodies of local government are appointed. He is also the trustee of the higher educational institution, which is in the direction of the direction corresponding to the direction of the college. The purpose of the educational institution is to provide secondary vocational education. In the college, knowledge is given on the basis of dual system of Education, bilateral vocational and educational programs.

The system of higher education is structured as follows:

- higher education institutions that implement educational and vocational training programs on the basis of the state educational standard, regardless of whether they are private or state dependent;
- Research institutes carrying out research work necessary for the development of higher education;
- Departments that govern education by the state, as well as enterprises, organizations and institutions that are subordinated to them.

Higher education consists of two stages: bachelor's and master's degree

Bachelor's degree is the first stage of higher education, which provides theoretical and practical knowledge, aimed at continuing for four years. Upon completion of the bachelor's program, the student will be deemed worthy of the bachelor's degree on the basis of the direction he / she studied in accordance with the state attestation and the diploma specified in the state sample will be given.

Master's degree-this is the stage of Higher Education, which provides theoretical and practical knowledge on the basis of a certain direction, which lasted two years, and which can be continued to receive education on the basis of choice only after graduating from Bachelor's degree. On the day of study in the magistracy, graduates will be given a diploma of the "Master" degree with a clear specialty in accordance with the kuniy conclusion of the state Attestation Commission and a state sample confirming the master's degree. Bachelor's and master's degrees of the state model allow holders of diplomas to engage in professional activities in their specialties or continue their further studies in an educational institution.

Higher education institutions. Higher education institutions have legal status. In our republic there are the following views of higher education institutions:

- in the implementation of the University - Higher Education Program, attention is paid to providing students with a wide range of knowledge in order to continue their studies in the field of education or in the future;
- Academy-prepares for a specific direction so that they can continue their studies later in addition to providing higher education in the performance of their higher education program;
- institute-like all higher education institutions, it fulfills the program of higher education, knowledge is given to one direction in the provision of knowledge.

The main purpose of higher education is to train specialists with high potential, capable of independent thinking, capable of contributing to the development of science, culture, economy, social spheres of the Republic, able to meet the requirements of a qualified, competitive, highly educated higher education specialist, able to meet the demand for his chosen direction.

Postgraduate education is aimed at satisfying the needs of the society for highly qualified scientific - pedagogical personnel, satisfying the creative and professional interests of the individual.

**TABLE 1 MUTUAL AGREEMENT OF UZBEKISTAN AND FOREIGN HIGHER EDUCATION INSTITUTIONS AND TRAINING ON THE BASIS OF JOINT EDUCATIONAL PROGRAMS[4]**

№	Number of higher education institutions	Number of educational directions and specialties		Number of partner foreign HEIs	Name of State
		bachelor or	master		
1	National University of Uzbekistan	5		2	Israel; Russia
2	Tashkent State Technical University	5		2	Russia; Belarus

Total		43	10	28	

Postgraduate education can be obtained in higher educational institutions and research institutions (postgraduate, postgraduate, doctorate, independent research).

Extracurricular education. In accordance with the Constitution of the Republic of Uzbekistan, the law of the Republic of Uzbekistan "On education", extracurricular institutions in all regions (towns, districts, cities, regions and the Republic) are opened in accordance with the decision of the relevant authorities. Extracurricular institutions can operate independently or as part of scientific-production, educational-training (center).

State bodies, public organizations, as well as other legal and physical persons for the purpose of satisfying the individual, increasing demand-needs for education of children and adolescents, organizing their leisure and leisure activities, organize extracurricular state and non-governmental educational institutions in the field of cultural aesthetics, scientific, technical, sports and other areas.

Extracurricular institutions are considered as part of the system of public education and they are intended for teaching and learning.

Extracurricular institutions (kamolot, museums, etc.) carry out their activities in accordance with the Constitution of the Republic of Uzbekistan, the law "on education" and other legislative acts, as well as the regulations "on extracurricular institutions".

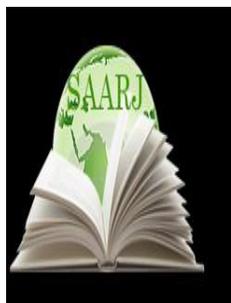

Legislative achievements on the reform of the educational system. From 1991 to 2002, the educational system in Uzbekistan has been developing and radically changed over the years. The graduates of the school in 2001, 2002 are the descendants who independently received education in Uzbekistan on new standards and educational programs.

The current normative and legal base of the general secondary education system is democratic and humanitarian attitude towards the people living in the Republic. In order to create conditions for children of different nationalities to have full school education in educational institutions of

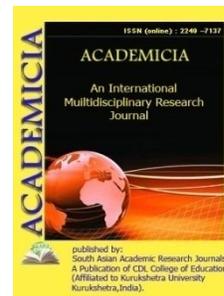

Uzbekistan, classes are conducted in Uzbek, Karakalpak, Russian, Kazakh, Kyrgyz, Tajik and Turkmen languages.

### ABSTRACT

*The use of information technologies in the educational process opens up wide opportunities for activating research work of students. The article deals with the main issues of effective use of information resources and technologies in the research work of students at the University.*

**KEYWORDS:** *Information Technologies, Research Work Of Students, Information Resources, Methods And Forms.*

### INTRODUCTION

The increasing role of information technologies in the professional training of modern specialists, both in the field of natural sciences and humanities, contributes to the growth of students' interest in information technologies and various aspects of their application. It becomes possible to use information technology tools to solve research, educational and non-educational tasks.

In modern conditions, an urgent problem of professional education is the implementation of educational programs for training scientific and pedagogical personnel at the third stage of higher education. This training is a unity of educational and scientific components. In the context of modernization of the education system, the main postgraduate program must reflect the promising trends in the development and application of information and communication technologies in the field of education. A graduate student should be able to navigate the global information space, have the necessary knowledge and skills to search, process and store information using modern technologies, computer systems and networks. Mastering them is

designed to improve the effectiveness of professional activities of teachers, the development of their information and communication competence (ICT competence).

It is noted that virtual training laboratories and virtual research laboratories are used to improve the effectiveness of research training of students of higher educational institutions. In conclusion, the authors come to the conclusion that it is necessary to use network resources more actively and apply them in various fields of students' activity, primarily in research work.

For example, a teacher should:

- master the basics of working with text editors, spreadsheets, email and browsers, and multimedia equipment;
- be able to apply modern educational technologies, including information and digital educational resources;
- use foreign language sources of information, translation tools, and pronunciation together with students;
- be able to use modern methods of assessment in the context of ICT (maintaining electronic forms of documentation, including an electronic journal and diaries of students).

Information technologies used in research work of students act as a means of communication, self-expression and self-realization. This is primarily due to the focus of research activities on the implementation of specific projects.

Research activities of students using information technologies contributes not only to better training of higher education graduates for professional activities in the context of rapidly developing informatization of society, but also to the formation of information culture of a specialist.

Today, the higher education successfully uses various software packages in the research activities of students. Modern tools for processing and preparing text documents are widely used in the preparation of various types of works, reports, presentations at scientific and practical conferences.

Indicators of the formation of ICT competence of bachelors in the context of this module are the following characteristics: students have basic concepts of probability theory and mathematical statistics, statistical data processing, the basics of variance, correlation and regression analysis; they are able to characterize the accuracy of computational results using mathematical methods; use office software (MS Word, MS Excel, etc.) to represent numerical data in the form of diagrams, graphs, and to solve standard statistical problems for finding the arithmetic mean, variance, mean square deviation, minimum and maximum values of an array using formulas and built-in mathematical and statistical functions. Examples of tasks for independent work of bachelors are calculations using ICT of the main numerical characteristics of a given sample: sample average, sample variance, standard deviation, median, mode, and so on.

MS Excel spreadsheets allow you to prepare training plans, various types of digital training reports, graphs, and charts. For example, the MS Power Point presentation preparation program helps students' research work develop solid material for equipping scientific and practical

conferences and seminars. In addition, students often prepare computer presentations using the MS Power Point program to protect their final qualification papers and coursework.

Using multimedia projectors, laptops, and web cameras, you can organize various events and scientific conferences. Students and teachers periodically use photo and video equipment to obtain photographic materials and videos for research papers.

Students study computer modeling, programming, computer networks, Internet and multimedia technologies, where they learn to create computer models, programs, and get acquainted with modern telecommunications technologies

Currently, the Internet has entered the system of research work of students and has opened up the widest opportunities for students to use useful educational resources: e-mail — for exchanging information between students, teachers and educational institutions; mailing lists — for sending General information to the study group and organizing collective discussions; also useful are data on research grants, scholarships, competitions; use of WWW technologies; access to world information resources via the Internet; websites of higher education institutions, research centers, public and state organizations that greatly facilitate the establishment of contacts between universities, organization of joint events, exchange of experience and information, holding conferences and seminars, etc. Internet resources can also be used for effective organization of research activities and educational research work of students. Internet resources are primarily websites of publishing houses and libraries. On these sites, you can find new books and reviews on them, order the necessary books and periodicals. Most of these sites also have free mailing lists, which allows you to easily track new work in areas of interest.

Creating local computer networks at the University, installing a dedicated line allows you to access the Internet from various points, including from computer classes, greatly expanding the possibilities, both in the educational process, and in the organization of scientific research, extracurricular work. This makes it easier to find the right information and allows you to view documents on the server, find electronic textbooks and much more, and also provides communication and communication via email, teleconferences and with other educational institutions.

Currently, virtual training laboratories and virtual research laboratories are used to improve the effectiveness of research training of students of higher educational institutions.

A virtual research space is a working environment that does not require physical space to organize research activities.

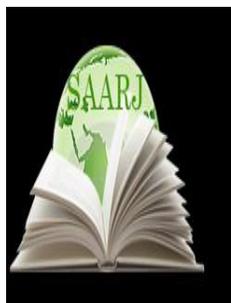

The basis of the virtual research space consists of information resources located in the global network. These sites and portals are dedicated to specific scientific topics. As a rule, they contain some fundamental works, as well as the results of research currently being conducted. These sites often work as collective information centers that select the most popular web sites on this topic. In addition, you can often find information that quickly introduces a novice to the subject area. As a rule, such resources have the opportunity to exchange opinions - both in the form of forums and via email.

Sometimes virtual laboratories function as part of an information resource. A virtual laboratory is an educational division of higher education equipped with computer equipment and software that simulates the processes occurring in real objects under study. In virtual laboratories, it is typical

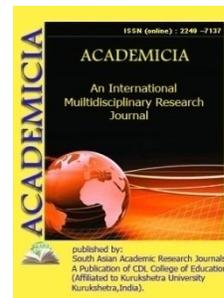

to use example modeling programs in the objects being studied or designed, as well as mathematical packages, optimization programs, databases, etc.

### ABSTRACT

*It is known that the effectiveness of the University is determined by the level of preparation of its graduates for the successful implementation of the acquired knowledge, formed skills, as well as the ability to quickly adapt to the constantly changing conditions of production and the labor market.*

**KEYWORDS:** *Effectiveness, Foreign Language, Professional Training, Specialist, Higher Education, Innovation.*

### INTRODUCTION

The methodology of teaching work, as well as any intellectual work, is based on the intellectual component of students. By the intellectual component of the personality in general, we understand the level of its cognitive activity formed in the learning process, the level of opportunities for abstract and logical thinking. The problem of developing the intellectual component of students is one of the most important psychological and pedagogical problems of higher education. Its solution should and can be based on the ideas of the internal needs of personal development, and the main task of the teacher is to create conditions conducive to such development.

Analysis of psychological and pedagogical, didactic, methodological, psychological and linguistic literature has shown that the development of the intellectual component of students is influenced by various factors. The main ones are heredity, environment, upbringing, learning process, individual's own activity, etc. The most promising in the framework of the pedagogical process are: educational and cognitive activities, educational and research activities, problem-based learning, the study and use of specific methods of knowledge representation.

Consequently, the development of the intellectual component depends on what cognitive means, and, accordingly, what methods of theoretical activity are provided for by the content of training and how their assimilation will be organized.

The requirements for a certified specialist presented in the state educational standard are both a guideline and a program of actions for us in our work [1]. Each subject studied in higher education should, to the extent possible, contribute to the development of those qualification skills that are necessary for students in educational and cognitive activities and will be in demand when solving professional problems.

In particular, a foreign language that is part of the cycle of general humanities in the higher education is multifunctional in terms of professional training of students. The process of mastering all types of speech activity (listening, speaking, reading, writing) is associated with the performance of complex mental operations: analysis, synthesis, systematization, generalization, comparison, contrast, concretization, abstraction.

As practice shows, such intellectual activity contributes to the development of professionally significant personal qualities, creates conditions for achieving consistently high academic results.

The peculiarity of our work is that teaching a foreign language is based on interactive methods. The use of the latter is aimed at updating the psychological mechanisms of intensifying the process of mastering a foreign language, activating the educational activity of students. The most promising and functional from the point of view of developing learning is the method of accelerated learning to translate scientific and technical texts, which we have been using for a fairly long period of time. Milashevich, and the system of step-by-step formation of mental actions developed by P. Y. Galperin.

As we noted earlier, professionally oriented language training makes it possible to obtain the necessary knowledge in the specialty from foreign literary sources, while simultaneously contributing to the intellectual and personal development of students.

When working with text, it is recommended to perform the following mental actions-micro-operations: navigate the content, identify basic meanings, structure and collapse them, build schemes for the deployment of meanings. First, you need to analyze the text by introductory, continuous, and then selective reading.

When mastering a foreign language, you need to know everything at once - phonetics, vocabulary, grammar, and have the skills of various types of speech activity (listening, speaking, reading, and writing). Each type of speech activity still needs to be taught. Thus, the teacher of foreign languages faces quite capacious and complex tasks: the formation and development of the intellectual component of students of higher education by means of a foreign language and ways of expressing them in their native language. The solution of these tasks will also make it easier to read special original literature in the future, while simultaneously extracting information from authentic foreign language materials, which in turn will lead to an increase in the level of professional competence of students.

Understanding the meaning of a scientific text is a complex process. To simplify it, it is proposed to work in the following sequence:

- Highlight the elements that make up the text, emphasizing the more informative parts;

- Compare the highlighted parts;
- Create diagrams of the ratio of parts of the scientific text;
- Form the provisions that follow from the comparison of parts of the studied text;
- Present brief diagrams that logically reflect the main content of the text;
- Present the text material in a detailed form.

Getting acquainted with the latest achievements of science and technology, best practices in the field that is related to their future profession, students learn to make a resume, abstract, theses, review, write a review, conclusion. At an advanced stage, they independently study foreign language material in order to prepare a report or even describe the solution of one of the current problems of a particular scientific discipline.

In terms of developing creative thinking, tasks for reproducing an authentic text in the specialty in their native and foreign languages are of interest; the presentation of the material is carried out in a short and detailed form, taking into account the opinions of students:

- Complete the phrase that contains the main idea of the text;
- Express doubts about the accuracy of the author's opinion or confirm their agreement with it;
- Make a critical comment on the content of the text;
- Analyze processes or phenomena using the concepts contained in the text about them;
- Compare different points of view presented in the article;
- Formulate conclusions and prove their reasonableness on the material of the read text;
- Establish a link between the developed material and future professional activities;
- Transmit the content of the text based on these keywords-terms.

Such types of work with scientific texts of professional orientation are especially relevant when studying a foreign language in groups of undergraduates and postgraduates. They should read a significant amount of foreign literature on a wide and narrow profile of the specialty, in order to use the information obtained when writing master's and PhD theses. By the way, it would be very useful in terms of expanding the information field and deepening the professional knowledge of students, so that teachers of graduate departments recommend using material from special foreign publications when performing term papers and theses.

As the theory of step-by-step formation of mental actions predicts, and the experience of practical training based on this method confirms, students not only develop translation skills, but also develop the ability to independently analyze grammatical means of the language. Everyone masters the language themselves, and in order to master it, the student learns and forms their own structures. Therefore, learning the structure is one of the most important stages in the process of language acquisition and learning. Consequently, the main task of the teacher in the classroom is to organize the cognitive activity of students, and as a result, the formation and development of the intellectual component, since the formation of complex ordered organized structures of knowledge representation is identical to mental development. These structures contain elements of knowledge about the language, levels of relations of individual elements, levels of

generalization and abstraction, cause-and-effect relationships, as well as knowledge, skills, and mental operations. These theses are based on the provisions of L.S.Vygotsky on the unity of structural and functional aspects of conceptual thinking. The main thing in these theses is that each generalization structure corresponds to its own specific system of logical operations possible for this structure, and the function of thinking depends on the structure of the thought itself. And how the thought itself is constructed depends on the nature of the operations available to this intelligence.

In parallel, the programs provide for the study of grammatical means of the language. But these tools are almost deliberately omitted by students in standard situations and in conditions of excessive language code, since understanding occurs only at the lexical level, without an accurate and detailed analysis of grammatical structures. Therefore, grammar is poorly learned. Memory is overloaded due to excessive memorization of lexical units. Undoubtedly, a dictionary is a repository of all known words of a given language. This is a complex verbal-semantic network with many nodes-cells corresponding to individual words, and with many links connecting them-vectors. The language system is represented by another representative structure, which consists of elements of words that are common to certain parts of speech. They are roots, prefixes, suffixes, and endings that are necessary for the correct design of speech, i.e. they are generalized typed samples.

The teacher cannot "transplant" an objective system of language into the student's head. What is formed in the minds of our students when mastering a foreign language system is not identical to this language system itself. We believe that in order to develop a good independent system for students to analyze grammatical means of language, we need a special method with purely formal speech features (syntactic elements, structures) with partial or complete exclusion of vocabulary. This method exists, and we actively use it in our practice.

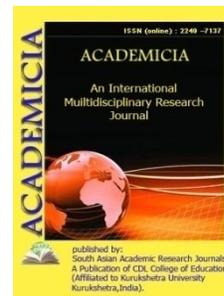

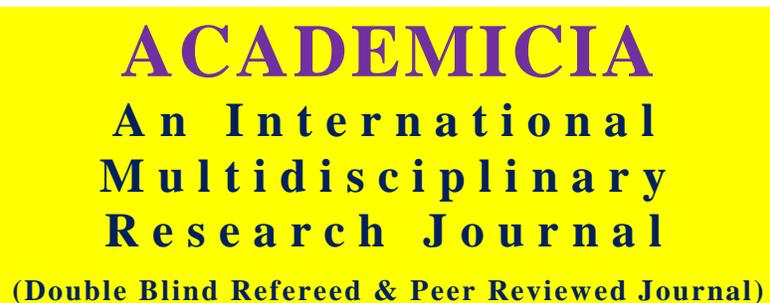

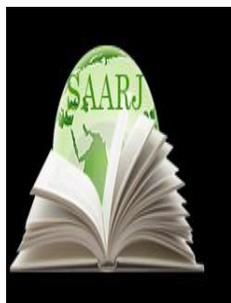

An important aspect of educational and cognitive activity when learning a foreign language is the development of oral speech skills in the mode of dialogue and monologue. Various exercises are based on lexical and grammatical means that are typical for communication in different communicative situations, including the professional sphere. As the vocabulary increases, the information presented becomes more complex and the structure of sentences becomes more complex. Gradually we move on to monologue speech, the mastery of which is a certain difficulty for students. Speech-thinking activity in a foreign language is associated with the process of perception of language and speech material, its transformation, techniques of involuntary and arbitrary memorization for the purpose of free reproduction, bringing speech actions to automatism. As a result of such intense intellectual work, students can communicate in the language they are learning, make oral presentations, and make presentations.

A foreign language, being a discipline of the humanities cycle, has organically entered the educational process of higher education. Along with specialized departments, we contribute to the preparation of young people for their chosen profession.

## PROBLEMS OF USING INFORMATION AND COMMUNICATION TECHNOLOGIES IN THE TRAINING OF LINGUISTS-TRANSLATORS

Haydarova Dildora\*

\*Teacher

Fergana State University,  
Fergana, UZBEKISTAN

### ABSTRACT

*In the last decade, the importance of information and communication technologies (ICTs) in the educational process of higher education has increased dramatically. Many experimental and theoretical studies aim to determine the effectiveness of ICT use. The article reveals the modern possibilities of training of linguists-translators with the use of information and communication technologies. The purpose of the work is to consider the role of modern technologies in the formation of information technology competence of future translators, their advantages, as well as the problems that both students and teachers face when teaching translation using ICT.*

**KEYWORDS:** *Information and Communication Technologies (Ict), Professional Competence Of The Translator, Electronic Dictionaries, Machine Translation, Translation Memory, Educational Forum.*

### INTRODUCTION

The processes of general globalization and integration, characterized by the rapid expansion of international contacts, the accumulation of a huge amount of information in various fields of human knowledge and the need for rapid exchange of this information, cause researchers to pay close attention to the problems of professional training of future linguists-translators who are able to solve problems related to these processes and ensure effective intercultural communication. Thus, today the translator is a key figure in international communication, and his professionalism depends, first of all, on a properly built system of training and mastering the necessary competencies. The effectiveness of ICT application depends on the ways and forms of using these technologies, on how well the teacher knows the methodology of working with them, and on the electronic resources used by them. First of all, it is particularly important to develop information technology competence in the professional training of translators. Information

technology competence is understood by us as a set of knowledge, skills and application of information resources and technologies in the professional activity of a translator, which contribute to their further self-improvement. Information technology skills of a translator are structured in the article depending on their functional purpose and are divided into linguistic, communicative, informational, etc. The possibilities of using electronic dictionaries, machine and automated translation programs, educational and translation Internet forums in training are also evaluated. The main conditions for using ICT in training, according to the authors, are the creation of a material base (computer classes and software); training of ICT teachers; development of modern methods of teaching translators using ICT.

The purpose of our research is to examine the role of modern technologies in shaping the information technology competence of future translators, as well as to study the problems faced by both students and teachers when teaching translation using information and communication technologies.

Traditionally, the following range of competencies is distinguished in the translator's activity: communicative (linguistic, pragmatic, and sociolinguistic); special (basic, subject, discursive, sociocultural, technological, and strategic); social; and personal. For example, A.V.Grebenshchikova believes that the professional competence of a translator includes linguistic, socio-cultural, psychological and informational competencies. And, in turn, K.V.Shaposhnikov designates such significant competencies as language, speech, socio-cultural, technological and personal.

These researchers rightly note the important role of the information (technological) component of translation competence. Indeed, translation theorists and practitioners, as well as professional translators have long stated that a modern linguist-translator should have extensive knowledge not only in the field of linguistics, but also in computer science; know the basics and prospects for the development of new technologies; have practical skills and abilities to use information and computer technologies in translation activities; be able to make the best choice of information and computer technologies when making translation decisions, etc. For example, V. A. Traynev in his research notes that an indispensable condition for conducting professional activities is the ability to work in the "human-machine information technology complex", where information technologies as a system of methods and methods for various use of information based on modern computer achievements play a key role.

Based on all of the above, the translator's competence model should include information technology competence in addition to the above-mentioned competencies.

Following N. G. Inyutin, we understand the information and technological competence of a translator as "an integral component of the professional competence of a translator, which is a set of knowledge, skills and abilities to use information resources and technologies, software and network tools for professional translation activities using a computer, the formation of which contributes to further self-improvement in professional translation activities".

This definition allows us to assume that the information technology competence of a translator is a complex structure and includes:

- The translator's desire and willingness to use information resources and technologies in their professional activities to solve specific tasks;

- Professional knowledge, skills and abilities in the field of information technology;
- a set of professional qualities of a translator (acting as a user of information technologies) that contribute to their further self-improvement and development in the professional environment.

Thus, the emphasis placed on the development of information technology competence in the process of teaching students a foreign language can have a significant impact on the modernization of education in terms of professional growth of the individual and the ability to navigate in the modern information space, knowledge, skills and abilities in the use of information and communication technologies, which is due to the social order of the society that has passed into the information age.

Students of the bachelor's program should have the following competencies, in particular:

- Knowledge of computer skills as a means of receiving, processing and managing information;
- Ability to work with various media, distributed databases and knowledge, with global computer networks;
- Ability to work with electronic dictionaries and other electronic resources for solving linguistic problems;
- ability to solve standard tasks of professional activity on the basis of information and bibliographic culture with the use of information and linguistic technologies and taking into account the basic requirements of information security;
- ability to work with the main information search and expert systems, knowledge representation systems, syntactic and morphological analysis, automatic speech synthesis and recognition, lexicographic information processing and automated translation, automated identification and verification systems.

Such requirements for training future linguists-translators make it necessary to consider in more detail the possibilities and advantages of information and communication technologies in solving specific translation tasks and determine the appropriate skills and abilities in the field of it.

Information technology skills and translator skills are divided according to their functional purpose as follows:

- 1) Translation skills that involve the use of a thesaurus, electronic dictionaries;
- 2) Communication skills related to receiving and transmitting information (e-mail communication, file transfer, participation in forums and conferences);
- 3) ability to conduct information search using electronic dictionaries, encyclopedias, Internet search engines, virtual libraries and archives, terminology banks, etc.;
- 4) Skills needed to increase productivity and efficiency (scanner, interactive voice menu, text editor, etc.).

Modern information technologies aimed at improving the efficiency of the translator's activity, their readiness and ability to learn new programs and services in order to minimize costs when performing translation are the main requirements imposed by the market. In the Arsenal of a modern translator there are such tools as: electronic educational resources of the Internet; specialized translation forums (proz, city of translators); numerous electronic dictionaries

(Multitran, Oxford dictionary) with the possibility of contextual word search (ABBYY, Linguee, Reverso Context); system machine translation engine (Yandex Translator, Google Translate, etc.); computer-aided translation, based on the technology accumulation of translation memory - Translation Memory (SDL Trados, SmartCAT, Deja vu, etc.).

It is also worth noting the important role of the educational Internet forum in teaching translation. The educational Internet forum is a tool for remote exchange of educational information between students and teachers, which is successfully used for organizing independent work of students. The moderator of the training forum is usually a teacher of translation practice, who regularly "puts out" tasks and exercises on translation. Completion of tasks and feedback from the teacher are mandatory for students.

This is not a complete list of electronic resources that modern translation students should master during their studies

However, we should not lose sight of the problems and challenges that students and teachers face when teaching translation using information and communication technologies.

Given such a rapid transition to the information age and the global computerization of society, we cannot ignore the fact that universities simply do not have time to equip their classrooms with the necessary equipment (computer classes and language rooms), special software, Internet connection, as well as educational and methodological literature, which is a prerequisite for training translators using information and communication technologies.

Summarizing the above, we can draw the following conclusion. The work of a translator in modern conditions against the background of widespread computerization of society is impossible without the use of information and communication technologies and working with electronic resources, and the development of information and technological competence becomes a priority. Accordingly, for high-quality training of linguists-translators, the following problems need to be solved:

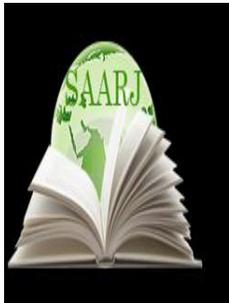

- equipping graduate departments with the necessary equipment and software;
- Professional development of teachers of translation disciplines in the field of modern information and communication technologies;
- Priority development and improvement of information technology competence for future translators;
- Development of methods and techniques for training translators using innovative technologies; providing the translation teacher with the necessary educational and methodological literature.

Thus, the formation and development of information technology competence for both the translation teacher and the students remains the same. This is still an urgent problem. The main factors that prevent the introduction of modern technologies in translation training are the psychological unavailability of translation teachers themselves and the lack of modern software in higher education institutions.

### ABSTRACT

*Happiness is the key to achieve self satisfaction in life. Happiness of children can be understood by some indicators like friendship, cooperation and optimism. Positive experiences during childhood can shape better personality and perspective of human being in further life. It is ethical responsibility of teachers and parents to understand the requirements of children related to emotional, psychological and social needs. In psychology the concept of positive education is becoming more popular day by day. According to Seligman (2009) positive education focuses on the gap between what people want for their children and what does school teach. Parents want to see their children to be self aware, confident, happy and satisfied but schools only focus on marks, academic work and discipline. To bring balance in students' life is the noble responsibility of teachers and parents.*

**KEYWORDS:** *Happiness, Learning, School, Students, Teachers, Positive Education*

### INTRODUCTION

Education is important to nurture strengths and ensures growth and development of students. Positive attitude, behavior and well being of the students are essential key concerns for teachers to perform their role efficiently (Shankland & Rosset, 2017) Joyful learning is vital for overall development of each child. Parents always make efforts to promote the well-being of their children through full financial, emotional and psychological support. Being as a parent it is also important to prepare children for facing every kind of situation with courage in life. Parents play an essential role in determining the learning environment at home. It is an ethical responsibility

of the parents to take rational decisions for children's education related choices. Parents are the main stakeholder to decide the type of school in which children will attain the education.

### **Objectives of the paper**

This paper tries to understand the role of teachers and parents in ensuring the happiness of children. This paper throws light upon the important aspects of learning and happiness. This paper examines the initiative of Delhi government to initiate 'Happiness Curriculum'.

### **Methods**

This paper is based on secondary sources. Descriptive research design has been used for this paper.

### **Students' Situation in Present Scenario**

In the fast growing and changing society children are becoming overstressed due to unrealistic expectations of parents, peer pressure and cut throat competition. Students become clueless and vulnerable while facing adverse situations in life for e.g. securing poor marks or failure in the exams. They don't get any kind of training to cope up with such situations in life. Such depressed situation makes students more violent, deviant and sometimes it leads to student's suicide. Such social crisis or lack of proper understanding creates negative environment and stressful emotions among students. In today's technology driven society students face various adjustment related psychological and social problems with friends, teachers, and parents.

In Indian conventional society children get less opportunity or space to express themselves without any fear or openly in front of teachers and parents. The culture of silence does not allow students to talk about their dilemmas and weaknesses without having any hesitation. Secured marks in the exams is the parameter to judge the development and future success of the children by parents. Indian education system is focusing on marks rather than skills and holistic personality development. Parents generally don't give time in the school to understand their children's mental, emotional and social situation and relationship with teachers and peer groups of the students in the school. In government schools there are various challenges e.g. inadequate teacher-student ratio, lack of proper infrastructure and facilities. Due to extra burden of work teachers find less opportunity due to various expected role in the school to address the problems and needs of each and every child in the classroom. As far as happiness is concerned parents and teachers can play a crucial role to promote positive mental, emotional well-being of the students.

### **Challenges of Student's life**

Problems/challenges faced by students can be seen as follows:

- Exam pressure
- Peer pressure
- Stressful competitive situation
- Psychological causes
- Economic factors

### **Happiness: Ultimate Goal of Life**

The programme for international student Assessment (PISA) has introduced indicators of student's happiness in 2012 assessment to measure the happiness of students and their learning

---

outcome. It was an initiative to understand the status of happiness in school. Bhutan has taken initiative and launched Gross National Happiness Index (GNHI) in 2010. This Index tries to measure a variety of aspects of psychological well-being and education. United Nations General Assembly identified 'pursuit of happiness as a fundamental human goal' in 2011 assembly. The Sustainable Development Goal four (SDG 4) has given importance to quality education and focuses on 'happy school', which would promote such healthy learning environment which includes safety, non-violence and leads to culture of peace. According to World Happiness Report, 2017, India ranked 122 out of 155 countries.

School is such a place where students not only learn academically but try to learn moral values and positive habits. Schools do impact upon students' overall personality development. Children spend most of the time of their childhood in the school. Major part of children's childhood would be affected by the environment of the school and behavior of the school functionaries.

### **Delhi Government's Initiative**

On 2<sup>nd</sup> July, 2018 Delhi government inaugurated and implemented 'Happiness Curriculum' in Delhi government schools for all students who are studying up to class VIII. The main objective of this Happiness Curriculum is to give assurance to students and parents that education should not focus only on acquiring good marks but also to promote such environment which would make students more satisfied, confident, happy and self aware.

This curriculum has included various activities based intervention such as:

- To promote mental health and peace of mind 'Meditation' has been included in the curriculum;
- To enhance the participation level through implementation of activities based joyful learning exercises;
- To inculcate habit of cooperation and enhancing harmonious relationship among students 'indoor games' should be initiated;
- To encourage active and sincere listening skill 'story telling' should be initiated;
- To promote free expression of views and learning acceptance for others 'group discussion' should be promoted;
- To inculcate habit of empathy practice of 'skits' should be initiated;
- To encourage public speaking and minimizing stage fear 'group presentation' has been included in the curriculum
- Other activities related to promote rapport building and team building has been initiated

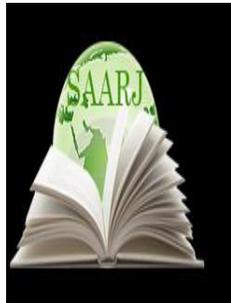

The main components of this Happiness Curriculum are meditation, mental activities and creating stress free joyful learning. The Delhi government has decided to give 45 minute 'happiness period' everyday for students from class I to VIII, while this class will be held only twice in a week for nursery and kindergarten children. This kind of reform and initiative can lead towards positive direction to attain the prime goal of becoming more decent and progressive citizen. This step will promote transformative process of positive change in the society. This initiative will determine the holistic approach as far as students' development is concerned. This concept will strengthen students from inside so that they can face success and failure both with positive attitude and balanced perspective.

### **CONCLUSION:**

It is crucial to understand the relationship between education and happiness. Students's leaning can be more enriching when they get joyful and supportive environment. Delhi government's initiative to implement happiness curriculum is giving an opportunity to students to become active participant in the learning process. A happy child can be a successful citizen in future. Practice of mindfulness can enhance the ability of students so that they can be more attentive, rational and cooperative. This initiative is strengthening the conventional education system and trying to blend it with modern education. Teachers, parents and students can be able to work in close relationship and can feel more connectedness to achieve their similar goal of holistic development of the students. Practice of moral values and mental exercise can strong citizen.

## ESSENTIAL ROOTS AND SOURCES OF YOUTH PATRIOTISM AND ACTIVITY

**Raxmonov Abdurauf Maxammedovich\***

\*Lecturer Teacher,  
 Tashkent Financial Institute,  
 UZBEKISTAN

### ABSTRACT

*This article reveals the essence of the formation and development of patriotism in young people, instilling in the hearts and minds of young people that patriotism is a sign of mature spirituality, one of the spiritual values that is of great importance for the development of society. Patriotism is a characteristic of people who have a deep respect for the motherland, the history and destiny of their people, who are able to show an example of devotion to the interests of the motherland. Influencing their activities, mobilizing them for responsible tasks and the essence of youth activism.*

**KEYWORDS:** *Youth, Youth Activism, Patriotism, Respect For The Motherland, The People, Love, Youth Consciousness, Modernization, Democratic, Vital Position, Spiritual Heritage, Sense Of Confidence, Historical Event.*

### INTRODUCTION

Strengthening independence is our main goal. One of the components of youth activism is patriotism. One of the urgent tasks is to inculcate the idea of patriotism in the minds of young people.

As noted by President Sh. Mirziyoyev: "In order to form a strong position in the hearts of the younger generation and a high sense of responsibility for the fate of our Motherland, a unique system of patriotic education has been created, which includes a wide range of people. should be learned from the rich spiritual heritage. To understand patriotism, let's focus on the word Homeland. There are different approaches to it. In particular, in the two-volume "Explanatory Dictionary of the Uzbek language" the word " Homeland " is interpreted as follows: " Homeland ": a country where a person was born and raised and considers himself a citizen. Country of

birth, city or village, homeland. Accommodation, shelter, place, house. Researcher Botirbek Hasanov's "Short Dictionary for the Works of Navoi" explains the word Vatan as follows: Homeland - (plural) "auton", Homeland. To make a homeland, to make a homeland, to settle down, to settle down, to be home ". Professor B. Kasimov approached the word Homeland as follows: "We will explain the next syllable of the word Homeland to "Tan ". By "body" we mean the human body, the body, the body. Now imagine how much suffering we suffer if our body or body suffers. Although we are a part of the Motherland, we are not patriotic if we do not feel every damage inflicted on the Motherland. As proof of this idea, it is appropriate to cite such an example from the work of the modern thinker Tavallo. "It simply came to our notice then," he said. One must preserve and protect the homeland as one's own body. In Arabic and classical Uzbek, "and" is used as an article in different senses. There is a hidden meaning in the word Homeland or Tan. Homeland is the source of body, soul, life, existence, both spiritual and physical being.

According to the philosophical teachings of the peoples of the East, especially Islam, the first Homeland of man was paradise, where Adam was created and man died and returned to that place. The meaning of the word "Homeland" is interpreted by Islamic thinkers as follows: Homeland is the paradise created by Adam; The belly of the motherland; Homeland is the world, the world of materialism; The grave where the body of the motherland is placed; The homeland is the world of spirits inhabited by the soul, the homeland is the space for the soul of the human body. Well-known scholars M.Imomnazarov and M.Eshmuhammedov in their book "Fundamentals of our national spirituality" describe the divine interpretation of the concept of homeland in a unique way. For example, they say, the body is the homeland for the soul in the eyes of the Naqshbandi pir, one of the mystical sects. "Homeland," says Hazrat Bahovuddin, following in the footsteps of his teachers. That is, the human soul must unite with the Truth without leaving the body, the material being, purify the mirror of the soul, and achieve the reflection of the beauty of the Truth in it. There is a sign here that the honor and dignity of the Motherland should be kept as pure as the human body. It is difficult to imagine a pure soul in an impure body. Alisher Navoi, in his famous ghazal, addresses the liquid gap and says, "Make the Motherland like a mardum in the eyes," and in this way he expresses the essence of the feeling of the Motherland in more depth. It is said that you live forever in the sight of this dear place, take it home. It is also worth quoting some of the wisdom of Eastern and Western thinkers about the Motherland and patriotism: Cicero said, "We value parents, children, relatives; but all our imaginations in the chapter on love are embodied in the word "Homeland". "G. Hegel" The true courage of enlightened peoples is reflected in their readiness to sacrifice for the sake of the Motherland. " J. Byron "He who does not love his country cannot love anything!" Hugo: "To tarnish one's homeland is to sell it." "Whoever is concerned about his homeland, he is not concerned about humanity," Belinsky said. Alisher Navoi: has found a job". Well-known scientists: A. Ibragimov, H. Sultanov, in N. Juraev's book "Sense of Homeland" says: "The term homeland is originally an Arabic word and means motherland. The concept of homeland is used both broadly and narrowly. This is a broad concept, given the area in which the representatives of a nation live together, where their ancestors have lived for a long time. When you think of the house, the neighborhood, the village where you were born and raised, it's a narrow concept. "

We have seen that different and colorful ideas have been expressed about the concept of homeland. Here are some of them: Abdullah Avloni, a Jadid intellectual and enlightened scholar,

said: the Arabs love Arabia, the sandy hot deserts, the Eskimos love the northern sides, the coldest and glaciers, more than any other land. If they did not love, they would leave their homeland and migrate to lands where the weather is good and life is easy.

In this regard, it is worth quoting Professor Qiyomiddin Nazarov's views on the homeland and patriotism: "The homeland begins with the honorable mother and dear father who gave birth to everyone. For a homeless baby, Mother's heart is the territory of the Motherland, her face is the sky of the Motherland, her eyes are the stars of the Motherland. It is no secret that breast milk is the water that life receives from the territory of the Motherland. The mother goddess appears as the first example of folk heritage and oral creation. But a human child does not stay as a baby. He falls from his mother's arms and walks to the door, seeing that there are other houses, neighborhoods, schools, and so on. Gradually he realizes that there is a district, a province, a republic, and then the whole earth is the common homeland of mankind. In this way, the "borders of the homeland" expand, and the sense of patriotism expands and improves in the same way.

In conclusion, the word Homeland is synonymous with the word space. So it means homeland. As a result of loving the motherland and carefully protecting it, the meaning of patriotism has emerged.

Academician Erkin Yusupov describes patriotism as follows: "Patriotism is a sign of mature spirituality. One of the spiritual values that is of great importance for the development of society is a sense of patriotism. Patriotism is a characteristic of those who have a deep respect for the motherland, the history and destiny of its people, and are able to set an example of devotion to the interests of the Motherland. Respect, love and trust for the homeland and the people are formed on the basis of certain common interests and goals and take a deep place in people's hearts. Influences their activities and mobilizes them to perform responsible tasks.

The Encyclopedic Dictionary of Philosophy defines the concept of patriotism as follows: Patriotism is the concept of responsibility and duty to the motherland. Patriotism is extremely multifaceted and is constantly improving and developing in the process of historical, political and economic development. The more the society understands the interests, values, destiny and prospects of the Motherland, the higher the sense of patriotism. The process is endless. Different stages of historical, socio-political, spiritual development are discovering new aspects of patriotism. The sense of homeland in each person is inextricably linked with the development of society. True patriotism is living in the interests of the nation, the homeland, working and fighting for its future and interests.

The First President of the Republic of Uzbekistan Islam Karimov wrote in his book "The Motherland is as sacred as a shrine": So, the truth is that patriotism justifies itself in front of the homeland! The highest form of patriotism is to sacrifice one's life for the Motherland. "In the National Encyclopedia of Uzbekistan, patriotism is a concept that expresses people's love and devotion to their homeland. Patriotism is one of the universal feelings, spiritual values that have been polished for centuries, common to all people, nations and peoples. "Historically, patriotism is a set of feelings that people have developed in the process of social development related to the fate of their homeland, the struggle of peoples for the inviolability and independence of the region in which they live."

First of all, patriotism means, in our opinion, that a person values his homeland and devotes his energy and zeal to it, regardless of his field. Although this definition does not cover all aspects of patriotism, but if the word patriotism itself is approached in a broad sense, the definition is understood correctly.

True, there are many works about patriotism. But each era has its own demands and needs. In this sense, it is useful to constantly think about patriotism. When we analyze how our ancestors approached patriotism, many aspects of our subject become clear. Because patriotism has played an important role in the historical life of our people. Great personalities Spitamen, Tomaris, Shirak, Muqanna, Jaloliddin Manguberdi, Najmiddin Kubro, Temur Malik, Amir Temur, Zahiriddin Muhammad Babur and others are seen as patriots. Furqat, Fitrat, Abdulla Qodiri, Cholpon, Abdulla Avloni It is necessary to study the characters in the works of Usmon Nosir, Hamid Olimjon, Gafur Gulam, Erkin Vahidov, Abdulla Aripov.

As mentioned above, patriotism means loyalty to the motherland. Loyalty is manifested in a person's daily life, in his way of life. This also applies to the concept of homeland. False patriotism, on the other hand, harms and hardens every nation. Patriotism must be ingrained in the blood of man. At the same time, loyalty to the country, the Motherland, humanistic feelings are ingrained in the blood of our people. Preservation and further development of these ancient aspects should determine the important direction of work in the field of spirituality, the issue of educating the next generation as worthy sons and daughters of Uzbekistan. Only when everyone has their own homeland can they be true patriots.

Patriotism requires moving from the general to the specific. The issue of patriotism should not be derived from public activity. But there are people in life for whom the whole earth is a homeland. Such people lack the concepts of national pride, loyalty, and pure patriotism. They will be dominated by the pride of homelessness, and will embody such inhuman patriotic qualities as living life, striving for supremacy in private life. More precisely, they are not interested in the feeling of homeland, but in the achievements of everyday life. But even such people only begin to realize their mistakes when their young people go somewhere. We see such mistakes more often in the example of those who fell during the Second World War and remained in other countries. Unfortunately, there are people among us who are selfish and not interested in the activities of their own nation and relatives. For them, it is the homeland where they feed their families and feed themselves. For some, the homeland is a family, a home built for children. Some, as mentioned above, understand the earth as the Homeland. They are called cosmopolitans. Such traits are very rare in our nation, of course. So we cannot include cosmopolitans, that is, such people, in the ranks of patriots. At this point, some people do not fully understand the concept of patriotism at all, or in particular, do not want to understand it objectively. They often live outside their homeland and throw stones at the soil of their homeland. A person who does not understand himself does not understand his nation deeply either. In turn, the more a nation realizes its nationality, the more it contributes to the social, economic, political, and cultural development of its country. To this end, we are analyzing the concepts of "homeland" and "patriotism" in more detail. Patriotism, respect for the country of birth, husband, people, care for its economic, social, political, cultural, spiritual development, make a worthy contribution to development, strive to preserve the independence of his country, and, if necessary, give his life for it. dedication. These cases are even more pronounced in the

process of modernizing society. During this period, he must demonstrate his patriotism with his own labor, not on a real battlefield.

Patriotism is closely connected with the word Motherland, and the Motherland creates this patriotism. Patriotic active young people have taken a step towards becoming a perfect person.

Vilamonvets-Mellendorf, who studied the work of Aristotle, wrote: "He who wants to create a perfect man must bring up perfect citizens, and he who wants to bring up a perfect citizen must create a perfect state." The ancient Chinese philosopher Xun-ji Zhao once said, "A perfect man is careful with uncontrollable words, actions and thoughts that have never been seen before."

This means that young people need to understand activism, not simple activity, but activity that goes from simplicity to complexity, from bottom to top, from ignorance to knowledge.

Youth activism is multifaceted. In fact, it can be negative or positive. Our goal is to deny the negative activity in young people and form in them an activity that improves human life, strengthens independence.

As long as our people take their destiny into their own hands, they have the right to build a new life, a new society. After all, our people are not inferior to anyone in the world, they deserve to be among the developed countries and live in peace, prosperity and tranquility. At the same time, it should be recognized that the patriotism of our ancestors served as the main source of activism as a legacy. "The oldest manuscripts and inscriptions, created by the noble activities and purposes of our ancestors, ranging from samples of folklore to the thousands of manuscripts stored in the treasury today, contain history, literature, art, politics, ethics, philosophy, medicine, mathematics. , the original works that need to be studied in mineralogy, chemistry, astronomy, architecture, agriculture and other fields are our spiritual wealth.

Knowledge also depends, first of all, on the mastery of this or that subject by young people. The subjects taught in Uzbekistan serve to train national staff. Helps to implement advanced pedagogical and information technologies. With the help of world development sciences, it is helping to unravel the mysteries of the universe day by day. In general, science serves to mobilize production, developing political thinking.

Indeed, science directly prepares the ground for young people to be scientifically strong in various fields, therefore: "will be a customer for the training of highly qualified, competitive personnel; directly and indirectly participates in the implementation of education; prepares highly qualified specialists for the education system, science and society; provides scientific and methodological support of the educational process at all levels of the system of continuing education.

It should also be noted that the modernization of society depends on the achievements of science. Modernization, on the other hand, does not reflect certain areas of society, but rather covers all areas that are necessary for society. In particular, the development of society also depends on equipping young people with democratic processes. To this end, the involvement of young people in various public organizations, especially those that shape patriotism, increases their activity. The roundtables, discussions and debates that take place in these organizations expand their worldview. After all, if our goal is to build a civil society, young people must integrate this area. "Civil society is a necessary, rational way of social life based on law and democracy, which

guarantees the free choice of forms of economic, political and cultural life, the rule of law and human rights and freedoms, multi-party, political institutions, diversity of ideologies and opinions. - a social system with high status and high status of self-governing bodies.

Although the formation of political, economic and ideological ideas in young people is not a one-day task, achieving it gradually is a requirement of the times. The economy and youth activism are two inseparable areas of life and development of any country. These areas do not deny each other, but rather support each other, integrate, develop and improve. In fact, if economic growth, development is the body of our society, the high spirituality-enlightenment and the maturity of political and legal consciousness determine its spirit, its whole activity. Thus, "The transition to market relations is a historical necessity that requires a high level of spiritual life of society, ideological, political, legal, cultural and spiritual maturity of man. The spiritual maturity of the people is one of the most important factors in ensuring the transition to a market economy. The development of the economy in the transition to market relations is itself patriotic. In fact, ensuring that these processes are integrated in young people also depends on values. Values are also a natural resource for young people to realize their noble intentions. Consequently, values are also one of the important factors in strengthening the foundation of independence.

It should be noted that every person will lead to a crisis as long as any nation does not understand its identity, especially its values. Unfortunately, most explanatory dictionaries do not include concepts that require the same content and form, such as "value", "national revival", "national consciousness", "national pride". For example, the two-volume "Explanatory Dictionary of the Uzbek language", published in 1981 by the Moscow publishing house "Russian language", which contains 60,000 words, does not define the meaning of these words. However, the above-mentioned concepts are a necessary condition for increasing youth activism. So, it can be concluded that until independence we did not try to increase the activity of local youth, on the contrary, barriers were built. So, colonialism is the result of the policy of turning the people of our country, including the youth, into mangroves, losing their centuries-old rich and unique national heritage and culture.

Focusing on value helps young people express their inner feelings. For example, one of the Russian scientists VP Tugarinov in his book "On tsennostyax jiznii kultury" gives such ideas. "Values are the essence or aspect of an event in nature and society, which are the real or ideal blessings of the life and culture of people belonging to a particular society or class. The reason these blessings are called values is that people value them because these values enrich their personal and social lives. That is why people defend the values at their disposal and strive to realize the values that are the goal or ideal for them. Values are first and foremost life itself, because the loss of life precludes the use of all other values, the remaining values are, in fact, the essence of the blessings of life, cultural values. So, when we define value, we need to understand the sum of natural and social phenomena that serve the interests and aspirations of the nation, people and social groups, society, and are therefore valued by the nation. After all, it must become necessary to accept value as a source of its importance for patriotism.

A correct understanding of the phenomena of nature and society, the analysis of its positive aspects and the drawing of positive conclusions also serve as a basis for increasing the activity of young people. Values serve to ensure the spiritual maturity of young people, which is the first; second, values are a means of linking history with the present and the future; third, values are

a powerful force that nurtures spiritually and enlightened mature, well-rounded people. Fourth, values are the primary vehicle that connects our society to the secular community. Therefore, the creative development of national values by enriching them in form and content is a requirement of the times. These are historically strong roots for increasing youth activism.

After all, while part of the national-spiritual heritage is values, spiritual heritage is more comprehensive than value. Because the structure of spiritual heritage is multifaceted. Spiritual heritage includes historical, historical heritage, historical memory, cultural monuments, fairy tales, artefacts, ancient manuscripts, masterpieces of science and philosophical thought, art and national literature, moral qualities, religious beliefs, customs, traditions and ceremonies, enlightenment, education and so on. Therefore, the inculcation of these processes in young people can play a significant role and motivate them to increase their activity, strengthen independence by young people, establish the necessary roots of patriotism and activism, the Motherland and national values and traditions.

In conclusion, the following conclusions can be drawn: first, in strengthening independence, young people must first embody the concept of homeland, understand its content, form, essence, develop in themselves a constant ability to speak the word homeland. Second, they need to feel the interconnectedness and dialectical relationship of the concepts of patriotism with the word Homeland through their conscious thinking. Third, in the process of modernization, they must understand the roots and sources of patriotism, the guidelines for achieving patriotism and have the skills to implement it. It is a requirement of the time that these areas become a necessity for the Uzbek people to accept their traditions and values.

After all, we must recognize that spiritual and moral growth is also an important factor in ensuring the activity of young people. The modernization of society, any society, is reflected in the spiritual and moral qualities of the peoples living in terms of their time. When the spiritual and moral qualities of the people living in the society, especially the youth, are enhanced, the renewal of the society is accelerated. Consequently, no matter how difficult it may be for young people to acquire high spiritual qualities, it is just as honorable. The more highly spiritual and moral people there are in a society, the faster the progress will be. As a result, people tend to stay away from lifestyle challenges. This does not mean that the contradictions and contradictions in the way of life of people will disappear, but any society, including the process of modernization, will continue to create new problems. The denial-denial continues. It is in this process that high-spirited young people easily overcome difficulties and contradictions.

## CONCLUSION

In our opinion, national-spiritual growth is of great importance. As mentioned above, the myths, legends, epics, works of art and literature passed down from ancestors to generations form the methodological basis of spiritual growth in the process of modernization. So:

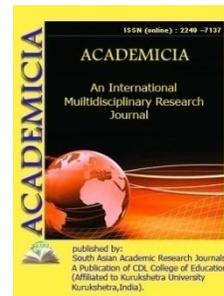

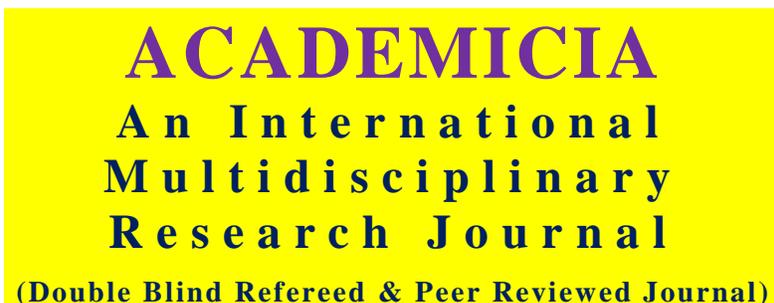

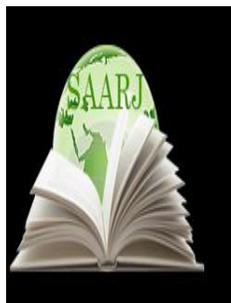

- First of all, for the modernization of society, it should be natural that the spiritual growth and content and form become a necessity for every age. Because the modernization of society requires the formation of tolerance, humanity, diligence and humility, and the elimination of dependency. Activity, on the other hand, requires interaction, connection, and relation with them;

- Secondly, the integration of spiritual and moral development requires a methodological framework. These foundations can be found in the history of the Uzbek people. Such methodological foundations still exist today.
- Thirdly, in order to improve and develop youth activism, it is necessary to draw conclusions from the difficulties and contradictions of the first quarter of the century of our independence, as well as the creative work done
- Fourth, the activity of young people in strengthening independence in the process of modernization will help to achieve certain results. Therefore, it is the sacred duty of every intellectual to arm the youth in detail and consistently with patriotism and the national idea, to take into account its continuity.
- Fifth, in order to strengthen independence, it is necessary to familiarize young people with the activities of those who sacrificed their lives for the Motherland and to make feature films about them, to make visual weapons, to translate patriotic works and instill them in young people.

## PARADIGM OF PERMANENT COMPOUNDS

**Ganiyeva Shodiya Azizovna\***

\*Senior Lecturer,  
Doctor of Philosophy in Philological sciences (PhD),  
Fergana State University,  
UZBEKISTAN

### ABSTRACT

*The article focuses on the differential and integral features of permanent compounds, their semantic properties, different interpretations in the scientific literature. In terms of the stability of the lexical units in the composition, it is also possible to include riddles in the series of paremas. Because they also have the signs of "stability" and "readiness" typical of parems. Thus it is recognized that a group of proverbs merges with sayings, the disappearance of the distinguishing sign between them, as a result of which a single stable unit in its meaning becomes indistinguishable when a proverb can be considered a saying.*

**KEYWORDS:** *Permanent Compound, Parema, Proverb, Saying, Aphorism, Riddle, Semantic Transposition, Informative Completeness, Opposition, Relevant Signs.*

### INTRODUCTION

Permanent compounds in the scientific literature have been called differently by different authors up until now. In particular, in the "Linguistic Encyclopedic Dictionary", all such compounds are expressed under the term "phraseological unit", idioms, proverbs and sayings; winged words, aphorisms; such as How are things? Are you in a good mood? stamps are included in its

composition. Signs of "semantic transposition", "stability" and "readiness" are recognized as important and universal signs of phraseology [1,559].

In particular, the paremiological unit closest to the proverbs is the sayings. Proverbs and sayings are so close to each other that although in many literatures the names of proverbs and sayings are mentioned separately, but in most cases they do not differ from each other. In some literatures, however, different characters are considered as distinguishing marks. In particular, H. Berdiyurov and R. Rasulov describe proverbs as "grammatically complete, small, concise, sharp, wise folk expressions used in a figurative meaning, or in a figurative meaning, as well as in their own meaning", and the sayings as "short, concise phrases that express educational, instructive meanings, grammatically complete, but only in their own sense - used in the right sense."

It can be seen that in these definitions the distinctive sign between the above two units is taken as the sign of "portable usage", "semantic transpositivity". At the same time, it is stated that the proverbs are neutral in relation to this sign, some are used in a figurative sense, and some are not used in a figurative sense. Thus it is recognized that a group of proverbs merges with sayings, the disappearance of the distinguishing sign between them, as a result of which a single stable unit in its meaning becomes indistinguishable when a proverb can be considered a saying. Therefore, in the "Explanatory Dictionary of the Uzbek language" as a differential sign between a proverb and a saying is taken not the sign of "semantic transposition", but the sign of "informative completeness", and this sign serves to clearly distinguish members of the opposition.

In particular, the proverb is described as "a concise, figurative, complete and wise phrase, speech, created by the people on the basis of life experience, usually with a teaching content" [3,569], and the saying is described as "a figurative expression that does not express a complete meaning, a wise word (for example, when the Red Snow falls, when the penguins fly)" [3,555].

The two-volume Encyclopedic Dictionary also gives a similar definition to the proverb [5,498]. At such times, proverbs have the sign of "informative completeness", which is characterized by a strong member of the contradiction, and the saying does not have such a sign. This member is considered weaker than the character on which the opposition is based. Based on the sign that is the basis of this contradiction, it is possible to show the unifying and distinguishing signs between the proverb and the saying. The above two permanent compounds have something in common with the first two signs, these two signs are the integral signs for these compounds. It is partially contradicted by the third sign, because some of the proverbs have the sign of "semantic transpositivity". Proverbs are therefore considered partially marked according to this sign and are denoted by the sign ( $\perp$ ). Proverbs and sayings contradict each other with the fourth sign.

In the paradigm of permanent compounds (paremas), proverbs and aphorisms are also close to each other. In the "Explanatory Dictionary of the Uzbek language" aphorisms are considered as compact, profound, authoritative; words of wisdom "[2,118], H. Berdiyurov and R. Rasulov emphasize that aphorisms are "simple, wise expressions representing the general idea", stating that they are of two kinds: verbal and linguistic aphorisms, and aphorisms of a particular person are verbal, popular, and linguistic aphorisms that have become public property [6,12].

Indeed, aphorisms differ from proverbs in that the author of aphorism is known. Over time, aphorisms become proverbs as a result of becoming public property. Proverbs and aphorisms have in common with three signs, which is considered their integral sign. They are distinguished from each other by the next sign.

Nowadays, many authors recognize the distinctive signs that are unique to each of them and emphasize that they are separate units. So, proverbs, sayings and wise sayings, i.e., aphorisms, are recognized as components of paremas. Their unifying features are "stability", "readiness", "semantic transposition". If these three signs are important features of paremas, and these signs are paradigm-forming characters, then it is necessary to add riddles to the paradigm of paremas [8,36]. Because the riddles also embody the abovementioned three signs that make up the paradigm of paremas. For example, the stability of the components of a compound, such as no snow on the pile, it's one with thousand eyes, forms a commonality with permanent compounds according to the signs that it is ready to be introduced into the speech by the speaker. If we add riddles to the list of permanent compounds according to these integral features, then the structure of paremas consists of proverbs, sayings, aphorisms and riddles.

In terms of the stability of the lexical units in the composition, it is also possible to include riddles in the series of paremas. Because they also have the signs of "stability" and "readiness" typical of paremas. In the Explanatory Dictionary of the Uzbek Language, riddles are "a brief description of what is to be found, an event, and something like that, represented by symbols and analogies; puzzle" [4,148]. So, the important features of the puzzles are "stability", "readiness" and "puzzle". The last sign serves to distinguish puzzles from other permanent compounds.

Some authors, on the other hand, deny that proverbs, sayings, and aphorisms are separate units, emphasizing that they are different names for the same phenomenon. For example, in the preface to the book "Uzbek folk proverbs" by academician Sh. Shoabdurahmanov, we read: "Although proverbs come in many forms, such as proverbs, parables, sayings, wise sayings, aphorisms, they are strengthened in the form of proverbs in modern Uzbek." [10,5].

From the above, it is clear that the author understands proverbs, sayings and aphorisms as a single phenomenon and does not pay attention to their specific signs.

G.Salomov distinguishes proverbs and sayings from each other: "A proverb is a phraseology and speech that is widely used in language, figuratively expressing things and events. The proverb expresses the speaker's attitude to the content of his speech" he emphasizes. The author considers the idiom to be a stable phrase that has an indivisible, portable meaning [7,263].

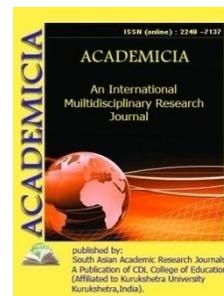

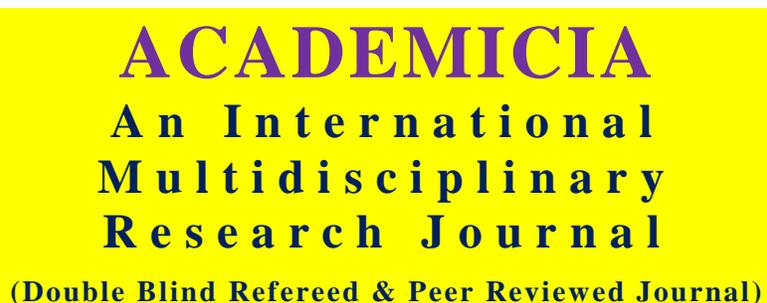

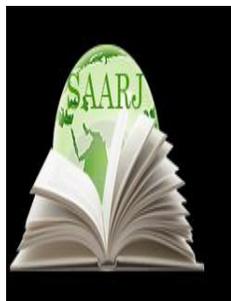

Permanent compounds have a total of six relevant signs, two of which are symbols that unite all permanent compounds, and the rest serve to distinguish them from each other. Phraseologisms differ from proverbs, sayings, aphorisms, and riddles, which are combined into a paradigm of paremas with the sign of "semantic transpositivity". Some of the proverbs approach phraseology with a figurative meaning. The transition from proverbs to phraseology reflects an intermediate point in the process of phraseologization. A similar intermediate situation is observed between aphorisms and proverbs. The over-popularization of some aphorisms obscures the sign of "copyrights" and leads to their praise.

Thus, phraseological units are distinguished by the features of "stability", "readiness", "semantic transpositivity", "informative completeness" in the composition of permanent compounds.

## SPORTS SPHERE LEXICAL UNITS

**Mahbuba Nazirgulomovna Shokirova\***

\*Senior Lecturer,  
Doctor of Philosophy in Philology (PhD),  
Fergana State University,  
UZBEKISTAN

### ABSTRACT

*The article discusses the specific features of the sectoral layer, the differences in lexical content, the presence of specific lexemes of each industry, as well as the lexical units of the sports industry. A number of researchers, on the other hand, prefer to divide this layer into terms, professionalism, professional jargon, and nomenclature. The role of industry vocabulary in sports is also significant. The reason is that many units of common use are also used as terms in sports terminology.*

**KEYWORDS:** *Lexical-Semantic Group, Terminological System, Universal Lexical System, Layer, Term, Concept, Level Of Consumption, Sports Terminology, Specific Lexeme, Intermediate Field.*

### INTRODUCTION

It is known that not all lexical layers - lexical-semantic groups, including lexical units in terminological systems - cannot relate to each other in the same way to all types of semantic relations. Only some of the types of semantic communication in this or that field can be seen

under the influence of interleaving factors, such as the specific features of each field layer, the difference in lexical composition, the presence of specific lexemes of each field [1,8]. With this in mind, it is expedient to study the field lexicon from the object itself.

M.Abdiev in his monograph "Problems of system analysis of field lexicon" [2,117] gave a detailed explanation of the general lexical system, words, terms, concepts, and said that even if the word is used at the terminological level, also writes that the scope of consumption cannot be completely limited. It follows that as a result of the use of common units in the formation of a particular terminological (lexical-semantic) level, these units form an intermediate level. The scientist distinguishes them as two-plan lexical units used in both term function and non-term function, recommending their expression by word / term term [2,9]. Such issues were also raised at the end of the last century and have been one of the most problematic situations in defining levels [3,112-119].

There are some works on terms and terminology in Uzbek linguistics [5; 6; 7; 8; 9]. A. Madvaliev, one of the scholars who has conducted extensive research in this area, defines the term as follows: "The term as a lexical unit belonging to a limited lexical layer is the main object of terminological research, an important source of terminological dictionaries" [9,29].

G. Ismailov's research on the semantic analysis of the terminological system of the Uzbek language refers to the methods of formation of terms, in which the development of terminology is widely discussed. According to the author: "Simple vocabulary and terminological vocabulary are inextricably linked. But it is also the case that the terminology itself is enriched autonomously, i.e. the term of one field becomes a term of another field as a result of semantic shift.

Currently, the development of sports journalism is leading to the Uzbekization of some sports terms.

Let's look at some of the thematic groups in sports terminology.

Most of the sports terms related to the game of football are in English. For examples, A.Y. Shutova states the following:

- the need to name a new sport (curling, squash);
- the need to distinguish between closely related concepts (runner, sprinter - short-distance runner; linesman - line referee; marker - assistant referee in cricket);
- specialization of the concept (referee - sports referee);
- popularity, attractiveness of a foreign language product (match, set, ball);
- celebrities use a lot of misleading words in the media [10,5].

Although most of the sports terms related to football are in English, a layer of Uzbek words related to the field has been formed in the Uzbek language so far.

For example:

1) "person" semantic units: referee, assistant referee, player, opponent, line referee, goalkeeper, defender, midfielder, striker, attacker, midfielder, center defender; these units are used

successfully in place of foreign words such as referee, linesman, player, goalkeeper / goalkeeper, defender, midfielder.

2) "situation" semantic units: game, offside, dangerous tackle, victory, defeat, revenge, appeal, penalty, penalty kick, derby, total football, disqualification, kick, knock down, kick, goal, combination, dribbling, disqualification, match-fixing, break, etc .; of which appeal, if the goal is an international term, is used to indicate the scale and level of the derby, total football, dribbling game, the term penalty kick is actively used instead of penalty;

3) "subject" semantic units: whistle, ball, card, red / yellow card, line, camera, goal line, goal post, goalposts, etc .;

4) "place" semantic units: field, center, right wing, left wing, penalty angle, penalty point, reserve, etc.

Signs such as the unambiguousness of the terms, the absence of various emotionally-expressive colors, and the fact that they are understandable only within a certain area mean that the study of sports lexical units under the name of terms does not fully cover them. For this reason, scientists recommend studying the field lexicon as types such as terminoids, nomenclature, preterms, quasi-terms, professionalism, professional jargon, terminology, term combinations. A number of researchers, on the other hand, prefer to divide this layer into terms, professionalism, professional jargon, and nomenclature. The role of industry vocabulary in sports is also significant. The reason is that many units of common use are also used as terms in sports terminology.

Sectoral units related to sports, on the one hand, are part of sports terminology, on the other hand, belong to the general consumer stratum. In other words, the active layer of the sports industry lexicon is the lexical units used by the public.

The separation of sectoral vocabulary provides solutions to a number of problems in language learning. Including:

1. The problem of the homonymy of terms, which have the same source and are interpreted differently in different disciplines and directions, is solved.
2. Concludes that scientific terminology consists of several layers.
3. Each field allows to have its own terminology, the determinants in the term indicate which field they are specific to.
4. Serves to reveal a certain hyponym of a word-term.
5. Multiple semantic units lead to their expression as a word-term in dictionaries. The result puts an end to the problem of whether many words are ambiguous or homonymous.
6. Each word-term is allowed to enter into separate paradigmatic and syntagmatic relations in its branch lexicon, as a result of which later there is a formation and serves to enrich the vocabulary of the Uzbek language.
7. One of the peculiarities of sectoral lexicon is the presence of compound terms in its structure. While this aspect proves to be an intermediate phenomenon, on the other hand, it imposes the responsibility of finding simple alternatives to these complex units.

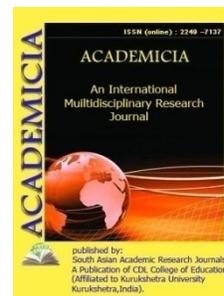

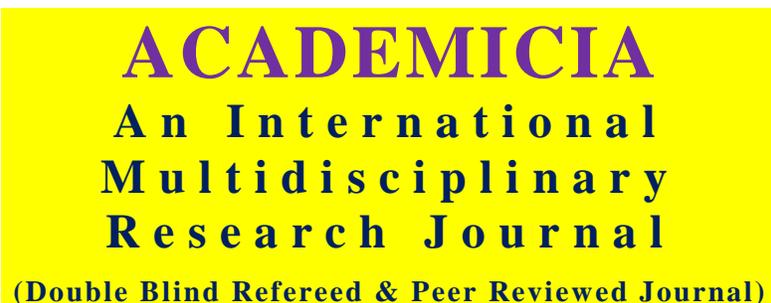

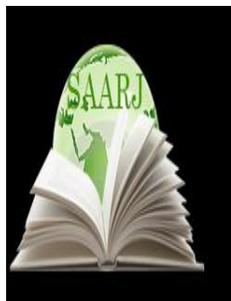

8. Terminological doublet sectoral lexicon differs from other lexical levels by its systematic nature.

In short, sectoral lexicon differs from other lexical levels, such as terminological lexicon, by its systematic nature. Sport is part of the culture. Therefore, at some points in the classification, the cultural semantics of sports-related lexemes also serve a differentiating function. The international nature of sports terms also to some extent reflects the contribution of Western culture to science and world culture.

Study of sectoral vocabulary related to sports shows that their classification, identification of areas of application, the formation of simple and unified terminology are important tasks.

## COMMERCIALIZATION OF MEDIASYSTEMS AS A FACTOR OF DEVELOPMENT OF ONLINE JOURNALISM IN UZBEKISTAN

**Beknazarov Kamoliddin Tursunpulatovich\***

\*PhD Doctoral Student,  
University of Journalism and Mass Communication of the Republic of Uzbekistan,  
Tashkent, UZBEKISTAN  
Email id: k.beknazarov@gmail.com

### ABSTRACT

*In the article discussed the mechanism of the process of commercialization of media products and the information model of the internet media as the main element of commercialization is very complex by nature of the news segment of the Internet Media: article technical, form legal, purpose socio-economic. Each of its components is considered to develop a serious supply of information (information-technological, information-analytical), which is the basis of the process of commercialization of media systems.*

**KEYWORDS:** *Internet, Communication, News Channel, Public, Information Models, Internet Media, Media Product, Commercialization Of Media*

### 1. INTRODUCTION

Already, it is safe to say that online publications and Internet representations of news agencies have become quite an effective communication channel. An important argument in favor of electronic resources is the fact that today, for most journalists of traditional publications, the

Internet has become one of the main sources of information. According to the Public Opinion Foundation, in the fall of 2010, the proportion of Internet users among the adult population of the country is 40% (or 12 million people). At the same time, 7-8 million people can be attributed to the active part of the audience accessing the Network at least once a day. Two years ago, about the same coverage was a monthly Internet audience (10.7 million). In large cities (with populations of 100,000 or more), Internet penetration exceeds the average for Uzbekistan. In cities with populations from 100 thousand to 1 million people, the monthly Internet audience is about 45%. In small towns and villages, the Internet is still not so widespread, but it is here that the largest increase is recorded: over the season (since summer), the Internet audience in cities with a population of less than 100 thousand people and villages has grown by about 10%, and over the year - by 28% and 31% respectively [1, 45-51].

All online media are divided into three types:

- The first is a complete copy of the materials of the printed publication on the Internet;
- The second is popular print media, which have an independent online edition, but at the same time the archive of the printed publication in electronic form is posted on the site;
- The third is a full-fledged independent online media.

On the Internet, such an integral feature of the media as periodicity is manifested in a new way. We can say that the generally accepted idea in the media community about the regularity of publications (publication, broadcast) of print media, radio and television programs in the new environment "does not work". True, the daily, weekly, monthly frequency of content updates is transferred from the parent offline publications to their online versions, but even in this case such "old" approaches are combined with new sections updated in a different rhythm (for example, news feeds in online versions of daily newspapers can be updated every hour).

The web edition, like any print publication, has its own edition, i.e. materials posted in it are edited. It seems to be taken for granted - if there is a publication, then it should have a revision, however, the Internet provides the possibility of existence of publications in which the materials are not edited, but are placed by the authors themselves at their own peril and conscience. In the dissertation, various online editions were analyzed and a typical structure of the online media editors was compiled, which is as follows:

**Table 1. "Edition of the online edition"  
Editor-in-chief (if there is a traditional media)**

Chief Editor of Internet Services					
<b>Editorial department</b>	Technical department	Advertising department	Video service	Press office	
<b>Section Editor</b>	Technical Director	Advertising Director	Producer	Media Manager	
<b>Staff Journalists</b>	Programmers	Designers	Filmmakers	Business Manager	
<b>Freelance reporters (freelancers)</b>	Layout designers	Animators	Operators	Manager for work with state bodies and authorities	
<b>Proofreaders</b>	System	Copy writers	Sound engineers	User	account

administrators	manager
<b>Invited Authors</b>	Editors Public Relations Manager
<b>Photo graphers</b>	

The social network is an interactive multi-user website, the content of which is filled in by the network participants themselves. The site is an automated social environment that allows a group of users to share common interests. These include thematic forums, especially industry ones, which have been actively developing recently.

Social Media Relations includes two definitions: 1) “Social Media Optimization” (SMO) - optimization for social media, a set of technical measures aimed at converting website content in such a way that it can be used as easily as possible in network communities. Having visited almost any media site, you can see the block “publish on a blog” or “post a link on a social network”. According to www.uz statistics, the most popular service for posting links to informational materials in Uzbekistan is a free cross-platform messenger for smartphones and other devices that allows you to exchange text messages and media files of various formats – Telegrams; 2) “Social Media Marketing” (SMM) - a set of measures that contributes to the promotion of the brand in social media. SMM includes the creation, promotion and promotion of groups, communities and pages on social media (Twitter, Vkontakte, Facebook, YouTube, MySpace, Yandex Photos, Flickr, Telegram, etc.), SMM includes working with official accounts and communities, so and monitoring of other informal groups, competitor groups, brand mention statistics, monitoring the number of positive, negative and neutral comments on company posts and posts that mention the company on blogs and social networks, table 2:

**TABLE 2. “SOCIAL MEDIA MARKETING”**

<b>Social Media Relations</b>

<b>The ability to register on the site using the mechanisms of Open ID and various APIs of Social Networks</b>	Monitoring Group and Brand Activity on Social Media
<b>The block of buttons on the site for publishing articles in links to them on social networks</b>	Regular update of information and work in Central Asia through Social Media

Electronic publications can post textual, photo, video and audio information, accumulating it in their databases. The first rule that applies to any material published on the site is its literacy. A large number of spelling and syntax errors will attract consumers to the site, but with a slightly different purpose than necessary, and ultimately the site will get the wrong popularity [2, 13-16].

The site visitor is primarily interested in what useful information he can find and what services to use, and only then, having found the information necessary for himself, he will find out about the

company's share in the market. The material offered to the visitor immediately after loading the resource is of paramount importance, the better the information provided, the greater the likelihood that the visitor will turn into a buyer.

It is on corporate websites that the manipulative model and the public information model are primarily manifested, because most sites do not have the ability to comment on their materials and news.

The work of a media specialist on the Internet is different in that you have to act in virtual reality. When preparing materials for electronic media, you must remember about the data format and size.

Internet publications publish (for example, [www.daryo.uz](http://www.daryo.uz), [www.kun.uz](http://www.kun.uz)), in the annotation to the article, pictures no larger than 340 pixels wide. The size (weight) of such a picture usually does not exceed 100 Kb, but so that journalists who do not understand graphic applications can publish their materials, they are set a threshold of 3-5 MB (a standard photo from a digital camera), after downloading the photo is compressed special program on the server, and is displayed to users already small [3, 67-74].

Video services, for example, YouTube allow you to upload a video of 1 GB in size, after processing it will become about 100-300 MB in size.

This allows novice "journalists" to lay out their stories quickly and not paying attention to size (this is what the server does).

Thanks to modern technology, it became possible to shoot the video on the mobile phone's camera and immediately place it on the site, thus, a large number of sites devoted to mobile reporting appear.

As you know, in a number of situations, direct communication is the best and often the most effective choice, for example, when the target audience is small and consists of disparate parts.

When publishing materials on video hosting services, companies can use several media models, for example, when "closing" the possibility of commenting, a "public information model" is used. When comments are possible, a two-sided asymmetric model is applied.

It is by keywords that the target audience can find the video and watch it. The signature can greatly change the semantic load of the video clip. If the video lasts only 5 seconds and only the tiger jump and scream can be seen on the screen, then the video is regarded differently, but the signature can change the attitude towards it in one direction or another [4,19-27].

When events associated with a change in the political situation in a country occur, a signature can seriously change the attitude of society and attract supporters, both one and the other, into the ranks. As an example of a video, on the screen we see a crowd of people with weapons, they are running, turning cars, shooting. The first version of the signature "Rebels during the occupation of the parliament building" - the minimum provision of information, users and representatives of the media will have to look for additional information; The second option, "The opposition party, after a 2-hour assault freed its associates from captivity and demands the government to resign" - a different emotional color, the "rebels" from the first signature become "liberators", while the information remains "true" in that another option. The public, depending on the information provided to it, will react differently to the events. Most often, such methods

are used to smooth out the emotional coloring of what is happening and not to bring society to revolt [5, 45-51].

When preparing news materials for electronic media, it is necessary to pay attention to the fact that the speed of the Internet is different for everyone (despite the fact that almost no one has access via a modem connected to the phone, there are companies in which the speed of Internet connection for staff is significantly limited).

When a specialist prepares material for a journalist, it is best if he creates a separate press folder on his company's server in which he will upload materials sorted into folders (Photo, Video, Text, Audio), then you can send the press release, as well as links to already laid out materials (the full path to the file, for example, "http://www.saytkompanii.ru/materials/foto/kosovo/12.jpg" - at the same time, do not forget that all folders should be called in latin letters. that these folders will be updated regularly.).

The captioned signature carries a great semantic load, which allows specialists to send journalists in the "right direction". Different signatures to the same photo in different ways make the media representative react to the situation, thereby changing the preference of the journalist when writing and publishing material.

With the advent of social networks, the usual usage of Internet users included such words as: Telegram, twitter, facebook, classmates, forksquire, altergeo, calorie, myspace, linkedin - the names of popular social networks; Tweet, retweet, replay, post, repost, tape, subject, direct, digital, friend, bots, multi-letter, check-in, badge - actions and definitions of users on social networks [5, 64-72].

Every year there are more and more social networks (including anonymous), their appearance leads to the modernization of activities

Ordinary users and online companies. And as a result, to increase the number of false messages on the Internet.

Bloggers are currently de facto social journalists. "But you need to keep in mind that, unlike ordinary media representatives, there are much more insane people on the Internet ... If you can ask a journalist, convince him of something, then it's impossible to put a block to a blogger. Therefore, any information on the Internet should be based on the principles of openness, and the company should understand that it cannot agree with anyone and about anything. You need to be aware that you have to play honestly, no matter how scary it sounds. "

Most users from actively speaking turn into listeners, this is explained, in particular, by the fact that users begin to lose interest in social networks, other, more functional and interesting services, the number of social networks is constantly growing and it takes more and more time to track your online activity in different projects.

Researchers identify four main reasons for using social networks: communication, increasing popularity among peers, entertainment and professional goals. At the same time, the number of simple sentences in messages on social networks is much more than complex sentences, this is due to the fact that the number of characters in social networks is limited, and they need to fit everything that the user wants to say.

Internet technology is the fastest way to disseminate information today, and with the advent of services microblogging - a new genre of online journalism has appeared and it can be called as well as one of the most popular services - Telegram-journalism. An important feature of Telegram is the ability to communicate with readers - other bloggers who tweet their blogs [6,12-19]. Users can subscribe to other people's blogs and read them in a single stream. Brevity, convenience, efficiency, interactivity, multimedia, a wide range of readers - all this makes Telegram the most popular blogging, news distribution service.

The Internet, as a means of forming publicity, combines all four media models. This is probably due to the fact that a number of sites does not allow users to comment on materials and leaves no contacts other than e-mails for communication; in this regard, the “manipulative” and “public information” models can be found on a number of sites. However, unlike print media, on the Internet, government bodies and large state-owned corporations use “bilateral asymmetric” and “bilateral symmetrical” PR models on their websites. There is almost always the possibility of quick feedback on sites, and in some cases virtual assistants, who can answer most questions. The Internet has gathered all the characteristics that apply to print and electronic media. All aggregate factors influence the perception of information on the Internet, and in addition, the response of the target audience and discussion is of great importance.

Today, the media are experiencing a process that can be conditionally called the second wave of commercialization. The mass transfer of property of many Internet publications specializing in innovations from a legal form to a private form is carried out gradually. Looking from the outside, this process is almost unnoticeable due to a number of factors:

- Within the framework of the general process, the locality of each solution leads to a valid interruption between the general cause and its various consequences;
- High level of adaptation of its new participants in the formed and functioning structure;
- Wide spread of such social practice in other areas of economic and social activity;
- Small consolidated mobility of social audiences;
- Uniformity within each specific demand area, which allows different sources of information to replace one another, the priority of materials in terms of brand offer.

Nevertheless, this process has attracted the attention of media professionals, representatives of the professional community at all levels, as well as media researchers, not only because of the scale not inferior to the first wave of commercialization of media, but also because of the trends and prospects inherent in this process

The development of the national media market shows that advertising has become a major source of new investment, not only has it become a type of support for the media by the audience at the moment, it has become the basis for the rapid development of the entire media System [1].

In the media market, a two – tier structure of revenues is observed: on the one hand – receipts from viewing the pages of the site, specializing in news related to the quality of journalistic content and its compliance with the information needs of readers, that is, with compliance with the demand; on the other hand-payments for advertising content related, to the number of Against this background, on the one hand, the interests of the audience, its information needs,

and on the other hand, potential advertisers, investors, sponsors have to maintain a balance between the interests of a particular audience.

In recent years, there have been drastic changes in the world media. Growing competition is forcing the media to use strategies that could wipe out the link between content and advertising and seriously undermine it [2].

Over the past decade, the commercialization of the media segment on the Internet has developed several key models. Within the framework of these models, the media can go smoothly with respect to compliance with the laws of the market economy. Conditionally we define these models as follows:

- Commercial content model;
- Production concentration model;
- Communicative (local) model.

At the stage of differentiation of the underlying factors that make up the basis of the proposed models of filings and the provision of a primary description, we have identified a specific feature: each of the models refers to only one specific structural unit of the activity of the Internet media.

This allows us to come to the conclusion that in each specific situation, the localization of commercial processes at one level of production, that is, the isolated integration of publications, and, ultimately, the transition of news portals and a large share of the professional community to market relations.

The commercial content model provides for the evaluation of commercialization as a commercial content strategy. Commercialization becomes a factor in which media is introduced into a specific "foreign body", from the outside, and therefore does not completely cover it. Thus, the main medium, which includes the general concept of publication, is excluded from the concept of competition in the product media market, the function of which is to attract the mass consumer, which gives its place to a specially adapted content.

In the Society of market economy period the development and character of the system of publications is determined by the overall impact of economic, ideological and political factors.

## **2. MATERIAL AND METHODS**

But in the end, the economic factor plays a special role [3]. The structure of the formation of this model was formed under the influence of a number of factors of the National media market conjuncture. First and foremost, the participation of the state in this business as a partial or total proprietor was impressive: 20% public and 80% Private Internet publications. In accordance with the media market structure reviewed in our study, the allocation is not conducted according to the principle of publication appropriateness. State news sites are considered to be market participants anyway, despite the presence of state support.

It turns out that public and Private Internet publications occupy a certain share of the market due to the uniqueness of their basic information, which generates a constant income from subscriptions. The market for these publications is not only an additional source of income, but

can also operate technically even in its absence: in fact, these publications have become one of the market factors.

The need to enter into competition with such large affiliates of the market is that a large part of the product offered by Private Internet publications should be adapted to such conditions of competition, that is, Internet publications should formulate special messages aimed at achieving a competitive advantage, which have nothing to do with the content of the main concessions. Market mastering is carried out based on the creation of special commercial elements of a particular content from the main produced product.

Long historical experience shows that relying on "scandals, investigations, Gossip" generates huge profits, first of all attracting large audiences capitalizing on revenues from advertising [1]. The publication "given" to advertising is highly likely to be separated from its readers. "Even if advertising is of no informational or cultural importance to the audience, its media is undoubtedly the first and main source of funding, as an important condition of their profitability" [4].

The essence of the model of production concentration looks at the media enterprise as a subject of material production. The essence of this model is the unique trend of the emergence of the media market, which is considered one of the elements of the emerging markets (such as the advertising market in terms of realizing the potential of mining, as well as the media product market in terms of the material component of production).

The production concentration model is a specific alternative variant of the formation of commercial content due to the absence of other competitive aspects. The costs in this case are compensated from the account of the sale of commercially profitable tokens: what is carried out on the account of content in a model is achieved here in the form, the account of material production.

As can be seen from the description of the above models, the basis of their development is the optimization of costs for production activities on account of the involvement of the Internet media in competition in the peer-to-peer market. The unifying aspect of these two models – this is on the basis of them lies in the optimization of costs for the production of the main product. They do not allow to achieve, to achieve, the main goal of the commercialization process, that is, to receive income on the account of the sale of media goods as a component of the social institution of the media. This means that media product has been able to solve the problems with the financing of production so that they are not directed to make a profit on the account of its implementation.

In this regard, the communicative model of media commercialization looks promising. Its essence lies in the realization of the commercial potential of the communicative component of media activity. In practice, for this model, the forms and types of use of feedback with the audience are more important than the content: instead of reporting, communication goes to the first plan.

The insistence of audience parameters on toys media and the success of a particular web journalist depends on their ability to clarify them. These data are necessarily included in the business plan of the publication or broadcast program [6]. This approach is primarily aimed at the formation of a communicative provision of notification, the calculation is carried out

depending on the specific prospect. This is logical, because with the help of this publication, the prospects for expanding and enriching the range of information offered to the level of participation of the audience in Mass Communication depend.

Journalists spoke with users in a normal language, helped in solving household problems, began to act, most importantly, listen. The main factor was communication, direct contact with a potential audience served, and in the end this led to the development of two systems, such as any interaction, effective joint work. The nature of these practical examples allows us to think about the extent to which the application of this commercial model is limited to a certain extent: it works on the example of a private media segment, but does not correspond to the scale of the state. This limitation is due to the difference in the composition of the public and private internet media audience both in terms, and most importantly in terms of quality, but due to the issues of profitability of the overall implementation. Nevertheless, as a result of our research, we have come to a number of conclusions, including the fact that within the framework of the second wave of commercialization of the media, its orientation to the private segment in the future of the current developments, commercialization in media activities becomes a priority, due to its focus on the formation and application of the communicative model. In this direction, the further development of commercially independent media at the regional level allows to see prospects for the development of the media sector within the framework of another paradigm of interaction in the media audience system.

The news segment of the internet media as a key element of commercialization is very complex by Nature: article technical, form legal, purpose socio-economic. Each of its components requires a serious supply of information (information-technological, information-analytical), which is the basis of the process of commercialization of media systems.

From the point of view of commercialization, various processes are integrated into a single information and innovation process that creates innovation that meets production demand and satisfies media consumer frustration, creating conditions for commercialization (figure 1). The process of commercialization of Internet media systems defines the procedure and methods of searching for options for their implementation with the participation of subjects of commercialization of information and organizational model (lisenziat(L), intermediate(PL) and strategic lisenziat (SL).

The Model is used at all stages of the life cycle of a media product, including incomplete stages "thought", "the process of working on a media product", "finished media product", as well as with raw documents on the protection of basic results in the form of actual property.

Model media is divided into two stages for product implementation:

Stage 1 - media product completion (participation in the completion of the stages "idea", "work on media product", "finished media product" and the preparation of legal protection documents for the main results of media activity);

Step 2-use of mass media activities (implementation with the participation of SL).

The principle of the application of Bunda financing schemes is based on the SL, that is, on the principle of the final implementation of the activities of the mass media, it is carried out in 2 stages.

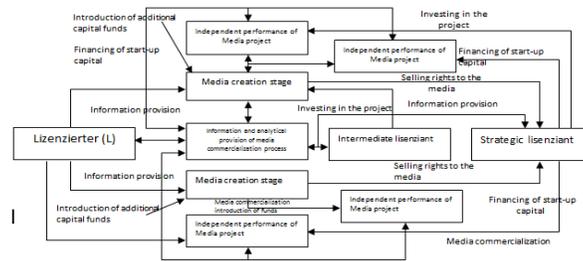

Figure 1. Information and organizational model of Media commercialization

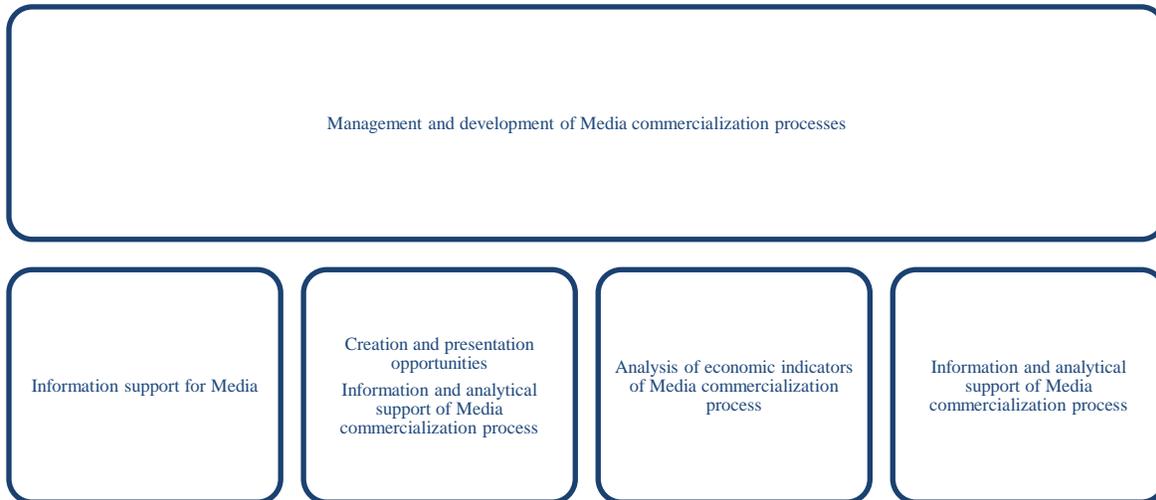

Figure 2. Information support mechanism of Media commercialization process

### 3. Results

Commercialization of information and media activities is a complex multi-component task of the organizational functional system. In the process of commercialization of the activities of the mass media, the situation of managing the case space of Information  $S$  and organizational support includes the main five components  $t$  in the optional time interval:

$S_1$  – a set of functions (orders) that are defined to complete and waiting in accordance with (when it is established);  $S_2$  – special equipment, software use, jobs,  $\rho^A$  employees involved in a collection;  $A$ ;  $S_3$  – involved employees;  $\rho^V$  bundle  $V$ ;  $S_4$  – volume of funds received in the period under consideration (current month);  $C_{np}(t_y)$ ;  $S_5$  – volume of collected current expenses  $C_T(t_y)$ .

$S_1$  component  $S$  cases makonida describes the flow of incoming service requests as a bit Field ordered of a certain length, designed to limit the collection of orders that have not been received for execution.  $S_2 \in S$  for componet, this approach is unacceptable to us, that is, changing the number of services performed during the process of satisfying this order after the events of the final character in relation to other commands is painful.  $S_3 \in S$  the componet is assigned the task of managing the distribution of the elementary functions of the executed commands.

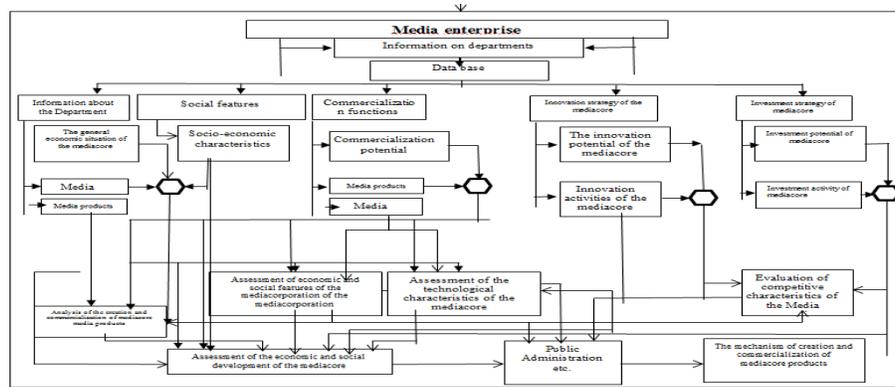

Figure 3. Information model of the process of commercialization of mediacorporate media products

It is proposed to design such a component in the form of a matrix  $M = |V|x|A|$ , strings are assigned personally to employees, columns-equipment engaged in information support. Components  $S_4, S_5 \in S$  in accordance with the purpose of strengthening  $C_{np}$  and current costs  $C_T$ , information related to software.

Components  $S^{n_1 n_2}$  correction of main events in the application for information support with tokens  $n_2$  or number  $n_1$  on time.

Changing many hundreds of functions to avoid viewing and storing in memory  $\gamma_1$  and  $\gamma_2$ , with their arrival, they are offered an automatic forming procedure. To do this, it is necessary to create some database of auxiliary information.

#### 4. DISCUSSIONS

Based on the proposed information and organizational model with a functional appearance, developed information support framework (fig. 3.3.2) it is a solution to specific problems by using the knowledge about the characteristics of the external and internal factors of the object of commercialization, allowing the management of the process of commercialization of the media.

Media Development and implementation opportunity research information support scientific and engineering potential scientific and technical and market information search scientific and engineering workers poll opinion and innovation project implementation opportunity within the existing potential of the enterprise include research definition (fig. 3).

The mechanisms that allow to assess the prospects for the independent implementation of the innovation product produced in the market should include, first of all, the collection and analysis of data on the results of mediarrivization.

This paper focuses on the analysis of media commercialization and development and is defined by three main types of tasks: information monitoring of regional problems, preparation of alternative management solutions for the relevant governing bodies (situation reports, problem-solving approaches, forecasts, etc.); preparation of analytical materials for higher bodies; formation of information and analytical products and services.

To assess the effectiveness of commercialization of the results of Media activities, the following groups of indicators are proposed.

Cost indicators: the cost of the region's media budget unit, characterizing the measure of intensity of research in the production of enterprises of the region; the cost of licenses, know-how; costs for the creation of media components; availability of regional funds, regional targeted programs that develop research initiatives and support the implementation of regional scientific and technical programs and projects.

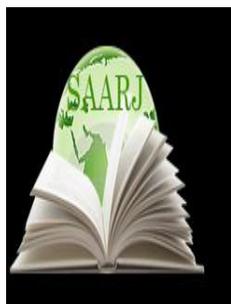

Indicators that characterize the dynamics of innovation process in Media enterprises: innovation; the duration of the media (media technology) development process, the planning of new product development and the cycle of new product production.

## **ABOUT THE PRINCIPLES OF THEORETICAL BIOLOGY**

**B. Xoliqazarov\***

\*Termiz State University, Termiz Region,  
UZBEKISTAN

### **ABSTRACT**

*The article analyzes the reasons why theoretical biology, such as theoretical physics, does not currently exist, and discusses the principles of theoretical biology. The energy principle also represents the efficiency of the function of a whole organism and its parts by the degree of energy saving. For example, an organism that consumes a lot of energy by consuming food is considered perfect. In the process of evolution, as the organism becomes more complex, the ability to produce valuable traits also increases, because the interaction between ontogeny and phylogeny is assessed by the value of genetic or other information generated in the organs. Thus, this science has not yet formed, since the prints of Theoretical Biology have not yet been fully developed.*

**KEYWORDS:** *Theoretical Physics, Theoretical Biology, Natural Selection, Convariant Replication, Complexity, Affordability.*

### **INTRODUCTION**

Theoretical biology, like theoretical physics, does not currently exist or has not been formed as a science. The basis of theoretical biology was originally Ch. In Darwin's theory of evolution, it is expressed in Mendel's law of the purity of gametes. Theoretical biology has been called general biology since the 19th century, and a number of fundamental works have been created in this field. These works have to some extent generalized the theoretical foundations of biology. The main reason for the absence or formation of theoretical biology is the lack of natural-historical biological principles of theoretical biology, such as the principles that have existed in theoretical physics since the eighteenth century and are still being developed, or have not been scientifically based and developed. NV Timofeev-Resovsky (1984) substantiated two such principles based on the achievements of physics, mathematics and biological sciences.

1. The principle of natural selection. Natural selection refers to the process of evolution in which individual traits that are beneficial to the organism are preserved and multiplied, and harmful traits disappear. If natural selection did not take place, living organisms would not be able to survive. Therefore, the idea that natural selection is obsolete and needs to be replaced by another concept or theory cannot be added to the comments at this time.

2. Convariant replication or heredity of living organisms the principle of transmission of information from generation to generation. According to M. Delbryuk, P. Drak, N. K. Koltsov's physicochemical model of chromosomes and genes, as a result of reproduction, the process of replication from molecules to cells takes place, and genetic and other information is collected, stored and passed from generation to generation.

Crystal molecules grow due to replication, and the multiplication of living organisms is called reduplication. These events the organic world becomes more and more complex from simple to complex. This can be seen from the level of information gathering. An example of this is the gradual increase in genetic information as a result of the evolution of the complexity of vertebrates. In particular, relative to the amount of DNA in mammals, the DNA in the genome of early chordates is 6%, in non-skeletal animals 17%, in round-mouthed 38%, and in some species of frogs and turtles 80%. Structural improvement is due to an unconditioned reflex derived from parental organisms, as well as a conditioned reflex that occurs during personal development is manifested in the behaviors that occur. It is very well developed in all animals, as well as in higher mammals, especially predators. NV Timofeev-Resovsky (1984) also stated the third natural-historical biological principle of theoretical biology based on a lot of scientific evidence. He called this principle progressive evolution. According to him, does progressive evolution occur when natural selection takes a long time? If it is necessary for scientists to use the methods of mathematical biology in solving this problem are considered necessary. In our view, the fourth principle is systematicity, in which systematicity represents the degree of complexity and integration of the structure and function of an organism. These include increased stratification of the body, tissues and organs, the provision of multifaceted vital functions, and oligomerization of homologous organs. The energy principle also represents the efficiency of the function of a whole organism and its parts by the degree of energy saving. For example, an organism that consumes a lot of energy by consuming food is considered perfect. It is characterized by the quality of enzymes, consumption of calorie-rich nutrients, low heat release into the environment. In the process of evolution, in parallel with the complexity of the structure of organisms, the value of some of the features that make up the structure and function of organs has increased, and the methods of reproduction and the mechanisms of reproduction associated with them have

improved. The importance of a particular organ is assessed by its “complexity” and “value” that arise in the process of natural selection. Complexity refers to the organism, and value to the organ and its functions, which increase in the course of evolution from one systematic group to a higher systematic group. Therefore value is a broader concept than complexity.

Due to the evolutionary simplification associated with reproduction, the structure of some organisms has become more complex, and the value of the organs that make it up has also increased. In particular, separate morphophysiological changes occur in the process of reproduction in samka and samets of representatives of 4 families of fish living in deep waters (Caulophrynidae, Ceratidae, Neoceratidae, Linophrynidae). Very small compared to the sametsa samka (in the *Ceratis holboelli* species, the sameta length is 1 meter, the sameta length is 15 mm), before reproduction, the sametsi penetrates the skin of the sametyi and its jaw, eyes and intestines are reduced and become sperm-producing tumors. At the same time, complex organs change their structure and become the sexual organ of the organism, which is valuable for the same stage of development, and this is a specific adaptation aimed at procreation, which occurs in the process of evolution. So when we say natural selection, the search, finding, and selection of characters that are valuable to organisms. In the process of evolution, as the organism becomes more complex, the ability to produce valuable traits also increases, because the interaction between ontogeny and phylogeny is assessed by the value of genetic or other information generated in the organs. As biological systems become more complex, so do their ability to produce valuable information. As the animal world evolved from simple to complex, so did the structure and methods of reproduction (M. V. Volkenstein, 1984). Hence, given that the complexity and value of an organism are also important for evolution, it can also be accepted as a principle of theoretical biology.

Thus, this science has not yet formed, since the prints of Theoretical Biology have not yet been fully developed. In the future, it is necessary to analyze, develop, determine the subject and the main topics of the prints of Theoretical Biology in depth. Bunda should be taken into account that the main themes of Theoretical Biology are the general theoretical basis for all areas of biology.

## CONCLUSION

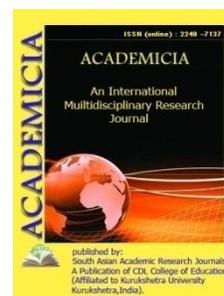

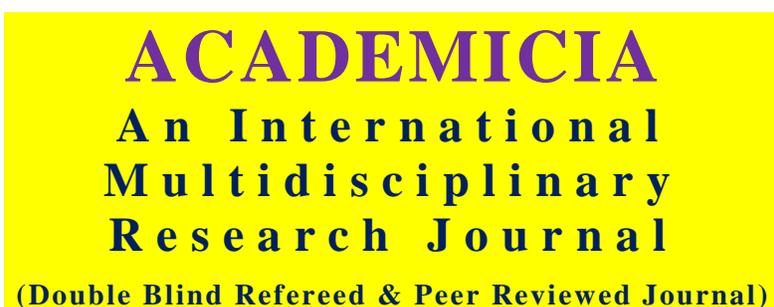

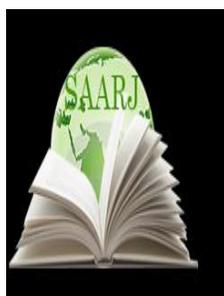

1. The Society of biologists of Uzbekistan has been established, and its one department should analyze the current state of laws, rules, theories and terms in all areas of biology, enrich it with relevant innovations and create an electronic platform that is constantly updated. This is a huge work, which should be attended by biologists of all research institutes and higher educational institutions of the Republic of Uzbekistan, as well as representatives of the general public.

2. Topics of Theoretical Biology, printouts, theories on biology, hypotheses should be identified and on this basis educational and scientific literature on theoretical biology should be created. This is important for the prospect of Biological Sciences.

### INTRODUCTION

Physical education in preschool institutions provides, first of all, the protection of life and health improvement of children, the timely formation of their motor skills and abilities, the development of physical qualities, the upbringing of cultural and hygienic skills and habits, the development of interest in physical exercises and outdoor games.

Physical culture and health-improving activities of preschool children should be aimed at increasing the resistance of the child's body to unfavorable factors of the external and internal environment, the development of mental and physical qualities and characteristics, interest and need for physical improvement, comprehensive formation of the child's personality [6].

Children of preschool age are sensitive to a targeted effect on the development of their motor function, improvement of the morphological structures of the motor apparatus. The full physical development and health of the child is the basis for the formation of the child's personality. Modern children, in most cases, experience a "motor deficit", i.e. the number of movements they make during the day is below the age norm, since children spend a significant part of their time in a static position (at a table, at the TV, computer, etc.). This increases the static load on certain muscle groups and causes them to fatigue. The strength and performance of skeletal muscles also decrease, which entails impaired posture, curvature of the spine, flat feet, delayed age-related development of speed, agility, coordination of movements, endurance, which undoubtedly aggravates the adverse effect of hypokinesia [3]. At present, many different children's studios, private preschool institutions, gymnasiums, etc. have appeared, where, first of all, the question of the physical development of children and physical fitness in modern conditions arises. The whole complex of physical education means, including the implementation of the daily regimen, health-improving hardening measures, ensuring the necessary motor loads, rational nutrition, should be aimed at solving the main task - raising a healthy child.

Physical performance of children depends on the characteristics of physical education, methods and forms of teaching physical culture. In this regard, the promotion of health problems among the priority tasks of preschool education determines the relevance of its theoretical and practical development, the need to develop ways to maintain health from childhood.

Insufficient theoretical elaboration of the issue and the practical need determines the purpose of the study: to study the features of the physical development of older preschool children in the conditions of preschool educational institutions of various types.

The purpose of our study was to solve the following problems:

1. To analyze the system of physical culture and health improvement work, as well as the process of development and education of the physical qualities of older preschoolers in theory and practice.
2. To organize and conduct a practical study of the level of development of physical qualities of children 6-7 years old in preschool educational institutions of various types.
3. Conduct a comparative analysis of indicators of physical development of senior preschool children, various preschool educational institutions.

The methodological basis of the research is the patterns of natural formation of human motor qualities in ontogenesis and the pedagogical principles of the formation of physical qualities of older preschoolers in the course of a purposeful pedagogical process.

To solve the set tasks, a complex of theoretical and empirical research methods was used: analysis of psychological and pedagogical literature; oral questioning of teachers-trainers in physical culture of preschoolers (interviewing); pedagogical control tests (tests); pedagogical observation; methods of mathematical statistics.

Physical education of children of the preparatory group for school requires special attention. The age characteristics of children in this group are favorable for achieving good physical development and health promotion. In the process of physical education under the guidance of a teacher, the child masters motor skills and abilities in accordance with the requirements of the program for each age group.

The formation of skills and abilities in the process of teaching various types of movements is carried out in inseparable unity with the education of physical qualities.

Motor qualities in preschool children are formed in the process of performing various exercises, with the help of which it is possible to influence various qualities, while gradually increasing the speed and frequency of movements (education of speed), the complexity of coordination (education of agility), the number of repetitions of movements (education of endurance), the amount of resistance to be overcome (strength training).

With the accumulation of motor experience, improvement of the morphological and functional properties of the child's body, favorable prerequisites are created for the development of all motor abilities [4].

Mastering new movements, the development of the motor analyzer determine the possibility of improving dexterity. The high level of development of dexterity is evidenced by the good performance by children of movements included in an outdoor game with changing conditions or complicated by additional tasks.

A firmly fixed motor skill, performed under constant conditions, ceases to contribute to the development of dexterity [2].

Preschool children have especially great opportunities in the manifestation of strength abilities. Determination of the strength capabilities of children is necessary for the correct dosage of physical activity in various types of activity.

The introduction of a senior preschool child to the values of physical culture is extremely important for the theory and practice of physical education and sports, i.e. it is during this age period that the image of his future life is formed. Therefore, it is important to lay the foundations of the value attitude towards physical education in the first 5-6 years of a person's life. Scientists and practitioners suggest various ways to achieve this goal. Among them are activities that expand knowledge about sports and physical education (excursions, conversations, meetings, films), emotionally attractive holidays and entertainment, homework, etc.

All these forms, one way or another, affect the attitude of children towards physical education. According to T.P. Bakurova (2001), a more effective way is to optimize the interaction of a teacher and children in a physical education lesson. An increase in the emotional content of training sessions, their attractiveness, personality-oriented interaction between an adult and a child in the process of physical education allows an increase in the number of positively experienced emotions, and this, in turn, will affect the general attitude towards physical

education. This statement is based on the fact that one of the motives of the initial stage of physical culture lessons is the motive of the emotional attractiveness of physical exercises [1].

Based on the analysis of psychological and pedagogical literature, we found that the specificity of working with children in physical culture is in the emotional saturation of classes. The creation of emotional saturation of classes, the creation of an atmosphere of cooperation, trust, creativity is achieved by the methods of emotional regulation: musical influence, color influence, reception of switching attention, method of modeling joint activities, reception of positive reinforcement of actions.

When working with children of older preschool age, attention should be paid to the biological clock, which is the main mechanism that ensures the balance of physiological processes and cyclic changes in the environment.

Of all the means of physical culture, the most widely used are general developmental exercises, exercises in basic types of movements, outdoor games, relay races, sports events. A very interesting and effective means of physical culture is a week of physical readiness with preschoolers, which are organized by teachers on a monthly basis. The main purpose of which is to have an idea of the physical condition of children, to make changes in planning, if necessary. A fitness week program can include Runner's Day, Jumper's Day, Fun Starts, and more. The week ends with summing up and rewarding children with gifts and certificates. This form, along with others, allows you to develop interest and needs in physical self-improvement, getting "muscle joy" from games and exercises, contributes to the upbringing of moral, volitional, physical qualities and abilities. Thus, a high level of physical fitness is achieved.

The successful teaching of children to movements largely depends on adherence to the basic principles of teaching: accessibility, gradualness, consistency, correct alternation of material, physical activity and rest, an individual approach.

Children of older preschool age should be taught elementary knowledge about the benefits of physical exercise, the correct ways of performing movements (technique), the rules of outdoor games, the appointment of physical education equipment; The simplest information about personal and public hygiene - the rules for caring for the body, clothes, shoes, physical training equipment, etc.

It is important to bring up aesthetic tastes in children: to acquaint them with the concepts of the correct physique, the beauty of posture and movements.

In the process of physical education, senior preschool children develop mental abilities, attention, memory, perception, thinking, and imagination. It should be noted that preschoolers are characterized by the relationship between the development of mental and physical.

Thus, physical culture, as a system of health-improving effects on the body of a preschool child, allows the most complete solution of educational and educational tasks.

Analysis of the results of our research allows us to draw the following conclusions.

1. The senior preschool age is considered by us as a life period during which the basic motor qualities of children are laid and developed, which are a springboard for the formation of a physically healthy full-fledged personality; Moreover, we see the lesson classes as a factor contributing to the formation of the physical qualities of older preschoolers.

2. Taking into account all the variety of methodological approaches to the process of upbringing physical qualities, the teacher is gradually given the task of creating the most effective structure of the educational process. Moreover, such a structure should be based on certain pedagogical principles.

3. The introduction of innovative approaches, technologies in the physical culture and health activities of preschool children provides not only the necessary conditions for their full natural development, but also contributes to the upbringing of a conscious need for health in preschoolers, the practical development of healthy lifestyle skills and the formation of a health culture. Such an organization of physical culture and health-improving activities of senior preschoolers to a greater extent contributes to more successful adaptation and educational and cognitive activity at school.

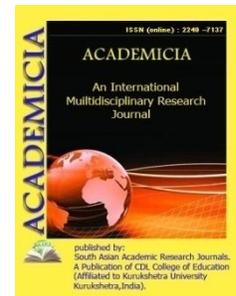

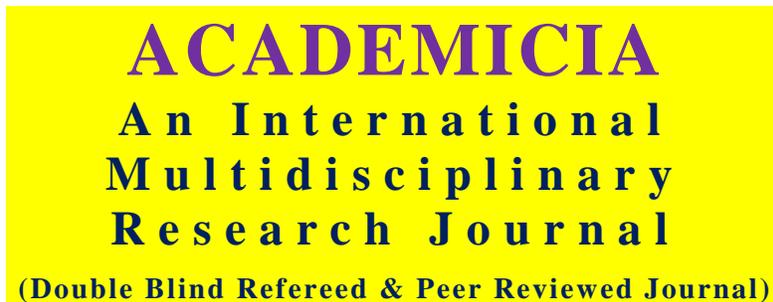

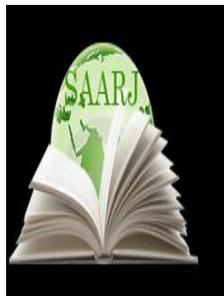

4. In the course of practical research, children of 6–7 years old fulfilled practical standards, but the level of physical fitness of children of two preschool educational institutions is different according to the results of test tasks. Children of preparatory school group of gymnasium No. 163 showed better results.

5. It should be noted that statistically significant differences are observed in push-ups, long jump, throwing a tennis ball with the right hand. Although there are differences in the results in the remaining test items, the statistical significance is low.

## HISTORICAL ANALYSIS OF PRIVATIZATION PROCESSES IN UZBEKISTAN (ON THE EXAMPLE OF NAVOI REGION)

**Aminova Aziza Marksovna\***

\*Doctor of Philosophy (Ph. D),  
Navoi state pedagogical Institute,  
UZBEKISTAN

### ABSTRACT

*The article analyzes approaches and methods of privatization and denationalization in Uzbekistan from a historical point of view and highlights the features of these processes in the Navoi region based on sources. Based on the analysis of the materials studied, the author reveals the mistakes, shortcomings, and successes in the implementation of privatization processes.*

**KEYWORDS:** *Denationalization, Monopoly, Privatization, Market, Phasing, Entrepreneurship, Abolition, Restructuring.*

### INTRODUCTION

The historical analysis of the implementation of privatization processes in Uzbekistan is an urgent scientific problem that currently needs a thorough scientific study. The privatization process, as a socio-economic phenomenon that was widespread in the late XIX - early XX century in economically developed countries such as great Britain, France, Japan, and the United States, was generated by certain prerequisites: a change in the social system, state transformations, and the introduction of new economic systems and reforms.

In contrast to economically developed countries, where privatization has only affected individual state-owned enterprises that can develop without state intervention, Uzbekistan, as in other countries of the former Soviet Union, has carried out large-scale privatization aimed at eliminating state monopolism. At the same time, based on the principle of gradual transition to the market, Uzbekistan has chosen the path "from simple to complex" to implement these processes and has developed a programmatic approach to the implementation of the stages of privatization and denationalization of property.

At the first stage of privatization, as it was called "small privatization" by the government, based on the theory and practice of developed countries, some experience was accumulated in choosing the forms of privatization in relation to various objects of state property, assessing the value of the privatized property. In 1993, on May 7, the Law of the Republic of Uzbekistan No. 846-XII "on privatization of the state housing stock" (1) was issued. Based on this Law, the first step in the privatization policy was made to transfer housing to the ownership of citizens of Uzbekistan at affordable prices. The next step was to make a decision to transfer objects of trade, consumer services, and local industry by selling them to a new owner.

During the denationalization and privatization of state property at the first stage of market reforms in Uzbekistan as a whole in 1992-1993, more than 66 thousand enterprises of non-state ownership were formed(2).

By the early 1990s, Navoi region had a powerful, multi-industry enterprise - the Department of labor supply (URS), formed in 1965 in the city of Navoi with divisions in the cities of Navoi, Zarafshan, Uchkuduk, and Nurabad. It also includes a wholesale and purchasing base, a fruit and vegetable state farm, feedlots with more than seven thousand pigs. (3).

In addition To the Department of labor supply in the region in the 90s, the regional consumer Union (OPS) and its GORPO and RAIPO, serving the districts and the Department of labor supply of the railway, functioned. In 1992, the regional workers ' supply (URS) of Navoi city was divided into trade Association No. 1 and trade Association No. 2.

Analysis of source documents shows that the government of the country used various ways to denationalize state property and provide the means of production for a new emerging class of entrepreneurs. The first of them was based on the demonopolization of state property, which was carried out by splitting up factories and trusts. Most intensively this process occurs in the field of maintenance, in particular in systems of "Uzbeksavdo", consumer "of Usbecause". As a result, the Navoi region was abolished head Department of trade Oblpotrebsoyuz, GORPO, RAIPO and transferred to private hands (4)

Consumer competition serving the rural population has been seriously tested for its ability to survive in the emerging market competition. In some cases, the transformation of collective farms into collective farms took place formally. The industrial and social infrastructure is in a

very difficult situation. There are no rural medical centers in the villages, and small amounts of trade facilities are located in district centers. Gasification of Nuratinsky, Kanimekh and Navbakhor districts in the first years of independence was at the level of 5-10 %. Provision of drinking water in Kyzyltepa, Navbakhor, Navoi and Nurata districts at the level of 10-35%. (5)

At the second stage, from 1994 to 1998, during the period of mass privatization, it was planned to denationalize small, medium and large enterprises of mechanical engineering, construction and construction industry, automobile construction and light industry into open joint-stock companies. Enterprises of the food, pharmaceutical, procurement and light industry were sold into private ownership in order to radically change the structure of the economy. During the process of denationalization, 21.9 thousand enterprises were privatized in Uzbekistan.

The difficult economic situation in the first years of independence especially affected the activities of construction organizations. If in 1990 the state allocated 106.9 million soums for construction in the region, in 1991 the allocated funds were reduced to 92 million soums, in 1992 to 66 million soums. This was due to the fact that construction prices increased 50 times. Construction materials that came from the former Soviet republics stopped coming in. In 1990, the construction of residential buildings was carried out on 50.4 thousand square meters, in 1991 on 42 thousand square meters, and in 1992 only 25-28 thousand square meters. (6)

Until 1991, almost the entire volume of construction and installation work on the construction of residential buildings and social infrastructure in the Navoi region was performed by the General contractor organization - the Navoi construction Department(NUS), as well as the Zaravshan construction Department(ZUS).(7) Navoi construction Department, established by order No. 581 of the Ministry of medium machine building of the USSR dated August 27, 1956, for the construction of one of the major mining complexes for the extraction and processing of uranium and gold-bearing ores - Navoi mining and metallurgical combine in the seventies had enterprises of automobile and iron transport, factories and quarries that supply the market with a wide range of construction purposes: precast concrete products, asphalt concrete, bricks, expanded clay, metal structures, lime, crushed stone, etc.

In Uzbekistan, the Navoi construction Department built the cities of Navoi, Zaravshan, and Uchkuduk with all the infrastructure and social and cultural facilities during the Soviet era. As well as Navoi metallurgical plant, Hydrometallurgical plant No. 1 and two sulfuric acid plants, Navoi GRES with a capacity of 1250 MW, Navoi cement plant, chemical plant, electrochemical plant, small-scale plant with silos. During the privatization process, the NUS was broken up, divided into 10 linear divisions and transformed into separate joint-stock companies, which led to the looting of construction equipment, transport, construction materials, and the gradual closure of divisions.

The Kolkhozstroy trust, which carries out construction and installation work, mainly in districts and rural areas during the transition period, especially felt a shortage of construction materials and experienced specialists. Dozens of unskilled specialists worked on the construction sites, performing the amount of work of two or three builders. These circumstances were explained by unemployment and a reduction in the cost of construction work. The incorporation of the trust led to the fact that during the preparation of documents for the privatization of its fourteen divisions, seven of them were disbanded due to the fault of the management and liquidated.(8)

In the development of the market transformation process in Uzbekistan, a new stage has begun since 1998, characterized by the increased attention of the state to the reform of large industrial enterprises in order to create prerequisites for their full adaptation to the market economy, their reconstruction and modernization. At this stage of reform, the state pays great attention to the creation of joint ventures by attracting foreign investment in order to increase the production of import-substituting goods and increase export potential. At this stage, it was planned to privatize the Navoi region on individual projects, the Navoiyazot production Association (PO), the electrochemical Plant, and the Navoi GRES.

The Navoiyazot chemical plant, which carries out complex processing of natural gas from which ammonium nitrate, liquid nitrogen fertilizers, acetic acid, and acetylene cellulose are obtained, was transformed into an open joint-stock company in 2002, but foreign investors failed to sell 49% of the shares put up for auction. As a result of attracting foreign investment at the joint-stock company, new ammonia production facilities were built by 2018 with an expected capacity of 660 thousand tons, and cyanide - 577.5 thousand tons, polyvinyl chloride (PVC)-100 thousand tons, caustic soda-71.8 thousand tons, methanol-295.4 thousand tons, nitric acid-500 thousand tons(9)

In 1994, on the basis of the Electrochemical plant, the Uzbek-Panamanian closed joint-stock company JV "electrochemical Plant" was established. At the electrochemical Plant, 26.14 % of the shares were retained by the state, and 55% of the shares were sold to Dalston Associated S. A. (Panama). As part of the localization program, the first production line for the production of simple superphosphate was launched in 2004, and the production of iodized salt, sodium sulfide, and rubber crumbs was launched.(10) However, due to heavy debts, the company was closed in 2018.

The next stage of the processes of economic transformation was the implementation of post-privatization support for enterprises, which includes a whole range of regulatory, financial, economic, industrial, technical, administrative, economic and socio-economic measures. The TACIS project "program for support of economically insolvent enterprises - Uzbekistan" is being implemented. In 1998, a loan agreement was signed between the government of Uzbekistan and the International Bank for reconstruction and development to provide a loan of US \$ 15 million for the implementation of the project "post-Privatization support and restructuring of enterprises" and a number of other projects. At this stage, the state applied a mechanism for selling low-profit, unprofitable, and economically insolvent enterprises at zero cost on a competitive basis. (8.55) In order to dynamic and sustainable development of the economy, accelerate the introduction of new efficient technologies in production, wide use of local raw and production resources, increase on this basis of manufacture of competitive products, efficient and rational use of currency resources, the creation of new jobs in 2006 was the decree of the President of the Republic of Uzbekistan "On program of localization of production of finished goods, components and materials based on local raw materials for 2006-2008". The adoption of this decree led to an increase in the production of local raw materials and saturation of the domestic market with consumer goods.

However, when conducting mass privatization of enterprises, the lack of experience and knowledge of the market management system leads to a number of significant miscalculations. Many enterprises of construction, light industry, and local industry were simply not ready for the

new economic relations. Lack of labor, raw materials, and monetary resources; certain knowledge, skills, and abilities; the experience of working in market conditions led to the fact that enterprises at the stage of their transformation into joint-stock companies were forced to change their form of ownership to limited liability companies, partnerships or private enterprises, which led to the theft of state property.

Members of the labor collective were not ready to manage the enterprise, and their managers used their assets for their personal interests. In addition, the hasty sale to private ownership of large blocks of shares in some enterprises has weakened the role of the state in regulating their activities. The government of the Republic has taken urgent measures to increase the state's share in the authorized capital of certain joint-stock companies to 51%. (11)

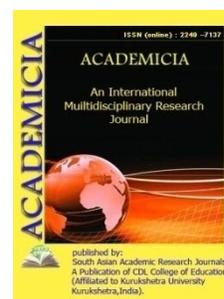

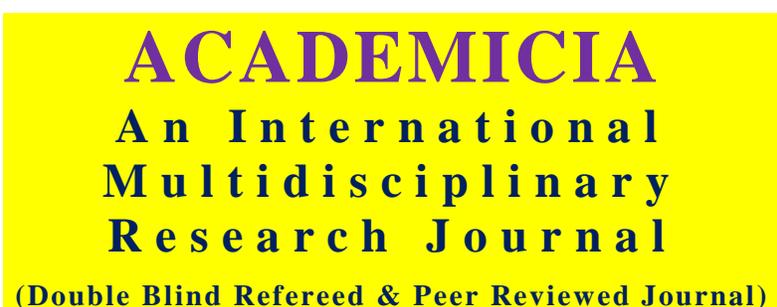

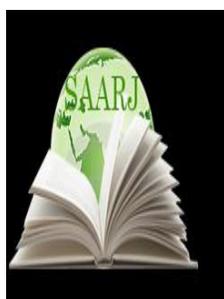

In many joint-stock companies, members of the labor collective not only did not become effective owners, but also did not realize their role in the management of the enterprise. The weak participation of state attorneys in the management and supervision of joint-stock companies has led to a weakening of the role of the state in regulating their activities. In some joint-stock companies, the Supervisory Board and the audit Commission existed only formally. The Chairman of the Executive body, a former head of the company, concentrated management in his own hands.

Despite these and many other omissions and mistakes, the processes of privatization and denationalization of property made it possible to solve the primary tasks of the country's transition to the market. As a result of a consistent policy of privatization was abolished the monopoly of state ownership, created conditions for formation of class of real proprietors, created a small, medium or large enterprises with participation of foreign investors, development of small and medium businesses, based on individual private property and the various cooperatives, partnerships, etc. A consistent policy of gradual transition to the market leads to the modernization of Navoi mining, chemical, construction industry and education companies with new forms of governance and management, the development of new types of industries like pharmaceutical, cotton, silk. Cardinal changes in the agricultural sector lead to an increase in crops for grain crops, the development of viticulture and animal husbandry. Drastic measures were taken to distribute state land among rural workers, create new legal relations, as a result of which farmers, dekhkan, collective, and contract farms were created, which today provide agricultural products not only to the population of the region, but also sell their products for export

A great advantage of our society is getting free education in primary and secondary schools, as well as in academic lyceums. Free access to medical care is guaranteed, programs are being implemented to combat the death rate of women in labor, and reproductive medicine services are being developed. During the years of independence, more than 300 rural medical centers were built in Navoi region alone. The creation of strong institutions - governmental, non-governmental, public funds, and self-government bodies-played a Central role in expanding the well-being of the Navoi region's population. An important role in the growth of social security was played by the implementation of special measures in the Republic and, accordingly, in the regions to create socio-economic infrastructures, including transport, telecommunications, health schools, and energy supply.

## **CRAFTSMANSHIP IN THE STRUCTURE OF SOCIAL-CULTURAL LIFE OF BUKHARA**

**Sayitov Anvar Sayemovich\***

\*Navai State Pedagogical Institute,  
UZBEKISTAN

### **ABSTRACT**

*The article deals with the formation and development of handicraft shops in the structure of the socio-cultural life of Bukhara. The structure and socio-cultural significance of the craft organizations of the workshop of painters, ornament lists, masters of artistic products is considered. It shows the education of the apprentice (apprentice) in the master in the shop of painters, based on the life rules of artisans (rice). Turning to the history of the issue, the author notes the diversity of the types and forms of the creations of the painters of the workshop of painters who contributed to the enrichment of the folk art of Central Asia. The abundance and diversity of the socio-cultural life of Uzbeks and Tajiks confirm the continuity of the traditions of the schools of craft organizations. The statute in the form of legends outlined the history of the craft and regulated the duties of members of craft shops. The author summarizes that the treatises regulate the labor - professional life of artisan shops, cementing ethical canons in*

*relation to the worker. It was believed that the craft received from a good master, does not know adversity, even if the student is deprived of all of his wealth. For the craft is inexhaustible, as a source.*

**KEYWORDS:** *Socio-Cultural Analysis, Bukhara, Craft, Miniature, Handicraft Shops, Pottery Shops, Workshops Of Painters, Rituals, Treatises, Codes.*

## **INTRODUCTION, LITERATURE REVIEW AND DISCUSSION**

The study of crafts workshops is of great importance for understanding the socio-cultural life of the people living in Bukhara.

It is the handicraft shops that are the forge of training cadres from among the young men and the successors of the millennial tradition of professionalism, which is always honorable in the eyes of people.

For many centuries handicraft shops were divided mainly into two groups, two forms of organizations of the city art crafts and home production. In the domestic craft, the local identity and its peculiarities are more clearly and distinctly traced; sometimes it is even relic and archaic. Almost all art productions (embroidery, carpet weaving, production of hats, pottery, various utensils, knitted goods, decorative and household items) can be attributed to home craft. The products of the city's artisan craft organizations included items of architectural and decorative art, chasing metal, jewelry, weaving.

Besides these craft organizations, there were also workshops of artisans - painters (nakkoshon), musicians (Sozanda), theater comedians (maskharabozon) and rope-walkers (dorbozon), weavers (bofandagon), tinsmiths (ohangaron), gold seamstresses (zarduzon), potters (kullgaron), san-gtaroshon (rockets), etc.

The shop organizations, due to tradition and increasing competition, had to resort to strict regulations of craft activities. It was especially rigid in the guild organizations of urban craftsmen, as they had a clear structure with well-developed "rules of conduct", which the members of the organization had to obey unquestioningly.

All handicraft organizations had their own statute (rice), which in general outlines was similar to that of other artisans. It was built according to one plan and consisted of such elements as: the glorification, the origin of certain instruments, the basis of faith and instruction, how to behave in the process of work.

Considering more specifically the craft organizations, it is advisable to give some lines from the "Memoirs" of the largest Tajik writer S. Aini, an eyewitness of the public and literary life of Bukhara at the end of the 19th and beginning of the 20th centuries. "... If the artisan is a weaver," remembers S Aini, "he becomes a member of the weaver's workshop, if he was a shoemaker, then he enters the shop of shoemakers." Each workshop, according to the interpretation of the clergy, chose a spirit-patron (feast-leader) from the number of historical or legendary personalities. So, for example, Imomi Azzam was considered a feast of weavers; a feast of shoemakers - Bukharan, Bobo Poraduz, ... Abbas (the uncle of the Prophet Muhammad) was the feast of water-carriers, ... the prophet David was a feast of blacksmiths; The feast of grooms was Kanbar - groom Aliya (the fourth friend of the prophet), etc.

"Students of any workshop, no matter how skillful they are in their profession, could not get the title of master until they have a treat and they will not be girt with a handkerchief. For the feast on the occasion of "girdling", then the initiation into the master was usually invited by the master of the pupil, the workshop's elder and other important guests. At the end of the meal the student offered his master a valuable gift. The clergy, the elder, and if the pupil studied in the studio, then the master, too, did not remain without gifts.

After receiving the gift, the master encircled the pupil with a handkerchief, read a prayer and gave him a tool (if it was a carpenter - that ax or saw, if the plasterer is a shovel for the plaster, if the barber is a razor or scissors, etc.) and , according to the drawing, allowed his student to work independently. Representatives of the clergy, reading the Koran, represented the new master spirit-patron of this craft.

Thus ended the ceremony of "girdling" ("miyonbandon").

S. Ayni then gives the structure of the internal shop organization, the election of the headman and assistant, as well as other members of the administration of the craft workshops, describes the statutes of the shoemaking organizations of shoemakers, water carriers, groomsmen, weavers, plasterers and carpenters [1, p. 555-562]. In his work, S. Aini approaches the craft organizations from a historical point of view, not assessing their socio-cultural significance for that period.

Let us analyze their socio-cultural significance by the example of the workshops of painters, who for many centuries acted in accordance with their statutes - rice.

Along with other artisan organizations, ancient art is the source of the creation of the masters of the workshop of painters, ornamentalists, and art products, who carefully carried their artistic traditions to the present day. From the rock paintings of the Paleolithic era, monumental wall paintings, miniatures of the Middle Ages to the modern vision and the embodiment of the world, to the diversity of species and forms-the long way of developing the painting of the peoples of Bukhara.

The unique paintings of the ancient Penjikent, the cities of Ustrushana, Khulbuk, Gissar, Bukhara, Samarkand, etc. have become famous all over the world. The works of art of these places are marked by high culture of performance, individual individuality of various craft schools of painting. The most famous are murals of temples, palaces, houses of Penjikent, badly damaged during the Arab conquest of Central Asia, which in their artistic merits are equated with the famous frescoes of Pompeii.

For the Penjikent craft organization of the art school (workshops) is characterized by a stylistic unity - the flatness of the image, the refined colorful range of local flowers, the line of drawing, refined to the refinement.

The craft schools of Samarkand and Herat were famous for all the countries of the East. According to V.Bartold, "the time of Timur and Timurids, as is known, was for Central Asia the epoch of the greatest external brilliance" [2, p. 74], and its capital, Samarkand, adorned with majestic architectural structures, was one of the largest and richest cities in the world and a true center of science.

In Herat, together with the growth of urban construction, various industries of handicraft production, trade, there was also a significant upsurge in culture, manifested in the development of both poetry, music, and schools of miniature painting, calligraphy and other arts where handicraft organizations played a significant role. The city became a famous center of intellectual activity during the reign of Sultan-Hussein.

Particularly interesting, from our point of view, the creation in the XV century. Herat Literary and Cultural Center, headed by the Tajik poet and scholar Abdurahman Jami and his student, the Uzbek poet Alisher Navoi, whose collaboration serves as a vivid expression of how much already in the fifteenth century. There was a rapprochement between two peoples - Tajiks and Uzbeks. Both of them were initiators and organizers of various palace handicraft organizations, large literary debates on issues of cultural life, poetry, prose, music, painting [3, p. 132]. Under their leadership, in the library organized by Shahrukh, skilful calligraphers and bookbinders from the best craft organizations of the schools of Herat, Bukhara, Samarkand, who were engaged in artistic design of the works of the masters of the word, were assembled. Among their products, the decoration of one of the most interesting creations of classical poetry of the East - the poem of Pavlin Abdurahman Jami "Salamon and Absal" - occupies a worthy place among their products.

The researcher-orientalist NV Dyakonova, touching upon the question of localization of this monument of world literature, notes: "The beautiful manuscript of the poem Jami" Solaman and Absal "... is unique in the grand and unusual decoration of the pages, the general nature of the picturesque ornaments imitating technique of applique typical for Bukhara at the end of the 16th century, but the only ones of their kind are miniatures arranged in these ornaments "[11, p. 18].

Along with the craft organizations of schools of painters, other genres of arts and crafts developed: workshops for painting on ganch and wood, ceramic dishes, minting for metal, jewelry and gold embroidery, embroidery of clothes, skullcaps, heels and others.

These facts once again confirm the continuity of the tradition of the Bukhara school of crafts organizations of painters, which, like other handicraft associations, had its own charter - a draft where the history of the craft was presented in legendary form and at the same time a kind of religious and ethical code regulating the duties of members of the craftshop of painters.

The charter was first analyzed from the point of view of the ethnographer historian E. Darsky [5, p. 104-109], where the term "nakkosh" is translated as an "artist-ornamentalist".

Since in analyzing the previous craft organizations we did not give the content of the texts of the drawing itself, we considered below, as an illustration, to bring in full the "Treatise of the Painters' Workshop" in full.

"In the name of God, merciful and merciful! Praise be to God, the ruler of the worlds, the blessing of the faithful, the prayer and peace to his messenger (ie, God) Muhammad, the house and his companions to all. Imam Jafar Sadiq, a worthy guide, says: (if asked) from the time of Adam, let there be peace over him, until the time of the divine prophet (Muhammad) how many painters were painters, answer that there were one thousand nine hundred and fifty masters of painting. But of them (only) twelve were outstanding masters.

The first is Hazrat Osman, the owner of two luminaries, the second is Hazrat Ali, the chosen one (God), the third is the uddal Abdal-Wahid, the fourth is Abdal-Karim, the fifth is Ustad Baba, the

---

sixth is Ustad Nizamaddin, the seventh Ustad Ubaid Bukhari, Abdi Jalil Tashkandi, the ninth one - Jalaladdin Andigani, the tenth - the wearer Muhammad Balkhi, the eleventh - the weary Shamsiddin Kashgari, the twelfth - Omar Baghdad. All the named (masters) have reached the fullness of perfection.

- If anyone asks who originated the painting, give the following answer: (from) Muhammad, the chosen one of God, may the Lord bless him and send him peace. Because (during) the construction of the mosque of Medina, the Almighty God ordered Jabrail to go to Muhammad (he) to (decorate) the holy mosque of Medina. Hazrat Jabrail, bringing thirty-two colors, handed them to Muhammad and taught him (the art) of painting. Muhammad, the chosen one (God), may God bless him and send him peace, teach (painting) the Hazrat of Osman, as well as Hazrat Ali, then decorate the mosque of Medina.

- If anyone asks (is) a painting of the commanded, compulsory, legal, recommended, answer what (after) the Almighty God ordered (Dzhabrailu) - became commanded; (after) Jabrail, peace be upon him, he taught (Muhammad) - became compulsory; (after) the prophet, God bless him and send him peace, made (ornaments), -became legal; (after Muhammad) taught the Hazrat of Osman and Hazrat Ali, - became recommended.

- If someone asks where the colors came from and how many of them, answer that (they appeared) by the will of the creator of the universe and the number of them is thirty-two.

- If someone asks what the artist should say when entering the workshop, answer that he should read Surat "Fatih" three times and Surah "Ikhlas" three times.

- If someone asks what the master should say, sitting down for work, answer: "(He must) thrice glorify God and the prophet." If anyone asks what to say during the dissolving of the paints, answer what should be said: "My Lord, open the gates of mercy and blessings!"

- If someone asks what should be said during the preparation of the brush, answer that it is necessary to say: "(In the name of) God and to his glory." If anyone asks what should be said at that time, (when the master) touches (paper) with a brush (paper), answer what should be said: "In the name of God, merciful and merciful!".

- If someone asks what you should say while drawing, answer: "We must say:" God is great, God is great, there is no god but Allah, and God is great, God is great and God be praised! "

- If anyone asks how many duties (to be performed) the artist, answer: "Seven duties: the first - to perform ablutions; the second - to honor the spirit of the feasts and masters (the past); the third is to produce a joint prayer reading; the fourth is to be sincere; the fifth - to be honest (in their own affairs); the sixth - allowed (by religion) to protect from the forbidden; the seventh is to observe modesty.

- If anyone asks (names) four Shari'ah feasts, (should answer) that the first (was) khazrat Adam, the chosen one of God, the second - Nuh, the prophet of God, the third - Ibrahim, my friend, the fourth - khazrat Muhammad chosen (God) God bless him and send him peace.

- If anyone asks (names) four feasts of the tariqa, answer that the first was the righteous Hazrat of Abu Bekr, the second is Hazrat Omar, the third is Hazrat Osman, the fourth is Hazrat Ali, may God's mercy be with him.

- If anyone asks (names) four hakikat feasts, answer that the first (was) Khazrat Jabrail, the second is Hazrat Mikail, the third is Khazrat Israfil, the fourth is Hazrat Azrail.

- If anyone asks (names) four feasts of the madhhab, answer: first (was) khazrat imam Azam (Abu Hanifah), second - khazrat imam Shafi, the third - khazrat imam Malik, the fourth - khazrat imam Khanbal, with them God's mercy!

- If every master painter knows these positions and reads this sacred tract, (a) if he can not read, (at least) hears hearing it, (a) if he does not hear it, then he will (in his hands ), - during all life in what will not feel needs.

The knowledge of this sacred tract, the Almighty will reward with bliss in another world. But each master, who will remain unknown to these rules, will be unclean. And anyone who admits doubt (in the truth of this treatise) will be wrong! We resort to God (in defense) from this, and God knows best "[5, p. 107].

The mention of the names of the four first caliphs (Abu-Bekr, Omar, Osman and Ali) indicates that the treatise was widespread in the Sunni context. The basis for more precise localization is given in the list of twelve "outstanding" masters. Five of them have a "nisbu" in their name, indicating their connection with Central Asia or neighboring regions. They are Ubaid Bukhari, Abdi Jalil Tashkandi, Jaloliddin Andigani, Muhammad Balkhi and Shamsiddin Kashgari. It seems quite acceptable to suggest that the founders of the charter borrowed these names from local legends.

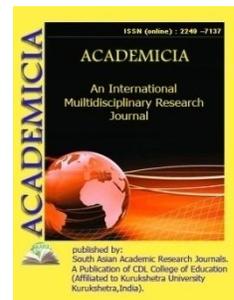

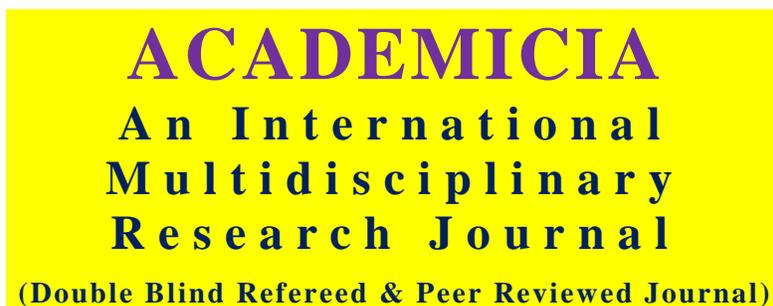

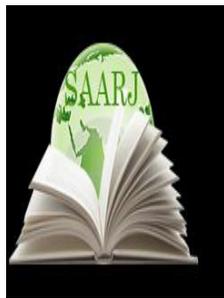

Thus, craft organizations for many centuries were schools of training professionals and continuers of the unique traditions of the material and spiritual culture that has reached us. It's not for nothing that the Eastern sages taught the children: "Oh, dear children, listen to my advice-study the craft. Property and money are so unreliable in this world. Gold and silver are only a danger for the traveler: while the living house can be robbed by robbers and fire. Craft is as inexhaustible as a source ... "[6, p. 78-79].

Craft, received from a good master, does not know adversity, even if it loses all its wealth. We must pay tribute to the craftsmen. Masterpieces of creativity of artisans of Bukhara convincingly testify that they were and are artistically educated people of their kind and period.

### ABSTRACT

*The article reveals the definitions of the concepts of "gender", "gender approach" from the point of view of representatives of various scientific fields: philosophy, psychology, pedagogy. The significance of the implementation of a gender approach for the modern education system is revealed, which allows one to think about the need to apply a gender approach as an integral element of organizing the learning process.*

**KEYWORDS:** *Gender, Gender Approach, Learning Process, Functional Asymmetry Of The Cerebral Hemispheres, Gender Characteristics, Psycho physiological Characteristics.*

## INTRODUCTION

The attention of representatives of various fields of scientific knowledge: philosophy, sociology, economics, demography, history, anthropology, psychology, political science, philology, sociolinguistics, semiotics, ethnography, cultural studies, as well as pedagogy, paid to the cycle of scientific concepts, united by the concept of "gender", contributes to the emergence general problem field for interdisciplinary gender research.

The special interest of pedagogical science in the gender issue is due to the existence of new opportunities for improving teaching and educational work through the introduction of gender knowledge. Today there is no unambiguous definition of the term "gender". The work of the American psychologist R. Stoller, published in 1968, "Sex and Gender: Towards the Development of Masculinity and Femininity", pointed to the sociocultural aspect of gender, separating it from the biological, defining this term, which was previously only a narrow philological one, as a set of behavioral norms associated with representatives of the male and female sex.

The concept of "gender", which has entered the categorical apparatus of social philosophy in the foreign countries of the XX-XXI centuries, is interpreted as a "system of relations between men and women, including ideas, informal and formal rules and norms, determined in accordance with the place, goals and position of the sexes. in society, institutions, behavior and social interactions that are prescribed in accordance with gender ", a certain set of " gender contracts ".

From the point of view of representatives of psychological science, "with a certain degree of conventionality" psychological sex and gender can be called synonyms, defining gender as the socio-psychological sex of a person, the totality of his psychological characteristics and features of social behavior, manifested in communication and interaction. " According to pedagogical practice, the concept of "gender", including sex differences, "focuses on a wide range of manifestations inherent in boys and girls, boys and girls, men and women, which are somehow related to their gender and age status, ethical, confessional and socio-cultural accessory ". In other words, gender is "a structured concept of social sex that synthesizes cultural and biological in a person." It is indisputable that gender, being one of the basic characteristics of a person, determines the psychological and social development of a person.

In connection with this situation, the results of gender studies conducted in various scientific fields, in particular, in psychology and pedagogy, find practical application in the special organization of the pedagogical process, taking place in the context of the implementation of a gender approach.

The implementation of this approach, based on the denial of "asexual pedagogy", within the educational process helps to create an organization of the educational process that provides students with the opportunity to self-actualize, taking into account individual characteristics, to master social experience that determines successful socialization in society.

The gender approach, taking into account the individual characteristics of the child in accordance with his gender, involves the determination of the content, forms and methods of teaching and

upbringing aimed at creating a gender-friendly environment that promotes the development of the personality in accordance with natural potential. At the same time, the purpose of the gender approach is to change the traditional cultural limitations of personality development depending on gender, which is directly related to the creation of conditions for the maximum disclosure of the abilities of boys and girls.

Achieving the goal requires not only changing traditional, but also developing new teaching methods that differ in quality, ways of organizing the educational process and pace from the existing ones. The gender approach can be carried out through a number of areas, including the creation of a special organization of the learning process, which involves the choice of forms, methods, teaching methods taking into account the gender characteristics of students, changing the content of education and creating educational and methodological literature of a new type, compiling assignments taking into account the psychophysiological characteristics of students, creating different types of schools and classes focused on the practical application of a gender approach, namely, on the introduction of separate education.

Considering the implementation of the gender approach, scientists pay special attention to the reasons for the existence of gender differences among members of the opposite sexes. Researchers in various fields of scientific knowledge (neuropsychology, psychology, medicine, pedagogy) state differences in the rates of intellectual development, motivation and assessment of the results of activities, behavior of representatives of different sexes, the main reason for which is a biological factor, i.e. those features that are laid down even before the birth of a child, consisting in the functional specialization of the cerebral hemispheres. At the same time, the existence of intellectual differences between boys and girls, which persist for a certain time, has been reliably established. The predominance of verbal abilities among female representatives has been experimentally confirmed. Girls and women have better developed abilities for articulation (3–8 years), imitation (3–4 years), more vocabulary (18–21 years), better developed speech skills, girls are more capable of decoding speech, building correct visual - motor and auditory-vocal associations, semantic understanding of speech, they are endowed with great psycholinguistic abilities, verbal intelligence, are distinguished by a greater development of reading skills (6-7 years), greater reading skills (5 and 7 years), reading speed (7-13 years) , reading comprehension (4–13 years old, 9–11 years old), make fewer mistakes in reading (9–11 years old) 5. Boys have more advanced mathematical and visual spatial abilities.

The founders of neuropedagogy (T.P. Khrizman, V.D. Ereemeeva), noting the dependence of the cause of these differences on the characteristics of the cerebral cortex, emphasize that only one difference in the electrophysiological parameters of the brain of newborns of different sex makes it possible to determine the sex of the child. Researchers distinguish three main types of functional asymmetry of the cerebral hemispheres: left hemispheric, right hemispheric and equal hemisphere. The left hemisphere type is characterized by the dominance of the left hemisphere, which determines the verbal-logical nature of cognitive processes, the tendency to abstraction and generalization. The right hemisphere type is characterized by the predominance of the right hemisphere, which determines the tendency to concrete-figurative thinking, creativity, and the development of imagination. The last type of functional asymmetry of the cerebral hemispheres is characterized by the absence of pronounced dominance of one of them<sup>6</sup>. According to most researchers, the first type of functional asymmetry predominates in girls, the second in boys.

The boys' brain is a differentiated system, since one of the cerebral hemispheres is predominant. Moreover, the ability of the centers of the cortex of the right and left hemispheres to enter into interhemispheric contacts is significantly lower than in girls. According to a number of researchers, a clear asymmetry in the activity of the cerebral hemispheres is the reason why it is more difficult for boys to compare information from the two hemispheres and it is easier to concentrate on one type of activity. The forebrain is especially active in boys, in particular, its frontal associative structures, which explains the high creative and search activity of representatives of this sex. In girls, the severity of the asymmetry of the cerebral hemispheres is less, but the posterior parts of the cortex and the auditory parts of the left hemisphere are especially active. The functions of the anterior and posterior parts of the cerebral cortex are not the same in the implementation of the cognitive functions of both sexes. Girls use both hemispheres to comprehend words, while boys use only one, more often the right hemisphere of the brain<sup>7</sup>. However, the gender approach is based not only on biological differences that exist between the sexes, but also on the sociocultural significance that society attaches to these differences. Genetically inherent features of brain activity can manifest themselves only under the influence of the environment, society, which contribute to the awareness and acceptance of stereotypes of male and female behavior.

Thus, many researchers come to the conclusion that it is impossible to use the same methods when teaching representatives of two sexes of the same age, but different neuropsychological structure, since the characteristics of boys and girls, when refusing to take into account gender characteristics, are not taken into account.

According to teachers and psychologists, when implementing a gender approach in teaching boys, it is most preferable to alternate physical and cognitive activities, conduct classes of shorter duration with a high rate of presentation, use group forms of work with a leader, use heuristic, research and problem methods, involve students in creative activity, solution of spatial problems, "rediscovery of discoveries", focus on practical information, discuss the results of activities with a specific assessment. Lessons for girls should be held at a slower pace with a sufficient number of repetitions of the material, the use of typical tasks, with the involvement of a large amount of clarity, a positive emotional coloring of the material being studied.

The gender approach in teaching makes high demands on the selection of types of tasks for students of the right and left hemispheric types of functional asymmetry of the brain. When drawing up tasks for representatives of the right-brain type of thinking, it is necessary to apply: replacement of verbal explanation with pictures, diagrams, diagrams; visualization; staging; illustrations; analogy; assignments for using practical skills and abilities in various activities; historical facts in the study of subjects of the mathematical cycle; tasks based on life situations that are emotionally close to children; activities for the acquisition of experimental experience in the joint solution of an educational problem when working in groups of 3-4 people.

For children of the left-brain type of thinking, the researchers recommend using tasks that are logical and well-structured, for example: sorting, grouping, classification; analogies; design; invention; creative tasks; solving logical problems; analysis of concepts<sup>8</sup>. Teachers believe that the content of education, revealed through educational standards, curricula, programs, educational literature, assignments, is also subject to some change in accordance with the gender

interests and characteristics of students, i.e. some freedom of choice for schoolchildren should be allowed in this matter.

Researchers note that the implementation of a gender approach requires the definition of the style of presentation of educational material (male, female, neutral). The textbook, as an intermediary between teacher and student, most often remains indifferent to the gender of the student or offers only one learning style. However, modern educational literature should take into account the characteristics and needs of students of both sexes, ensuring the proper assimilation of educational material by children with certain personal characteristics.

Analysis of modern educational literature demonstrates its targeting to students with a left-brain type of thinking, while the needs of children of a right-brain type are not taken into account. When implementing a gender approach in teaching, the student also has the opportunity to choose an educational institution that focuses either on the separate education of representatives of different sexes, or on the differentiation of activities within one educational institution, thus organizing joint or separate education, or creating parallel classes for representatives of different genders in one educational institution.

The provision of this opportunity within the framework of the modern educational process is due to the presence of the unaccounted for needs of students of different genders. Educators believe that at the initial stage of education, boys are forced to face a clearly feminized learning process, which is facilitated by the presence of female teachers, girls, exceeding boys in academic performance. The ways of presenting the material, numerous repetitions, memorizing, retelling, characteristic of the left-hemispheric type of thinking, are most often unusual for the neurophysiological nature of boys. With the passage of time, in middle and high school, with the beginning of the study of geometry, algebra, chemistry, boys begin to show a great interest in educational activities, great mental activity. Girls, on the other hand, face difficulties in understanding the material, a lack of discussion and repetition of the material, not enough time to understand it, sometimes they begin to demonstrate an aggressive male type of behavior. At the same time, education, being masculine in content, operates with feminine methods of presenting material, which gives rise to the main contradiction. Thus, co-education feminizes boys and masculinizes girls, contributes to the emergence of school maladjustment and neurosis in boys, which is associated with a higher level of vulnerability of the nervous system of representatives of this sex.

From a medical point of view, the researcher notes the health-preserving component of separate education, the main advantage of which is the positive dynamics of girls' development. Based on the results of the studies, it was possible to establish that among female students of the same-sex classes of the 3rd year of study, the prevalence of functional health disorders was less than among girls studying in mixed classes of the same school.

In addition to its health-promoting function, the gender approach serves as a means of intensifying the educational process, contributing to the improvement of the level of student achievement. Moreover, there is a direct dependence of the student's performance on the most important gender feature, namely, on the functional asymmetry of the brain.

Teachers, citing experimental data, prove the dependence of the level of student achievement on the correspondence of the teacher's teaching style (male, female, neutral) and the type of presentation of educational material in textbooks and teaching aids (similar), methods of

---

teaching gender characteristics of the student (right hemispheric, left hemispheric, equal hemispheric types of functional asymmetry of the cerebral hemispheres). The results of the experiment, carried out for 3 years in the senior grades of the school, demonstrate a positive dynamics in the level of student achievement and confirm the importance of a gender approach to teaching schoolchildren as an educational technology that contributes to increasing the effectiveness of learning and intensifying this process.

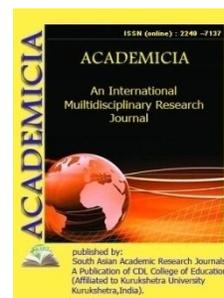

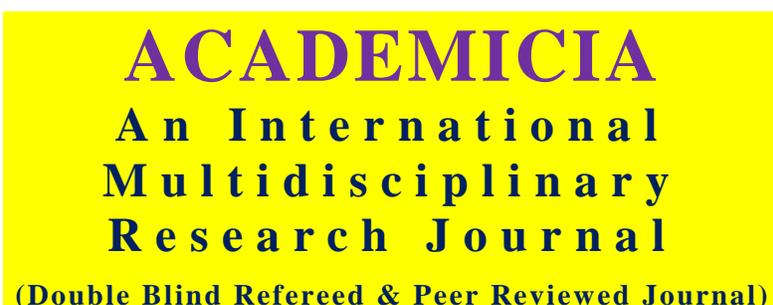

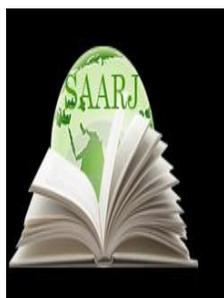

Thus, the implementation of a gender approach helps to take into account the psychophysiological characteristics of students, contributes, with the correct organization of the learning process, the formation of acceptable gender roles, harmonious development and maximum self-realization of the individual, helping the student to gain and maintain mental and physical health.

### ABSTRACT

*The article raises the problem of continuity in the mathematical development of preschool and primary school children. The historical aspect of continuity is considered, the main views on the continuity between preschool institutions and the school are studied, the possibilities of implementing continuity in the mathematical preparation of older preschool children are revealed.*

## INTRODUCTION

The modernization of the education system has especially actualized the problems associated with its humanization, one of the conditions of which is the implementation of continuity between the preschool educational institution and the school.

Currently, high demands are placed on the system of upbringing and education of children. Success in schooling largely depends on the quality of knowledge and skills formed in the preschool years, on the level of development of the child's cognitive interests and cognitive activity. Thus, the problem of continuity between preschool and primary school links is undoubtedly relevant.

The 21st century is marked by reforms in the education system. Experts are trying to make education more accessible, but one of the important problems of pedagogy is the organization of continuity between preschool and primary school levels of the education system.

Success in schooling largely depends on the quality of knowledge and skills formed in the preschool years, on the level of development of the child's cognitive interests and cognitive activity. The school is constantly raising the requirements for the intellectual, in particular mathematical, development of children. In order to improve the preparation of all six-year-old children for school, preparatory classes at schools, preparatory groups in kindergartens are organized.

Ensuring a higher level of mathematical development of children entering the first grade, their preliminary training, of course, significantly affect the quality of assimilation of educational material at school. Therefore, such serious attention is paid to the correct organization of teaching and educational work in kindergartens, especially in older preschool age.

Timely familiarization of preschoolers with arithmetic problems and examples is important for studying the school course of mathematics. Kindergarten graduates have already mastered the mathematical essence of the problem, understand the meaning and content of the problem questions, answer them correctly, choose and argue for the choice of arithmetic operation. In kindergarten, it begins, and in the first grade, children continue to master the addition and subtraction tables within ten based on knowledge of the composition of the number from the two smaller ones. In addition, in the first grade, children are introduced to the individual cases of addition and subtraction, when one of the numerical data is zero.

Studying the topic "Ten", first-graders deepen their knowledge of geometric shapes, and above all about polygons (triangles, quadrangles, etc.) and their elements (sides, corners, vertices). Initial knowledge about this was obtained in kindergarten. They already know how to highlight the shape of the surrounding objects, using a geometric figure as a standard. Relying on material objects around, models and images of figures, children compare, contrast figures with each other, and this contributes to the development of inductive and deductive thinking, forms the ability to draw the simplest conclusions. It is especially important at this age to ensure a purposeful and sufficiently complete analysis of the figure for this level of cognition, on the basis of which essential features are distinguished and abstraction from insignificant ones occurs.

First graders learn to highlight right and wrong angles, draw segments of different lengths, and draw geometric figures in squared notebooks. They prepared for this in kindergarten.

Positively affect the formation of knowledge about the number of children's ideas about continuous quantities, which is provided for by the kindergarten program, as well as skills in measuring by a conventional measure and such generally accepted measures as meter, liter, kilogram. In the first grade, children continue to measure length, mass, capacity, volume. Gradually, starting from kindergarten and continuing this work at school, children are led to an understanding of the functional relationship between the measured quantity, measure and the result of the measurement (the number of measures). All this knowledge expands the concept of number, develops the child's thinking, his interests and abilities.

However, the modern school is not satisfied with the formal assimilation of these knowledge and skills. Further education at school usually depends on the quality of the acquired knowledge, their awareness, flexibility and strength. Therefore, modern preschool didactics is aimed at working out ways to optimize learning.

All the variety of forms of continuity in modern teaching children mathematics can be systematized by conventionally identifying three types of continuity.

The first type is characterized by duplication in preschool preparation of the basic content and specific tasks of the programs of the first grade of the school;

In the second type, the preparation of children for school who do not attend preschool institutions is carried out at home, in the family, by the parents themselves, in this case, education, as a rule, has a spontaneous character, especially in families where the upbringing of children is not given due attention, children with such preparation assimilate non-systematic information and facts from the school curriculum, which are often given insufficiently skillfully and pedagogically expediently. It is characteristic that due to objective circumstances, taking into account real conditions and opportunities, it is precisely this type of continuity that modern education in the first grade of a mass school is designed for (curricula, textbooks, etc.).

The third type of continuity should be considered the most correct and promising. When using it in teaching schoolchildren, in particular mathematics, less than half of the teaching material of the first grade is used. This material is given to children for familiarization. Educational tasks for preschoolers and first grade students when studying the same fact have their own specifics. Such a partial simplification of the school curriculum, taking into account the age characteristics of children, which is carried out simultaneously by employees of a preschool institution and a school, makes it possible to achieve the best results in the transition of children from preschool to school education.

In continuity, the problem of education and upbringing of six-year-old children comes to the fore. The main thing in it is to ensure the same, sufficiently solid preparation of children for school. There are still facts of very different preparation of children for school, which usually complicates the work of first grade teachers, especially at the beginning of the year. Six-year-olds are taught and brought up in different conditions: some of the children are in kindergartens, the other part is in the preparatory classes of the school in accordance with school curricula and teaching methods, and, finally, some of the children are prepared for school by the parents themselves, relying on subjective teaching methods. Most often, before school, they begin to

force the process of teaching mathematics, teach children, mainly orally, to count within 100, 1000 and various calculations, including sometimes learning the multiplication table, trying to solve complex arithmetic problems, without paying due attention to the formation of knowledge about the set, size, space and time.

Purposeful preparation for school is provided in two main organizational forms:

- In the preparatory groups of kindergarten;
- Preparatory school classes.

At the same time, there is a clear trend towards one hundred percent coverage of children of six years of age with purposeful education.

It should be noted that there are significant differences in the work of the preparatory groups of kindergartens and preparatory classes at school. The contingent of kindergarten and kindergarten classes is somewhat different. Children are transferred to the preparatory group from the senior groups of kindergarten, and children who have not attended preschool institutions and have not previously studied are enrolled in the preparatory classes. Therefore, the programs of preparatory groups and classes cannot be identical, of course, the number of classes in them is not the same. In the preparatory group of a kindergarten, one (two) lessons in mathematics are held per week, lasting 30-35 minutes. At the same time, children acquire solid knowledge and skills that basically meet the requirements of modern primary education.

In kindergarten or first grades of a four-year school, four math lessons per week, also 35 minutes long, are given, which even suit their general preparation.

Before school, kindergarten and kindergarten graduates should in any case have almost the same level of preparation in mathematics.

In kindergarten, the program is learned faster, in just one year, so the question of methodology is extremely important. Here play is being actively introduced as a form, method and method of teaching, the practical activity of children with specific sets, etc.

However, the experience of teachers of preparatory classes and preparatory groups testifies to the impossibility and inexpediency of transferring the content and methods of school teaching to this level.

Note that improving the continuity in the work of kindergarten and school will provide conditions for successful learning in the first grade. At the same time, it is important for educators to know the basic approaches in the methodology of teaching mathematics in the first grade, to familiarize them with modern textbooks.

Forming a willingness to learn at school means creating conditions for the successful assimilation of the curriculum by children and their normal entry into the student body. One of the important indicators of special (mathematical) readiness is the presence of certain knowledge, abilities and skills among preschoolers. As the analysis of pedagogical work shows, the level of assimilation of this knowledge, abilities and skills depends on the age, individual characteristics of children, as well as on the state of the educational process in kindergarten.

For the educator of the preparatory group, it is of particular importance to identify this level before the children enter school. This is facilitated by individual conversations, didactic games and exercises with children, their performance of special tasks, etc.

In this case, one should focus on the following indicators:

- The amount of mathematical knowledge and skills in accordance with the kindergarten education program;
- The quality of mathematical knowledge: awareness, strength, memorization, the ability to use them in independent activities;
- The level of skills and abilities of educational activities;
- The degree of development of cognitive interests and abilities;
- features of speech development (assimilation of mathematical terminology);
- a positive attitude towards school and educational activities in general;
- level of cognitive activity.

The level of assimilation of knowledge is easier to determine than the degree of mastery of the techniques of educational activity, the more so - the degree of formation of cognitive interests and abilities. In this regard, to highlight general educational skills, it is necessary to select tasks in pairs: for example, the first task - guess, count, show, etc., the second task - explain, prove, tell, etc. The second task for children is more difficult, but it is its fulfillment that testifies about the level of preparedness of the child for school. The readiness level of 6- and 7-year-olds for schooling can be done through both group and individual surveys.

In the learning process, the ability to think abstractly, to make generalizations and comparisons, and to use these skills in solving problems develops. Learning activities are deliberate and educated. The psychological basis of educational activity is the development of educational motives and needs in children. In preschool children, it is impossible to form educational activity in the same form as it was mentioned earlier. The teacher creates conditions for the formation of the basis of educational activity in preschoolers.

The success of the formation of educational activity is associated with the level of development of a number of mental qualities of the child. We highlight the qualities that can be considered as some conditions of educational activity. These qualities include

- The ability to listen to the teacher,
- Work according to the instructions of the teacher,
- The ability to separate your actions from the actions of other children,
- Development of self-control, etc.

Learning activity is one of the types of cognitive activity of the child. It is characterized by certain practical and mental actions.

In preparation for school, the correct organization and purposeful development of children's attention in the learning process is of great importance. It should be noted that educational activity is generally impossible without an appropriate level of attention development. In older

preschool children, voluntary attention occupies a significant place in activity. The child is able to focus on performing a specific action. At this age, the volume and stability of attention significantly increase. The kindergarten teacher organizes the child's educational activities, teaches him to understand the tasks, goals and conditions for completing cognitive tasks.

Observations of first grade students show that the level of attention in lessons at school depends on how much the teacher uses the knowledge and experience of children. Where the teacher relies on this knowledge, the children's attention was quite stable, and where there was no such support, their weak concentration was observed. We can say that the productivity of the educational process is directly dependent on the adequacy (correspondence) of the complexity of educational tasks to the level of readiness of children, the volume of their knowledge and skills. The main pedagogical condition for the development of educational productivity is specially organized training, in the process of which children learn general ways and methods of solving various practical and cognitive problems.

The problem of forming the qualities necessary for successful schooling in preschoolers remained debatable for a long time. Both scientists and practicing teachers were worried about whether the physical and mental development of six-year-old children is sufficient to assimilate the school curriculum. Recent studies carried out by teachers, psychologists, physiologists, physicians show that the age-related capabilities of older preschoolers ensure the assimilation of a significant amount of knowledge from the primary school curriculum. These findings indicate the possibility of schooling from the age of six.

Scientific evidence shows that older preschoolers have fairly developed visual sensations. More than 80% of children are good at separating primary colors and shades, the same can be said about the development of perception. Almost all children can confidently perceive the shape of an object, size, distance and movement of an object.

We note some features of the sensory-perceptual organization of preschool children that influence the process of teaching mathematics. So, in teaching counting, it is more difficult to perceive counting by ear than counting the number of objects, perceived visually. This is due to the need to rely on a special ability to reconcile the numeral not with the visible, but with the audible indicator, with the establishment of complex associations. These complex sensory-perceptual processes are associated with the perception of numerical relationships and actions. Read, heard or named arithmetic action should cause visual-auditory associations. As a result of visual perception or visual representation, the digit is transformed into a generalized signal of a certain number (quantity), as well as the necessary actions with a given amount.

Scientific data reveal the complex psychological mechanisms of children's perception of mathematical actions. These patterns should be known and taken into account by educators of preschool childcare institutions and primary school teachers in order to effectively implement continuity in teaching and upbringing.

The age of five to six years old children is the most active, culminating in the development of the process of perception, memory, thinking, ideas. On the foreign side of senior preschool age, children sufficiently master their native speech, show a high interest in learning everything new. The central nervous system is developing rapidly. This provides a significant complication of mental functions. The ability to analyze and generalize the ideas of the environment contributes to the successful development of mental processes in general.

---

The success of teaching children at school is associated not only with the presence of a certain amount of knowledge among preschoolers. Even the ability to count and solve problems is not decisive in this case. School education makes basic requirements, first of all, to mental activity. In this regard, the level of development of mental abilities is one of the important indicators of a child's readiness for school. It is necessary to teach children to observe, analyze, generalize, draw conclusions. Intellectual opportunities expand in the process of active and purposeful acquaintance with the objects and ideas of the environment, the laws of nature, the peculiarities of relations between people.

Teaching the elements of mathematical activity is carried out against the background of the expanded mental activity of children. This process is a vivid illustration of I.P. Pavlova on the reflex nature of the psyche, on the transition from the sensory stage of cognition to the logical one. So, performing a counting operation at the initial stage of training, as a complex skill, relies on the detailed action of the hands, eyes, on the naming of numbers aloud. Later, as it improves, the counting operation changes noticeably, moving from expanded methods of counting with the movement of objects, which are considered, to abbreviated methods of pointing at them, naming numbers aloud and ending with oral counting to oneself.

One of the hallmarks of any item is its size. Assessing the size, the child not only learns each object separately, but also establishes the relationship between them. This influences the formation of generalized knowledge about the environment. Any measurement of the size of an object is given a numerical expression. Therefore, the development of the idea of the size of objects makes it possible to deepen the concept of number. Awareness of the size by older preschoolers significantly affects the development of mental abilities in general, since it requires the performance of actions of comparison, distinction, generalization.

Carrying out continuity between kindergarten and school in the formation of concepts about size, one important feature must be taken into account. Children have significant difficulties in using specific mathematical terms denoting the sizes of objects of different lengths. Most often they use the words big and small. When characterizing objects of different lengths, heights, widths, thicknesses, it is difficult for children to differentiate the corresponding terms. Moreover, scientific studies show that the word size (size) itself does not have a signaling meaning for most children, since they do not understand its essence. This circumstance should be taken into account by both educators and teachers of the first grades when they teach children to distinguish length or the most significant length in flat objects and understand the three-dimensionality of spatial relations.

Older preschool children are already able, although not fully, to restrain their impulsive actions. Game, educational, creative and work activities are characterized by free regulation. During training sessions, they exhibit organized behavior. The child purposefully solves the task set before him, achieves the desired result. At the same time, such strong-willed qualities as persistence, initiative, independence are noticeably manifested. Receiving assignments from adults, the child tries to show his strength, will. Such cognitive activity of the child enables him to acquire knowledge easier and better in the future.

The experience of work at school shows that the educational opportunities for kindergarten pupils are much higher than for children who come to school from a family. Pupils of kindergartens have sufficient experience of voluntary behavior, a large amount of mathematical

knowledge, a fairly high level of development of cognitive interests and abilities. And this depends, first of all, on the organization of the pedagogical process in kindergarten.

Research shows that a child's high level of intellectual development does not always coincide with his personal readiness for school. In some cases, at the beginning of schooling, children do not have a positive attitude towards a new way of life, which implies appropriate changes in conditions, rules, requirements of the learning regime, life and activities in general.

In accordance with the indicators we presented earlier, we can conditionally distinguish three levels of children's readiness for school.

The first level should include children who have well mastered the program requirements of the previous groups, have good skills in counting, examination, measurement, dividing the whole into parts, solving problems, etc. At the same time, children of the preparatory group are able to perform simple actions in their minds without reliance on visualization, when comparing objects in shape, they use a geometric figure as a standard, are able to classify, generalize, act in accordance with the teacher's instructions, have self-control skills, show interest in learning, know how to work with concentration, without being distracted, adequately use mathematical terminology, correctly, efficiently, on time to complete tasks, objectively evaluate their work.

The second level includes children who have mastered the program in mathematics; have certain skills in counting, measuring quantities, dividing the whole into parts. At the same time, their mental activity is not sufficiently developed: it is difficult for them to explain the choice of arithmetic operation, to generalize and classify; self-control in these children is unstable, they do not show interest in learning activities; their mathematical vocabulary is poor; self-esteem is most often underestimated, sometimes overestimated.

The third level includes children who have poorly mastered the program in mathematics. These children have some skills in performing operations of counting, but in all other types of mathematical activity they have little or no skill at all. Children belonging to the third level of assimilation of mathematical knowledge feel significant difficulties in performing mental operations of comparison, generalization, classification. These children do not show interest in learning activities, use special mathematical terminology incorrectly, and often cannot complete the teacher's task and compare it with a model.

Thus, we conclude that there are several stages of children's readiness for school. Before children enter school, pedagogical work should be directed towards the complete elimination of the third, lowest, level of mathematics knowledge, skills and abilities, towards achieving a sufficiently high-quality mathematical preparation of children for school.

## **CONCLUSION**

Continuity is a connection that presupposes, on the one hand, the orientation of the educational work of the kindergarten on the requirements that will be presented to children at school, on the other hand, reliance on teachers at the achieved preschool level of development, on the knowledge, experience of children and the use of this in educational school process.

In the course of the study, within the framework of this work, the theoretical aspect of continuity in teaching children mathematics was studied. So it was found that the kindergarten fulfills the task of all-round preparation of children for school in the process of systematic, purposeful

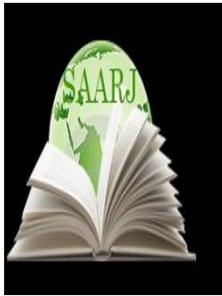

pedagogical influence. The tasks of the kindergarten teacher include, in addition to systematic preparation for school, the study of unfavorable options for the child's mental development, personality traits and behavior. The best option for the formation of school maturity in a child is close interaction between the kindergarten and the school, their cooperation on all aspects of the issue of preparing children for schooling.

The child's psychological and pedagogical readiness for school provides for the improvement, first of all, of the content, forms and methods of teaching and educational work in kindergarten, in particular in teaching them mathematics. The modern school requires from a child who begins education in the first grade, high working capacity, complex forms of mental activity, formed moral and volitional qualities already in the preschool years. The fulfillment of all these requirements helps to increase the level of the child's general readiness for schooling. Only against the background of the general readiness of the child, his mathematical training is able to ensure the assimilation of mathematics at school, the further development of interest in mathematical activity.

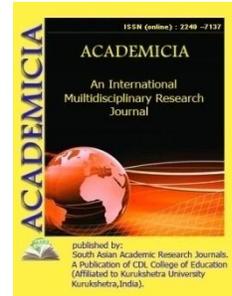

The content of continuity in the work of a preschool institution and a school for teaching mathematics is that improving the continuity in the work of a kindergarten and a school will provide conditions for successful learning in the first grade. At the same time, it is important for educators to know the basic approaches in the methodology of teaching mathematics in the first grade, to familiarize them with modern textbooks.

**ABSTRACT**

*The article examines the socio-cultural principles of the urbanization process. The implementation of the principles of state cultural policy, arising under the influence of not only urbanization, but also globalization, standardize the social and cultural needs of a person, transforming them into mass culture.*

**KEYWORDS:** *Socio-Cultural Principles, Process, Urbanization, Social, Cultural, Human Needs.*

**INTRODUCTION**

In Uzbekistan, within the framework of the implementation of the Action Strategy in five priority areas, new tools and mechanisms are increasingly being used to ensure high rates of economic growth in the country, taking into account global practice, which include the transition to an active state policy of urbanization.

Urbanization means urban in Latin and is measured by determining the proportion of the urban population of a country and regions. The process of urbanization is associated with ensuring:

- Sustainable economic development;
- Relatively high level and quality of life of the population;
- Efficient use of land;
- integrated urban development by balancing economic, social and environmental factors and prerequisites;
- solving the priority tasks of industrial and innovative development and implementation of the digital economy;

- Optimal combination of development of large, medium and small cities;
- the formation of effective forms of spatial organization of settlement through urban agglomerations, the creation in cities of industrial zones, technology parks, innovation centers, etc .;
- Large-scale implementation of housing construction, social and industrial infrastructure.

Analysis and generalization of the world practice of regulating urbanization processes showed that the purposeful urbanization policy in Japan, the Republic of Korea, Singapore, China, India, etc., was due to active industrialization, stimulation of the integrated development of cities, effective use of existing potential, consistent improvement in the well-being of the population, permanent and sustainable jobs, land reform and the creation of a land market. In many countries of the world, there is a steady trend towards urbanization, which is an important factor in stimulating economic growth and social progress.

The results of the research carried out confirmed that the increase in the level of urbanization by 1.0% ensured the growth of the gross domestic product per capita in China by 10%, in India - by 13.0%.

According to the UN forecast, by 2030 the share of the urban population in the world will reach 60.4% against 55.3% in 2018. Relatively high rates of urban population growth will also be observed in developing countries, where the outstripping growth in the level of urbanization will be mainly due to the migration of the population from the countryside to the city, natural growth of the urban population.

During the years of independence, Uzbekistan has done some work on the development of cities. The share of the urban population increased from 40.3% in 1991 to 50.6% in 2018, which increased mainly due to the administrative transformations of rural settlements into urban settlements (2009).

However, in the process of urbanization, a number of problems are observed:

- In the world coordinate system, the level of urbanization remains relatively low. According to the UN international rating (report for 2018), in terms of urbanization, Uzbekistan ranked 155th among 233 countries of the world, while this indicator was on average: in the world - 55.3%, in the CIS countries - 66.0 %, Russia - 74.4%, Turkey - 75.1%, Kazakhstan - 57.4%, Turkmenistan - 51.6%;
- over the past 10 years (2009-2018), there has been a tendency towards a decrease in the level of urbanization (from 51.7% to 50.6%) in 10 regions out of 13. Urbanization in Khorezm (33.3%), Surkhandarya (35 , 5%), Bukhara (37.4%) and Samarkand (37.4%) regions;
- From 2012 to the present, the number of cities (119 units) has not changed, they are home to 10.1 million. The basis of the country's urban network is small towns (68.1% of the total number of cities), which account for 20.5% the entire urban population. A characteristic feature of urban development is also that almost a quarter of the urban population (24.2%) lives in the capital, Tashkent. The number of urban settlements, where 6.4 million (38.7%) live, during the period under review increased from 1,065 to 1,071 units. A fairly large number of urban settlements can also be attributed to the peculiarities of the structure of urban settlements in the republic;

- The majority of small towns and urban settlements are organized by administrative decision, and they do not fully meet urban planning requirements. In fact, the population, mainly engaged in agricultural work, leads a typical rural lifestyle. According to the survey results, these categories of cities are characterized by their mono-profile, high unemployment, deterioration of production and social infrastructure facilities, unsatisfactory state of transport communications and the service sector, lack of funds and qualified personnel;
- For 2012–2018 the urban population increased by 1.4 million. (9.2% versus 1.7 million in rural areas - 11.9%). The main factors in the growth of the urban population were the natural movement of the population (102.0%), migration (-13.4%) and administrative territorial transformations (11.4%);
- the main reasons for the current level of urbanization are: the implementation of mainly large investment projects in the extractive industry, which did not contribute to the industrialization of cities; low mobility of the rural population and high level of external migration; lack of targeted urbanization policies aimed at integrated and sustainable urban development;
- inconsistency of the developed urban planning documents and the legal framework with modern requirements, limited local financial resources and powers of city authorities to ensure sustainable development of industry and infrastructure facilities, lack of qualified workers and specialists in all sectors of the economy, lack of a long-term social strategy for each city economic development, insufficient attention to the demands and needs of the urban population by the authorities;
- insufficient consideration of the features characteristic of certain categories of cities, location in the design and implementation of investment projects, certain errors in statistical reporting in the field of accounting for the real size of the urban population, especially large and large cities, etc.

In order to overcome the existing imbalances and systemic problems, intensify the intensification of urbanization processes as a new factor in ensuring sustainable development, the President of the Republic of Uzbekistan ShavkatMirziyoyev, in his message to the OliyMajlis on December 28, 2018, set a strategic goal - to bring the level of urbanization in the country to 60.0% by 2030 year.

To solve this goal, the President adopted a Decree "On measures to radically improve urbanization processes" (January 10, 2019), which provides for the main directions and a set of measures for targeted state regulation of urbanization and the integrated development of cities in the country.

The main directions for improving urbanization processes include: the implementation of a new housing policy balanced with transport and social infrastructure; privatization of land plots by legal entities and individuals on the basis of private property rights; stimulating the attractiveness of cities for free movement of the population; introduction of positive foreign practice of effective management of cities of various categories; expansion of the network of satellite cities adjacent to large cities with the placement of cultural and business zones in their central part.

Specific mechanisms and instruments for implementing urbanization policy should be noted. First of all, this is the formation of the necessary legislative and legal framework through the development of new and amendments to existing legislative acts, incl. Land, Urban Planning and Housing Codes, the Law "On privatization of non-agricultural land plots", etc.

Taking into account the socio-political significance and a certain complexity of organizing the privatization of land plots before June 1, 2019, it is envisaged to develop a package of normative legal acts regulating this process, their nationwide discussion before approval by the government. At the same time, it is advisable, as they say, to measure seven times, deeply analyze world practice in order to make a final decision on the privatization procedure and determine the market value of land plots occupied by buildings and structures, as well as land plots adjacent to them. It is also important to develop a specific mechanism for taxing private land plots.

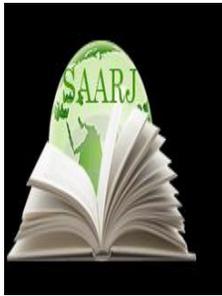

The main organizational and economic mechanisms for the implementation of an active urbanization policy are:

- Development of the Concept of urbanization in the Republic of Uzbekistan until 2030;
- development of a package of documents on strategic planning, long-term forecasts of the socio-economic development of the country, regions and cities, a general scheme for population settlement, a scheme for the development and placement of infrastructure facilities, master plans with their linking into a single system;
- Creation of the Urbanization Agency under the Ministry of Economy and Industry of the Republic of Uzbekistan for the implementation of a single targeted state policy in the field of urbanization, coordination of various ministries, departments and local authorities responsible for the integrated development of cities in certain areas, including scientific, design and survey support;
- Conducting a special survey (inventory) to identify promising rural settlements, urban settlements and small towns, which can become locomotives of urbanization processes, as well as medium and large cities, which can be points of sustainable development of the regional economy;
- urbanization processes, along with housing construction, should be linked directly to the industrial and innovative development of cities using digital technologies, rational placement of industrial enterprises in cities, based on their potential, concretization of investment programs and projects in the context of certain categories of cities;
- Formation of satellite cities around the city of Tashkent, regional centers, targeted regulation of the created urban agglomerations;
- creation of a favorable investment environment and conditions for the placement of industrial and social facilities with the status of the most promising cities – leaders in economic development, the formation of a land market;
- increasing the independence and responsibility of city khokimiyats for ensuring their sustainable development, through the effective use of the natural and economic potential, budgetary and extra-budgetary sources, as well as a special urbanization fund being created;
- effective use of the created and planned free economic zones, especially small industrial zones in order to activate the processes of urbanization;
- Improvement of statistical accounting of the urban population by harmonizing them with international standards and ratings.

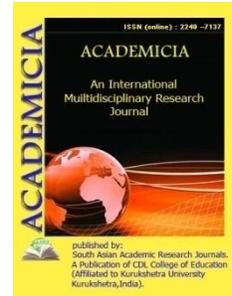

In general, the activation of urbanization processes in Uzbekistan creates new opportunities and sources of economic development, a significant increase in the welfare of the population.

**ABSTRACT**

*This article presents the basics of teaching schoolchildren the basics of fine arts, the development of their artistic and creative abilities, thinking, visual memory, creative imagination. All this finds its solution in the implementation of the system of educational tasks assigned to the lessons of fine arts in a general education school. A solid foundation is needed, cultural traditions, views and customs of the country, its region, the peculiarities of life and labor activities of the people are also reflected in the drawings. The older the child, the more he reflects in his work the national art of his homeland.*

**KEYWORDS:** *Educational Process, Game, Learning, Art, Visibility, Accessibility, Knowledge, Abilities, Skills.*

**INTRODUCTION**

The subject of fine art is the aesthetic attitude of the student to reality, his task is the artistic development of the world. Art, one of the forms of social consciousness.

Spatial thinking contributes to the development of a child's self-awareness, his place and role in the system of general development of human culture, thereby giving knowledge in the unity of his worldview. In the learning process, a whole complex of tasks is solved, among which the most significant are:

- 1) Stimulation of educational and cognitive activity of schoolchildren in fine arts lessons;
- 2) Development of their memory, creativity and talents;
- 3) The organization of their cognitive activities for the acquisition of scientific knowledge, skills and abilities;

- 4) Improvement of educational skills and abilities;
- 5) The development of a scientific worldview, raising the level of general culture.

To organize the process of teaching students the basics of visual literacy, the teacher needs to know the basic elements that are included in the training:

- 1) Target;
- 2) need-motivational;
- 3) Meaningful;
- 4) Operational and activity;
- 5) Emotional and strong-willed;
- 6) Control and regulatory;
- 7) Evaluative and effective.

The connection of these elements with each other allows us to talk about a harmonious system of teaching the visual arts, in which each element, being a component of the whole, performs its specific function.

Then the training will be:

- a) Scientific and have a worldview orientation;
- b) Visual;
- c) Active and conscious;
- d) Affordable;
- e) Systematic and consistent;
- f) Durable.

In the learning process, other types of schoolchildren's activities are organized - play, work, communication with friends. In these cases, the student is involved in another type of activity, during which he will learn what the teacher plans to teach him. At school, the student does not study the way he wants to, but the way he is taught. There is not only the mastery of knowledge, skills and abilities, but also the simultaneous development of the intelligence of the student.

It follows that learning leads development, it develops. The content of education in a modern school depends on the state of the sciences, the foundations of which are taught at school, the scientific and technological progress of society and the cognitive capabilities, interests and needs of schoolchildren. That is why, based on this pattern, the curricula are periodically revised, and modern curricula include a general educational standard, regional and school components, thus reflecting not only the interests of society, but also the students themselves.

Pedagogical skill comes only to the teacher who finds the optimal correspondence of the methods to the laws of the age and individual development of students. Being a very flexible and subtle instrument of touching the student's personality, the method of pedagogical activity, at the

same time, is always addressed to the collective, is used taking into account its dynamics, maturity, and organization.

The social purpose of art lies in the fact that, through the reflection of its object, it interacts integrally, universally and affects a person. All aspects of our society are embodied in the visual arts. Three functions of art are usually distinguished: cognitive, educational, aesthetic in their inseparable organic connection. Indeed, we can say that the fine arts learns by educating and educates by knowing, and this happens on an aesthetic basis.

Works of art should excite, shock, show new, unexplored sides of human life, psyche, the surrounding world and its conflicts. It should reveal the complex, rich, hectic and stressful life of our society, it should mobilize the personality of the perceiver. New art overthrows existing ideals, tastes, habits, memories on traditional art, while showing at the same time the complexity of a person's position in the world around him. Each child has his own view of the world, his own expression of impressions, emotions, his own direction of fantasy. In the works of children - individual images and complex subjects, a whole kaleidoscope of images, sharp characteristics; careful exploration of the nature and work of fantasy; different ways and manners of use, techniques of composition, colors, rhythms - all this merges into a feeling of amazing wealth, unlimited breadth of the worldview of children of all ages. The foundation is laid on which the human personality with all its riches grows. A solid foundation is needed, cultural traditions, views and customs of the country, its region, the peculiarities of life and labor activities of the people are also reflected in the drawings. The older the child, the more he reflects in his work the national art of his homeland. In art, the child finds an understanding of objects, knowledge of the world, phenomena of reality. He can cognize the laws of nature, his harmonious fusion with the whole world. This is the main meaning of art, the main meaning for the child and his creative works. It is necessary not only for the formation of the aesthetic ideas and taste of children, but also for their intellect, the entire area of emotional manifestations. This is the very need for educating children.

The interaction of fine and decorative and applied arts in modern conditions occurs at the level of artistic development of our society. In literature, the aesthetic reproduction of the world is carried out through the word; in painting - through the visually perceived images of the color richness of the world; in sculpture - through plastic images, volumetric forms; in graphics - through the line of the drawing, stroke - this is the unity of aesthetic perception. It gives a person joy (especially for children when they see their work), pleasure, spiritually enriches and at the same time awakens in them an artist who is able to create according to the laws of beauty in a specific area of his activity. There is another important link between objective activity, art and man - culture, the mastery of which determines his ability to create a work of art.

Culture begins where a person creates "to the extent of any kind," and for a child this measure is revealed through imaginative thinking and mastery of creativity. Mastering this yardstick is the essential feature of culture. But for this to happen, a person must be to a certain extent independent. Teaching the fine arts is the introduction of students to artistic culture. It is designed to develop in schoolchildren artistic thinking, creative imagination, visual memory, spatial representations, and visual abilities. To form in children the ability to use expressive means of drawing, painting, modeling, decorative and applied art. Students master the basics of

realistic depiction by teaching them such means of artistic expression as the texture of the material, color - line - volume, light tone, rhythm, shape and proportion, space, composition.

Every child is universal and feels the beat of the pulse of his time, and therefore the art he creates cannot but reflect the wealth of the spiritual life of society. It serves as a means of self-expression of the child in his works, and, therefore, the object of art is both the relationship between man and the world, and the man himself in all his dimensions - psychological, social, moral, everyday.

Play is of great importance in teaching schoolchildren in fine arts lessons. There are different opinions on the advisability of using the game in learning. Considering the great complexity of the modern educational content and, in general, the fact that learning is a serious matter, some believe that there is no place in learning to play. But still another opinion is more justified, the supporters of which argue that learning without play will not solve all the tasks facing it. The fact is that the tasks of teaching are much broader than communicating a certain amount of knowledge to schoolchildren and developing skills to apply this knowledge. The main task of training is to prepare them for life. And during the period of apprenticeship, children actually get the opportunity to transform the world around them in accordance with their desires only in play. Indeed, play helps to activate schoolchildren in learning, overcome boredom, move away from stereotyped solutions to intellectual and behavioral problems, stimulates initiative and creativity.

For the use of all games in teaching the fine arts, the general structure of the educational process is characteristic, which includes four stages:

1. Orientation: the teacher introduces the topic, gives a description of the game, a general overview of its course and rules.
2. Preparation for the conduct: familiarization with the script, distribution of roles, preparation for their use, providing procedures for managing the game.
3. Conducting the game: the teacher monitors the progress of the game, controls the sequence of actions, provides the necessary assistance, and fixes the result.
4. Discussion of the game: a description of the performance of actions, their perception by the participants is given, the positive and negative aspects of the course of the game, the difficulties encountered are analyzed, possible ways to improve the game are discussed, including changing its rules.

In the system of educational means, teaching the basics of graphic literacy, play has a very significant meaning, but in a certain short period of life. In games, the child masters the world around him and the relationship of adults. He not only masters ready-made methods of action, but also experiments, adapts objects to his needs, uses them in accordance with the developing imagination. Through himself in play, the child begins to understand another person, just as through another he begins to understand himself. Indeed, children love to build, create something complex from simple elements. These games develop motor skills, contribute to the improvement of the thinking apparatus, bring up independence, inquisitiveness, and creative orientation of the individual. Play in human life is of tremendous importance, and its role is especially great in the life of schoolchildren. The younger the child, the more educational and developmental significance of games in his life. With age, games are replaced by more serious occupations and work. However, even here the game does not completely disappear: business -

time, fun - an hour, but this hour often means a lot, and should not be neglected. And children - the future of humanity - deserve to be played with more often in art lessons.

Any means, even the most perfect one, can be used for good and bad. And even good intentions do not ensure the usefulness of the use of the means: we also need knowledge and skills to use the means appropriately, so that its use would bring unconditional benefit to schoolchildren. The foundation of the pedagogical process is the patterns of education, training and methodological premises of pedagogical activity. The patterns of upbringing are stable connections in the pedagogical process, taking into account which allows you to achieve effective results in the upbringing of schoolchildren.

Knowledge of the laws governing the upbringing of schoolchildren makes it possible to determine general approaches to their implementation:

- 1) The upbringing of schoolchildren occurs in the process of their inclusion in activities;
- 2) Education is the stimulation of the activity of the formed personality of the student of the student in the organized activity;
- 3) in the process of upbringing, respect for the student's personality should be harmoniously combined with high exactingness;
- 4) In the process of upbringing, the positive qualities of the student should be identified and rely on;
- 5) The age and individual characteristics of schoolchildren should be taken into account;
- 6) Education should mainly be carried out in a team and through a team. Education begins precisely with training, is based on it and cannot be carried out in isolation from it.

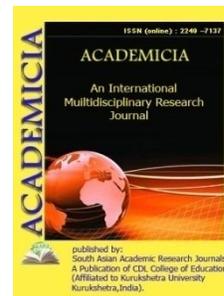

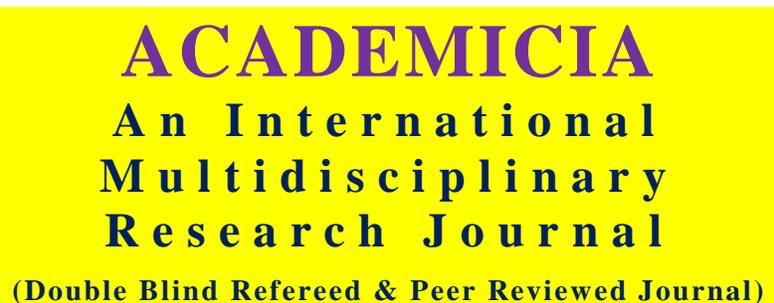

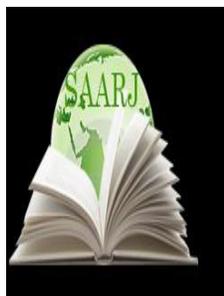

To form in schoolchildren such moral qualities as diligence, perseverance, hard work. The teacher educates, teaches, stimulates the students' desire for self-development, studies their activity, creates conditions for self-movement. Naturally, in this case, the professional and value orientations of the teacher associated with his attitude towards students, towards pedagogical activity are of particular importance.

Upbringing is associated with training, an essential aspect of their unity is that the content of training includes a large educational material. Education is an important form of joint activity of schoolchildren in their communication with the teacher and with each other, where there is also a wide "field" of educational efforts. The unity of teaching and upbringing is also built on the commonality of the methods by which they are carried out.

Thus, the comprehensive development of students' abilities in the process of learning at school determines the harmonious development of the student's personality. By creating their works, they see how seriously their work is evaluated, therefore they themselves take it seriously. The work of a child in the visual arts requires a serious attitude to the work performed - only then can you expect results. A creative thinking and literate person will develop through fine, decorative and applied and folk art. A teacher can teach creativity if he is a creative person himself, being carried away and captivating the child with art, which has always been extremely focused on the spiritual culture of feelings and relationships of people, great traditions, cultures, and artistic achievements.

## THE USE OF MOTOR GAMES IN THE EDUCATIONAL PROCESS (ON THE EXAMPLE OF PHYSICAL EDUCATION LESSONS IN PRIMARY SCHOOL)

Aslonova Malohat Akramovna\*

\*Associate Professor of Navoi State Pedagogical Institute,  
UZBEKISTAN

### ABSTRACT

*The article discusses the issues of using game technologies in physical education lessons in elementary school, their influence on the development of physical qualities, the upbringing of moral and volitional qualities, as well as the intellectual development of primary classes. An active game can be called the most important educational institution that develops physical and mental qualities, rules of behavior, ethical values. "The game form of classes is created in the classroom with the help of game techniques and situations, which act as a means of motivation and stimulation of students to learning activities. Quite often these children have worn out movement disorders that are invisible in everyday conditions, but are manifested with significant physical exertion. These violations can create great difficulties in mastering the program material.*

**KEYWORDS:** *Game Technologies, Outdoor Games, Game, Development Of Physical Qualities, Education Of Moral And Volitional Qualities.*

### INTRODUCTION

Game technology is a unique form of teaching that allows you to make an ordinary lesson interesting and fun.

Play is essential for children to develop their personality, since in play the child learns to know himself, to know the world around him and his place in it.

Play is a conscious activity aimed at achieving a conditionally set goal. Well-chosen and correctly guided play is a powerful means of educating children of primary school age. Under the bright, funny, attractive form of games, there are many pedagogical possibilities that are

manifested through games [6]. Outdoor games are a good active rest after prolonged mental activity, so they are appropriate during school breaks.

A pedagogical game has an essential feature - a clearly defined learning goal and the corresponding pedagogical results, which are characterized by an educational and cognitive orientation.

The main activity of younger students in physical education lessons is games. Games are used in each section of the program material, outdoor games are highlighted in the program in a separate section, which indicates the importance of outdoor games. Game technologies are used for the development of physical qualities, the formation of abilities and skills in the performance of physical exercises, the activation and improvement of the basic mental processes that underlie the motor activity of younger students. Games in the classroom act as a means of motivation, stimulation of students to learning activities.

Outdoor games are an affordable and very effective method of influencing a younger student. In the game, the ordinary becomes unusual, which means it is especially attractive. The game uses natural movement for the most part in an entertaining, unobtrusive manner. The main sign of outdoor games is the presence of motor actions, due to which they are an excellent means and method of physical development.

The educational value of outdoor games is not limited to the development of only physical qualities, such as: speed, strength, agility, endurance, flexibility. Intellectual qualities also develop: memory, observation, ingenuity.

A characteristic feature of children with intellectual disabilities is the presence of various defects in mental and physical development, caused by organic lesions of the central nervous system of various etiologies.

A decrease in the tone of the cerebral cortex leads to an increase in postural reflexes, which makes it difficult for students to perform movements, leads to an uneven distribution of muscle strength, creates stiffness in movements and static postures.

Quite often these children have worn out movement disorders that are invisible in everyday conditions, but are manifested with significant physical exertion. These violations can create great difficulties in mastering the program material. Therefore, play for them is a vital need and contributes to the development of orientation in space, coordination, development and consolidation of movements, making them automated.

The physical development of a growing organism is the main indicator of a child's health. The more significant the deviations in physical development, the higher the likelihood of diseases.

It is very important to timely identify children with deviations in health that are not yet irreversible, but reduce physical performance and delay the development of the body. And a mobile irga has a great impact on the health of younger students. The game brings joy and emotional uplift, therefore, more than other forms of physical culture, they contribute to versatile physical and mental development, the upbringing of moral and volitional qualities, and the strengthening of the body of schoolchildren.

Play activities are unique in the ability to develop cognitive interests. The game makes children of primary school age think, instantly react to the actions of an opponent and a partner, choose

from a variety of actions one that, in his opinion, is most expedient. The use of game technology in physical education lessons helps to increase the emotionality of the lesson, and this, in turn, helps to solve the assigned tasks. The learning process becomes joyful, promotes the desire to study.

The content orientation of the practical use of game material in physical education lessons is as follows. The lesson includes games and exercises related to short-term speed-power stresses. Bending, squatting, running or jumping with a load that is feasible for schoolchildren are very effective for solving this problem. It is possible to use the "Ball Race" relay, beloved by the guys. In this case, the ball is passed, rolled, carried, thrown in various ways, and very useful for the development of power, throwing various objects at a distance.

With pleasure schoolchildren play the game "Who is more?" Two teams, located opposite each other, throw light plastic balls, so as to throw it to the opponent's wall. The balls are light, they fly not far and in order to achieve the desired result you have to spend strength, and in order to defeat the opponent, you need to spend strength many times in a short period of time (the game lasts only 1 minute). To develop such a quality of speed, games are selected that require an instant reaction to various signals (clap, whistle, raised hand). In such games, accelerations, sudden stops are used. All movements are aimed at deliberately getting ahead of the opponent. Such games as: "Sparrows - crows", "Take a circle", "Day and night".

Due to the peculiarities of children of primary school age, not every game can be used; it is necessary to take into account the level of difficulty of the game and its complexity in the interaction of players. The game will be interesting if it is accessible and understandable to them. Therefore, it is necessary to follow the principle from familiar to unfamiliar, from simple to complex. For this, various variants of one game are used, which provide for the preservation of its rules and skills of students, taking into account their age and individual characteristics. For example: in 1-2 grade you can play the game "Hunters and Ducks", assigning one or two "ducks" to make it safe. And then complicate the game by adding ducks. This game contributes to the development of agility, endurance, it requires the manifestation of coordination of movements, orientation in space. The game requires quick coordination of actions with your teammates. The eye, the sense of the ball, the accuracy of movements are developing. In this game, such qualities as will, the ability to take on the game, courage, the ability to overcome their weaknesses are also manifested.

Outdoor games are successfully held in primary school. During the game, physical activity increases, contributing to the development of physical qualities: strength, speed, endurance, flexibility, agility. The following games can be used: "Who is faster", "Kangaroo", "Passing the ball", "Carrying balls", "Counter relay", "Circular relay", "Calling numbers", "Ball race in a column", "Loading watermelons" , "Through the hoop" [1].

In order for the game to be useful, you need to think carefully about everything. Observe safety precautions and strictly follow the rules of the game. And, also, it is worth conducting the game with a didactic orientation. In this case, schoolchildren learn to combine the movements gained in the classroom and in everyday life, knowledge, facts, systematizing them into a single holistic view of the surrounding reality.

The requirements for the selection of games are as follows:

- The game should give new concepts;
- The game should develop the ability to correctly assess spatial and temporal relationships, quickly respond to a frequently changing environment;
- Didactic and motional content of the game must correspond to the peculiarities of the program material;
- The degree of difficulty of the game should correspond to the acquired skills and abilities.

When organizing and conducting a game, you must adhere to the following rules:

- Simplicity and accessibility of the rules of the game.
- Every child should be an active participant in the game.
- Eliminate the slightest possibility of risk, threat to the health of children.
- Security of the used inventory.
- The game should not demean the dignity of the players.
- When conducting several games, didactic principles should be taken into account.

Play is of fundamental importance, introducing it into the pedagogical process, we get the opportunity of natural interaction, getting the most positive result.

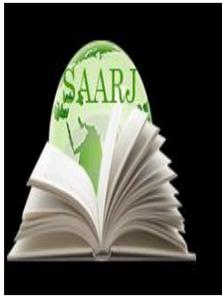

An active game can be called the most important educational institution that develops physical and mental qualities, rules of behavior, ethical values. "The game form of classes is created in the classroom with the help of game techniques and situations, which act as a means of motivation and stimulation of students to learning activities. Physical culture is the most important factor in the formation of an active life position of students of elementary grades.

### ABSTRACT

*In this article, we will look at the concepts of digital culture, digital literacy, and digital competence in general. A modern digital competent person, of course, is developing a “digital culture”. In a world of digital and technological opportunities, it is not enough to be able to use technology, it is important to understand how technology can improve your life, increase professional opportunities and do your job well. The structure of the university should be built in such a way that it facilitates the exchange of new ideas, identifying successful cases inside and outside the campus, in order to develop and apply them in practice.*

**KEYWORDS:** *"Digital Culture", "Digital Literacy", "Digital Competence", Modernity, Education.*

### INTRODUCTION

In the modern world, innovations are being introduced into various spheres of human activity, as a result of which there is an evolution of the educational industry, which orientates people towards new development, improving their knowledge, skills, competencies, mastering new types of activity. This article describes the era of the 21st century in terms of educational progress and how “old school” systems became “new school” systems that contributed to the development of digital education. We are entering the 21st century, where technology knows no boundaries. This is a phase of radical development where technology is taking over every niche and corner. Smartphones, laptops and tablets are no longer unknown words. At this stage, the education system develops for the sake of improvement, since students of this generation are not born to be limited by the limits of simple learning; their curiosity is immense and cannot be satisfied by the educational systems that were developed earlier. If we continued to teach our

children the way we taught them yesterday, we would rob them of tomorrow. Our old education system has no chance of having a chance in the 21st century. Therefore, we are forced to use digitalization in our educational system [1].

Digitization is the integration of digital technology into everyday life by digitizing everything that can be digitized.

Digitalization is a trending term that describes the 21st century as accurately as possible. We are in an era where unprecedented ideas are unfolding in our education industry and creating progress that cannot be matched by technology lag.

A new phase of learning has begun and includes various advanced methods such as: Online course. Do you want to learn a new language, or maybe take a course on a particular course, but can't cover the distance?

Online courses are designed by professionals who have unmatched proficiency in their specific field and can give you a real-time learning experience by designing your own online course.

Online exams. Digitalization has leveraged the creation of online exams, making the exam process convenient for both faculty and students.

Digital textbooks. Along with other titles such as e-textbooks and e-text, digital textbooks provide an interactive interface in which learners can access multimedia content such as videos, interactive presentations, and hyperlinks.

Animation. It's a fun approach where students learn better. By offering a visual representation of a topic, students understand the concept in a more understandable way. Even the most complex topics can be simplified with animation. It should be noted that with the advent of digitalization, the educational system has changed dramatically. Using all of the above methods, in the modern world, any person has the opportunity to receive a quality education [2].

The concept of "digital culture" was introduced into scientific circulation in the 2000s (2004, T. O'Reilly) in connection with the emergence of Web 2.0 technologies - the second generation of the Internet network service. The category of digital culture in modern scientific literature it is analyzed primarily as a humanitarian, technological phenomenon. Scientists in modern science L. Baeva and A. Guk consider digital culture as a technological phenomenon, since all objects of this culture function using digital devices based on the principle of digital coding of information using a binary code, becomes a backbone factor of this culture [6, 7].

S.I. Chernykh and V.I. Parshikov considers digital culture to be a humanitarian phenomenon in his research. The researchers explain that: "The influence of digital culture on the formation and development of personality is not only technogenic, but also humanitarian in nature, and the sixth technological order, within which digital culture develops, will change not only the world around a person, but also the person himself.

Today digital technologies open up great opportunities for us, and we recognize that they have great prospects in education. Modern teachers, in parallel with traditional teaching, when conducting their classes, try to use various types of digital teaching technologies, such as electronic textbooks, digital educational resources, Internet technologies, computer testing programs, etc. conducting training using such forms of training as distance learning, e-learning, massive open online courses, open educational resources. In this regard, it is extremely important

to create a digital culture of future professionals, which is the best driving force in the digital economy.

“Digital culture” is, first of all, an understanding of modern information transfer technologies, their functions and their correct use in work or in everyday life. A modern specialist who acquires skills in the field of "digital culture" knows how to properly use the tools offered by modern information, communication and digital technologies, regardless of whether he specializes in IT.

“Digital competence and digital culture are a set of knowledge, skills, opinions, creativity, strategies, responsibility based on the flexible use of continuously developing digital technologies, on the development and ability to manage digital technologies, compliance with security measures in the world of the Internet and the network, compliance with ethical, legal norms and rules, management, analysis and selection of information, the correct use of information for their needs, that is, this is the ability to process information, have a critical view, your opinion, joint study and training, the ability to creatively create a digital space, information objects and the ability to manage them and shared with effective responsibility”.

When we talk about digital culture, we must not forget about digital ethics. It is very important to be able to communicate through social networks, virtual reality, to be able to protect your information, use or view websites, work with information correctly, know cybersecurity and navigate the current legislation of the state in the field of working with Internet data. Today, almost 60% of the population of our country has access to the Internet.

In a world of digital and technological opportunities, it is not enough to be able to use technology, it is important to understand how technology can improve your life, increase professional opportunities and do your job well. Universities need to develop students' deep understanding of digital environments, the ability to intuitively adapt to new conditions and create new content.

Teaching students to live in the era of rapidly developing digital technologies, however, as well as to understand their own strategy for behavior in the digital world, is one of the most difficult challenges for higher education leaders. Online education is the greatest development in higher education. While universities compete for every student, educational platforms are gaining millions of listeners.

Online courses enable students to choose what they like and gain knowledge in a short period of time, anywhere, for less money. Also, online learning gives a sense of freedom and control over the process of their development, which is one of the key motives in obtaining the desired result.

Students also rely on teachers for life guidance and mentoring. Deep and meaningful human interaction is critical and very difficult, perhaps even impossible to automate completely. Artificial general intelligence is required to automate learning. Unlike narrow or specialized intelligence, it must understand natural human language, be sensitive to emotions, plan, develop strategies, and make optimal decisions in unpredictable circumstances. These complex problems have been considered for many years at a special section of social and psychological problems of higher education, regularly held within the framework of the conference. Until the beginning of this century, it was believed that the key figures in the life of universities were teachers, but with the onset of a new era, the vector changed to meet the needs of students and stimulate their

success. The structure of the university should be built in such a way that it facilitates the exchange of new ideas, identifying successful cases inside and outside the campus, in order to develop and apply them in practice. All activities of the university should be aimed at the formation of a successful student personality. To do this, according to the speakers at the conference, it is necessary to define clear goals and objectives, create the necessary organizational support structures, train teachers in digital technologies in pedagogy, revise curricula and student assessment systems.

The effective integration of technologies into the educational process has a positive effect on the dynamics of student development and stimulates interest in acquiring knowledge. However, the right environment must be prepared for the introduction of technology and new teaching methods. Educators using tools and platforms such as learning management systems often strive to come up with new combinations of different learning components, such as open content or educational applications.

The key problem here is the unpreparedness of the educational system to accept new teaching methods.

The gradual development and implementation of the presented conceptual provisions will not only improve the adaptability of the educational process, ensure the formation of the necessary professional competencies for the digital economy, but also significantly increase the motivation of students, interest and involvement in the educational process. Manufacturability, individualization of the educational process in accordance with the needs and capabilities of each child, interest and motivation to study at school should ensure the achievement of a new quality of education in the digital economy [7]. The professional development of a teacher, the transformation of the system of continuous pedagogical education for the preparation of a modern teacher, a teacher of the digital future, is one of the main directions of digitalization of education. A modern teacher should be able not only to effectively use existing IT, use various editors and information processing tools, programs for creating electronic presentations, but also master new technologies, pay special attention to self-improvement and development of their own digital literacy and the necessary digital skills.

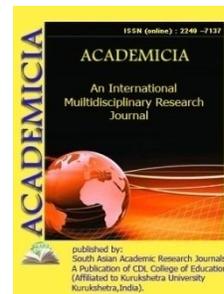

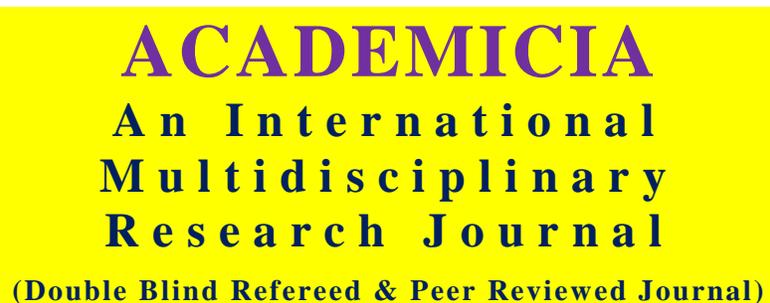

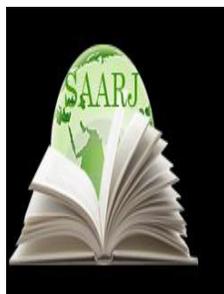

A modern educator should possess the following digital skills: - general digital skills necessary to effectively use IT capabilities in their daily life (for example, searching for information on the Internet, using office software, data processing and analysis tools, etc.); 14 - complementary digital skills related to using IT capabilities to accomplish new tasks (for example, using social networks and other digital messengers to communicate with students and parents); - special skills in using the latest services of the digital economy, implemented on the basis of the concept of the Internet of Things and other components (for example, the use of cloud technologies and storage for hosting educational content).

Digitization has undoubtedly changed our education system, but we cannot say that it has diminished the value of our old classroom learning time. We also do not want something so priceless to turn to dust. The best part about digitalizing education in the 21st century is that it combines aspects of both; classroom teaching and online teaching methods. Walking hand in hand, both act as a support system for each other, which provides a solid foundation of knowledge for our modern students. Digitalization in education has also proven to be the right way to save resources. Online examination platforms have limited the frivolous use of paper by

directly limiting tree cutting. Thus, the digitalization of the education industry in the 21st century is a boon for our society.

## IMPACT OF DIGITAL EDUCATION ON DELIVERING ENGLISH LESSONS

**Tukmuradova Malika Elmurodovna\***

\*3rd year student of the Faculty of English Language and Literature,  
Navoi State Pedagogical Institute,  
UZBEKISTAN

### ABSTRACT

*The article discusses the features and requirements for the formulation of an educational problem when teaching in cooperation in English lessons through a comparison of the basic principles of this technology and the developed theory of an educational problem in domestic pedagogy. Using the examples of setting and solving an educational problem, the advantages of learning in cooperation are analyzed.*

**KEYWORDS:** *Learning Task, Learning In Collaboration, Learning Activity, Communication Task.*

### INTRODUCTION

Learning in cooperation as a new form of interaction between participants in the educational process is increasingly becoming an alternative to traditional education in Russian educational institutions, both in schools and universities. This technology makes it possible to transfer the student from a passive participant, focused mainly on the teacher, to an active and conscious subject of educational activity, purposefully interacting with other students to achieve the set educational goals. But at the same time, the transition from a traditional lesson to a lesson using collaborative learning technology presents some difficulties. And one of them is the formulation of an educational task, which must meet a number of criteria arising from the basic principles of learning in cooperation: teamwork, positive interdependence, individual responsibility of each, face-to-face interaction, reflection, social communication skills (6).

According to R. Slavin, if one or more of the principles are not observed, then cooperation learning can turn into ordinary group work (7).

D. B. Elkonin notes that the goal and result of solving an educational problem are changes in the decisive subject itself, I am not in the subject of the problem, which seems to be an essential distinguishing feature of the educational problem from other kinds of problems.

Also an important property of the educational task, according to G.A. Ball, is the inherent in the formulation the ability to move from the external task given by the teacher to the internal task of the students themselves, which causes interest, the desire to learn new things and solve the problem.

Teaching methods in collaboration are precisely based on this property of the educational task, activating not external, but internal motivation of students. Not only the end result, which in a traditional lesson often boils down to an assessment for the correctness of the task, but the process itself becomes the subject of the task.

Thus, the formulation of a task in teaching in cooperation will always involve a transfer from an external task set by a teacher to an internal one, since the model for solving such a task is located within the team as a unit, where everyone is a part of it, taking a certain role.

E.I. Mashbits deduces a number of requirements for the design of an educational task that can be applied in organizing training in cooperation, correlating them with the principles of implementing this technology. 1. "It is not a separate task that should be designed, but a set of tasks," that is, a task in the task system. A feature of the formulation of an educational task when learning in cooperation is that it should be solved in a team (from 2 to 5 people) and stimulate a positive interdependence of team members in the process of solving it. For this, the team is united by a common goal, and the success of the task is determined by the successful completion of each of its parts.

Thus, the student is faced with his personal task, built into the general work. And then, the results obtained by each team become the subject of general discussion or further modeling of tasks for the whole class. With this approach to building a system of tasks, the principle of positive interdependence and individual responsibility for learning in cooperation is implemented.

The process of learning a foreign language itself implies a hierarchical sequence of stages of mastering language and speech skills. In accordance with the stages of teaching a foreign language in teaching methods, two main types of educational tasks are distinguished: pre-speech (language, training) and communicative (speech, creative).

Learning in collaboration allows you to introduce another type of heuristic problem, which can be an effective alternative to the teacher's explanation and presentation of new language material. So, when teaching in cooperation in English lessons, three types of tasks can be used, the learning goals of which follow from one another.

- 1) Training and preparatory. The goal in setting this type of problem is to develop language skills and speech skills in conditions of teamwork, the result of which should be a stable language skill in the use of phonetic, lexical and grammatical structures.
- 2) Heuristic. This type of tasks involves cognitive goals, the acquisition of new knowledge about the language through joint study, observation and study of linguistic phenomena, deduction of

patterns, drawing up conclusions. Through a system of this type of tasks, a presentation of new lexical and grammatical structures, temporal forms of the verb, articles, etc. can be presented.

3) Communicative. The achieved educational goals in the process of solving problems of the training and heuristic type allow you to use speech skills and activate the language material in prepared and free speech practice in communicative situations. At this stage, the educational task is multifunctional.

Learning in collaboration, in comparison with traditional forms of work, allows you to use a large arsenal of educational actions, ways to achieve results, techniques and methods that students master. This is achieved, firstly, due to the flexible distribution of roles in the team, when during the execution of one task the participants have the opportunity to prove themselves both as a trainer and as a trainee, as, for example, in the jigsaw technique; and secondly, due to the active formation and development of social skills demanded by productive interaction in a team, such as the ability to listen, respond, ask clarifying questions, argue a position, take a different point of view, etc.

As noted by I.A. Winter, the direct product of training should be not only the executive part, but also "the students' awareness of their actions, ie. reflection". Reflection is also a basic principle in collaborative learning. One of the reasons why reflection is not fixed as a constant practice in traditional teaching may be the passive state of students, when most of the time they listen to the teacher or perform tasks that did not become their internal task.

In this case, the analysis of the action does not occur, since there is no active action as such.

The educational process in cooperation requires from everyone both activity and a conscious approach, which means that an analysis of how this process proceeds and what happens in this case also appears.

Therefore, the system of tasks includes monitoring the quality of their work in the team and the whole team as a whole, which further helps to correct and improve their actions.

Thus, comparing the basic requirements for the design of an educational task in domestic pedagogy with the possibilities of teaching technology in cooperation, we can conclude that this method allows one to systematically implement those aspects in the formulation of an educational task that fall out during traditional teaching.

As already noted, when setting educational tasks, it is important that their hierarchical relationship is realized by students in the transition from one goal to another. For this, when studying each thematic section, it is important at the very beginning to identify the communicative task for the team to which they should come.

For example, under the theme "Travel. Tourism" is to publish an advertising brochure, but for this you need to master the necessary vocabulary and learn, for example, how to use articles with geographical names. And then the preparatory and heuristic tasks, which should lead to a certain speech practice, will acquire a conscious significance.

The technology of teaching in cooperation (cooperative learning) is successfully used in the formulation of communication tasks, when students already know the language at a sufficient level that allows them to express their thoughts and achieve communicative goals through

language practice. Techniques such as "openwork saw", "carousel", "brainstorming" are well built into the conditions of joint discussion of the problem, disputes, projects.

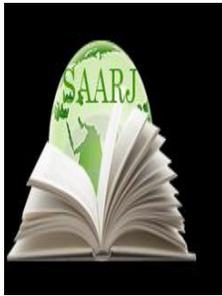

But learning in cooperation can take place at earlier stages of language acquisition and increase the efficiency of practicing pre-speech exercises through conscious activity in joint interaction. Let's give an example of a preparatory type of problems in an English lesson in collaboration. Let's take training-type tasks □ translated exercises from Russian into English using new lexical and grammatical structures. In traditional teaching, these tasks are usually performed individually, followed by a frontal oral check in the lesson or written check of notebooks by the teacher. Purpose of the work: activation of new lexical and grammatical structures in the prepared written and oral utterance. Preliminary preparation: homework to learn lexical structures and translate these sentences with new vocabulary.

Statement of the educational problem: using the knowledge of the learned vocabulary, make this knowledge the property of the whole team and demonstrate the overall result, gaining the highest number of points. Task progress: The class is divided into two teams, for example, 5 people each. Each is given a number from 1 to 5. The teacher calls the number, and a representative from one team with this number reads out a sentence with a new lexical unit in Russian (this may be a sentence from homework, or it may be a new sentence drawn up by a team, depending on educational purposes). A participant from another team with the same number must translate this sentence orally. If he does it the first time, then his team gets 3 points. If he has any difficulties, he asks for the help of his team - a limited time is given for a joint discussion of the translation of the proposal, for example, 1 minute. At this time, all members of the responding team join forces and must not only jointly make the correct translation, but also teach the person who will answer if he has difficulties. Then the same participant must answer again. If he answers correctly, then the team gets 2 points, if with errors - then 1 or 0. In this case, the teacher can evaluate the correct answer, or you can put the verification task in front of the assigning command and also give points for this. Next, the teacher calls the next participant number and the move goes to another command to ask the proposal. At the same time, within each team, participants can be offered an additional distribution of roles: when writing sentences and checking, someone can be responsible for the grammatical aspect, someone for the lexical aspect, someone for originality and relevance to the topic (if the guys make sentences themselves), and there is the role of the organizer of the discussion.

An example of a heuristic type of educational tasks can be, for example, the task to derive a rule for the use of articles with geographical names by translating the text containing the corresponding lexical and grammatical structures into a table. Here teams of 3-4 people can be formed, where each will choose from the text and fill in his part in the general table: water, mountains, countries, etc. And then, together, the team must draw a conclusion and name the rule. Thus, when setting this educational task, the success of the entire team depends on the knowledge and activity of each. Moreover, for those who have not learned or weaker students the opportunity to improve their knowledge "on-line" is open, since the conditions for completing the task motivate mutual assistance and interest in each other's success. This is how all 5 principles of learning in collaboration are implemented, and this learning task leads to both the overall result and the individual growth of students.

**ABSTRACT**

*The article deals with the generalization of the Uzbek language and the cohesive parts of speech. According to the facts we can say that despite the existence of definitions and classifications of the generalizing section given in different languages, this problem still needs to be studied much. In the first sentence, "under the double nut" explains the meaning of the word "in the stream", which precedes it, and in the second sentence, "youth" explains the meaning of the word "we", which precedes it, separated from the main parts of speech by a pause.*

**KEYWORDS:** *Generalizing Part, Cohesive Parts Of Speech, Grammatical Structure, Generalizing Word.*

**INTRODUCTION**

There is information in many literatures about the classifications and definitions given to the compound parts in the Uzbek grammar.

In linguistics, there are two types of use of cohesive parts: without generalizing part and with generalizing part.

An acquaintance with the scientific literature and an analysis of the works of art have shown that cohesive pieces can be used without more generalizing pieces.

To illustrate the point, let us look at some examples:

Cohesive sources are parts of speech that answer the same question in a sentence, perform the same syntactic function, and are connected by equal conjunctions or counting tones. Such passages may appear in more than one line in a sentence, and they are considered to be cohesive passages. For example: The rising sun is shining its morning light on the branches of apricots,

apples, peaches and cherries. The words apricot, apple, peach and cherry are combined in this sentence. They answer the same question and perform the same syntactic function. They are connected by a counting tone and an equal connector. All parts of speech can be cohesive: cohesive owners, cohesive cuts, cohesive determiners, cohesive complements, cohesive cases. Parts of a compound sentence usually have the same grammatical form. Parts of a sentence can be grouped together or expanded by words related to him: Abdullah Qahhor's creative experience is an invaluable resource for readers, literary critics, and young writers (P. Qodirov)

Conjunctions sometimes include generalizations. They are words and phrases that summarize the conjunctions and come before or after the conjugation. Generalizations that come before the cohesive section usually require comments. The generalizations that come after the cohesive part have the property of concluding. For example: Everything: houses, walls, trees fell silently into the darkness. (Oybek) The street - the village, the field, the village - it's as if I'm being questioned by Masuda. (P. Qodirov)

Different punctuation marks are used in compound sentences. As cohesive without interconnects (only with counting intonation); opposing binders, repetitive binders. When you make a connection using the loads in the connector function; a comma is placed between them. For example: if you visit Kashkardarya, Surkhandarya, Namangan, Samarkand regions, you will see 500-600-year-old plane trees. (A.Aminov) He left the hospital, sometimes insulting the doctors and sometimes speaking well. (S.Ahmad)

When the cohesive are used with the help of *and*, *as well as*, with communicate with each other and with the help of detachable conjunctions, there is no comma between them: the water in the river flowed calmly and majestically. (F.Musajonov) Father Salim and the boys followed the guest ... out. (S.Karomatov)

In compound sentences, the cohesive units come before the organizers, and after this unity two points are placed: Everywhere: in the houses, on the streets, the falls because of frost turns white in the morning. (Oybek)

When the cohesive units come after the organizers, they are preceded by a hyphen: Men, women, and children - the greeters ran along the wagon. (R.Fayziy)

**Separated parts of speech.** In some cases, separate parts may be involved. Separated passages usually explain, exaggerate, and clarify the meaning of the words to which they are related, and are separated from the other passages by a special pause. For example: He stood for a long time in the river, under a double walnut tree, buried in white snow. (O.Yoqubov)

No matter how hard the work was, we, especially the young people, worked with enthusiasm and courage. (CH.Aytmatov)

In the first sentence, "under the double nut" explains the meaning of the word "in the stream", which precedes it, and in the second sentence, "youth" explains the meaning of the word "we", which precedes it, separated from the main parts of speech by a pause. Both of the separated passages are used in the form of a simple sentence.

Separated parts can also be in the form of turnover. For example: VahidMirabidov laughed at his bitter irony and passed it by his ear. (O.Yoqubov)

In the quote, "laughing at his bitter irony," the rhyme is separated by a special tone, emphasizing the state in which the action understood from the predicate is performed.

This means that the separated parts can take two forms: 1) in the form of a simple part of speech and 2) in the form of circulation.

Separated parts are divided into the following types, depending on which part of speech they belong to:

1. Separated identifiers.
2. Separated commentators.
3. Separated fillers.
4. Separated cases.

**Separated identifiers.** Separated determiners have two types: separated adjunctions, separated focusers.

The separated adjunctions are used to highlight the character of the object. For example, "Autonomous, naked, wandering under the willows, dreaming." (S. Soliev) The adjective "naked" is given after the adjective to exaggerate the sign of the person ("Autonomous").

In this case, the focuser is distinguished by interpreting and clarifying another focuser that came before him. For example: It is true that most of what he wrote, or rather, what he wrote on paper, telling the typist, was shallow in content, repeating the previous ones. (T.Pulat). In this sentence, the determiner of "more precisely, what he wrote down on a piece of paper by telling the typist" has been exaggerated, explaining the meaning of the predecessor (the word "written") that came before him.

**Separated commentators.** Commentators are often separated. In this they come after the interpretation and are pronounced with a special intonation. For example: You, Sunnatillo, are a very smart, far-sighted person. (S.Soliev) Ali Tajang, an unsightly warrior ... came and drowned in Uzbek. (Oybek) The pulpit was occupied by senior graduates of the institute. (J.Abdullahanov)

Separated cases. There are two types of separated cases:

- I. Separated cases in the form of turnover.
  - II. Separated cases in the form of a simple part of speech.
- The separated cases in the form of turnover are further divided into three:
1. Separated cases in the form of relative turnover.
  2. Separated cases in the form of simulated turnover.
  3. Separated cases in the form of auxiliary cases.

**Separated cases in the form of relative cases.** Adverbials expand with their own words, and such a device is called adverbial circulation. Adverbial circulation is usually separated. For example: People roared like walnuts, covered with blood from all the cars on the platform. (T.Pulat)

Separated cases in the form of a relative statement express the state, time, and condition, reason, and so on of the action. For example: After eating an apple, the boy picked up the stick. (A.Mukhtor)

**Separated cases in the form of simulated circulation.** Words with the suffix “-day, -dek” can also be expanded. For example: In this factory, as in all factories, in the kitchen there is a separate advanced table. (A.Qahhor)

**Separated cases in the form of auxiliary cases.** Cases in the form of auxiliary devices can come from the predicate, expand with their own words, and be separated from other parts of speech. In this case, the device is formed with the helpers as opposed, as, as, due, due, without. For example: He stretched out his thin, white wrist to a tree and shook it as he threw a blackened shot into his mouth. (G.Gulyam)

Separated cases in the form of auxiliary cases turnover represent different situations, and analogies.

Separated cases in the form of a simple part of speech explain the meaning of the case that came before it. Its interrogation and function are equal to the interrogation and task of the case being explained. In this case, time and place are often separated.

Separated place: Not far from the village, where countless tulips were reddening the field and swaying, a wild grass was burning. (P. Qodirov). In the middle of the village of Oykul, by the spring, Master Kamar and father Norboy rebuilt three of them. (P. Qodirov)

Separated time: Tomorrow, young man, as soon as I see you, I'll be back. (P.Markov)

Separated fillers.

There are two types of fillers depending on their formation:

1. Separate fillers in the form of auxiliary device turnover.
2. Separate fillers in the form of simple part of speech

Separate fillers in the form of auxiliary device turnover come away from the predicate and are formed with the help of similar auxiliaries:

Fillers in the form of a simple part of speech explain the meaning of the filler that came before it, clarify it. In this case, both the instrumental can be distinguished.

For example: A medium-sized girl, atlas dress suits on you. (Y.Shukurov)

This protest was undoubtedly directed against his father, the Mother. (O.Yoqubov)

It turned out that one was a letter written by his father in his own handwriting, and the other was a letter written by the colonel, the commander of the unit where his father served. (H.Nazir)

Among those few was the captain, who provided the military aspect of the operation. (A.Chaykovskiy)

**Punctuation is used in the following sections:**

1. Separated parts are usually separated by commas. For example: We, the medical staff, serve the people wholeheartedly. (S.Soliev)
2. If the content of the separated parts is wide or has a comma in it, such separated parts are separated by a hyphen. For example: The secretary girl - Ulfatoy, a medium-sized, white-faced woman with tulip-shaped cheeks and dark eyebrows - came in with a teapot carrying tea ... (S.Soliev)

In Uzbek, the term conjugation refers to the organization of several parts of a grammar by a particular element. Without this organizing unit, an organizational event would not occur. There are organizing and generalizing units in the cohesive units. The organizing unit is present in almost all cohesive parts, and the generalizing unit is used only when it exists for the purpose of adding a comment or additional clarity.

In all of the examples, all the parts are arranged around the predicate that is the center of the sentence. The center of speech, their essence, and their position are determined by the valence of the predicate. There is no generalizing section in the analyzed examples. But in the examples, we noted that one person, like the greens, the words of life, and the additions act as organizers.

In our view, words such as greens, life, like a person, also have the property of generalization.

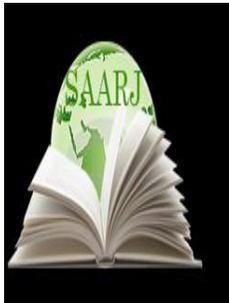

These are not the same phenomenon as the organization of additions or incomplete verbs. A person is an extension of the center of speech that comes in the function of having a phrase in a sentence. He not only organizes but also generalizes the phrases that preceded him: Appearance of man is a middle-aged with a broad jaw and a forehead like a fat monkey. If a man came at the beginning of a speech, it would be a separate piece: A man - a middle-aged man with a broad jaw, a forehead that looked like a monkey.

However, the writer has the right to change the order of the parts of speech in the sentence in order to achieve the goals of the poets.

Using of cohesive words and sentence expanders in conjunction with generalizing participles and generalizing units has nature of speech.

**ABSTRACT**

*Entrepreneurial Orientation (EO) is a universally accepted concept that is applied by the small and medium sized organizations. The studies have shown a significant relationship between EO and business performance. One element that connects EO and business performance is 'Culture'. Organizational culture and the culture as a whole have significant place in the modern entrepreneurial firms. Culture refers to national culture, organizational culture, societal culture and also corporate culture. This study contributes to examine the literature to understand the role of culture in Entrepreneurial Orientation (EO) and business performance. Study will discuss the direct and indirect effect of various cultures that have the potential to influence business activities, decision making and productivity. The various dimensions of EO are considered as important source of firm's survival in the competitive market. The success of such firms depends on the culture of the business performance. This shows that EO, business performance and culture, are inter-related as well as inter-dependent. The findings of the study will help to enhance the understanding of this inter-dependence and role of culture in EO and business performance.*

## INTRODUCTION

Entrepreneurial orientation (EO) can be considered as an important phenomenon and as an important concept for making new strategies. Entrepreneurial orientation (EO) can also be understood as a crucial factor for the success of business even with many complexities in today's business environment. Many empirical studies have positively associated EO with business performance (Semrau, Ambos, & Kraus, 2016). The modern firms require new opportunities and new ways to for making their business successful. EO includes different dimensions of the behavior that are fostered by the successful entrepreneurs of the world. EO states about the behavior that entrepreneurs have to reflect, such as innovation risk taking and being proactive (Arshad et al, 2014). The modern firms have to get involved in the continuous process of innovation; they are required to innovate new products, new process and services. The forms are required to be more proactive in comparison to their competitors. This also reflects the risk oriented behavior of the entrepreneurs that impacts the performance of business (Vij & Bedi, 2012).

Business performance can be understood as the set of performance management and an analytic process that helps in enabling the management of the firms to perform according to set standards for achieving success goals (Bulut & Can, 2013). Business performance can also be defined as *"the degree of fulfillment of managerial goals in business practices and realized outputs of these goals by the end of a certain period"* (Bulut & Can, 2013, p. 273). Organizational culture can have significant influence on the firm performance. Achieving the goal as the output of a certain process is determined by the organizational culture, and its influence on implementation of market orientation within the firm (Jogaratham, 2017). Globally, the business environment has become highly competitive, dynamic and unpredictable. Thus, marketing orientation is important element for small and medium sized businesses. The business environment has become more complex due to globalization, technological development and trade liberalization. The global market place has increased the competition for the firms and they have to adopt many new strategies to survive in the market place.

The rapidly increasing scope of the competition in the global market place, has resulted in creating a lot of challenges for the managers and business organizations. The organizations have to display entrepreneurial behavior and have to focus on developing the supportive organizational culture for surviving in complex market conditions. Accepting EO as the major component of the firm's strategic planning and strategic behavior can have positive influence on the firm's performance. The strategic behavior of the firm is determined by firm's culture (Engelen, Schmidt, & Buchsteiner, 2015). Therefore, Organizational culture is also significant for gaining competitive advantages over the competitors and to achieve high performance and productivity. Entrepreneurial activities are considered as the source of competitive advantage and vitality that helps to take the business performance to superior levels. Entrepreneurial or innovative activities have the ability to refresh the activities of the refresh business organizations, irrespective of their sizes and nature (Karacaoglu, Bayrakdaroglu & San, 2012).

The culture within any organization has the capability of influencing entrepreneurial orientation and business performance. The Entrepreneurial Orientation is at the heart of the corporate

entrepreneurship and has come up as an important, and powerful tool for making a business successful (Bayarçelik, & Özşahin, 2014). This paper will provided a review of literature related to the explanation of Entrepreneurial orientation (EO) and Business Performance. The first section of the review will focus on defining both concepts on firm levels. The other sections will discuss the impact and role of culture on Entrepreneurial Orientation and Business performance. Paper will also review the literature related to the concept that how culture can have significant impact on the performance and how cultural differences are accepted through EO. Since, EO is firm based and societal culture is a higher level concept. Therefore, relation between EO and performance will be analyzed in terms of societal culture.

### **What is Entrepreneurial orientation (EO)?**

Entrepreneurial orientation (EO) is the strategy making process used in the firms. The process of making the strategy involves planning, decision making, analysis, and also requires incorporating culture, values and mission in the strategy. Making the strategy is associated with taking actions with the committed resources. EO also includes the procedures and policies of the firm that will be used as the base for the entrepreneurial decision making and action taking. Rauch et al (2009) has define EO as the “*entrepreneurial strategy-making processes that key decision makers use to enact their firm’s organizational purpose, sustain its vision, and create competitive advantage(s)*” (p. 6). EO is considered to be significantly applied to the small and medium size enterprises. The removal of the global trade barriers has increased the completion in the market for the firms. This creates pressure for the small and medium sized enterprises to compete in the emerging economy.

Some of the studies have doubted the effieicnty of EO. Though there is a positive relationship between EO and business performance. However, the evidences could not answer a question that what will be the effect of EO on the business performance in the time economic crisis and uncertain environment (Kraus et al, 2012) SMEs face lot of pressure and from the competition because of the increasing number of the sophisticated customers and difficulty in maintaining and improving business conditions (Kreiser, & Davis, 2010). Such firms require the entrepreneurial mindset for identifying the opportunities and threats to ensure the successful survival of the firm in changing market conditions. Therefore, EO has been a significant approach to survive in global competitive market. EO is divided in five different dimensions or the components. These dimensions are risk taking, proactiveness, innovativeness, competitive aggressiveness and autonomy (Semrau, Ambos, & Kraus, 2016).

### **Dimensions of EO**

Various dimensions of EO can be derived from the entrepreneurship literatures.

#### **1. Risk Taking**

Risk taking mainly involves taking the bold actions that may result in negative consequences for the business. However, for surviving in the global market, companies have to take risk to that may include venturing with the unknown people, borrowing big amount for business and committing ventures in an unpredictable and uncertain environment (Otache & Mahmood, 2015). However, risk taking is the most significant element of entrepreneurship. It mainly understood as the risk that people take for themselves rather than being employed. Yet, this dimension of EO is widely applied to the organizations, where the senior staff members or the

managers take the risk of committing to large amount of resources with the uncertain outcomes. Risk taking is significant part of SMEs (Engelen, Schmidt, & Buchsteiner, 2015).

## 2. Proactiveness

Rauch et al (2009) states that “*Proactiveness is an opportunity-seeking, forward-looking perspective characterized by the introduction of new products and services ahead of the competition and acting in anticipation of future demand*” (p. 7). This is the ability of the entrepreneurial actions to anticipate the future opportunities. This proactiveness can be associated with identifying the opportunities related to technological advancement and producing innovative products. The proactiveness is applied by understanding the demands of market and customers (Kreiser & Davis, 2010). According to the early economic and market thinking, proactiveness was the important action taken by the entrepreneurs for identifying the market place opportunities and proactively pursuing them. On the level of firm, it is said that proactive companies work as the market leaders and not followers. Proactiveness has significant relation with business performance. The organization is significantly affected by this dimension, as it affects the organizational structure and life cycle of the firm (Kreiser & Davis, 2010).

## 3. Innovativeness

Innovativeness is the “*The tendency of a firm to engage in and support new ideas, novelty, experimentation and creative processes that may result in new products, services or technological processes*” (Bayarçelik & Özşahin, 2014, p. 825). Innovativeness can be considered as the predisposition to engage experimentation and creativity by introducing new products or services, as well as also displaying the technological leadership. Innovation can be considered as a very complex action, as it involves changes in the process of production (Kreiser & Davis, 2010). Some of the theorists and scholars have considered innovativeness as the integral part of entrepreneurship. This involves the use of varied resources and creating new combinations of the resources to make and produce new products. Innovativeness also refers to the firm’s capability to turn the resources in the innovative capabilities (Bayarçelik & Özşahin, 2014). The continuous process of revenue generation is mainly associated with the involvement of the new methods of production and transportation. Innovativeness is the element in business that is highly researched in terms of organizational and individual entrepreneurship.

## 4. Competitive Aggressiveness

Competitive aggressiveness can be considered as the aggressive response towards the competitive threats. This is also considered as the ability of the firm to outperform the rivals. According to the evidences proactiveness and competitive aggressiveness are highly related to each other (Shan, Song, & Ju, 2016). Proactiveness also encourages the business owners to proactively take part in identifying the opportunities and threats for preparing the better strategies for business. The researchers also believe that proactiveness and competitive aggressiveness are same dimensions and they have similar impact on the firm’s performance. Competitive aggressiveness also refers to directly engaging with the competitors for getting a position in the competitive market (Lechner & Gudmundsson, 2014). It is also found as the most significant part of EO in current global place.

## 5. Autonomy

The evidences have shown that firms with more significant EO are likely to perform better in market. The magnitude of the relationship between EO and performance may vary, still their relationship can't be denied (Covin & Miller, 2014). Autonomy has also significant impact on the business performance. It refers to the actions taken by the individual or the team for bringing new ideas and vision without being held back by the organizational constraints (Lechner & Gudmundsson, 2014). It also refers to make decision without any predefined supervision. This enhances the business performance and is considered as a part of organizational culture. Autonomy can also be considered as the dimension that refers to the ability or the willingness of the employees to take the self directed actions and to grab opportunities in their self directed manner (Lumpkin, Cogliser, & Schneider, 2009). Autonomy allows the entrepreneurs to feel free and make decisions and work according to these decisions.

### Business Performance

Business performance can be referred to as the subjective and objective, financial and non-financial achievements attained by an organization (Sibiya, Sandada & Mago, 2016). These achievements are evaluated in terms of business performance and in relation to all the stakeholders, shareholder and employees of the organization. The capability of the organization is directly associated with the performance of the company (Franco-Santos et al, 2007). Studies have also found that knowledge management capability and organizational capability have significant impact on the business performance. The capabilities of the organization importantly rely on the EO of the company (Daud & Yusoff, 2010). Therefore, it can be said that organizational performance and EO are inter-related.

The business performance is affected by the various internal and external factors. These factors are the business activities, forces or institutions. Nasiripour, Raeissi, & Hosseini-Fahraji (2012), found that internal factors that can affect the performance of business are controllable. However, the external factors affecting business activities and performance are uncontrollable. The internal environment affecting business performance are strategic planning, decision making, which is controlled by the management and managers. Otache & Mahmood (2015) argues that external factors also have the significant impact in determining the business performance of an organization, because these factors are uncontrollable and can affect the performance in a significant manner. External factors could be as, unpredictable market and stiff competition (Rosenbusch, Brinckmann & Bausch, 2011).

### Entrepreneurial orientation (EO) and Business Performance Relationship from the Perspective of Organizational Culture

According to the evidences, a firm can be benefitted by applying the new ideas and concepts, by applying the innovative approach, displaying boldness through risk taking, proactiveness to identify opportunities before the competitors do and responsiveness. The relation between firm's performance and entrepreneurial orientation has received considerable attention from the research studies (Rauch et al, 2009). The studies have displayed that firm level entrepreneurial behaviour displays the relative engagement of the firm in risk taking, innovativeness and proactiveness. Such behaviour of the firm is positively associated with the growth and profitability of the firm. The magnitude of this relation and level of firm's performance vary

from place to place. This can be associated with the degree of applicability of the EO dimensions (Vij & Bedi, (2012).

López-Gamero, Molina-Azorín, & Claver-Cortes, (2009) have found that business performance is also affected by the collaborative practices of the HRM. The uniqueness of the knowledge is increased by the HRM activities that also change the firm's knowledge to positive knowledge. The innovative activities therefore, have important influence on the firm's performance (López-Nicolás & Meroño-Cerdán, 2011). Business is also affected by the customer relationship performance and market orientation. The evidences have shown that business performance is affected by the various internal and external factors. The internal factors are those which are associated with the organizational culture. However, EO deals with the internal as well as external factors to enhance business performance (Rosenbusch, Brinckmann & Bausch, 2011).

The business environment in the global market place is rapidly changing that also influence the business models. For attaining profit with the existing operations, the organizations have to constantly look towards the new opportunities and innovations. Rosenbusch, Rauch & Bausch, (2013) the there is a strong relation between business performance and Entrepreneurial orientation. Walter, Auer, & Ritter, (2006) have also analyzed the relation of strategic EO and firm's performance. Study has shown that international performance of the firm can also be affected by EO. García-Morales, Lloréns-Montes & Verdú-Jover, (2007) has established the relation between innovativeness (a dimension of EO) and business performance and has established that innovativeness and dynamic organizational learning capabilities have significant influence on business performance.

Some of the studies have also proposed lower correlation between EO and business performance (Baker & Sinkula, 2009). Studies have also explains the relation of EO with business performance in an inverted position. This means that high degree of EO is not always considered being desirable for business and performance. They are also, not always desirable for the structural conditions and certain market. Thus, there is high variation identified in the reported relationship between EO and business performance. The variations in the results of the various studies are mainly due to some important factors. These factors can be "*difference in the scales of entrepreneurial orientation being used, difference in methodology being adopted, opinion regarding moderating variables and different indicator components of performance being measured*" (Vij & Bedi, 2012, p. 23). According to these evidences it can be said that Entrepreneurial Orientation is still a useful tool for predicting the performance of the business.

The performance of the business or the style of the business is understood as the culture of the organization. Culture can be considered as the way according to which it can be determined that how the firm do things and what are the unique qualities of the people in the firm (Shihab, Wisniarski, & Sine, 2011). The interest in understanding the organization culture and its relation to business performance and EO has increased, as it is believed that certain organizational cultures have the capability of improving the firm's financial performance García-Morales, Lloréns-Montes & Verdú-Jover, (2007). The various kinds of organizational culture can promote financial performance, market share and can also help to gain competitive advantage. Culture has the capability to influence the competitive position for the firm, and this is the reason that it has steamed the interest of the scholars in the business studies. The competitive position of the firm is developed and enhanced through EO therefore, culture have significant role to play in EO and

business performance (Basu, 2015). Research studies have also found that culture strength of an organization can improve the financial performance in terms of both, long term and short term benefits. Culture also boosts the competitive position that is important for EO because, the highly motivated employees are often dedicated to their goals that influence the organizational performance (Basu, 2015).

Culture also helps in developing the organizational competences and winning the competitive advantage. With the supportive and encouraging organizational culture, the employees of the organization are inspired to work hard and to improve the well fare of the customer that helps to gain competitive advantage (Engelen, 2010). This explains that organizational culture is determinant for the entrepreneurial orientation and this refers to all aspects of the organizational activities, including decision making, practices and processes (Jogaratnam, 2017). Kraus et al (2012) finds that though there is a positive relationship between EO and business performance, the cultural contingences can display the variance between EO and performance relation.

### **Entrepreneurial orientation (EO) and Business Performance and Role of Organizational Culture**

In the changing business world and market place, small and medium sized business has created many innovations for maintaining the competitiveness and making a place in the global market. EO can be considered as a significant framework that enables the firms to identify new opportunities and turn these opportunities in a new revenue generation process. Various dimensions of EO displayed that business performance is based on these dimensions. If the risk taking behaviour of the entrepreneurs is correct according to the business environment, then business performance can be improved. Culture also has significant impact on EO and business performance. It has been found that different cultural variables can modify the dimensions of EO. Different dimensions of culture have significant impact on EO and business performance.

#### **1. Entrepreneurship and National Culture**

The national entrepreneurial activities are not considered as recent. The scholars have given the central role to the culture. Bouchard et al (2008) states that '*culture is the conductor, and the entrepreneur is the catalyst of entrepreneurial activity* (p. 5). The influence of the institutional activities such as legal, financial, technological and political, can't be denied. Yet, the informal institutions also have significant role to play in national culture and EO. This means that socially transmitted information are also the part of national culture. Therefore, the entrepreneurial activities and orientation are also influenced by the informal institutions such as regulating bodies, political parties and financial system. Engelene (2010) had stated that "*Culture consists in patterned ways of thinking, feeling, and reacting, acquired and transmitted mainly by symbols, constituting the distinctive achievements of human groups, including their embodiment in artifacts; the essential core of culture consists of traditional (i.e., historically derived and selected) ideas and especially their attached values*" (p. 355).

The essential elements of culture are derived from the traditions, which are the historically selected and derived ideas. It also gives importance to the values that are attached to the traditional ideas (Engelene, 2010). This example displays the two significant element of the national culture; first is that the national culture refers to the group of people and not just individuals and second characteristic of the national culture is that it is divided in several layers and each layer has their own values that influence the behaviour and interaction of the people in

society (Kreiser et al, 2010). The third significant aspect of culture is that, it is not acquired by any means, but it is learned over time. Kreiser et al (2010) also found that national culture have significant impact on the various levels of entrepreneurship in the society, while Engelen (2010) explains that national culture affects the way in which the entrepreneurial orientation is adopted by the organization.

National culture enters the organizations through the individuals. Socialization is the key process of personality development and acquisition, so the values and personality of the people are developed before they come to organization (Schneider, Ehrhart & Macey, 2013). However, as national culture is considered as a social phenomenon, the process of socialization is significantly influenced by national culture. This influence is reflected through the culture of the organization, which is formed by the values, individual perception, behaviour and interactions with each other. All these aspects of the personality are influenced by the national culture which people bring to organization (Petrović et al, 2015). *Cultural values indicate the degree to which a society considers entrepreneurial behaviours, such as risk taking and independent thinking, to be desirable*” (Bouchard et al, 2008). Therefore, the culture also influences the business performance of the organization.

National culture can also have significant impact on the level of innovation applied by the organizations. Since, the level of innovation describes the business performance; innovation can also explain the importance of cultural factors (Strychalska-Rudzewicz, 2016). The culture that supports the individuals to develop strong working skills and strong innovative skills are tend to avoid uncertainty and improve business performance.

## **2. Uncertainty in Business and Organizational Culture**

In the disciplines like economic history, sociology, anthropology, the researchers have found the variation in the economic performance of the various companies being affected by heir national culture. One of the significant example of the France’s weak financial performance in 19<sup>th</sup> century displayed that the entrepreneurs of France lack boldness and innovativeness in their approach. The entrepreneurs of France based their business activities on their patrimonial logic, due to which they were unable to survive the change (Landes, 2015). It was found that people from different culture exhibit difference in the pattern of their perception and attention.

Entrepreneurship is associated with risk taking, which means to take risk, when the market is uncertain or there is a perceived environmental uncertainty (McKelvie, Haynie & Gustavsson, 2011). Uncertainty can also be considered as the salient feature of entrepreneurial. The study found that ‘cultural consequences’ always remain present within the organization in the form of uncertainty due to the presence of different cultures in international organizations (Liu & Almor, 2016). It was also found that entrepreneurial orientation, stress and personal attitude of people are the significant differences found in organization culture that defines uncertainty (Liu & Almor, 2016). It is also significant for the entrepreneurs to evaluate the various evidences from the cultural influence on business performance, individual recognition, personal reasoning and logic for developing a comparative perspective of the influence of various aspects of culture on performance and EO.

EO focuses on defining and finding the measures of environment uncertainties in business. Culture is also considered as a very significant element that has been analyzed by the entrepreneurs for developing a perception of uncertainty. The study of Telman (2012) focuses on

defining the relationship with culture and entrepreneurial processes. He finds that culture is a collective programming of the mind that impacts the various activities and decisions taken by entrepreneurs. Culture defines the underlying values as well as the behaviour of the people that will further define the business performance (Telman, 2012). The question arises about the family business, where the same cultural values are passed on and the uncertainties of the culture remain a question in such cases.

Cruz, Hamilton, & Jack, (2012) focused of finding the entrepreneurial activities, by understanding the culture in the family businesses. Earlier concept behind the family business was that funder centric entrepreneurial approach is applied for decision making in family business, which significantly overlooked the development of the entrepreneurial culture Cruz, Hamilton, & Jack, (2012). Therefore the researcher focused their research on understanding this process in family businesses. Duh, Belak, & Milfelner (2010) found that '*non-family firms, family firms are different in their set of goals because of the controlling family's influence, interests and values which provides firms with a stronger culture*' (p. 475). It is also found at family ownership of the firm allows the members of the family to control the values and belief within the family business that could help in controlling the uncertainties to some level (Duh, Belak, & Milfelner, 2010). The activities and behaviour displayed by the entrepreneurs align with the external complexities and display business performance in balanced form (Seaman, Bent & Unis, 2016).

### **3. Entrepreneurial climate and Impact on Business Performance**

The modern companies are more focused on the entrepreneurial behaviour, this is the reason that entrepreneurs are approaching towards creating an appropriate culture or climate. EO is considered as a very important tool for the modern firms in terms of industry culture, performance behaviour of employees and also internal organizational factors (Fu, & Deshpande, 2014). The relation between business performance and EO has been widely analyzed by the scholars, but effect of culture on business performance has been underrated. The corporate entrepreneurship requires the appropriate application of Entrepreneurial orientation that consists of the organizational culture (Gertsen & Sørderberg, 2011). The external and internal environment of the organization poses challenge in front of the managers to balance them through their risk taking capabilities and innovativeness. Climate or culture of the organization not only depends on the culture of the employees, but it is also influenced by the efforts of the managers. The organizational climate has to be created by understanding the culture, and such environment must encourage employees to display innovativeness and creativity. Creativity is very important for successful business performance (Fu, & Deshpande, 2014).

Business performance is the analysis of the success of the firm, which is affected by EO and its various dimensions. It is also affected by the financial factors, market, decision making and organizational culture (Kotter, 2008). Organizational culture also has significant association with productivity. Culture helps to understand the level of cooperation among the employees, conflict resolution strategies and also interaction between the employees and management of the organization. If the culture is beneficial for the employees and management then, productivity increases (Awadh & Alyahya, 2013). The commitment o the employees towards the organization increase with encouraging climate and cultural satisfaction. The perceived organizational support tend to influence business performance (Fu, & Deshpande, 2014). The business activities and

performance of the employees also depend on the external factors of uncertainty, dynamism and change. Therefore, the EO decision making has to be more influential.

Chuang, Morgan, & Robson (2012) found that organizational behaviour also defines that way through which organization is going to control the external factors. Therefore, it is very important for the firms to display entrepreneurial culture. Such culture encourages the organizations to be innovative, creative and risk taking in their approach, which is also important for the entrepreneurial activities. These activities positively influence the business performance (Idar, Yusoff & Mahmood, 2012). The culture of change and innovation is necessary for positive organizational performance and to retain the cultural capital in the organization (Michael, 2017). For this purpose the business owners and entrepreneurs have to behave entrepreneurially and should display innovativeness and proactiveness, to form a valuable culture within organization. The direct and indirect effect of the external factors can be seen on the business performance. Therefore the culture of organization can help in understanding and effectively addressing the internal and external factors (Michael, 2017).

#### **4. The influence of corporate culture on Entrepreneurial Orientation and Business Performance**

Corporate culture has very high influence over the entrepreneurial orientation and business performance. The national and industry culture could explain the entrepreneurial behaviour in the firm. However, corporate culture is also of great significance for an organization. The studies have shown culture as the internal factor that has the capability of influencing the entrepreneurial behaviours (Bouchard et al, 2008). It is also found that every organization has their tangible and intangible traits that help to establish their unique identity and culture. The effective corporate culture can work as an asset for the organization and can also be determinant of the strategic behaviour of the firm. Corporate culture has significant place as national or industry culture. Therefore, broader understanding of the corporate culture is significant to determine its influence on entrepreneurial orientation and business performance (Krueger, 2007).

Corporate culture has several dimensions. The first dimension is that it acts like a pervasive context for everything that individuals do in the organization. The corporate culture is also manifested in the business standards, principles, values, ethical standards and various approaches of personnel management (Eccles, Ioannou, & Serafeim, 2012). It is also used to develop the policies and procedures for enhancing performance and strategic orientation. Corporate culture also helps to develop a standard organizational environment that facilitates better interaction and relationships among the managers and employees. '*Corporate culture defines what is expected by others, what behaviors are rewarded by the community, how and what things are valued, be they a dress code, the office space, work habits, or anything else*' (Bouchard et al, 2008, p.12).

#### **CONCLUSION**

Culture plays very significant role in the personal and professional life of individuals. Culture has the capability of defining the failure or success of the organization. paper discussed the various aspects of culture that can influence Entrepreneurial Orientation and Business performance. Paper provides the review of literature to illustrate the various factors of national, industrial and corporate culture and its role in influencing EO and performance. Organizational culture has significant relation with corporate entrepreneurship and business performance. It can be concluded that by understanding the various entrepreneurial activities, the culture of

organization and performance can be determined. Every individual in the organization has their own values and belief. When the people come to join an organization, they also bring their values and belief to organization that forms the organizational culture.

Culture has been investigated by various researchers in different aspects. However, it is found that culture impact EO in terms of decision making, risk taking, innovativeness and also autonomy to some levels. Culture also influences the performance of the employee as well as performance of business. With the adoption of organizational culture, employees can enhance their performance and capabilities and it will also influence the strategic orientation of the organization. Therefore, it can be said that role of culture is embedded in the concept of entrepreneurial orientation and business performance and it can take entrepreneurship to very high levels.

### ABSTRACT

*This article provides information about the importance of aesthetic education, aesthetic education of students, as well as the teaching of science in the process of technology lessons. Understanding the importance and social significance of work evokes an awareness of its necessity and responsibility. First, the beauty of a relationship is born in the precise organization of the work. Thus, the task of cultivating the desire for beauty in labor is not only aesthetic, but also industrial, economic education, the formation of the desire to perform any work to the highest quality, the most skillful and perfect.*

**KEYWORDS:** *Aesthetic Education, Formation Of Internal Aesthetic Culture, Pedagogical Tasks, A.S. Makarenko's Opinion, Pedagogical Practice, The Basic Conditions Of Aesthetic Education, The Purpose Of Aesthetic Education, The Pedagogical System, The Words Of V. A. Sukhomlinsky.*

### INTRODUCTION

In the theory of aesthetic education, the living environment is often seen as an element of the aesthetic education process. Habitat includes not only the natural environment, but also the “second nature” created by humans. The work of changing this environment, in which the

experience of the generations embodied, becomes an active factor in education. Therefore, people strive to constantly improve this environment in line with the changing and deepening ideas of a full-blooded life. In this regard, the aesthetic preparation of the younger generation should be the most important area of its introduction into the universal values that form the basis of the cultural environment and therefore one of the most important forms of its socialization as a person. It also forms an internal unity with technological, environmental and social. Therefore, the utilitarian-practical approach to the subject of labor, which is the subject of nature, must be based on the principles of morality and humanity, aesthetics and technological ethics. Adherence to these principles, along with the understanding of aesthetics as a universal value, allows the optimal use of the objective-aesthetic and technological features of the natural object in the production process, creating the necessary artistic form, artistic quality and image of the product. This approach solves the pedagogical task of forming an internal aesthetic culture that predetermines the value attitude of school students towards the social functions of the product being created.

In improving the system of public education, the most serious attention should be paid to the forms and methods of labor, moral and aesthetic education in the school. All this requires the creation in each school of its own optimal conditions for the implementation of multifaceted educational work that leads to the spiritual prosperity of the student's personality.

As for pedagogical practice, Makarenko said: "I can't imagine a team like that ugly if the child wants to live in a team and is proud of it. You can't ignore the aesthetic aspects of life. The aesthetics of the costume, the room, the stairs, the benches no less than aesthetics. "

It is known that the lesson is the main form of teaching and educational work in the school. Students' practical work plays a key role in the labor lesson. This work is built on the basis of productive labor, as a result of which material values are created. School education should be educational. To bring up a harmoniously developed person means that an aesthetically developed person instills in the child a whole set of positive character traits. Fabric processing technology classes have created particularly favorable conditions for aesthetic education, so this task is one of the main tasks in technology classes.

As a mandatory element of a properly organized lesson, the technology teacher should show students the standard of the product or the scheme of its production sequence. The technology teacher should strive to introduce students to the tools of labor, while at the same time providing an opportunity to demonstrate their structure and movements. The didactic effect is much higher with this combination. When choosing an object of work, the teacher should think not only about its compliance with the requirements of the program, but also about how it will evoke emotions in students.

For the purpose of aesthetic education in the process of teaching students in the field of "Technology" it is necessary to:

- To acquaint students with advanced technologies, modern technological processes and advanced production. This encourages school students to have a valued attitude towards work;
- Involve as many students as possible in the workforce. It helps to broaden students' worldviews and develop their creative abilities;

- The activity of student labor collectives is to help teachers in the formation of public opinion of students, to participate in solving problems of labor education and vocational guidance. Forms of labor unions should be chosen depending on local conditions and opportunities. Physical labor, along with cultural leisure, helps to cultivate high moral qualities, healthy needs;
- Combining socially useful work with technical creativity and experimental work, nature protection, study of the motherland, labor traditions. In active work the consciousness of the specific value of its results is formed, the beauty of the changing activity is realized.

In order to form an ethical-aesthetic relationship between schoolchildren, to actively influence their personal qualities, the labor process is a single, integral, practically clear and aesthetically consistent, which is an integral part of the ideological, political and moral education complex. - There should be an organized system. Children's attitudes to teamwork are constantly improving, especially when the prospects for work are clearly defined, when everyone knows what is being done and why, when the outcome of work is socially beneficial and cost-effective, when work is closely linked to life. Understanding the importance and social significance of work evokes an awareness of its necessity and responsibility. First, the beauty of a relationship is born in the precise organization of the work. The beauty of work organization and the clarity of labor issues reinforce the best personal qualities in a student, bringing out the moral beauty of the individual. The main essence of the pedagogical organization of labor is not only to increase social wealth, but also to develop students' labor skills and diligence, first of all, to form and improve the moral beauty of the individual.

Aesthetic education of school students in labor activity can be effective only if a comprehensive approach to the entire labor system in the school. In other words, each element of the pedagogical system must bear the aesthetic burden of student labor in the classroom, socially useful, effective labor in an organic organic relationship with other components of the system: the purpose of labor - with its process, process - with result, result - personal relationship, relationships - with the qualities that shape a person. It is important to keep in mind that the beauty of each element of the labor process system is not some specific abstraction of the beauty inherent in that element. To reveal the beauty of all the elements of the labor process, their ideological, political and moral significance, only at the same time for the correct understanding of the beauty of each element of the labor system of schoolchildren and their pedagogical effective use possible. Any labor activity of school students, its purpose, process and outcome should be accompanied by the pursuit of beauty, its marriage and aesthetic pleasure. Education, socially useful, productive work - everything needs to awaken in students the need for beauty and creativity "according to the laws of beauty". At the same time, the pursuit of beauty should act not only as a pursuit of aesthetic pleasure, but also as a desire to create a high-quality piece that is an integral part of beauty. Thus, the task of cultivating the desire for beauty in labor is not only aesthetic, but also industrial, economic education, the formation of the desire to perform any work to the highest quality, the most skillful and perfect.

Focusing on a specific task in the course of the work activities of school students is for aesthetic purposes only. Living in a world of beauty, a schoolboy often doesn't see or hear it. He often perceives the colorful world clearly in black and white because he does not have a set to perceive colors, and he does not hear forest or field music or takes it as a simple background because he has to listen to music in it. There is no collection. At the same time, seeing, feeling, perceiving

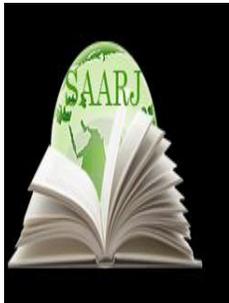

the beauty of the world not only gives it aesthetic pleasure, but also brings new shapes and colors to the piggy bank of creative activity. Therefore, it is important to teach the child to understand the shapes he sees in nature, the beautiful subtle combinations of colors, the patterns of construction of some structures, giving direction to a specific task. In addition to direct tuning, it is necessary to direct school students in search of beauty in the surrounding world in order to collect visual images that can be used in future work.

The process of aesthetic orientation of teaching schoolchildren in the technology of fabric processing covers the intellectual, emotional, volitional, value-oriented aesthetic aspects of the harmonious formation of the individual at work, resulting in the creation of something useful and beautiful. According to V. A. Sukhomlinsky, "beauty pleases a man only when he works."

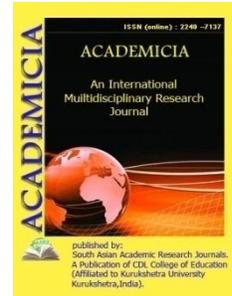

The main task of a modern school of education is to bring up a harmoniously developed person. Aesthetic education plays an important role in the formation of a harmonious personality. At present, as indicated in the main directions of general and vocational school reform, the most important task is to significantly improve the artistic and aesthetic education of students. It is necessary to develop a sense of beauty, a high aesthetic taste, the ability to understand and appreciate works of art, historical and architectural monuments, beauty and wealth. For these purposes, it is better to use the possibilities of each subject, especially literature, music, fine arts, labor education, aesthetics, knowledge and educational power.

### ABSTRACT

*People have always treated teachers differently and called them “mentors”. In folklore, phrases such as “Teacher is as great as your father” have glorified teachers and increased respect for them by the society. From ancient time, the society has increased the demand for teachers, desiring that these professionals to be free from all weaknesses. Correspondence of the year of 1586 showed the following requirements to the teachers: “... the teacher of a school must be pious as well as thoughtful, humble, but at the same time wise, polite, non-alcoholic, kind, far from dreamy, but at the same time striving for good qualities... “at the beginning of the XVII century, a well-known founder of world pedagogy KomenskiyYa. A. said: “the main goal of a teacher is to educate a mature specialist in his profession, who can demonstrate high personal morality, love, knowledge, diligence and other qualities that encourage students to set an example. Every teacher has his or her own way, style and way of teaching. “In educating the young soul - give them inspiration like sunlight,” – said Ushinsky K. D. The article reveals the essence of the requirements for a modern teacher.*

## INTRODUCTION

The President ShavkatMirziyoyevmade a speech in a video conference on improving the skills and prestige of teachers in society, raising the morale of the younger generation: “I think a lot about raising the image of teachers in our society. Personally, I have been a teacher at the university for many years;I understand very well how difficult and arduous this field is. Of course, financial support is important in this regard, but only a teacher can increase the prestige of this profession through selfless work, tireless work on the personal development, providing others with a role model. Now we need to create the environment in our society where teachers are respected, they are who get honor and respect, who are truly gloried as the creators of the future”

People have always been setting quite high standards for teachers. To start with, the teacher must have deep and multifaceted knowledge, an idea of how effectively transfer concepts in the field of science, to win a child’s trust, which is the main basis of human education, become a reliable friend of his students and give them right advice. Any curriculum, any teaching method, no matter how good it may be, if a teacher does not win a student’s trust, will remain only “dead letters and correspondence” on paper, but in fact, if the trust is justified, it will have a strong effect.

### Main Part

If we talk about a number of requirements for a modern teacher, primarily, the Master is obliged to set an example of spiritual life in his personal behavior, attitude to life, to educate students based on human qualities, high ideals of truth and goodness. An important requirement for a teacher today is the availability of pedagogical skills as a person who can demonstrate a love for working with students, a love for children, and the pleasure of interacting with them. According to the results of many surveys, the ranks of leading teachers include professionals who can always demonstrate their abilities and have pedagogical competence.

Necessary professional qualities of a teacher are the following ones: knowledge, creativity, thirst for innovation, perseverance and self-control, leadership, a tendency to love the student, not being nervous about small things. The unique professional quality of a teacher is fairness. He is obliged to systematically assess the knowledge, skills and actions of students according to the nature of his work. Therefore, it is important that its assessments are appropriate to the level of development of the students. They assess objectivity. Nothing enhances a teacher’s moral reputation as an ability to be objective. Partisanship, subjectivism is extremely detrimental to education.

The mental sensitivity of the teacher’s character is to feel the state of the student, their mood, to help those in need in the first place, to act as a barometer as much as possible. The natural state of a teacher is in the importance of having a sense of professional care and personal responsibility, caring for the present and future of the student. The teacher must be demanding. This is the most important condition for its successful operation. The teacher sets high standards for himself because others cannot demand what they donot have. Pedagogical demands must be reasonable, taking into account the capabilities of the developing individual.

A sense of humor helps the educator to neutralize a tense situation during the pedagogical process: a cheerful teacher teaches better than a sad one. His arsenal includes humor, proverbs,

aphorisms, friendly humor, a smile - everything that allows you to create a positive emotional background, attracts students to themselves and the situation.

The teacher's professional tactic is to have a sense of proportion in communicating with the student. Etiquette is a concentrated expression of the educator's consciousness, emotions, and general culture. Its main purpose is to respect the identity of the STUDENT. This warns the teacher of negligence, urging him to choose the optimal means of influence in a particular situation. Personal qualities in the teaching profession are inseparable from professional characteristics. These include: mastering the topic of teaching, methods of teaching the subject, psychological training, general knowledge, broad cultural outlook, pedagogical skills, mastering pedagogical labor technologies, organizational skills, pedagogical tact, pedagogical techniques, mastering communication technologies, public speaking and others. Its components are conscientiousness and dedication, the joy of achieving educational results, the constant growth of demands on oneself and one's qualifications.

## **RESULTS AND DISCUSSIONS**

Many experts are limited to the conclusion that the lack of specific skills can be compensated by the development of other professional qualities; in fact, the ability is formed through diligence, honest attitude to their duties, and constant work on themselves.

We must be familiar with pedagogical skills (talent, profession, inclination) as an important condition for the successful acquisition of a pedagogical profession, but in any case, the decisive condition remains innate professionalism. While most of the candidates for teaching had a professional inclination, they were not able to literally fulfill the task of teaching because they did not have the ability to convey it with their knowledge and interest in science. Despite all the possibilities, it is also possible to see teachers who are not able to manage the audience.

Therefore, the important professional qualities of a teacher are diligence, efficiency, discipline, responsibility, ability to set goals, as well as ways to achieve them, perseverance, regular and systematic improvement of professional level, desire to constantly improve the quality of teaching.

The personality of a modern teacher is largely determined by his knowledge and high culture. Anyone who wants to move freely in the modern world needs to know a lot. The teacher is a visual role model, the owner of a specific standard of behavior. An integral quality in the analysis of a teacher's work is the teacher's skill that comes first. It has many definitions. In the most general sense, it is a high and constantly improving art of education and upbringing. Skills are based on the combination of a teacher's personal culture, knowledge, and worldview with pedagogical techniques and best practices. Knowledge of the theory of mastery is expressed in the use of effective technologies of the learning process, their proper selection for a particular situation, the design of the process at a given level and quality, its organization in such a way that even in the most unfavorable conditions. A real teacher always finds a non-standard answer to any question, can address it in a unique way, arouses his interest, excites. This type of instructor ensures deep knowledge of the subject, has the ability to convey his or her knowledge to students, and has mastered modern teaching methods.

Most teachers can adopt modern work methods if they wish. The way to achieve this is not easy; it requires tension, monitoring the work of colleagues, constant self-education, study of special

literature, the introduction of new teaching methods. What a skilled teacher possesses is that he knows how to effectively root the knowledge, achieve a positive result in the learning process, change work methods, give interesting examples, and find unique ways to transfer knowledge.

An important element of compulsory education is the high level of teaching techniques. Pedagogical technique is a set of knowledge, skills and abilities necessary for the effective application of methods of pedagogical cooperation in practice. It also requires in-depth knowledge of pedagogy and psychology, special practical training. First of all, the teacher masters the skills of communication with children, the ability to choose the right tone and style, simplicity and naturalness.

An integral element of pedagogical technique is the ability of the teacher to control his own attention and the attention of the student. In large groups of students performing multiple surgeries, nothing should get out of control. It is important for the teacher to be able to determine his or her own mental state based on the external signs of the student's behavior. This cannot be ignored in the choice of pedagogical actions. Taking into account the situation of the student at every moment is the basis of pedagogical tactics, plays the most important role in the work.

A sense of urgency is also inherent in the teacher. One of the reasons for many mistakes is that teachers do not compare the pace of their actions proportionally: they may approach the topic in a hurry or late, which reduces the effectiveness of the pedagogical impact.

The acquisition of qualifications and skills influences certain actions of teachers, the manifestation of moral qualities, and the absence of subjective attitudes. In this sense, a teacher's skill is somewhat similar to an actor's skill. Teacher's appeal - please, can be a verdict, confirmation, order. The teacher always plays the same role - for himself and thus pursues the same goal - to interact properly with the students.

Pedagogical relationship and communication is the establishment of communication between teacher and student. It can also be defined as a teacher's professional interaction aimed at establishing a trusting relationship with students. Speech culture, proper breathing, and vocal exercises play an important role here. The teacher must learn to control his voice, face, pause, posture, facial expressions, and gestures.

Today, the problems of pedagogical communication are actively being studied in world pedagogy. The recently published American teachers J. Brofi and T. Gudd's book, *The Teacher-Student Relationship*, analyzes the characteristics of "subjective" communication that are manifested in a teacher's selective attitude toward students. For example, it has been found that teachers often turn to their students to arouse their sympathy. Students who are indifferent to them will be left out of the teacher's attention. Teachers treat "intellectuals" with good, disciplined, executive students. Liabilities are in second place. In addition, independent, active, and self-confident students do not enjoy the teacher's affection at all. The external attractiveness of the student has a significant impact on communication effectiveness.

At this point, J. Brofi and T. Gudd listed some of the positive and negative qualities of teachers:

- The desire to involuntarily appeal to students sitting in the front row;
- Evaluate their achievements with a high score;
- Give preference to students with beautiful writing;

- Separation of well-dressed people;
- Female teachers give high marks to young men;
- Male teachers slightly increase the grades of beautiful female students.

Enthusiasm, joy, and insecurity are usually conveyed in a loud voice, anger, and fear in a much louder voice, grief, sadness, and fatigue in a soft and muffled voice. Remembering how annoying the squeaking or hissing voices of some teachers in school can be assumed, the sound can also interfere with teaching. A lot can be changed through self-education, constant self-improvement classes. Speed of speech also reflects the teacher's emotions: fast speech is excitement or anxiety; slow - evidence of depression, arrogance or fatigue.

### CONCLUSION

To conclude, it can be said that the external, aesthetic aspect of teacher perception is also important for students. Students' interests in the formation phase are more prone to the effects of labile and environmental conditions. Therefore, it can be concluded that the process of teaching and learning takes place in the process of communicating with the teacher, and this is no less than accepting students as individuals with their own advantages and disadvantages, because its development is influenced by those around it, among whom the teacher is not the last.

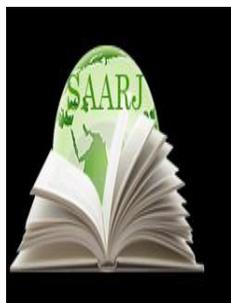

The ideal image of a future teacher for a modern student is taking shape today. In educating a future teacher, the main focus should be on the psychological and pedagogical disciplines, perhaps it is necessary to introduce such disciplines that will help the future teacher to develop his creative foundations, aspirations and creativity.

A teacher, first and foremost, is always a creative person. He is the organizer of the daily life of his students. Through the scale of his personal activity, the teacher demonstrates his will and tries to keep students interested in the subject. The teacher in the classroom is a teacher, a leader, an educator, an inventor, a professional who is fast, determined, always ready to solve any situation independently. Only by understanding the norms and rules of one's natural structure can one become a true professional. Moreover, this new integrity paves the way for shaping the future teacher. Pedagogy should shape a person who can demonstrate the rules of creativity. This approach expands the scope of development of scientific views and leads to their consistent movement towards integrity.

### ABSTRACT

*The article presents epizootological data of ephemeral rinderpest, diagnostic methods, pathogenesis, clinical signs and symptoms, pathological changes, differential diagnosis, methods of treatment and prevention of the disease. One of the most common carriers of the disease are bloodsuckers of the Culicoides and Culex genera. The disease persists in the form of epizootics, has a clear seasonal character, its greatest prevalence and manifestation is observed in summer and autumn during the period of peak activity of Culicoides and Culex.*

**KEYWORDS:** *Ephemeral Rinderpest, Productivity, Prevalence, Diagnosis, Symptoms.*

### INTRODUCTION

Ephemeral bovine fever (three-day epizootic fever, influenza, muscular paralysis; Febrisaefemera - Latin, Bovine ephemeral fever - English). It is a disease characterized by mouth, esophagus, eyes, muscle stiffness, stiffness and lameness). The disease is mainly spread by wind. Its carriers are Culexannulirostris and Anopheles annulipes flies.

### Epizootiological data

Under natural conditions, blood-sucking insects transmit the pathogen. [9.s 6-9], Culexannulirostis and Anopheles annulipes are the most active carriers of mosquitoes. The spread of the disease depends on the migration and density of the animals. It manifests itself in the warm, humid season, during the biological activity of blood-sucking insects. Predisposed to the disease are primarily large animals. One of the most common carriers of the disease are bloodsuckers of the Culicoides and Culex genera. The disease persists in the form of epizootics, has a clear seasonal character, its greatest prevalence and manifestation is observed in summer and autumn during the period of peak activity of Culicoides and Culex. The emergence and

spread of epizootics is largely determined by weather conditions and the direction of winds, as well as periodicity.

### **Methods of diagnosis**

When infected in the brains of 1–3-day-old mice, rats, and white mice, the ephemeral fever virus causes paralysis, with an average of 1-day mortality (17% of cases) on day 12, 3–8 times all after infection, and 3–5 times death is observed in animals during the day. Cattle are particularly susceptible to the virus, especially cattle fed over one year of age. The disease is not contagious in the absence of insects, it can be propagated by intravenous transmission [5.s 128-131]. There are reports of susceptibility to sheep virus (without clinical manifestations of the disease) [11.s 713-722].

### **The main part**

The economic damage in ephemeral fever is due to a decrease in the meat and dairy productivity of cattle and the quality of products derived from them, the efficiency and mortality of sick animals up to 10%.

The causative agent is an RNA-storing virus, a form of bullet or cone-shaped virions (I. Ito et al., 1969; G. Lecatsas et al., 1969), its size 70-80x140-170nm, morphological in terms similar to the causative agent of vesicular stomatitis. But its genome is double-stranded RNA. The density of the virus is 1.196 g / ml, sensitive to ether, chloroform, trypsin, unstable with divalent cations, resistant to heating at 50 ° C, but dies in 10-30 minutes at 56 ° C, rapidly under the influence of ultraviolet light dies, is activated at exactly 10 pH below 2.5 and above 12. The optimal pH zone is 7.2–7.6 (W. Heusche, 1970). It is not recommended to store the pathological material at 25 ° C for 5 days, at 37 ° C for 1-2 days, at 4 ° C for 1-1.5 weeks, at -20 ° C for more than 40 days. The virus is well preserved at a temperature of 70-80 ° C and lyophilized at + 4 ° C. Thermal stability of the virus increases when stored in a protective environment.

### **Pathogenesis**

RNA-containing arbovirus, fam. Rhabdoviridae. The virus causes paralysis and death in 1–3-day-old mice and 1-day-old guinea pigs, and multiplies well in some cells.

Ephemeral fever virus contains antigens that cause the formation of neutralizing, complementary antibodies found in the serum of animals 2-3 weeks after infection. Antibodies that neutralize the virus peak in convalescents 1-2 months after infection and persist for more than 400 days (VN Syurin, 1979). Many researchers believe that the ephemeral fever virus is antigenically identical. However, there are reports of several serotypes of this virus in Australia (N.Standfast et al., 1973).

### **Clinical signs and symptoms**

Emeral bovine fever is a sudden rise in body temperature to 40-41 ° C, foaming at the mouth and nasal discharge, muscle tremors, respiratory disorders (cough, wheezing, etc.), general malaise, lack of appetite, dryness of the front of the nose, stiffness of the muscles of the limbs, a significant decrease in milk during lactation. In severe cases, spasms or paralysis of the muscles of the throat and esophagus, emphysema of the lungs, lameness, inability to stand due to pain in the joints are observed. Clinical symptoms the manifestation of the disease lasts 1-2, sometimes 3-4 days. The disease is characterized by a sudden rise in body temperature to 41-42 ° C. After

1-2 days it returns to normal. Some sick animals develop subcutaneous emphysema in the back of the neck, in front of the chest. When the temperature drops to normal, these symptoms disappear. Hematological examination is characterized by the presence of a specific nuclear shape in leukocytes.

**Pathological changes.** The changes are most often observed in the lungs; there are bleeding in the mucous membrane of the upper respiratory tract, nasal cavity, larynx, trachea. Rarely, the lungs resemble large balls, and emphysema spreads intramuscularly and subcutaneously to the diaphragm, neck, and abdomen. Areas of hepatization in the lung parenchyma are vaguely expressed. Usually pathological changes are characterized by serofibrinosis, multiple articuloparostitis, periartthritis, lymphadenitis.

### **Differential diagnostics**

Ephemeral fever in cattle caused by adeno, roto, herpes viruses and other pathogens Infectious disease, foot and mouth disease, dangerous catarrhal fever, sheep catarrhal fever and Ibaraki disease, viral diarrhea and shortness of breath should be distinguished from the complex of infections of the respiratory tract.

Diagnosis is based on clinical, epizootic and pathological data, serological studies to determine the results of biocides (by intravenous administration) on immunological and non-immune animals (cross-immunization method) or in the neutralization reaction in RN and RSK determined. Antibodies that neutralize the virus are detected 1-2 weeks after infection and last up to 50 weeks, their maximum titer is 1: 1024. Complement-bound antibodies are detected after 2-3 weeks, persist for up to 9 weeks, their maximum titer is 1: 16. The method of fluorescent neutralization reaction is also used in the detection of the virus in the leukocytes of sick cattle, in vaccination of newborn mice, guinea pigs, cell culture BHK-21, Vero, etc., as well as methods of serological analysis (MFA, RN, RSK) and methods of pathogen isolation in electron microscopy. Antigens for CSC are obtained from the brains of mice by extraction from cultured fluid inoculated using sucrose, acetone, ether, or modern concentration methods. With pH isolated virus, the cell is cultured or placed in mice for 1–3 days. The best material for disease progression is defibrinated blood, a suspension of leukocytes; vaccinated material can be used and a 10% suspension of lymph nodes and spleen tissue obtained during fever.

### **Treatment**

No specific treatment has been developed for the disease. The sick animal is treated symptomatically. If the animal has symptoms of hypocalcemia, such as a large abdominal obstruction, calcium borogluconate may be given. Non-steroidal anti-inflammatory drugs can improve recovery. Rest for at least a week is very necessary, otherwise death may occur. Second, antibiotics are used to prevent infection (tylosin, oxytetracycline, penstrip, dithrim, etc.). To restore large abdominal atony, a solution of chemritsa (atanol, gastrovet, ruminaton) is taken at the rate of 2 ml per 10 kg of live weight. A 10% sodium chloride solution is injected into a vein. If sores form on the mucous membranes of the mouth, the wounds are treated with antibiotics and astringents (limoxin, chemri spray, oxy spray and other means).

### **Disease prevention**

The vaccine is available in Japan, but is very expensive, which limits its use. Ultravac BEF (from Zoetis) is a vaccine to prevent ephemeral fever in cattle. This product is registered in

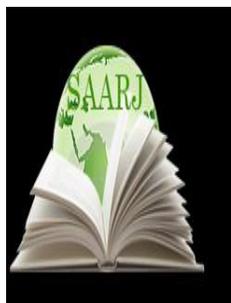

Australia, Israel and Egypt. It is recommended to disinfect cattle every 15 days in summer and autumn. In infected farms, cattle are thermometrically examined, and animals with elevated body temperatures are isolated and treated. Animals with normal body temperature are isolated and thermometry is performed daily.

### CONCLUSION

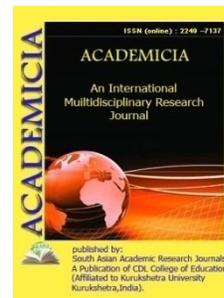

Cypermethrin, neatsedol, alfatsipermetrin, pteid and other disinfectants are used to kill blood-sucking mosquitoes in barns and barns according to the instructions. be located at a distance of 1 to 1.5 km from swamps, marshy forests and shrubs, lowlands and other possible places for breeding blood-sucking insects in high, open, dry, well-ventilated areas need. The minimum time for insects to move should be used to move the animals.

**ABSTRACT**

*The studies have shown that the second cropping of peanut, soybean and mung bean in all crops has an effect on planting time and seedling thickness, leading to an increase in economic profitability. The total cost of the experimental variants (fertilizer, seeds, wages, POL and additional costs) was summarized. The expenses were then deducted from the proceeds of the sale in order to earn a net profit.*

**KEYWORDS:** *Second Cropping, Planting, Duration, Norm, Number Of Seedlings, Cultivation, Agrotechnical, Yield, Net Profit, Level Of Profitability.*

**INTRODUCTION**

In agricultural sector of our country, a wide range of opportunities are being created for economic entities to modernize production, efficient use of land and water resources, further development of production of import-substituting and export-oriented products. Based on the fulfillment of these tasks, the domestic market will be filled with the agricultural products, new equipment and technologies will be introduced into production, and many new jobs will be created. Along with domestic investment, the scale of attracting foreign investment to the economy will expand, which will ultimately increase the economic efficiency of agricultural production. For this purpose, along with the creation of new varieties of low-cost, high-yielding, high-quality agricultural crops, the introduction of intensive and resource-efficient agro technology is invaluable.

## Research results

Based on the above problems, in our project research, we determined the effect of planting norms on the economic efficiency of peanut, soybean, and mung bean crops planted in the second crop period (25.06-05.07).

According to the analysis, in the project experiments, the amount received was calculated by multiplying the average grain yield for 3 years by the public purchase price. The total cost of the experimental variants (fertilizer, seeds, wages, POL and additional costs) was summarized. The expenses were then deducted from the proceeds of the sale in order to earn a net profit. After calculating the conditional net profit, the level of profitability between the variants was determined by multiplying the sum of the costs of production by 100(coefficient). According to the results of the experiment, the thickness of seedlings and planting dates had an impact on the productivity and economic efficiency of second crop crops in all crops.

In particular, the most optimal variant of the seedling thickness of four (180; 230; 280 and 330 thousand pcs/ha), planted in the experimental field for a second crop period (25.06-05.07), was 280 thousand pieces/ha seedlings per hectare, the average annual yield of peanuts was 30.8 centner per hectare, net profit was 1270.9 thousand soums and the profitability was 84.7%, additional net profit compared to the variant (180 thousand pieces/ha) amounted to 568.3 thousand soums a level of profitability was 36.5%.

In the project studies, according to the analysis second cropping of peanut which were planted in the variant with the seedling thickness 180; 230; 280 and 330 thousand pcs/ha had an impact on the cost- effectiveness indicators, with the lowest economic indicator in the variant of second crop peanut with seedling thickness of 180,000 pcs per hectare, , the net profit was 702.6 thousand soums and profitability rate was 48.2%.

The next highest indicator of economic efficiency was 330 thousand pieces/ha seedlings per hectare, the net profit was 914.3 thousand soums, the yield was 60.3% while the thickness of the seedlings was 230 thousand pieces/ha, in case of high economic efficiency, net profit decreased by 447.8 thousand soums and the profitability decreased by 28.7%.

Also, the most optimal variant of four (200; 250; 300 and 350 thousand pieces/ha) seedling thickness in the second crop soybean was specified in the variant with seedling thickness of 300 thousand pcs. per hectare, the average annual soybean yield was 23.7 centner per hectare with a net profit of 797.1 thousand soums and profitability was 59.7%.It was found that the additional net profit compared to the variant was 604.0 thousand soums, the rate of profitability was 44.9% (Figure 1).

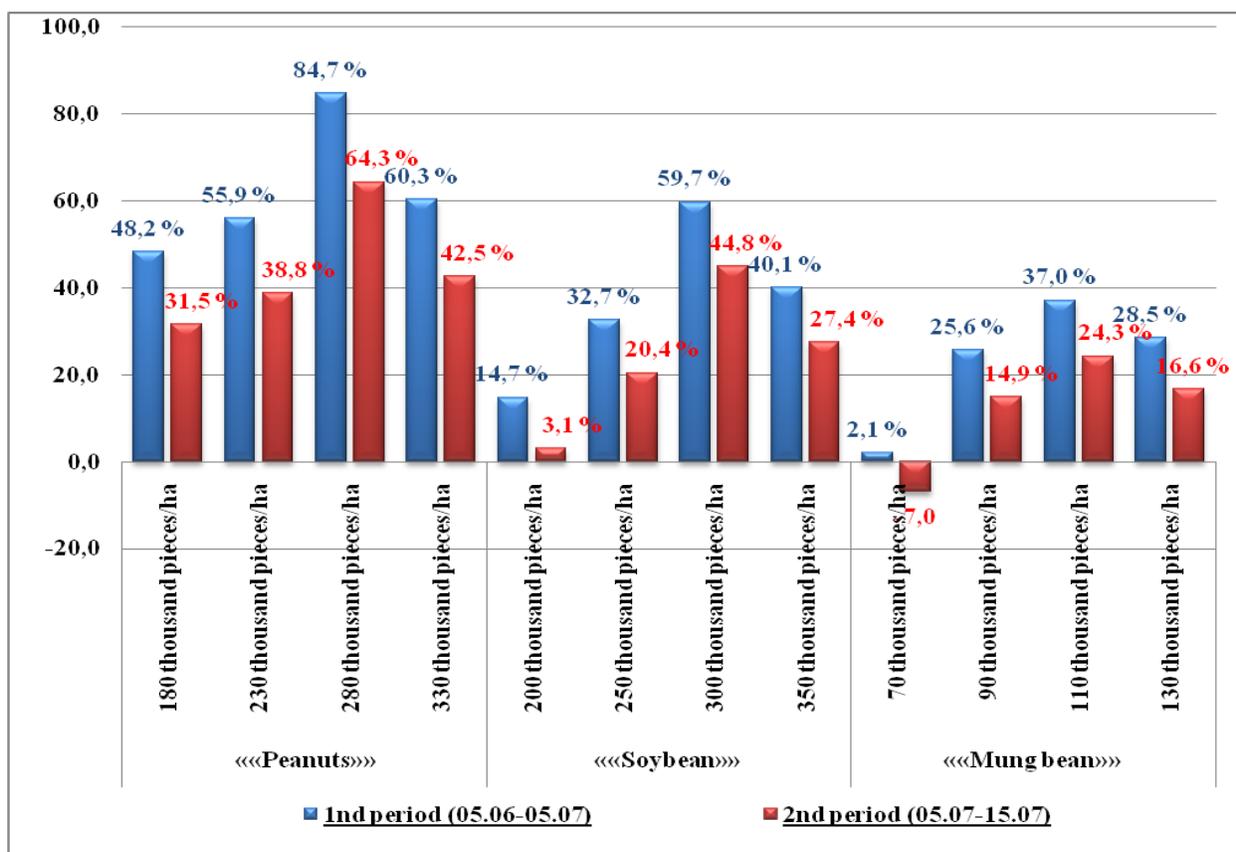

In the experiment second cropsoybean planted variants by;200; 250;300 and 350 thousand pieces/ha, the seedling thickness effected on the cost-effectiveness, indicators, the minimum efficiency was in the variant in which the seedling thickness of the second crop soybean was 200 thousand per hectare, the yield was 16.7 c/ha, the net profit was 193.0 thousand soums and the profitability rate was found to be 14.7%.

The next largest indicator of the profitability of the research was the seedling thickness of 350 thousand pieces/ha net profit amounted to 541.1 thousand soums, the level of rentability was 40.1%, while in the variant of the seedling thickness was 250,000 pieces/ha it was established

that the rate of return on net profit decreased by 27% to 365.0 thousand soums compared to the indicator of high economic efficiency.( Figure 1).

During the study of the project, the most optimal variant was found out of four (70;90;110 and 130 thousand pcs/ha) seedling thickness, specified during the second crop sowing mung bean in the variant with seedling thickness of 110 thousand pieces/ha seedling per hectare, the yield of mung bean was 19.3 centner per ha, net profit 417,4 thousand soums, the level of profitability was 37.0%, compared to control variant (70 thousand pieces/ha), net profit was 391.4 thousand soums, the level of additional profitability was 34.9%.

However, if an increase in the number of seedlings had a positive effect on increasing yields, then the seedling thickness was 130 thousand pieces/ha of the mung bean yield was 18.3c/ha, the net profit was 325.0 thousand soums, the profitability was 28.5%, while the thickness of seedlings was 110,000pieces/ha the net profit was 92,4 thousand soums compared to the variant, the yield reduced by 8,5%,it can be explained by the fact that the excess thickness of seedling in 20 thousand pieces/ha had a direct negative impact on the yield of mung bean (Figure 1)

**Figure-1. The influence of sowing time and norms of second crop peanut, soybean and mung bean crops on the level of economic profitability.**

When analyzing the impact of sowing rates on the economic efficiency of peanut, soybean and mung bean crops planted in a second crop period (05.07-15.07), according to the project study options, the amount received by multiplying the average grain yield for 3 years by the public

purchase price was calculated. The study showed that for all crops the yield of second cropping was affected by cost-effectiveness indicators depending on the thickness of the seedlings.

In particular, the most optimal variant of the seedling thickness of four (180; 230; 280 and 330 thousand pcs/ha) peanut planted experimental field in a second crop period (05.07-15.07) was 280 thousand pcs/ha seedlings per hectare, the average annual yield of peanut was 27.4 centners per hectare, net profit was 964.9 thousand soums, profitability was 64.3 %, this figure was controlled by this crop (180 thousand pieces/ha) compared to the planted variant, the additional net profit was 505.3 thousand soums, profitability was 32.7%.

As part of the project studies, second cropping of peanut which were planted with the seedling thickness 180; 230; 280 and 330 thousand pcs/ha had an impact on the cost-effectiveness indicators, with the lowest value in the variant of second crop peanut with seedling thickness of 180,000 pcs/ha per hectare the net profit amounted to 459.6 thousand soums and profitability was 31.5%.

The next highest productivity indicator was 330 thousand pcs/ha thickness of seedlings per hectare with a net profit of 644.3 thousand soums, the profitability was 42.5%, the thickness of the seedlings was 230 thousand pcs/ha, compared to the high economic efficiency the indicator, net profit decreased by 393.8 thousand soums and the rate of return decreased by 25.55 (Figure 1).

In studies during this period, the most optimal variant of four (200; 250; 300 and 350 thousand pieces /ha) of seedling thickness, which was also determined in the second crop soybean was 300 thousand seedlings per hectare, during this period, the average annual soybean yield was 21.5 centners per hectare with a net profit of 599.1 thousand soums and a yield of 44.8% (200 thousand pieces/ha) additional net profit compared to the planted option was 559.0 thousand soums, the level of profitability was 41.8%.

In the experiment second crop soybean planted variants by ;200; 250; 300 and 350 thousand pieces/ha, the seedling thickness effected on the cost-effectiveness, indicators, the minimum efficiency was in the variant in which the seedling thickness of the second crop soybean was 200 thousand pcs/ha per hectare, the net profit was 40.0 thousand soums and the profitability rate was found out to be 3.1%.

The next highest figure for soybean planted in the period of second crop (05.07-15.07) was 350 thousand pcs/ha seedlings thickness, net profit made 370.1 thousand soums, the profitability was 27.4%, the thickness of the seedlings was 250 thousand pcs/ha variant the net profit decreased by 329.0 thousand soums and profitability decreased by 24.4% compared with the indicator of high economic efficiency.

The most optimal variant of four (70; 90; 110 and 130 thousand pcs/ha) seedling thickness, which was also determined in the second (05.07-15.07) period of the project research amounted to 110 thousand seedlings per hectare, if the observed yield was 17.5 centners per hectare, the net profit was 273.4 thousand soums, the yield was 24.3%, this figure was controlled by the crop (70 thousand pieces/ha), net profit in comparison with the option amounted to 359.4 thousand soums, additional profitability of 31.2%. Although the increase in the number of seedlings during this period also had a positive effect on the increase in yield, the thickness of the seedlings was 130,000 pcs/ha, the yield in the variant of second cropping mung bean was 16.6 c/ha, net profit

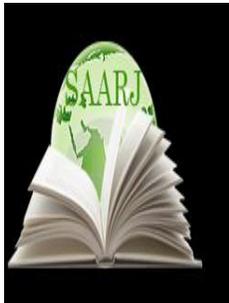

was 189.0 thousand soums , the yield was 16.6 % and when the seedling thickness was 110,000 pieces/ha. it could be seen that the net profit was 84.4 thousand soums and the profitability rate is 7.7% lower than that of the option for each unit.

### CONCLUSION

So, in conclusion, it can be said that the second crop sowing of peanut, soybean and mung bean has proven that planting time and seedling thickness have a significant effect on increasing yields of all crops and lead to an increase in economic profitability.

 Samarkand State University,  
 UZBEKISTAN

### ABSTRACT

*In this article, we will examine the meaning used in the philosophical work of Faust by the German writer Yu.G. Goethe, the novel by A. Kadiri, "The Past," and how they can be translated into Uzbek and German. As you know, Faust is a very complex philosophical and symbolic work by Goethe. Goethe highlights the problems that surround themselves, their era and their leaders.*

### INTRODUCTION

For centuries, peoples have created poetic forms that meet the needs of their languages and tastes. There are both "international" genres common to many nations and "pure national" genres that exist only in one or two nations. This poses a number of additional challenges to literary translation. The purely linguistic difference between languages in the translation of a poetic work is not only a matter of nationality, intonation, weight, rhyme, style, but also a problem of genre. Reflecting the uniqueness of a genre in translation is an attempt to convey the national characteristics of another people.

In the philosophical work of the German writer YV Goethe "Faust", we analyze the implicitism used in A. Kadyri's novel "Last Days" and the ways of their expression in the process of translation into Uzbek and German. Implicit information in the original text is for people and objects, place names, realities that increase the artistic value of the work, as well as the German way of life, customs, historical and geographical names, the spiritual image of the character and the author's pragmatic attitude to them. it contains information that seems to be ordinary words, but contains a lot of cognitive knowledge that is difficult for the readers of the translated

language to understand, often requiring interpretation within or below the text. Such information is usually expressed in the presupposition of information, in the imperative, which is understood through a logical conclusion, and in some cases through the subtext. Below we present our observations on their transmission in a foreign language.

It is known how honorable and noble it is to restore a mature monument of poetry and artistic thought of one nation on the basis of another nation's poetry and, consequently, to turn it into its spiritual and cultural property. Talented poet Erkin Vahidov is known not only for his original poetry, but also for a number of translations from the literature of the peoples of the world.

It is well known that Faust is Goethe's intricately complex philosophical and symbolic work. In doing so, Goethe raises issues that concern him, his time, and his progressives. Erkin Vahidov's "Faust" is a completely new experience of Uzbek translation with its creative freedom and thoroughness. Erkin Vahidov admits that he used the poetic translations of AL Sokolovsky's prose (Petersburg 1902), N. Kholodovsky's and B. Pasternak's when he translated the first part of the tragedy. Boris Pasternak's translation is the main source. In Pasternak's translation, we admire the fact that he sometimes distanced himself from Goethe, and sometimes found his way directly to the original.

Finding an alternative word in a translation and using it in its place requires skill and taste from the translator. Consider the following verses from the poet's language in the Introduction to the Theater:

Goethe:

Oft, wenn es erst durch Jahre durchgedrungen,  
Erscheint es in vollendeter Gestalt.  
Was glänzt, ist für den Augenblick geboren,  
Das Echte bleibt der Nachwelt unverloren.

B.Pasternak:

Пусть мысл твоя, когда она зреет,  
Предстанет нам законченно чиста.  
Наружный блеск рассчитан на мгновенье,  
А правда переходит в поколенья

E.Vohidov:

Bas, o'ylar toshqinin tindirolmasak biz,  
Mukammal go'zallik shunda tug'ilar.  
Jilvaning umridir bir lahza faqat,-  
Avlodlarga qolur haqiqiy san'at.

Posho Ali Usmon:

Necha yillar o'tib topadi qaror,

Inson zakosi-la yaralgan san'at.

Joziba oniydir, chin san'at xolos

Avlodlar nazdida topadi ixlos.

Goethe "das Echte" said "real thing", he mean real art. Pasternak gives it an abstract concept of "правда", and E. Vakhidov specifies the meaning of "haqiqiy san'at" - it is completely consistent with the original. He also does not use the word "мысль" to mean "thought" or "opinion," but figuratively translates it as "flood of thoughts." The translation of The Introduction to the Theater also contains some inaccuracies.

Goethe:

Euch ist bekannt, was wir bedürfen,

Wir wollen stark Getränke schlürfen;

Nun braut mir unverzüglich dran!

Pasternak:

Я вам сказал, что нам во благо

Вы варите вашу брагу.

Без разговоров за котел!

E. Vohidov:

Bizga nima kerak sizlarga ayon.

Sizdan shinni qilish- bizlardan qozon.

Tezgina kirishing, fursat kutmaydi (20)

Posho Ali Usmon:

Ma'lumingizkim, orzuimiz ayni shu tob

Sipqomoq o'tkir, safoli bodai nob;

Paysalga solmay, ishga kirishing darhol! (18)

The word "stark getränk" is used in the passage to mean implicit. Pasternak translates to "braga" (boza, house beer); In E. Vakhidov it has become a shin. It is clear from the context that the term "spicy drink" refers to a work that captivates the audience. Although Braga is a little closer to the original, the shinni is not to be missed. But Posho Ali Usmon translation fills this gap: He replaces the word "stark Getrnke" with "sharp, pure bodai nob" which means much closer to the translation.

Raphael, Gabriel, Michael, and Mephistopheles, the angels of God, will take part in the scene. The mythical angels were not to praise the universe, but the god who "created" it. Goethe expresses his views on the universe through their anthem. In our opinion, when we say god, Goethe means nature. But the author can't say it openly, that is, there is a hidden meaning in the word. Because the circumstances in which he lived required figurative thinking. From the tongue

of the angel Raphael, the sun, which gives life to all living things, is praised. The next four lines of Raphael's monologue are as follows:

Ihr Anblick gibt den Engeln Stärke,  
 Wenn keiner Sie ergründen mag;  
 die unbegreiflich hohen Werke  
 Sind herrlich wie am ersten Tag.

Pasternak:

Дивятся ангелы господни,  
 Окинув взором весь предел.

Как вы перввый день таки сегодня  
 Безмерна слава божых дел (47)

E. Vohidov:

Hayrat nigohin tikmish malaklar,  
 Ajabkim kuch bermish belgisiz dunyo,  
 Yaralish onidan tob u dam qadar  
 Mangu musharrafdir sun'iy taolo!

Poshali Usmon:

Maloik ahliga qudrat-nigohi,  
 Hech kim bilmas qayda uning asrori;  
 Nechuk topmish esa azaldan qaror

Hozir ham o'shanday cheksiz purviqor.

The content of the original is as follows: "His (the Sun's) gaze empowers the angels, though none of them understands its essence; these great things are as glorious as ever (that is, the world is as it was before), "Goethe said. However, both Pasternak and E. Vahidov avoided the poet's opinion. In Posho Ali Usmon translation, the verses come to life as if they had read Goethe's thought.

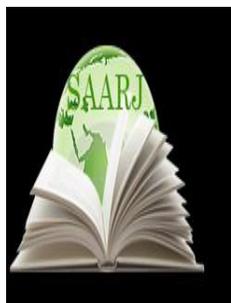

In the original, the glory of the vast universe is sung, while in B. Pasternak and E. Vakhidov the "glory" of God is sung. To say so would be to deny the atheism of the great philosopher. The author uses mythical images such as Raphael, Gabriel, Michael as conditional figurative images that describe reality, and God and Mephistopheles are also prototypes of such images.

In the linguistic literature, human names (pronouns) are defined as lexical units that distinguish the same objects from each other by implicit connotations, in contrast to cognate nouns, whose nominative function is at the forefront.

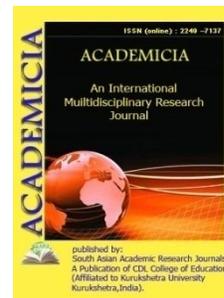

For this reason, famous nouns representing human names are studied in linguistics as onomastic realities, precedent nouns, pragmatic nouns, and implicit nouns. Famous horses of this type are traditionally translated by means of transcription and transliteration, rarely by kalkalash. As a result, it is observed that the connotative meaning of the implicit in the root of the famous horse does not reach the readers of the translated language, which leads to the inadequacy of the literary translation to the original.

## EXPLOSION OF SUBSTANCES AND MATERIALS

**Akramov Kxusniddin Muxitdinovich\***

### ABSTRACT

*This article discusses the explosiveness of technological equipment and materials, the terminology and the basics of grouping materials for explosiveness. Classification of dusts and explosive substances, firefighting of materials and their properties.*

**KEYWORDS:** *Fire And Explosion Hazard, Fireproof Materials, Flame Retardants, Dust-Air Mixtures, Degree Of Explosive Danger.*

### INTRODUCTION

Currently, the issues of explosion hazard of technological equipment and materials are given great attention not only from the fire safety authorities, but also from the government (regulatory documents) and educational literature. These questions are important for most sectors of the national economy. First of all, for organizations and the population it is necessary to clarify some of the concepts and definitions used for the fire and explosion hazard of substances and materials.

Fire and explosion hazard - the comparative probability of ignition and combustion of substances in equal conditions, which is determined by the following basic properties of the substance: - temperature of ignition, flash, self-ignition; - concentration limits of ignition; - minimum ignition energy; - tendency to fire; - dispersity and other properties.

All flammability materials are divided into three large groups:

1-Non-combustible materials under the influence of an ignition source do not ignite, do not smolder or char. These include granite, marble, brick, concrete, reinforced concrete, glass, steel, etc.

2-Non-combustible materials ignite, smolder and char in the presence of an ignition source, but after removing it they cannot burn independently. Such materials are some types of plastics (for example, fiberglass on phenolic resin), gypsum dry plaster, asphalt concrete, wood impregnated with fire retardants, etc.

3-Combustible refers to materials that can independently burn or smolder after the ignition source is removed from them. This group includes wood, linoleum, felt, roofing material, polystyrene and fiberboard, etc. (2)

To improve the properties against combustibility, materials are impregnated with fire retardants (Greek anti - against, pyr - fire) - substances that protect materials of organic origin from ignition and self-combustion. This is how materials are artificially transferred from the group of combustible to the group of difficult to burn.

Dust of some solid substances, which, when mixed with air, are also extremely explosive, constitute a great danger. It is known that any solid substance forms dust of different moisture content and particle sizes. Both of these qualities determine its ignition: the drier and smaller the size of the dust particles, the easier it is to ignite and explode.

Dust explosions are one of the main hazards in technological processes and production. They occur in confined spaces (in the premises of buildings, inside equipment, in adits of mines, transport channels, etc.). Dust explosions are possible in the flour milling industry, in grain elevators (flour dust), in the pharmaceutical industry, in the production of dyes, sulfur, sugar, powdery substances, in fuel crushing plants (coal dust), in the textile industry, etc.

According to foreign sources [4], out of 1120 explosions of dust-air mixtures in factories, 540 occurred during work with grain, flour, sugar and other food products, 80 - with metals, 63 - with coal dust at fuel crushing plants, 33 - with sulfur, 61 - in the chemical and oil refining industries.

Every day 23 people die from the fire, 12-13 of them are children of 4-5 years of age. Over the past 15 years in Uzbekistan, the number of eaters by 42%, and the economic damage has increased by 2.5 times.

According to the degree of explosive hazard, all dust is divided into four classes [4]:

I - the most explosive dusts with a lower flammable limit of up to 15 g / m<sup>3</sup> (dust of starch, wheat flour, sulfur, peat, etc.);

II - explosive dusts with a lower flammable limit from 16 to 65 g / m<sup>3</sup> (dust of aluminum, wood flour, coal, sugar, hay, oil shale, etc.);

III - flammable dusts with a lower flammability limit above 65 g / m<sup>3</sup> and an ignition temperature, respectively, up to 250 ° C;

IV - flammable dusts with a lower flammable limit above 65 g / m<sup>3</sup> and an ignition temperature of more than 250 ° C.

The upper concentration limits of dust explosiveness are quite large, and in practice, they can be achieved in production facilities only in the event of emergency situations or improper actions of the operating personnel.

In combustion and explosion processes, a special place is occupied by the minimum ignition energy of the mixture, which is defined under stationary conditions as the energy required for the flame to propagate in a self-sustaining mode. The minimum ignition energy determines the sensitivity of a substance to sources of initiation and characterizes the likelihood of ignition of a combustible mixture.

The standardized values of the minimum ignition energy characterize the level of stability of combustible substances and depend mainly on their chemical structure. Numerical values are given in the reference literature [3].

The fire hazard of solid combustible substances is also characterized by the specific heat of combustion, combustion temperature, burnout rate and propagation of the combustion front over the surface of materials.

When fuel is burned in fire-technical installations and combustion chambers, a torch is formed - a powerful source of thermal energy transmitted by radiation. This source of radiant energy can, under certain conditions, cause the ignition of combustible materials or flammable vapors and gases and contribute to the outbreak and development of a fire if fire safety measures are not followed. The flame temperature of a torch in fire-technical devices can reach high values in real conditions, K [4]:

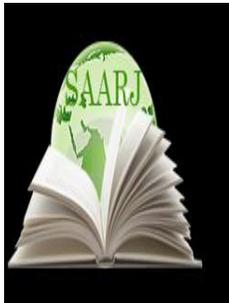

**TABLE THRESHOLD AMOUNT OF SUBSTANCES FOR SOME TECHNOLOGICAL PRODUCTION [4]**

№	Name of substances and groups of substances	Hazard category according to GOST 19433-88	Threshold amount of substances. T (not less)
Combustible gases, compressed, liquefied and dissolved under pressure			
	Acetylene C <sub>2</sub> H <sub>2</sub>	231	50
	Hydrogen H <sub>2</sub>	231	50
	Hydrogen sulphide H <sub>2</sub> S	241	50
	Ethylene oxide (CH <sub>2</sub> ) <sub>2</sub>	241	50
	Ammonia NH <sub>3</sub>	241	500
	All others compressed, liquefied and dissolved under pressure	231, 232, 241, 911	200
Flammable and flammable liquids			
	Propylene oxide C <sub>3</sub> H <sub>6</sub> O	311	50
	All other flammable and flammable liquids	311, 312, 321, 322, 324, 325, 335, 314, 315, 323, 331	200
Solids			
	Self-degradable substances	415, 416, 417, 418, 521, 522, 523	10

### ABSTRACT

*Language is a social phenomenon, and the teaching of the mother tongue in the classroom is given special attention by our state. This requires great skill from our educators. A variety of interactive methods can be used to instill native language lessons in the minds of pupils and students. In this way we can make the lesson more effective. It is our duty to our motherland to bring up the younger generation in their native language. This article describes the methods of effective teaching of the native language.*

**KEYWORDS:** *Methodology, Interactive, Language, Learn, Teach, Perfect, Teacher, Learner, Effectively, Instructor, Result, Lesson, Mother Tongue, Object, Realia, Different, Valuable, Instructions, Skills.*

---

### INTRODUCTION

The effectiveness of mother tongue lessons plays an important role in the development of our society. There is no doubt that the people who know their language perfectly will have a bright future. Today, a number of measures have been taken to develop the skills of our teachers. The tasks set for mother tongue lessons and the ways to implement them can give the expected results only if they are effectively inculcated in the minds of students. At present, scholars point to some of these methods as the best, as well as the use of interactive methods in teaching the native language, the problem of increasing the effectiveness of lessons, and the use of non-traditional methods in focusing, developing ingenuity and creativity. make recommendations on how to use it. Today it is recommended to follow a number of factors in order to teach at the level of modern requirements:

- thorough armament with didactics and educational theory;
- use of innovative technologies;

- keep abreast of news on their subject;
- to be able to apply non-traditional methods of teaching in practice
- updating the content of education in accordance with the knowledge, skills and abilities of students;
- introduction of multimedia in teaching;
- to be able to speak fluently, to persuade, to prove;

If a problem situation is created, identified and remedied in the organization of a non-traditional lesson, students will master the topic. There are many ways to create a problem situation in mother tongue classes. The following methods can be used to create a problem situation in mother tongue lessons:

- creating a problematic situation based on the analysis of linguistic evidence
- it is also possible to create a problematic situation based on the synthesis of language materials
- creating a problematic situation by contrasting and comparing language facts
- creating a problem situation using innovative technologies
- creating a problematic situation by requiring some changes to language materials
- It is also possible to create a problematic situation by comparing languages.

It is extremely important to take into account the level of complexity of the language material when creating a problem situation. Because the teacher chooses the method of creating a problem situation based on the level of complexity of the language material.

The use of innovative technologies is a tool to increase the effectiveness of the lesson. This education is a challenging method of teaching that encourages students to acquire knowledge independently. In accordance with this type of education, discussions with students, didactic games, special creative tasks are held. In accordance with the new pedagogical technologies, the student should not master the materials of the native language, but search for it and be creative.

The use of interactive methods in the lessons should be organized in such a way that all students in the class are active, that is, a certain part of the teaching materials is organized independently by students in the teaching process. The teacher is also the organizer, leader, supervisor of the educational process. Students should feel a little free in the classroom and the learning activities should satisfy them emotionally so that they can express their thoughts freely.

Syncway method. The meaning of the word syncvein is five, which means a five-line lion without rhyme. Students write a five-line lion without rhyming using the Syncline method. Accordingly, the first line should consist of one word and the word should belong to the category of nouns, the second line should consist of two words and this adjective should belong to the category of words, the third line should consist of three words and the verb should belong to the category of words, the fourth line should be full a proverb can be quoted and a word that is synonymous with the word in the first line can be placed in the fifth line. The teacher listens to the student's opinion and at the same time teaches the students to pay attention to each other's

words. Objections or additions are also respectable, in addition to your opinion, expressed in words as if we also had some opinions. In a lesson organized in this way, the student begins to think freely without any pressure and expresses his or her thoughts openly, respecting others as well. In primary education, the mother tongue should serve to develop students' logical thinking, vocabulary, oral and written speech (ie reading and writing), phonetics, vocabulary, word formation, and grammar. It is well known that even in the native language class, conducting vocabulary work, students become interested in the interpretation of words that are unfamiliar to them. In finding an explanation for these words, it is advisable for the reader to search less independently. In this case, the following method not only increases the vocabulary of students, but also teaches them to work with a dictionary.

The method of analysis and synthesis was introduced into the lessons through the work of teachers of Russian-style schools. Analytical analysis of the process of mother tongue teaching is applied in order to identify important features of the grammatical phenomenon, to reveal and strengthen new aspects of the organized grammatical concept. Phonetic, lexical, morphological and syntactic analysis is a practical manifestation of this method. Synthesis is the rounding of grammatical material organized into parts. For example, ot. The method of synthesis in the organization of word groups such as adjectives, verbs, numbers, etc. appears. Activation of students in the method of analysis-synthesis also depends on the questions and tasks given by the teacher to students, the forms of work organization. Because of these features of grammatical comprehension, comprehension is formed with great difficulty in students. To learn a grammatical concept, abstract thinking must be developed to a certain extent. Abstract thinking occurs in the learning process and requires special exercises. These exercises should be aimed at developing specific mental skills and a set of linguistic imagination and knowledge. Studies by many psychologists have shown that the process of forming a concept is also a process of learning to analyze, synthesize, compare, generalize, and define thinking. The outcome of concept formation in students depends on the extent to which their abstracting activity has increased

Methods of teaching the native language at different stages of education determine the knowledge, skills and abilities of students, determine the successes and failures of learning, look for the cause, find ways to overcome mistakes and shortcomings. Mother tongue methodology ensures consistency and continuity of mother tongue teaching at all stages of the education system. Preschool education is mainly concerned with developing your child's speech. In addition to developing students' speech in the primary school, it is also expected that they will master the theoretical concepts of the native language.

The main goal of the National Training Program is to radically reform the education system, to create a national system of training highly qualified personnel at the level of developed democracies, meeting the highest moral and ethical requirements. The state policy in the field of training envisages the formation of a comprehensively developed personality through a system of continuous education, which is inextricably linked with the intellectual and moral upbringing of a person. The methodology of teaching the mother tongue also works on the basis of the above objectives in the development of forms and methods of organizing the educational process.

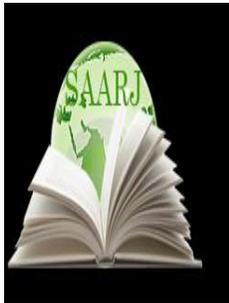

The peculiarity of the above methods is that they are implemented only through the joint work of teachers and students. This process of pedagogical cooperation has its own characteristics.

Organizing lessons based on the use of innovative technologies has a positive effect, because the content of education changes only when the teacher is innovative.

The use of interactive methods and scientific games in the lessons of the native language and literature to increase the effectiveness of teaching, as well as expand the range of independent thinking, creative research and logical thinking, increases their interest in science.

### INTRODUCTION

As we know, from the first years of independence in our country, the land issue has risen to the level of state policy. Because the land is the greatest wealth of the people, the state, the source of our livelihood, the continuity of our descendants, the backbone of our country. At the same time, one of the most important factors in strengthening the independence of the republic, increasing its economic potential, bringing it into the ranks of strong developed countries is the efficient use of available land resources, maintaining, increasing and restoring soil fertility.

In order to use irrigated lands efficiently, it is necessary to develop and introduce into production agro-techniques for resowing a large number of grain, fodder, oilseeds and other crops.

Planting legumes as a secondary crop is important because these plants solve the problems of grain, protein and oil. In addition, the high annual temperatures in the country, the use of accelerated soil cultivation during cultivation of crops, as well as the cultivation of crops under irrigation conditions leads to the rapid depletion of the natural reserves of humus accumulated in the soil. As a result, the biological properties of the soil deteriorate, the microorganisms that cause bacterial and fungal diseases increase in the soil, and the yield of crops decreases. The role of alfalfa in maintaining and improving soil fertility, in obtaining high yields from crops, in effective crop rotation is endless. However, the area under alfalfa has declined sharply in recent years.

Therefore, the introduction of intermediate, secondary grain, leguminous crops into crop rotation systems serves to maintain and increase soil fertility.

In addition, the widespread introduction of intensive technologies (winter wheat sowing after repeated sowing) is a guarantee of high-quality grain production on irrigated lands. Growing grain on the basis of this technology requires the simultaneous growth and development of the plant to provide all the factors. The effective use of irrigated land throughout the year allows not only to increase productivity, but also to increase soil fertility, improve the dangerous conditions associated with this. However, agro-technical measures in the agriculture of the republic, in particular, the nutritional standards of cereals, are not determined depending on the amount of residual roots left by secondary crops in the soil. Therefore, we conducted field experiments to study the productivity of secondary crops (corn, mash, beans and soybeans) in the conditions of meadow soils of the Fergana region and the effectiveness of the application of fertilizer norms in winter wheat planted after them.

The content of the issue. Field experiments were conducted at the Fergana branch of the Uzbek Cotton Research Institute. In the field experiment with repeated sowing, there are 5 options, each option with a total area of 720 sq. m and the estimated area of 360 sq. m, in the field experiment with winter wheat, 15 options were planted, the area of each plot is 240 sq. m, the calculation area is 120 sq. m. Experimental options were performed in 4 repetitions in 1 tier.

The soil-climatic conditions of the country create favorable conditions for obtaining grain and nutritious food for livestock twice a year from irrigated lands, sowing of secondary crops after winter wheat creates favorable conditions for improving soil fertility. [3,18 p]

In our study, we determined the nutrient units and the content of the digested protein in the grain, green mass (corn) and hay (mash, soybeans) repeated crops. It was revealed that in three years in corn grain there is (38,2 c/ha) 5042,2 kg/ha, in corn stem – (307,3 c/ha) 4837,3 kg/ha, a total of 9879,5 kg/ha of the nutrient unit, and 297,5 kg/ha and 338,9 kg/ha of protein, respectively, and a total of 636,4 kg/ha of protein.

It was revealed that in mash grain there is (15,2c/ha) 1991.1 kg/ha, in mash hay – (32.2 c/ha) 1032.3 kg/ha, a total of 3023.4 kg/ha of the nutrient unit, and it was also determined 443.8 kg/ha and 89.8 kg/ha of protein, respectively, and a total of 533.6 kg/ha of protein.

**Nutrient units and the content of digestible protein in grain (kg/ha), stems and hay of secondary crops**

Option	Secondary crops	Grain yield, centner/ha	Hay yield c / ha	Feed unit per 1 ha		Total	Amount of digestible protein, kg		Total
				In grain	In stem and hay		In grain	In stem and hay	
1	Control	-	-	-	-	-	-	-	-
2	Corn	38,2	307,3	5042,2	4837,3	9879,5	297,5	338,9	636,4
3	Mash	15,2	32,2	991,1	1032,3	3023,4	443,8	89,8	533,6
4	Beans	12,3	12,3	1611,2	393,4	2004,6	357,9	39,3	397,2
5	Soybean	23,5	33,5	3078,4	1071,6	4150,0	687,2	93,5	780,7

It should be noted that during the growing season the corn plant absorbs 200-250 kg/ha of nitrogen from the soil, so its nutrient content and digestible protein content in grains and stems were found to be 6856.1 kg/ha and 102.8 kg/ha higher, respectively, than that of mash. This means that corn is a nutritious food for cattle.

The nutritional unit content in bean grain was 1611.2 kg / ha, and in hay (393.4 kg / ha), and the amount of digestible protein was 357.9 kg / ha and 39.3 kg / ha, respectively.

It should be noted that among the secondary crops, beans were characterized by low yields and low nutrient content, protein content.

It was revealed that in soybean grain there is (23.3 c/ha) 3078.4 kg/ha, in hay (33.5 c/ha) 1071.6 kg/ha, a total of 4150.0 kg/ha of nutrient units and, respectively, 687, 2 kg/ha and 93.5 kg/ha - a total of 780.7 kg/ha of digestible protein.

This means that for livestock, soybeans rank 2nd after corn in terms of nutritional value, but it is not possible to draw a complete conclusion without studying the stubble and roots residues that left in the soil.

It is known that any agricultural crop removes a significant amount of nutrients from the soil during the growing season. Once the plants have been harvested, a certain amount of nutrients remain in their root and stubble residues. In addition, the remnants of secondary crops quickly decompose and become inorganic matter. [2.20]

In our study, when we studied the amount of stubble and root residues in the soil of secondary crops planted for 3 years, after corn, an average of 17.2 c/ha of stubble residues and 35.0 c/ha of the root residues (a total of 52.2 c/ha) were found in a layer of 0-50 cm of soil.

It was found that mash plant can leave an average of 11.8 c/ha of stubble residues in 3 years and 29.8 c/ha and 3.9 c/ha of root (total 45.5 c/ha) residues, respectively, in layers of 0-30 and 30-50 cm of soil.

A relatively smaller number of indicators were obtained for bean residues - 8.9; 21.5 (0-30 cm) and 2.5 kg / ha (30-50 cm), a total of 32.9 kg / ha.

From soybean, an average of 10.4 c/ha of stubble, 32.0 c/ha of roots and a total of 42.4 c/ha of residues were observed per hectare.

When the amount of nutrients accumulated in the mass of these residues was studied, 20.8 kg of nitrogen, 9.5 kg of phosphorus and 12.8 kg of potassium were left after one hectare of corn. However, the corn plant absorbs 200-220 kg / ha of nitrogen. It is therefore necessary to pay attention to the norms of fertilization of the plant to be planted later. But it has been written before that corn is a great food crop for livestock.

It was found that the root and stubble residues of the mash plant accumulated an average of 71.0 kg/ha of nitrogen, 51.0 kg/ha of phosphorus and 60.9 kg/ha of potassium in an average of 3 years. This creates good nutritional conditions for the winter wheat that is then planted.[4,20 p]

So, among the secondary crops, the one that leaves the most nutrients is the mash plant. It was followed by soybeans, beans and finally corn.

In addition, there are reports in the literature that legumes accumulate biological nitrogen in the soil under the influence of nodule bacteria.

It was found that the root and stubble residues of beans and soybeans leave 30.7 kg of nitrogen, 11.8 kg of phosphorus, 21.0 kg of potassium and 45.7 kg of nitrogen, 16.7 kg of phosphorus, 30.5 kg per hectare of land potassium, respectively.

When we determine the nutrient content in the stubble and root residues left over from winter wheat sown after repeated sowing, it was found that more stubble and root residues were 15.5 and 19.3 kg/ha, respectively, compared to the control variant, when fertilizers N -200, P-140, K-100 kg/ha were used in moderate amounts, and the amount of NPK in them, respectively, 1570; 0.930 and 2.130%.

The root and stubble residues of winter wheat sown after corn were 35.3 c/ha. 1.715% of total nitrogen, 1.080% of phosphorus and 2.180% of potassium were found in them.

High results in this regard were obtained from winter wheat sown after mash. In the variant where fertilizers N-150, P-105, K-75 kg/ha were applied normally, the root and stubble residue was 39.8 c/ha. They were found to contain 2,000% total nitrogen, 1,200% phosphorus and 2,280% potassium.[6, 10p]

These values were 5.0 c/ha, 0.430%, 0.720% and 0.90%, respectively, compared with the control and 4.5 c/ha 0.285%, 0.130% and 0.100%, respectively, in wheat after corn.

In winter wheat grown after re-sowing mash, the fertilizer rate of N-150, P-105, K-75 kg/ha was acceptable, and a relatively large number of root and stubbles residues were collected, which contained the more common NPK forms.

One of the main factors in maintaining and increasing soil fertility is the rotation of these crops. In addition, the application of optimal standards of organic and mineral fertilizers is also important in this regard. Therefore, the main goal of our research is to determine the effect of mineral fertilizer application rates on soil fertility on repeated plantings and winter wheat.

If the humus content in the (plowed) soil layer of 0–30 cm was 1.940% before the start of the experiment and 1.670% by 30–50 cm, then in the control variant (wheat planted after wheat) at the end of the experiment (after 3 years), the humus content was 1770 ; 1780 and 1760%, respectively (N-150, P<sub>2</sub>O<sub>5</sub>-105, K<sub>2</sub>O-75 kg/ha; N-200, P<sub>2</sub>O<sub>5</sub>-140, K<sub>2</sub>O-100 kg/ha and N-250, P<sub>2</sub>O<sub>5</sub>-175, K<sub>2</sub>O-125 kg/ha ). Relatively high values (1,780 %) were observed with the use of N-200, P<sub>2</sub>O<sub>5</sub>-40, K<sub>2</sub>O-100 kg/ha. This is 0.160% less than the initial state. This means that if wheat is planted after wheat, the amount of humus in the soil is found to decrease from year to year. Even in the underlying plowing layer, a slight decrease in the humus content was observed, which is mainly associated with the mineralization of humus and the assimilation of plants.

In the variant in which winter wheat was planted for three years after corn, a decrease in the amount of humus from the initial state was observed, regardless of fertilizer norms. These fertilizer norms were observed when N-250, P<sub>2</sub>O<sub>5</sub>-175, K<sub>2</sub>O-125 kg/ha were applied, but this was also 0.110% less than the initial condition and 0.05% higher than the control.

In the experiments, relatively high values of humus content were observed when winter wheat was planted after mosh plant and fertilizers N-150, P<sub>2</sub>O<sub>5</sub>-105, K<sub>2</sub>O-75 kg/ha were applied. This is 0.050% higher than the initial state and 0.210% higher than the control; 0.160% higher than the corn variant.

As a result of planting winter wheat after soybean, the amount of humus was found to be higher than in the control, corn and bean planted options, but lower than in the mash planted options.

In the variant planted after soybean, the humus content was 0.009% higher than in the initial case (0-30cm), 0.169% higher than in the control, 0.119% higher than in the corn variant, and 0.026% higher than in the bean variant..

Changes in total nitrogen and phosphorus were also found to replicate humus data on variants.

This means that when moss is planted as a secondary crop and then winter wheat is sown, when fertilizers were applied in quantities of N-150,P<sub>2</sub>O<sub>5</sub>-105,K<sub>2</sub>O-75 kg/ha, it was found that soil fertility improved compared to the initial state, this situation was also observed after soybean planting, when wheat was sown after corn (wheat), and a relative decrease in soil fertility was found.

Secondary crops also had a positive effect on the mobile nutrients in the soil. Studies have shown that the amount of nitrate nitrogen in the soil at the end of the growing season of winter wheat in 2013 (June) was 17.0 mg/kg in the initial state of nitrate nitrogen in the plowed layer (0-30 cm), whereas in the control version at the end the period of application of winter wheat, N-150, P<sub>2</sub>O<sub>5</sub>-105, K<sub>2</sub>O-75 kg/ha and N-200, P<sub>2</sub>O<sub>5</sub>-140, K<sub>2</sub>O-100 kg/ha and N-250, P<sub>2</sub>O<sub>5</sub>-175, K<sub>2</sub>O-125 kg/ha were 17,8; 18,0 and 19.2 mg/ha, respectively, when used in moderation. In 2014 and 2015, these

figures were 18.2; 19.5; 19.8 and 19.0, 20, 21.2 mg/kg, respectively. Thus, it was found that the amount of nitrate nitrogen increased slightly, even with increasing fertilizer standards, even when winter wheat was sown again after winter wheat, instead of re-sowing crops. In these options (1-3), relatively high amounts of nitrates in the norm of N-250, P<sub>2</sub>O<sub>5</sub>-175, K<sub>2</sub>O-125 kg/ha used in option (2015) are 21.2 mg/kg, it was noted that assimilation for plant development increased by almost 4.2 mg / kg from the initial state.

In the case of winter wheat planted after corn (4-6), optimal conditions were created when N-250, P<sub>2</sub>O<sub>5</sub>-175, K<sub>2</sub>O-125 kg/ha were used in moderation, and the nitrate content according to the years of research was 18.1, 19.0 and 21.8 mg/kg, respectively. This last (2015) figure was only 0.6 mg/kg higher than the control.

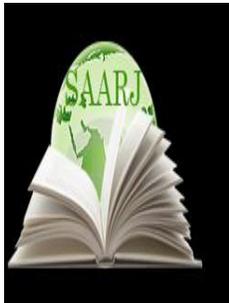

From the above data, we can conclude that if winter wheat is planted again after winter wheat, the nutritional conditions will be created as if it was planted after corn. In both cases, high amounts of nitrate nitrogen were detected when applied N-250, P<sub>2</sub>O<sub>5</sub>-175, K<sub>2</sub>O-125 kg/ha. However, it should be noted that in the control, the norms of fertilizers N-200, P<sub>2</sub>O<sub>5</sub>-140, K<sub>2</sub>O-100 kg/ha had an optimal effect. In all other variants, relatively large amounts of nitrate nitrogen were observed when high fertilizer standards were applied.

When we analyzed humus, a key indicator of soil fertility, it was concluded that the most favorable conditions were observed in winter wheat planted after the mash plant. However, a relatively high amount of nitrate nitrogen was observed at the end of the growing season of winter wheat planted after soybean production and in 2015 it was 25.5 mg/kg. In winter wheat planted after mash, the figure was 24.5 mg / kg. We express this situation by the fact that the plants assimilate more nitrate nitrogen in this (9 var.) variant.

To maintain and increase soil fertility, it is advisable to plant mash or soybean as a secondary crop in meadow loam soils, and then to plant winter wheat using optimal fertilizer standards.

### ABSTRACT

*This article provides information about the importance of aesthetic education and aesthetic education of students in the teaching of science in the process of technology lessons. The most important element of the content of aesthetic education is the development of students' artistic imagination. These perceptions should cover a wide range of aesthetic phenomena. Therefore, in addition to aesthetics, one of the most important tasks of labor is to teach not only the skills of good execution of the subject, but also the sense of form, combination of colors, composition, symmetry.*

**KEYWORDS:** *Aesthetic Education, Formation Of Internal Aesthetic Culture, Pedagogical Tasks, Pedagogical Practice, Basic Conditions Of Aesthetic Education, Purpose Of Aesthetic Education, Pedagogical System, Tasks Of Aesthetic Education, Content Of Aesthetic Education.*

### INTRODUCTION

The concept of “aesthetic education” is the most common in the theory of aesthetic education. It includes a number of concepts related to it. Among them should be noted: aesthetic development, aesthetic taste, aesthetic ideal, aesthetic feeling. Aesthetic development is the process of purposefully forming in a child the vital forces that ensure the formation of aesthetic perception, creative imagination, emotional experience activities, as well as spiritual needs.

In this regard, the aesthetic preparation of the younger generation should be the most important area of its introduction into the universal values that form the basis of the cultural environment and therefore one of the most important forms of its socialization as a person. Their interaction in the process of aesthetics, cognition, forms the culture of aesthetic attitude, the aesthetic

worldview. The formation of aesthetic relationships is based on aesthetic activity, which is an active means and condition of aesthetic education of students in the field of technology education. In this activity, aesthetic consciousness, aesthetic attitude to the object, the means of labor, the result of labor, and interpersonal relationships in labor are formed.

The formation of this system of values among young people is inextricably linked with the understanding that their artistic form, artistic quality and appearance of the product depends not only on the natural features of the object of labor, but also on the social conditions of its composition: socio-economic conditions, the state of the nation and moral society, its customs, the level of development of material production, scientific knowledge and professional skills, aesthetic culture and the value orientations of its participants, and other factors. The most powerful factor in their aesthetic upbringing is this systematic-active approach. In addition to the development of aesthetic theory, natural and social world, folk arts, design, decorative-applied arts, works of art, architecture by students, students should be directly involved in the creative process of creating beauty.

Achievements of functional and decorative beauty, such as logical scientific, aesthetic, technological depth of thought, subtlety of emotions, based on the technological and aesthetic monism of the product created by students in the process of independent aesthetic activity develops the ability to do. They play the most important role in the structure of aesthetically knowledgeable and educated human activity. The products created in the process of this activity serve not only as an object of perception, but also as a driving force to achieve an aesthetic ideal, stimulating creative activity. Study of the problem of multifunctionality of art - professional, folk, fine, decorative practice, design (E.A.Antonovich, Yu.B. Borev, R. V.Zakharchuk-Chugaev, G.Zeleper, T.V.Kozlova, M. N.Nekrasova, V. I. Panchenko, M.Yu. Rusin, M. E. Stankevich, etc.) allow to emphasize the basic principles of activation of independent aesthetic creativity of students in the process of its aesthetic education:

- value-oriented active;
- Cognitive-heuristic;
- Retrospective;
- Aesthetic-conceptual;
- Communicative;
- Information;
- Moral cataracts;
- Compensation;
- Aesthetics;
- Hedonistic;
- Creative;
- Art - design;
- Technological;

- Economic;
- Professional guidance;
- Professional development.

The process of activating creative activity in accordance with the laws of beauty is carried out on the basis of a synthesis of the listed principles. This allows students to form a holistic scientific and aesthetic worldview, to master the scientific theory and practice of creative transformational activity based on the aesthetic approach to the technological application of the laws of nature in achieving the aesthetic ideal, as well as their adaptation to the future profession.

The aesthetic upbringing of a person can be assessed by his attitude to labor. Anyone with a proper aesthetic upbringing will not allow labor productivity to increase, which is detrimental to product quality. In each lesson, the learning process should be structured in a way that reinforces students' love of work. A necessary component of a properly structured technology lesson is didactic tools. They include all the topics and activities that teachers and students use to make learning tasks more effective.

The main condition of aesthetic education in the field of "technology" education is: practical activity, the organization of which suggests the formation of school students' ideas and concepts of beauty in labor, its results, the relationship between the participants of labor; fostering aesthetic feelings, emotional response; the existence of collective creative activity. For the purpose of aesthetic education in the process of teaching students in the field of "Technology" it is necessary to:

- 1) to acquaint students with advanced technologies, modern technological processes and advanced production;
- 2) Involve as many students as possible in the workforce. It helps to broaden students' worldviews and develop their creative abilities;
- 3) The activity of student labor collectives is to help teachers in the formation of public opinion of students, to participate in solving problems of labor education and vocational guidance. Forms of labor unions should be chosen depending on local conditions and opportunities. Physical labor, along with cultural leisure, helps to cultivate high moral qualities, healthy needs;
- 4) combining socially useful labor with technical creativity and experimental work, nature protection, study of the native land, labor traditions. In active work the consciousness of the specific value of its results is formed, the beauty of the changing activity is realized.

The student must discover literally: everything a person does has a unique shape, composition, color, line, and therefore everything he or she does is beautiful and ugly, beautiful or ugly. can be. Any item and craft has not only a consumer, but also a spiritual, aesthetic value for a person. When formalizing the result of labor, a person should think not only about the convenience of what is given, but also about its appearance. Everything - from a sophisticated bench, an airplane and a rocket, to a toothbrush - can attract or point to itself, arousing or denying the desire to have it, causing hatred and resentment. Therefore, in addition to aesthetics, one of the most important tasks of labor is to teach not only the skills of good execution of the subject, but also the sense of form, combination of colors, composition, symmetry. The law of the unity of labor and beauty is that these are not two artificially combined processes, but two sides that are inextricably linked.

Man strives to make something more robust, compact, and economical, making it more aesthetic. At the same time, thinking about doing something according to the "laws of beauty", striving to make it more aesthetically pleasing, makes a person give up everything superfluous, looking for more perfect shapes, making it easier to use. That is, a technology teacher, master, coach, organizer of children's labor activity is responsible not only for teaching the skill, but also for developing his creative, aesthetic sense, the child's understanding of harmony, creative labor and aesthetic creation processes. The labor process itself can sometimes be difficult and requires great willpower.

It is very important that students themselves participate in the evaluation of products, various labor issues. The very fact of self-esteem and criticism not only develops an individual's independence, but also teaches us to see the end product of labor more and more deeply from an aesthetic point of view.

The field of study "Technology" includes important pedagogical aspects of aesthetic, economic, environmental education and upbringing of students. It is very important to implement the aesthetic direction of the educational process in the class of food processing technology, the main task of which is the formation and development of creative, aesthetic tendencies, general scientific, technological, design knowledge and skills, modeling and design work is inextricably linked with their abilities. The manifestation of such a tendency is the spirituality of the student's attitude to the performance of tasks on the topic in conjunction with the most important truths of his inner world (moral guidelines, aesthetic taste, searching ability - creative, emotional states, etc.). is to develop a principle. This course has a great educational and pedagogical aspect.

Aesthetic education in technology classes is based on the development of students' interest and creative abilities. All learning products are selected taking into account a number of psychological characteristics listeners, because only in this case there is interest and motivation for further learning and cognitive activities. All labor subjects are chosen in such a way that they have the maximum knowledge in terms of polytechnic education, are aesthetically appealing and have an idea of the traditional artistic forms of material processing. In addition, the selected work objects open up a wide range of opportunities for the development of creativity, which can be more fully implemented in the project activities and finally performed in the school workshop. The end result of the "Artistic Processing of Materials" program is that children can master a variety of artistic methods of processing materials, independently create beautiful, necessary things that will bring satisfaction from the results of their work. In the process of mastering the relevant technologies by students, aesthetic education is carried out more successfully using the capabilities of modern computer support for the description of the presented material, as well as for the preparation of working sketches. Aesthetic education affects the development of artistic taste, spatial imagination, abstract thinking, eye, clarity. In the process of creative work, aesthetic education allows to develop the personality, to form a creative attitude to work and to solve the problem of career choice. In its most general form, aesthetic education is a purposeful process of forming a creatively active personality of a child who is able to perceive and appreciate the beautiful, tragic, funny, ugly in life and art, living and creating "according to the laws of beauty" can be defined as.

Tasks of aesthetic education:

1. The formation of aesthetic consciousness, which includes a set of knowledge about the basics of aesthetics, the world and everyday culture, the ability to understand and distinguish art, folk art, nature, true beauty that can distinguish man from the surrogate takes
2. Formation of aesthetic feelings, tastes; pedagogically correct resistance to the disorienting influence of pseudo-culture; development of motives (needs, interests) and skills for artistic and creative activity.
3. Formation of methods of artistic and creative activity; support for gifted children: development of experience (skills and abilities) in the organization of the environment, work, teaching, taking into account aesthetic norms and needs.

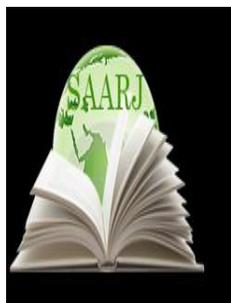

An equally important aspect of the content of aesthetic education is that it focuses on the personal development of students. First of all, it is necessary to form the aesthetic needs of students in the field of art, in understanding the artistic values of society. The most important element of the content of aesthetic education is the development of students' artistic imagination. These perceptions should cover a wide range of aesthetic phenomena. In particular, students need to be taught to perceive beauty in a variety of art forms, in nature, in the life around them, and in the behavior of people. An important component of aesthetic education is the ability to acquire knowledge related to the understanding of art and to express their judgments (views) on issues of artistic reflection of reality. It is associated with the formation of students' perceptions and understanding of the specifics of reflecting this reality in different types and genres of art, the development of the ability to analyze the content and ethical-aesthetic direction of art. In the context of aesthetic education, the formation of students' perception of beauty and artistic taste associated with the experience plays an important role. Students need to be taught to feel the beauty and harmony of a true work of art, to show artistic sophistication, as well as to strive to enhance a culture of behavior. Introducing students to artistic creation, developing their inclination and ability to music, fine arts and literature is an important component of aesthetic education. LN Tolstoy was convinced that every child's needs for artistic creation are different, that they should be developed and used for education.

Thus, the most successful goal of aesthetic education is to form a harmoniously developed person, who is well-developed, knowledgeable, highly moral, capable of reasoning and empathy, who understands the beauty of life and the beauty of art, who sees life around him through the eyes of another person. formation of scanning ability. This goal also reflects the specific features of aesthetic education as part of the whole pedagogical process.

### ABSTRACT

*Proper determination of the norm of fertilization, the normal course of growth and development of the plant, in turn, affects the size of the grain, weight gain. The grains of Grace variety are longer, the weight and yield of grain in one grain is high. If these varieties are given 25-30 tons of organic fertilizers and mineral fertilizers per hectare N200. P120. K.90kg, 100 c. The possibility of obtaining more grain was determined based on experimental results.*

**KEYWORDS:** *Quality, Grain, Yield, Organic Fertilizer, Mineral Fertilizer, Accumulation, Piping, Irrigation, Suspension, Microelement,*

### INTRODUCTION

The provision of food to the world's population has now become an economic, social and political problem. This calls for more efficient to use of arable land. Therefore, the President of the Republic of Uzbekistan Sh. Mirziyoyev noted that in the strategy of actions on five priority areas of development of the country in 2017-2021, one of the most important tasks in agriculture is the optimization of arable land and crop order, the introduction of advanced agro-technologies and increasing productivity.

Therefore, the principles of irrigation and effective use of mineral fertilizers to increase the productivity of saline soils, the norms of feeding it with optimal organic and mineral fertilizers, as well as the introduction of basic production methods on farms are becoming the most urgent task. In the Republic of Karakalpakstan and Khorezm region, the role of organic and mineral fertilizers in increasing soil fertility and growing high-quality grain from winter wheat is invaluable. Adequate supply of phosphorus to winter wheat ensures good nitrogen uptake, accelerates the development of the root system and the formation of generative organs, and increases the plant's resistance to winter and drought.

## **MATERIALS AND METHODS**

In order to find a solution to these problems, we conducted field experiments in 2017-2020 in the experimental field of the Nukus branch of Tashkent State Agrarian University to determine the effect of differential fertilization standards on the growth and development of different varieties of winter wheat. In the 4th iteration, the variants are systematically placed in one tier. The total area of each plot is 480 m<sup>2</sup>, of which 240 m<sup>2</sup> is taken into account. Mineral fertilizers were applied as follows: Annual application of phosphorus fertilizers was carried out at the same time as sowing of 20% of fertilizers under 80% plowing. Annual application of potassium fertilizers was divided into four times during the development period of the plant (accumulation. In the experimental field from mineral fertilizers ammonium, nitrate (N-34.6percentage) urea 46%. Nitrocalcium phosphate (NKF-A grade) (N-6percentage P<sub>2</sub>O<sub>5</sub>-16percentage Cao-14percentage) and potassium chloride (K<sub>2</sub>O-58-60percentage) applied.

## **Results and their analysis**

In the laboratory, seeds with a germination rate of more than 95% were prepared for sowing and 500 seeds per 1m<sup>2</sup> were planted at a depth of 5-6 cm. Immediate irrigation was carried out, taking into account the water shortage, 50-60 meters of the field was irrigated with juice. No matter how big or long the field is, it keeps the whole part of the field moist and allows you to get full seedlings. On the contrary, if the fields are not plowed, the soil at the beginning of the field will dry out and water will flow at the end of the field. Uneven removal of seedlings in the field has a negative impact on productivity. If the seedlings do not germinate completely in 7-8 days after the first watering, immediately repeat watering. Thorough study of soil reclamation, soil and climatic conditions of the northern regions of the country, increasing soil fertility in the cultivation of winter wheat on irrigated lands, the introduction of crop rotation, the development of new water-saving agro-technical measures

Demand the results of the experiment show that the germination of winter wheat is higher in Thunder and Grace varieties, and the effect of organic and mineral fertilizers is 3-5% higher in the variants given in the above norm. In order to get a high yield from winter wheat, it is necessary to keep the soil moisture at 70-75% during the accumulation period. To apply 30-40 kg of nitrate during the accumulation in autumn. To set the fertilization rate correctly at 30-50 kg / ha during the weeding period kg / ha of urea. If 25-30 kg / ha of urea is given at the beginning of the grain formation period, the desired yield can be obtained.

When observing the varieties in the accumulation phases of plants by variety, the number of tufts in the Grace variety affects the phase of accumulation of organic and mineral fertilizers. 1-2 cubes determine the number of tufts. Backward grain fields lagging behind in development are identified and these areas are treated separately. Another of the most important agro-technical

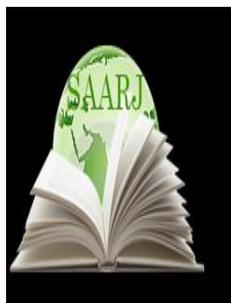

measures is the accumulation of an average of 30 tons of local fertilizer per 1 hectare. In order to turn the local fertilizer into juice in each area, it is necessary to dig ditches and bury the local fertilizers in the trenches to a thickness of 5-10 cm. It is also good to apply at least 20 tons of local fertilizer per hectare to the sparsely populated areas that have entered the rest of the winter without accumulation. In Karakalpakstan and Khorezm regions, where the winter was observed, this variety was found to be suitable for our conditions. From March 15 to May 15, stem length and growth of plants were higher in Thunder and Grace varieties. Stem length was 10-12 cm. Observations show that Tanya variety ripens faster than Thunder and Grace varieties, the differences between them were 3-4 days. Observations on the length of a grain of wheat showed that the grain of the Grace variety was longer, and the weight and yield of a single grain were higher. According to the results of experiments, it is possible to get 90-100 tons of grain per hectare if the agro-technical measures are carried out in time.

### CONCLUSIONS AND RECOMMENDATIONS

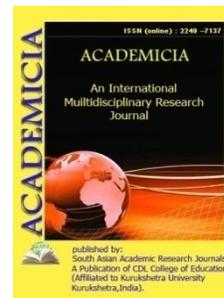

- I. The local fertilizer is applied to the soil, the more carbon is released, which accelerates the process of air nutrition of the plant and increases its resistance to drought. In addition to - 0.6%) and potassium (0.5-3.0%), as well as trace elements (chalk, manganese, cobalt, copper, zinc, etc.), as well as carbon, valuable fertilizer at the expense of 7-10 ts. premium,
- II. When observing the plants in the accumulation phases by varieties, it was found that the number of tufts in the Gratzia variety affects the accumulation phase of organic and mineral fertilizers, and the number of tufts exceeds 1-2. In winter, observers observed a tendency of this variety to saline soils in Karakalpakstan and Khorezm regions.
- III. It is recommended to apply 30-40 tons of pure manure per hectare, on average 200 kg of nitrogen, 120 kg of phosphorus, and 90 kg of potassium fertilizers on time. 7-8 kg of grain is obtained at the rate of 1 kg of NPK. The growth period of wheat is prolonged. The quality of grain decreases. Large amounts of sugar and starch accumulate in the leaves of the plant. The physiological processes in the leaves are very slow. Diseases increase and the plant weakens. Spots appear on the leaves and then wrinkle.

## DETERMINATION OF ECONOMIC AND SOCIAL EFFICIENCY OF MULTI-FLOOR HOUSING AND UTILITY SERVICES

**Kiyomov Yusuf Tokhtasinugli\***

\*Assistant,  
 Karshi Institute of Engineering Economics,  
 UZBEKISTAN

### ABSTRACT

*The article discusses the issues of determining the socio-economic efficiency of public services. As well as it provides the information about the quality of services. Economic efficiency gives a positive result only when it is calculated at the level of the network, enterprise, industry and division at each level of services. Therefore, it is analyzed comparatively at each stage. In addition to the initial economic criteria, special criteria are also used in practice, for example, the minimum level of consumption of means of production and resources is set to achieve the maximum increase in the volume of services.*

**KEYWORDS:** *Utilities, Rational Use Of Resources, Cost, Income, Profitability, Efficiency.*

### INTRODUCTION

The cost-effectiveness of multi-storey housing and communal services means the achievement of quality services through the rational use of each type of resource, saving at the level of a set of live and packaged labor spent on the implementation of the service unit. All these are aspects that improve the social situation of the population / 1, 2 /.

Economic efficiency is determined not only by the ratio of costs to the results of production and services, but also by the quality of the product or service and the level of demand.

The primary criterion of economic efficiency of economic services is the reduction of living and packaged labor, while maximizing the national income. In addition to the initial economic criteria, special criteria are also used in practice, for example, the minimum level of consumption of means of production and resources is set to achieve the maximum increase in the volume of services. At the same time protect the environment, improve product quality and so on. As a

result, all private criteria should allow for the growth of national income, which is the main criterion, and increase the economic efficiency of services and production / 3-5 /.

As in any other field, the main criterion of economic efficiency is the implementation of as many services as possible, using less material and labor resources, using less lively and packaged labor.

The final efficiency is the gross income after deducting the material and labor costs incurred here.

Economic efficiency gives a positive result only when it is calculated at the level of the network, enterprise, industry and division at each level of services. Therefore, it is analyzed comparatively at each stage. When calculating the economic efficiency of the service sector, it is necessary to take into account its specific industry characteristics, the geographical location of the region, the availability of material and labor resources.

Nature and value indicators are used to determine the economic efficiency of the industry.

In-kind indicators include the volume of drinking water and heat in kind, natural indicators for sewerage, cubic meters of gas, kilowatt-hours of electricity, and person-days of service. No matter how important the cost of resources and services is, it is important to know the cost of services, ie the same services or productivity can be achieved at different levels of cost. In addition, the quality indicators of homogeneous yields may be different. Therefore, services are converted into value to be able to compare with each other. Expenses incurred and results obtained are valued in sums.

It is an important indicator of economic efficiency, which is understood as the gross product relative to the live and packaged labor expended on it.

The higher the quality of the gross product and the more parts sold, the higher the cost-effectiveness of the services.

Since gross product is a generalized indicator, economic efficiency is also calculated by the ratio of gross income and the cost of creating it.

The efficiency of services can also be determined by the ratio of expenses incurred to net income or profit.

The cost-effectiveness of services is also calculated by the gross product, gross income, net income, and profit per capita of the average industry worker.

In determining the cost-effectiveness of multi-story housing and communal services, it is important to determine the efficiency of the use of fixed assets. Its indicators are the level of vehicle supply and engine armament.

The efficient use of capital investments plays an important role in increasing the economic efficiency of sectorial services and is determined by indicators such as gross output, gross income, and profit, calculated for each sum of capital investment.

Profitability is an important economic category that reflects the level of profitability and profitability of the enterprise, for any enterprise operating on any economic account. Profitability is one of the most important indicators of economic efficiency of agricultural

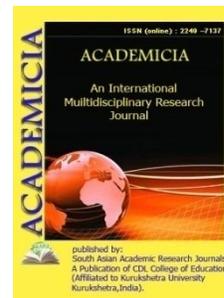

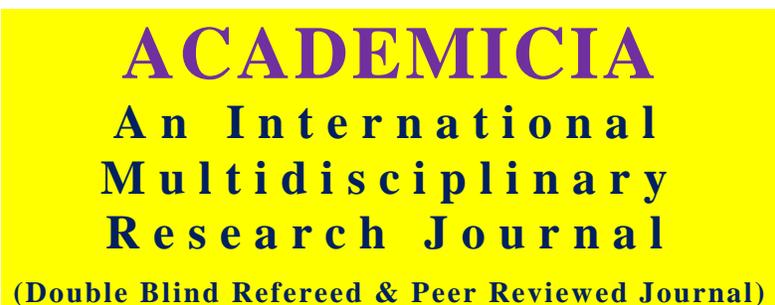

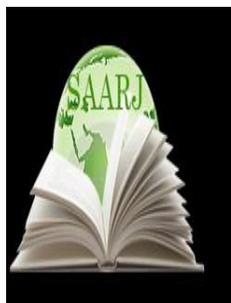

production, which reflects not only the level of live labor spent, but also the level of use of packaged labor, as well as the quality of services sold, the level of organization and management of services.

Pricing the cost-effectiveness of a particular service, network, or enterprise as a whole does not give a complete result. To do this, it is necessary to compare its value with the cost incurred in order to generate a profit. Therefore, the rate of return indicator is used. It shows the level of profit as a percentage of the ratio of the values of material and labor costs. Profit is calculated by deducting the full cost or cost of services (production) from the value of money received in return for services (products) sold, reflecting the converted part of net income.

Profitability rate is the profit per one soum of production costs spent on each percent, i.e. if the profitability of the enterprise providing services is 25 percent; it means that for every soum of material and labor costs, the profit is 25 tiyins.

## THE ROLE OF DIDACTIC AND METHODOLOGICAL INNOVATIONS IN THE IMPLEMENTATION OF PRIMARY MATHEMATICS EDUCATION

**Alisher Abdusamadov Sobirovich\***

\*Teacher,

Department of Primary Education,  
Termez State University  
UZBEKISTAN

Email id: aabdusamatov912@gmail.com

### ABSTRACT

*Design and implementation of methodological innovations for the systematic renewal of primary mathematics education, substantiation of the importance of the most modern innovations for the implementation of systemic changes in primary mathematics education, and the introduction of the concept of "methodological innovation" in full scientific and methodological circulation.*

**KEYWORDS:** *Elementary, Mathematics, Education, Systematic, Methodical, Didactic, Innovation, Design.*

### INTRODUCTION

At a time when large-scale consistent reforms are being carried out in our country on all fronts, it is expedient to examine the shortcomings within the achievements in the field of education. Education will be changed in scale and content in the process of reform and renewal. The reforming and qualitatively renewing education is a requirement of today.

The idea of projection and implementing methodological innovations for the systematic renewal of primary mathematics education are encompassed that the importance of methodological innovations in mathematics lessons in the implementation of the requirements of the State Educational Standards (SES). Thereat:

- It is defined as the concept of "methodological innovation";
- It is specified the sources of methodical innovations in primary mathematics education and principles of their design;

- It is identified the types of methodological innovations and the basis of distinguishing their appearances.

According to the researches, the creating process of projection and implementing methodological innovations for the systematic renewal of primary mathematics education is based on the current problems of primary mathematics education and the modern requirements placed on them. As well as, it should be done taking into account issues related to the history of the creation of advanced ideas of mathematics and primary education.

It is emphasized and paid attention to the important appearance of innovations in this research area. In particular, if we look for the answer to the question of what are the methodological innovations in the teaching of mathematics, it can be answered as follows: The methodological innovations are opportunities that allow a wide using of the methodological technologies, teaching aids, ensuring that the educational process is carried out in an updated form, taking into account the specifics of mathematics and the characteristics of primary school pupils.

It is known that the new goals of the primary education system that are putting in front of itself are the formation of reading and consciousness skills in children. The achieving of these new goals requires that the implementation of new methods (teaching aids, forms of teaching) in school practice. It should be achieved the using of the modern educational technologies in the organization of educational processes, as a result of full mastery of the essence of the science of mathematics, not only the teaching of mathematics but also education with mathematics; it should not only absorb ideas but also achieve results such as teaching thinking. These types of methodological innovations help to enrich the knowledge of pupils with the developing of ability in the calculating of the content of the course of mathematics, to develop a system of the tasks for primary school pupils which appropriate to their age, to teach a mathematical example solving, to connect logical sequences of events and phenomena.

The empirical basis of these cases is the methodological challenges that primary school teachers may face in the process of implementation of the modern requirements and didactic innovations in the education system at the school level.

The traditions of mathematics education in our schools have been formed and preserved over the years, but today we have “just begun to realize that the main task of a math teacher is not to fill a child’s memory with different formulas, but to develop it((In other words, most of the formulas that are learned in school math aren’t useful, people need not them in life). For this reason, It comes a time to reconsider our traditional teaching methods” [2, 45-6].

The methodology of teaching the essence of mathematical science is interpreted as "a system of rules that form the basis of the process of studying mathematics"[1, 8-6].The ideas that are analyzed in this research include the sources, appearance, and types of methodological innovations, the specifics of primary education, and the principles of projection of new types of innovations, taking into account the field of application of mathematical science.It is served as a basis for classifying new types and forms of methodological innovations in primary mathematics education, according to their importance and creating a general model of their implementation in practice.

For the systematic renewal of primary mathematics education, the projection and implementation of methodological innovations provide the followings:

- it is regulated the targeted processes of development of forms, types, methods, technologies of innovations for the implementation of structural changes in primary school and created opportunities for finding new means of teaching mathematics;

-the effectiveness of the process of preparation for the educational environment in which the requirements of the STS in primary mathematics education of primary school teachers are put into practice;

-the effectiveness of education will increase due to the use of forms, types, methods, and technologies of innovation, the renewal of educational tools.

As a result of the study and analysis of the practice of primary mathematics education, it is concluded that necessary methodological, normative-legal, pedagogical-psychological resources have a basis for the implementation of modern structural changes, despite the full development of didactic innovations in pedagogy. cannot be used in practice. Despite the existence of didactic innovations in the teaching of mathematics, It is being still observed cases of use of traditional methods. It is known that mathematical, pedagogical, psychological, normative-legal knowledge is necessary, but not enough, to implement the requirements of DTS and didactic innovations in the teaching of mathematics. It is important to create the most necessary and new type of pedagogical innovation - methodological innovation.

Socio-economic reforms in Uzbekistan that were carried out, changes in society have led to changes in the goals and educational standards in the national education system. As a result, A social situation that is being awaited the achievement of new goals, the updating of educational standards, and also a systemic change in the teaching of primary mathematics in general secondary schools in a short time had occurred.

Our research and observations that were carried out show that to implement the preparation process had been occurred in the form of slowly, unsystematic, and often imperfect requirements of DTS and didactic innovations in the teaching of mathematics by primary school teachers.

Only a few teachers who have to understand correctly the new goals of education are putting into practice the changed and updated standards in the teaching of mathematics, and by this way, independently demonstrate their methodological readiness for innovation. According to our researches, primary school teachers are also facing difficulties to put even the developed didactic innovations (approaches and principles) into practice without appropriate methodological support, and they consider it a complex issue.

Therefore, it is necessary to introduce "methodological innovation", which is a type of innovation. The transition of innovative processes to the methodological stage requires taking into account the characteristics of the subject (mathematics) and the specifics of the educational stage (primary education). It is proved that the introduction and a separate study of methodological innovations, which are the most important type of pedagogical innovation, is the right way.

Pedagogical innovations ensure the implementation of lesson training into the educational process through didactics and methodology. Theoretically, didactics and methodology have different functions, they are:

1. Generalization of principles, ideas, concepts that are related to different fields of science in didactics;
2. The methodology provides that the organization and conduct of educational processes (teaching methods, forms, tools, technology, tasks) for a specific age group in a particular subject.

Didactic innovation - new, effective ideas, principles, and concepts that are simultaneously required and implemented to achieve new goals in education.

Thus, pedagogical innovations in the education system can be divided into two types: methodological and didactic innovations.

Methodological innovations are an innovation in the teaching methods. That is, it can be said that methodological innovation means methodological support of pedagogical processes.

Methodological innovation is a methodological innovation that is investigated and utilized in educational practice, satisfied the requirements of pupils and which will be a tool in achieving new goals, provides a qualitative increase in the effectiveness of educational processes and extracurricular activities in a particular subject.

Methodological innovation is a type of pedagogical innovation, it:

- to solve methodological problems;
- to apply didactic innovations in the educational process, taking into account the characteristics of the subject and the specifics of the teaching processes;
- serves to implement tasks such as the introduction of systematic updates in the lesson training, taking into account the new goals of education and updated standards

Methodological innovation in primary mathematics education is such a change that was happened in the methodology of primary mathematics education that it can be considered as a new, demanding, achievable, effective innovation at the same time. In other words, it is such a change in the organization and demonstration of the essence of primary mathematics education activity that it can be seen as a new, demanding, achievable, applied effective innovation at the same time.

## CONCLUSION

The aim of the present work was to determine the level of their innovation indicators in the evaluation of innovations. These indicators include:

1. The level of demand for methodological innovations in primary mathematics education:
  - a) Compliance of mathematical education with the "socially acceptable effect" (that is, updated goals, objectives, requirements for primary mathematics education) that is defined in the updated normative-legal sources;
  - b) the relevance of mathematical education to the requirements of pupils;
  - v) the relevance of mathematical education to the requirements of the elementary school teacher who have problems

2. The indicative criteria that the methodological innovations introduced for primary mathematics education are novelty:

a) degree of differentiation from the methodological components that were used in the earlier stages of development of mathematical education;

b) the low level of methodological preparation of many teachers in the application of these methodological tools in mathematics lessons;

c) insufficiently deep and structurally undeveloped of these methodological means in journals and methodological recommendations in the field, as well as in other methodological literature;

g) It was being introduced insufficiently that the methodological innovations in mathematics textbooks, methodological manuals on teaching mathematics in primary school.

3. Indicating criteria the level of the practical application of methodological innovations introduced for primary mathematics education:

a) a mechanism for the implementation of mathematics teaching methods has been worked;

b) The methodology of teaching mathematics has been developed and tested in practice but has not been fully popularized.

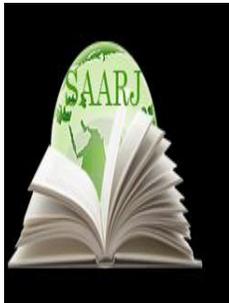

4. Indicating criteria of the level of effectiveness of methodological innovations that were introduced for primary mathematics education:

a) compliance with the goals, objectives, and requirements of modern education of the methods, techniques, forms, technologies and teaching aids of the teaching mathematics that were worked following the goals, objectives, and requirements of modern education is ensured at low cost (that is, not at the expense of "at any cost");

b) One of the main goals of the education system is the health of participants in the educational process, so the adequacy of the level of health of methodological innovations is the most important evaluation criterion.

---

### ABSTRACT

*The article analyzes the symbol of patriotism in the work of Alisher Navoi. The literary heritage of the famous poet that has come down to us is large and multifaceted, it is about 30 collections of poems, poems, scientific works and poetic treatises, which fully reveal the spiritual life in Central Asia at the end of the 15th century.*

**KEYWORDS:** *Interpretation, Patriotism, Life, Love, Poetry, Poem, Treatises, Humanist, Great Thinker.*

---

### INTRODUCTION

One of the most pressing issues is the study of the heritage of Nizamiddin Alisher Navoi, the scientific analysis of the ideas of patriotism and love in the education of youth. Nizomiddin Mir Alisher Navoi - (February 9, 1441 - January 3, 1501) - Sultan of Uzbek literature, scientist, poet, statesman, philanthropist, humanist, great thinker who made an invaluable contribution to the development of spirituality and world culture.

The rich heritage of Alisher Navoi is an invaluable contribution of the Uzbek people to the treasury of world culture. And the personality of Alisher Navoi is an example of effective service to the fatherland and his people. Alisher Navoi wrote poetry in 17 genres of oriental poetry. Gazelles occupy a significant place: - 2,600 Uzbek and 550 Persian are included in 5 sofas, one

of which is Persian. Throughout his life he wrote gazelles, poems about love and reverence for the mind, justice, faith in God, democracy and humanism, knowledge and art, patronage, about his teachers, about asceticism and other beautiful features of outstanding personalities. He wrote 6 poems, 6 qasid (od), many rubai, musaddas and others.

Musamman is a poem, each line of which is eight lines. Muammo is a verse riddle. Musatazad is a poem with a repetition of the final words of the second line of each bayt. Muhammad is a poem from five verses. Tajriband is an Arab. "Repeat lines", i.e. repeated repetition of lines. Tuyugi is a quatrain, in the rhyming of the lines of which homonyms are usually used, a play on words. Kyta is a short poem in which the first couplets do not rhyme. Fardas are poems.

A total of 45 thousand lines of poetry in Uzbek and more than 12 thousand lines of poetry in Perso-Tajik languages. "All his poems in his native language were collected in a huge collection" Treasures of Thoughts ". All his poems were collected in a collection, which he called "Hamsa - Five" - writes Nikolai Tikhonov in the preface to the translation into Russian of ten volume collected works of Alisher Navoi [1, p.9]. His thoughts about himself, about his relationship to God, about his spiritual state are woven into the canvas of the gazelles, etc. etc., the theme of the poems covers all aspects of spirituality, life and activities of people.

The sign of love on the scroll heart is imprinted with eternity,

Others - a tablet of oblivion, others - dust and decay [2, p.338].

Much has been written about love. The object of Alisher Navoi's main love was God. This love is "etched in eternity." What does "on the scroll of the heart" mean? Recent studies have shown that the shape of the heart, the outgoing and incoming blood vessels, one can read the word "Allah" in Arabic [3, pp.15-16]. Everything else, except for love for God, active service to him, which implies service to the Motherland, to people - "ashes and dust". Alisher Navoi served people - morally, physically and financially, making every effort. He was harassed by "boring affairs", i.e. government work took a lot of time and effort.

In the work of Alisher Navoi relied on three sources: the Koran, the Sunnah of the Prophet (s.a.v.) and the philosophy of Islam. He often quotes in his writings the Qur'an, the hadithi of the prophet. Al-Shakur. Grateful, Awarded for goodness is one of the 99 names of the attributes of Allah. Alisher Navoi thanks Allah in all types of his creativity. Is called "Shukurullo"

Darken my eyes in separation,

I thank Allah for seeing you again.

A. Navoi Mukammal asarlar typlami 20 zhldik 1 guild T. 1987.472-b

Repetition of the previous thought in other verbal expressions. Same with 522

Bladari Allah for the face in paradise and for not longing in hell. Vol. 1. from 76.

Thank you 100 times, not counting a lot and a little. Vol. 1. from 163

He thanks Alisher Navoi not only for what has been given to him, but also for what has been lost. Having lost something material, he gained spiritual, it became easier for him.

A request to Allah that he made the language of Alisher Navoi thankful to Allah forever and the head forever worshiped him.

In these three couplets, Alisher Navoi's edification to travelers:

- 1) Thank the Navo of Allah, if you want more (Navo) music, thank!
- 2) What language should I use to thank my idol for fulfilling my goal? - For any achievement, a tribute must be paid.
- 3) Thank the Lord much for the gifts, patience, and countless gifts.

Serving is material: he paid taxes to the treasury for the people, built hospitals, dormitories, schools, baths, canals, fed and dressed those in need. To give shelter to people of art, he built houses for them where they could live and work. Morally - his works - praise and educate in people kindness, honesty, hard work and all the best qualities of character.

Many poets, preparing their collected works, knew the importance of the beginning of the book. They knew the role and meanings of what the book begins with. The first poem sets the mood for the reader, defines the face of the entire book. It leads the reader into the author's world, establishes mutual understanding, arouses interest and draws the reader into the amazing, mysterious world of thoughts, thought - forms, imaginations and ideas of the poet about life, nature, about himself. They make it clear that the word has its own depths. The magic of the poetic word must be expressed from the very beginning. The first page of Alisher Navoi is a high springboard from which the seeker must jump onto the path of life he has chosen. He must comprehend what he can and what he is capable of. The book is also one of the ways of spiritual connection of people, one of the sources of education for people, at the same time, it serves to specialize people on the way to mastering any business - a specialty.

It seems that the era of Alisher Navoi has long passed, the progress of mankind - computers of radio, cinema, television, airplanes and others have made the global communication of intellectuals available. However, humanity is worried about the spirit of Alisher Navoi's poetry, his personality, his philosophical views, life path. Among the works of Alisher Navoi there is also a moral and didactic work "Confusion of the Righteous", where, summing up the results of life experience, wisdom and life lessons, expresses his thoughts on a number of socio-political and moral-ethical issues. Implementation of the edification of Alisher Navoi and his opinions, as well as their leadership would raise humanity to a high level of spirituality, moral perfection and the improvement of people's lives. This is the first book of "Hamsa" - "Five". He says: "The purpose of my introduction is this: ... but they do not know how joyful and difficult life is, and many of my friends who have not experienced good and evil" and he warns everyone about this. In his statements and admonitions, his worldview is evident and his personality, his dreams, ideals emerge. The ideal of a man, a sovereign, his personality, state structure, about the role of justice, especially with the ruler, about the army, about employees, and then whether.

All this raises the personality of Alisher Navoi not only above his era, his country, but also for many centuries. Alisher Navoi, creating works of art, weaves into it subtext - Sufi ideas, the Sufi school of education, on the one hand, the political-state code, as well as the code of honor of the sovereign, official, employee, peasant, sheikh, bek, esaul, judges, etc. , a perfect person with another.

He also creates his own image in literature. A person differs not only in bodily parameters, but in mental-intellectual-moral ones. Expressing his worldview, Alisher Navoi outlines his intellectual and spiritual world, his way of life, principles. He gives his creativity, his way of seeking God -

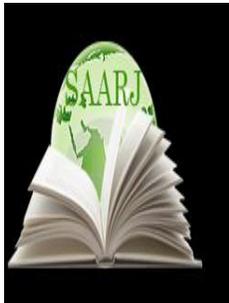

Truth in his gazelles, as well as in "Hamsa" and "Lison ut-tair". There is an opinion that Alisher Navoi's "Khamasa" is "Nazir" - a literary imitation of Nizami, Khosrov Dehlavi and Jami. "Nazira" is a form of literary imitation, widespread in the Near and Middle East and in Central Asia. A new work, as a rule, retains the main theme, size, order, rhymes, and sometimes even the form of the original. Contemporaneous poets often competed in the art of poetry, and also created a "nazir" and a famous poem. Modern examples of "nazir" were created on the basis of the poems of Nizami Ganjavi by the great poets of the East Alisher Navoi, Amir Khosrov Dehlavi, Jami, Fuzuli and others "[4, p.82]. Rahmat Majidi writes: "It should be noted that the "Khamasa" created after Nizami, as has been repeatedly proven by scientists, is in no way an imitation of the genius of its first creator. Each new "Khamasa" is a poetic response to the great works of Nizami, Khosrov Dehlavi and Jami, at the same time it was an original work of art reflecting the main ideas of their era. However, the architectonics, style, poetic techniques, poetic dimensions and complex lines of all The "Five" Remain Outwardly Similar "[5, P.262].

### CONCLUSION

We can say that Alisher Navoi believes that he does not imitate with his works, there is enough room for his mind, he will not lead his "horses" after strangers into the robbed "flower garden", but he dives into the sea of words, like a pearl fisherman, for this sea is inexhaustible, and manages to get such a valuable cargo, and he is proud of it. The basis of his work is the creation in people of correct, ethical standards of behavior, starting from rulers, officials, clergy, workers of men, women, children, based on love for God - the Creator, for humanity, the Motherland, the ideals of perfection.

### ABSTRACT

*More than 1.1 million cases of morbidity and more than 410,000 breast cancer deaths (BC) are diagnosed worldwide every year. The systematic review and analysis of the study of the influence of possible risk factors and causes of this type of cancer by the statistical materials of the oncology databases are essential. The study of risk factors for the incidence of breast cancer was carried out on a global scale, considering geographical and temporal variations in different regions of the world. The article analyzes the literature data on the role of the main risk factors in the mechanisms of development of breast cancer (BC) (hereditary factor, background precancerous diseases, the role of immunodeficiency, hormonal imbalance in various endocrinopathies, age factor and a number of others) on the molecular cell, organ and systemic levels. The authors focus on the mechanisms of oncogenic transformation of cells under the influence of hyperestrogenism of various origins, against the background of hypothyroidism, as well as excessive formation of free radicals in various forms of pathology that have mutagenic activity and disrupt the processes of intercellular interaction. An important role in the transition of the first stage of carcinogenesis - oncogenic transformation to the stage of promotion is assigned to the previous and concomitant immunodeficiency states, when the elimination of malignant cells is impaired.*

**KEYWORDS:** *Morbidity, Mortality, Causes, Risks, Breast Cancer.*

## INTRODUCTION

Breast cancer (BC) is the world's leading cancer in terms of prevalence among the female population and accounts for about 25% of all cancers affecting the female population [1]. The peak incidence among women is between 50 and 60 years of age - 25%. The reproductive age of women accounts for about 30% of diseases. Various causes cause this disease. The main ones are genetic disorders. In addition to them, other reasons can also contribute to the occurrence and development of breast cancer. No less important is the definition of risk groups due to age-related changes, anthropometric indicators, physical activity, external factors and other external causes.

### Age differences

In most European countries, two out of 1,000 women per year develop breast cancer among women over the age of 50, and about 15 have a high risk of developing breast cancer [2]. Age is one of the leading risk factors for breast cancer. The main increase in the incidence occurs at the age of 50 to 64 years. The most common cause of death among women between the ages of 40 and 50 is breast cancer. Mortality accounts for about 20% of all cancer deaths. At the same time, the number of sick women over the age of 65 over the past 30 years has increased from 14% to 21%. Thus, statistics indicate that even more women in this age segment will be vulnerable to breast cancer [3]. However, in some countries, there has been a decrease in morbidity after menopause. The age of onset of the disease and mortality from breast cancer significantly depend on the geographic characteristics of the place of permanent residence of women, and are very different in the west and east of Eurasia. Environmental factors also have a significant impact on morbidity and mortality, and much more significant than genetic factors.

The proportion of young women to the total number of patients can reach 5-10%. So, for example, out of 1,398 women followed up for 99 months, 107 patients under 35 years of age were identified [4]. During this observation period, in young, in contrast to older women, additional factors affecting morbidity and mortality were identified. In the proportional hazard model [4], which includes clinical, treatment-related variables as well as pathological features of the disease, age under 35 years of age remained the most significant predictor of relapse, long-term relapse, and overall mortality.

### Hereditary predisposition

Concerning the role of a hereditary factor in the development of breast cancer, it should be noted its role in about 5-10% of diseases. Hereditary cancer is more often diagnosed in young women of reproductive age [18]. Clinical observations show that the presence of relatives with breast cancer in the family significantly increases the risk of developing the disease. In this regard, a special nosological form of pathology was identified - breast cancer, within which the presence of various genetically determined forms is possible. Moreover, the authors do not exclude the possibility of the presence in the population of two forms of breast cancer - hereditary and sporadic. So, Ya.V. Bohman, 1993, on a large clinical material studied the role of genetic predisposition in the development of cancer of various localization. It turned out that blood relatives of patients with breast cancer have a 3-5 times higher risk of developing this disease than in the female population as a whole. A family background study revealed an association of ovarian cancer with endometrial and breast carcinoma. In addition, female relatives of patients with endometrial cancer have a high incidence of breast cancer, ovarian cancer and colon cancer.

Currently, the opinion has been established that an earlier age of cancer manifestation is the leading symptom of all hereditary neoplasias, including breast cancer. This is due to the development of a mutation already in the germ cells, for the manifestation of which a repeated somatic mutation is required. In a hereditary form of cancer, all tissues carry a "pathological" gene, therefore, hereditary cancer is characterized primarily by multiple lesions. Were identified such tumor associations as breast cancer and gastrointestinal cancer; breast and ovarian cancer; cancer of the breast and tumors of soft tissues, brain, tongue and larynx, adrenocortical adenoma (SBLA syndrome). Various tumor associations indicate genetic heterogeneity in breast cancer. One of the significant advances in molecular genetic studies of breast cancer was the discovery of the BRCA1 and BRCA2 genes, whose germinal mutations determine the hereditary form of these neoplasms. Hereditary mutations of these genes account for 56% to 80% of the risk of developing breast cancer throughout life [22, 26]. The range of BRCA1 gene mutations is quite wide: 71% of mutations are related to the shift of the reading frame due to micro - mini - deletions. As you know, the BRCA1 gene is located in the region 17q21.1.-21.2. Loss of BRCA1 expression correlates with increased proliferation and enlargement of the tumor node.

Another suppressor gene, more specific for breast cancer, is the BRCA2 gene. Mutation of this gene plays an important role in the development of familial breast cancer in both men and women [18]. Along with the hereditary factor, an important role in the development of breast cancer is assigned to the overproduction of estrogens, the formation of their reactive metabolites, as well as changes in the reception of these hormones by target cells. The point of view is expressed that under the influence of estrogens, the expression of some protooncogenes in target cells occurs, in particular the c-fos gene, c-myc gene, c-jun gene, the formation of cyclins, cyclin-dependent kinases, autocrine and paracrine growth factors and their receptors is stimulated [9, 21]. It has been established that the process of promotion in breast cancer, as well as neoplasia of other localization, is associated with a powerful induction of the estrogen receptor system. Estrogen-induced growth factor proteins have autocrine or paracrine effects. It has been found that receptors for polypeptide growth factors belong to the ERBB family, are expressed on cell membranes, with ERBB2 or HER2 / neu being the most important. In the process of intense hormonal stimulation of estrogen receptors in the mammary gland, an increase in the formation of transforming growth factor alpha (TGF- $\alpha$ ), which belongs to the EGF family (epidermal growth factor), occurs. TGF- $\alpha$  - stimulates mitotic activity, the growth of tumor and normal cells of epithelial origin, has angiogenic activity [9, 22]. At the same time, the formation of the estrogen-receptor complex induces the synthesis of insulin-like growth factor and suppresses the formation of transforming growth factor beta (TGF- $\beta$ ). The latter belongs to the EGF family, inhibits the division of tumor and normal cells, and increases their differentiation [9,10].

Cells of the stroma of the mammary gland, due to the release of fibroblastic growth factor, stimulate their own proliferation, and paracrine-epithelial tumor cells. The growth factor of platelet origin enhances the proliferation of the mesenchymal stroma of cancerous tumors [9, 11, 24]. It is important to note that a significant part of the cells that underwent oncogenic transformation die at the early stages of promotion during apoptosis. A characteristic feature of the effect of estrogens on target cells is the inhibition of apoptosis with the participation of the bcl-2 oncogene [14]. According to the data of a number of authors, estrogens promote the accumulation of microsatellite structures of DNA of target cells, considered as a manifestation of

defective repair of its damage. It has been shown that not only sex hormones, but also the products of their interconversion, in particular the products of 2-hydroxylation, 16-alpha-hydroxylation and 4-hydroxylation, the so-called catechol estrogens, have oncogenic activity. In the mechanisms of oncogenic transformation of the mammary epithelium, an especially important role is assigned to the enhancement of the process of 16 alpha-hydroxylation of estrone [7, 14].

**Impact of being over weight.** Anthropometric indicators (height and weight) also have an impact on morbidity and mortality rates. For example, observations in the period from 6 to 18 years for women aged 30 to 69 years (about 570,000 patients) showed that in all age groups, tall women had a high risk of both morbidity and mortality from breast cancer. Overweight was a risk factor for morbidity only in the postmenopausal period, mortality in all age groups [5].

Epidemiological data indicate a positive relationship between anthropometric body parameters and postmenopausal breast cancer. However, there is not yet a sufficient number of observations in order to reliably study this relationship. A prospective study to investigate the relationship between body mass index (BMI) and breast cancer mortality was initiated in the US population in 1982. After 14 years, there were 2,852 cases of malignant breast cancer among 424,168 postmenopausal women who had no previous history of cancer. As a result of this study, it was determined that mortality rates from breast cancer significantly increase with increasing BMI (OR (odds ratio) = 3.08; 95% CI (confidence interval) = 2.09 - 4.51 for BMI  $\geq$  40, 0 versus BMI 18.5 - 20.49). It has been shown that in 30 - 50% of deaths from breast cancer occurred in postmenopausal women with overweight [6]. This is an important predictor of malignant breast cancer. These results highlight the importance of maintaining a moderate weight throughout a person's life [7].

#### **Breast cancer deaths also increased with the woman's height.**

Being overweight is associated with poor outcomes in postmenopausal women with breast cancer. To study this theory, 1,360 Australian women with breast cancer under the age of 60 were examined. Obesity is defined as a body mass index  $\geq$ 30 kg / m<sup>2</sup>. It was confirmed that obesity increased with age ( $p < 0.001$ ), and was often associated with an increase in the recurrence of breast cancer ( $p = 0.02$ ), mortality of this group of women ( $p = 0.06$ ), the occurrence of larger tumors ( $p = 0.002$ ), as well as damage to the axillary lymph nodes ( $p = 0.003$ ), but not with receptor sensitivity to hormones ( $p \geq 0.6$ ) or dose reduction of the first cycle of adjuvant chemotherapy ( $p = 0.1$ ). So, obesity has been associated with a poorer prognosis for premenopausal and postmenopausal women [6]. Obesity is a risk factor for breast cancer and also affects the survival rate of women who have already been diagnosed with the disease.

The main goal of this study was to conduct a meta-analysis that would include more recent studies on this issue. The adjusted individual hazard scores in the studies were pooled using a random effects model. The meta-analysis included women diagnosed with breast cancer between 1963 and 2005. The sample size in different studies ranged from 100 to 424,168 people [24]. A meta-analysis showed the least favorable survival rates for obese women. However, survival did not change significantly, depending on the method of assessing body mass index or the degree of fat deposition in the waist and hips. At the same time, significant differences were determined in the case of diagnosing women during menopause or postmenopause, before or after 1995, as well as undergoing chemotherapy or not. The authors concluded that there is currently no basis to

classify obesity as an additional risk factor for women diagnosed with breast cancer. That is why, it was concluded that further research should be aimed at assessing other possible risk factors for morbidity and mortality from breast cancer, such as diabetes mellitus or the nature of chemotherapy (drug dosage), and also on changes in body weight [6, 24].

In [5], the relationship between obesity and the results of tamoxifen treatment among women with hormone-dependent breast cancer was analyzed. The experimental group consisted of 3,385 women enrolled in the national surgical adjuvant therapy for breast and intestinal oncology. The randomized, placebo-controlled study included the study of the risk of recurrence of cancer of the affected breast, the occurrence of contralateral tumors, new primary cancers, as well as the mortality of this group of patients. The assessment of these indicators was carried out in relation to BMI using statistical modeling with adjustments for other prognostic factors. The average follow-up time was about 166 months. As a result, it was found that the risk of breast cancer recurrence was the same for obese women ( $BMI > 30.0 \text{ kg / m}^2$ ) and for women with normal body weight ( $BMI < 25.0$ ;  $OR = 0.98$ ,  $95\% \text{ CI} = 0.80 - 1.18$ ). The risk of breast cancer in women with obesity was higher than in women with low or normal body weight ( $OR = 1.58$ ,  $95\% \text{ CI} = 1.10 - 2.25$ ), as well as the risk of others. primary malignant tumors ( $OR = 1.62$ ,  $95\% \text{ CI} = 1.16 - 2.24$ ). The risk of death associated with breast cancer was also higher among obese women than those with normal weight ( $OR = 1.31$ ,  $95\% \text{ CI} = 1.12 - 1.54$ ), as was the higher risk of death for reasons not related to breast cancer ( $OR = 1.49$ ,  $95\% \text{ CI} = 1.15 - 1.92$ ). At the same time, tamoxifen reduced the likelihood of recurrence and mortality from breast cancer, regardless of BMI. Thus, it was concluded that for women with lymph node metastases with hormone-dependent breast cancer, obesity does not affect the effectiveness of tamoxifen treatment. However, since obesity was associated with an increased risk of developing second breast cancer or primary cancers, and an increase in overall mortality, it was concluded that the prognosis for women with overweight and history of breast cancer was poor [5].

**Impact of physical activity.** An attempt to establish a link between the presence of physical activity, diet, obesity and survival rate in the diagnosis of breast cancer was undertaken in [23]. We examined 1,490 women who received treatment at an early stage of the disease in the period from 1991 to 2000. Univariate analysis showed a decrease in mortality, which was weakly associated with more frequent consumption of vegetables and fruits, increased physical activity and body mass index within the normal range. In Cox's multivariate model, specifically tailored consumption of five or more daily servings of vegetables and fruits was associated with a significant survival rate ( $OR = 0.56$ ;  $95\% \text{ CI} = 0.31-0.98$ ). An approximately 50% reduction in the risk associated with a healthy lifestyle was observed in obese and non-obese women, although fewer obese women were physically active (16% versus 30%). As a result, a pronounced protective effect of a healthy lifestyle was identified, which necessitates additional research on the combined effect of diet and physical activity on the survival of women with breast cancer [23].

The effect of physical activity on the reduction of mortality from breast cancer at an early stage of the disease and after treatment was carried out in [27]. The sample consisted of 1,970 women. A prospective study was conducted looking at behavioral risk factors and their health consequences that were associated with work, living conditions and recreation. Age-adjusted results indicated that high levels of physical activity were associated with a lower risk of recurrence and mortality from breast cancer ( $p = 0.05$  and  $0.07$ , respectively, highest versus

lowest physical activity). These data suggest that regular physical activity is likely to be beneficial for patients with a history of breast cancer in terms of reducing overall mortality [27].

**Impact of co morbidities.** In women over 55, the incidence of breast cancer in 77% of cases is fatal. Postmenopausal women develop other age-related health problems that can affect prognosis and treatment. In [30], the phenomenon of comorbidity in breast cancer patients was studied, and the relationship between the disease and age, treatment, and early mortality was assessed. Thus, 1,800 patients were divided into 3 age groups: from 55 to 64 years old, from 65 to 74 years old and over 75 years old. As a result, 73% (in 1,312 cases) had breast cancer diagnosed at stages I and II, 10% (188) at stages III and IV, and 17% (300) at unspecified stages. At the same time, it was revealed that patients in older age groups received therapy in accordance with the protocols significantly less often ( $p < 0.001$ ), and women aged 70 years and older had significantly less chances of axillary lymph node dissection, which was determined by regression analysis ( $p < 0.001$ ). Diabetes, renal failure, stroke, liver disease, history of a malignant tumor at another site, and smoking were significant factors in early mortality in a statistical model that also included age and stage of breast cancer. During the 30-month observation period, a total of 263 patients (15%) died. Moreover, breast cancer was the main cause of death in 135 cases (51.3%), cardiovascular diseases - in 45 (17.1%) and other types of cancer - in 22 (8.4%). The study authors concluded that treatment decisions for patients are based not only on the presence of breast cancer, but also on other age-related diseases. Thus, comorbidity in elderly patients may limit treatment options, as well as increase the risk of death from other causes not related to cancer. It is important to note that, despite the high rates of newly diagnosed breast cancer in women over 70 years of age, a less aggressive treatment strategy has been proven to be effective for this particular group of patients. It was also found that in patients in the eighth and ninth decades of life, special attention should be directed to the study of axillary lymph nodes [30].

A systematic review and meta-analysis to compare the overall survival of cancer patients with and without diabetes mellitus was performed in [2]. The presence of diabetes mellitus was associated with more frequent deaths (OR = 1.41; 95% CI = 1.28 - 1.55) compared with patients with normal blood sugar levels regardless of the type of cancer (OR = 1.61; 95% CI = 1.46 - 1.78) [2]. This analysis was performed to determine the effect of comorbid conditions on the occurrence and mortality of early breast cancer. The women who participated in the randomized trial (total of 2,542 patients) were surveyed regarding the presence of a wide range of diseases (cardiovascular, diabetes, gallbladder, gastrointestinal tract, arthritis, and osteoporosis), and physiological disorders (high blood pressure, high cholesterol). All subjects were followed up for an average of 7 years (range 0.8 - 15.0). Regression analysis was used to evaluate the results. Overall, 406 newly diagnosed cases of breast cancer and 242 deaths were identified. Patients with diabetes mellitus had a more than twofold risk of increased incidence of breast cancer (OR = 2.1, 95% CI = 1.3 - 3.4) and mortality (OR = 2.5, 95% CI 1.4 - 4 ,4). The presence of a large number of comorbidities did not statistically significantly increase the risk of breast cancer. However, compared with patients without comorbidities, patients with 3 or more comorbidities had OR = 2.1, 95% CI = 1.3 - 3.3 for mortality. Thus, diabetes mellitus is associated with a poor prognosis for patients with breast cancer. Considering that 85% of deaths were caused by this particular disease, the obtained data indicate that the presence of several comorbidities can reduce the likelihood of survival and increase the risk of cases of breast cancer [19].

Diabetes mellitus is significantly associated with all-cause mortality in 6 out of 7 studies [20]. Patients with breast cancer and diabetes mellitus had a significantly higher mortality risk (OR = 1.49; 95% CI = 1.35 - 1.65) compared with the comparison group without diabetes. Three out of four studies found a history of diabetes mellitus was associated with more severe breast cancer. Diabetes mellitus has also been associated with a change in breast cancer treatment and increased toxicity of chemotherapy. Further research is needed to study the pathophysiological interactions between diabetes mellitus and breast cancer [20].

**Impact of depression.** The effect of depression on mortality in breast cancer patients remains unclear. In this direction, a retrospective study was conducted in [12], in which all subjects with affective and anxiety disorders were divided into groups. The authors found that breast cancer patients with depression had a significantly higher mortality risk [12].

This study assessed the impact of depression on treatment and survival in older women with breast cancer. To achieve this goal, scientists conducted a retrospective analysis of medical records [11]. A total of 24 696 women aged 67 to 90 years old with a diagnosis of breast cancer were examined in the period from 1993 to 1996. As a result, 1,841 women out of 24,696 (7.5%) were diagnosed with depression for 2 years before breast cancer was diagnosed. However, no difference was found in tumor size or disease stage at the time of diagnosis for women with and without depression. It was shown that women with depression were less likely to receive treatment (60% versus 66%,  $p < 0.0001$ ), and this difference did not depend on age, ethnicity and comorbidity. In addition, women with depression had a higher risk of death (OR = 1.42; 95% CI = 1.13 - 1.79). Thus, it was concluded that women with depression are at a higher risk of premature stopping of treatment, and have a worse prognosis in terms of survival after being diagnosed with breast cancer [11].

**Influence of external factors.** In the United States, studies have been conducted on the effects of sunlight on mortality from breast, ovarian, colon and prostate cancer. Death certificates from 1984 to 1995 were analyzed. in 24 US states. Multiple regression was used as a model that included age, gender, race, socioeconomic status, physical activity, and exposure to sunlight, not only in the region of residence, but also in the professional activities of the subjects. Thus, as a result of the study, it was found that the sun's rays led to breast cancer (the odds ratio was 0.82 with a 95% confidence interval from 0.70 to 0.97) [9].

Epidemiological and laboratory evidence suggests that vitamin D may play a role in reducing the risk of breast cancer. Researchers assessed the relationship between the total average annual energy of sunlight falling on the earth and mortality from breast cancer. The risk of breast cancer in large areas of the United States was inversely proportional to the intensity of local sunlight. The ecological nature of this study indicated a likely indirect relationship with dietary and socioeconomic factors of this disease [10].

Exposure to the electrical and magnetic components of electromagnetic fields (EMF) can cause cancer [16]. Experimental studies have led to the conclusion that exposure to low-frequency EMF decreases the production of the hormone melatonin, thereby increasing the susceptibility of hormone-dependent cancers such as breast cancer. As a result of data analysis for the period from 1985 to 1989. it was confirmed that women working under conditions of exposure to elevated EMFs more often died from breast cancer compared with the control group (OR = 1.38; 95% CI = 1.04 - 1.82) [16].

### Geographic variability

An analysis of the distribution of subtypes of breast cancer among different racial groups was carried out in [3]. The study revealed the relationship of cancer subtypes with menopause, mitotic index, nuclear polymorphism and survival of women after diagnosis. It follows from the work that the basal type of breast cancer is most common among African American women during the premenopausal period (39%), in contrast to African American postmenopausal women (14%), and non-African American women (16%) of any age ( $p < 0.001$ ), while the prevalence of other subtypes of breast cancer did not change with race or the presence of menopause. In addition, basal tumors had significantly more mutations (44% versus 15%,  $p < 0.001$ ), a higher mitotic index (OR = 11.0; 95% CI = 5.6 - 21.7), pronounced nuclear polymorphism (OR = 9.7; 95% CI = 5.3 - 18.0). Thus, it is the basal type of breast cancer that indicates a poor prognosis for young African American women [3].

The survival rate of women of African descent with a diagnosis of breast cancer compared with women of European descent was investigated in [6]. Participated 1,130 women (612 African and 518 European) living in Atlanta, New Orleans and Oakland, aged 20 to 79 years, who were diagnosed with primary invasive breast cancer. Information about the stage of the disease, the prescribed treatment, comorbidities and demographic factors was obtained through the collection of anamnesis, examination of hospital records and test results. The study found that race and age were the leading risk factors for mortality from breast cancer. Thus, racial differences were approximately 75% in terms of patient survival [6].

The American Cancer Society in 2006 estimated the causes of morbidity and mortality from breast cancer [26]. According to the data presented, among the female population of various races, the incidence of breast cancer increased sharply from 1980 to 1987. (the period of the beginning of the mass passage of mammography). For the period from 1987 to 2002. it continued to grow, but at a slower pace. An increase in the incidence of breast cancer was found among African American women over 50, women of other races under 50. At the same time, there was a decrease in the incidence for African American women under 50 years of age. Thus, about 70% of women aged 40 and over had an annual mammogram, with incidence rates varying by race and ethnicity [26].

The American female population of different ethnic groups is most at risk of developing breast cancer in the presence of other forms of cancer. At present, the influence of psychosocial characteristics of the female body on the incidence and mortality of breast cancer is being intensively studied. The literature contains information about women of different ethnic groups with a confirmed disease in different socio-economic conditions. In [1], a qualitative study of surviving women with a previously confirmed diagnosis was carried out. A total of 102 female survivors participated in the interviews, of whom 24 were African American, 34 Asian, 26 Hispanic and 18 Caucasian. Important ethnic differences were investigated when choosing the appropriate type of treatment. For example, Asians and Hispanics were more likely to receive mastectomy, while African American women were less likely to receive adjuvant therapy, including radiation or chemotherapy. Among the women who survived, the majority, as a rule, had a satisfactory quality of life. Concerning fears about changes in the future quality of life, women predominantly named impaired general health, performance, recurrence of cancer or metastases, as well as psychosocial problems associated with anxiety about the future of their

children, burdening the family due to illness, changes in body appearance and decline libido. Additional concerns included a lack of general knowledge among patients about breast cancer, such as health care issues such as insurance and cost of services. In addition, women mentioned the following problems that they had to face in the process of treatment: language barrier with medical personnel, cultural factors related to the perception of the disease, their gender role and family responsibilities (for example, self-sacrifice). All women tested noted that their spiritual beliefs were critical in coping with stress. This study expanded knowledge about the psychosocial problems of breast cancer among women of different ethnic groups, as well as about specific cultural influences (for example, diet) and socio-ecological factors on the survival, morbidity and mortality of this group of patients. As a result, it was revealed that among women of various ethnic minorities, there were high rates of morbidity and mortality from breast cancer, as well as a later diagnosis of this disease [1].

From the analysis of literary sources, it follows that there are large discrepancies in data on the survival rate, morbidity and mortality from breast cancer among women in different countries and regions. Many complex factors underlie these changes, including population structure (e.g., by age, race, and ethnicity), lifestyle, environment, socioeconomic status, prevalence of risk factors, use of mammography, stage of disease at diagnosis as well as social accessibility of high quality medical care. Therefore, further research is needed to understand the true reasons for the differences between breast cancer incidence and mortality worldwide. The study of this problem will contribute to the development of adapted strategies aimed at reducing the incidence in general, as well as the development of standards of medical care for different groups of the population [13].

Morbidity rates were significantly higher in more developed countries than in less developed countries (72/100,000 and 30/100,000, respectively), while the corresponding mortality rates were 17/100,000 and 12/100,000. Five-year estimates of relative survival ranged from 12% in parts of Africa to 90% in the USA, Australia and Canada. Survival of patients diagnosed with breast cancer in more developed regions of the world has increased over the past decades thanks to the introduction of screening procedures for the population using mammography, ultrasound diagnostics and the systemic use of adjuvant therapy [31].

### **Influence of heredity**

The factor of heredity should be considered one of the leading causes of morbidity and mortality from breast cancer [8]. In a number of cases, joint breast and ovarian cancer is recorded, caused by mutations in certain genes. The proportion of cancers due to the BRCA1 suppressor gene mutation is about 5% in the age group under 40, 2% in the age group from 40 to 49 years old, and 1% in the age group from 50 to 70 years old [8].

A number of authors speak of the need for hormone replacement therapy in menopause in women with an increased risk of breast cancer. In this study, a random sample of 41,837 Iowa women aged 55 to 69 years. Morbidity (n = 1,085) and overall mortality (n = 2,035) after 8 years of follow-up were calculated using data from the State Health Registry in the specified state and the mortality index. Scientists reported that 12.2% of women with breast cancer had a hereditary predisposition. It was found that women genetically predisposed to this disease who used hormone replacement therapy had a lower risk of overall mortality than women who did not use this therapy (OR = 0.67; CI = 0.51 - 0.89) ... The data obtained indicate that the use of hormone

replacement therapy in women with a predisposition to breast cancer significantly reduces overall mortality [25].

However, many of the established risk factors for this disease are associated with the level of the hormone estrogen in the blood. The risk increases in the case of early menarche, late menopause, overweight in postmenopausal women, mutations in certain genes, and taking oral contraceptives or alcohol. Childbirth, breastfeeding and physical activity reduce the risk of breast cancer occurrence and development [14].

Genetically determined breast and ovarian cancer is caused by a mutation in the BRCA1 and BRCA2 genes, which were tested in blood samples, including from young patients in the UK. Mutations were found in 15 (5.9%) of 254 (100%) women with an established diagnosis of breast cancer under the age of 36 years (9 or 3.5% with a mutation in the BRCA1 gene and 6 or 2.4% in gene BRCA2); in 15 (4.1%) of 363 (100%) women with an established diagnosis, aged 36 to 45 years (7 or 1.9% with a mutation in the BRCA1 gene and 8 or 2.2% in the BRCA2 gene). 11% (6/55) of first-generation hereditary patients who developed ovarian or breast cancer before age 60 were carriers of the mutant genes, compared with 45% (5/11) of patients with 2 and more relatives of the first and second degree of kinship. Based on the data presented, the scientists suggested that carriers of BRCA1 and BRCA2 mutations accounted for 3.1% and 3.0% of breast cancer patients who were under 50 years old, 0.49% and 0.84% of breast cancer patients, whose age was over 50 years old, as well as 0.11% and 0.12% in the general population of women. Thus, mutations in the BRCA1 and BRCA2 genes have approximately equal contribution to the early manifestation of breast cancer in the UK and constitute a certain proportion of the risk for this disease in the presence of a family history [30].

A notable increase in the incidence of various types of breast cancer, benign skin tumors, and congenital malformations has been noted among children whose parents had a history of breast cancer. Understanding the biological mechanism of the relationship between breast cancer and skin tumors is possible with deeper genetic research, which may expand existing knowledge about the etiology of breast cancer [28].

Raloxifene hydrochloride is a selective estrogen receptor modulator that antagonizes the mammary gland itself and in addition to endometrial cells. An experimental risk assessment for invasive breast cancer was conducted in women with osteoporosis taking raloxifene or placebo for 40 months between 1994 and 1998. in 25 countries of the world. As a result, 30 cases of breast cancer were confirmed among 5,129 women who took raloxifene versus 27 cases out of 2,576 women who took placebo (OR = 0.24; 95% CI = 0.13-0.44;  $p < 0.001$ ). Raloxifene was found to reduce the risk of estrogen receptor-positive (ER-positive) breast cancer by 90% (OR = 0.10; 95% CI = 0.04 to 0.24), but not estrogen receptor-negative (ER-negative) breast cancer (OR = 0.88; 95% CI = 0.26 - 3.0). Moreover, raloxifene increases the likelihood of venous thromboembolism (OR = 3.1; 95% CI = 1.5 - 6.2), but not endometrial cancer (OR = 0.8; 95% CI = 0.2 - 2.7). Whence it follows that among patients with osteoporosis in postmenopausal women, the likelihood of developing a malignant form of breast cancer was reduced by 76% within 3 years as a result of the use of treatment with raloxifene. Tamoxifen citrate suppresses the action of estrogens directly in the area of the breast itself. It has been noted to improve survival in women with estrogen receptor-positive breast cancer. Scientists reported that tamoxifen reduces the risk of breast cancer by about 50% among women at risk for age (over 60) or other

risk factors. In addition, in addition to increasing the risk of thromboembolic disease, tamoxifen increased the risk of endometrial cancer [4].

## CONCLUSION

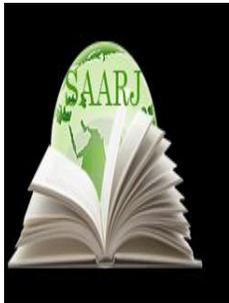

The main risk factors for the high morbidity and mortality from breast cancer include the following: overweight, high growth, physical activity, the presence of chronic diseases, depression. Among the external factors, environmental factors are especially distinguished - this is solar radiation, electric and magnetic components of electromagnetic fields. Also, it is very important to take into account factors such as heredity and the presence of hereditary oncology, and the leading among them are age and race, alcohol consumption, any type of hormonal therapy (taking oral contraceptives, hormonal therapy of menopause

### ABSTRACT

*The main purpose of learning Korean is to communicate fluently in Korean. Therefore, the importance of grammar education in Korean language teaching is highlighted in this article. The relevance of the chosen topic is explained by the comparison of closed sentences on the basis of Uzbek and Korean language materials. The purpose of this article is to consider the units of the grammatical layer of the language in the example of two languages, as well as to master the closed sentences in Korean and Uzbek, to compare its linguistic essence, as well as to understand the subtleties of meaning by reading them in different texts.*

**KEYWORDS:** Korean closed sentence, Uzbek closed sentence, comparison, 복합문, 내포문, 명사절, 관형절, 부사절, 서술절, 인용절, action name, adjective, adverb.

### INTRODUCTION

*A complex sentence in Korean "In the example of the concept of closed speech"*

The relations of the Republic of Uzbekistan with the countries of the East in the economic, social, cultural, political and scientific spheres are strengthening year by year, including a new stage in the relations between Uzbekistan and Korea. The history of social, economic and cultural ties between Uzbekistan and Korea dates back thousands of years, and the roots of these ties go back to the history of the Great Silk Road.

Complexity is the pinnacle of syntactic integrity. In Korean, a compound word is called 복합문 [pokhapmun]. Complex sentences have two parts that are structurally different from each other. In terms of its structure, it is basically a simple sentence - 단순문 [tansunmun]. This balance is especially evident in the main sections. A compound sentence, the structure of which is relatively similar to a simple sentence, can include all the main parts, that is, subject and the participle. Accordingly, in Korean, a preposition is structurally equivalent to a simple sentence, and the prepositions are synonymous with the prepositions in a simple sentence. But in this case, the question naturally arises as to how a complex sentence differs from a simple sentence. In a simple sentence, the cut is affirmative, while in the main sentence, the cut is relative. From this we can conclude that although the main sentence is considered to be structurally similar to a simple sentence, but it "needs" another sentence in order for it to complete its meaning.

In Korean, sentence types are divided into singular sentences (short sentences) and adverbs (complex sentences), and adverbs are connected sentences and closed sentences. In addition, when communicating in Korean, more complex sentences are made than simple sentences, and complex sentences are formed through them.

In Uzbek subject and main verb are important. If a sentence has one subject and one verb, it is called a simple sentence, a sentence that has two or more parts and a sentence is called a complex sentence. Because Korean and Uzbek are agglutination languages, the two languages have different propositions, and there are many additions at the core parts of verbs and adjectives. It will be easier to understand the meaning. However, due to the fact that there are more suffixes in Korean than in Uzbek, students of Uzbekistan studying Korean face great difficulties in composing Korean sentences.

The word order is almost indistinguishable between Korean and Uzbek, but differs in closed sentences. In Uzbek, as in Korean, there is one more sentence in one sentence. In Korean, this grammatical type is called 내포문 (closed sentence), In Uzbek, such a complex sentence is considered a simple sentence or a complex sentence. This is because, unlike closed sentences in Korean, they are treated as short sentences rather than complex sentences. Therefore, it can be assumed that there will be difficulties for Uzbek students in creating inclusive speech. Therefore, in this chapter, we will look at the similarities and differences through the contrast of closed sentences in Korean and Uzbek, and consider the advantages and difficulties of Uzbek students in learning Korean sentences.

**Types of closed sentences in Korean and closed sentences in Uzbek (verb form):** Closed sentences in Korean are divided into 명사절, 관형절, 부사절, 인용절, 서술절

1. 명사절- a sentence that acts as a closed sentence horse in this round.

Example: 철수가그어려운일을해냈음이분명하다. It is clear that Cholsu worked hard.

2. 관형사절- a sentence that serves as an attribute of a closed sentence in this round.

Example: 말하기대회에많은학생이왔다. Many students came to the public speaking competition.

**3.부사절-** a sentence that serves as a closed sentence following sentence in this round.

Example: 진달래가빛깔이곱게피었다 Azalea blooms beautifully.

**4.인용절-** in this round a closed sentence is a sentence that serves as a portable speech. Example:

철수는영희가참빠르다고말했다.

Chul-Su says Yong Xi is very fast.

**5.서술절-** a sentence that acts as a closed sentence main verb in this round.

Example: 토끼는앞발이짧다. The claws of rabbits are short.

The closed sentence in Uzbek is called a verb form, and the verb form is divided into action nouns, adjectives and adverbs.

- An action noun is a functional form of a verb that denotes only the noun of an action and has no meanings such as tense, person, number, or inclination. This form of the verb is formed by the affixes - (i) sh, - (u) v, moq; such as reading, writing, saying.
- Participle is one of the functional forms of the verb. Like adjectives, it is used to indicate the sign of an object and is called an participle, because of the same feature. The participle form is formed in modern Uzbek mainly by the affixes -gan, -vchi: the books which I read, the guys who wrestle.
- The action-oriented form of the adverb is a special form of a verb for use in a adverb-specific function. The action-oriented form of the adverb is a sign of action, a feature of it. The action-oriented form of the adverb can be used with any verb to describe an action. They usually indicate the sign of the action, including the time, the purpose, the cause, and are the main verb in the sentence. There are several forms of the action-oriented form of the adverb in modern Uzbek, which are made with the help of the following suffixes: — (i)b — o‘qib, ko‘rib; — a, — y—kula-kula, yig‘lay-yig‘lay; — gach (—kach, — qach), —kelgach, tikkach, chiqqach; — gani (—kani, — qani) — ko‘ringani, to‘kkani, soqqani; — guncha (—kuncha, — quncha) — borguncha, cho‘kkuncha, taqquncha and others. The action-oriented form of the adverb's negative form — may, — masdan is made with additions: o‘qib— o‘qimay, o‘qimasdan.

As mentioned above, the Uzbek language is considered a complex sentence only when there are two or more subjects and main verbs. In other words, another sentence that replaces one sentence is treated as a component that changes only one, regardless of whether it is a phrase or a sentence. This means that in Uzbek, most Korean complex sentences are considered short sentences.

## CONCLUSION

1. A number of scientific studies have been conducted on the analysis of sentences that are considered closed in Korean linguistics. In particular, Korean linguists such as Yu Hyun Gyeong, Han Chon, Hoyong, and Kim Pyong Il have thought about closed speech in their scientific works.

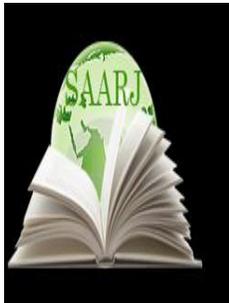

2. There are five types of closed sentences in Korean:

3. Closed sentences in Uzbek are divided into three types, but we consider them as simple sentences, not complex sentences in Uzbek.

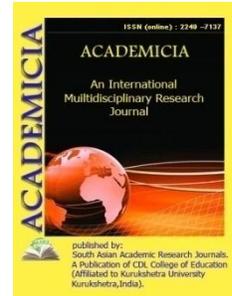

4. Each type of closed sentence differs in its meaning and syntactic functions.

**ABSTRACT**

*In the past few years the job market has changed significantly. Employers are often looking for the skills that go beyond the qualification and experience. As India have high growth in the 21st century, it becomes vital to ensure that workforce is capable to handle the incoming disruptions and find suitable jobs. Greater challenge is to tackle the problem of unskilled labor in India and take up its skilling initiatives. Many researches all over the world revealed that business management graduates lack the required skills to function effectively in the workplace and they cannot really apply the complex decision making skills, problem-solving skills that are required in the workplace. Since employability is the propensity of graduates to secure a job and progress in their career, employability is not just about getting a job, but mastering the skills needed to perform and excel in the work place.*

**KEYWORDS:** *Skilling Initiatives, Problem-Solving*

---

**INTRODUCTION**

The benefits of a growing economy are often reflected in the growing number of well-paid jobs in a country. Consequently, any policy that stimulates the economy to grow has an impact on job creation and the overall employability of the country's workforce. Large numbers of young people are entering the workforce every year. To make the most of the demographic dividend, it is critical to improve the employability of the youth. Hence, the newly set up Ministry of Skill Development and Entrepreneurship had taken up the task of coordinating all skill development efforts across the country. This includes the removal of the impediments that cause disconnect between demand and supply of skilled manpower, building a vocational and technical training

framework, developing new skills and innovative thinking, not only for existing jobs but also new jobs that will be created.

As India have high growth in the 21st century, it becomes vital to ensure that workforce is capable to handle the incoming disruptions and find suitable jobs. Greater challenge is to tackle the problem of unskilled labor in India and take up its skilling initiatives. Education Institutions should take the initiatives to enhance the employability and entrepreneurial skills. It is important to all the education institutions to explain the outcome of the education programs they offer. Most of the institutions now include a list of graduate attributes in their mission statements and strategic plans.

### **REVIEW OF LITERATURE**

The world of work is in continual change. The skills of graduates are a contentious issue for international and national employers. The employers became incapable to find graduates with the required skills to effectively contribute to the growth of the corporate and adapt to the work environment (Hesketh, 2000:245). When employers found difficulties to find skilled graduates, they started blaming education institution who they feel are responsible for developing the skills from newly employed graduates (Harvey, 2005:13). Since many universities focus on their traditional role, which is to prepare the elite to govern the nation and to provide a basis for research, universities are not always successful in preparing graduates for the demands and challenges of the work environment. Universities often expect students to master only subject matter with limited exposure to the demands of the work environment (Yorke & Knight, 2006:5). The pressure universities experience from the private sector to enhance the employability of graduates led to a major shift in the role of universities over the last decade (Barnard & Nel, 2009:3). According to Cox and King (2006:262) education institutions are focusing more on enhancing employability skills and preparing the graduates to meet the requirements of corporate world. Nowadays majority of the universities are focusing on enhancing the employability of graduates by collating the requirements of industry and economic information (Tran, 2010:9). Faculties in colleges guides the students in preparing for job interviews; encourage students to take internship, run job clubs and support students' search for part-time and casual work, and run extension activities on a range of areas (Tran, 2010:9). These initiatives by the colleges' leads to a change, but to develop the employability of graduates these initiatives are still not enough (Tran, 2010:9). Employers expect the graduates they employ to hold specific skills such as logical thinking, quick learning, communication skills, flexibility, ambition, high levels of motivation, creativity, critical thinking, initiative, teamwork and time management (Lester, 2013:1). Lack of these skills in graduates has impacted the employability of graduates in recent years to a large extent. Skill building in the universities curricula is required because number of unemployed graduates increasing year by year (Griesel & Parker, 2009:2).

### **Problem statement**

Industries place a high value on fresh graduated entrants with the right mix of skills. Employers are not satisfied with the available graduated workforce and they are not positive about graduates' readiness for work. Many researches all over the world revealed that business management graduates lack the required skills to function effectively in the workplace and they cannot really apply the complex decision making skills, problem-solving skills that are required in the workplace. Since employability is the propensity of graduates to secure a job and progress

in their career, employability is not just about getting a job, but mastering the skills needed to perform and excel in the work place. Attention should therefore be given to the specific skills graduates should master to obtain employment and function effectively in the work environment. Hence it is the responsibility of the education institutions to develop a list of skills which enhance the employability and entrepreneurial skills.

### **Aim of the study**

1. To investigate the skill requirements of the industry from graduates.
2. To increase awareness among the students about the importance of developing employability skills and entrepreneurial skills.
3. To spell out the activities that can be designed to empower the students to inculcate skill set and develop graduate attributes.

### **METHODOLOGY**

Qualitative methodology was considered to interpret and investigate the study objectives and to understand the requirements and expectations of corporate recruiters. Interviews were conducted by using a semi-structured interviewing with corporate recruiters. Feedback input was taken from alumni of the college. Through industry institution interaction the required soft skills for the students are investigated, with the help of industry experts various skill enhancement activities are drafted.

### **Concept clarification**

Employability refers to a fresh graduate possessing a set of skills and/or competencies that enable him or her to compete and secure employment, whether in formal employment, self-employment or any career (Harvey, 2003). Recently, the concept of employability has become more important due to the changing nature of the graduate labour market. This has been brought about by globalization and the rapid development of technology (Henry, Hill and Leitch, 2005). According to Henry et al. (2005), these changes bring with them opportunities at different levels. At the global level, opportunities are created from the reduction of trade barriers and advancements in technology. With advancements in technology, organizational forms have changed from the division of labour to holistic organizations (Datta et al. 2007). Additionally, the nature of work has shifted from specialization to versatility (Datta, 2001). Employability in the context of holism entails increased demand for skilled workers who have the ability to integrate work with both endogenous (meeting customers' demands, exploring new geographical locations and initiating discovery processes) and exogenous characteristics of the firm (which involves being conscious of changes in the business environment and technology and the ability to absorb multiple cultures) (Datta et al. 2007). At the organization level, the promise of employment security (stable employment relationship), a longstanding and central feature of the employment relationship is increasingly losing credibility (Cappelli, 1995). In this dynamic and competitive environment, employers demand workers with broader skills, who can manage labour market flexibility (Pfeifer, 2005; Brown, Green, Lauder and Sakamoto, 2001). According to Pfeifer (2005), there exist internal flexibility, which firms use over time or shift work to increase production in peak seasons, and functional flexibility whereby firms effectively use multi-skilled workers.

Entrepreneurship development (ED) refers to the process of enhancing entrepreneurial skills and knowledge through structured training and institution-building programmes. ED aims to enlarge the base of entrepreneurs in order to hasten the pace at which new ventures are created. This accelerates employment generation and economic development. Entrepreneurship development focuses on the individual who wishes to start or expand a business. Furthermore, entrepreneurship development concentrates more on growth potential and innovation than SME development does. Literature on entrepreneurship education shows the emergence of entrepreneurship as a discipline (Chell, 2001; Steyaert and Hjorth, 2003; Welsch, 2004). Indeed and worldwide, the number of introduced entrepreneurship education courses in different fields of study have increased significantly (see Hynes 1996, Katz, 2003, Kabongo and Okpara, 2010; Gerba, 2012) in realization of its impact on entrepreneurial skills, attitudes and intentions (Peterman and Kennedy, 2003; Matlay, 2008; Kolvereid and Moen 1997; Oosterbeek, van Praag and Ijsselstein 2010). The literature further shows that entrepreneurial values, attitudes, knowledge and skills enable students to cope with the current turbulent changes in the labour market as they provide an enriching educational experience that ensures graduates' success in the labour market (Charney and Libecap 2000).

## **DISCUSSION**

### **Organizations recruitment decision:**

In the past few years the job market has changed significantly. Employers are often looking for the skills that go beyond the qualification and experience. Hence enhancing graduates' employability skills is one of the major roles of education institutions in collaboration with other stakeholders. The skills are of importance as they enable graduates to remain sustainably employable in the world of work (Watts, 2006). Through the interview with industry recruiters it's revealed that there is a gap between the skills acquired at the university and the skills demanded by employers. For instance, while skills such as communication skills, problem solving skill, critical and analytical thinking skill, learning to learn and teamwork are mostly demanded by the industries, they are the skills the most lacking in fresh graduates. Besides focusing on developing academic knowledge, education institutions might also need to enhance students' employability skills through various skill enhancement programmes. Organizations recruitment is mainly depend on soft skills of an employee rather a hard skill.

### **Skill enhancement**

#### **Context:**

The remarkable shifts in the job market have brought pressure and responsibility on to the shoulders of educational institutions. Skill enhancement has thus become an inevitable part of any teaching programme. It is the skills that make the students employable, besides the acquisition of the degree. Students should have multiple skills to gain success in the job market.

In spite of all the efforts, practical component is missing in the curriculum. The only means through which practical oriented learning can be promoted is through these skill enhancement activities. The need for a shift from class room based instruction to experimental learning system is achieved through focus on skill enhancement activities.

Integrative thinking which is required in the practical world can be achieved through skill enhancement activities. In real life, problems rarely impact one discipline to the exclusion of

others. HR problems need finance support; operations issues have HR angle; marketing solution depends on production capabilities and so on. Thus thinking in silos can be avoided and more meaningful solutions can be arrived by incorporating skill enhancement activities. Inter-disciplinary approach can be promoted through these activities.

**Practice:**

In order to develop and enhance skills in different areas, various associations with the specific objectives of organizing wide range of activities through which relevant skills can be developed. These activities should be organized after the regular class hours. Faculties, who judge the competitive activities, give useful suggestions to the students for improving their skills. Following is an account of some of the skill enhancement activities:

**Skill enhancement activities:**

Learning beyond the class room is encouraged through skill enhancement activities designed in the form of management games. These management games are in the form of simulation exercises replicating the challenging situation faced in the corporate world so that students have a feel of it and are well prepare to face them. The games aim at developing team building, communication, strategy development, problem solving, decision making, coordination, creative thinking etc.

Those who design the game interact with professionals and take their guidance. This experience itself enriches them as they have to dive down deep into the area to formulate meaningful activities. Professionals who are like mentors to the student share their experiences and point out the novel and innovative skills required. Hence the activities should be designed in such a way that these skills are tested.

Various subject associations with the help of eminent alumni and industry experts' designs the activities related to their area. Finance association should organize programmes to improve the knowledge and give practical exposure to the students in the field of finance and also promote analytical problem solving and decision making skill along with the promotion of ethical practices.

Marketing association should organize the activities to promote innovative thinking, convincing skill and confidence to face cut throat competition

HR association with the objective of the improving the inter-personal skill, leadership skill and promoting group dynamism should organise the activities.

Computer association should promote Digitalization in all Functional areas of management by giving exposure to the students through simple activities design to promote use of IT knowledge.

Literary association should organize activities to promote the much needed skills both written and oral communication which are very much required in corporate communication.

**Entrepreneurship development programme**

To inculcate the thought of creating own business teachers should create EDP Cell in their college. Initiatives should be taken to invite alumni entrepreneur to the institution and organize programme where they share their experiences, it fosters practical knowledge and allows young professionals to rub elbows with established entrepreneur. It also should organize EDP workshop

to motivate the students and also create awareness about various government schemes and incentives. Activities like venture launch test the business acumen and more importantly such activities create dynamic team which brings like minded students together and forge relationship, who in future may become business partners.

To induct the students into the exciting and challenging world of entrepreneurship in their first year of study itself, students should be given an assignment on visiting a business entity and interact with entrepreneur and prepare a study paper based on the interaction. This gives them exposure and their first step into entrepreneurship motivates to go further. Inspire by the experiences of the interaction, many students are able to find their mentors in their enterprises. Students are also encouraged to take part in entrepreneurship contest conducted by leading organization.

EDP Cell should organize student presentation not only on successful entrepreneurs but also arranges programme to proverb the failures. By studying of past or present corporate success stories and learning about operational hiccups, students can dig deeper into the mind frame that executives imbibe to make stellar decision. EDP Cell should encourage students to take up apprenticeship and internship. They are also motivated to take active part in the family business and gain valuable insights from their family members. They are guided to take up innovations in their family business through diversification and digitalization.

EDP Cell motivates the students to run their own micro enterprises. Institution supports them through alumni entrepreneur who focus on their mentees personal and business development by sharing recourses and network and encouraging them to break out of their comfort zone. Thus the budding entrepreneurs get an informal training, better marketing information and technical inputs which enable them to turn ideas into profitable ventures. Thus the mentor literally becomes entrepreneur's window to the world. A piecemeal approach to mentoring cannot bring desired results. It requires committed focus across multiple streams and segments such as Banking, Development agencies and Industries which can ensure a long lasting impact.

Thus Programmes aimed at promotion of multi various skills have empowered the management graduate to perform well in the corporate and have also supported the students in their entrepreneur venture. This is evident from the success of alumni's who are holding key positions and also successful entrepreneurs. Encouraged by this, continues efforts are made by the institution to ensure that students who passed out from the portals of SDM are more skilled and job ready to meet the industry requirements.

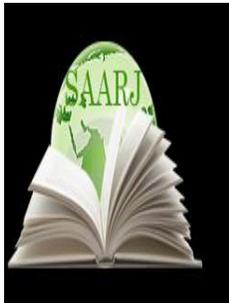

#### **RECOMMENDATION & CONCLUSION:**

A country can have sustainable development through substantial investment in human capital. Skilled and potential manpower and entrepreneurs are required for the progress of the country. While demand of labour market is growing eventually, skill gap between graduates is also widening. The main reason for this gap is lack of graduates' engagement in enhancing employable skills. With a unified vision for the education system, higher education institutions, industry leaders and public sector organisations can form alliances to promote skill development among students to enable to thrive in a professional set up. By establishing standards across different sectors and defining the competencies required for each role, they can enable uniformity in the job market and hiring parameters of organisations. As a result, students can

make a much more focused choice on the career they want to pursue and skills they need to acquire.

### ABSTRACT

*This article discusses the issues of creating the history of the statehood of the Republic of Karakalpakstan, based on a scientific point of view. The author emphasizes that such work is being carried out in modern Karakalpak historiography. The author also offers his own vision of the problems of memoiristics in the Republic of Karakalpakstan.*

**KEYWORDS:** *Statehood, Historiography, Memoirs, Memoir Literature, Remembrance, Kazakh-Karakalpak Autonomous Region, Khorezm People's Soviet Republic.*

### I. INTRODUCTION

As the First President of the Republic of Uzbekistan I.A. Karimov: "Statehood is currently an important political issue. For there are still forces that, through third parties, carry on propaganda that there was no statehood in Uzbekistan, they are trying to introduce this idea into our consciousness and even assure the international community of this". [15, P.135]

The main task of historians today is to prove the groundlessness of such statements, to create a history of our statehood based on a scientific point of view. And such work is being done in modern Karakalpak historiography. [10; 4; 11, P.15; 12, P.14-15; 13; 7; 21; 23; 17, P.416-428]

"Every nation, - stated the First President of the Republic of Uzbekistan I.A. Karimov - seeks to remember and respect his ancestors". [15, P.145] In this regard, the memoir literature contains very valuable information about the processes of restoration and development of the national statehood of the Karakalpak people from 1920 to 1932 years.

From a cultural and historical point of view, memoir literature is a fairly new phenomenon in the historiography of Karakalpakstan. It has become a tradition to write memoirs by the leaders of

the country, writers, military commanders about their life path, about participation in historical events.

Thus, the changes in the social and state life of our republic currently have ambiguous consequences. A new system of values is emerging that integrates the traditional orientations of the spirituality of the Karakalpak people. For example, the feeling of cultural isolation has disappeared in our people, and many values that were unfairly forgotten are returning in the memories of some individuals. In many respects, the spiritual potential of the past eras is being mastered anew, the phenomena of the past have begun to be elucidated by historians from modern positions. And also during the period of social reforms, there is a need for society in works of the biographical genre, which enable historians to create and reconstruct the image of the era.

The works of the memoir genre are a source of research in various sciences: history, literary criticism, psychology, sociology, philosophy, cultural studies. Therefore, we agree with the researcher Golovina T.I. that studies of the genre of memoirs lead to the synthesis of a number of sciences, "... the formation of a dialectically interconnected complex of scientific ideas about culture as an integral and diverse system, in which a person is a bearer of cultural qualities, a subject of spiritual activity". [6, P.3]

## II. MAINPART

The memoirs of Palvaniyaz Yusupov are of great importance when restoring the historical events of the 1920s, when Mukhammadrahim Allabergenov (chairman of the Central Executive Committee), Menglikhoja Ibniyaminov (chairman of the Council of People's Nazirs), Abdullahodzha Abdurakhmanov (Nazir of Agriculture), Oraz Yermanov (Nazir of Justice), (chairman of the Kazakh-Karakalpak department of the Central Executive Committee) and others realized the age-old dream of the Karakalpaks and Kazakhs, forming the Kazakh-Karakalpak Autonomous Region within the Khorezm Republic. [26]

Memoirs of Palvaniyaz Yusupov, which is a manuscript and consists of 323 whole sheets (645 pages of text), were criticized by M.Kh. Aliakberov [3, pp.71-74], L.M. Landa [19, pp.74-75], K.B. Mukhammedberdiev [20, pp. 60-64], R.I. Rakhimov [22, P.79-81].

P. Yusupov notes that the city of Khojeyli was chosen as the center of the Kazakh-Karakalpak Autonomous Region. The region was supposed to include the cities of Kunya-Urgench, Chimbay, Kungrad. On May 25, 1924, this proposal was discussed at the Bureau of the Middle Asian Bureau of the Central Committee of the All-Union Committee of the Bolshevik Party. Initially, it was supposed to gather all the Uzbeks and form the Uzbek Republic with its center in the city of Samarkand; all Turkmens centered in the city of Bukhara, and all Kazakhs and Karakalpaks of Khorezm, Bukhara and Turkestan centered in the city of Khojeyli. Representatives of the authorities were sent to the regions to find out the opinion of the population. [26, pp.455-456]

However, P. Yusupov considers Menglihoja Ibniyaminov to be a Kazakh. On August 28, 1924, M. Ibniyaminov together with I. Khansuvarov left for the city of Khojeyli to organize the Shuro Kurultay. P. Yusupov also covers the fact that on September 2 a meeting was called on the Begzhab tragedy. At the meeting, the names of the applicants killed on the bank of Begzhab were announced: Mukhammadnazir Odamov, Pir Kutlumuradov, Pirjan Muratov, Pirnafas

Babadjanov, Allabergen Zargarov, Mukhammadsharif Pakhlavanov, Vafaev, Sharipov, Babadjan Muradov. The bandits got the wife of Karimbergen Sapayev Anabiybi, Nogay girl Baygeldieva and another Russian girl. By the recommendation of the meeting, September 3-5 was declared a mourning day in the Khorezm Republic. [26, pp.465-466]

November 21, 1924, - P. Yusupov notes, - Moscow allowed the formation of autonomous regions within the Khorezm Republic. The Uzbek regions retained: Khiva, Pitnyak, Khazarasp, Besharik, Khanka, Urgench, Gurlan, Mangit, Klichbay, Kat, Shahabad, Gazabad, Monok, Kushkupir. Here the author is mistaken about one thing - Mangit was transferred to the Kazakh-Karakalpak Autonomous Region.

The following were transferred to the Turkmen Autonomous Region: Tashauz, Iliyali, Porsi, Kunya-Urgench, Kukchaya, Dargan, Sadivar.

To the Kazakh-Karakalpak Autonomous Region, according to P. Yusupov, was transferred Khodjeyli, Kungrad, Chimbay, Kipchak, China. Gorodetsky, Davlet Rizaev, Vais Rakhimov and others actively participated in the division of property.[26, P.469]

Thus, the memoirs of Palvaniyaz Yusupov, despite some inaccuracies, are a valuable source for recreating the history of the formation of the Kazakh-Karakalpak Autonomous Region within the Khorezm Republic in 1923-1924 years.

In this regard, the words of the First President of our state I.A. Karimov's: "... by the word "memory" we mean memories of our ancestors, the continuation of their noble deeds. This quality has been inherent in our people since ancient times. A nation that has no memory, has forgotten its history, does not remember its ancestors, has no future. This truth is confirmed by the whole history of mankind.

We must honor both those who have gone through many trials and difficulties in life, have not spared their lives in the name of the Motherland, in the name of this clear sky, and the older generation that is among us today".[16, P.376]

Thus, memories of the activities of the organizers of the restoration of the national statehood of our Karakalpak people - A. Dosnazarov, I. Bekimbetov, O. Bekimbetov, A. Kudabaev and others - are of great importance.

Kalli Aimbetov, a student of the Chimbay boarding school, recalled the events of the autumn of 1924 in his hometown: "During the lessons, the teacher lined up all the students in front of the boarding school. He said that yesterday Alliyar Dosnazarov left Turtkul in a phaeton, today he will be in Chimbay. We must meet him. The students took to the Orys Jol highway (literally - Russian road). They were served by the city bakers. In the evening A. Dosnazarov arrived in a phaeton. With him was his assistant Pakhratdin Chunchaliev (Fakhretdin Sunchaliev). The rally began, led by the secretary of the Chimbay district committee, Nurgabil Keunimjaev, and the chairman of the district executive committee, Dosimbet Kurbaev. At night, a meeting began in the building of the city's aksakal. The children listened to his speech through the window". [1, P.112]

Eshmurat Sultanov recalls that in 1924 he was campaigned for a trip to study in the city of Turtkul by the secretary of the Kungrad Komsomol organization Koptlew Nurmukhamedov. Together with him, Abil Matjanov, Gaip Khakimbaev, Mirzek Kalimbetov and others expressed

a desire to study.

At the rally in the city of Kungrad, applicants were warmly accompanied to Turtkul by the chairman of the Executive Committee, Kungradbay Yakubov. In Turtkul, students were met by the secretary of the organizational bureau of Karakalpakstan A. Dosnazarov, the chairman of the regional executive committee Kasim Avezov, the secretary of the regional Komsomol organization Kazakbay Allabergenov.

The group of students was divided into three groups: pedagogical technical school (representative Nuriddin Sagitov), agricultural technical school (director Oralov), Soviet-Party school (director Ablanov). [24, pp.36-38]

The mood of the leaders of the Kazakh-Karakalpak department was mainly determined by those trends that were characteristic of the population of the left bank of Karakalpakstan as a whole. Their national self-awareness has grown incredibly and faith in a near victory has constantly grown. Among the leaders of the left-bank Karakalpakstan, attachment to the idea of restoring the statehood of the Karakalpak people was very strongly developed, there were enduring memories of historical figures who at different times played a large role in the struggle for it.

In the Kazakh-Karakalpak Autonomous Region, the following entered the political arena during this period: Sarimoldaev, Balabaev, Sharipov, Safidullaev, Sayidrasulev, I. Mukhamednazarov, Mirmakov, Esemurat Erniyazov, Toreyev, Sarsenbaev, Mingbaev, Nurallaev, Uafaev, Khodjaev, Baltaev, Nawrizbaev, Ibadullaev and others. [18, pp.97-98]

On the eve of the fifth Kurultay of the Soviets of the Khorezm Republic, Isak Khansuvarov, Karimbergen Sadullaev, Sarimuldaev, Karim Baltaev, Mirsharap Masharipov, Khalidov visited the Kazakh-Karakalpak Autonomous Region.

The Khorezm People's Soviet Republic (KhSNR) was a formally independent, but in fact an ephemeral state formation created by the Bolsheviks on the territory of the former Khiva Khanate. Along with other similar state formations, such as, for example, the Bukhara People's Soviet Republic proclaimed in October 1920 (or the Far Eastern Republic that existed in 1920-1922), the KhSNR was intended to serve as a kind of intermediate stage in Sovietization captured by the Bolsheviks during civil war of the national outskirts of the former Russian Empire.

Young people from the Kazakh-Karakalpak Autonomous Region were sent to study in Khiva at the Pedagogical College and to refresher courses for teachers: from Khojeyli - Umar Buleshov, from Kungrad - Koptlew Nurmukhamedov, Nagmet Kuzenbaev, Yaumitbay Ismetullaev, Zulfuhar Ersheev, Temir Jumaniyazov. [8, P.6]

The city of Kungrad became another center for the development of intercultural relations. On the initiative of Khamza, a theater troupe was organized here consisting of Tolek Saribaev, Zeynep Murtazaeva, Juman Rozimov, Uzakbay Nurjanov, Tagan Yakupov, Kamal Turaev, Kurbanbay Aralbaev, Tanirbergen Rambergenov. [9, P.152] Progressive youth actively flocked there, assistance was provided from Khorezm in the form of sending trade and cultural and educational caravans.

According to N.A. Baskakov, "... in Khiva, Khorezm region, as well as in Karakalpakia in the 20-30s of the XX century there were famous puppeteers and masqueraboses: Tokhtamurat

Matyakubov was especially popular in Khiva and Urgench, which contained a theater of hand puppets and puppets, as well as his own state musicians and masqueraboses, Eit-kogurchakchi - one of the best puppeteers of the manual puppet theater and puppet theater, masqueraboses Bekman-gokkachi, Abil Vasinov and Karakalpak Klichbai Artikbaev; in Karakalpakia - both on the right and left banks of the Amudarya - the largest masqueraboses were Komek-Sakhaw, Khudaynazar, Aytbay-sari, Sherimbetbay and Kallibay Meliev.

Khorezm puppet theaters Kol-kogurchak, Chadir-khayal and masqueraboses also toured outside Khiva and Urgench. Their performances were seen by residents of Gazavat, Takhta-Bazar, Tashauz, Iiali, Aktepe, Kunya-Urgench, Khojeyli, Porsu, Klychniyazbay, Gurlen, Khanka, Turtkul, Beruni, Nukus, Chimbay, Kungrad. [5, pp. 48-49]

Thus, in the Khorezm Republic, great attention was paid to the national issue, the Kazakh-Karakalpak department was created under the Central Executive Committee, then the Kazakh-Karakalpak autonomous region was formed. In fact, the leaders of the left-bank Karakalpakstan initiated the restoration of the national statehood of the Karakalpak people.

### III. RESULTS AND DISCUSSIONS

It should be emphasized that the question of the formation of the Karakalpak Autonomous Region and the reunification of both parts of the lands of Karakalpakstan was raised by the Karakalpak representatives in Tashkent: students of the party school A. Dosnazarov, I. Bekimbetov and others. In the highest echelons of power in the Amudarya region there were groups of T. Napesov and E. Rustamov, who gravitated towards the Khorezm Republic.

On August 25, 1924, the Executive Bureau of the Amudarya Regional Committee of the Russian Communist Party of Bolsheviks of Turkistan considered the issue "About Comrade Dosnazarov, who announced his entry into the Commission for National Delimitation". It was decided: "In connection with a whole series of telegrams received from Comrade Dosnazarov about his joining the delimitation commission, send a telegram to the Central Committee of the Communist Party of Turkistan, categorically protesting against the appointment of Dosnazarov to the commission on such a serious issue as national delimitation, especially that the Karakalpaks do not recognize Dosnazarov as their representative". [7, pp.32-33]

The leaders of the Amudarya Regional Committee of the Communist Party of Turkistan, T. Napesov, A. Sidorenko, and N. Vorob'ev, not only did not put the issue of creating an autonomous region on the agenda, but also obstructed the activities of the Karakalpak National Subcommission. But, thanks to the help from the Middle Asian Bureau, the subcommittee continued its work.

In August-September 1924, more than 20 meetings and rallies, two volost conferences on agitation and propaganda of the formation of the Karakalpak Autonomous Region were held in the districts and villages of the Amudarya region.

September 6, 1924 in Tashkent at a meeting of the territorial commission for the delimitation of Central Asia chaired by I.A. Zelensky discussed the project of territories, maps and borders of the future Karakalpak Autonomous Region developed by A. Dosnazarov's group: the entire Amudarya Region of Turkestan and the Khojeyli (Kazakh-Karakalpak) Autonomous Region of the Khorezm Republic were to be included in the projected Karakalpak Autonomous Region.

It was suggested that from the point of view of the economic situation of the future region, it is more advantageous to have close relations with Kazakhstan, since there are fish lands here, which served as one of the most important sources of income for the region. This argument was expressed by Sveklov: "... the fishing grounds will enter the territory of the Kirgiz Republic, that is, the Aral Sea will be located on the territory of the Kirgiz Republic and cannot be divided, because in the event of division it will lose its power".

On September 9, 1924, A. Dosnazarov and A. Kudabaev in a note "On the issue of the annexation of the Karakalpak Autonomous Region to the Kyrgyz Republic" agreed with this argument, singled out the Aral Sea as one of the means of transport, the "Chimbay-Kazalinsk" and "Chimbay-Ak-Mosque", the connection of Kungrad with the Aday district, way of life, culture and common language.[7, P.35]

It was proposed to divide the entire Karakalpak Autonomous Region into four districts: Chimbay, Shurakhan, Khodjeyli, Kungrad.

8 people spoke on the presented project at the meeting of the commission. The commission decided the Khodjeyli and Kungrad regions of the Khorezm Republic, the Chimbay district of the Amudarya region, within the limits in which they existed before that time, were attributed to the composition of the Karakalpak autonomous region being created. The Middle Asian Bureau of the Central Committee of the Russian Communist Party of the Bolsheviks was supposed to resolve the issue of the entry of this national association into one of the republics: Kazakhstan, Uzbekistan or Turkmenistan.

A day later, on September 7, 1924, the Middle Asian Bureau approved this decision of the territorial commission, however, the question of including the Karakalpak Autonomous Oblast in one of the union republics was still open.

On September 16, at the meeting of the III emergency session of the Turkestan Central Executive Committee, the delegates heard a speech by A. Dosnazarov, but decided to postpone the decision on granting the status of an autonomous region to the population of Karakalpakstan. It was negatively affected by the fact that the delegates, relying on their own knowledge of the national question, did not take into account the many wishes of the representatives of the Karakalpak people, who knew perfectly well who deserves the right to independent statehood.

Nevertheless, on September 18, 1924, a meeting of representatives of Karakalpakstan was held in Tashkent, where the Organizational Bureau of the Karakalpak Regional Party Organization was elected - a special working body for convening the First Constituent Regional Congress of Soviets. On September 23, the Middle Asian Bureau recommended the Political Bureau of the Central Committee of the Russian Communist Party of Bolsheviks to approve the composition of the Organizing Bureau. [25]

The Middle Asian Bureau of the Central Committee of the Russian Communist Party of the Bolsheviks did not want to resolve the issue of granting autonomy to the Karakalpak people. Here, the principle of democratic centralism, designed for the "pointing and guiding" role of the center, worked hard.

On September 26, 1924, at the second Plenum of the Kazakh Regional Committee of the Russian Communist Party of Bolsheviks, A. Dosnazarov said: "... we do not want to lag behind our neighbors ... We insist and will continue to insist on granting autonomy to Karakalpakstan". [2]

---

A day later, on September 27, at a meeting of the Kazakh Regional Committee of the Russian Communist Party of Bolsheviks, A. Dosnazarov informed that the Middle Asian Bureau agreed with the question of creating the Karakalpak Autonomous Region, but there was still no final decision on assigning this region to one or another republic.

#### IV. CONCLUSION

Thus, the Karakalpak people, as a result of national-territorial delimitation, received a certain state status, although this status had the Soviet model. The formation of the Karakalpak Autonomous Region gave a great impetus to the development of the Karakalpak people, its economy, culture, and also influenced its cadres, since the Karakalpak people received their state status, representatives of the Karakalpak people began to be involved in managing the state apparatus, thereby training and placing personnel in all spheres of the socio-economic sphere received a new content.

It should be emphasized here that the publication of the Resolution of the President of the Republic of Uzbekistan “On the establishment of the Public Council on the Modern History of Uzbekistan under the Ministry of Higher and Secondary Specialized Education of the Republic of Uzbekistan”, the Resolution of the President of the Republic of Uzbekistan “On measures to further improve the system of organizing research in the history of Uzbekistan”, decrees of the Government of the Republic of Uzbekistan “On the preparation and publication of the New history of the Republic of Uzbekistan”, “On the activities of the Institute of History of the Academy of Sciences of the Republic of Uzbekistan”, the development strategy of the Republic of Uzbekistan for 2017-2021 shows that after achieving independence in Uzbekistan, much attention is paid to the study of the true modern history of the people. As the First President of the Republic of Uzbekistan I.A. Karimov emphasized: “Turning to history, it is necessary to proceed from the fact that it is the memory of the people. Just as there cannot be a full-fledged person without memory, so there cannot be a future for a people without their own history”. [14, C.77]

We agree with him, because memory is a form of social consciousness, a mirror of social ideology and psychology. Therefore, history to the greatest extent should fulfill its main function - the role of social memory of society. In it, society seeks for itself the social guidelines it needs, spiritual values, traditions, norms of behavior, and so on.

## USING AUTHENTIC MATERIALS IN ENGLISH CLASSES

**Tursunoy Shodiyorovna Karshiyeva\***

\*PhD Student,  
 Samarkand State Institute of Foreign Languages,  
 UZBEKISTAN

---

### ABSTRACT

*This article discusses the use of authentic (original) language materials in foreign language lessons, and highlights the effective use of foreign language-specific words, phrases, and expressions in such materials. Researchers note that when real materials are used to teach students, students realize that they are learning real language for communication, unlike classroom language. Unlike textbook design, authentic materials are very active, fun, and engaging.*

**KEYWORDS:** *Authenticity, Authentic Material, Motivation, Visual Stimulus, Interactive, Cognitive Demand, Linguistic Demand.*

---

### INTRODUCTION

Authentic or original language content is content created for native speakers, not teaching or learning. These materials are much more complex than textbooks and include art books, audio and video materials, magazine and newspaper articles, radio broadcasts, advertisements, kitchen menus, and more. Such materials are not complex and simplified because they are not designed for teaching purposes. There is a view and research that the use of such materials in language learning develops language aspects with high efficiency.

Lecturers began to use authentic materials in the 1970s as a result of the spread of communicative language teaching methods. Debates and debates about the use of authentic materials, authenticity, and the meaning of authenticity have been on the rise in recent years and now cover areas such as sociolinguistics, intercultural research, ethnology, and social psychology.

### **The Main Findings and Results**

Martinez [3] defines authentic materials as materials prepared for native speakers and not used for educational purposes. That is, such materials are not designed or simplified for teaching purposes. Because authentic materials are so diverse and complex, choosing them correctly in textbooks can increase the effectiveness of teaching. Authentic materials are complex but also interesting. For this reason, its use in the classroom, additional explanations, explanations and vocabulary by the teacher make it easy to learn authentic material.

The teacher should incorporate authentic materials into the learning process and constantly confront students with the original language. But that doesn't mean you should just turn away from the textbook using authentic material. Authentic materials provide access to real language and content, not in the form of language. Therefore, because they are used outside the classroom, they feel that they are learning the target language, which in turn motivates them.

Richards points out that there are a number of reasons why authentic materials are used in the classroom. They are:

1. They prepare learners for real life;
2. Meets the needs of learners;
3. Has a positive effect on motivation;
4. Encourages the teacher to use effective methods;
5. Provides authentic information about the culture.

Because of this, authentic materials help to understand the relationship between the language presented in the lesson and the language in real life situations.

Students who listened to the original radio broadcasts performed better in terms of listening comprehension than students who did not listen to such broadcasts [2]. Research has shown that the more authentic a student is faced with, the higher his or her ability to listen and understand.

There are many different types of authentic materials that can be used in the classroom, but the most common are newspapers, magazines, TV shows, movies, songs, and literature. The most useful of these is the internet. Because printed materials are very easy to wear. But online resources are constantly being updated, offering an active approach that is both visually stimulating and interactive.

Researchers note that when real materials are used to teach students, students realize that they are learning real language for communication, unlike classroom language. Unlike textbook design, authentic materials are very active, fun, and engaging. The goal of learning a foreign language is to be able to use it in the real world, in real situations. Because of this, teaching using authentic materials brings learners closer to the use of language in the real world and allows them to communicate easily in real situations without losing themselves.

According to some scholars, the authenticity of the material is considered useful and reliable material for the student only when it is understood, and for this, students must be interested in and participate in such materials. For material to be authentic, it must stimulate student interest in addition to their knowledge and skills. Authenticity can only be achieved if there is a

connection between the author's goal and the student's interpretation. In other words, the material can be authentic only if the meaning understood from the material is correctly understood by the reader. Such materials can be not only original in the real world, but also authentic, created by language teachers.

When choosing authentic materials, we must have a clear pedagogical goal - what students want to learn from these materials. With pedagogical support from the teacher, students study these materials with confidence and interest. One of the solutions to the problem of difficulty in authentic materials is to simplify the text according to the level of the reader. This can be done by removing a complex word or structure, or replacing it with simpler, less academic words. In order not to violate the authenticity of the text, the following parameters should be considered:

- Linguistic simplicity: grammatical structures, lexical units and readability;
- Cognitive simplicity: learner age, education and interests;
- Psychological simplicity: is it subject to traditional social norms?

Another solution when authentic text is difficult is to assign related tasks (pre-, while, post-tasks):

1. Pre-task - a task given before reading or listening. It can present, discuss, translate, or comment on difficult words that may be encountered in the text. This process also activates the learner's previous knowledge and prepares them for the main task.
2. While-task - a task performed while reading or listening. Creates communication between the speaker / writer and the reader and encourages them to be active in the process. Certain words or phrases can be highlighted or emphasized.
3. Post-task - a type of task that comes after the listening / reading process. Post-text questions are tasks that focus on specific areas of the text being read or listened to.

Genhard divided authentic materials into the following categories [1]:

1. Real listening materials like radio news, cartoons, songs and so on.
2. Real visual materials such as street signs, pictures of magazines and newspapers, postcards and so on.
3. Actual printed materials such as sports publications, newspapers, restaurant menus, train tickets and more.

Language learning requires strong motivation for learners, and one way to share motivation is to show them that they understand the language, the authentic material, used in real-life situations.

The following are some of the advantages of authentic materials in education:

Authentic materials bring the learner directly to the original language.

1. Media coverage is always new and frequently updated.
2. Materials from a particular source will be relevant to a particular area, and after reading that source, learners will be proficient in English in that area.
3. Authentic materials provide learners with new information based on their needs. By choosing and using authentic materials correctly, the teacher creates a lasting bridge between students and

real language in the real world. Using as much authentic material as possible will be effective and allow students to correctly interpret the content of the original text. Such materials, first of all, instill self-confidence.

Another aspect of authentic material is that such sources also enhance cultural awareness because they cover a particular culture. That is, the learner begins to understand how to use language in what situation, in what situation, and better understands the differences and similarities between one's own and other cultures.

Genhard offers eight criteria for selecting authentic materials [1]. They are:

1. Adapt to the needs of the textbook and the student;
2. Interesting topic;
3. Cultural compatibility;
4. Logistics aspects;
5. Cognitive requirements;
6. Linguistic requirements;
7. Quality;
8. Scope of use

This process unites, activates and attracts students. Students actively listen to their peers to ask and answer questions. In addition, in the course of their research, they come across thousands of words and real language used in authentic materials.

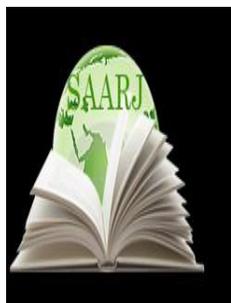

## CONCLUSION

In short, authentic materials are materials created for native speakers of the original language, not for teaching and learning purposes. The usefulness of authentic materials in teaching various linguistic aspects has been emphasized and discussed by several researchers.

Research shows that authentic materials are beneficial in every way. Such authentic materials show the reader how the language is used in real life situations in the real world and improve and improve general language competence, reading comprehension, writing, communication competence and lexical knowledge. Research shows that there is a strong correlation between the use of authentic materials and an increase in lexical richness. In other words, students who use authentic materials do better than those who use textbooks. Those who prefer to use authentic materials say that such materials increase student interest, motivation and confrontation with the original language in real life.

**ABSTRACT**

*The article describes the problems from the emergence of man-made waste and the priority tasks of their solution, the analysis of the technology of enrichment of tungsten-containing ores and their wastes, the study of the chemical and mineralogical composition of man-made tungsten-containing wastes from the Ingichka mine. The results of the study of the distribution of tungsten throughout the entire space of the main technogenic formation during the production of tungsten concentrate at the concentration plant of the Ingichka mine are described. And also the results of studies of the processes of gravitational, flotation and combined washability, a developed technological scheme and a circuit diagram of devices for processing stale tailings, carried out by senior lecturers of the "Mining" department of the Almalyk branch of the Tashkent State Technical University, Ph.D. Associate Professor Mutalova M.A. and Khasanov A.A.*

**KEYWORDS:** Mineral, Mineral, Tungsten, Mine, Losses And Depletion Of Mineral Resources, Beneficiation, Metallurgical Industry, Technogenic Deposits, Stale Tailings, Processing, Environmental Safety, Efficiency, Profitability.

## INTRODUCTION

In the world, despite the proposed commissioning of new deposits, the growth of ore reserves will lag behind the growing needs of the industry. As a result, much attention is paid not only to maximizing the degree of utilization of continental deposits, but also to the development of secondary raw materials, technogenic deposits, as well as ore reserves of the shelves and the ocean floor. All this indicates that at present, all-round increase in the complexity of the use of mineral resources by creating low-waste and waste-free processing of mineral raw materials is becoming extremely important [1; from. 90].

The concept for the development of the metallurgical industry in Uzbekistan defines the tasks and priority directions for the development of non-ferrous metallurgy by the development and implementation of innovative technologies both in primary production and enrichment, and from technogenic secondary raw materials, which make it possible to extract valuable components into a marketable product - precious, rare and rare-earth metals, create new technologies and production.

This task has several priorities. Firstly, the metal extracted from secondary raw materials is much cheaper than the extracted metal from ore mined from the subsoil, due to a number of reductions in technological processing. Secondly, after the extraction of metals from waste, the latter can be usefully utilized into finished products, a waste-free technology is created, while the issue of environmental protection is being solved in parallel [2; from. 94-104].

### Main part

Currently, the Republic of Uzbekistan has accumulated more than 2.3 billion tons of waste from non-ferrous metallurgy enterprises. Consequently, the involvement in the production of tailings of concentration plants and waste from metallurgical plants is an urgent task of the mining and metallurgical complex of the Republic and environmental protection.

An important problem of creating a waste-free technology is its organizational and technical principles, where the development of processing methods and the choice of equipment, the structure of departments and economic efficiency play an important role. In this aspect, there are positive experiences of a number of mining and processing enterprises, both in foreign countries and in the countries of the commonwealth of independent states [3; from. 92-95].

For the processing of the materials under study, the authors of the studies decided to check a number of technological schemes and enrichment methods in order to identify the optimal option for the layout of the circuit diagrams of devices and modes of conducting technological processes. As methods of enrichment and circuits of the apparatus chain, the following were selected: carrying out experiments on enrichment of stale tailings on a screw separator with a cleaning and on a concentration table with two cleaners; experiments using the gravity method in combination with flotation according to the Petrov method; experiments on the gravity method in combination with a jig with cleaning and check jigging, then enrichment of the product on a concentration table, preferably with two cleaners, also replacing the jig with a screw separator.

When performing the work, modern complex research methods were applied, including:

- analysis of scientific and technical information on the chemical and mineralogical composition of waste and tailings;

- Theoretical research using the analytical method of analysis;
- studied the content of valuable components by atomic emission spectroscopy;
- Laboratory experiments, pilot industrial tests;
- Electron microscopy, X-ray structural analysis, assay, chemical and phase analysis methods;
- Mathematical methods for processing test results.

In the process of performing research work, various reagents and several laboratory installations and techniques were used [4; pp. 135-139].

The reliability of the results obtained is substantiated by significant volumes of laboratory and pilot-scale pilot tests with satisfactory convergence of the experimental results and confirmation of the main idea of research work on the extraction of tungsten from production waste.

All experimental results were obtained using modern research methods such as IR spectroscopy, X-ray diffraction, potentiometry, scanning electron microscopy and atomic adsorption, as well as positive acts of laboratory and experimental industrial tests.

## **RESULTS AND DISCUSSION**

For the processing of the materials under study, it was decided to test a number of technological schemes and enrichment methods in order to identify the optimal option for the layout of the circuit diagrams of the apparatus and the modes of conducting technological processes. As methods of enrichment and circuits of the apparatus chain, the following were selected: carrying out experiments on enrichment of stale tailings on a screw separator with a cleaning and on a concentration table with two cleaners; experiments using the gravity method in combination with flotation according to the Petrov method; experiments on the gravity method in combination with a jig with cleaning and control jiggling, then enrichment of the product on a concentration table, preferably with two cleaners, also replacing the jig with a screw separator [4; pp. 12334-12338].

When enriching materials with a finer dissemination of minerals, processes and schemes are complicated with the addition of methods of reverse flotation, flotation gravity, magnetic and electrical separation, roasting and chemical treatment [5; p.608].

The practical results of the study are as follows: experimental installations were created for carrying out large-scale laboratory and pilot-industrial tests; the main factors influencing the degree of extraction of tungsten into concentrate are determined, and the optimal parameters of the beneficiation process are established; the technical parameters of the jiggling machine, concentration table, flotation machine and screw separator have been developed and calculated; a technology for extracting tungsten from the stale tailings of the Ingichki concentrating plant has been developed; for the first time in the Republic of Uzbekistan, a tungsten concentrate with a WO<sub>3</sub> content of up to 35.0% and an extraction of 69.75% was obtained from the tailings of an enrichment plant.

Finely disseminated scheelite ores with a low WO<sub>3</sub> content are enriched by flotation, and with a large dissemination of the mineral, enrichment can be carried out by combined methods, jiggling, concentration on tables and flotation. The finished product of the processing plant is a scheelite concentrate of the KSh-4 grade for the production of hard alloys [6; p.57-61].

At the initial stage, the ore concentration of the Ingichka mine was carried out by flotation at a pilot plant with an ore processing capacity of up to 100 - 150 tons per year. As a result of its activity, tailings dump No. 1 with a total volume of 3.6 million tons was reclaimed. tails. In 1976, the main processing plant was put into operation, with a capacity of up to 500 thousand tons of ore in terms of feedstock, which operated until 1996. As a result of its activity, tailings dump No. 2 was formed, contributing to the storage of about 12 million tons of stale tailings (fig. 1).

The total stocks of stale tailings according to factory accounting are estimated as follows: - the total amount is 14662 thousand tons, including 3614 thousand tons in the small tailing dump, 11048 thousand tons in the large tailing dump.

The average content in stale tailings is 0.06% WO<sub>3</sub>.

**Figure: 1. Man-made waste of the Ingichka concentration plant**

Losses of tungsten with tails occurred mainly with small intergrowths of scheelite with silicified calcite, large verism of scheelite and non-floating minerals - wolframite and hubnerite [7; from. 51-53].

There is a method of additional extraction of tungsten from the tailings of the Ingichka mine concentrating plant [8; p.47-54], which includes:

- Preparation of pulp and its desliming in a hydrocyclone (removal of class - 0.05 mm);
- Subsequent separation of de-sludge pulp on a cone separator;
- two-stage cleaning of the cone separator concentrate on concentration tables to obtain a concentrate containing 20.6% WO<sub>3</sub>, with an average recovery of 29.06%.

The disadvantages of this method are the low quality of the resulting concentrate and insufficiently high recovery of WO<sub>3</sub>.

The technology for extracting tungsten from stale tailings by this method includes:

- operations for obtaining rough tungsten containing concentrate and middlings, gold-bearing product and secondary tailings using gravity methods of wet concentration - screw and

centrifugal separation - and subsequent refinement of the resulting rough concentrate and middlings using gravity (centrifugal) concentration;

- And magnetic separation to obtain a conditioned tungsten concentrate with a content of 62.7% WO<sub>3</sub> while recovering 49.9% WO<sub>3</sub>.

In this case, the tails of centrifugal separation and the non-magnetic fraction are sent to the secondary tailings, the total output of which at the stage of finishing the rough tungsten concentrate is 3.28% with a content of 2.1% WO<sub>3</sub>.

The disadvantages of this method are the multi-operation of the technological process, including 6 classification operations, 2 regrinding operations, as well as 5 centrifugal and 3 magnetic separation operations using relatively expensive apparatus. At the same time, the refinement of the rough tungsten concentrate to the standard is associated with the production of secondary tailings with a relatively high content of tungsten (2.1% WO<sub>3</sub>).

In order to develop a technology for additional extraction of tungsten from waste, the following studies have been studied:

- Distribution and forms of WO<sub>3</sub> occurrence in the tailings of the Ingichka factory;
- the material, phase composition of the stale tailings of the Ingichka plant, in order to determine the reasons for the loss of valuable components with waste, which may be the basis for choosing one or another processing scheme.

The results of chemical analysis and mineralogical composition of stale tailings are given in table. 1 and 2.

The mineral composition of the tailings was determined from the mineralogical analysis of the averaged sample and, using mineragraphy, from briquettes made from a sulfide product (foam flotation product of a rough gravity concentrate). The granulometric composition of stale tails was determined by the method of analysis of particle size distribution by laser diffraction (Cilas) [10].

Experiments on the enrichment of stale tailings of the Ingichka ore department of the second tailing field were carried out, according to the scheme, which consists of a jigging machine MOD-02 SK and a concentration table SK-1 with cleaning. According to the proposed scheme, initially enrichment is carried out on a jigging machine, then on a concentration table with cleaning. As a result of the experiments, a tungsten intermediate product was obtained containing 27.77 WO<sub>3</sub> with a recovery of 67.95%.

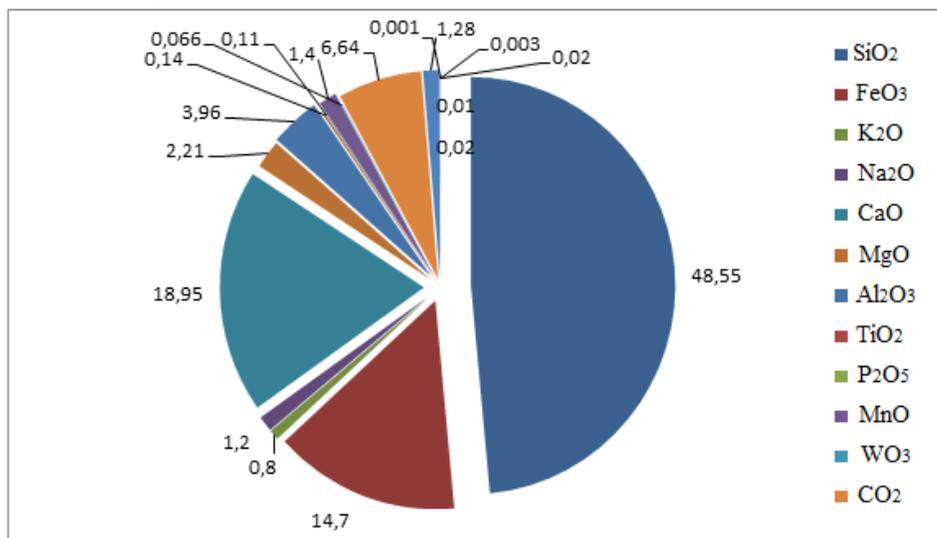

Experiments have been carried out on the gravity method for enriching the stale tailings of the Ingichka concentrating plant. From the first tail field on a screw separator and on a concentration table with cleaning, a middling product containing 9.2-12.7% WO<sub>3</sub> with an extraction of 49.7-51.2% was obtained(Fig. 3).

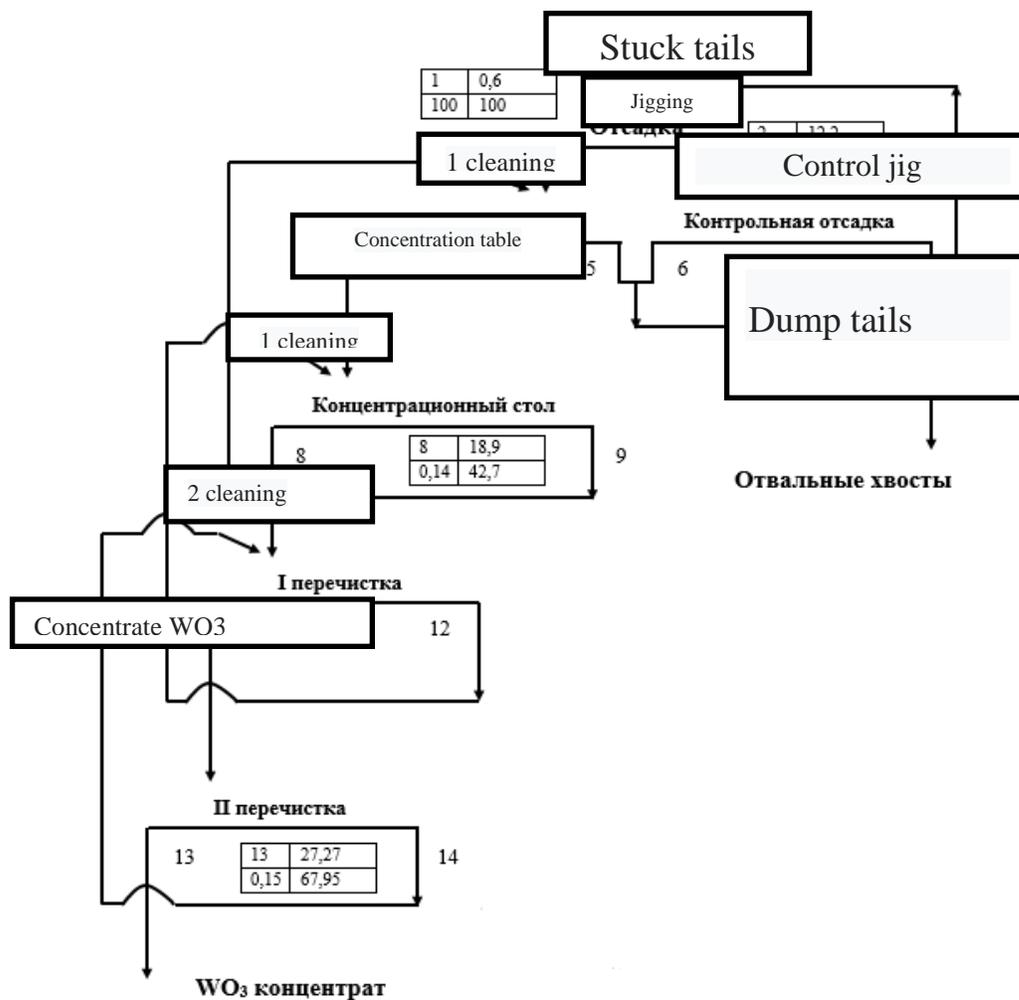

Conclusions on the choice of a rational technological scheme for the enrichment of stale tailings of the Ingichka concentrator in order to obtain tungsten concentrate:

1. An efficient and rational method of extracting tungsten from the stale tail-ings of the Ingichka concentrator is the gravity method of concentration(Fig. 3).

The article provides a solution to an urgent research and production problem: scientifically substantiated, developed and, to a certain extent, implemented effective technological methods for extracting tungsten from the stale tailings of the Ingichka concentrator.

The analyzes of the current state and development prospects of the technology for processing tungsten mineral raw materials and the extraction of tungsten from technogenic mineral formations and stale tailings of concentration plants, in particular, on the example of stale tailings of the Ingichka concentration plant, have been carried out. It is shown that the problem of involving stale ore dressing tailings in processing is an urgent problem of technological, economic and environmental significance.

**Figure: 4. Curves of extraction of tungsten anhydride from stale tailings of the Ingichka concentration plant on a jig with cleaners.**

## CONCLUSION

It has been determined that the effective and rational method of extracting tungsten from the stale tailings of the Ingichka concentrator is the gravity method of concentration. On the basis of analyzes of generalized curves of gravitational washability of stale tungsten tailings, it was found that tailings with a grain size of 0.1 + 0.0 mm. are a hallmark of enrichment of technogenic raw materials with minimal loss of tungsten. New patterns of separation processes have been established, which determine the technological indicators of gravity concentration of the stale tailings of the Ingichka concentration plant.

It has been proven that from the gravitational apparatus used in the mining and processing industry for the enrichment of tungsten-containing tailings with the maximum extraction of tungsten from technogenic raw materials into tungsten concentrates, it is advantageous to use a jig, a screw separator and a concentration table.

A pilot semi-industrial unit produced a tungsten middling product with a WO<sub>3</sub> content of 27.27-35% with an extraction of 69.75% from the stale tailings of the Ingichka concentrating plant.

The developed technology for extracting tungsten from the tailings of the Ingichka concentration plant by the method of gravitational concentration is proposed for implementation in the mining and metallurgical industry of the Republic.

**ABSTRACT**

*The successful development of mining enterprises in the conditions of a market economy is inextricably linked with the solution of the tasks of increasing production efficiency by reducing the cost of passing underground mining Solder. This is due to the fact that the work on the construction and reconstruction of new deposits requires the implementation of the passage of large-scale minerals, the length of which can reach tens of kilometers only in one enterprise. Optimization of production efficiency has a significant impact on the intensity of drilling-blasting work. Drilling-the calculation of rational parameters of blasting work is one of the most difficult issues in modern mining.*

**KEYWORDS:** *The Coefficient Of The Use Of Rocks, Solder, Slag, Sawdust, Drilling, Explosion, Crack, Zone, Junction, Slag, Explosive, Radius, Blasting Series, Operation.*

**INTRODUCTION**

The Republic of Uzbekistan occupies one of the leading places in the world in terms of hard mineral reserves. At the enterprises of the NMMC"DK and "OKMK"JSC, which are profitable miners in the Republic, a large volume of soldering work is carried out. In one of these enterprises, about 200kmga switches to the capital and permanent preparatory forty-mining Solder. One of the pressing issues is the expansion of the volume of mining of minerals in the conditions of the current period, the reduction in the costs of their opening and preparation work. Mining-capital and mining-preparation works in the system of extraction of minerals, costs constitute up to 40-45% on labor demand, 15-35% on cost. The purchase of new machines for soldering transition works by mining enterprises on account of depreciation is difficult for their

high cost. Increasing the efficiency of mining operations, the extraction of minerals leads to a decrease in the cost of mining. The transition with the help of drilling-blasting works of mining Solder in the extraction of Minerals has become the main one in recent years. Therefore, the study of the effective technology of soldering transition in the exploitation of hard-mined deposits is one of the important issues.

### **Main part**

Currently, there are many works devoted to the solution of this problem in the technical literature. S.RAyverson, A.P. Andrievsky, L.V. Baranov Stone V. B. I. Bogomolov, M. F. Drukovanny, I. E. Erofeev, B. N.Y. Kutuzov, O. E. Mindeli, M. Moskov, N. M. Pokrovsky, M. M. Protodyakonov, B. R Rakishev, M. Roginsky, N. I. Rybin, A. F. Sukhanov, P. eat it. Taranov, V. N.Y. Tupin and others were engaged in the study of the process of mass destruction and the development of methods for calculating the parameters of drilling-blasting work.

These scientists agree on the Basic Rules for further studies on the improvement of methods of calculating the parameters of drilling-blasting work based on theoretical and experimental studies of mountain rock forage drilling and their ideas so far. At the same time, despite many studies, so far there is no single way to determine the parameters of drilling-blasting work when passing underground mining Solder. The existing methods take into account the following omillarni: physico-mechanical properties of rocks, the type of explosive used, the diameter, the length and construction of the charge, the length and quality of the stopper, the interconnection of the simultaneously exploded charge. tiradi understand that the variable of the parameters of drilling-blasting work is their low efficiency.

As noted above, the creation of techniques aimed at increasing the efficiency of the parameters of drilling-blasting work in the transition of mining lshim in underground mines is an urgent scientific and practical task. All these factors significantly affect the opening and preparation of deposits, including mining-capital and mining-preparation. Mining-capital works indicate the completion of mining preparation work 84879 m, to 36692 m in a year. The volume of mining-capital, mining-preparation solders in the JSC deposits of " OKMK " is observed to grow year-on-year. As an example, the length of the solder passed each year increased by more than 2 times in comparison with 2010-2017 years.

### **RESULTS AND DISCUSSION**

The task of increasing the efficiency of drilling-blasting work is solved individually in each individual case. In such conditions, as a rule, each mining enterprise can develop its own standard passport of drilling-blasting work on the basis of experimental explosions, without relying on specific resources. Drilling is one of the main directions of increasing the efficiency of the mining industry, improving the existing methods of determining the rational parameters of blasting operations and creating new methods, their use makes it possible to reduce the cost of soldering passage by improving the quality of the blasted Massif. The use of the universal method for calculating the parameters of drilling-blasting in the passage of soldering will significantly reduce the time of development of the drilling-blasting passport and will allow you not to carry out additional blasting operations in order to determine its reasonable parameters.

In accordance with the high coefficient of drilling-blasting work explosion and its qualitative crushing, the higher the stability of the solder, the higher the coefficient of use of the shpur, the

higher the requirements for ensuring the cleavage of the rocks of the required size are laid when the soldering works are carried out. These tasks are relevant for all deposits that carry out the work of passing mining Solder with the help of drilling-blasting work. This study made a great contribution to the theory and practice of blasting work into modern science, the scientists whose names are mentioned above. However, despite the great attention paid to the research of drilling-blasting works, today the possibility of creating a universal algorithm for calculating the parameters of drilling-blasting works has not been solved. All available methods of calculating the parameters of drilling-blasting operations can be conditionally divided into two large groups: based on the determination of the relative cost of the explosive and based on the determination of the zones of decomposition of the mountain mass around the charge of the explosive. Analysis of the passage of mining solders is desirable with the selection of technological processes taking into account the exact mining-technical conditions. The share of solder transition in the total balance of mining work is large. Preparation of Ruda reserves for mining at the specified time requires a complete reduction in the work of the transition of the projectiles. Solder transition works are on average 40-45% on labor demand. And the work on the drilling of the Spurs is 35% of the total time of the soldering transition work. The type of explosives used in practice to break through the eruption of rocks in the passage of sarcophagi, the scheme of placement of Spurs at the place of extraction, the number of Spurs, the number of charges, the calculation of charges and the organization of works are regularly considered.[1]

When the explosive charge is detonated, the physical model of the breakdown of the rocks is illuminated in scientific research. The Bunda provides a description of the moving forces and the resulting voltages. The issues of the effectiveness of drilling-blasting work on the passage of soldering were considered in the work.

The main factors affecting the speed of the solder passage are the length of the fasteners, the scheme of placement of the fasteners, the amount of explosives, the type of corrosive fasteners, the series of blasting of the fasteners and the organization of work. In scientific research, the action of Rock rocks and the environment is presented in the form of an equation and the results of the dynamics of the explosion. The results of the explosion have a great impact on the compliance of the explosive with the patron and the diameter of the dowels. Increasing the diameter of the Shpur leads to a decrease in the volume of drilling, but this leads to a decrease in the degree of crushing of rocks [2].

Placing the combat patron first at the bottom of the Shpur reduces the cases of incomplete detonation of the explosive substance. In this case, the coefficient of consistency of the rocks increases by  $f=7\div 10\%$ . The combat cartridge is relatively large when placed in the middle part of the shpur chamber but less likely to give the reverse impulse. The effect of Stoppers on the effectiveness of blasting work was determined by scientific studies. Tiq the Stoppers increase the effective length of the shock wave, reduce the loss of explosion energy and reduce the force of the air shock wave. [3]

The purposeful filling of the syringe with the explosive was determined on the basis of scientific research. Increase in the charge of the explosivetiradi increase tog violation of the rocks. In this there is a reasonable amount of charge length. The distortion radius remains constant when the required charging length is reached in this amount. This is  $0,7\div 0,75$  part of the length of the shpur. [4,5]

The results of the generalization of the production experience of determining the number of plugs at the solder transition site indicate that the amount of charge sought, the diameter of the plug, the scheme of placement of the plugs, the depth of the plugs and the quality of the applied explosive substance are determined [6].

A large amount of scientific research is devoted to the issues of determining the intended depth of the Spurs at the site of the solder transition. In different Solder transition conditions, the depth of the bushings is determined to be different. The depth of the sleeves affects the organization of the work, the speed of the transition of the solder and the general labor requirement of the transition cycle. The consistency of the rocks has a significant effect on the depth of the shpur. The depth of the pit depends on the duration of the transition cycle, the number of pitches and the surface of the opened area of the extraction site [7,8].

The results of scientific research, based on the type of explosive used in the passage of Mining scraps, the methods of motivation for them, do not correspond to the technique of carrying out today's drilling equipment for shpurs, from where the exploded rocks were dug. Today, the deposits are equipped with effective self-propelled loading, conveying and drilling techniques. Along with this, scattered explosives were widely distributed. And this is the reason for the discrepancy in the results of the above-described scientific research. The factors determining the success of the transition work for mining Solder is the quality and structure of the organization of carving. Burr groove forming engraving can be divided into two types:

- slanted (prismatic) grooves made with slats drilled to the surface of the extraction site;
- straight (prismatic, punctured, segmented and other) grooves performed with the help of dowels drilled perpendicular to the surface of the extraction.

On the surface of the extraction will depend on the amount of angle of the drilled incline groove beams, the distance of siljish in one cycle of the extraction site. The amount of slope angle, in turn, will depend on the characteristics of the rocks and the transverse cross-sectional dimensions of the passing Solder. Because in the drilling process, the drilling strains are limited by the slope, the width and height of the passing Solder. Straight grooves are formed with the help of dowels, which are drilled perpendicular to the surface of the extraction site. they dimensions depend on the dimensions of the cross-sectional Solder. The structures of the correct groove are very diverse. The most effective of them are prismatic grooves.[9]

These grooves make up parallel drilled sleepers to the central sleepers around it from the central sleepers. Blasting of corrosive sluices can be carried out in two cases:

- first, the central veneer charge is detonated, which breaks down the rocks surrounding it, after which the remaining veneer charge is detonated and the carved cavity is formed.
- the central cord is drilled with a large diameter, and not charged. Its cross-sectional surface performs the function of an additional opened surface for the remaining corrosive sleepers.

But both these methods have significant drawbacks. In the first case, when the central cord is charged, a varoncasimon cavity is formed on the surface of the extracted site, which can lead to a violation of the corrosive Spurs in which the cord is located. In the second case, a lot of time is spent drilling a large cord of the central diameter. In the practice of carrying out the transition

work, all the drilled dowels can be of the same diameter, and the central cord in the middle can be of a larger diameter. The distance between these will be different. [10]

Scientific research has shown that the mucous membranes that break between the Spurs should be less than 6-8 sm. Given the working capacity of the explosive and the strength of the rocks, this size is calculated according to the formula:

$$h = 2d \sqrt{\frac{14e}{f}} \text{sm}, \quad (1.1)$$

Here h-the length of the slime gap between the sluices, sm; d-the diameter of the sluice, sm; e - the coefficient explosive, which takes into account the ability of the explosive to perform work; f-M. Coefficient of solidity of rocks on the Protodyakonov scale.

Depending on the type of explosive, the relative amount of coefficient of ability to perform work is determined: for granulitis and igdanites-0,75-0,9; for ammonites-0,95-1,1; for rock ammonites - 1,1-1,15; detanites- 1,1-1,25. The two ends are charged when the diameter of the plugs is different. The cord in the middle is not charged and serves as a compensation gap for the external plugs. Therefore, its diameter will be greater than that of overseas Spurs. The optimal distance between the Spurs (Spurs) is multiplied by the calculation of multiplying the diameter of any Spurs performing compensation gap service.

The volume of a large diameter cord is determined by the following formula:

$$V_{uu} = \frac{\pi D^2}{4} l_{uu} \text{ sm}^3, \quad (1.2)$$

Here  $V_{uu}$  —the size of the cord enlarged in diameter; D - the diameter of the cord;  $l_{uu}$  -the length of the cord

The volume of the exploded mass between the folded diameter and the ordinary dowels can be found as follows:

$$V_M = \pi \left( \frac{a}{2} - \frac{d+D}{4} \right)^2 * l_{uu} \text{ sm}^3, \quad (1.3)$$

Here:  $V_{uu}$ -diameter is the volume of the exploded mass between the folded and ordinary dowels; D – the diameter of the uncharged dowel; d - the diameter of the charged dowel; a - the diameter is the intermediate distance between the folded and ordinary dowel;  $l_{uu}$ -the length of the dowel.

The coefficient of compensation is known to be the inverse of the coefficient of softening of the rock:

$$K = \frac{1}{K_p} = \frac{1}{\frac{V_M}{V_{uu}}} = \frac{V_{uu}}{V_M} \quad (1.4)$$

Here  $K_p$  – p is the coefficient of softening of rocks

For monolithic rock rocks, the coefficient of mass loosening in the separation by blasting is equal to an average of 1,6. We solve (1.2) and (1.3) equations with respect to the variable  $l_{uu}$  and (a) and have the following.

$$K = \frac{1}{K_p} = \frac{1}{\frac{V_M}{V_u}} = \frac{V_u}{V_M} = \frac{1}{1,6}$$

$$V_M = 1,6V_u$$

$$1,6V_u = \pi \left( \frac{a}{2} - \frac{d+D}{4} \right)^2 * l_u$$

$$1,6 * \frac{\pi D^2}{4} l_u = \pi \left( \frac{a}{2} - \frac{d+D}{4} \right)^2 * l_u$$

$$a = \frac{3,5D + d}{2} \text{ sm,} \quad (1.5)$$

Here  $d$  - the diameter of the charged Beam;  $a$  – the diameter is the intermediate distance between the magnified and ordinary bushings;  $D$ -the diameter of the charged beam.

When the diameter of the uncharged cord in the center is large, it is possible to significantly increase the intermediate distance of the cords (up to 30-50%). This leads to an increase in the size of the carving space, which is organized when exploded. All drilling rigs at the place of extraction are divided into 3 groups: carving; auxiliary(divider); forming(limiting). The data on the dimensions of drilling-blasting work are presented in Table 1. As can be seen from this table, the coefficient of the use of Spurs does not exceed 0,85, even in the most optimal engraving. The stability of the charged explosive detonation and the results of the explosion depend on the amount of combat cartridges. Two combat cartridges are recommended when the depth of the cartridges is up to 3m, and three combat cartridges when higher than 3m are recommended with anti-thrust.

**TABLE 1 DRILLING-BLASTING WORK VALUES**

Name of mining enterprises	Coefficient of consistency of rocks, $f$	Cross-sectional surface of solder, $m^2$	Pants rocks, m	Rocks diameter, mm	Explosive type	Explosive consumption rocks, kg	The shortest resistance of the separating Spurs distance, m	The coefficient of the use of rocks	Groove type
Kuchbulok	8-10	9,0	2,2	42	Almanit	2,1	0,75	0,85	Prismatic
	10-12	10,0	2,2	42	Almanit	2,1	0,70	0,85	Prismatic

	14-16	12,7	2,6	42	Almanit	2,8	0,65	0,85	Prismatic
Kizil-olma	6-8	10,5	2,6	42	Almanit	2,0	0,85	0,80	Prismatic
	8-10	5	,6	2	lmanit	,0	80	,75	Prismatic
Razvedka	10	20	3,0	42	Almanit	3,0	0,75	0,83	Prismatic
	10-12	10,5	2,4	42	Almanit	3,0	0,70	0,80	Prismatic
	12-14	12,6	2,6	42	Almanit	3,0	0,65	0,80	Prismatic

The coefficient of saturation of the Spurs with an explosive charge is recommended as follows, depending on the average strength and softness of the rocks. For engraved dowels-0,75-0,80 ; for grinder (separator) bushings-0,70-0,75; for forming (limiting) fasteners-0,60-0,70.

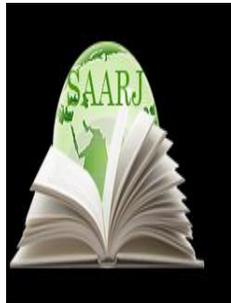

## CONCLUSION

At the beginning, after the formation of the carving cavity, the carving cords are drilled, and then the auxiliary cords are drilled. When drilling, the shortest resistance lari of the dowels the dowels should be perpendicular to the center of the surface where the low resistance line is opened, and its amount should not exceed the length of 0,70 from the side-opened surface. On such a low resistance line, the splitter plugs are drilled. Tiradi the restrictive shutters shape the contour of the cross-sectional surface of the solder. The distance between the sleeves should not exceed 1-1,2 m on the perimeter of the solder (limit).

## NON-ALCOHOLIC FATTY LIVER DISEASE AND MODERN MEDISINE

**Yuldasheva D.H\*; Shadjanova N.S\*\*; Oltiboyev R.O\*\*\***

1,3Bukhara State Medical Institute,  
 Bukhara city, UZBEKISTAN

### ABSTRACT

*Non-alcoholic fatty liver disease (NAFLD) - common chronic liver disease, characterized by pathological accumulation of fat droplets, not associated with alcohol. NAFLD is often a component of other diseases such as metabolic syndrome, diabetes, obesity, and contributes to the prevalence of CVD among the population. In the early stages of the NAFLD are characterized by ineffectiveness of specific treatment and progressive progression of the disease due to the nonspecific clinical signs.*

**KEYWORDS:** *Non-Alcoholic Fatty Liver Disease, Cirrhosis, Lipids, Obesity.*

### INTRODUCTION

**The urgency of the problem.** Non-alcoholic fatty liver disease (NAFLD) is one of the most common forms of damage to the hepatobiliary system in the world in 21st century. According to facts of the literatures spreading of NAFLD is 20-40% [1,8,13,19,28,29]. NAFLD (fatty dystrophy of the liver, fatty liver fatty infiltration) – is first disease of liver or syndrome, that is formed as a result of accumulation of excess fat in the liver, not less 5-10% from weight of organ, or hepatocytes must has lipids more 5%. Mostly the NAFLD was detected in the following age groups: 50-59 age (31.1%), 40-49 age (23.6%), 60-69 age (18.1%). The most common risk factors in the population of NAFLD was dyslipidemia (2<sup>nd</sup> type of Fredriksen)- in 75.9% patients, arterial hypertension -69.9% and hypercholesterolemia – 68.8% [1,13].

Non-alcoholic fatty liver disease is not related to alcohol consumption, a chronic disease characterized by the accumulation of fat in liver cell and that plays an important role in diseases of the gastrointestinal tract [2, 11].

Thus type of NAFLD may be, as independent disease, combined with obesity, 2<sup>nd</sup> type of diabetes mellitus and dyslipidemia, and according to a several authors, secondary functional violations of liver, for instance, with dyslipidemia, they can manifest as a NAFLD. In the early

stages of the NAFLD are characterized by ineffectiveness of specific treatment and progressive progression of the disease due to the nonspecific clinical signs[2,21,22].

NAFLD-progressive, chronic multifactorial steatosis of liver – (accumulation of fat in the liver, fatty dystrophy of hepatocytes), steatohepatitis – formation of inflammatory infiltrate around the site of necrosis in hepatocytes, non-alcoholic fibrosis-cirrhosis: destruction of liver architectonics and the disease complicated by connective tissue growth, that has been the main focus of local and foreign hepatologists for the last 10 years [2,13,27]. When the disease is periodic in 12-40% patients after 8-13 years may convert to non-alcohol steatohepatitis, from that in 15% patients may be liver cirrhosis and liver failure. After 10 years liver cirrhosis may convert to hepatocellular carcinoma in 7 % patients. NAFLD- the facts in last 10 years confirm growth of disease[24,31,33]. NAFLD is widespread in western Europe and USA. The spreading in common population of NAFLDL is not learnt well, but some authors determined that occurs 3-58% in Italy and USA[9,31].

The growth rate of NAFLD is problem and that will evaluate with propensity to obesity. As the level of obesity increases, the severity of the disease also increases[2,6,13,15,25]. NAFLD3-100 % occurs with obesity. In that situation when patients are checked at ultrasound examination, fatty dystrophy of liver will found[6,26]. The scientific researches show that, NAFLD occurs 70% with 2<sup>nd</sup> type diabetes mellitus [23,27]. Thus, the progressive progression and prevalence of the disease is one of the current problems of clinical medicine due to the observation of the time when the working capacity of the population is preserved, close clinical signs are observed in the late stages of the disease.

There are many causes of development of the fatty steatosis of liver. Primary steatosis mostly, appears on the basis of obesity, hyperlipidemia, 2<sup>nd</sup> type diabetes mellitus[4,10,13]. The cause of developing secondary fatty hepatitis is consumption drugs of some groups (steroid hormones, substitution hormonal therapy, antiarrhythmic and antibacterial drugs, cytostatic, non-steroidal anti-inflammatory drugs), chronic inflammatory diseases of the gastrointestinal tract, sudden weight loss, parenteral nutrition, gestational age hypoxia, Wilson Konovolova disease, lipoproteinemia, familial liver steatosis, glycogen accumulation disease[10,12]. Based on the entry of free fatty acids (FFA) into the liver, triglycerides accumulate in the liver the beta oxidation rate of FFA in the liver mitochondria decreases, and the synthesis of fatty acids increases. As a result, the synthesis of very low-density lipoproteins is reduced, triglycerides are excreted from the liver[12].

In developing of steatosis “First impact” is – gathering of FFA in hepatocytes, decreasing of oxidation and inhibition of triglyceride elimination. Different level of inflammation and fibrinogenase are observed in response to oxidative stress molecules (aldehydes). Oxidative stress products induce the expression of matrix – linked genes. Oxidative stress associated with the immune response, fibrinogenase develops in the trigger. Stress of hepatocytes with lipids and FFA leads to the development of functional insufficiency in the mitochondria and the formation of steatosis occurs. Progressive progression of steatosis makes condition for developing steatohepatitis. Additional oxidative stress, peroxidase oxidized lipids disturb the cellular defense mechanism and inflammation and necrosis occur. NAFLD stimulates formation of free radicals from endogenous ketones, food nitrosamines, aldehydes, cytochrome P450 (CYP) 2E1. 18 CYP 2E1 ketone and fatty acids can be cytochrome mediators[10].

The inflammatory process may develop endotoxemia in intestinal dysbacteriosis. Lipopolysaccharide, a gram-negative bacterium that enters the portal vein, activates Toll-like receptors in response to type 4 immunity and develops inflammation and fibrosis (254,273). In NAFLD, endotoxemia pro-inflammatory cytokines (TNF), Interleukin-6,8 and this increase the expression of cytokine receptors[23,27].

Last studies have shown that adipose tissue, namely, visceral fats, alters endocrine content, produces adipokin-hormones, which affect lipid metabolism, as well as the function of other organs and systems [3]. Changes in the amount of adipokines increase tissue infiltration monocytes and macrophages, pro-inflammation induct cytokines. Prolonged steatosis and local inflammation can lead to fibrosis and then may convert cancer. NAFLD over time increases the risk of cirrhosis, hepatocellular cancer, which results in liver resection and transplantation [5].

In obesity, the release of high concentrations of leptins in the blood stimulates the secretion of other neuropeptides: melanocytostimulating hormone, proopiomelanocortin, neuropeptide, corticotropin, corticotropin releasing factor. All of the above peptides cause dysfunction of the sympathetic nervous system, activate lipolysis in fat storage, accelerate the entry of FFA into the liver. FFA stimulates glycogenesis in the liver, inhibits insulin secretion, develops insulin resistance. Many patients on the visceral obesity develop on the basis of hyperleptinemia, hyperglycemia, metabolic syndrome (MS): persistent hypertension, severe IHD, obstructive apnea syndrome [7]. In the literatures emphasize that - high mortality rate and prevalence of cardiovascular disease from MS (10,32).

The development of fatty liver dystrophy occurs through exogenous and endogenous mechanisms. As a result of intestinal absorption of exogenous fatty acids, glycerin, glucose, galactose, fructose, the endogenous mechanism - increased peripheral lipolysis, decreased consumption of fatty acids from liver cells, increased fat synthesis, protein deficiency in liver cells, decreased liver enzyme activity, very low lipoprotein density increase in excretion by hepatocytes [2]. Dyslipoproteinemia (DLP) is characterized by a change in homeostatic constant, a violation of the functioning of systems. DLP can damage the liver as a target organ and cause atherosclerosis in the arteries parallel to it.

A group of researchers have noted that dyslipidemia is a disorder of the process of bile formation and secretion as a result of damage to the hepatocyte membrane. Other authors have suggested that DLP in hepatic steatosis is a "safe condition" and that the etiologic factor must be ruled out [20]. These ideas are complicated because in hepatic steatosis mitochondria, liver cell lysosomes are damaged, FFA is not consumed, cholestasis and hyperlipidemia may develop.

In NAFLD liver cell function is impaired, large amounts of cholesterol and small amounts of phospholipids and bile acids accumulate in the bile ducts, bile has lithogenic properties, and gallstone disease develops [13,20], resulting in impaired secondary metabolism [2]. NAFLD is 5 times more common in patients than in gallstone disease in the population. Gallstones were observed in 18.2% and 31.1% of patients with nonalcoholic steatosis and steatohepatitis. At the same time, cirrhosis of the liver and cholelithiasis were observed in 41.7% of patients [17].

Several authors link the formation of MS cholelithiasis in women with abdominal obesity, basal hyperinsulinemia, signs of insulin resistance, insulin response to the intake of exogenous fats. It was found that a number of factors, in the development of cholelithiasis, are associated with MS; accumulation of cholesterol in the bile, hypomotor disorders of the gallbladder, hyperinsulinemia

[15]. Thus, the metabolic syndrome NAFLD and gallstone disease are clearly related to each other.

Hyperinsulinemia is the main link in the development of IR-HI-obesity-IR. Today, an increase in fat tissue reserves based on a high-calorie diet increases the stress on insulin. Lack of physical activity leads to insulin resistance in adipose tissue, hyperinsulinemia is formed as a result of decreased tissue sensitivity to insulin.

In hyperinsulinemia, primarily carbohydrate metabolism is impaired. In IR, the pancreatic compensatory HI increases to a clear limit, then in the case of decompensation, glucose tolerance or insulin-independent type II DM (NRDTI) develops. Secondly, as a result of strong lipolysis from fat reserves, it provides energy to the tissues in the form of fatty acids, lipoproteins are formed in the liver. As the amount of glucose and insulin in the liver increases, more triglycerides are formed from glucose, and the amount of LDLP increases and the amount of HDLP decreases. An increase in the amount of insulin in the liver increases the amount of LDLP. Elimination of LDLP depends on the amount of insulin. Resistance to IR lipoprotein lipase is formed and elimination of LDLP is reduced. An increase in the formation and elimination of LDLP leads to an increase in the amount of triglycerides (LDLP) in the blood plasma. The decrease in the amount of HDLP is associated with the breakdown of LDLP, which is the cause of hyperinsulinemia. Thus, an increase in IR and insulin levels is characterized by dyslipidemia that is a decrease in the amount of HDLP in the blood plasma and an increase in the amount of LDLP. Developmental dyslipoproteinemia is atherogenic in nature. Third, IR and compensatory HI increase sodium reabsorption in the distal renal tubules and increase circulating blood volume, retain water, resulting in the formation of arterial hypertension. Also HI compensator increases the activity of the sympathetic nervous system. Fourth, the fibrinolytic activity of the blood changes, as a result of HI, the amount of fat in the reserve increases, the synthesis in the fat reserve increases, plasminogen activity slows down, fibrinolysis decreases, and cell aggregation increases. The factors listed are a hallmark of metabolic syndrome and are currently characterized by changes in metabolism. In the scientific literature, insulin resistance is one of the risk factors for NAFLD [2,14,16,17].

NAFLD is asymptomatic in most patients (48-100%). The remaining patients have abdominal discomfort and blunt pain under the right rib. Patients with cardiovascular pathology, digestive, endocrine and tumor diseases, as well as other diseases of the liver are often diagnosed suddenly at the time of complaint [2,26,29].

There will be no changes in blood biochemical analysis. Sometimes urobilinogenuria, hypertriglyceremia can be detected. ALT activity can significantly exceed the norm by 1.5-2 times. Obesity, 2nd type DM, hyperlipidemia, thymol test, increased levels of alpha 2 and gamma globulin are seen [2,14].

An anamnesis of alcohol is denied at NAFLD. Transferin, often sialic acid and mitochondrial isoenzyme AST is sensitive and specific, but is rarely used [1,14,17]. Because a perfectly collected anamnesis is an important diagnostic method in general practitioners.

FibroMax is a new non-invasive method that provides accurate information about liver fibrosis, – an innovative, unparalleled method for diagnosing path morphological changes in the liver (fibrosis, steatosis, cirrhosis), proposed by the French company Bio Predictive for use all over

the world. This method has been validated and validated in over 40 clinical studies. Analysis results are submitted in accordance with the generally accepted international METAVIR system.

Liver biopsy - the study of a local tissue sample in order to diagnose organ diseases - has faded into the background due to its high invasiveness and a large number of contraindications.

FibroMax is a highly effective, reliable and non-invasive (non-traumatic) method. During the study, ten biochemical parameters are determined: Apo lipoprotein A1, macroglobulin, GGT (gamma glutamyltransferase), total bilirubin, ALT (alanine aminotransferase), AST (aspartate aminotransferase), total cholesterol, haptoglobulins, glucose and triglycerides. The age, weight, height and gender of the person must be taken into account. Mathematical processing of data is carried out using five algorithms, which makes it possible to assess the degree of pathological changes and inflammation in the liver, regardless of localization.

FibroMax calculation algorithms: FibroTest - detection of liver fibrosis (proliferation of connective tissue) with the definition of the clinical stage (F0, F1, F2, F3, F4). ActiTest - determination of the degree of viral necrotic-inflammatory activity (A0, A1, A2, A3). SteatoTest (SteatoTest) - diagnosis of steatosis (fatty degeneration of the liver) of the liver. NashTest - detection of non-alcoholic steatohepatitis. AshTest - diagnosis of alcoholic steatohepatitis.

The test results are shown in the form of five diagrams, each consisting of two bars: the first is a scale with values from 0 to 1, the second (colored) reflects the degree of the disease.

This test helps to diagnose fibrosis, cirrhosis, steatosis, alcoholic and non-alcoholic steatohepatitis based on the assessment of the amount of apolipoprotein A1, ALT, ASAT, total bilirubin, cholesterol, Gamma-HT, glucose, haptoglobin, alpha-2-macroglobulin and triglycerides in blood [13,16].

## CONCLUSION

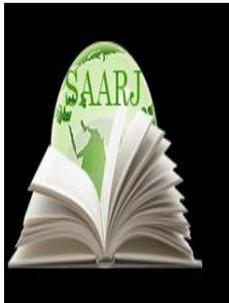

Like fatty hepatitis, non-alcoholic steatohepatitis is an independent disease that should be kept in mind when conducting differential diagnostics in patients with a stable increase in serum ALT and AST, especially in the presence of obesity, diabetes, and hyperlipidemia. The diagnosis is confirmed by liver biopsy. FibroMax is a non-traumatic diagnostic method, a unique alternative to liver biopsy. In connection with the noted steady increase in the prevalence of obesity, MS and DM among the population, the problem of diagnosis and treatment of NAFLD will become even more urgent. Poor coverage in the medical literature leads to little awareness of doctors about the possible outcomes of this condition and presents a huge problem. The complexity of diagnosis verification, the search for reliable and highly informative markers of the disease and new non-invasive diagnostic methods make it necessary to conduct further research. This is the goal of the multicenter studies that are currently being planned.

## PRODUCTION AND CONSUMPTION OF CONSUMER GOODS AS AN OBJECT OF GEOGRAPHICAL RESEARCH

**Zafarjon Khudoyberdievich Madaminov\***

\*Teacher of the Department of Geography,  
 Fergana State University,  
 UZBEKISTAN

### ABSTRACT

*In the process of population growth, the consumption indicators of the population will also increase, and, of course, this will require an increase in the production of consumer goods in the national economy. It is in this process that the dependence of the sectors of the national economy on the population and its growth becomes even clearer. Saturation of the domestic consumer market is primarily associated with the production of consumer goods. The complex of industries producing consumer goods includes light and food, partly machinery. Currently, a number of heavy industries are also involved in the production of consumer goods. This article analyzes the production of consumer goods and the object of consumer-geographical research and draws conclusions.*

**KEYWORDS:** *Consumption, Consumer Geography, Consumer Basket, Personal Consumption, Public Consumption, Human Geography, Cultural Geography, Construction Geography, Trade Geography, Public Service Geography.*

### INTRODUCTION

It should be noted that the country has launched the production of completely new types of products that did not exist in the former Soviet Union, such as cars and trucks, buses, soda, sugar, potassium fertilizers, oil and wood products. At the same time, great attention was paid to the modernization of industry, new modern technological equipment, enrichment of its structural structure, ie diversification. In particular, emphasis was placed on saturating the domestic market with high-quality consumer goods. [12]

It is known from world experience that it is important to determine the minimum set of products, goods and services necessary to maintain human life and health for a certain period of time. Such figures are reflected in the consumer basket of countries.

In his address to the Parliament on December 22, 2017, President Shavkat Mirziyoyev highlighted the priorities for the development of the social sphere, noting the need to strengthen the concept of "consumer basket" in legislation and create mechanisms to ensure its implementation in practice<sup>1</sup>.

At a meeting on November 21, 2019 to discuss priorities in the field of social protection, the President instructed the Ministry of Finance, the Ministry of Economy and Industry, the State Statistics Committee to involve experts from international organizations and develop a procedure for calculating the consumer basket and subsistence level and consumption standards<sup>2</sup>.

**Main Part.** The harmonization and stability of the national economy of each country is based on the gradual saturation of markets at different levels with their products, the creation of opportunities to replace imported products. For the same purpose, it is desirable to grow more consumer goods.

In general, the consumer goods industry is an intersectoral complex, although it does not constitute a separate sector of the country's economy.

The term "consumption", which is the core of "production of consumer goods" and "consumer geography", are defined in many modern scientific literatures and dictionaries.

It is determined by the number of products included in the consumer basket, then multiplied by the amount of money. Typically, the minimum consumption basket, i.e. the minimum consumption, is set. The consumer basket has a national character and is developed taking into account the economic level of a particular country, the composition of consumption. The consumer basket will vary from country to country depending on the economic power of the country and the characteristics of the population's consumption. For example, the consumer basket includes 300 products and services in the United States, 250 in France, 350 in the United Kingdom, 475 in Germany and 156 in Russia.

Production of consumer goods in industry (group B) is the production of goods intended for direct consumption in their natural form, ie for personal consumption of the population or for consumption by non-manufacturing enterprises [8].

In order to improve the living standards of the population, to solve economic problems, great importance is attached to the relationship between the rates of development of industrial groups "A" and "B".

Consumer goods are products produced for consumption that are necessary for the individual, family and community needs of the population. Consumer goods are divided into food products, non-food products and services according to the composition of consumption. These types of products are mainly created in the food, light industry and partly in the machinery industry.

Consumer goods are produced in industries belonging to group B of the industry. The territorial location of the production of consumer goods, like other industries, has its own laws. Industrial production of consumer goods is the process of production of goods intended for direct consumption in its natural form, ie for personal consumption of the population or for consumption by institutions and organizations in the non-manufacturing sector (schools, hospitals, theaters, etc).

Consumer goods (for example, public transport, furniture for educational institutions, theaters, special equipment for hospitals) are also included in consumer goods.

The main purpose of the economic-geographical study of the industrial sector is to determine the specific features of different industries and economic, natural, environmental and technical factors, the laws of their territorial organization. For example, the most important feature of electricity is the inability to accumulate its products, which is reflected in the ability of this industry to form a complex ("attract" other industrial enterprises). It is also noted that the ferrous metallurgy industry is located differently depending on the amount of raw iron ore, non-ferrous metallurgy requires a lot of electricity, the machine-building industry is diversified according to the base of ferrous metallurgy, skilled workers and regional production. and at the same time it should not be forgotten that it is 'calculated' by an environmental factor [10].

Production of consumer goods as an economic concept has been studied by representatives of the economy in the CIS. The main focus of this research is on the economic aspects of consumer goods production. These studies also explore regional aspects of consumer goods production. [9]

Research on the development of consumer goods production in Uzbekistan has been studied by representatives of the economy. Among them are such authors as SK Ziyodullaev, II Iskandarov, A. Olmasov, AA Abduganiev. [8]. These studies shed more light on the economic aspects of consumer goods production.

Although economic geographers in Uzbekistan have conducted research on the main sectors of consumer goods production, light, food industry, research on the production of consumer goods and its territorial aspects has been almost non-existent.

It is known that the sciences of economic and social geography consist of 4 major branches (economic geography, economic and social geography, social geography and political geography). While the production of consumer goods under study is a branch of industrial geography that is part of the sciences of economic geography, consumer geography is emerging as a new branch of social geography. For this reason, the geographical aspects of the production of consumer goods and consumption complement each other as separate industries.

The scope of geographical activity is expanding and the socialization of geography is taking place. As a result, new directions are emerging in the structure of economic and social geography. "Human Geography", "Geography of Construction Industry", "Geography of Territorial Information Systems", "Geography of the Unemployed", "Geography of Public Services", "Geography of Trade", "Geography of Housing and Communal Services", "Geography of Higher Education", Areas such as "Geography of Scientific Research", "Geography of Consumer Services", "Geography of Finance", "Geography of Culture", "Geography of Physical Culture and Sports", "Geography of Crime" [2]

A.S.Kovalev In economic geography, the geography of new service areas has emerged, which is now much more developed scientifically and methodologically, and in turn, this sector has further developed, which includes "cultural geography", "health geography" and other areas. It happened." [5]

Consumer geography is also emerging as a new direction among these disciplines. The term "consumer geography" has been used in the scientific literature since the 1960s. In 1966, SA Kovalev proposed the idea of forming and developing such a scientific direction. With different

branches of "consumer geography" A.I.Alekseev, V.A.Bezrukix, Yu.N.Gladkiy, N.V.Zubarevich, I.A.Ilchenko, E.I Kalmutskaya, M.M.Kalashnikova, T.G.Nefedova, N.A.Starikov, E.L.Faybusovich, A.D.Yakushev et al. Analysis of problems of food consumption in the scientific work of M.B.Wolf, Yu.D.Dmitrevsky, V.A.Pulyarkin, V.G.Kryuchkov, M.G.Nikitina, A.M.Nosonov on agricultural geography made. Economist, sociologist, culturologist, historian also conducted research in the field of "Geography of Consumer" and related topics (S.G.Afanasev, A.N.Ilin, I.Yu.Ilina, A.B.Rakhmanov, L.S.Revenko, M.U.Timofeev, R.A.Yakupov). In recent years S.Agilar-Rodriguez, L.Foreign scholars such as Williams, Dj. The geography of consumption was studied in more detail by (Table 1.1).

The term "consumer geography" is defined differently in the sources. In particular, encyclopedic dictionaries describe consumer geography. The encyclopedic dictionary of geography, published in 1988, defines consumer geography as follows: including natural conditions, national and regional traditions, income levels, demographics, etc[1].

While Gettner stressed the need to study the geography of consumption, N.N.Baransky called on geographers to keep in mind that "the population is both a producer and a consumer." "Unfortunately, the problems of consumer geography are not given enough attention today," he said. [6]

V.V Pokshishevsky, S.A Kovalev, Yu.G. Saushkin, N.Ya. Kovalsky, E.B.Lopatina, O.R.Nazarevsky, A.A.Dolinina in scientific articles on the "consumer geography" studies have been performed [4].

The economist-geographer V.V.Pokshishevsky said that "a human-producing entity, at the same time, the consumer pole is formed in the process of general production." In this process, there is an opportunity to develop the geography of consumption [3].

The first complete study of consumer geography was completed by E.I.Kalmutskaya [3].

Consumption and related problems have been studied since ancient times. At that time, consumption meant only meeting personal needs. Over time, consumption began to manifest itself not only in terms of personal and social consumption [7]

**\* Author's development**

Scientists point out that consumption is divided into two, production consumption and non-production consumption. There are two different forms of non-manufacturing consumption.

- Individual or personal consumption
- Community consumption

Production and consumption are inseparable. There is no consumption without production, there is no production without consumption. There are stages such as distribution, exchange in the range from production to consumption. The relationship between production and consumption is twofold.

First, production is determined by the consumption of the population. Second, the development of consumption will also lead to an increase in production. There is no consumption without production, and in turn there is no production without consumption. So the producer is also the consumer. The consumer is the producer. There is also no need for production without consumption. On the one hand, production provides the population with consumer goods. On the other hand, the consumer provides the production with labor.

The production of consumer goods consists of four stages: production, distribution, exchange, and consumption. Here, while production is the initial process, distribution and exchange are intermediate stages. Consumption is the last link in this chain.

Consumer geography studies only the final stage, i.e. consumption. That is, regional differences in consumption determine its level and composition. It also classifies national and interregional consumption levels. The service provides a link between the production process and the consumption of the population.

## CONCLUSION

Although the concepts of living standards and consumption of the population are narrowly synonymous, but they are separate categories that are inextricably linked. Consumption is a key component of living standards. While the concept of public consumption is a very narrow concept, the concept of lifestyle includes not only consumption, but also other indicators, including the location of productive forces, the continuity of production processes, employment, their working conditions, social security status and so on. Hence, this concept takes into account general indicators, the level of consumption implies the use of material resources and services. It turns out that the lifestyle of the population depends on the level of consumption of the population. Various natural-geographical, socio-economic, demographic factors play an important role in determining the living standards of the population. Regional differences also play a role in the consumption of the population and this must be taken into account in improving living standards.

The level of material and spiritual well-being of the population directly depends on the degree to which it meets the level of demand for consumer goods, spiritual wealth. With the development of science and technology and other factors, the population's demand for consumer goods, spiritual wealth increases.

It can be said that the level of demand of the population for consumer goods and spiritual wealth depends on the level of development of productive forces. But if we look at consumption separately from the level of development, it is considered to be limitless and varies in time and space.

Department of "Methods of Preschool Primary and Special Education,  
 " Surkhandarya Regional Center for Retraining and Advanced Training of Public Educators  
 UZBEKISTAN

### ABSTRACT

*The deteriorating environmental situation on the planet has posed a number of challenges for all mankind. Teaching this subject from an early age, even in the family and in the primary school, has become a necessity today. That is why they are all responsible for protecting the environment, regardless of age, gender, nationality, creed, career, social background. As long as man does not stop dominating and violating nature, it is necessary to inculcate in the minds of the younger generation the danger of nature's cruel revenge on man and the extinction of the achievements of civilization. Theoretical and practical aspects of the ecological situation are scientifically based. The main goal is to give the first educational concepts about the preservation and respect of nature, to bring them to their consciousness through innovative technologies.*

**KEYWORDS:** *Planet, Earth and Nature, Climate, Flora, Fauna, Atmospheric Air, Water Pollution, Deforestation, Soil Erosion, Environmental Crisis, Nature Conservation, Environmental Education.*

### INTRODUCTION

Today, due to the relationship between nature and humanity, the ecological situation has become extremely tense. The deteriorating environmental situation on the planet has posed a number of challenges for all mankind. Teaching such an issue from a young age, even from the family and elementary school, has become a necessity today. To solve such problems, the main goal is to provide primary school students with basic educational concepts about nature conservation and respect, and to bring them to their attention through innovative technologies.

In the introductory part of the article, an attempt is made to inform about the emergence of such situations, its prevention and the need to educate people about the preservation and respect of nature. In addition to being a part of nature, man continues to influence nature in new ways in his life activities. This leads to changes in the state of the ecosystem, especially the deterioration of quality and quantity in nature. As a result of such activities, the state of the Earth's surface: climate, flora, fauna, atmospheric air has changed, water pollution, deforestation, soil erosion have occurred. These, in turn, created an environmental crisis.

In particular, as a result of the drying up of the Aral Sea, the emergence of large toxic salt fields in its place is causing a lot of environmental problems not only for Uzbekistan, but for all Central Asian countries. In particular, the increase in various dangerous diseases among the population of the Aral Sea region, the extinction of livestock and other animal species, as well as the unsuitability of lands for agriculture and other serious problems.

At the 75th session of the UN General Assembly, President of the Republic of Uzbekistan Sh.M. Mirziyoev said that it was expedient to declare the Aral Sea region a zone of ecological innovation and technology, to introduce and implement it as the International Day for the Protection and Restoration of Ecosystems. .

Through this topic, our main goal is to define the content of the process of technology education of primary school students in the spirit of respect for nature and improve teaching through virtual e-software tools and environmental protection through consistent work in environmental protection, rational use of natural resources, sanitation and improvement is to educate.

In recent years, under the leadership of the President, a new system of public administration in the field of environmental protection has been formed, ways to set priorities of public policy, ensure the achievement of national goals and objectives in the field of nature protection and sustainable development until 2030.

It is known that human beings are distinguished from other living organisms by the development of the ability to consciously and deeply perceive, the mind. That is why they are all responsible for protecting the environment, regardless of age, gender, nationality, creed, career, social background. As long as man does not stop dominating and violating nature, it is necessary to inculcate in the minds of the younger generation the danger of nature's cruel revenge on man and the extinction of the achievements of civilization.

Therefore, one of the most important tasks facing humanity today is to focus on eliminating environmental pollution and ensuring their sustainable protection.

The growing tension between nature and man is increasing the need of the population, especially the younger generation, for theoretical and practical knowledge of ecology and environmental protection.

The relevance of the chosen topic "Providing primary school students with basic educational concepts about nature conservation and respect" is reflected in the following:

First, the integration of primary school students in the spirit of respect for nature with continuing education;

Second, the lack of a systematic study of the problems of educating primary school students in the spirit of respect for nature;

Thirdly, the technology of education in the spirit of respect for nature through interdisciplinary teaching in the teaching of "The world around us" and "Natural Science" is insufficient;

Fourth, the lack of scientific and methodological justification for educating primary school students in the spirit of respect for nature;

Fifth, the lack of a virtual electronic program, practical and methodological recommendations and conclusions on educating primary school students in the spirit of respect for nature.

Focusing on the theoretical aspects of educating primary school students about nature conservation and respect, the ongoing political, socio-economic, educational reforms in the country, spiritual and moral renewal in society, along with increasing human activity, consciously shape his attitude to the environment, humane principles. encourages an approach based on. According to the stages of historical development, environmental education can be divided into three main bases: environmental education in folk pedagogy; environmental education in Islam; universal environmental education. On the basis of each environmental education, environmental ideas have their own characteristics.

Educational ideas on nature protection are mainly reflected in the Avesto, the Holy Quran, the science of Hadith, folk pedagogy and similar sources. From a practical point of view, according to the laws of dialectics, man has been closely connected with ecology since its inception. Therefore, an incorrect assessment of the interdependence and unity of society and nature can lead to irreparable consequences.

It is known from the history of mankind that in the world of science the Central Asian scholars Al-Bukhari, At-Termizi, Abu Rayhan Beruni, Abu Ali ibn Sino, Mahmud Kashgari, Yusuf Khos Hajib, Ahmad Yugnaki, Abu Nasr Farobi, Amir Temur, Mirza Ulugbek, Alisher Navoi, Zahiriddin In the works of Muhammad Babur, Abdurahman Jami, Hussein Voiz Kashifi, the solutions of problematic issues related to the interaction of nature and society, environmental protection, conservation of natural resources, their conservation, respect for nature (water, air, soil, sun) given in practical terms.

The analysis of the literature and scientific studies shows that due to the need for new knowledge of technology in the education of primary school students in the spirit of nature conservation and respect, the results of theoretical and practical analysis of the education system show the following disparities in educating primary school students in the spirit of nature conservation and respect. There are conflicting situations:

- The need for the study of knowledge on the technology of nature conservation and respect in the content of existing programs and textbooks in primary school subjects, including "The world around us", "Natural science" is not taken into account and the necessary pedagogical conditions are not developed;
- Knowledge of the technology of organization of teaching through interactive methods and techniques of modern teaching in the education of "the world around us" and "Natural Science" in the spirit of nature conservation and respect is not systematized and interdisciplinary teaching technology is not improved;
- Educating primary school students in the spirit of nature conservation and respect, the existence of virtual electronic programs and didactic functions in extracurricular and extracurricular

activities have not been scientifically and pedagogically studied and put into practice, and no practical and methodological conclusions have been developed.

In the course of our research, the need for a new approach to interdisciplinary teaching in the education of primary school students in the spirit of nature conservation and respect, and the existing contradictions and disparities in education show the need to solve this problem scientifically and pedagogically.

Based on the results of a study on improving the conditions of teaching primary school students in the spirit of respect for nature technology:

Its content and practical results serve to improve the content of textbooks, methodological manuals, lesson plans and lecture materials in primary education, provide practical assistance in education. Preserving and respecting nature is a comprehensive concept. It forms a complex whole that includes the high spiritual, enlightenment, educational, and moral qualities in man. Every child grows up to love the nature of the country and the Motherland, to look at its beauties in a special way, to enjoy this beauty, to respect and cherish it, to use natural resources wisely.

The word "respect" in the "Explanatory Dictionary of the Uzbek language" Ezoz is an Arabic word (honor, respect; kindness, compliment), a sense of respect and its expression; respect. To honor (or do) to honor. It is interpreted as treating with kindness and respect. Based on these interpretations, we can say that respect for nature is an important sign of human spirituality, a universal, regional, national and local manifestation of ideological processes, and are universal problems of humanity.

The Constitution of the Republic of Uzbekistan stipulates that "land, subsoil resources, water and forests, flora and fauna, natural and other resources, spiritual resources of the Republic are the national wealth and property of the Republic of Uzbekistan." The analysis of scientific and practical sources showed that there is a new approach to interdisciplinary teaching in the education of primary school students in the spirit of nature conservation and respect, as a pressing pedagogical problem.

Preliminary experimental results and resource analysis have shown that no attention has been paid to the problem of practical training of primary school students in the spirit of nature conservation and respect. It is well known that in pedagogical practice, special attention is paid to the study of the level of formation of theoretical knowledge, practical skills and abilities. To this end, criteria are developed to help determine a certain level of cases, which are determined by their content and direction. In the course of the research, criteria were developed to educate primary school students in the spirit of nature conservation and respect, as well as to determine the level of education.

The content of the process of educating primary school students in the spirit of nature conservation and respect, the principles of its selection, educational technologies, experimental work with students in the educational process through classroom and extracurricular activities, a great opportunity to care for nature was found to be

This requires a reconsideration of the process of educating the younger generation, a new political and environmental approach to life. The teaching method is determined by the teacher's knowledge and the student's mastery of the material content, which is the leader in the learning process.

In the teaching process, the teacher uses a variety of methods. A number of factors play an important role in the choice of teaching methods: the current stage of development of the school, the subject matter, the content of the material studied, the level of readiness of students to master the material.

The most important pedagogical problem is to inform 1st graders about the role of the world around them in their lives, the negative impact of environmental pollution on human health, measures to prevent this situation, and to develop in them the skills of environmental cleanliness and health.

In the research process, we identified and systematized the environmental concepts that 1st graders need to know:

1. Environment; colorful world.
2. Trees, shrubs, grasses. Some protected plants and animals in the habitat.
3. Insects, fish, birds, wild and domestic animals.
4. The main signs of the seasons.
5. Rules of behavior in nature, basic information about his city (village), address, mode of transport, principles of personal hygiene, traffic rules, how to behave in public places.

Ways to introduce students to eco-concepts: through conversation, story, travel, question and answer.

The following is a sample lesson plan.

Topic: Water is life.

The lesson begins with the method of mental attack:

**1 - TABLE.**

1	What is water?	4	Tell us about Uzbek folk proverbs about water?
2	Why do you need water?	5	What fairy tale do you know about water?
3	How do you use water?	6	What poem do you know about water?

Once these questions are answered; give feedback on the water sources available around the reader and their quality.

In this lesson, students should know:

- It is a sin to spit in water; not to waste water;
- Closing water taps;
- Economical use of water for washing;
- How our ancestors used water in the past;
- The importance of not irrigating their fields with clean water.

**Homework:** Observe the current water situation in your area and tell your friends in the next lesson.

The following is an example of an hour-long lesson on environmental education for students in Grade 2, The World around Us.

**Topic:** Seasons. **Course Objectives:**

**a) Educational:** knowledge of the seasons and their characteristics.

**b) Upbringing:** to teach students to respect and care for nature, to educate students in the spirit of aesthetic enjoyment of nature and the right attitude to it.

**Lesson equipment:** textbook "The world around us", color pictures, test questions, handouts, technical aids.

**Course methods:** Brainstorming, conceptual table, small group work. Course:

### I. Organizational part:

Determining the weather calendar with the participation of students, reciting a poem about autumn.

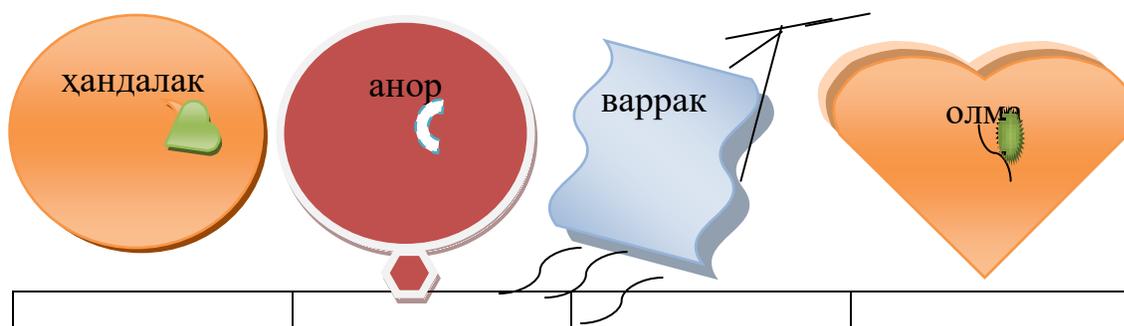

### II. Assessment of students' knowledge on the previous topic.

Topic: Weather.

Determining students' knowledge using questions.

1. What do you mean by weather?
2. How is the weather today?
3. What season is it now?
4. Is the weather always the same?

Once the questions are answered, a rebus on the topic is developed.

Assignment: Place the first letter in the pictures in the cells in such a sequence that the word on the topic is formed?

Students complete the task independently.

Students are divided into three groups; students will be given picture tests.

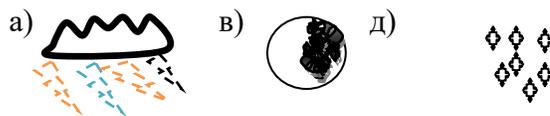

1- group. Which sign is on when the weather is clear?

1-group. What sign is put on a snowy day?

1-group. If the weather is partly cloudy, what sign will be placed?

Write down what you understand from today's topic with your group.

Students write answers to the questions as a group. Active team members are encouraged to:

Students will be asked the following questions:

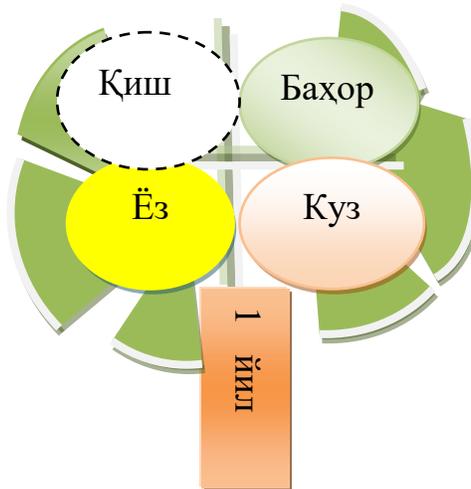

1. What does nature give us?
2. How should we treat nature?
3. Should we enjoy nature aesthetically?

### III. Reinforce the theme covered.

The topic is reinforced by repeating the base words of the previous topic. For example: words like weather, thermometer, smoke, night, dew. Speaking based on pictures on the topic (different pictures are shown).

### IV. New topic statement:

Seasons

Students are asked questions:

- 1) How many seasons are there in a year?
- 2) What season is it now?
- 3) How many days a year?

Students express the following thoughts about the seasons.

In our country, four seasons alternate. These are spring, summer, fall and winter. The weather of each season is different. The color of the plants also varies from season to season. The change of seasons depends on the sun and the weather. In autumn and spring the air temperature is moderate, the air warms under the influence of sunlight. So the sun provides the change of seasons. In winter, the weather is cold, with many snowy and rainy days. In spring, the days are warm, rainy, and nature is green. In summer the weather is hot, the fruits ripen. In the fall, everything is ripe. Fruits are harvested from the garden. So, each season has its own character, its own beauty. We must make productive use of nature. We need to take care of everything around us. We need to have the right attitude to nature, so that nature gives us food, gives us pleasure.

Students are given the task to fill in the following conceptual table independently:

- Draw a table in your notebook. Write the names of the seasons and months on it.

**2 – TABLE**

Winter		Spring		Summer		Autumn	
1.		1.		1.		1.	
2.		2.		2.		2.	
3.		3.		3.		3.	

#### **V. Reinforcing the theme:**

Write down what you understand in your notebook, The World Around Us. Students complete the assignment independently, reading the chapters they have written.

Homework. Exploring the theme of the seasons. Writing a text on the topic of "Autumn".

It is advisable for the teacher to dedicate each environmental education session to a specific topic. Raising students' environmental awareness, self-awareness, conservation and respect for natural resources, wildlife and flora imposes a special responsibility on the primary school teacher.

The teacher must instill in the minds of students the idea of nature conservation. The teacher needs to find the most effective ways to do this, and make effective use of drawing, herbarium, and visual aids developed in collaboration with students on environmental topics. This makes the lesson lively and interesting.

The teacher should use the following methods to impart environmental knowledge to students. Such unconventional methods encourage a better observation of what is happening in the environment. In particular, conference lessons based on topics that are inextricably linked to practice help students develop environmental thinking skills and gain a broader understanding of the nature of problematic issues.

The following is an example of an hour-long lesson on "The World Around Us" that aims to educate students in the spirit of respect for nature.

**Topic:** *Plant life in spring*

**Course Objectives:** To acquaint students with the first flowering plants in early spring and their living conditions.

- a) Educational: Introduction to spring flowering plants.
- b) educational: to teach plants to care for, reproduce, respect, to enjoy the nature.
- c) developmental: formation of concepts of plant protection, respect;

**Course Method:** Using interactive methods.

**Classroom:** textbook "The world around us", pictures of spring, test questions, handouts, projector, animation, computer, spring waltz.

**The course.** The lesson begins with a conversation about spring and students are asked the following questions:

1. Why does the day lengthen in spring?
2. What will be the length of day and night on March 21? What is this day called?
3. Why does nature wake up when spring comes?
4. What is the weather like at the beginning of spring?
5. What can be seen during a thunderstorm?

Students' entries in the Observation Diary will be reviewed, and their opinions on the signs of spring in the surrounding nature will be heard.

In the spring, the sun rises higher and higher, the plants wake up as a result of the weather, global warming, frequent rains, the soil becomes moist. In this humid weather, the desert and steppe fields are covered with grass, and the streams and hillsides are covered with grass, and the breath of spring begins to breathe.

Students are taught not to destroy plants in nature, not to harm wildlife, to protect and respect them. The importance of plants in human life, the fact that they absorb carbon dioxide and produce the oxygen needed by humans, is instilled in the minds of students.

**Musical minute:** "Spring" waltz music will be played.

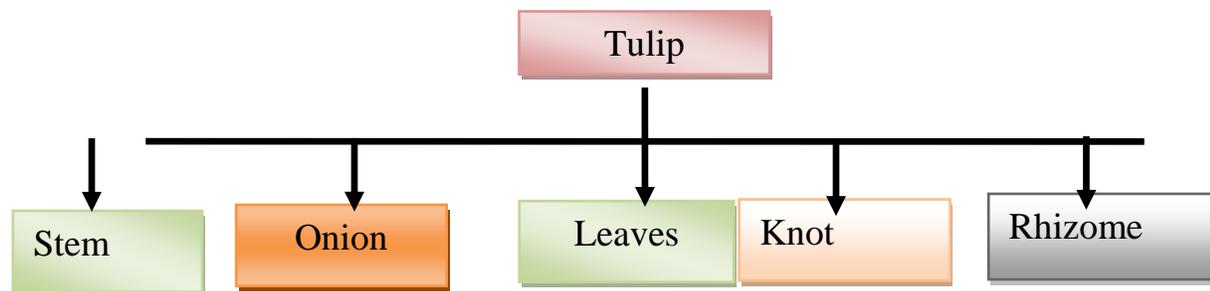

The teacher tells the names of several plants that bloom in the spring and shows the students the organs of those plants (flowers, stems, leaves, nodes, rhizomes, bulbs and other organs) through pictures and provides the following information:

In the fields and gardens, in the meadows grow plants such as dandelion, sagebrush, wormwood, sagebrush, sagebrush, sagebrush, mint along the streams.

			
<b>Mint</b>	<b>Zubturum</b>	<b>Qoqio't</b>	<b>Wormwood</b>
			
<b>Separation</b>	<b>Sachratqi</b>	<b>Ayiqtovon</b>	<b>Suvzamchi</b>

Some of these plants are medicinal plants. For example, the leaves of dandelion are treated by placing them on a wound, burn or bee sting. The leaves are also used in the treatment of colds, diseases of the stomach and intestines.

Rhubarb is also a medicinal plant. Inside the stem that bears the flowers is a milky white juice. The juice is used to make medicine. The leaves of the cauliflower are eaten.

Then practical work on herbariums and live plants will be carried out. The teacher writes the name of the plants mentioned above on the board and invites students to look carefully at the herbarium plant specimens and live plants. Students look at daisies, tulips, tulips, violets and find their organs.

Students write the names of the plants in their workbooks, noting in the Observation Diary which plants began to bloom.

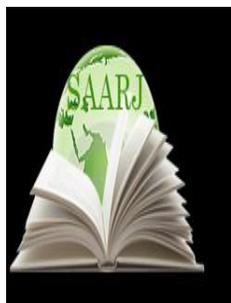

In conclusion, the results of the work, observations and generalizations in the field of technology of education of primary school students in the spirit of nature conservation and respect can be recommended as follows:

1. To take into account the fact that the content of educational subjects is enriched with nature-respecting competencies in order to strengthen the effectiveness of technologies for educating primary school students in the spirit of nature conservation and respect.
2. Creating a system of continuous education technology in the spirit of nature conservation and respect, holding a musical event on nature conservation and respect among students in the framework of five initiatives and organizing competitions for the depiction of natural landscapes on environmental protection.
3. In out-of-school activities, in cooperation with ecotourism and the family, hold competitions and contests on nature with the participation of parents, such as "Young nature lovers", "Respect for nature", "In the arms of nature", "I respect Mother Nature".
4. Implement a system of using technologies to educate primary school students in the spirit of nature conservation and respect.
5. Enrichment and expansion of the content of technology of education of primary school students in the spirit of nature conservation and respect.
6. Establish a strong partnership between preschool, school, academic lyceum, higher education and the general public in the field of nature conservation and respect.
7. To increase the scientific and theoretical knowledge of teachers in the field of nature protection and respect in the regional centers for retraining and advanced training of teachers and equipping them with advanced pedagogical technology methods.

**FROM THE HISTORY OF URBANIZATION PROCESSES (LATEST  
 BRONZE AGE – ON THE SAMPLE OF THE RUINS OF DALWARZIN  
 CITY)**

**Abdumukhtor Abdukhalimovich Hakimov\***

\*Doctor of Philosophy in Historical Sciences (PhD),  
 Department of “History of Uzbekistan”,  
 Andijan State University,  
 UZBEKISTAN

**ABSTRACT**

*In this article, data on the history of the Dalwarzin city ruins of the Late Bronze Age, the oldest major urbanization phase in the Fergana Valley, are analyzed on the basis of archaeological sources. When the wall was cut transversely from three places, it was found that the city's defensive structures had been rebuilt on a base built on cultural layers. The base is covered with bricks on both sides, filled with stone (up to 60 cm in diameter), brick fragments and mud, and a large wall is built. Archaeologists studying Fergana in many cases often find that the buildings intended for living are almost non-existent. There is a question as to why the dwellings of the Dalwarzins, who were able to make magnificent floral pottery, unique tools made of bronze, are not well preserved.*

**KEYWORDS:** *Dalwarzin, Central Asian civilization, Fergana valley, Pamir-Alay expedition, Chust culture, Academy of Material Culture, urbanization.*

**INTRODUCTION**

The Fergana Valley is one of the largest historical and cultural regions not only in Uzbekistan, but in Central Asia as a whole. According to the results of large-scale archeological excavations in the Fergana Valley, it was determined that the region has a unique and appropriate material culture. The process of the first half of the second millennium BC, ie the geographical environment typical of the eastern regions of the Fergana Valley, as well as the abundance of thousands of springs and fertile lands provided by the Karadarya water resources, gave rise to the first agricultural culture. As a result of these processes, the first agricultural culture appeared in the eastern regions of ancient Fergana. This culture was discovered and studied in 1950 by M.E.

Voronets near the spring called Buvanamozor near the city of Chust. Thus, the first agricultural culture of the Fergana Valley was called the Chust culture after the city near the first monument [1, pp. 69-76]. Special mention should be made of the services of Yu.A. Zadneprovsky, VI Sprishevsky and BH Matbobaev in the study of monuments of Chust culture [2].

## THE MAIN FINDINGS AND RESULTS

In the last quarter of the second millennium BC, the first agricultural sites of the Chust culture spread in the valley. According to the well-known Fergana scholar Yu.A. Zadneprovsky, more than 80 such monuments have been identified in the Fergana Valley [3, pp. 175-180]. The largest of them are: Dalwarzin (25 hectares), Ashqaltepa (13 hectares), Chust (4 hectares). It is this culture that has taken the first steps towards the emergence of urbanization processes. Later, they cultivate the buds of the first oasis statehood and develop the signs of the first statehood. In recent years, new data have been obtained on the study of the first urban planning in ancient Fergana. These data equate the age of the largest monuments of Chust culture to the XII-VII centuries BC, and give grounds to call Dalwarzin monuments such as the ancient city, Chust, Ashkaltepa, Khojambog as urban sites [4, pp. 16-17].

The largest and best-studied monument of the Fergana Valley is Dalwarzin. The ruins of Dalwarzin city are a monument located in the lower part of Dalwarzinmahalla, 2 km east of Oyim village, Jalal-Abad district, Andijan region. The area is 25 hectares and the thickness of the cultural layers reaches 5 meters. During the 16 field seasons in Dalwarzin since 1952, St. Petersburg archaeologist, Professor Yu.A. Zadneprovsky conducted the excavations [5, p. 32]. Inspections were carried out mainly in the central part of the monument and on the sides of the eastern defensive wall. Studies have shown that Dalwarzin consists of three parts, each surrounded by a separate defensive wall. That is, the ruins of the city have three components and they are called Dalwarzin I, II, III. Archaeological excavations have determined the functional function of each section.

1. Dalwarzin I - occupies an area of 18 hectares and is surrounded by a wall built of soil boundaries. When the wall was cut transversely from three places, it was found that the city's defensive structures had been rebuilt on a base built on cultural layers. The base is covered with bricks on both sides, filled with stone (up to 60 cm in diameter), brick fragments and mud, and a large wall is built. The walls were 4-6 meters thick and 2.5 meters high. Another part of this wall is built differently. This wall is built of cotton blocks (dimensions 50x50,40x30 cm) on top of the cultural layers. The defensive wall was on average 4 meters thick and 1.25 meters high. Parallel to this wall, at a distance of 2 m from it, the second wall was restored to a thickness of 1.2 m. It is clear that this wall was built to reinforce the first wall. The space between the two walls is filled with earth, bricks, blocks, and so on. The total thickness of the defensive wall was 8 meters.
2. In Dalwarzin II or in the eastern part, an area of 5 hectares is protected by a defensive wall. But this wall is not well preserved, it is also built on a lower cultural layer like the first wall. Thickness is 4 meters and stored height is 1 meter.
3. Dalwarzin III or arc-northwest section (2.2 ha) was protected by a third defensive wall. This wall is built of black and blue-colored ridges on a cultural layer of 60-80 cm. The wall thickness is 2.5 meters and the stored height is 2.6 meters [6, pp. 69-94].

As a result of the excavations, the remains of houses in parts Dalwarzin I and II were excavated at almost all three construction stages. Three different habitats have been excavated in the lower stratum [7, pp. 40-46].

First type synch houses: Such houses are recorded in Chust and Dalwarzin. Only the monumental houses in these monuments may differ from each other in size or function. Sinch houses have been known in the Fergana Valley since that time, and this tradition of construction continues to this day. The closest resemblance to Sinch houses is found in archeological complexes in East Turkestan. In particular, sinus construction was widely used in all constructions except the early medieval defensive walls at Hotan and Labnor. In the architecture of East Turkestan, there are four types of building houses [8, pp. 190-193].

Second types of cotton and brick houses: Complex houses consisting of a separate house (such a house measuring 5x8 meters was opened during the middle construction phase) and consisting of several rooms were excavated. Each complex consisted of three or four rooms, with an area of up to 140 sq. m. It is known from excavations in three complex arches consisting of 11 rooms. Most of all, the four-room complex with a hall in the middle (size 7.2x7 meters) is well preserved. 2 - Different dwellings are also found in Chust in stratigraphically slightly later layers, e.g., during the upper construction phase. In Dalwarzin, it was recorded at all stages of construction [9, pp. 70-86].

Third types of different basements: In Dalwarzin, these kinds of dwellings have been studied quite thoroughly. Basement 1 is located northwest of the monument. The plan is rectangular, the lower part is excavated in the mainland layer, the area is 60m<sup>2</sup>. The walls are partially bricked and plastered over. In the center of the basement is a plan rectangular special furnace and at each corner of it is restored column (column relay recesses are preserved). The difference between the walls of the basement and the absence of a domestic stove led Yu.A. Zadneprovsky to conclude that this place was a room for religious worship in honor of the fire [10, pp. 116-118]. Basement 2 is located close to the previous one. Despite the partial opening, it is slightly different from the previous one. For example, the location of several columns under an east wall rebuilt of brick has been identified. According to some indications, this basement was built for living.

According to Yu.A. Zadneprovsky, Dalwarzin can be divided into two groups according to the function they performed in the basements of the last Bronze Age:

1. Basements for living. These, in turn, a) had four columns and a central pipe (area 40-80 sq.m.); b) the plan is round and the area is 10-12 sq.m.
2. Farm basements built for production.

At the end of the housing analysis of this period it is necessary to note the following. Sinch houses and basements emerged under the influence of the architectural traditions of the desert Bronze Age inhabitants. Such monuments include the sites of Kayrakkum, Vodil, Yapagyi, Karamkul, Dahana, DashtiAsht. The origins of the aforementioned East Turkestan "Sinch Houses" also date back to the northeastern regions of Central Asia. The houses, rebuilt of cotton and brick, were built in accordance with the house-building traditions of the people engaged in farming in the southern regions.

Dalwarzin city defense structures are well studied. The city has three rows (two outer and one inner) of defensive walls, and they are divided into three parts. According to Yu.A. Zadneprovsky, the following methods were used in the construction of the walls:

1. Built from cotton blocks
2. Made of brick.
3. Both sides are made of brick "sheath" and the middle is filled [11, pp. 3-13].

It was noted that for the first time in the Fergana Valley, witnesses were used as a building material [12, pp. 12-14]. Each defensive wall of the Dalwarzin city ruin is of special importance.

Archaeological research shows that the defensive walls of the Dalwarzin city have gone through the following stages of development in the history of the monument:

Stage 1, the period before the construction of the city's defensive walls and the accumulation of the lowest cultural layers at a thickness of 50-80 cm;

Stage 2, the period of construction of defensive walls, their active use and repair, and in this interval, cultural layers with a thickness of 2.5-4 meters are collected;

Stage 3, the destruction of the defensive walls and the cessation of life at the monument and its abandonment. This includes cultural layers up to 60 cm thick at the top. According to the authors of the excavation, such periodicity of defensive walls does not contradict the stages of urban construction [13, p. 10].

Archaeologists studying Fergana in many cases often find that the buildings intended for living are almost non-existent. There is a question as to why the dwellings of the Dalwarzins, who were able to make magnificent floral pottery, unique tools made of bronze, are not well preserved. The reasons for this are still unknown. The only reason can be considered that the houses were rebuilt from scratch.

## CONCLUSION:

In conclusion, the archeological research on the history of the study of the Late Bronze and Early Iron Age monuments of the Fergana Valley provides ample opportunities for scientific research of the first urban culture in the valley and the first statehood formed on their basis.

### ABSTRACT

*Every artistic event has its own history of formation and stage of development. Proverbs, which have been passed down by word of mouth for centuries and are a shining example of the wisdom of the people, are also fully subject to this law. The article discusses the role of written literary sources in determining the formal and semantic evolution of Uzbek folk proverbs in terms of space-time, social reality.*

**KEYWORDS:** *Proverb, Evolution, Classical Literature, Oral Creation, Figurative Thinking, Pandnama, Variation, Ghazal, Perfection, Evolution.*

### INTRODUCTION

Proverbs are a small genre that occupies a central place in the oral art of all peoples. They differ from other examples of folk art by their compact form and wide content. The proverb reflects the worldview of the people [6. 111]. No other genre can be compared to a proverb in reflecting the question of national thinking, national spirit, national identity, and nationhood in general. In every nation there is no situation, event, event that is not evaluated by a proverb that is not concluded by a proverb. There is a proverb of the people, for better or for worse, right or wrong. The proverb is the key to studying the history, life, experience, values, and attitudes of the people.

The proverbs used in our speech are the product of a long gradual process. Over time, they adapted to speech and developed both formally and spiritually. Our observations confirm that articles that initially had two components took the form of a single-sentence sentence over time, or that only the part that represented the main content was omitted and the part that was not considered important was omitted. Since proverbs are an example of oral creation, it is impossible to directly study their evolution. However, the written literary sources specific to each period also allow us to study the oral creativity of that period. Because any artist is, first of all, a representative of the people. His work naturally reflects the customs, traditions and worldview of this nation. The artist uses examples of oral creation, in particular, proverbs, to evaluate an issue, and sometimes to prove his point of view effectively [3. 983]. Creators use proverbs, sometimes exactly and sometimes with change, as required by speech. Sometimes they create a new wisdom that fits the content of the proverb. Thus different variants of a proverb or similar new proverbs emerge. Therefore, the most appropriate way to study the development and spiritual progress of proverbs is to collect and comparatively study the proverbs contained in classical literary monuments. Indeed, it is "on the one hand important to study the aspects of the artistic skill of writers and poets, to trace the history of folklore, on the other hand, it is important to directly restore and create the history of folklore" [5. 218].

Determining the period of application of proverbs and comparing them. Although proverbs are a very ancient genre, the sources that show their antiquity are also written literary monuments. The oldest written monuments of the Turkic peoples date back to the V-VIII centuries. Hence, we rely on these monuments as the first examples of folk proverbs [8.120]. However, the tenth-century encyclopedic scholar Mahmud Kashgari's "DevoniLughati-t-turk" is the main source for the periodic study of folk proverbs. It contains more than three hundred proverbs, and the scholar notes that these proverbs were collected among the Turkic peoples for many years [3.14]. therefore, the proverbs used in the Devonian proverbs as part of later literary monuments pave the way for the study of the evolution of proverbs [4.16]. The work of the thinker-poet of the XV-XVI centuries AlisherNavoi made a great contribution to the improvement and development of folk proverbs. The great poet AlisherNavoi, in addition to using folk proverbs in his works, led to the emergence of new versions of them. The wise words used in his pandnoma works such as "MahbubUl-kulub", "Hayrat-ulAbror" later became popular proverbs. Comparison of later works such as "Boburnoma" (XVII), "Shajarayi Turk", "Shajarayitarokima" (XVIII), "Zarbulmasal" (XIX) and proverbs used in the poetry collections of Turkic poets of this period will help to study their periodic evolution.

## THE MAIN FINDINGS AND RESULTS

Written monuments play an important role in the implementation of both the formal and spiritual development of folk proverbs. The proverb is formed as a linguistic unit in a certain period, but its semantic development is constantly evolving and deepening. Proverbs are the summary of figurative thinking and coexist with constant time. The content of the proverb created in play XI does not retain the logic that served at that time. Any proverb takes into account the social life and society of the period in which it is applied [2.87]. This period, as a means of expressing attitude to social life, develops spiritually and adapts to the period. This helps in the study of the spiritual evolution of proverbs. In particular, proverbs that once appeared in relation to society do not meet the requirements of a new period in content, and it becomes obsolete as a proverb of

that period. However, some proverbs serve as a lesson for the life of a new era in content, and it will be further improved, but will lead to the creation of new versions of proverbs.

Proverbs have a deep philosophical meaning and their use in the written literature has a specific purpose. Representatives of classical literature repeatedly refer to folk proverbs in their creative process. Determining the cause of this sets a new task for research. Folk proverbs are never challenged by their sharp meaning and firm judgment, but the people use folk proverbs to prove that their opinion is valid [5.115]. Representatives of classical literature also pursue three important purposes from the use of folk proverbs in their works. a) in order to confirm the ideological idea expressed in the creative artistic thinking; b) in order to create an image in a work of art and to form its character; c) in order to enrich the content of the work of art and artistic bleaching.

Proverbs were originally a stable combination formed as a means of communication intervention, and entered the written literature as an artistic medium, the deep content of which was used by the creators as ready-made material. In the process of their application, their period adapted to the characteristics of the language and tried to enrich its content. On this basis, we can observe two main changes in the evolution of proverbs.

Formal perfection, that is, the social language is in constant motion, it is natural that over time the language changes phonetically, lexically, grammatically. Proverbs in particular also change formally as words as a linguistic unit. In this case, the proverb acquires a formal evolution while retaining its content.

We pay attention to the article “*Yi;parli;g` kesu;rgu;din yi;par ketsa;, yi;di; qali;r*” from the “DevoniLughati-t-Turk”. The date of creation of this proverb is unknown, but the period of its writing is XI century. This proverb was used in the dewan in two variants. 1) “*Yi;parli;g` kesu;rgu;din yi;par ketsa;, yi;di; qali;r- musk in a container [3.340]*”. This proverb tells of a person who can be found if he is asked for something, even if he has lost his wealth, 2) “*Kizda:ki kiz yi;par- the smell of musk is stored in a box of musk [“Odor smell stays in the odor box”]. This word is used when the smell of women's mouths resembles musk. (The commentary on the proverbs belongs to Mahmud Kashgari)*” means that this proverb was in evolutionary development even before Mahmud Kashgari wrote it.

The words in the first proverb belong to the ancient Turkic language, which is characteristic of the living language of that period. The proverb is grammatically two-component, formed in the form of a compound sentence with an unobstructed follow-up sentence. It consists of six words. *Yi`parli`g` (Jiparlig`)-odorful - musk - made with the addition of formed noun, kesu`rgu`din - dish ablative case noun, yi`par - odor-simple noun, ketsa;-the conditional verb formed a subordinate clause in the following compound sentence, yi`di` (jidi)-smell - a noun that takes the form of possession of the third person, qali`r - leave, adjective verb.*

The second version of the proverb is more concise than the first, that is, it is a simple sentence with one component, and the words in it are three: *Kizda:ki kiz yi`par-the smell of musk is preserved in the musk box. Kizda:ki -in the box - a noun in the form of time-space, kiz -box - a noun in the form of a subjective case, yi`par-ifor (smell) - a noun in the nominative case.* The proverb has a sentence structure based on the grammar of the ancient Turkic language and is a concise form of the first proverb.

Mahmud Kashgari says in the preface of the dewan: "I have traveled for many years in the cities, villages and pastures of the Turks, Turkmens, Oghuzs, Chigils, Yaghmas, Kyrgyz, collected dictionaries, studied and identified various word features [3,340]. both had their own evolutionary development. The order of life of proverbs is verbal and may have different variants in the process of word-of-mouth transmission, the following proverb emerged as a product of regional variation. Typically, variation in proverbs occurs on two grounds: a) region-related variation, or period-dependent variation.

Articles "*Yi`parli`g` kesu`rgu`din yi`par ketsa`, yi`di qali`r`*" and "*Kizda:ki kiz yi`par`*" used in Dewan are region-related variations. As the scholar points out, since he was in many lands inhabited by Turks and wrote proverbs from them, there are two versions of a proverb from the dewan. Time is also important in the formation of new versions of proverbs.

This proverb has been widely used in recent times, including in the time of AlisherNavoi, but as a result of gradual evolution, the proverb has improved:

*Chun masalbo`ldisochingzulmichra, yoshurmoq ne sud*

*Mushkisinyashursabo`lmas, bumasalmashhurerur[1.162].*

The proverb "Musk cannot be hidden" used in the verse is a form of the proverb we mentioned above, used in the 15th century. As the proverb moves to the written literature, it obeys the rules of literature and does not retain its original form. The proverb is used in the composition of the work of art based on the purpose of the creator and adapts to the weight and tone of the byte. However, the semantic logic of the proverb is preserved. Therefore, the creator increases the value of the idea he is saying and the art of the work with the help of proverbs. The proverb was also widely used in the living language in the XI century. That is why AlisherNavoi says in his ghazal, "This parable is famous".

The proverb "*Kizda:ki kiz yi`par`*" used in the XI century became "Mushk (smell) cannot be hidden" in the XV century. Apparently, the proverb differs in sentence structure and lexicon, even though it has retained one component in terms of grammatical structure for four centuries. This case shows the formal evolution of the proverb.

Proverbs do not always remain firm in their original meaning. His figurative expression adapts to this period according to the thinking of the period in which it is used. An additional philosophical observation is added to the original content. According to Mahmud Kashkari's commentary on the proverb "*Kizda:ki kiz yi:par`*", "this word is used when the smell of women's mouths resembles musk," and AlisherNavoi'sghazal has a special meaning.

*Chun masalbo`ldisochingzulmichra, yoshurmoq ne sud*

*Mushkisinyashursabo`lmas, bumasalmashhurerur[1.162].*

While the beautiful image of the sun is described in the ghazal, its beauty is first likened to the sun, its face to the moon, its black hair is likened to a tyrant who shares the lover's heart, and the proverb confirms the impossibility of hiding the lover's plight in the face of this beauty "It is impossible to hide the real love affair".

The proverb has not lost its status in later periods. In the collection "Uzbek folk proverbs" there are two variants.

*Iporismisandiqdanketmas,*

*Iporisiniyashiribbo'lmas* [3.200]

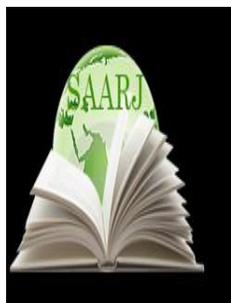

Apparently, the proverb had a concise form and perfect meaning as a result of long-term periodic evolution. Proverbs are used today in terms such as “The good and good work done will never be forgotten” and “goodness, or generosity, cannot be hidden among the people”.

## CONCLUSION

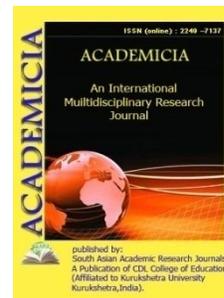

Thus, folk proverbs are an example of oral creation that has been refined as a result of long-term evolution, and over time has improved on two bases: formal perfection and spiritual perfection. The role of classical literature in the evolutionary development of proverbs is invaluable, and the works of classical literature serve as an important source in the study of the evolution of folk proverbs.

### ABSTRACT

*An overview of the formation and development of the theory of terminology as a separate discipline is offered. Various aspects of the theory of terminology are considered. The characteristic of the main unit of terminology - the term is given, and its structural and typological characteristics are revealed. In conclusion, the author points out the current trends in the development of terminology.*

**KEYWORDS:** *Terminology, Term, Lexicology, Nomenclature, Word, Concept, History Of Terminology.*

### INTRODUCTION

The theory of terminology is one of the most controversial issues of modern science, which, due to its versatility, is of interest to a wide variety of scientific fields. To justify the expression “controversial issue”, we will cite as an example some aspects of the development of the theory of terminology and start with the domestic one. The beginning of terminological activity as an independent scientific direction in domestic terminology can be dated back to 1931, which is associated with the publication of the first conceptual article by D.S. Lotte on the problems of unification and standardization of technical terminology

“The next tasks of scientific and technical terminology” [1]. The main attention of D.S. Lotte, who is considered the founder of the Russian school of terminology, was paid to the issues of standardization of terms, problems of term creation, borrowing terminological vocabulary, the creation of conceptual and terminological systems and the problems of translating scientific and technical terms.

Russian linguists G. O. Vinokur, A. A. Reformatsky also made a significant contribution to the history of the formation of the national school of terminology and terminology as a science. An important role in this area was played by the work of GO Vinokur "On some phenomena of word formation in Russian technical terminology" [2]. G.O. Vinokur considered issues that are still in the focus of linguistic analysis today, namely, questions about the linguistic essence of a term, the nature and formation of terminologies, the relationship between nomenclature and terminology. The research of A.F. Lesokhin and P.A. Florensky made an equally significant contribution to the activities of the national school of terminology. The peculiarity of the term, as AF Lesokhin believed, lies in the dynamism of scientific concepts, while the researcher interpreted the internal form of the term as a transitional link from the semantic content to the external form. PA Florensky's attention, in turn, was paid to the study of the structure and functions of terms.

### **MATERIALS AND METHODS:-**

In the middle of the XX century. In the context of the activities of the terminological schools of the world, the emerging theoretical discussion concerning the essential characteristics of the term acquires special relevance and acuteness. It was initiated by the Russian researcher and terminologist R. G. Piotrovsky. Scientists who took part in this discussion, in turn, identified further directions in the study of terminology. Thus, the problem of lexicographic reflection of the conceptual and systemic properties of the term from the 60s to the 80s. XX century. turned out to be in the center of attention of scientists, among which the works of such Russian and foreign researchers as R.A. Budagov, L.A. Bulakhovsky, V.V. Vinogradov, G.O. Vinokur, V.G. Gak, A. S. Gerd, S. V. Grinev, V. P. Danilenko, V. A. Zvegintsev, T. L. Kandelaki, L. A. Kapanadze, K. A. Levkovskaya, V. M. Leichik, A. I. Moiseev, S. Ye. Nikitina, V. D. Tabanakova, V. A. Tatarinova, AM Terpigorev, S. D. Shelov, V. deBesse, M. T. Cabre, M. Campenhoudt, L. Depecker, H. Felber, F. Gadet, D. Gouadec, L. Guilbert, J. Dubois, P. Lerat, S. Pavel, H. Picht, A. Rey, G. Rondeau, L. J. Rousseau, J. C. Sager, E. Wuster and many others.

From a scientific point of view, the Russian school of terminology combines logical, linguistic and philosophical approaches with a certain tendency towards the prevalence of the philosophical and logical direction. The study of the content of the subject area is combined here with a certain attention to the linguistic form and the distribution of terms in the texts [3, p. 209].

D.S. Lotte, G.O. Vinokur, A.A. Reformatsky are considered the founders of the Russian school of terminology. When mentioning the Western scientists, who laid the foundation for the theory of terminology, the name of the Austrian scientist Eugen Wüster should be mentioned first. Wüster was at one time an active supporter of Esperanto, an ardent supporter of accurate professional communication. He developed his own theory of terminology.

Analyzing Wüster's concepts and his theory, the main distinctive features should be noted, namely:

- The need to determine the means of standardization;
- Careful control of development (planning niya, unification, standardization) terms;
- Priority of the international form of the mark.

Wüster's theoretical work was based on the study of technical terms - standardized technical lexemes representing certain concepts. Wüster's theory was designed to meet cross-lingual needs, not to show the full depth and variability of terminology. This theory is not the most complete and profound reflection of the essence of the terminology. Nevertheless, it became exactly the basis on which this discipline developed further.

For many years, the theory of terminology did not receive proper development, since criticism was absolutely not allowed in this area. It did not have the usual scheme of development for any discipline through the opposition of opinions and basic works of eminent theorists. And only at the turn of XX – XXI centuries. scientists again drew attention to this problem. Moreover, in contrast to the previous period, when scientists were interested in terminology only as a subject applicable in each specific area of knowledge. For the first time, terminology began to be considered as a separate discipline.

At present, a number of national schools - Austrian-German, French-Canadian, Russian, Czech - are engaged in the development of theoretical problems of terminology, differing in their approaches to the consideration of special vocabulary; leading in terms of the scale and significance of research is the Russian school. Among the well-known representatives of modern Russian terminology one should mention OS Akhmanova, SV Grinev, VA Tatarinov. In Russia terminologists are united by the Russian Terminological Society "RossTerm".

The theory of terminology is recognized as a separate discipline by many scientists. The important role of terminology in the modern world is undeniable, because the level of development of a society is determined precisely by the state of national terminology. In this case, it reflects the state of science of a particular society and is an important component of politics, economics, and culture. "Not a single phenomenon in a language can be understood without taking into account the system to which it belongs" [4, Art. 7], therefore the question of the place of terminology in the language is special. It is not necessary to include terminology in the vocabulary of the general literary language, since this will lose its linguistic specificity, but it would be wrong to completely delimit these concepts. The best option would be to consider the terminology as a kind of Russian speech along with dialects, jargons, vernacular [4, p. 18].

Like any linguistic phenomenon, terminology develops and functions within the framework of a certain concept, which is a kind of field for its formation. With regard to terminology, we can call the language of science a similar environment. The language of science is distinguished by us beyond the functional-speech styles on the basis that the functions of the language of science do not completely coincide with the functions of the general literary language, for example, and practical activities - information and communication function "[4, Art. nine].

We analyze terminology within the language of science, and first of all I would like to consider its structural, genetic and grammatical aspects. First of all, the vocabulary of the language of science is not uniform, it can be divided into three main independent layers: non-terminological vocabulary, general scientific vocabulary and terminological vocabulary [4, p. 18]. The terminology contains both the original words of a language, and borrowed, highly specialized and generally accepted, old and new names. If we talk about term formation, two types of education can be distinguished - from term elements and by means of affixation. Words, taken as ready-made units, have, as noted by A.A. Potebnya, immediate and further meanings, whether we consider them as everyday ones or apply to specific sciences. This phenomenon can be called

"the implementation of different types of information, depending on the ratio of the word with an everyday or scientific concept" [5, p. 72]. Here we can note such a phenomenon as neologism, or intersystem homonymy. According to VP Danilenko, three structural types of terms can be distinguished:

- 1) word terms (non-derivative, derivative and complex);
  - 2) the terms of the word combination (decomposable and indecomposable); 3) symbol-words.
- But before delving into the structural specifics of the term, you should define it.

The term as a basic unit of interprofessional communication has different interpretations. According to A. A. Reformatskiy, "terms are special words, limited by their special purpose; words striving to be unambiguous as an exact expression of concepts and the naming of things" [6, p. ten]. As a result of the study of various areas of special vocabulary, it was found that along with the terms there are other special lexical units that have been identified and described: nomens [2], professionalisms [7], professional argotisms [8], or professional jargon [9], preterms and quasi-terms [10], terminoids [11], prototerms [12]. These special lexemes have both a number of common features with terms and distinctive features.

Nomens are the names of individual concepts, as well as specific mass production, reproduced according to the same sample a given number of times. The difference between a term and a nomen is that nomens refer to singular concepts and terms as general concepts. Preterms are special lexemes that are used as terms to name newly formed concepts, but do not meet the basic requirements for the term.

A terminoid is a special lexeme used to name insufficiently established (emerging) and ambiguous concepts that do not have clear boundaries, and therefore definitions. Therefore, terminoids do not have such terminological properties as accuracy of meaning, contextual independence and persistence, although they name concepts.

Prototerms are special lexemes that appeared and are used before the emergence of sciences (the earliest, perhaps 30-40 thousand years ago), and therefore they do not call concepts (which arise with the advent of science), but special concepts.

The term has a number of specific features that are implemented only within the terminological field:

- Consistency;
- The presence of a definition;
- The tendency towards monosemicity within its terminological field;
- Lack of expression;
- Stylistic neutrality [13].

The structural and semantic features of the term are manifested in the sphere of word formation, where there is a specialization of individual formants characteristic of the actual terminological models. To describe the structure of a term, the concept of a term element is used - the minimum significant component of a term. The specificity of the terms allows them to be separated from other units of the language and to dismember the entire set of terms. One of the features of the

terms is their designation of general concepts. Since there are several types of general concepts, different types of terms can be identified. First of all, the most general concepts of matter and its attributes are highlighted, which are called categories (matter, space, time, quantity, quality, measure, and others). Accordingly, the terms that denote categories are a type of category terms.

The terminological issue has also something to do with philosophical understanding of the text and terms functioning within it. The philosophical problem is reconstructed basing on the study of the text. But this is a certain difficulty: philosophical problems understandable for one person may not be so obvious for another. Therefore, the problem solved by a philosophical text can be recreated, reconstructed by the reader's own thinking [20, p. 128-136].

A characteristic phenomenon of the Russian and European philosophical terminological systems as an integral phenomenon is the semantic ambiguity of drill elements, due to different interpretations of philosophical concepts by different thinkers and different philosophical schools. The semantic content of the philosophical term is determined and specified in the process of its actual functioning. The question of the semantic polysemy of a philosophical term is removed within the framework of a specific philosophical term system: a term can be ambiguous in composition. The "large" terminological system of philosophy, however, the term belongs to a certain philosophical course and philosophical terminological system of one particular thinker determines its relative uniqueness, which is uniqueness within the term system. The correlation of terms with the worldview of a particular thinker allows one to speak about author's philosophical terminological systems, the study and lexicographic description of which constitute an important task of modern terminology [21, p. 627-631].

It is known that typology is the basis of classification. In this sense, the division of terms according to their most important features is actually a terminological classification of terms. The basis for all subsequent classifications are various separate signs of terms - meaningful, formal, functional, intra- and extra-linguistic. All these classifications can be associated with those sciences and fields of knowledge in which they are used. G. P. Melnikov distinguishes several types of classifications.

The first classification of terms by content, used primarily in philosophy, is the division into observation terms and theoretical terms. Behind the terms of observation are classes of real objects, and behind theoretical terms are abstract concepts that usually depend on a certain theory or concept.

The second classification of terms by content - by the object of the name - is their distribution by areas of knowledge or activity, or, in other words, by special areas. We refer to these spheres as science, technology, production, economic basis, superstructure. Based on this sociological scheme, it is possible to formulate a list of headings included in the classification of terms according to the field of knowledge.

The third meaningful classification of terms is based on the logical category of the concept that is designated by the term. The terms of objects (mammals), processes (multiplication, paperwork, compression) are highlighted; signs, properties (cold brittleness), quantities and their units (current strength, ampere).

Classification by content (semantic) structure allows you to single out unambiguous terms (shunting, nut, chromosome) and ambiguous terms, that is, those that have two or more meanings

within one terminology system (court - 1. a set of judges and assessors; 2. court session; 3. courthouse). The terms are highlighted - free phrases (muffle furnace, certificate of residence) and stable (including phraseological) phrases (gravitation) [22].

The classification of terms by formal structure is very fractional. First of all, word terms are highlighted. They, in turn, are subdivided into root (water), derivatives (preposition, divider, re-grading), complex (social science, biosphere), compound (capital investments), as well as words of unusual structure - telescopic (radio tape recorder - from a tape recorder + radio), with the reverse order of sounds (MO - from ohm), chain formations (synthesis gas, 2,5-dimethyl-5-ethyl-3-isopropylheptane).

Further, the terms-phrases are highlighted. The most common structures here are combinations of a noun with an adjective, a noun with an indirect noun (degree of freedom), a noun with another noun as an attachment (a seamstress-minder). There are also many-word terms, sometimes consisting of more than 5 words (filtration potential of spontaneous polarization in a well - GOST term).

Typical phenomena in the formal structure of terms are the truncation of single-word terms (cinema - from film or cinema) and the reduction (abbreviation) of wordy terms. There are many types of abbreviations: alphabetic (KPD), sound (ZhEK), syllable (gorkom), word-like (sigran - from synthetic granite); in addition, combinations of abbreviations with words (MHD generator - from magneto hydrodynamic generator) [23, p. 590-598].

### **Result:-**

Terms of specific formal structure using elements of artificial languages are constantly appearing; symbols-words (x-particle), models-words (i-beam, that is, an I-beam by similarity to the letter I). The classification according to motivation / non-motivation shows that there are terms, the meaning of which may or may not be explained by their structure. It distinguishes between terms fully motivated (gas pipeline), partially motivated (Parkinson's disease), completely unmotivated (diamond), and falsely motivated (lightning rod).

Depending on the source language, the terms are primordial (sensor), borrowed (display - shal, cross - German), hybrid (metallurgy, anti-icing).

From the point of view of belonging of terms to parts of speech, they distinguish between noun terms, adjectives, verbs, adverbs. For example, among linguistic terms there are nouns (voice, kind), adjectives (unmotivated, parasynthetic, compositional). Among the terms of musicology, adverbs (piano, pianissimo) appear. Calculations show that there are much more terms - names of objects in percentage terms - than terms - names of features.

The classification of terms by authorship reflects a sociological approach to terms. Collective and individual terms are known in this regard. Thus, the term helicopter was created by Leonardo da Vinci, the term industry - NM Karamzin, the term sociology - O. Comte.

According to the sphere of use, universal (for many related areas), unique (for one area) and conceptual and author's terms are distinguished; for example, linguistic terms can denote phenomena that are characteristic of all languages (phonetics), for one or several languages (ergativity), or only for one approach (glossmatics is the term of L. Elmslev).

The leading role of terms in the process of scientific cognition of objective reality makes it possible to construct their scientific classifications. So, the terms are highlighted that serve to fix knowledge; terms used as a cognitive tool; and learning terms [24, p. 414-419].

Due to the fact that the terms perform an applied function as tools of cognition and as a means of fixing scientific or technical knowledge, they are unified and fixed in one form or another as recommended or standardized. On this basis, a classification of terms according to normativity is built - non-normativeness, which includes terms that are in the process of standardization (standardized), that have undergone standardization (standardized) (pump), rejected in the process of standardization (unacceptable); in the process of ordering (recommended), subjected to ordering (recommended) (Helmholtz energy - in a thermodynamic system), parallel admissible (isochoric-isothermal potential - in the same place, in the same meaning).

Finally, as a result of the analysis of the frequency of use of terms in texts, a classification can be applied that distinguishes high-frequency and low-frequency terms. The above list of classifications of terms allows us to conclude that such a multifaceted phenomenon as a term is included in a variety of classifications according to logical, linguistic, scientific and other principles. These classifications in their totality characterize the role and place of terms in the scientific, economic, political, managerial and other spheres of functioning in society [13]. It is also necessary to mention the issue of the difference between term and word. A term is a word or phrase that serves to unambiguously and accurately designate (name) a special, scientific concept in a certain system of special concepts (in science, technology, production). Like any common noun, the term has content or meaning (semantics, from the Greek *semantikos* - denoting), and a form, or sound / graphic complex (pronunciation, spelling). Unlike non-terms, that is, from all the rest of the common noun vocabulary, which denotes everyday, everyday concepts, terms denote special, scientific concepts.

In contrast to ordinary, everyday concepts, a special, scientific concept is always a fact of a scientific concept, the result of theoretical generalization. The term, being a sign of a scientific concept, plays the role of an intellectual tool. With its help, scientific theories, concepts, provisions, principles, laws are formulated. The term is often a messenger of a new scientific discovery, a phenomenon. Therefore, unlike non-terms, the meaning of a term is disclosed in a definition, a definition that is necessarily attributed to a term. A definition is a formulation in a concise form of the essence of the terminated, that is, designated by the term, concept: only the basic content of the concept is indicated. A definition does not just clarify the meaning of a term, it establishes that meaning. The requirement to define what a particular term means is tantamount to the requirement to give a definition of a scientific concept.

In encyclopedias, special explanatory dictionaries, textbooks, the concept (term) introduced for the first time is revealed in definitions. It goes without saying that the conceptual content of terms can be fully and strictly scientifically disclosed only in the study of special disciplines [19, p. 98-101]

As you know, the lexical composition of the language is divided into two basic groups: common nouns and proper names. The latter we refer only to certain concepts, carriers of a certain conceptual content (for example, these are names, geographical names, and so on). The terms are usually attributed to the first group of common nouns, that is, to nouns denoting the name (common name) of an entire class of objects and phenomena, possessing a certain common set of

attributes, and naming objects or phenomena according to their belonging to such a class, however, by themselves not bearing any special indication of this class. However, it should be noted that the terms tend to occupy some intermediate position between these two groups. Let's analyze the male name "Victor" and the common noun "tree". The word "tree" defines a wide range of concepts, from dwarf birch to age-old oak. "Victor" carries only the name of a definitely male representative. Just as, for example, the drooping birch or warty *Bétulapéndula*, defines only a very specific type of tree. This is the main similarity between a term and a proper name - in the narrowness of the concept being defined. The conceptual content of a term is always strictly fixed, and even in the process of re-terminology it does not lose its meaning. The second important similarity between a term and a proper name is revealed in the following example - in the dictionary of botanical terms, plant names are given with a secondary generic name, for example, *Ambrosia tripartite* [14, p. five]. Such an extended definition absolutely does not allow its use in the plural, as well as in the case of proper names. Therefore, sometimes terms are close to proper names, and in some - to common nouns. Just as in the problem of the relationship between the concepts of "word" and "term", the issue of determining the place of the term within these two groups (IS and IN) is quite controversial and requires more detailed study.

### CONCLUSION:

All these issues are considered within the framework of the modern theory of terminology, which is actively developing and improving. The Russian terminological school continues the traditions of the Russian classical school of terminology, developing the directions of research in this area that developed in the 60s and 80s. XX century. - study of terminography, issues of unification of terms and terminological systems in modern conditions of globalization of scientific knowledge.

A distinctive feature of foreign schools of terminology is still the development of the lexicographic direction, the study of the etymology of certain terms or terminologies, as well as attempts to standardize terminologies.

In this regard, in recent decades, the number of special studies devoted to the study of the ways and principles of the formation of new terminological systems and the restructuring of some old industrial terminological systems has naturally increased. In this direction, such works are known as "Linguo-cognitive foundations of the analysis of industry terminologies (on the example of the English-language terminology of venture funding)" [15], "Cognitive-physiological study of vocabulary (the experience of comparative analysis of the names of medicinal plants)" [16], "Modeling and cognitive foundations of the terminology system of preventive toxicology in modern English" [17], "Lexicological terminology as a system" [18] and many others.

Thus, at present there is a particular growth of scientific interest in the cognitive direction in the field of terminology, in particular, the problems of cognitive saturation and other aspects. The relevance of this direction is due to the interest that causes the identification of patterns in the organization of terminology in a new area of knowledge, which may be useful for studying developing terminological systems.

The development of different directions of terminology speaks of its dynamism. The analysis of terminological literature has shown that the focus of terminologists is on all aspects of terminological activity - from training to processing vocabulary and compiling specialized programs.

In conclusion, we note that terminological traditions close to the scientific positions of O. Wüster were established in Russia, and work is intensively carried out in the field of industry terminologies. At this stage of development of terminology, the following areas are distinguished:

1. Onomasiological, studying the features of semantics, morphology, morphological and syntactic term formation.
2. Gnoseological, considering the cognitive aspects of the semantics of terms and their aggregates.
3. Functional, studying the specifics of the function of the term.
4. Typological, which links individual types and classes of terms with the concepts they designate, compares the term with other classes and subclasses of the language vocabulary.
5. Stylistic terminology describes the terms created and used in their "native" sphere, as well as within the common vocabulary.

The study of terminology serves as an important factor for the acceleration of scientific and technological progress and is a prerequisite for the exchange of scientific and technological achievements in the world.

### ABSTRACT

*The article analyzes Beruni's life, scientific heritage, the formation of his philosophical worldview, his development, as well as his work at the Khorezm "Mamun Academy", his research on scientific directions and problems, his role in the history of philosophical thought. As a result, the Sivan ul-Hikma (Treasure of Wisdom), which appeared in Bukhara during the Samanid period, or the Majlis ul-Ulama, built in the capital of the Buwayhids, Ray, under the leadership of the great Sadr Azam Sahib ibn Ismail Abbas, could compete scientifically and creatively. Moreover, although Beruni's scientific worldview was initially dominated by the study of pure natural sciences, the exact sciences, but this process underwent a deep and fundamental evolution during the scientific activity of the thinker.*

**KEYWORDS:** *Ancient Greek and Middle Eastern natural philosophers Eastern Aristotelianism, Renaissance. creative-critical thinking method, science, philosophical problems, scientific logic, experience, fundamental natural sciences.*

### INTRODUCTION

Abu Rayhan Beruni (973-1048) lived in a time rich in historical events. The specificity of this period, its strong socio-political and ideological processes, in particular, the social environment

in Khorezm, spiritual life, the development of science, the formation of the Khorezm Mamun Academy influenced the formation of Beruni's worldview. Beruni and his scientific heritage, the depth of his thinking, the fundamentality of his methods of scientific proof are reflected in the generalization and further development of the rich scientific and cultural traditions created by other peoples of Central Asia and the East over the centuries.

Indeed, an in-depth study of philosophy, especially the views of ancient Greek and Middle Eastern natural philosophers, fully and perfectly mastered the culture, potential, methods and techniques of debate on philosophical, natural-scientific issues, the ability to freely find their conclusions and solutions, to present evidence, it requires knowledge and mastery of high logical, philosophical ways of thinking. This required a deep, thorough knowledge of existence, the theory of knowledge, human society, the development of thought, especially the exact sciences — natural sciences and social sciences, life.

The prosperity of economic and socio-political life, the establishment of a peaceful and prosperous life in Khorezm as a result of the establishment of a new Khorezmshah Mamun dynasty in Khorezm for 35 years, which stabilized, strengthened, centralized and grew rapidly in power. traditionally strong science has led to the development of culture.

The development of science and culture has reached such a rapid and high level that in Kat and Gurganj there are not only primary but also secondary educational institutions - schools, mosques, madrassas, foundations, private (private) libraries, jurisprudence, observatories, etc.[1]. As a result, the Sivan ul-Hikma (Treasure of Wisdom), which appeared in Bukhara during the Samanid period, or the Majlis ul-Ulama, built in the capital of the Buwayhids, Ray, under the leadership of the great Sadr Azam Sahib ibn Ismail Abbas, could compete scientifically and creatively. One of the first was the formation of the Supreme Academic Scientific Association of Scientists, Writers and Politicians - "Majlis ul-Ulamo" (Ma'mun Academy) of Khorezmshahs, which for almost 22 years functioned as an active association of highly scientific and creative people.[2]. According to sources, the members of the academy conducted research on the problems studied by scientists from the Platonic Academy in Athens and the Bayt al-Hikma in Baghdad. Many sources have been compiled, translations have been made, the works of Muhammad ibn Musa al-Khwarizmi and other scholars have been studied, and the inaccuracies in the works of Aristotle have been corrected. "[3].

Unlike other "Academies" of his time, the Mamun Academy of Khorezmshahs made a great contribution to the development of not one or two, but several dozen world sciences, created a period in the development of science called by its name, for example, Abu-l-Vafo Bozajani - "Buzjani period", "Khorezmian period", "Beruni period" [4] etc., a well-known scientist, thinker was organized, operated. Beruni was not only an active participant of this Khorezm "Mamun Academy", but also chaired it from 1010 to 1017, he was able to create his own period in the development of world science - the "Beruni era".

The very name of each of the above-mentioned thinkers could dazzle the rulers who tried to establish their own "academies" in Baghdad, Ghazni, Bukhara, Ray, or elsewhere. Abu Sahl al-Masihi (philosophy and medicine), Abu Nasr ibn Iraq (mathematics), Abu Ali ibn Sina (philosophy, medicine, politics), who took an active part in the Khorezm "Ma'mun Academy", founded and headed a whole scientific direction, schools. Beruni (politics, history, geography, astronomy, religion, mythology, geodesy, etc.), Hammar and his son Abu Ali (science handasa,

natural sciences, logic, mathematics, etc.), al-Saalibi (politics, nazim, orator, preacher, poetry, literature), Sadri Azim as-Suhaili (organizer of politics, poetry, science), as-Sahri (magician, comedian, critic, clever and clever debater) and others are all so great, were immortal geniuses, stars of science.

This has led to the establishment of cooperation at the Khorezm Mamun Academy with scientists of different nationalities and countries, and as a result to conduct effective research in almost all fields of science, systematize their results, create philosophical generalizations, create scientific and philosophical landscapes. Hans Dayber, a professor at Goethe University in Germany, director of a seminar on Oriental studies, and head of the Department of Oriental and Non-Oriental Languages and Cultures, said, "This is a remarkable example of the interaction of different cultures. It is also an example of the falsity of claims about the clash of Islamic and non-Islamic civilizations." [5]. Dr. Jens Peter Laut, a professor at the Albert Ludwigs University in Freiburg and chairman of the German-Uzbek Scientific Society, echoes this sentiment: means. Although it is a question of the past, it is only natural that today's Central Asian states, as they experience the young age of independence, should strive to restore their historical traditions and develop them in new conditions." [6].

The last return of Beruni from Khorezm to Georgia, in particular, the scientific-creative and active political-diplomatic activity of the Khorezmshahs in the "Mamun Academy" was very intense, at the same time, very fruitful and tragic. .I.Karimov, Yu.N.Zavadovskiy, P.G.Bulgakov, A.J. We learn from the results of special research published by Sharipov, A.Zakhidi [7].

In his own time, Beruni demonstrated a good knowledge of Greek, Persian, and Arabic sources. We can see this in his views on astronomy and especially astrology. In particular, Beruni was the first in the Arab world to translate Indian sources on astrology. In doing so, he developed the mathematical and astronomical apparatus of astrology, created a chart of planetary motion, determined the coordinates of "stationary" stars, and proposed his own horoscope system. At the same time, Beruni says to avoid overconfidence in the "judgment of the stars." The great scientist showed that astrology is related to other fields of science, especially astronomy and mathematics. "I started with geometry, then I went to arithmetic and numbers, then I studied the structure of beings, and then I decided to explain the judgment of the stars, because only someone who has mastered these four sciences deserves the title of astronomer." [8]. The connection of astrology with these sciences, especially astronomy, is clearly shown in the views of the representatives of medieval Islamic philosophy. That is why it is understandable that medieval Muslim philosophers were interested in astronomy and conducted experiments on its problems. [9].

Beruni was, as noted by Western European historians of science, a truly great naturalist in the history of world science, given all the conditions of the time in which he lived. Just as his method of research is strictly scientific and rational, so his scientific language is the language of fundamental mathematical and astronomical formulas, constants, axioms, and equations. Therefore, it is very difficult to study his works not only by researchers of the history of philosophy, but also by historians of science without directly mastering a special mathematical instrument, concept and categorical apparatus. Western European historians of science Wiedemann, Meyerhof, K. Shoy, and Russian orientalists and historians of science have made great strides in this direction. In this regard, Uzbek scientists, academicians UIKarimov,

PGBulgakov, A.Akhmedov, O.Fayzullaev, H.Khikmatullaev and other historians of science have made significant and significant scientific achievements.[10].

Moreover, although Beruni's scientific worldview was initially dominated by the study of pure natural sciences, the exact sciences, but this process underwent a deep and fundamental evolution during the scientific activity of the thinker. From a very young age to the period of advanced scientific research in Beruni - until 994, Eastern naturalists Eranshahri, Razi, Khorezmi, Fergani, Abu Mashar, as well as some Gnostic scholars, sought to find the views and heritage of the ancient Greek naturalists.[11]. Official natural theologians, such as Jabir ibn Hayyan and Abu Bakr ibn Zakariyya al-Razi, who had attained their priority over science, exerted their oppressive influence on science and subjugated it to religion and divinity, and who did not want to follow such a path, were condemned. At a time when their works are being persecuted and even their names are not allowed to be mentioned, Beruni's search for, acquaintance with, preservation of, and transmission of the works of these thinkers to future generations, compiling a list of their works (Fexrest) was a great scientific courage, free thinking, courage. , the attainment of scientific truth required that everything take precedence. As he said, there was no doubt that Jabir Eranshahri could be accused of blasphemy by being influenced by them in the process of searching for and talking about Razi's works.[12].

Such free-spiritedness in Beruni's scientific work and legacy dates back to his youth. - Kat, Ray, in Jurjan, and then in Khorezm "Mamun Academy". Such aspects, although they manifested themselves from time to time, took the form of a firm, stable position in which his life, the Ghazna period of his scientific work, was completely moderate in the following periods, in accordance with the requirements, norms and values of official Sunni Islam. was. This led to the formation of Beruni first as a naturalist and then as a natural philosopher. After all, a deep, well-founded study of philosophy, especially to have a culture of philosophical, natural-scientific debate, requires knowledge of highly logical, philosophical methods of scientific thinking, mastering them. For this, it is necessary to have a very deep, comprehensive, perfect knowledge of existence, cognition, human society, the development of thought, especially the natural and social sciences, and, of course, life. That is why Beruni deliberately aimed to study philosophy seriously only a little later, when he was approaching maturity, when he had the potential for study, high knowledge and thinking.

According to sources, Beruni's interest in science began in childhood, while high-level scientific observations, research, measurements in the fundamental natural sciences - mathematics, astronomy, physics, chemistry, arithmetic, etc. - took place in the city and other places. , Determining the position of the moon and stars according to their position, measuring the distance between them, and telling the direction of the Qibla, the beginning and end of the month of Ramadan at the age of 14-16[13], began to engage in philosophy in the second half of the 90s of the tenth century. In particular, through letters to Sheikh-ur-Rais Ibn Sina, a heated, ongoing and heated debate ensued.[14](997) and dealt mainly with important philosophical issues, including the problem of existence, in the Khorezm Mamun Academy, and later in adulthood and adolescence.

However, Beruni's knowledge, creative-critical way of thinking, his ideal in science, his attitude to philosophy, his problem-solving, his attempt to prove them scientifically to the end, made

science, philosophy active, consistent and rational from various threats, aggression, attacks. can be said to have been evident in his defense.

The analysis of the above-mentioned sources shows that Beruni's activity at the Khorezm "Ma'mun Academy" ("Majlis ul-ulamo") in 1010-1017 began with great intensity and scale. It was mainly in the following 3 directions:

**I.** Khorezmshahlar is the head of a number of scientific researches of "Mamun Academy", the chairman, the organizer and the leader of fundamental researches of the academy.

**II.** The closest person to Khorezmshah Abu-l Abbas Mamun II ibn Ma'mun was his aide, state adviser, responsible for foreign policy, embassy communications and relations.

**III.** In a very difficult situation, despite the conditions, he personally conducted fundamental scientific research, measurement, computation, experimentation, experiments. He was engaged in establishing a very wide range of scientific contacts (personal and written letters, letters), directing his students' scientific research.

The way of life of the thinker, the development of scientific and philosophical creativity

The most important cycles, the most important results of which were:

- Grab Beruniy boss i ngan father and teacher Abu Nasr Mansur ibn Iraq, the first yazov ancient palace Afrig'iylar scientists, politicians tour (982-994).
- Ray conducted astronomical observations and measurements with Hamid Khojandi at the observatory in Tabarrak (995-996).
- Through Hamid Khojandi, a scientific correspondence with Abu al-Wafa Buajani, through letters, agreed on the height of the Sun in Baghdad and Katta, the distance between these cities, and their location.
- He created his own globe, astrolabe, instruments.
- Sheikh-ur-Ra'is ibn Sina had a continuous written scientific discussion on 18 current and complex, unresolved problems of natural philosophy in Aristotle's books "Physics" and "On Heaven and the Universe".
- Beruni has created dozens of large and small scientific observations and studies, including works such as At-Osar-ul-Baqiya.
- In Ray, Jurjan, Qiyat and Gurganj, a great and lasting scientific cooperation was established between Beruni and Ibn Iraq, al-Masihi. This was reflected in the 12 works of Ibn Iraq, 12 of Al-Masihi, 10 of Ibn Sina, as well as other works of other scholars in the Ma'mun Academy, under Beruni's guidance, sponsorship, and fundamental scientific research dedicated to him.
- Including 10-15 other works of Beruni, written in 1010-1017, when he was the founder and chairman of the Khorezm "Mamun Academy", it is recognized that a total of 50-60 of his most important works were created here.
- It should also be noted that Beruni's scientific research was particularly fruitful in his work. His most important works, such as Geodesy, Mashoikhiri Khorezm, Razi and his bibliographic fixist in 1021-1027, were in fact the result of a generalization of the materials collected in Khorezm and became a book in the first decade of the Ghazna period.
- The world-famous encyclopedic works of Beruni's scientific work, activity and heritage in the time of Sultan Mas'ud Ghaznavi and Sultan Mahmud Ghaznavi - "India". Al-Qanun al-Mas'udi, Kitab-us-saydana, Kitab-ul-Jamahir (mineralogy) and others were created. These

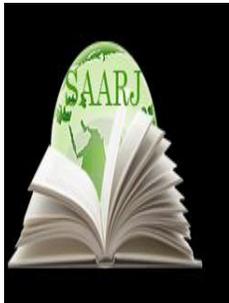

works reflect the results of research in various fields of science. It is appropriate to cite a few of them as examples.

- In the field of chemistry, Beruni Gurganch wrote a pamphlet on the problem of specific gravity, in which he expressed his views on the discovery of a special property of each substance by its specific gravity.
- In his works on geography, he focuses on the problem of shape and size of the earth, creating a geographical model of it - a globe. He also conducts research in the field of hydrology, mineralogy.
- Beruni's way of life, political activity, scientific work, his division into two periods: in Khorezm "Mamun Academy" and in the Treasury, can be summarized as having the sub-stages we have mentioned.
- Thus, the following conclusions can be drawn summarizing the primary materials, research, descriptions carried out in this chapter on the period of Beruni's life, life, scientific work, practical social activity, heritage, formation, development, main directions and problems of scientific and philosophical worldview:
  1. The historical period in which Beruni lived was marked by economic, socio-cultural upheaval associated with the attempt to revive the ancient traditions of Khorezm statehood, the struggle to restore the state of the centralized Khorezmshahs Mamun dynasty, albeit in the short term.
  2. Beruni Mamuni played an extraordinary role in the socio-political and scientific-cultural life of the Khorezmshah state as a statesman, politician and diplomat, an active participant, organizer and chairman of the Mamun Academy.
  3. Beruni's complex, intense way of life, the whole set of his great empirical natural sciences, his scientific research methods in this field, such as observations, experiments, measurements, the very rich, advanced level of his tools, his extensive research based on Beruni's worldview. , a creative and critical approach, national or religious-confessional tolerance.
  4. The scientific research carried out at the Mamun Academy, including Beruni's scientific discoveries, not only raised science and philosophy to the heights in the Middle East, but also to some extent laid the groundwork for the emergence of experimental mathematical science and new philosophical systems in the West. This is probably why, when it comes to Beruni, European experts call him "the first sage of the New Age (Europe of the XVII-XVIII centuries)." [15], - they estimated. As can be seen, Beruni's legacy, worldview, and scientific and philosophical position have been scientifically and fairly assessed by Western European scholars not only on a regional scale, but also in terms of the development of world science, philosophy, culture, and civilization.

### ABSTRACT

*The article deals with the issue of interaction between professional football teams, the scientific findings of research in this area and the results of research conducted by the author on sports teams. Some aspects of the relationship between professional football teams and possible causes of conflict and the impact of the perception of the group by athletes on the overall performance of the team are studied and expressed in certain conclusions.*

**KEYWORDS:** *Football, Relationships, Competition, Cooperation, Compromise, Avoidance Of Conflict, Adaptation To The Situation, The Method Of Attitude Group Perception, Individualistic, Collectivist, Pragmatic Type, The Laws Specific To Small Group.*

### INTRODUCTION

In recent years, a number of measures have been taken to take care of the health of our people, to form a spiritually and physically harmonious generation, to attract the population, especially young people, to football, which is a game of millions and occupies a special place in our country.

At the same time, the selection of young players with high talent, the selection system and further development of the football infrastructure in our country today, one of the urgent tasks is to raise the activities of sports schools in football to a new level, to improve the system of training and financial incentives for specialists in the field, to raise the level of competitions [1,1-3].

Football as a game of millions is a popular sport with all heart. In this sport, the success of the individual is linked to the success of the team, serving not only the individual formation of the athlete, but also an important stage in the formation of personality based on the acquisition of social experiences within the group, self-awareness and activity.

As a team game, football not only contributes to the development of individual physical development, but also the development of individual abilities, willpower, the acquisition of important social experiences based on relationships with team members, the development of social consciousness, and a sense of responsibility towards others. plays an important role in content search. [2].

In sports psychology, the topic of psychological training and mental state management of athletes, interactions in sports teams is very relevant, it is A.Ts. Puni, E.P. Ilin, A.B. Alekseev, Yu.Ya. Kiselev, G.D. Gorbunov, I.P. Volkov, A.N. Nikolaev, P.A. Rudik, A.B. Rodionov, JI.K. Serova, Yu.L.Xanin, A. Stambulov, Kolomeytsev Yu.A and V.F. Sopov tried to give a scientific basis in his research [2].

As a small group, football teams and their psychological environment issues Yu.A. Kolomeytsev, 2005; Yu.L. Hanin, studied by 2007 [3]. However, research in this area is still scarce and requires extensive research.

### **The purpose of the study**

- To determine the characteristics of the relationship between football teams;
- diagnostics;
- analysis of the obtained results;
- draw conclusions based on the results obtained;

### **The main statement of the study**

Our study involved 24 athletes from “PFC Zomin Wolves”, 24 young players from “Sogdiana PFC” and 17 young players from “Nasaf PFC”, for a total of 69 athletes. Athletes range in age from 17 to 29, with 7 to 14 years of athletic experience.

The following methods were used in the research:

- The method of determining interpersonal relationships (K. Thomas);
- The method of studying the characteristics of group perception by the individual (E.V. Zalyubovskaya) was used.

**The results obtained during the study are presented in Table 1.**

**TABLE 1**

	Football team	N	Average value
Competition	Zomin	24	6,4
	Sogdiana	24	6,8
	Nasaf	17	6,3
Cooperation	Zomin	24	5,2
	Sogdiana	24	5,9

	Nasaf	17	5,2
Compromise	Zomin	24	6,4
	Sogdiana	24	5,2
	Nasaf	17	6,4
	Zomin	24	4,8
	Sogdiana	24	4,9
	Nasaf	17	5,2
Avoid controversy	Zomin	24	7,1
	Sogdiana	24	7,1
	Nasaf	17	6,8

**The descriptions of the data given in the table have the following content:**

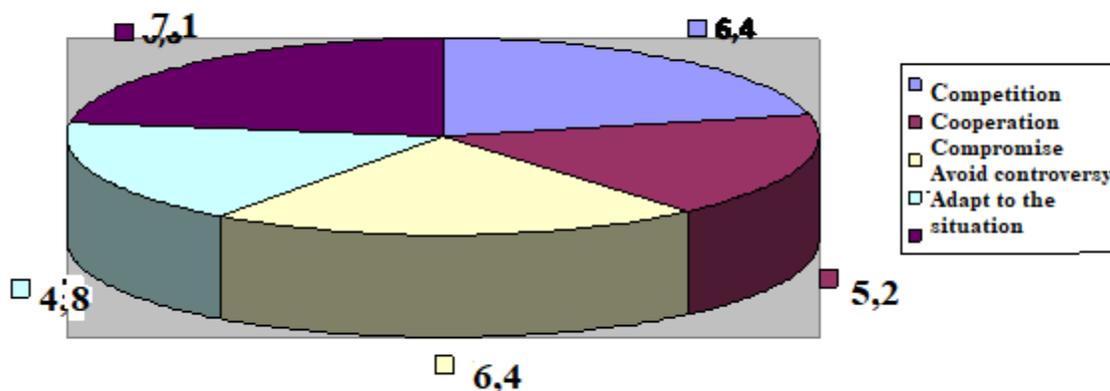

The average score of the players of PFC “Zomin Wolves” was 6.4 in the method of interaction, 5.2 in the method of cooperation, 6.4 in the method of compromise, 4.8 in the method of avoiding conflict, and 7.1 in the method of adaptation (histogram-1). It can be seen that the method of competition in team relations has a higher than the norm (5 points). The competitive method means that one party in the communication process tries to control the communication situation and take control of the whole process by demonstrating its dominance over the other party. Typically, we can observe such a landscape between adults and minors, in the relationship between a manager and a subordinate employee. In doing so, the first party exercises its superiority over the second, using its superiority. Naturally, a person who feels dependent from communication to communication accumulates internal discomfort and tension. When this situation is expressed in psychological language, it can be said that “hidden conflict accumulates.” This leads to a sharpening of relations and the emergence of larger conflicts over time. In addition, on the scale of conciliation, there is a score of 6.4, and Compromise - that is, conciliation. In controversial situations, acting like “You don't lose and I don't lose” is a way for both sides to get out of a contentious situation without being upset. Of course, this is the most effective among the types of relationships listed above. But this kind of attitude will be aimed at resolving the situation right now, acting like “what will happen next”. The downside is that if the problem is not resolved to the end, the possibility of a gradual conflict will remain.

Another noteworthy aspect was observed on the adaptation scale, where the average value of the team on the mazur scale was 7.1. From this we can see that, in contrast to this competition in the community, the institutions that can sacrifice their own interests for the benefit of other people are well formed. In general, we can see that the course of interaction in the team is more focused on collaborative team activities than on conflicting relationships, there is a system of relationships that is sometimes competitive in defending its position. But we can also say that the adaptation of athletes to the team and their desire to adhere to the social and ethical norms established in the team is at a high level. While such a course of interaction is often based on the law of subgroups expressed in social psychology, a football team as a subgroup requires that athletes know each other intimately and that there is always clarity in the relationships between them. So we can say that no matter how organized the football team is as a small group, it is worth noting that sometimes conflicts arise due to the direct implementation of the relationship. Yu.L.Khanin emphasizes that the interaction in sports teams is also directly related to the

effectiveness of the management system in the team [2]. The course of interaction in the team can be seen more clearly in the histogram below.

**The expression of the relationship in the professional football team “Wolves of Zomin”. In the style of K. Thomas**

**Histogram-1**

The second object of our research was the relationship between the team of young players of PFC “Sogdiana” as follows:

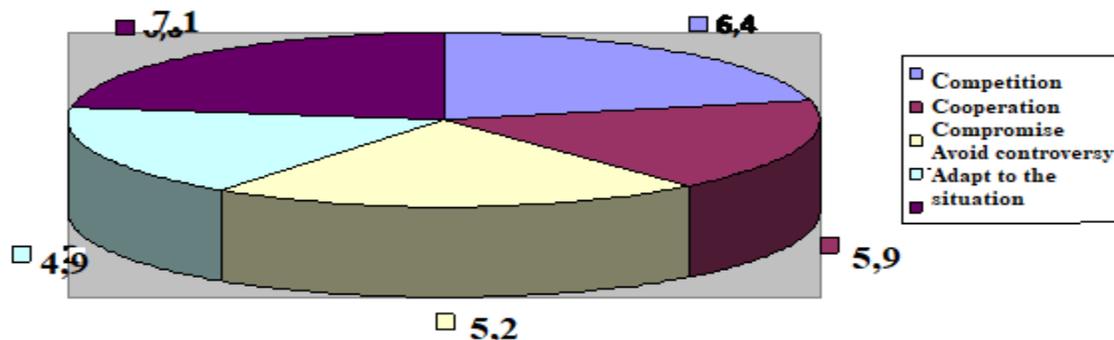

The average score for the competition method was 6.8, the collaboration method was 5.9, the compromise method was 5.2, the avoidance of conflict was 4.9, and the adaptation was 7.1 (histogram-2).

In this team, too, the interaction was characterized by strong competition. The average score on the method of competition was 6.8. This is a high figure. The competitive method means that one party in the communication process tries to control the communication situation and take control of the whole process by demonstrating its dominance over the other party. This leads to an escalation of the relationship and the emergence of larger conflicts over time. This means that there are frequent conflicts in the team based on the competitive environment, and team members try to strengthen their position by participating in the group as a reference group. We can witness the existence of a system of relationships that consists of acting like “You don’t lose and I don’t lose” in contentious situations, looking for an opportunity to get out of a contentious situation without offending both parties. The downside is that if the problem is not resolved to the end, the possibility of a gradual conflict will remain. This team also had a high score on the adaptation scale, with the team's average score on the mazur scale being 7.1. From this we can see that, in contrast to this competition in the community, the institutions that can sacrifice their own interests for the benefit of other people are well formed. At the same time, we can see that athletes have a high desire to adapt to the team and adhere to the socio-ethical norms established in the team. In general, we can observe that the course of interactions in a community is accompanied by more conflicting attitudes, as well as the acceptance of the collective interest as a common interest in collaborative team activities and the pursuit of social norms established in

that community. The course of interaction in the team can be seen more clearly in the histogram below.

**Sogdiana PFC's performance in the team of young players. In the style of K. Thomas.**

**Histogram-2**

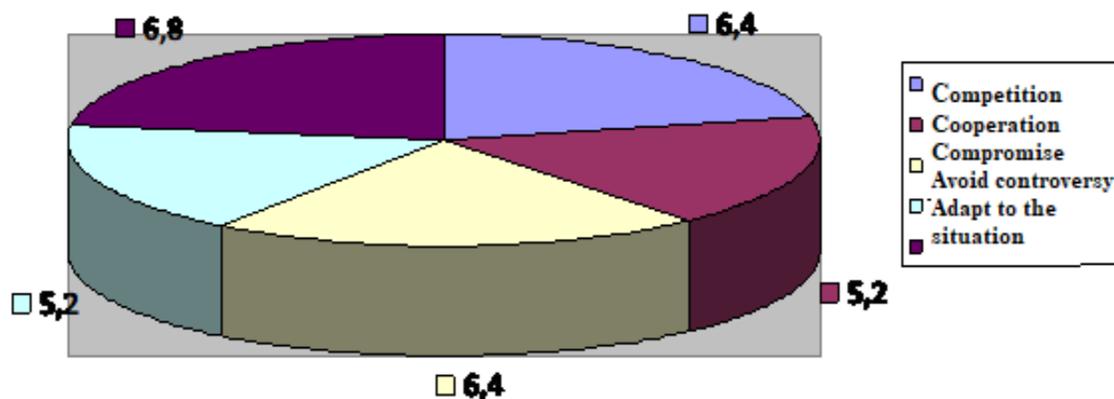

The indicators of interpersonal relationships in the team of young players of PFC "Nasaf", which is the object of our third research, were as follows:

The average score for the competition method was 6.3, the collaboration method was 5.2, the compromise method was 6.4, the avoidance of conflict was 5.2, and the adaptation was 6.8 (histogram-3). It is obvious that in this sports team, too, high scores on the scales of reconciliation and adaptation to the situation require constant clarity in the interaction within the team, ie in small groups, which often leads to frequent conflicts paves the way.

**An indicator of the interaction of Nasaf PFK in the team of young players. In the style of K. Thomas.**

**Histogram-3**

One of the components of interpersonal relationships is that people understand and comprehend each other. The process of human perception is influenced by a number of factors - social institutions, the characteristics of interpersonal relationships, people's knowledge of each other, and others. The process of social perception is influenced not only by interpersonal relationships, but also by a person's relationship with a group. Because of this, the study of how a group is perceived by an individual is an important aspect of the study of interpersonal cognition.

The individual proposed by E.V. Zalyubovskaya makes it possible to determine which of the 3 types of group perception is superior. The results obtained through this research method will be able to assess the indicators of the cognitive process in interpersonal relationships based on the study of how the group is perceived by the individual. In our study, using this method, we obtained certain results by trying to determine how the group (football team) is perceived by the individual (athlete) in the interactions in sports teams and the impact of social perspective on overall performance. You can see the results obtained in the table below

**TABLE-2**

Group (type of team perception)	Football team	N	Average value
Individualistic	Zomin	24	4,8
	Sogdiana	24	4,5
	Nasaf	17	4,7
Collectivist	Zomin	24	5,7
	Sogdiana	24	4,8
	Nasaf	17	5,7
Pragmatic	Zomin	24	3,4
	Sogdiana	24	4,9
	Nasaf	17	3,4

According to the results, the average football team in the professional football team "Zomin Wolves" had an individual score of 4.8, a collectivist score of 5.7, and a pragmatic score of the

individual perception of the group - 3.4. It is clear that the collectivism of the football team is high. In this type of interpersonal relationship, the majority of team athletes perceive the group as a whole and an independent value, focusing on the problems of the group and the members of the group, sees itself as interested in the success of both the whole group and individual members, and we can see that institutions have been formed to strive to contribute to the overall performance of the team, to show a positive attitude towards teamwork.

**The second object of our research was the relationship between the team of young players of PFC “Sogdiana” as follows:**

The average for the individualistic type was 4.5, for the collectivist (collective) type it was 4.8, and for the pragmatic type of group perception it was 4.9. Accordingly, it is perceived and evaluated by most athletes on the team depending on how useful the group is. The individual prefers the group representative, who can provide the necessary information and assistance on specific issues, and prefers to communicate with them. Of course, the composition of such relationships increases the likelihood that they will affect the overall team activity and create factors that prevent the team from moving towards a common goal or from interacting with all team members.

The third object of our research, based on the study of how the group is perceived by the individual in the team of young players of PFC “Nasaf”, the indicators of the cognitive process in interpersonal relationships have the following content:

The average for the individualistic type was 5.4, for the collectivist (collective) type it was 4.8, and for the pragmatic type of group perception it was 3.8. It can be seen that the highest performance was observed in the “Individualistic type” type. Therefore, most athletes in the team have a desire for individual self-improvement in the overall performance of the group. While this perception of the group may in part lead to the success of some athletes, in a sport that relies on team spirit, the overall success of the team or dependence on individual athletes increases the likelihood of some conflict between team members.

**CONCLUSION:**

**Based on the results of the study, the following conclusions can be drawn:**

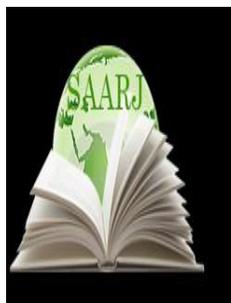

- Football teams as a small group are required to know each other intimately according to the laws inherent in small groups, the direct occurrence of relationships and, accordingly, the constant clarity in their interactions. Any imbalances in the relationship, i.e. imbalances, sometimes increase the likelihood of causing open conflicts. We have witnessed this above based on a study of group relationships in the Thomas-Kilman style.
- The expression of the relationship between football teams as an organized group and the results of the study of this process are almost identical. Of course, in this process, too, we can see that the laws specific to small groups, which have been the object of much research, are fully functional.
- How an individual perceives a group as a small group can affect the overall performance of football teams, can also lead to conflicts, individual goals and aspirations (individualistic type) or the role of the group as a means to achieve certain goals of the individual (pragmatic type) we

must not forget that it also leads to a decrease in overall efficiency, which negatively affects the overall goals and aspirations in the team.

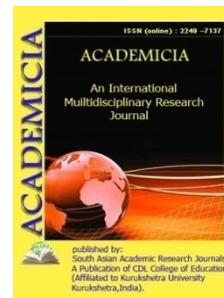

- The interaction of football teams as an organized group depends on the effectiveness of the management system in the team.

**ABSTRACT**

*This article sets out the main facts of the life and scientific activities of the outstanding scientist-encyclopedist Abu Ali ibn Sino, who left a rich scientific heritage - treatises and books on preserving natural balance, strengthening human health and treating diseases, physical education, in philosophy, pedagogy and other sciences. ... The scientist owns over 450 works, only 242 of them have survived to us. His works "Kitobul-insof" ("Book of Justice"), "Kitobul-nazhot" ("Book of Salvation"), "Donishnoma" ("Book of Scientists"), "RisolaiTadbiriManozil" ("Treatise on home economics"), "TibKonunlari" ("Medical Canon"), "Quito bush-shifo" ("The Book of Healing") are known all over the world. At one time, both in the East and in the West, he was called "Chief among the Sheikhs", "King of physicians", "Leader (head) of scientists". Abu Ali ibn Sino carefully studied the works of Greek, slave, Persian scientists, as*

*well as the works of his compatriots - Muhammad al Khorezmi, Abu Nasr Farabi, Abu Bakr Rosi and creatively interpreted them.*

*In the book of the scientist "Canon of Medicine", the essence of the daily lifestyle of growing youth and people who have reached adulthood is outlined. The scientist defined physical exercise, proper, moderate nutrition, and orderly sleep as the basic principles of maintaining health. Abu Ali strongly recommended to engage in physical and moral education of children, starting from an early age. The idea expressed by a scientist a thousand years ago is very relevant today in the upbringing of a healthy and strong comprehensively developed generation.*

## INTRODUCTION

The study of the scientific, practical and theoretical heritage of Abu Ali ibn Sino is of great importance for medicine, philosophy, literature, pedagogy and many other sciences.

Outstanding scientist ("Shaikh ur-Rais", "DonishmandlarSultoni", "Tabiblarshokhi" that is, "Chief among doctors", as he was called). He left us his great works on preserving the natural balance, strengthening human health and treating diseases, which were the fruit of many years of scientific research and practical experience.

His famous book "The Canon of Medicine" reflects the issues of human physical education, starting from the moment of his birth and as he grows and matures. The scientist gives recommendations on the use of physical exercises, massages, swimming in cold water, walking in the fresh air, various types of physical activity - everything that is successfully used today in physical education among the peoples of the whole world.

Abu Ali ibn Sino, a prominent scientist-encyclopedist of the Eastern Renaissance, was known in the West as "Avicenna" (3.5). Ibn Sino's full name is Abu Ali - al Hussein ibn Abdulloh ibn al-Hasan ibn Ali ibn Sino. For his great services to humanity, he was awarded the honorary title of "Shaikh ur-Rais" in the East (roughly "The Great Sage (Sheikh)").

**TABLE LIFE PATH AND ACTIVITIES OF ABU ALI IBN SINO**

№	Life path stages	Main events
1.	980year	A tax inspector who traveled from Afghanistan to work in the Peshkun district of the Bukhara region (Afshona village) married a local girl, Sitara. AbuAliwasborninthisfamily.
2.	985 year	Abu Ali's family moved to Bukhara
3.	990 year	Has mastered scientific knowledge in many areas
4.	996 year	Abu Ali ibn Sino ranked among the most famous doctors (doctors) of Bukhara
5.	997 year	The famous doctor Abu Ali cured the sick Bukhara Emir and as a reward for this received permission to work in the Amir's library
6.	1000-1001years	Abu Ali creates his first major scientific work
7.	1002 year	Abu Ali's father died. The conditions for scientific activity became

		complicated, as a result, the scientist left Bukhara and moved to Khorezm
8.	1002-1017 years	Abu Ali conducts large-scale scientific activities in the Khorezm Academy of Mamun together with famous scientists of Khujandi, al-Khorzmi, al-Masikhi, al-Beruni
9.	1019-1021 years	Serves as a wazir (minister) in Hamadon
10.	1021 year	As a result of enmity with some politicians, Abu Ali was detained for 4 and a half months
11.	1023 year	The scientist moves to the Iranian city of Isfahan
12.	1037 year (june)	Abu Ali died at the age of 57 in Isfahan hospital from a serious illness (intestinal obstruction)
13.	1037 year	The body of Abu Ali ibn Sino was transported to the city of Hamadon, and was solemnly buried there. An eternal flame was lit on the grave, guarded by sentries
14.	1980 year	By the decision of UNESCO, the 1000th anniversary of the birth of Abu Ali ibn Sino is solemnly celebrated all over the world
15.	1999 year	On the initiative of the President of the Republic of Uzbekistan I.A. Karimov, the Abu Ali ibn Sino foundation was created in the republic

Abu Ali was born in August 980 (according to Christian chronology) - 370 of the Khizhra in the village of Afshona, Bukhara region. His father was from Balkh (Afghanistan), in Afshon he was on duty in the tax system, where he married the girl Sitora and created a family.

As a child, Abu Ali showed a great interest in knowledge, science, and his father received a good education - first at school, then in Bukhara he studied with the best scientists. Among them were Abu Ali Abdullah Notimi, Abu Mansuri - famous scientists at that time.

At the age of 17, he cured the Bukhara Emir from the disease and got the opportunity to work in the largest library in Bukhara - the Amir's library. In 1004, having moved to Khorezm, he established contacts with many scientists of the Mamun Academy, met with the great Beruni. Two great scientists are conducting joint research work.

Beginning in 1011, the life of a scientist flows in Iran and Kharasan, then he works as a wazir (minister) in Hamadan, but the hakim and some officials are hostile to the scientist, as a result, Abu Ali is imprisoned for four and a half months (Officers from The IRS rebelled over a small salary, and Minister Abu Ali was accused of this).

In 1023, Abu Ali returned to Isfahan and devoted the rest of his life to writing scientific papers. On June 24, 1037, at the age of 57, the scientist died of illness in Isfahan and was buried in Hamadon.

During his life, the scientist had to endure many injustices, and this further strengthened his humanism, a sense of love and devotion to the people.

Abu Ali is a real encyclopedic scientist, he deeply learned all the famous sciences of his time and left a huge legacy that covers twelve scientific areas - medicine, culture, physics, astronomy, physical education, etc.

What is the heritage of the great Abu Ali in the field of physical education?

The scientist analyzed the works of his predecessors on physical culture, enriched with their basic ideas and systematized them. On the basis of a deep study of theory and observations in the process of practical activity, he created works on each of the directions of the health strategy (classification of physical exercises, the role of the bath, sports massage, hardening, slow walks).

Of the more than 450 works created by Abu Ali, only 242 have survived to us. His works "Kitobul-insof" ("Book of Justice"), "Kitobul-nazhot" ("Book of Salvation"), "Donishnoma" ("Book of Scientists"), "RisolaiTadbiriManozil" ("Treatise on Home Economics"), "TibKonunlari" ("Medical Canon"), "Kitobul-shifo" ("Book of Healing") are known all over the world. At one time, Ibn Sino, both in the East and in the West, earned fame as "Chief among the Shaykhs", "Leader (head) of scientists", "King of physicians" and other honorary titles.

The first of the Republic of Uzbekistan in his book "YuxakManaviyat - YengilmasKuch" (High spirituality is a necessary force), set forth his thoughts on the basic principles of the formation of spirituality, noted the scientists who left their mark on world science, and named among them Abu Ali ibn Sino - "the famous a scientist with a rare nobility. For several centuries, his works

"The Canon of Medicine" have been used as the main textbook on medicine in the most prestigious higher educational institutions in Europe. This book serves as a fundamental basis for many concepts in the field of medicine, healthy lifestyles, as it is based on deep scientific knowledge and life experience.

More precisely, this incomparable scientist carried out all his scientific activities in the spirit of serving the development of mankind, which had a tremendous impact on the development of the spirituality of the world" [1].

The great scientist covered in his works the issues of education, not only from the point of view of healing, but also as a famous teacher.

In the book "Canon of Medicine" Abu Ali comprehensively considered the issues of physical education of the child, revealed such aspects of the problem as nutrition, bathing of children, rest and sleep of the child. He especially focused on the need for a child of fresh air, sun, water and exercise. Along with this, the scientist urged to take into account the anatomical and physiological characteristics of the child. In the "Canon of Medicine" Abu Ali presented the scientific classification of physical exercises, characterized each type, theoretically and practically substantiated, physical exercises are somewhat useful for the body.

"Moderate and timely physical education serves as a prophylaxis against the occurrence of all kinds of diseases, as well as from their relapses, while no medication is required," says the scientist [9].

In the "Canon of Medicine" Abu Ali justifies the need for physical hardening of the child, starting from birth. He explains how to feed, bathe the child, walk with him in the fresh air, even put him in the cradle (tie him up), singing lingering melodic songs [5].

Here is a sample of his poems:

You know how many ways of abstinence there are

Be worthy and most importantly - moderate in everything.

Keep your body clean, tidy,

Throw everything dirty into special boxes (urns).

The scientist explains that without exercise, the body weakens and is exposed to dangerous diseases.

He argued:

If you are not abstinent, you will not experience joy

You cannot find well-being from pleasure.

If you move a little, the body will be filled with different bacteria,

Never eat unproven food.

Abu Ali showed particular interest in the development of children. He divided the entire period of natural development and maturation of children into five periods - infancy, childhood, adolescence, adulthood, maturity (adulthood), and for each period he defined special physical exercises.

The scientist urged all people to exercise, and then he would not need medicine. Abu Ali explained the importance of such sports as tug-of-war, hand-to-hand fights, throwing stones, running and walking, equestrian sports, and various types of wrestling [9]. The ideas expressed by a scientist a thousand years ago have deep content and are very relevant today in the upbringing of a healthy and strong, comprehensively developed generation.

Scientists of the outstanding scientist-encyclopedist are aimed not only at educating a physically healthy person, but also at building social relations on the basis of a reasonable system of education in the country as a whole, the formation of a person's personal qualities.

In the book of the scientist "Canon of Medicine" the third part of the second chapter is devoted to the preservation of health, which sets out the essence of the daily lifestyle of young people and people who have reached adulthood (adulthood). The scientist defined physical exercise, proper nutrition and orderly sleep as the basic principles of health preservation. All human life, Abu Ali believes, is subject to physical education [6].

Excessive consumption of food, according to the scientist, creates a load on the internal organs, which serves as the oprichnina for the occurrence of various diseases. Physical movements help to remove accumulated harmful substances from the body and, therefore, prevent diseases. Proper nutrition and normal sleep are the main conditions for physical development. Exercise, movement, exercise help to maintain the natural body temperature, strengthen the limb and create an opportunity for quick recovery of the body.

Refusal to exercise, lack of movement lead to weakness and impotence, as a result of which various diseases appear [9]. These conclusions of the scientist are fully reflected in modern medical science and practice.

Abu Ali strongly recommended to engage in moral education already in childhood. In his famous book, there is a special section "On education", in which the author outlined his thoughts on how to form the character and behavior of children. "Good habits and behavior do not appear in

children by themselves, they must be introduced to good examples, qualities and moral concepts must be introduced into the minds of children," Abu Ali ibn Sino said.

According to the scientist, children must, first of all, be protected from bad influences and bad deeds [5].

Abu Ali considered the following factors to be the most valuable in raising a healthy generation:

- Firstly, the scientist called on young people to master knowledge and sciences;
- Secondly, Abu Ali recommended that young people be sure to engage in socially useful work;
- Thirdly, he explained that the word should not be at odds with the deed, and that you need to take care of your health;
- Fourthly, Abu Ali guided the youth, but that their life path was dedicated to serving the Motherland, its protection.

The great healer, outstanding thinker Abu Ali ibn Sino considered massage the most important and effective way to relieve fatigue and people involved in sports [9]. The scientist for the first time studied in detail the property of Oriental massage, determined their types: hard power massage, soft rubbing massage, weight-reducing massage, cosmetic massage, preparatory (warm-up) massage - before physical activity and restorative massage - after physical activity. Subsequently, Abu Ali ibn Sino made the following conclusion: "If different types of massage are combined, you can get a variety of combinations" [6].

For this, Abu Ali believed, it is necessary to constantly develop the fingers. The scientist emphasized that massage should be applied when the human body needs it. The great scientist carefully studied the works of Greek, Arab, Persian scientists, as well as the works of his compatriots - Muhammad al-Khorezmi, Abu Nasr Farabi, Abu Bakr Rosi, Ahmad Fargani and creatively interpreted them.

His treatises and manuscripts testify to a good knowledge of the works of philosophers and thinkers of Ancient Greece, including Aristotle, Plato, Euclid, Thales, Heraclitus, Socrates, Pythagoras, Galleon, Hippocrates. The works of Abu Ali ibn Sino have been translated into many languages of the world, and many studies have been carried out on them. The originality of Abu Ali's scientific treatises, their high level makes him one of the great encyclopedic scientists in the history of mankind. During the years of independence, the socio-economic, political, spiritual, educational and cultural foundations of the development of society have significantly strengthened.

The sacred duty and high responsibility of the young generation is to deeply study the heritage left by the great ancestors. Each person determines for himself the criteria for his future activities, looking for ways to achieve happiness. And in order to win a worthy place in life, to see a bright future, you need to be a comprehensively developed and spiritually rich person. Therefore, the younger generation needs to be trained and educated with a position of harmonious development. First in the family, then in preschool institutions, in schools, colleges and lyceums, higher educational institutions.

In addition, public organizations and the makhalla must necessarily participate in the formation of the perfect personal qualities of young people, that is, a spiritual and moral environment must

be created. The creativity of young people and the results of future activities depend on what kind of education and upbringing the youth will receive, what lessons and examples of morality will be offered to them. Young people are faced with complex tasks that require energy, high intelligence, wisdom and strong will. And only strong, spiritually rich, talented young people are able to fulfill these tasks.

In each side, at all times, special attention was paid to the upbringing of highly spiritual youth as the basis for the prosperity of the nation (people). History lessons teach that a spiritually rich nation will never win. And, above all, in the formation of the spirituality of young people, the role of the family and parents is great. Cleanliness and order in the house, mutual respect and love, hard work, devotion to the fatherland and humanism - all this atmosphere in the family is the main condition for the formation of the personal qualities of children.

Young people should know that these qualities and family traditions need to be passed on from generation to generation. The role of great ancestors and outstanding historical figures of the country and state is invaluable in this matter.

The Uzbek land presented the world with great people, whose fame spread throughout the planet. These are Imom al-Bukhari, Termizi, Al-Fargani, Ahmad Yassawi, Baouddin Naqshbandi, Amir Temur, AlisherNavoi, Bobur, Al-Khorezmi, JaloliddinManguberdi. And, of course, among those who made a huge contribution to the development of science and culture, we are proud to name the great philosopher, scientist Abu Ali ibn Sino. Its invaluable scientific heritage has been deeply studied and continues to be studied. It is of particular importance for the spiritual and physical education of young people.

2010 in the Republic of Uzbekistan was declared by President I. A. Karimov "The Year of Comprehensively Advanced Generation". This was the period of implementation of a specially developed State program for the education of intellectual, spiritually and physically developed youth. The expression "comprehensively developed man" was developed and applied by Abu Ali ibn Sino 1000 years earlier. The theoretical basis created by the great scientist has not lost its significance. The scientific heritage and practical recommendations and advice left by Abu Ali ibn Sino - a philosopher, scientist-researcher, hakim (ruler) - serve us not only today, but will also serve for many years to come, since on their scientific potential young people are brought up in a spirit of devotion and love for their homeland.

### ABSTRACT

*This article provides information about sacred objects and sacred landscapes, sacred objects of Fergana region and their stratification. Sacred objects develop the functions of rituals, celebrations, festivals, religious ceremonies, recreation, inherited from ancestors. Over time, tombs, mausoleums, shrines, historical and religious monuments develop and sanctify their functions. Most often, natural-historical sacred objects are located in the mountainous areas of the region, along the sacred springs at the foot of the mountains, terraces, hills, near rivers and streams, forming historical-cultural-natural complexes.*

**KEYWORDS:** *Sacred Objects, Sacred Places, Ethnos, Sacred Landscapes, Shrines, Sacralization.*

### INTRODUCTION

Fergana region is distinguished by the abundance of natural-historical, religious-enlightenment sacred objects in the Republic, its territorial location, its potential in religious and pilgrimage tourism. In recent years, many Resolutions and Decrees adopted in the Republic pay great attention to the use of sacred objects for tourism and recreation purposes.

Resolution of the President of the Republic of Uzbekistan “On measures to further increase the responsibility of local executive authorities in the development of tourism” dated July 12, 2017 No PP-3129, Presidential Decree “On additional organizational measures to create favorable conditions for the development of tourism potential of the Republic of Uzbekistan” dated February 3, 2018 PF-5326, important instructions on the development of tourism infrastructure, promotion of religious, educational, historical and cultural tourism.

In the development of domestic tourism in the country, the study of sacred sites, the provision of information about them, the organization of tourist infrastructure are important in increasing the interest of foreign tourists and locals in religious, historical, cultural and educational facilities.

### THE MAIN FINDINGS AND RESULTS

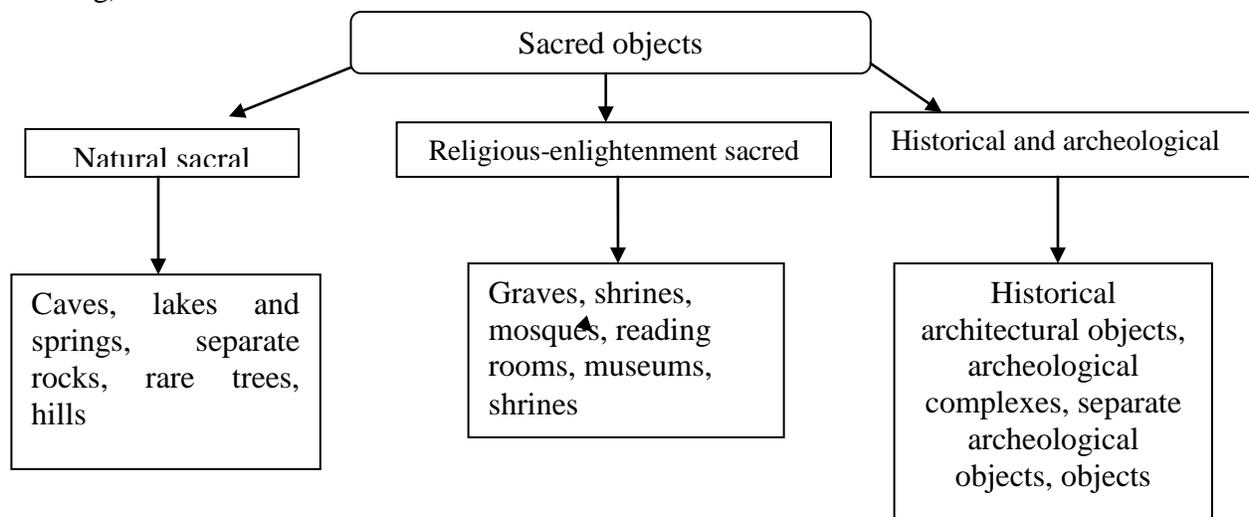

In the Fergana region, which is the object of our research, there are many sacred objects. Such objects as shrines-tombs, mausoleums, natural sacred objects, architectural monuments, historical and cultural objects as sacred places of sacred faith-sacred areas are factors that provide spiritual nourishment in long historical processes and play a special role in the life of the population; however, sacred objects were formed as places of interaction between different ethnic groups. In the life of historical ethnos, in the way of life, in the acts of pilgrimage, there are the principles of hope for goodness, spiritual relief, and forgiveness of sins, spiritual purification, peace and brotherhood. One of the important aspects of sacred objects is to turn people away from evil intentions, to polish national and spiritual values.

Sacred objects develop the functions of rituals, celebrations, festivals, religious ceremonies, recreation, inherited from ancestors. Over time, tombs, mausoleums, shrines, historical and religious monuments develop and sanctify their functions. This leads to the expansion of sacred objects into sacred landscapes, and thus to the formation of protective functions.

Sacred regions form a healthy attitude, ideological immunity, against evil enemies, whose ideology and purpose are hostile.

The shrines serve as hospitals and sanatoriums to restore people's health, provide recreation, physical and spiritual recreation, and spiritual rejuvenation.

Information about shrines in Fergana region is described in detail in the book “Pilgrimages and shrines of Uzbekistan”. All the shrines in the Fergana region, as sacred monuments, have great potential in terms of tourism and recreation potential. In the use of such potential, it is important to classify the shrines, to define their functions according to the functions they perform. (See drawing).

**Figure 1. Sacred objects in Fergana region (drawing by the author)**

Sacral landscapes in Fergana region are a complex of sacred objects, the formation of which occurred in 2 important aspects.

1. The religious aspect, the transformation of religious objects into religious shrines and their sanctification.

2. Natural-historical aspect. That is, the sacralization of unique natural-historical objects.

We can see their mutual proportions in the location of sacred objects in the Fergana region. That is, natural-historical sacred objects are located next to religious shrines. In such regions, sacred objects form sacred landscapes. For example: Satkak springs and Satkak ota shrine, Robial First Shrine with First Springs; Shrine of Hoja Ahmad Wali with a thousand-year-old maple in Vadil, Chakka tomar shrine in Shohimardon village and spring of the same name, Lake Tolmazor, located near Lake Qubbon and its surroundings, Archamozor, Aksu mausoleum, Beshpanja, Moon cradle shrines; Located on the banks of the Sokh River, Yigit Pirim-Er Hubbi connects between sacred objects such as the shrine to form sacred landscapes. The primary factors in such territorial proportionality of sacred objects were natural sacred objects, which were the basis for the organization of religious shrines. Tombs and shrines built around them played an important role in the preservation of unique natural objects and their transformation into sacred objects.

According to the functions performed by the main sacred objects located in the Fergana region are divided into: 1. Natural - historical sacred objects and 2 religious enlightenment sacred objects. We classify some of them below.

1. Natural-historical sacred objects.

The natural-historical sacred areas of Fergana region, according to their geographical location, occupy the plains, river valleys, hills, foothills and mountainous areas of the region. The territorial location of sacred objects is directly related to the development of the territorial territory of local ethnic groups. Most often, natural-historical sacred objects are located in the mountainous areas of the region, along the sacred springs at the foot of the mountains, terraces, hills, near rivers and streams, forming historical-cultural-natural complexes. At the same time, the political, social, economic situation, military and defense potential of the region at historical stages played an important role in the location of historical and archeological sites. Pre-Islamic religions such as paganism, Islamic shrines, mosques, tombs, and archeological sites play an important role in the location of most natural and historical sacred sites. Often we see the interdependence of natural historical sacral regions, and they have become more and more sacred over time.

We will focus on some of the sacred objects in our region.

In the village of Karakoyli of Besharik district there is a shrine of Kaynarbulak, which is a natural sacred object. The water of this spring has been used to treat earaches. The spring is also protected by fish, which means that hunting is prohibited. However, there is a perception that jaundice can also be treated by watching the fish here.

Hawthorn is a shrine. This sacred object is located in Galcha village of Besharik district. The hawthorn tomb is associated with the hawthorn tree that grows here, the main function of which is believed to be to protect the hawthorn from prying eyes.

Another natural shrine in Besharik district is Changalmozor shrine. The dense growth of thorny plants at the shrine in the village of Karayantog was of great importance in the preservation of the tomb here, i.e. the appearance of the shrine was caused by the claw tree.

Blue stone shrine - a sacred object located in the cemetery of Andarhon village of Besharik district is recognized as a separate stone. Legends about natural stone admit that seven brothers who were martyred were buried in this tomb and their tombs were consecrated under the name of Koktash.

Yigit pirim- Erkhubbi shrine is located in Chongara village of Rishtan district. The cave near the hill on the banks of the Sokh River is consecrated in the image of Chongara - Chongara cave young pirim and is recognized as a symbol of protection from floods, floods, productivity and blessings.

Moy Kol Buva Shrine is located near the village of Akboyra in the Oltiariq district, where there used to be a large lake instead of a spring. It is believed that he called it "Moy-Kol" because of the glistening surface of the lake. The reason for the sanctification of the shrine was that one of Satkak's relatives came here and stopped and said, "Do not withhold blessings from your servants, O Allah!" he begs and stabs his stick into the ground, and from the place of the stick the water begins to gush forth, the surface of the water being shiny, as if it were covered with oil, and the food was delicious. This water was used as a treatment for ear and throat pain.

2. Religious and enlightenment sacred areas include graves, shrines, mosques, reading rooms, museums and shrines in our region. Shrines have played an important role in the way of life of the peoples of Central Asia, as well as of all peoples. Over the centuries, the notion of tombs and shrines has been formed in the minds of our people as a sacred place. Even during wars and natural disasters, holy shrines have protected people.

The origin of shrines, mosques, cemeteries in Fergana region, their sanctification is directly related to the historical culture of our people, customs, religious rites, wars, battles, the activities of saints, governors, companions. Such shrines increase the prestige of our country and attract local and foreign tourists.

Religious shrines, mosques define the area of a particular culture, religious activity. The sanctification of religious shrines leads to a certain degree of restriction and stratification of human activity in such areas. For example, not fishing in springs, not cutting down trees in shrines, not interfering with the protection of sacred objects that have been in harmony with nature for thousands of years, creates a tradition of passing from generation to generation.

Sacred landscapes are natural anthropogenic geotisms that perform a religious (spiritual) function, they are primarily visited, believed objects associated with the religious needs of mankind, as well as those who belong to a certain category of population seek to interact with such places. Religious enlightenment includes all territorial complexes in which sacred cultural landscapes are considered sacred and determined by the existence of a purpose of worship (cult).

Sacred objects of religious enlightenment are also common in the mountainous areas of Fergana region. On the way from the village of Shohimardon to Lake Qubbon, the Stone of the Koktash shrine is recognized as a natural sacred object. The main reason for its sacralization was that patients with whooping cough were brought here, licked the bruise, and thus healed.

Beshpanja Shrine - The water that flows from Lake Qubbon flows through 5 networks. According to the narrations, Hazrat Ali cut the river water with his sword, formed a dam and struck five claws to keep the water from coming out.

The Golden Cradle shrine is also located in a natural sacred object, and there are legends that it is located on a steep rock above Lake Qubbon.

Lake Kubbon is also a unique landscape, a product of natural beauty, as well as a sacred area for people. The lake has a high recreational and tourist potential, the lake, which by its origin depends on natural processes, has been sacred for centuries and turned into a sacred shrine.

Chilmahram Shrine - This sacred object, located on the banks of the Syrdarya River in Besharik district, consists of a small cave located at the top of the hill more than 50 meters and a collection of several smaller caves. Inside the cave is the tomb of a saint named Chillakharam. Visitors to this tomb offer sacrifices for their children, then descend and bathe in the waters of the Syrdarya.

Akmozor Buva shrine is a hill made of a pile of soil as a sacred object, located in the village of Zarkent, Toshloq district. A spring was formed near this hill. Those who fell white on the body and hair from the soil of the tomb were called "white graves" because they were healed.

Hot spring shrine - this sacred object is located in the village of Karakoyli, Besharik district. It is the sanctification of the spring as a natural sacred object and the use of its water as a cure for ear pain in its transformation into a shrine. Fish also live in the spring water, sanctify them and hunting is prohibited.

Sangi Oyina Shrine is a natural sacred object located in the village of Tul, Sokh district. One of the legends about the sanctification of the Sangi Oyina shrine is directly related to the name of Zahiriddin Muhammad Babur. It is said that after Babur was defeated by Shaibanikhan, while living in the villages around Sokh for some time, he came across a stone called Sangi Oyna, i.e. Oyna Stone. The locals sanctified this stone as a stone that foretold the future. Through the stone, Babur also found out about his future, gathered an army and marched through India to Afghanistan. About the Sangi Oyna Shrine Babur Mirzo in his work "Boburnoma" – In one part of Isfara, a piece of stone fell between the hills to the south. It is called "Sangi Oyna", "Everything will be like a mirror".

Sangi Navasita Shrine - This place of pilgrimage is a sacred object located in the village of Ravon, Sokh district, the meaning of which is - "Written stone" and was written on the rocks hanging by the road. It became a holy place of worship after the name of Abdullah Eshan was given to the saint. It is said that when there was no water in the village, Abdullah prayed for the water to flow smoothly, and then the water began to flow smoothly. The name of the village was changed to Ravon.

From the above-mentioned natural sacred objects in Fergana region

In addition, there are many objects in the sacralization of which the activities of indigenous peoples, ethnos, customs, rituals, religious ceremonies play an important role, which led to the sacralization of natural objects and the expansion of sacred landscapes.

There are many historical and archeological cultural monuments in Uzbekistan, including in our region, which are directly related to the lifestyle, way of life, customs and religious ceremonies

of local ethnic groups. According to the Greek historian Herodotus (6th century BC) in his book “History”, the Achaemenid king Darius, who marched to conquer the nomadic Scythian warriors, sent a letter accusing the Scythians of fleeing the war Idanfiris. Idanfiris replied, “If you really want to fight, try to find the graves of our fathers and trample them, and then you will know whether we will fight or not”. From this answer it became clear that for our ancestors the graves of their ancestors were considered sacred, and to be deprived of them was tantamount to losing one's homeland. According to the beliefs of the ancient Turkic peoples, the surrender of shrines was tantamount to breaking away from custom and surrendering to the wild.

Sacred monuments perform spiritual, spiritual and socio-political functions among peoples. Sacred shrines of natural origin serve people to love nature, enjoy its beauty and aesthetic pleasure. Pilgrimages related to human activities serve to appreciate their beliefs, religious desires, spiritual and spiritual aspects. As sacred places, the shrines are inherited from ancient ancestors, preserving traditions such as customs, holidays, festivals, recreation, and passing on the rich heritage of our people to future generations.

Religious enlightenment sacral regions can serve as semantic centers of landscapes for religious ceremonies. Such territories and objects are places where an event took place by the will of divine power, places where great saints of all times and cults and their companions are buried, sanctuaries of lost religions, perennial shrines and objects of asceticism, as well as places of power are amazing landscapes created and created by the invisible forces of nature.

Important features of the geographical location of religious and enlightenment shrines are taken into account in the choice of location for the construction of such facilities, their durability, the possibility of transmission from generation to generation, the conditions of protection. Accordingly, most religious and enlightenment sacred objects are more common in the Sokh and Fergana districts of our region.

### CONCLUSIONS:

1. Sacred objects are natural-historical, religious and spiritual-cultural objects that form the customs, traditions, religious and spiritual values of a society that play an important role in world civilization.
2. Through the study of sacred landscapes, we gain a greater understanding of the historical culture, customs, and religious beliefs, national and spiritual values of our peoples.
3. The wider study of sacred objects and the sacred landscapes they create as objects of tourism and recreation expands the possibility of using such objects in the tourism industry.

### ABSTRACT

*Currently, biological diversity is of paramount importance for the normal functioning of systems and the biosphere as a whole, contributes to the sustainable development of the region. Further conservation of biodiversity in the territories of the Fergana Valley requires a transition from a mono-resource approach to an ecosystem approach in nature management. The article and methodological plan consider the issues of accounting and assessment of biological diversity in the development of new protected areas.*

**KEYWORDS:** *Protected Natural Areas, Representative, Nature Reserve, Key Biodiversity Areas, IUCN, Endemic, Flora, Fauna.*

### INTRODUCTION

The Fergana Valley is an intermontane plateau in the mountains of Central Asia, it is an intermontane depression bounded in the north by the Tien Shan mountain system, and in the south by the Alai ridge. In plan it resembles an ellipse about 300 km long and up to 170 km wide. If from a geographical point of view, the territory is a homogeneous space, then in political terms it is characterized by significant heterogeneity. Today, there are three regions of Kyrgyzstan - Osh, Jalalabad, as well as the recently formed Batken, three regions of Uzbekistan -

Andijan, Fergana and Namangan - in the central part of the plain, and the southwestern part of the valley is occupied by the Sogd region of Tajikistan [7, 8].

The Fergana Valley is the most fertile and densely populated region in all of Central Asia and, in some respects, it still retains the importance it had when it lay on the ancient Silk Road. The economies of all three countries are predominantly agricultural in nature. Therefore, the general degradation and fragmentation of natural ecosystems, which are intensified under the influence of anthropogenic impacts, led to a reduction in the ranges and numbers of both rare and resource species. Such species have an increased risk of extinction in the wild and are recommended for inclusion in the Red Book. The Fergana Valley (belonging to the Republic of Uzbekistan) is home to 52 species of animals listed in the "Red Book" of the Republic of Uzbekistan, of which 16 are invertebrates, 7 species of fish, 7 species of reptiles, 16 species of birds, 3 species of mammals [10, 11].

Over the past decades, as a result of intensive nature management, some species of animals in the Fergana Valley have been subjected to anthropogenic impact, and therefore their ranges and numbers have decreased, some species are on the verge of extinction or have disappeared completely. The number of many animals has not yet reached a critical level, but continues to decline steadily. Degradation of habitats and direct extermination affected, first of all, large carnivores (*Ursus arctos*, *Cuon Alpinus*, *Canis lupus*, *Uncia uncia*, *Vulpes vulpes*) and ungulate mammals (*Capra ibex*, *Capreolus pygargus*, *Sus scrofa*) [5, 9].

The flora of the Fergana Valley is rich in endemic, rare and endangered species. In the Fergana Valley, 45 species of plants are distributed, listed in the Red Book of the Republic of Uzbekistan. The distribution of these species is indicated in the Red Book of Uzbekistan (2009) and in individual publications [4, 6, 7]. But, these data cannot give a general picture of the distribution, abundance or reasons for the reduction in the number of individuals and the area of distribution, and others, also the predominant part of the data on the state of populations requires new research.

Population growth and acceleration of urbanization processes lead to the loss of unique and valuable natural ecosystems in the Fergana Valley, as well as the genetic fund of plants and animals. In the Fergana Valley (belonging to the Republic of Uzbekistan), the situation is further complicated by the fact that here I, II and IV categories of protected natural areas (PNA) are absent, which would make it possible to restore and preserve biological diversity in the Fergana Valley. For the further implementation of the effective protection of biodiversity components, a systematic approach is required; it is necessary to develop comprehensive measures both for the protection of the species themselves and for the preservation of their habitats [1, 2, 3].

In the Fergana Valley, insufficient study of fauna and flora leads to a reduction in biodiversity. Therefore, the current situation requires optimization and new approaches to solving the problems of ecosystem conservation. One of the possible ways out of this situation is to identify key biodiversity areas (KBA) that meet international standards [5]. The target results of the protection of natural objects are created by KBA - objects that are important for the conservation of biodiversity on a global scale. KBA are defined by elements of biodiversity that, globally, natural sites contribute significantly to conservation, such as endangered species or ecosystems. When identifying KBA, several criteria and subcriteria are used, each of which has

corresponding quantitative threshold values [13]. Natural objects are classified as KBA if they meet at least one of the following criteria [5]:

- A1: the presence of a significant proportion of the global population of one or more globally threatened species;
- A2: the presence of a significant proportion of the ecosystem under threat of global extinction;
- B1-B4: presence of geographically limited elements of biodiversity (not necessarily threatened), including individual species, associated species, species populations and ecosystem types;
- C: ecological integrity: natural sites where ecological communities and the ecological processes that support them are kept completely intact;
- D: exceptional biological processes, including demographic aggregations (for example, seasonal aggregations for the purpose of breeding or feeding), ecological refuges and initial populations necessary for the survival of the species;
- E: irreplaceable: natural sites recognized through quantitative analysis of complementarity very high indispensability for global biodiversity.

Biodiversity and natural ecosystems are concentrated in remote mountainous areas, where state borders often pass. Therefore, many key biodiversity areas are cut apart by boundaries. This means that the best approach to their protection is bilateral or regional cooperation. Long-term conservation of nature requires the protection of landscapes and geocological corridors. This is especially important for the conservation of large-scale ecological and evolutionary processes, as well as for the conservation of species with large ranges, low natural population density and migratory instincts. In addition, such corridors facilitate cross-border cooperation between KBA that are ecologically similar, but can be separated by borders. Conservation corridors can also be an effective tool for integrating environmental protection requirements into land use plans, contributing to the conservation of biodiversity in the use of cultural landscapes such as cropland, pasture and forestry [5, 9].

In the part of the Fergana Valley belonging to the Republic of Uzbekistan, the provision of the territory with environmental protection facilities is slightly lower. The region is characterized by a high degree of anthropogenic transformation of the territory, mainly due to the plowing of the territory, and some of the smallest values of the areas of natural geosystems are noted. The high degree of preservation of natural geosystems corresponds to mountainous regions and partly to Central Fergana. Some areas with natural vegetation are preserved in the Chatkal and Kuramin ranges, the foothill and mid-mountainous parts of the Alai and Turkestan ranges and in the flat part of Central Fergana [2, 3] (Table 1).

In the Fergana Valley, there is an urgent need to increase the areas of protected areas, according to the results of the assessment of key areas of biodiversity developed by IUCN (2016). Currently, there are several natural monuments, water protection zones and zones of fresh groundwater deposits as PNA. However, they are not able to ensure the conservation of the region's biodiversity in the long term, if measures are not taken to reliably preserve it throughout the region outside the protected areas.

TABLE-1 FERGANA VALLEY KEY BIODIVERSITY AREAS

No	Name of KBA	Criteria KBA	Rare and endemic species	Existing protected areas	Prospective protected areas
1	Upper part of the Akhangaran river basin	B1	<b>Flora:</b> <i>Aconitum talassicum</i> Popov, <i>Hedysarum angrenicum</i> Korotkova, <i>Iridodictyum winklerii</i> (Regel) Rodionenko, <i>Dorema microcarpum</i> Korovin, <i>Achoriphragma kuramense</i> (Botsch.) Sojak, <i>Tulipa kaufmanniana</i> Regel.	No	National Park
2	Northern and southern slopes of the Kuraminsky ridge	B1, C, A2	<b>Flora:</b> <i>Acantholimon laxiusculum</i> , <i>Acantholimon margaritae</i> , <i>Allium praemixtum</i> , <i>Allium pskemense</i> , <i>Astragalus dolonus</i> , <i>Astragalus nucleosus</i> , <i>Astragalus pseudoamygdalinus</i> , <i>Bunium angreni</i> , <i>Cicer mogoltavicum</i> , <i>Eremurus korovinii</i> , <i>Rindera fornicate</i> , <i>Salsola titovii</i> , <i>Tulipa mogoltavica</i> , <i>Tulipa vvedenskyi</i> . <b>Fauna:</b> <i>Cuon Alpinus</i> , <i>Ursus arctos</i> , <i>Canis lupus</i> , <i>Cicindela galatea</i> Theime, <i>Alsophylax loricatus</i> Strauch, <i>Gypaetus barbatus</i> , <i>Gyps himalayensis</i> Hume, <i>Gyps fulvus</i> Hablizl, <i>Aegyptius monachus</i> , <i>Columba eversmanni</i> Bonaparte, <i>Ursus arctos</i> Linnaeus, <i>Vormela peregusna</i> , <i>Ciconia nigra</i> , <i>Terpsiphone paradoxa</i> , <i>Capra ibex</i> , <i>Sus scrofa</i>	Protected forests	Strict Nature Reserve
3	Southern slope of the Chatkal ridge	B1, C, A2	<b>Flora:</b> <i>Aconitum talassicum</i> Popov, <i>Ferula czatkalensis</i> M.Pimen, <i>Iridodictyum winklerii</i> (Regel) Rodionenko, <i>Dorema microcarpum</i> Korovin, <i>Lomatocarpa korovinii</i> Pimenov, <i>Achoriphragma saxifraga</i> (Botsch. et Vved.) Sojak, <i>Tulipa kaufmanniana</i> Regel, <i>Allochrysa gypsophiloides</i> (Regel) Schischk. <b>Fauna:</b> <i>Uncia uncia</i> , <i>Canis lupus</i> , <i>Marmota menzbieri zachidovi</i> , <i>Cicindela galatea</i> Theime, <i>Alsophylax loricatus</i> Strauch, <i>Gyps himalayensis</i> Hume, <i>Gyps fulvus</i> Hablizl, <i>Aegyptius monachus</i> , <i>Columba eversmanni</i> Bonaparte,	No	Strict Nature Reserve

			Marmota menzbieri, Ursus arctos Linnaeus, Vormela peregusna, <i>Terpsiphone paradoxa</i> , Capra ibex, Sus scrofa.		
4	Sokh Territory	B1, C	<b>Flora:</b> <i>Astragalus auratus</i> , <i>Astragalus dianthoides</i> , <b>Calligonum calcareum</b> , <i>Calligonum elegans</i> , <i>Ferula vicaria</i> , <i>Tulipa ferganica</i> . <b>Fauna:</b> Tetrax tetrax, Columba eversmanni Bonaparte, Falco naumanni Fleischer, Hieraaetus fasciatus, Hieraaetus pennatus, Canis lupus, Capra ibex	No	National Park
5	Upper reaches of the Chadak and Chorkesar rivers	B1	<b>Flora:</b> <i>Acantholimon laxiusculum</i> , <i>Dracocephalum komarovii</i> , <i>Euphorbia mucronulata</i> , <i>Kuramosciadum corydaliifolium</i> , <i>Tulipa dasystemon</i> , <i>Tulipa dasystemonoides</i> , <i>Tulipa dubia</i> .	Protected forests	<u>Habitat/Species Management Area</u>
6	Papal adyrs	B1	<b>Flora:</b> <i>Allium haneltii</i> , <i>Allium isakulii</i> , <i>Allium kuramense</i> , <i>Anthochlamys tianschanica</i> , <i>Astragalus austroferganicus</i> , <i>Astragalus pseudodianthus</i> , <i>Dorema microcarpum</i> , <i>Mogoltavia sewerzowii</i> , <i>Salsola drobovii</i> , <i>Tulipa intermedia</i> , <i>Tulipa scharipovii</i> . <b>Fauna:</b> <i>Alsophylax loricatus</i> Strauch.	No	<u>Habitat/Species Management Area</u>
7	Karatag	B1	<b>Flora:</b> <i>Acantholimon nabievii</i> , <i>Allium filidentiforme</i> , <i>Mogoltavia sewerzowii</i> . <b>Fauna:</b> <i>Aegyptius monachus</i> , <i>Alsophylax loricatus</i> Strauch	No	Natural Monument
8	Ungortepa	B1	<b>Flora:</b> <i>Allium filidentiforme</i> , <i>Allium tatyanae</i> , <i>Allium viridiflorum</i> , <i>Tulipa ferganica</i> . <b>Fauna:</b> <i>Alsophylax loricatus</i> Strauch	No	Natural Monument
9	Chartak adyrs	B1	<b>Flora:</b> <i>Acantholimon nabievii</i> , <i>Hedysarum gypsaceum</i> , <i>Lamyropappus schakaptaricus</i> , <i>Mogoltavia sewerzowii</i> . <b>Fauna:</b> <i>Alsophylax loricatus</i> Strauch.	No	Natural Monument
11	Sands Yazyavan and Akkum	B1, C	<b>Flora:</b> <i>Phrynocephalus strauchi</i> , <i>Astragalus rubellus</i> Gontsch, <b>Astragalus subauriculatus</b> , <i>Astragalus austroferganicus</i> Kamelin et R. --	--	--	--	--

Over the past fifteen years, a number of projects have been implemented in Uzbekistan with the involvement of international grants, within the framework of which new approaches have been demonstrated for the conservation and management of biodiversity and natural resources in and around PNA, and the expansion of the PNA system. Thanks to the implementation of these projects, new categories of PNA were created, their material and technical base was improved, specialists and employees of the system of the State Committee of the Republic of Uzbekistan on Ecology and Environmental Protection, as well as ecologists of companies and enterprises of the republic were trained in new advanced approaches to biodiversity conservation.

All territories promising for the creation of PNA are distinguished according to the corresponding groups of criteria (landscape diversity, biodiversity, soil, geological diversity, valuable natural areas with high recreational significance), which are characterized by a certain specificity of the protected object. As part of the creation of a system of protected areas at the regional level, it is impossible to preserve all the valuable natural objects of the Fergana Valley. For the development of PNA of regional significance, it is recommended to carry out comprehensive studies to create an ecological network. This methodology involves assessing the representation of geographic diversity, analyzing the availability of PNA in the area under consideration by the basin principle, assessing the informational availability of PNA activities, their ecological and cognitive functions, and considering the problem of regulatory support. Only in the case of joint development of PNA networks at all levels (global, regional, local) is it possible to create an effective system of protected natural areas.

Based on the results, to determine the key areas of biodiversity of the Fergana Valley and the prospects for creating protected natural areas, draw the following conclusions: In order to develop the PNA system, 16 key areas of biodiversity, promising for the creation of new protected areas, have been identified. The promising PNA system according to the laws of Uzbekistan is represented by 10 categories. In this case, the category "state reserve" is introduced for the first time. The prospective PNA network is representative of the geographical diversity and ensures the ecological balance of the Fergana Valley. Additional recommendations for optimizing the PNA system: the creation of a state nature reserve, an integrated (landscape) reserve and a natural park, in areas with a combination of natural and recreational value and the development of protected areas of local importance.

### ABSTRACT

*Organizational intelligence was defined as an organization's capacity and potential in mental power and focusing this power on the realization of the organization's mission. Organizational intelligence is a low standard for the efficiency of organization in releasing information, decision-making and implementation. Intelligent organizations enhance their mental power like their physical power. This study is aimed to identify different levels of organizational intelligence in the knowledge based pharmaceutical companies in Paradise Technology Park, Tehran. In this regard, the components of organizational intelligence were determined for identifying, investigating and measuring. The method applied in this study is descriptive survey and the population is the knowledge based pharmaceutical companies in Paradise Technology Park. The statistical population is 220 personnel of the companies having diploma or higher degrees among whom 140 were chosen using sample Cochran formula. Data collection tool was Carl Albrecht questionnaire including 49 questions whose validity was verified by experts of the field. Its reliability was obtained 0.7 using Cronbache's Alpha. For analyzing data, descriptive statistics including frequency percentage and inferential statistics including mean test of population were used. The results reveal that organizational intelligence of the study population with the experimental mean of 3.49 was higher than the theoretical mean of 3 and the highest mean was the component of alignment and congruence and lowest one was appetite for change.*

## INTRODUCTION

Organizational intelligence is a low standard for efficiency of an organization in releasing information, decision-making and implementation. The IQ of organizations is measurable like human beings'. Intelligent organizations enhance their mental power along with physical power. Today, those who are familiar with the competitive state of organizations are well aware of the fact that organizations are changing dramatically. The major pressure for all organizations is the high speed of the introduction of new products to the market and imitation of the same product by the competitors. Organizations that don't haste, they will be removed. Lack of long-term agreements among organizations and employees is also a factor leaving them in the concern about their job status. Today, delegation of authority is different from the past and it is not time for ordering and controlling strictly. All of such challenges made a quite different position for organizations even way different from the last ten years. Why some companies remain in the arena of competition while others are expelled? Why some companies make progress quickly while others can't continue their activity? Why some companies adapt themselves to the changeable conditions of environment while others are disabling to do so? The notion of organizational intelligence is a case in the path of today's organizations and for sure it is going to be critical in the future and attracting and maintaining intelligent people seem necessary in an organization (Albrecht, 2009). The simple fact is that the success of businesses is contingent upon intellectual power of a few of staff with high capability and knowledge. Such people are those who are able to plan, organize, lead, manage, analyze, make concept, make strategies, make decisions, be innovative, teach, recommend and explain ideas. In surviving in the competition with other organizations, this point ought to be taken into account that heads of companies must pay attention to the instructions of management and apply them. One of the vital concepts for this kind of organizations is organizational intelligence. The aim of this study is to enhance the level of organizational intelligence in knowledge based pharmaceutical companies in order to enhance competitiveness and pursue and achieve organizational goals. Enhancing the level of organizational intelligence result in competitiveness, efficiency in releasing information, decision making and proper implementation in the knowledge based companies.

## REVIEW OF LITERATURE

Today, we talk about different kinds of intelligences one of which is organizational intelligence. It makes us competent for decision-making. Organizational intelligence means having a comprehensive knowledge about all the influential factors on organizations. Having a deep knowledge of all the factors such as customers, competitors, economic environment, organizational processes and operations have high influence on the quality of management decisions in the organization (Abzari et al. 2006, P.25). We often witness a significant difference between the staff's performance. Some of them do their job eagerly and persistently and have better job performance compared to others, while the others must be pressured for doing minimum work. The quality and effectiveness of management and its function are determining and vital factors for development and welfare in the society.

Presently, there are various factors influencing survival of service and industrial units, such factors change quickly and the changes are unpredictable. Most of the organizations work under

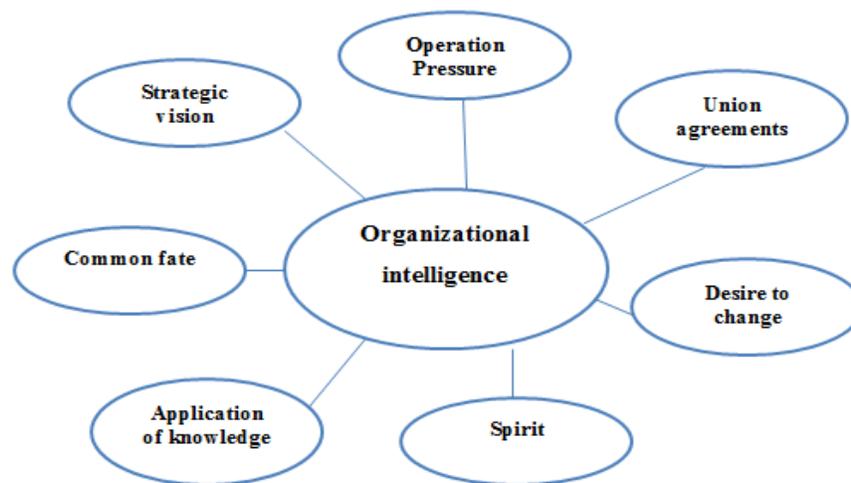

the same conditions. Organizations must always adapt themselves to the changes. An organization not only changes its situation from time to time but also it is aware of the fact that the phenomenon of change is permanent and its survival will depend upon this procedure in the competitive world (Al Daft, 2011, P. 20). One of the most important capabilities of an organization is the organizational intelligence enhancing the capacity of changing the organization. Organizational intelligence is an ability using all intellectual abilities of organization to attain goal and the mission of organization (Albrecht, 2003, P. 25). The concept of organizational intelligence which is introduced in the recent years attracts scholars' and researchers' attention to the areas of knowledge including management and authorities of the organization. In other words, people who enjoy higher intelligence are more successful than others. Organizational intelligence is a new concept in the management and organizational books.

Researchers investigated organizational intelligence in different views of epistemology such as cognitive, behavioral, social and emotional. Each of these approaches leads to a path to recognize this complicated phenomenon and each of them are complementary for the other approaches for example, while cognitive view emphasizes inner processes and structures such as ability to process information, behavioral view investigates behavioral-environmental connections leading to the conformity of organizational behavior to the environment (Nasabi, 2008, P. 14). In addition to epistemological views, ontological basis of intelligence (whether individual or organizational) causes bewilderment in terms of who or what is in the area of organizational intelligence, as a result of this phenomenon, organizational intelligence is reduced. Organizational intelligence is related to individual intelligence with integration mechanism (organizational intelligence is formed by the accumulation of individual intelligence), transition between surface (individuals' intelligence is interpreted as organizational intelligence) and distribution (organizational intelligence appears in the structural patterns of thought and the interaction between the members of organization) (Sattari, Ghahfarrokhi, 2006, p. 15). Organizational intelligence is a social and group outcome, this means this intelligence is the result of group function of individuals serving as a unit (William, 1998, P.790).

Another definition of organizational intelligence, organizational intelligence defines the process of troubleshooting of data collection, processing, interpreting and relating the required technical-political information in decision-making (Wilensky, 2000). The idea and concept of organizational intelligence includes other minor paradigms such as organizational learning and knowledge management (Yolles, 2005, P. 100).

Pundits found out that individuals and organizations enjoying high organizational intelligence variable have superiority over others in innovation and understanding organizational problems (Macgilchrist, 2004, P. 190). Recent studies in the field of human resources have revealed that the five characteristics of personality, aptitude, interest, intelligence and skill are effective on the advancement of the objectives of organizations, creating job satisfaction, organizational learning, tendency to knowledge, creativity coefficient and evaluating the staff. Today, it can certainly be claimed that identifying and using organizational intelligence can increase the power of competitiveness in an organization and make it distinctive from other organizations. The necessity to investigate organizational intelligence is now responding the current conditions and needs of managers. Taking advantage of organizational intelligence, organizations increase effectiveness of using current information structures along with their goals and the information

will be developed from limited and operational form to be used in the executive layers of organizations for managers. Considering the fact that managers work in the organizations that are affected by internal and external environments and they are in need of the power of learning in accountability to their problems like other people. Therefore, the issue of organizational intelligence can help managers in this regard and enable them to be accountable to needs, problems and on time reaction to environmental changes with regard to their organizational memory. Thus, managers need organizational intelligence for the advancement of their organizational goals and achieving them so that they can improve their function by relying on them. Albrecht (2002) introduces organizational intelligence as the capacity and potential of an organization in improving its mental power and focusing that on the realization of the mission of organization. He considers this intelligence as an ability improving mental power of the organization and focusing it on achieving the mission. Albrecht (2003) provides an organizational model (figure 1) having seven dimensions that include: strategic vision, shared fate, appetite for change, alignment and congruence, spirit, knowledge deployment and performance pressure (Albrecht, 2003, P. 25). Knowledge based pharmaceutical companies are the ones that are active in using innovation and inventing as well as commercializing the results of research and development including (design and production of items and services) in the field of high pharmaceutical technologies with high added value). Such companies are concerned about enhancing organizational intelligence that finally turns into the study issue in this paper. The aim of this study is to investigate components of organizational intelligence in knowledge based pharmaceutical companies using the seven dimension model of Albrecht. In Albrecht's view organizational intelligence falls into the following seven dimensions that are illustrated in the figure:

**Organizational intelligence:** capacity of an organization in integrating all mental abilities available and focusing them on achieving the mission. Strategic vision: ability to create, deduce and expressing a goal for an organization. Shared fate: feeling to

Figure1: conceptual model of research (Albrecht, 2003)

have the same goal among all the members for attempt and function in synergistic form. Appetite for change: adaptability and inclination to change for the realization of strategic vision. Enthusiasm: psychologists consider that as the optional attempt as extra energy of the members in higher level than what is going to be carried out. Alignment and congruence: existence of systems and series of specified regulations for implementation for people and groups. Applying knowledge: effective use of knowledge, information and data. Performance pressure: each of the executives must have their own executive position (Albrecht, 2003, P. 26).

Intelligence as an attractive concept has attracted lots of attention in many fields even the ones outside the area of individual and cognitive psychology. One of the areas showing high interest in intelligence is management and organization. However, this concept is ambiguous for the researchers of organization and management. One of the reasons is lack of strong and coherent theoretical frameworks in this field. On the other hand, despite passage of one decade from the introduction of organizational intelligence, few researches conducted in the knowledge based companies on the aforementioned area. Organizational intelligence is a low standard for efficiency of the organization in releasing information, decision-making and implementation. IQ of organizations is measurable like IQ of people. Intelligent organizations enhance their mental power along with their physical power.

The importance of this study is that if the level of organizational intelligence is low in knowledge based companies, the possibility for development, commercialization and competitiveness will be decreased. Now that we realized the importance of the issue and no research conducted in knowledge based companies, we investigate components of organizational intelligence in such companies.

Main hypothesis

Components of organizational intelligence are higher than average among the staff of The knowledge based pharmaceutical companies (considering the five option spectrum of Likert mean is 3).

Subsidiary hypotheses of the study

- H1. The factor of strategic vision is higher than average.
- H2. The component of shared fate is higher than average.
- H3. The element of aptitude for change is higher than average.
- H4. The component of sprit is higher than average.
- H5. The factor of alignment and congruence is higher than average.
- H6. The component of application of knowledge is higher than average.
- H7. The factor of performance pressure is higher than average.

### **Method of research**

Since the aim of study is to determine amount of organizational intelligence components among the staff, hence, the study is applied one in terms of aim and descriptive and correlational in terms of collecting data for testing hypotheses. The method is survey, the most important

---

advantage of which is ability to overgeneralize the results. After collecting data through a standard questionnaire having validity and reliability as well as a statistical population being chosen through at simple random, SPSS software was used for inferential statistics and generalizing the results to the population and LISREL version 8.8 for validity of the construct. For collecting qualitative and library data we used library information of universities, relevant theses, ISI articles as well as valid Internet journals and sites in the country and around the world. Quantitative and field information: one of the most important levels of research is collecting quantitative information, thus, we used questionnaire which is the most common method for data collection. In this part statistical analysis, we will discuss distribution of statistical sample in terms of organizational position, salary, education, work experience, gender and age.

**TABLE 1. DEMOGRAPHIC CHARACTERISTICS OF THE RESPONDENTS**

Work experience	1 to 5	6 to 10	11 to 15	16 to 20	21 to 25	Higher than 26	Total
Percent of frequency	6	34	48	8	2	2	100
Education	Diploma	A.A	B.A	Higher than M.A	Total		
Frequency	18	18	50	14	100		
Gender	Male	Female	Total				
Frequency	76	24	100				
Age	Under 30	Between 31 and 40	Between 41 and 50	Above 51	Total		
Frequency	8	82	8	2	100		

**Testing main hypothesis of the study**

Main hypothesis of the study: intelligence of the staff of knowledge based pharmaceutical companies of Paradise Technology Park is more than average. Therefore, the statistical hypotheses can be written as following:

$$H_0: \mu \leq 3$$

$$H_1: \mu > 3$$

**TABLE (4) SHOWS THE RESULTS OF ABOVE-MENTIONED HYPOTHESIS:**

Confidence interval at the confidence level of 95 percent		Mean difference	Level of significance	of	Level of freedom	of	T
High line	Low line						
0.632	0.552	0.495	0.000	149	11.667		Organizational intelligence

As the results of test reveals, the value of t is significant in the significant level of 0.05 (higher than 1.96). Therefore, null hypothesis is rejected with 95 percent certainty. Thus, the research hypothesis is verified.

### Testing one to seven subsidiary hypotheses

First hypothesis: vision of the staff of knowledge based pharmaceutical companies of Paradise Technology Park is higher than average.

Second hypothesis: shared fate of the staff of knowledge based pharmaceutical companies of Paradise Technology Park is higher than average.

Third hypothesis: appetite for change is higher than average for the staff of knowledge based pharmaceutical companies of Paradise Technology Park.

Fourth hypothesis: sprit of the staff of knowledge based pharmaceutical companies of Paradise Technology Park is higher than average.

Fifth hypothesis: alignment and congruence of the staff of knowledge based pharmaceutical companies of Paradise Technology Park is higher than average.

Sixth hypothesis: application of knowledge by the staff of knowledge based pharmaceutical companies of Paradise Technology Park is higher than average.

Seventh hypothesis: performance of the staff of knowledge based pharmaceutical companies of Paradise Technology Park is higher than average. For all hypotheses: the following statistical hypotheses can be considered:

$$H_0: \mu \leq 3 \quad H_1: \mu > 3$$

Single sample of the test							
Theoretical mean-3							
Row	T	Level of freedom	Level of significance	Mean difference	Confidence interval at the level of 95 percent		
The results of the first hypothesis: vision	1 0.627	148	0.000	0.521	0	0.7	60
The results of the second hypothesis: shared fate	1 1.333	148	000.0	0.684	0	0.7	93
The results of the third hypothesis: appetite for change	4. 567	148	0.000	0.342	0	0.3	85
The results of the fourth hypothesis: sprit	7. 556	148	0.000	0.278	0	0.4	85

The results of the fifth hypothesis:	1 3.345	148	0.000	0.752	0 .640	0.8 64
The results of the sixth hypothesis: application of knowledge	5. 345	148	0.000	0.28	0 .149	
The results of the seventh hypothesis: performance	4. 475	148	0.000	0.480	0 .353	0.6 07

As the results of test reveals for all hypotheses, the value of t is significant in the significant level of 0.05 (higher than 1.96). Therefore, null hypothesis is rejected with 95 percent certainty. Thus, the research hypothesis is verified.

## DISCUSSION AND CONCLUSION

The results revealed that the mean of intelligence was 3.49 which was higher than theoretical mean of 3, in addition, SaipaPlasco Car Company was higher than average with the mean of 4.52 compared to the theoretical mean of 4 and the intelligence of the Organization of Research and Planning Education was less than average of 3 with the mean of 2.82.

Components of intelligence of the company	Results of researches in the Organization of Research and Planning	SaipaPlasco Car Company	Knowledge based pharmaceutical companies of Paradise Technology Park
Strategic vision	3.17	4.66	3.64
Shared fate	2.99	4.59	3.67
Appetite for change	2.66	4.46	3.26
Sprit	2.69	4.39	3.37
Alignment and congruence	2.66	4.68	3.75
Applying knowledge	2.73	4.30	3.28
Performance pressure	2.73	4.56	3.48
Company intelligence	2.82	4.52	3.49

With regard to the results, the component of alignment and congruence in the staff of knowledge based pharmaceutical companies of Paradise Technology Park and SaipaPlasco Car Company has highest mean and appetite for change in knowledge based pharmaceutical companies and applying knowledge in SaipaPlasco Car Company have the lowest mean.

The results of the subsidiary hypotheses of the study were indicated as following:

1. First subsidiary hypothesis: the company intelligence of the staff of knowledge based pharmaceutical companies of Paradise Technology Park in the strategic vision is more than average.

This hypothesis was verified using mean test of a population by providing mean of company intelligence as 3.64 that had been mentioned among the staff of knowledge based pharmaceutical companies of Paradise Technology Park. In fact, strategic vision is the ability to provide and implement goals and prepared strategies and the results suggest revision and continuous investigation of such strategies in the staff of knowledge based pharmaceutical companies of Paradise Technology Park.

2. Second subsidiary hypothesis: intelligence of the staff of knowledge based pharmaceutical companies of Paradise Technology Park in shared fate is higher than average.

This hypothesis was measured using mean test of a population and the results of test (3.67) show its verification. The aim of this hypothesis was the importance of encouraging the staff to have supportive vision toward organization and investigation of goals. Supportive vision is created for attempting synergistically as a result of shared goal among the members. On the other hand, one of the outstanding characteristics of the committed people is emphasizing the fate of organization which is the main area of discussion in shared fate. Results of the study reveal that the staff of knowledge based pharmaceutical companies of Paradise Technology Park put the principle of interference and sharing of the staff in the affairs and their participation in determining and achieving goals of the company, creating successful business teams and strengthening cooperation among the members, creating job security and the sense of belonging to organization as the radical steps in reaching shared fate.

3. Third subsidiary hypothesis: the company intelligence of the staff of knowledge based pharmaceutical companies of Paradise Technology Park in appetite for change is more than average.

This hypothesis was verified by attaining the mean of 3.26 from testing the mean of a population, as it is observed it has the lowest mean among the components. The aim of this hypothesis also was encouraging progress in high levels that is summed up in appetite for change, interest in taking risk and curiosity and it is the feature of talented and potentially competent people to see to what extent it is available in the staff of knowledge based pharmaceutical companies of Paradise Technology Park. The outcomes of this study manifest that supporting the teams of developing and improving products and services, promoting business processes, encouraging the staff to make familiar and apply new technology and the proposition committees are for getting in line with the changes in the workplace in the staff of knowledge based pharmaceutical companies of Paradise Technology Park.

4. Fourth subsidiary hypothesis: company intelligence is more than average in the staff of knowledge based pharmaceutical companies of Paradise Technology Park in spirit.

This hypothesis was measured using the mean of a population and the results were verified with the mean of 3.37. In this hypothesis the aim was to give spirit to the staff of knowledge based pharmaceutical companies of Paradise Technology Park so that they function with more energy. They have tendency to use this component and their success depends on the success of the

organization. Besides, optional attempts of the members of organization in achieving goals of the company are the effect of the above-mentioned encouraging factors.

5. Fifth subsidiary hypothesis: company intelligence is more than average in the staff of knowledge based pharmaceutical companies of Paradise Technology Park in alignment and congruence dimension.

This hypothesis was measured using the mean of a population and the results suggest its verification. With regard to the obtained mean (3.75), it is observed that the state of bank was described favorably in the above cases, but it is still far from the ideal. This hypothesis was mentioned so that it can be the cause of alignment and congruence, the presence of systems and series of specified laws to implement commands for individuals and groups. The outcomes of study reveal that lack of codified laws for executing commands will make lots of problems and disagreement for the working group.

6. Sixth subsidiary hypothesis: company intelligence is more than average in the staff of knowledge based pharmaceutical companies of Paradise Technology Park in the dimension of applying knowledge.

This hypothesis was measured using the test of mean of a population and the results of test (3.28) suggest that the component of applying knowledge has the lowest degree after appetite for change. While acceptable grade was obtained in this regard, it is far from ideal and requires more attempts of authorities to realize management strategies of knowledge to have a successful organization. The aim of this hypothesis was to investigate the importance and enforceability of knowledge and specialty. No one will be able to do so unless he has what it takes in that field. Assets of knowledge, systems and information technology are useful in the development of company intelligence in the staff of knowledge based pharmaceutical companies of Paradise Technology Park, intelligence is a God-given feature that needs to be strengthened and this requires technical knowledge and applying new and evolved knowledge in the organization.

7. Seventh subsidiary hypothesis: company intelligence is more than average in the staff of knowledge based pharmaceutical companies of Paradise Technology Park in the dimension of performance pressure.

This hypothesis was measured using the mean of a population and the results (3.48) manifest its verification. In this hypothesis we wanted to know if clear understanding of roles and responsibilities by the staff, proper working relationship among the unites, abrupt measures of directors for solving problems, receiving feedback and feeling of being effective for the organization can be factors for developing and promoting company intelligence.

Therefore, recognition and promotion of company intelligence must be taken into consideration as a new subject whose reinforcement leads to the success of organization, and then we will succeed in making organization attain its vision and mission.

## **CONCLUSION AND PROPOSITIONS**

According to the findings of research, to develop organizational intelligence the managers of knowledge based pharmaceutical companies must continuously focus on the seven intelligent dimensions of organization. By the same token, the following eight steps are recommended to promote knowledge based companies into intelligent ones:

√ Findings of the study reveal that the main verified hypothesis of organizational intelligence with the mean of 3.49 is higher than the theoretical mean of 3. Paying attention to the component of organizational intelligence results in the promotion of company intelligence and finally it leads to the formation of an intelligent company. Thus, it is proposed that the managers of knowledge based pharmaceutical companies put all components of company intelligence, its measurement, periodic investigation and its reevaluation in their agenda.

√ Findings of the study reveal that the first verified subsidiary hypothesis with the component of strategic view with the mean of 3.64 is higher than the theoretical mean of 3. This finding manifests that emphasizing strategic vision can contribute to the enhancement of ability to provide and achieve goals and prepared strategies. In this regard, we propose that the managers of knowledge based pharmaceutical companies emphasize the development of this component among the staff. To perform this important task in the dimension of strategic vision: revision and rearrangement of structures compatible with the missions of company and the existence of a compiled plan are necessary for identification and promotion of managers.

√ Findings of the study reveal that the second verified hypothesis has the same fate with the mean of 3.67 which is higher than theoretical mean of 3. Thus, emphasizing this component in the knowledge based companies can cause sympathy among the staff, formation of contribution among them and finally success. Therefore, it is proposed that the managers of such companies take measures to provide a vision to achieve this goal.

√ Findings of the study reveal that the third verified subsidiary hypothesis of appetite for change with the mean of 3.26 is higher than theoretical mean of 3. The component of appetite for change has had the lowest amount compared to the other components of organizational intelligence. However, this component has a determining role in the survival and development of organizations. Thus, it is proposed that to develop the component of appetite for change in such companies we should consider developing capabilities such as having inclination to change, creating the situation for accepting change and new ideas at the part of managers, avoiding haste in expelling the managers that don't function well and giving permission to the managers to question current accepted methods. The main priority in this regard is to provide a proper atmosphere and employ leaders who are change-oriented.

√ Findings of the study reveal that the fourth verified subsidiary hypothesis with the mean of 3.37 is higher than theoretical mean of 3. Sprit is a component that is in the third place in terms of amount and its promotion is recommended. In the dimension of sprit we need enthusiastic planners who apply all their power to create a good quality for working life and create the opportunity for promotion of the staff for the young generation of the staff of knowledge based pharmaceutical companies of Paradise Technology Park.

√ Findings of the study reveal that the fifth verified subsidiary hypothesis with the mean of 3.75 is higher than theoretical mean of 3, this component has the highest amount compared to the other components of company intelligence among the staff and this advantage can be used to enhance ability of the staff. In terms of alignment and congruence it is proposed that the managers give enough responsibilities to deputies and there must be coordination among the goals of different deputies rather than conflict.

√ Findings of the study reveal that the sixth verified subsidiary hypothesis with the mean of 3.28 is higher than theoretical mean of 3. Applying knowledge is the lowest component after appetite

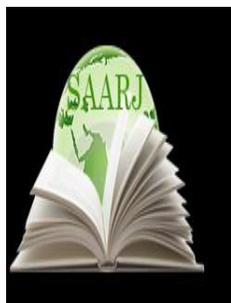

---

for change. It is proposed that the managers of knowledge based companies increase that with more emphasis and making the culture. In general, despite measures taken in the dimension of applying knowledge, it is still far from the desirable level. The process of identifying, classifying, knowledge distribution, power to learn from experiences and memory of the company are weak, so the proper methods of saving and recovery of data has a determining role in improvement of this component.

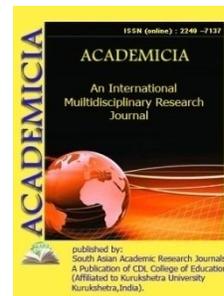

√ Findings of the study reveal that the seventh verified subsidiary hypothesis with the mean of 3.48 is higher than theoretical mean of 3. In the dimension of performance pressure despite the staff's proper understanding of the roles and responsibilities, lack of receiving feedback and on-time action of managers in solving problems are counted as important factors in the reduction of performance and to strengthen this dimension it is proposed that the pharmaceutical companies take the processes of decision-making, policy-making and taking measures for reaching goals serious.

**ABSTRACT**

*In the complex treatment of acute and chronic kidney diseases in children, diet therapy plays an important role. High requirements are imposed on therapeutic nutrition, since the kidney is the main organ for the excretion of metabolic products that come with food and are formed as a result of the breakdown of body tissues, as well as the organ responsible for maintaining the constancy of the internal environment. Under certain conditions, it becomes necessary to correct in the diet of nutrients such as animal protein, gluten, oxalates, urates, phosphates, the metabolic products of which are excreted through the kidneys and affect not only the pathogenetic mechanisms of the development of the disease, but also participate in the formation of non-immune processes of progression disease to the stage of renal failure.*

**KEYWORDS:** *Children, Dysmetabolic Nephropathy, Crystalluria, Oxalaturia.*

## INTRODUCTION

Epidemiological studies show that the prevalence of urinary tract pathology in environmentally polluted areas was 187: 1000 children, but at the same time, the rate of nephropathy in ecologically "clean" areas increased to 60: 1000. However, the first signs of nephropathy in children in environmentally disadvantaged areas have already been identified in the first year of life, and crystalluria predominates in their composition. [2,8,9,10].

The purpose of the study. To study the prevalence of oxalate nephropathy and to improve prevention and rehabilitation measures for preschool and school age children in environmentally unfavorable areas.

Research methods. The study used retrospective analysis data, anamnesis, clinical methods, biochemical examination methods, functional examination methods. Daily urinary excretion of oxalate was tested enzymatically in the biochemical analyzer "Mindray".

In order to carry out our tasks, we conducted our research in three stages:

- ✓ Step 1. Retrospective determination of the use and effectiveness of therapeutic and prophylactic measures in children treated in an inpatient setting with DMN, SYI and other kidney diseases; history of child development (f.112), medical history of somatic department (f.003).
- ✓ Phase 2. Given the latent clinical course of the disease in the early stages of DMN, almost no complaints in patients, and the appearance of salt crystals in the urine, a general clinical examination of 1,309 children aged 3 to 15 years who did not complain of kidney disease was performed.
- ✓ Step 3. In Khorezm region, a clinical examination of 211 children was conducted to correct and prevent ON treatment, taking into account the actual nutrition and drinking water. In DMN, children were divided into 4 groups to determine the use and efficacy of Uralesan in combination with diet.

Practical results of the research. In the first phase of our research, according to statistics from 2012 to 2019 in Khorezm region, there was an increase in diseases of the urinary system in children, SIT in children in 2012 was 23.7% in the region, and in 2019 it was 46.1%.

A retrospective review of the medical history of 2,976 sick children aged 3–15 years treated in the pediatric wards alone in 2011-2018 found that 220 children, or 74%, had oxalate salts in their urine.

According to a comparative analysis of the Khorezm region's VDSNM communal analysis conducted in 2016-2019, water scarcity has increased significantly over the past year. In 2016, the total number of trials was 19748, of which 1935 (9.7%) did not meet the trial requirement. In 2017, it was 2,170 (11.1%), and in 2019, the figure increased to 2,450 (13%). We determined the rate of occurrence of DMN in children and the statistical correlation between their habitats, which was confirmed by a high reliability index of oxalaturia - 62% ( $R < 0.001$ ).

In Phase 2 of our study, 960 out of 1309 children with no complaints of SIT were found to have salt crystals in their urine, i.e. DMN from the initial cases, nosological anterior stage elements, and 27% of children had no clinical signs.

The incidence of persistent crystalluria and micro hematuria was 27.7% in preschool children in the main group. In the primary group during the school period, more than half of the respondents were found to have insignificant proteinuria, as well as occasional pain in the morning eyelid drooping, back lumbar region, lower abdomen. Despite the early onset of metabolic disorders, the risk of STK formation (7%) ( $R < 0.05$ ) was observed in children older than 10 years. Enuresis was present in up to 4.5% of preschool children, but not at all in school-age children. Physical retardation was almost the same in school-age children (11.4%) and relatively similar in pre-school children (11.1%).

Glomerular (kalava) filtration rate KFT is the most accurate indicator, which allows to assess the functional status of the kidneys in the form of a single exact number. Our next study was to determine CFT levels in children with oxalate nephropathy, the most common (45.6%) in our main group, against the background of impaired phosphorus-calcium metabolism in renal function. The results of the study showed a significant increase in serum creatinine and urea ( $R < 0.001$ ) with a significant decrease in CFT levels ( $76.24 \pm 0.95$ ).

In Phase 3 of our research, we used Uralesan syrup as an antioxidant drug that improves metabolic processes in the body in the complex treatment of oxalate nephropathy. In our study, we selected 211 children from 960 children aged 3 to 15 years who were diagnosed with oxalate nephropathy. The children were divided into 4 groups:

- ✓ 1 - comparison group (control) - 40 children - treated with 2 courses of vitamins;
- ✓ 2 - A group of children receiving uralesan syrup - 41 children - Dosage prescribed a 1-month course of treatment according to age;
- ✓ 3 - a group of children who received a diet only for a year - 80 children, 4 - 50 children in a group of children who received a Uralesan + diet.

They undergo a course of treatment for 1 month in age-appropriate doses.

Renal CFT increased by 50% in our 4 groups of children recommended Uralesan + diet, and in children of the 1st, 2nd and 3rd groups this figure did not exceed 7-10%. This indicates a 2-fold increase in CFT from treatment in four groups of children compared to the previous case.

In children of control group 1 treated with vitamins, the amount of daily oxalates in the urine was almost no different from the pre-treatment and post-treatment conditions (first  $1475.7 \pm 63.8$   $\mu\text{mol} / \text{day}$ , then  $1340.1 \pm 61.9$   $\mu\text{mol} / \text{day}$ ,  $R < 0.05$ ). The amount of oxalate release did not decrease to the normative value. Conversely, after 6 months, these children again showed an increase in oxalate salts by 83%.

Group 2 In the group of children receiving only Uralesan syrup, the daily amount of oxalate in the urine was significantly different from the pre-treatment and post-treatment conditions (first  $1751.0 \pm 88.6$   $\mu\text{mol} / \text{day}$ , then  $964.9 \pm 52.8$   $\mu\text{mol} / \text{day}$ ,  $R < 0.05$ ). Oxalates in the urine of these children were reduced by almost 2 times. This is mainly due to the fact that the drug Uralesan has the property of increasing the excretion of urea and chlorides, helping to drive small stones and sand from the bladder and kidneys. However, on the 30th day of treatment, crystalluria with oxalate was observed in 12% of this group of children, and a similar condition was re-detected during the examination 3 months after the start of therapy. After taking

Uralesan, diuresis increased significantly (first  $796.3 \pm 83.6$  ml / day, then  $1126 \pm 60.5$  ml / day,  $R < 0.05$ ). In doing so, we were convinced that Uralesan enhanced diuresis.

3 - only in the groups rehabilitated by diet, the amount of oxalate in the urine was significantly reduced (first  $1765.6 \pm 87.2$   $\mu\text{mol}$  / day, then  $1077.5 \pm 55.1$   $\mu\text{mol}$  / day), but did not reach the norm (norm 3-15 years 100-200  $\mu\text{mol}$  / day in children). This means that in the case of oxalate nephropathy, diet alone is not enough to get rid of oxalate salts. Daily diuresis is also relatively rare in this group of children. Even after treatment, it did not change significantly, only increased to 140 ml. (first  $737.5 \pm 82.3$  ml / day, then  $873.1 \pm 91.1$  ml / day,  $R < 0.05$ ).

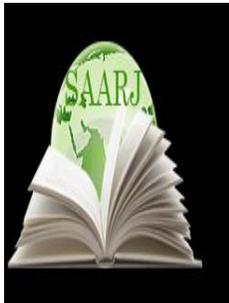

4 - The amount of oxalates in the urine of children recommended in combination with Uralesan + diet decreased by 3 times (first  $1757.0 \pm 88.9$   $\mu\text{mol}$  / day, then  $665.78 \pm 49.3$   $\mu\text{mol}$  / day). It should be noted here that the Uralesan + diet together with the elimination of the alimentary factor in the body at once, prevents the formation of oxalates, forming a protective colloid in the urine. Daily diuresis was also less isolated in this group of children before treatment. After co-administration of Uralesan + diet, diuresis increased and reached the daily norm (first  $828.6 \pm 84.2$  ml / day. Then  $1222.2 \pm 96.8$  ml / day,  $R < 0.001$ ). Here again, we are convinced that the drug Uralesan enhances diuresis.

Conclusions. Thus, the results of the study show that oxalate nephropathy in schoolchildren and preschool children in Khorezm region was highly effective in the rehabilitation period of group 4, and in children who used Uralesan + diet together. Co-administration of the drug with the diet helps to normalize metabolic processes, strengthen cytomembranes, has an anti-inflammatory effect on the renal parenchyma and improves capillary blood flow. This complex can be recommended for complex therapy in children with oxalate nephropathy. However, criteria for risk the group dysmetabolic nephropathy in children and an early diagnosis algorithm have been developed and recommended for practice.

### ABSTRACT

*This article provides information on how to teach elementary school students to think independently. The most important effective way to do this is to set motivational problem situations or to set specific cognitive tasks that reflect the social nature of the subject being studied. One of the main tasks of modern primary education is to provide students with in-depth knowledge of the basics of science, using methods that teach students to think independently, develop creative thinking.*

**KEYWORDS:** *Reading, Writing, Grammar Concepts, Independent Thinking, Independent Work*

### INTRODUCTION

Thanks to independence, a period of renewal and development has begun in the Uzbek land, and social life is rapidly entering the path of development in line with international standards. Huge reforms are being carried out in all sectors of the economy, including education. From the first days of independence in our country began to pay serious attention to the education of the younger generation. One of the leading tasks of the National Program of Personnel Training of the Republic of Uzbekistan is to scientifically and pedagogically introduce a new model of continuing education aimed at improving the quality of education, updating the content of education, ensuring the intellectual development of the younger generation. is a continuous improvement in the mines.

Prospective teachers should be able to organize the process of teaching the basics of special subjects in non-traditional forms, to design the educational process on the basis of a perfect standard, to use them wisely in these projects. Thorough, in-depth mastery of theoretical knowledge by learners can be a guarantee of the formation of practical skills and competencies. As noted in the Law of the Republic of Uzbekistan "On New Education" and the Concept of Primary Education, "Primary education is necessary for students to continue general secondary education. One of the main tasks of modern primary education is to provide students with in-depth knowledge of the basics of science, using methods that teach students to think independently, develop creative thinking. In order to fulfill this task, it is necessary to introduce new pedagogical technologies into the educational process. New pedagogical technologies play an important role in the development and maturity of the primary school student. It is well known that mother tongue education enables children to expand their thinking activities, to think freely, to understand the opinions of others, to express their opinions fluently orally and in writing, to communicate freely with members of society. serves to develop acquisition skills and competencies. Here, mother tongue education is seen not as a subject but as an educational process that organizes the entire education system.

The content of knowledge of the native language in primary school is based on the phonetic structure of the Uzbek language and methods of expressing sounds in written speech, word change and word connection in speech, morphemic structure of words and word formation, knowledge of the lexical-semantic group of words, the correct spelling of the Uzbek language and the use of punctuation.

Native language - skills and abilities in the field of speech, reading and writing are a necessary condition and means of student learning. As a child acquires reading skills, he or she must first learn his or her mother tongue. Because the mother tongue is the key to knowledge, intellect. Mother tongue is also a tool of other sciences, both the history of society and the natural sciences are studied using the mother tongue. This means that the mother tongue plays a special role in the overall development of the child, as well as in stimulating knowledge and hard work. Language is an important educational tool. A child who reads fiction, newspapers, magazines, develops the best qualities in himself. Acquires a culture of communication. As the mother tongue plays a key role in the primary school, it is necessary to cultivate in every student an interest and love for the mother tongue. The type and content of mother tongue lessons in primary school include:

1. To develop students' oral and written speech in connection with reading, writing, grammar, observation and social activities of students.
2. To teach literacy to first-graders, that is, to teach them elementary reading and writing, to turn these skills into skills.
3. To master the norms of literary language, ie spelling and punctuation, orthoepic correct pronunciation, speech and methodological elements.
4. The study of theoretical materials from grammar, phonetics, lexicon, the formation of scientific concepts of language.

The subject of methods of teaching the native language is a pedagogical subject, in-depth knowledge of this subject is a prerequisite for teacher training. A modern teacher has a

comprehensive knowledge of the work on the subject of mother tongue in primary school, mastering the theoretical foundations and principles of teaching mother tongue, knowledge of the basic methods of teaching and the ability to apply it in practice must have the skills.

One of the best ways to teach elementary school students to think independently is to work independently. Independent student work, which is widely used not only in the primary grades but also in education in general, has been a constant focus of researchers as a means of increasing educational effectiveness. Methodist scholars have always advocated the widespread use of independent work in the teaching process. Because the acquisition of knowledge and teaching students to think independently is formed, first of all, in the process of independent work, finding solutions to problems and issues.

Here are some suggestions on how to look or get an appointment for extracurricular activities.

"Train." Such independent work can be used in the 1st grade native language lesson on the topic of "Speech".

Each word of a sentence is written and mixed on separate pieces of paper in the form of train cars. The students' task is to pick up the wagons in such a way that the result is correct.

For example: First, the Princess went to class.

Correct Answer: The princess went to first grade.

Divide into joints. During this independent work, students copy a piece of text from Guncha magazine or various picture booklets into syllables. This will strengthen students' knowledge of the rules of articulation or articulation. At the same time, the ability to translate capital letters into written letters and copy them from a book is developing.

Write a comment. Commentary exercises can be used to reinforce past topics or reinforce new knowledge through textbook or extracurricular activities. To do this, one of the students writes (aloud) the given word or sentence independently. The rest of the students listen and write the words of the "beginner" student.

As in all subjects, independent work plays an important role in teaching students to think independently in primary school mother tongue classes. They are characterized by the following features:

- The conditions required for independent work require students to be inquisitive;
- direct students to make independent judgments, conclusions and generalizations;
- The need for students to acquire new knowledge in the process of independent work.

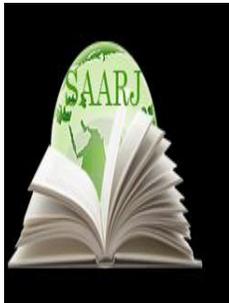

The main goal of mother tongue education is that mother tongue lessons should focus on the formation and development of children's creativity, independent thinking, the ability to express the product of creative thought in oral and written forms in accordance with the conditions of speech.

The process of primary education is to develop the child's ability to think logically, mental development, worldview, communicative literacy and self-awareness, to feel the beauty of material existence, to be physically healthy, to go The ability to enjoy elegance and sophistication, to absorb and respect national customs, teaches to follow them. Relying solely on

interest in education does not ensure that motivation can be reasonably effective. The most important effective way to do this is to set motivational problem situations or to set specific cognitive tasks that reflect the social nature of the subject being studied. When preparing a lesson plan, the teacher should clarify the purpose and organize the learning activities of students on the basis of this goal in such a way that the set goal is fully achieved. It is important to develop motives in the teaching process in the primary school. The teacher's greater focus on interactive methods in organizing students' learning activities ensures the effectiveness of the students' learning process.

### ABSTRACT

*This article analyzes the image and teachings of Prophet Ibrahim, which are equally accepted by Jews, Christians and Muslims, on the example of "The Story of Rabguzi", "History of the Prophet and the Ruler".*

**KEYWORDS:** Religious Source, Ibrahim, The Only God, Namrud, Fire, Palahman, Swallow, Istigno, Khalil, Image, Tazod.

### INTRODUCTION

In every society, they are factors that affect the creativity and worldview of the people around it. One such factor is religion and religious literature, religious sources. One of the people whose name is often mentioned in the Qur'an is Ibrahim. His names are mentioned sixty-nine times in the Bible. The story of Ibrahim is one of the most frequently narrated in the Qur'an. There are verses about Ibrahim in Surat "Baqara", "Mariyam", "Ankabut", "Nahl", "Niso", "An'om", "Zariyat" and others. Also, the fact that there is a special surah "Ibrahim" in the Qur'an shows how important the name of this prophet is. Of course, it is not for nothing that Abraham is given so much attention in the Qur'an. Jews, Christians, and Muslims also link their religions to the teachings of Abraham. Moses and Jesus Isaac, the son of Abraham, peace be upon him. and Muhammad s.a.v. his eldest son Ishmael a.s. through are the descendants of Abraham.

It was natural that the image of Prophet Ibrahim, who was so important and respected in Islam and his book, had a strong influence on Uzbek literature as well. We see this image of the prophet in the Qisasi Rabguzi, which is considered to be the first story in the history of the prophets in the Turkic language. The Story of Abraham is one of the largest volumes. The story

can be divided into two parts. , to be thrown into the fire, not to burn in the fire, and finally to kill Namrud.

In the second part, Abraham, who is called the "father of the prophets", marries Sara, migrates, marries Hagar, the birth of the prophet Ishmael, the relationship between Abraham and Ishmael, the birth of Isaac, the sacrificial event, the construction of the Ka'bah and the death of the - prophet such events are recorded.

One of the most touching points in the first part of the story is the conversation between the child and Abraham's mother.

- I came from nothing.
- Who is my god? he said one day in a conversation with his mother.
- I am, "said his mother.
- Who is your God? he said.
- Your father, 'said his mother.
- How? he asked.
- That's why he's taller than me, 'said his mother.
- Who is the God of my father? he said.
- Namrud, 'said his mother.
- How so ?he said.
- That's why he's older than your father, 'said his mother.
- Who is the God of Namrud? he said.
- Don't speak, don't say that! Said her mother. (Nosiruddin Rabguziy. Qisasi Rabguziy. Wwww.ziyouz.com)

This question-answer itself is a sign of the child's unique thinking and great future. This conversation is not given in the Qur'an. So we can say that Rabguzi took it from auxiliary sources - the stories of the prophets in Arabic and Persian, written in his own way

In the age of Alisher Navoi's "History of the Prophet and the Ruler", this conversation is described in a slightly expanded way:

Ibrahim a.s. The part was reached, and his mother used to discuss many strange things, and one day I asked my mother, "Who is my Lord?" I said: -Father. Who said: Who is its Lord? I said: Namrud. He said: Is the form of Namrud better or that of my father? He said, "Your father." He said, "Is my father more beautiful than you?" He said: maning. I said: is your beauty better or mine? I said, "Yours." Ibohim a.s. I said that the Creator cannot create something better than Himself. (Alisher Navoi. History of prophets and rulers. MAT. Tashkent, Science. 2000, p. 16)

Ibrahim's mother is amazed by the logical answer at the end of the conversation. Indeed, the child was guided by a knowledge unknown to them — the knowledge of God. However, during this period, the people of Babylon worshiped celestial bodies and planets. Abraham's call to

believe in the One God provoked the wrath of the fanatical ruler Namrud, and the king condemned the prophet to blasphemy and set him on fire.

This is exactly what is stated in Surat al-An'am in the Qur'an: According to Kafir's constant habits, they resorted to violence after being defeated in a mental and logical argument.

They said: Build for him a furnace, then cast him into the fire. (Surat al-An'am, 97)

The criminal polytheists said to one another, "Make a place for Ibrahim to light a large fire to punish him, and set him on fire, and throw him into the fire." We said, "O fire, be cool and safe for Abraham." (Surat al-Anbiya ': 69)

The event described in these one or two verses is perfectly described in the Qissa as a whole story:

"All the army was mobilized and gathered firewood for four months. He did not pick up the firewood on which they loaded it. They loaded it on a camel, did not move. Neither the donkey nor the horse received it." When Ibrahim saw this, he cursed the mule. Therefore, the mule's offspring will not multiply. they slept without sleep, sold at the market during the day, and bought firewood for the money.

Ibrahim's father's cousin Hazar (Lot's father) was the one who started the fire. The swallow would bring water in its beak and pour it into the fire.

"O swallow, let the water in your beak affect this fire," said Abraham, and blessed him. And the sparrow came and struck the grass with its wings, so he cursed it, and burned it in the fire for forty days and nights. The fire was so high that one could not approach from the four wooden floors. If a bird flew in the air, its wings would burn. Namrud built a tower of iron and copper, and when he climbed over it and looked at the fire, he said:

- "How do we fire Ibrahim?" he thought. Then Satan came and taught him how to make a tent. Until then, there was no such weapon in the world. (Nosiruddin Rabguzi. Qisasi Rabguzi. [Www.ziyouz.com](http://www.ziyouz.com))

We see that the beautiful artistic details and images in the story served to depict the event in a clear and impressive way in the mind of the reader. The Prophet said that the size and appearance of the fire to be lit, how it was formed, who carried the firewood to it, by what means, the condition of the fire and the fact that Abraham a.s. s shooting, etc. are clearly and vividly reflected in the mind of the reader. The steadfastness of the faith and determination in the heart of the prophet against the scene in the story creates a peculiar logical contradiction.

"And the hands and the feet of Ibrahim were bound to him with an iron ring of seventy cubits.

- O Ibrahim, are you not afraid? They asked.

- Whoever has the fire of Allah in his heart, how can he fear the fire of people?

- They said, "Ask God to save you."

- What will save me? he said.

- "Your soul," they said.

- The work of the nafs is writing, sin. Sin is doomed to fire, "he said.

- "Otherwise, ask for your life," they said.
- "Soul's a deposit." His job is to return to the Creator, "he said.
- "Then ask for your heart," they said.
- The soul is the property of God. He's the one who makes it what he wants it to be, "he said.

In the course of events, the strength of the faith in the heart of the prophet becomes even clearer:

At that moment, Gabriel arrived.

- "Ibrahim, do you need anything?" said he.
- "I need you, but not you," said Ibrahim.
- "If you don't need me, go to Allah and tell me," he said.
- "O Gabriel, he knows what I want, that is enough for me, there is no need to ask," said Ibrahim and sympathized with Allah.

At that moment he said:

- O fire, Ibrahim be his cold and healthy! he shouted. This command was a reflection of the prophet's faith, which ultimately saved him from the fire. Below, Rabguzi interprets a verse from the Qur'an: The scholars say that if he had not said, "Be cold," and "Be healthy," he would have killed Ibrahim with the cold of fire. Until the Day of Judgment, people would never see food cooked on fire. It is also said that the fire of the love of Allah in Ibrahim's chest competed with the fire of Namrud and began to burn the fire of Namrud. Then the fire of love would not have cooled down, and Ibrahim would not have been saved, for that fire would not have saved either Namrud himself or L himself, it would have burned them all.

This is the case, that is, Ibrahim a.s. The divine love in his heart and the fire of Namrud became a unique image in Uzbek classical literature and became one of the main details of the poet's aesthetic ideal, especially in the works of Navoi and Mashrab. In one of Navoi's first hymns in Hazayn ul-Maoniy, a reference is made to the story of Prophet Ibrahim and his burning:

Jamoling partavidin sham o'ti gap gulsitonernas,

Nedinparvona o'tichra o'zin solur Xaliloso.

(Alisher Navoi. Gharoyib us - sig'ar. MAT. 3 - vol. Tashkent: Fan, 1988. p. 21)

In the verse, the images of the propeller and Khalil (the title of Prophet Ibrahim) are contrasted with the images of the spark of beauty and the image of the gulfistan, bringing the art of tazad to the surface.

In the above story, we see Abraham being thrown into the fire with a machete. Navoi draws attention to this situation and writes in a joke in "Garoyib us-sigar":

Ohim ko'ngulni ko'yung arosolsa ne ajab,

GulzoraroXaliltushar manjaniqdin.

(Alisher Navoi. Gharoyib us - sig'ar. MAT. Vol. 3 - Tashkent: Fan, 1988. p. 301)

In the verse, Navoi puts his lover's heart in the fire of Namrud, which has become a gulistan with the cabbage of Allah, and his aunt Ibrahim a.s. He created a beautiful word game by comparing his imagination to a shot manja and his imagination to Ibrahim Khalilillah, referring to the arts of tanosub and tasbeeh.

In the epic "Hayrat ul-abror" Navoi presented divine mercy to Khoja (soul) as if it were the fire of Namrud, which turned into a flower garden.

Haq angarahmatnidalilaylabon,

Shu'lanigulzoriXalilaylabon.

(Alisher Navoi. Hayrat ul abror. MAT. Volume 7. Tashkent: Science, 1993. Page 103)

In the epic "Lison ut-tayr" in the parable dedicated to the valley of Istigno, Navoi narrates the story of the shooting of the Prophet Ibrahim and makes a unique contribution to it:

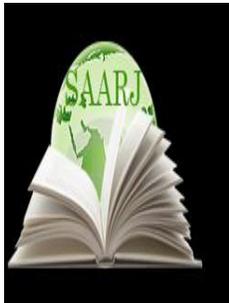

Qildi chunNamrudsozimanjaniq,

HaqXalilnio'tqaaylarg'ahariq.  
 Tog'-tog' o'tung'a o'tlarurdilar,  
 Shu'lasinaflokkayetkurdilar.  
 Otqocho'tsoriXalilullohni,  
 Ishqko'yidadalilullohni.  
 Hukmbo'ldikim, yetishtiJabroil,  
 O'tqayetkonchog'dadedi: - "Eyxalil!  
 Oytqilkimehtiyojingnegadur?  
 Lutfuehsondinmijozingnegadur?  
 Nekisendersenmuhayyoayloli,  
 Ulchakomingoshkoroayloli?"  
 Dediulkim: - "O't manga ro'ziqilur,  
 Ehtiyojim ne ekonniulbilur.  
 Yo'qsangaxudehtiyojimbunafas,  
 Toki zohiraylagaymenmultamas".  
 Barchaholimdao'zungmuhtojqil,  
 Eldinistig'nonasibimaylagil.

The parable contains the Prophet's answer to the question of the angel Gabriel, "Do you need me?" In general, the story of Abraham, especially his burning by the fanatical ruler Namrud, and the various interpretations of this story are very interesting. has a special place in Uzbek literature.

**CURRENT OPPORTUNITIES OF THE TEACHER FOR IMPLEMENTING  
 INTELLECTUAL ABILITIES OF PRIMARY SCHOOL STUDENTS**

**Shaniyazova Dilafruz Sabirovna\***

\*Senior Teacher,  
 Department of Pedagogics, Psychology,  
 UZBEKISTAN

**ABSTRACT**

*This article discusses the importance of qualified teachers in educating today's most knowledgeable students. Moreover, there are some information about opportunities of the teacher for implementing intellectual abilities of primary school students. When the topic goes about educating and upbringing the younger generation as it is wanted, it must be emphasized that such a difficult and multifaceted task can be fulfilled with high skilled pedagogue teachers.*

**KEYWORDS:** *Noble Teachers, Social Position, Generation, Educational Process, Professional Skill.*

**INTRODUCTION**

Today it is worth speaking with pride about how much the profession of the teacher plays difficult, responsible, honorable and prestigious role in the society. Because, in our country main attention is paid to supporting teacher's noble profession in every way, encouraging them, increasing their social position. Annual republican contests "The best teacher of the year" that has been organized by the Ministry of Public Education for many years are also playing significant role in popularizing the best experience of teachers in the education system, creating opportunities in for teachers to exchange their opinions and ideas, implementing the most innovational methods and technologies of education.

Two important indicators of the reforms carried out in the continuing education system quality and efficiency concern especially with the potential and professional skill. In addition, their demands are increasing day by day. When the topic goes about educating and upbringing the younger generation as it is wanted, it must be emphasized that such a difficult and multifaceted task can be fulfilled with high skilled pedagogue teachers. So, teaching is a great art. Moreover, this or that pedagogue cannot master this art easily. Therefore, those who are interested in the profession of teacher, i.e. having a high enthusiasm and ability to become an educator for smart

generation and those who realize the demands of the age quickly and deeply and develop their social-economical, pedagogical skill, real patriot and industrious ones can achieve it.

In the online meeting of June 21 in 2018 our President Sh. M. Mirziyayev emphasized “I will not respect the one who does not respect a teacher” while giving necessary orders concerning to increase respect to the teacher. Of course, such kind of attention to a teacher contributes to the progress of country.

From the past they have considered the school a holy place and called it a palace of knowledge and contemplation, a threshold of good deed and the first foundation of the future. Indeed, the thorough knowledge gained in the school today provides our peaceful and happy life tomorrow. Especially, for a child who makes a first step to school it seems a magic world and teachers seem to be kind and knowledgeable people. He begins to have sweet dreams. He sits gazing at his teacher with admire and dreams “I will certainly do well, have a perfect handwriting and then my teacher will love me best”. However, after some time, i.e. when classes begin we can notice that those children who were sitting with shining eyes have no the same interest in learning. Disability of doing well in subjects makes some of them passive, shy and inactive.

Therefore, teacher’s professional skill is of great importance in primary classes. Any primary class teacher thoroughly studying the age and psychological characteristics of primary class students should continuously work at the development of effectiveness of teaching-education process.

In this teacher’s skill makes a great importance.

Skill is the ability of the creativity of the teacher and we can say that it has four degrees.

- I.** The degree of creating interaction with the students of the class: If only the learners can come into communication freely with the teacher interaction takes place and in the process of reciprocal feedback the teacher comprehends his shortcomings and implies correction in the education process. In this, the teacher mainly works basing on ready-made recommendations and creativity is not seen in it.
- II.** The degree of optimizing: It is an interaction that planned beforehand, and the teacher determines and implements familiar methods, ways, content of the education, forms of it skillfully.
- III.** The heuristic degree: In this the teacher in the state of communication with learners establishes creative opportunities for them, applies new methods and devices, uses the ways of finding solutions to unexpected pedagogical problems.
- IV.** Personal-independent degree: In this the teacher is entirely independent, and uses together with ready-made methods and techniques innovations of his own. The teacher uses them considering pupils’ personal characters, knowledge and their level of development.

The work created by the teacher is the one belonging only to him. Also the main purpose is to realize all the potentials of the learner, to achieve his mastering knowledge well.

Coming to the conclusion of “ignorant” about the student does not give a good result because intellectual abilities in man sometimes do not emerge immediately. His teachers found the

famous Russian writer N.V.Gogol fully ignorant and they advised his parents to send him to a shoemaker as an apprentice.

Alternatively, the outstanding scientist, the founder of Moscow school of Mathematics and created new direction in it academic N.N.Luzindid not do well in mathematics at school and learned it with the help of his tutor. The tutor thought that Luzin is quite incapable for mathematics. Later he became a scientist in this sphere.

In schools also pupils who were weak in subjects in primary classes sometimes turn into excellent ones in upper classes. It testifies that intellectual abilities of some people emerge a little later.

That is why a primary class teacher should work at his knowledge regularly, master pedagogical skills realizing his own self and be his own critic, look for effective ways of getting rid of his shortcomings. As primary school teachers teach a number of subjects they must know interdisciplinary relations well and use the method of teaching them in an integrative way and this gives good results in the education process.

Teachers should regularly study in order to develop his students' motive for learning. It gives a good result to use didactic games effectively in classes and to work basing on the above-mentioned third and fourth degrees of pedagogical abilities. Didactic games eliminate qualities such as shyness, fear of making mistakes in students. An interesting didactic game increases pupils 'active participation and develops their creative and critical thinking.

In the education process to direct students to self-study influences on the development of their intellectual ability well. For instance, in reading classes after a subject has been studied students attention should be drawn to working at that theme, i.e. giving such kinds of tasks as "Read the text and find out the meanings of unfamiliar words, Find out the subject and the content of the text. Divide the text into parts according to the meaning of it and put a title to the text. Make up a plan to retell the text. Compare your plan with the text. Look: does your plan reflect all the important points? Are the points in the plan linked to the content? Does the plan represent the main meaning of the title and the text?, Make sure whether the points in the plan are repeated Check whether the plan can be used to retell the text" help explore abilities of students well. In such kind of tasks, a student works individually and applies his intellectual opportunities. Intellectual opportunities rise in him. When intellectual opportunities begin to work, previous passiveness and shyness completely disappear.

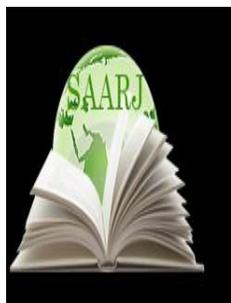

After the President of the Republic of Uzbekistan adapted PR-3931 "About the measures of the implementation of the new management principles in the Public Education system" in 2018, on September 5, according to this resolution the Law ID-1852 "About the status of teacher" was adapted. It will be right to say that defining the honor and dignity of teachers in the Law is a guideline for the teachers of our country to work hard to increase their professional skill and their knowledge to meet the demands of the age and to educate perfect and knowledgeable youth who can build our future.

## CONCLUSION

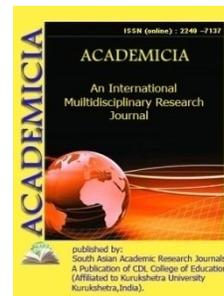

In conclusion we can say if the future of the country lies with intellectually powerful, knowledgeable, initiative and capable youth teachers who are responsible for educating such kind of people taking advantage of numerous opportunities, should develop their pedagogical skills.

## IMPROVEMENT OF TRAINING SESSIONS IN SOLID PHYSICS

**Ergash Kilichovich Kalandarov\***

\*Doctoral Student,  
 Uzbek Research Institute of Pedagogical Sciences,  
 UZBEKISTAN

---

### ABSTRACT

*This article discusses how to improve the teaching of solid state physics in accordance with today's requirements and with the help of inter-course communication. As well as it informs about improvement of training sessions in solid Physics*

**KEYWORDS:** *Solid State, Physics, Methodology, Education, Training, Membership, Modular System*

---

### INTRODUCTION

The world is experiencing a significant increase in the share of scientific research aimed at the development of methodological foundations of teaching science and natural sciences and interactive e-learning resources based on information and communication technologies, the technologicalization of the educational process. In turn, along with all disciplines, the interdisciplinary study of physics requires the scientific development and implementation of tools and methods, ensuring the continuity and continuity of physics education, based on which to increase the effectiveness of teaching. Therefore, in this regard, special attention is paid to the integral study of the physical sciences taught in educational institutions.

Today, to determine the scientific and pedagogical principles of achieving the effectiveness of teaching in physics through interdisciplinary links, to scientifically substantiate the importance of appropriate methodological forms and methods to improve the quality and effectiveness of teaching, to develop students' independent thinking skills through interdisciplinary communication. The development and implementation of recommendations is an urgent task.

This process places new and higher demands on the content of physics teaching methods and is an important link in ensuring the continuity and continuity of physics lessons, preparing students for didactic activities:

- The formation of knowledge, skills and abilities of students in the study of physics in accordance with modern requirements;
- -Introduction of components of the national model into the content of the subject of physics teaching methods;
- -improvement of the process of formation of teaching methods and skills of physics teachers, creation of pedagogical conditions for the provision of teaching materials;
- -update and improve forms of education;
- to take into account the features of new discoveries and technologies related to solids in the country in the formation of knowledge, skills and abilities of students;
- Improving the curriculum and programs of the course "Physics of Solids" in physics and its main part on the basis of today's requirements;
- -Organization of training sessions with the use of modern pedagogical and information technologies, interactive methods based on them;
- -Development of criteria for selecting the content of students' educational activities;
- Methodological changes in the content of professional training in accordance with changes in the content and objectives of vocational guidance of students in the educational process;
- Direct system of knowledge, skills and qualifications in the direction of students and careers: scientific and methodological analysis of such areas as practical laboratory classes, pedagogical games, test questions, assessment of knowledge in the rating system, updating methods of its implementation, etc.

Skills of formation of physical-professional direction of the pupil or student are general pedagogical skills, such as definition of clear purposes of lessons of physics, choice of forms, methods and means of teaching, creation of pedagogical problems, explanation of educational materials.

According to the analysis of international experience, methodological training should focus on modular solutions, finding the right ways of didactic methods, but in any case, the methodology should not be focused on the demonstration of didactic schemes.

Each subject has its own didactic and professional characteristics and requires a special teaching methodology. Teaching methods determine the direction of the activities of teachers and students in the educational process, how the teaching process is organized and conducted, as well as the actions of the teacher. These methods include a set of methods used by the teacher to help students master their knowledge, skills, and competencies.

Translating learning objectives into assignments is an important step in designing a lesson on pedagogical technology.

Assignments can be structured in oral question and answer, written, and test forms. Creating assignments in different forms for the same purpose is also effective. Because it creates an opportunity to assess the student's knowledge of the mastery of a particular task. An oral question-and-answer session is a direct interaction between a teacher and a student, in which the

answers to the questions are evaluated. For example, "Why"? "Compare", "Divide into components", "What are the most important features?" Questions and assignments that encourage students to think independently or, after reading an unfamiliar topic, encourage them to think, "What is the title of this topic?", "Find five key words in the topic that fully express its content," "What question would you ask?" It is also advisable to ask questions such as.

Written assignments involve the use of a variant of key words and phrases. When creating tasks in this form, it is necessary to pay attention to the number of tasks to be solved, using interactive methods. Because the use of interactive methods such as cluster, sinkway, Venn diagram, incept, conceptual table, case study, T-scheme, technical dictation writing develops students' thinking skills, ensures quality mastering of educational material.

The general content of the course materials in the course of solid-state physics can be expressed by the following elements. Scientific and methodological bases of distinguishing the content of solid state physics education from academic lyceums and general secondary schools, methods and technologies of theoretical teaching, practical teaching methods and technology is like a methodology for designing the learning process.

The modular system meets the requirements set in many respects in the development of the content of the course of physics methodology. The system of modules related to the course of teaching methods includes the following and is divided into modules, which are independent of the course, approximately the same in size, for which the following elements are developed:

- ✚ Primary requirements: knowledge, skills, forms and methods of their examination, which must be acquired by students in order to successfully master the module material;
- ✚ The basic units of the module: the concept of laws, etc.;
- ✚ Auxiliary module, didactic primary: identification of descriptive concepts, etc.;
- ✚ Organization of teaching the module material: the forms of teaching used in the module and their main content, the nature and content of independent work are given;
- ✚ Practical assignments offered to students to work independently in the laboratory. These include assignments for the analysis of educational documents, the development of a fragment and a complete methodology of the lesson, laboratory practical training, the requirements for students' knowledge and skills at the end of the module study, and criteria for their assessment; control assignments-tests, oral questions, written work questions, etc.;
- ✚ Types of student activities; participation in lectures and study of its material, practical and accurate test assignment are evaluated by points;
- ✚ Modules within each course should be connected with courses included in psychological-pedagogical, social-humanitarian blocks.

The mastering of each module is carried out in an active learning process, the results of which are measured by the knowledge and skills of students. The reports do not describe the general structure of science and its components in the physics program. To do this, it is necessary to create the structure and components of the subject and convey it to students in lectures. In doing so, they will have a holistic view of science (its structure) and prepare themselves for high-level training in educational institutions.

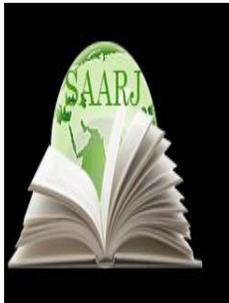

The application of the content of physics in the educational process can be achieved if the following scheme is implemented. That is curriculum-concept - educational standards - program - textbook - methodical instruction - educational content is expressed in educational and methodical literature.

### CONCLUSION

In conclusion, it should be noted that on the basis of new requirements for the content of solid state physics, the formation of professional knowledge, skills and abilities in general secondary schools and higher education students. Improvement of solid state physics in accordance with modern requirements, harmonization of teaching methods and techniques are plays a significant role in meeting the needs of our independent republic for qualified personnel, creating confidence in the profession and specialization of pupils and students.

## PREVALENCE OF ABDOMINAL OBESITY AMONG THE POPULATION AS A MAIN CRITERION FOR METABOLIC SYNDROME

**Badritdinova M.N\*; Orzikulova Sh.A\*\***

<sup>1,2</sup>Bukhara State Medical Institute,  
 Bukhara, UZBEKISTAN

### ABSTRACT

*The article presents the results of studying the prevalence of abdominal obesity, overweight and obesity as the main the criterion for metabolic syndrome among the disorganized population and the state of detection by doctors of medical institutions. From with age, there is an increase in the incidence of abdominal obesity, overweight and obesity. In medical and prophylactic institutions state of detection of abdominal obesity, overweight and obesity is insufficient.*

**KEYWORDS:** *Metabolic Syndrome, Abdominal Obesity, Overweight, Obesity.*

### INTRODUCTION

Obesity has become one of the most important medical social problems in the world due to its high prevalence and significant costs to overcome its consequences. The prevalence of overweight and obesity in the Russian Federations make up 59.2% and 24.1%, respectively [7]. According to the report UN, in 2013 the Russian Federation ranked 19th among all countries the world in the prevalence of obesity, lagging behind the top Mexico and the United States by 8%. According to the multicenter (11 regions of the Russian Federation) observational study ESSE-RF (Epidemiology of cardiovascular vascular diseases and their risk factors in the regions of the Russian Federation) with the participation of 25,224 people aged 25-64 years the prevalence of obesity in the population was 29.7% [1]. For the last three decades prevalence of overweight and obesity in the world increased by almost 30-50% among adults and children, respectively. Obesity is not only seen as a major risk factor today cardiovascular diseases and type 2 diabetes mellitus (according to World Health Organization, overweight and obesity predetermine the development of up to 44-57% of all cases of type 2 diabetes mellitus, 17-23% of cases of ischemic heart disease, 17% - arterial hypertension, 30% - gallstone disease, 14% - osteoarthritis, 11% -malignant neoplasm's [2,8], but also reproductive disorders function and increased risk of developing cancer [5,6]. In general, obesity according to expert estimates leads

to an increase in the risk cardiovascular mortality by 4 times and mortality as a result on oncological diseases 2 times [3,4].

**Purpose:** To study the prevalence and detestability of abdominal obesity among the unorganized population in primary care health care.

## MATERIALS AND RESEARCH METHODS

The surveyed population is represented by a representative sample of unorganized female and male population of the city of Bukhara. For initial screening from voter lists on a random basis was formed a 10% representative sample of women and men 15-69 years old in number of 797 people.

Metabolic syndrome was diagnosed in the presence of abdominal obesity (waist circumference > 94 cm for men and > 80 cm for women) if body mass index exceeds 30 kg / m<sup>2</sup>. overweight, according to the recommendations of the International Group-obesity (1997) is fixed at the Quetelet index, calculated by the formula: weight (kg) / height (m)<sup>2</sup> ≥ 25, and IR levels ≥ 30 are accepted for obesity. However, in population studies for BMI it is recommended to take IR values > 29 (Rose G.A., Blackburn H., 1968).

Therefore, in this work, indicators of IC ≥ 30, since this level of CI differs little from the BMI criteria, recommended for population studies, and at the same time meets obesity criteria recommended by the International Obesity Group.

## RESULTS AND DISCUSSION

Currently, in assessing obesity, great importance is attached to abdominal obesity (AO). This is due to the fact that in many studies have shown that abdominal obesity is more important risk factor for the development of insulin resistance and cardiovascular vascular diseases.

According to the data obtained, the prevalence of AO among the population

turned out to be quite high (table 1.). General prevalence abdominal obesity among women was 42.57%, and among men 24.9% (the revealed differences are statistically significant, P < 0.01).

**TABLE № 1 PREVALENCE OF ABDOMINAL OBESITY IN THE POPULATION (%)**

Age Group	Women (n=555)		Men(n=242)	
	Thereis JSC	No JSC	Thereis JSC	No JSC
20-29years old	17,74	82,26	14,45	85,55
30-39 yearsold	46,49	53,51	35,54	64,46
40-49 yearsold	46,55	53,45	29,31	70,69
50-59 yearsold	62,50	37,5	54,65	45,35
60-69 yearsold	78,13	21,87	48,64	51,36
Total	42,57	57,43	24,9	75,1

Note: the table shows the reliability of the differences relative to the previous age group.

It is alarming that 17.74% of young women have AO. It should be noted that in the fourth decade there has been a large increase infrequency AO. At the age of 30-39 years, the frequency of AO (46.49%) is 2.62 times higher than in aged 20-29 (17.74%). The differences found were highreliable (p < 0.01). Then, up to 50 years, the frequency of AO practically does not change, but in the age groups 50-59 years old and 60-69 years old, the frequency of AO is again

significantly increases (62.5% and 78.13%, respectively). Such a high percentage of JSC indicates that the female population has adverse epidemiological situation in relation to AO. Considering that, that AO is one of the triggering mechanisms of the MS, it should be recognized that in the female population has a very high risk of CVD and associated mortality.

Among men, abdominal obesity occurs -14.45%, 35.54%, 29.31%, 54.65% and 48.64% respectively. The frequency of AO in men aged 30- 39 years old compared to 20-29 years old 2.46 times, and 50-59 years old than the age 40-49 years old increased by 1.86 times.

Given the high importance of abdominal obesity in the development of cardiovascular and other diseases of particular interest was the question of the detectability of abdominal obesity among the surveyed population (tab. 2).

**TABLE 2 DETECTION OF ABDOMINAL OBESITY BY DOCTORS**

Sex	Having abdominal obesity	Have abdominal obesity		No abdominal obesity	
		n	%	n	%
Men	Revealed in health care facilities	8	13,33	4	2,21
	Not detected in health care facilities	52	86,67	177	97,79
Total among men		60	100,0	181	100,0
Women	Revealed in health care facilities	55	23,4	6	1,89
	Not detected in health care facilities	180	76,6	311	98,11
Total among women		235	100,0	317	100,0

Note: the table shows the reliability of the differences between the indicators men and women.

As it turned out, in 86.67% of men who, with screening examination revealed abdominal obesity, the doctors of the diagnosed this pathology. At the same time, among women, the percentage is not of the identified cases of abdominal obesity was slightly lower -76.7%. Attention should be paid to the following fact – patients with normal waist circumference reported being obese (1.89% in women and 2.21% in men).

The presented data allow us to conclude that among inorganic of the population of Bukhara, the state of diagnosis of abdominal obesity unsatisfactory.

As recommended by the International Obesity Group (1997) BMI and obesity are identified based on the Quetelet index, which reflects the height and weight indicators. The data obtained (Table 3) indicate quite high prevalence of BMI and obesity, as among women (20.65% and 18.48%) and among men (37.34% and 12.03%, respectively).

It should be noted that BMI was significantly more frequent ( $p < 0.01$ ) among men, and obesity was significantly more frequent ( $p < 0.05$ ) among women. Further, the analysis of the detection rate of BMI and obesity was carried out (Table 3).

**TABLE 3 STATUS OF BMI AND OBESITY DETECTION IN HEALTH CARE FACILITIES**

Sex	Availability BMI and obesity	BMI		obesity	
		n	%	N	%
Men	Revealed in health care facilities	10	11,11	18	62,07
	Not detected in health care facilities	80	88,89	11	37,93
Total among men		90	100,0	29	100,0
Women	Revealed in health care facilities	36	31,58 *	62	60,78
	Not detected in health care facilities	78	68,42 *	40	39,22
Total among women			100,0	102	100,0

Note: the table shows the reliability of the differences between the indicators men and women.

Analysis of the state of detection of BMI and obesity showed that in treatment in preventive institutions, BMI is detected only in 31.58% of women and in 11.11% of men, these differences were statistically significant ( $p < 0.05$ ).

The situation with the detection of obesity in health care facilities is somewhat better. In health care facilities obesity was found in 60.78% of women and 62.07% of men. Requires special attention that 62.42% of obesity in women and 88.89% of obesity in men were not diagnosed in the medical facility.

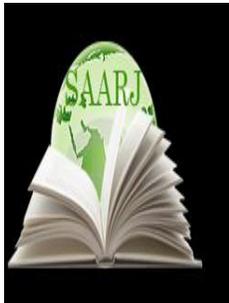

## CONCLUSIONS

1. Abdominal obesity as the main criterion for metabolic syndrome after 30 years, it occurs in almost half of the population of Bukhara.
2. Abdominal obesity among women is 1.17 times more than men.

## **THE SPECIFICS OF THE SPEECH DEVELOPMENT OF UZBEK- GERMAN AND RUSSIAN-GERMAN BILINGUAL CHILDREN**

**Askarova Shakhnoza Ismailovna\***

\*Basic Doctoral Student,  
 Fergana State University,  
 UZBEKISTAN

Email id: askarovasch@gmail.com

### **ABSTRACT**

*This article discusses the development of speech of children - monolinguals and children - bilinguals when acquiring a second language associated with semantic and syntactic processes. A good example is the presence of articles in German, as opposed to the Russian and Uzbek languages. German-speaking children should devote more time to adjust and properly apply a complex system of articles. The process of acquiring speech of a bilingual child at the sound, semantic, and syntactic levels does not differ significantly from the level of a monolingual child. Bilingual children set themselves an additional task, to differentiate two language systems.*

**KEYWORDS:** *Bilingualism, Monolingual Children, Bilingual Children, Syntactic Structure, Semantic Units, Sound System, Children's Speech.*

### **INTRODUCTION**

Bilingualism is a thematic area associated with numerous studies of various sciences. There is now a steady increase in publications in this sector [1, 166-187]. The reasons for the interest of linguistics in this problem seem to lie in the multidimensional nature of this phenomenon within the sciences, on the other hand in the relevance of this topic to social events around the world caused by the globalization of economics and politics. As mobility increases, people are becoming more multicultural.

Within the framework of the sciences, bilingualism has been intensively studied since the beginning of the 20th century. Until the 1980s, research interest was mainly focused on children's bilingualism in bilingual families, with the topic mostly covered by researchers who studied their own bilingually growing children [2. 44]. Most of these studies were primarily

related to linguistic statements of the question [3, 17]. At the same time, the linguistic development of bilingual children was described in detail, from which various theories about the acquisition of a second language by children were made and formed. Recent studies go beyond linguistic considerations and deal extensively with other components of the acquisition of two languages. So it was proved that the formation of bilingualism is also influenced by psychological, sociological and pedagogical factors.

The great scientific interest in bilingualism in the research of the above-mentioned disciplines can be attributed to the fact that it is closely connected and contacts various academic fields of knowledge.

The concept of "bilingualism" has recently been in great demand by representatives of various sciences. Numerous studies have examined comparisons of language acquisition between monolingual and bilingual children, and it was found that there are mainly similarities in the process of appropriate development of both groups of children. According to B. McLaughlin, differentiation is an additional task for a bilingual child to separate both languages [4]. In subsequent studies, he explains the model of the second language acquisition process. When studying this problem, there are disputes about the path from one language system to the second language system, and a project is presented about the three stages proposed by T. Teschner in terms of lexical and syntactic development. At the same time, special attention is paid to compare the development of speech between bilingual and monolingual children in order to identify existing differences, as well as to develop and find their common features [5]. A bilingual child has a unique view of the world, as it reflects the combination of several cultures. This uniqueness is manifested primarily at the linguistic level, and the language reflects its bi-culture.

The purpose of this article is to study the language processes when acquiring a second language by Uzbek-German and Uzbek-Russian bilingual children. The relevance of this work lies in the fact that over the past decades, the interest of linguists in the study of problems related to the issues of linguistic variability, bilingualism and the analysis of linguistic situations in different countries has increased. The practical value of the work is that its results can be used as a basis for further linguistic research in the field of peculiarities of word formation in bilingual children, analysis of the style of children's statements (oral and written), in the methods of teaching foreign languages, as well as in theoretical and practical courses in linguistics, lexicology, lexicography, stylistics, intercultural communication, in the practice of teaching German and Russian as foreign languages in educational institutions of the Republic of Uzbekistan.

According to B. McLaughlin, the acquisition of language includes semantic and syntactic processes. [4, 91]. It is necessary to consider the processes of acquiring a language sound system. The sequence of development of the sound system of a bilingual child is comparable to the sequence of development of the sound system of a monolingual child. Both groups begin to produce more easily pronounced sounds such as [p], [b], [d], [m] and [n], but more complex fricatives [f], [s], [z], consonant clusters [fr], [st] or diphthongs are correctly articulated only during the development of speech [7,50]. Both mono- and bilingual children should be able to recognize and separate from each other the voiced and silent features of prosodic circuits. Likewise, they must experience the characteristics of the vowels, length and stress of syllables and master their correct formation. However, this acquisition process is more difficult for

bilingual children, as it operates in two phonological forms. They usually use linguistic power to combine into a single language system, which occurs in a later process dividing into two sound structures [4, 86]. A clear separation of the two sound models takes time and seems difficult for bilingual children. V. Leopold, for example, determined that confusion of sounds is found at an early age of a child, especially if the level of complexity of the corresponding phonemes of both languages is different. Due to such circumstances, it is necessary to study less complex sounds firstly. If both languages develop in a balanced manner, this critical phase is quickly overcome. On the other hand, if the superiority of one language over another prevails, then the sound units of the dominant language appear in the more weakly represented language [4.87].

### **Semantics Acquisition Process**

From the point of view of semantic development, one of the significant achievements of the child is the combination of sounds with adequate concepts. At the age of 2 to 6 years, word names are usually used both in monolingual children and in bilingual children relative to various objects. Generalized expressions decrease as vocabulary base expands. For example, V. Leopold's daughter Hildegard used the "sh" sound for all moving objects, such as a "car" or "plane". Later, she learned words "machine" and "chu-chu," this is instead of "sh". The newly learned words "train" and "plane" at a later time replaced the extended designation "chu-chu". For bilingual children, the distribution of the same words indicates different subjects in both languages, which is often problematic. For example, the designation "Blatt - Sheet" in German and Russian is used for concepts such as "leaf of a tree - das Blatt des Baumes" and "sheet of paper - das Blatt Papier". In the Uzbek language, on the contrary, the designation "sheet - (barg)" means "leaf of a tree - darakhtbargi", but not "sheet of paper". At the same time, the Uzbek-German and Uzbek-Russian bilingual child sets himself the task of identifying and recognizing the correct object concepts for the corresponding semantic units of the two languages [10].

### **Syntax Acquisition Processes**

The processes of acquiring syntactic structures also go through a similar stage in bilingual and monolingual children. In the development of syntax in languages with varying complexity, the rules of individual constructs become more complex and are studied only at later stages [4, 90]. B. Kilhefer and S. Jonkeith, on the basis of their research, indicate that the speech development of two German-French children is described by the fact that bilingualism does not have a particular effect on syntactic acquisition [12, 49]. As with the acquisition of the first language, both children aged 1; 6 to 1; 9 years old form mainly single-word sentences in both languages. In children's utterances, verbs and nouns pronounced first, followed by participles, adjectives and adverbs. Two - and multi-word sentences with subject, addition, adjectives and articles are used at the age of 2,5 and 3 years. This brief comparison should serve only as a general example, because the width of the variations of each language depends on its level of complexity, the field of linguistics is so large that there is no established scheme for the development of all languages. A good example is the presence of articles in German, as opposed to the Russian and Uzbek languages. German-speaking children should devote more time to adjust and properly apply a complex system of articles. On the other hand, Russian-speaking and Uzbek-speaking bilingual children, cannot relatively quickly use article correctly when learning German in an educational institution.

## Two independent language systems

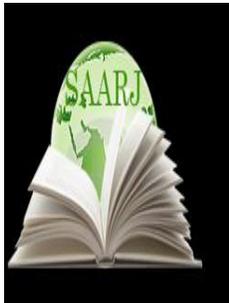

In the research of bilingualism, there are opposing points of view, whether a bilingual child, already at the beginning of acquiring a language, can process two systems separately, whether he can distribute in the initial period of speech development the elements of two languages of a single, unified language system and a kind of mixed elements of two languages. Some researchers argue that a bilingual child from the very early stages of development of the process of acquiring a language is able to distinguish between both languages and use them differentially, and only very insignificant mixed statements are found in children's speech. The sound systems of both languages are also clearly separated, therefore, scientists support the opinion that bilingual children have two independent language systems from the very beginning [13, 182].

## CONCLUSION

The main conclusion of this work can be defined as follows: the definition of the concept of bilingualism and the analysis of bilingual situations contribute not only to understand the existing language situations in the world, but also to predict their further existence and development. The process of acquiring speech of a bilingual child at the sound, semantic, and syntactic levels does not differ significantly from the level of a monolingual child. Bilingual children set themselves an additional task, to differentiate two language systems. With regard to this problem, there is debate as to whether the child is bilingual at the beginning of speech, whether he can distinguish two language systems from each other or has only one linguistic system from two languages. It should be emphasized that the varying widths of language systems in language acquisition depend on the ability of the child and the level of language complexity in terms of duration and degree of development. These chronological age data correspond only to individual cases in the literature and not to standard values. Nevertheless, as the analysis of linguistic literature shows, these questions are not fully studied in modern linguistics.

**ABSTRACT**

*In this article said about Berdakh's "Shejire" and the importance in the history of the origin of Karakalpak nation.*

**KEYWORDS:** *Karakalpak Nation, Chronicle, Tribe, Historical, Karakalpaks. Berdakhgargabayuli Was The First Historian In Karakalpak Nation. He Wrote The History Of His Nation With His Literary Words And Talent. It Was Big Courage To Write The History Of Karakalpak Nation In Karakalpak Literature.*

Berdakh began his work with the below lines:

Ra'siyulilapiraqminip ,  
 Qabiqaw'seyn barg' aneken,  
 Qudabilenraziy tiship,  
 Haqdiydarinko'rgeneken.[1]

“The meaning of the word “Shejire” is year in which people talk about the history of people , tribe, seed, even human race. That’s why we can call “Shejire ” , is a part of history , even as a basis. Because the facts are mentioned in it. With regard to the history of humanity , “Shejire” can be divided into several different species. For instance, “KhanlarShejiresi” , “Khalikhlarshejiresi” and etc”.[]

People who know many historical realities are known as “Chronicle human” (Shejireadam) . Every nation has its own history. According to Orientalists, the first part of human history is “Shejire”. There are a lot of scholars and poets who wrote about the history of their people in the East countries.

It is worth mentioning the poetry of the Karakalpak classical poet, Berdakh, who lived in the XIX century, who wrote “Shejire” about the origins of the Karakalpak people, the history of the Karakalpak tribe. The difference of this first recorded written in the history of Karakalpakstan.

Secondly, his carrier was not only in Karakalpak nation, but also Berdakh, who was a poet and thinker, had been recognized by other people. Therefore, although this work cannot be regarded as a real historical work, it is one of the earliest prophecies about the Karakalpaks’ history. The reason of Berdakh’s “Shejire” is not considered to be the original of history is that it is actually a literary work. In this literary work some fantasies and illustrations are given to describe the theme. Berdakh used more myths while writing this work. There are also few historical facts. So we can say that he knew about many historical informations and facts. That is why he writes his work, based on what he knows and read. Berdakh’s “Shejire” work is not merely the story of the Karakalpak people, but also a document that is very characteristic for the history of all Turkic peoples. Berdakh, along with his other fellow Turkish poets, began his “Shejire” with prophets’ time and finished with Karakalpaks’ life in XIX century. In which time, Berdakh was living, it was customary for the educated man of any kind to write his own people’s chronicle. Berdakh also made this custom. Because he was a prominent poet of his own nation, but also a philosopher and historian of his time. He was a man who lived on the edge of Karakalpakstan, despite his talent. That is why he may not know all details of historical events. Considering this side, there are some contradictions in Berdakh’s “Shejire”. But such contradictions exist in other national chronicler of that time. That’s why we can not blame Berdakh. Because it is a great work to write a written book of his own people. Thus, he wrote the first yearbook of the Karakalpak people.

According to the last lines below, we can conclude that he wrote this work in 1894:

Berdimurathaqnin’ quli  
 Sahradao’skenbu’lbili  
 BulShejireni jilqijili

Xaliqqamashurqilg'aneken.[2]

Like other Turkish chronicles, Berdakh's chronicle begins with the prophets' time. The main story in it begins with the prophets and their hadiths. In other chronicles the four hadiths of the Prophets are given as Abubakr, Sidikh, Umar and Usman. But in Berdakh's "Shejire", Sidikh replaces wit Ali. For example:

GulyuzleriShamsuwqamar

Abubakr, ha'zireti Omar

Ospan, Ali, to'rtsha'riyar

Payg'ambardin' yaranieken.[3]

According to S.P.Tosltoy, kipshakhs called the eastern pechenegs, according to their hats, as "черныйклубокы".

Berdakh also began his grandfather's history in the X-XI centuries from the time of Arab rule in Khorezm.[4] For instance,:

Anes, Maliekkikishi

Payg'ambardin' sahabasi,

Anesqazaqtin' babasi,

Shundan "alash" bolg'aneken.

Maliktin' uliRazihaq

Yashilig'indaqoydig'ulpaq

Kiygenekenqaraqalpaq

Shundan"qalpaq"bolg'aneken.[5]

Berdakh came to the conclusion that the Karakalpak people came from the royal priesthood of Malik Khan. This situation corresponds to the historical reality. The next episode of the poem begins with Mayqibiy. He was truly given as the father of Turkish nation in all branches. He had two sons, named Jayilgan and Seyilkhan. It is estimated that Turkmens were born from Seyilkhan and Kungrats from Jayilgan. It is said that Khitay and Kipshak were born from his second wife, Sarnaz and from the next wife, Mangit and TekeYawmit:

A'welbabamizMayqibiy,

Anin' ug'liJayilg'anbiy,

Jayilg'anuliNag'aday,

Nag'adaybiybolg'aneken.

Or:

Mu'yten, Qon'irat, Qitay, Qipshaq

Keneges, Man'g'itjipikdek,

Ba'rialtiuriwqaraqalpaq.

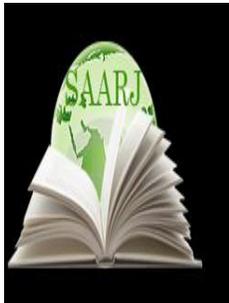

In Berdakh's "Shejire", it is possible to feel that the Kungrat and Mangits plays important role in the origin of Karakalpak. Berdakh divided karakalpaks into two large groups (this large group is called "Aris" in the karakalpak language) and came to the conclusion that Karakalpaks are from six tribes. They are: Muyten, Kungrat, Kipshak, Mangit and Keneges. So he mentioned about the origin of every tribe in Karakalpak nation.[6]

In conclusion, despite of some mistakes, this poem is valuable for every karakalpak nation because it is the first historical document in the history of Karakalpak nation and the best historical poem in Karakalpak literature.

**ABSTRACT**

*This article describes the formation and development of university education in the first years of independence, the reconstruction and improvement of the higher education system, the profound structural changes in higher education from the first years of independence to the present, the ongoing reforms to increase innovation capacity. It also analyzes the initial changes in the financing of higher education institutions, improving the quality of education, the funds allocated from the budget of Uzbekistan for education, the development of non-state educational institutions.*

**KEYWORDS:** *University, Education, State Youth Policy, Reforms, Competition In Science, Fundamental Sciences, State Budget, Methods Of Financing, Financing Of The Education System, Test-Rating Systems, Marketing And Monitoring Services, Non-Governmental Educational Institutions.*

**INTRODUCTION**

The new global order that began in the late twentieth century, that is, the acceleration of globalization, which covers all spheres of society - economy, politics, ideology, culture and even personal life - has set Uzbekistan a number of difficult tasks, such as choosing the path of development, radical socio-economic reforms. put. At the same time, the development of the education system in accordance with modern requirements, especially the modernization of higher education, has become one of the priorities for our country.

One of the main reasons for the priority given to education was, on the one hand, the socio-demographic processes that have been formed without taking into account for many years, and

on the other hand, the unilateral economic development of Uzbekistan in the former Soviet Union.

Shortcomings in economic development have led to a shortage of modern personnel in the country who can work with high technology. Complex socio-demographic processes, combined with one-sided economic development, contradicted the pre-independence and its early years, leaving the education sector in dire straits. Especially in the early years of the transition period, these challenges had a negative impact on the psyche of young people, the problem of employment of young people entering the life with the first steps became acute, it did not even bypass higher education.

In the early years of independence, Uzbekistan was plagued by acute socio-economic problems. In addition to large-scale social measures to support the population, the real situation is difficult to educate young people in a new society, to form a new generation that embodies the spiritual wealth of our people, the best achievements of world civilization and, most importantly, immunity to various destructive ideas. was considered an important task. In this regard, the development and implementation of youth policy aimed at creating conditions for social security of young people in the country after the independence of Uzbekistan has been of particular importance.

In particular, on November 20, 1991, the Supreme Council of the Republic of Uzbekistan adopted the Law "On the Foundations of State Youth Policy in the Republic of Uzbekistan." It defines the goals of the state youth policy, "Youth policy is a priority of the state activity of the Republic of Uzbekistan, its goal is socio-economic, legal, organizational aspects for the social formation and development of youth, the full realization of their social potential in the public interest. It is about creating the conditions and guaranteeing them." The document also provides for organizational measures for the implementation of state youth policy.

In 1992-93 alone, 14 Presidential decrees were adopted to ensure the social security of young people and to develop their talents. They included activities ranging from improving the financial situation of young people and students to providing them with spiritual encouragement. For example, a whole set of additional social benefits aimed at supporting young people (free meals, housing, etc.) was in effect during the first difficult period of the transition period. In addition, the Presidential Decree "On measures to encourage student youth in Uzbekistan" dated February 5, 1993 established Presidential Scholarships for excellent students and graduate students.

The reconstruction and improvement of the higher education system has become an important part of the reforms in the educational process and has been carried out step by step. In particular, the profound structural changes that have taken place in higher education since the early years of independence (closely related to the reforms in the education system, of course) have gone through two major stages: the first stage in 1991-97 and the second stage in 1997. Reforms in higher education in the country are primarily aimed at expanding and improving university education.

"Why is so much attention paid to the development of university education?" the question may arise. The purpose of organizing higher, university education in the provinces, according to experts, depended on a number of factors.

First, the main goal was to turn the regions into a scientific and educational center, to ensure that scientific and educational work penetrates deeper into the lives of the people. Through this, the consciousness and worldview of the population of the country will be expanded, as well as people directly involved in the labor process will now have the opportunity to be constantly and timely informed of scientific innovations. There will be an opportunity to introduce new scientific and technical developments, inventions into production faster at the place of creation.

Second, Uzbekistan is a country with historically and geographically diverse conditions and climates. Moreover, although the peoples of different regions have a common history, they differ in terms of their psyche, way of life, attitude to reality, and perception of it. This is also the case in one region. In such a country, it was impossible not to take into account the specifics of each region. In particular, ancient Khorezm was famous for its famous mathematicians, astronomers, historians and statesmen, and the Fergana Valley was famous for its world-renowned poets and writers.

Third, the introduction of university education in the provinces will greatly contribute to the convergence of life and science, theory and practice. Consequently, in the current era of developing market economy, a competitive environment in the field of science has become a vital necessity. Competition in science stimulates new thoughts and ideas, expands one's worldview. The more famous a university is for its inventions, scientific conclusions and developments, the more prestigious it will be.

Fourth, the future development of the regions is directly related to the higher education centers in these regions. In order to further develop production in the regions, there is an opportunity to acquire new industries, create new specialties, train the necessary personnel in these areas. It is known that during the former Soviet Union, the issue of sending personnel trained at the center to the provinces was a problem. In turn, in today's conditions of monetary and commodity relations, as well as in times of economic difficulties of the transition period, studying in the capital from abroad is also costly. With the establishment of universities in the provinces, the solution to these problems has almost been found.

Fifth, there will be an opportunity to cooperate with the most advanced, famous universities in the world through the universities in the provinces. This, in turn, will allow to bring the world experience to life on the ground, to turn science and technology into a new one, and on this basis to accelerate the development of the country. In particular, the introduction of university education in the regions of the country was based on the experience of developed countries. In particular, Harvard, Stanford, Princeton in the United States, Oxford, Leeds in the United Kingdom, Strasbourg, Lyon, Dijon, Grenoble in the United Kingdom are located in different regions of the country, not in the capitals of these countries. and world-renowned for its scientific potential.

It is known that in the national training program, it is recognized that universities have a priority position in the field of education among higher education institutions. At this point, it is necessary to focus on the status of universities. When the name "University" is used in relation to the University, it is primarily understood as an educational institution with faculties specializing in various fields of science and knowledge. At the same time, there are universities (e.g., technical, agricultural, medical universities) that specialize in a specific area of knowledge, and

they are educational institutions that allow for in-depth study of scientific knowledge and acquisition of fundamental knowledge.

So how are universities different from institutions? This difference can be seen in the following:

First, fundamental sciences play a central role in the activities of universities. In other words, universities are universities that have a wide range of opportunities for the development of fundamental sciences within the university, and there are scientific schools that conduct in-depth research. Universities are strong by strengthening the scientific base of teachers and students, and today it is the universities who are responsible for strengthening the link between science and education. For example, only 2.8% of U.S. universities are prestigious universities, and 80% of federal funding goes to research.

Second, another important aspect of universities is their ability to impart a wide range and systematic knowledge. This means that the status of the university imposes a great responsibility on every university that has it, because conditions must be created for the graduates of this university to be given the knowledge they deserve to be called quality "university education".

Third, a true university is not only a center of learning, but also a factor in the dissemination of political, economic, spiritual and cultural knowledge of the life of a country, region or province. It should be noted that the goal of state and community development has always been a priority for universities. Universities are distinguished not only by the fact that they reflect this or that event and process, but also by the ability to predict the main directions of development of society and the state.

Fourth, the democracy of universities in education is capable of fostering free thinking, free spirit and movement in the younger generation. Only in a real university environment can a person who is free and at the same time responsible for the fate of the people and the state be brought up. In particular, the universities themselves are characterized by a certain degree of independence, academic freedoms.

Fifth, in the process of globalization today, universities are increasingly moving beyond national boundaries, becoming national and regional centers for the interaction and enrichment of different civilizations, the interaction of different cultures.

It should be noted that on the eve of independence, the first reforms in the education system of the Government of the Republic of Uzbekistan under the leadership of the First President Islam Karimov were carried out in higher education, and changes in this area were aimed at improving university education. In particular, before 1991 there were three universities in the country (Tashkent State University, SamSU and Nukus State University), on the basis of special decisions of the government in 1991 on the basis of Tashkent State Institute of National Economy - Tashkent State University of Economics, Fergana State Pedagogical Institute - Fergana State University, Tashkent Agriculture Tashkent State Agrarian University and Tashkent State Technical University were established on the basis of the Tashkent Polytechnic Institute. As a result, by the beginning of 1992, the number of universities in Uzbekistan was seven.

The Decree of the First President of Uzbekistan dated February 28, 1992 "On the establishment of new higher education institutions in the Republic" was another important step in this direction. According to the decree, "in order to further improve the system of higher education, improve

---

the training of highly qualified specialists and researchers, as well as to provide all regions of the country with them more fully and equally" seven regions (Andijan, Bukhara, Kashkadarya, Namangan, Syrdarya, Surkhandarya, Khorezm) Pedagogical institutes in accordance with the decree, new institutes and branches of higher educational institutions of the republic were established in the regions. These include the Nukus branch of TSU, the Urgench branch of TSU and the Bukhara, Karshi, Navoi and Fergana branches of TSU.

In addition, on May 12, 1992, Presidential decrees were issued to establish the Uzbek State University of World Languages on the basis of the Tashkent State Institute of Foreign Languages and the Republican Pedagogical Institute of Russian Language and Literature, and on September 23, 1992 to establish the University of World Economy and Diplomacy.

Thus, the first stage of the reform of the higher education system was mainly aimed at eliminating the shortcomings and deficiencies in the training system and the location of educational institutions, which were formed during the former Soviet era. Therefore, it is natural that from the first years of independence, the government of Uzbekistan has taken the path of development of science in the regions, especially university education.

The next stage in the improvement of university education in Uzbekistan coincided with the first stage of radical reforms in the field of education since 1997. In particular, the Tashkent State Pedagogical Institute named after Nizami was transformed into a university on the basis of the tasks set out in the special resolution of the Cabinet of Ministers of February 24, 1998 "On the organization and management of academic lyceums and professional colleges." On April 7, 1999, during the years of the totalitarian regime, an unimaginably important event took place: the decree of the President of Uzbekistan "On the establishment of the Tashkent Islamic University." The decree provides for the preservation of the rich spiritual and cultural heritage of Islam, the sacred faith of our people, in-depth and comprehensive study and analysis of the ideas and scientific research of great scientists born and raised in our country, development in the modern spirit, scientific and theoretical research. The main purpose of the Islamic University was to increase the religious literacy of the people by providing the training of qualified specialists at the level of modern requirements, creating the necessary conditions for this, disseminating knowledge based on the study of rich and unique sources inherited from our ancestors.

As a result of profound structural reforms in the higher education system in the 1990s, the network of universities, including a number of universities, expanded in the republic, from 46 and 3 in 1990 to 64 and 18 in 2000, respectively.

Of course, it is impossible to train qualified specialists only by opening new universities and expanding the network of specialties trained in them. This required the selection and application of new directions in the organization of higher education based on the experience of advanced countries and universities around the world.

In the first phase of the reforms, there were also initial changes in the financing of higher education institutions. Not only budget but also extra-budgetary sources of funding emerged. The analysis shows that until 1994, expenditures on education were allocated by the state. But as a result of the transition to a market economy, new conditions have emerged. It is also to find additional sources of funding for the education system, to transfer a certain part of the costs to organizations and institutions, students and their sponsors, as well as to increase the share of expenditures of the local budget to achieve these goals. In 1994, a new source of funding

---

emerged, namely, tuition fees at higher and secondary special education institutions were paid by organizations, institutions and citizens.

Since then, the higher education institutions of the republic have the right to admit students from among the applicants who took the test on a fee-for-service basis, provided that they or their sponsors pay 20% of tuition fees. targeted acceptance was introduced on the condition of payment. Thus, the multi-level financing system in Uzbekistan has also been initially tested.

In general, many innovations were tested in the first phase of reforms in the Republic's universities. As a result of such structural changes, the ground was laid for the development of university education and a network of universities was formed. New sources of extra-budgetary funding were sought. In the field of higher education, including universities, a test method of admission and teaching has been introduced, exchange of experience and sending students abroad at the expense of established national organizations and international communities, specialists in economics and business and purposeful work on teacher retraining was carried out. However, the analysis of the situation at this stage showed that there are shortcomings in the training system of higher education institutions. These include: the incompatibility of graduates of higher education institutions with the democratic and market changes taking place in the country, the lack of integration in the system of education, science and industry, the lack of material and technical and information base Inadequate provision of modern educational and methodical and scientific literature, incomplete provision of didactic materials, etc. In addition, there was no strong link between education, training, reform and change in society. The one-level education system did not allow to fully take into account the needs of market labor, changes in production, advanced foreign experience. Educational institutions did not have the necessary independence, could not adapt to the changing conditions of the professional labor market, the system of attestation and accreditation of educational institutions did not provide fairness and speed in assessing the level of knowledge of students.

In the second phase of the reforms, one of the important measures aimed at improving university education was to find a solution to the problem of training mature professionals who could work in a market economy.

At the same time, the process of training specialists and employing them required not only the creation of new management mechanisms, but also the achievement of the main goal through forecasting. This was not an easy task. To do this, first of all, it was necessary to create a new system for predicting the need for specialists who have no analogues in the country, based on the development of the necessary balance in the management of economic state, the training of specialists with higher education in key sectors of the economy. To this end, on January 28, 1998, the Cabinet of Ministers of the Republic of Uzbekistan adopted Resolution No. 48 "On measures to accelerate the formation of marketing in the field of educational services and training." The resolution provides for the creation of marketing services in each educational institution. Students and graduates of marketing on the one hand ensure the mutual interest and balance between the host company, organization, institution on the other hand, determine to what extent the requirements and needs of the customer are met by higher education institutions, what opportunities it has for future prosperity. This means that educational institutions need to intensify their work on the selection of students, the development of special training programs

for them, as well as the study of market demand for specialists, services, production management.

One of the important changes made in the higher education system in the second phase was the modernization of funding methods. To this end, on September 3, 1999, the Cabinet of Ministers of the Republic of Uzbekistan adopted Resolution No. 414 "On improving the procedure for financing organizations in the budget." In general, as a result of the adoption of a number of laws and regulations aimed at improving the education system in 1997, the republican budget, regional budgets, funds of organizations, institutions and enterprises, private funds of citizens of the Republic of Uzbekistan, foreign legal entities and individuals will participate in financing educational institutions. See Appendix 2).

On the basis of the above decisions and a number of normative documents of the Ministry of Higher and Secondary Special Education, changes and additions were made to the existing charters of higher education institutions, including universities. These additions have expanded the capacity of universities in terms of funding. In particular, the Charter of Termez State University states that "Termez State University operates at the expense of the state budget and on the basis of contracts, orders of legal entities and individuals and funds received on the basis of entrepreneurship."

According to the charter of Samarkand State University, SamSU "can carry out paid activities in education and other areas that do not harm the main activity ... the university has the right to participate in the charter funds of economic organizations, pay tuition, consulting and other services, use the proceeds in accordance with law." "Has been shown. The wide range of funding opportunities provided to the University is also reflected in the charters of other universities.

However, the above-mentioned cases do not occur in the articles and paragraphs of the charters of the Republican University adopted in the early 90's. For example, the Charter of NamSU (in Russian) does not include in its articles and clauses activities related to earning additional income, while the university has the status of a legal entity and the right to participate in property and non-property relations.

In addition, the transition to a fee-for-service form of higher education has played a significant role in the financing of universities. The order of spending and the amount of annual expenses for each student is approved annually by the Cabinet of Ministers of the Republic of Uzbekistan. Revenues from the payment-contract type of the education system (ie extra-budgetary funds) are used by higher education institutions to provide students and strengthen the material and technical base.

In general, extra-budgetary funds in the system of the Ministry of Higher and Secondary Special Education have been steadily increasing, reaching 3,153.1 million soums in 1999 alone. soums, of which 2696.7 mln. UZS 456.4 mln. soums of various extra-budgetary revenues. In 2000, these figures were 4,688.5 million and 4,045 million, respectively. and 645 million. soums.

One of the main goals of the ongoing reforms in the education system is to improve the quality of education. One practical way to achieve this is to improve financial incentives. Despite the fact that the bulk of public funds allocated to education is teachers' salaries, in practice, these allocations and the salaries of teachers organized on its basis have shown that they do not meet

the existing needs. At the same time, the current tariff rates confirmed that teachers have limited opportunities to differentiate their salaries according to the quality of their work.

Thus, given that the bulk of the funds allocated from the budget of Uzbekistan to the education sector goes to cover the salaries of teachers, it can be said that there is a need to expand funding sources in this area. One of the factors driving the improvement of financial incentives is the emergence of competition among educational institutions. This will require the establishment of non-governmental educational institutions in the field, along with state-owned educational institutions. However, in 1991-2001, the environment of mutual competition in the education system of the republic was not fully formed. However, in the first years of independence, the Cabinet of Ministers of October 6, 1992 "On the order of establishment and licensing of non-state educational institutions" aimed at implementing the Law "On Education" and allowing the establishment of non-governmental educational institutions. was adopted.

The first phase of the implementation of the National Program of Personnel Training, adopted in 1997 (1997-2001), also provided for the creation of competition in the field of educational services through the development of non-state educational institutions. Also, Article 4 of the Law of the Republic of Uzbekistan "On Education" of August 29, 1997 provides for the right of citizens to education through the "development of state and non-state educational institutions" and Article 9 of this Law states that the education system of the Republic of Uzbekistan consists of state and non-state educational institutions ". However, at the beginning of the XXI century, practical measures in this direction were observed only in the preschool education system, and by the beginning of the XXI century, 28 non-governmental primary schools were registered in the country, of which only seven (2 in Tashkent, 4 in Andijan and 1 in Khorezm). noted. During this period, no such cases were observed in secondary, secondary special and higher education. This, in turn, indicates the inefficient use of available financial resources. However, it was the first among the former Soviet republics to introduce a test-based entrance exam to universities.

In world practice, it is recognized that even in countries with large financial strength, it is impossible to adequately develop the education system only at the expense of the state budget. This indicates that the development of the non-governmental sector in education is a necessary measure not only to improve the quality of education, but also as one of the main means of financing it. In particular, 70% of higher education institutions in Japan are not state-owned, but the most exemplary and prestigious of them are public schools. Importantly, tuition fees at public universities are higher than at private universities.

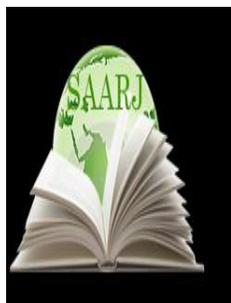

Nevertheless, as a result of the rapid implementation of reforms in the field of education during the years of independence, the foundation for the development of university education in Uzbekistan has been laid, and its network has expanded. In doing so, it relied on the experience of well-known universities located in developed countries of the world, taking into account local conditions and national identity. The process of formation of university education in the country was carried out in several stages in parallel with the changes in the education system and the necessary experience was gained.

During the reforms, universities began to train competitive specialists with in-depth knowledge of fundamental sciences, creative abilities, independent thinking. In this process, new principles of development in line with the status and prestige of universities in a market economy were considered. In particular, in order to improve the quality of training, the introduction of test-

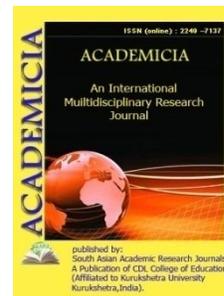

rating systems, marketing and monitoring services, attention to individual approach to education, the transition to a multi-option financing system of higher education has allowed universities to develop independently.

## ANALYSIS OF THE PROCESS OF PREPARING OILSEEDS FOR OIL PRODUCTION

**N. Z. Sharipov\***

\*Bukhara Institute of Engineering and Technology,  
 UZBEKISTAN

### ABSTRACT

*In the process of preparing non-traditional seeds grown locally for oil, soybean seeds were obtained as an object in the raw material classification equipment. Methods of cleaning soybean seeds from mineral and organic wastes are described. Methods and advantages of classifying local soybean seeds by size are given. The choice of methods of biting oilseeds and the methods and advantages of separating the husk from the husk are described in detail.*

**KEYWORD:** Sieve, Press, Grading, Luzga, Sunflower, Shade, Bite, Sort, Bark, Shell, Core.

### INTRODUCTION

In order to increase the competitiveness of the fat industry and modernize the industry, an inventory of existing equipment and technologies at enterprises, modernization of old production facilities and construction of new modern enterprises will be carried out in 2019-2022. developed a program of increased investment projects. Currently, systematic work is underway to ensure the implementation of these projects. According to the established measures and approved programs, a total of 143 investment projects will be implemented in the sector in 2019-2022, which will result in 265.5 mln. It is planned to use the funds in the amount of \$ 1 billion. Of these projects, 70 are the construction of modern enterprises for the production of vegetable oil, 9 are the modernization and reconstruction of existing enterprises, 27 are the production of granulated feed products, 2 are the production of process equipment and spare parts, 35 are other production projects. The project focuses on the production and localization of import-substituting products. For this purpose, a system of continuous analysis of the composition and quality of imported oil and fat products entering the consumer market of the republic has been established. Within the framework of the localization program, 19.2 mln. It was found out that 7.3 thousand tons of soybean flour and protein isolate were imported. As a result, 11.4 mln. dollars of import substitution.

From the above data, it is clear that the processing of soybean seeds will make a huge contribution to the development of our country. In addition to being profitable, soybean seeds also have many beneficial properties. Let's look at some of the properties of oilseeds. 1 kg of soybean seeds contains 173 g of oil and the following minerals: sodium-440 mg, potassium-160 mg, calcium-3480 mg, magnesium-1910 mg, phosphorus-5100 mg, iron-3950 mg. They also contain manganese and cobalt, which are necessary for the biologically complete nutrition of animals.

Amino acid composition of various proteins (basic amino acids, g / 100 g)

Source	Theonine	Leysin	Izola ysin	Lysine	Methio nine	Phenylalanine	Valin	Tryptop hone
Ideal protein	11,1	13,9	19,4	11,1	15,3	9,7	16,7	2,8
Wheat grain	8,9	13,5	20,4	10,0	8,7	12,3	22,9	3,3
Soybeans	9,8	12,2	19,8	11,6	16,2	6,6	20,6	3,3
Cow's meal	9,4	12,3	20,2	10,0	16,5	7,0	21,5	3,0
Aramant grain	11,4	10,6	14,8	10,25	16,6	11,2	23,1	2,1

Chemical composition of soybean grain (in% of dry matter of seeds)

Names	Protein	Carbohydrate	Fat	Kletchatka	Ash
Orzu	38	24	22	3,5	5,0
Parvoz	38	24	22	3,4	5,0
Oyjamol	42	25	20	7,0	6,0
Oltintoj	40	25	20	6,0	6,0

From the above data, it can be seen that high yields can be achieved by processing soybean seeds and other oilseeds.

Preparing the seeds before extracting the soybean oil will result in a quality oil and sesame oil. The preparation process can be seen as conditional on the following basic processes: cleaning the seeds, sorting by size, biting, and separating the soybean husk from the husk.

Seed cleaning methods are performed as follows. The seeds contain 2 different compounds:

- 1) Mineral compounds: soil, sand, stone and so on.
- 2) Apply organic compounds to leaves, stalks, seed pods, stems, etc.

Methods and principles of purification of raw materials are as follows:

1. The method of cleaning raw materials from the mixture on sieved surfaces, based on their shape and size;
2. The method of purification of raw materials from mixtures based on their differences in aerodynamic properties;

3. Method of purification of seeds and mixtures based on differences in metallomagnetic properties;

4. Wash oily seeds from the mixture using water or a solution.

5. Separation of oily seeds from mixtures by mechanical action or friction This method is a method of washing in the dry state.

Metal stamped sieves and woven sieves are used to separate impurities from raw materials.

The hole shape of metal sieves can be circular or elongated. Through the circular hole, the raw material passes along its width. Passes along the thickness of the elongated shaped holes.

Organic and mineral impurities are sorted according to the size of the cleaned seeds. The sorting process is done using sieves of different sizes.

Circular perforated sieves are widely used in industry, and in general metal stamped sieves allow long-term use with their durability, but the useful surface coefficients of metal sieves are not very large and are around 50-60%  $K = 0.5-0.6$ . The dimensions of the circular sieves range from 0.8 to 4.0 mm. The dimensions of the elongated holes are  $b = 0.5-1.0$  mm,  $L = 10-50$  mm

Woven sieves can be woven from iron, copper, kapron, neutrons or ordinary yarns. The shape of the holes in this case is square, and the advantage of woven sieves is that their useful surface coefficient is  $K = 0.5-0.85$ , and the size is 0.6-0.9 mm.

However, woven sieves are rarely used in industry due to their low mechanical strength and rapid breakage, moreover, the size of the holes varies due to the displacement of the woven yarns under the influence of a rigidly advertised product.

All types of sieve surfaces used in industry are characterized by 4 different types of movement:

- 1) Anterior and posterior movement in the direction of product movement.
- 2) The movement of the sieve forward and backward transversely to the direction of movement of the product.
- 3) The movement of the sieve in a circle, while the product is in a spiral direction.
- 4) High frequency oscillation motion of the sieve in the vertical direction.

The cleaned and sorted soybean seeds are sent to a bite device.

One of the main tasks of improving the quality of oil and sesame seeds is to separate the husk or husk from the core as much as possible. Some oily raw materials, such as indov, flaxseed, are not well separated from the husk, so they do not crack and the core does not separate. Cotton seeds, sunflower, soybean seeds should definitely be chewed and separated from the core of the pod.

The mechanical properties of oilseeds are mainly determined by their hardness, elasticity and plasticity. The mechanical hardness of seeds is related to the crushing or breaking of oily seeds under the influence of force. The elasticity or plasticity of seeds depends on the biological and morphological structure of the shell. For example, soybean and sunflower seeds have shell fragments oriented along the length of the seed, giving the shell a very elastic property. As the humidity increases, the elasticity of the seed coat decreases and the plasticity increases.

Therefore, taking into account the characteristics of oilseeds, different methods are used in their biting. Because sunflower seeds are brittle, this type of seed is crushed by beating methods. When bitten by a shovel, which is one of the special threshing equipment, the seed is bitten randomly by hitting the machine blades several times. With the help of another type of centrifugal thresher, the seed is threshed only once at a high speed.

Various methods are used to grind oily seeds. The choice of which method depends on the following factors: the physico-mechanical and biochemical properties of the seed, the structure of its morphological parts. The most important feature is the strength, elasticity and deformation of the shell. Based on the above characteristics, the following methods of crushing oilseeds are currently used in industry:

1. The seeds break as a result of friction on the surface. In this case, the seed, which is moving on the surface at a certain speed, touches the surface, and there is friction between the surface and the seed coat, which prevents the seed from moving. As a result, the seeds are separated from the crushed core.
2. Hit the shell one or more times and crack the shell using dynamic squeezing. In multiple crushing, the seeds are compressed very strongly in a short time, their shell is separated from the core and spilled on the machine's deck. Peel a squash, grate it and squeeze the juice. In this method, up to 25% of the core is crushed along with the shell.
3. The method of cutting the seed coat between the flanges with a sharp blade. In this method, the seed falls into the range of the flanges on which the movable and immovable blades are mounted, as a result of the rotation of the movable flange, the sharp blades on the surface of the flanges cut the seed coat and separate into the core. In this method, cotton seeds are crushed and then the kernel is separated from the husk. Devices that work in this way are called shells.
4. Squeeze and break the seed coat between the rollers. In this case, as a result of the slow increase in the force acting on the surface of the seed falling between the two rollers, the shell of the seed is crushed and the kernel separates.
5. Separation by the wet method, in which the seed is immersed in water, the soaked seed is easily separated from the thin husk. This method is used to clean sesame seeds.

Currently, work is underway to introduce new methods of soybean sowing in the industry, including:

1. Aeroshelusheniya- splitting the seed coat and separating the kernel from it by moving air or gas at a speed higher than the speed of sound and sound.
2. Bite the seed by generating an excessively high pressure inside the seed coat using various methods (in a high-frequency electromagnetic field, by changing the pressure several times to create a pulse inside the seed).
3. Separation of seeds from the husk as a result of self-friction.
4. It is crushed under the influence of various mechanical forces (shaft mill, centrifugal force) and other methods.

The purpose of applying these methods is to separate the cortex as much as possible without breaking the nucleus and to reduce the amount of nucleus that does not come out with the cortex, to prevent the nucleus from crumbling.

Maximum separation of the core from the shell allows you to get high-quality oil and shrot. Since the effect of moisture on the elasticity of the seeds is large, this index of germinated seeds should be optimal for the germination process. The optimum moisture content is 14.1% for sunflower seeds, 9-11% for cotton seeds, 11-12% for soybean seeds and 5.8-6.5% for mustard.

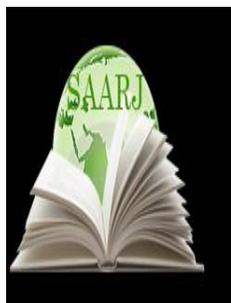

At the end of the grinding process, the bark should be separated from the crushed material. Separation is mainly separated by air flow.

## CONCLUSION

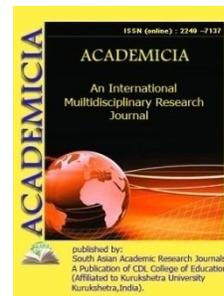

In conclusion, by optimizing the moisture content of the raw material and the fractionation of the crushed products, it is possible to obtain high-quality oil and high-protein shrot from soybean seeds.

## IMPROVING THE HYDRODYNAMICS OF THE PHASES OF THE FINAL DISTILLATION OF COTTON MISC BASED ON MULTI-STAGE SPRAYING

**Khabibov Fakhridin Yusupovich\***

\*Bukhara Institute of Engineering and Technology  
 UZBEKISTAN

### ABSTRACT

*The article outlines methods for studying the structures of hydrodynamic flows of opposing phases, providing maximum contact surface, achieving minimization of product residence time in the apparatus where, the process of final distillation of vegetable oil miscel is going on. Methods are given for determining the diameter, velocity of the drop, and the mass of the volatile component while simultaneously moving phases, which is of practical importance for the final distillation of vegetable oil based on multi-stage spraying.*

**KEYWORDS:** *Construction, Miscella, Oil, Diffuser, Confuser, Cone, Nozzle, Nozzle, Branch Pipe.*

### INTRODUCTION

The production of vegetable oil from oil-containing crops in the factories of Uzbekistan is carried out in two ways, by pressing and extracting. They are accompanied by various technologies, using a complex of mechanical, hydraulic, heat exchange, and mass transfer processes.

In the extraction method of production, the final distillation of vegetable oil misc is carried out in devices of various designs.

Removal of the solvent from the miscella is carried out in two stages. The first stage is the removal of gasoline in the pre-distiller, it obeys the known laws of the evaporation process. During the first stage of solvent distillation, the miscella must reach a concentration at which its boiling point does not exceed 100 °C. At the second stage – the final distillation, hot water vapor is used. To avoid steam condensation, the distillation apparatus is supplied with as much hot steam as necessary so that the temperature of the outgoing gasoline and water vapor is 10-15 °C

higher than the condensation temperature of water vapor at the pressure used. Methods of distillation by spray, in a film, in a layer are used.

When mistella is sprayed, the interface of the liquid phase increases significantly, which ensures a high intensity of the distillation process.

Distillation is the separation of a mixture of mutually soluble components by evaporation and condensation of vapors enriched with a volatile component. During distillation or simple distillation, the vapors leaving the evaporation surface move in the same direction until they reach the condensation surface. The separation of components depends on the physical and chemical properties of the mixture, the hydrodynamics of the phases, the geometric characteristics of the devices and their operating conditions.

We have considered the issues of improving the hydrodynamics of counter phases, ensuring their maximum contact surface, achieving minimization of the product residence time in the apparatus and metal consumption.

To improve the hydrodynamics of the phases of the final distillation process, we propose a new design for the final distillation of vegetable oil misc based on multi-stage atomization with phase mixing.

In the new design of the final distiller, equipped with a new nozzle, simultaneous mixing of phases occurs at the entrance to the device. The nozzle consists of the following elements. A steam supply pipe with a nozzle, a misc feed pipe, a confuser-which promotes partial mixing of steam with the misc; a neck that serves to partially increase the speed of the resulting mixtures by narrowing (steam and misc), a diffuser-which provides complete mixing of steam with the misc, installed nozzles in the form of fingers that contribute to the fragmentation of the formed steam bubbles and misc.

To increase the kinetic energy of the steam, a nozzle with a diameter of 0.004m for the steam outlet is installed. Due to the high kinetic energy, the steam jet will entrap the misc and simultaneously the incoming misc will split into droplets. Droplet sizes vary depending on the amount of steam entering the injector and determined parameters such as the mass of the volatile component, diameter, speed drops miscella when spraying.

The mass of the volatile component passing into the vapor phase can be determined by the following mass transfer equation:

$$M = \left( \frac{\pi^2 \cdot D}{4 \cdot R^2} \right) \cdot (y - y^*) \quad (1)$$

$$M = \left( \frac{\pi^2 \cdot D}{4 \cdot R^2} \right) \cdot (x^* - x)$$

where, R is the radius of the misc drop, m; D is the diffusion coefficient at  $a=90\%$ ,  $t=105^{\circ}\text{C}$ .

The radius of the misc drop formed in the device by the spray nozzle can be determined by the following formula:

$$R_k = \sqrt{\frac{4,5 \cdot \pi \cdot G_L \cdot d_{nozz}^2}{(\rho_L + \rho_G) \cdot \omega_L^2}}, \text{ m.} \quad (2)$$

where  $G_L$  - volumetric flow rate of miscella,  $d_{\text{nozzle}}$  - diameter nozzle,  $\rho_L$  - is the density of miscella and  $\rho_G$  - is the density of the gas phase,  $\omega_L$  - the initial velocity of the miscella.

Calculate the initial radius of the misc drop in the following sequence:

The drop shape oscillation starts at  $Re > 500$  - and to determine the critical Reynolds numbers we use the formula:

$$Re = \frac{\omega \cdot d}{\nu} \quad (3)$$

where,  $w$  - is the velocity of the liquid,  $d$  - is the characteristic length, and  $\nu$  - is the kinematic coefficient of viscosity of the miscella.

When analyzing the processes of heat and mass transfer after liquid spraying, an important characteristic is the speed of the drop. The drop velocity is determined by the initial velocity and the dynamic interaction per drop of the gas phase.

The thermal effect on the drop during its movement is manifested, in particular, on the deformation of the drop due to the influence of temperature on the viscosity and surface tension of the liquid, and mass transfer. All this data is used to determine the condition for crushing drops.

Numerous experimental studies and visualization have allowed the process of crushing a drop to be presented in the following form.

A pressure distribution (close to the distribution on the ball) is created on the surface of a liquid particle by a streamlined flow, which deforms the drop. At a certain ratio of parameters, the external forces of aerodynamic action  $\rho_G \omega^2 \cdot \pi d^2$  overcome the surface tension forces,  $\pi d^2 \cdot \sigma_L$  causing the drop to split.

Quantitatively, the ratio of these forces is determined by the value of the deformation criterion - the Weber number ( $We$ )<sup>1</sup>:

$$We = \frac{2 \cdot \rho_G \cdot \omega^2 \cdot R}{\sigma_L} \quad (4)$$

where,  $\rho_G$  - is the density of the gas phase,  $\omega$  - is the relative velocity of the phases,  $R$  - is the radius of the misc drop, and  $\sigma_L$  - is the surface tension of the misc drop.

The relative velocity of the phases is determined by the following formula:

$$\omega = \omega_G - \omega_L \quad (5)$$

where,  $\omega_G$  - is the initial velocity of the gas phase, and  $\omega_L$  - is the initial velocity of the liquid phase-misc

Scientists have established the following characteristic values of the Weber criterion:  $We < 10,7$  the drop in the flow is deformed, but does not yet disintegrate; at  $We = 10,7$ , the lower limit of crushing is reached, the drop is destroyed into two parts, while 10-20 %<sup>2</sup> of the total number of drops decays.

As the Weber criterion increases in the range  $10,7 \leq We < 14$ , the drop is divided into 3, 4, 5, and so on. the percentage of drops and broken drops increases. At  $We = 14$ , the upper limit of crushing

is reached – all 100% of the drops are crushed into many small particles. Further, for all modes where  $We > We_{kp} = 14$ , the droplet crushing is preserved. The resulting drops will be smaller the larger the value of the Weber- We number.

To select the parameters of the experimental setup, we took this feature into account for selecting the initial parameters of this final distillation apparatus, which is currently used.

In our case, for the experimental setup, the following parameters were selected: the initial mass flow rate- $G_L$ , the density of the miscel- $\rho_L$ , the nozzle radius-- $r_{nozz}$ , and the nozzle diameter- $d_{nozz}$ .

To calculate the Weber number, you will need the initial velocity of the miscella, and it can be calculated from the parameters of the initial flow of the miscella using the following formula:

$$\omega_L = \frac{G_L}{S_L} \quad (6)$$

where,  $S_L$  – is the cross-sectional area of the misc nozzle, which is equal to:  $S_L = \pi \cdot r_L^2$

To calculate the Weber number, we first calculate the volume flow rate of the miscella<sup>3</sup>:

$$G_L = \frac{q_L}{\rho_L}$$

After determining the volume flow rate of the miscella, its initial velocity can be calculated:

$$\omega_L = \frac{G_L}{S_L}$$

Gas phase parameters: the volume flow rate of the gas phase is-- $G_G$ , the radius of the gas phase nozzle is- $r_G$ , the density of the gas phase at a temperature of 130<sup>0</sup>C is- $\rho_G$

Therefore, the cross-sectional area of the gas phase nozzle is determined as follows:

$$S_G = \pi \cdot r_G^2$$

Thus, we determine the initial velocity of the gas phase using the following formula.

$$\omega_G = \frac{G_G}{S_G}$$

Now you can determine the relative speed of the phases.

$$\omega = |\omega_G - \omega_L|, \frac{M}{сек}$$

According to the above method, the following results were determined: - the length of the initial section of the gas jet when the initial volume flow rate changes.

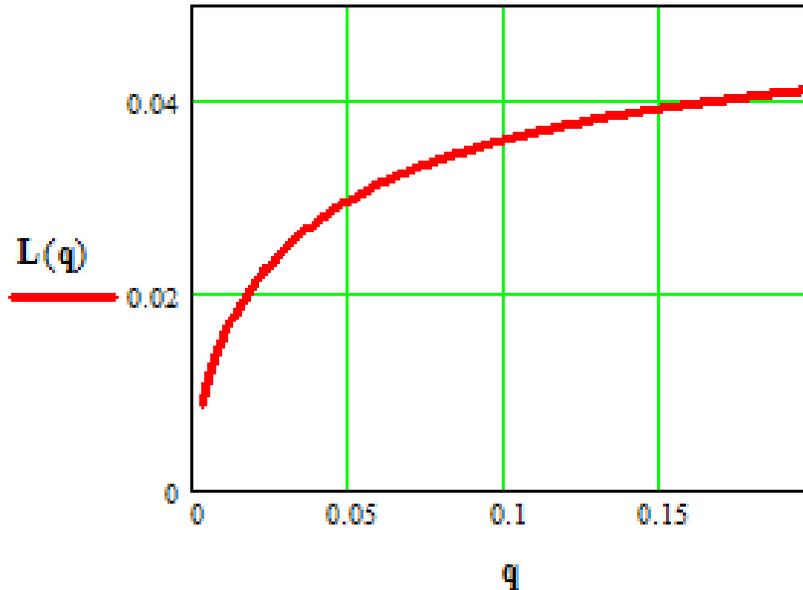

Figure 1. Relationship between the length of the initial section and the initial flow rate.

As the gas flow increases, the length of the initial section increases. From this it can be seen that at a gas jet flow rate of 0.1, the length of the initial section will be in the range of 35-40 mm, and the length of the confuser of the designed installation is 180 mm. In the remaining parts of the confuser, after the initial section of  $\approx 140$  mm, the gas jet and the miscella jet are mixed.

Relationship between the Weber number and the initial relative velocity.

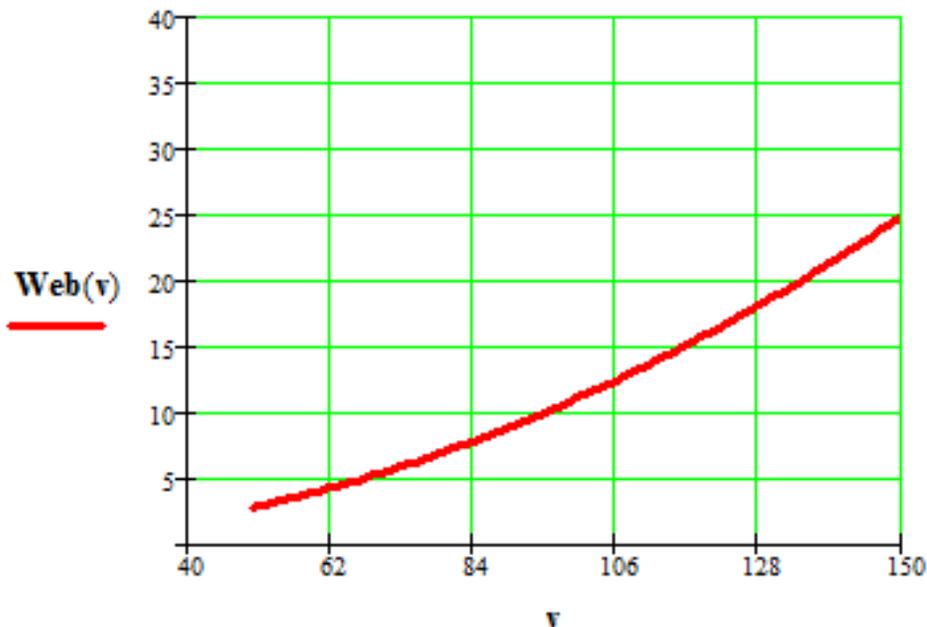

Figure 2. Relation of relative velocity and Weber number.

Figure 2 shows that when selecting the above initial data, the relative velocity was greater than  $\omega=90$  m/s in order to achieve the initial droplet crushing ( $We \geq 10$ ).

It can be seen that for a velocity greater than  $\omega=$ , the Weber number  $We > 10$ , so that when selecting the remaining initial data for the initial velocity of the gas phase,  $We > 10$ , the droplet is crushed.

To further determine the diameter of the drop, and to determine the evaporation time, we use one-dimensional ordinary differential equations for the drop.

To derive the equation of motion in a one-dimensional formulation, we use the second Newton's law:

$$m_d \frac{du}{dt} = -\frac{1}{2} K \cdot u^2 \quad (7)$$

$$\text{where } K = \frac{1}{2} \rho_g \cdot A^2 \cdot C_d$$

Here:  $A$ —is the cross-sectional area,  $C_d$  is the drag coefficient of the drop.

$$m_d = \frac{4}{3} \pi \rho_{\text{ж}} R^3 = \frac{4}{3} \pi \rho_{\text{ж}} \left( R_0 - \sqrt{2 \cdot D \cdot t \frac{\rho_{\text{г}}}{\rho_{\text{ж}}}} \right)^3$$

Integrating both parts (7) we get

$$\int \frac{du}{u^2} = -\frac{1}{2} \int \frac{dt}{m_d} \quad (8)$$

We introduce the notation

$$b = 2 \cdot D \cdot \frac{\rho_{\text{г}}}{\rho_{\text{ж}}} \quad k_1 = \frac{4}{3} \pi \rho_{\text{ж}} \quad a = R_0 \quad (9)$$

Given (9), equation (8) is written as

$$\int \frac{du}{u^2} = \int \frac{K dt}{k_1 (R_0 - \sqrt{bt})} \quad (10)$$

The left part of (10) is easily integrated; for the right part, we introduce the notation

$$a - \sqrt{bt} = z, \quad t = \frac{1}{b} (a - z)^2, \quad dt = \frac{2}{b} (a - z) dz \quad (11)$$

After inserting (11) into (10) on the right side, we get

$$\frac{K}{K_1} \int \frac{\frac{2}{b} (a - z) dz}{z^3} = \frac{K}{K_1} \int \frac{2 a dz}{z^3} - \int \frac{2 z}{z^3} dz = \frac{K}{K_1} \left[ -\frac{2a}{b} \frac{z^{-2}}{-2} - \frac{2}{b} \frac{z^{-1}}{-1} \right] + C \quad (12)$$

Inserting (10) into (11) given (9) we get

$$-\frac{1}{u} = -\frac{2K}{K_1} \left[ -\frac{a}{b} \frac{1}{(a - \sqrt{bt})^2} + \frac{2}{b} \frac{1}{a - \sqrt{bt}} \right] \quad (13)$$

Modifying (13) we come to the equation

$$u = \frac{b \cdot K_1 \cdot (a - \sqrt{bt})^2}{2(a - \sqrt{bt}) - a} \quad (14)$$

The mass of particles evaporating per second from a drop, in our example, is equal to

$$\frac{dm}{dt} = -\frac{D \cdot \rho_g}{R} \cdot 4\pi R^2 \quad (15)$$

On the other hand,  $m = \frac{4}{3}\pi R^3 \rho_{liq}$ , so taking the derivative on both sides we get

On the other hand, so taking the derivative on both sides we get

$$\frac{dm}{dt} = \frac{4}{3}\pi \rho_{ж} \frac{dR^3}{dt} = 4\pi \rho_{ж} R^2 \frac{dR}{dt} \quad (16)$$

If we equate (15) and (16) by making some simplifications, we get,

$$\frac{dR}{dt} = -\frac{D}{R} \cdot \frac{\rho_g}{\rho_{ж}} \quad (17)$$

(17) we will convert to the form

$$R \cdot dR = -D \cdot \frac{\rho_g}{\rho_{ж}} dt \quad (18)$$

Integrating (18) and taking into account the initial condition, we get

$$R^2 - R_0^2 = -2 \cdot D \cdot \frac{\rho_g}{\rho_{ж}} t \quad (19)$$

From here

$$R^2 = R_0^2 - 2 \cdot D \cdot \frac{\rho_g}{\rho_{ж}} t \quad \text{и}$$

$$R = \sqrt{R_0^2 - 2 \cdot D \cdot \frac{\rho_g}{\rho_{ж}} t} \quad (20)$$

where  $R_1 = R_0^2$

Figure 3 shows the process of decreasing the drop radius over time for different initial values of the gas phase density. It can be seen that with a higher initial density of the gas phase, the drop radius decreases faster and tends to zero.

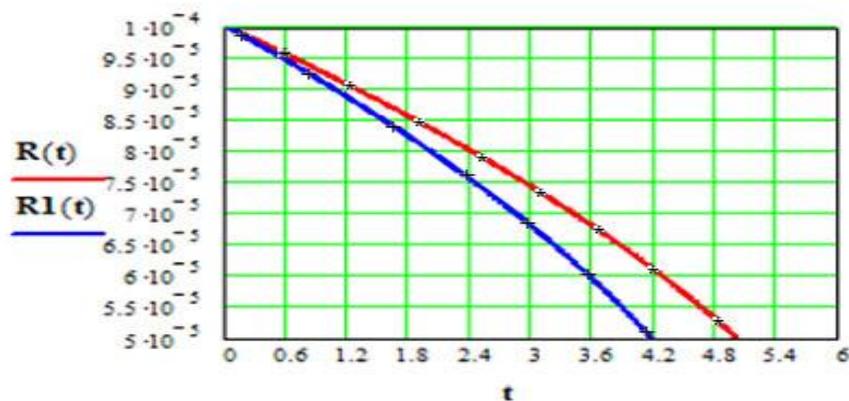

Figure 3. decrease in the size of the micelle drop relative to the initial density of the gas phase. (\*- $\rho_{ж} = 0,4$ ; + $\rho_{ж} = 0,5$ .)

Figure 4 shows the process of decreasing the longitudinal velocity over time for different initial values of the gas phase temperature (density). It can be seen that at a higher initial temperature, the speed decreases faster.

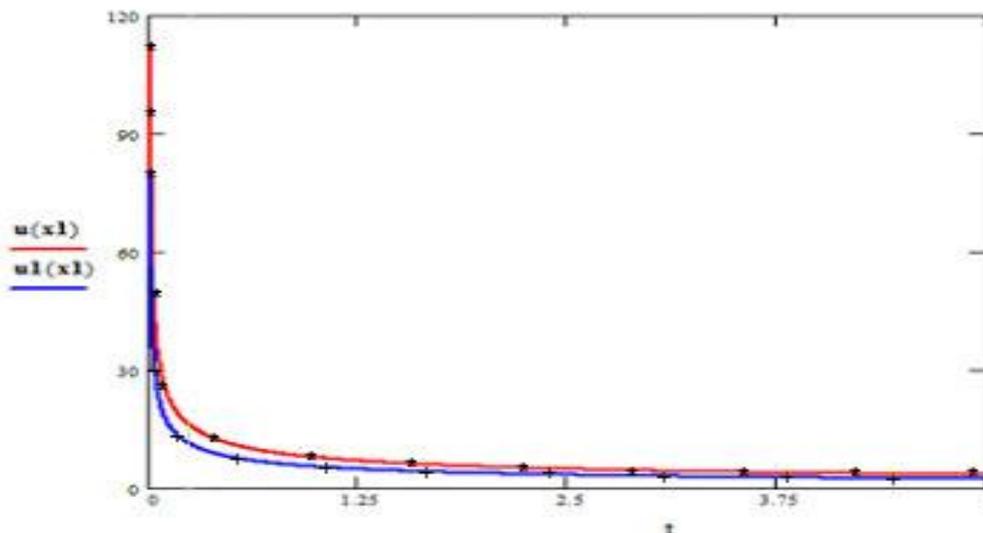

Figure 4. Reduction of the gas phase velocity relative to the initial temperature of the gas phase. (\*- $T_0=100^{\circ}\text{C}$ , +- $T_0=130^{\circ}\text{C}$ .)

Thus, with the initial velocity of the gas phase of 100 m/s, after half a second, the velocity drops to about 9 m/s. at this stage, the drop radius in figure 1. is 0.00006=60 microns. After one second, the drop radius will be 0.000003=30 microns.

In the above proposed method, we studied the factors that effectively affect the hydrodynamic structures of phase flows, in order to improve the design of the apparatus, in which the final distillation process takes place on the basis of multi-stage spraying of a vegetable oil misc with a nozzle.

Using the proposed research method, we studied the structure of hydrodynamic phase flows on a new design of the final distiller by multi-stage spraying of vegetable oil misc. The calculated equation (1) is obtained for determining the mass of the volatile component, which depends on the diffusion coefficient and the radius of the misc drop during spray distillation with a nozzle. Based on the obtained calculation equation, the effect of the diffusion coefficient, which depends on the radius of the misc drop, is studied.

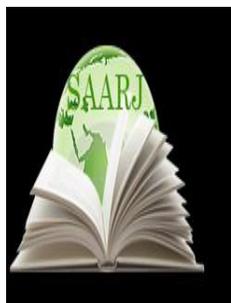

At the same time, the radius of the misc drop formed in the final distillation apparatus with a spray nozzle is determined. The process of crushing a misc drop is studied, and the effect of the ratio of the parameters of the external aerodynamic forces and the surface tension forces of the liquid on the Weber number is determined.

These studies can be used for solving problems on mass transfer processes in research works.

## CHARACTERISTICS OF PSYCHO CORRECTIONAL ACTIVITY IN SCHOOL PSYCHOLOGY IN CONFLICTING SITUATIONS

**Todjiboyeva Gulxumor Rahmandjanovna\***

\*Associate Professor,  
 Head of the Department of General Psychology,  
 Andijan State University,  
 UZBEKISTAN

### ABSTRACT

*The development of practical psychology in the education system, the psychological support of educational work are associated with the need to humanize the Uzbek school. With a change in the paradigm of the pedagogical process, the appeal to the personality of the child, his individuality required the development of professional methods of psychological support for the growing and developing personality. With the creation of a psychological service at the school, the need for the training of educational psychologists who are focused in their professional activities on issues related to the teaching and upbringing of children.*

**KEYWORDS:** *Problem, Adolescent, Conflict, Collective, Psychological Moments, Situation.*

### INTRODUCTION

Until recently, the training of practical psychologists for educational institutions was of an academic nature. Possessing the necessary information, psychologists found it difficult to use it in practice. This was due to the insufficient development of methodological issues in this branch of science. Many technological approaches in working with children and adolescents are borrowed from foreign experience without sufficient adaptation to Uzbek socio-cultural conditions.

An analysis of the activities of psychologists shows that professional difficulties are more often associated with the technological aspects of practical work in the education system, starting with the general organization of work, ways and means of interaction with the teaching staff and ending with specific methods used in work with different age groups and in the most common cases.

The negative consequences of interpersonal conflicts are well studied and are widely represented in domestic and foreign psychological and pedagogical literature, which considers the conflict as a collision of oppositely directed, incompatible tendencies in the consciousness of an individual or in interpersonal relationships associated with acute negative experiences. In this regard, an unequivocal negative attitude towards conflicts has developed in school pedagogy. The emergence of interpersonal conflict is usually seen as a symptom of an unfavorable relationship. A common conflict resolution tactic is to suppress them. A preliminary analysis of the causes of contradictions leading to interpersonal conflict, as a rule, is not carried out.

The constructive functions of interpersonal conflicts among adolescents include the following:

- Interpersonal conflict is an important source of personal development, as well as the development of intragroup relations;
- Interpersonal conflicts can positively change and expand the scope and methods of interpersonal interaction;
- Through open confrontation, interpersonal conflict frees the group from the negative factors of its development;
- Interpersonal conflict contributes to the development of mutual understanding between adolescents, develops their social intelligence.

Moreover, the positive meaning of the conflict lies in the disclosure of his own capabilities for the adolescent himself, in the activation of the personality as the subject of preventing, overcoming and resolving interpersonal conflicts. In this regard, the problem arises of finding forms and methods of organizing conditions for maximum realization of the constructive potential of interpersonal conflicts among adolescents.

Interpersonal conflicts among adolescents, arising in the context of the educational process, have their own pronounced specificity, determined by the simultaneous influence of conflictogenic factors of different nature and age characteristics of children.

Working with interpersonal conflicts of students in the educational process is considered as one of the tasks of the school psychological service. Practice shows that the most common ways of overcoming interpersonal conflicts in adolescents are the neutralization of aggressive and hostile manifestations, the separation of conflicting parties, the elimination of conflict-generating factors, that is, methods that reduce the activity of adolescents themselves. As a result, the developmental potential of interpersonal conflict is underutilized. Great opportunities in the development of the personality of a teenager in conditions of constructive overcoming of interpersonal conflict open up if the activity of a school psychologist is in the nature of active psychocorrective influences.

Analysis of the psychological theories of J. Bugenthal, L. Wingswanger, L. S. Vygotsky, K. Levin, A. Maslow, K. Rogers, V. Frankl, A. Freud and others contributed to the formation of a broader view of the essential forces and capabilities of the personality itself in conflict prevention.

At the same time, it is obvious "that the readiness of adolescents for constructive behavior in conditions of interpersonal conflict, which makes their positive potential a reality, is not a natural given. It is formed in special conditions, the creation of which is the subject of the professional

activity of teachers, but first of all - school psychologists, specialists who know the methods of scientific reflection on the characteristics of the personal development of adolescents and the socio-psychological characteristics of adolescent groups.

In this regard, the purpose of our study is to develop a model of the school psychologist's activity to prevent the personal-destructive consequences of conflict interactions between adolescents.

The object of the research is the psych correctional activity of a school psychologist.

The subject of the research is to increase the effectiveness of psycho-correctional activity of a school psychologist in a situation of interpersonal conflict among adolescents.

In the course of our research, we came to the conclusion that interpersonal conflicts among adolescents arising in the context of the educational process have their own pronounced specificity, determined by the simultaneous influence of conflict genic factors of various nature and age characteristics of children. In the context of an interpersonal conflict among adolescents, the activity of a school psychologist for their constructive resolution and prevention of their possible negative consequences is in the nature of psych correctional effects and can be organized in appropriate forms using psych correctional methods.

The analysis of the psychological essence of adolescent conflict allowed us to formulate a hypothesis of the immanence of interpersonal conflict among adolescents: interpersonal conflicts between adolescents are of an internally natural nature, which necessitates the orientation of the psychologist's activities to transform a spontaneously developing conflict situation into a personally developing conflict.

Conflicts are an integral part of modern life. Talking about conflicts, we most often associate them with aggression, disputes, hostility. However, many conflicts contribute to making informed decisions, developing relationships, and helping to reveal hidden problems. In any case, conflicts must be resolved.

Insufficient attention to disagreements leads to the fact that children and teachers cease to trust each other, ascribe responsibility for not understanding the personal qualities of the opponent. This leads to mutual hostility and the consolidation of stereotypes of conflict behavior.

Pedagogical conflicts can be divided into three large groups. The first includes motivational conflicts arising between teachers and students due to poor learning motivation of students or, more simply, because students either do not want to learn, or learn without interest, under duress. Conflicts like this grow and eventually there is mutual hostility, opposition, even struggle between teachers and students.

The second group is formed by conflicts associated with shortcomings in the organization of the educational process. This refers to the four conflict periods through which students go through the learning process at school. Thus, a first grader goes through a rather difficult and even painful stage in his life: his leading activity changes (from entertaining to educational), his social position changes (from a child he turns into a school student), new requirements and responsibilities arise. Psychological adaptation to school can last from three months to one and a half years.

Only a student gets used to his new role, a teacher at school, when a new conflict period begins, he moves to the middle link. Instead of one teacher, different subject teachers appear. And if the

primary school teacher, as a rule, takes care of his children, helps them, takes care of them, then the middle school teachers are generally more strict and demanding. And it can be difficult to adapt to several teachers at once. In addition, new school subjects appear, more complex in comparison with the subjects of elementary school.

The next period of conflict begins at the beginning of the 9th grade, when a new painful problem arises: you need to decide what to do - go to a secondary specialized educational institution or continue your studies at school. Children who go to technical schools and colleges often experience a peculiar "inferiority complex" compared to other schoolchildren. Quite often situations arise when a young person intends to go to the 10th grade, but is rejected due to low academic performance. The greatest regret is the cases when a talented student is forced to go to a secondary special educational institution for Thus, for many young people, the ninth grade is the line to which they lived a carefree childhood and stormy adolescence, but after which they are forced to start adult life with its worries and problems.

And, finally, the fourth period of conflict: graduation from school, choice of a future profession, competitive exams at a university, the beginning of a personal life. Unfortunately, while providing basic secondary education, the school does not prepare its pupils to fulfill certain roles of "adulthood." Therefore, this period is often acutely conflictual: failures, breakdowns, problems.

Conflicts between teachers can arise for a variety of reasons, from school timetable problems to intimate and personal conflicts. In most schools, especially in urban areas, there is a typical conflict between elementary school teachers and middle and high school teachers. The essence of mutual claims can be briefly outlined as follows: subject teachers say that children who came to them from third grades are not independent enough and are accustomed to excessive adult guardianship. In turn, primary school teachers say with bitterness that they spent a lot of effort on teaching children to read, count, write, and reproach subject teachers for lack of attention and warmth to children. Apparently, this conflict is due to objective reasons: the lack of continuity in the content and organization of education in primary and secondary schools. In interactions "teacher - school administration" arise conflicts caused by problems of power and subordination, and more recently - associated with the introduction of innovations. Thus, school life is literally full of pedagogical conflicts. The versatility of the educational process determines the variety of possible interpersonal conflicts and their specific forms leakage. The difficulty is that situations leading to collisions are often unique in their own way, inimitable, and therefore there are no universal ways of resolving them.

When resolving conflicts between a teacher and a student, in addition to analyzing the reasons that led to the current situation, goals, and probable outcomes of a particular interpersonal collision, it is necessary to take into account the age characteristics of schoolchildren. In the lower grades, conflicts between the teacher and his wards, as a rule, are generated by the failure of the latter to comply with disciplinary requirements. In this way, the conflict situation is regarded by the teacher as a purely business one. At the same time, in most cases, children are not yet able to determine its true nature and perceive the teacher's position as an insult to themselves, as a personally unfriendly attitude towards them. This sometimes determines the child's choice of behavior that does not correspond to the real content of the situation. He can withdraw into himself, which is called "pout on an adult." In this case, the teacher's task is to

reveal to him the true reasons for dissatisfaction, and only then show the need to comply with the requirements, explain the inexpediency of continuing conflict and the undesirable nature of its possible outcomes.

A teenager, unlike a junior schoolchild, feels an equal participant in an interpersonal conflict with a teacher. Along with business conflict situations that arise between a teacher and schoolchildren of this age, there are often contradictions of a purely personal nature. As a rule, they are caused, on the one hand, by increasing tendencies of individualization, the adolescent's feeling of adulthood and the desire to recognize himself as such, and on the other - the teacher's lack of serious objective grounds for recognizing him as equal. Conflicting behavior here can be realized in the form of a sharp confrontation, be unusually brightly emotionally colored, and in the case of the wrong tactics chosen by the teacher, it can lead to stable personal mutual hostility and even enmity.

As for high school students, the interpersonal conflict between them and the teacher can lead to much more serious consequences than a similar situation with a teenager, and even more so with a younger student. Sometimes a seemingly insignificant conflict of a personal nature, being transferred to the business sphere, can largely affect the further fate of a young man and a girl, push them to the wrong a step that will lead to the many failures of a young person entering adulthood. Any conflict can be viewed from two positions: destructive and constructive.

Conflict is destructive if it distracts from more important problems and affairs; destroys the state of mind, strengthens low self-esteem and causes stress; polarizes groups of people and hardens positions within groups; deepens differences in value orientations; causes irresponsible or regrettable behavior or manifestation violence.

A conflict is constructive if it opens up an acute problem for everyone; leads to a collision with a real problem; expands employee involvement in problem solving; evokes real communication; gives an outlet to accumulated emotions, anxiety, stress; helps recognition interdependence and fostering unity; helps to improve and use the knowledge and experience gained. Any conflict can be analyzed according to a specific algorithm.

At the same time, you can gain experience in solving and be able to calmly and more accurately understand conflict situations.

Conflict analysis algorithm:

1. Description of the situation, its participants.
2. The nature and essence of the situation.
3. Behavior of one side.
4. Behavior of the other party.
5. The moment that made it possible to prevent the escalation of the problem into a conflict.
6. What prevented this (emotional state, presence of witnesses, confusion, surprise, etc.).
7. What was the way out of the conflict.
8. What methods of interaction with conflicting ones I could use; how i used them.
9. Analysis of my behavior in this situation: right - wrong.

10. Options for behavior after the conflict.

11. What to do to avoid similar conflicts.

The relationship between educators, parents and students today resemble a battle of three sides. It is no coincidence that school conflicts are increasingly being brought to court, and it has come to the point that students commit suicide because of the mistakes of teachers or, conversely, beat or kill their teachers. And it is no coincidence that school psychologists began to be involved in resolving conflicts in many schools, and school psychological services. These services help teachers, parents and students find constructive ways out of difficult conflict situations, provide knowledge and skills on measures to prevent conflict situations, help reduce the level of aggressiveness in the school environment, teach constructive interaction skills for all participants in the educational process.

Under the prevailing conditions of the functioning of the educational system, the school psychologist becomes a link in the family-school interaction system, harmonizing the relationship between parents and the school and contributing to the satisfaction of the needs for positive contacts of each of the parties. The involvement of the school psychologist in the interaction between parents and the school helps to increase positive connections, changing the qualitative structure of relationships, which become more trusting and open.

The main functions of a school psychologist include psychological support of the educational process, career guidance, identification of inclinations, interests, abilities of students, conducting trainings in various problems, individual counseling on academic performance, classroom relationships, student relationships with teachers, with parents and others. It is impossible for one specialist to fully implement monitoring, testing, trainings, drug prevention, etc. Like any person, a psychologist cannot do everything well, therefore the optimal solution is to create a psychological service at the school, where several psychologists specializing in various fields work. psychological knowledge.

The psychologist must position himself as an independent specialist. It is this position that will strengthen the role of the psychologist as a real assistant, and not as a "spy" of the administration. Yes, and for the psychologist himself, this will greatly facilitate the task of maintaining the mental health of schoolchildren, work on psychological correction. It will allow you to more freely solve the real problems of the student, so that the child does not feel alone with his often unchildish problems, he feels comfortable at school, does not feel abandoned and unhappy. Pupils, as a rule, do not turn to a psychologist themselves, especially for younger students. Usually parents or teachers do it for them. Teachers bring children in more often because they want the psychologist to deal with the problems of a difficult child with whom they themselves are no longer in

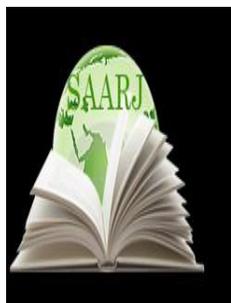

able to fight. Parents turn less often for several reasons: some believe that their child is the best and therefore prefer not to notice difficulties, others simply do not trust the psychologist, because they do not have the correct idea of the functions they perform, or simply do not believe that he is able to do something.

The school psychological service should carry out work aimed at correcting the already existing situation, as well as create programs that would provide an opportunity to avoid many psychological mistakes and difficulties in pedagogical activity. The two proposed strategies will

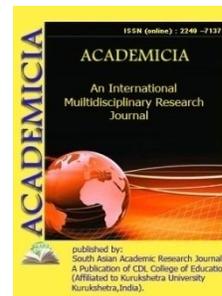

help to understand the content of those goals that confronts the school psychologist with the current situation in society.

## THE PECULIARITIES OF LEXICAL UNITS WITH THE COMPONENT OF TEMPORALITY IN ENGLISH, UZBEK AND RUSSIAN LANGUAGES

**Murzajanova Dilnoza Shavkatbek qizi\***

\*1st year Master's degree student,  
 National University of Uzbekistan named after Mirzo Ulugbek,  
 UZBEKISTAN

### ABSTRACT

*The study of time in linguistics has focused foremost on the temporal and lexical expressions of time. It seems that the linguistics of time has divided into different branches. Cognitive linguistics which has created a significant amount of literature based on the theory of metaphors, conceptual integration, spatial semantics of temporality. On the other hand, the typology of the language made it possible to obtain a significant amount of knowledge about the grammatical means of expressing time, cross-linguistic generalizations and comparisons. This article provides the lexical features of temporality in English, Uzbek and Russian.*

**KEYWORDS:** *Time, Temporality, Tense, Typology, Lexical Units.*

### INTRODUCTION

Time is a fundamental concept of human knowledge and action. Therefore, it is not surprising that all the languages that we know about have developed rich means for expressing various aspects of time: time intervals, their position on the timeline or their duration. Roughly, there are six main devices to encode time in natural language: the first one is a tense. "Tense" is an inflectional verb category (often in combination with an auxiliary; in its simplest understanding, it means a temporal relationship (earlier, simultaneous, later) between an occurrence or state and some temporal anchor, usually the moment of speech. Tense is not found in all languages, but the present, past, and future can be related to in all languages. Another is "grammatical aspect". Aspect is also an inflectional verb category, often in combination with an auxiliary. It indicates a clear point of view on the event in its simplest understanding, : the speaker can show it as incomplete or perfectly completed. It is at least as common as a grammatical category as it is tense, with which it is sometimes mixed. . The third is "lexical aspect". Events, as encoded in the sense of the verb, vary according to different temporal features: they may involve end points or

not, they express inherent changes or not, they may last for some time or be punctual, and others. Therefore, we differentiate between processes, acts, events, states and so on. In all languages, distinctions of this type are found. This is by far the richest group of temporal expressions: “Temporal Adverbials. There are various forms structurally: bare adverbs like now, then, shortly, and also, prepositional phrases like after the autopsy, over the years, at first sight, for three hours, and so on. Functionally, on the time line, its length, and its frequency, temporal adverbials may convey the location of any case, .Some Chinese, use special particles to express temporality “Temporary Particles” also this is somewhat unusual, most languages have a form of expression, such as still, yet, again, that is somehow between particles and temporal adverbs.. “Discourse Principles” the construction of texts typically follows certain temporal constraints, the best known of which is the principle of chronological order. Unless marked otherwise, the order of mention corresponds to the order of events.[ Klein W. F. N-2008].Thus, a sentence such as e fell asleep and switched the light off sounds distinctly odd because it violates this principle.

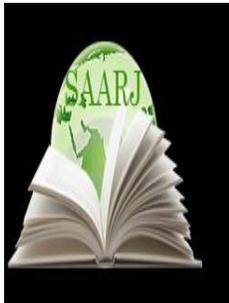

The analyzing of typological categories of tense and aspect in three languages shows that we distinguish three aspects of the verb forms in comparative language: simple (common or indefinite), continuous and perfect aspects. They form the so called “tense aspect forms of the verb” along with all the tense forms of the verb. The English verbs also define the continuous process of aspect group. It also possible to define the notion of aspect as a form of the verb showing habituality, continuity or completion of the action or state represented by the root of the verb. The features of Uzbek grammar is not studied as a separate category of the verb, as it is not always expressed separately as it appears due to the absence of analytical forms. The concepts of tense and aspect are so closely fused together in the comparative languages that it is difficult to treat them separately. The verb’s one and the same form serves to simultaneously express tense and aspect, and thus they should be known as “tense aspect forms” of the verb. Past Continuous of the English verb is formed by means of the combination of was ,were denotes an action happening in progress at a definite time in the past. Definite time may be expressed by means of time expressions or by a clause of time connected to the principle one with the, conjunctions while and when. In Uzbek in the past continuous the verbs may take the suffixes. Future Continuous is formed by means of the auxiliary will or shall be plural form of the notional verb and expresses an action taking place in progress at a definite time after the moment of speech. For example: I shall be waiting for you at the arrival hall at 1 o'clock (when you plane arrive at the airport). As is seen from this example Uzbek future continuous is expressed with the help of the suffix “yotgan” and auxiliary verb ”bo’lmoq”. Present Perfect Continuous is used to express an activity which continues to the present. The Present Continuous Tense expresses the prolongation of the action.[Nasirdinov O.A. K-2018] Example: I am sitting in Uzbek language to express this tense is used only simple tense:”Men o’tiraman”.Present Continuous denotes an action happening now or at the moment of speech. In English the predicate verb is formed by means of the auxiliary verbbe of the notional verb which correspond to the Uzbek verb forms in the example of the verb 'bor'. Also the best way to think of time expressions in Russian is in connection with the aspects of the verbs, the major time expressions are associated with them.For example, imperfective verbs refer to actions or states which are in progress or which are repeated over a stretch of time. These verbs must then refer to the duration or frequency of the actions and states they refer to.Perfective verbs refer to actions which are completed in a single point in time, which may be referred to as punctuality. The cardinal time expressions

specify the duration, iteration, and punctuality of actions and states expressed by verb.[Gurevich V.S. M-2016]

The basic idea that time representations are organized in terms of space is questioned in recent works, and attention is also drawn to characteristics that are peculiar to temporal expressions and not spatial by nature and origin. Typological studies of tense, aspect, and related phenomena, meanwhile, are further developing. There is still plenty of work to be done in understanding the dynamic interconnections of language and time, considering the flexibility of various approaches.

## THE ROLE OF MODERN TECHNOLOGIES IN FOREIGN LANGUAGE TEACHING

**Azimova Nilufar Nuriddinovna\***

\*Senior Teacher at the Department of English Language,  
 UZBEKISTAN

Email id: nilufar.azimova.1977@gmail.com

### ABSTRACT

*As knowledge of a foreign language is very important today, one of the most pressing issues in education is the reform of the foreign language teaching system, the application of advanced teaching methods in the teaching process using modern pedagogical and information and communication technologies. turned. With the rapid development of information and communication technologies, which is one of the peculiarities of our time, special attention is paid to a new approach to the educational process and its organization, using its opportunities. The role of the teacher in the classroom is also changing. The teacher is now mainly a facilitator. It is time for teachers who want to keep pace with the times to be ready to bring any part of the lesson to life through information and communication technologies.*

**KEYWORDS:** *Education, Information, Purpose, Foreign Language Lessons, Modern Methods, Technical Means, Multimedia, Special Programs, Topics, Electronic Dictionaries.*

### INTRODUCTION

The introduction of information and communication technologies in the educational process is becoming increasingly important, especially in the teaching and learning of foreign languages. New information technologies offer great opportunities for teaching foreign languages, play an important role in obtaining quality knowledge in science and increase the effectiveness of education. It is a well-known fact that in order to teach a subject in accordance with the requirements of the time, no lesson in this subject should be given without the presentation of the teacher or students. In line with this important decision, a more in-depth look was taken today, especially in foreign language classes. In order to properly defend the honor of the country on the world stage, our young people must first be able to compete with their foreign peers. Today,

the competition is in foreign languages, especially English, which is an international business language.

Much attention is paid to training to work with the main means of communication (e-mail, chat) in the search for information on the network. Initially, the exchange of information is limited to written text, but gradually graphic and audio documents are added.

Various on-line, ie interactive tests;

Off-line tests, ie the use of electronic versions of tests;

There are many tests on the Internet for students from elementary to advanced level, such as TOEFL and IELTS.

When using information and communication technologies, the teacher should prepare a plan for it in accordance with state standards. In the classroom, information and communication technologies can never replace the teacher, but help him. According to the content of the lesson, information and communication technologies and other pedagogical technologies should be used wisely. The purpose of the application of information and communication technologies in the teaching process is to enrich the lesson, to provide didactic exhibitions of information that ordinary books can not give.

Today, at all stages of the education system, the introduction of advanced teaching methods using modern pedagogical and information and communication technologies, further increase the interest of the younger generation in foreign languages and, in turn, fluency in these languages. It is planned to radically improve the system of training specialists, as well as to create conditions and opportunities for their achievements in world civilization and the wider use of world information resources, the development of international cooperation and dialogue. Effective use of modern information and communication technologies is important in the consistent study of foreign languages. It should be noted that one of such tools is an interactive whiteboard. These boards allow creative teachers to organize lessons in an interesting, unconventional way, and to easily explain topics of any complexity to students. Many of the videos and audio files help students develop their reading, writing, and counting skills, and develop their speech from simple to complex.

It is advisable to use modern teaching aids, language rooms, multimedia, specially programmed topics, multilingual electronic dictionaries in foreign language lessons. Use of distance learning methods, press, telecommunications and Internet materials in learning foreign languages the reader - serves as a source of information not only for students to learn foreign languages, but also to increase their intellectual level. The goal can be achieved if each student effectively uses the literature published in foreign countries, the necessary magazines, newspapers and media in their field of specialization. If the literature is obtained mainly from the Internet, the use of foreign sources, textbooks and manuals in their field of specialization gives effective results.

The fact that students prepare their articles in foreign languages and participate in scientific and practical conferences held in higher education institutions every year is also very useful in learning a foreign language. The use of computers in learning foreign languages is much more convenient for students. Planning to learn the terms of your specialty from general language learning can help you solve this problem quickly and efficiently with the help of a computer. In

the course of the lesson, they not only increase their knowledge with the help of computer programmed topics, but also learn computer skills.

In addition to foreign languages, excellent reading and speaking in their field creates great prospects for students. Books from the libraries of developed countries - the United States, England, Germany, Russia, France and other countries on the Internet. , it is expedient to try to get magazines and news. Organization of various didactic educational activities for perfect mastering of foreign languages and creation of language environment and ensuring their connection with materials in the course process, organization of extracurricular lessons dictation, narration, learning to write essays, quizzes and debates, solving tests, course work, independent work and writing dissertations in a foreign language is useful in improving students' knowledge. The organization of spiritual and educational events in foreign languages in educational institutions and the transformation of students into active organizers. One of the modern requirements for future professionals is to communicate with higher education institutions and research centers. This allows you to learn the language as well as teach new literature without translation.

### **METHOD AND MATERIALS**

Significant work is being done in our country to form an information society, to introduce the most advanced information and communication technologies in all areas. In particular, the capabilities of interactive services in this process are highly valued. One of the main directions in improving teaching methods today is the introduction of interactive teaching and learning methods. All science teachers are increasingly using interactive methods in the classroom. As a result of the use of interactive methods, students are able to think independently, analyze, draw conclusions, express their opinions, defend them reasonably, The skills of communication, discussion, debate are formed and developed. In the process of interactive learning, the lesson is based on the interaction of students. Derived from the English word "interactive", "Interact" means "interaction", "act" - means action, influence, activity. Interactivity is the interaction of two people, that is, the learning process takes place in the form of a dialogue, in the form of dialogue (computer communication) or on the basis of teacher-student interaction. Interactivity - Interaction, movement, sensitivity, student-teacher, student-student (subject-subject) conversations. The main purpose of interactive methods is to create the most favorable environment for the learning process, creating an environment for active, free, creative thinking of the student, the use of his needs, interests, inner potential. Such lessons are held in such a way that in the process, no student is left out, and has the opportunity to openly express their views on what they have heard, read and seen. There is a process of mutual exchange of views. Children develop an interest in learning, and friendly relations are formed.

Modern interactive methods in foreign language teaching methods have been developed by scientists and have been proven to be more effective than traditional methods. Interactive methods significantly increase the knowledge potential of the learning process compared to traditional methods. Because in interactive methods, the student thinks independently and works in partnership with the teacher. When teaching a foreign language using modern technologies, the student plans the lesson process, engages in it on the basis of the curriculum, chooses teaching methods jointly by the student and the teacher, o ' participate in the discussion of the study material. Students help each other.

In the late twentieth and early twenty-first centuries, the term "interactive" methods of education was widely used in the pedagogical literature. We will try to explain the meaning of this phrase. "Inter" is used in the extreme sense. Interactive means a very active learning method. This group of methods allows students to think independently, to be creative and to be interested in the essence of the topic. It is more effective than traditional methods of teaching, such as interactive methods of explanation, demonstration and use of tools, which is an important factor in the formation of students as individuals, the development of personal abilities, creative independence.

## RESULT AND DISCUSSION

A few centuries ago, A. Navoi wrote about the impact of such differences in social life in the introduction to his famous work "Mahbub ul-qulub": "Umid ulkim, readers pay attention and e. 'Let them look at each other with their own eyes, and let each one enjoy according to his own understanding ...' It shows that everyone can understand, master, benefit and apply this work in a different way, that is, only at the level of their own understanding, and from this we can understand the essence of interactive teaching methods. we can summarize the above conclusions about the main differences from the traditional methods, that is, to increase the understanding of the students.

It should be noted that interactive teaching methods in Uzbekistan since ancient times in the educational process, such as discussion, debate, negotiation, observation, analysis, consultation, poetry reading, reading in the dialogue between teacher and students and between students and students. used in the forms. These methods helped students to become independent thinkers by developing their speech, thinking, reasoning, intellect, talent, and intelligence.

The purpose of a distance learning course is, in its most general form, primarily to teach listening and speaking in the oral form of communication in the language being studied. In addition, the extension of the course will allow for a serious focus on written forms of communication. Written communication involves mastering different types of speaking activities, such as reading and writing (written speech). The expansion of learning objectives in the distance learning course involves the activation of previously acquired speaking skills, the formation of a higher level of communicative skills and a deeper systematization of users' grammatical knowledge. One of the factors that allows them to increase their awareness and achieve better results in their work is the interactivity factor.

In addition to the advantages and conveniences mentioned above in distance learning, we may face some challenges. First of all, it is advisable to choose a method that is appropriate and specific to the distance learning process. Because the effectiveness and success of any education system depends on the methods used. Let's define the concept of teaching method. The teaching method is a method of interaction between teachers and students, aimed at achieving educational goals at a modern level.

Choosing an interactive method of distance learning in foreign languages is a good idea. Because the interactive method of teaching serves to activate the acquisition of knowledge by students, to develop personal qualities by increasing the activity between students and the teacher in the educational process. Using interactive methods can help increase the effectiveness of the lesson. The main criteria for interactive education are: informal discussions, the ability to freely express and express the learning material, the small number of lectures, but the large number of

seminars, the creation of opportunities for students to take initiative, small group, large group, classroom assignments, written assignments, and other methods that play a key role in increasing the effectiveness of educational work. With that in mind, we can say that. The interactive method leads to many positive results in the process of distance learning foreign languages.

The use of interactive methods in the process of distance learning of foreign languages enhances the participation of students, encourages them to achieve maximum results. Interactivity also helps teachers incorporate more complex material into the course. Interactivity can be combined with imitating the environment in which students learn. For example, if the course involves the use of a computer program, the images on the screen must match the images that must be displayed when running the program. Students should be given the task of doing something that is relevant to one of the topics being studied. For more complex topics on the subject, it is possible to model the business process and encourage the reader to move on.

Distance learning - learning that is carried out by special means of interactive Internet technologies, the interaction between the teacher and the student is carried out at a distance and reflects the computers that are suitable for the learning process shape. From the above definitions, it can be concluded that there is no single system for understanding the essence of distance learning. However, at present, distance learning in higher education is presented in the form of distance learning technology, which is not supported by the legal framework..

The main purpose of the use of interactive methods in distance learning of foreign languages is to involve students in the process of active learning, to help them develop knowledge and research skills. Interactive methods are based on an active relationship between teacher and student, full understanding of each other. The ultimate goal of the introduction of interactive methods in the learning process is to organize the interaction of the teacher and the student in the classroom, regardless of the form of the lesson. The teacher needs to engage the students in the problems of the lesson, activate their movement and teach them to master as a result. Interactive teaching method is implemented by each teacher at the level of available tools and their own capabilities. In this case, each student learns at different levels, depending on their motives and intellectual level.

Interactive learning technology - ensures that every teacher conducts the lessons that all students learn as intended. In this case, each student will master the lesson at the intended level, with their own motives and intellectual level. Based on the study of some experiences in the practical application of interactive training, we can identify some of the factors that affect the quality and effectiveness of these trainings. They can be conditionally called organizational-pedagogical, scientific-methodical and factors related to the teacher, students, teaching aids. We need to keep in mind that they have a positive or negative effect, depending on their nature.

There are many types of interactive activities, which are selected and prepared according to the nature of the subject and the objectives. There are specific requirements for the preparation of students to participate in interactive lessons, which include the acquisition of knowledge necessary for active participation in the lesson, readiness for communication, collaboration, independent thinking, self-expression. skills of free expression and defense, and so on. Making the most of your time is a must. This requires the correct selection and preparation of the necessary tools, as well as a clear definition of the trainers and their responsibilities. There are specific differences between interactive methods and traditional teaching methods, and each

teacher should compare these differences, their advantages and disadvantages in relation to each other, in choosing the methods of lesson planning and conduct. should be taken into account. In this case, the most appropriate interactive for the transfer of new knowledge, the formation, development, consolidation of skills, repetition of knowledge, practical training, as well as for training on each topic, taking into account the specifics of the subject. or the correct choice of other techniques. The application of properly selected techniques will ensure that the training is fun and effective. The current stage of development of educational technology is characterized by the widespread use of interactive teaching methods in the educational process. The uniformity of teaching technology used for many years, the hegemony of the teacher in the learning process, the teacher's attempt to present the science to the student at a level that is ready, acceptable without excessive observation, reduces students' activity and develops creative thinking skills. had begun to prevent its formation. Therefore, there is an increasing attempt to use interactive teaching methods in the educational process, which do not teach the student, but teach him to read and learn. However, there are cases when trying to solve all the problems in educational practice with the help of interactive teaching methods is considered as a magic wand that leads to success. In our opinion, this is a misconception - firstly, it undermines the ability of interactive games to find the right place in education, obscures their positive aspects, and secondly, puts aside the effective forms of traditional technology that have been polished over the years. yadi. There is no universal teaching method that always succeeds, so it is better to think about the introduction of interactive teaching methods, while retaining its advantages, rather than abandoning traditional teaching technology altogether. will be. How interesting, useful and effective the organization of lessons depends on the creativity and initiative of teachers. The teacher not only teaches, but also develops students' reading skills through independent reading. , manuals, internet messages, teach students to learn through the analysis of sources, ensure that the student not only hears and sees in the learning process, but also becomes an active participant in the study of the content of the lesson. If a teacher is able to study, master and apply the content and essence of interactive education, its methods in his pedagogical activity, he will be able to fully implement the improved State educational standards and modernized curricula. guarantees mastery, ensures quality and efficiency. If every teacher can activate his student in the classroom, the level of children's reading, mastery, knowledge, skills and abilities will be high. A teacher who aims to ensure the effectiveness of the lesson will achieve his or her goal only if he or she skillfully uses interactive teaching methods in their place. Interactive lessons are organized in such a way that in the process no student is left out, that is, they have the opportunity to openly express what they see, know and think. Students will have the opportunity to contribute to the development of collaborative learning. There is a process of exchange of knowledge, ideas and opinions. Such situations provide mutual sincerity, increase the desire to acquire new knowledge, in the process of mutual support, friendly relations. This is of great educational importance.

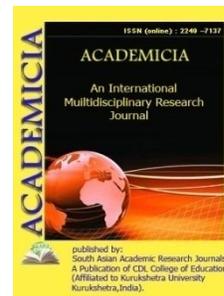

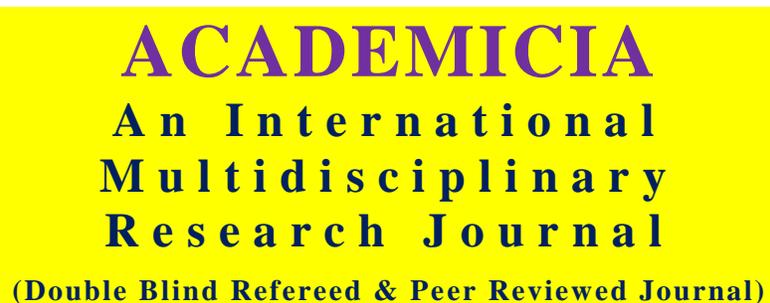

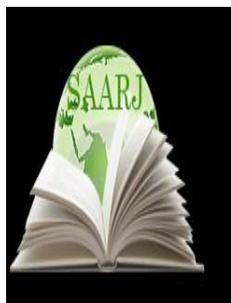

## CONCLUSION

In short, interactive learning allows you to solve several problems at once. Most importantly, it develops students' communication skills, helps to establish emotional connections between students, teaches them to work in a team, to listen to the opinions of their peers. ensures compliance. At the same time, practice shows that the use of interactive methods in the classroom eliminates the nervous tension of students, allows them to change the form of activity,

to focus on the main issues of the lesson. The main goal of the educational process is to train highly qualified, well-versed specialists in all areas of science. Therefore, the use of modern information technology in the study of modern foreign languages is important. Direct use of modern teaching aids, language labs, multimedia, specially programmed topics, multilingual electronic dictionaries in foreign language lessons. purposeful. The use of distance learning methods, press, telecommunications and Internet materials in the teaching of foreign languages serves as a source of information not only for students to learn foreign languages, but also to increase their intellectual level. Among the effective approaches are the methods of language teaching in distance learning through information and communication technologies.

**REPRESENTATION OF ARCHEOLOGICAL MONUMENTS OF  
KHOREZM OASIS IN WRITTEN SOURCES (6TH CENTURY BC –10TH  
CENTURY AD)**

**Abdirimov R\***

\*Senior Researcher of Khorezm Mamun Academy,  
UZBEKISTAN

**ABSTRACT**

*The historical and cultural centers of the lower Amu Darya basin and its geologically connected Sarakamishbuyi and Uzboy areas and the economic activities of the population living in their micro districts in the ancient and medieval times can be described on the basis of scientific conclusions based on theoretical comparative analysis of written sources. The article considers the history of coverage of archeological monuments of Khorezm oasis in written sources.*

**KEYWORDS:** *Avesto, Var, Daxyu, Kavi, Yima, Hecate, Khorasmia, At-Tabari, Al-Muqaddasi, Al-Istahri, Kat, Gurganch, Amul, Marv*

**INTRODUCTION**

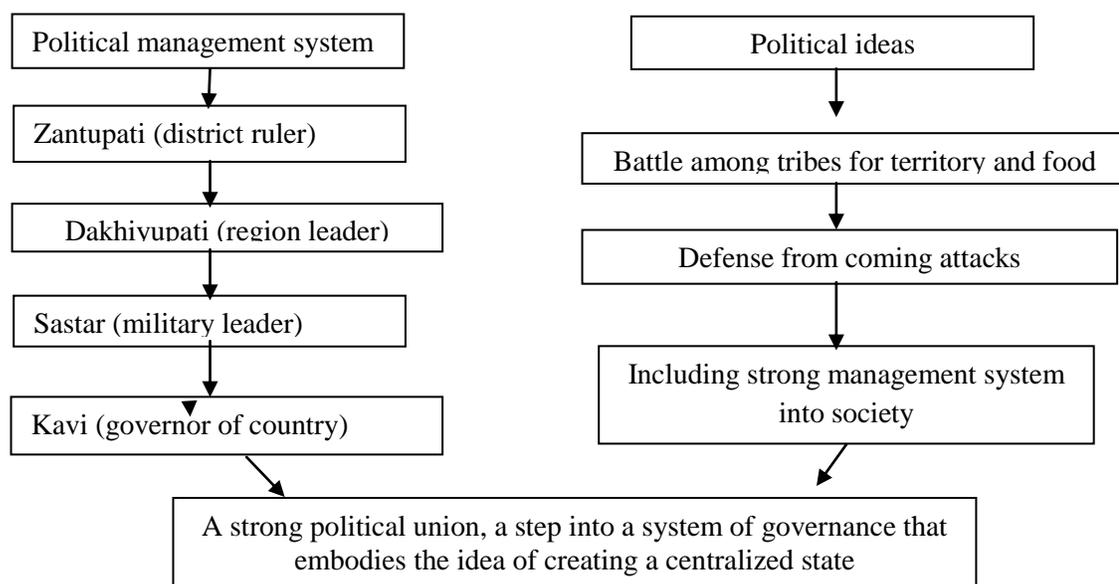

The construction of human settlements is recorded in Avesto, associated with the activities of Yima. The four-sided wall, erected by Yima, is described by the term “Square Vara”. That is, he built the Yima Vara on all four sides, equal to horse's one run, and moved there the seeds of bulls, dogs, and birds, as well as the burning fire. The four-sided horse-riding Varana was swept away by Yima, who brought water from a place a khatr (1.5 km) away. There he built enclosed dwellings on all sides, a house dome, and a courtyard. In the wide part of the building he built nine exits, six of which were medium and three narrow. And he opened the corridor and the lighted window”.

However, although the term urban is not mentioned in the information recorded in the play, it is possible to have some idea of its archeological complex. The data recorded in Avesto indicate the beginning of a new historical period in the socio-economic relations of society. In the time of Avesto society, the historical and geographical boundaries of the pastoral and sedentary populations in the historical and cultural regions of the Central Asian region were defined.

Military-political alliances had also been formed. The above-mentioned historical data found meaning and essence in the sense of “Square Vara”. The “Square Vara” mentioned in Avesto is a fortress, which was developed by a special group of people, including the inner fortress, settlements, houses, handicraft workshops, streets, open spaces, defensive walls, the front and outskirts of the city, villages, fields. At the time of Avesto, there were historical and geographical regions such as Bactria, Sogdiana, Margiana, where the settlement of tribal associations was based on the system of irrigation.

Based on the knowledge of agriculture and handicrafts, the culture of urban planning has become an independent field. These regions are part of the Eastern urban planning system. As a product of the urban process, there was a process of formation on the basis of urban and city-states and on their basis the first state structures (Marokanda, Kyzyltepa, Koktepa, Yerkurgan, Uzunqir, Sangirtepa, Chirakchitepa). In Avesto, tribal communities and tribal relations are clearly described in the governing system of society. Issues such as defense, war, and truce were discussed in the tribal council, as well as conflicts over pastures and water with tribes living in the neighboring area. According to Avesto, in this historical period, the content of society was governed by the tribal association of the region – Dakhyu, the ruler of the association – “Kavi”, the region – “Dakhyupati”. The chief of the tribe formed a tribal association by uniting a number of tribes in order to protect them from attack by neighboring cattle-breeding tribes and states. The chief of the tribal association, who had a large military force, invaded the neighboring territories, took possession of their property and enslaved the captives. As the position of tribal chief increased, he rose to the rank of chief of staff on the council as a result of the consolidation of personal power and served as military commander. His kin was considered great, and he himself became the sole ruler, and as his position in the community increased, he was able to form personal guards, ensuring the interests of his life and family, his accumulated wealth and security. Relying on personal guards, he subdued the tribes, organized military expeditions to neighboring territories, and gradually expanded the territory of the tribe, while maintaining its political and economic dominance.

#### Political terms mentioned in the book "Avesto"

The data recorded in the works of Greco-Roman historians and Arab geographers have played an important role in covering the process of socio-economic and ethno-cultural relations in the ancient and medieval society of our country. Although real information about the history of Khorezm is reflected in Ahamanid cuneiform inscriptions (4<sup>th</sup>-5<sup>th</sup> centuries BC), Bihustun and Naqshi Rostam rocks, in artifacts from the fortresses of Suza, Hamodan and Personal, there is no information about the villages and towns built by the people of the oasis. The first historical information about the knowledge of our ancestors in the field of urban culture, which carried out economic activities in the oasis, can be traced in the work of the Greek historian Hecate Miletusky.

## MATERIALS AND METHODS

In a special “Asia” section of Hecate Miletusky’s work “Image of the Earth,” he describes Asia, saying, “To the east of Parthia, live Khorasmians who occupied the plains and mountains. In the mountains grow wild trees, willows, thorny cypress. At the beginning of the road passes through the land of the Parthians, a mountain, then the land of Khorasmians, in which there are mountains and plains. Here is their city “Khorasmia”. Unfortunately, information about the topographic structure of the city and the defense complex is not reflected. The works of Arab tourists and geographers contain valuable information about the first and medieval villages and cities of Khorezm oasis. At-Tabarani's works contain information about the cities of Khazarasp Kat, Urgench. In the notes of a tourist who came to Khorez in the 7<sup>th</sup> century AD, information about the city of Kat is recorded. Al-Belozuri's work states that the area occupied by the Kat fortress is 200 hectares, equal to the size of the Afrasiab monument. An interesting legend about the history of Khorezm is presented in the work of the Arab geographer and traveler Al-Muqaddas. According to the legend, “The king of the East was angry with four hundred people for the services of his state. He ordered them to be taken to an uninhabited place a hundred miles away. They were brought to the place where the city of Kos is now located. Some time later, the king sent a man and ordered them to take notice of their condition. When the king's men come, all the exiles were alive; they built tents for themselves and made a living by fishing. They had a lot of firewood. When they had told those things to the king, he asked, “What do they say about meat?” – Khor. And what about wood for fire? – Razm. Then the king said, “I have given those places to them”. Let their land be called Khorezm. He then took four hundred Turkish girls and ordered them to be handed over to them.

Al-Muqaddas gives clear information that Khorezm oasis is surrounded by defensive walls and ditches of villages and towns. Khiva is surrounded by the majestic wall and ditch and on the sand border at the end of the irrigation structure. Zamakhshar is recorded as a small town, surrounded by a wall and a trench, in which a market with a square depicts a mosque at the end of it. The author pays special attention to the city of Kas, which is located on the eastern side of the Amu Darya. In it, the mosque is located in the middle of the market and the mosque is built of wooden pillars on a black stone that is the height of a man. The city is prosperous, rich in scientists, rich in food, rich in skilled architects and craftsmen. They recite wonderfully: their faces are also beautiful. That fact must be taken into account. “Not to mention the size of the layer, it equates its size and structure to Nishapur. Unfortunately, in the works of Arab geographers, there is not a single idea about the size of Kat.

At the same time, the tourist noted that the city of Darkhan is located on the trade route from Bukhara to Amul, Merv and Khorezm, around which there are about 500 vineyards. The author notes that Gurganch has four gates, the interior of which is filled with residential buildings, surrounded by walls and ditches, the inhabitants are hospitable, love to eat, are not afraid of battle and are brave. He notes that they have unique and amazing features. Kas, Gartman, Oykhon, Ardakhiva, Nukfar, Kardar, Mizdahkon, Jashir, Sadvar, Zardukh, Barategin, Madkaminya, Jurjoniya, Nuzvor, Zamahshar, Ruzvand, (Ruzund), Daskahankhas, Khushmisan, Madamisan, Khiva, Kardaronkhos, Khazorasp (Khazarasf), Jigarband, Jazz, Dargan, Katta Jiz, Kichik Jiz, Kichik Jurjonia, Sadfar, Madkaminiya, Nuzvar, Darin, Juvion, Amir, Barabsar, Vardara villages and towns. The work also contains information about the history of Khazorasp. In al-Muqaddas's works, Mizdahkon is a large city with 1,200 rustaks (arable villages). After Jurjonia, he left valuable information that Khorezm was a big city, where 500 vineyards stretched 2 miles along the river, and raisins were extracted. At the same time, the author mentions the fortress of Qalajik, west of Khazarasp.

Al-Istahri's work contains information about such rural settlements and cities as Khorezm (Kas, Kat), Dargan, Khazorasp, Khiva, Mizdahkon, Khushmisan, Ardakhushmisan, Safardiz, Nuzbar, Kardaronkhosh (Kardaronkhos), Andaraston Kurdar, Baratakin. The author writes about the city of Khorezm: "The capital of Khorezm is located north of Oks, the main city of the country is called Kat in Khorezm, but it was destroyed by Oks, and the people settled behind it. The river approached the castle again. There is also a possibility that the castle will collapse. The mosque is behind the castle. The palace of Khorezmshahs is next to this mosque. The dungeon is located near the castle, through which the Jardur Canal flows through the center of the city. It divides the city and the market into two parts. The width and length of the city is about 1/3 of a mile. The gates in the ruined part of the city were destroyed.

Khorezm is a rich city, rich in food. It is located on the west bank of the Oks River, a 3-day drive from Jurjonia. He noted that the circumference of the city of Kat was 2 km (1/2 farsah), which had a rabod. Elsewhere in the work, he says, "Khorezm is a fertile city with a lot of food and fruits, but no nuts. Cotton is grown there and much more is made of it and these things are transported to distant places. The distinguishing feature of the population is the desire to show wealth and courage. They travel more than anyone. There is not a single city in Khurasan where the population does not live. There is no gold in their country, no silver mines, no mention of precious stones, and they often trade with the Turks. However, about Gurganch, "It is a place where Guzlar trades, where the caravan goes to Jurjania, Khazar and Khorasan". Hudud ul-Alam, written by an unknown author, lists 10 cities in the oasis. There is a lot of information about the cities of Gurganch and Kat. He noted that the city of Gurganch was divided into inner and outer parts, and that its inhabitants were well versed in the art of fighting and archery. The author writes: "Kat is the capital of Khorezm, the gateway to the Guzlar Turkestan, the city where the Turks, Turkestan, Movarounnahr and the Khazars gathered".

In the book "Kitab ul-Futuh" (Book of Conquests), the city of Khorezm is described as follows: Khorezm consists of three parts, which are surrounded by ditches. Al-Fir is the strongest part of the city. There is a large pool between the three parts of the city that provides them with water during the siege. Ibn Khurdodbek in his book "Kitab ul-masolik va al-mamolik" showed that along with Khorezm, the city Kat was surrounded by a wall and a ditch. Written sources and historical data first record the historical and political events that took place in the early medieval

society of Khorezm oasis and the villages and towns that were surrounded by these events. Abu Rayhan Beruni studied the historical data recorded in Greek and Arabic sources, described the historical geography and geological structure of Khorezm, and in the agricultural oases, Khorezmians built more than 300 villages and towns on both banks of the river.

He noted that their ruins are still standing. At the same time, he noted the existence of a Siyavush-led state in Khorezm in the 5<sup>th</sup> century BC.

## RESULT AND DISCUSSION

According to Abu Rayhan Beruni, the person who ruled the state with the title of Khorezmshah was Kaykhusrav, the son of Siyavush, the grandson of the king of Turan Afrosiyab. According to him, the Khorezmians got their history from the beginning of the settlement of people in Khorezm, which was nine hundred and eighty years before Alexander. Then they learned about the arrival of Siyavush ibn Kaykovus in Khorezm and the reign of Kaykhusrav and his descendants in Khorezm. At that time, Kaykhusrav moved to Khorezm and began the reign of the Turkish kings. This political process took place ninety-two years after the settlement of people in Khorezm. Then they followed the Iranians in making history, and each of the descendants of the so-called kings of Kaykhusrav (Khorezm) got a history (from the beginning of the tsarist period). Finally, the kingdom of Afrighiys began with the descendants of Kaykhusrav. Just as the Iranians sent the sinful Yazdijard to the evangelist (Khorezmians), they brought Afrigh to the evangelist. After Afrigh, his son became king. On the outskirts of the city of Alfir Khorezm was a fortress built of mud and mud bricks, built on three floors, located one inside the other and not far from each other in height. At the top of these forts were the palaces of kings.

Alfir was visible from a distance of ten miles or more. Every year Jaihun would tear it down, tear it down, and finally, in the one thousand three hundred and fifth year of Alexander's history, not a trace of it remained. Then Khorezmians took history from the kingdom of Afrighiys and its descendants, the representatives of the Afrighiys' dynasty Afrigh, Boza (Bughra), Sukhtang (Sahbang), Askajamuk, Azkojvor, Sukhoro, Shovush, Hamgari, Buzkor, Arsamukh (Artamux), Amurishi ozari and concluded that part of Khorezmians had moved to the shores of the Caspian Sea. During his trip to Khorezm, the Arab geographer Yakut said: "Khazarasp is like an island surrounded on four sides by water. A strong fortress enters the city from Khorezm side.

The population is engaged in trade, rich and wealthy", he said, noting that the Khazarasp people have a well-developed knowledge of clay architecture. Thus, based on the content of the historical data mentioned above, the following final conclusion can be drawn. The main productive force of the Lower Amu Darya, Sariqamishboyi and Uzbay, which formed a single territorial unit in terms of the borders of the oasis and naturally historical-economic and political-military, is the source of development of the ancient world society. At the same time, it can be explained that the content of economic activities in the historical and cultural massifs of the indigenous population, which is the creator of the development of society, is reflected in the toponymy of "khvarizam" and is an ancient ethnic group. The historical and cultural centers of the Lower Amu Darya Basin and its territorial continuation and its micro-districts are mentioned in the Achamanid sources under the term "Khvarazmish", managed by the rulers, allows them to obtain historical information about the tax policy levied on the population. Unfortunately, in this historical period, information related to the defense system of settlements built by the population

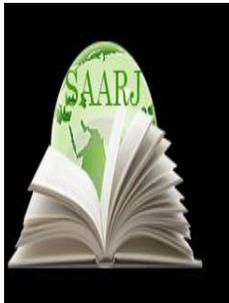

in the territory of the oasis is not recorded. Because in the Avesto era, the knowledge of urban planning did not take place in the spirituality of the indigenous people. In the works of Greek historians, there is no information about the knowledge of Khorasmian clay architecture.

### CONCLUSION

In the works of Arab geographers and tourists, large irrigation facilities built by the population on the right and left banks of the Amu Darya and agro-irrigated agricultural oases with a territorial boundary along the canal on both sides of them left clear information about their centers villages and cities. In the 16<sup>th</sup> century BC, villages and towns were centers of handicrafts and trade.

### ABSTRACT

*We are part of the Universe which is an infinite source of primordial cosmic energy. Our gross physical body and subtle metaphysical body constantly interact with the Universe in diverse ways on different human energy fields - aura. Our secular body consumes material foodstuff and executes different motor actions while moving from birth to death. This is a closed process and has its ends as our organic body becomes non-functional and perished. On other side, our psycho-spiritual body receives cosmic energy from the Universe and preserves it as 'Prana Shakti' or life force. Cosmic energy is ethereal and undying, even continued to exist as 'eternal soul' after death. The primordial cosmic energy subsists at seven energy centres or Chakras as Kundalini Shakti in astral body and spins around these regions in form of sonic or electromagnetic waves. Chakras are non material entity having no existence in gross body but exists in subtle or etheric body. Kundalini shakti flows in our astral body through nadis or channels in a precise way. Physical science didn't venture to investigate its flow mechanism so far, as the matter lies outside its domain. In this paper an analytical structure of Kundalini Chakras has been proposed on the basis of physical science. The author thinks that chakras are seven quantised energy states of cosmic energy. Kundalini Chakras act as the transformation hub where cosmic energy converts to spiritual energy or life force. So chakras act as passageways to connect our astral body with the gross body.*

**KEYWORDS:** *Chakras, Kundalini, Nadi, Quantised State, Solfeggio Frequencies.*

## INTRODUCTION

Charkas or Kundalinis are the core centres of cosmic energy in the human energy fields. Chakras literally mean wheel and are best thought of as Multi-Dimensional Energy Vortices where energy spins or whirl continuously. According to yogic concept, there are four bodies that constitute a complete human being. These are the physical body, the psychic or astral body, the spiritual body and the causal body. Chakras reside in the astral body and serve as transport junction to streamline cosmic energy in these bodies through nadi or channels.

Chakras, are said to be open and balanced when cosmic energy flows through the nadi spontaneously in full synchronisation and complete coordination. Chakras are assumed to lie along the spinal cord from the bottom to the head of our physical body at specific locations. There are seven main chakras that govern the physical region of the body where they are situated and are responsible for certain physiological and psychological traits of human being. When seven chakras are properly activated and sensitised by optimal cosmic energy, corresponding physical regions of the body are rejuvenated and higher order emotions are developed. We are elevated to higher dimensional consciousness.

The dynamization of Kundalini when energy passes from one chakra to another spontaneously, is a revelation of spiritual consciousness that leads to the attainment of ultimate *Siddhis*.

**KUNDALINI CHAKRA** : The seven chakras and their main areas of influence, both physical and emotional are given in the following order.

Chakra Name - Location - Physical influence on - Emotional or Personality traits

1. *Mooladhara (Root) Chakra*: Perineum: Excretory Systems: Physical Security & Fear.
2. *Swadhisthana (Sacral) Chakra*: Base of the Spine: Sexual Systems: Self-Expression, Creativity.
3. *Manipura (Naval) Chakra*: Solar Plexus: Digestive Systems: Willpower & Annoyance.
4. *Anahata (Heart) Chakra*: Centre of the Chest: Circulatory and Respiratory Systems: Love.
5. *Vishuddhi (Throat) Chakra*: Throat: Auditory and Vocal Systems: Communication.
6. *Ajna (3rd Eye)*: Centre of head, directly in line with forehead: Eyes & Perception: Intuition.
7. *Sahasrara (Crown)*: Top of Head: Brain and Nervous System: Ecstasy.

In seven chakras, energy spins or whirls with specific speed and definite frequency. In root or first chakra, rotational speed and frequency are the least while in the crown chakra these parameters are highest. The seven chakras are assigned seven rainbow colours, which are : *Red, Orange, Yellow, Green, Blue, Indigo and Violet*. These seven colours have definite frequency and wavelength that lie within our visible range of spectrum. In acoustics, there are seven musical scales like *sa, re, ga, ma, pa, dha, ni*, or *A, B, C, D, E, F, G* which are allocated to seven chakras. These optical or acoustic frequencies can be used to activate the chakras and to accelerate flow of kundalini shakti in the astral body. It may be pointed out that excitation status of wheels or chakras would vary with individual development, physical condition, energy levels, disease, or stress level of the person.

If seven chakras are blocked and not synchronised with each other, cosmic energy cannot flow spontaneously in the astral body causing abnormal variation in our physical or mental state. Basic life forces would be slowed down and the individual may feel restless, tired or depressed. A negative attitude, fear, doubt, etc. would preoccupy the mind that may affect mental equilibrium. Physical body functions will be affected as well and several diseases may manifest. This problem is negotiated by opening the chakras and balancing them properly. When the chakras are open and balanced, they functioning normally, spinning in proper direction to absorb the particular energies needed from the universal energy field. This is best done through the methodical process of regular meditation and pranayama. They are designed systematically to remove the psychic debris that accumulates in the channels and blocks the flow of energy. When the flow of energy reaches optimum level after cleansing, the chakras are said to be open and become favourably balanced. This leads the person to reach higher levels of awareness and elevate to higher dimensional consciousness.

**NADI OR CHANNEL:** Nadis are the astral tubes made up of astral matter. In our subtle body runs complex network of nadis that carry cosmic energy or prana shakti, chi or life-force in the form of psychic current. They are not seen by naked physical eyes, since they are made up of subtle matter. The quality and quantity of this energy, flowing through the nadis resolve overall state of our physical and mental health. This depends on purity of nadis. So the first step in kundalini arousal is the purification of nadis.

**SUSHUMNA NADI:** The central channel “Sushumna Nadi”, known as the Middle Path begins at the base of spinal cord and passes straight up the spine to the highest chakra, the 7th or Sahasrara Chakra. It provides direct passage of flow of energy from root chakra to crown chakra.

**PINGLA NADI:** The right channel “Pingala Nadi”, known as the Sun Channel begins at the Swadisthan Chakra and travels up the right side of our physical body. It crosses over at the Agnya Chakra and provides the conduit for our active or vital energy necessary for mental and physical activities.

**IDA NADI :** The left channel “Ida Nadi”, known as Moon Channel begins at the Mooladhara chakra and runs up the left side of spinal cord, crossing over at the Agnya Chakra into the right side of the brain. It provides the conduit for the mental energy.

**MIND AND BRAIN:** Meditation or Pranayama are considered as powerful tools to activate chakras by controlling the flow of energy through nadis. Meditation is a mind related activity, where mind is focused on a particular object, thought or activity. As a matter of fact mind is quantum mechanically entangled with the brain. Researcher assume, ‘thought pattern of mind translates into brain waves’. They describe thought as energy that causes the neurons in the brain to fire in a certain pattern. Unusual brain wave patterns cause irregular flow of cosmic energy in the channels that ultimately lead to chakra imbalance. So the mind and the brain should have proper coordination during meditation to activate the guided flow of cosmic energy through nadis or channels. This depends on the state of vacillation of our mind and brain. Five different brain wave states are :

1. Delta waves ( Up to 3 Hz)
2. Theta waves ( From 3 to 8 Hz)
3. Alpha waves ( From 8 to 12 Hz)

4. Beta waves ( From 12 to 38 Hz)

5. Gamma waves ( From 38 to 42 Hz)

Human Psycho-biologists describe the characteristics of different brain waves in different meditative state of mind. Fast beta waves (14 Hz and above) are said to be associated with normal waking state of consciousness when attention is directed towards cognitive tasks and outside world. Alpha waves (7-13 Hz) are associated with dreaming and light meditation. Theta waves (4-7 Hz) are associated with sleep and the deepest state of mediation where senses are withdrawn from the external world. Slow delta waves (0-4 Hz) are associated with deepest meditation and dreamless sleep. It is observed, fast gamma wave activity (25-42 Hz) in the frontal lobes increase after meditation. Gamma waves are thought to reflect superior mental activity such as higher dimensional consciousness.

**SIGNIFICANCE:** Cosmic energy plays a vital role in psycho-spiritual as well as vital development of human being. This energy remain stored in the astral body at seven energy centres and flows through nadi or channels in specific way. The cosmic energy which is stored in ethereal body as Kundalini shakti has not been quantified so far. The flow dynamics of this energy in spiritual body of human being has no scientific model so far. This study was conducted to estimate different physical parameters of Kundalini chakras and to justify a scientific model to ascertain how Kundalini shakti streams in astral body.

**OBJECTIVES:** Major objectives of this study are as follow:

1. To develop an streaming-model of Kundalini shakti in human body.
2. To estimate energy contents of seven Kundalini chakras.
3. To estimate temperature of seven Kundalini chakras.
4. To draw a qualitative relation between mind wave and spiritual energy.

**HYPOTHESES:** The chakras are not materially real and are not positioned in the gross body but in the subtle enteric body. Kundalini shakti is metaphysical in nature and does not appear as other forms of physical energies: Heat energy, Sound energy, Nuclear energy etc. This ethereal energy is not related to logical perception of human senses about real physical world. In broader perspectives, this study assumes spiritual energy or Kundalini shakti as physical in character and follows scientific laws and principles related to the material world.

**RESEARCH METHODOLOGY:** This is a theoretical study based on available secondary data. According to Upanishad, optical and acoustic signals can stimulate Kundalini chakras. Seven rainbow colours are assigned to seven chakras. In this study, corresponding frequencies of seven colours e.g., Violet, Indigo, Blue, Green, Yellow, Orange and Red were assumed to incite seven chakras. On the acoustic side, *Solfeggio tones* and *Bija* mantras can arouse Kundalini chakras. So seven Solfeggio tones and seven *Biza* mantras are considered for seven chakras as excitation tools. In the frequency scale of respective colours and sonic signals, mean values are taken into consideration for calculation. Relevant scientific formulae and equations are used to find out specific energy levels, temperature and other physical parameters of chakras.

**RESULTS AND DISCUSSION:**

**ANALYTICAL MODEL:** Scientists think that vibration energy is the primordial form of energy that was emanated in sound forma as 'OM' during Big Bang. This vibration energy is

stored in the Universe as cosmic energy and manifests as light and sound energy along with other forms of energy. Kundalini shakti is a metaphorical form of universal energy which is downloaded in our body and remain stored in Kundalini chakras. It subsists in the form of bio-photons and remains stored in the DNA of our biological systems. Basically Photons and Phonons are quantised energy particles of colours and sound and exhibit wave-like and particles-like characters concurrently. These photons transit across seven energy states of chakras and produce coherent laser-like radiation. This radiation possesses electromagnetic energy which is allegorically predicted as '*Kundalini shakti*' in Upanishads.

Kundalini shakti subsists as bio-electromagnetic energy or acoustic energy in seven chakras and spin around these vortex fields as waves of definite wavelength and frequency. The author assumes that ethereal energy of astral body is quantised and remain localised in seven energy states which are known as Kundalini chakras. So the seven chakras are basically seven quantum energy states of our subtle body. Initially Kundalini shakti or spiritual energy is downloaded to root chakra and remain dormant there. When aroused by some external sources, it moves up to other chakras and recharge them. Quantum particles like Photons or Phonons carry this energy across different chakras. During every transition positive energy is liberated in the form of bio-magnetic energy that supply vital energy or life force to the physical body. During this process of transition of photons other chakras are recharged with optimal energy and got synchronised or balanced. In these transactions, positive or negative energies are emitted and streams through *Ida* and *Pingala* nadi. Once activated, Kundalini energy whirls around the chakras as waves and diffuse in our astral body through various channels or glands.

Researchers think that cosmic energy is converted to acoustic waves by piezoelectric vibrations through piezoelectric connective tissues within our living matrix. Cosmic energy enters the astral body in the form of electromagnetic or sound energy and moves down the Sushumna nadi adjacent to spinal cord. This downward streaming of energy causes vibration of spinal cord, bone matrix and endocrine glands in the brain. Piezoelectric vibration of crystals in the connective tissues, skeleton and brain generates electromagnetic energy that streams as Kundalini shakti in the astral body. Due to the flow of Kundalini shakti in spiritual body, pineal glands synchronise our heart rhythms, modulate our brain waves, control the respiration rate and all other physiological activities in the body. Piezoelectric vibrations generate phonons that amplifies the acoustic waves to organise all levels of our body activities through the living matrix. This state of transformation in the body is known as 'awakening of Kundalini'. Hence, Kundalini awakening process is a complex, multi-dimensional physiological process that is initiated at quantum mechanical level and propagates to psycho spiritual level.

#### ANALYSIS OF DATA:

**TABLE 1.** Seven centres of cosmic energy or the seven chakras in our subtle body along the spinal cord are assigned seven optical colours. These seven optical colours are VIOLET, INDIGO, BLUE, GREEN, ORANGE and RED in the visual range of our physical vision that ranges from nearly 400 nm to 800 nm wavelength. According to Hindu purana, ROOT chakra existing at the base of our body has been assigned RED colour having frequency range 430-480 THz. Mean value of this red colour as considered is 455 THz. Just above root chakra, SACRAL chakra is located in the genital region. The sacral chakra is assigned ORANGE colour having frequency range 480-510 THz, with mean value 495 THz. The third chakra SOLAR PLEXUS

possesses YELLOW colour having frequency range 510-540 THz with mean value at 525 THz. HEART chakra or Anahata chakra is located in the cardiac region. It is assumed to possess GREEN colour in the frequency region 540-580 THz, with mean value at 560 THz. THROAT chakra, the 5<sup>th</sup> in the row, is pale BLUE having frequency range 580-

610 THz with mean value at 595 THz. The sixth chakra THIRD EYE or Ajana chakra has INDIGO tint in the frequency range 610 – 670 THz with mean value at 640 THz.

**TABLE 1 : OPTICAL FREQUENCY RANGE OF CHAKRAS**

No	Chakras / Kundalinis	Colours	Optical Frequency Range $\nu$ THz	Mean Optical Frequency $\nu_m$ THz	Energy eV	$\Delta E$ eV	$\Delta \nu$ THz
1	ROOT Muladhar	Red	430-480	455	-1.879	-	-
2	SACRAL Svadhithan	Orange	480-510	495	-2.004	$\Delta E_{12}=0.125$	$\Delta \nu_{12}=40$
3	SOLAR PLEXUS Manipura	Yellow	510-540	525	-2.168	$\Delta E_{23}=0.164$	$\Delta \nu_{23}=30$
4	HEART Anahata	Green	540-580	560	-2.312	$\Delta E_{34}=0.144$	$\Delta \nu_{34}=35$
5	THROAT Vasuddha	Pale Blue	580-610	595	-2.457	$\Delta E_{45}=0.145$	$\Delta \nu_{45}=35$
6	THIRD EYE Ajna	Indigo	610-670	640	-2.643	$\Delta E_{56}=0.186$	$\Delta \nu_{56}=45$
7	CROWN Sahasrara	Violet	670-750	710	-2.932	$\Delta E_{67}=0.289$	$\Delta \nu_{67}=70$

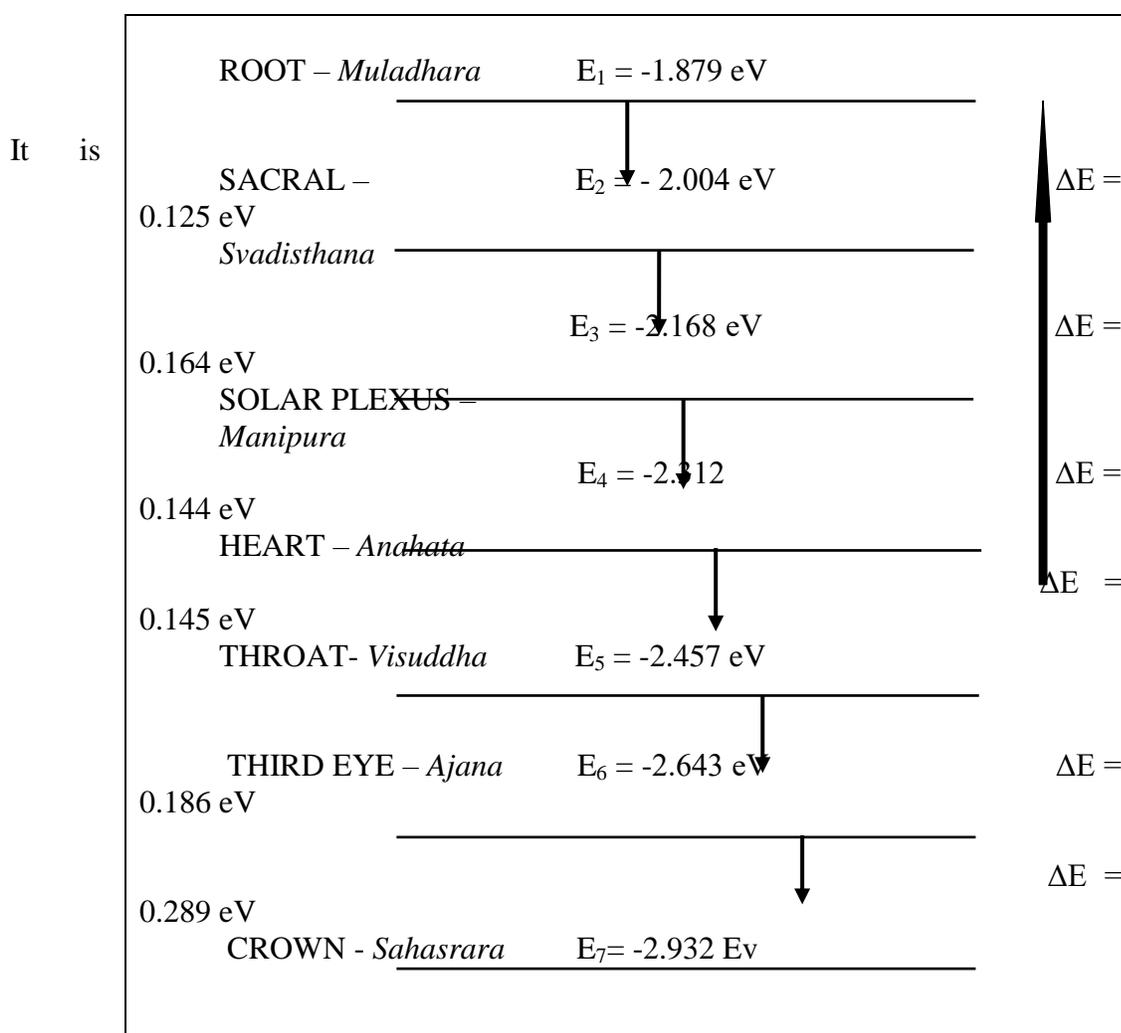

The seventh chakra in the series is CROWN which exists at the top of head skull. Colour of this chakra is VIOLET having frequency range 670-750 THz with mean value at 710 THz. Optical colours are considered here to sensitise Kundalini shakti which is assumed to be electromagnetic in character. Energy of this electromagnetic radiation is calculated on the basis of 'Quantum Theory'. Famous equation of Max Planck:  $E = h\nu_m$  is used as tool to estimate the energy of the photons that belongs to different optical radiation of seven chakras. Here,  $h$  = Planck's constant and  $\nu_m$  = Mean frequency of radiation. Mean frequencies of different colour spectrum, corresponding to different chakras are considered to find energy  $E_n$  emanating from the chakras. Calculation yields the following optimal energy values for seven chakras:  $E_1 = -1.879$  eV,  $E_2 = -2.004$  eV,  $E_3 = -2.168$  eV,  $E_4 = -2.312$  eV,  $E_5 = -2.457$  eV,  $E_6 = -2.643$  eV,  $E_7 = -2.932$  eV. Here negative energy implies bound state of Kundalini shakti which is confined in the chakras and spins or whirls around them. Energies of seven chakras ( $E_1, E_2, E_3, E_4, E_5, E_6, E_7$ ) as calculated above represent the minimum excitation or activation energies of corresponding Kundalini chakras. So additional energy is assumed to thrust in the body by some external source to activate the chakras that remain dormant in their respective locations.

**DIAGRAM 1:** Our body receives primordial cosmic energy from the Universe. Cosmic energy is assumed to enter our astral body through 'Brahma Randhra' at the top of our head. This energy is received by CROWN chakra and streams down the susumna nadi that regulates the flow of cosmic energy in various parts of our subtle body. Susumna nadi is connected with two other

channels viz. IDA nadi and PINGLA nadi. IDA nadi regulates the flow of *psychic* energy in astral body while PINGLA nadi, the *vital* energy in our gross body.

Seven chakras have specific excitation energy as noted in Table:1. In diagram:1 seven quantised energy states of seven chakras are shown. Cosmic energy as received by the body flows down to root chakra and station there. Root chakra is aroused by external incitation to move the Kundalini shakti upward. This energy is partially used to synchronise root chakra and remaining part rises to other six chakras through ida and pingla nadi to recharge them. During upward journey, some energy  $\Delta E$  is released due to transition of photons across the chakras. This released energy is assumed to be positive and surges through pingla nadi as vital energy for activating our mind and body.

**DIAGRAM 1. ENERGY LEVEL TRANSITION IN CHAKRAS**

observed in diagram:1, that CROWN chakra exists in most stable state with highest negative energy  $E_7 = -2.932$  eV. Cosmic energy transits from root chakra to sacral chakra and releases positive energy which is nearly  $\Delta E = +0.125$  eV. For transition from sacral to solar plexus  $\Delta E = +0.164$  eV, for transition from solar plexus to heart chakra  $\Delta E = +0.144$  eV, for transition from

heart to throat chakra  $\Delta E = +0.145$  eV, for transition from throat chakra to third eye chakra  $\Delta E = +0.186$  eV. So total positive energy that flows through pingla nadi and reaches third eye chakra is nearly  $\Delta E = +0.764$  eV. This positive energy supplies vital energy to our body in each cycle of Kundalini vitalisation. It is very interesting to note, positive energy released  $\Delta E = +0.186$  eV during throat to third eye chakra transition is highest of all other transitions. *From these findings it may be concluded that during chanting of mantras, singing, recitation and other throat or vocal cord related activities, vital energy flows in the body at the highest level.* So sonic stimulation of throat chakra may be regarded as most efficient method for inciting vital energy flow in our body. On the other side, least positive energy is released  $\Delta E = +0.125$  eV during root to sacral chakra transition. *So sexual activities or lower chakra transitions are not as efficient as other chakra transition to activate vital energy streaming in the body.*

**TABLE 2 :** Seven chakras are seven centres of divine cosmic energy, latent in the astral body of all human being. Kundalini sakti whirl around these centres in the form of acoustic or electromagnetic waves. Spiritual, Vital and Psychic energies emanate from these points and circulate in the ethereal body through nadi or channels. These energy centres may be treated as metaphysical equivalent of Black Body that liberates Kundalini sakti in the form of black body radiation. So it is rational to think that core of seven chakras have specific temperature and radiate definite amount of energy according to Plank's concept of black body radiation. In this Table:3, Temperature  $T_c$  and radiant energy  $E$  of seven chakras are recorded to bring out a comparative assessment. Standard theories of black body radiation as enunciated by Max Planck, Stephan- Boltzman, Wein and other scientists are applied for the estimation. **Temperature  $T_c$  of chakra nucleus:** According to Wein's displacement law:  $\lambda_m T_c = b$ . Here  $\lambda_m$  is the wavelength of maximum radiant energy and  $b$  is Wein's constant where,

**TABLE 2. THERMAL PROPERTIES OF CHAKRAS**

No	Chakras	Colours	Optical Frequency Range THz	Mean Optical Frequency THz	Temperature $T_c$ K	Energy Emission Watt/mm <sup>2</sup>	$T_c/T_h$
1	ROOT Muladhar	Red	430-480	455	4395	21.15	14.2
2	SACRAL Svadisthan	Orange	480-510	495	4781.7	29.54	15.4
3	SOLAR PLEXUS Manipura	Yellow	510-540	525	5071.5	37.48	16.4
4	HEART Anahata	Green	540-580	560	5409.6	48.70	17.5
5	THROAT Vasuddha	Pale Blue	580-610	595	5747.7	61.80	18.5
6	THIRD EYE Ajna	Indigo	610-670	640	6182.4	82.83	19.9
7	CROWN Sahasrara	Violet	670-750	710	6858.6	106.70	22.1

Normal body temperature is  $T_h = 310$  K. Rate of emission of thermal energy from human body

Wein's constant =  $2.898 \times 10^{-3}$  m-K. From this equation, temperatures  $T_c$  of chakra nucleus are calculated using mean value of corresponding chakra frequencies. It is observed that crown chakra possesses highest temperature of 6858.6 K while root chakra the least at 4395K which is nearly 1.5 times smaller than that of crown chakra. Normal body temperature of a person is nearly  $T_n = 310$  K. Ratio of Chakra temperature  $T_c$  and normal temperature  $T_n$  of human body ( $T_c : T_n$ ) are found to be 14.2, 15.4, 16.4, 17.5, 18.5, 19.9 and 22.1 for seven chakras in order of increasing magnitude. *Temperature of crown chakra is 22.1 times the normal body temperature while that for root chakra, it is 14.2 times.*

**Energy  $E_n$  of Chakra Nucleus:** Radiant Energies of chakras are calculated by Stephan-Boltzmann formula  $E = \sigma T^4$  which is generally applied to work out energy of black body radiation. Stefan's constant  $\sigma = 5.67 \times 10^{-8}$   $Wm^{-2}/K^{-4}$ . It is found that seven chakras emanate 21.15, 29.54, 37.48, 48.70, 61.80, 81.83 and 106.70 Watt  $mm^{-2}$  energy respectively at their ambient temperatures  $T_c$ . *It should be noted that crown chakra radiate cosmic energy on larger scale which is quantitatively Five times that of root chakra. So crown chakra is the most powerful source of psycho-spiritual energy.*

**TABLE 3.** Sound energy is an important tool that can recharge seven chakras. For this reason people resort to chanting mantras, singing devotional songs, sounding bells or giant gongs and blowing conch shells before holy rituals. Sound has amazing power to rejuvenate the body in different levels of physical, emotional, mental and spiritual activities. Sound waves produce vibration energy that adjust the frequencies of seven chakras and tune them to the universe. Seven chakras, located vertically along the centre of our body are vortices of vibration. Chakras are subjected to forced vibration as we focus sonic vibration of specific frequency on them. They are tuned to resonate with the spiritual and mental consciousness.

Our ancient spiritual masters and modern quantum physicists acknowledge that our universe is vibration. Dr. Michio Kaku one of the world's preeminent scientists said, 'Everything is music.' The Vedas state: 'In the beginning there was Brahman: *Nada Brahma* – the World is Sound'. From Genesis in the Old Testament, it is told that *sound is the first creative act of God preceding the manifestation of light*. Sound is the fundamental creative force in the universe.

TABLE 3. ACOUSTIC FREQUENCY SCALES OF CHAKRAS

No	Chakras	Vowel Sounds	Bija Mantras	Solfeggio frequency $n_s$ Hz	Chakra tones based on 432Hz Grid Frequency $n_g$ Hz	$\Delta n_s$
1	ROOT Muladhar	UH- huh	LAM/LUM	396	512,256,128 C	-
2	SACRAL Svadhithan	OOO-you	VAM/VUM	417	576,288,144 D	$\Delta n_{s12}$ 21
3	SOLAR PLEXUS Manipura	OH-o	RAM	528	648,324,162 E	$\Delta n_{s23}$ 111
4	HEART Anahata	AH-aah	YAM	639	729,364.5,182.25 F	$\Delta n_{s34}$ 111
5	THROAT Vasuddha	EYE-I	HAM	741	768,384,768 G	$\Delta n_{s45}$ 102
6	THIRD EYE Ajna	AYE-ay	SHAM	852	864,432,216 A	$\Delta n_{s56}$ 111
7	CROWN Sahasrara	EEE-ee	OM/AUM	936	972,486,243 B	$\Delta n_{s67}$ 84

- A,B,C,D,E,F,G represents the musical notes.
- When sound OM /AUM is chanted, vibration frequency of 432 Hz is generated. As such

The powers and sacredness of vowels have been known for thousands of years. Vowel sounds are considered as the vibration of Heaven. Resonance of sacred vowel sounds with the energy centres of the body is a well known practice in Kundalini arousal process. *AH* sound is a powerful tool for resonating the heart centre. *AH* is believed to be the sacred seed syllable – one of primordial sounds that led the other six chakras.

*Bija* mantras are the root sounds that are used to balance and align chakras. Letters of Sanskrit alphabet are the bijas. There are fifty letters in Sanskrit alphabet that sound with different wavelength and they are treated as *bija* mantras. Some of these letters are assigned to seven chakras. Bija mantras for seven chakras: *LAM*, *VAM*, *RAM*, *YAM*, *HAM*, *SHAM*, *OM*. They are considered as sonic tools and are chanted aloud to harmonise seven chakras.

Vowel sounds or Bija mantras have specific wavelengths and frequencies. In this study, Solfeggio frequencies and 432 Hz-Grid frequencies are considered as sonic tools for chakra tuning. Solfeggio frequencies make up ancient six-tone scale, used in sacred music. These tones were believed to impart spiritual blessings when sung in harmony. The main Solfeggio frequencies are: 396, 417, 528, 639, 741, 852, 936 Hz. and these frequencies are considered in this study for chakra balancing. On other scale, highest *Octaves of 432 Hz-grid frequency* are considered here as they are very close to Solfeggio frequencies. These octaves are 512, 576, 648, 729, 768, 864, 972 Hz respectively.

The study revealed the following:

1. According to Solfeggio scale, root chakra and sacral chakra frequency differs by 21 Hz. As sound energy rises to sacral chakra from root chakra, frequency of sound increases by 21 Hz with a corresponding decrease in wavelength of the wave. This variation is estimated to be least

with respect to all other chakra transitions in Solffeggio scale. In 432Hz grid frequency scale minimum variation of sonic frequency viz. 39 Hz is found for heart to throat chakra transition.

2. In Solffeggio scale, highest variation of sonic frequency is observed to be 111 Hz between throat chakra and third eye chakra which is very close to that 108 Hz of 432 Hz grid scale between third eye to crown chakra transition. In Solffeggio scale, shift of sonic frequencies across 2<sup>nd</sup>, 3<sup>rd</sup>, 4<sup>th</sup>, 5<sup>th</sup> and 6<sup>th</sup> chakras are more or less uniform around 100 Hz. But shift of frequencies across different levels of transition is very non uniform in 432 Hz grid scale.

**TABLE 4.** Brain is quantum mechanically entangled with mind that controls the flow of spiritual cosmic energy in our subtle body. As a matter of fact brain is a physical entity consisting of nearly 86 billion neurons and equal number of other cells. Brain activity is initiated by the interconnection of neurons and release of neurotransmitters in response to nerve impulses. On the other side, mind is a metaphysical notion that in turn dictates our brain activity. Relation between brain and mind is a debatable issue for a long time. Researchers found correlation between Kundalini arousal and mind dynamics. Kundalini automatically arises as one resort to meditation and advances spiritually. At the point of unconditional love, the Kundalini is very high in one's spiritual body. As Kundalini rises to higher chakras, the mind slows down. Meditators show slower *alpha* and *theta* brain wave activity, corresponding to lower brain wave frequency. Brain waves are correlated to different awareness levels and that lower the brain wave frequency, the higher would be the awareness level of mind. Fast beta waves correlate with material reality; alpha waves correlate with perception of subtle energy; theta waves correlate with the realization of one's true self ; delta waves correlate with out-of-body experience and a collective and universal feeling.

**TABLE 4 . BRAIN WAVES SPECTRUM**

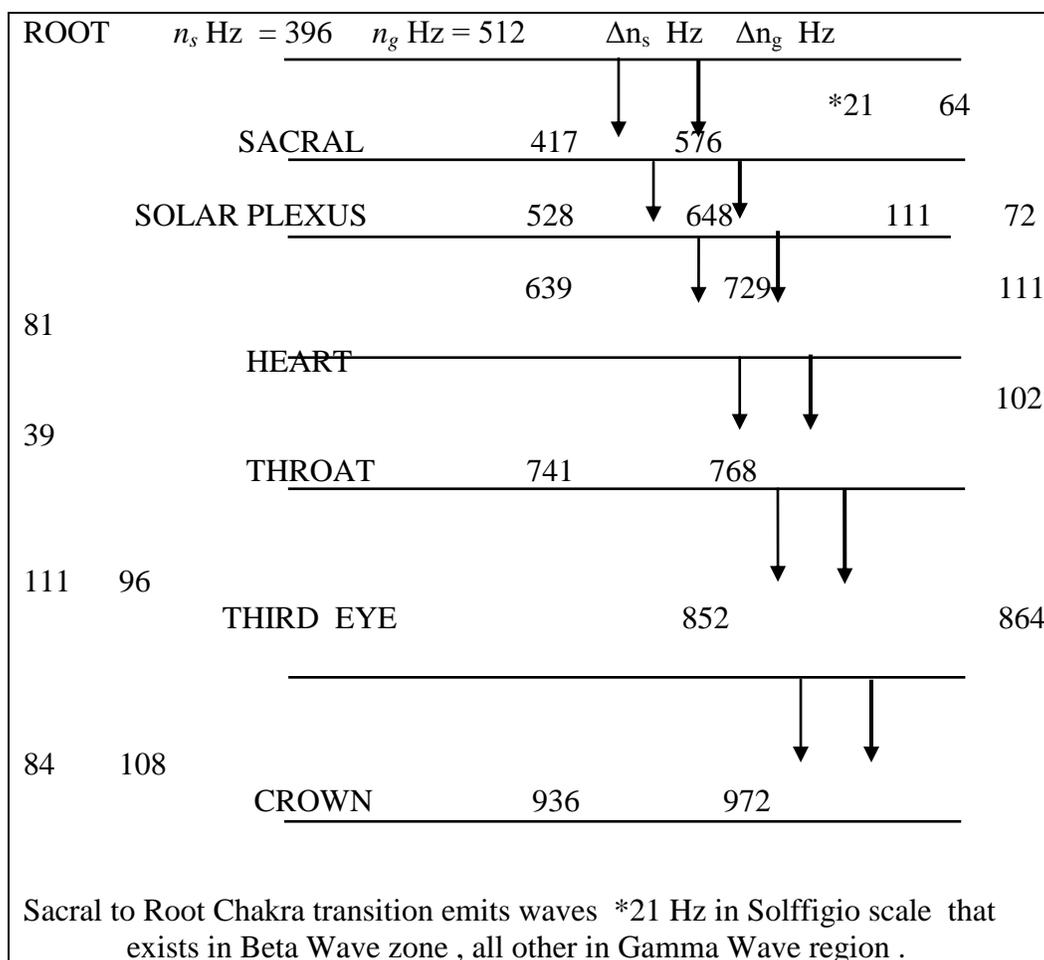

Wave	Frequency Hz	Maximum frequency Hz	Amplitude micro volt	Maximum energy f eV	Impulse
Delta - $\delta$	0.5 -4	4	100	7	Meditative state, Deep sleep, Healing, Regeneration, No body- awareness
Theta - $\Theta$	4-8	8	110	17	Creativity, Memory, Imagination, Intuition.
Alpha - $\alpha$	8-14	14	40	34	Relaxation, Resting of brain, Calmness Alertness, Mind -body coordination.
Beta - $\beta$	14-30	30	11	70	Concentration, Arousal Alertness, Judgemental Intellectual activity,
Gama - $\gamma$	> 30	100	4	140	Universal love, Higher virtues, Expanded consciousness , Spiritual emergence

**Frequency shift:** It is seen from Table:4, as the acoustic waves moves up the chakras from mooladhar to sahasrara, acoustic frequency increases and wavelength decreases. During chakra transitions, frequency level shifts by an amount  $\Delta v$ . In reference to Solffeggio tone, these shifts are : 21Hz, 111Hz, 111Hz, 102Hz, 111Hz and 84Hz respectively for seven chakras. During root to sacral chakra transition, frequency shift  $\Delta v$  lies in  $\beta$ -wave region while in all other transitions, shifted frequencies lie in high  $\gamma$ - wave region of brain waves. So it can be predicted that *due to dominant  $\beta$ -wave activity in brain, Kundalini arises from root chakra to sacral chakra with*

prevalence of concentration, alertness, judgemental qualities of meditator. In all other Kundalini transitions, due to high level  $\gamma$ -wave activity, expanded consciousness, higher virtues, spiritual orientation would develop in the mind. According to 432Hz grid frequency level, all chakra transitions correspond to high level  $\gamma$ -wave activity of brain, that reflects higher consciousness level of meditator. Gama brain waves are the fastest brain wave with higher frequency but with the smaller wavelength. Gamma wave activity of brain are associated with peak concentration and high level of cognitive functioning of mind.

**DIAGRAM 2:** According to the conventional model of Kundalini chakras, universal energy is poured down into our astral body through *Brahma Randhra*, that exist in the form of a small hole on top of head skull. This energy flows through the spiritual channels: *Sushumna*, *Ida* and *Pingala* nadi. Sushumna nadi come down vertically along spinal cord and directly connects to the root chakra at base of our physical body.

**DIAGRAM 2. FREQUENCY SPECTRUM IN CHAKRA**

**TABLE 5.** To activate the latent energy of Kundalini chakras, a laser source of +20 eV is considered as source of electromagnetic energy. This is assumed to focus on the skull of a subject pointing towards the crown chakra. This electromagnetic energy enters the astral body of the subject through brahma randhra and transmitted down to root chakra through sushumna to

activate it. Root chakra consumes -1.879 eV energy to recharge itself. Remaining +18.121 eV energy moves up to sacral chakra through pingla and resynchronise it with - 2.004 eV energy. Residual +16.117 eV energy moves up to solar plexus and retunes it with -2.168 eV. As a result, remaining +13.949 eV flows up to heart chakra which is recharged with -2.312 eV. Remaining +11.637 eV energy spirals up to throat chakra and recharges it with - 2.457 eV. Rest amount of energy +9.18 eV reaches third eye chakra and balances it with -2.643 eV. Remaining +6.537 eV energy reaches the crown chakras and recharges it with -2.932 eV. Finally excess amount of energy +3.605 eV leaves our astral body through third eye after balancing the whole chakra system. These data are recorded in Table:5.

**TABLE 5. FLOW OF ENERGY IN KUNDALINI CHAKRAS:**

No	Chakras	Colours of Chakras	Optical Frequency Range THz	Mean Optical Frequency THz	Recharge Energy eV	Absorbed Energy - $\Delta E$ eV	Surplus Energy +eV
1	ROOT	Red	430-480	455	-1.879	-	+18.121
2	SACRAL	Orange	480-510	495	-2.004	$\Delta E_{12}=0.125$	+16.117
3	SOLAR PLEXUS	Yellow	510-540	525	-2.168	$\Delta E_{23}=0.164$	+13.949
4	HEART	Green	540-580	560	-2.312	$\Delta E_{34}=0.144$	+11.637
5	THROAT	Pale Blue	580-610	595	-2.457	$\Delta E_{45}=0.145$	+9.18
6	THIRD EYE	Indigo	610-670	640	-2.643	$\Delta E_{56}=0.186$	+6.537
7	CROWN	Violet	670-750	710	-2.932	$\Delta E_{67}=0.289$	<b>+3.605</b>

\*Induced energy of excitation is taken to be 20 eV

Chakra	Recharge Energy	Position
7. Crown chakra	-2.932 eV	
6. Third Eye Chakra	-2.643 eV	
5. Throat chakra	-2.457 eV	
4. Heart chakra	-2.312 eV	
3. Solar plexus chakra	-2.168 eV	
2. Sacral chakra	-2.004 eV	
1. Root chakra	-1.879 eV	

**Diagram3 : Energy flow in chakras with recharge energy = 20 eV**

According to the conventional model of Kundalini chakras, universal energy is poured down into our astral body through *Brahma Randhra*, that exist in the form of a small hole on top of head skull. This energy flows through the spiritual channels: *Sushumna*, *Ida* and *Pingala* nadi. *Sushumna* nadi come down vertically along spinal cord and directly connects to the root chakra at the base of our physical body. So energy received by our body through *Brahma Randhra* passes directly to mooladhar or root chakra. *Ida* nadi and *Pingala*

nadi that spiral up around the *sushumna* channel from root chakra, interact with each other at other five chakra centres, except crown chakra. *Ida* and *Pingala* carry spiritual cosmic energy or kundalini shakti in the upward direction. Dynamics of flow mechanism of spiritual energy in three channels is demonstrated schematically in this diagram 3.

**CONCLUSION:** Chakras are sensed as discs or wheels of cosmic energy which is basically metaphoric form quantised energy states of spiritual body. This energy spins round the nucleus of chakras which act as vortices of energy field. In this whirlpool, cosmic energy from the spiritual body becomes denser and denser and converted to vital energy of gross body. Although, nadis and chakras have metaphysical manifestation and operation in the spiritual body, physical centres of gross body have close relationship with these astral centres. The piezo-electric vibrations that are produced in physical centres by external excitation, have desired effect in the subtle centres to convert cosmic energy to spiritual energy. As a matter of fact, *chakras act as*

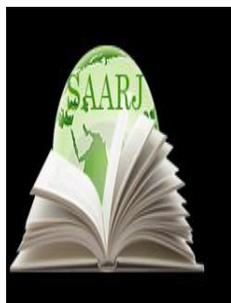

*bridges between subtle body and physical body for the passage of cosmic energy to be converted to physical energy.* Chakras behave like modulation centres for converting astral energy to physical energy and creates link between ethereal body to physical body. Cosmic energy of our astral body is quantised in seven energy states that emerge as seven chakras. Quantised energy transits across the chakras through photons or phonons and liberates vital energy that supplies psycho-physical energy to our gross body. This transition of energy particles can be sensitised by meditation and by inputting additional energy to the chakras through acoustic or optical excitation. This study revealed the following results:

1. Maximum psycho-physical energy is generated during Kundalini arousal from throat to crown chakra transition. So sonic stimulation of throat chakra may be regarded as most efficient method for inciting vital energy flow in our body.
2. Ethereal energy of astral body exists in quantised form and remains localised in seven energy states which are known as Kundalini chakras.
3. Temperature of crown chakra is highest out of seven chakras which is 22.1 times the normal body temperature of man while that for root chakra, it is 14.2 times only.
4. Crown chakra possesses maximum cosmic energy  $-2.932\text{eV}$  which is quantitatively Five times that of root chakra. So crown chakra is the most powerful source of psycho- spiritual energy.
5. When Kundalini rises from root chakra to sacral chakra, dominant  $\beta$ -wave activity is observed in brain with prevalence of concentration, alertness, judgemental qualities of meditator. In all other Kundalini transitions, due to high level  $\gamma$ -wave activity, expanded consciousness, higher virtues, spiritual orientation would develop in the mind.
6. In every cycle of Kundalini balancing ,18 percent of excitation energy as excess amount leaves our astral body through third eye .

 Department of "Geography",  
 Candidate of Geographical Sciences,  
 Fergana State University,  
 UZBEKISTAN

### ABSTRACT

*The article covers complex natural geographical studies conducted in the Fergana Valley in the first half of the last century; that is, the study of geology and geomorphology, the study of climate and water, the study of soil cover, the study of flora and fauna, the study of landscapes, the study of complex natural geography, and the concepts of geo-ecological problems formed after the third quarter of last century opinions about.*

**KEYWORDS:** *Landscape Structure, Ecological Situation, Groundwater, Anthropogenic Impact, Meteorological Conditions, Pesticide, Concentration, Idea, And Concept.*

### INTRODUCTION

The Fergana Valley has a complex landscape structure, which is a huge and unique depression among the mountains. It consists of various natural and natural-anthropogenic landscapes in the highlands, such as deserts, hills, mountains and pastures. The ancient use of available natural resources, the extremely high population density (160, sometimes 500 people per km<sup>2</sup>), the large number of manufacturing enterprises have led to extremely drastic changes in the natural environment. Production has contributed not only to changes in the environment, but also to pollution, the impoverishment of wealth. As a result, the local ecological balance has become relatively unstable, becoming thinner and more volatile.

### THE MAIN FINDINGS AND RESULTS

The change of the natural environment in the Fergana Valley and the aggravation of the ecological situation, its geographical location, specific natural conditions and factors, existing territorial and local natural laws and regulations; stability and variability of natural complexes,

nature of economic activity of the population, associated with several other characters, such as the development characteristics of production. The main focus is on the analysis of the land fund by the administrative-territorial structure of the country. As a result, within the administrative units we will be able to identify the state of the land fund, their quantitative and qualitative changes, the state of the environment in the region and possible environmental problems and develop rapid measures to prevent them [7, pp. 14-19].

The fact that the Fergana Valley is surrounded by high mountain ranges and is connected to the Tashkent-Mirzachul foothills by a narrow corridor (Khojand Gate) only in the west, and only the Syrdarya River flows from it, defines its many individual, local features. In this regard, the outflow of many streams, especially from mountain slopes, leads to the accumulation of natural and man-made substances in their conical distributions. The flow of groundwater is saturated with salts, heavy metal ions, petroleum products, pesticides, mineral fertilizers, detergents, industrial waste, etc., dissolving various substances due to the flow of sediments from the layers close to the surface. Consequently, cone spreads are observed not only in the accumulation of salts, but also in the accumulation of man-made wastes, part of which is observed in the transition of the alluvial-proluvial plain to Central Fergana with groundwater flow. That is why Syrdarya water is absolutely unfit for drinking from Uchkurgan.

The presence of mountain winds is typical for the Fergana Valley. The winds are northerly in the north, south in the south, and east in the west. Kokand and Bekabad winds are seasonal, sometimes reaching 15-20 m / s. The abundance of mineral resources in the region serves as a basis for the development of industrial production, but man-made wastes, due to the specific characteristics of the sinkhole, lead to the accumulation of the bulk of them here. The development of various industries and the development of transport will lead to the saturation of the environment with man-made waste.

Existing industrial hubs in Khojand, Kokand, Margilan, Fergana, Altiyarik, Kuva, Haydarkon, Sulukta, Kyzylkiya, Kadamjay, Chauvay, Osh, Jalal-Abad, Asaka, Andijan, Namangan and other places surround the valley and pollute it with various wastes. Due to the complexity of their disposal, waste accumulates in the area, exacerbating the environmental situation. Atmospheric air pollution is caused only by natural factors, such as dust, in this regard; it is worth noting that the weight of anthropogenic impact is extremely large. In the air industrial zone, the REM in the air is 2.2 times more phenol, 14 times more hydrogen sulfide, and 14 times more hydrocarbon [1, pp. 71-76. 87, 90-91].

The aggravation of the ecological situation in and around the city of Quvasoy in 1980-90 is associated with the activities of a cement plant located in the region. Thus, each km<sup>2</sup> area averaged 743 tons of cement dust, 33 tons of lime dust, 542 tons of eol and inorganic dust per year. If, in addition to the cement plant in the city, the phosphorus, paint plants, quartz and reinforced concrete plants, GRES and other manufacturing enterprises, as well as dust, toxic gases and emissions from vehicles are taken into account, the environmental situation will worsen.

Due to the peculiarities of meteorological conditions in the Fergana Valley, ie the stagnation of the weather, especially in summer, the distribution of waste in it slows down, which can be felt in the settlements. In the Kirguli industrial zone of Fergana, bitter smoke (smog) occurs in autumn and winter, which indicates that the atmospheric air is sometimes stagnant, confirming

its pollution. Air pollution has been found to increase from west to east and from north to south. According to the State Committee for Nature Protection (1990, 1994, 1995, 1998, and 2000), the analysis of the dynamics of air pollution in the cities of the Fergana Valley allowed to determine the following results [1, pp. 71-76, 87, 90-91].

First of all, we can see that by 2000, the amount of emissions into the atmosphere has decreased by almost 2 times compared to 1990. However, high levels of air pollution remain in Fergana, Kokand, Andijan, and neighboring cities.

It can be seen that in 1990, the amount of waste in the cities of the Uzbek part alone was 151.3 thousand tons, while in 2000 the total amount of waste in the same cities was 64.0 thousand tons. This is a satisfactory level in any case. According to the study of water use data, the Syrdarya and groundwater in the valley currently generate an average of 25.7 km<sup>3</sup> of life per year (of which 1.1 km<sup>3</sup> is groundwater and the rest is surface water). Experts estimate that more than 18 km<sup>3</sup> of that water is used in agriculture and more than 1.5 km<sup>2</sup> in industry and utilities. Of this, the amount of non-returnable water is more than 8 km<sup>3</sup> per year.

In order to develop the protected lands of Central Fergana in 1950-60, to improve the reclamation of existing irrigated lands in Fergana and Andijan regions, the construction of several main collectors and dense drainage networks was started. Currently, the irrigated area of the valley is occupied by very dense collector-drainage networks, as a result of which the previous positive salt balance was replaced by negative expenditure in the second half of the 1980s, the amount of salt leaving the drainage network is quantitatively higher than income. According to EI Chembarisov (2001), in the second half of the 1990s, the average in Andijan region was 3.6 km<sup>3</sup>, the level of mineralization was 1.3 g / l, in Namangan region it was 1.2 km<sup>3</sup> and 1.6 g / l, respectively, 2.7 km<sup>3</sup> and 2.6 g / l of collector water were generated in Fergana region, the total water volume was 7.5 km<sup>3</sup>. All collector-drainage water is discharged into the Syrdarya. As a result, the river water became polluted and its salinity increased several times. According to experts, the salinity of the Syrdarya water increases from an average of 0.60-0.63 g per liter in Namangan to 1.6-1.8 g at the confluence of the Keles River [2, pp. 135-137].

It was found that up to 13% of mineral fertilizers are washed away during irrigation, with an average of 30% of nitrogen and potassium in the drainage water, and about 1 kg of phosphorus per hectare. In addition, pesticides, heavy metals, petroleum products, and other substances that fall into the soil are found to leach out when dissolved in runoff. Consequently, the Syrdarya water is not only increasing in level of mineralization, but also becoming polluted. Due to this phenomenon, the accumulation of salt in the soil during the irrigation of crops in Mirzachul and Lower Syrdarya is developing.

As a result of the spill of more than 1 million tons of oil at the Fergana oil refinery, a large area of groundwater was polluted. In this case, the concentration of methane (up to 10%), the volume of gaseous hydrocarbons, carbon dioxide exceeded 5% [5, pp. 219-223]. The New Kokand Chemical Plant was launched on the Sokh River cone, which was designed to produce sulfuric acid and ammophos. Due to the fact that the cone distribution is composed of coarse rocks, the water permeability is extremely fast, and there is a clean and fresh artesian water basin with large reserves in the area. After the launch of the plant, the water basin began to become polluted and the flow of polluted water reached the Syrdarya. Due to this, the enterprise was suspended and

adapted for the production of other products. It is unfortunate that when a chemical plant is designed, its environmental impact is not summarized.

Chemical pollution is predominant in groundwater pollution. The main reason for this is due to several factors such as mining, chemical, oil refining industries, application of mineral fertilizers and pesticides to the soil. According to experts, the presence of hydrogen sulfide in the well water around the Fergana furan compounds in the amount of 0.58-2.40 mg / l. The small amount of hydrogen sulfide added to the water also prohibits the use of such water for any purpose [3, pp. 29-87].

The Novkat-Kadamjay-Haydarkon non-ferrous metals and radioactive substances region on the southern slopes remains an active factor in the pollution of mountain groundwater. Heavy metals are found in the groundwater in the Kuvasoy-Fergana-Margilan-Kokand region. This phenomenon is also explained by the presence of an ore zone on the slopes of the Alay Mountains and the migration from it towards the foothills as it melts in the groundwater flow. The fact that the weight of heavy metals is several times higher than REM makes it possible for groundwater to develop various serious diseases when it is consumed by living organisms. For example, the wastes of lead and mercury deposits in Southern Fergana are transmitted to humans and livestock through soil-water-vegetation, causing various endemic diseases in their organs. The impact zone of the mines is facilitating the proliferation of endemic goiter in humans and livestock. Livestock affected by this disease produce 30-40% less product.

In a densely populated and irrigated valley, where water is scarce, the most urgent and priority task should be to use water efficiently and prevent its pollution. According to the data obtained, 3.8 million hectares of the plain part of the Fergana Valley are arable lands. Of this, 1.3 million hectares are arable land, 2.9 million hectares are natural pastures, 1,278,000 hectares are arable land, 137.6 thousand hectares are vineyards and orchards, and the rest is state reserve land. The current use of this land fund is seriously problematic and requires many factors to be taken into account [6, pp. 39-42].

The most pressing problem is the efficient use of available irrigated lands at a time when the population is growing every year, the continuous increase of soil fertility, the introduction of irrigable lands into scientific management, etc. The development of irrigated agriculture in the region, where land and water resources are extremely limited, requires a highly rational use of land. But analysis of available data often shows the opposite. In order to develop new lands, in the early 70's, the hills were introduced into irrigated agriculture. Due to the fact that irrigation was not carried out on the basis of an engineering project with the participation of mature specialists, land development was started by collective farms or small construction organizations without making sure that the hills could be developed for irrigation and without understanding how efficient land use would be.

The hills are mainly composed of layers of conglomerate, sandstone, sand, gravel, limestone, gypsum; the surface of the coarse rocks is covered with thin loess deposits, in some places the layers of sand and sand are completely washed away. The terrain is steep and wavy, weak, moderately indented in places. The water issue in the hills is complicated. As a result of land development without taking into account the specific features of the hills, large areas are covered by soil washing, jar erosion, suffocation, karst events, salinization, erosion and other processes. Therefore, many "damaged" landscapes are emerging in the hill region. Therefore, the

"experience" of development and use of hilly lands is quite dramatic, in this regard, it is necessary to rely on scientific achievements in the use of water and land, as well as the experience of farmers [4, p. 111].

Due to the natural geographical features and reclamation status of the Fergana Valley, the plains and the foothills of the cones are prone to soil salinization. In the 60s and 70s, soil salinity was strongly developed in these areas. The main reason for salinization was due to the extremely low water permeability of lysosim deposits, the abundance of residual salt reserves in them, the unevenness of the soil, and so on. Construction of main collectors (Northern Sokh-Isfara, Achchikkul, Pishkaron, Karakalpak, Fayziabad, Sari Joga, etc.), dense (25-30 m per hectare and more) ditch networks in the 70-80s, and most importantly, the widening of vertical ditch wells scale construction led to a curbing of the soil salinization process in the Fergana Valley, as a result of which the regional negative salt balance began to dominate. Salt accumulation is still occurring in some areas, but can be managed.

Conclusions and Discussions: The Fergana Valley is a typical area where deflation and erosion occur on a large scale. Low mountains and hills are dominated by floods, hail and torrential rains. Experts' opinions on these issues have been published. Erosion is particularly developed in Namangan, Osh and Fergana regions. Only 60-65% of the hilly lands of Namangan region are eroded. In the process of washing the fertile humus layers of soils, their content is reduced to 30-45%, the mechanical composition is roughened. Consequently, washing of the humus layer has a negative effect on the normal vegetation of the plant.

According to A. Kazakov and others (2003), in Namangan region, the slope is 0-10 in 36.7% of the area, the soil is not eroded in this area, and the slope is 1-30 in almost 11% of the area, in dry lands erosion almost does not occur. Lands with a slope of 3-5 and 5-70 account for 19% of the area. In such areas, especially on irrigated lands, erosion has developed to varying degrees. The slope of the remaining lands is more than 70 and they occupy 67% of the area. Erosion on these slopes has the potential for formal development [5, pp. 219-223].

In the western part of Fergana, the wind blows from the Khojand corridor to the valley at a high speed (15-20 m per second) every year to the Altiyarik meridian. In the process, the entire Kokand oasis, especially Dangara and Besharik districts, will suffer serious losses. This means that its environmental and socio-economic consequences must be comprehensive, complex and wide-ranging.

The flora of the Fergana Valley is diverse, a feature that is especially well observed in the zoning of landscapes along its height. In the plains, the area of natural flora has been significantly reduced due to the long-term development of irrigated agriculture and animal husbandry on the hills, the growth of dry farming on the lower slopes, as well as the provision of housing and land.

Rare brush wood forests are rare on small plots along the Syrdarya. In the Kokand forestry, about 10,000 hectares of natural brush wood ecosystems have been preserved. In order to protect crops from the wind, special shelters of several rows of fruitless and fruit trees were built on the banks of canals and ditches, along roadsides, on the borders of farms, starting from the 50s. At first, the reserves were under the control of the state authorities and no one dared to cut them. Later, the reserves were handed over to the collective and state farms of that time.

In mountainous, hilly and low mountainous areas, due to the almost complete absence of vegetation, especially trees and shrubs, they are generally considered to be a place of bare, erosion, flood and torrential rains. That is why landslides, landslides, jar erosion are widely developed. Indeed, there are changes in the direction of increasing the depth of the land fund, pastures, soil cover, and the roughness of the mechanical composition. At their footsteps, everything from mudslides to rockslides is accumulating.

### CONCLUSION:

Based on the above ideas and considerations, the periodicity of geo-ecological problems formed in the Fergana Valley has been developed by us. By studying this periodicity, it is possible to analyze the dynamics of geo-ecological problems formed in the region.

It is possible to develop a system of measures to improve the state of the environment in the region by analyzing the geo-ecological problems that have arisen in the Fergana Valley and the concepts (views, ideas) related to their solution [5, 7].

 UZBEKISTAN  
 Email id: mushtariy63@mail.ru

### ABSTRACT

*The article discusses the issues of teaching students to work with literary texts, interest in reading aesthetic perception of a work of art in general, the use of questions and tasks in mastering the content of the work in the Uzbek language lessons for Russian groups. The reader begins to observe the intention of the author of the work, his attitude to the protagonist, the causes and consequences of events and happenings. This process takes place in connection with the study of the realities of life. Readers who see fictional text are always intimidated by the thought that they need to study literature. On the other hand, a literary work is of great interest to students with its content and life experience.*

**KEYWORDS:** *Work Of Art, Artistic Perception, Visual Medium, Tradition, Custom, Independent, Creative, Problematic, Questions And Assignments, Methods And Techniques.*

### INTRODUCTION

Young people are at the center of all reforms in Uzbekistan. Therefore, the upbringing of a harmoniously developed generation is one of the main tasks of our state. "First of all, we are talking about promoting the rich history of our country, its unique culture, creating the necessary environment and conditions for broadcasting the achievements of world science and literature among young people and the population" [1].

The problem of teaching students to read a work of art is not only the basis for the formation of readers, but also creates wide opportunities for enriching their spiritual world. Based on this, students will be able to perceive the work of art as a whole. The study of the literary text in the Uzbek language classes in Russian groups serves not only to educate the reader who can enjoy

the aesthetics of the work of art, but also to absorb the oriental spiritual wealth that makes up the content of fiction. Working in the Uzbek language helps to understand the psyche, lifestyle, customs and traditions of the Uzbek people. Accordingly, pedagogically and methodologically correct organization of work on a literary text is important in all respects.

In adolescence, there is a need for self-awareness, knowledge and assessment of the moral and spiritual qualities of others, an understanding of one's own feelings and experiences, which leads to the desire to read and study literary texts that can satisfy this need. The reader begins to observe the intention of the author of the work, his attitude to the protagonist, the causes and consequences of events and happenings. This process takes place in connection with the study of the realities of life. Only when his independent research goes in the right direction and leads to the right solution will he be satisfied with his work, inspired to continue this work. All that is needed in these studies is the motivation that gives the reader the right direction, that sometimes leads to the choice of one of two paths, that encourages deep observation. Questions and assignments about the text should serve such a motivating function.

#### The Main Findings and Results

Some teachers of the Uzbek language take an excerpt from a literary work or even a poem as a simple educational text and use methods of working with the text according to the method of the second language: teach the text, learn words and some grammatical materials to explain the content, translate the text into Russian in order to master the content, get answers to questions, retell the content of the text and other similar activities. It is true that it is difficult for a Russian-speaking reader to read and understand a text in Uzbek, and sometimes it becomes the most difficult task for him. But the main goal of reading and studying a literary work is not to assimilate its content, but to understand it artistically. In the process of working on the artistic perception of the work, a deep penetration into the content spontaneously occurs. This is the only way to correctly select and implement the system of methods and techniques. Carefully designed questions and tasks should point to this system of methods and techniques.

Readers who see fictional text are always intimidated by the thought that they need to study literature. On the other hand, a literary work is of great interest to students with its content and life experience. Observations show that there are students in the class who have not read the lesson, and who want to read the rest of the passage to the end, even after the call. This is also the advantage of such texts over insensitive reading texts of the scientific article type.

After reviewing the terms of the assignment, a Russian-speaking student should feel that his hadith is unfounded. Indeed, it is desirable that the questions and tasks do not contain clear signs of studying the theory of literature. Works on the literary text in the Uzbek language represent the work in the context of transferring the knowledge, skills and abilities acquired by the student in the lessons of Russian literature, their use, application to the work in the Uzbek language. It is true that sometimes it is necessary to remember the theoretical information given in the lessons of Russian literature, but still, it should not take the form of a theoretical lesson - a form.

The above is the basis for creating a system of questions and tasks on the literary text, which serves to educate national spirituality in the lessons of the Uzbek language. This can be expressed in terms of the following principles:

- 1) not to focus on mastering the content of the work on the work of art, to focus it only on artistic perception;
- 2) to rely on the knowledge, skills and abilities acquired by students in the lessons of Russian literature;
- 3) to formulate questions and assignments in a way that does not arouse the imagination of studying the theory of literature;
- 4) directing questions and tasks to the understanding of the behavior of the characters, the visual means used in the text, the aesthetic value, the charm of the genre of the work.

An excerpt from a work of fiction can cause aesthetic pleasure in a Russian-speaking reader with a certain literary background (which is formed in the lessons of Russian literature). But for this, first of all, it is necessary to read the text and then understand the content. So, to prepare the student for this, it is necessary to start lexical and grammatical exercises a few lessons before.

Work on a work is aimed at determining whether the emblems that provide an aesthetic perception of the work of art are perceived correctly and to deepen the perception. In organizing this work, the teacher of the Uzbek language will be helped by the first expressive reading of the text, as well as questions and tasks related to the first analytical work. H. Suyunov's research work "Methods of teaching students to work on questions in literature classes" [2] describes in detail what should be the questions and assignments on the work of art in Uzbek schools.

Of course, it is not possible to use these recommendations in the Uzbek language classes of academic lyceums and professional colleges where education is conducted in Russian.

For both the teacher and the student, who becomes the subject of instruction, a task, a creative question that allows solving problems, serves as the key to defining independent, purposeful activity in work. Pedagogical management of the educational process is manifested in the indication of the correct path to the goal, which involves the organization of students' activities in an orderly manner, consistently at the level of new pedagogical technologies. The results of reading and studying each literary material are also taken into account.

Questions and assignments are divided into two types according to their placement in relation to the text:

1. Assignments before reading a literary text.
2. Questions and assignments after the literary text.

In most cases in the textbooks "Uzbek language" before the text "Read the text", "Read the text". Answer the questions ", "Read the story, retell its content in your own words ", "Read and memorize the poem expressively ", "Read the poem expressively and tell us what impressions you made ", "Read the passage".

Researcher K. Jalilov notes that "one of the strategies developed to work with literary texts and help to understand the text in literature lessons is to activate the existing scheme in the reader before reading the text. There are several ways to activate the scheme: to set specific goals for the reader, to ask questions about the essence of the work being read, to memorize knowledge that helps to understand the text, to pre-teach words that are difficult to understand in the text "[3].

Reading a literary text begins with an assignment immediately after the teacher's brief introduction. The assignment refers to the scope of the work to be done in the lesson. For example, "Read the text" means that the work on the text should be limited to the level of reading comprehension.

The methodology uses different approaches to whether students should be asked questions and assignments before reading work on their own: assignments focus students' attention on some important aspects of the work that they may not notice independently, but, on the other hand, on questions and assignments, especially if there are several of them. In this case, it interferes with the direct perception of the work, reducing their interest. This is confirmed by observations.

According to S. Kambarova, a methodologist, "reading any text in its entirety in many cases can lead to a superficial understanding of its content. Naturally, the questions and tasks asked while reading the text enrich the reader's feelings with aspects that were not understood in the previous acquaintance." [4].

Post-text questions and assignments should focus on the mental and emotional development of students, as well as create an appropriate speaking environment for comfortable communication in the Uzbek language in the process of studying the literary text.

In some Uzbek language textbooks [5], the questions and assignments given after the literary text are aimed only at mastering its content. For example, the following assignments are suggested for a passage from the novel "Riding the Yellow Giant": *Read the text carefully. Tell us about how the magic cap helped Hashimjan. Read the text in roles. Explain that a child who is not well educated in school cannot have a profession.* Questions and assignments on some texts also reflected the idea of the work, its connection with life. But these are by no means sufficient for a deep and complete understanding of the literary text.

We consider it expedient to formulate questions and tasks in the context of the sequence in which the activities of the teacher and students are carried out in the study of a literary work. For instance:

- 1) questions and assignments related to lexical and grammatical exercises performed before reading an excerpt from a work of art;
- 2) questions and assignments asked before reading the literary text;
- 3) questions and assignments in the process of expressive reading and during the initial analysis;
- 4) questions and assignments after reading the passage;
- 5) questions and assignments as homework;
- 6) Questions and assignments related to the repetition of what was taught in the next lesson.

In the methodical literature the classification and typology of questions and tasks according to a method of performance, methodical descriptions are various. The manual "Methods of teaching literature in SPTU" offers the following types of questions and assignments: individual, group (for several people), general, ie general questions; questions and assignments for homework and classroom activities; questions and assignments that organize and summarize observations on the text during reading; a wide range of questions and, if necessary, additional questions and assignments indicating where to look; questions on the selection and collection of material, as

well as questions that organize the comprehension of the text; a system of questions for the teacher to talk to students and for independent work; a system of questions aimed at analyzing a single event or a set of events, as well as comparing works, emblems [6].

The above classification includes questions and assignments based on the text read.

Today's demand is based on a compensatory approach, taking into account the talent of the student in education. Such education requires gifted students to be given individual or group tasks. Accordingly, there are three types of question and assignment preparation:

1. Questions and assignments for students.
2. Group questions and assignments.
3. Questions and assignments for individual students.

Naturally, the tasks set for the student differ from the tasks set for the group. Because there are several people working in a group, most of them have to solve problems. Student options will be limited. But in general, it is natural that the task that the gifted student will take on will be more difficult and complex than the questions and tasks that are given to the whole class.

Questions and assignments for the whole class on the study of the work are usually given to students who are well versed. But based on questions and assignments, everyone prepares to the best of their ability. Not giving additional or complicated questions and assignments to gifted students has a negative impact on the activity of the students in the class. When 3-4 students are always asked, they feel that other students do not have enough opportunities and do not take interest in the lesson. It is preferable to have written assignments in mind when assigning homework. The student has to find written answers to several questions and so on. But the fact that these tasks should not take much time from the student stems from the general didactic requirements. Questions and tasks that organize and summarize the work of observing the text while reading are one of the most important types of work done in the classroom. For example, identifying details that help reveal the character of the character, etc.

In Uzbek lessons, detailed questions are rarely used, as well as additional questions and assignments indicating where to look if necessary. This is due to the fact that it takes a certain effort for the Russian-speaking reader to find the word to answer in the text instead of the question word in the creative question and answer creatively (and not the sentence used in the text), but this is not an easy task. A student who does not have practical speaking skills in Uzbek will not be able to give a satisfactory answer to a wide-ranging question in which he will be able to express his thoughts in a few sentences (he can only read a passage from the text).

Questions that focus on the selection and collection of material, as well as questions that organize its understanding, can search for, highlight or articulate visual aids, symbols, words that express the position of the author, and other similar aspects of the text. These materials serve as a basis for describing the protagonist of the work. The system of questions for the teacher to talk to students and for independent work, as mentioned above, should consist of creative questions.

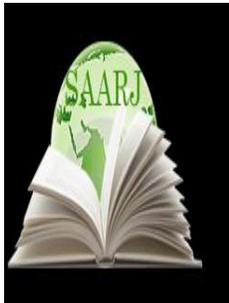

A system of questions aimed at analyzing an individual event or a set of events, as well as comparing works, symbols, is useful when working with gifted students who know the Uzbek language in practice.

**CONCLUSION:**

In short, the study of literary texts that serve to perceive the spiritual wealth of the East in the lessons of the Uzbek language in Russian groups, the correct use of the system of questions and tasks is of great pedagogical and methodological importance in instilling in the reader aesthetic enjoyment of a work of art.

## MANIFESTATION OF NATIONAL SPIRITUAL FEATURES IN THE SUBJECTS OF SOCIAL POLICY

**Shahlo Urinboevna Akhrorova\***

### ABSTRACT

*In social policy, the structure of society, the objective potential of the country and subjective factors of management interact with each other, and the identification of these objects and subjects, their compatibility and national-spiritual characteristics is one of the main problems of modern theory and practice of social policy. The article discusses issues such as the impact of the existing social policy on the activities of objects and subjects, the impact of manifestation of national characteristics on the development of society.*

**KEYWORDS:** *Society, social policy, subject, object, economy, politics, spirituality, social sphere, nation, national upbringing, national characteristics, national values, social relations, social relations, citizen, state.*

### INTRODUCTION

It is well known that in subject-object relationships, the subject always has an initiating property representing the side that purposefully acts on the object. The object is the affected side. Many believe that the subject of social policy is the state, and the object is society, but in the process of making decisions in the system of social relations, the subject can also be society, and the object - the state. In any society, social groups, people, or parts of society grouped in a particular direction follow, and they become real subjects of social policy. Groups that do not act on an organizational basis in social processes are inactive formal subjects. Thus, the subject of social policy is an active participant in the processes and relations associated with social policy, having its own competence and responsibility in the development and implementation of social policy in accordance with the procedures established by state legislation. Each subject will have boundaries of impact on society and an object that covers this area. Today's social policy is characterized by its multi-subjectivity and diversity, and its subjects - organizations, institutions,

various socio-legal institutions, government agencies and departments, social and political associations, associations, associations and movements, as independent and real social groups in society. committees, economic entities, local self-government bodies and even commercial structures. In a democratic state, the people are the only source of state power and therefore can logically be the first subject of social policy. But the people act as the main object of social policy, since they exercise their power directly through the bodies of state power. The object can also include society, people, labor resources, social strata and groups, processes related to social policy, relations, mechanisms for implementing social policy. In addition to social groups, the subjects of social policy include secondary organizational structures that serve the interests of this group. For example, in order to further revitalize the higher education system, such structures as the “Council of Scientists”, the “Association of Women Scientists”, and the “Academy of Sciences” can be established. But they are inseparable from the higher education system and are a secondary subject.

### **The Main Findings and Results**

Although the activities of subjects in civil society are independent, the general rules specific to society and the nation, the national characteristics, give rise to their interrelationships. The criteria that govern national norms are national values. Although the rules of society change depending on the type and period of social policy, the basis of national values in the space in which society operates remains. This basis is reflected in the national-spiritual characteristics of independent subjects and remains a criterion that ensures commonality even among conflicting subjects. For example, the introduction of a national education system based on national education in Uzbekistan reflects a specific form of educational effectiveness and determines the development of national society. Based on the concentration, formation and application of national values as a core, the mahalla institute is also essentially national. It is important to take into account national and spiritual characteristics in ensuring the viability of society and the stability of social policy. Citizens are also subjects of social policy. Because their interactions, interactions, will have their place in society, and as a representative of a particular nation, their activities will certainly reflect the characteristics of the nation.

The activity of the subjects, their place in society, the degree of expression of national characteristics depend on the social policy system. For example, the absence of the role of some subjects in the system of administrative command, the fact that they should be the same institution in the existing social system, may be organized in form, not content. They do not fully comply with the functions enshrined in the charter, or even if they do, this activity is adapted to the single ideology of the totalitarian system. In order for a social policy entity to function as a subject and to reflect its national characteristics, it must move from a system of administrative governance to a system of democratic governance. Only then will the basis for the transition to civil society be created. Thus, an important condition for civil society is multiplicity, which actually acts in the social, economic, cultural, educational, legal and political implementation of social policy. Social policy forms an integral system with subjects and objects of all spheres of society, and a broad analysis of all its branches requires the study of society in the economic, social, political and spiritual spheres. We look at the manifestation of national characteristics in the subjects of the industry.

Economic freedom, which is the core of the economic sector, means that everyone has private property. Or, the economy is a set of activities aimed at meeting the socio-economic needs of people [1]. According to another definition, the economy is a socio-organizational economic system that provides the processes of production, distribution, exchange and consumption of socially necessary material goods and services [3]. The level of economic development is a key indicator of the well-being of society. Economy - creates material conditions for the activities of other sectors. However, in a social policy system, the economy cannot be separated from other sectors. Efficiency in the social sphere depends on the economy, budgetary provision, and financial resources of the state. This does not mean that the social, political or spiritual realms are inherently passive. They, in turn, actively influence the economy, its growth, and the progress of society. The political sphere interacts through effective organization and management of the economy, the social sphere through the active participation of labor resources in economic development, which is a key factor in increasing labor productivity, and the spiritual sphere through the formation of labor relations with public labor. While the political basis of the transition to a market economy is the state economic policy, the spiritual and ideological sphere creates a spiritual basis for the formation of a new attitude to production, the harmonization of personal and social interests, taking the population out of dependence. It is on this spiritual basis that the national characteristics of economic entities are manifested.

Sociality is a connection with society. However, in the system of social policy, the social sphere considered by us separately does not mean the totality of all social relations in society. This territory covers a socio-cultural complex, which includes such industries as education, health care, culture. The development of the social sphere depends on the improvement of economic indicators. In turn, the social sphere provides the economic sphere with personnel, socially protects and stimulates them, lays the foundation for the provision of fixed assets - the perfect product of the achievements of science and technology, which is a key factor in economic development. The role of the social sphere in the development of society is also enormous. For example, the education system is a criterion that forms and develops the intellectual potential of a nation. Based on national values, it is important to improve the education system. Because the principle of upbringing based on upbringing has long been the method of our ancestors, in which the national mentality is formed, and this contributes to the development of the state and society and a positive attitude.

The role of the health care system is also great. It is known that indicators of morbidity, disability and physical development are indicators that characterize the health of the population in society. The health care system serves as the main criterion for the formation of a healthy generation of the nation, and health, which is a personal value, is socialized here. In other words, the public health system is a system that serves not only to protect the health of citizens, but also to preserve social values in accordance with national interests. The effective functioning of this system is inextricably linked with all spheres of society. The interdependence of education and health care systems is manifested in the fact that a citizen must be physically healthy in order to think logically. The transformation of medical literacy into a value and an expression of national interests in it takes place at different levels in different regions, including urban and rural areas. At the same time, along with the improvement of modern medical, cultural and other services in remote areas, the priority should be to transform medical literacy into a national and social value by expressing its national significance.

The network of culture and sports, in addition to the global cultural significance, also has a national character, reflecting the national development and national values in the cultural sphere. The spheres of culture, arts, and sports play an important role in uniting nations, promoting the nation, and enhancing its position in the world community, without the need for an interpreter. It is also an important factor in the formation of a person's psycho-aesthetic and spiritual image. Sport has always been an important part of culture. Our ancestors considered this a criterion for physical and spiritual perfection. On this basis, wrestling, kupkari, archery and other national games were held. During the reign of Amir Temur, sports and martial arts were well developed. During the colonial period, our people suffered a lot in this area as well. After all, the center needed a simple, rolling workforce from Central Asia, not alpinists and barchinoys. After independence, special attention was paid to the restoration of national spirituality in the field of physical culture and sports. It has become a tradition to hold special competitions in national games and sports. Back in 1992, the International National Wrestling Tournament was held in Termez and Shakhrisabz. Forgotten theoretical aspects of the national struggle have been revived and recognized by international experts. This is based on an orientation not only towards culture and sports, but also towards the development of society, which is one of the issues considered as an important factor in social policy.

In the social sphere, special attention should be paid to the direction of social protection, especially "strong social policy", which is the main direction in the transition period. Here, the concept of social policy implies the coverage of that part of the population that needs social protection, which is reflected in the social sphere, and not from the point of view of the whole society. This policy has not only social but also political significance, which also requires a targeted approach. Because, firstly, the intensification of economic stratification in society; secondly, that this segment of the population is always infiltrating and perpetuating destructive ideas using the propensity to protest from the existing system; thirdly, as long as this layer is in need of social protection, it will always remain a passive subject of society and its negative impact on the development of society will be prevented. In addition, this policy, as a national value, reflects the age-old traditions of our people and serves national unity. Consequently, each direction of the social sphere has its own function, place and tasks in social policy and is reflected in specific national characteristics.

The political sphere takes into account the interests of the nation and the national characteristics of the subjects leading society to development through political reforms, ensuring the balanced functioning of internal structures, maintaining law and order, harmonizing the interests of society and the individual. Otherwise, society can face decline.

The field of spirituality has become one of the main areas, especially at the height of today's ideological attacks. At the heart of society lies man, and he has a spiritual essence. Spiritual perfection is a measure of a person's humanity and determines his or her way of life. In the development of the spiritual sphere, it is important for people to have a sense of national character and dignity, to be able to see in harmony the interests of the individual and society. Questions of national language, identity, national feelings, national values, patriotism, faith are an integral part of spirituality. The spiritual sphere is an important factor in the development of other spheres, and it ensures integration in the spheres of society.

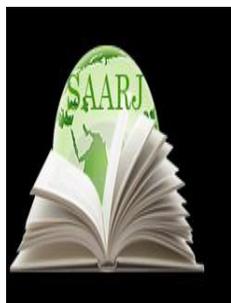

**CONCLUSION:**

In a word, the spheres of society cannot be improved individually. For the development of society, it is necessary to conduct governance and policies that take into account and ensure both their membership and their specific aspects, as well as their national characteristics. Regarding the connection with the national entity, it must be acknowledged that, first, society, due to the nature of its existence, “survives political, social, economic and ideological coming and going.” [5] Any state is a transitory phenomenon of a certain civilization, the development of any society depends on national and cultural values passed down from generation to generation; secondly, social policy is inextricably linked with the foundations of national identity. New relationships, acceptance of values, language, novelty in writing will also lead to a change in the culture and psyche of people.

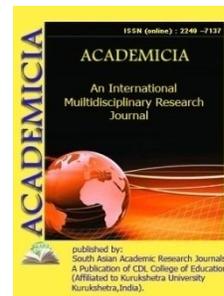

The philosophical aspects of the relationship between national values and national identity in social policy are the same as in public policy: taking into account national and cultural characteristics is a condition leading to the path of independent development; the language, cultural characteristics, values, interests and goals of each nation must be recognized, and conditions must be created for free development; Along with the development of the nation state and society, it is necessary to pay attention to ensuring their harmony.

## CHARACTERISTICS OF VERTICAL REGIONAL DISTRIBUTION OF SAP IN NATURE

**Shokhista Kobiljonovna Yuldasheva\***

\*Associate Professor,  
 Candidate of Biological Sciences,  
 Fergana State University  
 UZBEKISTAN

### ABSTRACT

*The article describes the distribution of sap in vertical zones. As the low plains alternate with the foothills, the middle mountains, and the highlands, the larvae of the aphids are delayed in hatching, their development takes longer, the larvae mature late, and the larvae borne by the founders develop more slowly. In higher regions, more time is spent on the maturation of female females without wings and with live wings.*

**KEYWORDS:** *Low Plains, Foothills, Midlands, Highlands, Natural Landscapes, Founders, Winged And Wingless Live Births.*

### INTRODUCTION

Saps play an important role in nature and human life. These insects, which are a major component of natural landscape *entomocenoses*, have become pests of crops grown in cultivated *cenoses*.

Any extensive and extensive research on sap requires knowledge of their faunal composition, biology, ecology, and other aspects of lifestyle, as well as their vertical distribution. It is the vertical regionalism that determines the vital properties of animals, including aphids. Features ranging from the diversity of biodiversity to the specificity of insect development cycles are related to the distribution of species at absolute altitudes.

### THE MAIN FINDINGS AND RESULTS

The solution of the problems raised by studying the characteristics of the distribution of animals in vertical regions can be found in the example of saplings [1].

In different vertical regions, the species composition of these insects varies dramatically in quantity and quality.

In the conditions of southern Fergana, 143 species of lizards belonging to 5 families (*Pemphigidae*, *Lachnidae*, *Drepanosiphidae*, *Chaitophoridae*, *Aphididae*), 58 genera were recorded. Most of the Shira species are members of the *Aphididae* family, while the fewer species are *Lachnidae*, *Drepanosiphidae*, and *Chaitophoridae*.

TABLE

Families	The number of small families	The number of generations	Number of species
<i>Pemphigidae</i>	3	6(10.34%)	12(8.39%)
<i>Lachnidae</i>	1	4(6.89%) 4(6.89%)	4(2.80%)
<i>Drepanosiphidae</i>	1	2(3.44%)	4(2.80%)
<i>Chaitophoridae</i>	1	42(72.44%)	4(2.80%)
<i>Aphididae</i>	2		119(83.21%)
Total:5	8	58(100%)	143(100%)

In the southern Fergana region, 12 species of the *Pemphigidae* family belonging to 6 genera (8.39% of the *aphidofauna*) have been identified. Of these, the genus *P.umaroviof* of the genus *ProciphilusKoch* feeds on snails. This species has a wide range, ranging from lowland to high mountain range. 2 species (1.4%) of *Thecabius Koch's* genus - *Taffinis* feeds on rabbit (*Ranunculus sceleratus*) and occurs only in the middle mountain region; *T.lupovae* live in poplars and are distributed in the foothills and middle mountainous areas [4].

4 species (2.8%) of the family *Pemphigidae* are *PemphigusHart.* belonging to the genus (*P.immunis*, *P.bursarius*, *P.populi*, *P.vesicarius*) are associated with poplars. These 4 species are common in 3 regions (lowland, foothill and middle mountain regions).

*The Eriosoma Leach.* genus consists of 3 species (2.09%) in Southern Fergana. Of these, *Eriosomalanagerum* (red blood sap) is a serious pest of cultivated apples, distributed in lowland, foothill and middle mountain regions. In the study area, it forms large colonies in apples.

Only one species from the genus *ParaclsetusHeyd.* (0.70%) - *P.cimiciformis* is associated with herbaceous plants (*Equisetum arvense*, *Andropogonhalepensis*, *Poa sp.*) In the study area, and is mountainous and mid-mountainous regions.

In southern Fergana, one species (0.70%) of the *SlavumMordovian.* genus - *S.lentiscoides*, which lives in pistachios, is found in the foothills and in the middle mountain regions. In this region, 4 genera and 4 species of lizards belong to the family *Lachnidae*. Of these, *Cinaratujafilina* is distributed in the lowlands, foothills, middle and highlands, and feeds on spruce. *Tuberolachnus* belongs to the *Mordovian* genus *T.salignus* (0.70% of the *afidofauna*) and is widespread in lowland, foothill and middle mountain regions. It forms large colonies in the willows and severely damages them. *Pterochloroides* 1 species (0.70%) of the *Mordovian* genus *P.persicae* forms large colonies on peaches, almonds, apricots and cherries. It is found in the lowlands, foothills and middle mountains. The only species of the genus *MaculolachnusGaum* (0.70%) *M.subrnacula* is rare in southern Fergana. It was first discovered in Central Asia in 1958 by M.N.Narzikulov in the Muminabad district of Tajikistan, between the *Khazratisho* and

*Kokhitong* mountains, at an altitude of 1000-1200 m above sea level. This researcher described the morphological features of the species by collecting *M. submacula*'s wingless live female females and their larvae from the young triple twigs of the wild rose (*Rosa lutea*).

In the Alay mountain range (Shohimardon, Lake Qubbon, Jordan, Mashalang, Dugoba, Khurjun) at altitudes of 1200 m-2500 m above sea level, *M. submacula* is found near the roots of wild roses (*Rosa kokanica*, *R. fedtschenkoana*) and in the middle and upper in large and small groups. The area has been home to wingless live female, winged live female, egg-laying female and male juveniles.

As the plateau rises from the lowlands to the middle mountains, the diversity of the fauna's fauna increases. In the highlands it is extremely impoverished; the lack of afidofauna is due to the harsh climatic conditions of the area. The lowlands are characterized by xeromorphic and mesophilic species of more algae.

The biology and ecology of aphids change from bottom to top.

The ecology of saplings is closely related to their biology, soil and climatic conditions of the habitat, species of food plants, the presence of *phyto-* and *entomophagous*, and other factors. The *Mediterranean region* is a region where some species of algae live in the same food plant, forming separate ecological shelves with other algae species. For example, the sap of *Macrosiphum rosae* feeds on *Acyrtosiphon catharinae* in a single namat plant. *A catharinae* occupies three parts of the plant's twigs, and *Macrosiphum rosae* has three lower parts. There are many such examples.

Many species of algae found in the middle and especially high mountain regions are characterized by low density.

In mountainous areas, the low density of sap can be explained by high humidity and heavy rainfall. When there is a lot of rain, a certain amount of sap is washed away, and sap cannot withstand the cold caused by it, so the damage of sap is less felt in the highlands than in the lowlands. In the mid-mountainous and higher regions, the low density of sap leads to a decrease in beneficial insects at these altitudes. Some species of tree shrubs (*Maclulolachnussubmacula*, *Tuberolachnussalignus*, *Pterochloroides persicae*) found in the mid-mountain region coexist with large red ants of the genus *Formica sanguine*.

The distribution of sap across vertical zones is inextricably linked to soil-climate, vegetation cover, developmental modifications, and other biological characteristics. When comparing soil climatic conditions in the upper foothills of the western Tien Shan and in the plains of the northern latitudes and the development characteristics of saplings along vertical zones according to vegetation cover, the main difference (relative to sea level) was found in altitudes. It is observed that some shea tribes are not evenly distributed in different vertical regions. As the sap rises along the vertical zones, their ecological shelves in forage plants separate. Due to the decrease in the amount of sap in the upper regions, their degree of damage and changes in the plant (leaf wrinkling, etc.) are less than in the lower regions. Some changes are observed in the color of the sap [2].

The anthropic and middle mountain vertical regions are the richest in aphidology, with a unique aphid fauna. In the upper regions, aphids are declining. The foothills of the central Tien Shan are poorer in terms of species composition than other regions bordering it. Elements of the Euro-

Siberian and Far Eastern forests in the central mountainous region of the Central Tien Shan lag behind in development due to orographic, soil-climatic conditions and absolute altitude, and their development varies by 20-25 days. The middle mountain region has been found to be more suitable for the feeding and development of algae than other regions. In the rocky and grassy mountain deserts of the upper mountainous region of the Central Tien Shan, the development of aphids has been observed in connection with the formation of vegetation. In general, the vertical regions of the Tien Shan have a specific effect on changes in the morphological features, density and other characteristics of the sap [3].

As you move from the lowlands to the middle mountains, the diversity of the fauna's fauna increases. In the highlands, it is very poor - the lack of afidofauna is determined by the severity of climatic conditions.

The sap *Cinaratujafilina*, *Aphis rumicis*, *A. craccivora*, *Macrosiphumrosae*, which are widely distributed in the horizontal and at all absolute heights in the Southern Fergana region, are proof of N.A. Severtsov's law that the horizontal distribution of animals is directly proportional to the distribution of vertical heights.

As it progresses from bottom to top, changes in the biology of intra-species sap are associated with shifts in developmental time periods.

As the low plains alternate with the foothills, the midlands, and the highlands, the larvae of the aphids are delayed from hatching, their development is prolonged, the larvae mature late, and the larvae borne by the founders develop more slowly. In higher regions, more time is spent on the maturation of female females without wings and with live wings. Their generation is declining. The above amphibian generation emerges early. Females and males that lay eggs complete their life cycle until the onset of cold autumn days. Under the influence of mesophilic conditions of the cultural landscape, the xeromorphic features of the saplings are weakened (cellular structures are reduced; the width and height of the tail, head are reduced; the mustache, body, legs and thighs are lengthened).

Under the influence of mesophilic conditions, the proliferation of sap increases, which depends on the nutrient content, optimal humidity and other favorable factors. The ecology of the saplings distributed in different vertical regions (within the species), their biology is closely related to the soil and climatic conditions of the habitat, the species of food plants, the presence of phyto-entomophagous and other factors.

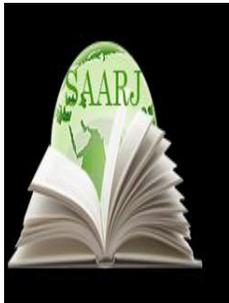

#### **CONCLUSION:**

Many species of algae found in the mid-mountain and high-mountainous regions are characterized by low densities. For this reason, pest infestation is less noticeable in the highlands than in the lowlands. In the higher regions, the low density of the sap leads to a decrease in beneficial insects.

Some indicator species (*Aphis craccivora*, *Myzaphisrosarum*, *Macrosiphumrosae*) describe the vertical-regional distribution of Southern Fergana sap.

## STUDY OF THE PROBLEMS OF SUICIDAL PERSONALITY BEHAVIOR IN FOREIGN PSYCHOLOGY

**Zuxra Daribaevna Palvanova\***

\*Chief Physician of the Neuropsychiatric Dispensary,  
 Republic of Karakalpakstan Nukus,  
 UZBEKISTAN

### ABSTRACT

*The article deals with the issues of spiritual ill health of society, the spread of moods of disappointment, nihilism, disbelief in their future, which contribute to the loss of the meaning of life, the choice of a suicidal model of behavior. The author emphasizes that suicide is one of the most acute problems of modern society. At present, they occupy a leading place among the causes of mortality among the working-age population and continue to grow in a number of countries around the world, including in the Republic of Karakalpakstan. The study of various aspects of the causes of suicide is an extremely urgent psychological problem, since in recent years' suicide has been put forward among the root causes of the growing mortality of the population of the whole world and our republic, especially.*

**KEYWORDS:** *Modernization, Globalization, Internetization, Virtualization, Acceleration Of Development, Suicidal Behavior, Moral Crisis, Suicide Research.*

### INTRODUCTION

The Uzbek society quite recently, literally 29 years ago, passed from a state-planned economy to a market economy, from socialist democracy to liberal, from mono-ideology to pluralism. And therefore, all socio-cultural, economic and political transformations are reduced to one thing - the formation of a civil society. Some statesmen and scholars argue that we have already formed the institutions of civil society, while others believe that, although these institutions have been formed, however, their "effectiveness" is invisible.

However, it should be borne in mind that in parallel with the construction of civil society, other processes also occur autonomously, for example, the "waste" and devaluation of moral values, traditional foundations of culture in our modern society. This situation can be defined as a risk

situation. Its sources are: the contradictions of modernization in the modern world, globalization and internetization, virtualization of the economy, accelerated development of all spheres of life. Of course, such a moral crisis against the background of profound changes taking place in society leads to maladjustment of a person, to the growth of destructive tendencies in his development. A modern person often cannot find a positive meaning in his own life due to the destruction of old values and traditions, discrediting new ones, the absence of a culture of ideological reflection that allows him to come to a unique meaning in his own unique way. The "existential vacuum" largely explains social pathologies that are the pain of society: crime, drug addiction, suicide.

The suicide rate as a consequence of social distress is one of the most important indicators of the social, economic, and political state of society. The spiritual ill health of society, the spread of moods of disappointment, nihilism, and disbelief in their future contribute to the loss of the meaning of life, the choice of a suicidal model of behavior.

Suicide is one of the most pressing problems of modern society. They occupy a leading place among the causes of mortality of the working-age population and continue to grow in a number of countries of the world, including in the Republic of Karakalpakstan. The study of various aspects of the causes of suicide is an extremely urgent psychological problem, since in recent years' suicide has been put forward among the root causes of the growing mortality of the population of the whole world and our republic, especially.

The spread of suicidal moods among various categories of the population in the Republic of Karakalpakstan is associated, first of all, with the large-scale destabilization of the relationship of the individual himself with the social environment. Against the background of significant degradation of social institutions in the post-Soviet period, the resulting normative-value vacuum began to be filled with transitional worldviews.

The prevailing socio-economic conditions of modern Uzbekistan gave rise to a feeling of fear and anxiety in most people, which, in turn, created a complex of reasons and conditions for the development of suicidal moods in young people. First of all, suicide is directly related to a person's social integration - that is, the degree according to which an individual feel like part of a large group. Suicidal behavior has both a causative agent, a motive, and a reason, however, in general, suicide is a consequence of the socio-psychological maladjustment of the personality in a transforming society.

## **II. MAIN PART**

It is well known that the problem of suicide is not new, since it has long worried scientists in various fields of science and was the subject of discussion, study and interpretation of scientists of the ancient world (Aristotle, Pythagoras, Plato). Therefore, we began our research by studying the works of foreign scientists-psychologists who, in their works, touched upon various aspects of this problem. A significant contribution to the study of suicide was made by E. Durkheim, K. Mannheim, A. Adler, D. Hume, N.A. Berdyaev, A.F. Koni, M.N. Gernet, V. Frankl, V.M. Bekhterev, I.A. Sikorsky and many others.

Analyzing the literature on this topic, we drew attention to the fact that it is widely covered from the point of view of psychology and jurisprudence. But, unfortunately, in sociology, the problem under consideration has an autonomous approach, despite the fact that in recent years a number

of dissertation studies have been carried out. Thus, various aspects of deviant behavior are devoted to the dissertations of Yu.V. Dulin's, H.A. Djarimova, V.N. Kochiyan, N.M. Belgarokova, N.V. Derevianchenko, I.A. Novikova and others. However, these works did not raise the problem of suicide as an independent one, much less analyze it in the context of sociological theories.

It should also be emphasized that suicide, as an act of human behavior, is reflected in all religions and in the overwhelming majority of cases is condemned, with the exception of some religions, where the act of self-immolation of a woman along with the corpse of her husband is approved as a manifestation of the wife's loyalty to her husband (among the peoples of India).

The term "suicide" comes from the Latin "sui" - oneself, "caedere" - to kill that is, and means the human act of self-removal from life.

According to the classical definition of E. Durkheim, the author of the first fundamental work on suicide, "Suicide is called every death that is directly or indirectly the result of a positive or negative act committed by the victim himself, if he knew about the expected results". [10]

We believe that the most concise definition is the definition of Russian suicidologists Y. Gilinsky and P. Yunatskevich. In their opinion, "Suicide is the deliberate (intentional) deprivation of life". [7]

According to the definition of S. Avanesov, suicide is a conscious, voluntary and purposeful achievement of death by a person, carried out on his own. [1]

The basis for the scientific development of suicidology was the classic philosophical treatises on suicidology by Plato (Phaedo), Lucretius (About the Nature of Things), Seneca (Moral Letters to Lucilius), D. Hume (About Suicide), I. Kant ("The Metaphysics of Morals"), A. Schopenhauer ("The World as Will and Representation"), E. Durkheim ("Suicide: A Sociological Study"), W. James ("Is It Worth Living?"), N. Berdyaev ("About suicide"), A. Camus ("The Myth of Sisyphus"), J. Batay (Tears of Eros), M. Blanco (Death as a Possibility), J. Derrida (Gift of Death), A. Kojev (The Idea of Death in Hegel's Philosophy) and etc.

The multidimensionality, multifactorial, polymodality of the problem of suicide forces researchers to study its various directions. So, for example, the social aspects of suicide were the subject of research by P.F. Bulatsel, M.A. Gubsky, A.V. Mikhachev, N. Mukhin, P. Olkhin and T.K. Sheinis.

The cultural, anthropological and ethnographic aspects of suicide were reflected in the works of V.G. Bogoraz, D.K. Zelenina, A.N. Makhovikov. In their writings, the authors point to the role of cultural and ethnographic factors both in the origin and in the forms of resolving suicide.

The psychological aspects were studied by A.G. Ambrumova, T.A. Donskikh, Ts.P. Korolenko, S.G. Smidovich, V.A. Tikhonenko, Ya.I. Gilinsky, P.I. Yunatskevich, who note the multifactorial nature of the origin of suicide, certain personality traits of suicides and their social nature of origin, the great dependence of suicide on external socio-economic factors.

In the works of V.M. Bekhterev, John Locke, G.M. Dzedushitsky, A. Nevzorov, G. Spencer, the importance of education, the micro-society of the individual in the prevention of suicide is noted.

In recent years, such a form of suicide as euthanasia has been increasingly reflected in the

literature on suicidology, where information on the results of research by D. Humphrey, F. Foote, B.G. Yudin.

Historical analysis of the positions of world famous philosophers shows that Socrates was an unwavering supporter of the prohibition of suicide. Plato supports Socrates and at the same time finds situations to justify suicide.

Aristotle in his comments supports and argues for Plato's position.

The ancient Armenian philosopher David Anakht admits the following six reasons for which suicide can be justified:

- With a lack of funds for subsistence;
- Illness accompanied by severe pain;
- A hopeless situation (captivity, threat, torture);
- Deep old age;
- Coercion into an unholy or degrading action;
- A common misfortune (the prospect of taking the city by enemies).

Scientific analysis of the above positions and arguments shows that suicide is the result of a special psychological state of the individual based on the strong influence of society on her. And this is clearly expressed in the definition of N. Berdyaev: "Suicide is a psychological phenomenon, and in order to understand it, you need to understand the state of mind of a person who decided to commit suicide ... The psychology of suicide is, first of all, the psychology of hopelessness ...". [3, pp. 89-112]

We emphasize that M. Dutkin in his dissertation research gives interesting facts, approaches, definitions, positions of famous philosophers, scientists, founders of suicidology. Thus, the author tries to systematize the interpretations of suicidal behavior and, on the basis of this, makes an attempt to generalize them in three main suicidal behaviors.

In his research, M.P. Dutkin makes a number of mistakes, but this in no way underestimates the value of the results of his dissertation research. Most likely, the author, not realizing the essence of the issue and being not a specialist in either psychiatry or psychology, replicates the mistakes of others.

First, the author, referring to the WHO, claims that "90% of suicides in the world are committed by people with mental disabilities, citing a source". [9] At the same time, the same error is trying (distortedly) to substantiate the judgments of famous scientists (A. Shopangauer, E. Durkheim, N. Berdyaev, K. Jaspers, D. Shepilov), making a reference to them, that they indicated the connection between suicide and anomalous personality traits, as well as the harmful effects of alcoholism and drug addiction.

Quotations from the works of the above authors (A. Schopenhauer, E. Durkheim) from the point of view of psychological science, we can assume that we are talking about accentuated personalities. [17]

According to the quote taken from the work of N. Berdyaev, one can clearly see that a person during suicide is in a state of passion, and not during a stage of exacerbation of mental illness.

---

In addition, we do not entirely agree with the interpretation of the causes of suicide among Yakut women, set forth in the work of D. Shepilov, to which M.P. Dutkin. Not excluding the disease in some cases, WHO has proved that the prevalence of the number of completed suicide of women over those of men in the overwhelming majority of cases is caused not by specific diseases of the individual, but by the "disease" of society, region, country, their socio-economic level of development. The lower the quality of life, the closer, if not prevailing, the number of completed suicide in women in comparison with men.

M.P. Dutkin, setting out the presence of modern views (75% - mentally healthy, 25% - with mental illness), nevertheless clearly shows the invariability of his views ("the bulk of suicides are mentally ill"), completely incorrectly referring to the experience of foreign experts from China, who also focus on unemployment, sharp social and economic changes, noting mental illness, drug addiction, alcoholism, family conflicts and life problems in general as the main reasons for the increase in suicide.

A very controversial and insufficiently effective, in our opinion, is the practical proposal of M.P. Dutkin that "all potential suicides should receive qualified help from a psychotherapist and psychiatrist, since they suffer from so-called "masked "(undiagnosed) mental disorders of varying degrees in the form of neuroses and characterological personality traits (mainly, this is a depressive syndrome of varying degrees ), that is, society should not have a condescending attitude towards suicides. [9]

First, today, society is not capable of universally and skillfully identifying all potential suicides. Secondly, not so much psychiatrists as psychologists should work with potential suicides, since the registration of a psychiatrist to a certain extent narrows the scope of the personality's perspective.

The results of the dissertation research by T.G. Kosheleva, who studied "Medical-psychological and social aspects of suicide prevention in children and adolescents". [11] According to the results of the study, the maximum number of suicides was committed in the autumn-winter period and early spring with a peak in January, while their number is minimized in the summer period.

According to the test results, anxiety and depressive manifestations were noted in 68% of patients aged 13-15 years. In the structure of depressive symptoms, the most pronounced were such indicators as: suicidal intentions, depressive mood and guilt. Of the surveyed respondents, 68% of suicides showed symptoms of anxiety and depression. At the same time, children of relatively young parents were more prone to attempted suicide.

A link has been found between suicidal behavior and family structure. More suicidal attempts were observed in single-parent families, relatively complete families, moreover, with alcoholization of the father and mother.

An interdependence was also found between suicidal activity in the group and the severity of somatic pathology in adolescents. Variables such as impaired REG ( $z = 0.92$ ), ECHO ( $z = 0.88$ ), EET ( $z = 0.79$ ), and the presence of perinatal pathology ( $z = 0.74$ ) directly correlated with the frequency of suicides among the subjects. The results of her research show that more than half of the suicides have a poor somatic status.

When preventing suicide, one should pay attention to and take into account the fact that none of

---

the suicides discussed their feelings with their parents or peers, despite the fact that 79% have a loved one with whom they would share their problems.

Conflicts in the family, more precisely parent-child conflicts and conflicts between parents, were more often indicated as the reason for the emergence of suicidal thoughts and intentions.

Difficulties in communicating with peers and isolation in the class were noted by 23% of suicides. In addition, 19% of adolescents have tensions in the family, frequent quarrels and a lack of understanding with relatives.

According to the research results of T.G. Kosheleva, the vast majority of suicides have parental families with a low social status, they are brought up in unfavorable conditions.

Of the suicides, 40% are from single-parent families, 44% of the respondents have unemployed parents, and 20% of families have alcohol abuse by one or both parents.

According to the analysis of the results obtained in the study of adolescents of the general population, adolescents of high suicidal risk identified among them, according to the author, are characterized by a high level of anxiety, a depressive mood background, a low level of self-esteem, difficulties in social adaptation, a tendency to antisocial behavior, alcohol and drug abuse. ... 58% of adolescents have an increased degree of sensitivity, 32% have suicidal thoughts.

The sociological aspects of suicide among minors as a form of deviant behavior were the subject of research by G.S. Galstyan. "According to the Serbsky State Scientific Center for Social and Forensic Psychiatry, for more than 15 years in Russia, about 2 thousand child and adolescent suicides have been committed annually. If in the world adolescents aged 15-19 commit 10 suicides per 100 thousand of the population, then in the Russian Federation there are 38 suicides". [5]

From the point of view of sociology, suicide is regarded as deviant behavior. According to E. Shir, 20% of incomplete suicide is committed by children and adolescents, 18.5% of suicides occur in children aged 10-14 years, 36% of suicidal attempts are observed in girls 15-17 years old. [6]

In the Russian Federation, 17 children commit suicide with a fatal outcome every day. 70% of suicides are committed by mentally healthy children.

At the age of 9-10, more suicides are committed by boys, from 16 to 18 years - by girls. The age of 13-14 is equally dangerous for both boys and girls. The vast majority of suicides under the age of 10 are committed by children because of the abuse of the child in the family, ignoring him as a person. Moreover, 70% of suicides are committed by children from outwardly prosperous families. Children make 9 out of 10 suicide attempts at home. [5]

A.G. Ambrumova considers social and psychological maladjustment of the personality to be the main reason for suicidal actions. [2, pp.7-25]

A.E. Lichko among the most common causes of suicide among adolescents includes:

- loss of a loved one;
- a state of overwork;

- wounded self-esteem;
- Destruction of the defense mechanisms of the personality, as a result of the use of alcohol, hypnogenic psychotropic drugs and drugs;
- Identification with a person who committed suicide;
- Various forms of fear, anger and sadness for different reasons. [12]

Currently, another reason for suicide has appeared - the Unified State Exam (USE). In addition, according to A. Grebinkina, M. Gorshkov, F. Sheregi, the family is one of the leading factors in suicidogenesis. The following statistics can serve as a basis for this judgment:

- Close relatives, mainly adult family members, introduce adolescents to the first sample of alcohol (on average 13-9 years old);
- the number of adolescents who abuse alcohol per 100 thousand peers was 827.1 hours, which is three times more than the coefficient of alcoholism for the total population of Russia;
- among young people aged 11-24 years, 46.5% (13.3 million people) live in families burdened by various serious problems, including 20.9% (6 million people in families where one or both parents abuse alcohol; 1.8 million live in families where systematic marital and parent-child scandals; 1.1 million are constantly abused in the family; 229 thousand have constant physical abuse; 57.2 thousand have drug addicts, etc.). [8, pp. 22-37]

### III. RESULTS AND DISCUSSIONS

We believe that all of the above can stimulate suicide among young people.

The results of the dissertation research by M.V. Chernobavsky, who studied the medico-social aspects of suicide among adolescents. [15] In this study, the statistics of suicide among peoples of different countries was subjected to a comparative scientific analysis, differences in the frequency of suicides in boys and girls, the relationship of suicide with the seasons, days of the week and holidays were revealed. When comparing data on suicide in the Ryazan region and the Russian Federation, the author identified regional and gender and age characteristics.

Of great scientific interest are materials on the causes and factors of suicide that stimulate suicide, as well as age characteristics in relation to other factors.

Of particular value are the recommendations and developments introduced into the practice of suicide prevention. The general pattern is an increase in suicides at the age of crisis, which begins in the middle of life: in men - after 45 years, in women - after 55 years.

In Russia, 20% of completed suicides among men are at retirement age, while among women retired suicides make up almost half.

Sufficient commonality of the above trend is noted in comparison with statistical data, the availability of research, and at the same time there are significant differences, which, in our opinion, are due to the way of life, ethno psychological, ethnographic (traditions, customs, rituals), ethno-regional, ecological, socio-economic and other factors of the peoples living in Russia (Ryazan region) and the Republic of Karakalpakstan.

According to the results of the study, several features of suicide in Russia have been identified. First, the prevalence of suicide men over women. According to M.V. Chernobavsky, "over 80%

of suicides in our country are among men". [15] According to the interpretation of this phenomenon, a large quantitative superiority of completed suicide, as can be seen from the results of the study, is in the male population. The author explains this by the pronounced alcoholization of men relative to women.

When analyzing suicide in minors, it was found that the "peak" of suicide in boys is at the age of 9-14 years, in girls at 15-18 years.

The suicide of children is more often carried out at night. This is apparently due to the seriousness of intentions. Significantly more completed suicides occur on Sundays and holidays. In our opinion, this is due to the significantly higher consumption of alcohol on Sundays and holidays, as well as more intensive communication between family members on rest days, when, under alcoholic intoxication, family conflicts can be more acutely emotionally sensitive. In addition, on Sundays and holidays for a certain category of suicides, when people close to them are busy with the worries of Sundays and holidays, it is very convenient to realize their intentions to end the suicide.

British scientists found that suicides among nurses were 4 times more, and among doctors - twice more than in other professional groups.

In the United States, suicidal thoughts arose in one in 16 surgeons. [15]

Swedes with a low level of intelligence, growing up, more often resort to suicide, while in Russia, completed suicide is more often observed among smart people.

According to Durkheim, the greatest propensity for suicide is observed among Protestants, and the least among practicing Judaism.

British researchers have shown that white Americans are more likely to commit suicide than African Americans or those who migrated from Latin America.

In India, suicide was and remains one of the characteristic features of ritual life. They consider the best sacrifice that a person can make to the gods - this is himself, a suicidal widow, etc.

In Italy, the attitude towards suicide is the harshest and critical.

In England, suicide was considered illegal until 1961.

The processes of separation of individual individuals in relation to social groups can be characterized by the definition - anomie, i.e. the general state of disorganization of society.

According to A.G. Ambrumova "... suicide is a consequence of the socio-psychological maladjustment of the personality in the conditions of the experienced and unresolved micro-social conflict". [2, p.7-25.]

Modern suicidologist M. Farber: "Suicide is a deliberate, deliberate and rapid deprivation of life". [18]

In social and legal psychology, the dissertation research of M.Yu. Puchnina on the problem of criminal suicide of minors. [13]The author revealed the real scale of the phenomenon of criminal suicide of minors and the degree of their involvement in information flows associated with criminal suicide.

M.Yu. Puchnina developed her own methods for monitoring the information space to identify

---

minors involved in organized forms of suicidal behavior with the aim of early prevention of criminal suicide.

The author also identifies three main subspecies of criminal suicide:

- Individual impact on a specific person in the form of driving to suicide, inducement to suicide or assisting suicide;
- Group informational impact of a destructive nature on members of the informal community ("suicide clubs", "death groups", "criminal cyber suicide");
- Training of perpetrators of terrorist acts, suicide bombers ("suicidal terrorism").

It should be emphasized here that on the basis of the results obtained, a substantial revision was made to a number of articles of the Criminal Code of the Russian Federation.

The practice of suicide has been known since ancient times. During lean years, in order to preserve and continue the family line, the oldest members of the communities committed suicide (altruistic suicide).

The peoples of India self-immolate the corpse of their husbands at the stake with the conviction that they will be together in the other world.

Philosophers Diogenes, Socrates, Seneca passed away as a result of suicide.

The Japanese have "hara-kiri", "kamikadze". And also until recently, mass suicides.

According to the dissertation research by G.M. Valitova, who studied the medico-social aspects of suicide among children (0-14 years old), 69.8% of children attempted suicide at home. In the first place are students of general education schools (52.45%), in second place are from auxiliary schools (29.4%), in third place are students in higher educational institutions (9.5%). [4]

The author's study clearly shows the correlation between suicide in children and suicide among close family members. When studying the materials of refusal cases among children, the motives for suicide were established: family conflicts - 22.1%, conflicts with peers - 10.7%, school conflicts - 7.6%, love conflicts - 5.3%, rape - 5.3% %, loss of a significant friend - 3.8%, guilt - 3.1%, and somatic illness 0.8%.

The leading place among the reasons in cases of attempted suicide in children was occupied by family conflicts (27.8%). Among the forms of attempts, in 41.3% of cases, suicides resorted to self-cuts, falling from a height, drowning in the bathroom - 24.6%.

Most of the suicides preferred winter time (35.7%), spring (27%) and autumn (22.2%) as the time of year.

To improve preventive measures for suicide, it is proposed to organize various forms of medical, social and psychological assistance to the population in general and children in particular.

Considering that more than 50% of completed suicides both in the world and in Uzbekistan claim the lives of young people aged 15 to 34, the results of S.V. Shamkova, dedicated to the study of the social characteristics of suicides among youth. [16] The value of the results of this work lies in the fact that the author demonstrates the need for a transition from a psychiatric model of prevention and care to a social model.

The author also believes that the most suicidal age is for women from 15 to 19 years, and for men over 23 years old, a significant part of whom are respondents from incomplete, often asocial families, with a low level of education with the presence of bad habits.

Special attention should be paid to the recommendation of G.M. Valitova on the need to ensure clear interdepartmental interaction on the prevention and reduction of suicide. This proposal has been put forward by G.B. Shoumarov in Uzbekistan.

Based on the analysis of the work of S.G. Smidovich, the typology proposed by the author has been supplemented and edited by us. [14, P.74-79] Moreover, it is scientifically interpreted. So, for example, S.G. Smidovich distinguishes two types according to the prevalence of suicide: European and Asian.

With the European type, the prevalence of suicide in the city is noticeably less than in the countryside. In Asian, on the contrary, there is more suicide in the city than in the countryside. At the same time, the author classifies the Republics of Central Asia, Transcaucasia (except Georgia) and Kazakhstan as the second type, where the level of urban suicides was twice as high as in rural areas.

#### **IV. CONCLUSION:**

According to the results of our own research, we propose not two, but four types. At the same time, we admit that with a special study and improvement of this typology of suicide, their number can be much greater. Thus, we offer the following types:

1. The type with the prevalence of the epidemic in cities - the urban type.
2. Type with prevalence of the epidemic in the village - rural type.
3. Mixed, i.e. combination of "urban type" with "rural type" in one line of the region.
4. A class with epidemics around a big city. For example, Tashkent region or Nukus district of the Republic of Karakalpakstan.

The names "Asian", "European" are rather conventional and scientifically unfounded, since the Trans Caucasus is not geographically an Asian region. In Uzbekistan itself, the so-called S.G. Smidovich European type.

In addition, they can lead to ambiguity, inaccuracy and ambiguity in the formation of ideas among managers, but not specialists, about the epidemiology of suicide in their country or region.

In our opinion, the typology of suicide based on epidemiology needs further improvement.

There are all four types in Uzbekistan. Within the framework of the Republic of Uzbekistan, including Karakalpakstan, the mixed type should be called, within the Kashkadarya and Surkhandarya regions - the rural type, in the Tashkent region and Nukus region - the fourth type with epidemiological foci around the big city, the city of Tashkent - the second type - with the prevalence of the epidemic focus of suicide in the village.

A large percentage of attempts on their lives are committed by those who do not study and do not work.

As noted in previous works, the main causes of suicide, according to the results of S.V.

Shamkova, are conflicting relationships in the family and with a loved one, a significant person. In men, such attempts at suicide are noted in a state of alcoholic intoxication. A high percentage of repeated assassination attempts remains. The most popular methods for attempting to kill one's life are drugs and self-cutting, hanging and drowning.

On the basis of the study, the author notes the following features of society that affect the deviant, including suicidal behavior of young people. These include:

- Instability, inconsistency of processes in the economic, political, socio-cultural sphere of Russian society;
- High criminalization of society, a tendency to a decline in morality, growth without spirituality, social insecurity of youth;
- Lack of information, inadequate understanding of the established new principles, norms and values;
- The tendency towards the dominance of negative samples of Western and domestic culture, promoted by the mass media and their negative influence in the process of personality formation;
- Low efficiency of socialization institutions, family crisis.

It will be appropriate to note that a number of the above conclusions take place, sometimes even in a more pronounced form, in Uzbekistan in general and in the Republic of Karakalpakstan in particular.

It should be noted, however, that the aforementioned tendencies of society are observed in any country during the transition stage.

However, the main thing is how quickly this process will take place without any particular complications in the socialization of the personality of youth. Protraction of these undesirable tendencies in years often leads to the rooting of a number of them, with which then society will struggle for several decades, losing years, the well-being of the people, trust in the policy of the government and the leader of the country, and the most important irreparable loss is the life of the young, mature, healthy people.

At the same time, we believe that negative tendencies should not merge with the mentality, with the life values of indigenous peoples, since otherwise it will be very difficult to eradicate and eliminate from the life of society. The reason will be the personal interests of the leading elite of the given society. This should be borne in mind both in the elimination and in the prevention of such negative trends in the life of society and the country.

It should also be added that the "biological basis of suicidal behavior" was the subject of a special study by M.S. Zinchuk, A.B. Gekht, N.V. Gulyaeva, A.S. Avedisova, R.G. Akzhigitova and M.N. Grishkina.

The epidology of suicide, the great loss of human resources and the multifaceted nature of the problem led to the development of the concept according to which suicide in the classification of mental disorders is beginning to be considered as an independent transnosological unit. This is reflected in the American classification system DSM-5. [19, pp.79-91]

**ABSTRACT**

*The article provides data on the faunistic complex of phytonematodes of pomegranate agroecosystems in southern Uzbekistan. The study revealed 128 species of plant nematodes belonging to 54 genera, 30 families, 7 orders and 3 subclasses. It has been established that the species *Eudorylaimus pratensis*, *Cephalobuspersegnis*, *Eucephalobusoxyuroides*, *Chiloplacusclerovaginatus*, *Ch. propinquus*, *Panagrolaimusrigidus*, *Rhabditisbrevispina*, *Aphelenchusavenae*, *Aphelenchoidesparietinus*, *A. bicaudatus*, *A. blastophthorus*, *A. composticola*, *A. graminis*, *A. limberi*, *Filenchusfiliformis*, *Tylenchorhynchuscylindricus*, *Quinisulciuscylindricus*, *T. claytoni*, *Helicotylenchuserythrinae*, *Pratylenchuspratensis*, *P. crenatus*, *Meloidogyne incognita*, *M. javanica*, and *Ditylenchusdipsaci*.*

**KEYWORDS:** *Pomegranateagroecosystem, rootsystem, rhizosphere, parasitic phytonematodes, ectoparasitic perforators, end parasitic perforators.*

## INTRODUCTION

Today in the world providing the population with high quality fruits is one of the most important tasks. Especially, in recent years, the high harmfulness from parasitic plant nematodes of fruit trees and shrubs has led to a decrease in productivity and deterioration in the quality of products. Therefore, the disclosure of the diversity of phytonematodes in different agrocenoses, the peculiarities of their distribution, the identification of parasitic species and the development of integrated measures to combat them, acquire an important scientific and practical significance.

The pomegranate was brought to Uzbekistan two thousand years ago from Iran, Turkmenistan and northern Afghanistan. Currently, anoraks are installed in most regions of Uzbekistan. All parts of the pomegranate are useful for humans, and the fruit juice contains 12-20% sugar, organic acids, vitamins and other useful substances. The pomegranate fruit consists of 38.6-63.5% water, 27.6-51.6% peel, 7.2-22.2% grains. The fruit contains 1.6% protein, 0.1-0.7% fat, 0.2-5.2% fiber and 0.5-0.7% ash. Pomegranate juice contains 0.208-0.218% of minerals, including manganese, phosphorus, magnesium, aluminum, silicon, chromium, nickel, calcium, copper. In folk medicine, pomegranate peel, fruit, fruit peel and flower are used as a remedy for diarrhea, scabies, cough, diarrhea, ringworm, gastrointestinal diseases, anemia.

The species composition, patterns of distribution of phytonematodes and substantiation of measures to combat parasitic species of pomegranate agrocenoses on the territory of the Republics of Central Asia were first studied by Sh.Kh. Khurramov and A.S. Bekmuradov [1, P. 13-15; 2, - 92 p.; 3, P. 28-32; 8, P. 146-157; 9, 333 p.].

## MATERIALS AND METHODS

In order to study the faunistic complex of phytonematodes of pomegranate agrocenoses of southern Uzbekistan (Surkhandarya and Kashkadarya regions) in the period from 2009-2019. We collected phytonematodes from the root soil and root system of plants in shirkat farms from 17 districts of the Surkhandarya and Kashkadarya regions of the Republic. The studies were carried out by the generally accepted route method [6, P. 338-369; 7, P. 3-11].

During the phytohelminthological study, 1700 samples of soil and root system of pomegranate plants were collected and analyzed. Phytonematodes were removed by the Berman funnel method and fixed with 4% formalin solution. Enlightenment of nematodes was carried out in a mixture of glycerol with alcohol (1: 3), and permanent preparations on glycerol were prepared for in-office processing of the material according to the Seinhorst method [11, P. 67-69]. Soil samples for the presence of cyst nematodes were usually analyzed according to the standard Decker method [4, 445 p.]. Preparations for determining the species of root-knot nematodes were prepared according to the well-known method of E.S. Kiryanova, E.L. Krall [5, 447 p.].

## RESULTS AND DISCUSSIONS

As a result of the phytohelminthological studies carried out in the pomegranate agrocenoses of southern Uzbekistan, we found a total of 128 species of plant nematodes belonging to 54 genera, 30 families, 7 orders and 3 subclasses. In total, the detected nematodes are distributed by orders as follows: Order Enoplida is represented by 3 species, order Mononchida-2, Dorylaimida-26, Plectida-4, Rhabditida-30, Aphelenchida-23 and order Tylenchida-40 species.

The data obtained show that phytonematodes of pomegranate plants and its basal soil differ significantly from each other both in species composition and in the number of individuals.

In the root soil of the pomegranate, 15622 individuals (69.3% of the total number of detected phytonematodes) were registered, belonging to 128 species. *Eudorulaimus parvus*, *E. pratensis*, *E. similis*, *E. discolaimioideus*, *Aporcelaimellus obtusicaudatus*, *Tylencholaimus minimus*, and *Diphtherophoracommunis* were common pararasobionts. The dominant daisy-family species are *Cephalobus persegnis*, *Eucephalobus oxyuroides*, *Acrobeloides buetschlii*, *Chiloplacus quintastriatus*, *Ch. sclerovaginitus* and *Panagrolaimus rigidus*, and *Rhabditis brevispina* was common among eusaprobionts.

Among the representatives of phytohelminths of nonspecific pathogenic effect, *Aphelenchus avenae*, *Aphelenchoides parietinus*, *A. blastophthorus*, *A. composticola*, *A. graminis*, *A. limberi*, and *Ditylenchus myceliophagus* prevailed, while *Xiphinema opisthohysterum*, *Bitylentes erythrinae*, *Pratylenchus pratensis*, *Meloidogyne incognita*, *M. javanica*, *Paratylenchus hamatus* and *Ditylenchus dipsaci*.

The main faunal complex of phytonematodes in the pomegranate root soil is represented by the species *E. pratensis*, *D. communis*, *C. persegnis*, *E. oxyuroides*, *A. buetschlii*, *Ch. sclerovaginitus*, *P. rigidus*, *Rh. brevispina*, *A. avenae*, *A. parietinus*, *A. bicaudatus*, *A. blastophthorus*, *A. composticola*, *A. graminis*, *A. limberi*, *Tylenchorhynchus cylindricus*, *T. claytoni*, *Q. capitatus*, *H. erythrinae*, *P. pratensis*, *M. javanica*, *D. dipsaci*, and some comparatively few species.

In the root soil of plants, according to the species composition, representatives of the order Tylenchida dominate, containing 33.6% of all species found in the root soil. At the same time, in terms of the number of individuals, representatives of the Aphelenchida order predominate, which is 32.9% of all registered individuals in the root soil of pomegranate plants.

In the root system of the pomegranate, 6931 individuals (30.7% of the total number of detected phytonematodes) were found, belonging to 73 species. Among the pararasobionts, only *D. communis* was found in the root system. *C. persegnis*, *E. oxyuroides*, *A. buetschlii*, *Ch. quintastriatus*, *Ch. sclerovaginitus* and *P. rigidus*. Among eusaprobionts, *Rh. brevispina*.

Among the representatives of phytohelminths of nonspecific pathogenic effect, *A. avenae*, *A. parietinus*, *A. bicaudatus*, *A. blastophthorus*, *A. composticola*, *A. graminis*, and *A. limberi* dominate.

From the group of phytohelminths with a specific pathogenic effect, *Q. capitatus*, *H. erythrinae*, *P. pratensis*, *M. incognita*, *M. javanica*, and *D. dipsaci* prevailed.

The main phytonematode community of the pomegranate root system is represented by the species *C. persegnis*, *Ch. sclerovaginitus*, *P. rigidus*, *A. avenae*, *A. parietinus*, *A. bicaudatus*, *A. composticola*, *A. graminis*, *A. limberi*, *Q. capitatus*, *H. erythrinae*, *P. pratensis*, *M. incognita*, *M. javanica*, and *D. dipsaci*.

In the root system, in terms of species composition, representatives of the order Tylenchida dominate, containing 34.5% of all detected species in the root system of plants. In terms of the number of individuals, representatives of the Aphelenchida order prevail, which is 47.7% of all registered individuals in the roots of pomegranate plants.

The following species dominate in the root soil and root system of pomegranate plants: *C. persegnis*, *Ch. sclerovaginitus*, *P. rigidus*, *Rh. brevispina*, *A. avenae*, *A. parietinus*, *A. bicaudatus*, *A. blastophthorus*, *A. composticola*, *A. graminis*, *A. limberi*, *Tylenchorhynchuscylindricus*, *T. claytoni*, *Q. capitatus*, *H. erythrinae*, *P. pratensis*, *M. incognita*, *M. javanica*, and *D. dipsaci*.

During the period of research on pomegranate agrocenoses of the territory of South Uzbekistan, we identified 128 species of phytonematodes belonging to 3 subclasses, 7 orders, 13 suborders, 21 superfamilies, 30 families, 34 subfamilies and 54 genera. All detected phytonematodes by orders are distributed as follows: (Table 1.).

**Table 1.**  
**Taxonomic composition of pomegranate plant nematodes (by order)**

Orders	Number of specie	of %	Number of individual	of %
Enoplida	3	2,3	328	1,5
Mononchida	2	1,6	90	0,4
Dorylaimida	26	20,3	1526	6,8
Plectida	4	3,1	140	0,6
Rhabditida	30	23,4	5294	23,5
Aphelenchida	23	18,0	7744	34,3
Tylenchida	40	31,3	7431	32,9
<b>Total:</b>	128	100	22553	100

Order Enoplida is represented by 2 suborders: Oncholaimina and Tripyloidina; 2 superfamilies: Oxystominoidea and Tripyloidea; 2 families: Alaimidae and Prismaticolaimidae; 2 subfamilies: Alaiminae and Prismaticolaiminae; 2 genera: *Alaimus* and *Prismaticolaimus*; 3 species (which is 2.3% of the total number of species). A total of 328 specimens (1.5% of the total number of detected plant nematodes).

The order Mononchida includes one suborder Mononchina, one superfamily Mononchoidea, one family Mülonchulidae, one subfamily Mylonchulinae, one genus *Mylonchulus* and 2 species (1.6%). A total of 90 individuals (0.4%) of phytonematodes were registered.

The order Dorylaimida is represented by 2 suborders: Dorylaimina and Diphtherophorina; 4 superfamilies: Nygolaimoidea, Dorylaimoidea, Leptonchoidea, and Diphtherophoroidea; 9 families: Nygolaimidae, Dorylaimidae, Qudsianematidae, Aporcelaimidae, Nordiidae, Xiphinematidae, Leptonchidae, Tylencholaimidae and Diphtherophoridae; 9 subfamilies: Nygolaiminae, Mesodorylaiminae, Qudsianematinae, Aporcelaiminae, Nordiinae, Xiphinematinae, Leptonchinae, Tylencholaiminae and Diphtherophorinae; 11 genera: *Nygolaimus*, *Mesodorylaimus*, *Eudorylaimus*, *Ecumenicus*, *Labronema*, *Aporcelaimellus*, *Longidorella*, *Xiphinema*, *Leptonchus*, *Tylencholaimus* and *Diphtherophora*; 26 species (20.3%). A total of 1526 individuals (6.8%) of phytonematodes were found.

Order Plectida includes one superfamily Plectoidea, one family Plectidae, one subfamily Plectinae; 2 genera: *Plectus* and *Proteroplectus*, 4 species (3.1%), a total of 140 specimens (0.6%) of phytonematodes.

The order Rhabditida includes 2 suborders: Cephalobina and Rhabditina; 3 superfamilies: Cephalobioidea, Panagrolaimoidea and Rhabditoidea; 3 families: Cephalobidae, Panagrolaimidae and Rhabditidae; 5 subfamilies: Cephalobinae, Acrobolinae, Panagrolaiminae, Peloderinae and Rhabditinae; 10 genera: *Heterocephalobus*, *Cephalobus*, *Eucephalobus*, *Acrobelloides*, *Chiloplacus*, *Cervidellus*, *Acrobeles*, *Panagrolaimus*, *Xylorhabditis* and *Rhabditis*; 30 species (23.4%). A total of 5294 individuals (23.5%) of phytonematodes were identified.

The order Aphelenchida is represented by one suborder - Aphelenchina, one superfamily - Aphelenchoidea, 3 families: Aphelenchidae, Aphelenchoididae and Seinuridae; 3 subfamilies: Aphelenchinae, Aphelenchoidinae and Seinurinae, 3 genera: *Aphelenchus*, *Aphelenchoides* and *Seinura*, 23 species (18.0%). A total of 7744 individuals (34.3%) of phytonematodes were recorded.

The order Tylenchida detachment covers 3 suborder: Tylenchina, Criconematina and Hexatyliina, 6 superfamilies: Tylenchoidea, Dolichodoroidea, Hoplolaimoidea, Criconematoidea, Anguinoidea and Sphaerularioidea, 9 families: Tylenchidae, Dolichodoridae, Psilenchidae, Hoplolaimidae, Pratylenchidae, Meloidogynidae, Paratylenchidae, Anguinidae and Sphaerulariidae, 11 subfamilies: Tylenchinae, Tylenchorhynchinae, Psilenchinae, Rotylenchinae, Rotylenchoidinae, Pratylenchinae, Meloidogyninae, Paratylenchinae, Anguininae, Nothotylenchinae and Sphaerulariinae, 14 genera: *Tylenchus*, *Filenchus*, *Aglenchus*, *Bitylenchus*, *Quinisulcius*, *Psilenchus*, *Rotylenchus*, *Helicotylenchus*, *Pratylenchus*, *Meloidogyne*, *Paratylenchus*, *Ditylenchus*, *Nothotylenchus* and *Prothallonema*, 40 species (31.3%). A total of 7431 individuals (32.9%) of phytonematodes were registered.

## CONCLUSION:

The above analysis shows that among the orders in terms of species composition, the order Tylenchida occupies the first place, accounting for 31.3% of all detected species of nematodes of pomegranate plants. This is followed by the order Rhabditida (23.4%), followed by Dorylaimida (20.3%) and the order Aphelenchida (18.0%).

In terms of the number of individuals among the orders, the Aphelenchida order takes the first place - 34.3% of the total number of detected phytonematodes. Then the orders Tylenchida-32.9%, Rhabditida-23.5% and Dorylaimida-6.8%.

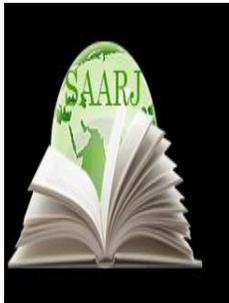

In the faunistic complex, pomegranate plant nematodes are represented by 30 families. The most diverse in terms of species composition is the family Cephalobidae, which accounts for 18.3% of all detected species of pomegranate plant nematodes. Then Aphelenchoididae - 15.4%, Qudsianematidae - 8.2%, Tylenchidae - 6.9 and Anguinidae - 6.2% each.

Aphelenchoididae ranks first in the number of individuals among families. It contains the main number (35.2%) of phytonematodes, followed by Cephalobidae - 14.2%, Meloidogynidae - 6.3%, Aphelenchidae - 5.4%, Anguinidae - 4.9% and Hoplolaimidae - 4.2% individuals.

### ABSTRACT

*This article discusses educational technologies to improve students' ability to think independently in physics classes, as well as speech culture. Independent thinking is not a short-term process, and it is the responsibility of every educator to shape this process from a young age. Practical training plays an important role in this. By solving problems, students expand and deepen their knowledge, learn more about laws and formulas, and consider the limits of their application. The following are also educational technologies for improving the ability to apply general laws to specific situations.*

**KEYWORDS:** *Innovation, Educational Technology, Independent Thinking, Intellectual, Pedagogical, Non-Traditional Education, Deductive Method, Logical Parts Of The Problem, Innovation, Educational Technology.*

### INTRODUCTION

An important factor is to educate today's younger generation on the basis of modern knowledge, to form in them independent thinking. Man generalizes reality indirectly and indirectly through independent thinking. Understands the intricate connections, properties, and mechanisms between things and events. Man has the ability to foresee the origin, development, and consequences of certain laws, laws, and events. The formation of a person's ability to think independently is more in line with the educational process [1].

Independent thinking is not a short-term process, and it is the responsibility of every educator to shape this process from a young age.

It is time to update the content and methodological framework of traditional education in the education system and to radically change the organization of the educational process [2]. At the same time, it is possible to increase the effectiveness of education by applying innovative teaching technologies to the physics education system. One of the most pressing issues today is the application of innovations and advanced foreign experience in the teaching of physics, as well as in all higher education institutions of our country.

### **THE MAIN FINDINGS AND RESULTS**

The educational process carried out in higher education institutions creates favorable conditions for the formation of students as individuals, intellectual and moral development. The teacher's use of innovative educational technologies in the coverage of the topic, the involvement of the student in the lesson, creates the necessary conditions for students to acquire theoretical knowledge, acquire practical skills and abilities. All of these technologies have their own characteristics, which ensure that students master the subject and are highly effective.

Defining a clear goal in communicating the topic to students in practical classes, didactic conditions (the ability to choose the optimal form of education, methods and tools, to achieve interaction and harmony between them, the organization of the educational process and clearly define the amount of time required for the acquisition of knowledge), students should be able to develop the subject not only theoretically, but also to solve problems, to develop a person as a teacher, to create a creative, businesslike mood in the group. In-depth study of pedagogical and didactic knowledge of the teacher in the coverage of the topic; Emerging situations require the ability to quickly assess the nature, the ability to find solutions, to take into account the age and psychological characteristics of students, the ability to monitor students' learning activities and to evaluate objectively [3].

The student, in turn, understands the essence of the topic, the internal need for the acquisition of theoretical knowledge and relevant practical skills and abilities, the determination of interest, the ability to apply the topic in practice, mastering the topic. He must perform the assigned tasks in a timely and quality manner, strengthen the theoretical knowledge acquired through independent work.

In modern education, interaction should form the basis of pedagogical technology and fully cover the learning process. The concept of "activity" is the leader. Because in reproductive education students are taught only to acquire ready-made knowledge, and the teacher recalls the knowledge given in the lecture in seminars, practical classes.

Most of the graduates of physics education in recent years have been working as teachers in schools, vocational colleges and academic lyceums. This means that we need to form in students the culture of speech, pedagogical features, to express their ideas correctly and fluently, and in practice to write the problem in the correct sequence on the board, and the student can easily understand it, we need to prepare.

Therefore, in practice, the following sequence can be used to solve a problem:

- a. Everyone works independently on a given issue,

- b. The teacher goes around and checks,
- c. The student who completes the problem first and correctly will work full time on the board,
- d. The students are randomly selected and placed on the board and explain the problem written on the board,
- e. He can write his own easier way if he wants to.

At the same time, we will achieve the following: "

- All students take an active part in the lesson,
- Students study the topic in depth,
- Learns to communicate his ideas to others,
- Learns to solve problems in new ways,
- Increases the student's ability to think,
- Gets new information.

By solving problems, students expand and deepen their knowledge, learn more about laws and formulas, consider (understand) the limits of their application, develop the ability to apply general laws to specific situations.

But if he does not understand the essence of the problem, if he realizes that a lot of work is needed to solve it, his desire to work independently may decrease. Therefore, it is necessary to gradually move from the problems to the problems that serve to gain knowledge, so that most students will be able to solve them.

Quality issues are addressed through logical discussion. In solving computational problems, equations are created and they are solved mathematically. Some problems can be solved by drawing geometric shapes.

The problem can be solved according to the following plan (some points may be omitted in solving some problems):

1. The condition of the case is read carefully;
2. Do you understand the meaning of all the words in the question? The meaning of an unknown word is determined by a book or a teacher;
3. Write the condition of the problem (it is determined that all are in the system of units of measurement);
4. Draw a diagram (if necessary);
5. Analyze the problem and reveal its physical meaning;
6. It is determined what laws will be used to solve this problem.
7. An equation is constructed that connects physical quantities;
8. Solve the equation, find the unknown quantity and get the answer in general;
9. The numerical value is found by calculating the values of the quantities in the SI system;

10. The received answer is analyzed, how the unknown changes with the given data is considered [6].

Students will get used to the fact that the problem is always solved according to this plan. If there is a step left, the issue may not go right. The teacher has to show it.

Problem solving classes in physics sometimes require the identification of several quantities. If the problem is logically divided into several parts and analyzed in a separate case, the problem is covered in a consistent manner.

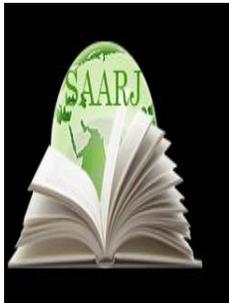

Thus, using the deductive method to solve this type of problem, the student performs the problem with an understanding of the problem in the appropriate sequence. The teacher is asked to break the problem down into logical parts.

### CONCLUSION:

The conclusions and suggestions can be used in the activities of educational institutions, in the teaching of physics, including specialty subjects. Modern educational technologies teach students to search for their own knowledge, to study and analyze it independently, and to draw their own conclusions. In this case, the educator creates conditions for the development, formation, acquisition and upbringing of the individual, as well as acts as a manager, guide, consultant, and evaluator.

### ABSTRACT

*This article deals with lexical-semantic and metaphorical-functional analysis of the content of Arabic loanwords in the “The Stories of the Prophets” by Nosiruddin Burhonuddin Rabghuzi, being primarily published in Turkic language based on Islamic sources, from the viewpoint of Arabic science of balāġat which was included into the sciences of Qur’ān in Middle Ages and issues that involve the science of balāġat – rules and methods of expressing the sentence by various means in order to interpret and explain the purpose are studied in the science of bayān.*

**KEYWORDS:** *Arabic Loanwords, Science Of Balāġat, Lexical-Semantic Analysis, The Science Of Bayān, Tašbīh, Mušabbah, Mušabbah Bih, Kināya, Majāz , 'Isti'Āra, Transfer Of Meanings.*

### INTRODUCTION

The periods of XIII–XIVth centuries is considered as separate and difficult periods in the history of turkic people and turkic languages. During this period on the areas of Central Asia and Golden Horde had been written many works that were different from the viewpoint of language peculiarities. Very few works from that period have survived. “The Stories of the Prophets” (second name “Qisasi Rabghuzi”), completed by the judge Rabghuzi in Khwarezm in 1311, is one of those few. Qisasi Rabghuzi’s vocabulary includes many arabic sentences, phrases and loanwords (Sagdullaeva, 2020).

Arabic loanwords, which have served as an external source in the enrichment of the Turkic language vocabulary, are valued primarily for their meaning, and their semantic adaptation to the Turkic language is particularly significant and interesting. Consequently, semantics

(semasiology), which studies the meaning of lexical units and changes in them, is one of the most important sections in the whole contemporary schools of linguistics (*Gaysina, 2008, p.7*). Identifying the ways of semantic expression of Arabic sentences and loanwords used in the work "Qisasi Rabghuzi" and their lexical-semantic and metaphorical-functional analysis can be the basis for highlighting the impact of Arabic balāḡat to the development of medieval Turkic languages by studying the author's oratorical skills. It also allows determining the semantic possibilities of the Arabic dialects, their position and tone in the text of the work, as well as the features that can be expressed in the process of interaction with other words, to draw appropriate conclusions about their methodological occurrence in the text.

## MAIN PART

It has been pointed out by Arab scholars that words have one and many meanings, and that their polysemy is due to the fact that the same word means different objects and events in different places (*Rustamiy, 2018, p.189*). In modern linguistics the product of the phenomenon of meaning transfer is called "figurative meaning". "The development of lexical meaning usually takes place by transferring the name of one object, sign and action to another one. The nature and position of such transfers are determined by the semantic rules of each language. The transfers that lead to the development of lexical meaning are mainly: metaphorical transference, functional transfer, metonymy transfer, synecdoche transfer" (*Tursunov, 1990, p.21*). In the East, these issues are studied in the science of bayān of Balāḡat (the science that studies the methods and phenomena associated with the expression of meaning). The science of bayān includes tašbīh, majāz, kināya and 'isti'āra (*Rustamiy, 2017, p.90*).

As a result of the research in the work "Qisasi Rabghuzi" a number of methods of expression based on the constructions asarabic loanword + arabic loanword, arabic loanword+ turkic lexeme, turkic lexeme + arabic loanword were identified, and found out that such kind of expressive means as tašbīh, majāz, 'isti'āra and kināya were perfectly implemented with participation of Arabic sentences and phrases. While some methods of expression have been introduced directly into the work through the introduction or quotation of Arabic sentences and compounds, others have been skillfully used by the author using Turkic, Arabic, and Persian elements.

## RESULTS AND DISCUSSIONS

One of the methods that serve to express meaning in the work using both languages effectively is tašbīh.

One of the first descriptions of tašbīh in Arabic Balāḡat was given by Abu Abdullah al-Khwarizmi in the work "Mafatihul-Ulum":

التشبيه: تمثيل الشيء بالشيء.

That is: Tašbīh is to resemble one thing to another (*Ziyovuddinova, 2001, p.47*).

There are three groups according to the rankings of Tašbīh.

1. The highest status. Such tašbīh results from the omission of odotu-t-tašbīh (means of similitude) and vajhu-sh-shibh (similarity).

The tašbīh which has reduced similitude and similarity, according to another definition suits to التّشبيّه البليغ *balig' tašbīh* (Ali Jarim, 1999, p.23-25).

The phrase *aqeeq irinlig'* meaning *red lips* can be the sample for this kind of tašbīh. In the compound "aqeeq" (agatestone) - "arabic mušabbah (simulated)", "irinlig'" - "turkic mušabbah bih (similar)". In this allegory, it is omitted which aspect of the lips and by what means it resembles an aqeeq. The most common type of aqeeq is red aqeeq. The given data show that "aqeeq" is compared to red in this example and in the classical literature of the East in general.

2. The medium status. In it, either the aspect of the tašbīh or allegory, or the means of analogy, is reduced. In the work, a similar type of tašbīh is found in a significant amount. *Qalamtek ko'zung* was used in the compounds as "qalam" (pencil) - "arabic mušabbah bih", "tek" (as) - "turkic odotu-t-tašbih", "ko'zung" (your eyes) - "Turkic mušabbah". This compound does not mention how the eye resembles a pencil.

Besides, in the samples like "aqeeqtak irinlaring", "aning ilmi daryotek", it wasn't mentioned how and on which features dudoq (lips) resembles aqeeq, and ilm (knowledge) to daryo (river). That is, the feature of resemblance of tašbīh was omitted. The given tašbīh is called التّشبيّه المجمل (abstract tašbīh) (Ali Jarim, 1999, p.23-25). This kind of tašbīh was widely used in the work.

3. The lowest status. In this tašbīh all the rukns take part. In Balāḡat the given tašbīh is called التّشبيّه المرسل (mursal tašbīh) (Rustamiy, 2017, p.93). Such kind of tašbīh has been reflected in the following examples of the work. For example: "Azrail bir badaviy arabtek kirib keldi" (Azrail came in as an Arabman). In the samples all types of rukns were existing and fulfilling the functions of tašbīh as in "Azrail" - "mušabbah", "badaviy" - "vajhu-sh-shibh", "arab" - "mušabbah bih", "teg" - "odotu-t-tašbīh". It should be noted that the "odotu-t-tašbīh" part of the tašbīh is used in the turkic sentence by means of analogy, such as "-tek, -teg" (as, like), "-cha, oncha" (as), "mengizlig'" (like), and as in introduction or as cited arabic sentences is expressed by means of simulation as "ك (kabi, -dek) » « مئلل (misli) ».

In the work one of the means of transfer meaning is majāz. The word مجاز (majāz) is made from the stem of «جوز», has the meanings of "causeway", "waterway", "irony, hint".

المجاز سموا به اللفظ الذي نُقِلَ من معناه الأصلي، و استُعْمِلَ ليبدل على معنى غيره، مناسب له.

That is: a word that is transferred from its original meaning and used to express the meaning of something else that suits it is called a majāz (metaphor). Or: "Words that change their meaning in consumption are called majāz (metaphors)" (Ahmad Hashimiy, 2004, p.318; Rustamiy, 2018, p.193).

The majāz (metaphor) is the best means of expression. It consists of parts such as mental and lexical majāz (metaphors). Balāḡat scholars have described mental majāz (metaphor) as "one of the styles of the Arabic language, the richness of language, the power to transcend the boundaries of reality into imagination." The real performer of the action expressed in the mental majāz (metaphor) is not mentioned in the word, but instead is assigned to something else whose action is related to the real performer (Rustamiy, 2018, p.193). But the fact that this thing is not real is perceived by the mind. Also, in a mental majāz (metaphor), the word is applied to what is set for itself.

The composition of the phrases used in the work with the participation of Arabic idioms consists of Arabic verb + Turkic verb or adjective, Turkic verb + Arabic masdar + Turkic auxiliary verb, Turkic-Arabic verb + Turkic verb, Arabic verb + Turkic verb. The connection between the original and the figurative meanings is different due to the difference in the isnad (reliance) in the mental majāz (metaphor) (Rustamiy, 2018, p.99).

One more methods related with meaning transfer is ‘isti‘āra, which means “borrowed”.

الإستعارة من المجاز اللغوي، و هي تشبيه خذف أحد طرفيه، فعلاقتها المشابهة دائما.

An ‘isti‘āra is a majāz lug‘aviy and also it is a tašbīh in which one of the two sides (mušabbah, mušabbah bihi) is revealed, and its relation is always based on similarity (Ali Jarim, 1999, p.99). So as to consider a phrase as ‘isti‘āra, it :

1) must be based on tašbīh; 2) must have *qarina* in its content; 3) a word mustn’t serve for itself, 4) must reduce a thing resembled or resembler.

In the work, involving arabic loanwords, the two kinds of ‘isti‘āra were effectively used. The first type of ‘isti‘āra is “al-’istiā’ra-t-tašrīḥiyya” (الاستعارة التصريحية) or called “istiorai musarraha” in which mushabbah, that is a thing or notion resembled, isn’t used.

In the work, in terms of quantity, the Arabic noun + the arabic noun and the istiorai musarraha in the construction of the arabic noun + the turkic noun are used equally. Most of them are formed as *Turkic idafa*. In some cases, this type of ‘isti‘āra is expressed as Turkic symbolic, Arabic and Persian idafa.

For example, the Arabic phrase *haybat bisoti* is likened to the denotation of the Day of Judgement, which, according to Islam, terrifies the whole mankind.

Apparently, the mushabbah was omitted, and the lexeme of "greatness" served as a *qarina*, i.e., the word did not serve itself. This transfer meaning must be understood in the sense of "when the Day of Judgement comes."

The constructions and samples used in the work as noun+arabic noun - *saodat tamg’asi*, arabic noun + turkic noun – *qiyomat ko’rki, iymon kaliti, shafoatning quri* and forms of chain idafa – *nubuvvat riyozining lolasi, badr-i xitta-i-vafo* combine a type of ‘isti‘āra-musarraha, and here a resembled object is Muhammad (SAV).

Another method of expressing meaning actively used in the work with the participation of Arabic loanwords is *Kināya*. The word كناية - “kināyat (un)” is made from the stem of ك ن ي is an action name (masdari) of كني “kana” (meanings: 1. to give a nickname, to give a name; 2. to signify; to imply). Meaning - a sign, symbol. An Arab scholar Ibn Manzur says about the meaning of *kināya*:

لكناية أن تتكلم بشيء وتريد غيره وكنتى عن الأمر بغيره يكنى كناية عني إذا تكلم بغيره مما يستدل عليه

That is: When you say one thing and mean another, it's *kināya* (ابن منظور).

The case is given a different name. To make a mockery is to say something else (something) that points to it. There are *sifat, mavsuf* and *nisbat* types of *kināya*, and its *sifat* type is widely used in the work. Much of the *kināya* that is meant by the adjective in the work is reflected in the Arabic idafa compounds that have entered through Islamic culture.

For example, *sodiqu-l-va'd* (honestly) is related as *kināya* to Ibrahim (a.s.) who was ready to sacrifice his own child. That is, with an adjective “*sodiq*” is mentioned *mavsuf- Ibrahim* (a.s.). To such kind of *kināya* the following samples can be given: *Ahsanu-l-qisas* (the best stories)– *mavsuf* of *surah Yusuf*, *Abu Jahl mavsuf* of *Abu-l-hikam* who was one of the Meccan polytheist pagan Qurayshi leaders known for his opposition towards the Islamic prophet Muhammad, *Abu-l-fazl - mavsuf* of *Abu Bakr* (r.a.) who was a senior companion (Sahabah) and the father-in-law of the Islamic Prophet Muhammad.

Almost all of these phrases have a name transfer status. In some cases, *kināya* are also expressed by adjective-words. Apparently, it is known that, *الصِّدِّيقُ*- *as-Siddiq*, that is “honest” was given to *Abu Bakr* (r.a.), *الفاروق*- “*al-Foruq*”, i.e. “wiseman” to *Umar* (r.a.). In the work the meaning of *siddiq* makes *kināya* for *Yaqub* (a.s.) and *Abu Bakr* (r.a.). For example, in the sentence “*Siddiqning duosi ijobatga ulandi*” *mavsuf* of *Yaqub* (a.s.), and in “*Rasul (a.s.)ning payg'ambarliqi kun tuqqanteg ravshan bo'lmasdin burun Siddiqning subhi belgurdi*” *mavsuf* of *Abu Bakr* (r.a.).

In the *mavsuf* type of *kināya*, quality is referred to through the adjective. This kind of *kināya* is used in the epithet part of the fiction in honor of Muhammad (SAV) and the Mongol prince *Nosuriddin Toqbuga* are expressed by the following samples: *payg'ambarlar toji* (crown of the prophets), *nubuvvat toji* (crown of the prophecy), *anbiyo qiblasi* ( *qiblah* (i.e. the direction of the Kaaba (the sacred building at Mecca), to which Muslims turn at prayer) of prophets.), *xotami rasul* (the last of prophets), *toju-l-umaro* (crown of emirs).

As can be seen, the author referred to his qualities through the adjectives with lexemes as *toj* and *qibla*, relating to such qualities as the last. The meaning of some of the phrases in this work of this type of *kināya* dates back to pre-Islamic times. For example, in “*Yanoqlari nurindin shaqoiku-n-Numon otlig' chechak uvtanar erdi*” its part *-shaqoiku-n-Numon chechagi-* was a red flower on the grave of king *An-Numon ibn Al-Munzir* who was beheaded for keeping the honour of Arab women ([ar.wikipedia.org/wiki](http://ar.wikipedia.org/wiki)), and this phrase means “*Numan's birth sisters*”. Through this phrase, which involved the relative type of *kināya*, the author referred to red colour in the text. This, in turn, constitutes a *mavsuf* type of *kināya*.

## CONCLUSION:

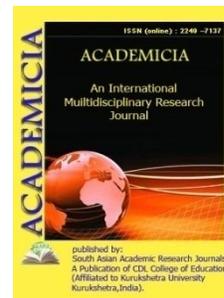

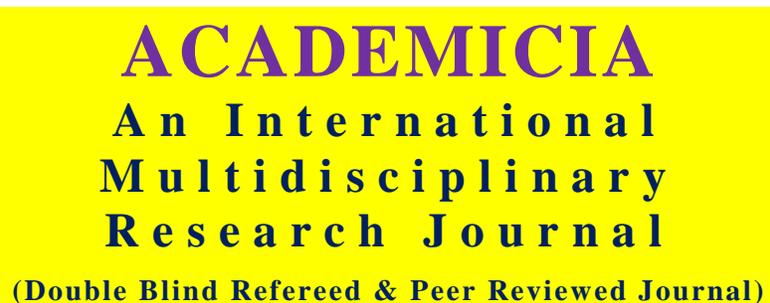

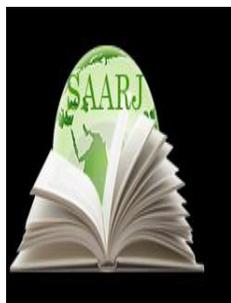

The results of the study of semantic expression methods with the participation of Arabic assimilations in the work showed that the science of *bayān* significantly contributed to the development of the language of the work. The most commonly used method of semantic method is irony, and most expressions of its qualitative type consist of Arabic *idafa* compounds. Some Arabic phrases of the *mavsuf* type have been adopted in accordance with the rules of science of *bayān* and have acquired a new meaning in the Turkic text.

While methods *oftašbīh* and *'isti'āra* were used in quantitative equality in the expression of meaning, the mental type of metaphor was less used.

In general, the Arabic loanwords served to express the basic meaning in the Turkic text. The author's skill in the use of Arabic words gave a new twist to the Arabic mastery. This was manifested in one way or another in the science of *bayān*.

### ABSTRACT

*This article examines and analyzes the reclamation status of the para-genetic landscapes of South Fergana. In the western hills, enterprises producing and processing construction materials, the landscape and ecological situation is unstable due to the activities of quarries, the slopes and slopes of the hills close to the onboard zone are used for agriculture. As a result of the development of hills in the conditions of cotton monopoly, the expansion of cotton fields at the expense of the area of hills, the reclamation condition of hill landscapes has worsened. The main reason for this is that the order of matter and energy flow in the hill landscapes developed for irrigation has been disrupted.*

**KEYWORDS:** *Reclamation Status, Para-Genetic Landscape, Para-Dynamic Relationships, Para-Genetic System, Reclamation Assessment.*

### INTRODUCTION

Sustainable functional development of landscapes and optimization of ameliorative condition largely depends on the observation, study, stationary research of dynamic processes in them.

A lot of scientific research on the study, assessment, planning of landscape-reclamation conditions has been carried out on the scale of different regions. Yu.F. Kobchenko (1975), A.A. Chibilev (1978, 1980), D.Ch. Jamgirshiev (1991), S.M. Kvashniy (2003), E.Yu. Nachelevsky 2004, 2011), A.I. Dobrov (1999) and many other scientists.

The scientific researches of A.A. Rafikov (1974, 1976) on the regional principles of landscape reclamation in the eastern part of Mirzachul are of great importance in our republic.

G. Yuldashev's (1993) research is based on regional principles aimed at land reclamation in the Fergana Valley. In the monograph published by A.Abulkasimov and O.Kuzibaeva (2009), researches aimed at assessing the reclamation condition of landscapes were carried out in the territory of Sokh conical distribution.

In this monograph, researchers, based on the views of V.B.Mikno [1998], point out the need to take into account regional features, typological features, para-genetic and para-dynamic relationships in the reclamation of landscape complexes.

Due to the interaction in para-genetic landscapes, it forms unique landscape-reclamation complexes.

### **THE MAIN FINDINGS AND RESULTS**

In assessing the reclamation status of para-genetic landscapes, in addition to the dynamic relationships between them, it is necessary to take into account the human economic activity in them. The hill-plain para-genetic complexes in the southern part of the Fergana Valley, which are the object of our research, are today para-genetic landscape-ameliorative systems that have changed to varying degrees. Accordingly, it is necessary to evaluate the para-genetic complexes of the hills as a natural economic system, taking into account the intensive processes between the para-genetic models.

In the reclamation assessment of para-genetic landscapes of the hill-plain, we considered the application of the principles of para-genetic and para-dynamic correlation, based on the above issues.

It is known that although the para-genetic landscape-complexes of the hills have certain differences in their reclamation status, the interrelationships and dynamic processes between them form a single reclamation system.

In the reclamation assessment of para-genetic landscapes it is important to study the climatic, hydrological, hydrogeological, soil, vegetation cover, the impact of human activities on reclamation systems as factors that shape the reclamation situation. As a result of such research, we have performed the following important tasks in the study area:

1. We determined the reclamation status of the para-genetic landscapes of the hill-plain and its dynamics;
2. We assessed the reclamation status of the para-genetic landscapes of the hill-plain;
3. We recommended the use of adaptive (landscape-reclamation) systems in the implementation of measures aimed at reclamation of para-genetic landscapes of the plains.
4. As a geological basis for the reclamation of para-genetic landscapes of the southern Fergana hills and plains, we have developed scientific developments on the organization of protection objects in typological landscapes and the development of protection systems through them.

In determining the reclamation status of the para-genetic landscapes of the southern Fergana plains and its dynamics, we first studied the para-genetic systems of the hills and plains separately, taking into account the landscape reclamation status.

One of the main factors determining the reclamation status of para-genetic systems of South Fergana is their territorial position, geological, geomorphological structure, climatic, hydrological-hydrogeological, soil and vegetation cover, the level of development.

Information on the formation, dynamics, and ameliorative condition of the para-genetic landscapes of the southern Fergana plains is perfectly presented in R. Khalikov's monograph "Fergana Valley" (2020). According to the author, in determining the landscape reclamation status of the hills, their territorial location, hypsometry, lithological composition play an important role. According to its territorial location, the southern Fergana hills occupy an intermediate position between the foothills and the foothills. Erosion-tectonic, erosion-denudation processes play an important role in their geomorphological structure. The intensity of tectonic, geological and geomorphological processes determines the location of the hills in 2 positions: flat low hills 500-800m and high hills 800-1200m. The soil is clearly represented in the vegetation.

We divide the hills in the southern part of the Fergana Valley into the group of southern, western, southern and southeastern hills. Based on such a distinction, we took into account not only their territorial location, but also their lithological composition, hypsometry, climatic features, and the degree of intensity in the para-genetic relationships between hills and plains.

Shursuv, Sokh-Isfara hills are located in the latitudinal direction and the absolute height reaches 800-1200 m. The relief of these hills consists of steep, complex anticline folds.

The western hills are distinguished by their dry climate and low rainfall (80-100 mm). Although these hills are somewhat higher, the inflow of air from the west pushes the precipitation eastward throughout the year. Accordingly, the western hills are located on the territory of 0.08-0.18 GTK on the Selyanikov scale. Under conditions of lack of moisture, gypsum gray and gypsum sur-brown soils are prevalent. Gypsum layers form lenses on the hills from the surface to the bottom (15-20m). The intensity of geochemical migration processes is related to the intensity of physical erosion. The surface flow is low, and the Isfara and Shursuv valleys form deep ravines and floodplains in the part where they cross the hills. Vegetation is very sparse ephemerals and shrubs grow in the upper part of the hills and in the areas crossed by ravines.

In the western hills, enterprises producing and processing construction materials, the landscape and ecological situation is unstable due to the activities of quarries, the slopes and slopes of the hills close to the onboard zone are used for agriculture. The water supply does not meet the demand. Over the next 5 years, vertical drainage was introduced by farmers and entrepreneurs.

Adverse effects of irrigation are due to incomplete formation of the soil layer, melting of gypsum layers under the influence of irrigation water and the formation of pits.

The system of southern hills consists of Rishtan, Chimgan-Kapchigai, Arsif and Quvasoy hills. formed erosion valleys, crossed by ravines and dry valleys, erosion-denudation anticline structures. The lithological composition of these hills includes conglomerate-gravel rocks, sandstones, clay and siltstones, as well as lyoss layers. In the lithological composition of the hills, the amount of lyoss is greater and thicker than in the western hills, so that such slopes are

strongly assimilated. The soil of the hills is light and on the high hills there are dark gray (Chimgan hill) gray soils. But there are gypsum lenses in the subsoil. New tectonic movements are clearly reflected in the marginal parts of the hills (Khalikov, 2020), the opening of eroded layers is an indication of new tectonic movements.

The development of Chimgan and Arsif hills and inter-hill basins in terms of landscape-ameliorative conditions is associated with the establishment of recreational zones of several treatment sanatorium farms on the basis of healing ground thermal mineral waters. The slopes and inter-hill lowlands of the hills are well developed. Seasonal recreation areas have a unique landscape design around streams and springs.

According to the level of mastery, Kuva-Arsif hills are also distinguished. The hypsometric condition of the Kuva-Arsif hills is characterized by a relatively large number of flat denudation surfaces that gradually rise. This is especially true of expositions. This situation creates ameliorative opportunities. However, lithological composition and relief play a key role in determining the landscape and reclamation status of these hills.

Conglomerate-gravel rocks also play a key role in the lithological composition of Kuva and Arsif hills. The amount of loess rocks and suglinkas is very small, siltstones are relatively more common. Gypsum rocks in the subsoil are 20-50cm. gypsum lenses are found in the range of slightly sandy-gravelly strongly cemented rocks, which gradually become thicker in the lower layers. In terms of the level of mastery, the Kuva-Arsif hills cover some long periods.

Recreation zones on the Arsif hills occupy the inter-hill valleys, the area around the springs at the foot of the hills, and the level of land reclamation is high. Recreation areas are surrounded by gardens and ornamental trees.

Although the hills in the territory of Southern Fergana are an integral para-genetic system, due to the above-mentioned differences between them, it is necessary to form landscape reclamation (adaptive) systems that are unique to each of them. It is also necessary to take into account the intensive processes between the para-genetic models of the hills. This is due to the fact that the development and reclamation of hills in the current conditions is not only spatially specific to the hills, but also para-genetic processes are intensive in the inter-hill and trans-hill plains.

The development of these hills and their stages are also important in assessing the reclamation status of the para-genetic landscapes of the southern Fergana hills. The development of these hills for irrigation dates back to the 50-60s of the last century. The first development was carried out by the local population, and winter wheat was planted on the basis of lalmi (land with not watering system) farming. On the hills of Markhamat-Polvontash and Kuva-Arsif, winter wheat was planted and used until the 70s of the last century on the flat heights at their top. Due to the lack of spring moisture in the western hills, it was not possible to cultivate lalmikor (land with not watering system). The hills have been used as spring pastures. As a result of the development of hills in the conditions of cotton monopoly, the expansion of cotton fields at the expense of the area of hills, the reclamation condition of hill landscapes has worsened. The main reason for this is that the order of matter and energy flow in the hill landscapes developed for irrigation has been disrupted. In fact, the controlled flow of matter and energy due to the assimilation of hill landscapes was supposed to be aimed at improving biological productivity. Each of the southern Fergana hills has its own morphogenetic system, and the selection of a homogeneous reclamation regime of the same type did not lead to good results.

At present, ensuring the reclamation stability of steppe para-genetic landscapes, increasing biological productivity is largely associated with human activities, and the landscape-system approach is important in determining the natural-reclamation potential of para-genetic landscapes and reclamation assessment. In the landscape system approach, it is expedient to determine the positional location of para-genetic landscapes, the specific features of morphological structures, the analysis of vertical and horizontal connections between them and the associated migration processes.

Scientific and methodological research on land reclamation has been carried out by researchers such as Yu.E. Mender (1979), V.S. Anoshko (1990), M.N. Brilevsky (1990), O.P. Maskalenko (1990). It should be noted that the ameliorative condition of each landscape and especially its morphological units has general and specific aspects. Therefore, the application of land reclamation requires taking into account the specificity of the landscape.

In a textbook published by V.B. Mikno (2007), he demonstrated a number of methods for land reclamation.

In the reclamation assessment of the paragenetic landscapes of the southern Fergana hills, we first determined their level of contrast based on the hypsometric position, depending on the positional position of the hill riders. In determining the degree of contrast, we used the scale recommended by V.S. Anoshko and M.N. Brilevsky (1990).

**TABLE 1 THE DEGREE OF CONTRAST OF THE PARA-GENETIC LANDSCAPES OF THE SOUTHERN FERGANA HILL**

Hill para-genetic landscape species	Types of urchins	Appearance of urchins	Lithological composition	Groups by contrast level
1. Salty hills	High and steep slopes, erosion, denudation	Strong and moderately eroded steep slopes and steep hills, inter-hill lowlands	Coarse rocky-gravel rarely lyoss	5
2. Chimgan hills	High and flat peaks, steep and medium, hills, denuded eroded inter-hill lowlands	Erosion denudation high hills are sloping slopes in the form of dry valleys	The rocky gravel is strongly cemented, with lyoss layers on the slopes and skirts	5
3. Arsif hills	Erosion denudation hills with medium and low flat peaks	Flat-sloping hills, eroded hillsides of varying degrees	Gravel sand mixed siltstone, lyoss rocks	3
4. Kuva hills	Erosion-denudation hills with medium and low, steep	Medium-height flat hills, closed and open lowlands of	Coarse-grained, gravelly, moderately cemented,	3

	and sloping peaks	inter-hill valley type	slightly thick lyoss	
--	-------------------	------------------------	----------------------	--

In determining the degree of contrast of the landscapes, we used the following formula recommended by the above researchers:  $[Kn = Kp.Kk.]$  Where

Kn-landscapes are an indicator of diversity

Kp- An indicator of the prevalence of urticaria

Indicator of different fog of Kk-Urochishche.

Based on the table above, we determined the level of contrast of the hills selected from our study area based on the appropriate formula. In this case, we adopted a 5-point system and divided the groups according to the level of contrast through the indicators in the table.

Determining the level of contrast is important in assessing the reclamation status of para-genetic landscapes. At the same time, qualitative and quantitative analysis of landscapes is important in land reclamation assessment. Irrigation reclamation is not always suitable for hill landscapes. Planning of the hills, the correct choice of agricultural crops, the choice of the most suitable irrigation techniques and methods are also important reclamation measures.

Quantitative reclamation assessment compares the quantitative indicators of paragenetic landscape complexes, which are evaluated on a point system.

We analyzed the changes in the reclamation status of the para-genetic landscapes of the southern Fergana hills based on the level of assimilation of the hills. At the same time, the level of development of hill landscapes, the states of involvement in human economic activities were taken into account.

**TABLE 2 INDICATORS OF CHANGES IN THE RECLAMATION STATUS OF PARAGENETIC LANDSCAPES OF SOUTHERN FERGANA**

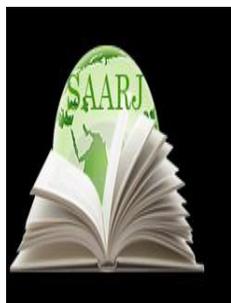

Hill landscapes	Component change				mastering rate in%	Reclamation status indicator
	relief	soil	Vegetation	Animal world		
1. Salty hills	average	average	strong	strong	70	салбий
2. Sukh Isfara hills	weak	weak	weak	average	60	
3. Altiyarik Kapchigay hills	average	ўртача	strong	strong	70	
4. Chimgan hills	average	average	strong	strong	60	
5. Arsif hills	average	strong	strong	strong	80	
6. Kuva-Tolmozor hills	average	average	strong	strong	80	
7. Marhamat Polvontash hills	average	average	strong	strong	70	

**CONCLUSION:**

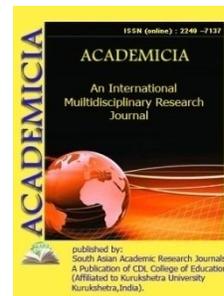

The table shows that the reclamation condition of the southern Fergana hills and the negative indicators in the dynamics of its change are significant, so it is expedient to develop special reclamation programs to improve the ecological and reclamation condition of the hill landscapes.

### ABSTRACT

*This article analyzes the effect of green apple juice (Aphis pomi De Geer, 1773) on the release of carbon dioxide during the study of gas exchange and the influence of environmental factors on this process. The fact that the annual dynamics of the respiratory coefficient in these juices is directly proportional to the dynamics of the population density in them proves that the study proceeded in accordance with the biological laws. This situation depends on the rate of consumption of oxygen accumulated in the tracheal system. On the other hand, the rate of gas exchange in insects is manifested in relation to eco-topic conditions.*

**KEYWORDS:** *Green Apple Juice, Vinegar, Nymph, Swarm, Amphibian, Winged Live Birth Juices, Aphid indication, Decade.*

### INTRODUCTION

Among the vital processes of insects, gas exchange is of particular importance. In insects, this process is complex and unique. This is because the gas exchange associated with the structure of the respiratory organs of these animals is also unique and is not repeated in other animals. They take in oxygen during respiration and absorb it for a long time (in some cases up to 1 hour), but can only release carbon dioxide after a certain amount of time. This situation depends on the rate of consumption of oxygen accumulated in the tracheal system. On the other hand, the rate of gas exchange in insects is manifested in relation to eco-topic conditions. All this may make it

possible to interpret the ecological and evolutionary adaptation characteristics of individual species.

So far, the exchange of gases in some small animals and insects has been studied by scientists. In particular, specific features of this process have been studied in some worms, houseflies, waterfowl, bees, spiders, and other animals [2,p. 142; 3, p. 794]. According to their data, silkworms, locusts, bees, moths and fungi of moths receive oxygen during respiration and may not emit carbon dioxide for up to 1 hour.

Green apple juice is one of the most common and harmful species in all regions of Uzbekistan [4, p. 340].

### **THE MAIN FINDINGS AND RESULTS**

Some information on the study of gas exchange of small insects, in particular aphids, is given in the dissertation of I. Zokirov (2009) [5, p. 23]. Preliminary work has been done in this regard, including the creation of a mechanism for the uptake of oxygen by the juices and the release of carbon dioxide. New equipment has been created for this mechanism.

MH Akhmedov made an ecological analysis of the phenomenon of morphological variability in aphid sap of arid and mountainous regions of Central Asia, giving a comprehensive explanation of the geographical, vertical-regional, seasonal variability of these insects and the effect of forage vegetation on sap variability [1, p. 45].

The biology of green apple juice is somewhat different from other species. These saplings live mostly in the leaves of fruit trees such as apples, pears, quinces, forming large colonies in the three growing parts.

The period of onset of seasonal development of green apple juice can occur in mid-March and early April, depending on air temperature. For example, in 2019, the year we surveyed, the first founders laid their eggs on March 12-15. The maturation of the founders lasted 9-11 days. Founding vinegars mature in 6-10 days. The founders began to multiply, gathering on the underside of the newly formed leaves. 2-8 days after their first emergence, a small number of whitish-yellow colored vinegars and wingless live-producing juices began to appear. Their maturation lasted 7-8 days. In particular, live offspring without mature wings were found on March 23-25. Within 10–15 days of maturation of the vinegar, the gangs became denser due to the formation of new individuals.

An increase in the quantity density of juices was noted in the first days of April (2-3.04). Wingless live-born juices have been found to mature in an average of 7 days.

The appearance of nymphs occurred in the second half of April and the first decade of May. The first nymphs were recorded on April 20th. By this time, most of the flocks were composed of nymphs and winged live-bearing squirrels.

The amphibian joint of green apple juice began to occur from the 2nd decade of October. The egg-laying of the squirrels mainly occurred in late October and early November 2019. Wintering eggs can be observed from November. The 2019 seasonal development of green apple juice (*Aphis pomi* De Geer.) Was completed in October-November.

Because these juices are smaller in size than other types of juices, the amount of oxygen or carbon dioxide in the inhaled air has also been found to be relatively small.

Taking no more than 10 green apple juices for the experiment will allow the experimental results to come out more accurately. The fact that the annual dynamics of the respiratory coefficient in these juices is directly proportional to the dynamics of the population density in them proves that the study proceeded in accordance with the biological laws.

In the process of studying the gas exchange in green apple juice in the conditions of the village Tegirmonboshi of Toshloq district, the results were obtained on the release of carbon dioxide. In particular, experiments conducted on March 28 (2019) were conducted on green apple juice living in a pear plant. Temperature + 11°C, barometric pressure at the time of the experiment was 711 million rubles. The current water vapor pressure is 9.59 million soums. The viability of the juices in the chamber was 3 h.

It should be noted from experiments that the viability of spring saplings is higher than the viability of sap of other seasons. For the experiment, 10 syrups were placed in the syrup chamber. A volume of 0.008 ml of 0.1 ml of inhaled air was ingested into the KOH solution.

<b>Determination of carbon dioxide.</b>	
Date	28.03.2019 .
Plant type	Pear
Experiment time	11.00
Temperature during the experiment	+11 <sup>0</sup> C
Barometric pressure during the experiment	711 mlnsoums
Constant pressure	760 mlnsoums
Water vapor pressure (taken from the table)	9,59 mlnsoums
Universal gas constant	0,00637
The amount of SO <sub>2</sub> in the air (according to SI)	0,03%
The amount of SO <sub>2</sub> in 0.1 ml of air (according to SI)	0,00003 ml.
The number of syrups obtained for the experiment	10 та
The viability of juices in the chamber (quoted for 1 hour for formula)	3 coat
Initial indication of the KOH solution in the pipette	0 ml
Pipette indicator when inhaling air	0,1 ml
Pipette reading after 1 day (temperature constant)	0,092 ml
The volume of gas absorbed by KON	0,008 ml
Calculated for 1 hour	0,0026 ml
1 та шираучунютилган газ ҳажми	0,00026 ml
The SO <sub>2</sub> in the gas absorbed by KOH is found by Gay-Lussac's law: $V_o = 0.00026 \frac{711 - 9.59}{760(1 + 0.00637 \cdot 11)} = 0.00026 \frac{701.41}{813.253} = 0.00022$	0,00022 ml
From the result obtained, the amount of SO <sub>2</sub> in the air is subtracted, resulting in the amount of pure SO <sub>2</sub> emitted by 1 syrup in 1 hour.	0,00019 ml

$V_o = 0.00022 - 0.00003 = 0.00019$	
The amount of SO <sub>2</sub> emitted by 1 syrup per 0.1 ml of air volume (100%) in%:	0,19 %
$CO_2 = \frac{0.00019 \cdot 100}{0.1} = 0.19$	

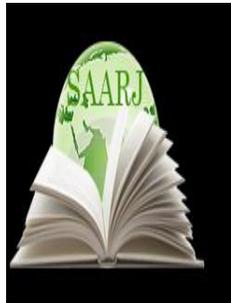

At the same time, when calculating the exhaled air output per 1 hour and 1 syrup, this figure was 0.0026 ml. The result was brought to a normal gas state according to Gay-Lussac and Boyle-Mariott laws. The result was 0.00022 ml. The amount of SO<sub>2</sub> in the air is subtracted from the result, resulting in the amount of pure SO<sub>2</sub> that 1 syrup emits in 1 hour. This figure was found to be 0.00019 ml. It was found that the amount of SO<sub>2</sub> emitted by 1 syrup was 0.19% relative to the volume of 0.1 ml of air (100%).

### CONCLUSION:

In this regard, the detection of respiratory processes of other types of juices may be important in the aphid indication of man-made pollution of the environment.

**ABSTRACT**

*This paper discusses the development of object to perform specified functions, preserving in time the values of established performance indicators within specified limits that correspond to specified modes and conditions of use. The dependence of the failure rate on this site, which is the most important for the ECO, is usually described by a logarithmically normal law, for which the failure rate is not constant over time. When statistically predicting the reliability characteristics of an ECO using models of the development of degradation of parameters from time and load, failures are divided into two types: partial and complete.*

**KEYWORDS:** *Diod, Function, ECO System, Manufacturing Technology, Crystal Material, Contact Material, Model.*

**INTRODUCTION**

**Main part**

The reliability function (probability of failure)  $R(t)$  Is the probability that no failure will occur under the specified operating conditions (or tests) by time  $t$  . Values of  $Q(t)=1 - R(t)$  is called the aggregate failure function and corresponds to the probability of failure occurring under the same conditions at a point in time  $t$

Failure rate is the probability of device failure  $D$  per unit of time

$$\lambda(t) = - 1/R(t) \cdot dR(t)/dt. \quad (1)$$

The failure rate function can also be expressed in terms of the failure rate  $f(t)$ .

Thus, four basic probability functions are introduced:  $R(t)$ ,  $Q(t)$ ,  $\lambda(t)$ ,  $f(t)$ , each of which fully characterizes the reliability of the device, since knowing any of them, you can define three other

functions. The function  $\lambda(t)$  and  $f(t)$  they have a dimension that is the inverse of time, and the functions  $R(t)$  and  $Q(t)$  are dimensionless.

For rice. 1 shows a typical dependence of the failure rate over time. On the plot AB failure rates are dropping. This section is called the run-in period. The high failure rate here is associated with the loss of operability of devices that have significant hidden technological defects. Such devices are usually detected (rejected) in the process of technological testing (training) and do not come to the consumer [1-8].

On the plot BV failure rate is practically constant and can be described by an exponential distribution of failures over time, for which probability functions have the form:  $I(t) = \exp(-\lambda t)$ ; (2)

$$Q(t) = 1 - \exp(-\lambda t); \lambda(t) = \lambda = \text{const.} \quad (3)$$

The failure rate in this case does not change during running time and is calculated using the formula  $\lambda = d/T_{\Sigma}$ ,

where  $d$  is the received number of bounce rates;

$T_{\Sigma} = \sum_{i=1}^n t_i$  total running time of the products;

$t_i$  - running time  $i$  - product year;

$n$  is the number of observable items.

If the number of failures is zero, the failure rate  $\lambda = 0.69 / T_{\Sigma}$ . In the area to the right of point B, the failure rate increases due to wear and aging of materials. This section is typical for ECO systems where parameters are degraded. The dependence of the failure rate on this site, which is the most important for the ECO, is usually described by a logarithmically normal law, for which the failure rate is not constant over time. In the initial period, it increases, then, having reached the maximum, it decreases. Logarithmically normal distribution of failures is widely used in assessing the reliability indicator of the EP, but in some cases, it is possible to use other laws: Weibull, normal, exponentially gamma distribution, beta distribution. These laws can be used not only to find the quantitative characteristics of operating time before failure, but also to describe the distribution functions of device parameters, physical characteristics of materials, and manufacturing processes that are subject to random variations.

The study of ECO reliability is closely related to methods of predicting quantitative indicators, which can be divided into two main groups: forecasting based on the results of forced tests and statistical forecasting using models of parameter degradation. Prediction based on the results of forced tests is based on the change in the test process of the parameter  $x$  of devices associated with physical and chemical processes occurring in the devices and causing their failure. Parameter  $x$  is a random variable and changes depending on the time and load on the device. Therefore, the failure rate (uptime) is also related to the operating mode of the device. However, the distribution law is preserved for different loads. Only the characteristics of the law, which are invariants with respect to test modes, and the acceleration coefficient change  $K$  can be found through the characteristics of the distribution law.

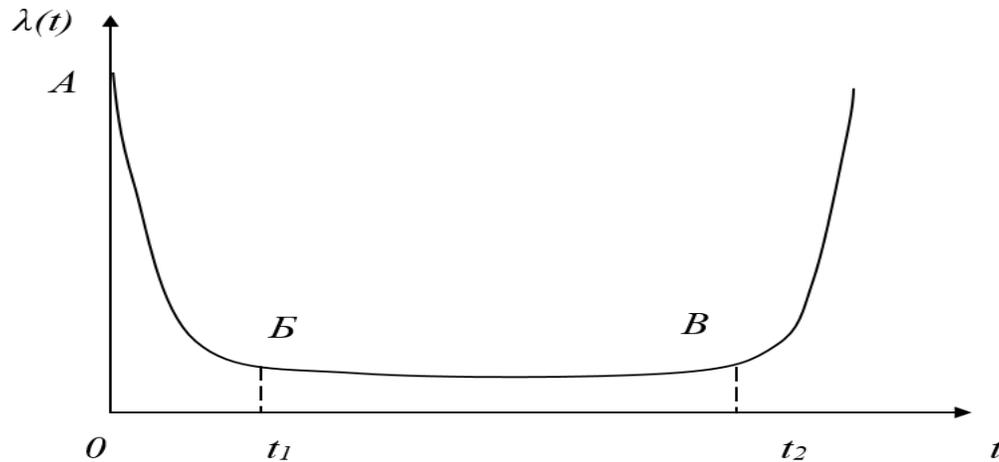

Figure 1- Typical dependence of the failure rate the ECO from time to time

If the uptime of the product obeys the logarithmically normal distribution for the load  $\varepsilon_1$

$$F[x(\varepsilon_1)t] = f[(\ln t - m_1) / \sigma_1], \quad (4)$$

Where  $f(I)$  is the Laplace function;  $m, \sigma$  are the distribution characteristics, then for the load  $\varepsilon_2$

$$F[x(\varepsilon_2)Kt] = f\left(\frac{\ln K + \ln t - m_1}{\sigma_1}\right) = f\left[\frac{\ln t - (m_1 - \ln K)}{\varepsilon_1}\right] = f(\ln t). \quad (5)$$

It can be seen from (33) that the acceleration coefficient  $K = e^{m_1 - m_2}$ .

For the We I bull distribution with characteristics  $n$  and  $\alpha$

$$F[x(\varepsilon_1), t] = 1 - \exp(-t^\alpha / \eta_1). \quad (6)$$

The are parameter depends on the test mode, so the acceleration coefficient is calculated using the formula

$$K = (\eta_1 / \eta_2)^{1/\alpha}. \quad (7)$$

For the exponential distribution law, which is a special case of Weibull's law for  $\alpha = 1$  and  $\lambda = 1/n$ , it follows from (34) that the acceleration coefficient  $K = \lambda_2 / \lambda_1$ .

If refusals are described by Arrhenius ' law, then

$$K = \exp\left[\frac{E_a}{k}\left(\frac{1}{T_1} - \frac{1}{T_2}\right)\right], \quad (8)$$

Where  $K$  is the Boltzmann constant.

The properties of the invariance of the distribution law and the presence of invariant values can be used as criteria for the correctness of making a decision on a particular model of failure development when predicting reliability characteristics based on the results of accelerated tests in forced modes.

When statistically predicting the reliability characteristics of an ECO using models of the development of degradation of parameters from time and load, failures are divided into two types: partial and complete. Partial values are characterized by a change in at least one parameter and its value exceeding the established limits (or norms). As a rule, these boundaries are used to

control the quality and reliability of devices during manufacture, acceptance and delivery to the consumer. Complete failures are characterized by the loss of device properties based on any one or more parameters-failure criteria. [6]

The behavior of any parameter  $x$  at can be described by a continuous function  $x(t)$ , increasing or decreasing. The continuity and monotonicity conditions of the function  $x(t)$  in this case are: for the constraint  $x$  from above

$$dx(t)/dt \geq 0, x(t) - x(t + \Delta t) \leq 0, \tag{9}$$

to limit  $x$  from the bottom

$$dx(t)/dt \leq 0, x(t) - x(t + \Delta t) \geq 0. \tag{10}$$

Given expressions (9) and (10), the partial failure condition can be defined as the output of the value  $x(t)$  beyond some boundaries  $x_{in}$ (lower) and  $x_{in}$ (upper):

$$x(t) = \begin{cases} x_h \leq x(t) \leq x_{in} & \text{for } \begin{cases} 0 \leq t < t_0, \\ t \geq t_0, \\ t \geq t_0, \end{cases} \\ x(t) >> x_{in} \\ x(t) < x_n \end{cases} \tag{11}$$

where  $t_0$  is the time when the failure occurred.

From equation (38), taking into account (36) and (37), it can be seen that the probability of failure depends on the boundary values (either  $x_h$  or  $x_b$ ).

A complete failure for parameter  $x$  can be described by a function that looks like

$$x(t) = \begin{cases} x_h^K < x(t) \leq x_v & \text{for } 0 \leq t \leq t_0; \\ \delta[x(t_0) - x_{in}^K] & \text{for } t = t_0 \text{ and } x(t_0) = x_n^K \text{ or } x_b^K, \\ \frac{1}{\delta[x_n^K - x(t_0)]} \end{cases} \tag{12}$$

where  $x_{toh}$ ,  $x_{tob}$  - the lower and upper critical values of the parameter  $x$ , when reaching which there is a loss of operation or destruction of devices. Critical values of  $x$  are constant for devices United by technological community\*, and are related to the norms for this parameter, according to which quality and reliability control is carried out:

$$x_{in} - x_{in}^K, x_{nK} - x_n. \tag{13}$$

It follows from expressions (11) and (12) that total failures do not depend on the established norms for parameters. The reliability characteristics for total and partial failures are formally the same, but for partial failures they are functions of the norms for parameter  $x$ , which is used to register the failure. For complete failures defined as (12), independence from the norm for parameter  $x$  allows us to assume that the probability of failure at time  $t + \Delta t$  does not depend on  $\Delta t$ . Such failure events are described by an exponential distribution.

Given that the physical processes leading to total and partial failures defined as (11) and (12) are usually independent, the probability of failure-free operation can be written as the product of two probabilities:

$$R(t) = R_n(t) R_h(t) = e^{-\lambda t} R_h(t), \quad (14)$$

Where  $R_n(t)$  and  $R_h(t)$  are probabilities for total and partial failures, respectively. Expression (14) shows that to restore the distribution law  $R(t)$ , it is sufficient to know the distribution law  $R_h(t)$ .

To restore the distribution function  $RR4(t)$ , we use the fact that the change in the parameters for which a partial failure is registered can be described over time by a function of the form  $x = \omega(t)$ . There is an inverse transformation of  $t = \eta(x)$  [7].

In this case, the technological commonality is understood as the similarity of manufacturing technology, crystal material, contact material, method of connecting current-carrying elements, protection of the p-n junction.

In this case, there is a connection between the initial distribution of parameter  $x$  (at  $t = 0$ ) and the probability density function of the time-to-failure distribution in the form

$$f(t) = f[x(t)] dx(t)/dt. \quad (15)$$

The analysis of equation (15) shows that for many practical problems, depending on the type of function  $x(t)$  and the initial distribution density of the parameter  $f(x)$ , it is possible to obtain fairly simple distributions of the probability density of run-to-failure  $f(t)$

For a logarithmically normal law

$$f(x) = \frac{1}{t_{\sigma} \ln \sqrt{2\pi}} \exp \left[ -\frac{(\ln x_i - \overline{\ln x})^2}{2\sigma_{\ln x}^2} \right]; \quad (16)$$

$$m = \overline{\ln} = \frac{1}{n} \sum_{i=1}^n \ln x_i = \ln x_i = \frac{1}{n} \ln \prod_{i=1}^n x_i \quad (17)$$

- average value;

$$\sigma_{\ln x} = \sigma = \sqrt{\frac{1}{n-1} \sum_{i=1}^n (\ln x_i - \ln x)^2} \quad (18)$$

- the average square deviation (standard).

The value of  $x$  in time is described by the functions:

$$1) \quad x = a + bt, \quad \sigma = \text{const}, \quad (19)$$

$$f(t) = \frac{b}{t_{\sigma} \sqrt{2\pi}} \exp \left\{ -\frac{\left[ \ln \frac{a+bt_i}{a+bt} \right]^2}{2\sigma^2} \right\}; \quad (20)$$

$$2) \quad x = \ln t, \quad \sigma = \text{const}, \quad (21)$$

$$f(t) = \frac{1}{t \ln t_{\sigma} \sqrt{2\pi}} \exp \left[ -\frac{(\ln \frac{\ln t_i}{\ln t})^2}{2\sigma^2} \right]; \quad (22)$$

$$3) \quad x(t) = \exp Kt, \quad \sigma = \text{const}, \quad (23)$$

$$f(t) = \frac{K}{t_{\sigma} \sqrt{2\pi}} \exp \left[ -\frac{(t-\bar{t})^2 K^2}{2\sigma^2} \right]. \quad (24)$$

This, knowledge of the processes of changing the parameters-parameters expiration criteria in time- allows us to restore the probability density of the distribution of time to failure and, accordingly, other reliability characteristics.

Promising methods for obtaining data on the reliability of an ECO are methods based on non-destructive testing for characteristics and parameters. These methods are called parametric methods. They are based on the relationship between the physical structure of the device and the reliability characteristics. The method is based on the causality hypothesis, which establishes that the degradation of parameters is completely determined by the physical state of the device before use. Since the physical condition of the device before use cannot be described by a complete system of characteristics, the quantitative characteristics of reliability in this case are also probabilistic. You can differentiate between one - dimensional rating if it is based on one parameter, and multidimensional - in the view of the large number of parameters.

### CONCLUSION:

SD radiation occurs as a result of spontaneous radiative recombination of charge carriers and is therefore incoherent, and therefore relatively broadband and weakly directed.

Particularly, super luminescent (SLD) materials should be singled out. In these diodes, in addition to spontaneous recombination with radiation, the process of induced recombination with radiation is used; the output radiation is amplified in the active medium.

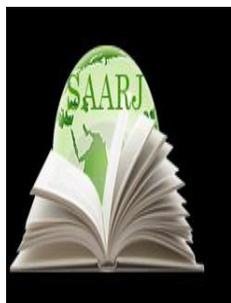

The average power of radiation in continuous operation determines the total power radiated by the surface of the active area of the device in the direction of radiation output.

## ANALYSIS OF SEMANTIC AND METAPHORICAL IDIOMS WITH THE WORD “TIGER” IN CHINESE AND ENGLISH

Li Hujun\*

\*Tashkent State University of Oriental Studies,  
 UZBEKISTAN

### ABSTRACT

*The idiom “tiger” is quite typical for animal idioms, which embodies the unique way of thinking of the Han people in understanding the picture of the world. The metaphorical meaning of idioms is formed to explain abstract truth. The tiger idiom shows that the reason people use different idioms to express the same concept is the result of metaphor. The study of zoomorphic idioms with the word 虎 through the prism of figurative, metaphorical meanings in linguo-cultural and comparative aspects makes it possible to reveal the peculiarities of ideas about the animal world and about ourselves, which is an important part of the linguistic picture of the world in China and in the West.*

**KEYWORDS:** *Linguistic Picture Of The World, Metaphor, Idiom, Tiger, Connotation.*

### INTRODUCTION

According to statistics, in the “Dictionary of Chinese Idioms” (1) there are 82 idioms related to the word “tiger”, which is 11.71% of all animal idioms, Ranked second [2, P.10]. There are many related articles about animal idioms and metaphors, and most of them focus on the source of animal idioms, cultural connotations, and the mapping of metaphorical meanings. There are also many results from studies of certain types of animal idioms, such as analyzes of the metaphorical meaning of the idiom “horse” or the idiom “dog”, and discussion of the structure of animal idioms. The purpose of this article is to identify general and nationally specific metaphorization mechanisms inherent in the languages under study, as well as to explain their functioning within the framework of the linguocultural-ological approach. The study of zoo-metaphors is productive, since such metaphors persist in the language for a long time, and also represent one of the most numerous types of metaphors. The study of zoomorphic metaphors is an integral part of the study of the linguistic picture of the world.

## THE MAIN FINDINGS AND RESULTS

**1. The main shade of the word “tiger”.** The definition of the word “tiger” in the Dictionary of Modern Chinese is as follows: a noun, a mammal, with a large round head, yellow hair and black horizontal stripes. He has a keen hearing and sense of smell, he is fierce, strong, good at swimming, cannot climb trees and goes out at night to hunt birds and animals. Metaphor of courage and power: 虎将(tiger general), 虎虎有生气 (brave like a tiger) . It can also be used as a verb in dialects to show a fierce look, for example: 虎起脸 (to express evil facial expressions like a tiger's face) . It is because of many natural attributes that the tiger has a strong duality in the minds of people: as the king of beasts, people admire his powerful strength. The idioms “虎略龙韬”, “虎踞龙盘”, “虎头燕颌”, “龙骧虎视”, “龙精虎猛” show the respect and love of tigers. But on the other hand, the tiger is still a beast, carnivore, and people fear its cruelty. The idioms “虎狼之心”, “虎视眈眈”, “羊入虎口” speak of the cruelty of the tigers, and people are full of fear of it. According to the description of tigers in the “Encyclopedia of China • Volume of Biology”, tigers belong to the orders of mammals, predators and panthers of the feline family and are large animals. The main characteristics of the “tiger”: (1) Appearance: a. the head is round and large; b. ears are short; c. the neck is thick; d. sharp teeth; e. limbs are strong and powerful; f. the whole body is pale yellow or brown; g. has black horizontal stripes. (2) Behavior: h. Walks at dusk or at night; I. mobile; j. swims well. (3) Habits: k. live alone; l. carnivorous; m. cruel. (4) Intelligence: n. keen hearing and sense of smell; o. well-developed brain.

**1.2. Classification of idioms with the word “tiger” by semantics.** As the king of beasts, the Han people have worshiped the tiger since ancient times. As a result of long-term accumulation, many idioms associated with the “tiger” (5 were formed. p, 76). Some of these idioms are related to the tiger's own organs, and some to the tiger's environment. Some of them are associated with the tiger pose, and some are combined with other animals to form an idiom. Below is a summary of the content of the component “tiger” ginseng, and its classification is as follows: 1). Idioms are associated with the body of a tiger. There are many idioms associated with the body of a tiger. Most of these idioms highlight the distinctive characteristics of the tiger. People use the organs of the tiger and rhetorical devices such as metaphors and exaggeration to describe the tiger comprehensively to achieve a certain performance effect. For example, people use the metaphor “虎口之厄” to express a dangerous place; the three idioms “o 虎口余生”, “虎口逃生” and “虎口残生” refer to the lives escaped from the mouth of a tiger in great danger. “虎口拔牙” refers to the removal of teeth from the mouth of a tiger, expressing doing something extremely dangerous and extremely difficult. Zhuangzi says: “料虎头, 编虎须, 几不免虎口哉!” (To make a tiger's head and weave a tiger's whiskers, it's almost impossible to avoid the tiger's mouth!) [6. p, 145]. Therefore, idioms consisting of “虎口] (tiger mouth) often indicate dangerous places.

2) Idioms are related to the behavior and manner of the tiger. The tiger is a symbol of strength and courage, and these characteristics of the tiger are fully reflected in its behavior. People often use the tiger action pose to describe the way people live and express their admiration for the image of the strong and brave. For example, a tiger's eyes are very fierce. “虎视鹰瞵” and “鹰扬

虎视" denote powerful enemies spying on someone. The tiger is a very energetic animal. The idiom "虎虎有生气" describes the tiger's bold, powerful and energetic posture. “虎啸生风” and “虎啸风冽” show the dynamics of the tiger's long roar. The "饿虎扑食" shows a hungry tiger rushing for food.

3) Idioms refer to the tiger's habitat. There are also many descriptions of the tiger's habitat in the tiger idiom. In the minds of people, tigers are very dangerous animals; naturally, the tiger's habitat is also considered a dangerous place. In The Biography of Banzhao · Late Han Chinese Book, “虎穴焉得虎子” (If you don't enter a tiger's lair, you can't have a tiger baby) is an idiom that is closely related to the tiger's environment and denotes that you cannot succeed without going through difficulties [7. p, 88]. "虎穴龙潭", "虎穴鲸波" (Tiger Lair and Whale Wave) , “虎穴狼窝” are all idioms that describe extremely dangerous places.

4) In combination with another animal. In nature, tigers are inextricably linked with other animals. In long-term life and work practices, people have created many idioms that express the habits of animals and their deep meanings in accordance with the natural attributes and life habits of animals. Many of the idioms created by the word "tiger" are combined with other animals. The tiger and dragon combination is the most common. For example, "龙争虎斗" (dragon battle and tiger battle) - this expresses fighting with each other; "降龙伏虎" - expressing the possession of great abilities, to defeat a strong opponent or overcome great difficulties; “龙行虎步” describes the mannerisms of an emperor or general, expressing a stately and extraordinary behavior. Idioms consisting of a tiger and other animals like wolves, leopards, bears and eagles, which have common characteristics. often used to express ferocity and brutality. "虎狼之心" describes a ferocious, vicious and greedy person. "虎狼之势" describes a fierce aura like a tiger and a wolf, "如狼似虎" describes extremely greedy and vicious people; “熊虎之士” and “熊虎之将” describe brave warriors and generals.

By classifying the idioms with "tiger", one can see that, based on natural characteristics and life habits, the tiger's coat is shiny, its appearance is powerful, its appearance is majestic, and its image is endowed with courage, power, resilience and characteristics of vitality - precisely because that the tiger has such a deterrent that it can be declared the king of beasts. People also consider him to be a totem of worship, the embodiment of justice and the protector of humanity, becoming an emperor, hero and warrior. Synonymous with outstanding people, it symbolizes powerful and courageous people or forces such as warriors, heroes and heroes. However, the tiger's powerful, ferocious, and harmful characteristics revealed negative characteristics such as cruelty, anger, greed, and domination. Therefore, the tiger is often used as a metaphor for calamities, enemies, wicked people, corrupt officials, and people with bad qualities. It symbolizes images that are dangerous and frightening.

**2. Metaphorical types of “tiger” idioms.** 2.1 different source domain, same target domain (similar portable meaning) . A notable feature of idioms in their development is that their meanings are relatively stable, with little variation. Certain idioms often express the same or

similar metaphorical meanings. It's the same with the tiger idiom. This article analyzes only two groups: (1) 藏龙卧虎 and 潜龙伏虎 (source domain) → hidden talents or heroes (target domain)

Tiger → Talents, Heroes. "Talents and heroes" in the conventional sense include: having special knowledge or skills, strong creativity, outstanding contributions to society, and political integrity and ability; great people, good fighting skills, extraordinary courage, delightful, selfless, majestic, prestigious and other basic characteristics. The reason people associate these two types of item is because people categorize these two types of items by basic characteristics or family resemblance. The courageous and daring characteristics of "talents and heroes" are associated with the bravery of the "tigers", forming a metaphor.

(2) 放虎归山、养虎自咥、引虎自卫、养虎遗患 (Source domain) → keep yourself in trouble (target domain) tiger → → → disaster

The abstract concept of "danger" in the general understanding of mankind contains such characteristics as: can cause disasters, damage to life, property damage, natural disasters, man-made disasters, predictable, frightening and destructive properties. The frightening, carnivorous and even cannibalistic characteristics of the "tiger" in this phrase are associated with the main feature - damage to life. An analysis of the above two groups of tiger idioms show that the reason that there are multiple idioms that represent the same metaphorical meaning is that people choose different characteristics of the source domain to associate with the target domain.

2.2. Same source domain and different target domain. An idiom does not necessarily have only one figurative meaning. It can contain multiple values. Which of these meanings is used depends on the cognitive subject to be assessed in a particular context. The "single source domain" referred to in this part specifically refers to the "虎头" shared in the "" source domain (tiger head and snake tail) “虎头虎脑” (tiger head, tiger brain). “羊入虎口” (Sheep enters the mouth of the tiger), “虎口余生” (the rest of life from the mouth of the tiger) and “虎口拔牙” (tooth extraction from the mouth of the tiger) all have a “mouth of the tiger”, which reflects the “dangerous places” ... The two idioms "虎头虎脑" and "虎头蛇尾" share the common "tiger head". The first "tiger head" is used to refer to people, especially children, with a trait of the strong and simple-minded appearance of a tiger. The "tiger head" the latter acquires the characteristic features of a large head, which means that business starts well but ends badly, or started with great impulse but later had little strength.

**3. Metaphorical mechanism of the “tiger” idiom.** By analyzing the above two types of tiger idioms, we can see that the reason people choose different source domains to map the same target domain is because people continue to recognize as they learn about the world. Various characteristics of animal "tigers" are used to match the target domain. Also, because humans have a strong two-way understanding of the animal “tiger,” the metaphorical meaning of the idiom “tiger” is more complex. Animal idioms acquired their basic literal meaning only through the initial categorization of human cognition. With the continuous expansion of human knowledge, when each category is divided into more categories, the meaning and form of the dictionary also expanded, so did the metaphorical. In the process of using language, people associate the target domain with the special meaning of the idiom allusion in a particular context

through cognitive mechanisms. This connection is a metaphor. Metaphor is an instrument of thinking, language is an external expression of thinking, and metaphorical idioms are an externalization (external expression) of thinking. A metaphor is a way of using one concept to express another concept. He must find similarities between the two concepts. Knowing this similarity is a function of categorized cognition stored in the human brain [3. p, 40]

Categorization is an advanced human cognitive activity to classify everything in the world. Only on this basis can people have the ability to form concepts and have the meaning of linguistic signs [4.p, 55]. The metaphor connects two concepts in different categories. The premise is the categorization of human cognition of these things.

### **3. Comparison of idioms in Chinese and English. 3.1 comparisons of idioms with the word "tiger" in Chinese and English**

There are many idioms in which animals are used as metaphors in English. Comparing the Chinese idioms "tiger" with English, we can easily find that there are certain differences between them, which are mainly reflected in the following three situations: 1) Idioms with "tiger" in Chinese and English are semantically consistent. For example, "fight like a tiger" corresponds to the Chinese idiom "凶猛如虎" ; "ride the tiger" in Chinese means "骑虎难下" ; "have the tiger by the tail" in Chinese translates to "虎尾春冰". It seems that it is cut off at the tail of a tiger and in the spring they walk on thin and light ice, expressing its dangers. The semantics of the word "tiger" in these examples are the same, and they all show the fierce and cruel image of "tiger".

2) Idioms with "tiger" in Chinese and English are semantically consistent. Sometimes they use opposite metaphors to express the same meaning. For example, in Chinese "虎父无犬子" or "虎门无犬种" - it means that the talents of parents, children and grandchildren will not be mediocre. English has the idiom "many a good cow has a bad calf", which means that many good cows have a bad calf, which is equivalent to Chinese "虎父无犬子" (tiger-father without a son-dog), but the expression is completely opposite.

3) Expressing the same value using different images. For example, as they say, "山中无老虎, 猴子称霸王" (there is no tiger in the mountains, the monkey is the king). The tiger is strong and the monkey is weak. This expresses that ordinary people can also play a major role in the absence of capable people. This is similar to the relationship between a cat and a mouse in English, so instead of the corresponding image of the animal, the expression "when the cat is away, the mice will play" will be replaced (when the cat is absent, the mice will play). For example, the Chinese idiom "虎毒不食子" (angry as a tiger does not eat its son) describes how angry a tiger does not eat its own child. In English, the word "dog" is used instead of "虎", that is, "dog doesn't eat dog".

**3.2. Comparison between the Chinese idiom "tiger" and other idioms of animals in English.** Since tigers were once a unique animal species in China, English-speaking countries have rarely seen this species before. Therefore, in terms of linguistic expression, "tiger" is rarely found in English. And it is replaced by familiar animals such as "lion" and "wolf", but the meaning is actually the same or similar to the meaning of the word "tiger" in Chinese.

1) Comparison of tiger and lion. The lion is the king of beasts, symbolizing strong and powerful greatness. Britain compares itself to a lion. In English, "twist the lion's tail" means humiliation of Britain, which indicates the high status of a lion in English. Chinese idioms have more "tiger" and less "lion", and the translation often uses "tiger" instead of "lion." For example, in the English idiom "beard the lion on his den" matches the Chinese idioms "捋虎须", "虎口拔牙", "老虎头上搔痒" and so on. As another example, "place oneself in the lions mouth" is equivalent to the Chinese idiom "置身虎穴" (to be in a tiger's den). The English term "虎穴" is represented by "lion's mouth", which means that the lion is also a symbol of ferocity and danger for English-speaking countries. The English idioms "an ass in the lions skin" and "a donkey in the lions hide" (a donkey in a lion's skin) talk about a donkey in a lion's skin and scaring away people and animals, but then the lion's skin was blown away by the wind, and the donkey was beaten after that as it showed its original shape. Equivalent to the Chinese idiom "狐假虎威".

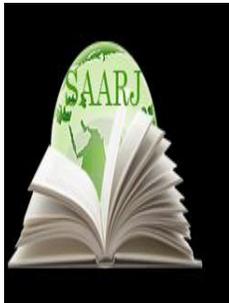

2) Comparison of a tiger with a wolf. In English or Chinese, the wolf is considered a vicious and greedy animal; so many English idioms about the wolf correspond to the Chinese idioms about the tiger and express similar meanings. In Chinese, the idiom "狼吞虎咽" is often used to describe how a person eats food with fury and impatience. In English, this can be expressed in just three simple words, namely: "to wolf down". Here we use the greedy image of a hungry wolf to describe people eating food. The appearance matches the Chinese word "狼吞虎咽". Sometimes "make a lions meal" is used to describe a voracious appearance, the same meaning.

### CONCLUSION:

This article first uses semantics as a starting point for analyzing the semantics of the tiger idiom. The semantics of the idiom "tiger" is associated with the organs of the body of the tiger, the posture of action and the habitat. There are also some "tiger" idioms associated with other animal combinations. Then the semantic content of the Chinese and English idioms "tiger" was compared. The tiger is completely unfamiliar to ancient Westerners, but in Chinese mythology, the tiger is one of the four great totems. He possesses the same characteristics of courage and devotion as the lion, which Westerners consider the king of beasts. Through comparative analysis of animal idioms in two languages, we can understand the way of thinking, national culture and linguistic worldview in China and in the West.

### ABSTRACT

*The article examines the social - political views of the IX - XI centuries. About the period of Samanid rule, the economic and cultural upsurge in Khorasan and Maverannahr, in which special attention is paid to artisans who are famous for their products. Carpets, cotton and woolen fabrics, tanned leather, butter horse saddles, hemp, sulfur, walnuts and, of course, the famous Bukhara watermelons and melons also took a significant place in its export. The Shash region, or Chacha, was famous at this time for the manufacture of leather and leather goods, which was primarily due to its proximity to the nomadic steppe.*

### INTRODUCTION

The rule of the Arab Caliphate in Central Asia fell at the end of the ninth century. Period IX-XII centuries. in Central Asia, in political terms, it was a period of existence of several centralized states Samanids, Karakhanids , Ghaznavids, Seljukids and Khorezmshahs. As for the level of cultural development, the period of the IX-XII centuries. received in the historical literature the definition of "Eastern Renaissance". [1.]

The relative calm during this period contributed to the economic and cultural development of the region. To the east-west trade was added intensive trade with the Volga regions through Khorezm.

Samarkand has become a significant city in Central Asia. The markets were overflowing with goods from all over the world: Persia, India, China. Silk and cotton fabrics of the Zarafshan valley were in great demand. And the copper smelters were famous for their lamps and boilers. Stirrups, bits, belts, scarves, and nuts were also exported from Samarkand. Of particular importance was the production of paper, the secret of which was previously known only in China. According to the English historian Hilda Hookham, the secret of making paper was revealed by the Chinese papermakers themselves, who were captured at the battle of Talas( 751 ) and then brought to Samarkand. Samarkand masters - papermakers mastered the art of writing writing paper and further passed on their skills from generation to generation. This transfer of the secrets of paper making has been one of the reasons for its high grade for many centuries. By the end of the XI century. Samarkand paper replaced parchment and papyrus in the eastern countries, and even when its production Prevalence nilos west Samarkand paper was unequalled.

Bukhara was famous for the products of goldsmiths. Carpets, cotton and woolen fabrics, tanned leather, butter horse saddles, hemp, sulfur, walnuts and, of course, the famous Bukhara watermelons and melons also took a significant place in its export. The Shash region, or Chacha, was famous at this time for the manufacture of leather and leather goods, which was primarily due to its proximity to the nomadic steppe. They were exported from Shash ; high horse leather saddles, arrow quivers, tents; in addition : cloaks, prayer rugs, bows, needles and scissors. Trading activity X-XII centuries. was especially favorable for Khorezm: This oasis in the lower reaches of the Amu Darya, south of the Aral Sea, acted as an intermediary in the steppe trade between the Volga and nomads. From the main city of Khorezm, Urgench, caravans could follow to Otrar and then to China, or the main road could connect in Bukhara and lead to the south. From here the road went east, to China, or farther south through the Hindu Kush to India. It is known that Khorezm "specialized" in almond confectionery and magnificent melons, which were exported packed in lead molds with snow or ice. In addition, the Khorezm bows were especially appreciated, which only strong people could pull; and also: boats, fish glue, fish teeth: not to mention a large number of fish that were caught in the lower reaches of the Amu Darya and exported in salted form. The merchants, of course, could not conduct caravan trade on an individual basis, since the costs of sending even the smallest caravan were significant. As in previous times, merchants were united in certain trading companies, with the aim of conducting trade operations along the caravan route. In trade operations in the X century. Checks were often used ("check" is a Persian word that in this case meant "document"). It was possible not to carry large amounts of money with you, but to give it in any city to one of the commercially trustworthy sarrafs (money changers), take the corresponding document from him - a check and, upon presenting it in another city, receive the fully surrendered amount.[2.]

In the 9th century, the political power of the Arabs in the region weakened, and local dynasties gradually came to rule. A centralized state is emerging. Social and economic processes are accelerating.

During the reign of the Samanids, there was an economic and cultural upsurge in Khorasan and Maverannahr , and Merv , Samarkand, Bukhara and Urgench gained fame as the most cultural centers of that time.

The consolidation of centralized government under the Samanids contributed to the fact that the country was no longer plundered and plundered by neighboring rulers and nomads, the developing caravan trade promoted cultural exchange with many European and Eastern countries.

For social and economic progress, the importance of geodesy, geometry, astronomy at that time is very significant.

Science experienced a great rise during this period. Many Central Asian scientists went to study in Baghdad and other major scientific centers.

The Islamization of the population contributed to the introduction of the Arabic language, which began to be used not only in Muslim theology, in the official bureaucratic world, but also among the Persian, Khorezm and Sogdian aristocracy.

Under the Samanids, local languages also developed - Turkic, Persian - Tajik, which did not go out of use among ordinary people. Court poetry, created in the Tajik language, which mainly grew out of folk literary tradition and folklore, reached a special flourishing. Rudaki and Dakiki wrote in the Tajik language, based on knowledge of folk legends and folklore. Dakiki is the founder of the "Shah - name " (Book of Kings), which was supposed to reflect the history of Iran and Central Asia before the Arab conquest. Finished "Shah Namah " great Ferdowsi at the beginning of X - th century, during the reign of Mahmud of Ghazni.[3.]

Thus, the patronage of poetry, literature and science was a characteristic feature of the policy of the Samanid rulers. Many feudal lords had large libraries, which were used by scientists.

The formation of a single political system from previously disparate areas on a new feudal basis and the rapid growth of the economy created favorable conditions for the development of science and culture in the medieval East.

United politically and economically, connected by the unity of religion and language (Arabic became not only the state language, but also the language of science and culture), the peoples of the Near and Middle East were given the opportunity of a freer exchange of spiritual values. Thanks to intensive translation activities already in the 9th century. in the Arabic-speaking world, all the main works of scientific thought of antiquity were published. The Arabs treated the ancient heritage with the greatest respect. So, in 823 . Caliph al- Mamun demanded that the Byzantine Tsar Michael II, whom he had defeated, hand over a number of Greek manuscripts or their copies. Among them was received and "Almagest" by K. Ptolemy. The assimilation of a complex complex of local cultural traditions and cultural heritage of antiquity ensured the flourishing of Muslim culture. [4.]

The works of Aristotle were especially widespread in the East. The pinnacle of Arabic-speaking Aristotelianism was the work of Ibn Rushd (in Europe he was called Averroes), who interpreted Aristotle's works in the spirit of materialism and pantheism Ibn Rushd strove to establish the complete independence of philosophy and science from theology, Muslim theology,

Ibn Rushd also developed a "theory of two truths" - scientific, philosophical and theological. Both science (philosophy) and religion (theology) reflect primarily on God, the first and highest cause of all that exists and knowable. But they are completely different in the way they are explained. Science (and philosophy), based on logic and evidence, gives a more perfect

way. Religion (and theology) gives figurative, sensory knowledge, a representation of God, containing many logical contradictions. The "inner" first is comprehended by theology, the second by science, philosophy.

Significant successes in the IX - XII centuries. reached science, especially the field of exact sciences. The Abbasid dynasty began to patronize education and the development of knowledge. The new capital of the state - Baghdad is becoming not only a political and scientific center. Caliph Harun ar - Rashid (786 - 809), his son al - Mamun (813 - 833) invite scholars from various countries to Baghdad.

In the capital of the Caliphate, "Bayi ul - hikma" ("House of Wisdom") was created, which served as the Academy of Sciences. The library contained over 400 thousand volumes of manuscripts, two observatories (in Baghdad and Damascus). Serious scientific research was carried out here. Many scientists who worked at the Academy were from Central Asia. [5]

Abu Bakir ar (865-925) - Razi, an outstanding thinker and encyclopedist in matters of religion, departed from the mutakallims, criticized the ideas of the prophets and their mission, as well as the sacred books. Razi was the author of two extant works "Maharik al- anbiya" (The tricks of the prophets) and "Hiyal al- mutanabbiya" (The tricks of the false prophets), in which he exposes the trickery and deceit of the clergy and preaches the idea of human equality.

Abu Bakr Muhammad ibn Zakariya Ar-Razi was born in the Persian city of Rhea, near Tehran. In Persia, he received a versatile education and, in particular, studied philosophy, metaphysics, poetry and alchemy. Even in his youth, he began to engage in experiments in the refinement of metals and the search for an "elixir". At the age of 30, Ar-Razi went to Baghdad, where he studied medicine. He soon became famous as a very skillful physician; ran a clinic in Rhea, then in Baghdad. Ar-Razi was well acquainted with ancient science, medicine and philosophy; he left works on philosophy, ethics, theology, logic, medicine, astronomy, physics and alchemy - a total of 184 works, of which 61 have survived; many of Ar-Razi's works were translated into Latin in Europe in the X-XIII centuries.

In ethics, Ar-Razi opposed asceticism, called for an active social life, considering Socrates as an example. Ar-Razi criticized all religions that existed in his time: truth is one, religions are many. The source of truth, according to Ar-Razi, should be the books of philosophers and scientists,

Among the alchemical writings of Ar-Razi, the most famous are the "Book of Secrets" and "The Book of Secrets of Secrets". Ar-Razi evidently knew well the works of the Greek philosophers and the works of the Alexandrian alchemists; he also studied the original works of Arab authors of the 8th and 9th centuries.

... In The Book of Secrets, he divided all the material of alchemy into three main sections: 1) Knowledge of the substance, 2) Knowledge of devices and 3) Knowledge of operations.

The main works of Ar-Razi on medicine are the book "Alhavi" ("Comprehensive book on medicine") and the 10-volume "Medical book dedicated to Mansur" - a kind of medical encyclopedias in Arabic. Translated into Latin, they served as a guide for doctors for several centuries. Ar-Razi also compiled instructions on the construction of hospitals and the choice of a place for them, wrote works on the importance of the specialization of doctors ("One doctor

cannot cure all diseases"), on medical care and self-help for the poor ("Medicine for those who do not have doctor ") and others. [6.]

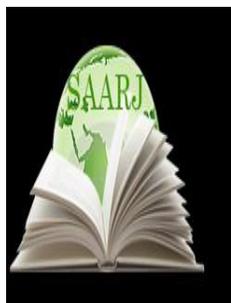

Ar-Razi was one of the first to suggest the infectious nature of some diseases. In his work On Smallpox and Measles, he gave a classic description of these diseases, especially noting the immunity to recurrent disease; used smallpox vaccination to prevent disease. Ar-Razi introduced into medical practice the compilation of a medical history for each patient, the use of a plaster cast to immobilize a limb in case of fractures. He was one of the first to use cotton wool for dressings and catgut for stitching wounds; described a special tool for extracting foreign bodies from the pharynx.

Ar-Razi was a supporter of mathematical atomism, the doctrine of which was outlined by him in the "Book of Time and Space". He also wrote "A treatise stating that the fact that the diagonal of a square is incommensurable with a side does not apply to geometry."

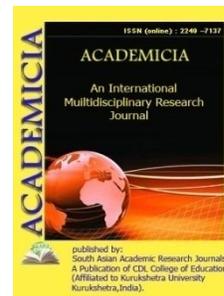

A number of Ar-Razi's treatises on the spherical nature of the Earth, stars and space in general are also known.

### ABSTRACT

*This article discusses the results of a research of the effect of soil fertility on the cultivation of winter wheat in areas prone to irrigation erosion, by cultivating the soil in different ways and applying mineral fertilizers at various rates.*

**KEYWORDS:** *Irrigation Erosion, Soil, Mineral Fertilizers, Soil Graininess, Typical Gray Soil, Particles, Macrostructure, Hectare.*

### INTRODUCTION

The improvement of soil agro ecology has been achieved through the improvement of agricultural technologies for sowing and cultivation of winter wheat by treating soils on erosive soils in various ways, through obtaining high yields through the effective use of mineral fertilizers, which reduces the leaching of soil particles in world agricultural practice. In particular, it is significant to conduct research that will meet the needs of the population for food by improving the ecological state of the soil, preserving soil fertility and increasing the yield of winter wheat.

The water resistant particles that are considered agronomically acceptable are soil particles of 10–0.25 mm, which have been identified by our scientists as the data that can be obtained through tillage, crop rotation, organic fertilization and other agronomic measures.

To determine the effect of the applied agrotechnical measures on soil fertility and its physical properties, for 3 years, we conducted research on typical gray soils with a slope of 1.7 degrees, subject to irrigation erosion, located in the Kibray district of the Tashkent region. In our field

experiments, after studying the agrophysical state of field soil after the annual completion of the study, it was found that when growing winter wheat using different methods and depths and different amounts of mineral fertilizers, it affects the macrostructure of the soil in different ways.

**The Main Findings and Results**

When we studied the macrostructural state of the soil after our research in the first year after harvesting winter wheat, the agronomically favorable fractions (10–0.25 mm) were 67.4% in the 0–10 cm soil layer, 67.5% in the 10– 20 cm. It was noted that 66.9% in the 20-30 cm layer, 65.9% in the 30-40 cm layer and 63.5% in the 40-50 cm layer (Table 1).

**TABLE 1 INITIAL GRAIN SIZE OF THE EXPERIMENTAL FIELD, %**

Layer, cm	>10	10–0,25	<0,25
0–10	23,8	67,4	9,1
окт.20	23,1	67,5	9,4
20–30	23,0	66,9	10,1
30–40	22,3	65,9	11,8
40–50	25,3	63,5	11,2
0–30	23,3	67,2	9,5
30–50	23,8	64,7	11,5
0–50	23,5	66,2	10,3

In the first year of the study, the agronomic favorable fraction (10–0.25 mm) of mineral fertilizers N<sub>150</sub>P<sub>105</sub>K<sub>75</sub> kg / ha was applied in the aisles of cotton by sown winter wheat. The seeding rate increased from 4 million to 6 million seeds per hectare, and the rate of application of mineral nitrogen fertilizers increased from 150 kg / ha to 250 kg / ha., Phosphorus fertilizers increased from 105 kg / ha to 175 kg / ha, and potash fertilizers - from 75 to 125 kg / ha. In the 50 cm layer, there was an improvement from 2.0% to 6.2% (Table 2).

Between the rows of cotton, we sowed 4 million seeds of winter wheat per hectare, at the end of the growing season, mineral fertilizer  $N_{150}P_{105}K_{75}$  was applied agronomically favorable

fractions(10–0.25 mm) due to an increase in sowing rates and mineral fertilizers( $N_{150}P_{105}K_{75}$ ,  $N_{200}P_{140}K_{100}$  and  $N_{250}P_{175}K_{125}$  kg/ha) in a layer of 30–50 cm and 2.9% in a layer of 30–50 cm), at the end of the validity period compared to the beginning of the validity period it improved from 2.6% to 4.4% in the 0-30 cm layer and from 2.9% to 7.0% in the 30-50 cm layer.

## CONCLUSION

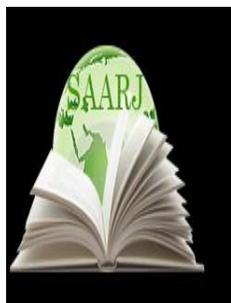

In short, the experimental field was plowed to a depth of 28–30 cm and 4 million winter wheat seeds were sown per hectare. At the beginning of the application period of 19 variant agronomic favorable fractions (10–0.25 mm) due to an increase in sowing rates and mineral fertilizers ( $N_{150}P_{105}K_{75}$ ,  $N_{200}P_{140}K_{100}$  and  $N_{250}P_{175}K_{125}$  kg / ha), and in the layer of 30–50 cm it was 68.5% relatively improved from 3.5% to 5.1% in the 0–30 cm soil layer and from 3.8% to 7.7% in the 30–50 cm soil layer.

This means that the agronomic valuable soil fraction (10–0.25 mm) is among the variants treated in different ways, in variants plowed to a depth of 28–30 cm (6 million seeds are sown per hectare, mineral fertilizers  $N_{150}P_{105}K_{75}$ ,  $N_{200}P_{140}K_{100}$  and  $N_{250}P_{175}K_{125}$  kg / ha) turned out to be 1.5% higher in the upper layer of 0-30 cm than with inter-row sowing of cotton, and 0.7% higher than with chisel sowing.

### ABSTRACT

*In this article, the main focus was on the dominance of the concept of “Patience” (“Sabr”) in our social life, in all languages, particularly, in the Uzbek language. It was looked at from different viewpoints and approaches. The expression of the semantic concept of “patience” in the Uzbek national spirituality, language, and thinking was discussed.*

**KEYWORDS:** *Patience, Communication, Lingua-Cultural Concept, Conceptual Field, Associative Field, Subject, Object, Sender, Receiver.*

### INTRODUCTION

During the process of globalization at the present, countries, political groups, ethnic backgrounds, religious beliefs, the relationship between nations, internal relationships are reflected in different viewpoints. The concept of “Patience” (“Sabr”) plays a great role to create a win-win situation for both parties by giving an equal opportunity to be heard, and to solve the issues after understanding the deeper meaning. The concept of patience is always in the middle of the attention between opposing sides. Therefore, “Patience” (“Sabr”) is the circle of balance that keeps the peaceful life of humanity in the balance that binds nations and people, religious views, and the contradictions of cultures. A human is always about the objective world. This leads to different connections with objects in the world. The human solves the issues with objects that are related to him, the news, situations, and various internal controversies in realms of the concept of “patience” (“sabr”). If the human doesn’t practice the concept of “patience” the

conflicts that happen among various political groups, religious views, geographic locations, nations, countries cannot be prevented. The concept of “patience” is associated with the settlement of military conflicts, conflicts between religious and racial and social groups, the settlement of disputes, the settlement of differences of interest for the benefit of all parties, and peaceful coexistence.

At the same time, man is a living being, living in a relationship with society. This connection reflects the flow of various events, situations, views, the psychological impact on a person throughout his life. Finding the philosophical solution without being emotional and despite the psychological effects is the basis for the concept of “patience” (“sabr”). As a result, this is coming into action in the widespread use of “patience” as the scales of justice and it is symbolized in human intelligence. It turns out that a person's attitude to a renewed, violent, globalizing world, the expansion of the world of science and thought, the re-education in the world one understands, is associated with “patience”.

### **Main body**

As man develops an objective being, he synthesizes from it in his thinking the relation of the universe to man. The generalized scene of the world is gathered in the sciences with the principles of generalization and personification. Therefore, the knowledge gained about the worldview is relevant to all disciplines and becomes the object of everyone's study. During the process of learning, analyzing every subject paints its scene about the world. That means that every subject gives a conclusion based on its observations and experiences. Thus, every single thing in the world is the object of learning for all the disciplines. In particular, the concept of "patience" is one of the most discussed topics in interdisciplinary research. Because the scope of study of the concept of “patience” is wide, the semantic field is infinite. We think that concept of patience unites these components together:

1. Insoniylik, oliyjanoblik, to'g'riso'zlik. (Humanity, nobility, honesty.)
2. O'zini tuta bilish, muvozanatni saqlash, boshqalarni tinglay bilish. (Ability to behave, keeping balance, ability to listen to others.)
3. Erkin fikrlashni bilish, o'zaro munosabatda xushyor bo'lish. (The ability to think freely, being careful in relationships.)
4. Kelishuvchan, boshqalarga e'tiborli, tenglikka da'vatkor bo'lish. (Agreeable, attentive, striving for justice.)
5. Hamfikirlik. (Consensus.)
6. Bag'ri kenglik. (Generosity.)
7. O'zaro bir-birini tushunish: anglash. (Mutual understanding, comprehension.)
8. Teng huquqli yashash, erkin harakatlanish. (Equal rights, freedom of movement.)
9. O'zaro hurmat, hurmatni saqlay bilish. (Mutual respect and the ability to keep the respect.)
10. Chidamlilik, mustahkamlik. (Durability, strength.)
11. Turli og'ir sharoitlarda yashay olish. (Ability to live in difficult circumstances.)

12. Ruhiy yoki jismoniy qiyinchiliklarga ko'nikish. (Adaptation to mental or physical challenges.)

13. Murosasozlik. (Compromise)

14. Olijanoblik, fe'li kenglik. (Nobility, kindness.)

15. Vazminlik, bosiqlik. (Calmness, tranquility.)

As N. Mahmudov mentioned correctly: "The worldview created in the human mind is, of course, not a completely stable structure, it can change and improve in connection with the development of thinking, the development of society, the achievements of science, the perfection of methods of cognition."<sup>1</sup>

To date, the study of the world landscape has been analyzed in-depth by several science researchers, which has also had an impact on linguistics. Man's complex approach to knowing the universe is also reflected in language. Thus, the realization of the concept of "Patience" in language was manifested in linguistics and other disciplines and they are inextricably linked and inseparable.

Therefore, the concept of "Patience", which is a product of the human mind, has become the object of study of linguistics, as well as philosophy, sociology, psychology, history, political science, literature.

From a linguistic point of view, a comparative study of the concepts of "patience" clearly shows that it has many meanings. Studying and analyzing it from a different conceptual point of view requires a study based on the social norms of different languages with different cultures. Although several scientific studies have been conducted in world linguistics, including Russian linguistics, the concept of "Patience" in Turkish linguistics, especially in Uzbek linguistics, has not been studied in a monograph. Therefore, the study of this topic as a scientific study is important for Uzbek linguistics. In Russian linguistics A. A. Barilovskaya, V. V. Didenko, A. M. Volaev, E. M. Fomin, O. A. Mixaylova, S. G. Rastauyeva, A. A. Selyutin, I. N. Sternin, K. E. Nagaeva, E. V. Romanova, V. A. Yamshanova, E. Yu. Jmyrova's research has covered many aspects of this topic. Each researcher analyzed that the concepts of "Терпение" ("Patience") and "Толерантность" ("Tolerance") have one semantic field using various theoretical perspectives. When looking with the linguistic perspective the researchers took the lexo-semantic, linguacultural, (communicative), synchronic and diachronic, cognitive viewpoints as the core.

What's important is that the viewpoints about the semantic field of the concept of "Толерантность" ("Tolerance") fulfill each other in all the research that has been done. The conceptual field of "Толерантность" ("Tolerance") is actualized among dependant, interrelated lexemes. The semantic concept field of "Терпение" ("Patience") gathers patience, content, will, perseverance, endurance, toughness, grit, and determination in itself. The concept of "Терпение" ("Patience") is at the heart of the semantic field that surrounds it with its breadth of content and is its core.<sup>2</sup> A.A. Barilovskaya wrote: "According to humanities experts, "Терпение" ("Patience") is a concept that reflects the characteristics of the Russian national mentality. "Терпение" ("Patience") is a socio-cultural concept based on the Russian national mentality. It is a concept that reflects the modern worldview in Russian, as well as the specific features of the Russian language that reflect its sociolinguistic features."<sup>3</sup>

She divided the concept of “Терпение”(“Patience”) into two semantic groups. Observations show that this concept is not only a semantic concept that represents a central place in Russian, but also a general concept that reflects the communicative, psychological content that is unique to other languages.

Concepts are expressed in words. Therefore, a word is considered to be a sign consisting of a representative and an expressed unit, and the represented side of this sign is considered an understanding or concept. The word is conceptually connected with the members of the objective universe, that is, with the denotation.<sup>4</sup> It can be seen that, being ready to accept any kind of opinion of others, being attentive to the basis of their opinion, understanding each other, making an agreement and mutual respect are the core of the concept of “Sabr” (“Patience”).

It is clear from the data that the concept of “Sabr” (“Patience”) as a phenomenon is associated with mutual trust between different social groups, currents, states within a particular society. When the word patience is approached psychologically, it is a person’s spiritual perfection, one’s ability to comprehend, one’s generosity, and one’s ability to control oneself in any situation. Therefore, logically, the concept of “Sabr” (“Patience”) has risen to the level of discussion issues. At the same time, the concept of “patience” as a polysemantic word has a semantic character and reflects social, moral norms. In the communicative approach to the concept of “Sabr” (“Patience”), we can observe two cases. I and others or sender and receiver interrelation. Thus, in both situations, communication happens between sender and receiver. The semantic concept of patience takes an active part in the communicative process. Therefore, during the process of communication, patience comes to action in the interrelations between me and others or sender and receiver. The sender expresses his attitude towards the receiver about the word patience and its semantic field. Or if the connection between sender and receiver has the spirit of consensus, mutual benefit in views, one can achieve equality and stability.

It is understood that the lexeme of patience means equality, mutual respect in human relations with others.

L. V. Romanenko points out that the origin of this phenomenon dates back to ancient times. According to him, this concept can be defined as follows:

“All this is for the person, that is, to recognize and respect the legal freedom of the person, to treat everyone equally, to stay away from other attitudes.”<sup>5</sup>

Scientific research and observations have shown that the expression of the semantic concept of understanding the national language and culture has a unique expression of each nation. If we look closely at the languages and peoples of the world, their culture, it can be seen that in any language the concept that enters the semantic field of patience, which determines its spirituality, is not the same, semantically different. Because the concept of “Sabr” (“Patience”) has a unique meaning in the spirituality of each people and nation.

This is demonstrated by the process of comparative analysis in the linguistic approach, S. G. Rastaujeva writes: The concept of “Толерантность” (“Tolerance”) in Russian as a lingua-cultural discourse is characterized by its specific conceptuality, as well as the fact that this concept consists of a comprehensive system of Russian semantics.<sup>6</sup> It is understood that patience comes from the basis of each nation and people’s national character, norms of thinking, spirituality.

The semantic field of the concept of “Sabr” (“Patience”) consists of lexemes, which are uniquely used by the Uzbek mentality, embodying a wide range of features that mean that the Uzbek people are heavy, calm, strong-willed, contented. In the materials of the Uzbek language, it is revealed through the characteristic features of the Uzbek people that can express the lexeme “Sabr”

(“Patience”). For example, divine patience, motherly patience, family patience, religious patience, ethnic patience, and others. The concept of patience in the examples given has been relevant to the Uzbek people for centuries.

In language, word semantics is realized by the name of the concept. “Sabr” (“Patience”) as a conceptual field consists of the following characteristics: uncomfortable, awkward, bad, change in mood. The conceptual field of “Sabr” (“Patience”) refers to positive qualities such as endurance, grit, will, perseverance, contentment, behavior, patience, perseverance, stamina as a self-sufficient, interdependent unit. It also reflects negative traits such as mental anguish, tension, suffering, calamity, pain, torture. It also refers to the qualities that characterize a person's spiritual, moral upbringing: meekness, piety, peace, conciliation, and so on. “Sabr” (“Patience”) is the core of such a meaningful field, and it stays in the center as the nucleus.

In the Uzbek language, the concept of “Sabr” (“Patience”) represents a unique color unit in the lexical-semantic space. The following meanings of the lexeme “Sabr” are given in the “Explanatory dictionary of the Uzbek language”.

Sabr [a –endurance, grit, will, perseverance]

1. To wait patiently for a situation or event, to be satisfied; behaving well.
2. Grief –trouble, enduring pain, being patient, endurance.

Sabr kosasi to’lmoq (to be impatient), ortiqcha chidash yoki kutishga toqati qolmaslik (enduring more than you can take or losing patience to wait), toqatitoqbo’lmoq (to have enough of something).

Sabr-bardosh, sabru-bardosh (patience and stamina). See. Sabr. 1-2

Sabrli (patient):

1. Calm - natured, balanced, restrained, contented, resilient, durable, enduring.
2. Fulfilled, content<sup>7</sup>

The definition of the lexeme “Sabr” (“Patience”) in the dictionary also shows that the semantic field of this lexeme is wide in content. The concept of “Sabr” (“Patience”) as a polysemous word also varies depending on the form, type, measurement of degree. Firstly, patience is the carrier of the patient’s individual, inner psychological experience, his interactions with those associated with him, his commitment to various influences, and his attitude. In the Uzbek language, the lexemes of patience, contentment, determination, endurance, will have the following meanings: the various characteristics of a person, i.e., factors that are unfavorable to him during his actions, states of inner mental change and physical pain, give rise to the constant control of his behavior. For example: *“ Ammo hozir vaziyat ahlikali, yumshoqlik qilsak, ichkiparokandalik avjlangay, tashqidushmalar oldidaza iflashib halok bo’lgaymiz. Shuning uchun sizdan qat’iyatlozim ”* (“But now the times are perilous, being soft-hearted will lead

*to inner segregation, and we will be weak and die in front of the enemies. That's why you need determination") (P. Qodirov).*

***The lexeme of "determination" ("qat'iyat") in the text implicitly expresses the meanings of patience, perseverance, and will.***

***The "need" ("lozim") lexeme, on the other hand, reinforces the meaning of the emphasis.*** In the relationship between the speaker and the listener, special emphasis is placed on the importance of "qat'iyat" ("determination") for the listener than ever before. This is because the lexeme of "qat'iyat" ("determination") is reflected in the text in associative semantics such as reason, weight, equality, tension, surrounded by the conceptual field of "patience". **The lexeme of "Qat'iyat" ("determination") conveys the meaning of the listener as the protector of the family's honor, future, the destiny of the throne, and the lives of others.** It is well known that the semantics of semantic units in language are, of course, revealed through contiguous meanings (close, contradictory, similar meanings).<sup>8</sup> It is understood that the lexeme of determination also has its associations in the conceptual field of "sabr" ("patience"), the semantic circle being a broad lexeme. In some research papers, words connected to "sabr" ("patience") are given as doublets<sup>9</sup>, synonyms<sup>10</sup>. R. Meyer points out that every word has a semantic function, that word is considered a member of the system by having closely related and differentiating factors in this or that system.<sup>11</sup>

In the verbal and nonverbal situations involved, the two opposing parties are always in an interdependent relationship when the word "Sabr" ("Patience") (in a general sense) is used. Which means, subject and object. The subject is the force that decides the underlying situation, and the object is the one who creates the physical or mental state or the one who manages and controls the particular situation. In such a situation, it is important for the subject to be "patient" in any situation, to be careful in dealing with an awkward situation, or, if such a situation arises, to be able to get out of it, to feel the responsibility, perseverance, concentration in his spirit. For example "HamidabegimtalpinibAkbarningoldigabordi-yu, uningyelkasidanquchdi :

-Bolajonim, botirlaravlodidansiz, sizningsherdilyigitbo'lishingizgaishonchimkomil! Faqatendio'noltigakirdingiz. Shoshilmangbilan, bir -ikkiyilkuchyig'ing .Hechbo'lmasao'nsakkizgakiring, davlatnio'zingizboshqaradiganbo'ling. Biz bunisabr - bardoshbilankutgaymiz!" ("Hamidabegim got nearby Akbar fast and hugged him on his shoulder:

-My dear child, you are from the ancestors of the warriors, so I'm sure you will be a lion-hearted man! You're only sixteen now. Take your time and gather strength for a year or two. At least become eighteen and run the country yourself. We will wait for it with patience!") (P. Qodirov).

The word "sabr-bardosh" ("patience") means: To wait patiently for a situation or event, to be satisfied; restraint<sup>12</sup>. The implicit statement of the expression, the meaning of the sentence, is inextricably linked with the thinking activity of the participants in the communication, and their perceptions of the world. The wider the speaker's perception of the external world, the faster he or she will understand the level of the speech situation. Therefore, the explicit or implicit expression of information views in the semantic structure of an expression is related to the intrinsic purpose of the speaker to give the appearance of information that cannot be expressed explicitly in the form of a metaphor.<sup>13</sup> It is clear that in the text, the speaker, particularly, the subject, emphasizes the importance of vigilance by focusing his or her primary goal on the

dangerous situation associated with the situation. The choice of a path of reconciliation with internal enemies is expressed in the spiritual support of the object, the necessity of the situation, the importance of **self-restraint** (“**tiyish**”) to achieve the goal. At the heart of Hamidabonu's advice to her son is an expression of hidden meaning. Because of the strength of the family and the state, the preservation of the throne required Akbar to be calm, heavy-mannered, and gritty in the face of his internal enemies. Besides, Hamidabonu's usage of the phrase *sabr-bardosh* (“patience”) means the “crisis” that will decide the faith of the Baburid family empire. It can be seen that if there is no patience the faith of the whole family will be doomed. As Sh. Safarov points out: “A person who uses linguistic symbols is in a certain emotional state, his social background and culture are reflected in his actions”<sup>14</sup> It turns out that a person relies on “sabr” (“patience”) in showing his positive or negative attitudes to social groups, friendship, solidarity, as well as in resolving their conflicting aspects. This is reflected at the level of the individual's thinking. It should be noted that in the conversation between Hamidabegim and Akbar, the mental state of the two people, their experiences, getting out of a sad situation, and the condemnation of temporary restraint are revealed through a combination of “sabr” (“patience”).

In the semantic field of the lexeme, “sabr” (“patience”) the lexeme of “qanoat” (“contentment”) is also characterized by the fact that it carries several signs.

In Uzbek linguistics: “Word's semantic structure consists of lexical meaning and this meaning's additional tones” is mentioned, “the additional tones in semantic structure include the tone of meaning, emotional-expressive tone, and stylistic tone” is also stated.<sup>15</sup> Therefore, the semantic structure of the lexeme “qanoat” (“contentment”) is expressed via a collection of semas that have multiple meanings. Thus, “Explanatory dictionary of the Uzbek language” describes the lexeme of “qanoat” (“contentment”) as: [a.-contentment, being grateful to what you have; gratefulness, agreeing for less]

1.Ozga yoki borga ko'nish (agreeing for less or what you have),boribilankifoyatlanish (being content with you have),nafsitiyiqlikbilanko'pga, ortiqchalilikkaintilishhissi (the feeling of motivation to gain more by not being too greedy).

2.Manmunlik (contentment), qoniqish hissi (feeling of satisfaction); manmuniyat (being content), qoniqish (satisfaction). *Qanoatli* ozga, boriga qanoat qiladigan,ko'p talab qilmaydigan (Content the one who is content with less or what in hand, the one that doesn't ask for more): sabrli (patient).<sup>16</sup>

As the famous linguist, A. Nurmanov points out: “... linguistic units, in addition to the speech process, are grouped in memory based on some common feature. For example, the word school is associated with several words in the mind, such as school, book, teacher.”<sup>17</sup> Thus, when the lexeme of “qanoat” (“contentment”) is associated the above-mentioned lexemes come to our minds. Indeed, the linguist D. As Lutfullayeva notes: “Because the external world is reflected in the human mind in the form of various interconnected objects, events, they associatively recall each other. Not only objects in the external world but also different experiences of a person together and at the same time remind each other on the principle of connection.”<sup>18</sup> For example, in SaidaZunnunova'sradifipoem “Hay-hay” the lexeme of “qanoat” (“contentment”), as a broad concept, also contains different meanings, reminding each other as a broad concept.

... Goh xanjar ,goh asaldek so‘zlarindan dog‘damen ,  
 Jon olib ,jon berguvchi tilcha bo‘lurmi hay-hay.  
 Vaslingni umidida dunyodan o‘tib borgum ,  
 Qanoatda Saida filcha bo‘lurmi hay-hay. (S.Zununova).  
 (...I’m sad of your sometimes edgy, sometimes sweet words,  
 Is there anything as deadly, resurrecting as a tongue, hey-hey.  
 I’m vanishing from the world in the hope of meeting you,  
 Can Saida be as patient (content) as an elephant, hey-hey.)(S.Zununova).

In the given poetic text, lexeme of “qanoat” (“contentment”) unites in the semantic field of self-respect of a human among various events and incidents, opinions, looking right in the eyes of all kinds of injustice, being a leader and brave in the world of honesty and piety. It can be understood that a human cannot be as big as an elephant physically and he or she cannot have its strength. However, he or she is stronger than an elephant from spiritual and moral perspectives. A human can endure obstacles and painful incidents. Modesty and restraint will provide one with a constant strength. Every type of harsh life will collapse the elephant. The human is superior in this case. This is the national Uzbek mentality and the character of the Uzbek woman.

It turns out that lingua-cultural concepts are grouped into a common character in terms of expression, expressing a common content, and occurring in a circle of specific meanings. Characters that represent one essence of the content consist of reference characters and form a conceptual field.

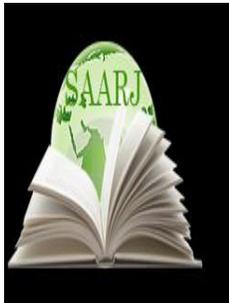

## CONCLUSION

In conclusion, it can be said that the article focuses on some aspects of the Uzbek mentality's unique and versatile connection to the word "sabr" ("patience"). In the vocabulary of the Uzbek people, the semantic field of words expressed by the concept of patience is wide and important because they do not repeat each other.

**A HISTORICAL VIEW REGARDING THE ELEPHANT TRADE IN  
 JAFFNA (SRI LANKA) PRIOR TO THE ARRIVAL OF THE BRITISH (13  
 CENTURY B.C -1796)**

**ABSTRACT**

*Sri Lanka is a country with very long historical traditions. Particularly in Northern Sri Lanka, as one of the main sources of revenue, elephant trade occupied a dominant place, right from very ancient times up to the arrival of the British. Through this trade not only the kings of Jaffna, but also the Europeans who came later including the Portuguese and the Dutch were immensely benefited. This trade which was one of the chief sources of income to the Northern Sri Lanka, was so profitable that apart from local purchasers, even, South India and Bengal were induced to buy Jaffna elephants willingly for their various purposes. Though the elephant trade had been so flourishing, in the past, no individual scholar appears to have gone into this aspect in detail. This study therefore aims primarily in filling such a gap, and also pioneering such scholars as may be taken up by future scholars into this aspect. This study is based on a historical approach. It uses primary and secondary data. Primary data mostly include stone inscriptions, reports of Europeans and various other documents. As secondary data are used, subsequent books, articles, website data and interviews based on primary data. When the elephant trade carried on in Jaffna prior to the arrival of the British, is studied, the results bring one to the conclusion that elephant trade had been one of the main source of income of Jaffna.*

**KEYWORDS:** *Monopoly, Perl trade, elephant trade, Aryan kings, Europeans.*

**INTRODUCTION**

Generally, to understand the history of Jaffna prior to the arrival of the British, it is easy for the scholars to dividing three main periods, viz the 3 periods of Jaffna Kings, the Portuguese period and the Dutch period. Among these the first was a period of administration kings of Jaffna and

the other two may be treated as periods of European administration. During each of these periods the contribution made by Jaffna to the economic activities of Sri Lanka had been significant. Though agriculture and fishing formed the base of the economy of the people of Jaffna, right from very ancient times they were interested and involved in local and overseas trading activities. Thus pearl fishing and elephant trade occupied a prominent place in their activities. Here too, elephant trade had been of special importance in their local and overseas trade activities. During the periods of Jaffna kings, the elephant trade was totally under their control. Later during the periods of Portuguese and Dutch rule, it was brought under their control. While the profits from such trade activities reached the hands of the rulers who administered Jaffna during the relevant periods, the name of Jaffna got renowned in a number of other countries even beyond India.

### **The period of Jaffna Kings (After the 13th century A.D)**

At the time of the arrival of the Portuguese, Sri Lanka was divided into three separate administrative units, viz: Kotte, Kandy and Jaffna. Each of these was functioning as an autonomous kingdom. (*Silva, K.M.De.,1981*). However there was no unity among these kingdoms. Thus, the kingdom of Jaffna was being administered by Hindu, Tamil Kings with Nallur as their capital. During their period, the notes of indicate that the kingdom of Jaffna comprised the neighbouring islands and there land areas from Mannar in the west to Trincomalee in the east. (*Rev.Queyroz de Fernando 1930*)

Though controversies exist between Singala and Tamil historians regarding the beginning of the Jaffna Kingdom, generally its beginning is attributed to the 13th century by most of the historians. Similarly much difficulties are experienced in obtaining historical information about the original boundaries of Jaffna Kingdom. The early kings of Jaffna are said to have descended from the dynasty of Singai Ariyan. This is known from the literary words and inscriptions that appeared during this period. Generally speaking, it may be held that the rule of Aryan Kings in Jaffna was a result of the invasions modern Sri Lanka under the leadership of the Aryan emperor .(*Pathmanathan,S., 2011*). The administrative systems that followed, were also introduced by them.

The commercial activities undertaken during the period of the Jaffna kingdom were of two types, viz: local and overseas. The overseas trade activities again, could be viewed from two angles. One is the trade activities it undertook within Sri Lanka with the other kingdoms and the other refers to trade activities carried out outside the country with other countries. harbours like Kayts, Kankeshanthurai, Point Pedro, Colomboththurai, mathottam, Arippu, Kachchai and Mullaitivu were immensely helpful to their trade activities. Thus it was through these harbours that trade relations were maintained with the eastern and southern parts of the island as well as with parts of South India. These harbours had been useful not only to the kings of Jaffna but also to the Kingdom of Kandy to maintain relations with south India.(*Nithiyanantham,V.,2003*). Since Colomboththurai was very much closer to the kingdom of Jaffna, relations with Vanni could be easily maintained.

Elephant trade occupied a prominent place among the revenue sources of Jaffna kingdom. Though the kings of this period imposed various taxes such as land tax, head tax, officers' tax and cast tax and also earned much income through such activities like pearl fishery, elephant trade occupied a much more significant place among their sources, of income. There was no

particular season for elephant trade which was a monopoly of the kings of that time. They were earning revenue through this elephant trade throughout all seasons of the year.

Unlike as at present, elephants were found in large numbers in all parts of the country. They were abounding in the vanni forests, and beyond this in the eastern parts of Sri Lanka including forests around Trincomalee and Batticaloa and also in the southern forests of Sri Lanka. (Sivasamy, V., 2014). These animals which could cause severe damages, occupied a prominent place in the internal and overseas trade of the kingdom of Jaffna.

The role played by the inhabitants of Vanni area and known as *vanniyars*, is of great significance. At present this area includes places like Vavuniya, Mullaitivu, Mannar and Kilinochchi. Though elephant trade occupied a place among the sources of revenue to the Jaffna kingdom, it has to be pointed out that the elephants were obtained from Vanni areas which were far away from the township of Jaffna. However the ancient history of Vanni area depends largely on archaeological evidences. Information is available to the effect that they paid annual rates to the Aryan kings and also that during Portuguese invasions on Jaffna, the *Vanniyars* of Mulliyavalai and Panankamam had offered military assistance to the kings of Jaffna (Pathmanathan, S., 2014). As Vanni area was mostly occupied by dense forests and was far away from Jaffna the Portuguese and the Dutch could not directly administer it during their periods.

The *Vanniyars* were highly trained in catching elephants. Many of the chieftain kings in Vanni used to catch elephants and offer them as tributes to the kings of Jaffna. Professor S. Pathmanathan says that the kings of Jaffna received such tributes particularly from *Vanniyars* of Adangappattu. (Pathmanathan, S., 2011). As most of the lands in Vanni were not owned by the people of that area, the Dutch company claimed ownership to such lands. Thus the *vanniyars* were able to administer such lands only after paying tributes to the Dutch. Annually the *vanniyars* paid tributes in form of 30 elephants out of which two thirds were male elephants while one third was female elephants. (Kunarasa, K., 1995). The land portion through which elephants were led into Jaffna from vanni was known as Anaiyiravu (Elephant pass), which name is still in vogue.

The kings of Jaffna used to benefit immensely by selling such elephants gathered as tributes, to other countries including South India. Mostly they were sent to South India. They were used mostly for various purposes by contemporary kingdoms in South India and Bengal. Besides, they were also trained to do other types of work. They were also used to lift and drag heavy objects. Elephants were also kept and displayed in temples for worship as well as marks of religious faith. While they were kept and maintained in the palaces of kings and residences of chief officials, they were also habitually taken out whenever the king went out on his visits. (Sivasamy, V., 2014). In other words elephants were regarded as auspicious objects too.

Professor S. Krishnaraja mentions that elephants from Sri Lanka were used with much profuse in the kingdoms of Vijayanagara and Bamini. (Krishnaraja, S., 2000). He further says that there were 8000 elephants in the kingdom of Vijayanagara alone. There are references to the effect that traders who come to Jaffna from the coasts of Cholanamandala and Bengal used to purchase the elephants brought down from Vanni and export them via Kayts harbour. While coming to Jaffna, they used to bring in their ships, loads of paddy and rice which were readily purchased by the kings of Jaffna because during that period there was much shortage for rice, as cultivation depended totally on the availability of rainfall.

The importance attached to elephants by the kings of Jaffna is comparatively less, than that of the kings in South Sri Lanka. This was more because contemporary people in South Sri Lanka attached higher religious importance to elephants and the chances of their use in wars were also more. There are references to say that Rajasingha II, used 12,000 elephants in his battle against the Dutch. On the other hand in the Jaffna regions there had been only a few battles, and these too were not so big as to warrant the use of elephants in big numbers.

By the nature of the landscape of Jaffna it had several harbours which were of great help in carrying out its overseas trade activities. Much income was derived from such trade activities. Ibn Battuta who came to Sri Lanka in 1344 A.D says that he had seen in the kingdom of Jaffna, extended business activities which were connected largely with overseas trade. (Pathmanathan, S., 2002). Thus a larger portion of the overseas trade activities of the kingdom was more closely linked with the coastal areas of South India.

There are evidences of elephant trade going on between Jaffna and other parts of Sri Lanka as well as with South India as available in the form of many stone inscriptions. A specific example is the inscription Parakramabahu I, in Nainativu. This inscription speaks of certain facilities provided to foreign traders and also some rules to be followed by them. Foreign traders were called '*Paradesis*'. There are also references about bringing their ships loaded with animals like elephants and horses and also other commercial goods.

There were rules to the effect that if the sea vessels bringing animals like horses and elephants were found damaged, one fourth of the animals were to be offered to the king's chieftain, and the rest was to go to the vessel's owner. Likewise, if the vessels transporting other commercial items were found damaged, half of the goods should go to the chieftain and the other half to the owner. (Krishnaraja, S., 1998). Thus, this inscription gives a broad description of the trade relations between Sri Lanka and South India. Particularly this stone inscription confirms that elephants were imported into Sri Lanka. An important message given in this inscription is about the importation of elephants to Jaffna. This appears to be somewhat different to a situation where South Indians preferred to purchase elephants from here. Maybe that the Indians offered these to please the king, while there are also instances where kings on their own preference, chose to purchase such elephants from India. Irrespective of anything, it is noteworthy that elephant trade played an important role in the acquisition of the king's sources of revenue.

### **Portuguese and Dutch periods (1050-1658, 1658-1796 A.D)**

The Portuguese who accidentally stepped into Sri Lanka, took advantage of the disturbed political situation in the kingdom Kotte. Step by step they interfered into political affairs of Sri Lanka and brought all the maritime areas under their control. At the same time it has to be noted that their influence over Jaffna was achieved rather late. The main reason for this, was that, unlike as in South Sri Lanka spices like cinnamon were not found in Jaffna. However to ensure their own security and because of the availability of pearls from Mannar, the Portuguese brought Jaffna also under their direct control. (Arunthavarajah, K., 2014). Following them, the Dutch brought the entire coastal areas including Jaffna under their rule in 1658.

Through in general, the objectives of the Portuguese and the Dutch many appear similar, as seen from their activities the former had religion and trade as their prime motives, while the latter were concerned mostly about trade. Furthermore, both parties adopted the same administrative systems that prevailed during the rule of the kings of Jaffna. Since they found those systems

quite congenial, they did not try to bring about any considerable changes in those systems. They accepted the same sources of revenue that were in vogue during the time of Jaffna kings. The various taxes they imposed on the people of Jaffna many in this regard be cited as examples.

This led to the continuation of the internal and external trade activities that went on during the period of the kings of Jaffna. However, the production and export of tobacco were introduced only by them in Jaffna. Besides, elephant trade was considered to be a profitable commercial activity during their periods. The elephant trade during their periods, had developed into a far greater trade activity than during the period of Jaffna kings. The main cause for such development was the importance attached to this trade by the Portuguese and the Dutch. Elephants caught from various parts of Sri Lanka including Vanni, were taken to India through the harbours in Jaffna. A large number of elephants were exported via Karaitivu harbour. Professor V. Sivasamy that this is ascertained by the name 'Anaippalam' (Elephant bridge) still found in Karainagar. (Sivasamy, V., 2004). At the beginning, among all commercial goods, only the trades of elephant and dyeing roots were declared as the monopoly of the rules.

There are references to say that during the 17th century elephants were exchanged for salt petre with the *nayakkars* of Mathurai. During the Dutch period, the trades from Bengal to Jaffna used to come with cheap rice stocks and take elephants in return. The Moggallayans showed much interest in purchasing Jaffna elephants. They were sold elephants by the government at the rate of 800 bushels per elephant. As far as Jaffna was concerned, the Dutch derived the highest income from the sale of elephant. (Pathmanathan, S., 2014). Particularly, Muslim trades had been engaged in bringing the necessary rice quantities, and taking back elephants in big numbers. Further, the trade of the Dutch also included such items like sugar, silk, oil and opium. 29 percent of the income of the Dutch was derived from the trade of elephants during period 1669-70 A.D.

The following information pertaining to elephant trade is available from a report sent to the viceroy in Budgeia by a Dutch commander at the time the Jaffna fort was captured by the Dutch from the Portuguese.

"I have seized 27 elephants, which had been tied at Anaippanthi for sale to Muslim traders. The price fixed for these elephants by the Portuguese is very low. I have decided to sell them at a higher price to Muslim traders. I have also despatched 10 of these elephants to governor Pitt of Chola mandalam" - (Kunarasa, K., 1995).

Dutch officials paid much attention to keep elephant hunting grounds and stables in good condition. An officer by the name *gajanayaka* was appointed in charge of catching elephants. He was a *mudaliyar* belonging to the Sinhala race. An elephant department was created and an officer called *Ethendenerala* was appointed in charge of it. He was fully responsible to the profession of catching elephants. *Gajanayaka* would take necessary steps to train the caught elephants and put them into stables. At this background, these two officers were responsible for the hunting areas as well as for the people living there. People residing in the training areas for elephants had been ordered by the Dutch to provide their services in respect of the land occupied by them. (Krishnaraja, S., 2000).

Normally the elephants caught by the hunters and given to the government are kept at stables for about two weeks in order to check whether the elephants developed any problems, in which case those who caught and gave the elephants were held responsible. People engaged in elephant hunt

were known by various names such as *Mothakkam*, *Pannikers* and *Thalayars*. Thanakkarars were another section of people responsible for feeding the elephants. After two weeks, the height of the elephant would be measured and signets would be marked on their backs. There after the elephants would be ready for sale.

As mentioned earlier the Dutch also encountered certain problems in vanni as did the Porliguese. Hence they entrusted the administrative responsibilities into the hands of the *Vanniars* themselves and in return collected tributes in the form of elephants. Thus the Dutch government entered into agreements jointly, severally and expanded its elephant trade. Generally all such agreements made with the *vanniyars* were favourable to the Dutch. Such agreements helped the Dutch, to obtain valuable elephants and other goods at no cost. In general, more than any other trade activity, it was the elephant trade that helped to maintain close connections between Vanni and Jaffna. Besides it was this activity that was causal to the establishment of market settlements and industries within Jaffna peninsula and Vanni region. (*Krishnaraja,S.,2014*).

It is worth noticing that people who lived in places like Mathottam, Musalippatthu, and Nannattan were willing to offer elephants instead of the grain tax and head tax payable by them to the Dutch government. Consequently the Dutch had the hope of collecting 29 elephants from them annually. They also hoped to get another 25 elephants from poonakary area. Each of the officers in these areas, estimated the value of the grain tax they received and calculated the number of elephants to be given to the Dutch. The value of a male elephant was decided as 300 bushels and that of a female elephant as 250 bushel. Professor S. Pathmanathan is the famous historians in Sri Lanka, gives the following figures as examples:

Panankamam	- 16 elephants
Karikkattumoolai	- 7 elephants
Karunavalpathu	- 4elephants
Thennaimaravady	- 1 elephants
Melpatthu	- 1 elephants
Mulliyavalai	- 1 elephants ( <i>Pathmanathan,S., 2014</i> )

Because of the problems the *vanniyars* encountered in catching elephants, they could not supply the number of elephants as calculated. Owing to this there are references to many deficits in the supply of elephants. It is worth noticing that the number of elephants not provided as tribute was 80 in 1665 A.D, while it rose to 300 in 1669 A.D. Generally the streets constructed by the Dutch were of great help to their trade activities. The trade activities undertaken during their period, may be regarded as to have provided the bases to the present shape of towns and villages seen by us, and also to the self sufficiency of the people who lived here. (*Krishnaraja,S.,2014*).

The elephants collected by the Dutch from South Sri Lanka as well as from the Vanni areas, were taken for exportation through the main commercial roads that were joining Ottisuttan, Mannar and Jaffna areas. Besides these, the Dutch acquired further elephants from Batticaloa and Trincomalee as tributes. These elephants were later sold by auction in Jaffna. The use of the roads constructed by them for their elephant trade, is still remaining indispensable to road users.

Some hearsay information about elephant trade and the names of some places remind the elephant trade of the past even today. Anaicottai, Anaippanthy, Anayiravu and Anaippalam are examples of such names. The notes of Rev. Foldeyer and other Dutch official references indicate that Sri Lankan elephants were exported to South India and Bengal via Anaippalam in Kalaboomi, Karainagar. (*Sivasamy, V., 1990*). Even the name chankanai is supposed to be associated with elephant trade. There is a traditional hearsay information to say that during the period of the Dutch, elephants and conch shells were taken to Mathagal harbour through this place and hence it derived the name Chankanai. There is a tank called Pattanaikeni in Dutch Road, Chankanai. Various tales exist among the people to the effect that ten elephants were bound and bathed in this tank to reduce their wild temper. (*interview - Pavalachandran, S., Chankanai*).

### CONCLUSION

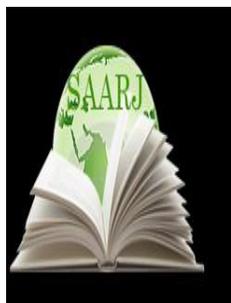

Prior to the arrival of the British in Jaffna, elephant trade has been occupying a prominent place among the trade activities that prevailed in Jaffna. This trade which dates back to a time prior to the period of the kings of Jaffna, continued to be a famous trading activity throughout the periods of Jaffna kings, the Portuguese and the Dutch. This elephant trade activity played a significant role in the internal and external commercial activities as far as the economy of Sri Lanka was concerned. Thereby the name of Sri Lanka was world renowned.

### ABSTRACT

*This article is about the study of the spiritual, moral, educational, psychological and pedagogical significance of toys produced in industrial enterprises, as well as the impact of toys on children's health.*

**KEYWORDS:** *Gadget, Mobile Device, Device, Emotional Intelligence.*

---

### INTRODUCTION

The 2020 pandemic has caused a huge change in people's lives. Various electronic devices, especially gadgets, have become our closest companions. Previously, pupils were not allowed to use the phone during class time, but now a pupil without a phone is unable to attend classes. It's hard to imagine our lifestyle today without cell phones or computer tools. But it is good that there is a norm in everything. Today's modern gadgets have already been proven to pose a serious threat to human health.

A gadget is a small, carriable technological device. It is usually designed to perform one or more functions. Another distinctive feature of such wonderful devices is that each of them differs from the others with its original design and usefulness. Modern gadgets have been helping people in various fields. These include sports, art, medicine, education.

Prolonged use of mobile devices can lead to a number of serious problems such as muscle malnutrition, dry eyes, and short-sightedness. The fact is that long and constant staring at a phone or computer screen makes people's eyes blink five times less than usual. This causes the anterior upper part of the eye to dry out. According to experts, long-term use of gadgets causes the problem of caps.

Most of today's modern professions are done in offices and, of course, using computer tools. What's the problem with that?

If a person sits in the wrong position while using the device, problems with his body structure will occur. This leads to the development of hypo dynamics, another painful problem of our time. Hypnosis, scoliosis, and simple flexion are also among these problems. It is even sadder that the problem has a stronger impact on young children. Because the young plant will grow in the same direction as you tilt it. In addition, excessive use of gadgets can cause neurological problems in a person, as well as problems in the neck and limbs. Excessive use of a computer keyboard can cause muscle pain in the elbow joints.

Pediatricians and psychologists say that children under the age of one and a half to two should not be given mobile devices at all, and that older children should be set order to spend time with devices.

The use of gadgets has a negative impact on children as follows.

**Sleep disorders.** Experts from Bareback University in London examined 715 children aged 6 months to 3 years and found that children who played with smart phones and devices slept less than others. Scientists estimate that every hour spent in front of a device screen means a 15.6-minute reduction in sleep for a child. One of the experts, Tim Smith, points out that at first glance, this may seem like a very short time, but every minute of sleep is important for children to develop properly. Research has shown that a reduction in sleep duration in the first year of life leaves long-term complications in a child's development. Disorders of sleep patterns and sleep deprivation can then lead to problems in a child's mental and physical health, mental development, and mastery of lessons. In particular, the use of devices before bedtime is more harmful. The blue light emitted by the screens makes it difficult for the body to produce the sleep hormone melatonin. This applies not only to children but also to adults. For example, adults can get rid of smart phone addiction, but for toddlers it is a difficult process.

**Excessive agitation and effects on the psyche.** It is observed that the number of hyperactive (overactive) children increases with the change of generations. The bright and fast-changing images on the screen lead to a large number of excessive excitations of the nervous system, which is especially harmful during the period when this system is in active formation. Parents often give the child devices to calm him down, but they are unaware that they are only increasing the impulsiveness - involuntary mobility - in him. Scientists are also linking the growth of aggression and mental illness among children with technology. Adults with nervous system disorders report that one of the doctors' recommendations to them is to be less in front of a screen (whether it's a TV or a mobile device). Since it is restricted for adults, it is very important that we limit the interaction of children whose screens are still very sensitive with the screen.

**Physical health problems.** Physical activity is very important for children - a child's mobility is the norm. Gadgets, on the other hand, are only useful for fine motor skills - they use children's fingers effectively. Little ones who use a lot of mobile devices develop better than others only in this aspect. But on the other hand, they lag behind their peers, who are far from devices. Especially since he is physically inactive and bent over, the child's spine is curved and overweight is a clearly visible negative condition. It should also not be overlooked that a regularly flashing bright display can damage the eyes. Another risk is radiation: mobile devices are recognized by the World Health Organization as potential carcinogens, i.e. - one of the

causes of cancer. The growing organism is more susceptible to the negative effects of radiation. You can take a look at our article on the most harmful smart phones in this regard. There is also information on our site about the physical damage that can occur as a result of excessive use of smart phones.

Lack of communication skills. By handing a gadget to a child, a parent who gets rid of his or her harassment deprives his or her child of the opportunity to learn. To develop important communication skills, a toddler should be able to communicate with their parents by seeing and touching them. The child needs to learn speech, understand emotions, and finally, simply play useful games with their parents. The results of a study involving sixth-graders showed that children who did not use electronic devices had better understanding of emotions during the experiments. If a child spends time interacting with people on devices, it will negatively affect future relationships with relatives, communication with other children, self-esteem, and emotional intelligence.

**Delay in Child Development.** Children's understanding of the world is largely based on touching, caressing: they learn by touching the shape and surface of objects. It is possible to learn small colors, letters and words better with the help of a device or smart phone, but it is not possible to learn large objects by touching them with gadgets. During the school enrollment phase, it becomes clear that some children are lagging behind in development; which is reflected in their literacy and mastery of the lessons. This is precisely because children have been hooked on gadgets since infancy. There is also another aspect that worries doctors: spending time with electronic devices reduces children's ability to concentrate, focus on something, learn, and remember. It is a disease known in modern medical parlance as 'digital dementia'.

**At what age should a child start using mobile devices?** The American Pediatric Association has previously stated that a child should not be given a smart phone or tablet until the age of two. Now the restriction has been loosened a bit: a child can be allowed to play with gadgets from the age of one and a half. Only in this case it is necessary to be under the control of parents and play with age-appropriate content (such as games for babies). It is recommended that children between the ages of 2 and 5 spend one hour a day with devices. According to pediatricians, children aged 6-12 can spend up to two hours a day on technology.

Microsoft CEO Bill Gates, the world's richest man, did not allow his children to use smart phones until they were 14 years old. According to UNESCO, 93 percent of children between the ages of 3 and 5 spend 28 hours a week or about 4 hours a day in front of a screen. It is much more convenient for parents to distract their child with cartoons, video games, smart phones. However, the child is disconnected from the outside world at this time. This can damage his mental health. Defects in speech activity occur as a result of a child becoming addicted to gadgets during speech development. For the record, 25 percent of 4-year-olds worldwide today have speech defects. Forty years ago, the figure was four percent.

For the full development of the child should be in constant contact with the external environment. During hearing, sight, thinking, learning, the child becomes self-aware. True, this can be done on gadgets. But the most important thing is feedback. The child develops speech through feedback from family members. Learns to communicate. People who have been addicted to gadgets since they are young develop a condition called "lack of concentration" and it can lead to mental health problems. As a result of lack of concentration, the child is unable to concentrate,

there is a constant loss of interest in one area, distraction increases. Constant being in front of the screen affects the physical condition of children and adolescents: vision, mobility, body strength and endurance deteriorate.

He does not plant millet for fear of sparrows. It is also a mistake to leave children behind because gadgets are harmful. Technological progress has its own advantages, of course. Mobile devices can be a good "teacher" for children to learn, to learn a language. Only if parents control the time their child spends with mobile devices. Doctors also gave their recommendations in this regard:

Children under the age of three are not recommended to sit in front of the screen. For children aged 3-5, 15 minutes is enough. The fact that six-year-olds stay in front of the screen for more than 20 minutes affects their health. Children between the ages of seven and eight should not sit in front of a screen for more than 30 minutes, 10-12 year olds for 40 minutes, and 13-14 year olds for no more than 50 minutes.

Gadgets also have their own unique benefits, of course. When you travel a long way, you will spend your time meaningfully while waiting. Favorite game on the phone in stressful situations, cartoons can give a child a good mood.

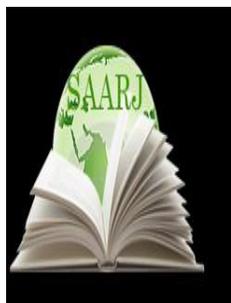

In addition, modern gadgets contain a variety of games and puzzles that help to develop the child's mind. It would be a great light upon light if parents agreed with their children on their effective use.

**Let the boundaries be reasonable.** Also consider a few principles that will help you set reasonable limits when your child spends time with devices:

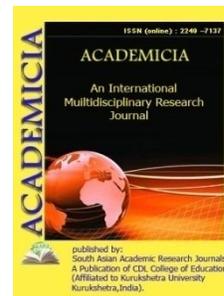

1. Smart phones and tablets should not interfere with the child's physical activity, real play and sleep.
2. It is best to alternate your time with gadgets with physical activity at intervals of 15-20 minutes.
3. Remove the device from the child's hand a few hours before bedtime.
4. Do not give your child a mobile device when he or she is nervous about something.
5. Don't trade personal attention and communication for communication through gadgets.

## THE NATURE OF NATIONAL CULTURE IN THE CONTEXT OF GLOBALISM AND FUNCTIONAL DEVELOPMENT

**Jamolov Davronbek\***

\*Teacher,  
National University of Uzbekistan

### ABSTRACT

*In the state, the author examines the dryness and basic character of the national culture. National culture is understood as the totality of material and arc values created by the representatives of the nation in the process of historical development, the methods of their creation and transmission by the next generation. In the state, the features of modern and postmodern national culture are revealed.*

**KEYWORDS:** *Culture, National Culture, Peculiarities Of National Culture, Conservative Aspect Of National Culture, Innovative Aspect Of National Culture, Modern National Culture, Postmodern National Culture.*

### INTRODUCTION

Issues related to the content and essence of human culture, the laws of development are one of the rarest problems of social philosophy. Undoubtedly, the description of a category of social philosophy is not so diverse, that the essence and composition of any phenomenon have not become the subject of cultural debate. At a glance, such a pluralistic interpretation and intensive research ought to have clarified the quintessence of the issue. But throughout the years, as scientific research has expanded, the interpretation of the concept of "culture" has only increased. In fact, such diversity in the theoretical understanding of culture manifests that this phenomenon is extremely complex in nature.

However, we do not want to comment on these discussions. Moreover, we will not dwell on the content and components of the concept of "culture". At this point, we will confine ourselves to acknowledging that the cornerstone of the scientific conception of culture is that it consists of a set of material and spiritual values. National culture, on the other hand, shows itself as a particular form of culture. There is a lot of scientific work on the specifics of national culture. Works and articles on various aspects of this issue are regularly published in the scientific

community, both abroad and in our country. In studying the essence and structure of national culture, these sources serve as a solid theoretical and methodological basis.

National culture is a set of material and spiritual values created by representatives of a particular nation during historical development, as well as ways to create these values, their use in the path of national and universal development, the ability to pass from ancestors to generations. It has material and spiritual forms. The material aspect of national culture includes, first and principal, the means of production and the objects of labor that are part of the social being. It is a standard of the level of practical mastery of nature by the nation. The spiritual aspect of national culture consists of science, the application of its achievements in production and everyday life, the level of education, the state of national enlightenment, the state of health care, art, the behavior of members of society, the nature and development of people's needs and interests.

National culture is the result of the embodiment of the nation's consciousness and thinking. The elements contained in it, the artifacts are not only preserved within a certain historical period, but also passed down from ancestors to generations. For example, the ideas of Plato, whose philosophical heritage has already become the property of national culture, are as valuable today as they were two thousand years ago. National culture is the sum of the nation's spiritual experiences, successes, achievements, it emerges as an individual-subjective and concrete-historical phenomenon and gradually acquires a socio-objective character and becomes a nationwide cultural tradition.

There are a number of unique features of national culture. Firstly, it is an objective reality. National culture allows us to imagine a nation not just as a collection of people, but as a socially developed whole. Just as there is no culture that is separate from the nation, there can be no nation that is deprived of culture: national culture is the common property of those who belong to that nation. Secondly, national culture is the result of the nation's historical activity. There is no nation that has emerged with a culture ready from the beginning, and it cannot be. The culture of any nation is formed, perfected and developed throughout its historical development. Just as it is not possible to artificially create an ethnic unit called a nation, its culture cannot be artificially shaped. It is worth recalling the example of the famous German philosopher Immanuel Kant: "King James I of England was approached by his foster mother to make his son a gentleman. James replied, "I cannot do this; I can make him a count, but he has to make himself a gentleman" [3]. Thirdly, national culture is a social phenomenon not only of the past and present, but also of the future. The best examples of national culture, interspersed with the past, are manifested in the modern man, influencing his formation as a human being. But the nation is not indifferent to the future of its culture: the mature representatives of any nation living and creating today strive to pass on the fruits of their ideas and labor to the generations who will replace them in the course of the historical epoch.

If we describe the national culture figuratively, it is a peculiar shell of the existence of the nation, which, as we have pointed out, emerges and develops with the nation. Such a depiction of the nature of national culture does not contradict the various notions of culture. For example, in ancient times (at least remember the ancient Greek logos), both in the Middle Ages and in the New Age, there were such notions about human culture. V.I. Vernadsky's noosphere[1] and the cultural pathos of human philosophy by P. Teyyar de Sharden is in sync with such notions[2]. At first glance, such an idea may seem to be riddled with mysticism, but in reality, it is not. These

perceptions only allow us to interpret culture as a reality that embodies the harmony of matter and spirit, a natural product of social development.

National culture has its own stable, conservative aspect, as well as a changing, innovative side. Its conservative side is reflected in national traditions. It is thanks to the traditions that the historical experience of the nation is accumulated and transmitted from ancestors to generations. Each new generation of the nation intensifies these experiences by its goals and interests.

The innovative side of national culture characterizes its creative basis. The more this foundation is perfected, the more the national culture develops. This was particularly evident in the historical period in Europe from the Renaissance to the New Age. This period was a period of profound spiritual revolutions. The Medieval religious culture based on ethnocentrism gave way to a culture focused on objective knowledge of nature through experience and thinking, rational understanding of reality. Such exchange serves as the ideological basis for a society based on capitalist production. The development of scientific knowledge, technical progress was stimulated, philosophical and humanitarian knowledge, new ideas about reality began to form in art. The discovery and development of new lands have also changed people's worldview. The period formed active, independent and enterprising people. Changes in the system of human values and worldviews have accelerated scientific and technological innovation, which in turn has raised the creation or discovery of innovation to the level of an institutional norm.

Nowadays, the innovative side of national culture is reaching new features. Experts see today as a time when the opportunities for industrial development are running out, the tendencies of postmodern society are taking root, and a new form of national culture is emerging. During this period, the national culture of a modern character is replaced by postmodern national culture.

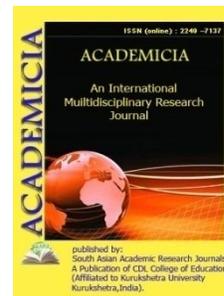

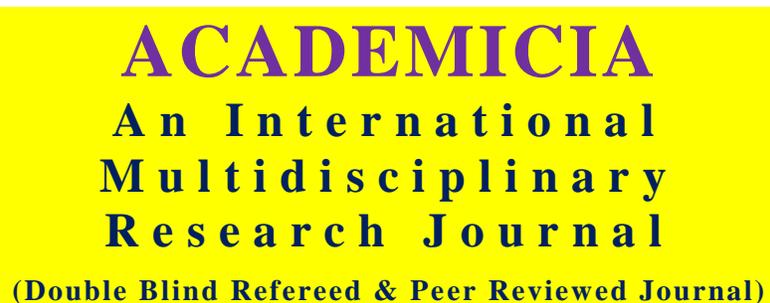

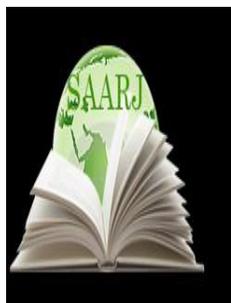

The anticipation of postmodern national culture are described and evaluated in different ways. This is not in vain, of course. On the one hand, the current period of human development is increasing the factors that can serve the development of national cultures. Opportunities to preserve, save and transmit elements of national culture to future generations are expanding. On the other hand, there are emerging factors and means, trends and tendencies that serve to erode national cultures, depriving it of its originality. Whether the postmodern society will pave the way for the development of national cultures or pave the way for its decline will be determined by the future.

## CONCLUSION

In conclusion, national culture is a dynamic phenomenon that has various distinctive features, representing the set of material and spiritual values created by representatives of a particular nation during historical development, ways to create these values, their use in national and universal development, the ability to pass from ancestors to generations. It changes and improves in line with the breath of the times, and the reality of today is no exception.

### ABSTRACT

*In the state, the author examines the dryness and basic character of the national culture. National culture is understood as the totality of material and arc values created by the representatives of the nation in the process of historical development, the methods of their creation and transmission by the next generation. In the state, the features of modern and postmodern national culture are revealed.*

**KEYWORDS:** *Culture, National Culture, Peculiarities Of National Culture, Conservative Aspect Of National Culture, Innovative Aspect Of National Culture, Modern National Culture, Postmodern National Culture.*

### INTRODUCTION

Issues related to the content and essence of human culture, the laws of development are one of the rarest problems of social philosophy. Undoubtedly, the description of a category of social philosophy is not so diverse, that the essence and composition of any phenomenon have not become the subject of cultural debate. At a glance, such a pluralistic interpretation and intensive research ought to have clarified the quintessence of the issue. But throughout the years, as scientific research has expanded, the interpretation of the concept of "culture" has only increased. In fact, such diversity in the theoretical understanding of culture manifests that this phenomenon is extremely complex in nature.

However, we do not want to comment on these discussions. Moreover, we will not dwell on the content and components of the concept of "culture". At this point, we will confine ourselves to acknowledging that the cornerstone of the scientific conception of culture is that it consists of a set of material and spiritual values. National culture, on the other hand, shows itself as a particular form of culture. There is a lot of scientific work on the specifics of national culture. Works and articles on various aspects of this issue are regularly published in the scientific

community, both abroad and in our country. In studying the essence and structure of national culture, these sources serve as a solid theoretical and methodological basis.

National culture is a set of material and spiritual values created by representatives of a particular nation during historical development, as well as ways to create these values, their use in the path of national and universal development, the ability to pass from ancestors to generations. It has material and spiritual forms. The material aspect of national culture includes, first and principal, the means of production and the objects of labor that are part of the social being. It is a standard of the level of practical mastery of nature by the nation. The spiritual aspect of national culture consists of science, the application of its achievements in production and everyday life, the level of education, the state of national enlightenment, the state of health care, art, the behavior of members of society, the nature and development of people's needs and interests.

National culture is the result of the embodiment of the nation's consciousness and thinking. The elements contained in it, the artifacts are not only preserved within a certain historical period, but also passed down from ancestors to generations. For example, the ideas of Plato, whose philosophical heritage has already become the property of national culture, are as valuable today as they were two thousand years ago. National culture is the sum of the nation's spiritual experiences, successes, achievements, it emerges as an individual-subjective and concrete-historical phenomenon and gradually acquires a socio-objective character and becomes a nationwide cultural tradition.

There are a number of unique features of national culture. Firstly, it is an objective reality. National culture allows us to imagine a nation not just as a collection of people, but as a socially developed whole. Just as there is no culture that is separate from the nation, there can be no nation that is deprived of culture: national culture is the common property of those who belong to that nation. Secondly, national culture is the result of the nation's historical activity. There is no nation that has emerged with a culture ready from the beginning, and it cannot be. The culture of any nation is formed, perfected and developed throughout its historical development. Just as it is not possible to artificially create an ethnic unit called a nation, its culture cannot be artificially shaped. It is worth recalling the example of the famous German philosopher Immanuel Kant: "King James I of England was approached by his foster mother to make his son a gentleman. James replied, "I cannot do this; I can make him a count, but he has to make himself a gentleman" [3]. Thirdly, national culture is a social phenomenon not only of the past and present, but also of the future. The best examples of national culture, interspersed with the past, are manifested in the modern man, influencing his formation as a human being. But the nation is not indifferent to the future of its culture: the mature representatives of any nation living and creating today strive to pass on the fruits of their ideas and labor to the generations who will replace them in the course of the historical epoch.

If we describe the national culture figuratively, it is a peculiar shell of the existence of the nation, which, as we have pointed out, emerges and develops with the nation. Such a depiction of the nature of national culture does not contradict the various notions of culture. For example, in ancient times (at least remember the ancient Greek logos), both in the Middle Ages and in the New Age, there were such notions about human culture. V.I. Vernadsky's noosphere[1] and the cultural pathos of human philosophy by P. Teyyar de Sharden is in sync with such notions[2]. At first glance, such an idea may seem to be riddled with mysticism, but in reality, it is not. These

perceptions only allow us to interpret culture as a reality that embodies the harmony of matter and spirit, a natural product of social development.

National culture has its own stable, conservative aspect, as well as a changing, innovative side. Its conservative side is reflected in national traditions. It is thanks to the traditions that the historical experience of the nation is accumulated and transmitted from ancestors to generations. Each new generation of the nation intensifies these experiences by its goals and interests.

The innovative side of national culture characterizes its creative basis. The more this foundation is perfected, the more the national culture develops.  UZBEKISTAN

**ABSTRACT**

*The results of studies of 92 patients with lung abscesses complicated by bronchial fistula of various etiologies, who were treated in the purulent surgical department of the clinical base of Bukhara State Medical Institute in the period of 2010-2019, were analyzed. All patients, depending on the method of treatment, were divided into 2 groups: I - comparative group and II - main. The control group I consisted of 68 (73.9%) patients who received traditional conservative methods of treatment with the use of daily endobronchial sanitation of the bronchial lumen. In the 2<sup>nd</sup> -main group included 24 (26.1%) patients who, in addition to conservative treatment, underwent transtracheal drainage of a purulent focus with sanitation with antibacterial and thinning drugs. The analysis of the obtained results revealed that although transtracheal drainage of the purulent focus of the lung is a more effective method than the conservative method of treatment with the use of bronchoscopic lung debridement and has its drawbacks in the form of complications such as: in the form of suppuration of soft tissues in the area of microtracheostomy up to 12.5%, acute tracheobronchitis 20.8%, bronchospasm 8.3%, in 16.7% cases, there is an independent extrusion of drainage in the bronchus, loss of microdrainage from the purulent cavity 8.3%.*

**KEY WORDS:** *Transtracheal Drainage, Bronchoscopic Debridement, Lung Abscess*

**INTRODUCTION**

The authors' researches show the percentage of development of pulmonary-pleural complications with lung abscesses ranges from 30 to 70%, and the incidence of gangrenous forms from 28 to 74% [Bisenkov L.N., Oxunov A.O.]. In general the mortality rate also remains

high with various forms of purulent-necrotic process in the lungs from 12.7% to 77.8% [Geller D.B., Gostishev V.K.].

The main treatment for an abscess is drainage. However, lung abscess is usually treated conservatively because drainage of the lung abscess is problematic. Drainage is considered only in cases of refractory lung abscess; in such cases, percutaneous lung drainage is usually used. Even when drainage is successful, percutaneous drainage is associated with the risk of complications such as pneumothorax and pleural culture; such complications occur in 16.1% of patients (Drobyazgin E.A. 2020).

The main goal of interest is the article by scientists from the American Association of Bronchology and Interventional Pulmonology (AABIP) Raman Tuhina, McClelland Sarenthia, Bartter Thaddeus (2018) with the increase in the availability of methods for treating pleural effusion, including medical thoracoscopy (MT) and tunnel pleural catheter (TPC), in practice, there has been evolution

Takaki Masahiro, Nobuaki Tsuyama, Eriko Ikeda (2019) A lung abscess is usually treated with long-term antibiotic therapy. Due to the lack of a safe and simple drainage technique, drainage is only used in special cases.

The experience of successful closure of persistent air leaks in patients with severe pleural empyema - the use of an endoscopic unilateral endobronchial valve is presented in the work of the authors of Schweigert (Michael, Kraus Dietmar Ficker, Joachim H, 2019).

Currie G.P., McKean M.E., Kerr K.M., Denison A.R. (2011) Over the past decade, the Endobronchial Ultrasound Transbronchial Aspiration Needle (EBUS-TBNA) has become one of the most exciting and innovative developments in respiratory medicine. This procedure allows for the selection of mediastinal lymph nodes and masses in both malignant and benign diseases and overcomes some of the disadvantages associated with mediastinoscopy and blind transbronchial aspiration with a needle.

The use of techniques that ensure the supply of antibacterial and other drugs to the pathological focus through the vascular bed presents great difficulties for their implementation, especially in the group of seriously ill patients and, in addition, do not solve many problems of local treatment. In this situation, it becomes necessary to carry out sanitation measures through the chest wall using the techniques of "minor pulmonary surgery" [Kapitulin S.Yu. 2013]

Modern methods of treatment of abscesses and gangrene of the lungs are aimed at removing purulent contents from cavities by minimally invasive methods, endoscopic or transthoracic methods. The authors (Sizdikbaev M.K., Kurtukov V.A., Shoyxet Ya.N.) argue that bronchial stenosis is an effective method in complex treatment in patients with cicatricial stenosis of the bronchi against the background of purulent-inflammatory processes in the lungs, complicated by acute lung abscess and lung gangrene.

New technologies in the diagnosis and treatment of purulent-inflammatory lung diseases have made it possible over the past decades to slightly reduce the incidence, which is confirmed by existing literary publications, but the search for the most effective and low-traumatic treatment options is extremely relevant.

**Purpose of the study:** to reveal the effectiveness and disadvantages of transtracheal drainage and sanitation in the treatment of patients with lung abscess complicated by bronchial fistula.

## **MATERIALS AND METHODS**

Examined and treated of 92 patients with abscesses of mild bronchial fistula of various etiology were treated in the purulent surgical department of the clinical base of Bukhara State Medical Institute, the period from 2010 to 2019 were analyzed. All patients, depending on the method of treatment, were divided into 2 groups: I - comparison group and II - main. The control group I consisted of 68 (73.9%) patients who received traditional methods of treatment - conservative, antibacterial, general strengthening symptomatic treatment with the use of daily endobronchial sanitation of the bronchial lumen. II - the main group included 24 (26.1%) patients, for whom conservative treatment was supplemented with transtracheal drainage of a purulent focus with antibacterial and thinning drugs (trypsin, chymotrypsin).

The effectiveness of the used and proposed clinical methods for the treatment of suppurative lung diseases was assessed by the duration of bronchopulmonary symptoms, general symptoms of intoxication, the dynamics of a decrease in the size of the purulent-destructive cavity, the value of the total bed-day.

### **Methodology for sanitation bronchoscopy.**

Sanitation bronchoscopy was performed using a flexible bronchoscope, apparatus KARL SHTORS (Germany 2006). Bronchoscopic manipulation was performed in a sitting position of the patient. For the purpose of local anesthesia, immediately before the study, the nasal and oral cavity was treated with 10% Lidocaine spray. To reduce the gag reflex at the time of the introduction of the bronchoscope, the patient was recommended to breathe shallowly and as often as possible. The endoscope was introduced into the airway under visual control, gradually examining the underlying parts of the tracheobronchial tree from both sides. If necessary that the bronchial tree was sanitized along the way by aspiration. After sanitation from the aspiration material, a qualitative and quantitative bacteriological study was carried out, as well as the determination of the sensitivity to antibiotics of the identified microflora was carried out to determine the tactics of further antibiotic therapy.

### **The technique of applying microtracheostomy.**

After appropriate premedication in the supine position of the patient, local anesthesia was performed on the anterior surface of the soft tissues of the trachea and along the midline of the neck. After three times skin treatment with 96% alcohol, 2 cm longitudinal incision of the skin and soft tissues was made. A puncture is performed between 2-3 cartilaginous rings of the trachea, a thin trocar, a tracheostomy is performed with the help of a microtrocar. Microdrainage is carried out through the lumen of the microtrocar with a lumen with a diameter of 2.0 mm. The microtrocar is removed, the microdrainage is fixed to the skin of the neck using polypropylene sutures, and an aseptic bandage is applied.

### **Technique of drainage of the abscess cavity through tracheostomy**

The position of the patient and the technique of anesthesia was carried out as noted above. A flexible bronchoscope, 5.2 mm in size, is passed through the nose, larynx and vocal cords under visual control. The inflated microdrainage is captured through the microtracheostomy with the

help of the bronchoscope spike and further, under strict visual control, is brought to the fistula gate and drainage is carried out by introducing the end of the microdrainage into the abscess cavity.

## RESULTS AND DISCUSSION

In all patients, laboratory indicators of signs of endogenous intoxication from peripheral blood (hemoglobin concentration, leukocytosis, ESR, LII, LI, MSM), analysis of the duration of anti-inflammatory therapy, the qualitative composition of sputum micro flora, and the length of hospital stay were studied in all patients. At the time of admission and in the course of treatment, the patient's condition was assessed by clinical signs, according to laboratory and instrumental examination methods, as well as using X-ray research methods.

Bacteriological studies in patients of group I were carried out from the lavage fluid of the bronchial tree, in group II the microflora was studied from catheter discharge from the abscess cavity. In most cases, 65 (70.6%) patients had pathogenic staphylococci (*Staphylococcus aureus*) inoculated. Pneumococcus was sown in 30 (32.6%) cases, *E. coli* was sown in 9 (9.8%) cases. It was inoculated in 5 (5.4%) cases, followed by streptococci (*Streptococcus haemolyticus*) in 13 (14.1%) cases. *Pseudomonas aeruginosa* (*Pseudomonas aeruginosa*) was inoculated in 8 (8.6%) patients.

The analysis of the results of indicators of intoxication of the organism of patients with purulent lung diseases of the I group of comparison revealed the following changes (table No. 1). As can be seen from the table, on the first day of treatment, the body temperature of patients averaged  $39.3 \pm 0.410^{\circ}\text{C}$ . The content of blood leukocytes was on average  $9.9 \pm 0.46 \times 10^9 / \text{l}$ . The volume of medium molecules averaged  $0.199 - 0.010$  units. Similarly, an increase in LII and ESR was noted. On the third day of treatment, there was a slight decrease in body temperature indicators from  $38.2 \pm 0.13$  to  $37.8, 140.14$ , the number of blood leukocytes decreased on average to  $8.4 \pm 0.45 \times 10^9 / \text{l}$ . The volume of medium molecules averaged  $0.168 \pm 0.007$  units. There was a decrease in LII and ESR indicators to  $1.9 \pm 0.08$  and  $40.4 \pm 1.52$ , respectively. By the seventh day of treatment, patients in the comparison group with purulent lung diseases retained a slight subfebrile condition ( $37.8 - 0.14^{\circ}\text{C}$ ). At the same time, according to all indicators of organism intoxication: L, MSM, LII and blood ESR, their further decrease was noted, that is, there was a tendency towards normalization  $-7.4 \pm 0.39 \times 10^9$ ;  $0.152 \pm 0.009$ ;  $1.7 \pm 0.07$ ;  $34.1 \pm 1.22$  respectively.

**TABLE №1. DYNAMICS OF INDICATORS OF INTOXICATION OF THE 1ST COMPARISON GROUP (N=68)**

Indicators	Observation time				
	Day of admission	Day 3	Day 7	Day14	Day20
t <sup>0</sup> body	39,3±0,41	38,2±0,13*	37,8±0,14*	36,9±0,14	36,6±0,20*
Lblood ×10 <sup>9</sup> /l	9,9±0,46	8,4±0,45*	7,4±0,39	7,0±0,31	6,6±0,25
MSM	0,199±0,010	0,168±0,007**	0,152±0,009	0,126±0,005**	0,114±0,006***
LII	2,4±0,06	1,9±0,08*	1,7±0,07	1,4±0,05	1,2±0,04***
ESR mm / h	45,8±1,66	40,4±1,52*	34,1±1,22*	27,2±1,11***	15,2±0,62***

**Note:** \* - differences relative to the data of the previous day are significant (\* - P < 0.05, \*\* - P < 0.01, \*\*\* - P < 0.001)

By the seventh day of treatment, these figures, although they tended to further decrease, however, remained above the norm. With further treatment and observation, by the tenth day, all analyzed parameters of intoxication, except for ESR of blood, were within normal limits.

When analyzing control X-ray images and CT. It was established that in the 1<sup>st</sup> group of patients on the day of admission, the size of the cavities of the purulent focus averaged  $6.8 \pm 0.66$  cm. In dynamics, throughout the entire observation period, the size of the cavity of the purulent focus decreased systematically (Table 2). By the 18-20th day of treatment, the size of the cavities decreased to  $3.1 \pm 0.35$  cm, that is, by 45.6% of the original size.

**TABLE №2 DYNAMICS OF DECREASING THE SIZE OF ABSCESS CAVITIES OF 1<sup>ST</sup> GROUP**

Patient groups	Cavity dimensions, sm				
	Day of admission	Day 3	Day 7	Day 14	Day 20
<b>1 st group</b>	6,8±0,66	5,9±0,26	5,2±0,28	4,5±0,34	3,1±0,35

**Notes:** - Where \* the reliability of differences ( $p < 0.05$ ) in the size of the foci of destruction between the dynamics according to the terms given in the table.

It should be noted that the analysis of the conducted studies of group I revealed the following: daily long-term bronchoscopic examination also has its drawbacks, such as: with prolonged daily bronchoscopic examination of patients of group I, complications in the form of tracheobronchitis up to 23.52%, hoarseness of the voice up to 2.94% of cases were noted, all these complications arose as a result of irritation and traumatization of the vocal cord, trachea and bronchi, which were eliminated with appropriate conservative therapy.

The average duration of conservative treatment of lung abscess complicated by bronchial fistula in group I is  $18 \pm 1.5$  days

Analysis of the results of indicators of intoxication of the body of patients with purulent lung diseases of the II-comparison group revealed the following changes (table № 3). As can be seen from the table, on the first day of treatment, the body temperature of patients averaged  $39.5 \pm 0.380$  C. The content of blood leukocytes was on average  $9.9 \pm 0.36 \times 10^9 / l$ . The volume of medium molecules averaged  $0.198 \pm 0.011$  units. Similarly, an increase in LII and ESR was noted. On the third day of treatment, there was a slight decrease in body temperature indicators from  $39.5 \pm 0.17$  to  $36.9 \pm 0.14$ , the number of blood leukocytes decreased on average to  $8.0 \pm 0.25 \times 10^9 / L$ . The volume of medium molecules averaged  $0.143 \pm 0.009$  units. There was a decrease in LII and ESR indicators to  $1.6 \pm 0.07$  and  $38.4 \pm 1.34$ , respectively.

**TABLE №3 DYNAMICS OF INDICATORS OF INTOXICATION IN PATIENTS WITH PURULENT LUNG DISEASES II - COMPARISON GROUP (N=24)**

Indicators	Время наблюдения				
	Day of admission	Day 3	Day 7	Day 14	Day 20
t <sup>0</sup> body	39,5±0,38	36,9±0,17**	36,7±0,12*	36,6±0,11	36,5±0,10*
Lblood ×10 <sup>9</sup> /l	9,9±0,36	8,0±0,25*	7,1±0,29	6,5±0,23	6,4±0,32

MSM	0,198±0,011	0,143±0,009 **	0,138±0,006	0,122±0,007**	0,104±0,004***
LII	2,5±0,08	1,6±0,07*	1,2±0,08	1,1±0,06	1,0±0,05***
ESR mm / h	48,6±1,54	38,4±1,34*	26,3±1,44*	19,6±1,13***	15,1±0,60***

**Note:** \* - differences relative to the data of the previous day are significant (\* - P<0,05, \*\* - P<0,01, \*\*\* - P<0,001)

By the seventh day of treatment, in patients of the comparison group with purulent lung diseases, the body temperature was normalized ( $36.7 \pm 0.12$  ° C). At the same time, according to all indicators of intoxication of the body: L, MSM, LII and blood ESR, their further decrease was noted, that is, there was a tendency towards normalization -  $7.1, 20.29 \times 109$ ;  $0.138 \times 0.006$ ;  $1.2 \pm 0.08$ ;  $26.3 \pm 1.44$ , respectively. By the fourteenth day of treatment, these numbers, although they tended to further decrease, however, remained above the norm.

With further treatment and observation by the twenties, all analyzed indicators of intoxication were within normal limits.

When analyzing control X-ray images and CT of the chest, it was found that in 2<sup>nd</sup> group patients on the day of admission, the dimensions of the cavities of the purulent focus of the lung were identical to those in 1<sup>st</sup> group. Table №4 shows that the numbers of both groups on the day of admission did not differ significantly.

**TABLE №4 DYNAMICS OF REDUCING THE SIZE OF ABSCESS CAVITIES OF THE 1<sup>ST</sup> AND THE 2<sup>ND</sup> GROUPS**

Patient groups	Cavity dimensions, sm				
	Day of admission	Day 3	Day 7	Day 14	Day 20
1 <sup>st</sup> group	6,8±0,66	5,9±0,26	5,2±0,28	4,5±0,34	3,1±0,35
2 <sup>nd</sup> group	7,1±0,72	5,3±0,22	4,7±0,27	3,3±0,38	2,5±0,37

**Notes:** - Where \* the reliability of differences ( $p < 0.05$ ) in the size of the foci of destruction between the dynamics in terms of the time given in the table.

It should be noted that the rate of reduction in the size of the cavities in patients of the 2<sup>nd</sup> group was faster than in the 1<sup>st</sup> group. By the 16-18 days of treatment, the dimensions of the cavities during treatment with the use of permanent catheterization of purulent cavities, the dimensions were reduced to  $2.5 \pm 0.37$  cm, that is, by 35.2% of the initial size, which in patients of group I at this time was equal  $3.1 \pm 0.35$  cm, that is, by 45.6%. As can be seen from this, the process of decay of purulent cavities in patients of the 2<sup>nd</sup> group proceeded much faster than in the control group.

It should be noted that, although there was a positive effect in contrast to conservative treatment, in patients with the use of permanent catheterization of purulent cavities, some complications of this method were noted. Complications were observed in the form of suppuration of soft tissues in the area of microtracheostomy 3 (12.5%), acute tracheobronchitis 5 (20.8%), bronchospasm 2 (8.3%), in 4 (16.7%) cases during treatment, there was an independent extrusion of drainage in bronchus (exit of the end of the catheter into the bronchus), which is re-introduced into the

abscess cavity with the help of a bronchoscope. In 2 (8.3%) patients, spontaneous loss of microdrainage was noted, where it became necessary to re-establish it in an appropriate way.

The average duration of conservative treatment for a lung abscess complicated by a bronchial fistula with the use of transstrachial drainage is  $14 \pm 1.8$  days, which is 3-4 days ahead of the control group.

## CONCLUSION

Thus, our research revealed the following:

With an abscess of the lung complicated by a bronchial fistula, *St. aureus* and *Pneumococcus* dominate from the pathogenic microflora.

When using the method of treatment of bronchoscopic sanitation of patients with lung abscess, complications in the form of tracheobronchitis were noted up to 23.52%, hoarseness of the voice up to 2.94% of cases. The average duration of conservative treatment of patients is  $18 \pm 1.5$  days.

The use of permanent catheterization of the purulent cavity and sanitation with the use of antibiotic therapy is an effective method in comparison with conservative therapy.

When used in a complex for the treatment of endotracheobronchial catheterization of purulent cavities of the lung with sanitation and antibiotic therapy, it accelerates the normalization of all indicators of intoxication and improves the dynamics of reducing the size of purulent cavities by 2-3 days.

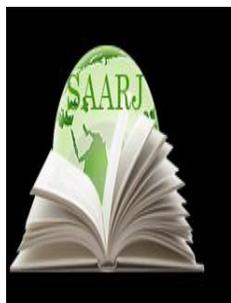

The average duration of treatment for a lung abscess complicated by a bronchial fistula using transstrachial drainage is  $14 \pm 1.8$  days, which is 2-3 days ahead of the duration of treatment for a conservative method of treatment with the use of endobronchial sanitation.

Although there are advantages of a positive effect compared to conservative treatment, patients with constant catheterization of purulent cavities have some complications of this method: in the form of suppuration of soft tissues in the area of microtrachestomy up to 12.5%, acute tracheobronchitis 20.8%, bronchospasm 8.3%, in 16, In 7% of cases, there is an independent extrusion of the drainage in the bronchus (exit of the end of the catheter into the bronchus). Spontaneous loss of microdrainage is observed up to 8.3% of patients. That indicates the need to improve the methods of drainage of purulent lung cavities and which do not have the above disadvantages.

### ABSTRACT

*The classification of phonological oppositions was originally developed by N.S. Trubetsky, the founder of the Prague Phonological School, whose ideas are explained on the example of the German language. Linguists such as V.A. Vasilev, A. Abduazizov classified phonological oppositions on the example of English. Those classifications refer to the stressed position of the vowels. This study is devoted to the problem of classification of phonological oppositions of English unstressed vowel phonemes. The purpose of this study is to explore the extent of forming phonological oppositions of English vowel phonemes in the unstressed position and to classify the identified phonological oppositions. While carrying out of this study, a comparative method was used to compare vowel phonemes with each other, and a descriptive method was used to express their specific features. In the study, simple and complex classifications of phonological oppositions of English unstressed vowels have been developed. The study concludes that distinguishing between simple and complex classifications of phonological oppositions of unstressed vowels is important from both theoretical and practical viewpoints.*

**KEYWORDS:** *A Vowel System, Stressed Vowels, Unstressed Vowels, Phonemes, Phonological Oppositions, One-Dimensional Oppositions, Multidimensional Oppositions.*

### INTRODUCTION

The study of phonological oppositions on the example of unstressed vowels plays an important role in determining the phonological peculiarities of unstressed vowels. The importance of a

special study of the unstressed vowels is even more evident in languages where there is a basis for dividing the vowel system into subsystems according to the presence of stress. English is an example of a language in which there is a basis for dividing the vowel system into subsystems according to the stress is present or not. In this language, the numerical difference between stressed and unstressed vowels serves as a basis for dividing the vowel system into two subsystems. Thus, the system of vowels in English can be divided into two subsystems: 1) stressed vowels, 2) unstressed vowels [1, 112]. The subsystem of stressed vowels differs from the subsystem of unstressed vowels in that it contains 19 phonemes. Due to the transition of all vowel phonemes to the neutral vowel in the unstressed position, the subsystem of unstressed vowels enriches by one more phoneme and consists of 20 phonemes. The distinction between stressed and unstressed vowels makes it necessary to study the phonological oppositions of vowel phonemes in the stressed as well as in the unstressed positions. The peculiarity of the phonological oppositions in the unstressed position is that they are enriched with a neutral vowel that is not found in the stressed position. As a result, the opportunity of forming a phonological opposition of unstressed vowels increases due to the phoneme which is found only in the unstressed position. The peculiarity of unstressed vowels to form a phonological opposition makes it possible to classify these oppositions from different perspectives. The classification of phonological oppositions of vowels can be divided into a simple and complex one, depending on the number of criterion which the classification is based on. The phonological oppositions which are classified by only one criterion can be an example to a simple classification where is the classification of phonological oppositions based on more than one criterion is an example to a complex classification. In this study, the classification of phonological oppositions of unstressed vowels has been approached from both perspectives: a) a simple classification of phonological oppositions of unstressed vowels, and b) a complex classification of phonological oppositions of unstressed vowels.

## MATERIALS AND METHODS

A simple classification of the phonological oppositions of unstressed vowels. Vowel sounds in English are distinguished by three phonological features. They are the features relating to: a) vertical movements of the tongue, b) horizontal movements of the tongue and c) the qualitative and quantitative (long-short) characteristics of vowels. On the basis of these distinctive features, vowel phonemes form the phonological oppositions. The phonological oppositions of vowel phonemes in English are classified by V.A.Vassilyev and A.A.Abdouazizov, in which mainly the stressed position of vowels is dealt. Since in these classifications the vowel oppositions are classified only in terms of the number of phonological distinctive features in one opposition, they can be included in the simple classifications of phonological oppositions. V.A.Vassilyev, taking into consideration the number of phonological distinctive features in one opposition of English vowels, classified them as follows: a) singleopposition; b) double opposition; c) plural opposition, which is distinguished by more than two phonological characters. [6, 183-194]. A.Abdouazizov combined English vowels into the oppositions that differ by one feature according to the horizontal movement of the tongue. He gave nine examples of vowel oppositions according to the vertical movement of the tongue and noted that these oppositions also differ by one feature, but if the qualitative and quantitative features of vowels are taken into consideration, most of these oppositions differ by two features [1, 124-125]. In English, vowel phonemes can also be distinguished by three features in one opposition. For example, the phonemes /ɑ:/, /ʌ/,

which distinguish the words dark /dɑ:k/ - duck /dʌk/, differ from each other according to the distinctive features relating to the horizontal movement of the tongue, the vertical movement of the tongue and the qualitative and quantitative (long-short) characteristics of vowels. Thus, in English, the oppositions of vowel phonemes in the stressed position are divided into the following three subgroups depending on the number of distinctive features in one phonological opposition: a) single opposition, which is distinguished by one distinctive feature; b) double opposition, which is distinguished by two distinctive features; c) triple opposition, which is distinguished by three distinctive features.

## RESULT AND DISCUSSION

In order to determine if the classification mentioned above is true or not in the unstressed positions, we applied it to unstressed vowels and achieved the following results:

Unstressed vowels, like stressed ones, are distinguished by either horizontal or vertical movement of the tongue in single oppositions. For example:

/ə-ʌ/ – mixed - back-advanced: some /səm/ (pr.) - some /sʌm/ (adj.) [1, 123];

In double oppositions, the unstressed vowels are distinguished by both horizontal and vertical movements of the tongue, as well as by either horizontal or vertical movement of the tongue and the quantitative (long-short) feature of vowels in one opposition. Examples of this are the following oppositions:

/ə - ɪ/ – mixed - front-retracted, mid-open (broad variation) - close (broad variation): pepper [ˈpepə] - peppy [ˈpepi];

/ə - e/ – mixed - front, mid-open (broad variation) - mid-open (narrow variation): supplement [ˈsʌplɪmənt] n. - supplement [ˈsʌplɪmənt] v.;

/ə - u:/ – mixed - back, mid-open (broad variation) - close (narrow variation): cooker [ˈkukə] - cuckoo [ˈkuku:];

/ə - ɑ:/ – mixed - back, mid-open (broad variation) - open (broad variation): forum [ˈfɔ:rəm] - fore-arm [ˈfɔ:rɑ:m] n.;

/ɪ - ʌ/ – front-retracted- back-advanced, close (broad variation) - mid-open (broad variation): enable [ɪˈneɪbl] - unable [ʌnˈeɪbl];

/ɪ - ɔ:/ – front-retracted - back, close (broad variation) - open (narrow variation): innate [ɪˈneɪt] - ornate [ɔ:ˈneɪt];

/ɪ - ɒ/ – front-retracted - back, close (broad variation) - open (wide variation): inside [ɪnˈsaɪd] - outside [aʊtˈsaɪd];

/ɪ - æ/ – front-retracted - front, close (broad variation) - open (broad variation): catnip [ˈkætnɪp] - catnap [ˈkætnæp];

/ɪ - u:/ – front-retracted - back, close (broad variation) - close (narrow variation): cookie [ˈkuki] - cuckoo [ˈkuku:];

/ɔ: - ɜ:/ – back - mixed, open (narrow variation) - mid-open (narrow variation): export [ˈeksɜ:t] - expert [ˈeksɜ:t];

/ɔ: - ʊ/ – back - back-advanced, open (narrow variation) - close (broad variation): output [ˈaʊtpɔ:t] - output [ˈaʊtpʊt];

/ʌ - e/ – back-advanced - front, mid-open (broad variation)- mid-open (narrow variation): unlisted [ʌnˈlɪstɪd] - enlisted [enˈlɪstɪd];

/ɒ - i:/ – back - front, open (wide variation) - close (narrow variation): proton [ˈprəʊtɒn] - protein [ˈprəʊti:n];

/ə - ɜ:/ – mid-open (broad variation) - mid-open (narrow variation), short - long (quality and quantity feature): forward [ˈfɔ:wəd] - foreword [ˈfɔ:wɜ:d].

In triple oppositions, the unstressed vowels are distinguished by all the three distinctive features such as the horizontal movement of the tongue, the vertical movement of the tongue, and the qualitative-quantitative characteristics of vowels in one phonological opposition. For example:

/i: - ɪ/ – front–front-retracted, close (narrow variation) - close (broad variation), the qualitative-quantitative features of vowels (long-short): forefeet [ˈfɔ:fi:t] n. - forfeit [ˈfɔ:fit] v.

/ə - ɔ:/ – mixed - back, mid-open (broad variation) - open (narrow variation): addition [əˈdɪʃn] - audition [ɔ:ˈdɪʃn];

The above examples show that vowel oppositions in English can be distinguished by up to three distinctive features even in the unstressed positions. Thus, the oppositions of unstressed vowels can be classified as follows according to the number of distinctive features in one opposition:

- a) singleopposition, which is distinguished by one distinctive feature;
- b) double opposition, which is distinguished by two distinctive features;
- c) triple opposition, which is distinguished by three distinctive features.

#### A complex classification of phonological oppositions of unstressed vowels.

N.S. Trubetskoy's classification of phonological oppositions [9, 73-98], which is interpreted as a complex classification of phonological oppositions [1, 124-125], serves as basis for studying the peculiarities of phonological oppositions of other languages. The application of this classification to the unstressed vowels of English is important in determining the specific features of the vowel opposition in the unstressed position. In this logical classification, oppositions are classified in relation to the entire system of oppositions, according to the relationship between the members of the opposition, on the basis of distinctive force and their occurrence in different positions:

**1.** In the classification of phonological oppositions according to the entire system of oppositions unidimensional, pluridimensional, proportional and isolated oppositions are differentiated. If a set of characters belonging to both members of an opposition cannot be found in another member of the same system, it is called a unidimensional opposition. In English, the feature of mixed in the opposition /ə-ɜ:/, the feature of close (narrow variation) in the opposition /i:-u:/, the feature of close (broad variation) in the opposition /ɪ-ʊ/ is common to both members of the opposition and not found in any other member of this system: /ə-ɜ:/: forward [ˈfɔ:wəd] - foreword [ˈfɔ:wɜ:d], /i:-u:/: he [hi:] - who [hu:].

If a set of features specific to both members of an opposition is found in another member of the same system, it can be an example to a pluridimensional opposition. In English, the features

relating to both members of the vowel oppositions such as /i:-e/, /u:-ɔ:/, /æ-ɔ:/ are found in another member of this system. For example, the vowel feature “front” which is common to both members of the opposition /i:-e/ is also present in the other vowel phoneme /æ/. Also, the common feature of the members of the opposition /u:-ɔ:/ (back vowel) is characteristic of the phonemes /ɒ/, /ɑ:/. The vowel feature “open, (broad variation)” that belongs to both members of the opposition /æ-ɒ/ is found in the other vowel phoneme /ɑ:/. So, the vowel oppositions /i:-e-æ/, /u:-ɔ:-ɒ-ɑ:/, /æ-ɒ-ɑ:/ are regarded as the pluridimensional opposition.

If the relationship between the members of one opposition is exactly similar to the relationship between the members of the other opposition in the same system, it is called proportional oppositions. The relationship between the members of the opposition /i:-u:/ (front vowel – back vowel) being exactly similar to the relationship between the members of the opposition /æ-ɒ/, the oppositions /i:-u:/ and /æ-ɒ/ are considered to be proportional oppositions. On the basis of the distinctive feature “front-retracted – mixed” the oppositions /i:-ɜ:/, /i:-ə/; on the basis of the distinctive feature “mixed – back-advanced” the oppositions /ə-ʌ/, /ɜ:-ʌ/; on the basis of the distinctive feature “open – close” the oppositions /i:-æ/, /u:-ɑ:/ are also examples of proportional oppositions.

If there is not a pair of phonemes which are distinguished on the basis of the distinctive feature of the existing pair of phonemes, such an opposition is called isolated. In the English vowel system, there is not a pair of phonemes which can be an example to this phonological opposition.

2. In the classification of opposition in relation to their members private, gradual and equipollent oppositions are defined. If the members of the opposition are differentiated from each other by one distinctive feature, such an opposition is regarded as private. Such vowel oppositions as /i:-u:/ (front vowel – back vowel), /ɪ-ʊ/ (front retracted vowel – back advanced vowel), /e-ɜ:/ (front vowel – mixed vowel) /ə-ʌ/ (mixed vowel – back advanced vowel), /æ-ɔ:/ (front vowel – back vowel), /æ-ɒ/ (front vowel – back vowel), /æ-ɑ:/ (front vowel – back vowel), /i:-ɪ/ (front vowel, close: narrow variation – front retracted vowel, close: broad variation), /i:-ʊ/ (front vowel – back advanced vowel), /ɪ-u:/ (front retracted vowel – back vowel), /ɪ-ʊ/ (front retracted vowel – back advanced vowel), can be an example to the private opposition.

The phonological oppositions in which it is possible to put other phonemes between their members according to the gradations of their distinctive features are considered to be gradual oppositions. The phonemes /e/ (mid-open: narrow variation), /ɜ:/ (mid-open: narrow variation), /ə/ (mid-open: broad variation), /ʌ/ (mid-open: broad variation) can be placed between the members of the opposition /i:-æ/, the phonemes /ʌ/ (mid-open: broad variation), /ə/ (mid-open: broad variation), /ɜ:/ (mid-open: narrow variation), /e/ (mid-open: narrow variation) can be positioned between the members of the opposition /u:-ɒ/, the phonemes /ɜ:/ (mid-open: narrow variation), /ʌ/ (mid-open: broad variation), /ə/ (mid-open: broad variation), /e/ (mid-open: narrow variation) can be put between the members of the opposition /u:-ɑ:/ according to the heights of the tongue. So, the oppositions /i:-æ/, /u:-ɒ/, /u:-ɑ:/ are the examples of gradual oppositions. In these oppositions a pair of phonemes /i:-æ/ is distinguished as close (narrow variations) – open (broad variation) where mid-open members (/e/ (mid-open: narrow variation), /ɜ:/ (mid-open: narrow variation), /ə/, /ʌ/) are omitted. Likewise the oppositions /u:-ɒ/, /u:-ɑ:/ are based on the close (narrow variation) – open (broad variation) feature according to the heights of the tongue where mid-open members (/ɜ:/, /ʌ/, /ə/, /e/) are omitted.

The oppositions /i:-u:/, /ɪ-ʊ/, /æ-ɑ:/ and /æ-ɒ/ can also be examples of gradual oppositions. Because some phonemes can be placed between the members of these oppositions in accordance with the gradations of their distinctive feature based on the horizontal movement of the tongue. For instance, the phonemes /ɪ/ (front-retracted vowel), /ʊ/ (back-advanced vowel), /ɜ:/ (mixed vowel), /ə/ (mixed vowel) may be positioned between the opposition /i:-u:/ which is based on the distinctive feature front – back whereas the phonemes /ɜ:/ and /ə/ (mixed vowels) can be put between the pair of phoneme /ɪ-ʊ/ which is opposed by the distinctive feature front-retracted – back-advanced. In the same way, the phonemes /ɪ/ (front-retracted vowel), /ɜ:/ (mixed vowel), /ə/ (mixed vowel), /ʌ/ (back-advanced vowel), /ʊ/ (back-advanced vowel) can be placed between the members of the oppositions /æ-ɑ:/ and /æ-ɒ/ according to the horizontal movement of the tongue. The mentioned examples prove that the minimal pairs /i:-u:/, /ɪ-ʊ/, /æ-ɑ:/ and /æ-ɒ/ are also the gradual oppositions.

The phonological opposition is called equipollent if the members of opposition have an incidental – phonologically non-distinctive character in addition to their main distinctive feature. In English, tongue-positions of vowels are inextricably connected with lip-positions. But the lip-position can not be a distinctive feature of vowels because not any minimal pairs based only on it are found in English while the tongue-position is regarded as the distinctive feature because of being able to form a phonological opposition without being accompanied by the feature of lip-position (/æ-ɑ:/). It means that although the oppositions such as /i:-u:/, /ɪ-ʊ/, /æ-ɒ/ are based on both tongue and lip-positions at a time, only the tongue-position is considered to be the main distinctive feature whereas the lip-position is incidental. So, the oppositions /i:-u:/, /ɪ-ʊ/, /æ-ɒ/ are regarded as equipollent by the reason of having an incidental (phonologically non-distinctive) character besides the main distinctive feature.

3. Oppositions are divided into constant and neutralized ones, according to the distinctive force and their occurrence in different positions. The oppositions that keep their distinctive features in any phonetic context are called constant oppositions. Oppositions based on the horizontal and vertical movement of the tongue are considered constant oppositions because they keep their distinctive features in any phonetic context. On the contrary, the oppositions that lose their distinctive features in a particular phonetic context are called neutralized oppositions. In English, the quantitative (long-short) feature of vowels can be neutralized in some phonetic contexts. For example, checked and free vowels in stressed positions are pronounced longer than their unstressed allophones. However, the long vowel /i:/ is pronounced as a half-long /ɪ-/ even in stressed positions when it is surrounded by consonant phonemes /b/, /t/. In this phonetic context the long vowel /i:/ is semi-neutralized because of neighbouring unvoiced consonant /t/. So, the vowel opposition /i:-ɪ/ which serves to differentiate the meaning of the words beat /bi:t/ - bit /bɪt/ is mainly based on qualitative feature in which the quantitative feature is of secondary importance [3, 18].

## CONCLUSION

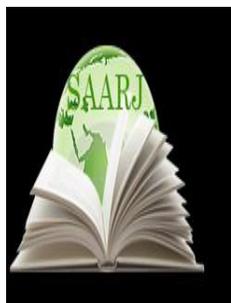

In conclusion, it is necessary to differentiate between simple and complex classification of phonological oppositions of unstressed vowels in English according to the number of criteria for classification. In a simple classification of phonological oppositions, unstressed vowels are classified on the basis of only one criterion, that is to say the number of phonological distinctive features in one opposition. According to the simple classification of phonological oppositions,

English unstressed vowels are classified into a) single opposition, which is distinguished by one distinctive feature; b) double opposition, which is distinguished by two distinctive features; and c) triple opposition, which is distinguished by three distinctive features. In single opposition, unstressed vowels are distinguished by either horizontal or vertical movement of the tongue. In double oppositions, the unstressed vowels are distinguished by both horizontal and vertical movement of the tongue, as well as by either horizontal or vertical movement of the tongue and the quantitative (long-short) feature of vowels in one opposition. In triple oppositions, the unstressed vowels are distinguished by all the three distinctive features of English vowels such as the horizontal movement of the tongue, the vertical movement of the tongue, and the qualitative-quantitative characteristics of vowels in one phonological opposition.

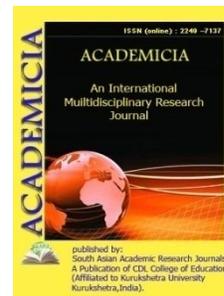

In the complex classification of phonological oppositions, the unstressed vowels are classified on the basis of more than one criterion – the entire system of oppositions, the relationship between the members of the opposition, the distinctive force and their occurrence in different positions. In English, the following types of phonological oppositions of the unstressed vowels are differentiated in their complex classification: unidimensional, pluridimensional, proportional and isolated oppositions according to the entire system of oppositions; private, gradual and equipollent oppositions in relation to the members of opposition; constant and neutralized oppositions in accordance with the distinctive force and their occurrence in different positions. The complex classification of phonological oppositions allows a more in-depth analysis of the distinctive features of unstressed vowels than in a simple classification. So, distinguishing between simple and complex classifications of phonological oppositions of unstressed vowels is important from both theoretical and practical points of view.

### ABSTRACT

*This article discusses the importance of succinic acid and succinate in industry and pharmaceuticals and the order in which they are synthesized. Succinic acid is widely used in the chemical industry as a raw material for the production of important chemicals. Therefore, obtaining succinic acid and its salts from renewable sources is in great demand. Japanese scientists have succeeded in creating such technology. They found that when cyanobacteria are above the ideal temperature, the synthesis of succinic acid in these bacteria becomes more intense. The authors of the work published in Metabolic Engineering used bioengineering methods of metabolic pathways, as a result of which they were able to create the most efficient strain of microorganisms in the world for biosuccinate production and develop technology for its cultivation.*

**KEYWORDS:** *Succinic Acid, Succinic Acid Synthesis, Succinate, D-Metal Succinate*

### INTRODUCTION

The discovery was made under the guidance of Professor Tomohisa Hasunuma (Kobe High School of Technology and Innovation). Scientists have sought to find a reaction that acts as a barrier in the metabolic pathway to convert CO<sub>2</sub> to succinic acid. Subsequently, genetic engineering techniques were used to increase the intensity of this reaction and, accordingly, the production of succinic acid.

The cyanobacteria used in this study (*Synechocystis* sp. PCC 6803) is a favorite model of research worldwide. Japanese scientists have found that the ideal temperature for succinic synthesis by this cyanobacteria is 7 degrees above the temperature at which these cyanobacteria grow optimally. Using dynamic metabolic analysis, they shed light on the mechanism of

succinate formation at high temperatures and showed that phosphoenolpyruvate is involved in the carboxylase (PEPC) enzyme reaction. Using genetic engineering techniques, the group developed a strain of recombinant *Synechocystis*, which has higher PEPC activity than the wild species. By improving PEPC activity and increasing cyanobacteria by 37 degrees Celsius, the scientists were able to increase the rate of succinate synthesis by 7.5 times compared to previous studies. Thus, the production of succinic acid and its salts from renewable sources was achieved biologically.

Succinic acid is produced by electrochemical reduction of maleic acid at the cathode of stainless steel in batch mode in distilled water at a current density of 0.5–1.0 kA / m<sup>2</sup> and a temperature of 50–60 ° C. the product is characterized by crystallization. The result is a product with a melting point of 186-187 °, which meets the requirements of the pharmaceutical industry.

Obtaining succinic acid by oxidation of furfural with hydrogen peroxide (15-30%) in an aqueous medium at atmospheric pressure, without organic solvents and metal catalysts In this process, the use of hydrogen peroxide as an oxidizing agent makes succinic acid synthesis explosive and does not go and is expensive.

Succinic acid is obtained by the reduction of maleic acid in cylindrical rotating lead cathodes at a current density of 2 kA / m<sup>2</sup> in a 5% sulfuric acid solution. Under such conditions, the decline continues with a yield of 95% for the substance and 99% for the flow. Disadvantages of succinic acid electro synthesis include the following.

- the use of sulfuric acid and lead cathode as an electrolyte, which requires additional purification of succinic acid from sulfate ions and lead;
- The process at the rotating cathodes significantly complicates the design of the electrolyzer.

In technical terms, the closest and most effective effect to the proposed method is the electrochemical method of producing succinic acid by reducing maleic acid.

Example 1: 180 ml of distilled water and 32 g of maleic anhydride are placed in a thermostatic vessel and mixed at 50 ° C. Maleic acid, formed as a result of the dissolution of maleic anhydride, is poured into a filter-press electrolyzer for electrochemical reduction. The cathode and anode cavities of the electrolyzer are separated by a cation exchange membrane. A stainless steel plate is used as the cathode, and a lead-silver alloy (1% silver) plate serves as the anode.

200 ml of a 10% sulfuric acid solution is poured into a separate intermediate thermostated vessel and this solution is pumped into the anode area of the electrolyzer.

After allowing the solutions to circulate through the electrode chambers, a constant current with a density of 0.5 kA / m<sup>2</sup> is applied to the electrolyzer at 50 ° C.

In complete conversion of maleic acid, electrolysis is stopped and 214 g of catolite with a concentration of 17% succinic acid is sent to isolation by crystallization. After crystallization and drying, 29.9 g of succinic acid with a melting point of 186-187 are obtained. The yield of succinic acid is 94.5% by substance in the declining phase and 75% by flow.

Example 2 The recovery and separation of the whole product is carried out at a current density of 1.0 kA / m<sup>2</sup> similar to Example 1. In this case, the electrochemical decrease corresponds to 95%

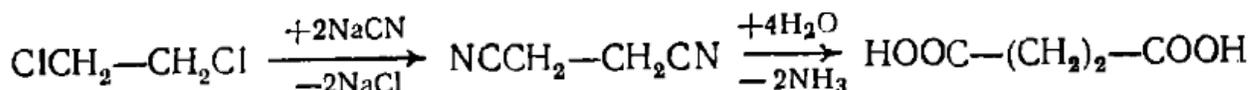

of the succinic acid substance and 70% of the current. The melting point of the product is 186-187.

Example 3 The recovery and whole product separation process is carried out at a current density of 0.7 kA / m<sup>2</sup> and a temperature of 60, as in Example 1. In this case, electrochemical reduction occurs in 95% of the substance in succinic acid and 73% in the stream. The melting point of the product is 186-187.

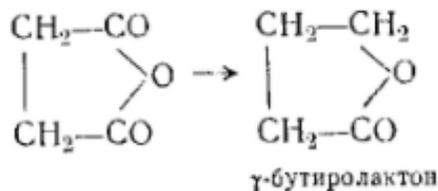

Example 4. The recovery and separation of the whole product was carried out in a manner similar to Example 3 at a temperature of 50 ° C and using maleic acid as the starting compound. In this case, the electrochemical reduction continues with a yield of 95% substance and 75% stream succinic acid. The melting point of succinic acid is 186-187.

Thus, the proposed method for the production of succinic acid ensures a high quality product without additional purification with satisfactory product yield.

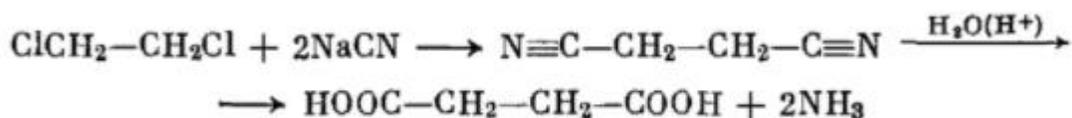

Succinic acid HOOC—(CH<sub>2</sub>)<sub>2</sub>—COOH has previously been encountered as a by-product of the oxidation of paraffins s - g. It can also be obtained from 1,2-dichloroethane via dinitrile

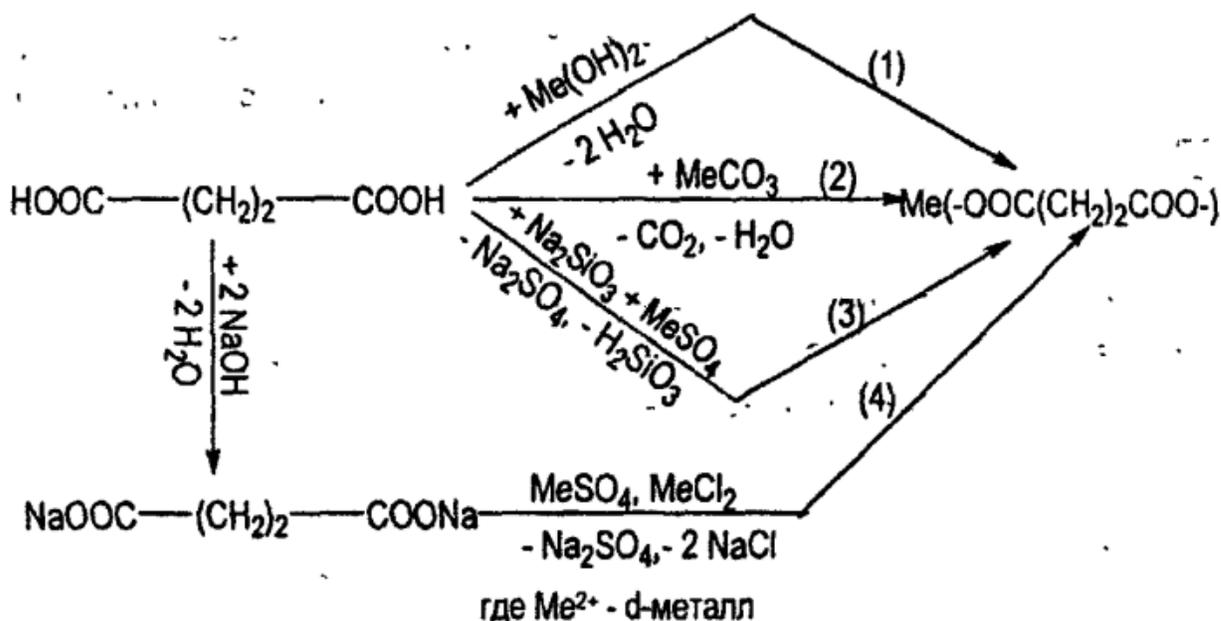

Succinic acid chloride (succinyl chloride) HOOC—(CH<sub>2</sub>)<sub>2</sub>—COCl and succinic acid anhydride are used for various syntheses, for example, succinic anhydride can be reduced to butyrolactone.

Succinic acid can also be obtained by hydrogenation of maleic acid or by synthesis of Conrad by sodium malonic ester.

Salts of succinic acid are called succinate. An analysis of the literature data showed that d-metal succinate is obtained by simultaneous exposure to succinic acid by hydroxides, d-metal carbonates, or sodium silicate and d-metal sulfates, as well as sodium succinate (or ammonium). ) with the inorganic salts of d-metals according to the scheme:

According to the literature, the most commonly used method has been found to be the synthesis of d-metal succinate, an exchange reaction between alkali metal succinate and inorganic d-metal salts. Other methods of synthesis used, such as the reaction of hydroxides of carbonates, oxides, and d-metals with succinic acid, make it impossible to observe the end of the reaction because the starting materials are slightly soluble or completely insoluble in aqueous solutions. Some of these reactions, such as cobalt (II) hydroxide with succinic acid, are very long in terms of time (24 hours).

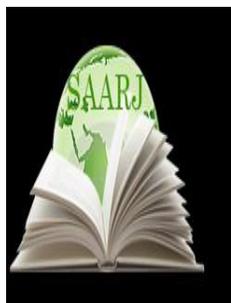

Obtaining salts of higher d-metals than shown in the diagram (4) was the basis of the reaction, because according to the remaining (1,2,3) reactions, mixtures of sparingly soluble hydroxides (1), carbonates (and their hydrolysis products) (2) and the presence of silicic acid (3).

**Method 1.** Sodium succinate was obtained as a substrate. A solution of sodium succinate in water (pH 7.4) is added to the first suspension of iron (II) sulphate at  $85-90^\circ\text{C}$  (pH of ferrous sulphate solution 3.0) in parts in a ratio of 1: 1 and mixed for 30 minutes (pH of reaction mixtures). 6.1). The reaction mixture was cooled, filtered, washed with water, dried, and iron (II) succinate (80%) was obtained in the form of brown crystals. Qualitative reaction with potassium thiocyanate leads to the formation of  $\text{Fe}^{3+}$  ions in the product.

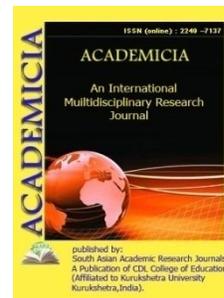

**Method 2.** Succinic acid is obtained as a substrate. An aqueous solution of sodium hydroxide is added to an aqueous solution of succinic acid in a ratio of 1: 2 and heated to a temperature of  $85-90^\circ\text{C}$  (pH of the reaction mixture is 6.44) and ferrous (II) sulfate with vigorous stirring for 20-30 minutes. pH 4.73). The reaction mixture is cooled, filtered, washed with water and dried, iron (II) succinate (90.26% is formed) in the form of yellow crystalline white crystals. Qualitative reaction with potassium thiocyanate does not lead to the formation of  $\text{Fe}^{3+}$  ions.

**INTRODUCTION**

Art is a great resource source of power that leads to the perfection of the human psyche, purifies the heart and soul, develops and beautifies the mind. Therefore, the status of this art is a series that has had its own place in the history of Uzbek art for centuries. As a young performer, the definition of status as an art series made me think deeply. This is because of the fact that art has its own history, just as it has had its own history. Every time we listen to Shoshmaqom, we are proud to be Uzbek. Only when everyone understands and feels this sense of pride can we develop makom art. Below you will find valuable information about our great teacher, honest man, unique voice MahmudjonTadjibayev.

MahmudjonTadjibayev was born in 1957 in the Kuva district of the Fergana region. In 1984 he graduated from the Tashkent Conservatory. He first learned to sing from E.Mamatov, G.Khojikulov, then from O.Otakhonov, O.Alimahsumov, O.Hotamov and F.Mamadaliyev, and learned the secrets of music from T.Alimatov. MahmudjonTadjibayev has been a soloist of the YunusRajabiMaqom ensemble since 1984, and since 2000 he has been working as an associate professor at the State Conservatory of Uzbekistan. In 2000, he was awarded the title of People's Artist of Uzbekistan.

Creator repertoire Shashmaqom ("Saraxbori Navo", "Saraxbori Dugoh", "Mo'g'ulchai Segoh", "Navro'zi Sabo", "Nimcho'poniy and others) and Makom ways of Fergana-Tashkent ("Dugoh", "Chorgoh", "Ushshoq", "Shahnozi Gulyor", "Bayot" va boshqalar), high songs (as "Yovvoyi Chorgoh", "Yolg'iz", "Ey dilbari jononim"), took a seat classic version ("Topmadim", "Asiriy" va "Adoiy", "Chorzarb", "Bozurgoniy"). Also in the creative repertoire of the owner of a wide range of sound, composer of 20 century ("Keldik", "Nazzora qil", K.Jabborov: "Kezarman", F.Toshmatov: "Jonim erursan", M.Murtazoyev: "Dilrabolar", O.Nuriddinov: "Bu oqshom", O.Hotamov and others) have as these poems. As a poetic vocalist, MahmudjonTadjibayev was known for his calm style of performance, lyricism, sound and instrumental balance. The late artist has toured in Asia, America, Europe and North Africa. In 1987, he won the YunusRajabi Republican Competition.

Her son, RuxsoraTadjibayeva, recalls the following about a great teacher with such a unique talent: "The book I saw the most in their hands was Boburnoma. Babur's love for personality and creativity was unique. I've heard it said many times, "When I read Bobur's poems, my heart breaks." Although they were centuries apart, they were close. They even got up early one morning and said that they had seen Babur in their dreams; It's a beautiful garden. There is a table in the middle of the garden. My grandfather ate soup with Hazrat Babur at the same table. They had a wonderful conversation," said RuxsoraTadjibayeva in her memoirs.

Another interesting fact is that M. Tadjibayev was a writer who paid great attention to literature and read ancient words deeply. It is true that art and literature are as close as two wings of a bird, but not everyone understands the secrets of this field. Our late teacher Babur was also associated with the poems of Hazrat Babur. And below, I would like to draw your attention to this puzzle and testify to the mastery of a dead artist, who is not limited by his unique voice.

### **This M. Tadjibayev's poem was designated to Babur's ghazal**

### ABSTRACT

*The use of innovative technologies in the teaching process of all subjects related to mathematics in the world, as well as ensuring the quality of education, the development of creative abilities of students, the practical application of mathematics, various types of problems, including graphic. There is various scientific articles and research on such issues as. The article considers the solution of problems related to the function graphically. This, in turn, is of particular importance in the application of innovative strategies in the teaching of mathematics, in-depth schooling, increasing the activity of students, independent learning, and the widespread application of acquired knowledge in practice. Therefore, the article describes the method for solving graphic problems in the classroom and classroom, the solution to this problem, and is described in detail in the article.*

**KEYWORDS:** *Graphic, Ordinate, Equation, Graphic Method, Matters Coordinate, Parabolic Correct Line.*

### INTRODUCTION

There are many forms and types of extracurricular activities [23], which can be divided into 2 groups:

- 1) extracurricular activities;
- 2) Extracurricular activities.

Extracurricular activities include math classes, math evenings, math week, quizzes, competitions, posters, and working with additional math literature, and more [24].

Increasing the effectiveness of the lesson will reduce the amount of homework to a certain extent [25]. Students have different types of memory, so some of them will not be able to fully master the material during the lesson [1], [2], [3], and [4]. Many of them must read the textbook independently after explaining the teacher's topic and see and memorize its main idea and structure [25], [5], [6], and [7]. Others need teachers to explain and read the text at home to read the text in class and remember its difficulties. Even if the student has mastered the material in class, it is useful to give him homework, not only to revise the text of the topic but also to observe, conduct homework, give assignments for creative assignments [8], [9], and [10].

Extracurricular activities can be organized in the following ways.

I. Individually: reading textbooks, manuals and additional literature, magazines, preparation of abstracts and problem solving, participation in external Olympiads [11], [12], and [13].

II. Public: Mathematics Olympiads, quizzes; mathematician of the decade; parties; newspaper contest. Students' interest in mathematics depends first to all, on the organization of the teaching process [14], [15], and [16]. Simultaneously, well-organized extracurricular activities can significantly increase students' interest in mathematics. Students interested in mathematics do not have enough knowledge of mathematics. Although the teacher uses new pedagogical technologies, handouts, test assignments, competition lessons, operations, visual aids and teaching at the level of modern requirements, it is not enough for students to get a full education [17], and [18].

Students want to learn more about mathematics, to study the work of mathematicians, to solve the problems of entrance tests to higher education, to solve problems, to know how to use mathematical knowledge in life, and to get acquainted with the latest achievements of science [19], and [20].

### **1.1. Individual extracurricular activities.**

Here individual theoretical and practical work is conducted with the student. Some problems in mathematics are studied. During such sessions, the student is given a broader and deeper knowledge. The student prepares for the Olympiads or prepares to enter the university. This helps achieve the intended goal closely and the student loves to read science [21], and [22].

### **1.2. Extracurricular activities in small groups.**

During such training, a special plan is developed and regular work is conducted. The number of students can be 6–8. Group work: a circle of young mathematicians; work on equipping the mathematics room; preparation for the Olympics; group poster publishing; preparation for university entrance exams as a group, etc [30].

### **1.3. Extracurricular activities are conducted in public.**

This type includes parallel classes, school, inter-school scientific conferences and evenings, Olympiads, math's week, film screenings, excursions to a scientific organization or manufacturing enterprise, and so on [31].

The circle is a basic form of extracurricular activities. Among the extracurricular activities, the circle is more effective and important than others with its long duration and versatility. Students participate in the circle voluntarily. Today, several schools and clubs operate in the country.

Measures to further develop mathematics education include "an in-depth study of important and demanding subjects such as mathematics, physics, chemistry, biology, computer science, and foreign languages." In this regard, the teaching of "Fundamentals of Mathematical Analysis," which is an integral part of mathematics, plays an important role in the development of creative approaches to creative activity, the design of teaching processes, and teaching based on advanced educational technologies. Scientists, such as B.Abdullaeva, S.Alikhonov, M.Barakaev, G.Zlotsky, J.Ikramov, M.Tojiev, T.Tulaganov, D.Yunusova, N.Gaybullaev on improving the content and teaching methods of the department of the basics of mathematical analysis of the course of mathematics research, as well as the importance of graphical problems in mathematics. Several textbooks on teaching the basics of mathematical analysis and the organization of lessons were created by T. A. Azlarov, Sh. Alimov, N. Jabborov, N. Dilmurodov, T. J. Juraev, A. Sadullaev, and others. The creation of textbooks in mathematics for schools, academic lyceums, and higher education institutions is relevant as a scientific study of the features and problems of teaching in the field of improving the quality of mathematics education.

In the CIS countries, Y. I.Kolyagin, E. U.Medeyov, V. I.Mishin, V. M.Monakhov, A. G.Mordokovich, M. N.Roganovskaya, R. S.Cherkasov, P. M.Erdnievthe pedagogical and psychological problems of teaching the basics of mathematical analysis in research work, the importance of graphic problems in mathematics in education. Therefore, in schools, lyceums, and universities, circles are critical in solving problematic graphic problems. Extracurricular activities play an important role in improving the quality of education. Students' interest in science depends first to all on the correct organization of the teaching process. Simultaneously, well-organized extracurricular activities can significantly increase students' interest in reading, including mathematics. In the upper grades, the use of graphic methods in solving text problems in extracurricular activities has a special place  $\frac{x-x_1}{x_2-x_1} = \frac{y-y_1}{y_2-y_1}$  we use the formulas. We devise the coordinates of points A, B, and C, D, and devise these equations  $48x + y = 1008$ ,  $72x + y = 1416$  in this way, we can have this system of equations.

## 2. MATERIALS AND METHODS

It consists of teaching the solution of graphic problems by improving the methods for teaching the basics of mathematics and mathematical analysis in general secondary schools, academic lyceums, higher education institutions. An analysis of the current state of teaching the basics of mathematical analysis in academic lyceums [23], [26], and [27]; The teacher teaches the content of the creative approach to the methodological system (purpose, content, form, means, and methods) of teaching the basics of mathematical analysis (the innovative activity of the teacher, the student's independent learning, comprehension, memory, application, and control) [25]. As a methodological aid to high school students, we recommend graphic problems in extracurricular activities in mathematics [24], [28], and [29]. We will explain them by improving the method of their solution.

**2.1.Issue 1.** The first pool has 750 m<sup>3</sup> and the second pool has 840 m<sup>3</sup>. At 6 a.m., he started pumping water from the first pool with a pump of 48 m<sup>3</sup> per hour, and at 8 o'clock he started pumping water from the second pool with a pump of 72 m<sup>3</sup> per hour. What time does the water in the two pools equal? (Solve the problem graphically.)

**Solution:** The extraction of water by both pumps is a smooth process.

Hence, this process can be graphically described as a straight line. If we know that at 6 a.m. there is  $720 \text{ m}^3$  of water in the first pool, then we mark it with the point A  $(x; y) = A(6; 720)$ , knowing that the water in the pool decreases by  $48 \text{ m}^3$  per hour. The second point on the graph can be found, for example, point B  $(x; y) = B(10; 528)$  corresponding to 10 o'clock (Fig. 1).

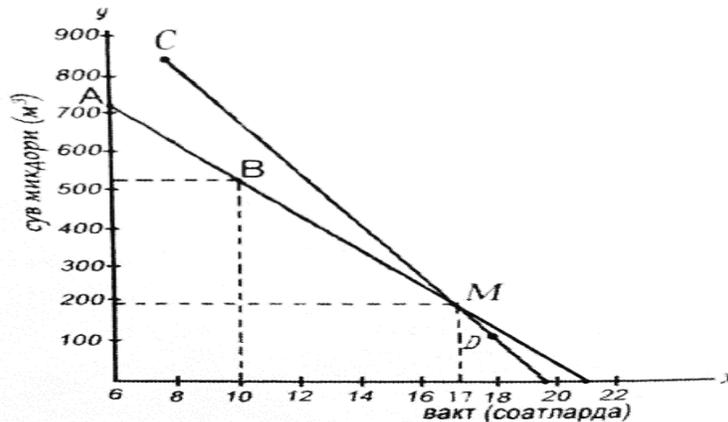

Figure 1 Graph of the relationship between the amount of water in the first and second pools and time

Draw a graph of the relationship between the amount of water in the first pool and time.

From these points, we find the graph we are looking for by drawing a straight line. At 8 a.m., we denote the condition that there is  $840 \text{ m}^3$  of water in the second pool with point C  $(x; y) = S(8; 840)$ , knowing that the water in the pool decreases by  $72 \text{ m}^3$  per hour. The second point of the graph can be found, for example, point D  $(x; y) = D(18; 120)$  corresponding to 18 o'clock. Draw a graph of the relationship between the amount of water in the second pool and time. From these points, we find the graph we are looking for by drawing a straight line. The solution to the problem is the coordinate of the point of intersection of the straight lines AB and CD.

Answer; At 5 p.m., the amount of water in both pools is equal. The point M is the common point of the two graphs  $M(x; y) = M(17; 192)$ .

We will show the complete solution to this problem by the second method for the full mastery of pupils and students.

The equation of the straight-line AB passing through points A  $(6; 720)$  and B  $(10; 528)$  and the straight-line CD passing through points C  $(8; 840)$  and D  $(18; 120)$  in the drawing.

$$\begin{cases} 48x + y = 1008 \\ 72x + y = 1416 \end{cases} \Leftrightarrow \begin{cases} -72x + y = 1416 \\ 48x + y = 1008 \end{cases} \Leftrightarrow 24x = 408 \quad (1)$$

Of which  $x = 17$ . From  $x = 17$ , we find  $72 * 17 + y = 1416$ ,  $y = 192$ :

ANSWER: 17 and 192 are searched.

**2.2.Issue 2.** The object was fired vertically at an initial velocity of  $40 \text{ m/s}$ . How many seconds does the object split at a height of  $60 \text{ m}$ ? (solve the problem graphically).

Solution: From the physics course, if the Havonian resistance is not taken into account, the vertically tilted object is the height  $h$  (in meters) that is thrown after  $t$  seconds.

$$h = v_0t - (gt^2) / 2 \quad (2)$$

can be calculated using the formula, where  $v_0$  is the initial velocity (in m/s), and  $g$  is the free fall velocity at a value of approximately  $10 \text{ m/s}^2$  equal to  $g$  and  $v_0$ ,

$$h(t) \approx -5t^2 + 40t \quad (3)$$

We develop the function (fig. 2).

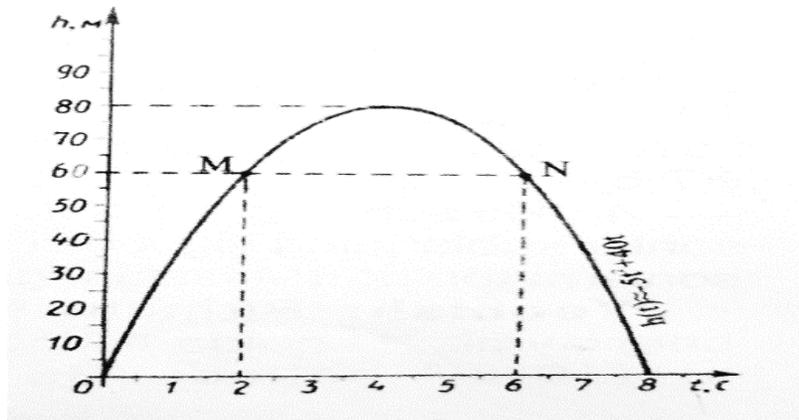

Figure 2  $h(t) \approx -5t^2 + 40t$  Function graph

To draw a graph of a function, we find its zeros and the coordinates for the parabola.  $-5t^2 + 40t = 0$ , henceforth  $t_1 = 0$ ,  $t_2 = 8$ .  $(0; 0)$ , and  $(8; 0)$  we make points.  $t_0 = \frac{t_1 + t_2}{2} = 4$ ,  $h_0 = h(4) = 80$ , and  $(t_0; h_0) = (4; 80)$  we make a point. The end of the graph of this function is at the point  $(4; 80)$ , and the branches passing through the points  $(0; 0)$  and  $(8; 0)$  are downward parabolic. The parabolic shows that an object thrown vertically upwards rises to a height of 80 meters for the first 4 seconds, then begins to descend. The object is twice at a height of 60m from the ground: 2 seconds after the shot and 6 seconds after the shot. So the answer to the question of the problem is as follows: The body will be at a height of 60m after 2 seconds and after 6 seconds. Answer:  $(2; 60)$ ,  $(6; 60)$ .

2.2.1. **Issue 3.** Describe the number 15 as the sum of two numbers so that the product of these numbers is the largest (solve the problem in a graphical view).

Solution; We denote the first number by the letter  $x$ . In that case, the second number is  $15 - x$ , and their product is  $x(15 - x)$ . Let us change the form of this expression:  $X(15 - x) = 15x - x^2 = -x^2 + 15x$

That is the case (Fig. 3. a, b).

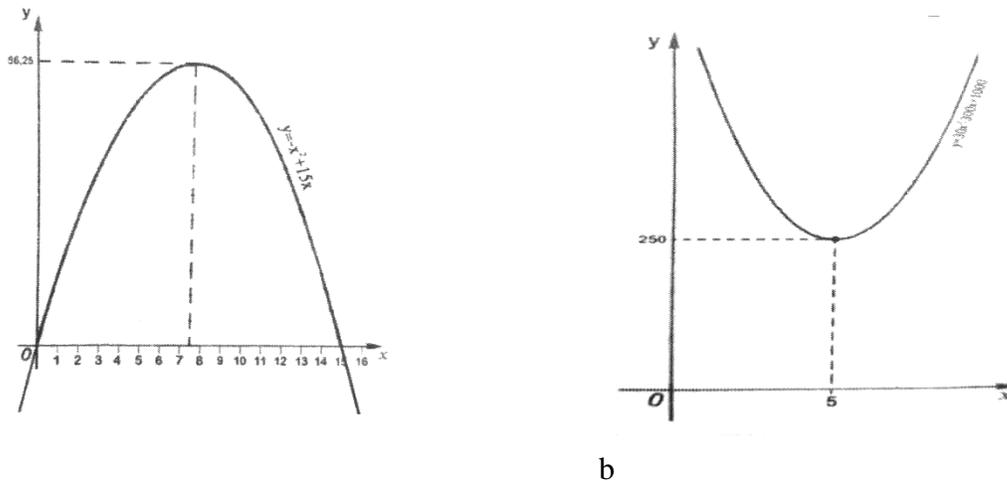

Figure 3  $y = -x^2 + 15x$  function graph (a), and  $y = 30x^2 + 300x + 1000$  Graph of functions (b)

The problem of finding the maximum value of the function  $u = -x^2 + 15x$  is given. To draw a graph of a function, we find its zeros and the coordinates of the parabola.  $-x^2 + 15x = 0$ , where  $x_1 = 0$ ,  $x_2 = 15$ ,  $x_0 = (x_1 + x_2)/2 = 7.5$ ;  $y_0 = y(7.5) = 56.25$ .  $(0;0)$ ,  $(15;0)$ , and  $(7.5;56.25)$  we make points. We pass the parabola through the points made. As can be seen from the graph, a function with  $x = 7.5$  assumes a maximum value of 56.25. So the first number is 7.5 and the second number is  $15 - 7.5 = 7.5$ . The maximum value of the product of these numbers is 56.25, the maximum value  $y(x) = y(7.5) = 56.25$ .

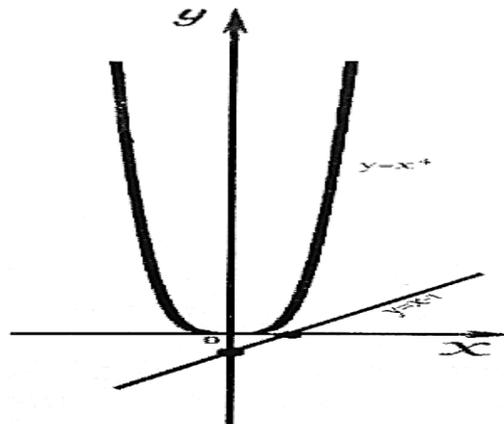

Answer:  $7.5 + 7.5$ .

**2.3.Issue 4.** The distance between the two villages is 12 km. The worker left his village at 9:25 a.m. and reached the second village at 1:15 p.m. The next day he returned to his village. He left at 11 a.m. and arrived at home at 2:40 p.m. How far is the point at which the worker passes at the same time on the way out and back from his village, and at what time does he pass through this point? (solve the problem graphically).

We draw a graph related to the problem.

The point of intersection of two straight lines determines the quantities sought. The drawing shows that the point in question is located 8.4 km from the village and worker passed through this point in 12 h and 06 min. The point N is the point of intersection of the straight lines AV and SD. Answer:  $N(S;t) = N(8.4\text{km}; 12\text{s } 06\text{m})$ . The second way to solve the problem:

$AD = 14\text{h}40\text{min} - 9\text{h}25\text{min} = 5\text{h}15\text{min} = 5.25\text{s}$ ,  $BC = 13\text{h}15\text{min} - 11\text{s} = 2\text{h}15\text{min} = 2.25\text{s}$ . Without drawing  $\Delta ADN \sim \Delta BCN$ ,  $\frac{AD}{BC} = \frac{EN}{NF}$ ,  $\frac{5.25}{2.25} = \frac{x}{12-x}$  in this  $x = 8.4\text{km}$ ,  $y = 11 + m = 11 + 1,1 = 12,1\text{s}$  (Fig. 4).

Figure 4  $y=x^4$ , and  $y=x-1$  Graph of functions

Answer:  $N(S; t) = N(x; u) = N(8.4\text{km}; 12\text{h}06\text{m})$ .

The solution of the problem in the third method: the straight-line AV passing through the points A (0; 9h25min) and V (12km; 13 h 15min) in the drawing and equation of the straight lines SD passing through the points S (12km; 11s) and D (0; 14 h 40min).  $\frac{x-x_1}{x_2-x_1} = \frac{y-y_1}{y_2-y_1}$  using the formula, we construct these equations by placing the coordinates of points A, B and S, D in the formula.

$\frac{23}{6}x - 12y = -113$ ,  $\frac{22}{6}x + 12y = 176$  So we have this system of equations.

$$\begin{cases} \frac{23}{6}x - 12y = -113 \\ \frac{22}{6}x + 12y = 176 \end{cases} \Leftrightarrow \frac{45}{6}x = 63, \text{ henceforth } x=8,4, x=8,4, \text{ and } \frac{23}{6} * 8,4 - 12y = -113;$$

$y=12\frac{1}{10}c$ ,  $y=12\text{h}06\text{min}$  we find that. Answer:  $N(S; t) = N(x; u) = N(8.4\text{km}; 12 \text{ h } 06\text{m})$ .

It was found that the solution to the above problem is to raise the level of teaching the basics of mathematics and mathematical analysis in general secondary schools, academic lyceums, higher education institutions and to teach the solution of graphic problems by improving the methodology of mathematics.

### 3. RESULTS AND DISCUSSIONS

The objective of the topic is to determine the content of the components of the creative approach to the methodical system of teaching (the innovative activity of the teacher, independent learning, comprehension, memory, application, and control of the student and the student) based on dialog between teacher and student, graphics in the classroom and circle problem-solving methodology.

Methods of the topic: In the process of covering the topic, the methods of observation, comparative analysis, experimental testing, modeling, questionnaires, tests, interviews, mathematical and statistical analysis of the results were used.

The scientific novelty of the topic is as follows: the components of the creative approach to the methodological system (purpose, content, form, means, and methods) of teaching the basics of

mathematical analysis (the innovative activity of the teacher, independent learning, comprehension, memory, application, and control) and defined based on expanding the structure of student interaction;

Criteria for logical proof of the theorem and problems (order, membership, application) are determined based on indicators of interdependence (type, essence, classification, feature) of basic concepts in interdisciplinary and educational subjects;

The practical results of the topic are as follows: the current state of teaching the basics of mathematical analysis in general secondary schools, academic lyceums, and schools is analysed, the methodological system of solving these graphical problems is improved based on lesson plans;

Based on the principles and features of improving the methodological system in the teaching of the basics of mathematical analysis using advanced educational technologies, the "Fundamentals of Mathematical Analysis" were explained and recommended for practice through technology of solving graphical problems in the classroom;

The scientific and practical significance of the topic and results. The scientific significance of the results of the topic is explained by the fact that the improved methodological system and lesson plans developed above can be used in teaching the basics of mathematical analysis in the teaching of academic lyceums.

Generally, in the current context, at each stage of education, "what (general content) can be taught and what can be done to achieve this?" and "who should be taught, what exactly should be taught (in each specialty), why should it be taught (goal), how should it be taught (method, form, tool, technology)?" The issue of effective solutions to the problem is one of the important problem.

Nowadays, "what to teach?" rather, "what can be taught and how can it be done?" Apparently, the approach to the organization of the educational process plays a key role in modernizing the teaching of mathematics in academic lyceums.

For example, students should consciously know that geometric formulas are based on mathematical analysis, e.g.

In defining teaching methods, it is recommended to use pedagogical methods, which are divided into three categories, used in the organization of the educational process formed based on DTS based on modern pedagogical technologies.

## CONCLUSION

The first category of methods is called "Traditional methods," which are based on the principle of "delivery" to impart knowledge to students. They include informational-receptive or illustrative-explanatory; reproductive; problematic statement; heuristic or semi-research and study, "narration," "demonstration," "demonstration," "presentation of a report," "question-answer," "debate," and so on.

The second category of methods is called nontraditional or "interactive methods" and is based on the principle of "activation" in the acquisition of knowledge by students. These include "Shatalov's Accelerated Learning Method," "Problem Lesson," "Brainstorming," "Working in Small Groups," "Roundtable," "Cluster Method," "BBB," "6x6," ("3x3," "4x4," "5x5," ...),

“Boomerang,” “Black Box,” “Business Game,” “Role Play,” “Debate,” “Opposite Relationship,” “Intelligent clever,” “Zig-zag,” “Charkhpalak,” “Zinama-Zina,” and many other methods.

The third category of methods is called "Advanced or modern methods" and is based on the principle of "Acceleration and efficiency" of the educational process. These include "Oriented Text," "Programming," the "Technological Map Method," the "Modular Teaching Method," "Intelligence Card" and "Design Method," as well as the "Pedagogical Technology" Method, which combines the advantages of all methods. Explained by the possibility of using an improved methodological system and lesson projects in the creation of a new generation of textbooks. It is required that all science teachers have a sufficient understanding of modern methods and be able to use them correctly and appropriately in the process of pedagogical activity.

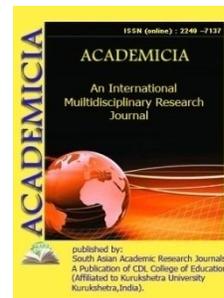

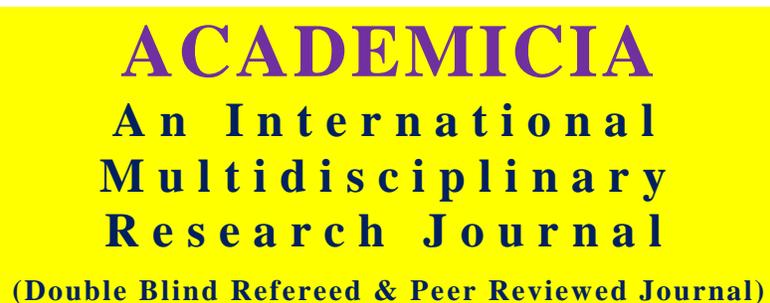

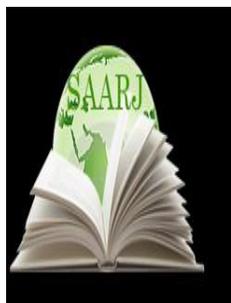

Scientific and methodological recommendations for mastering the basics of mathematical analysis based on the integration of creative approaches of teachers and students based on creative approaches (innovative activities of the teacher, independent learning, comprehension, memory, application, and control) developed.

## INTER-SUBJECT INTEGRATION AND APPLICATION OF TERMS

**Abdurakhmanova Madina Ulugbekovna\***

\*Andijan State Medical Institute,  
UZBEKISTAN

### ABSTRACT

*This article discusses inter-subject integration and the use of terms. And it is also said that to the goal and objectives of this study, the study of the features of the functioning of interdisciplinary terms in various areas of scientific knowledge, the concept of interdisciplinary integration approaches the category of interdisciplinarity.*

**KEYWORDS:** *Interdisciplinary Integration, Interdisciplinarity, Term, Transdisciplinary Level, Complex Interdisciplinarity, Pseudo-Interdisciplinarity, Auxiliary Interdisciplinarity, Complementary Interdisciplinarity.*

### INTRODUCTION

Modern studies of the functioning of the language touch on many aspects, among which one of the most important is the question of lexical composition. The growth of scientific interest is mainly due to the fact that the terminological range of the modern lexical composition is constantly increasing, expanding, completely new realities appear, which are reflected in the language, and modern terminological dictionaries do not have time to reflect all the changes taking place [1].

First of all, it should be noted that, as the analysis of materials reflects, in modern science the concept of interdisciplinary integration is associated mainly with the education system, it is a term that is used in pedagogical science. This concept is understood as “the creation of a new whole on the basis of the identified elements and parts of the same type in several previously different units (academic subjects, types of activities, etc.), and then the adaptation of these elements and parts into a monologue of special quality that did not exist before” [8 ]; “The process of convergence and communication of sciences, which is ... a high form of embodiment of intersubject connections at a qualitatively new level of education” [2].

In other words, at the basis of interdisciplinary integration is the awareness of the need to converge the sciences, teaching, methods of cognition, etc., the formation of a single integral

space. With regard to the purpose and objectives of this study, the study of the features of the functioning of interdisciplinary terms in various fields of scientific knowledge, the concept of interdisciplinary integration approaches the category of interdisciplinarity.

It should be noted that interdisciplinarity is a relatively “young” phenomenon that originated in the 19th century and developed in the last century [5]. If scientists and thinkers of the 19th century emphasized the need for the differentiation of sciences, then at the end of the last century “interdisciplinary synthesis became not a game of the mind, but an urgent need. Unfortunately, the "physicists" and "lyricists" separately did not pass the exam in the twentieth century. In the next century it will have to be taken together ”[4].

At its core, interdisciplinarity acts as a concept in opposition to the concept of a discipline - a field of scientific knowledge, the institutional boundaries of which are determined by the needs of study, the specifics of funding, administration and professional development [3]. These boundaries may change over time.

Individual disciplines, areas of scientific knowledge differ significantly. According to Squires, the differences boil down to the following aspects [9]:

- 1) the object of research: content, topics, problems that are being studied;
- 2) the position of science in relation to the object of research: methods, techniques, procedures that are used in the study process;
- 3) philosophical or reflective nature of research.

A slightly different approach to identifying differences between disciplines is presented in the works of Heckhausen, which identifies seven distinctive parameters [11]:

- 1) "material field" — a set of research objects;
- 2) the subject of research: the point of view from which the discipline looks at the material field;
- 3) the level of theoretical integration: a categorical apparatus that is used to describe the results of research e that is, directly the terms that are used in the field of science;
- 4) research methods that are used, firstly, to obtain observations, results for further study, and secondly, in the process of transforming the observed data;
- 5) analytical tools of science based on logical laws, mathematical reasoning and building models;
- 6) the possibility of practical application of scientific results;
- 7) additional disciplinary "historical" circumstances that affect the formation of the field of scientific activity.

As these approaches reflect, scientific disciplines can differ significantly in their goals, object and subject of research, opportunities for practical application, can use various techniques, methods of study, etc. The fact of their constant development, changes in each separate area of scientific activity remains unchanged: disciplines are not a static whole, showing a constant character in time and space. They are changeable in space, subject to recombinations in time ”[13]. This variability of individual sciences, their variability, transitions into each other allows individual researchers to say that the category of discipline is becoming artificial, that today science is breaking up into a postdisciplinary world [10].

Awareness of this variability, the variability of individual disciplines, the need to overcome the crisis of the postdisciplinary scientific world led to the formation of an interdisciplinary approach aimed at integrating certain areas of scientific knowledge, "smoothing" the differences identified earlier in order to derive qualitatively new scientific knowledge.

In modern scientific literature, interdisciplinarity is understood as "a collective term that unites all forms of scientific cooperation, leading to the violation of the institutional boundaries of individual disciplines, areas of scientific knowledge" [3]; "The process of integration of a number of (two or more) sciences, accompanied by diffusion (overflow) and unification of the various approaches, theories, methods of analysis existing in each of them" [14] and, of course, terms.

The result of such a synthesis, merger is "the emergence of a new, conceptually formed (with a specific name), area of knowledge, which some experts call the" interdisciplinary area of knowledge "(MOH)" [6]. The main task of interdisciplinarity, interdisciplinary integration is to strengthen the relationship between disciplines, weaken the separation of scientific fields, identify gaps in knowledge of each individual discipline, create a new field for the derivation of knowledge, as well as test research methods that are used in each separate scientific field.

Interdisciplinarity is not universal; it can be of a different nature, pursue different goals. Heckhausen identifies the following types of interdisciplinarity [11]:

- 1) disorderly interdisciplinarity, which consists in the disorderly use of knowledge, terms, methods of various sciences;
- 2) pseudo-interdisciplinarity arises when separate disciplines are engaged in the study of the same topics, use the same methods, often duplicating each other, but at the same time they argue that this is — a synthesis of two independent areas of scientific knowledge;
- 3) auxiliary interdisciplinarity: this type of interdisciplinary integration can be said in a situation when research methods of one science become a source of knowledge for another field of science in the absence of close theoretical integration;
- 4) complex interdisciplinarity is manifested in the synthesis of two or more areas of scientific knowledge, which in the study of the same problems will use different methods, supplementing, specifying, specifying the results obtained;
- 5) additional interdisciplinarity arises when the subjects of study of different fields in different sciences coincide, the intersection concerns the theoretical integration of disciplines;
- 6) combined interdisciplinarity is carried out when different areas of scientific knowledge agree on the subject, levels of theoretical integration and methods of cognition that will be used in the learning process.

As you can see, in modern foreign literature there are several types of intersubject integration. Within the framework of this dissertation research, of particular interest is complex, additional and combined interdisciplinarity, which imply the functioning and use of intersectoral terms.

Scientists also focus on the heterogeneous, differentiated nature of interdisciplinary integration, which makes it possible, following VA Nekhamkin, to single out several levels in its structure —

“units of the vertical structure of interdisciplinary knowledge, fixing the degree of its generality and the boundaries of prevalence in scientific knowledge” [5 ]:

1) intra-sphere interdisciplinarity: as a rule, interdisciplinarity, the tendency of various fields of scientific knowledge to integrate is formed initially at the disciplinary level. Intrasphere interdisciplinarity presupposes the synthesis of sciences of one sphere of knowledge: humanitarian or natural. The proximity of the fields of scientific knowledge determines the trend towards integration. The result of such a synthesis is the emergence of such sciences as physical chemistry, chemical physics, psycholinguistics, historical psychology, etc. The result of the synthesis of such sciences is the erosion of the narrowly limited framework of the traditional areas of scientific knowledge, the formation of qualitatively new ideas about the object and subject of research. For example, as noted by VM Rozin, “a sociologist now cannot conceive of society without resorting to cultural studies and communication theory” [7].

2) inter-sphere interdisciplinarity reflects the integration of sciences, the spheres of the cognitive cycle, the integration of natural and human sciences, which results in the emergence of such areas of scientific knowledge as biopolitics, sociobiology. The first attempts to derive scientific knowledge at the junction of natural and humanitarian sciences were undertaken back in the 19th century, when, for example, the model of a "social organism" appeared, which was used to study society. As we can see, in terms of terminology, it is not so much the transfer of terms from one area of scientific knowledge to another that is noted, but the derivation of new terminological units based on the synthesis of terms of both sciences. In general, it is important to note that already at this level of interdisciplinary integration, the development of terminology, a "common language" becomes a serious problem;

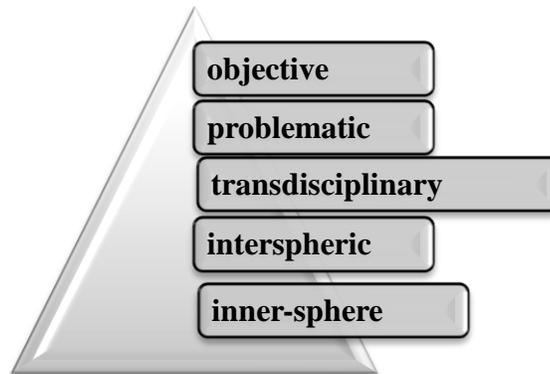

3) the transdisciplinary level, at which the extrapolation of cognitive models into natural, humanitarian, technical, etc. sciences in general is carried out. At this level, the problem of developing a common language, developing and testing the categorical apparatus is aggravated;

4) the problem level of interdisciplinarity, at which the solution of a certain practical problem becomes the point of integration of various sciences, areas of practical activity. As an example of the formation of a new field of scientific knowledge at this level, we can cite globalistics, founded by representatives of the Club of Rome to solve specific problems related to global problems and globalization processes. Scientific knowledge at this level of interdisciplinarity has a pronounced practice-oriented character, integrates both scientists and a complex of various sciences.

The main problem is the need to develop a theoretical and methodological foundation, to develop a universal methodology;

5) the object level of interdisciplinarity, at which the formation of new areas of scientific knowledge is set by the very object of research in various sciences. Such disciplines include cratology, futurology, propetology, etc.

In a graphical form, the structure of interdisciplinarity as a phenomenon of scientific knowledge can be presented in Fig. 4:

**Figure 4. Levels of interdisciplinarity of scientific knowledge**

Today, each of the levels of interdisciplinarity is going through different stages of its historical development. The most developed is the inner-sphere level, which originated in the 19th century. The object level of interdisciplinarity was formed only at the end of the last century, today it is in a state of its intensive development.

At each level of development of interdisciplinarity, certain problems arise with the development of a terminological apparatus. The most developed direction of interdisciplinarity of cognition, areas of scientific knowledge is the inner-sphere, which is characterized by an intensification of the processes of implicit transterminologization, in which the meanings of terminological units are synonymous, but not identical.

Starting from the inter-sphere level, the problem of developing a common terminology becomes a significant problem, which only gets worse as the manifestations of interdisciplinarity become more complex. As an example of inconsistency in the understanding of intersectoral terms, differences in scientific languages of representatives of different scientific fields, we can cite the results of an experiment conducted by Bracken and Oughton in 2006 [3]

Physicists and sociologists took part in experimental work aimed at developing interdisciplinary terminology as a basis for the implementation of interdisciplinary research. Accordingly, we are talking about interdisciplinary interdisciplinarity, work at the junction of natural and humanitarian knowledge. Scientists were invited to visit the river Esk. When visiting, physicists described in detail the physical processes that occur in the reservoir, the research carried out, research methods and tools. Based on the materials of the speech, sociologists began to ask questions that were far from what the physicists wanted to say. Despite the fact that sociologists understood the logic of the described processes, the latter were associated with the field of physical science, which did not allow them to explain these processes in the logic of any sociological concept, theory, as a result of which confusion arose both among physicists and among sociologists ... Accordingly, we can conclude that even at the level of inter-sphere interdisciplinarity, the development of a unified approach to the terminological apparatus faces significant difficulties.

Despite the fact that sociologists understood the logic of the described processes, the latter were associated with the field of physical science, which did not allow them to explain these processes in the logic of any sociological concept, theory, as a result of which confusion arose both among physicists and among sociologists ... Accordingly, we can conclude that already at the level of

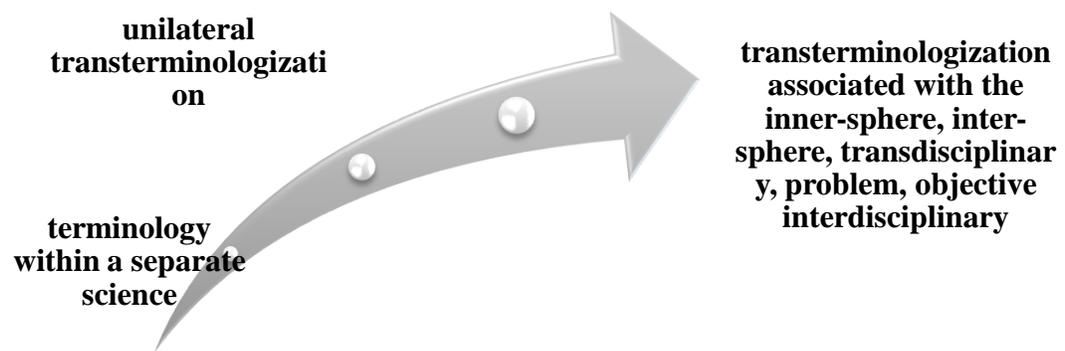

inter-sphere interdisciplinarity, the development of a unified approach to the terminological apparatus faces significant difficulties.

Consequently, today an obvious contradiction is formed between the development of interdisciplinarity, the proclamation of a course to expand the boundaries of certain areas of scientific knowledge and the impossibility of implementing an interdisciplinary approach to research, the study of certain objects, processes of socio-cultural reality largely due to the lack of a "common language", the discrepancy of special languages, conceptual apparatus of representatives of various scientific communities.

As a rule, the formation of the scientific terminology of certain sciences is the result of a long evolution [15], in the process of which the conceptual apparatus of science is developed, the meaning is coordinated between scientists who use a lexical unit. However, as the level of interdisciplinarity increases, an almost complete reworking of the categorical apparatus is carried out. Moreover, the terminological substantiation of related, interdisciplinary areas of scientific knowledge largely depends on the stage of development of the level of interdisciplinarity. Xu et al. in their study, the following stages of the formation of the terminological apparatus are distinguished, depending on the degree of development of interdisciplinarity [12]:

- 1) The latent period, when the formation of terminology is carried out within the framework of one discipline, the tendencies for integration are at the stage of their initiation, formation. At this stage, the terminology of the concepts of a separate area of scientific knowledge or practical activity is carried out;
- 2) Embryonic phase — at this stage, the number of publications, works devoted to the study of certain objects, processes increases, knowledge of one area of scientific knowledge, fixed in terminological units, begins to penetrate into other areas of scientific knowledge, the initial stages of transterminologization are carried out, at which other areas of scientific knowledge or practice are beginning to borrow terms from another area. In other words, at the initial stages, transterminologization is predominantly one-sided. Interdisciplinarity is slowly developing, terminological units are being transferred from traditional theoretical sciences to applied ones;
- 3) Mature phase — at this stage, the number of works performed in various fields of scientific knowledge increases, the terms of one science begin to be used in others, new meanings of terminological units are formed.

Accordingly, in a graphical form, the periodization of the development of terminological systems in the logic of interdisciplinarity can be represented in Fig. 5:

**Figure 5. Stages of development of terminological systems in the logic of interdisciplinarity**

As you can see, in the process of development of terminological systems under the influence of interdisciplinarity, they go a rather long way, starting from the stage of terminology, the formation of terms for conceptualizing scientific knowledge within a separate field of scientific knowledge, to the period of functioning of the terminological polysemant in various sciences.

It is important to add that the results of the study by Xu et al. did not reveal the presence of a direct correlation between an increase in the number of scientific works and an increase in the use of certain borrowed terminological units in other areas of scientific knowledge [12]. In other words, the basis of the process of transterminologization is not an increase in the number of works, but other factors, presumably, the significance of the term, its correspondence to the essence of the designated scientific concept, which suggests that the process of metaphorical rethinking lies at the basis of transterminologization.

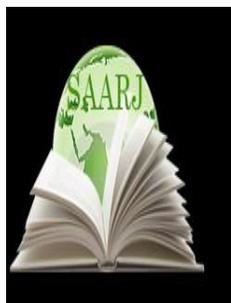

Thus, on the basis of the analysis carried out, it can be concluded that today interdisciplinary integration, interdiscipline as a phenomenon that involves the synthesis of several sciences in order to solve the most complex, significant, urgent problems based on the implementation of various approaches to research, the use of various methods study, which will allow to overcome the one-sidedness of certain areas of scientific knowledge, will ensure the complexity of a comprehensive study of the object. In turn, the formation of interdisciplinarity is carried out at several levels: inner-sphere, inter-sphere, transdisciplinary, problematic and objective. Strengthening the interdisciplinarity of all levels actualizes the problem of developing a theoretical and methodological apparatus for new areas of science. Unfortunately, the development of a unified terminology at all these levels is one of the most significant problems of our time, which remains unresolved to this day.

If the study of terminology in the case of intrasphere interdisciplinary integration seems possible when studying denotations that representatives of various fields of scientific knowledge put into the concept, there are significant differences in the understanding of terminological units already at the interspheric level. The situation is aggravated by the fact that the formation of terminology is carried out in stages, at the initial stage, the process of terminology is carried out, the formation of scientific concepts within the framework of a separate field of scientific knowledge, and only then the term begins to be borrowed by other sciences, and the reasons and mechanisms for which one term is borrowed, and the other remains highly specialized, remain not fully studied, understandable at the present stage of terminology.

### ABSTRACT

*One of the necessary drugs for the treatment of diabetic dyslipidemia affecting lipid metabolism is hydroxycis-methylglutaryl-coenzyme A-reductase inhibitors (statins) [2] and ezetimibe, which blocks the absorption of cholesterol in the epithelium of the small intestine, thereby preventing erythematic enterohepatic circulation of cholesterol [2,4]. Their effectiveness in correcting atherogenic dyslipidemia (DLP) and preventing macroangiopathies has been studied in patients with diabetes mellitus (DM). The aim of this study was to study the lipid-lowering efficacy of the combination therapy of rosuvastatin with ezithymibe in patients with type 2 diabetes mellitus*

**KEYWORDS:** *Diabetes Mellitus (DM), Lipid-Lowering Therapy, Rosuvastatin, Ezetimibe, Total Cholesterol (TC), Low Dencity Lipoproteins (LDL), High Dencity Lipoproteins (HDL).*

### INTRODUCTION

Diabetes mellitus (DM) is a chronic progressive disease that has taken over in 21st century a truly pandemic spread. According to the latest data, the number of patients with diabetes in the world has more than doubled over the past 10 years, and by the end of 2017 exceeded 425 million people. According to the forecasts of the International Diabetes Federation, 629 million people will suffer from diabetes by 2045 [ 1 ]. The prevalence of cardiovascular diseases (CVD) among patients with type 2 diabetes is 2–4 times higher than people without diabetes, they are the cause of death in more than 65% of patients [ 2,3,5,6 ]. The most dangerous consequences of diabetes are its systemic vascular complications - nephropathy, retinopathy, damage to the main vessels of the heart, brain, arteries of the lower extremities. These complications are the main cause of disability and mortality in patients with diabetes. The high prevalence of CVD among patients with type 2 diabetes is due to a cluster of risk factors for atherosclerosis, which are based on insulin resistance, dyslipidemia, arterial hypertension, increased activity of the blood coagulation system, visceral obesity and hyperglycemia [ 7,8 ]. However, at present, not

everyone agrees that hyperglycemia has a decisive importance in the development of atherosclerosis in patients with type 2 diabetes [ 2,9 ]. The British prospective diabetes study (UKPDS) showed that the compensation of carbohydrate metabolism reduces the risk of microvascular complications without significantly affecting the macrovascular complications in patients with type 2 diabetes. At the same time, this and other studies clearly demonstrated the relationship between the level of total cholesterol (TC) and low density lipoproteins (LDL) cholesterol and the risk of developing macrovascular complications both in the general population and in patients with type 2 diabetes [ 10,12,13,14 ]. Analysis of results of a multicenter randomized, placebo-controlled studies enrolled patients with type 2 diabetes, suggests a positive effect of the application of lipid-lowering therapy using the of inhibitors HMG CoA - reductase both as primary and secondary prevention of cardiovascular disease in these patients [ 14 ]. At the moment there is evidence that anti-atherogenic properties of HMG inhibitors CoA - reductase caused not only by their effect on the lipid profile. The pleiotropic antiatherogenic effects of some representatives of this class of drugs are described that do not depend on the main mechanism of their action, in particular, the effect on atherosclerotic inflammation [4,5,6]. However assignment of HMG CoA - reductase inhibitors in clinical practice for correction of the lipid metabolism in patients with diabetes type 2 remains extremely rare [4]. Rosuvastatin is the most effective statin currently available. However, patients with coronary artery disease may not achieve targets on monotherapy [10,14]. The study compares the efficacy of rosuvastatin monotherapy with rosuvastatin and ezetimibe combination therapy.

**The aim** of this work was to assess the efficacy and safety of Rosulip plus 10/10 mg in patients with diabetic dyslipidemia .

## MATERIALS AND METHODS

We screened 35 patients with type 2 diabetes with confirmed dyslipidemia ( $LDL \geq 2,6$  mmol/l and triglyceride  $\geq 1,7$  mmol/l) II A type (by Fredrickson), treated in the department of endocrinology clinic 3-TMA . Among them, 12 are men and 23 are women. The duration of the disease ranged from 1 to 10 years, the average age was  $56.6 \pm 9.8$  years. Patients with severe concomitant diseases and micro- and macrovascular complications were not included in the study. Also, apparently 10 healthy individuals were examined, 53.5% of this group suffered from ischemic heart disease, 88.4% - arterial hypertension.

Most of the patients received aspirin, B-blockers and angiotensin - converting enzyme inhibitors. All patients were overweight - their body mass index (BMI) exceeded  $25 \text{ kg} / \text{m}^2$ . Overweight was diagnosed in 11 (31.4%) patients, obesity in 24 (68.6%) patients ( $BMI \geq 30 \text{ kg} / \text{m}^2$ ). The average waist circumference was  $105.1 \pm 2.0$  cm for men,  $108.3 \pm 3.0$  cm for women. The majority of patients 19 (48.5%) received sulfonylurea and metformin as hypoglycemic agents, 12 (34.2%) - iDPP4, 7 (20.0%) received insulin in combination with metformin . Considering that all patients were diagnosed with decompensation of the disease, the hypoglycemic therapy was corrected, so 60% of patients were transferred to insulin therapy.

All patients underwent general clinical examination. Fasting and postprandial glycemia was studied using the glucose-oxidase method. The study of glycated hemoglobin (HbA1c) was carried out according to the Fluchiger method . Lipid metabolism indices were determined by the enzymatic method using a set of reagents from the company "Human" (Germany) on the

analyzer "Randox" (Great Britain). The data obtained were processed on a computer using the statistical software package "Statistika-6".

In terms of age and duration of the disease, patients in both groups did not differ from each other. Patients complained on increased blood pressure, dry mouth, thirst, frequent urination, recurrent pain in the heart, headaches, and excess weight.

### Results of own research

So, according to the data of carbohydrate metabolism, all patients have an increase in fasting and postprandial glycemia and HbA1c, which are increased by 41.0, 43.2 and 43.5%, which indicates diabetes decompensation.

**TAB. 1BIOCHEMICAL PARAMETERS OF BLOOD IN PATIENTS WITH TYPE 2 DIABETES BEFORE TREATMENT**

Index	Control n - 10	Before treatment n- 35
Fasting glycemia, mmol / l	4.2 ± 0 . 48	7.1 ± 0.37 *
Postprandial glycemia, mmol / l	5.8 ± 0.67	10.2 ± 0.33 *
HbA 1 c ,%	4.5 ± 0.5	7.9 ± 1.0 *
TC, mg / dl	3.7 ± 1.0	6.6 ± 1.2 *
LDL, mg / dl	1.85 ± 0.04	3.15 ± 0.09 *
HDL, mg / dl	1.53 ± 0.03	1.21 ± 0.05
TG, mg / dl	1.11 ± 0.03	3.93 ± 0.09 *
Atherogenic coefficient	2.02 ± 0 ,09	4.71 ± 0.25 **
ALT	0.30 ± 0 02	0.30 ± 0 02
AST	0.18 ± 0 01	0.18 ± 0 01

Note: n is the number of examined patients;

\* - presence of reliability (  $P < 0.05$  ), \*\* (  $P < 0.01$  )

By analyzing the lipid spectrum in patients with type 2 diabetes, was observed hyperlipoproteinemia- a significant increase in lipid metabolism as compared with the control group.

At the same time, the content of TC in the blood was 34.0% (  $P < 0.05$  ) higher than in the control group, LDL increased by 37.5%, TG by 40.6% (  $P < 0.01$  ). The content of HDL cholesterol was 60.2% (  $P < 0.05$  ) lower in the main group than in the control group (Table 1). The obtained results of an increase in atherogeniclipoproteins such as LDL, TG and a decrease in the level of antiatherogenic fraction - HDL in patients with type 2 diabetes, coincided with the data described in the literature [ 12 ] .

The distribution of patients with type 2 diabetes depending on BMI revealed that the level of LDL cholesterol was 16.8% higher in the group of patients with a BMI > 30 in comparison with overweight, and the level of HDL cholesterol in the same group was 26% (  $P < 0.05$  ) lower than in the studied group (table 1 . 2 ). The TG level was 29.0% higher (  $P < 0.05$  ), it was reflected on the atherogenic coefficient which was 24% higher (  $P < 0.05$  ). Thus, the results showed that with

an increase in the patient's body weight, the lipid profile worsens, which is reflected in the development of micro- and macrovascular complications of diabetes [ 9 ].

**TABLE L . 2 CLINICAL CHARACTERISTICS OF PATIENTS AND BIOCHEMICAL PARAMETERS IN PATIENTS WITH TYPE 2 DIABETES, DEPENDING ON BMI**

Indicators	control n-10	BMI < 30, n- 11	BMI> 30, n- 24
Age, years	54.9 ± 8.9	55.9 ± 7.6	54.7 ± 8.3
Duration of the disease, years	-	6.9 ± 4.8	7.5 ± 3.9
Fasting glycemia, mmol / l	4.2 ± 0.48	7.7 ± 1.9 *	7.5 ± 2.0 *
Postprandial glycemia, mmol / l	5.8 ± 0.67	11.2 ± 3.9 *	12.9 ± 4.1 *
HbA1c ,%	4.5 ± 0.5	7.8 ± 2.1 *	8.3 ± 2.4 *
TC, mmol / l	3.7 ± 1.0	6.1 ± 1.2 *	6.3 ± 1.7 *
LDL, mmol / l	1.85 ± 0.04	3.18 ± 0.09 *	3.45 ± 0.07 *
HDL, mmol / l	1.53 ± 0.03	1.2 ± 0.05	0.81 ± 0.08 *, **
TG, mmol / l	1.11 ± 0.03	3.2 ± 0.4 *	4.5 ± 0.9 *, **
Atherogenic coefficient	2.02 ± 0.09	4.0 ± 0.7	4.68 ± 0.79 *, **

Note: n is the number of examined patients;

□ □ the presence of reliability in relation to control ( P < 0.05)

\*\* - the presence of reliability in relation to the group with BMI <30 ( P < 0.05)

The distribution of patients with type 2 diabetes by the duration of the disease showed that LDL cholesterol, depending on the duration of the disease, was increased in relation to the control group, but these indicators did not differ among themselves. Triglycerides in the group with duration of the disease from 6 to 10 years were increased by 28.2% ( P < 0.05) compared with the group under 3 years and by 22.5% ( P < 0.05) compared with the group 3-6 years. This is confirmed by the literature data, which describes the deterioration of the lipid spectrum with a predominant increase in triglycerides in the lipid spectrum of blood compared to total cholesterol in diabetic dyslipidemia [ 5 ]. The level of HDL cholesterol was 36.0% ( P < 0.05) lower in the group of patients aged 6-10 years compared to 3 years of illness. This is reflected in the atherogenic index, while the AI in the first group was increased by 60.0%, in the second by 65.4% and in the third - 65.3%, respectively (Table 3).

**TAB. 3 CLINICAL CHARACTERISTICS OF PATIENTS AND BIOCHEMICAL PARAMETERS IN PATIENTS WITH TYPE 2 DIABETES, DEPENDING ON DURATION OF THE DISEASE**

Indicators	control n-10	Up to 3 years old, n-10	3- 6 years , n-14	6-10 years old n-11
Age	54.9 ± 8.9	52.9 ± 4.1	56.4 ± 5.9	54.7 ± 8.2
Duration of the disease	-	1.9 ± 1.5	4.9 ± 1.8	8.4 ± 2.8
Fasting glycemia, mmol / l	4.2 ± 0.48	6.9 ± 1.33	7.1 ± 1.37	6.8 ± 1.27
Postprandial glycemia, mmol / l	5.8 ± 0.67	11.8 ± 3.3	9.9 ± 3.7	13.0 ± 3.1 *
HbA 1 c ,%	4.5 ± 0.5	8.5 ± 2.4 *	7.9 ± 1.9 *	8.3 ± 2.7 *
TC, mmol / l	3.7 ± 1.0	6.3 ± 1.7 *	6.0 ± 1.5 *	6.6 ± 1.1 *, **

LDL cholesterol, mmol / l	1.85 ± 0.04	3.0 ± 0.3 *	3.4 ± 0.3 *	3.2 ± 0.5 *
HDL cholesterol, mmol / l	1.53 ± 0.05	1.4 ± 0.06	1.2 ± 0.05	0.90 ± 0.07 *, **
TG, mmol / l	1.11 ± 0.03	3.4 ± 0.9 *	3.7 ± 0.4 *	4.7 ± 0.9 *
Atherogenic coefficient	2.02 ± 0.09	3.5 ± 0.9	4.0 ± 0.5	4.0 ± 0.6

Note: n is the number of examined patients;

□ □ availability of reliability ( P < 0.05)

Thus, a relationship was revealed between the content of lipid metabolism indicators with indicators of carbohydrate metabolism, the duration of the disease and BMI. This probably indicates a connection between the atherogenesis process and the patient's body weight. The obtained results coincided with the data described in the literature [ 7 ].

Assessment of the cardiovascular risk category (CVR) is extremely important for the development of optimal patient management and the appointment of adequate therapy that can maintain an optimal level of LDL cholesterol. In accordance with the provision of agreed recommendations ESC / EASD diabetes, pre-diabetes and cardiovascular disease ( CVD ), adopted in 2019 , it should be considered that the patients with diabetes allow to a group of high and very high risk of CV-complications, the patients with diabetes and whether one risk factor of CV disease or damage to target organs should be considered as a very high risk group, and all other patients with diabetes - as a high risk group [ 9 ]. Achieving the target level of LDL cholesterol below 2.5 mmol / L (for patients with high CVR ), and even more so below 1.8 mmol / L, is a rather difficult task, which dictates the need to use the most effective statins in high doses. The use of rosuvastatin at a dose of 20 mg led to a 34% decrease in LDL cholesterol levels, while the risk of CV events decreased by 23%, and the difference with the group of patients receiving placebo was statistically reliable[ 9 ].

With insufficient effectiveness of statins in achieving the target level of LDL cholesterol in patients with type 2 diabetes, it is possible to use combination therapy: adding to statin therapy the ezetimibe . The latest belongs to the class of cholesterol absorption inhibitors. The mechanism of action of ezetimibe is that it prevents the absorption of cholesterol at the level of the villous epithelium of the small intestine. In connection with a decrease in the intake of bile acids and food cholesterol from the intestine into the liver, the uptake of cholesterol by hepatic cells from the blood serum increases, due to which its content in the blood decreases [ 11 ].

In this regard, for the treatment of patients with type 2 diabetes, along with hypoglycemic and complex therapy, patients were divided into 2 groups: group 1 - 17 patients, rosuvastatin was added to the treatment complex at a dose of 10 mg / day , group 2, these are 18 patients , they added a combination of rosuvastatin and ezetimibe ( Rosucard plus 10/10). The patients took a lipid - lowering drug, 1 tablet per day in the evening for 3 months. Dose adjustments were made in a month and 3 months until the target blood lipid level was reached .

The safety of therapy was assessed by the number and type of registered undesirable side effects, as well as by identifying clinically significant changes in blood biochemical parameters: an increase in the level of hepatic transaminases by 3 times or more. After a month and 3 months, 32 ( 91.6 %) patients were re-examined , the remaining 3 ( 8.4 %), due to various personal reasons, did not appear for a second examination.

During the study, there were no cases of exacerbation of angina attacks, an increase in blood pressure, changes in heart rate, a significant decrease in body weight and BMI.

On the background of the therapy with Rosuvastatin and Rosuvastatin with ezetimibe, after a month, were not revealed significant changes in the lipid spectrum were revealed. Also, there were no changes in the liver enzymes in the blood. In connection with this, the patients were encouraged to continue Lipidlowering therapy.

During treatment, positive changes in carbohydrate metabolism were observed in both groups. Thus, HbA 1 c in groups 1 and 2 decreased by 17 and 19%, respectively.

The results showed that in groups 1 and 2 there were positive changes in carbohydrate and lipid metabolism. In group 1, there was a decrease in TC by 19.8%, LDL by 16.0%, and TG by 23.1% (  $P < 0.05$ ) (Table 4 ). The concentration of HDL in the blood did not show significant changes. However, there was a tendency to its increase by 15.2%. This all reflects on atherogenic index , which was reduced by 32% (  $P < 0.05$ ).

In group 2, TC was reduced by 22% (  $P < 0.05$ ), LDL by 23%, triglycerides by 49% compared to the indicators on admission and by 32% in relation to group 1 (  $P < 0.05$ ). It is known that the target values of LDL should be below 2.5 mmol / L, at which the risk of cardiovascular diseases developing reduces by 2 times [ 9 ].

HDL cholesterol increased by 15% in relation to the indicators at admission and by 23% in relation to group 1 (  $P < 0.05$ ). The atherogenic index decreased by 60 and 44%, respectively, and by 32% in relation to group 1 (  $P < 0.05$ ), which indicates a decrease in total cholesterol and an increase in the amount of "good" lipids of HDL cholesterol.

**TABLE 4 BLOOD BIOCHEMICAL PARAMETERS IN PATIENTS WITH TYPE 2 DIABETES ON THE BACKGROUND OF COMPLEX THERAPY WITH THE INCLUSION OF LIPID-LOWERING THERAPY**

Index	Before treatment n- 35	1st group n- 16	2nd group n-1 6
Fasting glycemia, mmol / l	7.1 ± 0.37	6.4 ± 0.73	6.2 ± 0.23
Postprandial glycemia, mmol / l	10.2 ± 3.33	9.3 ± 2.5 *	8.09 ± 0.1 *
HbA 1 c , %	7.9 ± 1.0	7 , 3 ± 0.54 *	7.2 ± 0.8 *
TC, mg / dl	6.6 ± 1.2	5.8 ± 1.2	5.2 ± 0.9 *
LDL, mg / dl	3.15 ± 0.09	2.98 ± 0.09 *	2.48 ± 0.04 *, **
HDL, mg / dl	1.21 ± 0.05	1.47 ± 0.09 *	1.84 ± 0.07 *
TG, mg / dl	3.93 ± 0.09	2.9 ± 0.23	2.05 ± 0.04 *, **
Atherogenic coefficient	4.71 ± 0.25	3.2 ± 0.19 *	1.89 ± 0.11 *, **
ALT	0.30 ± 0.02	0.31 ± 0.0 7	0.30 ± 0.02
AST	0.18 ± 0.01	0.26 ± 0.0 6	0.22 ± 0.01

Note: n is the number of examined patients;

□ □ the presence of reliability (  $P < 0.05$ ) in relation to the group upon admission

□ □ \* the presence of reliability (  $P < 0.05$ ) in relation to group 1

Blood biochemical parameters - AST, ALT did not change significantly.

In group 2, where patients took rosuvostatin with ezetimibe, a decrease in LDL levels was found during the observation period ( $p < 0.05$ ). The average level of LDL at the beginning of the study was  $3.15 \pm 0.09$  mmol / l, at the end -  $2.48 \pm 0.04$  ( $p < 0.05$ ). During the period of treatment with Rosucard plus, out of 16 examined patients, 10 (62.5%) reached the target LDL level by the end of the term, the rest of the patients were recommended to increase the dose of the drug to 20/10 mg / day. During the period of treatment with Rosuvastatin, out of 16 examined patients, 7 (43.7%) reached the target LDL level by the end of the period, the rest of the patients were also recommended to increase the dose of the drug to 20 mg / day.

Thus, the ability to reach the target level of LDL in the short term for the treatment of combined drug P ozukard plus, its safety and tolerability, as well as a favorable ratio of "cost / benefit" can be recommended as one of the drugs of choice among lipidlowering drugs.

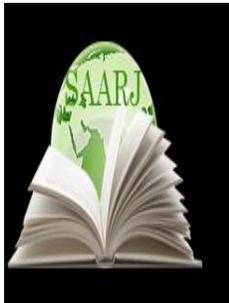

### CONCLUSIONS:

1. A study of lipid metabolism in patients with type 2 diabetes revealed a significant increase in total cholesterol, triglycerides and atherogenic fractions of lipoproteins - LDL by 34.0, 40.6 and 37.5%, and the content of anti-atherogenic lipoprotein fractions - HDL by 60, 2% was lower compared to the control group.
2. Was revealed relationship between the content of lipoproteins of various classes with the duration of the disease and BMI of patients.
3. The combination therapy of rosuvostatin and ezetimibe 10/10 mg is an effective drug for the treatment of diabetic dyslipidemia, with a decrease in TC by 22%, T - by 32%, LDL by 49% and an increase in HDL by 23% compared to the group with rosuvastatin monotherapy. where the lipid spectrum indicators also improved, but not significantly.
4. Good tolerance of the combined drug, favorable cost / effectiveness ratio allows Rosulip plus 10/10 mg to be recommended as one of the drugs of choice in the treatment of diabetic dyslipidemia.

## LEXEMALISM AS A DIACHRONIC EVENT

**Bakhtiyor Kholmukhamedov\***

\*PhD, Senior Lecturer,  
 Samarkand State University,  
 UZBEKISTAN

---

### ABSTRACT

*This article discusses the fact that the phenomenon of lexemeization is one of the main factors in the enrichment of the Uzbek language, the use of lexemation as a diachronic phenomenon. In the Uzbek language, historical words are involved in the process of lexemes, from which new words are formed and mean independent meanings in the later stages of development.*

**KEYWORDS:** *Uzbek Language, Diachronic, Lexemes, Affixoid, Affix, Speech Process, Linguistic Processes, Historical Development.*

---

### INTRODUCTION

Every change and renewal in the language has its own historical basis - the period of emergence, the style of origin. In this sense, the phenomenon of lexemeization also existed in the earlier stages of development of the Uzbek language. In other words, the occurrence of the phenomenon of lexemeization cannot be studied in isolation from the processes of historical development of language. The fact that several units used in the modern Uzbek language in the form of a single word have become a single word is also related to the continuous use of syntactic structures, which are their materials, at different stages or stages of language development. Of course, it is more difficult to restore the previous form of each lexemeled word, to give it a clear description on this basis, but it is possible to give some linguistic insights into the syntactic structures coming to the status of a word. These processes are discussed below.

It is known that words such as *room, obod* in the Uzbek language took part in the lexicalization process and included *printing, library, observatory, tavern, embassy, prison*; words such as *elobod, manzilabad, musulmonobod, Khalkabad, Nurabad, Hamzaabad, Zafarabad, Mirabad* were made. However, in the further development of the Uzbek language, it is observed that the words became more active in the process of word formation, the process of shifting to the affix rather than their independent meaning, and they began to be called affixoid.

Indeed, in connections such as *printing, library, observatory, customs, embassy, enterprise, temple, toilet, dormitory, pharmacy*, the word **room** did not participate in an independent sense. It is lexemed together with the word before it, meaning a particular organization, institution, address in general. If these words are translated into Russian, it is even more noticeable: *printing house – типография, library – библиотека, observatory – обсерватория, customs – таможня, embassy – посольства, business – предприятие, temple – церковь, toilet – туалет, bedroom – общежитие, pharmacy – аптека*.

Here is a translation of other words made in the same pattern: *bakery – пекарня, teahouse – чайная, dovecote – голубятня, lobby – приемная, corral – коровник, greenhouse – цветник, workshop – мастерская, hospital – больница, vigilance – втрезвитель* and others. In the second case, the room unit becomes more affixed. If the word *hotel* is used differently in Russian as *гостиница* and *гостиня*, and in one of these two cases *it means a reception office, a place where guests live*, in the other *a place where guests are housed in a house or a place where guests rest / sleep*. Therefore, it is difficult to say that the combination of word components such as *cattle, pig, sheep, chicken, calf, barn or beverage, toilet, living room* is involved in the process of lexeming. Only the fact that the first component of these words, as noted above, is in a metonymic state can ease the problem. On the contrary, we can say that the words *gamkhona, khayolkhana, khilkhona, eskhona* are the product of a lexeme phenomenon in the true sense.

But we cannot equate room and well-being affixes with affixes such as *-oy, -gul, -jon, -toy, -boy, -bibi, -xon, -bonu, -poshsha, -beka, -niso*. Because the latter are involved not only in the process of word formation, but also in the formation of subjective forms of evaluation, and therefore do not participate in the process of lexemation [7.117-138].

Lexicalization has existed in the Uzbek language since ancient times, and it has regularly contributed to the enrichment of our language. In the ancient Turkic language, there is a word *kayin*, which means "wife's relatives (relative to her husband)". Mahmud Kashgari specifically noted that the word *kayin*, which is not used independently in the Uzbek language, was formed by replacing the consonant *z* in the original word *kazyn* [Devon, I, 383] with the consonant [2.68]. The word *kazyn* is associated with the word *katun*, which means "woman" [Devon, I, 388]. L.A. Pokrovskaya, who specifically studied the terms of kinship in Turkic languages, notes that in some Turkic languages the word *kayin* means only "wife's relatives", and "husband's relatives" also came later [3.71]. The combination of this word with the words *sister, mother, older sister, brother, cousin* was the basis for the emergence of new lexemes for husband and wife, which mean each other's relatives. Their appearance in the modern Uzbek literary language is as follows: *father-in-law, mother-in-law, sister-in-law, brother-in-law*. These words have become a word in modern Uzbek, and the first part of them, as noted above, is not used alone.

The following examples also prove that it is a historical process for word combinations to undergo a lexeme event and become a single lexeme over time: *alchak = al + chak*. According to the "Short etymological dictionary of the Uzbek language", the first part of this word **al** is historically found in Turkic languages: used in the sense of 1) "cunning", 2) "soft-natured", "gentle", "subtle", "weak", 3) "low", "lower part". The second part, **chak**, was also an independent word that originally meant "dimensional, small". Currently, only the first meaning of the Uzbek language is unique [2.7-8]. Even some of the words *buyunturuk, buysun* are not used independently today. "A *buyunturuk* is a hammer that is attached to the neck of a working

animal". *The yoke of the bull was worn out.* This word is said to be made by adding the suffix *-turuk* to the noun of *buyun*. Originally, the word was formed by combining the compound neck stem into a word (the stem horse is made from the verb type stem with the suffix *-uk*); *boyun + turuk = boyunturuk*. In the Uzbek language, the vowel *u* in the second syllable is replaced by the vowel *i*: *boyunturuk > boyinturuk*.

*Buysun - "obey". Some employees disobeyed the instructions of the head of the department.* The word originated in the Old Turkic language as a result of the combination of the word *boyunsu* into one word; after being combined into a word, the *un* part of the word *boyun* is no longer pronounced: *boyinsu- > boysu*; finally, the identity ratio maker was added: *boyun + n = boysun-*. In the ancient Turkic language, the verb *sum* means "give", so the *boyunsu-* originally means "obey" and figuratively means "obey" "[2.37].

Dictionaries also contain words that occur only in the units of lexemes, but which are not used separately: such as *donabay* (with pieces), *ishbay* (depending on the case), *kunbay* (daily), *yilbay* (depending on the year), *soatbay* (depending on the time). These examples are taken from parts 2, 3, 4 of the "Short etymological dictionary of the Uzbek language" by Sh.Rakhmatullaev, M.Kadyrov (Tashkent, 1998-1999): *single* (part 2, page 21), *printed* (part 2, page 21), *boots* (part 2, page. 28), *silence* (part 2, page. 56), *windmill* (part 2, page 73), *far away* (part 3, page. 44), *slate* (part 4, page. 67), *the frog* (part 4, page 123) and etc.

However, the same understanding of the reasons why the second part of these words is not observed in the modern Uzbek literary language, mainly in isolation, is incorrect. For example, the *bay* lexeme in the words *donabay*, *ishbay*, *kunbay*, *yilbay*, *soatbay* means "agreement between both parties in trade and employment"..... It is the second component of a compound word and indicates how it is connected. [6.141] This was the case in the lexeme *bay*, *to make bay*, *bay money* can be used independently in the composition of compounds, but such a situation is almost non-existent in modern Uzbek speech. It was replaced by the word *contract*. Hence, the reason why this lexeme does not occur in an independent form is due to its low use in speech.

The fact that the second part of the lexeme *single* is not used separately can also be explained in a certain sense for the same reason. However, there are other reasons for this. "This word is a form of the singular form formed by the addition of the suffix *-akay* to a *bar* compound consisting of the word *bar*, which originally means a *number* and means *times*, and now the grammatical suffixes in it are inseparable: [(*bir bar*)+*akay*]+*i+ga*= *birbarakayiga*; then the consonant *b* at the beginning of the second syllable is replaced by the vowel *a*: *birbarakayiga > birvarakayiga*".

The reason why the two parts of the word *bosvoldi* are inseparable is due to the phenomenon of shortening in the Uzbek language. This lexeme was originally formed as a result of the conversion and lexemization of the compound verb "conquest" and had a completely new meaning - a type of melon. The formation of the headless lexeme is related to colloquial speech. According to the "Uzbek Explanatory Dictionary", the word is formed by combining the thumb with one word. The preposition is involved with the meaning of 'first'; it was a multi-step sound change during the formation of the compound word: first the consonant *b* at the beginning of the word *finger* is replaced by the consonant *m*, then the consonant *m* at the beginning of the second syllable is replaced by the consonant *d*, then the consonant *r* is replaced by the consonant *l*: *bash barmaq > bashmardaq > bashmaldaq*. [2.28] The fact that the word *finger* in the Uzbek

language has taken the form of *maldak*, which is incomprehensible in the speech process, naturally made it impossible to use it alone. The meaning of the word is known only when it is approached from the point of view of etymology and pronunciation of the Uzbek language.

In addition, in the modern Uzbek literary language there are *yelvizak*, *frog*, and the fact that the second and first components of the same words used in the same way are not used alone is a metaphor, and the fact that the first and second components of the words *far away* and *slag* are not used separately is due to the fact that they have undergone various phonetic phenomena in pronunciation and are historical. But the words *what should I do*, *why is that*, *where*, *which side*, which are similar in form to these words, cannot be confused. Because they are not units that have undergone the phenomenon of lexemes.

In language, such phenomena are observed that both components of a lexemed word cannot be used independently. For example: Let's take the word *jimjiloq*, which means "the smallest finger" = *jim* + *jiloq*. This can be explained in terms of what event. "This noun is made up of the ancient Turkic word **chim**, which means "minimum amount", and *choluk*, which means "small hand": *chim* + *choluk* = *chimcholuk*; later, under the influence of the word *lame*, which means "without one hand," the word was pronounced in the form of a sparrow, and then the vowel *o* in the second syllable was changed to the vowel *y* and the vowel *a* in turn to the vowel *i*: *chimcholaq* > *chimchalaq* > *chimchilaq*. Finally the consonants *ch* are replaced by the consonants *j*: *chimchilaq* > *jimjiloq* [2.56-57].

Not only phrases but also sentences are lexemed. Take the word *beshikkerti*, for example. "This joint is formed by combining the word back of the noun is cradle into one word; **-di** is written according to the pronunciation of the sound *t* in the tense: *beshikkertdi* > *beshikkerti*" [2.19]. The words *beshiktervatar*, *beshkotarar*, which are subject to lexicalization, are actually formed by adding the adjective **-ar** suffix to the words *beshik tebrat*, *besh kotar*.

In this regard, it is important to cite the following views of A. Gulyamov: "One of the types of construction that is very close to word formation is lexical-syntactic generation. In this case, the emergence of a new word is in the nature of a phrase, some sentences, the elements in it are completely merged to form a whole. For example, *while* (actually: having and cutting), *self-aware* (self-aware) - *selfishness*, anyway (all - noun, one - verb). Apparently, such construction is also related to phraseology, and new word formation occurs as a result of the lexemation of phrases and sentences. Both affixation and conversion can be involved in making it this way. For example, *the mother was overjoyed to hear that the boy was returning from the field*. (In such "integration" the affix *-lik*: *-lig* + *üs* is often used) [5.25].

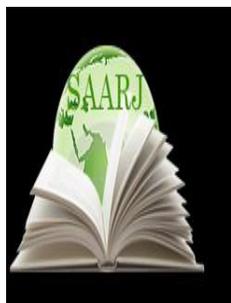

Renowned linguist Otto Espersen had a number of problems in general linguistics, focusing on the interrelationship of logical and grammatical categories, and also on the lexemeization of an entire sentence. The peculiarity of these sentences (units in the form of proverbs, proverbs) is that they are not re-created in the process of speech, but are introduced into speech as a ready-made unit [1]. Many Uzbek proverbs and phraseological units are examples of this. Here are some examples: *The blind find the blind in the dark. The tag of patience is gold. Hunger and hunger have nothing to do with it. If he grows bigger than his mullah, he will set fire to his tent. Do not dust before the herd. The king's love fell on the frog. Like a fall on a donkey.*

Thus, the phenomenon of lexemeization is one of the main factors in the enrichment of the Uzbek language, which leads to semantic-methodological shifts in the meaning of words; the

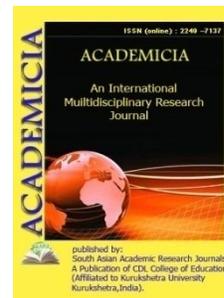

participation of such units in different syntactic encircles leads to the expression of different meanings in different situations. The closeness between things-events, concepts expands the scope of use of words, which are their expression, and, consequently, the scope of meaning. The fact that their use in later meanings is becoming more common in the language leads to the full assimilation of this second meaning by language users.

### INTRODUCTION

In recent years, measures have been taken in the country to promote physical culture and sports, promote a healthy lifestyle, create the necessary conditions for physical rehabilitation of people with disabilities and ensure the country's worthy participation in international sports arenas. Measures are being taken in our country to promote physical culture and sports, create the necessary conditions and infrastructure to promote a healthy lifestyle, especially among young people, to ensure the country's worthy participation in international sports arenas. The Laws of the Republic of Uzbekistan "On Science and Scientific Activity" <sup>1</sup> and "On Education" <sup>2</sup> provide instructions in this regard. At the same time, it is necessary to implement specific programs to promote public health in physical culture and sports, attract young people to sports and select

talented athletes, form national teams with skilled athletes who provide high results in sports, and additional conditions for coaches. There is a need to create conditions. Consistent measures are being taken in our country to promote physical culture and sports, create the necessary conditions and infrastructure to promote a healthy lifestyle, especially among young people, to<sup>3</sup> ensure the country's worthy participation in international sports arenas. The World Health Organization also defines overweight and obesity as “abnormal or excessive fat storage that can lead to health problems”.<sup>3</sup>This also indicates that the topic is dedicated to a very important issue.

## **MATERIALS**

There are also a number of systemic problems and shortcomings in the organization of physical culture and sports, which hinder the effective implementation of state policy in this area and the full use of the country's existing sports potential. In the training of mature personnel, it is important to study their body composition in order to select them in advance, to what extent they are suitable for the chosen sport and in what sport they will achieve good results physiologically. Also, if we follow the research of foreign experts, it was noted that children who do sports are more physically active in adulthood than children who do not do sports in childhood.<sup>4</sup> Although sports are popular among children, there is evidence that activity decreases, especially during adolescence. It is also more common among girls than boys.<sup>5</sup> There are two main health-related frameworks for focusing on physical activity (PA)<sup>6</sup> in adolescents and young adults<sup>4</sup>: first, strengthening physical health and well-being at these stages of life; the second is to promote physical activity to improve future health by increasing the likelihood of being active for a lifetime.

## **Methods**

The structure of the human body is systematically poorly studied in our Republic. Our goal is to determine the amount of fat in the body by studying the body composition of young people, on the basis of which they select and direct to sports. So far, there are the following methods of studying body composition. Currently, body composition is carried out in a five-level model.

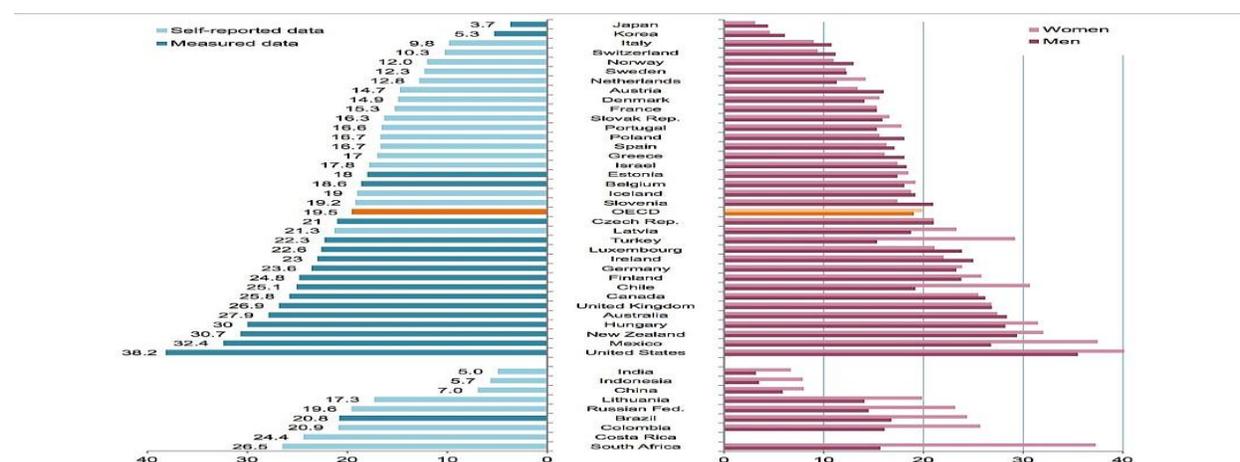

1. The study of the elements in the body.
2. Study of molecular levels in body composition.
3. Study in the cells of the body.
4. Study of body tissues.

### **5. Study of body composition throughout the body.**

The study of body composition in the whole organism is studied in the following ways: anthropometry, study of natural radioactivity of body composition, computed tomography, magnet resonance tomography, spectopy, bioimpedance analysis<sup>7</sup> <sup>4</sup>method, calipometry, hydrostatic densitometry, three-dimensional scanning of the body, blood enzyme, isotopes absorbiometry, neutron activation analysis is applied. Of these, we used calipometry to study the amount of fat in girls 'bodies.

The human body should contain 10-15% fat. Foods contain 50-100 g of fat, and fats are converted into various fatty acids in the digestive tract. Glycerin is rapidly absorbed in them due to their solubility in water. The rest of the breakdown products are absorbed in combination with

bile acids. In the cell, glycerin selectively combines with the fat-forming substances found in the human body to form fat. Freshly synthesized fats accumulate in the large and small fat sacs in the abdomen and around the kidneys, as well as under the human skin, without entering the liver through the lymphatic vessels. Accumulated fat goes into the bloodstream to the liver, where it is hydrolyzed, activated in the presence of Atf and used as an energy material after complex changes. If these processes do not occur completely, the fat enters the body in 3 places in the abdominal cavity and passes to the liver, heart and other organs. various diseases begin to develop. The most dangerous of these are diabetes, nerve and liver diseases. Documents prepared by the United Nations World Health Organization clearly show that one in two people on earth is obese. Most of the Semigans are in the United States, Mexico, New Zealand, and Hungary, while the least are in Japan and South Korea. Below are the materials from that report. On the left, there are diagrams for%, and on the right, for every 100 people. The figure shows that 38.2% in the United States are obese, 32.4% in Mexico, 3.7% in Japan and 5.3% in Korea.

*Women-hungry red*

*Men - dark red*

**Figure 1. The obesity rate of the world's population.**

To achieve this goal, the existing methods for determining the amount of fat in the human body are tested and tested in models that meet the requirements, in order to determine the amount of fat in the human body and compare it with foreign work done in the field.

Results

**TABLE 1. ACCORDING TO EXPERIMENTS, THE AMOUNT OF FAT IN THE BODY OF ATHLETES IN DIFFERENT DISCIPLINES IS AS FOLLOWS<sup>8,5</sup>**

Types of sport	<i>Fat Tissue</i>		<i>Muscle Tissue</i>		<i>Bone Tissue</i>	
	kg	%	kg	%	kg	%
football	7,57±1,7	10,25±2,02	37,5±2,4	50,7±2,4	11,6±1,1	15,8±0,9
<i>Hammer throwing</i>	22,2±6,4	19,6±5,5	54,8±5,05	49,4±2,22	14,6±1,3	13,2±1,5
<i>Short-distance running</i>	6,5±1,4	9,81±2,15	32,7±2,5	49,6±3,4	10,6±0,8	16,12±1,75
<i>Long-distance</i>	6,5±1,5	10,1±1,94	30,0±3,2	49,96±2,0	9,5±1,10	14,96±1,29

<i>running</i>						
Hockey	9,47±2,8	11,3±3,3	43,3±3,6	52,14±2,0	12,7±0,7	15,27±1,21
Volleyball	9,41±1,9	10,5±1,8	45,8±3,6	51,15±1,9	13,7±1,5	15,2±1,43
Баскетбол <i>Basketball</i>	12,9±2,4	13,7±2,5	47,3±6,9	49,3±2,4	16,4±3,1	17,2±1,4
<i>Water polo</i>	13,2±2,2	14,8±2,2	44,1±2,7	49,9±2,3	14,13±0,9	15,7±0,7
<i>Mountain slope</i>	19,9±2,6	13,7±3,5	35,4±4,6	48,7±2,5	12,01±1,4	16,5±1,02
<i>Skating</i>	9,2±2,3	12,01±2,5	38,6±3,7	50,5±2,6	11,8±1,3	15,4±0,7
<i>Gymnastics</i>	5,3±0,16	9,2±0,1	31,3±0,5	49,7±0,3	9,4±0,4	14,9±0,3
<i>Wrestling (up to 63 kg)</i>	5,8±0,16	9,2±0,1	31,3±0,5	49,7±0,3	9,4±0,4	14,9±0,3
<i>Wrestling (heavyweight)</i>	19,4±8,7	16,21±5,8	59,9±2,1	50,8±1,3	16,98±2,0	14,4±0,5
<i>Swimming (100 m)</i>	8,2±1,7	10,7±1,7	40,5±3,0	54±0,1	14,5±1,2	22±1,6
<i>Swimming (100 m)</i>	6,4±0,8	8±0,5	33,4±3,0	51,4±0,4	12±2,6	20,6±1,6

To determine the fat in the human body, it is necessary to measure the skin-skin layers of the skin. To do this, the left hand is measured in mm by pulling the skin to 1 cm with two paws. On the chest - on the large pectoral muscle (not measured in women), taken from the shoulders and back, elbows thick, 5 cm from the right side of the abdomen to the navel, from the thighs while sitting on a chair, from the back to the right side of the shoulder blade, from the right side of the hip bone. The results obtained in all dimensions should be divided by 2. The obtained measurements are calculated by the following formula:

$D = Sdk$ , where: S is the body surface area, square meter, d is the sum of all measurements

K - cons. 1.3

For girls,  $d = (d1 + d2 + d3 + d4 + d6 + d7) / 2.7$

For guys  $d = (d1 + d2 + d3 + d4 + d5 + d6 + d7 + d8) / 2.6$

Since body level depends on weight and height, we use Boyda formulas. The table below shows the height and weight of the girls who participated in the experiments.

**TABLE 2. HEIGHT AND WEIGHT OF STUDENT GIRLS**

№	Last name, first name and surname	Height cm	Weight, kg

## CONCLUSION

Following the experiments, we can conclude that the experimental anthropometric measurements were conducted in a group of girls studying in the field of Physical Culture at the Faculty of Physical Culture of Fergana State University. The anthropometric measurements to determine the amount of fat, fat-free substances and water in the body of girls were analyzed by selecting and applying specially selected mathematical and statistical formulas. The mean parameters of the 15 girls who participated in the experiments are given below.

*Height - 163.8 cm*

*Weight - 54.8 kg*

*The body surface - 2,110 square meters*

*The amount of fat in the body is 9,876 kg*

*The layer of fat under the skin is 0.272 kg*

*Fat-free substances in the body - 39.74kg*

*The amount of water in the body of girls is 33,972 liters.*

The arithmetic mean values of the materials from all experiments and observations were recorded accordingly in the tables. According to statistics, the average amount of body fat in girls is 5.414%. This was achieved as a result of their years of involvement in sports and exercise, which prevented them from becoming obese. These girls rank high in the world in terms of obesity in the ranking of obesity.

The study of fat, fat-free substances and water in the body of the student girls allowed to draw the following conclusions.

1. The amount of fat in the body of student girls depends on their height. As they grow taller, the amount of fat in their body increases.

$$X = 8.72, y = 164 \quad S^2_x = 8.38 \quad S^2_y = 5.74$$

$$r = 0.72 \quad t_{st} = -78.9 \quad P = 0.001 \quad t_{kp} = 1.94.$$

1. **The amount of fat in the body of student girls is more dependent on their weight.**

$$X = 8.72, Y = 164, S^2_x = 0.83 \quad S^2_y = 4.92$$

$$r = 0.92 \quad t_{st} = -29.9 \quad P = 0.004 \quad t_{kp} = 2.44$$

2. **The total amount of fat in the body of girls has a direct effect on the amount of fat under their skin. The reduction of the total amount of fat in the body of girls leads to a decrease in the amount of fat under the skin:**

$$X = 9.8, Y = 0.22, S^2_x = 9.8, S^2_y = 0.0017, \quad r = 0.75 \quad t_{st} = 29.9, P = 0.008, t_{kp} = 1.85$$

3. **Girls' body level also affects the amount of fat in their body. The larger the body level, the more fat there is in the body.**

$$X = 10.18, Y = 0.206 \quad S^2_x = 0.83 \quad S^2_y = 0.07$$

$$r = 0.92 \quad t_{st} = 28.2 \quad P = 0.06 \quad t_{kp} = 1.94$$

4. **The increase in body weight of girls leads to an increase in body water:**

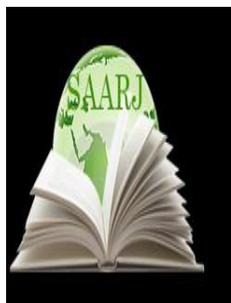

$$X = 9.58, Y = 33.8, S^2_x = 0.53 \quad S^2_y = 6.11$$

$$r = 0.85 \quad t_{st} = -35.9 \quad P = 0.001, t_{kp} = 1.89$$

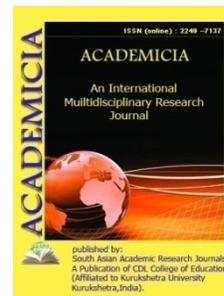

Domestic and international studies show that there is a correlation between bodybuilding performance and physical performance of athletes.

### ABSTRACT

*The article describes the specifics of producing raw velvet fabric on a modern Somet Thema Super Excel machine. The basic technological parameters of the loom were adopted and a sample of vilvet fabric was produced. Cotton yarns were used as body and back yarns*

**KEYWORDS:** *Tanda, Arkak, Arkakwool, Decorative, Ornamental, Cotton, Silk, Man-Made Fiber, Weaving, Ground Arqaq, Milk, Raw Velvet, Avrli.*

### INTRODUCTION

Backed woolen fabrics are commonly referred to in the vernacular as velvet and are used as consumables: shirts, suits, decorative (ornamental, beautiful) items.

People living in Central Asia have used velvet fabrics made of natural yarns as shirts, suits, jackets, coats, blankets for young and old, as well as various items for use in wedding decorations. These fabrics have been widely used as clothing with a unique charm, especially in autumn and winter. Cotton, silk and man-made yarns were also used for the body and back yarns.

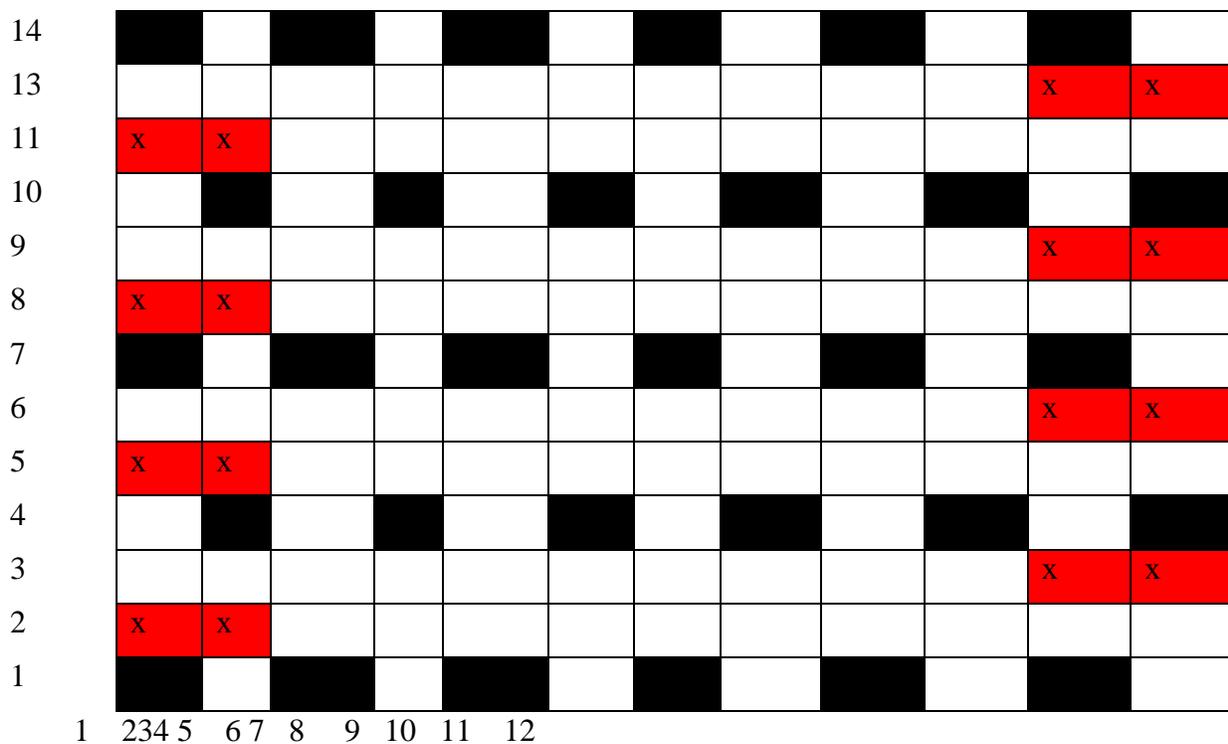

### THE MAIN FINDINGS AND RESULTS

In this scientific work, the possibilities of weaving velvet fabric on a modern Italian loom using 29x2 textile yarns for the back yarn with a 25x2 textile for the tanda yarn were tested and woven

patterns were produced. The number of twists of the body thread was given to 750 back twists. He also carried out scientific research on the production of heavy velvet fabrics using tan yarns embroidered in the avrband method as tanda yarn and obtained a state patent. These tissues differ from other tissues by the shortness of the hairs. The formation of hairs in these tissues is carried out in the process of decoration using special equipment. These fabrics can also be woven on simple knitting looms. The convenience of modern computer-controlled looms makes it easy to change the density of the back yarns when weaving fabrics.

In Figure 1 below, the raw velvety texture is cut. a) Tissue weaving, b) weaving section in the direction of the back yarns.

In the tissue mowing program, the reinforced satin 12/9 was selected in the picture for the hair back base mowing, and the fabric mesh was obtained for the ground mowing mowing. The back yarn report is 6 and the tan yarn report is 12.

a)

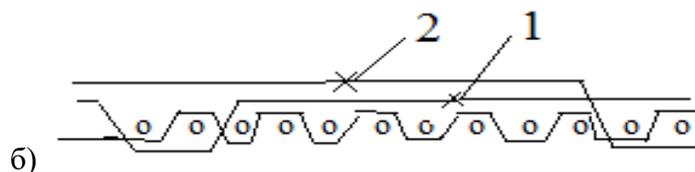

Figure 1. Harvesting of raw velvet fabric. a) braid, b) braid section in the direction of the back threads.

In the cutting section Fig. 1 b) when the first ground backing thread is thrown, the ground backing thread is formed in the fabric backing, when the second and third backing threads are

thrown, the satin backing threads are formed along the satin cut. The hair back threads are cut from the places indicated by numbers 1 and 2 in the picture. The result is a backy hairy tissue.

The report of the back yarns can be determined according to the equation given in [1].

$$R_A = (2+1) \cdot 2 = 6 \text{ ип.}$$

The report of the body threads can be determined by the following formula for the given weave

$$R_T = R_{A_{\text{сос.Т}}} = 12 \text{ ип.}$$

where  $R_{A_{\text{сос.Т}}}$  is the report on the basic thread weave.

The problem of weaving velvet pleated woven fabrics and their weaving with the help of looms is given in [2], but the problem of obtaining velvet textures on modern looms is not mentioned. On something loom, the tension of the yarns, the density of the back yarns, the weaving of the fabric are entered into a computer program.

A copy of the woven fabric is shown in Figure 3

$$P_{\text{тук.аркок}} = 288 \text{ тук/см, } T_{\text{танда}} = 25 \times 2 \text{ текс, } T_{\text{аркок}} = 25 \times 2 \text{ текс,}$$

$$P_{\text{танда}} = 240 \text{ ип/дм, } P_{\text{аркок}} = 200 \text{ ип/дм, } N_{\text{о-тиф}} = 60, Z_{\text{тиф}} = 4 \text{ ип.}$$

Figure 2 below shows the introduction of a mowing program into the computer of an Italian Somet machine.

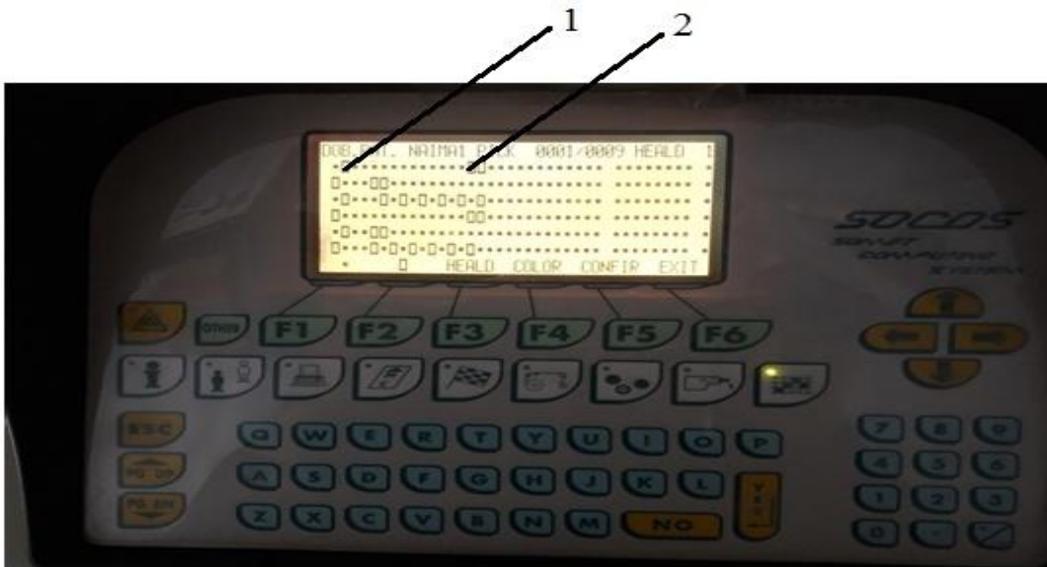

Figure 2. Computer monitor of the Italian Somet machine and built-in mowing program

In the weaving program in the picture, the number 1 is the rise and fall of the branches of the gum thread, the weaving of which is a canvas. The satin weaving program is included in the fabric center mowing program 2. A copy of the woven fabric in the new structure is shown in Figure 3.

As can be seen from the pattern of the woven fabric, in the selected weave, a small striped stripe 1 in the direction of the threads of the body and the hairy threads 2 next to it are cut during the

finishing process. The avrband pattern on the body threads provides an attractive appearance of the fabric due to the unique colors under the feathers.

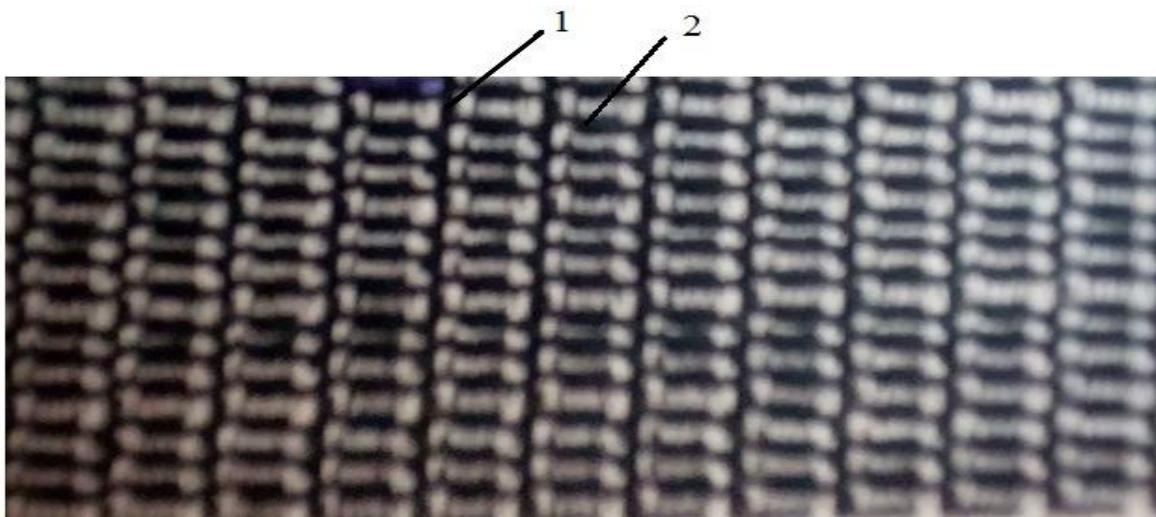

Figure 3. A replica of velvet (raw velvet) fabric woven on something loom

Also in this study, tissue patterns were woven in five variants at 20 textile without changing the linear density of the tan yarns.

Accordingly, options 1-5 were included in the machine program as 16, 20, 24, 28, 32 with a density of 1 cm on the back yarns and tissue samples were taken.

The physical and mechanical properties of the woven fabric in the new variants were tested on modern equipment of the certification laboratory CENTEXUZ of the Institute and the test results were checked for compliance with GOST 29298-2005. The standard requires that the tensile elongation of the tan yarns be 441 (N) and 245 (N) for the back.

The test revealed some of the main properties of the fabric: resistance to tearing and elongation of the body and back yarns, as well as air permeability. The strength of the body threads is shown in Figure 4 (a), the strength of the back threads is shown in Figure 4 (b), and the histogram for air permeability is shown in Figure 4 (c).

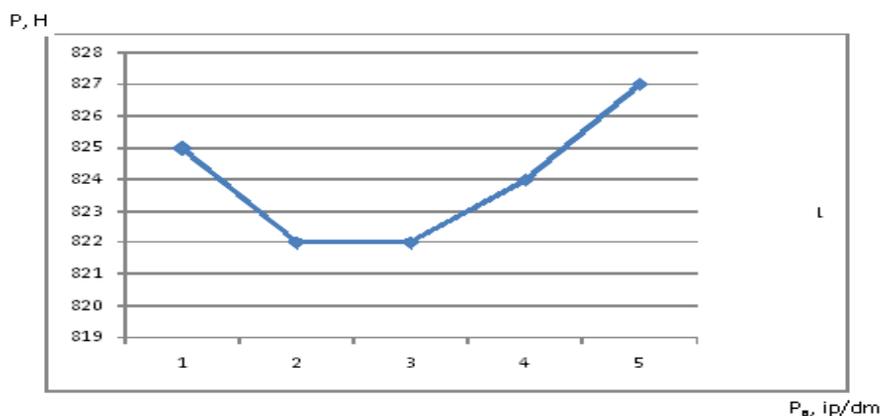

Figure 4. The elongation at break of the body threads

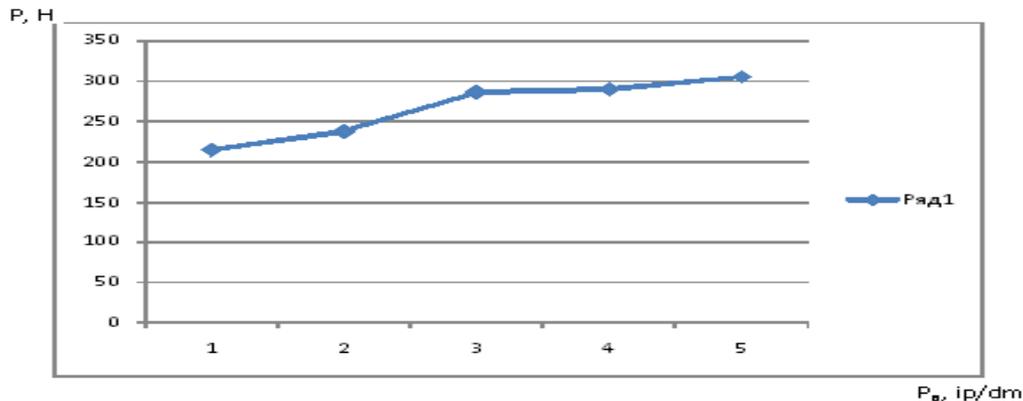

Figure 5. The elongation at the break of the back threads

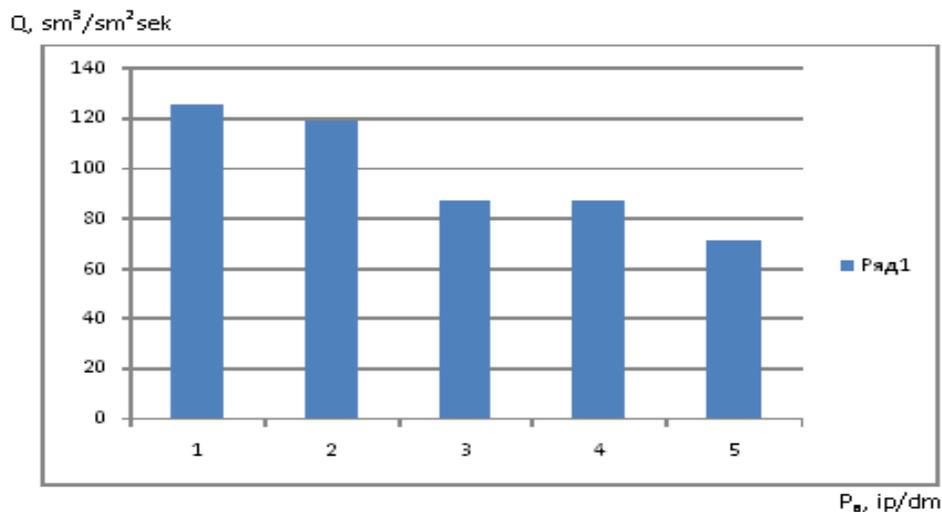

Figure 6. Air permeability of tissue

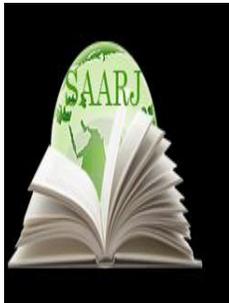

It can be seen from the graphs that the strength of the fabric meets international requirements, i.e. the strength of the tan yarns is at least 820 N. was 290 N in variant 4 on the back yarns. Analysis of tissue width shows that Figure 4 (a) explains the reasons for the variation in the width of the tissue of the tanda yarns due to the lack of strength between the tissues at the expense of the device that holds the width of the tissue. Figure 4 (b) the increase in the strength of the back yarns of the fabric is explained by the change in the density of the back yarns. Figure 4 (c) explains that the air permeability option 1 is the highest and the tissue density is the lowest.

## CONCLUSIONS

1. Its weaving parameters have been determined for weaving raw velvet fabric on a modern loom.
2. Raw velvet fabric on the loom was developed on the basis of the program, a new structure of raw velvet fabric was developed and the properties of the fabric produced in different variants were checked on the basis of international standards. As a result, the properties of the woven fabric met the international standard on the surface density of the fabric.

### ABSTRACT

*This article reveals the methodological and functional-semantic features of transpositive words used in the poems of the People's Poet of Uzbekistan Usman Azim. The analysis of some transpositive words based on the principle of economy is also analyzed.*

**KEYWORDS:** *Transposition, Migration, Lexeme, Language Of Art, Writer's Style, Writer's Skill, Poetic Originality, Individuality, Thrift, Precision, Brevity.*

---

### INTRODUCTION

In the process of creating a work, a creator not only skillfully uses simple, vernacular words of our language, but also becomes a word-creator. Although he uses the riches of the vernacular, he finds new words in his place, dresses the existing words, shows all his brilliance, finds new meanings that give spiritual nourishment to human nature and consciousness. Every word in a work of art gives the reader an aesthetic pleasure [5.11]. The poet should use such units in writing his poems that each word should express the whole height, color, melody, charm and subtleties of meaning of the poem, as well as the aesthetic impact of the poem. This means that the poet can absorb the idea only if he can choose the right word without using the words he encounters in the process of conveying the idea to the reader. Given that language is the heart of the writer's style, the study of the linguistic features of a work of art in relation to its subject, idea, and image will inevitably lead to the identification of the most important aspects of the writer's style [2.92]. One of the peculiarities of a writer's skill is that the meaning he wants to express in a poem can be assigned to a single word, the use of different descriptive means, or the unity of a certain word group to express the meaning of another word.

### Main part

In his poems, Usman Azim uses metaphor, metonymy, synecdoche, analogy, adjective, animation, and various repetitions, as well as transpositive words. Transposition is one of the means of enhancing the individuality of the writer's style and the aesthetic impact of the language of the work of art.

In the communicative process, linguistics observes that a unit in a particular word group adopts grammatical categories specific to another word group. According to J.Eltazarov, the highest form of inter-family communication is inter-family migration, which is associated with the universal laws of language. Language transformation is one of such laws [3. 146].

Transposition refers to the fact that a word belonging to a certain category has a semantic and grammatical character that is specific to another word group, weakening the function semantics [6. 183].

We can see that the term transposition is given different names in different linguistic sources.

In O.S.Akhmanova's "Dictionary of Linguistic Terms" it is noted that the terms "transition", transposition, conversion are used to move between word groups [1. 320, 480, 202].

Linguist Azim Hodzhiev in his "Explanatory Dictionary of Linguistic Terms" shows the use of the terms migration, conversion, transposition for the type of migration at the vocabulary level. Transposition – (word derived from the Latin *transpositio* – substitution) when it is said that the grammatical categories are used in a non-specific task, it is indicated that in the case of the conversion event there will occur "the formation of a new word by transferring a category lexeme to another category-specific form-building paradigm" [9.48, 45, 94]. The term "conversion" is widely used in the book "Grammar of the Uzbek language", not transposition. "Conversion is the name of a specific event in which the word is used in another category function without changing its form" [8.44]. Apparently, both the dictionary and the grammar use terms such as *migration*, *conversion*, and *transposition* for the lexical type of migration.

The poet Usman Azim used transpositive words in his poems. In some of his poems, he also uses lexical economy, which is a form of transposition.

Boryapman sog'inib seni,

Seni sezib borlig'im bilan.

*(I'm going to miss you,*

*With whom I noticed you.)*

Ko'karishning zumrad yolqini,

Yomg'ir yuvgan ruhimga to'lgan.[7.156]

*(Emerald mane of bruises*

*The rain is full of my washed soul. [7.156])*

*Kumush* shudring to'shaldi tongga,

Yer yuziga junjikkan havo. [2.277]

*(Silver dew covered the morning,  
Air blowing on the ground. [2.277])*

Yil o'tar... Sayrga chiqqan

Kelinlarday tizilib,

*(A year later ... He went on a trip*

*Lined up like brides,)*

Gul libosli daraxtlar

Boqqanida suzilib. [7.301]

*(Flowering trees*

*Filtered in the pasture. [7.301])*

Hali temir so'liqlar

Lablaringni yirtmagan,

*(Still iron*

*Didn't tear your lips,)*

Hali mixlar jizillab

Tuyog'ingga kirmagan[7.305].

*(The nails are still scratching*

*Not in your hooves. [7.305])*

Ko'kda o'lgan qushning yoshiday

«Oh»im uchar cheksiz bo'shliqda.

*(Like the age of a dead bird in the sky*

*My "oh" is flying in infinite space.)*

Go'yo ketgan shodmon lahzalar,

Go'yo g'ussa fasliyetganday [7.311].

*(Happy moments gone by,*

*It is as if the season of grief has come. [7.311])*

Lexemes such as *emerald, silver, flower, iron, and grief* are categorically related to the word noun. It acts only as an attribute, that is, as a determiner, in relation to the word to which it is connected. It is well known that attributively requires a definite relationship. Units are transposed only when they are bound to a definite and come in a compound state.

Considering the transpositive words used in these poems, the following changes were observed when used in conjunction. A change in the syntactic position of a unit, a determiner instead of being used in the possessive and complementary functions specific to the noun; as a result of the

change in syntactic position, the categorical meaning of the transpositive word also changed, and it was observed that it served as a qualitative character instead of a noun specific to a noun. The special sign of the units that move from the noun phrase to the adjective noun is **N>At**, a condition called adjectivation.

At the same time, there is a lexical saving in the poems of Usman Azim. Thrift and transposition are closely related. Savings have been observed in transposition. In linguistics, in particular, the careful use of lexemes in terms of meaning and content creates conciseness. Conciseness, on the other hand, creates clarity.

The economical use of units is widely used in the language of fiction, especially in poetry. The savings not only increase the aesthetic effect, but also serve to maintain weight balance, as well as provide tone. For example,

Yaraqlab ochildi yovuz tumanlar,

Moviy koinotdan keldi nurli sas:

*(Evil districts opened up,*

*A bright voice came from the blue universe:)*

Sizni baxtsiz qildi, ruhi yomonlar [7.110]

Ayriliqning g'ussasi

*(He made you miserable, evil spirits [7.110]*

*The grief of separation)*

haddan ziyoda, yolg'izim.

Bul azobning dashtida

*(too much I'm alone*

*It is in the wilderness of torment)*

Qoldik piyoda, yolg'izim.

Yurdim-u yetolmagaymen –

*(We're on foot, alone.*

*I can't walk -)*

buhajrso'ngsizerur,

Voh, sabrborganqurib,

*(it will melt forever,*

*Wow, the patience is running out,)*

etmasiroda, yolg'izim.

Tanholikningdashtida

*(insufficient will, alone.*

*In the desert of solitude)*  
 jimlikilaxushdo‘sto‘l,  
 Shar-u g‘avg‘oetmagay  
*(die a good friend in silence,*  
*Don't make a fuss)*  
 ishqinifoda, yolg‘izim.  
 Qo‘y, falakningcharxini  
*(love expression, alone.*  
*The wheel of the universe)*  
 har dam malomataylama,  
 Anglagin – ulgohziyoda,  
*(don't blame me all the time*  
*Understand - more and more,)*  
 gohriyoda, yolg‘izim[7.116].  
 Tushlargakirdifaqat,  
*(sometimes lying, alone [7.116].*  
*Only in dreams,)*  
 (Faqattushda!) muvaqqat  
 Dunyoningyorug‘lari.  
*((Only at noon!) Temporary -*  
*The lights of the world.)*  
 Umrnitalabborar, [7. 139]  
 Momo, shu chaqaloq – shu bir parcha jon  
*Qirq beshda Berlinga borib o‘ladi [7.287]*  
*(It takes a lifetime, [7. 139]*  
*Mom, this baby is a piece of soul*  
*Forty-five died in Berlin [7.287])*

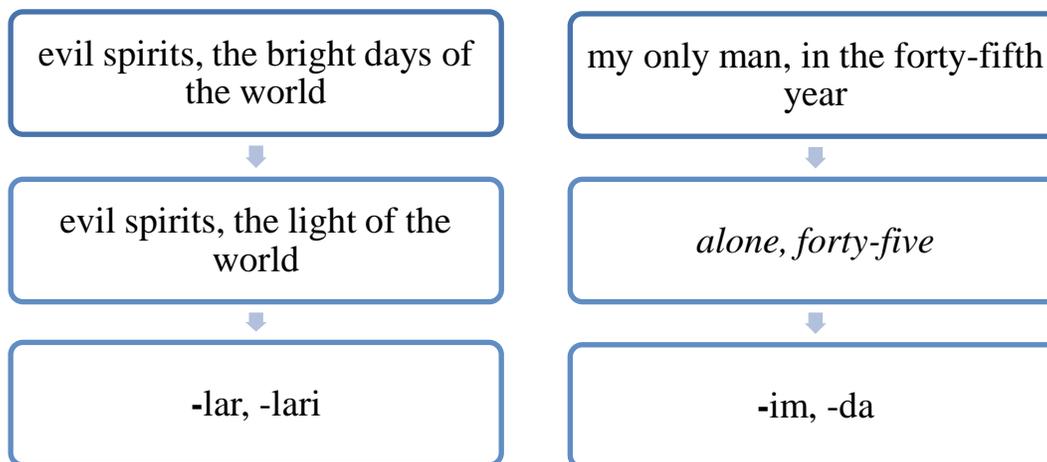

The transpositive units used in the repetitive form of this clause, such as the evil spirits, the lonely (6 times used), the lights of the world, and the forty-fifth, are a shining example of lexical economy. Because in the structure of the sentence, these units have an attributive function. An attributive function, on the other hand, requires a definite relationship to the determinant. Although the detainee was in this condition, the interrogator also acted as a temporary detective, as required by the circumstances. In fact, in the verses, the evil spirits, the lonely man, the bright

days of the world, in the forty-fifth year, were to be used in a compound form. Categorically, it comes as a jump and syntactically as a motivator.

In poetry, the categorical change of quality, its use in another function, gave rise to categorical migration, that is, morphological transposition. In examples, the definite article is a transitive word, and the definite article is a subjunctive word, used instead of a compound. In the above poem, the poet uses the lexeme of loneliness in this case with the demand for weight, based on the principle of economy, which is a form of transposition. The need for syllables is also taken into account in the use of any unit in poetic verses. In the verses, the -im form of possession has always meant dependence.

There is also a fire of quantity (forty-five) in the poem. In fact, it is a rare occurrence for a number to perform the function of another set of words. However, in the expression of human age, the noun phrase, which came after the number phrase, fell due to the demand for economy and weight. This jump in the poem does not present any difficulty to the reader. This is because it is very common in public discourse.

Immigration of the number is observed once. It is well known that "the transition of different word groups to one word group represents an emigration migration (EC), and the ability of each word group to move to other word groups represents an immigration migration (IM)" [3.23]. The ratio of EC and IC units in a number is 1: 0. The special sign of the units that have moved from the number phrase to the noun phrase on the basis of economy is **Num> N**, which is called substantivization.

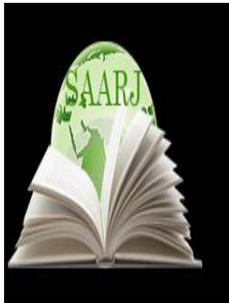

## CONCLUSION

1. The transpositive words used in the poems of Usman Azim are used as a means of providing the features of the language of the work of art: simplicity, simplicity, freedom, variety, imagery, as well as the emotional-expressive effect of the poem. It plays an important role as a means of enhancing the linguistic potential of a poetic work and demonstrating the artist's use of words.

2. In Usman Azim's poems, the short and succinct use of units in form does not affect the meaning of the poem, but is used as one of the means to enhance the poet's unique style, the aesthetic impact of the poem.

### ABSTRACT

*This article scientifically and philosophically analyzes the need to combine traditional and modern values in ensuring the stability of society. The article critically analyzes the existing management methods and examines in detail their negative impact on the stability of society. And in the formation of an environment of stability in society, the criteria of a new concept of traditionalism based on traditional and modern values were studied and recommendations were developed.*

**KEYWORDS:** *Values, Tradition, Traditional Values, Modern Values, Social Stability, Capitalism, Socialism, Liberalism, Democracy, The Concept Of Tradition, Directions Of Development, Islam, National Idea.*

### INTRODUCTION

Today's global reality is the highest stage of human development, at which the development of relations between people and the world is based on new trends based on the need to form a single universal consciousness. Human history has created various doctrines based on the needs of a particular period. Humanistic ideas developed in doctrine in sync with the growth of human self-esteem. In particular, unlike slavery and feudalism, human rights and freedoms were guaranteed to some extent under capitalism and socialism, while under liberalism and democracy they were fully guaranteed. As humanity approached the realization of its "dignity" in the course of historical development, social doctrines are also born. But humanity is tired of such unstable doctrines, because new doctrines such as modernization, liberalism, democracy have turned into

a "tool of government" in the hands of individuals and groups, sometimes discarding the traditions and values of certain ethnic groups, sometimes unable to distinguish human feelings from animal passions. In particular, such teachings, which are considered the achievements of three thousand years of human development, today appear as a factor that intensifies antagonistic conflicts between nations and peoples, creating a state of mistrust and indifference in the minds of ordinary people. In particular, the "reins" of such teachings can fall into the hands of individuals or groups, imposing values that are alien to the way of life and thinking of a particular nation or people, which can lead to the gradual emergence of social nihilism

### **Main part**

The choice of the values of Western society as an "ideal model" for members of our renewed society, following their example in defining socio-political relations, in our opinion, is unacceptable for representatives of civil society, consisting of independent thinkers and staunch believers. For example, the current development of many Southeast Asian countries means the development of modern values based on traditional values, and not a "celebration" of Western values in the full sense of the word. These countries abandoned modern values in reforming the socio-political life of society and chose the path of development based on their traditional values (social responsibility, hard work, patience, mutual assistance, compassion). At the same time, it was necessary to completely abandon Western "patterns" and use local opportunities. In his book *The Clash of Civilizations*, Samuel Huntington, an American political scientist, argues that as the English language penetrates deeper into the social life of Singapore, there is a growing risk that the West will be influenced by the Western environment. "After much debate, the government developed a system of moral and ethical criteria based on a five-point tradition:

First, the superiority of the nation and society over the group and individual;

Secondly, the family is the basic unit of society;

Thirdly, respect for the individual and social support;

Fourth, compromise instead of debate;

Fifth, racial and religious harmony "[1].

All features of this system are consonant with the essence of tradition, proving once again that social development should be based primarily on national foundations. The principles of individuality, the supremacy of interests over human "values" or "unlimited" human rights and freedoms that are characteristic of modern societies have been replaced by traditional values such as "respect for the individual and social support".

Today, the attitude towards foreign languages in our country, especially English, is based primarily on our traditions, values and customs, and when our state restores them and develops methods and theories for their effective use in our socio-political reforms, they become the driving force of our national politicians. The Japanese state also created the "Japanese miracle" because it defines its social development on the basis of a system of traditional values (obedience to elders in society, social responsibility, social loyalty, the strength of national honor).

When modernizing the country's socio-political system, modern values are used (bicameral parliament, political prudence, pragmatic thinking, liberal and democratic principles) and the system of socio-political traditions characteristic of all peoples of the East (localism and kinship,

political limitations, hierarchical relations in government) strength, unconditional obedience to elders, intellectual dependence on an official) is a complex process that requires a lot of time and effort. Failure to resolve this situation gradually can lead to certain types of conflicts between social actors. In our opinion, these social conflicts are, first of all, a struggle between modern values based on new liberal-democratic principles, with the characteristics of a traditional society based on "unconditional execution" in management, and a modern society based on a market economy, in which profit is more important moral values. the appraiser is found in traditional societies.

A dialectical analysis of the socio-political, economic and spiritual aspects of traditional and modern values in the prevention of these social conflicts is a necessary requirement of reality:

- The formation of a new attitude towards hierarchical relations in public consciousness;
- Harmonization of all traditional values with the realities of time and space;
- The renewal of some traditional values in the spiritual life of society (indifference, simplicity, reliability, intellectual dependence);
- To declare an open mass struggle against the shortcomings of our mentality;
- achieving fair competition in all spheres of society in a market economy and thus creating a society based on economic and spiritual equality, which is different from the Western economic society.

Today, modern values, formed on the basis of traditional values in the socio-political development of our country, are the basis of a new "model" of our national development. But the state in any form is faced with a system of a number of socio-political problems during the period of transformation. In this situation, especially the intellectual intelligence of a political leader, his strategic knowledge will be of great practical importance. The consequences of not being able to see these problems in time can be seen in the example of the Rose Revolution in Georgia, the Orange Revolution in Ukraine and the Red Revolution in Iraq.

Contemporary values can serve social development only if they are in harmony with the traditional values of the nation, which is a historical and cultural paradigm. This is a policy pursued without regard for traditional values, alien to the suffering and psyche of the nation, and which people perceive as violent. It is easy to understand that today in many CIS countries there is a desire to see in the future a system of values formed in Western Europe and the United States. This is especially evident in changes in the socio-political, economic and cultural spheres of society. Most dangerous is that all aspects of the Western way of life are perceived as "modernization". A superficial attitude towards these "modern values" creates shortcomings that impede social growth. For example, the emergence of such negative phenomena as lumpenization (loss of identity), bribery, corruption, moral degradation (devaluation of the traditions of "humanity", drug addiction, AIDS, human trafficking), social depression, dissatisfaction with their way of life, social responsibility and social responsibility causing weakening ... One of the most important aspects of traditional values is the recognition of social responsibility. The stability of the way of life and activity of a particular ethnic unit is ensured through a responsible approach to the traditions and values of reality. That social responsibility fulfills several functions in traditional societies. Jonas analyzed: "the preservation of human

relations, the establishment of social partnership, the establishment of sustainable development” [2].

The fact that in our society there are also people who have become slaves to their own interests without a sense of social responsibility reduces the effectiveness of the results of today's reforms. “The most important thing is that everyone living in our country, every family today feel the influence of our reforms in their lives. To do this, leaders at all levels must work for every citizen to ensure his or her vital interests, without chasing interests, numbers, paperwork. Then our enlightened elders, dear fathers and mothers, dear women, dear children, great-grandchildren, our entire multinational people will be pleased with us ”[3].

Of course, the period of transformation of society causes a number of socio-economic contradictions in the minds of real people and can even cause nihilistic sentiments in the minds of those who are deprived of certain rights and freedoms, privileges and property. In such a situation, a nation or an ethnic group that is not indifferent to its fate must create the barriers to change these negative situations for the better. In such conditions, it is advisable to combine modern values with the traditions and customs of the local ethnos. By "modern values" we mean "a set of moral, political, legal values" [4].

The reforms carried out in Uzbekistan are the basis for the formation of a new system of spiritual and moral values in the minds and hearts of our people, which in the process of globalization stimulates the renewal of the means of protecting national pride from foreign influence. In this sense, the traditions and values that have been observed in the minds of people for centuries, as well as the value of traditional methods of economic management, are growing. In particular, in the minds of our people, the need for today's innovations to be based on national traditions and values is becoming a national concept. In the most difficult moments of the past, people rely on traditions and values, receive spiritual support from them, and therefore always try to preserve them. Tradition has played an important role in the regulation of social relations in human history. Traditions determine the social behavior of an ethnic unit. They give spiritual fuel to the feelings of the members of the ethnic group. These conclusions can be confirmed by the results of the following sociological survey: “73.5% of the respondents consider customs and traditions as a source of spiritual nourishment. 71% of them admitted that “following customs and traditions is the key to a positive upbringing, 64% of them said that they could participate more actively in ceremonies related to customs and traditions, and 39% regret that their work, family and household chores do not allow them to actively participate in ceremonies associated with national traditions ” [5]. In this sense, taking these factors into account in the process of modernizing society is important for increasing the effectiveness of reforms.

In a world where material values are of paramount importance, the study of the spiritual aspects of the relationship between man and the universe is becoming a conceptual topic today. This requires the formation of traditional philosophy that studies the psyche and the manifestation of ethnic unity in social philosophy.

Today, the issues of preserving the national gene pool, ethnic unity, the formation of the national idea of our country require the study of national traditions as a separate area.

In our opinion, along with liberalism and democracy, traditionalism is an important phenomenon in the modernization of the political life of society today. The prevailing socio-political consciousness in our society tends to unilaterally analyze the concepts of

fundamentalism, fanaticism, and conservatism. In our opinion, the study of such doctrines as fundamentalism, fanaticism, conservatism, traditionalism is an objective necessity, just as it is necessary for the future development of our society, the study of such doctrines as modernization, globalization, liberalization, democracy.

However, in the study of traditions in our country, there is a one-sided attitude, that is, no attention is paid to the peculiarities of creativity, but rather the tradition is expressed as a legacy of the totalitarian regime, "sarkit". A. Kadyrov explains the influence of tradition on social and political development: "Thanks to independence, society's interest in the past and the search for its spiritual roots are growing. For almost ten years, we have been discovering various scientists and noble people from the yellow pages of history. This is, of course, necessary for understanding national identity. But it also means a call to return to medieval spirituality, to traditional society. Traditional society is a society that encourages silence again, to be a believer, to be obedient, to be patient. Traditional society is a society based on the law of repetition of all aspects of human life. This leads to stagnation. Of course, it is logically wrong to take these views as absolute truth. Because the values that the world offers us today do not and cannot have the same characteristics as our traditions, such as patriotism, kindness, benevolence, vitality, impartiality, the desire to preserve identity. This is due to the fact that, although traditions have formed naturally over the years as the real needs and aspirations of a particular nation and people, all the values that are being created now are largely the product of the consciousness of groups that value "value" over "value" serves interests and purposes. Proof of this can be seen in the thousands of "strategies" in the ideological arena of the modern world.

Since the communist ideology of the former totalitarian regime was based on conservative ideas, today the scientific community of our country views the tradition as a relic of conservatism. The main issue is the need to form a new dialectical approach to traditionalism associated with conservatism in the context of the restructuring of the value system in our country.

Tradition manifests itself in the thinking, lifestyle, aspirations of these ethnic communities. It is the unity of these factors that forms the basis for the formation of convention. Under the influence of these factors, an ethno-national traditional environment is formed: national sports, national folklore, creative initiative, folk medicine and pedagogy, holidays and religious rituals, national moral ethics and cooking, connecting the past and present of the people.

The subject of a tradition is a certain ethnic unit or social group, and the object is a system of values, traditions, customs, rituals and socio-spiritual values passed down from generation to generation. The process of renewing old traditions and values between generations based on the principle of continuity and the law of denial-denial ensures the sustainability of the tradition.

Breaking the eternal connection between the subject and the object of the process of traditionalism can lead to social nihilism. In today's era of renewal, maintaining a balance between subject and object of tradition is a strategically important issue.

## CONCLUSION

Based on the above considerations, today's reality requires the study of the positive features of the tradition and its implementation in practice. In our opinion, it is advisable to take into account the following:

- a comprehensive, extensive study of traditions;

- Theoretical and comparative study of local and foreign experience in this area;
- Preservation of national and moral traditions leading to spiritual maturity;
- Compliance with the requirements of the law of denial of dialectics when creating a new value system.

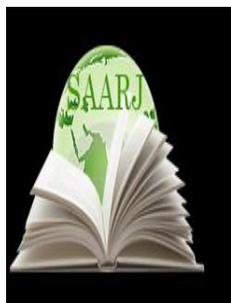

The tradition is based on the exchange of the most important and significant social and spiritual experience between generations on the principles of continuity, formed under the influence of a creative approach to the social life of an ethnic unit in a certain space and time.

In our opinion, the process of uniting a certain ethnic unit and encouraging the next generation to a creative life for prosperity, a process that renews the world based on traditional values in accordance with reality, is called traditionalism.

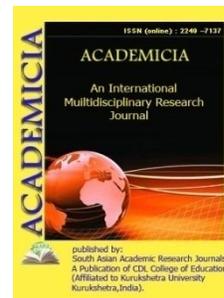

Analysis of the socio-philosophical aspects of the phenomenon of tradition shows that this is a concept with its own principles, categories, functions, social structure and topics of discussion that are unique to other doctrines, that is, the ability to live.

### ABSTRACT

*The article describes how religious themes were reflected in photographs of Uzbek periodicals of the 1920s-1930s. It is well known that the policy of the Bolshevik Party denied religion, its role and significance in the life of society. In this regard, anti-religious information and propaganda activities were carried out in periodicals. In carrying out this task, the mediation of periodic photographs was also widely used. This article provides a number of examples from periodicals covering religious topics. On the basis of these examples, the types of images, the essence of the content, functions, methods of depiction, objects dedicated to the issues of religion are analyzed.*

**KEYWORDS:** *Periodicals, Cartoons, Photographs, Soviet Power, Propaganda, Religion, Clergy, Believers, Religious Ceremonies, Criticism.*

---

### INTRODUCTION

In the 1920s-1930s, photographs found their place in the system of periodicals. Initially, the photographs appeared in only a few issues of the magazine during the year, but gradually began to appear in every issue of the magazine. The first pictures were made for advertising, and gradually they reflected some areas of production, some issues of domestic and foreign policy, government and department heads. The number of photos in the pages of periodicals and the scale of the issues covered in them became more and more important, and they served as an appendix to articles and reports or as an independent propaganda tool. Thanks to written and graphic materials, periodicals served as propaganda for the Soviet government and the Communist Party, for their ideas, programs and instructions, as well as for mobilizing the population to fulfill the current tasks of society in changing conditions. One of the main directions of the Soviet government's propaganda work was anti-religious. The purpose of anti-

religious propaganda was to eliminate the influence of religion and religious scholars among the population. The policy of the Bolshevik Party denied religion and its role and importance in the life of society. In Soviet propaganda, clergy were interpreted as one of the main “enemies” in the way of building socialism. Priests were included in the “class / social enemies” link in this system in research studies of the “enemy” image in the Soviet era [1, 2] (more universal, ideological / political links of this image are also highlighted). In the graphic materials of periodicals, propaganda against them was decided differently. In general, posters, cartoons (caricatures) in newspapers and magazines prevailed in graphics. Photo opportunities were also used in periodicals for anti-religious propaganda. In the anti-religious propaganda, the objects of satire are shons, Sufis and other clergy, as well as judges who conduct court proceedings on the basis of Sharia, religious prayers, holidays, and ordinary believers who perform them. For example, in the picture attached to the article “Village spoilers” in the 71st issue of the newspaper “Poor Farmer” in 1926, a farmer who was working the land was wearing a turban. He is depicted waving his hand as if he were standing on a rat-like creature with a rosary around its neck, and is given the caption, “Judge not in vain.” One of the main tasks of anti-religious propaganda was to systematically exclude clerics from the socio-political life of the society. As a result, the newspaper's cartoons portray clerics as people who try to maintain their privileges in the shadow of “foreign elements” who have infiltrated party ranks and councils, [14] and who quickly find common ground with other “hostile elements.”

### **The Main Findings and Results**

From the pictures and the comments given to them, it is possible to trace the areas in which the struggle for change was linked to the struggle against religion. The issues of collectivization in the village, increasing the social activity of women, the promotion of a new life, protection from religious influence in the upbringing of children are raised. In the 1920s and 1930s, the conditions of ideological struggle with religion were also linked to the issue of women. In the resolution of the first congress of the Communist Party of Uzbekistan (b) held in Bukhara on February 6-12, 1925, the political and economic liberation of women was carried out simultaneously with the struggle against the medieval living conditions of women. It is said that it can only succeed if it counteracts its influence on the ignorant, illiterate indigenous population [4]. The fact that the disenfranchisement of women has been preserved for centuries, that it has become a tradition of life, and that the negative impact of religion on women's liberation has been highlighted in newspaper photos. During this period, the image of a woman enslaved by religion, striving for freedom and social equality despite the opposition to freedom, the negative impact of religion and clerics on the liberation of women [19], the positive role of Soviet reality in all these and other issues of society [10].

Various issues showing discrediting of religion were covered in periodicals in the form of images and comments to them. Scholars have tried to convince public worshipers that they have deceived the public [12], that the clergy are indifferent to problems, that they do not share in the suffering of the people, [15] and that religion has been interpreted as a way to poison the people. Newspaper photos also show dilapidated buildings in Russia [12] or women's clubs [10], workers' kitchens in Tver [12], demolished temples in Tashkent [8], a polyclinic in Tashkent [18], a school [8, 16], and a sewing cooperative in Khiva religious structures such as the mosques used [12] were photographed.

Through anti-religious propaganda in newspapers, propaganda in the form of not celebrating Eid, sacrificing, slaughtering sheep, not fasting, and emphasizing their medical, material, and spiritual harm is also seen. For example, in the June 4, 1928 issue of the newspaper "Red Uzbekistan" under the headline "Workers did not celebrate, they did not make sacrifices" were published photos, articles and reports of anti-religious propaganda. The photos show the anti-religious propaganda held at the Tashkent Tram Company on the day of Eid. The photos show the factory workers listening to a lecture in their clubs on the day of Eid, and after the lecture, the workers are organized to rest and gather without celebrating Eid. [12] The idea of propaganda and propaganda of these pictures is aimed at giving specific instructions to other similar enterprises, organizations on how to protect and repel the population from the influence of religion during mass religious ceremonies, holidays. Also, the sacrifice and slaughter of sheep was tasted by the priests [12, 18], this method is expressed through satirical humorous images that do not allow a person to cross the bridge and take him to heaven [12, 18]. There was also a propaganda urging people not to perform fasting and related rituals like Eid. One of the cartoons depicts a man fasting and swollen in the middle of the night after iftar, surrounded by his wife and children. Thus, in the monthly magazine "The Ungodly", the column "The Ungodly Gurzisi" is entitled "Can you find such people?" Articles and photos under the headings "Bordi keldi gaplar" ("It's time to talk"), in particular, people who do not give up religious prayers, especially those who continue to pray, are ridiculed in a peculiar way [7, 8].

There are also excerpts from performances that denounce religion and ridicule it, staged at various festivals and other events. For example, one of the newspaper's photos shows that on May 1 in Tashkent, a performer with a white beard and a turban and make-up played the role of Eshan on a donkey. Both Eshan and the donkey are surrounded by large and small spectators with shawls on their heads. The caption reads, "Donkeys and donkeys should cover their headscarves." [12] After an article on the organizational aspects of the carnival on the night of August 29, 1935, there are photos from the carnival [17], a picture of the ugly image of Eshan with the caption "Hazrat Eshan". According to the article that told about this carnival, tens of thousands of people attended the carnival. However, as interesting as it may seem, only one or two Uzbeks met at this carnival in the capital of Uzbekistan. The reason for this is that no explanatory work was carried out among the indigenous workers and their working wives to attract them to the carnival [17].

Anti-religious propaganda was also carried out by contrasting science with it. The article titled "Religionless Tashkent" about the anti-religious exhibition opened at the Tashkent Red Army House is a photomontage above the exhibition. "The aim is to show the difference between science and religion, that the evidence of religion is as strong as the evidence of religion is weak," the article says. [13]. Another of the newspaper's photographs shows tourists and spectators visiting a section of the Central Museum against Religion entitled "Islam and Its Reactionary Essence."

The photographs depict religious organizations, clergy as a counter-revolutionary force against the people, as "enemies" such as khans, amirs, tsarist officials and the rich. For example, in one of the works in the newspaper "Red Uzbekiston" the priests were depicted among the khans, courtiers and tsarist officials fleeing from Bukhara and Khiva, which were abolished by the Soviet government [14].

The paintings also show the connection between the clergy and other counter-revolutionary internal and external forces, in particular national chauvinism and the clergy [14, 20], interpretations such as the ideological leadership of the clerics [20], the guide of the “enemies” [14], humorous images described as concomitant [14] are common. In such a humorous way, the anti-Soviet campaigner is portrayed with social fascism, the king with a war-preparing commander, the ruling nation with chauvinism, the national chauvinism with a mullah, the negative image with a negative image. They appear to be under the iron-clad pillars that have shaped the country’s thirteenth-century development, moving under the banner of marching under the banner of marching, collectivization, social competition, and more, fulfilling the five-year plan in four years. The caption to the painting reads, “We are overcoming any obstacles.” Due to the problems of opposition in foreign policy, there are also photos of religious scholars in foreign countries with sarcastic comments. In particular, in addition to the article “The Vatican is” out of politics “(!)” In the 1st and 2nd issues of the magazine “The Ungodly” in 1932, “The Vatican is” out of politics only gives a “white blessing” to the fascist flags! All demonstrations are not forbidden. In Italy, police armored vehicles were on display, and the pope’s representatives gave them “white blessings” with sarcastic comments. Political propaganda in newspaper photos has also developed by contrasting the images of “hero” and “enemy.” In this case, the force against the “enemies” that hindered the new marriage was the image of the Red Army, workers and peasants [7, 14]. In one of the paintings, the rich man runs away from the red soldier who hangs Eshan with the tip of his rifle, while the “old” intellectual (probably an illiterate figure in the dark who follows Eshan and the rich man) is hiding under a small rock. Behind the Red Army is an eastern city with the sun shining on the right, and a red army lined up on the left [10].

The method of depicting negative and positive images, which was widely used in the visual arts in the early years of the Soviet era, is the repeated use of similar elements in all forms of propaganda to quickly identify them - heroes, friends and enemies, such as clothing, appearance, facial expressions. The rest is to describe by ways of expression in a related group. For example, the images included in the category of “enemy” are described in general, and in some unnamed photos, the image of a priest in a turban can be recognized. In one of the newspaper’s cartoons, a farmer wearing a bed and a belt is lying at his feet, famous-looking people in the ranks of “enemies” are being thrown on the floor, saying, “These manure must be completely eliminated.” Among them you can see the familiar image of Eshan, a rich man with a big turban. The second picture shows a farmer scattering real manure, saying, “This manure can be used” [14].

Defamation of “enemies” is a number of ways to exaggerate negative qualities, such as the depiction of facial expressions, body in a very funny, ugly, cruel or bizarre way, stealing money from images and comments [14], drinking [14], bad quality or manifested in giving additional descriptions such as interpretation by analogy [14]. Sometimes, in order for them to be able to recognize images, to distinguish them when many images are depicted in one place, it is written on the appropriate image, for example, on his shoulder [14, 20].

Newspaper articles contain various reports and information about the harmful effects of religion, those who continue to follow it, and attached pictures with appropriate content. For example, “Izboskan district education should be ridiculed. Let the teaching staff be cleared of class enemies. In the article entitled “Those who discredit public education should be prosecuted

immediately”, among the causes and manifestations of shortcomings in the field of education, “the teaching staff is a criminal, a trader, a pervert, a thief and similar contamination with class enemies, a number of shortcomings, such as teachers giving large sums of money, marrying women, and holding sharia-compliant weddings, and one of the teachers teaching children religious prayers instead of revolutionary songs. The article is accompanied by a cartoon depicting three people, one of whom was drunk, one of whom was playing the dutar. One of them is reminiscent of the image of a mullah in a turban and robe. The caption reads: “Cultural work in Izbaskent” [15]. Real and artistic images can be seen in the pictures of the newspaper where the idea of anti-religious propaganda was put forward. The ideological content and impact of the pictures is enhanced by the comments given to them.

Newspaper articles are often criticized for adhering to various religious rites and customs. But not all of them have pictures attached. For example, in the article “Violence from Shakhrisabz”, a couple of members of a Jewish sect were accused of committing a number of wrongdoings among the poor, drunkenness, and injustice in taking the lands of rich peasants. He was criticized for taking teachers home when his daughter died and for tearing his collar, for mourning at home for eight days without working, and for cutting off his son in a temple. ”[13] The article “Preparing for March 8” makes a similar criticism. It says that Khalilov, the head of the Uzbekbirlush district office, a member of the party, had a big wedding on the occasion of circumcising his nephew. “Kokand has never seen such a big holiday, such a wedding, such a soup, such a bread. At this wedding, Kokand’s greatest Ishans blessed and forgave his ties with the Communists. There are still those who diligently obey the laws of God and the prophets! ” [12], the article quotes. It again criticized the county officials for doing things like marrying a second wife and giving the bride a large sum of money instead of being a role model.

Periodicals also covered the trials of clerics and clerics through articles and photos. The article “Eleven Counterfeits Shot” states that a mobile session of the Supreme Court sentenced several mullahs, traders and rich people to be shot in an attempt to assassinate a local official in the village of Naryn Kapa, Andijan district. [13]. In the article “Famous Numanjon Eshan answered sitting on a black chair”, Numanjon Eshan, who had thousands of followers in Samarkand, Tashkent, Kazakhstan, Afghanistan and Fergana, said that 228 tanob husbands in Behbudi were taken during the liquidation of idle farms, where a cooperative named after Ikramov was established it is said that after the seizure of many other possessions, it began to move in the opposite direction due to distress. Numanjon Eshan poisoned and killed Ergash Rakhmatov with the help of another batyr Kadyr Hamidov, in addition to concealing groundwater, there was a backlash among the public, sentenced to death by firing squad for causing the disintegration of the newly formed collective farms, and his son was deported from Kashkadarya for five years at the request of the prosecutor to put an end to his provocations from now on. The case of Kadyr Hamidov, who was sold to Eshan and took part in poisoning Ergash Batrak, is under investigation. Ergash Rakhmatov, a member of the artel who was poisoned to death, was an active batrak and was instrumental in locating the lands hidden by the rich, the Eshans and the Mushtumzars. [13]

## CONCLUSION

The study notes that anti-religious propaganda led not only to the exclusion of priests from public life, but also to massive repressions against priests and ordinary believers [5]. The use of

inhumane means such as coercion, the use of political means, the use of coercive measures, persecution, intimidation, imprisonment, deportation and physical extermination in the conduct of anti-religious propaganda, the administrative means of combating religion are widespread, including the closure of mosques; the banning of all religious ceremonies and holidays, even national folk holidays, is said to have been banned [3].

Periodicals, one of the most important means of propaganda, carried out anti-religious information and propaganda activities. The negative influence of religion and religious scholars on the life and development of society, as well as the positive role of Soviet reality in this regard, is emphasized. At the same time, the possibilities of periodical printing were widely used not only in the form of written materials, such as articles, news, but also in its pictorial, artistic and photographic means. The paintings, which played a very influential role in the field of information and propaganda of that period, were widely disseminated among the masses through the periodicals and played a special role in promoting the ideas and instructions of the Soviet government.

**ABSTRACT**

*This paper discussed about role conflict across with different industries. Literature review on Role Conflict has been done to identify what types of problems are facing by employees across different industries. The study has been done Moreover, the paper is also written to examine that the areas which has not been touched and less discussed and have a potential to carry out further research.*

**KEYWORDS:** *Role Conflict, Role Ambiguity, Role Stress, Institutions, Employees, Organization*

---

## 1. INTRODUCTION:

Toady's organizational life is stressful. Workplace life is a composition of work pressure, hectic schedules, long meetings, unhelpful environment, sometimes critical and over-demanding seniors, incompetent colleagues and many others. Work related stress is an outcome of the intense work pressure put on the employees over a period. When the pressure becomes excessive, employees perceive a threat to their wellbeing and experience unpleasant emotions such as fear, anger or anxiety.

Role conflict is made up of two important words 'Role' and 'Conflict'. These two words have their own meanings. First, meaning and origination of term conflict should be clear. Then in later section role will also be discussed.

Every Job role has some contradictory requirements within the same role or bunch of roles. The term itself defines Role conflict means clashes between person role or between two person's roles. Differing expectations, beliefs, requirements and attitudes lead to incompatibilities. **For example**, A working mother is a mother, employee as well as wife. These are three major roles which she serves harmoniously but sometimes these roles demand different responsibilities.

The idea of the research on 'Role conflict' has come up with the concept of 'Role Taking Theory'. This was the first concept which evolved in the year 1913 by George Herbert Mead. This theory discussed when one person feels fit him or her in other's role. Gradually Mead's work take-up by Katz and Kahn in the year 1966 where roles of employees are differentiated on the basis of the perception of their colleagues in 'expected' and 'required' roles. This leads to repercussions in form growing dissatisfaction, lowering in commitments and productivity and many more. So, in the fast-growing and developing world, role conflict is playing a very crucial destructive role in the growth of the organizations. Though many studies have been done on this current issue and many solutions have been suggested in those researches, but the problem is still same. This paper will simply understand the problem of role conflict among the members of faculty and explores the different dimensions of demographics.

## 2. LITERATURE REVIEW:

- Conflict is ever present process in every human relation (Loomis & Loomis, 1965). Conflict is used as a negative connotation.
- Study on 217 university lecturers of Dammam, it is to examine relationship with individual role stressor (role overload, role conflict and role ambiguity) with psychological strain. It has been concluded that Role conflict stressors increase strain in university lectures (*Jdaitawi et. al. 2014*).
- Clerical work in the colleges and universities is getting increased day by day. Paper discussed mainly about types of role conflict, comparison between govt. and pvt. Institutions and strategies to manage these problems. (Rajarajeswari, 2010).
- Study on salesperson's discussed about Right person on the right job can minimize the problem of role stress in the different organization (Weeks & Fournier, 2010)
- Another study on salesperson's discussed about male and female distinction. They have discussed No Best policy can influence job satisfaction (Boles et. al., 2003).

- Role conflict increases in non- formalized roles. With work experience increase there is a significant decrease in role ambiguity (Minnick, 2013).
- This paper discussed about training can be one of the solutions which can clear the dilemma and confusion among staff in hospitality staff in gambling venues (Hing, 2011).
- There was a study held on hotel managers, discussed that positive climate diversity leads to less role conflict and role ambiguity but more in job satisfaction (Madera, 2013)
- The result has been seen that dual career couples are facing more stress, work family conflict and work overload rather than single career couples (Elloy, 2003)

### 3. Research Methodology:

- This paper is descriptive study.
- This is review based paper and through literature review some conclusions has been drawn.

### 4. Conclusions:

Role Conflict is inevitable in social structures. Each conflict is unique in its nature, so one method cannot be applicable for all types of role conflict. Open communication, positive climates of work organization, confusion and dilemma, right person on right job can lead minimization of role conflict.

### 5. Recommendations:

- a) Right recruitment minimizes the effect of role conflict.
- b) The roles should be clear at all the levels in the organization.
- c) The organizational support is necessary for minimizing the role conflict.
- d) Supervisors and seniors should make a lucrative environment.
- e) The organization should make an environment where employees should be able to express ideas, view-points freely.

### Abstract

*The main objective of the legal communication is to participate in the implementation of the concept of improving the legal services system in the development of democratic principles of the state power in the Republic of Uzbekistan. As well as facilitating the effective implementation of the fair legal system.*

**KEYWORDS:** *Legal State, Innovation, Democracy, Legal Services, Communication, Public, Community, State, Decision, Orders, Statements, Advantages*

### INTRODUCTION

The level of information of the society is becoming so important from the socio-political, economic, is a dual point of view that the study, research and drawing appropriate conclusions of the problems related to this extremely complex and multifaceted process requires special approaches from experts.

In the state's management and society, we can see it that the issues of shaping the modern worldview are strengthening as a legal culture, a form of mass communication. One can be proud of the fact that the tasks performed by the modern structures of state and society, typical of today's requirements, are the well-being of the people, peace, tranquility and prosperity of the state, the growing interest of people in a new life. The chief value of human rights and freedoms, which are the reflection of the state and society, and the further improvement of the laws reflect the fact that human perfection is glorified on this basis. The first President of our country Islam Karimov, in his book "Man, his rights, freedoms and interests are the highest value", said: "How

vital is the lifeblood of our Constitution, which is a mirror of the political thinking and intelligence of our people, our national values and at the same time, we have repeatedly made sure that it fully complies with universal requirements”(1, 62). Today, the state of Uzbekistan, which has reached the level of development, growth, as well as one of the most advanced countries in the world, is making great strides in the spiritual, educational, economic and political spheres. In addition, his leadership in the field of state and public administration, with its entrepreneurial spirit and aspirations, encourages the people to be more united, the author's goal is in line with his ideas: “We must all get rid of the complications of indifference and indifference in our lives. for the fate of his family and for the future, we must resolutely fight against the obstacles that stand in the way of our development”(2.65). In the system of democratic reforms and development of civil society, there are educational resources such as further enhancing the right to govern, improving the political system, raising the morale of the people with legal knowledge, expressing their views on the laws developed by the state. When everyone in society does not understand the legal process, persuading ideas contrary to humanity in their minds leads to a sire to believe in various nonsense, with the desire to encourage people to act together: “Today, a rational approach to life It is not about propaganda, but about opening people's eyes, awakening independent thinking in their hearts and minds”(3,67). The author explains his ideas in a broader and simpler way. There is a great need to understand and follow the great meaning of this sentence. Islam Karimov, the first President of Uzbekistan, said in his book that the fate of man, his place in society, and his rights and freedoms, and the guarantee of a peaceful life by the state are of the highest value. It is important not only to define this strict requirement in our laws and legal norms but also to apply this priority principle in our lives. (4, 62-63). And in another place he points out the extremely harmful aspects of ideological views to people's lives: “We are abandoning ideological views that are alien to our national nature, relying on our Constitution to build a new life, a new society, its constitutional foundations, and principles.” (5, 61-62). The issues of creating a modern structure (systems) of government and society are a serious issue on the agenda today as a priority task. It is emphasized that "the task of every leader is to understand the policy pursued in our country, its priorities, strategic goals, to think about the future of our people, to create appropriate conditions for this" (6, 51). These sources are not limited to works, of course, the new head of state has been working on these issues since his first day. This is evidenced by the fact that the virtual forms are working on the basis of clear and unambiguous instructions, and the tasks performed are accountable to the people.

### **THE MAIN PART**

The issue of social life and the perfect man in the management of the state and society: the value of the individual, his place in society, the cultural and spiritual formation of his worldview, diligent study of modern and technical sciences, free and independent expression of views, the right to vote , is notable for the fact that the law serves to uphold its human dignity. "We make it a priority to ensure the interests of man and his interests, to strengthen peace and tranquility in our society, the environment of compassion and humanity, to address pressing issues of concern to many" (7, 82). If we take a deeper and more detailed look at the issue of shaping the modern worldview, we can see that “Man is a unique creature who embodies both material and spiritual qualities and traits in his image. It is a great and mysterious miracle of the Creator.

That is why his inner world, the full understanding of the qualities and attributes bestowed on him, is a complex matter of little understanding of time. It was necessary to generalize such views and ideas, to bring out the aspirations of man during the day, to compare the material and spiritual worlds necessary for his life with the secondary wing of a bird in flight (8, 67). Indeed, it is clear to all of us today that the role of spirituality in human and social life has been the subject of controversy over the value of the girl during the applications made by great thinkers and scientists. For example, "The theoretical views of Socrates and Plato, Epicurus and Democritus, the Chinese scholars Confucius and other scholars, who present the files of antiquity, are well known from the history of science" (9, 65) - defined the ecological situation, ma I know I don't want to look for known signs. they do everything in their power to prove that they are right. If you refer to different periods of social development, the testimony of sources recorded in historical works is a system known in the context of contradictions that highly imply such assessments, as well as the status of the official administration of states. "Yesterday's history is a school of life for us, a clear mirror," he said. We learn from it, draw conclusions, and determine the path to the future" (10, 112). I believe that our ability to focus on a recent issue, democratic reform and the development of civil society, is our right to govern - consider the recent work that the state is doing with our state today. "in a state of continuity: along with the "practical implementation of the concept of" from a strong state - the head of a strong civil society" (11, 11) on improving the system of state and public administration" Introduction of the ongoing situation in implementing the current work of the social life of the community - political life in the day-to-day visit, the practical growth of the state support in the initial situation, the improvement and efficiency of public administration; should be aimed at improving the documentation process and is continuing to treat the person who continues to treat the person who continues to provide the priority of working in the Society, designed to put into practice the principle of "Power is in Justice". It was created by officials involved in the creation of state buildings, which will be carried out by the new state, which should be built as a priority issue related to improving the living standards of the population, ensuring peace, harmony, and stability in the country.

Analyzing the development of the rule of law and legal norms in the management of state and society based on legal principles, we are proud that the leaders of the state and society led by great state leaders, following their current tasks, put forward the slogan "We are the children of great masters."

In the work of Abu Nasr Al-Farabi, we quote a source written by Plato: "Doctrines should be the major work to be done step by step and with other measures in the affairs of state. This doctrine should first apply to people who are engaged in falsifying the customs of the period. These falsifications can cause certain defects in people and children who are not familiar with the law. If the teachings and teachings of the law are carried out gradually and consistently, then they will give excellent results" (12, 88). It is noteworthy that today, during such a gradual transition, the leaders of our country, in order to inform the people about the constitutional doctrine, annually implement a law and make it a political tradition to call it the name of the year.´

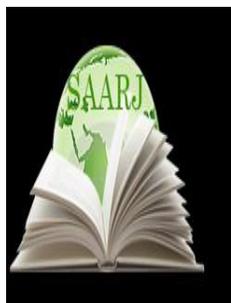

## CONCLUSION

In conclusion, it should be noted that the legal system introduced in the world and in Uzbekistan today has been formed for many centuries and has achieved great results over time, and the fruits

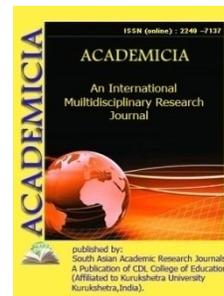

of these results are being implemented by the leaders of our country. We have reached the time dreamed of by the great thinker, scientist Farobi. It is impossible to describe the formation of the "City of Noble People" in our country, the repeated publication of his works, the formation of the image of a perfect man in the education of young people.

### ABSTRACT

*Information about the formation of the Bukhara oasis, its hydrogeological regime, climate, soils is given. In this state, the author discloses information about the hydrogeological regime of the origin of the Bukhara oasis, the soil climate. Its hydrological regime is the birth of the Bukhara oasis, the soil provides information about the climate.*

**KEYWORDS:** *Bukhara Oasis, Zarafshanriver, Desert, Climate, Soil, Salinity, Canal.*

### INTRODUCTION

Ancient manuscripts and monuments of history and culture development of the agricultural culture of South-West Asia in the valleys and oases of Central Asia, including the Bukhara oasis. According to V.G. Saakov, in the lower reaches of the Maosif (Zarafshan) River at the end of the 2nd - beginning of the 1st centuries. BC. due to the construction of irrigation facilities, new lands were developed. As a result of these works, the Bukhara oasis was formed, from where a beautiful view opens.

According to the famous historian Muhammad Narshakhi, the main reason that the Bukhara oasis has become such a fertile land is the fact that the Maosif (Zarafshan) river originates in high mountains and contains many muddy streams. Academician Gulyamov (1974), as a result of archaeological research, scientifically substantiated the fact that the city of Bukhara is located in the middle reaches of the Shokhrud channel, which was formed in the middle of the first millennium BC.

Despite the fact that the irrigated lands of the Bukhara oasis have been used for agriculture for centuries, the problem of changes in the physicochemical and mineralogical composition of soils under the influence of the Shokhrud, Vobkentdarya and Shafirkan canals is one of the least studied areas. The irrigated lands of the Bukhara oasis are located in the desert and occupy the central part of the KyzylKum. Due to its distance from the ocean and the open sea for thousands of kilometers, Bukhara is one of the typical arid countries.

Bukhara region is one of the countries included in the inner basin and is located on the border of the transition from a temperate climate to a subtropical one. This geographical position of the region has a significant impact on the climate. That is, the regional atmosphere in the summer is formed under the influencedry tropical air, and in winter - under the influence of cool air coming from the north, temperate latitudes.

The average annual air temperature is 150C. The hottest month - July - 28.6 ° C - 32.6 ° C, and the coldest month - January - 0.4-1.5 ° C. In sandy and rocky deserts on some summer days, the temperature rises to 66-74 ° C .

Annual precipitation is 125.5 mm, falling mainly in winter and spring. High temperature and dry air lead to strong evaporation. Evaporation from the water surface is 2057 mm per year. The bulk of moisture is observed during the growing season (until September), which corresponds to 1648 mm. During this period, it is very important to maintain soil moisture. Because during the growing season, the total temperature is 4500-5600oC.

Differences are observed when comparing air temperature with soil surface temperature. If the surface temperature of the soil is higher than the air temperature for 10 months (in the Bukhara oasis), then in the remaining two months (November and December) it will decrease. However, in the Karakul oasis, the soil surface temperature is high all year round.

The beginning of freezing of the soil surface occurs on average in November. The last frost is in April.

A small difference in vibration between the soil surface and air temperature occurs in December at 0.20 C, and a large difference is observed in July at 70 ° C. In autumn and winter, the difference between the soil surface and air temperature is small. The drop in soil surface temperature per night reaches 20-250 C.

As a result of observations, it was found that the climate of the Bukhara oasis is adapted for the care of irrigated crops, but has some drawbacks. A small amount of precipitation and nighttime temperature fluctuations lead to salinization of the surface soil layer and the occurrence of waterlogging processes. These processes, in turn, interfere with the normal development of crops.

In the 50-60s of the last century, due to the complexity of irrigation of the lands of the Bukhara oasis by the Zarafshan River, the construction of the Amu-Bukhara machine channel (ABMK) began in 1959.

Its length is 197 km, the flow rate is 100 m<sup>3</sup> / sec. Up to 50 km. In other words, the ABMK flows to the Dengizkul plateau. Then, with the help of the Khamza-1 pumping station, the water of the canal rises by 45 m and is collected in the Tudakol and Kuyimazor reservoirs through the Kumsultan lowland, located in the western part of the SaritoshDzhargok plateau.

The Kuyimazar reservoir was built in 1957, the basin area is 16.3 km<sup>2</sup>, the depth is 18-44 m. The Tudakol reservoir is located in the southeast of the Kuyimazar reservoir and occupies an erosion-tectonic depth with a total water area of 1250 million m<sup>3</sup> and an annual evaporation rate of 400 million m<sup>3</sup>. It contains up to 40 million m<sup>3</sup> of salts, of which 20 million tons of rapidly dissolving chloride compounds.

Currently, the Shokhrud canal starts from the Kuimazor reservoir, the distribution of water in it, turbidity, the mechanical and micro-aggregate composition of suspended watercourses, the amount of chemical compounds are directly related to the Amu Darya current. The average annual consumption of ABMK is currently 69.5-135.8 m<sup>3</sup> / s, and in the summer months - 308.6 m<sup>3</sup> / s. and 80% of irrigated water in Bukhara region.

An increase in turbidity in the lower reaches of the Shokhrud canal up to 3.27 g / l can be associated with an increase in construction work in Bukhara and the discharge of various secondary substances, compounds, sediments and debris into the canal. Thus, 16-22% of silt in the water will settle from the upper reaches of the Shokhrud canal to the lower reaches. In addition, the level of turbidity in the upper, middle and lower reaches of the Shokhrud canal is decreasing as a result of a gradual decrease in the flow rate from the canal to irrigated fields and fields. Examples include the New Bukhara basin in the middle reaches of the Shokhrud channel and the Gulistan basin. In the basin of New Bukhara, the turbidity of water is 2.92 g / l, in the Gulistan basin, its content decreases to 0.72 g / l, or the level of turbidity decreases by almost 4 times. Similar changes are observed in other branches and tributaries of the Shokhrud channel.

The hydrogeological regime of the irrigated lands of the Bukhara oasis can be divided into two parts in terms of character and structure. The flow of groundwater in the upper reaches of the delta of the Zarafshan River, a semi-arid hydrogeological region, is more difficult, in the rest of the delta, the flow of groundwater is more difficult.

Sources of balance of groundwater inflow: 1) precipitation; 2) groundwater flowing through gravel from the nearby proluvial-diluvial uplands and the Zarafshan valley; 3) groundwater close to the surface. This is the sum of the waters formed as a result of infiltration under the influence of irrigation in Zarafshan.

The first source is a small amount of precipitation, which is practically insignificant for the formation of groundwater.

The role of the second source is much greater. This is due to the fact that groundwater comes out of gravel in the lower part of the Zarafshan Valley, which increases the area of groundwater at a depth of 2-4 meters.

According to the Regional Department of Agriculture and Water Resources, 50% of the water irrigated from the surface soil layers is wasted through filtration and evaporation. Groundwater discharge balance routes: 1) runoff from the oasis territory through the collector-drainage; 2) is consumed during evaporation and transpiration.

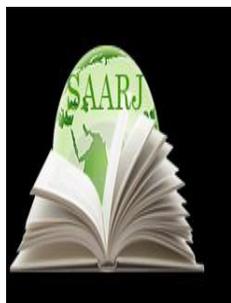

Alluvial and agro-irrigation deposits serve as suitable groundwater rocks. The formation, accumulation and drainage of groundwater in irrigated areas, their proximity to the surface leads to the development of salinization and salinization of soils as a result of excessively slow water discharge, large-scale evaporation. As the groundwater approaches the upper soil layers, the level of mineralization increases and the runoff decreases. For the reasons indicated above, the

presence of highly saline and saline areas was found on the southern and southeastern sides of the area studied by us.

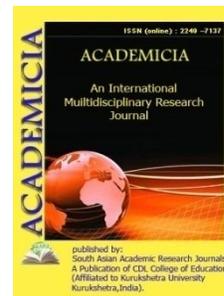

Despite the fact that the irrigated lands of the Bukhara oasis have been used for agriculture for centuries, the problem of changes in the physicochemical and mineralogical composition of soils under the influence of the Shokhrud, Vobkentdarya and Shafirkan canals is one of the least studied areas. By further focusing on these areas, the problems will be solved.

### ABSTRACT

*The issue of strengthening tax discipline remains in the focus of attention to ensure the flexibility of tax policy to modern requirements for the purpose of financial security in the world. In this regard, this article discusses the issue of strengthening tax discipline from a scientific and theoretical point of view.*

**KEYWORDS:** *Economic Security, Financial Security, Tax Security, Tax, Tax Discipline, Tax Policy, Tax Mechanism.*

### INTRODUCTION

Modernization of the modern tax system and the formation of an effective tax administration in the Republic of Uzbekistan are taking their first steps; the fact that its development is an important mechanism for economic development underscores the importance of a realistic assessment of the progress of drastic reforms in the tax system and the structural changes in tax practice in this area. As a separate area of tax system reform, which is the subject of much debate today, it is important to study the relationship between the organizations of effective tax administration in order to strengthen tax discipline.

Reducing the tax burden in the current globalization environment in the developed countries of the world; unification of tax types and reduction of tax rates; application of modern information technologies in the development of electronic systems of tax payment and tax reporting; special attention is paid to the creation of a favorable investment climate and business environment for doing business. In the development trends of world tax practice, government measures to stimulate an innovative economy play an important role in strengthening tax discipline.

## LITERATURE REVIEW

The economic sectors, levels of governance, strategic priorities and the breadth of tasks to be addressed testify to the *multifaceted nature of the concept of economic security*. Based on the logical transformation of economic relations in the *fundamental foundations of economic theory - the transformation* of different types of concepts of economic security (financial security, tax security, investment security, etc.), the status of these concepts has been discussed by various researchers [12]. In particular, N.N. Kaurova defended her dissertation on the study of financial and economic security [1, p. 38], E.V. Karanina - on the study of financial security [2, p. 239], O.A. Mironova - on the study of tax security [3, p. 463], E.L. Kuzina - devoted to the study of ecological and economic security [4, p. 46], T.M. Vorozheykina and E.I. Kendyukh - studied the problems of food security [5, p. 42].

U. Aves, a professor at the University of Birmingham in the UK, applied the interrelationship between tax discipline and financial stability on the example of the Commonwealth. The strengthening of tax discipline has strengthened the tax base by reducing the number of cases of tax evasion, concealment of taxable assets and income, and has led to more efficient management of expenditures by taxpayers [6].

H. Schubertta, a professor at the Massachusetts Institute of Technology in the United States, studied the impact of tax discipline on financial security in his research. The high risk of financial crisis in countries with low tax discipline has confirmed that it is not possible to ensure financial stability by any economic means unless tax discipline is strengthened [7].

Academician V.K. Senchagov defined the concept of “financial security” as “financial security - is to ensure the development of the financial system and financial relations and processes in the economy in such a way as to maintain socio-economic and financial stability, integrity and unity of the financial system (including money, budget, credit, tax and currency systems), the necessary financial conditions will be created for the successful elimination of internal and external threats in the financial sector”[8, p. 269].

## THE MAIN FINDINGS AND RESULTS

Since the concept of financial security is a category inextricably linked to economic security, it can be concluded that at the enterprise level in the description of its essence and characteristics, there is a synthesized concept that combines the two concepts of economic security and financial management.

The concept of financial management is characterized by the application of a number of concepts and categories, such as “finance”, “financial resources”, “sources of funding”, “methods of financial management” [11, pp. 212-223]. These concepts have been studied in sufficient depth in the modern economic literature, and in our opinion, a certain theoretical basis and methodological guidance has been created to improve the financial basis of security. A striking example of this situation is the statement of existing descriptions of financial security made by I.A. Blank [9, pp. 14-24]. Such descriptions include the following:

*1. Financial security as a key element or component of the economic security system.*

2. *Financial security as a system of quantitative and qualitative indicators of the financial condition of the enterprise, which allows a comprehensive assessment of the level of financial protection.*
3. *The formed system of priority, balanced financial interests of the enterprise as an object of financial security.*
4. *Threats to the financial security of the enterprise (both external and internal) are the main content of the concept of financial security.*
5. *The differentiated level of quantitative and qualitative parameters of protection of financial interests of the enterprise forms the basis of system of measurement and an assessment of level of financial security.*
6. *Financial security can be understood as a system that ensures the stability of the financial ratios of the enterprise's development, and this is a determining factor for the protection of its financial interests.*
7. *The financial security of the enterprise requires the preparation of the appropriate foundations for sustainable growth in the current and strategic periods.*

The task of ensuring sustainable growth in the short (current) period is directly related to the stability of the financial condition of the enterprise, which is sufficient to create the basis for sustainable development in the future. The tasks of financial security in the strategic (long-term) period are mainly aimed at maintaining significant financial ratios that ensure sustainable growth in the enterprise and a constant (stable) increase in its market value.

A general description of the approaches of individual authors to determining the content of financial security is given in Table 1.

The analysis shows that there is a need to study the shadow economy and its theoretical aspects, as well as to ensure economic security [10, pp. 106-116]:

**TABLE 1 DESCRIPTION OF THE CONCEPT OF FINANCIAL SECURITY IN THE WORKS OF VARIOUS AUTHORS (AUTHOR'S DEVELOPMENT)**

<b>Author and source</b>	<b>Description of the concept of financial security</b>
1. Blank I.A. Financial security management of the enterprise. / I.A. Form. - 4th ed. Kiev: Elga, Nika-Center, 2017. – p. 784. - (Series “Library of the financial manager”. Issue 10),	“The financial security of an enterprise is a quantitatively and qualitatively coordinated level of its financial position that provides stable protection of the company's priority, balanced financial interests from internal, external real and potential threats, the parameters of which are determined by its financial philosophy. creates the necessary conditions for financial support for growth”(p. 24)
2. E.V. Karanina Financial security (at the level of the state, region, organization, individual): Monograph. - Kirov: Vyatka State University, 2015. – p 239.	“Protection of financial interests at all levels of financial relations; a certain degree of independence, stability in the face of external and internal factors of instability, including threats to the financial security of the country; the ability of the public financial system to ensure the effective functioning of the national economic system and sustainable economic growth” (p. 11)

3. Economic security of Russia: General course: textbook / ed. VC. Senchagov. 5th ed. – Moscow. Delo, 2018. –p. 896.	“To ensure the development of the financial system and financial relations and economic processes in such a way as to ensure the socio-economic and financial stability of the country's development, maintaining the integrity and unity of the financial system (money, budget, credit, tax and currency systems), internal and external financial threats. the necessary financial basis for successful liquidation will be created” (p. 312)
4. Economic security: textbook / ed. S.S. Mayilyan, N. D. Eriashvili - 3rd ed. – Moscow. UNITI-DANA, 2016. – p. 503.	“... Is a state of protection of national interests, which is ensured by the state through a set of measures capable of mitigating the effects of external and internal threats through the budget, tax, monetary and investment policies” (p. 231).

Our study, which chose to explore ways to strengthen tax discipline for financial security in a new context [16, pp. 64-69], to study it on the basis of the rules of economic systematization requires to consider this process as a sum of targeted activities of three levels of systemic relations participants (Figure 1).

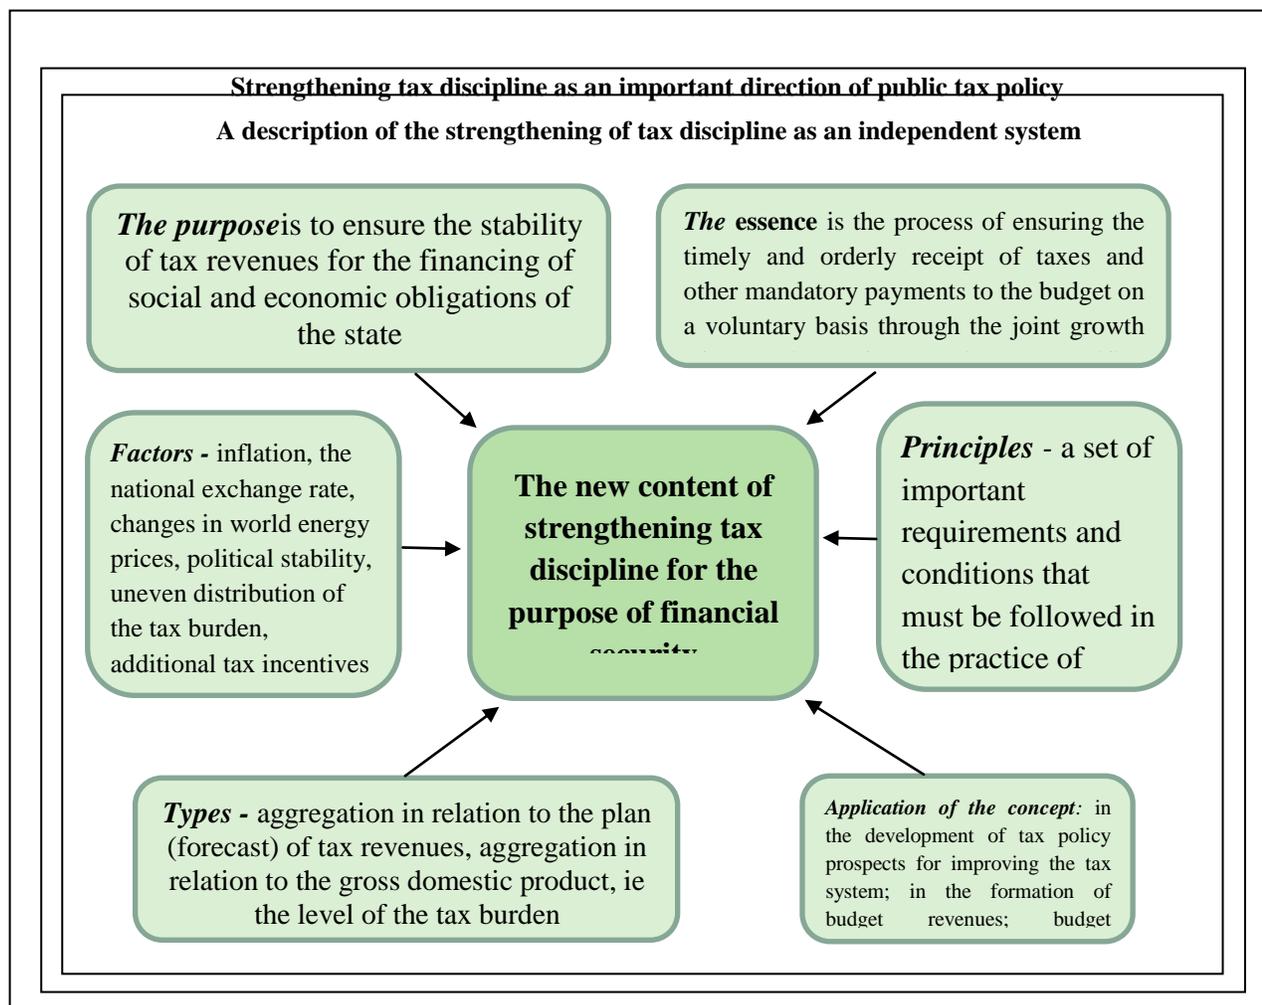

Figure 1. New content of strengthening tax discipline for the purpose of financial security

(Author's development)

## CONCLUSION

In our view, non-payment of taxes, tax evasion, non-registration as a taxpayer, and other similar tax offenses and tax offenses imply that taxes are closely related to legal relationships [13;14,pp. 7849-7855; 15, pp. 7920-7926].

Since the level of compliance with tax discipline depends not only on all forms of financial security at the state, economic sector or a particular region, and in particular on tax security, it is important to study the features of its calculation procedure and methodology.

**Abstract**

*This article examines the movement of the ball, which regulates the uniform distribution of the torque of the curved yarn, under the action of the tension of the thread. The parameters of a moving ball mounted on a spindle are calculated for the uniform propagation of the spindle along the thread at different angles of the circumference of the surface. In addition, the static and dynamic equilibrium condition of the ball, which regulates the distribution of the torque within the rotating axially symmetric vessel, has been investigated to study the conformity of technological and kinematic performance on the new torsion buckle device.*

**KEYWORDS:** *Torsion, Yarn, Technique, Spherical Vessel, Ball, Equation, Tension, Angle, Torque, Evenly.*

---

**INTRODUCTION**

Curved products create a variety of thread structures. The torsion process in the production of curved yarn is considered the main process at this stage. Consequently, much attention has been paid to the improvement of technology, torsion technology, as well as thread productions. Production of combined and shaped threads is one of the most effective ways to expand the range and improve the quality of fabrics and knitwear.

Products from combined and shaped threads have useful operational and consumer properties (attractive appearance, good hygienic performance, high wear and shape resistance, etc.) A great contribution to the development of technology of combined threads and yarns was made by prof.

A.G. Kogan [1, 2], one of the first in Russia to develop and implement a method for producing a cotton-kapron combination thread on a spinning machine he upgraded (PKE-100). The author [2] proposes that the machine should be equipped with hollow spindles with a nozzle; with an out-of-the-way spindle for placing inlet packs with component threads; with tensioners of a plate type; devices to control the presence of the component threads and the automatic deactivation of workplaces when any component is cut off or the threads are removed from the supply packaging. The original method for producing combined (reinforced) threads was proposed by Prof. P.P. Trykov [3]. Any type of yarn, chemical threads and even metal wire can be used as a core produced according to the P.P. Trykov method. Having conducted by prof. V.A. Usenko a comparative analysis of methods and machines for the production of combined and shaped yarns [4,5,6,7] showed that the most effective way to obtain them on single-process machines with hollow spindles produced by a number of foreign companies (Germany, England, USA, Bulgaria, etc.).

Although the productivity of this machine is 3.4 times higher than that of machines with conventional ring-twisting spindles, it should not be recommended for widespread use, since the machine is complex, and has a number of design drawbacks, the cost of producing combined threads on it is much higher than the cost of obtaining similar threads on machines with ring spinning spindles.

The current production of twisted threads in the textile industry is mainly in dual-torsion machines. Studies shown that, despite the high performance of dual-torsion machines, there are some disadvantages in terms of the limited range produced and the uneven distribution of steep.

In order to increase the range of textile materials and the requirements for curved yarn, the authors have developed a new device to produce curved yarn on the spindle [8].

Theoretical studies have been carried out to determine the optimal parameters of the working organs of the new device. It was studied about the dynamics of rotational motion along the spherical surface of the ball, which determines the kinematic parameters of the new device [9, 10].

**Theoretical Basis.** To match the technological and kinematic parameters on the new device, the statistical and dynamic equilibria of the thread with the ball was investigated.

The ball mass  $m$  is in contact with a thread moving along its surface along the arc of the girth  $s_0 = r\alpha_0$  (figure 1).

The movement of the ball begins at a moment of time  $t = 0$  when the thread tension along the arc is distributed according to Euler's law:

$$T_c = T_n \exp(f\alpha) \quad (0 < \alpha < \alpha_0)$$

In the process of rotation of the ball, the centrifugal force is additionally applied to the strand  $m_0 r \dot{\varphi}^2$  ( $m_0$  - linear mass of the thread, ( $\dot{\varphi} = \frac{d\varphi}{dt}$ ,  $\varphi$  - ball rotation angle  $oz$  centered at  $O'$ ), which causes the thread tension to change.

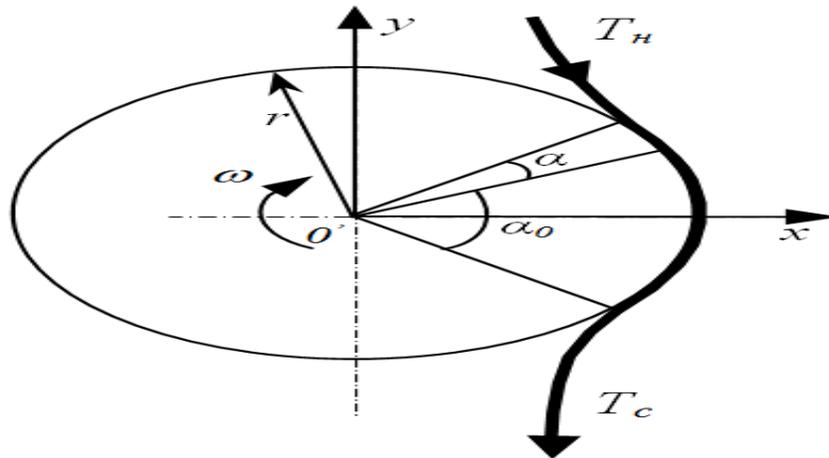

Figure 1. Contact diagram of the ball with a moving thread on its surface

The string equilibrium equation with ball rotation is written in natural coordinates

$$\text{as } \frac{dT}{ds} - \tau = 0 \quad (1)$$

$$\frac{T}{r} - q = m_0 r \dot{\phi}^2 \quad (2)$$

Where,  $T = T(t, \alpha)$  - Thread tension at random contact arc.

$s = r\alpha$  Girth arc,  $\tau$  and  $q$  tangent and normal forces on the surface of the ball per unit length. Assume that on the surface of the contact these forces are connected by the Coulomb dry friction law (friction coefficient), i.e.

$$\tau = fq \quad (3)$$

Having subtracted (1) from (2) taking into account (3) we get:

$$\frac{dT}{d\alpha} - Tf = -m_0 r^2 \dot{\phi}^2 f \quad (4)$$

Equation (4) is integrated under the condition:

$$T = T_{H0} \text{ at } \alpha = 0; \quad (5)$$

Then the solution of equation (4) has the form:

$$T = (T_{H0} - m_0 r^2 \dot{\phi}^2) e^{f\alpha} + m_0 r^2 \dot{\phi}^2 \quad (6)$$

We will obtain:  $\alpha = \alpha_0$

$$T_{C0} = T_{H0} e^{f\alpha_0} - m_0 r^2 \dot{\phi}^2 (e^{f\alpha_0} - 1) \quad (7)$$

In this case, the contact force with (1) shall be equal to:

$$F = r \int_0^{\alpha_0} \tau \cdot d\alpha = (e^{f\alpha_0} - 1) [T_{n\sigma} - m_0 r^2 \dot{\varphi}^2] \quad (8)$$

Record the ball's movement equation at a known angle  $\alpha_0$ :

$$J\ddot{\varphi} + m_0 r^3 \dot{\varphi}^2 (e^{f\alpha_0} - 1) = r \cdot T_{n\sigma} (e^{f\alpha_0} - 1) \quad (9)$$

Here:  $J$  – moment of inertia of the ball.

This equation describes the rotational motion of a ball.

Introducing the following notation:  $a = \frac{m_0 r^3}{J} (e^{f\alpha_0} - 1)$ ,  $b = \frac{T_{n\sigma} r}{J} (e^{f\alpha_0} - 1)$ ,  $\gamma = \sqrt{ab}$

solving the equation lead to:

$$\ddot{\varphi} + a\dot{\varphi}^2 = b \quad (10)$$

For  $\dot{\varphi}$  under the condition  $\dot{\varphi}(0) = 0$  has the form:

$$\dot{\varphi} = \frac{b}{\gamma} \operatorname{th} \gamma t \quad (11)$$

We integrate the level 11 if  $\varphi(0) = \varphi_0$

$$\varphi = \varphi_0 + \frac{b \ln}{\gamma^2} [(ch \gamma t)] = \varphi_0 + \frac{b}{\gamma^2} \ln ch \gamma t$$

Thus, the law of changing the angle of rotation of the ball around the center of gravity is described by the expression:

$$\varphi = \varphi_0 + \frac{b}{\gamma^2} \ln ch \gamma t = \varphi_0 + \frac{b}{ab} \ln (ch \gamma t) = \varphi_0 + \frac{1}{a} \ln ch \gamma t \quad (12)$$

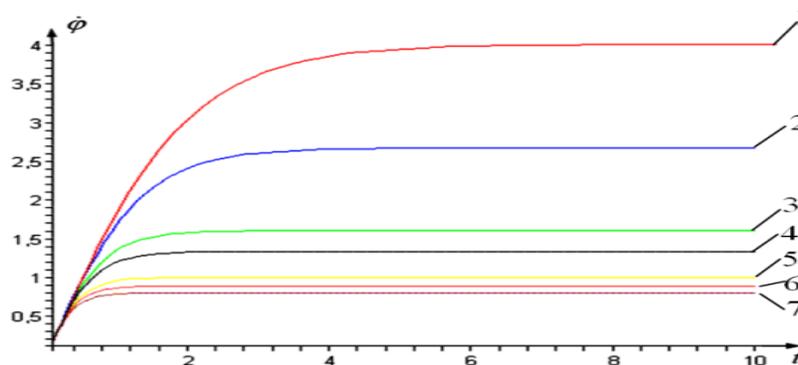

Figure 2. Time-dependent change in ball velocity –  $t$ (sec) at various parameter values  $\gamma = \sqrt{ab} : 1$   
 -  $\gamma = 0.5$ , 2 -  $\gamma = 0.75$ , 3 -  $\gamma = 1.25$ , 4 -  $\gamma = 1.5$ , 5 -  $\gamma = 2.0$ , 6 -  $\gamma = 2.25$ , 7 -  $\gamma = 2.5$

The limiting values of the angular velocity of the ball will be:

$$\dot{\varphi} = \frac{b}{\gamma} = \sqrt{\frac{b}{a}} = \sqrt{\frac{T_{н\bar{\sigma}} r (e^{\alpha_0 f} - 1)}{J} \cdot \frac{J}{m_0 r^3 (e^{\alpha_0 f} - 1)}} = \sqrt{\frac{T_{н\bar{\sigma}}}{m_0 r^2}} \text{ if } t \rightarrow \infty$$

It is like: 
$$\dot{\varphi}_{np} = \sqrt{\frac{T_{н\bar{\sigma}}}{m_0 r^2}} \quad (13)$$

The tensile strength of the thread with regard to the angular velocity shall be determined as:

$$T = \left[ T_{н\bar{\sigma}} - m_0 r^2 \cdot \frac{b^2}{\gamma^2} th^2 \gamma t \right] e^{f\alpha} + m r^2 \cdot \frac{b^2}{\gamma^2} th^2 \gamma t \quad (14)$$

The tension on the running part of the thread is equal to:

$$T_{c\bar{\sigma}} = \left[ T_{н\bar{\sigma}} - m_0 r^2 \cdot \frac{b^2}{\gamma^2} th^2 \gamma t \right] e^{f\alpha_0} + m r^2 \cdot \frac{b^2}{\gamma^2} th^2 \gamma t \quad (15)$$

We obtain: 
$$T_{c\bar{\sigma}} = \left[ T_{н\bar{\sigma}} - m_0 r^2 \cdot \frac{b}{a} \right] e^{f\alpha_0} + m r^2 \cdot \frac{b}{a} \text{ при } t \rightarrow \infty$$

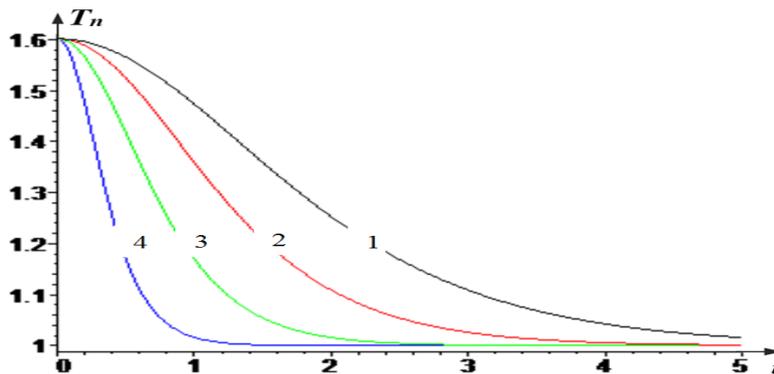

Fig. 3. Tension change  $T_c = T(t, \alpha_0)$  (related to  $T_n$ ) in  $t$  (сек) if  $f = 0.3$ ,  $\alpha_0 = 90^\circ$  different parameter values  $\gamma = \sqrt{ab}$ : 1 -  $\gamma = 0.5$ , 2 -  $\gamma = 0.75$ , 3 -  $\gamma = 1.25$ , 4 -  $\gamma = 2.5$

Figure 2 shows the variation of the ball's angular velocity according to time-t.

It is observed that at  $\gamma \rightarrow \infty$ ,  $\omega = \dot{\varphi}$  strives for its ultimate value  $\omega = \dot{\varphi} \approx \omega_{np}$ .

This law corresponds to experimental values  $\omega$ . Figure 3 shows the change in the thread tension  $T_{c\bar{\sigma}}/T_{н\bar{\sigma}}$  from time - t, for various values of the parameter -  $\gamma$ .

Next, we will do theoretical studies to determine the equilibrium position of the ball regulating the distribution of the steep within the rotating axis of the symmetric receptacle.

Let the ball of radius  $r$  be in equilibrium within the rotating angular velocity of the axially symmetric receptacle. We set the origin of the coordinates at the lower point of the receptacle, steer the axis along the axis of rotation of the  $ox$  axis and  $oy$  perpendicular to it (Figure 4).

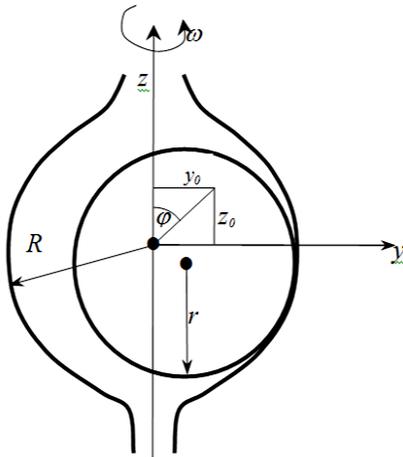

Figure 4. Schematic of an axisymmetric receptacle with a ball inside

For simplicity, we consider the center of the ball in the plane of  $zoy$  at the point  $M_0$  with the coordinate  $(0, y_0, z_0)$  as the point  $M_I$  with the coordinate  $(0, y_1, z_1)$  (figure 5).

The rotation surface equation (receptacle) should be represented as

$$z_n = f(x^2 + y^2) \quad (16)$$

In the plane  $x=0$ , we have a curve  $z_n = f(y^2)$

The ball equation in the  $xyz$  coordinate system has the following form:  $x^2 + (y - y_0)^2 + (z - z_0)^2 = r^2$

In the plane  $x=0$ , we get the equation of the circle:

$$(y - y_0)^2 + (z - z_0)^2 = r^2$$

By allowing the variable  $z$  we have:  $z = z_0 - \sqrt{r^2 - (y - y_0)^2}$

At point  $M_I$ , the geometric conditions are satisfied:

$$z = z_n, \quad z' = z'_n \text{ if } y = y_1$$

Which provide

$$f(y_1^2) = z_0 - \sqrt{r^2 - (y_1 - y_0)^2} \quad (17)$$

$$2y_1 f'(y_1^2) = \frac{y_1 - y_0}{\sqrt{r^2 - (y_1 - y_0)^2}} \quad (18)$$

We denote by the angle  $\varphi$  between the segment  $MB$  and the radius of the circle  $M_0M_I$  through which we express the coordinates of the point  $M_I$ .

$$y_1 = y_0 + r \sin \varphi$$

$$z_1 = z_0 - r \cos \varphi \quad 0 < \varphi < \frac{\pi}{2}$$

Equation (17) and (18) are given as

$$f[(y_0 + r \sin \varphi)^2] = z_0 - r \cos \varphi \quad (19)$$

$$2(y_0 + r \sin \varphi) f'[(y_0 + r \sin \varphi)^2] = \operatorname{ctg} \varphi \quad (20)$$

The system of equations (19) and (20) allows the coordinates to be determined according to a given value  $y_0$  and  $z_0$ .

Consider the special case of a spherical vessel of radius  $R$ :

$$x^2 + y^2 + z^2 = R^2$$

In the plane  $x = 0$  we have a circle

$$y^2 + z^2 = R^2$$

Consider the part of the circle located in the region  $y > 0$  and  $z < 0$ . The equations (19) and (20) take the form like:

$$-\sqrt{R^2 - (y_0 + r \sin \varphi)^2} = z_0 - r \cos \varphi$$

$$\frac{y_0 + r \sin \varphi}{\sqrt{R^2 - (y_0 + r \sin \varphi)^2}} = \operatorname{tg} \varphi$$

From equality (17) we obtain:

$$(y_0 + r \sin \varphi)^2 = \operatorname{tg}^2 \varphi [R^2 - (y_0 + r \sin \varphi)^2]$$

or

$$y_0 + r \sin \varphi = R \cdot \sin \varphi$$

$$y_0 = (R - r) \sin \varphi$$

From equation (16) we find

$$z_0 = -(R - r) \cos \varphi = (R - r) \cos(\pi - \varphi)$$

To determine the angle, we now compose the equation of relative equilibrium of the ball in the spherical vessel.

We prepare a projection of forces acting on the ball in a normal and tangent direction (Figure 5).

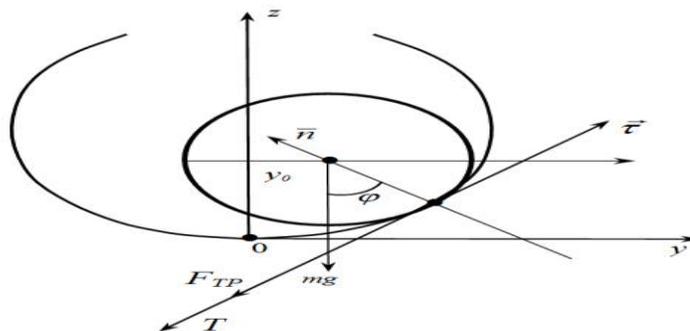

Figure 5. The arrangement of the ball inside the axisymmetric vessel [11].

The ball is affected by the weight of  $mg$  and the centrifugal force  $m\omega^2 y_0$ , the projections on the normal and the tangent are equal to:

$$N = mg \cos \varphi + m\omega^2 y_0 \sin \varphi$$

$$F_{TP} = -mg \sin \varphi + m\omega^2 y_0 \cos \varphi$$

We accept that the law of dry friction takes place on the contact surface, where  $f$  – coefficient of friction.

$$T = f \cdot N$$

By providing the expression  $T, N$  and  $y_0$ , we get an equation to determine the angle  $\varphi$ :

$$(\sin \varphi + f \cos \varphi) - \lambda \sin \varphi (\cos \varphi - f \sin \varphi) + \overline{T} = 0 \quad (21)$$

Where,

$$\sin \varphi + f \cos \varphi - \lambda \sin \varphi (\cos \varphi - f \sin \varphi) + \overline{T} = 0$$

$$\lambda = \frac{\omega^2 (R - r)}{g}, \quad \overline{T} = \frac{T}{mg}$$

Table 1 shows the coordinates of the center of the ball  $y_0, z_0$  and the normal force  $N/mg$  for various values of the angular velocity of the ball  $\omega$ .

In the calculations decision  $R=9\text{mm}$ ,  $r=6\text{mm}$ ,  $f=0,3$ ,  $m=8,2\text{gr}$

**TABLE 1. COORDINATES OF BALL CENTER AND NORMAL FORCE FOR DIFFERENT BALL ANGULAR VELOCITY VALUES**

Coordinates of the ball center $y_0, z_0$ and normal force $N/mg$	Angular velocity of the ball $\omega, \text{c}^{-1}$								
	<b>84</b>	<b>100</b>	<b>200</b>	<b>300</b>	<b>400</b>	<b>500</b>	<b>600</b>	<b>700</b>	<b>800</b>
$y_0 (mm)$	1.47	2.28	2.78	2.83	2.85	2.86	2.86	2.87	2.87
$z_0 (mm)$	-2.61	-1.93	-1.11	-0.97	-0.92	-0.9	-0.88	-0.88	-0.87
$N/mg$	1.38	2.39	10.71	24.5	43.7	68.5	98.9	134.6	176

By inserting the data into the equation, the equilibrium position of the ball inside the spherical vessel is determined at different angular velocity values of the receptacle.

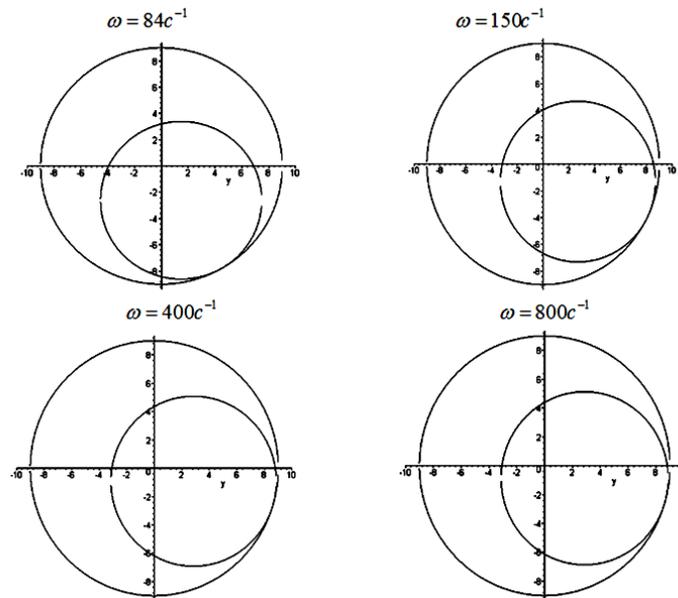

Figure 6. Equilibrium positions of the ball inside the spherical receptacle at different angular velocity values of the receptacle

## CONCLUSIONS

From the graphs (Figure. 2. 3.) follows that with the increase of the parameter  $\gamma$ , the thread tensioning value is closer to the limit  $T_{np}$ . This means that the ball's rotation becomes stationary and promotes an even distribution of the torque along the thread.

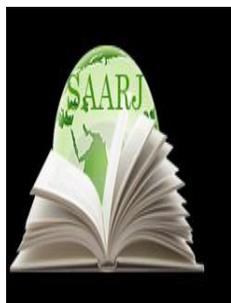

An analysis of the position of the ball relative to the rotating spherical receptacle (Figure 6.) shows that the lowest position of the ball corresponds to the angular velocity of the vessel  $\omega = 84c^{-1}$  and under  $\omega < 84c^{-1}$  at the centrifugal force will be insufficient to change its position relative to the receptacle and the ball will be in equilibrium position by gravity and friction.

Further, with the height of the coordinate of the center of gravity, the ball is moved to the positive side of the axis and at the same time, they remain unchanged.

### ABSTRACT

*This paper analyzed the working principle of the Michelson interferometer and the measurement capabilities of some physical quantities. A graphical representation of the experimental results was also analyzed using the expression of the refractive index of air as a function of its pressure using Michelson interferometry.*

**KEYWORDS:** *Interferometer, Refractive Index, Michelson Interferometer.*

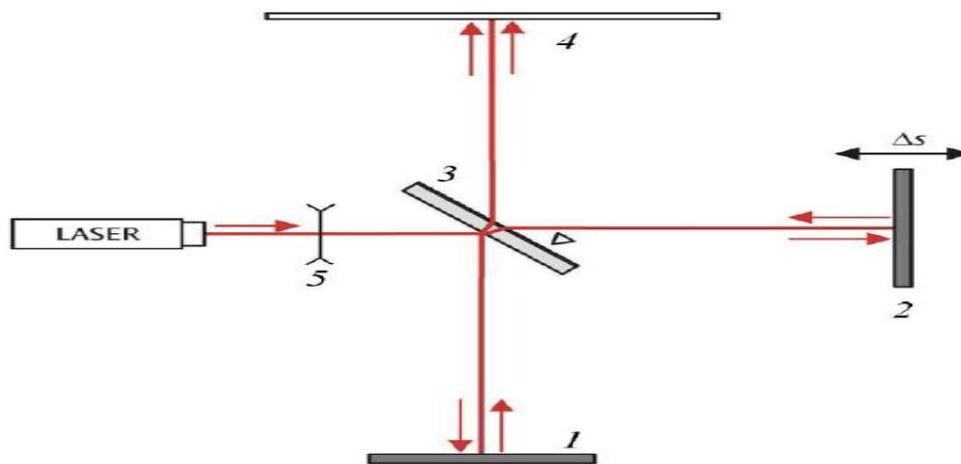

---

### INTRODUCTION

Nowadays, not only in science but also in technology, various methods of measuring the size of objects require high accuracy. Therefore, interferometers are widely used today in scientific research and industry to detect very small shifts, the refractive index of the environment, and the detection of uneven surfaces.

It is known that the refractive index of a vacuum is 1. The refractive index of air differs very little from it. However, by varying the pressure in the chamber, it was investigated that such small differences could also be detected by shifting the interference pattern on the Michelson interferometer.

In the first part of this article, the ability to measure not only optical waves but also high-frequency electromagnetic waves for waves using the Michelson interferometer was tested. In the second part of the article, we made a comparative analysis with the theoretical results by experimentally determining the dependence of the refractive index of air on its pressure using the Michelson interferometer.

### 1. Michelson interferometer

An interferometer is a measuring device whose operation is based on the phenomenon of light interference. There are many types of interferometers, in this work we use a Michelson interferometer. The schematic diagram of the Michelson interferometer is shown in Fig.1. The laser beam, passing through the diffusing lens 5, is divided into two using a translucent mirror 3. After passing a certain path, one ray is reflected from the unmovable mirror 1, the second from the mirror 2, the position of which can be changed. The beams return along their trajectories to the translucent mirror. From the mirror, the rays go to screen 4, where, as a result of their addition, an interference pattern is observed - alternating light and dark rings [1]. Looking at the change in the interference pattern, can be measure some physical quantities.

In this paper, we will study how to determine the wavelength of an electromagnetic wave and the refractive index of air depends on its pressure, using a Michelson interferometer.

### 2. Measurement the wavelength of electromagnetic waves using a Michelson interferometer

Interferometers are devices that are used to accurately measure the length of electromagnetic waves not only in the visible, but also in other ranges. The principle of operation of the interferometer is as follows: a beam of electromagnetic radiation (light, radio waves, etc.) is spatially divided into two or more coherent beams using one or another device. Each of them

passes different optical paths and is directed to the screen, creating an interference pattern, according to which it is possible to establish the phase difference of the interfering beams at a given point in the pattern.

The Michelson interferometer is shown in Fig.2. Electromagnetic wave propagates from source 1. Part of the incident flow is reflected from the semitransparent plate 2 in the direction of the mirror 3, the other part passes through the plate 2 and propagates in the direction of the mirror 4. Having reflected from the mirrors, the rays again reach plate 2 and pass in the direction of the receiver 5. Subject to the conditions of spatial and temporal coherence, these rays will interfere. The result of the interference depends on the optical path difference  $\Delta$  from plate 2 to the mirrors. The amplification or weakening of the vibration amplitude, recorded by the receiver 5, occurs when the position of one of the mirrors, for example, mirror 4, changes.

The condition for maxima (or minima) has the form:

$$\Delta = n\Delta r = m \cdot \lambda \quad (1)$$

Where  $n$  - refractive index of medium,  $\Delta r$  - geometric difference of path,  $\lambda$  - wavelength,  $m$  - order of interference maxima.

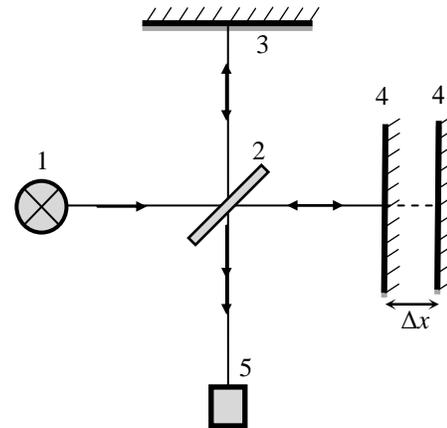

Then, for two neighboring maxima (minima) of  $m$  and  $m + 1$  orders, we can write the equality

$$n\Delta r_1 = m \cdot \lambda \text{ and } n\Delta r_2 = (m + 1) \cdot \lambda$$

Hence we get

$$\lambda = n(\Delta r_2 - \Delta r_1) = 2n(x_2 - x_1) \quad (2)$$

Where  $x_2 - x_1$  - the minimum distance by which it is necessary to move the movable mirror 4 in order to obtain amplification (attenuation) of oscillations again.

**Fig.2.** 1-electromagnetic wave source, 2-translucent plate, 3-unmovable metal plate 4-movable metal plate, 5-receiving source.

### 3. Determination the dependence of the refractive index of air from its pressure using a Michelson interferometer

It follows from Maxwell's equations that the speed of electromagnetic waves is:

$$v = \frac{1}{\sqrt{\varepsilon_0 \mu_0}} \cdot \frac{1}{\sqrt{\varepsilon \mu}} = \frac{c}{n} \quad (1)$$

Where  $c = 1/\sqrt{\varepsilon_0 \mu_0} = 2,9979 \cdot 10^8 \text{ m/s}$  - speed of light in vacuum,  $n = 1/\sqrt{\varepsilon \mu}$  - refractive index of medium.  $\varepsilon_0 = 8,85 \cdot 10^{-12} \text{ F/m}$  - electrical constant,  $\mu_0 = 4\pi \cdot 10^{-7} \text{ Gm/m}$  - magnetic constant,  $\varepsilon$  and  $\mu$  - dielectric and magnetic permeability of the medium, respectively. For air  $\mu = 1$ , then the refractive index  $n = \sqrt{\varepsilon}$ .

In accordance with the classical theory of dispersion, a molecule of a medium can be regarded as a system that includes electrons in an equilibrium position. Under the action of an external periodic field of the wave, electrons are displaced from the equilibrium position, while the atom acquires an electric moment.

The electrical displacement (electrical induction) of the medium is determined by the ratio:

$$D = \varepsilon_0 E + P \quad (2)$$

Where  $P = \alpha \varepsilon_0 N E$  - electric moment acquired by a unit volume of a medium under the action of an external field  $E$ ;  $\alpha$  - polarizability coefficient, characterizes the structure of the molecule;  $N$  - number of molecules per unit volume.

The electrical displacement  $D$  and the field strength  $E$  are related:

$$D = \varepsilon \varepsilon_0 E \quad (3)$$

Then (2) can be written as

$$\varepsilon \varepsilon_0 E = \varepsilon_0 E + \alpha \varepsilon_0 N E \quad (4)$$

Wherefrom  $\varepsilon = 1 + \alpha N$

and the refractive index:

$$n = \sqrt{\varepsilon} = \sqrt{1 + \alpha N} \approx 1 + \frac{\alpha N}{2} \quad (5)$$

From molecular kinetic theory, pressure  $p$  is related to temperature  $T$  :

$$p = NkT \quad (6)$$

Where  $k$  - Boltzmann's constant. Then the refractive index for ideal gases is:

$$n = 1 + \frac{\alpha}{2} \frac{p}{kT} \quad (7)$$

Now by determining what the coefficient  $\alpha$  is equal to for the Michelson interferometer, we can determine the expression of the refractive index of air as a function of its pressure.

At constant pressure (7) the formula will take as:

$$n(p) = 1 + A \cdot p \quad (8)$$

where we used the following definition  $A = \alpha / 2kT$  .

We place on the path of one of the rays, for example, going to the movable mirror, a chamber of length  $d$  (Fig.3), filled with air at a pressure  $p_1$  , and then pump air into it to a pressure  $p_2$  .

Let us represent the optical path length of this ray at the pressure  $p_1$  in the chamber as:

$$S_1 = L_1 + 2d \cdot n_1$$

Where  $L_1$  - the entire optical path of the beam outside the camera,  $2d \cdot n_1$  - optical path in the chamber [2-3].

At pressure  $p_2$  ( $L_1$  does not change):

$$S'_1 = L_1 + 2d \cdot n_2.$$

Thus, when the pressure changes from  $p_1$  to  $p_2$ , an additional path difference is introduced into the path difference of the interfering rays  $S'_1 - S_1$ :

$$\Delta = S'_1 - S_1 = 2d(n_2 - n_1) = 2A \cdot \Delta p \cdot d \tag{9}$$

Where  $\Delta p = p_2 - p_1$ ;  $n_1$  and  $n_2$  refractive indices at pressures  $p_1$  and  $p_2$ , respectively.

In this case, the interference pattern will shift by  $\Delta m$  lines, and the stroke difference becomes:

$$\Delta = \Delta m \cdot \lambda = 2A \cdot \Delta p \cdot d \tag{10}$$

The relationship between the number of lines and pressure:

$$\Delta m = \frac{2A \cdot d}{\lambda} \Delta p \tag{11}$$

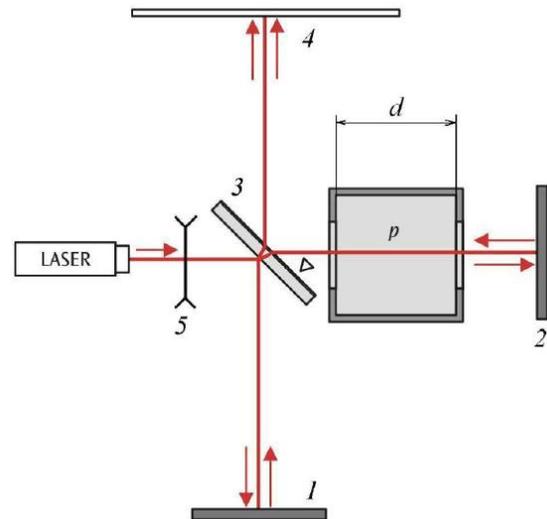

Where  $tg\varphi = 2A \cdot d / \lambda = \Delta m / \Delta p$  the tangent of the slope of the dependence of the number of new interference fringes on pressure. Having determined the tangent from the graph of this dependence, we can find the constant  $A$ :

$$A = \frac{\lambda}{2d} \frac{\Delta m}{\Delta p} \tag{12}$$

Using the expression for  $A$ , it can be found that the refractive index of air depends on its pressure[4-5]:

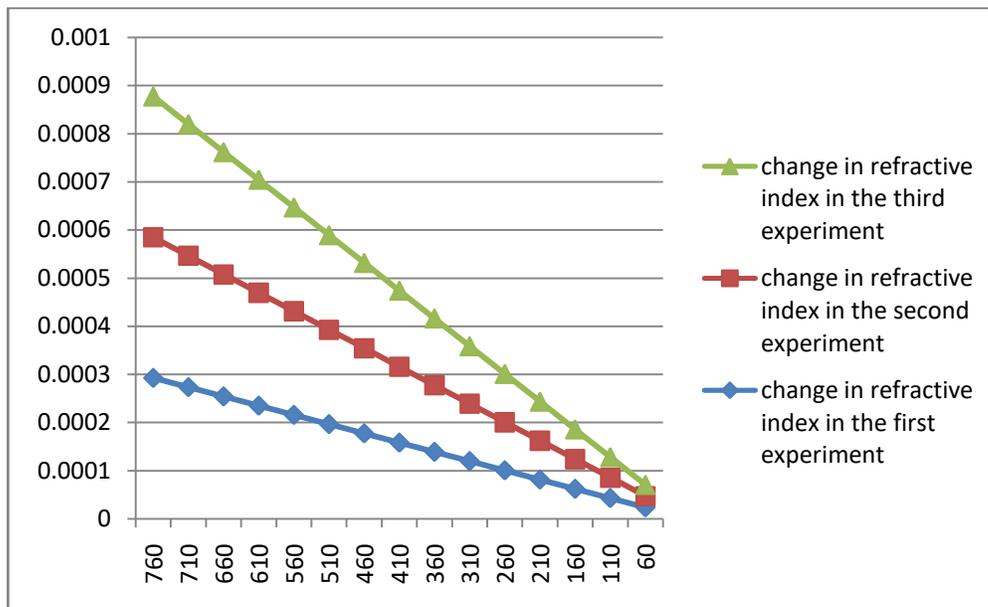

$$n(p) = 1 + Ap = 1 + \frac{\lambda}{2d} \frac{\Delta m}{\Delta p} p \tag{13}$$

Using the formula (13) we compare laboratory results with theoretical data. . It is known that the refractive index of a vacuum is equal to 1 and the refractive index of air also differs very little

**Fig.3.** Camera in the path of the Michelson interferometer beam

from 1. Therefore, in Fig.4 shows the pressure dependence of the light refractive index of the air, which differs from 1. **Fig.4**

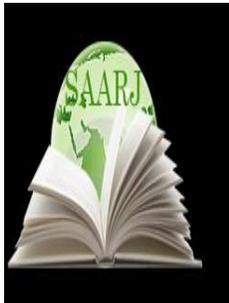

## CONCLUSION

In the first part of this article, the Michelson interferometer explored a methodology for measuring not only the light wavelength but also the wavelength of an electromagnetic wave. The next section of the article analyzes the formula for the refractive index of an ideal gas depending on its pressure. It is known that the refractive index of vacuum is equal to 1. The refractive index of air very little differs from it. However, by varying the pressure in the chamber, it was verified that even such small differences can be detected by shifting the interference pattern on the Michelson interferometer.

## DEPICTION OF EVENTS IN WORKS BY MEANS OF SYMBOLS

**Lolaxon Alimovna Aminova\***

\*Associate Professor of the "Turkish Philology"  
 Tashkent State University of Oriental Studies  
 UZBEKISTAN

---

### ABSTRACT

*This article is dedicated to the study of the story "White Tulip" by the famous Turkish writer Omar Sayfiddin. The article analyzes the means of artistic imagery that define the skill of the writer, the symbols embedded in the plot of the story. How the truth of life is revealed through symbolism is explained in the example of the passages in the work. The contrast between the feelings of purity and beauty - how convincingly the cruelty and cruelty are portrayed in the play - is illustrated by examples.*

**KEYWORDS:** *Symbols, Images, Heroes, Inner Experiences, Purity, Emotions.*

---

### INTRODUCTION

Of course, the writers' point of view is different from that of ordinary people. They can see life as more colorful, vibrant, and figurative than we are. They also approach a simple landscape or situation from a different perspective. That's probably why works of art seem more interesting and engaging than real-life events. The image in the works of art is like another world. Illustrations, animations, and symbols add color to the works like a rainbow.

The works of the Turkish writer Omar Sayfiddin are characterized by authenticity, a mixture of romanticism and realism, and a flurry of educational and spiritual ideas. There is no work of Umar Sayfiddin that does not contain spiritual nourishment, fertilizer, and advice. With his works, he addresses the human mind and consciousness directly. He is also able to use symbols in his works. He uses symbols in almost every work, whether in the title, in the content, or in the description of events. Her stories include "White Tulip," "High Heels," "Brown," and "Pink Pearl Coat."

**MAIN PART**

The author's most famous story, *The White Tulip*, depicts conflicting emotions such as purity, kindness, cruelty, faith, and disbelief, and the events are portrayed symbolically. As you know, white is a symbol of purity and innocence. Everything in white gives light to a person and removes the dust from the heart. The massacre of Turks in the Balkans is the principal theme of the story. The image of Lola symbolizes simplicity, purity, and the Turkish nation's belief in modesty. The image of Radko, contrasted with the image of Lola, is a symbolic representation of oppression. In this story, the author emphasizes that the Turkic peoples did not oppress the people of the country they captured, but respected their traditions and way of life. However, this emphasis is not expressed by the author, but through the language of images. "If the Turks had taken these lands, if they had obeyed their elders and killed us all, we would not be here today," he said. They made a big mistake, they had to kill our women and children without missing an opportunity. The undead Bulgars multiplied in pairs and gained strength. Now they are on the heads of the owners who have shown them kindness. " (Seyfettin O. *White tulip*. S 12.)

The protagonist of the story, a girl named Lola, is described as a white, delicate, world-class beauty. It is no coincidence that the protagonist is called *White Lola*, given that she comes from white. At the heart of Lola's description of *White Lola* is a large symbol.

The story describes the tragedies, sufferings, and atrocities committed by Bulgarian soldiers in Turkish neighborhoods. When describing events, the author does not describe any image as "good" or "bad". Only by drawing on the portraits of the heroes, the reader can distinguish between good and bad, positive, and negative heroes through the symbols embedded in the depths of the image of the situation.

The description of the Turkish command, as opposed to the brutality and chaos of the Bulgarian, Greek soldiers and command is as follows.

"Radko did not want to waste five minutes. He hadn't tasted salt since morning. He called his assistant. He hurriedly devoured the roasted meat and wine brought by his assistant and the big juicy apples. He then sat on the Turkish commander's soft, wide chair, which was not even dusty. It was a decorated room with red curtains and carpets. The widow looked more like a woman's room than a military commander. Radko could not sit too long in such a soft chair that made a person's eyes fall asleep. "(Seyfettin O. *Beyazlale*. S 10.)

In the image of this simple room also lies a prominent symbol and metaphor. The awkwardness, the instability of the Bulgarian officer named Radko, that he swallowed the food in front of him without noticing the taste, and in contrast to this image, the writer draws the reader's attention to the Turkish commander's room. Referring to the information. The room, which is decorated with a soft chair, carpet, and curtains that do not contain even a speck of single dust, is so pleasant that even the eyes fall asleep and the soul is at rest. The room in the piece is beautifully decorated, but it looks like a widow's room. We know that the word "widow" means that the couple is divorced and has no head. It is not in vain that the writer describes a beautifully decorated room as a widow's room. Here the writer skillfully hides a mysterious symbol. In this passage, the widow is depicted as a symbol of a Turkish command that has lost its will and power. The beautiful appearance of the room, the relaxing atmosphere behind the Turkish soldiers, as well as the peculiarities of the Turkish people's way of life, loyalty to traditions, orderliness, and cleanliness, which are a sign of a clean generation, are reflected.

The protagonist of the story, Radko, lives with the dream of reaching Lola, the most beautiful girl in the neighborhood. The dream of growing up does not leave her alone. Radko is curious about who the girl is from, her ancestry, her parents. She hears that she is the daughter of Haji Hasan Efendi.

The author does not give any information about the personality of Haji Hasan. He only paints a portrait of her. He paints his portrait in such a way that the student has a good impression of Haji Hasan Efendi. Haji Hasan was a man with a patterned, white silk dress, a gentle, plump figure with no wrinkles on his face, and a pink cheekbone, indicating that he lived in peace, happiness, and bliss. As the reader reads this image, he or she is portrayed as an enlightened, moral, and disciplined person. This image alone shows that Lola's family, their way of life, lived in peace and happiness.

The most symbolic, culminating point of the work is the image of the house of Haji Hasan Efendi, i.e. Lola. In our opinion, the writer explains the whole purpose of this image. Here, the comparison between East and West, the tradition-based, faith-based life, is palpable. The author expresses this analogy through the eyes of Radko. Radko's heart, which is not a work of cruelty, cruelty, lack of culture, and humanity, is stunned by this scene.

"He slammed the door and went in and froze. Suddenly, the gates of paradise opened. A paradise that glows like an emerald. He looked around and closed his eyes. He knew Ferdinand's palace and the most beautiful buildings in Europe, but he had never seen such a fantastic place of peace. The dark shadows of the big trees fell on the flowers, like velvet carpets. At the end of a sandy corridor resembling a fish's skin is a marble pool, and next to it is a marble staircase leading into the house. From the outside, not a single stone can be seen inside the wall that surrounds the house like a fortress. The wall is surrounded by ivy. Even the smell of flowers, which he did not even know the name of for the first time in his life, made him dizzy. He looked at the clear water gushing from the marble fountain of the pool. There were little rainbows on the fountain. " This image will be followed by another comparative image.

"Radko imagined his life when he saw this magnificent scene. Even in Sofia, there were barns at the foot of the courtyards, and the courtyards always smelled of manure. There was no home without pigs. The courtyards of the rich were as ugly as if they were naked as if they were European. The great gardens of Bulgaria were as ugly as a hairless man next to this emerald paradise. What a wonderful life in this paradise. "

This is where the writer's unique style, or rather his skill, comes into play. When a writer describes situations, characters, and scenes, it is as if he is not expressing his reaction. He narrates the events in the language of the protagonists in such a way that the protagonists themselves analyze the situations, compare the protagonists themselves, and finally, it is the protagonists themselves who select the good and the bad and recognizes the best of them. This is the most important aspect of a work of art. The uniqueness and skill of writers are to inspire the works and convince the reader of the works.

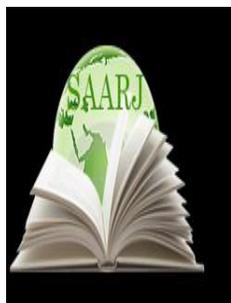

## CONCLUSION

In this article, we have tried to analyze the images, analogies, and symbols that show the writing skills of the writer Umar Sayfiddin in the example of his story "White Tulip". The story of the White Tulip is in fact a tragic work. The plot of the story is superior to any other image.

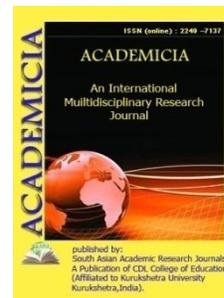

However, the portraits, nature, and landscapes used to make the plot events add color and shine to the work. This is a summary of the story without images. In this article, we have tried to analyze the images, analogies, and symbols that show the writing skills of the writer Umar Sayfiddin in the example of his story “White Tulip”. The story of the White Tulip is in fact a tragic work. The plot of the story is superior to any other image. However, the portraits, nature, and landscapes used to make the plot events add color and shine to the work. It’s hard to imagine a story without these images. In fact, every artistic device used in a work serves the writer's idea and makes the work more attractive and interesting. As we read The White Tulip, we are immersed in a series of events, and the content of the work draws our attention. In the course of the story, every image that the writer represents comes to life before our eyes, and the writer gives life to each image. Because the original skill of the writer is also determined by the dedication of the works and is forever imprinted in the hearts of students. In fact, every artistic device used in a work serves the writer's idea and makes the work more attractive and interesting. As we read The White Tulip, we are immersed in a series of events, and the content of the work draws our attention. In the course of the story, every image that the writer represents comes to life before our eyes, and the writer gives life to each image. Because the original skill of the writer is also determined by the dedication of the works and is forever imprinted in the hearts of students.

**ABSTRACT**

*This article presents the results of a study on twice-a-year grain yields. It investigates the higher yields of cotton in short-rotation 2: 1 systems. It is known from many years of research that legumes absorb free nitrogen from the air and form endogenous bacteria at the root, and therefore are a good past crop for follow-up crops.*

**KEYWORDS:** *Short-Crop Rotation, Soy-Bean, Bean, Harvest Capacity, Yield, Nutrients.*

**INTRODUCTION**

Today, population growth requires a high level of development of agricultural culture. This, in turn, requires the efficient use of land while maintaining and increasing soil fertility. The reforms being carried out by our government in the agricultural sector are reflected in this regard. The Decree of the President of the Republic of Uzbekistan PF-5614 "On the Strategy of Agricultural Development of the Republic of Uzbekistan for 2020-2030" signed on 11.11.2019, calls for further development of the sector, efficient use of land and water resources, food security, high-income and competitive products. A number of tasks, such as production, have been identified [1]. Therefore, the cultivation of secondary crops in the grain-free areas, especially legumes, on

the one hand, meets the demand of the population for food, on the other hand, helps to maintain soil fertility by assimilating free nitrogen in the air.

According to Y.Kenjaev, R.Oripovs [2, pp. 33-35], many types of secondary crops have been studied in scientific experiments in the conditions of Zarafshan oasis. identified as achievable. Q.Jo'raev, A. Khaydarov, G. According to the research conducted by Rakhmatulaev [3, pp. 202-204] in the conditions of light gray soils of Andijan region, in the system of short-rotation rotation cotton + winter wheat + soybean soybean was planted as a secondary crop after winter wheat, and cotton was planted next year. in the variant, the incidence of cotton wilt disease was reduced and an additional cotton yield of 7–12 ts / ha was obtained.

According to S.A. Vorobev [4, p. 368], although very little plant lefts remain in the soil, they mainly provide the plant with the necessary nutrients, and the important thing is that they have rapid microbiological decomposition, in most cases is superior to organic fertilizers in terms of humus production. Just for this, enough biomass must accumulate in the soil.

DNPranishnikov [5, p. 124] confirmed the positive effect of plant organic residues on soil volume mass in his scientific research.

#### **Object and method of experiment (research).**

Field experiments were conducted in 2018-2020 in the conditions of typical irrigated gray soils of Tashkent region. In the study, bean and soybeans were grown as a repeat crop after winter wheat in a 2: 1 (2 years wheat, 1 year cotton) system of short-rotation rotation. Cotton was planted against the background of cultivated secondary crops, and its effect on growth and development, as well as productivity was studied.

The experiment included 3 options. The area of each option was 1100 m<sup>2</sup>, of which the area to be taken into account was 1000 m<sup>2</sup> and was carried out in three repetitions. The total size of the experimental area is 1.0 ha.

Based on the methods of field experiments, the following systems of short-crop rotation were studied:

Option 1 (control) 2: 1, 2 years winter wheat: 1 year cotton;

Option 2, 2: 1, 2 years winter wheat + repeat crop (bean): cotton;

Option 3, 2: 1, 2 years winter wheat + repeat crop (soy-bean): cotton;

#### **Experimental results and their discussion**

The experiments were carried out in the conditions of typical irrigated gray soils of Tashkent region in the varieties of cotton "Navruz", winter wheat "Yuka", bean "Durдона" and soybean "Orzu". Agrotechnical measures in all crops were carried out on the basis of generally accepted recommendations.

The experimental field soil is low in nutrients with humus and phosphor, very low in nitrogen, and moderate in potassium.

If the nutrient elements were analyzed in a single humus sample during the study period, the average period in the drive layer of the soil in the first period of the experiment was 0.855%, while in the first variant without replanting after winter wheat in the second year, this figure was 0.801%. The best performance was observed in the soybean variant after two years of winter wheat as a repeat crop, with a result of 0.867%. Similar data were obtained in the bean-careded variant (Table 1).

**TABLE 1 THE EFFECT OF SHORT-ROTATION PLANTING SYSTEMS ON THE AMOUNT OF HUMUS IN THE SOIL, %**

№ variants	Rotational Planting Systems	Soil Layers, cm	2018 year, wheat growing season at the beginning of the fall	2019 year	
				in the summer, in the fall at the end of the growing season of winter wheat,	after repeated crops in the fall
1	2:1	0-30	0,855	0,823	0,801
2					0,858
3					0,867
1		30-50	0,623	0,618	0,601
2					0,627
3					0,630

The result can be attributed to the seasonal maintenance of crops in short-rotational crop rotation systems and the absorption of free nitrogen from the air by organic residues, i.e., root residues of plants and legumes of legumes. We discuss this below.

According to the results, the thickness of seedlings in the the plant bean as a repeated crop in 2018-2019 was 100.7, 99.7, 206.7-270.8 thousand bushes per hectare in the soy-bean, and 14.5 ts / ha in the first year of the study and 13.4 thousand bushes in the second year. ts / ha, 16.7 from the soy-bean, respectively; A grain yield of 15.0 ts / ha was obtained (Figure 1).

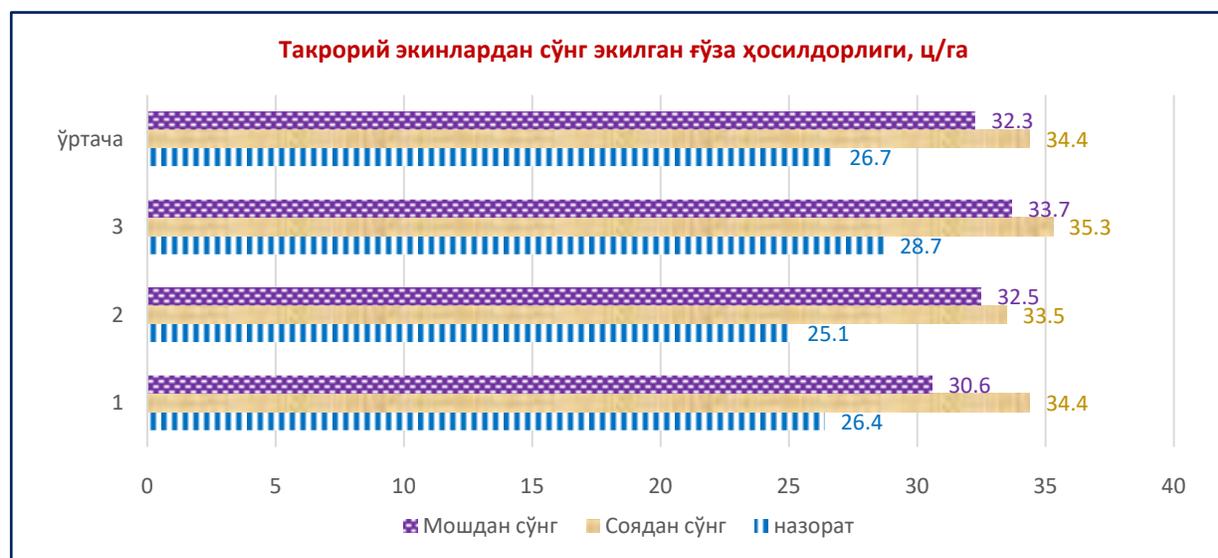

Figure 1. Yield of bean and soybeans planted as a secondary crop, ts / ha. In two years, winter wheat yielded an average of 53.6 ts / ha of grain. On the positive side, in the soil-climatic conditions of the study, repeated crops were cultivated after seed wheat, which in turn achieved an average grain yield of 66.6-69.5 ts / ha per year. It is known from many years of research that legumes absorb free nitrogen from the air and form endogenous bacteria at the root, and therefore are a good past crop for follow-up crops. This law has been confirmed in our experiments. In addition, each crop absorbs a certain amount of nutrients from the soil, leaving behind root remnants. As mentioned in the above literature, plant residues serve to enrich the soil with nutrients while improving the soil microflora.

In our research, it was found that 30.8 t / ha of root crops were left from winter wheat, 22.3 t / ha from bean planted as a second crop, and 28.1 quintals per hectare from soybeans. In total, 53.1 quintals of plant residues remained in the soy-bean and 58.9 quintals in the soy-bean when replanting, Table 2. The change in humus in the soil explains that the differences observed in the yield of cotton planted as a follow-up crop are also directly related to plant residues.

**TABLE 2 IN SHORT-ROW PLANTING SYSTEMS, THE ROOT-AND-ROOT REMNANTS LEFT BY THE PLANTS IN THE SOIL, TS / HA (IN THE 0-50 CM LAYER OF SOIL, 2019)**

№ variants	Available Rotational Planting Systems	Autumn Wheat average crop	Repeated Crop bean	Repeated Crop Soy-bean	Total
1			-	-	30,8
2	2:1	30,8	22,3	-	53,1
3			-	28,1	58,9

In the control variant, where cotton was grown without any re-sowing after winter wheat, the average yield of cotton was 26.7 ts / ha, in the variant sown after bean 32.3 ts / ha, and in the variant sown after soybean, the highest 34, A cotton yield of 4 ts / ha was achieved (Figure 2). This showed that no crop was planted after the fall wheat, which resulted in an additional yield of 5.6 t / ha per hectare in the cultivated variant after the bean planted as a secondary crop compared to the control option, and 7.7 t / ha in the post-soy-bean cultivation.

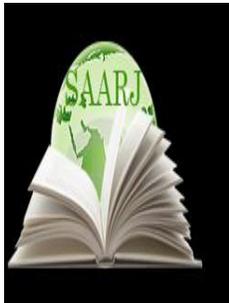

**Figure 2. Yield of cotton grown after repeated sowing of legumes, ts / ha.**

## CONCLUSION

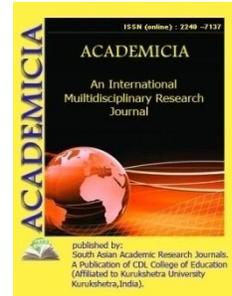

Thus, it can be concluded from the above research that in the typical gray soils of ancient times, in the 2: 1 system of short-crop rotation, the cultivation of bean and soybeans from legumes as a repeat crop twice a year with a grain yield twice a year allows for additional yields of 6-7.7 quintals. Year-round crop rotation in areas vacated by primary crops, also ensures high yields from crops and serves to increase soil fertility.

**ABSTRACT**

*The article traces the social position of women in Turkestan in the late 19th and early 20th centuries based on materials from newspaper publications. It covers the social aspects of girls' marriage, family issues and equality. Used materials from "Turkestanskivedomosti", "Turkestanskaya native newspaper", "Turkestanskiykuryer" newspapers and stored in the personal fund of Ostroumov of the National Archives of the Republic of Uzbekistan. The article analyzes the role of the mother in the education of girls, the influence of local traditions on the life of women. The colonial local press was the first to raise issues concerning the social life of Muslim women in Turkestan.*

**KEYWORDS:** *Woman, Turkestan, Newspaper, Kalym, Local, Kyrgyz, Sart, Hijab, Emancipation, Letter, Nugay (Tatars), Family.*

**INTRODUCTION**

In Central Asian society, since ancient times of history, a woman was valued primarily as a mother, and a sister, spouse and child. A woman deserved such a special attitude, first, with her tenderness, patience, endurance, intelligence and mercy. In particular, at different historical times, it personified a woman in the images of the brave Tomiris, the scientist Fatima [1], the shrewd Bibi-khanum [2] and the noble sister of Khanzada-begim. Unfortunately, today, if a woman, on the one hand, has become a victim of social violence in society she becomes "famous" as a representative of easy behavior, cheating on her husband, easily violating age-old family traditions [3].

There are aim and subjective reasons, because of which a woman may find herself in such positions. In particular, the intensification of globalization processes on a global scale, increased population migration, the emergence of an economic crisis and a precarious political situation in some regions can negatively affect the social position and status of women. Also, this can include the lack of effectiveness of efforts to develop gender issues in social, economic, legal and spiritual direction at the international and local level.

### **THE MAIN FINDINGS AND RESULTS**

In this article, I have attempted to analyze the social situation of women in Central Asia, in particular in Turkestan, based on the materials of articles published in periodicals [4].

### **THE PRESS AND THE MUSLIM WOMAN QUESTION**

The newspaper “Turkestanskieveedomosti”, it published whose first issue on April 28, 1870, is the first newspaper in the Turkestan General Government. Also, the “supplement” to this newspaper “Turkistonvilyatininggazety” was published in 1870-1883, 4 times a month - 2 times in Uzbek and 2 times in Kyrgyz (Kazakh) languages [5]. In particular, by 1912 there were 23 Muslim printing houses in Russia. These printing houses published various editions, of which 36 were in the Kyrgyz (Kazakh) and 40 in the Uzbek (Sart) languages [6]. These publications published orders of the Turkestan General Governorship, events carried out by the tsarist government and articles about the life of the local population. Among them, it also gave a large place to articles devoted to the problems of Muslim women. Most of these articles were published on the pages of such newspapers as Turkestan Vedomosti, Newspaper of Turkistan Region (Turkestanskaya native newspaper), TurkestanskiyKurer and Samarkand. In particular, the personal fund of N. Ostroumov (1848-1930) [7], kept in the National Archives of Uzbekistan (formerly the Central State Archive of the Republic of Uzbekistan) [8], contains pieces of articles devoted to Muslim women cut off from various newspapers.

These articles are collected from such newspapers as “Turkestansky Courier”, “Turkestanskieveedomosti” and “NovoyeVremya”. The articles give us information not only about Turkestan women; they also highlight the life of Muslim women in Turkey, Egypt, their participation in the educational process and their life in harems. Also, in the bibliographic index “Turkistonviloyatininggazeti” (“Turkestan native newspaper”), compiled by R. Fayzullayev, the titles of 18 articles are given, which reflect the problem of women [9]. This index is compiled on the basis of the issues of the Newspaper of Turkistan Region (Turkestan Native Newspaper) published in 1870-1916; and stored in the National Library of Uzbekistan named after AlisherNavoi. According to the author, the issues of the newspaper for 1891-1892; for some unknown reason are not kept in the fund. In addition, it should be emphasized that some of the page numbers of the newspapers stored in this collection contain defects.

Based on the reviewed material, articles can be divided into the following thematic subgroups:

- Trafficking in girls.
- The situation of women and brides.
- Education of girls.
- The question of the hijab.

- The problem of emancipation.

Within the framework of one article it is impossible to cover all the problems and connections with this, below we will consider only some of the above topics.

### “THE SITUATION OF KYRGYZ (KAZAKH) GIRLS-DAUGHTERS-IN-LAW”

An article with the above title was published No. 12-13 of the Newspaper of Turkestan region (Turkestan native newspaper) from 1900 [13]. This article also begins with the idea that before marrying a girl, she must master a profession or get an education, and then get married. As the author of the article emphasizes, a girl must marry of her own free will, and the forced marriage of women is contrary to both Sharia [14] and the decree [15]. *“But the Kazakhs have one custom, they give girls in marriage to those people whom girls hardly see before the wedding and do not know their future spouses. Or they tie ties with the “beshikKerty” [16] tradition or with the help of “kalym” [17]. They trade their daughters and become the culprit that their children spend their entire lives in sorrow and misery. “Also, when elections approached in order to increase the number of their voters, some passed off their daughters as influential people”.* The article provides information that one of the Kazakhs was forced to return 70 sheep, which he took as a “kalym”, after the future groom did not like his daughter. But emphasizing that this happens very rarely, and the author continues in this way: *“We ask Allah to have more parents who love their children. The aforementioned case in the Kazakh newspaper is taken from the life of this people (Cossacks), but it is no secret to anyone that among the Sart population there are also cases when their children are forcibly forced to marry or marry, not taking into account their desire”* [19].

### “THE PROBLEM OF EQUALITY OF WOMEN AND MEN”

Articles of such content began to be published by representatives of the local intelligentsia after the appeal of Tatar (Nogai, Muulman) women in April 1907 to the State Duma with a request to ensure their rights. Articles containing opinions of this kind were published in the pages of the “Newspaper of Turkestan Region” under the heading Objection to progressive Muslim women. Specifically, an article by an unknown author titled *بر مسلمان* (one Muslim) cites the following thoughts: *“Unfortunately, one article was published in the 25th issue of the Turkiston newspaper. As it is stated in it, “Nogai (Tatar) women of cities of several provinces turned to the members of the State Duma with a statement. They asked the Duma to consider on the agenda the issue of granting those equal rights with the male population ... as it is written in the address, men walk all the time and everywhere with an open face, and they deprive women of this right. These women demand that they be given the right to walk everywhere with an open face”.* As a result of this article, the issue of emancipation of Muslim women has become a topic of discussion in a wide range of authors. One of the authors who actively participated in the discussions is Imam Ali Buronov. In his article titled *آخر زمان بلاسی دجال فتنه سی* (“Tragedy of the End of the World and the Devil's Intrigues”), he sharply criticizes Tatar women. He writes that after he saw and read this article, he had a desire to write another article in response to it, and he assesses the demand of Tatar women “as a tragedy of the End of the World and the intrigue of the Devil” [20].

The author writes, “That the Turkestanis will announce the issue of granting women rights in the pages of the newspaper, they are ashamed to even mention it. He further writes that he tried to publish his protest in the Vakt newspaper published in Orenburg, but the attempt was

unsuccessful. After that, his conscience haunted him, and he decided to send a copy of his protest to the editorial office of Newspaper of Turkestan Region.

He also expresses his bewilderment with the following words: *“Why did such a pro-chariat and civic newspaper “Vakt” not publish my letter. I wrote my letter in Nogai, and in it I indicated the natural (natural, physical, mental - N.Kh.) weaknesses of women. “He signed the article as a resident of the city of” Karmokchi”* Imom Ali Buronov [21].

#### **“THE SITUATION OF KYRGYZ (KAZAKH) GIRLS-DAUGHTERS-IN-LAW”**

I published an article with the above title No. 12-13 of the Newspaper of Turkestan region (Turkestan native newspaper) from 1900 to [13]. This article also begins with the idea that before marrying a girl, she must master a profession or get an education, and then get married. As the author of the article emphasizes, a girl must marry of her own free will, and the forced marriage of women is contrary to both Sharia [14] and the decree [15]. “But the Kazakhs have one custom, they give girls in marriage to those people whom girls hardly see before the wedding and do not know their future spouses. Or they tie ties with the “beshikKerty” [16] tradition or with the help of “kalym” [17]. They trade their daughters and become the culprit that their children spend their entire lives in sorrow and misery. “Also, when elections approached in order to increase the number of their voters, some passed off their daughters as influential people”. The article provides information that one of the Kazakhs was forced to return 70 sheep, which he took as a “kalym”, after the future groom did not like his daughter. But emphasizing that this happens very rarely, and the author continues in this way: “We ask Allah to have more parents who love their children. The aforementioned case in the Kazakh newspaper is taken from the life of these people (Cossacks), but it is no secret to anyone that among the Sart population there are also cases when their children are forcibly forced to marry or marry, not taking into account their desire” [19].

#### **“THE PROBLEM OF EQUALITY BETWEEN WOMEN AND MEN”**

Articles of such content began to be published by representatives of the local intelligentsia after the appeal of Tatar (Nogai, Muulman) women in April 1907 to the State Duma with a request to ensure their rights. Articles containing opinions of this kind were published in the pages of the “Newspaper of Turkestan Region” under the heading Objection to progressive Muslim women. Specifically, an article by an unknown author titled ب ر م س ل م ا ن (one Muslim) cites the following thoughts: “Unfortunately, one article was published in the 25th issue of the Turkiston newspaper. As it is stated in it, “Nogai (Tatar) women of the cities of several provinces turned to the members of the State Duma with a statement. They asked the Duma to consider on the agenda the issue of granting those equal rights to the male population ... as it is written in the address, men walk all the time and everywhere with an open face, and they deprive women of this right. These women demand that they be given the right to walk everywhere with an open face”. As a result of this article, the issue of emancipation of Muslim women has become a topic of discussion among a wide range of authors. One of the authors who actively participated in the discussions is Imam Ali Buronov. In his article titled ا خ ر ز م ا ن ب ل ا س د ي د ج ا ل ف ت ن ه س ي (“Tragedy of the End of the World and the Devil's Intrigues”), he sharply criticizes Tatar women. He writes that after he saw and read this article, he had a desire to write another article in response to it, and he assesses the demand of Tatar women “as a tragedy of the End of the World and the intrigue of the Devil” [20].

The author writes, “That the Turkestanis will announce the issue of granting women rights in the pages of the newspaper, they are ashamed to even mention it. He further writes that he tried to publish his protest in the Vakt newspaper published in Orenburg, but the attempt was unsuccessful. After that, his conscience haunted him, and he decided to send a copy of his protest to the editorial office of Newspaper of Turkestan Region.

He also expresses his bewilderment with the following words: “Why did such a pro-chariat and civic newspaper “Vakt” not publish my letter? I wrote my letter in Nogai, and in it I indicated the natural (natural, physical, mental - N.Kh.) weaknesses of women. “He signed the article as a resident of the city of” Karmokchi” Imom Ali Buronov [21].

In addition, the aforementioned author in No. 80 “Newspaper of Turkestan Region” from 1908 published a feuilleton article entitled "An open letter (edification) to some persons who advocate the provision of equal rights to the weaker sex with their husbands" and as an appendix to his article declares the story “Tilsizhotin” (“The Silent Woman”) and its purpose from the publication of this appendix explains: “... I have included here in the appendix the story“ Tilsizkhotin (“The Silent Woman”) as an edification to those people who advocate the provision of equal rights to women, so they take part equally with them in trade in the bazaars. My goal from publishing these stories is to influence the views of those who advocate for such rights (for the emancipation of women - N.Kh.)”. The story was published in No. 80, 83 newspapers. It says that a merchant named Moryubus had a mute wife. The merchant, on the advice of his friend, showed his wife to the doctor. The woman gradually began to learn to speak and was cured. Eventually, the woman developed a habit of interrogating and yelling at her husband. The author here wants to say that the acquisition of freedom by a woman can lead to such consequences. Some issues of the newspaper also discussed the problem of the hijab. In particular, the reason for this kind of discussion was the announcement of articles titled حجاب حق نده (“About the hijab”) and “Qizhobgadoir” (“About the hijab”) by the Samarkand author Muhammad Bakokhoja mufti Sayidhojaugli.

At the beginning of the article, the author tried to give detailed information about the hijab. He writes and criticizes as follows: “... the hijab is worn in Iran, Afghanistan and India. The hijab of Bukhara, Samarkand and Tashkent women are also correct. Ferghana women do not have hijab ... they walk with an open face. “Against this article, a feuilleton was published entitled “The Disadvantage (Taxir) of Tefsir Mufti Muhammad Bakokhodja Mufti SayyidhodjaUgli on the Hijab Question”. The article is signed under the pseudonym خوق نددوران (HukandiDavron). In the article, the author sharply criticizes Muhammad Bakokhodj and considers it wrong, first of all, to announce the verses of the Koran and texts from “TafsiriHusseini” in the pages of the newspaper. Since these newspapers can get into desecrated places and verses from the Holy Quran can also end up there. Also, he further continues his text in an accusatory spirit thus: “As Muhammad Bako writes, as if the hijab was not preserved among the women of Fergana. But in fact, it is not so. Moreover, if Bakokhodzha himself were far from sweet feelings (he would not have been a voluptuary) he would not have looked at the faces of Fergana women.

Alimzad's article “On the face of Muslim women” tells about Tatar women who participated with an open face in a charity event at the theater in favor of the school of Tatar girls in the city of Tashkent. The article analyzes the question posed to the religious ulema (mullahs) by one

Muslim official (tour) who participated in this event and the responses of the ulema to the question.

The problem of ensuring equality between women and men is becoming the reason for the appearance of very serious protests, as evidenced by the article "Can a woman be a kazi". In particular, it is written like this: "... as some progressive Muslims say, the rights of Muslim women are equal to the rights of men, it is even possible to appoint them as kazis. There is only one sentence about this in the book on Sharia "Khidaya" [23]. But there the proposal has a different meaning, and according to the meaning of this proposal, the appointment of a woman to the position of kazi is not correct. At the end of the article, the author concludes that a woman should not be appointed a kazi.

It should be emphasized that the discussion of the women's issue raised heated discussions not only in Turkestan, but also in other Muslim regions and colonies of Russia. Here, as an example, we can cite the disputes between representatives of the Tatar and Turkestan intelligentsia, which were reflected in published articles under the titles "The strange logic of the Tatar newspaper", "Sado", "Answer to the newspaper "Yulduz" [24].

## CONCLUSION

As a conclusion, we can say that the local press of the colonial period for the first time was able to raise the social and everyday problems of Muslim women living in Turkestan for public discussion. Also, materials published in the press, to some extent, showed the real situation of Muslim women who lived in Turkestan and other regions of Russia [25]. It is impossible to assess some of the positive changes in the life of women in the late 19th - early 20th centuries; as a result of Russian colonial policy. Since the local intelligentsia (especially the Jadids) realized that the fate of progressive changes in society is directly related to the provision of the right to education for women and the expansion of their rights.

At the same time, not only social issues were discussed in the pages of newspapers and magazines, but they attached great importance to the coverage of rituals and customs of sedentary and nomadic cultures, and articles on medicine, economics, history, etc. were also published.

## PECULIARITIES OF RASHIDIDDIN VATVOT'S PERSONALITY AND CREATIVE ACTIVITY

**Zuhra Kodirova\***

\*PhD Student,  
 Tashkent State University of Oriental Studies,  
 UZBEKISTAN

### ABSTRACT

*Although Amir Imam Rashididdin Sadalmulk Muhammad ibn Abdujalil al-Umari (1081-1178), better known as Hoja Rashididdin Vatvot, was a well-known literary scholar and writer, his work has not yet become the subject of extensive research in Uzbek classical literature. Hence, there are presently a number of important issues that have to be explored in the setting of a writer's history, scholarly legacy, and his or her various activities. With this in mind, this article highlights the most headings of Rashididdin Vatvot's life and creative activity.*

**KEYWORDS:** *Sa'd-al-Mulk, Hadoiq as-Sehr fi daqoiq ash-She'r, Munsho'at, panegyric gazelles.*

### INTRODUCTION

In the middle Ages, Khorezm was scientifically and culturally developed, and local scholars and poets, as well as writers and poets who came to Khorezm from everywhere for various reasons, played an important role in this development. This is especially true in the XI-XIII centuries - during the reign of Khorezmshahs. Abu Hamid al-Garnati (1080-1169), an Andalusian scholar and traveler, and Sharafuddin Muhammad ibn Nasr (1144-1232), a famous Shami poet known as Ibn Aini, came to Khorezm in 1153. Among them are al-Qazi Yaqub ibn al-Jandi, the famous scholar and scribe Muhammad ibn al-Husayn from Nasa, Khurasan. However, among those who came to Khorezm at that time, lived, and worked here, the Balkh poet and writer, the famous secretary Rashididdin Vatvot has a special place. In the following places, the personality of Rashididdin Vatvot and his scientific and literary heritage will be discussed.

## THE MAIN FINDINGS AND RESULTS

Rashididdin, [nicknames (Vatvot - bat, flying mouse, a reference to the small size of the writer's body); Muhammad bin Abdjalol al-Umari] (1087, Balkh - 1177 or 1183, Khorezm) - poet, literary scholar, studied at the Nizamiya Madrasah in Balkh, later came to Khorezm and worked in the palace of KhorezmshahAtsiz (1127-1156). During his career, he was awarded the honorary title of "Sa'd al-mulk" ("Happiness of the country") [1, p. 65].

Despite the fact that RashididdinVatvot was a mature writer, famous scientist and secretary of his time in Khorezm, no special monograph has been written in our classical literature that gives detailed information about his life and work.

In our opinion, in determining the details of his life and work and in researching the number of works of RashididdinVatvot that have come down to us, first of all, "Lubabul-Albob" by Muhammad Awfi Bukhari's, "Mujam al-Udabo" by Yaqut al-Khamavi's, "Selected History" by Hamidullah Mustafa Kazvini's; the first sources are the works of "TazkirotUsh-Shuaro" by DavlatshahSamarkandi, "Bahoriston" by Abdurahmon Jami, and "Kashfuz-zunun" by Haji Khalifa. Subsequent sources include the introduction to the critical text of Abbas Iqbal Ashtiani's "Hadoyiq Us-Sehr" [2, p. 470], and the research work of Said Nafisi, who published RashididdinVatvot's "Devon" [3, p. 784] of Persian poetry; this is the preface to KasimTuysirkani's research work on the Arabic-language work "Letters" of Vatvot. More precisely, they expressed controversial views on the biography of RashididdinVatvot.

The first issue in restoring RashididdinVatvot's biography is to determine the exact form of the author's name. In this regard, one of the most reliable sources on the name of RashididdinVatvot and his father's name is the work of Muhammad Awfi Bukhari, "Lubabul-Albob". Muhammad Awfi Bukhari mentioned the name of the poet, known by the pseudonym Vatvot, as Rashididdin Malik Muhammad ibn Abdjalil Umari [4, p. 80]. HamidullahMustafaviQazvini in his work "Selected History" mentions the name of the poet as Rashididdin Muhammad ibn Muhammad ibn Abdjalil Umari [5, p. 594]. Yaqut al-Hamawi, in his Mujam al-Udabo, gives the name of Vatvot more fully as Muhammad ibn Muhammad ibn Abdjalil ibn Abdumalik ibn Muhammad Ibn Abdullah ibn al-Khattab [6, p. 560].

Davlatshah ibn AlouddawlaBakhtishahar-Razi as-Samarkandi says that RashididdinVatvot is the heir of Umar ibn al-Khattab. That is why he considered his lineage to be among the caliphs [7, p. 69]. MalikushshuaroBahari mentions the writer's nickname Sadalmulk and mentions him as a relative of 'Umar ibn al-Khattab [8, p. 465].

Baddi'uzzamanFurozonfar writes in his book Sukhan and Sukhanvaron (The Speaker and Speakers): "His father and his name was Muhammad, and his lineage goes to the Caliph "Umar ibn al-Khattab. That is why he is called 'Umar in the book and is known by the nicknames Rashid and Sadalmulk" [9, p. 322].

Mirza MuhammadaliMudarris, in his work "Rayhonatul-Adab", mentions the poet's name as Muhammad ibn Muhammad ibn Abdjalil ibn AbdulmalikBalkhi and considers him to be a descendant of Umar Farooq ibn Khattab [10, p. 310].

Considering the literary and historical sources and the conclusions of the research, it is clear that his real name was Amir Imam RashididdinSadalmulk Muhammad ibn Muhammad ibn Abdjalil

Umari and he was known as the secretary HojaRashididdinVatvot. Thus, ZabihullahSafa gave a complete picture of the name Vatvot in his book, A History of Iranian Literature “11, p. 628”.

We do not find such a complete form of mentioning the poet's name in other scientific sources.

Another issue is to determine the pseudonym of RashididdinVatvot. According to ZabihullahSafa and other researchers, Vatvot was the pseudonym of Khoja Rashididdin and the reason he was called by such a pseudonym was his small size.

ZabihullahSafa writes in this regard: Rashididdin’s nickname “Vatvot” was due to his small size. “Vatvot is the name of a bird called Farastuk, and the small size of its body corresponds to this name”. Of course, ZabihullahSafa cited this information on the basis of reliable information, including Muhammad Awfi Bukhari's Lubabul-Albob, Yaqut al-Hamawi'sMujam al-Udabo, and DavlatshahSamarkandi'sTazkiratush-Shuaro.

AliakbarDehhudo's “Lugatnoma” gives several definitions of the word Vatvot, one of which is a form of mountain worship. Dekhudo, referring to the authoritative dictionaries of the past, said that the words “haffosh”, “shappara” or “shaparak”, which have the same meaning, mean a mountain called “farastuk” [12, p. 478]. There is an interesting fact about RashididdinVatvot’s small stature that is repeated in many sources. For example, DavlatshahSamarkandi said in his work “Tazkirotush-shuaro”: “One day Khorezm scholars were discussing at the meeting of KhorezmshahAtsiz. RashididdinVatvot was also present at that meeting, showing discussion, debate and eloquence. Khorezmshah saw that such a small man was arguing. A pencil was placed in front of RashididdinVatvot. Khorezmshah jokingly said: “Take the ink, let's see who is standing behind him and talking”. RashididdinVatvot, who understood Pisanda, took the da'wah and stood up and said, “A man is a man with his heart and tongue, not with his body” [7, p. 70].

Poets and scholars who lived with RashididdinVatvot also called his nickname Vatvot.

It turns out that RashididdinVatvot himself and several other poets used the names Rashid and Rashididdin as nicknames in their poems. Nevertheless, these names were not as popular as the name Vatvot. Therefore, research shows that the nickname of HojaRashididdin was Vatvot.

The author of the book "History of Tajik Literature" KhaliqMirzazoda gives his name as Muhammad, his nickname Rashididdin, and his nickname Vatvot [10, p. 35]. This information means that Rashididdin’s contemporaries use the nickname Rashid or Rashididdin in his poetry. However, it is not Rashid’s pseudonym, but a short portrait of Rashididdin that more closely corresponds to the weight of the poem.

RashididdinVatvot was born in Balkh, no doubt about it. Nevertheless, we do not know the exact year of his birth. Many authors speak in their sources that RashididdinVatvot lived to be 97 years old. In particular, the State Samarkand wrote in his work "Tazkiratush-shuaro" (Memory of Poets): “RashididdinVatvot's death took place in Khorezm on the dates of Samanin, Sabina and Hamsamiat, and he lived for 97 years. His grave was in the city of Jurjaniya in Khorezm” [7, p. 73].Yaqut al-Hamawi did not say the date of the poet's birth, and only indicates the date of his death as 1177 [6, p. 83]. HamidullahMustafavi, who lived two centuries after RashididdinVatvot, does not write anything about the year in which he was born or died. Haji Khalifa also considered his life to be 97 years. KasimTuyserkoni connects the year of the poet's death with 1178 and writes about the year of RashididdinVatvot's birth: “The poet was in the service of Khorezmshahs until the end of his life and lived far from his homeland” [17, p. 79]. According to

the Samarkand state, Rashididdin Vatvot lived a long life and lived until the reign of Sultan Shah ibn Elarslan ibn Atsiz after the death of Khorezmshah Atsiz [7, p. 71].

Muhammad Muzaffar Husseini Saba writes in Ruzi Ravshan that the spirit of Vatvot flew out of his body at the age of ninety-eight on the dates of samana, sabina and hamsimata.

Muhammad Muzaffar Husseini Saba writes in his work "Ruzi Ravshan": "at the age of ninety-eight on the dates of samana, sabina, and hamsimata, the spirit of Vatvot flew from his body" [14, p. 195-196].

The authors of Asarofaridon (biographies of Iranian cultural figures), Parviz Notali Khanlari and Yusuf Hiravi, write that Rashididdin Vatvot died in Khorezm in 1178-1183 [15, p. 107]. Said Nafisi states in the preface of Rashididdin Vatvot's Devoni that "some scholars have given that he lived for 97 years and that the most accurate information about his death was given in 573 A.D., 1177-1178 A.D., and that he must have been born in 1083-1084" [3, p. 3].

One of the modern Iranian writers, Aliakbar Dehudo, in his Dictionary, considers that "the poet was born in Balkh in 1087-1088" [12, p. 470].

Zabihullah Safa, in his History of Iranian Literature, mentions only his place of birth: "He was born in Balkh and died in 573 AH / 1178 AD" [11, p. 633].

One of the Tajik researchers, Khaliq Mirzazoda, states in his book "History of Tajik literature" that Vatvot was born in 1090 and died in 1183. Sadonshah Imronov in his book "Encyclopedia of Tajik Literature and Art" tells about the life of Rashididdin Vatvot in 1087-1183 [17, p. 38-39]. Teacher Khudoy Sharipov writes in his research work that Rashididdin Vatvot died in 1178 and lived for ninety-seven years [26, p. 144].

Thus, according to the authors of these sources, the year of Rashididdin Vatvot's birth is not clear. However, all researchers have confirmed his death in 1178.

If we consider the sources and researches of such authors as Davlatshah Samarkandi, Haji Khalifa, Muzaffar Hussein Sabo, Said Nafisi and teacher Khudoy Sharipov, the year of Rashididdin Vatvot's death was 1178, 97 years, then the year of birth of the poet is 1081.

Therefore, it can be concluded that Rashididdin Vatvot was born in 1081 in Balkh and studied at the "Nizamiya" Madrasa in Balkh. It is not unreasonable for Rashididdin Vatvot to study at this madrasa, as at that time the city of Balkh was recognized as one of the great centers of enlightenment. In particular, there were authoritative representatives of science and literature, sages, scientists and philosophers, as well as authoritative libraries and madrasas. One of these madrasas was Nizami, where, according to Rashididdin Vatvot's mentor, Davlatshah Samarkandi [7, p. 71], and Abbas Iqbal Ashtiani [2, p. 5], Imam Abu Said Hirawi. Rashididdin Vatvot also mentioned his mentor in one of his letters. Abbas Iqbal Ashtiani in his research work entitled "Hadoyiq us-sehr fi daqoyoiqush-she'r" with introduction and commentary: "In his letters about him, Rashid praised and exaggerated the fact that the position of his brother Najibuddin Umar ibn Muhammad spread throughout Khorasan. Imam Abu Said, on the other hand, said that he praised him in one of the meetings and did not stop criticizing him. In a letter to him, Rashid recalls the meritorious deeds of his master and emphasizes that he knows him as his true protector".

Teacher KhudoySharipov said: “He (Rashididdin) was interested in the art of poetry, and it is not surprising that he is a descendant of scribes and scholars, because the masters of this profession follow his traditions. At the time, their profession was considered an ancestral tradition” [18, p. 9].

ZabihullahSafa learns the secrets of literature, writing and secretariat from his teacher Abu Said al-Hirawi at the Nizamiyya Madrasah in Rashid al-Vatvot in Balkh. After completing his studies, AbdulmuzaffarAlouddavlaAtsiz ibn Qutbiddin Muhammad entered the service of Khorezmshah [11, p. 629]. However, he did not give information about the year of RashididdinVatvot's visit to Khorezm from Balkh. SadonshahImronov indicates the year of RashididdinVatvot's arrival in Khorezm as 1120 and says: “RashididdinVatvot was fully acquainted with most of the sciences of his time; in particular, philosophy, theology, grammar, vocabulary, meaning and expression, art, etc., and entered the literary sphere of the Khorezm Palace” [17, p. 38].

From this period, RashididdinVatvot's activity in the Khorezmshah's palace began as a secretary, and he continued his life in this palace.

According to Said Nafisi, 153 of Vatvot's 223 hymns mention Atsiz [3, p. 6].

Amin Ahmad Razi says about RashididdinVatvot's relationship with Sultan Atsiz: “He worked in the Sultan Atsiz office until the end of his life, and that king always encouraged his conversation and listened to his advice” [19, p. 581].

The high-ranking officials of this palace were jealous of the poet's high status and led him to hostility. Eventually, in 1153, a group of court judges slandered him for having a connection with the king of the Ali Afrosiab dynasty (Muhammad ibn Alparslan, nephew of Sultan Sanjar). Atsiz was furious with Vatvot and removed him from service for a time.

According to ZabihullahSafa, RashididdinVatvot slandered the king and tried hard to prove his innocence, wrote poems praising him, and believed that Atsiz would be kind to him and return him to his former work soon. When the poet came to Northern Khorasan in 1153-1154, this story is described in a letter to his friend and fan Ziyovuddin [7, p. 630]. Said Nafisi also states in the preface to RashididdinVatvot's “Devon” that “RashididdinVatvot was expelled from the palace between 1153-1154 and returned” [3, p. p]. It follows that RashididdinVatvot left the Khorezm palace for some time due to jealousy and slander of the courtiers and was re-employed at the suggestion of Sultan Atsiz.

After the death of Atsiz, Rashididdin was in the service of the son of Vatvot and his successor, Elarslan (reign: 1156 to 1172). After Elarslan, this political power passed to Sultan TekishElarslan. RashididdinVatvot resigned from the devon service in those days because he was old and tired.

As for RashididdinVatvot's scholarly work, he held a worthy place among the people of literature in his time and corresponded with many poets, writers, scholars and scholars. Among them are Imam Hasan KattanMarwazi, JarullahZamakhshari, Anwar Abivardi, Muizziy, SanoiGhaznavi, SuzaniSamarkandi, HakanShirani, Adib Sabir Termizi, Mukhtar and Said HasaniDashtavi. Correspondence with well-known writers allowed him to compile a collection of “Munsho'at”, ie a collection of letters of historical and literary significance.

The first Persian work on science was written by Muhammad bin Umar Roduyani in the 11th century and is called Tarjimonul-balaga. In the 11th and 12th centuries, Ahmad ibn Muhammad Manshuri wrote treatises on the art of Samarkand talwun (which Khurshidi called "Kanzul-Gharaib"), Abdumhammad ibn Muhammad Rashididdin Samarkandi ("Ziynatnoma"), and other authors on this science. Nevertheless, the most perfect of the works of science bade created in the XI-XII centuries is Rashididdin Vatvot's work "Hadoyiq u-s-Sehr fi dakoyik a-sh-She'r".

The work on the theory of poetry "Hadoyiq u-s-Sehr fi dakoyik a-sh-She'r" ("Magic Gardens from Poetic Subtleties") was written in Khorezm until 1156, which deals with such poetic arts as tajnis, sajj, zulqofiyatayn, maqlubimustavi, question and answer. The work served as a guide for poets and literary scholars of later times, and in his time the literary critic Sharofiddin Romi (XIV century) wrote a commentary on this work entitled "Hadoik al-hakayik" ("Gardens of Truth"). It is noted in the scientific literature that Shams Kays Razi and Ataullah Hussain referred to him in their works on the art of poetry.

"Hadoyiq u-s-Sehr" is a high-level work written by a great scientist, which was later used by all authors engaged in science bade. Rashididdin Vatvot's work has not lost its scientific and literary value to this day. "Hadoyiq u-s-Sehr fi dakoyik a-sh-She'r" is the main work of Vatvot on poetics, which contains all the sources of his famous works.

Panegyric gazelles are rare in the history of Persian literature up to the time of Vatvot. This tradition began to spread during the Vatvot period, and then developed in the Persian literature of India in the sixteenth and seventeenth centuries.

All this has led to the fact that Vatvot poetry is highly valued by both poetry enthusiasts and literary critics in both Persian and Arabic.

Rashididdin Vatvot's "Hadoyiq u-s-Sehr fi dakoyik a-sh-She'r", written in the 11th and 12th centuries, is a perfect work dedicated to the science of bade, and has been used by all authors who have been engaged in science bade since then. There are many reasons for this:

- 1) It covers all areas of poetics;
- 2) The author summarizes the existing experiences in pre-Arabic poetry;
- 3) The book contains samples of selected works not only by the author, but also by artists from the most ancient times;
- 4) Each poetic event is interpreted from different angles.

The work is popular mainly in Arabic script. It is therefore no coincidence that their first researchers were connected to the Muslim world. At the same time, his translations into many languages of the world are also increasing. In particular, partial translations and conversions in Turkish, Uzbek and Tajik languages were made.

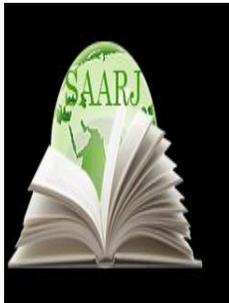

## CONCLUSION

The life, activity and creativity of our great compatriot, famous scientist and writer Rashididdin Vatvot, as well as his masterpiece "Hadoyiq u-s-Sehr fi dakoyik a-sh-She'r" have been studied in Uzbek literature. However, this work was unparalleled in its time due to its great importance in the history of Persian-Tajik and Uzbek poetry, especially in the East. A

comprehensive study of the scientific and literary heritage he left behind will undoubtedly play an important role in the full coverage of the history and culture of the peoples of Central Asia.

## SOME DIFFICULTIES IN TEACHING TRANSLATION

### ABSTRACT

*One of the most important aspects of the language learning process is the issue of correct translation. When we translate any information into our native language, we understand the meaning by limiting the features of the language. In the following article, we will talk about the translation of phrases in Russian and English.*

**KEYWORDS:** *Translation, Language Structure, Idioms, Russian*

---

### INTRODUCTION

Many methodologists are against grammar translation method because they think that a native language may interfere with the second language. However, there are also linguists who recognize the importance of translation in learning language. In my view, translation plays an essential role in learning a language, especially for advanced level students. First of all, translation expands lexical resource of learners. They enrich their vocabulary remembering new lexical units through translation, getting the exact meaning of a word. Besides, translation helps learners understand and use language structures correctly, as while translating they revise vocabulary, grammar and style of both a native language text and a foreign one. They are also taught to see similarities and differences between language structures, style and even cultures. It becomes obvious when students translate idiomatic expressions. Idioms reflect culture and style. For example: 1) to face gathering storm, 2) to sort sheep from goats, 3) he is a bit of a drama queen, 4) retirement nest-egg, 4) to spill the beans on somebody.

English phrasal verbs are of great interest for students because they possess a good number of semantic, grammatical and stylistic peculiarities, which sometimes make their accurate translation into Russian difficult. In dealing with the translation of this kind of lexical units into Russian, a student can consult an appropriate English - Russian dictionary but the "feeling" of

the language may help him understand why this or that phrasal verb is translated exactly this way.

Strictly speaking appropriate translation of English phrasal verbs into Russian to a high degree depends on the context, which suggests the proper interpretation of the described event. For instance, the sentence, "There was a little fire there. She built it up when it was already hot inside" is translated into Russian as "В очаге ещёбылигорячиеугли, онаиххранилаипламявспыхнуло».

In another sentence the same phrasal verb may be translated differently "After a long illness, it takes some time to build up your strength."

Inthiscaseitmaybetranslatedas «восстановить», - Чтобы восстановить здоровье после длительной болезни требуется определенное время.

English phrasal verbs can be highly idiomatic, their meanings unpredictable (e.g. lay down- заложить фундамент, take in –обманывать, let on – выдавать секрет). In these cases, a good explanatory dictionary may be of a great help to the translator.

Different meanings of one and the same word may cause some difficulties. For example.1. A) Unemployment improved –Безработицызнизилась. B) productivity improved – Производительностьтрудаувеличилась2. A) The deficit worsened–Дефицитвозрос. B) The trade balance worsened – Торговыйбалансхудшился.

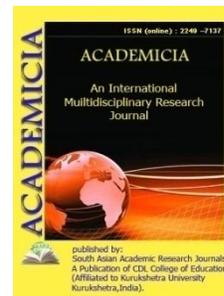

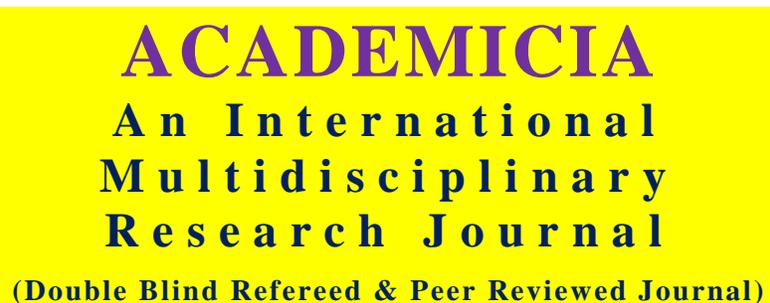

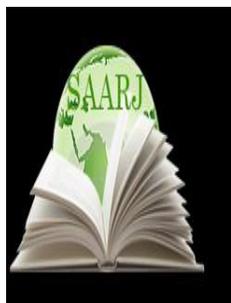

Translation gives a teacher an opportunity to test text comprehension and it can be used vocabulary and words in context. Translation can also be used to test grammatical structures, especially word order as in the English language it is different from that of in the Russian language. For example, an article, which does not exist in the Russian language, may lead to the change of word order in the target language. The sentence "A girl came into the classroom" may be translated as: "Вклассвошладевочка», while the same sentence with the article "the" before the word "girl"- " The girl came into the class room" may have a different word order- "Девочкавошлавкласс".When infinitive constructions are translated, word order is also often changed. For example, the sentence "The plant was given grants to improve working conditions" should be translated as:"Дляулучшенияусловийтрудазаводубыливыделенысубсидии".

Translation can be included into computer test. It may be highly recommended for ESP learners to check and improve their knowledge of scientific terms in Universities and colleges. Furthermore, the use of translation in university teaching may narrow the gap between the learning and working spheres, as it can be used in some non-academic careers. Specialized translation can stimulate research in a certain field in both languages- English and Russian and then an option of one of these languages to write a report, an essay or master's thesis. For this reason, my opinion is that translation is a facilitating tool for advanced ESP students, when communicative approach fails, e.g. culture-bound words.

### ABSTRACT

*The article discusses the issue of the reliability of the scientific substantiation of the relationship between the world and man, their interconnections and interactions, which are the subject of research in the system of human sciences.*

**KEYWORDS:** *Literature, Research, Problem, Philosophy, Wealth, Prosperity, Harmony And Solidarity, Justice, Happiness, Artistic Images;*

### INTRODUCTION

The study of a person in literary criticism is considered one of the main features of science. This requires the study of artistic and aesthetic concepts, first of all, the views of a person about a person. Considering that fiction is a form of public consciousness, it becomes clear that in every social setting a new hero will appear on the agenda, the creation of a new literary image.

### Main part

Literature in the Republic of Uzbekistan and the Russian Federation is developing on the basis of updating forms, styles, genres. Literature of the second half of the 20th century is of particular interest, today it is becoming an experimental literary platform, where polar concepts of the world and man are implemented, where the studies of Uzbek and Russian literary scholars are embodied, devoted to the “methodological, historical, literary and analytical problems of the genre development of prose”[9, 227]. The problem of literary scholars in the modern world is

the creation of literary works reflecting the personality, as the only conscious being in the process of globalization, the discovery of specific aspects of the relationship between the world and man. The problem is multifaceted, complex, the solution to which will also be different. It is important to study the human factor, its hypothetical essence in the philosophical, economic, scientific and technical, political, didactic and other directions. In our study, we pay attention to how this socio-psychological problem is solved in modern Uzbek and Russian literature. First of all, it should be noted that the concept to which the phrase “new concept of man” [9] belongs is widely covered in such sciences as philosophy, psychology, aesthetics, natural science, political science and literature. Based on this statement, the approach to the problem proceeds from the fact that each people has its own specific feature.

Based on historical facts, the culture of the BC era, the culture of the Karakhanid era, the period of the awakening of the Middle Ages, the Timurid era, the essence of man in Aristotle are those of his properties that cannot be changed so that he does not cease to be himself [3].

In philosophy, there is no single and unambiguous definition of man and his nature. In a broad sense, a person can be described as a being with will [17], reason, higher feelings, the ability to communicate [18] and work. In the philosophy of the Ancient East and antiquity, man is presented as a fragment of nature, the life path of which is predetermined by the laws of fate, and the essence is a certain deity [16]. In the Middle Ages, a person is endowed with free will, which raises it above nature, while making it possible to control its own destiny, reflects a new idea of a person based on the views and principles of these eras.

Since the Middle Ages, thinkers such as Abu Nasr Forabi, Abu Rayhon Beruni, Abu Ali Ibn Sina also expressed valuable ideas and opinions about the new man of his time and his views in oriental literature. In particular, Abu Nasr Forabi describes in detail his new concept of society and man in his work “The City of Fazel People” [13]. In Eastern classical literature, the concept of a perfect person developed under the influence of the philosophy of mysticism, which for several centuries was recognized as the leading concept in literature. This concept is so relevant in its theoretical and practical significance that even today attention is focused on its main aspects [8, 272].

As a mature representative of oriental poetry, Hofiz Sherozi in the XIV century artistically expressed a great need for a new human concept of his time: “a true person should not seek, a person should not want, a person, moreover, a new scientist should restore” [15, 62]. In the works of Alisher Navoi, a new concept of man was also put forward. In particular, according to Abdukodir Hayitmetov, the great thinker in the dastan “Kairatul-abror” raises a socio-political or moral problem necessary for his time, deeply and comprehensively analyzes it, proceeding from the life of his time, the position of social strata, expresses his humanistic attitude to him” [14, 6] at the same time emphasizes that the new human qualities in the ideal of the scientist Alisher Navoi are integrated. According to these statements, it can be determined that in a person the main factor that forms the basis of the social system, towards which a perfect society strives, is wealth, prosperity, harmony and solidarity, justice, happiness and the rule of law. This opinion deserves attention associated with the modern new concept of man.

The development of mankind went through several stages until the emergence of the modern era. Changes in consciousness and perception of humanity were a new human concept for these periods. Proceeding from this, it should be noted that after gaining independence in the Republic

of Uzbekistan and the Russian Federation, the literature began to describe people with new thinking and a new worldview. Thus, national independence became the leading social basis of the new concept of man in modern Uzbek and Russian literature, and creative freedom was granted. If earlier artistic images demanded description on the basis of certain principles of the ideology of the previous regime, now it is possible to describe it as a pure socio-psychological subject, to describe it in such a way that a person could imagine what kind of thinking she lives, what kind of creativity it has.

In the philosophical understanding of human knowledge, the idea of the integrity of ideas is persistently actualized: what a person is, in what his essence is expressed. It is obvious that Plato was still convincing us of a holistic understanding of the world and man in a dispute with Zeno: “Everything that has arisen arises for the sake of the whole, for the sake of realizing the blissful being inherent in the whole whole, and this being arises not for your sake, but you - for its sake”.

It is very difficult to deal with a person as a “thing in itself” and orient him towards positive manifestations. G.P. Shchedrovitsky, V.M.Rozin, N.G. Alekseev, in connection with the analysis of the problem of a person as a whole, note that a person is considered in two planes - as an element of a social system and as a biological being. Since the role of nature in empirical awareness is indisputable, this is completely natural and gives rise to the idea that, first of all, a biological being is seen in a person, his natural essence, then the original, which ensures his mental life and all social connections.

The model of a holistic understanding of a person in his interconnection with the world is presented in the studies of the author of the article [4, 46-59], which reveals the relationship “world-man” and “man-world” in their system-integral organization, which allows you to analyze the relationship and interaction of a person and the world, the laws of development of the world and man. The vision of the model of the systemic and structural organization of man and the world makes it necessary to consider, analyze, interpret the manifestations of the essence of man in the sphere of his being.

The creation of an image based on a new concept of a person was considered one of the most ancient problems of literature, and in different periods of social development, a different attitude was expressed towards it. Avesto, as a huge cultural monument, knows what a new person of his time should be and what he should pay attention to for this. Professor N. Zhuraev notes “this ancient written monument embodied the genesis of man and his moral views, the principles of the development of the personality of society, not only moral, but also the foundations of socio-economic, legal and value. We can say that the interpretation of such rare cultural monuments allows us to apply them to life, having mastered the life experience of our ancestors, their wisdom, their intellectual potential” [6, 13]. The totality of the artistic, aesthetic, social and psychological views of the new person is relevant in our time. In the theory of building a new state, the function of the individual in a new society is the totality of relations between the people and the state. The historical basis of a person in works of art and his new appearance in each social period, reflecting his new views, has a long history. Even in the most ancient written sources, the reflection of the human concept was recognized in scientific research [10, 44].

In European literature, a new concept of man was formed on the basis of the principles of enlightenment literature, then Friedrich Wilgil von Hegel, Arthur Schopenhauer, Friedrich Nietzsche, Nikolai Berdyaev admit the following. “Under the influence of the ideas of European

literature of enlightenment, literature is being formed, based on new aesthetic imprints, on the basis of which the idea arises that ideological literature is needed that can change the world and man. That is, in other words, the social ideal of enlightenment is the construction of a society according to human nature and reason” [1].

The thinker claims that literature uplifts a person who, as an aesthetic ideal, recognizes his right, corresponds to his soul and life goals.

In particular, the principle of dialectical understanding of reality put forward by Hegel was the basis for understanding the perfect position of a person and the formation of a new person in the center of development [5, 400].

From these considerations, it becomes clear that the creation of a new person, a change in the artistic and aesthetic ideal is based on the principles of literary continuity, tradition and renewal. In this sense, the creation of an image and its form, closely connected with social life, expressing it in the necessary artistic form requires great skill from writers. It is difficult to make a new assumption, to describe a completely new person is a difficult task.

According to Friedrich Nietzsche, the nature of the superman allows him to be free from moral [11, 218] and religious norms. “Friedrich Nietzsche, like his mentor Arthur Schopenhauer, had great respect for Eastern spirituality, Eastern human understanding and sought the truth about a person from the East” [2, 167].

In the East, the traditional concept of man was formed. The compassion he created on his basis (God, nature, mother, creator), religion, adheres firmly to such human characteristics as social cohesion, the desire for progress, patience, willpower and intelligence, and work is the leader.

## CONCLUSION

The desire to understand the true essence of man at all times constituted the core of the human concept. Friedrich Wilhelm Nietzsche has finally laid the foundation for a new direction called “philosophy of life” and which is progressing. This direction, despite some of its shortcomings, became the main contribution to the development of world philosophy, served as the ideological and theoretical basis for such trends as pragmatism, phenomenology, existentialism. In the modern world, the new man of the 20th century was based on this concept.

For the studied problem, we came to the following conclusions:

1. The concept of personality in fiction is expressed in a complex of views of the writer, social ideals. The social, national, spiritual, aesthetic position of the writer in relation to the individual and society, in one word, the humanism of the author is determined precisely by the concept of personality in the work.
2. Problems of man and society, time and heroes are also the main task of all genres of fiction. The writer is vividly represented by resourcefulness, wit, features of harmony with time. They keep pace with people and their problems.
3. Changes in social and historical life lead to the emergence of a new concept of man in literary criticism.
4. The concept of man came from ancient written sources mixed with the concept of a religious relationship, in which everything is combined into a single creation.

5. In the Islamic period, the concept of a person in Uzbek literature was formed and developed on the basis of the concept of a perfect person.

6. The Christian Church believes that original sin has corrupted the nature of man, from which there appeared in him a tendency to deviate from the norms expressed in the covenants of God. The heresiarch Pelagius sees in original sin only a single act of deviation of a person's free will from good [12].

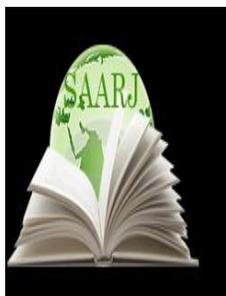

7. In the works of T. Muradi and V. Shukshin, the concept of man and the world is based on spiritual and moral principles. (“The Field Inherited from Father”, “Lyubavins”).

8. The deep rootedness of the spiritual heritage of the Uzbek and Russian peoples in the souls of the writers was reflected, absorbing religious, philosophical and literary concepts and views.

#### ABSTRACT

*In the conditions of typical gray soils of Tashkent region, before sowing of winter wheat under the plow once in three years in addition to the norms of mineral fertilizers  $N_{200}P_{140}K_{100}$  and  $N_{150}P_{105}K_{75}$  kg/ha 1,5-3,0-4,5 t per hectare. The effect of irrigation on soil agrophysical properties and plant growth and grain yield was studied for three years in the order of 60–70–60 and 70–80–70% of the soil moisture before irrigation during the period of application, using bentonite mud.*

**KEYWORDS:** *Typical Gray Soil, Soil Volume Weight, Soil Water Permeability, Mineral Fertilizers, Bentonite Sludge, Winter Wheat, Seedling Thickness, Total And Productive Stem, LFMC, Grain And Straw Harvest.*

#### INTRODUCTION

In the world's leading wheat-growing countries, guidelines have been developed and scientifically based for the use of non-traditional agro-ores in a variety of soil conditions as a supplement to mineral fertilizers. The use of non-traditional agro-ores in the soil as a resource-saving technology has improved the agrophysical and agrochemical properties of the soil, accelerated biological processes in the soil, increased the rate of assimilation of applied mineral fertilizers by plants and, consequently, improved grain quality. It should be noted that the development of agro-measures to save water and mineral fertilizers, using non-traditional agro-ores in the production of high-quality grain from winter wheat is a topical issue.

Foreign scientists M. El-Nennah, A. Abdel Latif, Soils Dept, Ain Shams, Dr. Zoltán Adamis, József Fodor, János Kátai, Magd, Magd Lazányi, Edina Veres Lukácsné, Zsolt Sándor, A.V.Tsygankov, E.V.Agafonov, A.V.Tsygankov, V.V.Turchin, A.A.Gromakov, A.S.Sokolov,

U.G.Distanov, Ya.Steyskal, K.Vnouchek, scientists of the Republic S.N.Ryjev, M.G.Tlyavov, L.N.Slesareva, A.Djalalova, D.Alimardanov, R.Nazarov, E.M.Belousov, D.A. Many scientific researches have been carried out by Tungushova, S.O. Abdurahmanov, S.M. Boltaev and others.

Bentonite slit is a natural element rich in minerals, and many species of it are found in nature. Bentonite sludge not only fills the soil with a shortage of microelements, but also serves to improve its reclamation condition (M. El-Nennah, A. Abdel Latif, Soils Dept, Ain Shams (1979).

Studies by Russian scientists AS Sokolov (1982) and UG Distanov (1985) have shown that the specificity of bentonite, its physical and chemical properties, the source of micronutrients in terms of composition, which helps the absorption of mineral fertilizers, water and soil while increasing the ion absorption properties, it has a comprehensive effect on increasing soil fertility.

They concluded that reducing the amount of harmful salts in the soil helps to increase physiological processes, as well as increases the plant's resistance to various diseases.

According to DA Tungushova, EM Belousov, SO Abdurahmanov, SM Boltaev (2007), the composition of agro-ores, which are a source of food for plants, consists of macro-micro elements: phosphorus 1–8%, potassium 0,7–3,6% carbon 0,7–4,9%, as well as copper, boron, zinc, manganese, molybdenum, cobalt and others. Deposition of bentonite sludge and glauconite sand into the soil prevents leaching of nutrients along with soil volume weight, moisture capacity, water retention ability, and improved soil structure. In the conditions of typical gray soils of Tashkent region, the use of hammer bentonite mud under driving at the rate of 750-3000 kg cotton yield 3,4-3,2 ts/hect, the use of glauconite sand at the rate of 750-1500 kg per hectare 4,5-3,1 allowed to increase ts/hect.

*From the analysis of the literature we can see that the application of bentonite sludge to the soil has a positive effect on the agrophysical and aquatic physical properties of the soil, resulting in improved plant growth and nutrient uptake, which has been proven by many scientists.*

*However, no research has been conducted to study the combined effects of bentonite sludge, mineral fertilizer standards and irrigation regimes on the growth, development and grain yield of winter wheat in the conditions of typical gray soils of Tashkent region.*

## **PROCEDURE AND METHOD OF CONDUCTING THE EXPERIMENT**

This research was conducted in 2008-2011 at the Experimental Site of the Research Institute of Cotton Breeding, Seed Production and Agrotechnology (PSUEAITI). This area is located in Kibray district of Tashkent region, 7-8 km from the Chirchik river. in the distance, to the right of the Gray Water Canal.

The soil of the PSUEAITI experimental plot is a typical gray soil with ancient irrigation, groundwater depth 18–20 m, medium and heavy sandy, high carbonate, humus content 1.0–1.5%, total nitrogen 0.08–0, 1 percent, phosphorus 0.2–0.3 percent. Due to the high content of saturated cations, biological processes are accelerated.

The experimental system consisted of 16 variants, placed in 3 iterations, one tier. In the experimental field, the width of the edges is 60 cm, the length of the edges is 100 m. In the experiment, Moskvich variety of winter wheat was planted. The area of each plot is 480 m<sup>2</sup>, of which the area to be taken into account is 240 m<sup>2</sup>. The total area of the experiments is 2.5 hectares.

In the experiment, two different fertilizer rates ( $N_{200}P_{140}K_{100}$  and  $N_{150}P_{105}K_{75}$  кг/га kg / ha), two different irrigation regimes for LFMC 70–80–70 and 60–70–60%, and three different types of bentonite sludge from the Bolgali deposit 1.5–3.0–4, 5 t / ha standards are set.

**The purpose of the study:** to determine the amount of mineral fertilizers and water requirements of winter wheat in the application of bentonite mud under the driving conditions of typical gray soils of Tashkent region and to assess the impact of non-traditional crops on wheat growth, development and grain yield.

**TABLE 1 EXPERIMENTAL SYSTEM (2008–2011)**

№	Variants	Fertilizer amount, kg/ha			Moisture of soil according to LFMC, %.	
		N	P <sub>2</sub> O <sub>5</sub>	K <sub>2</sub> O	60–70–60	70–80–70
1	Without bentonite	200	140	100		
2	Without bentonite	150	105	75		
3	1500 kg/ha bentonite	200	140	100		
4	1500 kg/ha bentonite	150	105	75		
5	3000 kg/ha bentonite	200	140	100		
6	3000 kg/ha bentonite	150	105	75		
7	4500 kg/ha bentonite	200	140	100		
8	4500 kg/ha bentonite	150	105	75		

**Note:** The norms of bentonite mud shown in the experimental system were applied once before driving in the 1st year before planting, and the effect was studied for 3 years.

### FINDINGS FROM THE STUDY

At the time of irrigation of the experimental options, the threshold was 50 and 25 cm. the amount of water used for irrigation was determined using a Chippoletti water meter with a width.

Analyzing the experimental data, the norms of mineral fertilizers  $N_{150}P_{105}K_{75}$  kg/ha were applied, and when the pre-irrigation soil moisture was 60–70–60% relative to the LFMC, the control option was irrigated a total of 3 times during the application period, 0–2–1 in the irrigation system. 1 time (irrigation rate 860 m<sup>3</sup>/ha), 1 time during sowing (irrigation rate 880 m<sup>3</sup>/ha), and 1 time during ripening period (irrigation rate 850 m<sup>3</sup> / ha), seasonal irrigation rate was 3350 m<sup>3</sup> In the case of bentonite mud in the amount of 1500 kg/ha in addition to the norms of mineral fertilizers, a total of 2580 m<sup>3</sup>/ ha of water was used during the growing season, irrigated 2 times during the growing season, 0–2–0 irrigation system.

In addition to the norms of these mineral fertilizers, even when bentonite sludge is applied at high rates, ie in the amount of 3,0–4,5 t/ha, it is necessary to irrigate a total of 2 times during the growing season in 0–1–1 irrigation system, seasonal water consumption is 2540 m<sup>3</sup>/ha. and 2500 m<sup>3</sup>/ha of water consumption.

According to the data obtained, in addition to the norms of mineral fertilizers  $N_{150}P_{105}K_{75}$  kg/ha, 1,5–3,0–4,5 t per hectare. It was found that in the variants using bentonite sludge in the amount of 770–810–850 m<sup>3</sup>/ha compared to the control variant.

In the second irrigation procedure, the same patterns were repeated, with pre-irrigation soil moisture at 70–80–70% relative to LFMC, and 1,5–3,0–4,5 t. per hectare in addition to the norm

of mineral fertilizers  $N_{150}P_{105}K_{75}$  kg/ha. The variants with bentonite mud were irrigated 3 times during the season in 1–1–1 and 0–2–1 systems, the seasonal irrigation norms were 3660–3500–3400 m<sup>3</sup>/ha, and 630–790–890 m<sup>3</sup>/ha more than the control variant. was found to have been saved, and it was observed that the above laws had been proved.

The full germination of wheat sown in the fall depends on many factors, mainly the biological characteristics of the variety, planting times, soil moisture, fertilization with mineral fertilizers, temperature and others.

Data on seedling thickness of winter wheat during the growing season of 2009–2010 show that the effect of mineral fertilizers and bentonite mud norms on germination and seedling thickness of winter wheat was significant among the options.

In particular, pre-irrigation soil moisture is irrigated at 60–70–60% relative to the LFMC, in addition to the norms of mineral fertilizers ( $N_{200}P_{140}K_{100}$  and  $N_{150}P_{105}K_{75}$  kg/ha) 1,5–3,0–4,5 t. per hectare. when using bentonite muds in the amount of 18–16 compared to the control options; It was found that 33–28 and 46–44 m<sup>2</sup>/piece of seedlings sprouted a lot.

In the second irrigation regime in the experiment (pre-irrigation soil moisture 70–80–70% relative to LFMC), in addition to the two norms of mineral fertilizers ( $N_{200}P_{140}K_{100}$  and  $N_{150}P_{105}K_{75}$  kg/ha), 1,5–3,0 per hectare, in addition to the two norms of mineral fertilizers, while maintaining the above regularity 4.5 t. The number of seedlings germinated per 1 m<sup>2</sup> ranged from 290–309–318 to 276–297–312, while the number of seedlings per hectare increased from 22–41–50 to 15–36–51 m<sup>2</sup>/unit compared to the control variant. observed.

With the autumn wheat, the period of time until the end of the application period is the viability of the plant. Survival varies depending on several factors: soil-climatic conditions, level of nutrition, planting times and standards, irrigation, biological characteristics of the variety. Data from experiments conducted during the growing season of 2009–2010 also to some extent confirmed the above ideas.

In particular, pre-irrigation soil moisture is irrigated at 60–70–60% relative to the LFMC, in addition to the norms of mineral fertilizers  $N_{200}P_{140}K_{100}$  kg/ha 1,5–3,0–4,5 t. per hectare. It was observed that the death of seedlings in the winter with the use of bentonite mud in the amount of 0,6–1,0–1,4% less than the control option.

Irrigated in the same irrigation regime, in addition to the norms of mineral fertilizers  $N_{150}P_{105}K_{75}$  kg/ha, 1,5–3,0–4,5 t per hectare. It was noted that the use of bentonite mud in the amount of 1,4–2,5–3,3% less than the control option.

The same pattern was observed in the second irrigation regime (70–80–70% of the LFMC), in addition to the norms of mineral fertilizers  $N_{200}P_{140}K_{100}$  kg/ha, 1,5–3,0–4,5 t per hectare. In variants 11–13–15 with the use of bentonite mud in the amount of 0,3–1,4–1,9% compared to the control variant, in addition to the norms of mineral fertilizers  $N_{150}P_{105}K_{75}$  kg/ha 1,5–3,0–4,5 per hectare t. In variants 12–14–16, where bentonite mud was applied in the amount of 1,7–3,3–3,9%, it was observed that the loss of seedlings was low.

However, when the actual thickness of seedlings at the end of the application period was studied in terms of variants, it was observed that during the period from collection to the end of the ripening period, seedlings died under the influence of various factors.

According to the data obtained, pre-irrigation soil moisture is irrigated at 60–70–60% relative to LFMC, and in addition to the norm of mineral fertilizers  $N_{200}P_{140}K_{100}$  kg/ha, 1,5–3,0–4,5 t. per hectare. By the end of the application period, the actual seedling thickness was 239–254–267  $m^2$ /piece, the number of dead seedlings was 6,1–5,6–5,2%, and the number of seedlings compared to the control variant was 3–5–7 variants. In addition to the norm of mineral fertilizers  $N_{150}P_{105}K_{75}$  kg/ha, it was observed that the number of dead seedlings was higher by 19–34–47  $m^2$ /unit, the amount of dead seedlings was reduced by 0,6–1,1–1,5%, 1,5–3,0–4,5, t. per hectare. By the end of the validity period, the actual seedling thickness was 227–242–258  $m^2$  / piece, the number of dead seedlings was 6,5–6,0–5,8%, and the number of seedlings compared to the control was 18– 33–49  $m^2$ /unit, and the number of dead seedlings was found to be 0,7–1,2–1,4% lower.

**TABLE 2 EFFECT OF BENTONITE TURBIDITY ON EXPERIMENTAL WINTER WHEAT GERMINATION AND SEEDLING THICKNESS, 2010**

№	The number of sprouted seedlings $m^2$ /piece	The number of seedlings perished in winter, %	The number of seedlings obviated winter, $m^2$ /piece	The number of perished plants from gathering to the end of maturing, %	The number seedlings at the end of, $m^2$ /piece
1	259	8,9	236	6,7	220
2	252	10,7	225	7,2	209
3	277	8,3	254	6,1	239
4	268	9,3	243	6,5	227
5	292	7,9	269	5,6	254
6	280	8,2	257	6,0	242
7	305	7,5	282	5,2	267
8	296	7,4	274	5,8	258
9	268	8,2	246	6,2	231
10	261	10,0	235	6,6	219
11	290	7,9	267	5,6	252
12	276	8,3	253	5,1	240
13	309	6,8	288	4,8	274
14	297	6,7	277	4,5	265
15	318	6,3	298	4,1	286
16	312	6,1	293	4,4	280

The above rules are reflected in the second irrigation regime, when the pre-irrigation soil moisture is 70–80–70% relative to the LFMC, in addition to the norms of mineral fertilizers  $N_{200}P_{140}K_{100}$ kg/ha, 1,5–3,0–4,5 t. per hectare. In the variants using bentonite mud, the actual seedling thickness was 252–274–286  $m^2$ /piece, the number of dead seedlings was 5,6–4,8–4,1%, and the seedling thickness was 21–43–55  $m^2$ /piece higher than the control. seedlings were found to be 0,6–1,4–2,1 percent lower. In addition to the norms of mineral fertilizers  $N_{150}P_{105}K_{75}$  kg/ha, 1,5–3,0–4,5 t. per hectare. In the variants with bentonite mud, the actual seedling thickness was 240–265–280  $m^2$ /grain, the number of dead seedlings was 5,1–4,5–4,4%, and the seedling

thickness was 21–46–61 m<sup>2</sup>/grain higher than the control, the number of dead seedlings decreased by 1,5–2,1–2,2%.

The data obtained show that in addition to the mineral fertilizer standards, in the variants where bentonite mud was used, the effect on seedling germination and actual seedling thickness was found to be significant.

Studies conducted in 2008–2009 and 2010–2011 also obtained data in accordance with the above-mentioned legislation, in addition to mineral fertilizers, 1,5–3,0–4,5 t/ha. It was observed that when bentonite mud was applied, the germination rate of seedlings increased and the mortality of seedlings decreased.

Accumulation of winter wheat is one of the main indicators. Some of the resulting stalks do not form spikes or grains in the spikes, while others form spikes. The total number of stems in a plant is called the total stem. Stems that form spikes and receive full grain are called productive stems or productive accumulations.

The results of the experiment show that along with the growth and development of winter wheat, the effect of irrigation regimens, mineral fertilizers and bentonite sludge on the total and number of productive stems was significant.

In particular, according to experiments conducted in 2010, pre-irrigation soil moisture was irrigated at 60–70–60% relative to the LFMC, and in addition to the norms of mineral fertilizers N<sub>200</sub>P<sub>140</sub>K<sub>100</sub> kg/ha, 1,5–3,0–4,5 t. per hectare. In the variants with bentonite mud in the amount of 5,9–6,9–9,7 cm, the total number of stems is 49,0–96,6–104,7 m<sup>2</sup>/piece and the number of productive stems is 47,4–97,7–102,2 m<sup>2</sup>/piece, in addition to the norms of mineral fertilizers N<sub>150</sub>P<sub>105</sub>K<sub>75</sub> kg/ha, 1,5–3,0–4,5 t. per hectare. In the variants with the use of bentonite mud in the amount of 2,9–4,3–11,1 cm, the total number of stems is 81,6–99,4–108,3 m<sup>2</sup>/piece, the number of productive stems is 76,1–100,3–107, More than 6 m<sup>2</sup>/piece.

In the second irrigation regime, the above laws were observed, pre-irrigation soil moisture was irrigated at 70–80–70% relative to the LFMC, and in addition to the norms of mineral fertilizers N<sub>200</sub>P<sub>140</sub>K<sub>100</sub> kg/ha, 1,5–3,0–4,5 t per hectare. In 11–13–15 variants, where bentonite mud was applied in the amount of 91,1–93,5–95,7 cm by the end of the validity period. The total number of stems is 445,1–456,7–487,4 m<sup>2</sup>/grain, the number of productive stems is 404,0–416,7–446,5 m<sup>2</sup>/grain, and the height of the plant compared to the control is 3,9–6,3–8,5 cm. In addition to the norms of mineral fertilizers N<sub>150</sub>P<sub>105</sub>K<sub>75</sub> kg/ha, if the total number of stems is higher than 44,2–55,8–86,5 m<sup>2</sup>/piece, the number of productive stems is higher than 47,5–60,2–90,0 m<sup>2</sup>/piece. 1,5–3,0–4,5 t per hectare. By the end of the growing season, the plant height was 88,7–91,1–93,5 cm, the total number of stems was 437,3–455,7–487,2 m<sup>2</sup>/piece, and the number of productive stems was 397,1–415,5–444,5 m<sup>2</sup>/piece, compared to the control variant, the plant height is 5,8–8,2–10,6 cm, the total number of stems is 42,4–60,8–92,3 m<sup>2</sup>/piece, the number of productive stems is higher than 61,2–79,6–108,6 m<sup>2</sup>/piece.

**TABLE 3 HEIGHT OF AUTUMN WHEAT, TOTAL AND NUMBER OF PRODUCTIVE STALKS, 2010**

№	Variants	Height of plants, cm			Total number of stems, m <sup>2</sup> /piece	The number of productive stems, m <sup>2</sup> /piece

15	4500 kg/ha bentonite	40,5	94,8	95,7	487,4	446,5
16	4500 kg/ha bentonite	38,1	92,2	93,5	487,2	444,5

In our 2009 and 2011 studies, the same patterns were observed, with significant effects of bentonite sludge, mineral fertilizer rates, and irrigation regimens on the height of winter wheat and the number of total and productive stalks.

The spike length of the autumn wheat crop, the number of grains in the spike, the weight of the grain in one spike, and the grain weight of 1000 grains are important indicators of wheat yield.

In our experiment from 2008 to 2011, it was observed that the effect of bentonite mud and mineral fertilizers norms and irrigation regimes on the yield elements of winter wheat was specific.

In particular, based on the results of experiments in 2010, pre-irrigation soil moisture was irrigated at 60–70–60% relative to LFCM, mineral fertilizers were applied at the rate of N<sub>200</sub>P<sub>140</sub>K<sub>100</sub> kg/ha, in option 1 (control) the average spike length was 8,6 cm, the number of grains per grain is 38,1 grains, the weight of grain per grain is 1,43 g and the weight of 1000 grains is 37,6 g. 1,5–3,0–4,5 t. per hectare in addition to the norms of mineral fertilizers. In the 3–5–7 variants, where bentonite mud was used in the amount of 8,7–8,9–8,9 cm, the average spike length, respectively. The number of grains per grain is 38,2–38,3–39,1 grains, the weight of grain per grain is 1,48–1,48–1,53 g. and the weight of 1000 grains is 38,6–38,7–39,1 g. showed that.

In the control of variant 2, which was irrigated in this irrigation regime and applied norms of mineral fertilizers  $N_{150}P_{105}K_{75}$  kg/ha, the average grain length was 8,3 cm, the number of grains per grain was 38,0 and the weight of grain per grain was 1,39 g. and 1000 grains weighing 36,5 g. 1,5–3,0–4,5 t. per hectare in addition to the norms of these mineral fertilizers. In the case of bentonite mud (4–6–8 variants), the length of the spike is 8,5–8,7–8,8 cm, respectively. The number of grains per grain is 38,1–38,2–38,8 grains, the average grain weight is 1,43–1,45–1,48 g. and the weight of 1000 grains is 37,6–37,9–38,2 g. it was noted that.

**TABLE 4 EFFECT OF BENTONITE SLUDGE ON BIOMETRIC INDICATORS OF AUTUMN WHEAT, 2010**

№	Variants	The length of spike, cm	The number of crops on one spike, piece	The weight of crops on one spike, gr	The weight of 1000 pieces of crops, gr
1	Without bentonite	8,6	38,1	1,43	37,6
2	Without bentonite	8,3	38,0	1,39	36,5
3	1500 kg/ha bentonite	8,7	38,2	1,48	38,6
4	1500 kg/ha bentonite	8,5	38,1	1,43	37,6
5	3000 kg/ha bentonite	8,9	38,3	1,48	38,7
6	3000 kg/ha bentonite	8,7	38,2	1,45	37,9
7	4500 kg/ha bentonite	8,9	39,1	1,53	39,1
8	4500 kg/ha bentonite	8,8	38,8	1,48	38,2
9	Without bentonite	8,8	38,5	1,49	38,7
10	Without bentonite	8,5	38,1	1,41	37,0
11	1500 kg/ha bentonite	9,0	38,7	1,50	38,9
12	1500 kg/ha bentonite	8,9	38,5	1,47	38,1
13	3000 kg/ha bentonite	9,3	38,7	1,52	39,2
14	3000 kg/ha bentonite	9,2	38,5	1,50	39,0
15	4500 kg/ha bentonite	9,5	39,5	1,57	39,6
16	4500 kg/ha bentonite	9,2	39,3	1,54	39,2

In the second irrigation regime (70–80–70% of the LPMC), the same pattern was observed, a spike weighing 1,49 g. and 38,7 g per 1,000 grains. 1,5–3,0–4,5 t. per hectare in addition to the norm of these mineral fertilizers. In variants 11–13–15, where the amount of bentonite mud was used in the amount of 9,0–9,3–9,5 cm. The number of grains in one grain is 38,7–38,7–39,5 grains, the weight of one grain is 1,50–1,52–1,57 g. and 1000 grains weighing 38,9–39,2–39,6 g. These indicators are based on the fact that mineral fertilizers  $N_{150}P_{105}K_{75}$  kg/ha used in the norm of control 10–variant, the average length of a spike is 8,5 cm. The number of grains in a grain is 38.1 grains, the weight of a grain is 1,41 g. ni, 1000 pieces of grain weight 37,0 g. 1,5–3,0–4,5 t per hectare in addition to the norm of these mineral fertilizers. In 12–14–16 variants, the length of one spike is 8,9–9,2–9,2 cm, the number of grains per spike is 38,5–38,5–39,3 the weight of one spike is 1,47–1,50–1,54 g. and the weight of 1000 grains was 38,1–39,0–39,2 g. It was noted that.

According to the data obtained, in addition to the norms of mineral fertilizers  $N_{200}P_{140}K_{100}$  and  $N_{150}P_{105}K_{75}$  kg/ha, 3,0–4,5 t. per hectare. It was observed that the application of bentonite mud,

the length of the grain, the number of grains per grain, the weight of the grain per grain and the weight of 1000 grains were significantly affected.

In the conditions of typical gray soils of Tashkent region, the requirements of winter wheat variety “Moskvich” for bentonite sludge, norms of mineral fertilizers and irrigation procedures were studied.

Accordingly, the pre-irrigation soil moisture was irrigated at 60–70–60% relative to the LFCM, and in the control variant of mineral fertilizers  $N_{200}P_{140}K_{100}$  kg/ha, the average grain yield was 46,4 ts/ha in three years, in addition to the norm of mineral fertilizers. 1,5–3,0–4,5 t. per hectare. The average yield of 53,3–55,2–56,5 ts/ha was obtained in three years, respectively, with the use of bentonite mud (3–5–7 variants), with an additional 6,9–8,8–10,1 ts/ha grain yield was obtained. Irrigated in this irrigation regime, it was observed that the control of mineral fertilizers  $N_{150}P_{105}K_{75}$  kg/ha yielded an average grain yield of 41,5 ts/ha in three years (43,7–40,2–40,5) from option, which is in line with the standards of these mineral fertilizers. in addition, 1,5–3,0–4,5 t per hectare. In the variants with the use of bentonite mud (4–6–8), the grain yield was 52,8–54,9–56,2 t/ha, respectively, and 11,3–13,4–14,7 t/ha more than the control. Was found to be a grain crop.

**TABLE 5 IRRIGATION REGIME, NORM OF MINERAL FERTILIZERS AND AUTUMN WHEAT GRAIN AND STRAW OF BENTONITE MUD EFFECT ON PRODUCTIVITY**

№	Grain yield, ts/ha				Straw yield, ts/ha			
	2009	2010	2011	Total	2009	2010	2011	Total

10	48,9	43,6	42,3	44,9	57,1	51,8	51,5	53,5
11	58,6	55,5	49,3	54,5	79,5	74,9	67,9	74,1
12	58,0	55,3	49,7	54,3	71,8	67,9	60,7	66,8
13	60,4	59,0	52,0	57,1	82,3	79,2	70,9	77,5
14	59,8	58,8	51,8	56,8	73,6	72,1	63,1	69,6
15	62,9	60,8	52,9	58,9	84,6	81,6	72,1	79,4
16	62,6	60,5	52,5	58,5	77,0	74,8	64,2	72,0

The second irrigation regime was carried out when the pre-irrigation soil moisture was 70–80–70% relative to the LFCM, and mineral fertilizers were applied at the rate of  $N_{200}P_{140}K_{100}$  kg/ha.

Control variant 9 yielded an average grain yield of 48.9 ts/ha in three years. In addition, 1,5–3,0–4,5 t. per hectare. When using bentonite mud, the grain yield was 54,5–57,1–58,9 ts/ha, respectively, and 5,6–8,2–10,0 ts/ha more than the control variant. In this irrigation procedure, the standard yield of mineral fertilizers  $N_{150}P_{105}K_{75}$  kg/ha was obtained from the control variant 10 with an average grain yield of 44,9 t/ha in three years, in addition to the norms of these mineral fertilizers 1,5-3,0-4,5 t/ha. 54,3–56,8–58,5 ts/ha of grain were harvested in three years from the 12–14–16 variants using bentonite mud in the amount of 9,4–11,9–13,6 ts/ha in addition to the control. Yield was obtained.

The data show that the effect of bentonite mud, mineral fertilizer standards and irrigation regimes on the grain yield of winter wheat was significant.

## CONCLUSIONS

1. In addition to the norms of mineral fertilizers, 3,0 t/ha of bentonite mud was applied under the plow. When irrigated in the order of 80-70%, it is possible to save 790 m<sup>3</sup>/ha of water.
2. When pre-irrigation soil moisture is irrigated in the order of 60–70–60 and 70–80–70% relative to the LFMC, in addition to the norms of mineral fertilizers  $N_{150}P_{105}K_{75}$  kg/ha, 3,0 t/ha of bentonite sludge is applied under the drive. actual seedling thickness up to 33–46 m<sup>2</sup>/piece, height up to 4,3–8,2 cm, total number of stems up to 608,0–994,0 thousand/ha, and the number of productive stems up to 0,796–1,003 million/ha observed.
3. When pre-irrigated soil moisture is 60–70–60 and 70–80–70% relative to the LFMC, in addition to the norms of mineral fertilizers  $N_{150}P_{105}K_{75}$  kg/ha when applying bentonite mud in the amount of 3,0 t/ha under the drive, an additional 11,9 Grain yield was 9–13.4 ts/ha, and the yield was high, ranging from 21.1–18.9%.

### ABSTRACT

*This article presents the results of studying the characteristics of the "Optics" department in general secondary schools, identifying the methodological features of its teaching, contributing to the most effective acquisition of the necessary knowledge and skills by pupils. The main content of the sections "Optics" and "Quantum Optics" in general secondary schools and the requirements for the level of preparation of pupils in these sections at the end of education are considered. Based on the analysis, the study of optical phenomena in the school physics course has a high ideological significance and contributes to the formation of the personality of the modern graduate of the school.*

**KEYWORDS:** *Physics, Basic School, High School, Light Phenomena, Geometric Optics, Wave Optics, Quantum Optics, Methods Of Teaching Physics*

### INTRODUCTION

Modernity is characterized by the rapid development of science and technology, the information of all spheres of human society. In such conditions, the task of developing pupils' creative, problematic thinking, which allows them to quickly and efficiently find solutions to the problems they have to face on a daily basis, is becoming increasingly important. The solution to this problem can be found, inter alia, in the process of teaching physics in basic and high school using a practice-oriented approach [1].

One of the most important topics studied in the school physics course is the topic "Optics". Indeed, the knowledge that pupils get acquainted with during the study of this section can be used by them in the future not only in professional education based on the study of natural

science disciplines, but also applied in everyday life and activities of every person, because it is optical phenomena that become the basis for cognition of the surrounding reality through visual perception. That is why we can say that the study of the section "Optics" in the school physics course not only contributes to the practical preparation of future graduates for further education and professional activity, but also deepens the sphere of their general culture, contributing to the formation of a physical picture of the world based on the study of optical phenomena which are closely related to the subjects of study of other branches of physics[2].

However, despite this, the content of this section, presented in the physics course at school, does not fully reflect the enormous importance of optics. Today, educational programs provide for the study of a fairly large amount of information on this topic, but the methodology of their presentation needs significant improvement. In particular, in the traditional methodology there are no topics that contribute to the formation of pupils' idea of light as a real object - a free electromagnetic field, and in modern scientific literature, methodological research in this area is not numerous and does not always reflect the change in social reality in which educational process and the formation of the student's personality takes place.

In accordance with the above, an important point is to identify the specifics of studying the topic "Optics" at school, to determine the methodological features of its teaching, contributing to the most effective assimilation of the necessary knowledge and skills by pupils. The object of the research is the process of studying physics at school, the subject is the study of the topic "Optics" in the school physics course.

Acquaintance with optical phenomena occurs in secondary school, when in grade 6 pupils begin to study the section "Light phenomena", in the process of mastering which they get basic ideas about the following basic concepts: light beam, visible radiation, light reflection, light refraction, flat mirror, lens, imaginary focus, focal length of the lens, optical power of the lens. In addition, in the course of studying this section, pupils master the skills to build images, form the ability to obtain various types of images: enlarged, reduced, inverted, direct, real, imaginary.

An important circumstance necessary for understanding the specifics of studying the topic "Light phenomena" in basic school is that the section "Optics" as such is studied in grade 11, while the initial information about optical phenomena is taken out of it and included in the physics program main school, which is due to the already discussed above high importance of light phenomena in everyday life and in professional activity. In addition, familiarization with the material in this section contributes to the development of cognitive activity and the cognitive interest of pupils in the further study of optical phenomena due to the simplicity of the laws of geometric optics, considered during the period of study in grades 6-9, as well as the variety of related phenomena of the surrounding reality and the possibility of visual experiments.

An important feature of the topic "Light phenomena" studied in the physics course of the basic school is the fact that the pupils, when mastering it, get acquainted only with the basic concepts from the field of geometric optics, on the basis of which they continue to study the formation of ideas about the nature of light, its speed, knowledge about the phenomena of decomposition of white light into a spectrum and other issues related to the study of optical phenomena.

In other words, during the period of study in grades 6-9, pupils get the opportunity to get acquainted with only two of the most important problems of the system of knowledge about light phenomena, namely, with the behavior of light at the border of two environments, as well as with

---

the features of the propagation of light in a homogeneous environment[3]. Based on the content of the material studied in the basic school, the content of this section can be considered as uniting three main components: the straightness of the propagation of light, the laws of its reflection, and the phenomenon of light refraction. All the rest of the material with which pupils of the basic school get acquainted can be considered mainly as a consequence of the indicated elements of the content.

In addition, the study of light phenomena in basic school, as its feature, has the predominance of the use of qualitative methods of cognition over quantitative ones, which limits, in particular, the possibility of working on computational problems: pupils master the idea of only two quantitative dependencies - the law of light reflection and the connection between focal distance and power of the lens. In accordance with this, the work on qualitative tasks on the topic "Light phenomena" should involve the concentration of the teacher's increased attention on the formation of pupils' ability to independently explain the studied physical phenomena.

The presentation of the topic "Light phenomena" is carried out using the model "light beam" and is based on experiments. In connection with the above-mentioned features, the clarity of the presentation of the material acquires high importance in the study of light phenomena in basic school. In addition, an important aspect of the pupils' mastery of the topic we are considering is the fact that, despite the breadth of the use of the concept of "light ray" in the lessons in this section, at this stage of school education it is impossible to give a strict definition of it. However, despite the fact that the theoretical essence of this term will be studied only in grade 11, pupils should already have formed the idea that the specified phrase is, in essence, an abstraction and, using it, we are talking about converging or diverging light beams.

Thus, the study of the topic "Light phenomena" in the basic school has a number of peculiarities associated mainly with the impossibility of mechanical transfer to this topic of teaching methods for additional issues related to optics, studied in grade 11.

At the stage of obtaining secondary general education, the acquaintance of pupils with the section "Optics" continues at a deeper level, the possibility of achieving which is due both to the peculiarities of the cognitive development of the individual at this age stage, and to the presence of a more solid foundation of knowledge and ideas about the surrounding reality in general and physical phenomena in particular.

In accordance with the text of the secondary general education, the section "Optics" in the physics course includes the study of geometric optics, wave properties of light, as well as elements of quantum optics. To study the section "Optics" in accordance is given 14 hours (including, it is possible to carry out three laboratory works), the topic "Quantum optics" - 3 hours[4].

The mastery of the topic "Geometric optics" by pupils in physics lessons in grades - 11 as its basis has the knowledge acquired by them at the previous stage of education. In the course of studying this section in secondary school, there is an expansion and deepening of the knowledge that pupils already have about light phenomena, the nature and laws of propagation of a light beam. In addition, at this stage, the attention of those studying optical phenomena is focused on such aspects of this problematics that have not only practical, but also theoretical and methodological significance. As an illustration of this feature, the following example can be used: consideration of the behavior of rays in a trihedral prism allows pupils to conclude that in

this case there is multiple reflection and refraction of the ray at the interface between media of different optical density. However, this conclusion leads high school pupils to find a contradiction between the ideas they already have and the knowledge they acquire in secondary school. In other words, we are talking about the emergence of a "visible" violation of the laws of geometric optics. Overcoming such a contradiction is possible only through the pupils' analysis of the concepts of "symmetry" and "asymmetry", which allows them to discover that the laws of reflection and refraction of light can be considered as a consequence of the space-time symmetry of the laws of nature, and therefore their study is of great methodological importance.

As for the study of wave optics in the course of high school, it must be said that the greatest importance in its content is given to the study of the phenomenon of interference of light, built on the ideas of the phenomena of interference of mechanical and electromagnetic waves already existing among high school pupils. At the same time, the diffraction of light waves is studied in much less detail in the content of this section, since its main task is to prove precisely the wave properties of light. Nevertheless, pupils' understanding of light diffraction is also of great importance due to the need to demonstrate that geometric optics is the limiting case of wave optics.

The study of the phenomenon of polarization of light also acquires great importance in the study of wave optics in high school - its necessity is determined by the fact that the establishment of the transverse nature of light waves is one of the most important conditions for convincing proof of the electromagnetic nature of light. Knowing about the transverse nature of electromagnetic waves, in the process of studying the polarization of light, pupils answer the question about the study of wave optics in the physics course in high school allows one to explain from the wave standpoint the "laws of geometric optics; supplement them; indicate the boundaries that wave optics sets for geometric".

An important element of the content of the section "Optics" in secondary school also becomes familiarization of pupils with the elements of quantum optics, which occurs at the end of mastering the course of physics. In the course of studying this content element of the course, high school pupils for the first time encounter the phenomena of the dualism of the properties. This circumstance makes it necessary for the teacher to carry out the most careful selection of the content of the educational process, control over the course of its implementation, determine the practical tasks used (tasks, topics of laboratory work), and select didactic material. Of great importance in this respect is the possibility of using the ideas about optical phenomena already formed in pupils. As an illustration, the process of studying the rules of displacement during radioactive decay by high school pupils, as well as acquiring knowledge about nuclear reactions, the basis of which is the attraction of the knowledge they already have about the laws of conservation of mass and charge. To do this, it is advisable, even before turning to this topic, to repeat Newton's laws, Coulomb's law, the concept of centripetal acceleration, together with pupils, to recall the structure of the atom, studied in chemistry and physics lessons in basic school, with elementary particles that they have not previously studied.

Describing the peculiarities of studying quantum optics in high school, it is necessary to say that here pupils are faced with a contradiction, the essence of which is that many properties and regularities of the micro world they study do not correspond to the concepts of classical optics. In accordance with this, we can conclude that for the effective organization of education at this

stage, a high level of development of abstract thinking in eleventh graders is required. At the same time, it is inappropriate for the teacher to point out the paradoxical nature of the micro world - on the contrary, when revealing its originality, the teacher must draw the pupils' attention to the naturalness of the revealed differences.

The assimilation of quantum optics can be facilitated by the use of visual teaching aids (drawings, pictures, tables, graphs, posters, photographs, etc.) in physics lessons in a high school course, which can be used, albeit in a limited amount, when pupils master necessary teaching material.

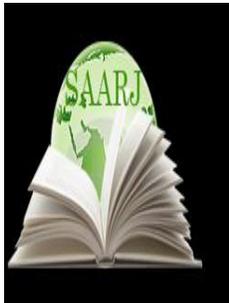

Thus, it should be borne in mind that the study of the basics of quantum optics at school is a complex methodological problem, the specificity of which is determined by the low visibility of the objects under study, the complexity of the mathematical apparatus, the unusual and "apparent" contradictions of the initial ideas and concepts of quantum optics. Therefore, in our opinion, one should start studying the material of this section in a school physics course with so As a result of studying the sections "Light phenomena" and "Optics", pupils should have the following knowledge and skills:

- after graduating from basic school - to understand the meaning of basic physical terms; to set up experiments on the study of light phenomena, while formulating the problem task of the experiment; analyze situations that arise in the course of practical activities, use in the course of their solution knowledge about the studied light phenomena;
- after graduating from high school - to distinguish between the main electromagnetic phenomena (rectilinear propagation of light, reflection and refraction of light, dispersion of light) and use the existing knowledge to explain the basic properties of such phenomena; use optical schemes for imaging; to analyze objects and phenomena of the surrounding reality, referring to the knowledge about optical phenomena and their laws; solve problems using these laws.

Thus, in the process of studying optics at school, a number of important problems of modern education are being solved. Mastering the content of this section contributes to the formation of a scientific worldview among pupils, expands the physical picture of the world, allows you to reveal the material unity of the world and the dialectical laws of its existence. The study of optics at school is of great importance for the formation of pupils' ideas about the role of experience in the process of cognition, the relationship between theory and practice, and the infinity of the cognition process. All this contributes to the formation of creative thinking in school graduates, the formation of their subjectivity, which, in turn, is a necessary condition for a successful life and work in the modern world.

## IMPORTANCE OF TEACHING READING AS PRODUCTIVE SKILL IN HIGH SCHOOLS

**Toleubayeva Aliya Ondasinovna\***

\*Assistant Teacher,  
 Karakalpak State University,  
 UZBEKISTAN

Email id: aliyatolewbaeva@gmail.com

### ABSTRACT

*The article discusses the importance of teaching reading not only as receptive skill but productive one for high school students, and stages of the lesson for understanding the text they read. Reading is one of the most important skills that helps students to learn new materials not only at school but also in everyday life. Not just by reading and understanding the text, but by communicating it the student realizes the importance of this or that information.*

**KEYWORDS:** *Foreign Language, Reading, Reading Comprehension, Receptive, Productive, Semantic, Lesson Stages.*

---

### INTRODUCTION

Reading should be built as a cognitive process, evoke mental activity among students, be accompanied by the solution of certain mental tasks requiring comprehension of the facts contained in the text, and their comparison and grouping. In teaching understanding of what is read, one should rely on the students' mastery of the structure of the language, which facilitates and accelerates the reading process, as it allows the reader to quickly and correctly divide the sentences of the text into syntagmas and establish semantic relations between the elements of the text. All this provides the ability to accurately understand the text.

Learning to read should include not only the receptive, but also the productive activities of students. Although reading refers to receptive types of speech activity, its course requires a number of productive operations, which are most clearly traced in internal pronunciation and in the operation of forecasting mechanisms. The functioning of reading as a speech activity requires automation of its implementation. An external manifestation of automation is the high reading speed and the ability of the reader to read at different speeds. All this requires special attention to

the development of reading speed. In this case, however, it should be borne in mind that its development is not an end in itself, but a way available to the teacher to control the formation of technical reading skills, the semantic processing of what is read.

**Stages of work on the text.** There are various points of view regarding which stages of work on the text should be included in the educational process, which are the most effective. Naturally, the selected types of work depend on the goals that we set before reading.

So, for example, V. M. Fadeev, based on the goal of teaching foreign languages in a modern school, distinguishes two stages in organizing home reading.[4]

The first stage is actually reading as a process of obtaining information from a text. This stage is required to work on any text. However, at this stage the work on most of the texts proposed by students for independent home reading should be completed.

The second stage is a conversation on home reading material. This stage of the work should be selective and apply only to some of the texts most suitable for speech practice or their fragments.

G. G. Skazkiv in the organization of verification of home reading distinguishes two stages.[5]

The first stage is the analysis of the lexical and grammatical difficulties of the text, the activation of new lexical material and the control of understanding the information embedded in the text.

The second stage is a creative discussion of the contents of the text.

Balakireva believes that the following sequence is needed to work with the book: Vocabulary work, Comprehension, Discussion, Writing.[2]

E. V. Bepalchikova, on the contrary, says that at the middle stage, home reading lessons no longer require direct work on language means and do not contain language and pre-speech exercises. Analytical conversation is built on the level of meaning.[3]

A.I. Panov also considers it inappropriate to apply forms and methods of work that turn the control of what is read into work on the development of oral speech or translation skills. [6]Therefore, he applies speech exercises only as a means to verify reading comprehension. The lesson includes three stages:

- 1) Control understanding of the general content;
- 2) Verification of understanding of certain essential details;
- 3) An assessment of the read material.

N. Ishchuk, offering home reading guidance for high school students, provides mainly what we call “pretext” exercises. Most of the tasks are focused specifically on working with words and grammatical constructions used in the text, which are aimed at developing oral speech skills. Thus, she puts reading as a means, and not the goal of learning.[1]

In a more traditional methodology, 3 stages of work on any text are usually distinguished: the pre-text stage (the stage of anticipation), the text stage, and the post-text stage (pre-while and post reading stages). Obviously, the post-text stage will be present when the text is considered not so much as a means of forming reading skills, but rather for developing productive skills in oral or written speech, but more simply, speaking and writing skills in a foreign language

In the pre-text period, reading rules are also mastered. Usually they apply to letter combinations, the mastery of which contributes to the anticipatory recognition of words. At the same time, the assimilation of the simplest symbolism necessary for the subsequent marking of texts (vertical lines for marking pauses, the sign of verbal and phrasal stress, the sign of increasing and decreasing tones, etc.) is necessary.

In the pre-text period, students learn to read not only words, but also phrases and simple sentences. In connection with the latter, it is necessary to learn some prohibitive rules, in particular: do not put emphasis on official words: articles and prepositions; do not pause between the article and the next word, between the preposition and the word related to it. The pre-text period lasts until students read individual elements of the text, that is, syllables, words, phrases and sentences that do not reflect the situation. With the advent of simple but coherent texts, a text period begins that extends to all stages of learning.

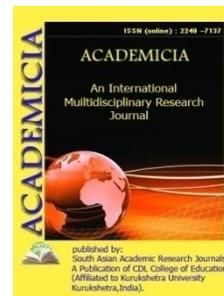

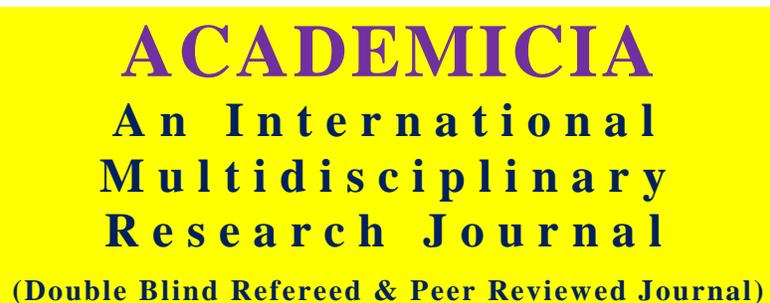

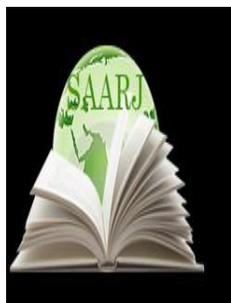

Since in this period the text acts as a semantic whole, it should be read in full or, if large, in semantic pieces.

## CONCLUSION

The task of this period is to bring students to the simultaneous perception and understanding of the text. Moreover, the development and improvement of perception is carried out in unity with the solution of semantic problems. For this, it is important to continue working on the following components of the content of learning to read aloud in parallel with stimulating and controlling understanding: grapheme-phonemic associations, verbal and phrasal stress, pause, and fluency in reading.

## THE URBANONIMS' PECULIARITY IN URGANCH CITIES

**Matnazarov Murodbek Maxsudbekovich\***

\*Doctoral Degree,  
Urganch State University,  
UZBEKISTAN

### ABSTRACT

*This article is named of peculiarity urbanonims' in urganch cites', the area is types of the separated urbanonims' and it's a forming of the motives they are belong to a group of the separate semantic, the Area describes mutual attitude urbanonims' and as question of transonimisation.*

**KEYWORDS:** *onomastika, urbanonim, oronim, fitonim, gidronim, antroponim, oykonim, mikrotoponim, nekronim, lingvistikomil, semantiktahlil, transonimizatsiyalashuv.*

### INTRODUCTION

Urbanonim means ( Latin word- "city", «urban», «municipal» ) It is renowned(1) every topographic founds are located (inside) area of the city, Urbanonims includes renowned like mahalla(neighborhood), guzar(area of the village), ko'cha(street); and *Al-khorasmy(street), Tinchlikmahallasi, "Avesto" Bog'i, Qozoqovul.*

In Urbanonims' language common changes, exchanges and to being uninterrupted that is why it differences from other toponymies, the characteristic is that, it is given some microvolumes but it is not ended just with divides and especially they are divides into some additional sizes, for example, *oykonim, urbanonim, nekronim, partonim, xrematonim, okeonominals*, are microsizes, E Begmatov emphasizes Urbanonims include and dividing the microsizes as *oycodomonims, godonim.*

*Oycodomonims* are especially renowned name, build, structure, architectural monuments and *godonims* are includes where in the city (alleys, local objects, streets, republic parks, coasts, and etc).

It shows to realize renowned name, it is monographic researching on Urbanonims' Urganch city's *Oycodomonims*. But alleys, local objects, streets, republic parks, coasts, neighbourhood,

yards, districts, markets are not research object in urganch city. It is known that, such kind of objects' name changes during passing time. This process is belong to peoples' centre of the social - political, economical – cultural, and also lifestyle. In social - political, economical – cultural changes show us name of streets' it is fact in society. Some streets' name were exchanged after independence, for example; *Зональная – Do'stlik, Базарная – Djizzakh*.

Exchanging reason is that Republic of Uzbekistan's low of nation language and it is iodine for our ideology, sometimes street names are changed by native people, to learn point of Urbanonims' linguistic is cultural property Urganch native peoples which has been living during thousand years, so it helps to keep for centuries in the future. Urbanonims had not researched as especially object in Uzbek linguistics and also urganch cities'.

We cannot say Urbanonims' accordingly for our national - our values and all people. Some names demand to change, so some orthographical mistakes damages for our mother tongue.

Sh. M. Mirziyoyev emphasizes such kind of thoughts «unfortunately, it has written a line, words for our ideology, foreign words, different signboards, on public places, on arches etc... it testifies to get worth literacy natives, damages our national- culture and it is disrespect for our language. It is a ethical criteria, indicative our countries level and patriotism, it is necessary no one, never forget about it. We think about future, the first of all our national, we must conserve like eyes-glass of our essence quality, customs, unique arts, literary, mother tongue».

It is the culmination question to gather Urbanonims and researching, to get systematization them, to named new historical objects,

It is necessary to named toponomic objects with new words, included words, scientific based on words it should be belong to legalize, and adapted to uzbek, choosing modern words and, supply with county wind.

The tendency gathered Urbanonims' names, the factors of changing reasons, to cultivate special semanticnames of motives in Urbanonims',it must investigate in into Urbanonim areal different typs of names about linguistic characterized.

There is peculiarity of the naming toponomic objects', the developing urbanonimic is the most important that in transition area. Transition significances to enrich lexical part of the urbanonimya, also important to copy names from first to second object. So during this process will be observed names are met again;

for example *khoraizim(street), urganch(street), ko'ynaqala(street), djaykhun(street), Yangiariq (neighbourhood), and Gurkan(avenue)*.

Urbanonims may change quickly than other types of toponims, it proves inurganch cities' Urbanonims' analysis too.

That is why it is necessary to note and researching historical- linguistic in soon times.

Urbanonims are considered main part in our language, them peculiarities are discovered by naming tendency, cymantic and functional peculiarity, etc

To learn this questions mark culmination point this theme for us.Lost years the brench of linguistic developed sa main part The component of uzbekonomisticIt is not sufficient discovered in urganch cities' toponimic materials.

Z. Do'simov, A. Otadjonova X. Egamov, M. tillayev, and U. Radjabov were busy with khorasim region's toponomic, and they noted in themselves' works and presentations hvesominformatins about urbanonims, sometimes episodic characters. Butthis thought can not bring most imagination about native city's feature's of urbanonims', urbanonims are not discovered as monographic work objects in our country's other regions.

To call geographic objects inurganch, it is organizedstrucure by government about to exchange alien names to national names. Groups have been working on native regions names' researching by in districts' governorinEvery single district. It has been discussing on gathering and researching on different aspects. There are lots of problem about it.Such kind of problem will be settled after has learnt urbanonims as linguistic,

Reason of works are done point on naming objects The emphasize is important that helps forrepublic commission to orderurbanonims'detached ideology,

Such kind of Researching works show this one, it is important point to discover for urbanonims' lessonic aspects in Uzbek language

Such kin of researching works show this ones they are important part for discover urbanonims' lessony in Uzbek language,

But urbanonims' are not researched till now in urganchcity's, their foundation of define to discover as monographic, it brings out important appropriately significance omonistic level of Uzbek language's

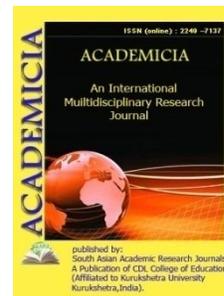

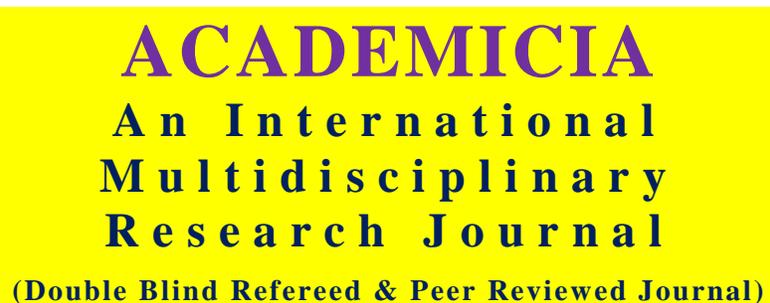

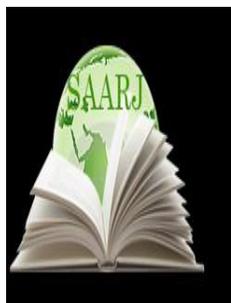

New appeared or renamed objects are to being named, it is like conclusion of high level remembrance to creaturbanonimsreflections native peoples' history, mentalities and hops and it produces recommendation and proposals.

Also now gathered and will be gather materials serves for region urbanonims'to be foundation of explanatory dictionary.

## INTRODUCTION

Uzbekistan is a double landlocked country in Central Asia bordering with Kazakhstan from the north, Kyrgyzstan from the northeast, Tajikistan from the southeast, with Afghanistan and Turkmenistan from the southwest. Uzbekistan got its independence in 1991 after the collapse of the Soviet-Union. Its population is diverse and over 33 million people. Uzbekistan is rich in mineral resources, its main economy depends on cultivating and exporting cotton abroad. Uzbekistan is considered one of the leading distributor of cotton in the world.

Before Russian colonization, the land of Central Asia split into Khokand, Bukhara, and Hivakhanates (empires). In 1917 Communist took power over the bourgeois capitalistic class and established the Soviet Union. Due to the National Territorial Delamination process, Central Asia was divided into ethnically-based republics. Accordingly, in 1924 Uzbekistan Socialistic Republic was established by the former Soviet Union. In 1991 Uzbekistan proclaimed its independence and sovereignty.

### *Education during the Soviet Union*

The history of Uzbekistan educational system divided into four periods: Soviet education (1923-1991), post-Soviet educational transformation (1991-1997), educational reforms (1997-2018), political transformation (2018-present).

The Soviet education system divided into nursery (3-7 years old), elementary (1-4 grades), and secondary schools (5-11 years). At that time it was compulsory for students to finish 1-9 grades then they may opt to continue further education in the secondary specialized institution such as *PTUs* ( or *technikums*(1.5-3 years). They had also a choice to finish 11 years in secondary school then pursue higher education (5 years). All educational schools were for free except nursery schools and kindergartens. Soviet Education was centralized and controlled from Moscow for all socialistic republics (Read, 1989). During socialism period Soviet Union education was portrayed as the best in the world, however, it was fully centralized, bureaucratic and hierarchically managed (Silova 2009a;Kobakhidze, 2018). Read (1989) described it as a social and educational levelled, stagnated and resistant to change the system. Marxist-Leninist communistic ideology was a core concept at that time and it significantly reflected on education.

The educational system of Uzbekistan almost resembled the Soviet Union system at the beginning of the post-Soviet transformation period. Uzbekistan inherited hierarchical central planning and inefficient resource allocation policy which brought many issues in budgeting not only education but also other sectors. In fact, during the transformation process, Uzbekistan experienced a catastrophic decline in economics. UNESCO/ADB (2001) data suggests that government spending on education decreased to 6.8 % but voluntarily contribution of parents increased to 55% (as cited in OSI, 2002). The country cannot afford much investment in education and attempted to decentralize it simply the transferring financial burden to local authorities, schools, and parents (OSI, 2002). Delays of teachers' salaries increased corruption in enrolling for higher education but for school teachers, private tutoring has become a means of earning (Khaydarov, 2018).Quality of education declined drastically. Moreover, equity and equality issues emerged. The country was unable to undertake fundamental reforms in the education system therefore, the government was open for a partnership to make radical changes. Despite all of this complexity, it was time to identify major problems and contradictions, analyse along with economic and political transformations (UNDP,2007-2008).

*Reforms during Post-Soviet transformation*

According to UNDP (2007-2008), 1997-2001 period was a time for framing national education policy in Uzbekistan. In 1997 the government adopted National Program for Personal Training (NPPT) and it was formulated into national law (UNESCO, 2011). NPPT stopped ad hoc reforms in education in the early post-Soviet period and provided with a coherent framework to undertake educational reforms (Ruziyev et al., 2018). In 1998, with the initiative of the first president of Uzbekistan a significant reform was executed in the sector. The secondary education was modified to be compulsory, Technical and Vocational Educational Training (TVET in the view of colleges) and special secondary education (in the view of lyceums) were introduced. From 2001 every student should enrol at colleges or lyceums on a full-time basis (3 years) after finishing 5 years in high-schools. The purpose of TVET was to raise teaching quality, to develop professional skills of youth, and create more opportunity to enter the labour market (UNDP, 2007-2008).

Also, there was a need to undertake reforms in higher education of Uzbekistan. The following important reforms were adopted to refine it: introducing of automated entrance examination; adopting of three stage higher education system comprised of bachelor, master and doctorate program; establishing partnership with foreign higher educational institutions; and switching from fully centralized funding of higher education into personal financing model (Ruziyev et al., 2018).

**INTERNATIONAL ORGANIZATIONS IN UZBEKISTAN AND THEIR ASSISTANCE**

The assistance of international organizations such as Asia Development Bank, World Bank, UNESCO/UNICEF, European Union, and others has become very much salient especially, in the first decade of the post-Soviet period. The intervention of these organizations solved many issues concerning not only financing education but also policy management in education. Open Society Institute (OSI) indicated that Uzbekistan government cannot achieve education reform goals without the right kind of international assistance or without an effective mobilization of local resources and stakeholders (2002). It was noted in the same report that following strategies were important to redesign educational policy: develop information system and independent policy analysis; promote quality in education; build social coalitions and institutional partnerships around education goals; invest physical and virtual infrastructure; establish policies for equity and access (OSI, 2002).

Next table shows the financial and management assistance of donor organizations in Uzbekistan

International organizations	Loans/ Programs/ Activities
Asia Development Bank (ADB)	37 500 000\$ (Investment Loan) Education sector development project (expected approval in 2002)
	70 000 000\$ (Policy & Project Loan) Education Sector Development Program (2002)
	57 000 000\$ (Loan) Senior Secondary Education Project (2000-2004)
	40 000 000\$ Basic Education Textbook Development Project (1998-2003)
	900 000\$ Monitoring and Evaluation of Education Reform

	(1998-2000) 500 000\$ Capacity Building in Education Finance (1999) 350 000\$ Basic Education Staff Development / Teacher Education Reform (1999) 8000000\$ Technical Assistance
World Bank	Basic education loans to support preschools and primary schools: 15.0 million\$ (i) Basic Education Project, the first phase (2006) 28.0 million \$ (ii) the second phase (2009)
European Union	1 660 000\$ Restructuring of the Education System (1998-2000) 950 000\$ Assistance for the Reform of Vocational Education (1999-2001)
Germany Deutsche Gesellschaft für Technische Zusammenarbeit (DGTZ) Kreditanstalt für Wiederaufbau (KfW)	7000000 \$ Support for the Development of Vocational Education and Training (1999-2001) 10710000\$ Assistance to Primary Professional Education (1997-1998)
UNESCO	150 000\$ Education Program (2000-2001) Education Management Information System (2004–2006).
Soros Foundation	1 090 000\$ Education Programs of OSIAF-Uzbekistan (2002) English Language Program; Secondary Education Program; Youth Program; Scholarship Program
UNICEF	296 000 (RR) 788 000 (OR) Early Childhood Growth and Development Program (2000-2004) 2 626 000 (RR) 3 250 000 (OR) Child-Enrichment Program (2000-2004) 1 600 000 (RR) 3 750 000 (OR) Young People's Well-being Program (2000-2004)
Save the Children	1 000 000 (UK Pounds)
Japan Bank for International Cooperation (JBIC)	60 000 000\$ (Soft Loan) Vocational Education Development (announced in 2001 for 10 years)
United States Agency for International Development (USAID)	Basic Education Sector Strengthening Program (2003–2005).
Government of PRC	Provision of information and communication technology in basic education (2004).
Islamic Development Bank (IsDB)	10.3 million \$ loan on construction and equipping of secondary schools (2007–2008).
British Council	Development of English textbooks and teacher training (2006–2010).

Source: OSI (2002); ABD (2010)

From the table above it is apparent that support of international organizations was fundamental for Uzbekistan to develop its own strategy in education. Particularly, the partnership of ABD brought substantial changes in education. The total value of ADB loans to Uzbekistan was \$1.29 billion during 1996-2009, of which \$290.5 million (22.5%) were loans to the education sector (ABD, 2010). ABD and Uzbekistan partnership was based on improving quality of education, raising system efficiency, and strengthening national capacities to manage sector reforms. ABD loans came from ordinary capital resources (72.5%) and Asia Development Fund (27.5%) which included textbooks loans and rural school loans (ADB, 2010). In post-Soviet period the shortage of textbooks was already visible in Uzbekistan due to curriculum change. Besides, the shift from Cyrillic to Latin alphabet in 1996 increased critical situation in the country. Significant resource investment was required to publish new books in Latin and train teachers to a new alphabet. Therefore, ABD financed two projects: Education Textbook Development Project in 1998-2003 and Basic Education Staff Development /Teacher Education Reform in 1999, which were substantial at that time. ADB has become the leading development partner in the education sector and its assistance was assessed meaningful and successful in the report of Country Evaluation Study of Uzbekistan (ABD, 2010).

### **SUCCESSFUL ONGOING REFORMS**

Adoption of NPPT was a trigger for implementing a series of reforms in the education system of Uzbekistan. Accordingly, in 2000 National Action Plan on Education for All (NAP-EFA) project was elaborated with recommendations of UNESCO consultants (The Ministry of Public Education and the Ministry of Higher and Secondary Special Education of the Republic of Uzbekistan/UNESCO, 2002). The project put goals to improve quality of education by 2015; to make accessible education for all children with different SES and gender disparity; to create equal access to adult and women to all levels of education. By the end of 2015, the project achieved tangible outcomes in female enrolment for education where it reached 98.6% in primary and 91% in secondary education in 2015 (UNESCO statistics, 2017). Literacy rate increased to 1.6% from 2000 and reached 99.9% of the population (UNESCO, 2015). Albeit, the given data is not impressive, it is necessary to note that the population illiterately rate diminished and became insignificant. However, the enrolment rate for tertiary education declined when it was 13% in 2000 and dropped to 8.1% in 2015 (World Bank, 1986-2017). Besides, gender disparity became more visible in enrolment for tertiary education by dropping down from 8.13% in 2003 to 6.3% in 2015. The most plausible justification for this phenomenon could be the expansion of secondary education, particularly TVET, because students practice specialization and get diploma. The financial position of most Uzbek families is not stable. Therefore, many young people want to help financially to their parents and enter the labour market once completing secondary schools. Moreover, people's stereotypes also play a great role in decision making on the further educational development of girls. Parents give priority to investing boys' education as they consider the future of girls will be connected with motherhood at home and they will financially be depended on their husbands.

Uzbekistan and the European Union (EU) partnership was launched to reform Uzbekistan education system and adapt it to the standards of the globalized world. Radical reforms have been accomplished in higher education with the assistance of the EU. Uzbekistan was involved in EU education assistance programs such as Tempus, Erasmus Mundus, The EU-Central Asia Education Platform, and The Central Asia Research and Education Network (CAREN). With the

assistance of these programs cooperation between local and foreign universities was established; students and teachers staff mobility was promoted by educational training programs and individual scholarships; access to globalized distance learning programs was enhanced. Furthermore, the connection of Central Asian students and researches was strengthened in the field of telemedicine, disaster risk management, water resources management, and geo-hazard potential of retreating glaciers (Peyrouse, 2018).

Until 1997 tertiary education comprised 5 years of study but due to reforms, it was redesigned to be two-tire, consisting of bachelor (4 years) and muster (2 years) courses. The number of higher institutions increased from 43 in 1989 to 78 in 2015 and relatively the number of full-time students increased from 180000 to 250000 (Ruziyev et al., 2018). Leading foreign universities such as Westminster University (UK), Inha University (Korea), Turin Polytechnic University, Lomonosov Moscow State University (Russia), and Management Development Institute of Singapore opened their branches in capital city Tashkent. Currently, each region has its own university and specialized institutes preparing professionals to meet the challenges of regional development.

In early 1990, evening and correspondence courses were phased out to make higher education effective and responding to the international standards (Ruziyev et al., 2018). Reforms also affected the organizational structure of higher education. Now it is classified into institutes, comprehensive universities, specialized universities, academies, regional branches of specialized higher educational institutions and branches of foreign universities.

One more significant reform was an introduction of automated exam system for tertiary education in 1994. Due to this reform students of different level gained equal opportunity to enrol for the tertiary institution and continue higher education. During the Soviet Union the admission for higher education based on oral and written examination which was corrupted and far from fairness (Roziyev et al., 2018). Students from lower-income families could not enrol in higher institutions. Usually, high-income families were able to buy places for their children. However, this corrupted system was banned and replaced by automated and transparent exam.

### **REFORMS WITH LESS SUCCESSFUL OUTCOMES**

It is salient to note that not all the post-Soviet reforms in Uzbekistan turned to be successful. For example, financial decentralization of higher education and making it on payment basis aroused inequality among people. 69% of enrolled students pay tuition fee for studies at bachelor level and 75% for muster level. Therefore, 59% of university students belong to well-off families (Peyrouse, 2018). The social economic position of Uzbek household cannot afford the university tuition fees. There are some students cannot even afford to pay house rent or everyday transport to the university.

Another less successful reform was transforming secondary schools into compulsory education. In 1999 4+7 (primary school education+ high school education) system was changed into 4+5+3 (primary school education+ high school education + secondary professional education) system. Introducing TVET seemed would stop problems with unemployment. It was aimed to form a new generation with a new professional culture responding to the labour market needs (Education Sector Plan for 2013-2017, 2013). Finishing colleges students get diploma confirming of special professional education in specific areas. School should play an important role in providing students with jobs, therefore, school and organization partnership should be

ongoing process. However, this reform did not approve its expectations in Uzbekistan. It brought a bunch of issues such as:

- An additional year of compulsory education increased students' absenteeism and drop-out rate.
- Secondary, higher education and TVETs did not meet labour market needs, the number of unemployed and immigrating youth increased
- Weak partnership with private sector/industry, poor facilities and learning resources, and corruption emerged
- Quality of education significantly declined
- Gender disparity expanded in tertiary education

Considerable amount (31.6% of total expenditure in education) of resources was annually spent to refine secondary education in Uzbekistan (UNESCO, 2007). However, it did not help to achieve envisioned objectives. Many secondary schools, especially in rural areas, lacked equipped classrooms and fully qualified teachers (UNESCO, 2011) Daily report of colleges about students' attendance was lower than the real numbers. The situation in rural schools took catastrophic turn and attendance dropped dramatically that schools could not manage the situation. What was the reason for the failure of implementing TVET as compulsory education? No empirical investigation has been done on this issue. As a matter of fact, the investment of Uzbekistan government and international organizations was sufficient to develop this sector. The rationale of these outcomes could be one more extra year of compulsory education is not favoured by the majority of low-income Uzbek families. Also, poor equipped colleges, training facilities and unqualified specialists to prepare students for the future job increased discontentment of population. Reforming secondary education into compulsory education maybe successfully accomplished in other countries but there is no established blueprint that can be applied generally to all countries (Riddell & Nino-Zarazua, 2016). It seems the country was not ready for reforms in secondary education and it became a burden to the populace.

The arrival of the next president Shavkat Mirziyoyev in 2016, brought about new reforms in the education sector. Ministry of Preschool Education was established in 2017 to increase enrolment of children into preschool education. Secondary specialized schools and TVETs redesigned to be elective and compulsory education decreased from 12 years to 11. However, secondary education was not banned but took a new vision to serve to the public. TVETs modified to be on a fee basis and shortened for 1,5/ 2 years. Students after finishing high-school have the choice to enter tertiary or secondary education. As a usual who fails exams for tertiary education apply for TVET. Currently, Uzbekistan continues to develop TVET policy and puts new goals to achieve.

## CONCLUSION

After becoming an independent country in 1991, Uzbekistan chose its own path to the development. From the analysis of the economic situation in 1990-1996 government practised recession in financing all sectors including education. This brought a decline of adequately educated youth and fully qualified specialist in the country. At this stage, financial and practical assistance of international organizations was very substantial to develop a system. International organizations such as UNESCO, ABD, UNICEF, World Bank and others have done a great deal of work to improve effectiveness the education in Uzbekistan and assisted practically to make it more accessible to all level of population. Implementation of NAP-EFA project in Uzbekistan

enhanced education system made it more accessible to all level of population. The partnership of Uzbekistan and world organization brought a new turn in the education system of the country. Particularly, a considerable investment of ABD raised quality standards of education in Uzbekistan. As the newly independent country, Uzbekistan was at the stage of the great economic recession, and all sectors required radical reforms but lack of resources limited government opportunity. External intervention and assistance saved the country from greater loses. However, not all of the executed reforms were successful in implementation. If a strategy was successful in one country it may not give the same results in another one. Therefore, blindly following reforms which are offered by international organizations may bring unexpected outcomes. In reform implementation, all aspects should be considered such as the economic situation of people and their financial opportunity. As long as all reforms should serve the wellbeing of the people.

## THE EXPERIMENTAL WORK RESULTS ANALYSIS ON FORMING PROFESSIONAL COMPETENCIES OF FUTURE TEACHERS IN THE DESIGN AND CONTEXTED TRAINING CONDITIONS

G. A. Aldjanova\*

Associate Professor,  
 “Pedagogy and Psychology” Department,  
 Karakalpak State University  
 UZBEKISTAN

### ABSTRACT

*The article presents the experimental work results aimed at professional competencies formation of bachelors of pedagogical education in the project-contextual learning context. The material is revealed that reflects the experimental verification course of the conceptual model, the professional competence formation and proves that the proposed system contributes to an increase in students training level according to all professional competence formation criteria of future teachers.*

**KEYWORDS:** *Competence-Based Approach, Professional Competence, Experimental Work, Teacher-Educator, Professional Competence Components, Interdisciplinary Approach*

### INTRODUCTION

In Uzbekistan, the pedagogical personnel training issue in accordance with international requirements on the advanced pedagogical technologies base is acquiring particular relevance. In the education modernization context, giving priority to the principle "from theory to practice" requires future teachers to master the creative activity skill [1:70]. The demand for active and proactive specialists with research competencies and research and innovation specific knowledge is constantly growing all over the world.

**The study purpose** consists of scientific substantiation and experimental verification effectiveness of the important competencies formation of future teachers at vocational education in the project-contextual technology context, identifying their pedagogical ways improvement.

Experimental work was carried out at Karakalpak state university, Urgench state university, Tashkent state pedagogical university, at the professional education faculties.

The experimental work was aimed primarily at checking the research activities state at the university and predicting the students' activities, for further training and their promotion in research activities. Also, the teachers and students joint innovative activity not only contributes to the students' creative abilities development, but also makes them in-demand specialists in the labor market.

Serious attention was paid to a future faculty teachers group. At the analyzing stage the technology developed implementation by us for the professional competencies formation in the context-project training context through the future teacher preparation for project activities. For this purpose, we have established the future teachers' readiness initial level for project activities. To identify the future teachers' initial characteristics, we developed a comprehensive diagnostics consisting of observations map and a questionnaire, in which was made an assessment and self-assessment of readiness for project activities.

The experimental work on the research topic is organized as follows: sociological surveys were conducted with respondents; a questionnaire to assess the theoretical knowledge level of the secondary schools teaching staff in the innovation field.

#### Work tasks and research methods at the first motivational stage of the formative experiment

Stages	Stage objectives	Research objectives		Research methods	
		Diagnostics	Transformations	Diagnostics	Transformations
Motivational	1. To include students in educational and cognitive activities, a guide to reflection, search for solutions to pedagogical problems.	1. The motivational level determination and readiness reflexive components for project activities.	1. Motivation formation as a direction for design; reflection skills in lectures and seminars.	1. Observation, questioning, conversation, testing, micro-research results analysis.	1. Designing learning situations that require assessment and self-assessment.
	2. Offer the future teacher information about pedagogical projects.	2. The nature study and the answers completeness of future teachers to the active cognition	2. Knowledge formation about the features essence of the pedagogical project in lectures and seminars.	2. Observation, questioning, analysis of judgments.	2. Cognitive construction situations.

3. To include future teachers in the mastering activity skills of pedagogical design.	3. The proficiency level in study in pedagogical project skills.	3. Skills formation in pedagogical situations, detection and problems formulation analysis.	3. Design assignments, observation, and conversation analysis.	3. Constructing design situations.
4. To create conditions for the creative orientation of pedagogical activity formation	4. The mastering level determination of creative thinking techniques	4. The creative formation of pedagogical activity orientation.	4. The individual creative tasks performance, observation, conversation analysis.	4. Constructing creative situations.

In the experimental work course, simultaneously all components readiness formation for project activities was projected, while some of them had a priority value at each preparation stage, having the potential to implement the tasks. [5] We took into account the fact that traditional lecturing will not give the expected result, and therefore all classes were conducted in accordance with A.A. Verbitsky's contextual learning technology described by us in paragraph 3.1. [3:207]. Therefore, the lecture topic was formed as a problem that needed to be solved. (Appendix), for example, when studying the topic "Pedagogical activity, its characteristic features and characteristics", the teacher actualizes the problem "What roles should a teacher play today in a professional college in order to help streamline the project environment?" This problem was solved in communication - dialogue when discussing such issues: pedagogical activity as an educational service, expanding the educational services range.

The need to include knowledge about pedagogical innovations in educational and cognitive activities (the second task) was determined by a number of considerations. Firstly, the diagnostic stage data recorded their insufficiency in future first-year teachers; secondly, the need for this knowledge arose among the future teachers of the experimental groups already at the initial experiment stage; thirdly, we believed that in the preparing process future teachers for project activities, knowledge about the essence and pedagogical design specifics, its foundations, should contribute to the motives awareness that determine the need to change, transform oneself and one's activity. [2: 103].

The third task implementation of the stage was facilitated by a problematic, contextual-technological approach to the knowledge organization. Interaction in this kind of situation included the acts exchange of the type: the teacher begins the pedagogical situation analysis - future teachers continue and finish it. When organizing and conducting experimental work, the principles reflecting the main research activity elements were taken into account [4].

The experimental work logic required to pay special attention to the creative direction formation of future teachers' activity of vocational education. The didactic search for the content and project orientation methods led us to the need to discover the project activity skills and the

choice methods for their formation. To master this skills group, we used the creative learning situations construction. The mastering process the project activities experience was carried out in sequence.

### The professional competence forming process in the project-context technology context

Design activities elements	Designing educational situations
Pedagogical situations and decision-making analysis - characterization and the situation assessment, weighing and making final decisions, choosing one from several decisions.	The situation can be analyzed in the discussion course organized by the teacher. The purpose of such discussion and debate is to identify their personal attitude to this problem and to determine possible ways to solve it, based on the pedagogical situation.
Forecasting - predicting possible events, or referring to the past, makes assumptions about events that might take place.	Work on situations: future teachers of vocational education need to express hypothetical certain events consequences, both in education and in the social sphere.
Micro-design - selection means for the idea, possible difficulties characterization implementation.	Educational texts fragments are distributed to prospective teachers and are invited to underline words in them that may not be understood by vocational education students.

At this stage, a creative search was organized on the detection, formulation, problem solving basis during the discussion and didactic games.

### Criteria and professional competencies formation levels of future teachers in the project-contextual learning context

Criteria	Readiness levels		
	1. Formed	2. Partially formed	3. Not formed
Motivational	A pronounced interest in pedagogical projects, understanding of the need for new introductions; striving to take an active position.	Understands the need, situation ally takes an interest in pedagogical projects, situation ally takes an active position.	Understands the need, but has no interest in them, takes a passive position.
	1. Complete	2. Incomplete	3. Superficial
I chnologica cognitive	Operates systematically with knowledge about pedagogical projects and their types.	Fragmentary knowledge about the essence of the types of pedagogical projects.	Fragmented, partial knowledge of pedagogical projects.
	1. Master	2. Does not fully master	3. Doesn't master

	Fully possesses the ability to detect the formulation of pedagogical problems, to search the literature.	Possesses individual design skills: formulates a problem only with the help of a teacher.	Doesn't know how to detect problems, finds it difficult to formulate them.
<b>IV Reflective</b>	1. Master	2. Does not fully master	3. Doesn't master
	Possesses the skills of analysis and self-analysis of his own activity (adequate self-esteem).	Does not always analyze and self-analyze his own activities.	Does not possess reflexive skills, self-esteem is not always adequate.

After the end of this procedure, a discussion of the course of the game, the correspondence of solutions to the "portraits" of a modern teacher, the semantic load of certain issues takes place. Evaluation of the effectiveness of the technology of formation of readiness at this stage was carried out according to the results of the questionnaire, the implementation of diagnostic tasks, when analyzing the solution of educational situations by future teachers.

#### Knowledge levels

Knowledge level	Number of correct answers
Low	1-10 (ниже 54%)
Average	11-14 (55-70%)
Above the average	15-17 (71-85%)
High	18-20 (86-100%)

In order to determine the students knowledge level at the cognitive stage was chosen the "Professional pedagogy" course. We propose to organize the educational process taking into account the characteristics identified in the experimental group of future teachers.

Based on the initial situation analysis, work tasks and diagnostics and transformation methods were formulated at the second cognitive study stage. To accomplish the first task, we have developed two lectures:

№1. Basic concepts of pedagogical design

№2. Pedagogical design as a technology for the pedagogical projects development and implementation. Both of these lectures were delivered by us after the majority participation (42 people) of future teachers of the 2nd year of the Professional education faculty in the city scientific and practical conference "The pedagogical innovations effectiveness in the school educational process."

The second lecture "Pedagogical design as a technology for the pedagogical projects development and implementation" was supposed to consider the following issues:

1. The structure of the teacher's project activities.
2. Pedagogical design and its relationship with pedagogical tasks in education.
3. Designing solutions to pedagogical problems. Pedagogical project as a substantiation of the desired state of the object, its structure, result.

Continuing preparation for project activities at this stage, we considered it necessary when studying the topic "Pedagogical research methods", along with traditional questions, to consider the following:

1. The pedagogical diagnostics essence, its importance in the educational process.

2. Pedagogical diagnostics methods, diagnostic technique.

As a learning task, future teachers were asked to develop a diagnostic program that can be used to develop specific pedagogical projects. To complete this task, the future teacher had to choose a problem that he considers important for solving in pedagogical design on the basis of his learning experience.

When evaluating the results during and after the completion of the discipline, we noted an increase in the confidence of future teachers in: motives that encourage them to be interested in pedagogical projects, to master them; in self-esteem and introspection. Along with this, developing the project, future teachers not only relied on the knowledge and skills gained in this course, but also used the opportunity to show their subjectivity, self-realization; 204 students developed projects as their own, original solutions to pedagogical problems. Creating the conditions for mastering the experience of creative activity at this stage, we identified the need to develop educational situations of a creative type, involving the solution of problems-problems that require resourcefulness, quick orientation, and the ability to choose a non-standard solution. For this purpose, a number of pedagogical problems were selected, for the solution of which we used the so-called "case method" (situations).

Thus, the project-context technology implemented in the dissertation, which integrates context and project technologies, proceeding from the characteristics of each period of student education in higher educational institutions in the study of pedagogical disciplines, confirms the effectiveness and purposefulness of the model of the formation of the professional competence of the future teacher of professional education in the context of the project-context technology, which determines the acceptability and significance of this model for teacher education.

## Review Process

Each research paper/article submitted to the journal is subject to the following reviewing process:

1. Each research paper/article will be initially evaluated by the editor to check the quality of the research article for the journal. The editor may make use of iThenticate/Viper software to examine the originality of research articles received.
2. The articles passed through screening at this level will be forwarded to two referees for blind peer review.
3. At this stage, two referees will carefully review the research article, each of whom will make a recommendation to publish the article in its present form/modify/reject.
4. The review process may take one/two months.
5. In case of acceptance of the article, journal reserves the right of making amendments in the final draft of the research paper to suit the journal's standard and requirement.
