### ABSTRACT

*In the world practice, the use of non-traditional energy sources is expanding, but in Uzbekistan this process is developing very slowly. The country's economy is built on the use of mainly hydrocarbon raw materials, which are mostly used for domestic needs. At the same time, natural gas is exported in ever-increasing volumes. At the same time, Uzbekistan has a great potential for alternative energy sources, which, according to experts, are three times higher than the resources of organic non-renewable fuel. The country has more than 300 Sunny days a year, windswept territories, and mountain rivers that can be used to generate electricity. Such a rich natural potential must be used for its intended purpose, and highly efficient renewable energy sources, whose popularity is growing all over the world, must be widely applied in practice. The article discusses the possibilities of efficient use of alternative energy in Uzbekistan.*

**KEYWORDS:** *Wind Generator, Alternative Energy, Wind Power, Solar Energy, Energy Efficiency.*

### INTRODUCTION

The use of non-traditional and renewable energy sources in the fuel and energy industry is an urgent task of the world energy industry. One of their main types, which is environmentally friendly and affordable, is the energy of solar radiation. The use of non-traditional and renewable energy sources in the fuel and energy industry is an urgent task of the world energy industry. One of their main types, which is environmentally friendly and affordable, is the energy of solar radiation. Uzbekistan has favorable climatic conditions for the use of solar energy, the energy potential of which is 98.5 percent of all renewable energy sources combined, so its use is relevant both for the purpose of ensuring energy security and improving the social and living

conditions of the population. At the same time, the possibility of preserving hydrocarbon fuel reserves for future generations and mitigating the environmental situation in the country is of no small importance.

The main components of renewable energy sources in Uzbekistan are solar, hydraulic, wind and geothermal energy, as well as biomass energy. According to the results of the conducted assessments, the technical potential of renewable energy sources in the Republic of Uzbekistan is 180 million tons of oil equivalent, which is more than three times higher than its annual demand for energy resources.

The most prepared area of large-scale use of solar energy in the country's economy, as well as in the whole world, is its conversion to low-potential heat using flat solar collectors for heating water and its use in hot water supply systems for residential, municipal and social facilities.

It should be noted that in low-rise residential buildings, which make up 76 percent of the total housing stock, out of the total natural gas consumption (15,100 million cubic meters), only about 3,000 million cubic meters are spent on hot water supply.

Analysis and generalization of world experience in this area show that the actual scale of solar energy use in hot water systems, all other things being equal, depends on the technical and economic indicators of their main element—a flat solar water heating collector, the scale of production and use of which is constantly growing worldwide.

It should be noted that considerable experience has been accumulated in the field of thermal conversion and solar energy use in Uzbekistan, and a sufficient scientific and technical reserve has been created. In particular, small – scale production of the main element of solar hot water systems—a flat solar collector—was organized; experimental individual and collective double-circuit solar hot water systems were created and their main operational characteristics were determined; solar-fuel boilers have been developed for hot water supply of a group of single- and multi-store buildings and industrial enterprises, as well as small towns and micro districts, which allow saving traditional fuel and energy resources.

## **MATERIALS AND METHODS**

The extensive use of alternative energy sources is in line with the priority objectives of each country and the tasks of energy security and is one of the rapidly developing directions of the energy sector.

Certain works are being carried out on the development of renewable energy sources in the Republic, first of all on the use of the potential of hydropower.

Energy is currently the highest priority area of engineering science, which deals with the transformation, transmission, storage and use of energy. The history of the civilization of all mankind is connected with the consumption of energy of various types. The main feature of the modern world is an increase in energy consumption in all spheres of public life.

In the field of development and use of non-traditional renewable energy sources in Uzbekistan, the decree of the First President of the Republic of Uzbekistan "on measures for the further development of alternative energy sources" dated March 1, 2013, which became a program document in the planning and implementation of fundamental and applied research aimed at expanding the use of alternative energy sources, primarily solar.

In accordance with the Program of measures to reduce energy intensity and introduce energy-saving technologies in the economy and social sectors for 2015-2019, approved by the decree of the President of the Republic of Uzbekistan dated May 5, 2015, our country is implementing a wide range of measures to ensure energy conservation in the economy and social sectors. Construction of residential and social facilities using solar and energy-saving technologies continues.

In this work a powerful impetus was given the decree of the President of our country Shavkat Mirziyoyev, "About the program of development of heat supply system for the period 2018-2022 years," April 20, 2017, to speed up measures to increase quality and ensure uninterrupted supply of thermal energy to consumers, updating and modernization of fixed assets of heat supply systems through the introduction of modern efficient and energy saving technologies, effective and rational use of energy resources.

In the roadmap "development of solar energy use in the Republic of Uzbekistan" for the period 2014-2031, it is noted that the share of solar energy use in the total energy balance of the country by 2030 should be 6 percent.

In 2016-2017, solar heating systems using solar water heating collectors were installed on a number of multi-store buildings in Tashkent. For example, a residential building on Navoi street has a hot water supply system with an area of 159.72 square meters of high-efficiency flat solar water heating collectors, and a residential building on Oybek street in Mirabad district has 40 vacuum-tube collectors for hot water supply with a total volume of 8 tons.

Over the next half century, an increasing number of environmental risks on the planet have been causing serious concern to scientists. The increasing use of energy for economic development purposes is recognized as the main cause of the problem. The environment is polluted because of the harmful gases coming out of the power and heat stations and internal combustion engines that use organic types of fuel. Over the years, it has been undermining the ozone layer as a result of the massive release of the remains of harmful substances into the atmosphere, while on earth there is a global energy deficit. As a result, the change in the world's climate, the decrease in energy resources are closely connected with the problem of food scarcity, which puts enormous problems before humanity.

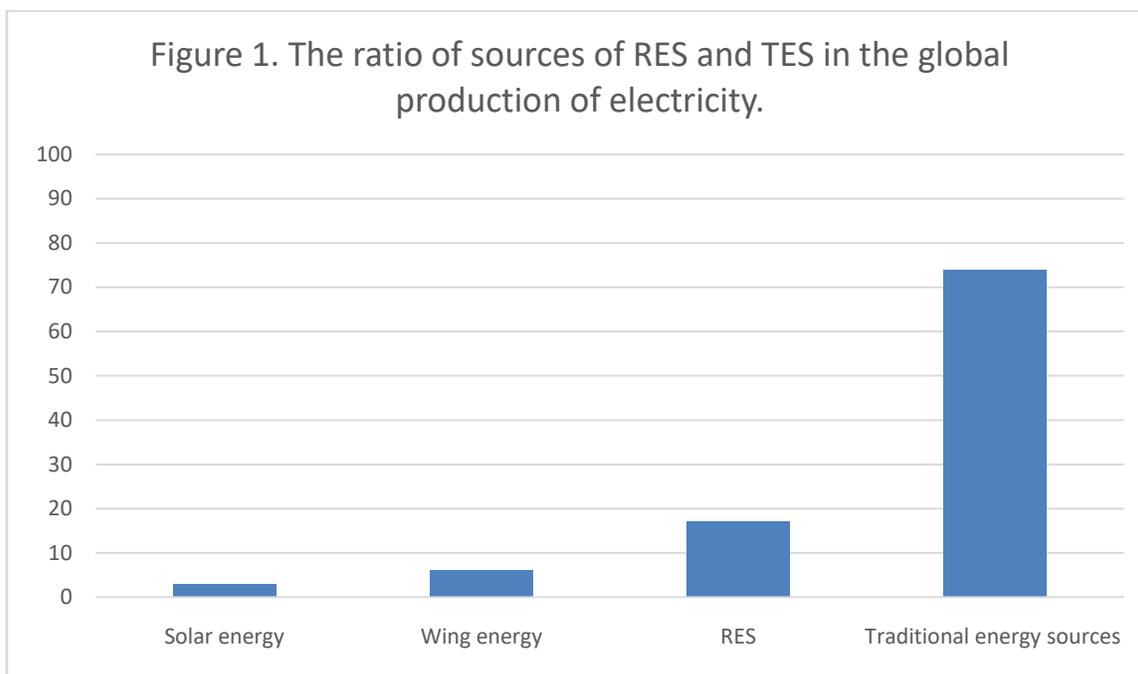

Production of electric energy using traditional energy sources in the form of minerals (coal, gas, oil) leads to environmental pollution due to carbon dioxide emissions into the atmosphere. An increase in the concentration of CO<sub>2</sub> in the atmosphere leads to global climate change and the formation of a greenhouse effect, and as a result, to possible environmental disasters.

In this regard, the use of environmentally friendly renewable energy sources in the energy sector is an urgent and priority task. Renewable energy sources are solar, wind, hydro, biogas, geothermal, wave and current energy of the seas and oceans. Most types of renewable energy sources (RES) are derived from solar exposure. Such as the appearance of winds due to changes in temperature and atmospheric pressure, the formation of water resources due to evaporation from the seas and oceans.

As the above analysis shows, the production of electricity using traditional energy sources has a significant impact on the environment. All this in General creates the necessary prerequisites for the introduction of energy-saving and efficient technologies, the development of environmentally

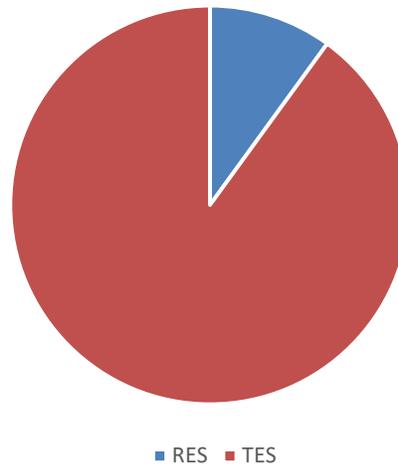

friendly and harmless types of energy. In this regard, the current urgent task of energy is to switch and increase the share of renewable energy sources that are environmentally friendly and harmless to the environment.

According to world energy data, the ratio of energy sources in global electricity production in 2018 was as follows: renewable energy sources (RES) 26%, including the share of solar energy 3%, the share of wind energy 6%, other types of RES 17%, traditional energy sources (TES) – 74% (Figure 1).

Consumption and demand for electricity both around the world and in the Republic of Uzbekistan is growing every year. The reason for this is the intensive development of industry, manufacturing, construction and other sectors of the country, the growth of settlements and infrastructure facilities that consume electricity. The specific share of renewable energy sources (RES) in the total volume of electricity generation in Uzbekistan is currently 10% [13]. The remaining 90% of electricity comes from traditional energy sources (TES) (Figure 2).

Figure 2. The ratio of RES and TES in electricity production in Uzbekistan

In this regard, the development and widespread use of solar energy in Uzbekistan are more relevant and promising. There are various technological methods for using and converting solar energy, the use of which can produce a sufficiently large amount of heat and electricity.

The use of solar energy can be carried out by the following main installations and methods:

- Solar water heating installations (collectors) in which the heat carrier, water, air is heated. Such installations are widely used for heating and hot water supply.
- Solar power plants, in which solar energy is sent by various types of concentrators to the receiving surface to form steam, which rotates turbines that generate electricity.
- Direct conversion of solar radiation into electricity by means of photovoltaic converters (PVS) built on the basis of semiconductor materials.

All these technologies, power plants for the use and conversion of solar energy can be successfully applied in the climatic conditions of Uzbekistan.

## CONCLUSIONS

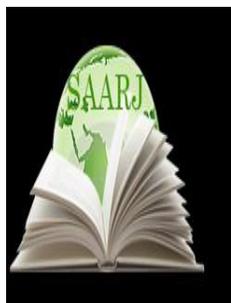

For the large-scale implementation of solar-based technologies, it is advisable to develop a regulatory framework, as well as state standards and all necessary documentation in the field of renewable energy sources, widely promote the experience of using solar-based technologies in the media, use economic mechanisms to encourage solar energy producers and consumers, select the most promising investment projects and technologies for generating and using renewable energy sources, expand the production of equipment, components and materials used in technologies related to the use of alternative energy sources in the country.

In addition, it is necessary to organize experimental and applied research related to the use of alternative energy sources at the International Institute of solar energy and other scientific institutions of Uzbekistan on the basis of the existing scientific potential of the country and in cooperation with foreign research centers.

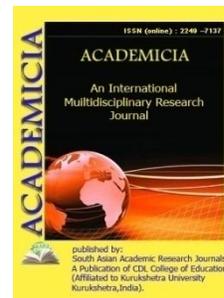

In General, as the First President of the Republic of Uzbekistan Islam Karimov noted at the 6th Asian solar energy forum, we have every reason to say that the problem of using solar energy at the present stage of development is steadily moving from the field of scientific research and experimental development to the field of practical application, and solar energy, like other types of renewable energy, is becoming competitive, one of the cleanest ways to generate energy.

## RENEWABLE ENERGY SOURCES IN UZBEKISTAN

**Jumanov Abbos Nabijonovich\***

\*Assistant of the Department of Electric Power,  
 Jizzakh Politechnic Institute,  
 Jizzakh city UZBEKISTAN

### ABSTRACT

*Traditional (alternative or renewable) fuel and energy resources (TER) are the energy resources of rivers, reservoirs, and industrial drains, wind, solar, biomass, wastewater, and solid waste. The use of renewable energy sources in the Republic of Uzbekistan is relevant both for ensuring energy security and for improving the social and living conditions of the population. The main components of renewable energy in the country are solar energy, hydraulic, wind and geothermal energy, as well as biomass energy. The total technical potential of renewable energy in the Republic is 179.4 million tons of oil equivalent, which is more than three times the annual demand for energy resources. Unconventional (alternative or renewable) fuel and energy resources (FER) are understood as energy resources of rivers, reservoirs and industrial drains, wind, solar, biomass, wastewater and municipal solid waste. The use of renewable energy sources in the Republic of Uzbekistan is relevant both to provide energy safety, and to improve the social and living conditions of the population. The main components of renewable energy in the country are solar energy, hydraulic, wind and geothermal energy, and biomass energy. The total technical potential of renewable energy in the republic is 179.4 million tons of oil equivalent, which is more than three times higher than the annual demand for energy resources.*

**KEYWORDS:** *Renewable Energy Sources, Solar Energy, Wind Energy*

### INTRODUCTION

All energy sources can be divided into two classes.1. Renewable energy sources are sources based on continuously existing or periodically occurring energy flows in the environment. Renewable energy is present in the environment in the form of energy that is not the result of purposeful human activity, and this is its distinctive feature.2. Non-Renewable energy sources are natural reserves of substances and materials that can be used by humans for energy

production. The energy of non-renewable sources is in a bound state in nature and is released as a result of purposeful human actions. The main sources of energy on Earth are:

- \* Solar radiation falling on the Earth;
- \* Movement and attraction of the Sun, moon, and Earth;
- \* Thermal energy of the Earth's core, as well as chemical reactions and radioactive decay;
- \* External energy of some bodies on Earth (air and water flows) that have a reserve of mechanical energy;
- \* Substances that carry highly concentrated internal energy that can be released in chemical and nuclear reactions.

## RESULTS AND DISCUSSION

The territory of the Republic of Uzbekistan (447.4 thousand square kilometers, of which 70% is desert) is located in relatively favorable climatic conditions (between 37° and 45° North latitude and between 56° and 73° East longitude) for the Southeast. use, the energy potential of which is 98.5% of the total renewable energy [1], and therefore is considered the main determining factor in planning the share of renewable energy use in the total energy balance of the Republic.

From the analysis of the state of work in the field of solar energy use in the Republic and their comparison with foreign levels in this area, it follows that in order to expand the scale and reduce the time for the introduction of solar energy, it is necessary to: accelerate the development of competitive, environmentally friendly and modern technologies adapted to the operating conditions, create a market for energy equipment used by SE, and eliminate financial and legal barriers to its widespread use. The roadmap "Republic of Uzbekistan: development of solar energy" was prepared to identify problems and obstacles to creating favorable conditions and develop mechanisms, actions, programs and specific implementation projects in which the development of solar energy use will be implemented for sustainable and environmentally safe, socio-economic development of Uzbekistan in accordance with its national interests and state program , phased implementation in the period up to 2030. Since Uzbekistan has a fairly high technical potential for renewable energy sources, namely, energy production from solar generation can range from 525 to 760 billion kWh, wind generation-more than 1 billion kWh, and biomass energy-up to 6 billion m<sup>3</sup> of bio methane per year [2].

If appropriate actions are taken, in 2030 it will be appropriate to supply 6% of all electricity produced in Uzbekistan using solar technologies, less than 0.1% of its territory (88 km<sup>2</sup>) will be required [3,4].

The energy of solar radiation coming to the earth's surface is almost 40 times higher than all the energy consumed by mankind. The sun gives the Earth 80 thousand billion kW every second, which is several thousand times more than all the power plants in the world. . On our planet, due to natural processes and human production and economic activities, solar energy is converted into other types. The General scheme of these processes is shown in Fig. 1.

Fig.1. The conversion of solar energy.

Methods of solar energy utilization can be divided into three large groups:

- 1) Direct conversion of solar energy into heat and electricity;
- 2) Indirect conversion — use of wind energy, sea waves, ocean currents, ocean temperature difference, etc.;
- 3) Biological conversion — burning of biomass, gasification of urban and agricultural waste.

The attractiveness of solar energy is due to its inexhaustibility, availability in every point of our planet, and environmental cleanliness, but solar radiation is not constant during the day and depends on weather conditions. Because of this, each installation must have either an energy storage device or a duplicate installation with a different energy source. The potential resources of Solar energy in Russia are estimated at 2,300 billion tons per year. but at the same time, a negligible share of solar energy coming to Earth is used ~ about 0.0003%.

The market for renewable energy services remains extremely limited to address the issue of radically changing the structure of the fuel and energy balance through the introduction of renewable energy sources. No more than 1 MW of solar energy is involved in the industrial use of solar energy, and there is practically no industrial use of wind energy (table-1) [5]

**TABLE 1 INTENSITY OF SOLAR RADIATION ON THE TERRITORY OF UZBEKISTAN**

№	Regions	$\sum q_1$ , kW, h/m <sup>2</sup> .	n, hour
1	North of the Republic (Republic of Karakalpakstan, Khorezm region and North of Navoi region)	1900-2100	2900- 3000
2	South of the Republic (Kashkadarya and Surkhandarya regions)	1900-1960	2950- 3050
3	Ferghana valley (Ferghana, Andijan and Namangan regions)	1500-1550	2650- 2700
4	Zeravshan valley (Samarkand, Jizzakh, Bukhara regions and South of Navoi region)	1910-1980	2930- 3000
5	Tashkent	1943	2852

It is not worth anything that Uzbek scientists also participate in the creation and development of alternative energy sources. In particular, the first experiments in the field of alternative energy were studied since the 1950s. Engineers developed a system for heating homes and supplying water, and several homes were built and tested.

However, it is clear that Uzbekistan is currently not developing enough innovative research and development in the field of alternative energy, and as a result, the use of these energy sources is declining. The country uses traditional methods of energy production.

If you look at the situation with electricity generation in Uzbekistan, you will see a 20% increase in electricity generation in 2018 compared to 2010.

In this regard, it is necessary to study the experience of using alternative energy sources in developed countries in order to introduce new technologies and technologies that are important for obtaining additional energy as an energy source. The growing demand for electricity in Uzbekistan requires the use of alternative energy sources. We need more sources of heat, wind and biogas installed in the country, and we need more electricity. When developing alternative energy sources, it is advisable to study climate data and regional indicators and develop them in relation to the types of alternative energy sources [7]. When using alternative energy sources, first of all, we get natural energy without harming the environment and without passing on our fossils to future generations. In turn, the population will be fully provided with electricity. The company creates opportunities for production, service, export and import. As a result, new businesses will be opened, new jobs will be created, and the welfare of the population will grow. Wind power has become one of the most rapidly developing areas of scientific and technological progress in the energy sector in recent years. Wind power in many countries is a priority for energy conservation and the use of environmentally friendly renewable energy. The installed capacity of wind farms in the world over the past 10 years has increased 10 times.

In [6], the power of a low-power wind power plant is calculated. The reasons that generate air currents are uneven heating of certain areas of the Earth. When the Sun heats some part of the Earth's surface more intensely than the surrounding ones, the air tends to move. In this case, the warm layers rise up, and their place is taken by colder ones. The different rate of heating and cooling of land and sea generates a breeze—a wind that blows from the sea during the day, and at night – from the shore. Larger-scale air circulation is caused by periodic changes in temperature in the coastal regions of the oceans. These winds are called monsoons. Thus, the wind is the

result of converting the thermal energy coming from the Sun into the kinetic energy of movement in the atmosphere of air masses. Moving air masses, air currents – have huge reserves of mechanical energy, about 100 times more than the energy of rivers. Wind power was used for a long time in navigation, as well as for driving mill wheels. Recently, it has been used for generating electricity. If you look at the situation with electricity generation in Uzbekistan, you will see a 20% increase in electricity generation in 2018 compared to 2010.

In this regard, it is necessary to study the experience of using alternative energy sources in developed countries in order to introduce new technologies and technologies that are important for obtaining additional energy as an energy source. The growing demand for electricity in Uzbekistan requires the use of alternative energy sources. We need more sources of heat, wind and biogas installed in the country, and we need more electricity. When developing alternative energy sources, it is advisable to study climate data and regional indicators and develop them in relation to the types of alternative energy sources [7]. When using alternative energy sources, first of all, we get natural energy without harming the environment and without passing on our fossils to future generations. In turn, the population will be fully provided with electricity. The company creates opportunities for production, service, export and import. As a result, new businesses will be opened, new jobs will be created, and the welfare of the population will grow. Wind power has become one of the most rapidly developing areas of scientific and technological progress in the energy sector in recent years. Wind power in many countries is a priority for energy conservation and the use of environmentally friendly renewable energy. The installed capacity of wind farms in the world over the past 10 years has increased 10 times. It is worth nothing that Uzbek scientists are also involved in the creation and development of alternative energy sources. In particular, the first experiments in alternative energy have been studied since the 1950s. Engineers developed a home heating and water supply system, and several homes were built and tested.

However, it is obvious that innovative research and development in the field of alternative energy is not being developed enough in Uzbekistan at present, and as a result, the use of these energy sources is decreasing. The country uses traditional methods of energy production. A wind power plant (wind turbine) is designed to convert the kinetic energy of the wind into the energy of rotation of the rotor of a generator that generates electricity. The output power of the installation is proportional to the area swept by the wind rotor blades and the wind speed in the cube. Therefore, high-power wind turbines (of the order of MW) should be very large in size, since the average wind speed is not very high.

The disadvantages of wind as an energy carrier are: constantly changing wind speed; electricity generation only at intervals when the wind blows, and not when it is needed, which leads to the need for energy storage; high cost of electricity received.

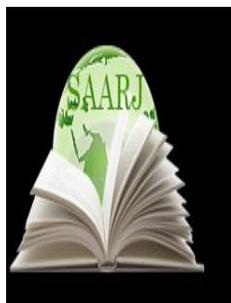

## CONCLUSION

The described methods of energy conversion and calculated ratios for determining the main energy characteristics of converters are designed to broaden the horizons of specialists in electrical engineering.

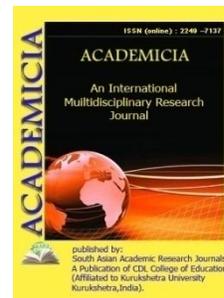

The given characteristics of the main types of energy, their sources, methods of accumulation, storage, transportation and interaction of various types of energy carriers allow us to identify the General principles of building energy converters.

**ABSTRACT**

*This article describes the linguistic views on French lexical and phrase logical antonymy, the specific lexical-semantic, grammatical and stylistic features of antonymous phraseological units, and the linguistic description of the phenomenon of antonymy.*

**KEYWORDS:** *Antonym, Lexical Antonym, Phrase logical Antonym, Feature, Phraseology, Linguistic, Grammatical, Stylistic, Practical Interpretation, Phenomenon, Theoretical, Lexical, Lexical-Semantic, Speech, Relationship, Paradigmatic Relation, Symmetrical Antonym, Asymmetrical Antonym.*

**INTRODUCTION**

Problems of French phraseology in linguistics have been extensively studied, first of all, by A.G Nazaryan. In particular, the specific lexical-semantic, grammatical and stylistic features of antonym phrase logical units were developed in detail by A.I Alyokhina. However, it is distinguished by the generalization of information in this regard, its simple examples and explanations, as well as the practical interpretation of the features of antonymous phrase logical units by analyzing them in terms of their Uzbek interpretation. The analysis of the phenomenon of antonymy in phraseology is based on the contrast of the meanings of phrase logical units with logically contradictory concepts. Accordingly, the content of any linguistic unit implies a binding relationship between its internal logical content. Contradictory concepts form the logical basis of antonymic phrase logical units, which reflect general categorical concepts such as human characteristics. Thus, the phenomenon of antonymy requires a logical contradiction of concepts and follows the semantic contradictions of language units in language [1].

Problems of phraseology in linguistics, first of all, A.V.Kunin, Amosova N.N. extensively studied by In particular, the specific lexical-semantic, grammatical and stylistic features of

antonym phraseological units were developed in detail by AI Alyokhina. However, it is distinguished by the generalization of information in this regard, simple examples and explanations, as well as the practical interpretation of the features of antonymous phraseological units by analyzing them in terms of their Uzbek interpretation. Theoretical views of such linguists as N.N Amosova, A.V. Kunin, D. Barskaya and A.M. In phraseology, the analysis of the phenomenon of antonymy is based on the contrast of the meanings of phraseological units with logically contradictory concepts. Accordingly, the content of any linguistic unit implies a binding relationship between its internal logical content. [2]

It allows to determine the semantic, structural, functional laws of formation of phrase logical units in the system interpretation of phraseology. In particular, system indicators in the development of internal features specific to the forms of antonym phrase logical units are described, the specific diversity of French antonym phrase logical units is shown. Much of the research devoted to the study of phrase logical antonyms shows that a relatively new front has emerged in the field of linguistics in comparison with lexical antonyms. Lexical and phrase logical antonyms in a number of other languages have never been comparatively studied, while in modern French. However, the study of content-specific aspects of the units under study, defined by their ability to express existential phenomena, requires the establishment of systematic connections in language, as well as the study of the reasons for the need to process the language nomenclature problem. [3]

The category of opposition is expressed in language by various linguistic and phraseological antonyms, both in terms of content and in terms of the form of thinking. This category of contradictions in language, that is, the phenomenon of antonymy, is one of the most common types of relations in the description of the system of linguistic content. In the phraseological system of a language, as in the lexical system, there are paradigmatic relations of synonyms, polysemy, and antonyms, which are the main "core" that unites the vocabulary of a language into a single system.

Antonyms are units of opposite meaning in a language. W. Humboldt was a famous scholar who tried to define the problem, the subject, and the boundaries of the science of linguistics. W. Humboldt tried to include linguistics in the list of historical, philosophical and ethnographic disciplines studied by man.

According to W. Humboldt, language is a complex phenomenon that combines qualities and features that contradict each other, so the use of the method of antonymy in the scientific study of language, in understanding its true nature expedient. The main antonyms inherent in the nature of language are:

The first antonym is the inseparable unity and inner contradiction of thinking with language. Thinking with language is an inseparable phenomenon that requires each other. Language cannot be separated from thinking.

The second antonym: language is a dynamic phenomenon that is constantly evolving. On the one hand, language is an activity, on the other hand, it is a product of activity. Everyone who speaks a language contributes to the development of the language in the process of speaking. At the same time, language is a concrete historical norm that embodies all the historical riches created

in the course of the historical development of human society and is passed down from generation to generation.

It is clear from this antonym that W. Humboldt put forward the problem of distinguishing between language and speech as objects of linguistic science. So the second antonym is the question of the relationship between language and speech.

## **MATERIALS AND METHODS**

The third antonym; is an antonym of speech and comprehension. According to W. Humboldt, speech and speech comprehension are two aspects of human speech activity.

The fourth antonym; includes objective and subjective features of language. According to W. Humboldt, every individual uses a language created by a collective of humanity and follows the rules of that language. As a subjective phenomenon, each speaker contributes to the development of language in the course of his speech activity.

The fifth antonym; are collective and individual features of language. It is well known that speech is the product of individuals, but individuals are the product of the collective created by their predecessors.

Phraseological antonymy is studied as a specific part of the problem specific to general antonyms. Therefore, it is natural to have a problem with the properties of relationships that fall into this semantic category.

The hypotheses that allow to determine the semantic, structural, functional laws of the formation of phrase logical units in the system interpretation of phraseology are generalized. In particular, the systemic indicators of the development of internal features of the forms of antonym phrase logical units are described; the peculiar diversity of the French antonym phrase logical units is shown. Many studies devoted to the study of phrase logical antonyms show that a relatively new object of study in the field of linguistics has emerged in comparison with lexical antonyms. Lexical and phrase logical antonyms in a number of other languages have never been comparatively studied, while in modern French.

However, the study of content-specific aspects of the units under study, defined by their ability to express existential phenomena, requires the establishment of systematic connections in language, as well as the study of the reasons for the need to process the language nomenclature problem. The category of opposition is expressed in language by various linguistic and phrase logical antonyms, both in terms of content and in terms of the form of thinking. Since this category of contradictions in language, that is, the phenomenon of antonymy, is one of the most common types of relations in the description of the system of language vocabulary, the phrase logical system of language, like the lexical system, has paradigmatic relations of synonyms, polysemies and antonyms. is the main tool that unites into a single system. In French phraseology, the phenomenon of antonymy is the phenomenon of antonyms that express people's feelings and inner experiences. The phenomenon of French phraseological antonymy is that the inner experiences of similar people between compounds can be combined with words specific to a group of verbs to form many phraseological units. For example:

*être content-to be happy*

*Etremécontent -to be upset*

Phraseological units that are symmetrical, that is, antonyms that are compatible with each other, are phraseological units. Exactly symmetrical antonyms are antonyms that are both semantically and semantically compatible. Here are some examples of symmetric antonyms.

For example:

*Etre fort de* - to be strong

*Etre faible de* - to be weak

*Avoir la main heureuse-* Have a happy hand

*Avoir la main* - To be always ready to help

*Avoir peur de* - Be afraid of

*Avoir du courage* - To have courage

*Avoir l'air malade-* Look sick

*Avoir une bonne* – Have a maid

Exactly asymmetric antonym, that is, in terms of content includes some different antonyms. For example:

*Arriver à bon port* - to live a peaceful life

*avoir des paroles ensemble avec qn-* quarrel with someone

*avoir le coeuroye-* drink a lot of water

*avoir le gosier sec* - fell dry

*faire la quete-* do the quest

*faire les largesses-* to give tip

*vivre en seigneur* - to live as a lord

*être dans le lac-* be in the lake

Exactly symmetrical antonym phraseological units and asymmetrical antonym phraseological units are predominant in French phraseology. Exactly asymmetrical antonyms are antonyms that differ in content and do not have the same meaning. They are widely used in language and are the flower of speech, as well as the beautiful flower of our language. In addition, when the phenomenon of antonymy is observed in phraseological units, it is obvious that their special dictionaries are not formed, and they should be selected in opposite meanings, distinguishing each of them according to its separate linguistic meanings. Therefore, there are several ways to analyze the phenomenon of antonymy between phraseological units of the French language and their interpretation into Uzbek, including phraseological units expressed by the French "comme" analogy and their interpretation into Uzbek. we want to think about ways to do that.

Phrase logical units with the French "comme" component are one of the most effective means of creating antonyms. There are many examples of such phraseological units in French phraseology. For example: fort comme un boeuf; rondcommeune boule; fleurercommebaume; write as an ange; froidcomme (du, le, un) marbre; mine as an elephant; paresseux as a loir; sobre as a chameau; doux as aagneau; moucomme du cotton; savant as a livre; muetcommeune carpe. In French, such phraseological units with the component "comme" are mainly qualitative and verb phraseological units. It is well known that the formation of antonymous meanings is also very common in morphology, mainly between adjectives and verbs. However, when interpreting them in Uzbek, it is necessary to be more careful about their similarity components.

## CONCLUSION

The simulation tools available in the language are mainly aimed at expressing that a particular object is similar in nature to another object. However, when interpreting French phraseological units with a “comme” component into Uzbek, the required meaning may not be obtained if the identification objects on both sides of them are translated exactly. For example, let’s take the phrase *comme un escargot*. When this phrase is translated into Uzbek, it is not advisable to interpret it through translation. Because if we translate it literally into Uzbek, it will be translated as *slow as a shell*. However, in the Uzbek language, it has become a tradition to express the image of a tortoise rather than a shell, rather than a very slow movement, ie the phrase “*lent comme un escargot*” is interpreted in Uzbek as *slow as a tortoise*.

The antonym of this phraseological unit, *rapidecommel’éclair*, which is considered to be the opposite of this meaning, is interpreted in Uzbek as *fast as lightning*. Because in Uzbek there is a phrase “*lightning speed*”. Based on this, the phrase *rapidecommel’éclair* can be interpreted as *lightning fast*. The French word *l’éclair* means *light or oil*. However, this does not mean that lightning is a natural phenomenon.

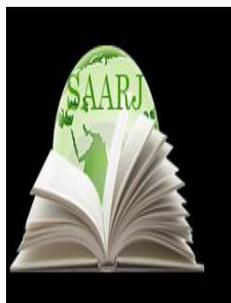

Such phrases are common in French. In the process of translating them into Uzbek or interpreting their meaning, the objects of comparison are the most important. If the same images are used to translate them into Uzbek, as well as in French, the full meaning of the phrase may not come out. In such cases, it is appropriate to interpret this phrase in Uzbek versions. For example, the phrase *laborieuxcommeuneabeille* should be translated into Uzbek not as *industrious as bees*, but as *industrious as ants*. There are also phrases in French that can be translated into Uzbek without analogy. For example, the phrase *paresseuxcomme un loir* can be translated into Uzbek as *lazy or overly lazy*, without any comparisons to make it understandable. However, among the phraseological units with the French *comme* component, there are those that correspond exactly to the Uzbek forms with the comparative components. For example, the phrase *leger comme un oiseau* means *light as a bird* when interpreted in Uzbek. It is observed that the feature of relief is compared with the same image in both languages, that is, the image of a bird.

It is obvious that in the interpretation of phraseological units with French antonyms with *comme* component in the Uzbek language, the objects of comparison in the French language may not correspond to the Uzbek language at all. In such cases, it is advisable to interpret them in a way that preserves the general semantic meaning, based on the culture and customs of the speakers of the language.

**INTRODUCTION**

The homogeny system, consisting of two or more components and their interaction products, is called a solution. Solutions are important in the life of living organisms. For example, blood, lymph, and saliva fluids are solutions. Solutions occupy an intermediate position between chemical compounds and simple mechanical compounds. Solutions are homogeneous, that is, homogeny, similar to chemical compounds. The melting process occurs with the absorption or release of heat, similar to a chemical reaction. Solutions differ from chemical compounds in that their composition is changeable, showing both the properties of the solvent and the dissolved substance. The dissolved substance can be separated from the Solvent by a physical way. With these properties, the solution is similar to a mechanical mixture.

In the process of preparation of the solution, the aggregate state is a variable component solvent. In solutions, one component in the other, so as to form a homogeneous environment in the state of molecules, ions, or atoms spread. Solutions three in gas, liquid and solid state.

## METHODS OF EXPRESSING THE CONCENTRATION OF SOLUTIONS

The amount of substance dissolved in a unit of volume or mass of a solution or solvent is called concentration. Such a solution is a concentrated, slightly diluted solution, if there is a lot of dissolved substance in the solution. There are several ways of expressing concentration. 1. The ratio of the mass of the dissolved substance to the total mass of the solution indicates the mass fraction of the dissolved substance:

Metals (Yun. *metalleuo* — I dig, I dig from the ground) - simple substances that have such distinctive properties as high electrical conductivity, hot conductivity, electrical conductivity, good return of electric magnetic waves, plasticity, under normal conditions. M. in the solid state, the crystal is in the structure. In Steam, it is an atom. oxides in combination with water often turn into hydroxides (bases). M. the electronic structure has its own characteristics, which are mentioned above in the true-file. M. atoms easily give external (valence) electrons. The crystal lattice, not all electrons will be combined with their atoms. Some of them move.

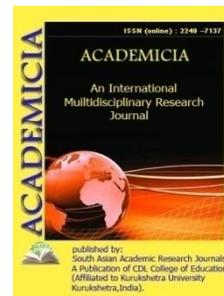

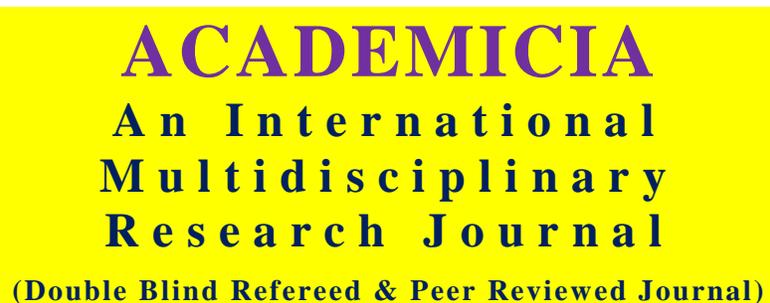

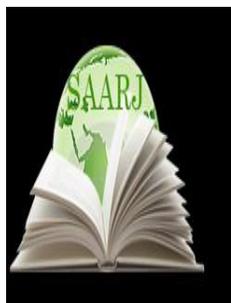

Chemical properties. D. I. 109 of the 87 chemical elements in Mendeleev's process system M., 22 of them are metallic. All M.ni it forms "ordinary metals", "intermediate metals", "lantanoids and actinoids". Process in the system, metals in the main groups are called ordinary metals (s - and r-elements), metals in the additional Group — Intermediate metals or (D - and f - elements). Simple substances are conditionally divided into two groups as metals and. Mas, Ge and SB do not have a single opinion about which category. But since Germany has semiconductor properties, it is not, although is a semi-metal according to its physical properties, M. it is more correct to count as. Tin has metal (Z-Sn) and semi-conductor (a-Sn) modifications. Germany, Silicon, phosphorus and some under high pressure M. as determined by the presence of conductive modifications. In addition, all substances under high pressure can also exhibit metallic properties. Therefore, it is necessary to use this or that element M.ga or when determining whether it is resistant to, it is necessary to take into account not only its physical properties, but also its chemical properties. M. it enters chemical reactions as an electron donor, forming positively charged ions in compounds or solutions. M.on electromagnetism is lower than the electromagnetism. Many M. it reacts actively with hydrogen, halogen. Alkaline and alkaline earth metals at normal temperatures with water, m as zinc and iron. reacts with water vapor at high temperatures. Series M with nitrogen., mas, lithium reacts at room temperature, magnesium, zirconium, gaily, titanium when heated. The metal itself compresses the original metal from that metal solution.

Density is smaller than 5 M. light, older than 5 years-heavy M. it is called. Iron and its alloys are black M., the rest is colored M. refers to as. The Original M. he does not look at it. Rare M. in the sentence vanadium, molybdenum, beryllium, indium, zirconium, lanthanum, niobium, tantalum, renium, German, galley, thallium and others are included. "Rare M.the phrase " quot; is a conditional phrase, depends on how much the methods of separating pure metal are improved; titanium, which was once considered "rare", now does not refer to the sentence" rare " (M.on the chemical and physical properties of metals, see articles on metal elements). M.in some compounds (even in alloys), metal bonding (bonding between particles that form the metal) is preserved. In the case of free and chemical compounds in nature. The Original M. (gold, platinum, silver), sometimes copper, tin and Mercury are found in pure form.

Ores M.ni the work of obtaining in pure form is carried out in various branches of metallurgy (drilling, hydrometallurgy and electric metallurgy) as a result of the processes of return, thermal decomposition, exchange in the technique. Very pure M. to obtain substances, the method of driving in a vacuum is also used. In subsequent years, the method of liquefaction along the zones is often used. On the basis of this method, niobium, tantalum, tungsten and other M. the yacht is cleaned of substances. M. in pure form, it is rarely used. Most often, it is used in the case of an alloy. Mas, cast iron, steel, brass, bronze, Constantine, milkier, Nixon and other atmospheric conditions M. edible (corrosion). It is of paramount importance to store metal objects from decay. The finding of a method of preparation of special stainless steels will help to solve this issue. M. it is used in marriage, construction, Cosmonautics, Shipbuilding, Mechanical Engineering, aircraft building and many other fields (neither q nor Q. Working metals).

## TEACHING MATHEMATICS TO PRIMARY SCHOOL STUDENTS THROUGH MENTAL ARITHMETIC

**Xusanova Zilolaxon Mirzaxolmatovna\***

\*Teaching staff of Fergana State University,  
Department of Primary Education Methodology,  
Fergana Region, UZBEKISTAN

### ABSTRACT

*The teaching of mathematics in the primary grades should address the educational, pedagogical and practical qualities of teaching any other subject. The success of the formation of mathematical thinking in primary school students depends on the profession of educator, his professional training.*

**KEYWORDS:** *Mathematics, Mathematical Operations, Pedagogical Practice, Teaching Mathematics In Secondary Schools*

### INTRODUCTION

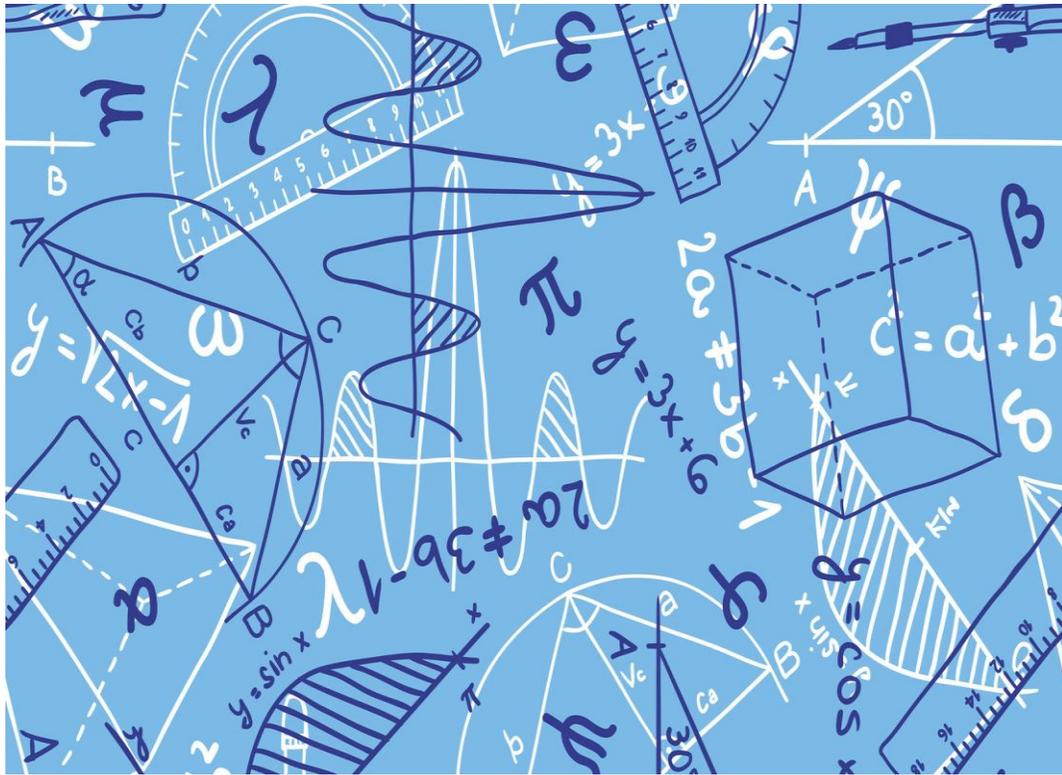

Teaching math in the elementary grades is generally seen as the first step in mastering a school math course. It is therefore important to take into account the general issues involved in teaching mathematics in secondary schools when working in the primary grades and to properly assess the importance of primary education in addressing these issues. Many of the issues related to the secondary mathematics curriculum need to be mastered to such an extent in the elementary grades that they remain in the minds of students for a lifetime, while other issues are discussed in detail in later grades in the early stages of teaching, is included only in preparation for the exit; or to be able to increase the level of thinking ability in the process of forming a skill or ability. The above considerations should be taken into account when it comes to the fact that children in the primary grades of the school consciously and firmly acquire a certain amount of knowledge, skills and abilities provided in the program in the field of mathematics. The mathematics course involves students to generalize the learning materials to the best of their ability, to explain the general principles and laws underlying the mathematical facts being studied, and to explain the connections that exist between the events under consideration. This mainly applies to the study of the properties of actions, the existing connections underlying them, and the mathematical

relationships and connections that form the basis of practical learning and skills that are formed in children. Teaching students to apply the knowledge, learning, and skills they have acquired in a variety of contexts can be seen as a special matter for students. At the same time, the application of knowledge is one of the important tools to increase the effectiveness of children's learning. Psychologists have proved that the full acquisition of knowledge and learning skills can be achieved only through their independent application in changing conditions. To a large extent, this can be overcome on the basis of the transition of children from primary school to the next grade in school, and vice versa, if the teacher does not pay special attention to all-round knowledge and instructs children to the same type of questions, assignments, expressions, this further increases the complexity of the transition to science teaching in 5th grade. This issue is inextricably linked to the more general issue of children's cognitive development. Much work has to be done since elementary school to observe and compare, to identify similarities and differences in the events being compared, to analyze, synthesize and generalize, to abstract, to identify. The problem of developing students' ability to think mathematically is inextricably linked with the problem of developing accurate, clear, concise mathematical speech. One of the main tasks of teaching mathematics is to create a clear system of calculation, measurement and graphic skills for students, in other words, this system consists of performing the simplest operations, which are brought to automation through repetition. . Inadequate assessment of this task leads to a decrease in the quality of children's knowledge in practice. However, at present, the study of elementary mathematics cannot be replaced by the development of skills and the acquisition of the same facts. Students should learn to make generalizations to the best of their ability to discover laws and relationships as independently as possible, as well as to draw oral and written conclusions.

The elementary mathematics curriculum focuses on the same, in which the increase in the level of theory in teaching is clearly expressed, and it is felt that the theory is inextricably linked with practice and practice. Here is an example to illustrate what it means to increase theoretical thinking in the teaching of mathematics. In Grade 1, the first decimal numbers are studied sequentially according to a previously used program. When looking at each number, for example, it is explained that 1 must be added to 1 to form the number 2. All of these facts are considered in different lessons when they are not related to each other. Such an approach did not create the conditions for children to generalize what they had learned in previous lessons. At the same time, this approach does little to help them acquire new knowledge in the next lessons on numbers 5 and 6.

## **MATERIALS AND METHODS**

According to the National Association for the Education of Young Children, children's knowledge of math skills at the primary level "predicts their math achievement for later years." Using different activities that allow children to use and develop math skills develops strong logic and reasoning skills in children. Teaching math skills to primary level students should be done using multiple teaching strategies to optimize student learning.

**Fig\_1 Theoretical and mathematical diagrams**

Engage the students in math activities such as sorting, organizing, and patterning, mapping and making pictures or drawing to find the answers to math problems.

Provide materials to enhance math discoveries. Math manipulates, number lines, the hundreds chart and play money give students tangible items they can use to make connections to their math skills.

Introduce one math concept in several different ways, demonstrate it to the class, allow the children to work in pairs on problems, and have them engage in math games or activities related to the concept.

Ask children to explain their thinking process. Have them explain in their own words how they came to the answer, or they can show you using manipulates or drawings.

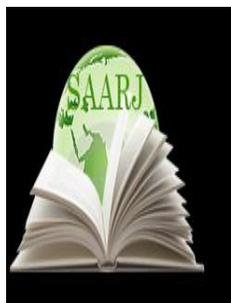

Encourage children to make connections between math they know and new concepts. Ask questions guiding children to make their discoveries about mathematical concepts. Have the children predicted the answer based on what they know, then have them work out the problem to find out if they were right. For example, in a subtraction problem, they can predict the answer will be lower than the top number.

Support the students in building math skills by encouraging them to ask questions and use reasoning skills.

**ABSTRACT**

*This article presents a view of using and incorporating information and communication technologies (ICT) into the teaching and learning of chemistry. Studies that investigate students' ICT skills in chemistry in particular and in science in general establish that ICT-based learning environments play a significant role in education. While this seems to be true as an overall assessment, the future is affected by innovations, fast-moving, and in many ways unpredictable*

**KEYWORDS:** *Science Education Audience Response System, Informal Learning Environment Multiple Literacy, Microcomputer Base Laboratory*

**INTRODUCTION**

There are several topics in chemistry which required computational technique to learn and use of ICT enhance learning capacity of learner as well as facilitator. The present article deals with the use of ICT in some of the topic of chemistry All though chalk and talk method has gain attention of the students but it has been found that using ICT to teach such topic of chemistry helps teacher to overcome from class room difficulty like presenting 3 D structure of molecule with model. The objective is to reveal teachers' ICT experiences and views on ICT integration into teaching-learning process as well as uncover the perceived obstacles to the integration process. The main difference between ICT and more traditional techniques for representing knowledge, such as textbook, is based on the nonlinear representation of information (Jacobson & Archodidou, 2000). In hypermedia, nodes of symbols are linked together in a flexible manner that make it powerful but which increases the difficulty (e.g. for teachers) to enter the product to appropriate its potentialities.

Information and Communications Technology (ICT) is an umbrella term that includes all technologies for the manipulation and communication of information. The term is sometimes used in preference to Information Technology (IT). A large number of commercial software packages offer teachers exciting and visually appealing approaches to teaching. These often drive the pedagogy and to a certain extent might restrict flexibility in teaching. In addition, some teachers resist the opportunity of teaching someone else's lesson and report that commercial software packages might not be available to pupils outside school. Experienced ICT practitioners can produce very effective lesson material using Microsoft® applications which can be uploaded to a school's intranet and internet and in a number of other ways can be made available for pupils to use outside school. Sharing lesson material is helpful for colleagues who can customize files to suit their own approach. Teachers require continuous support and training to effectively integrate technology initiatives. Successful technology integration involves the allocation of time for teachers to experiment with new technologies, collaborate with peers, and the provision of professional development opportunities. As teachers collaborate and plan lessons that integrate technology, they reframe their perceptions towards innovative technology implementation and, ultimately, student achievement.

## MATERIALS AND METHODS

Many researchers have been devoted to ICT to understand the factors that can influence learning such as the multimedia effect – in which students learn more deeply from words and pictures than from words alone, the coherence effect – in which students learn more deeply when extraneous material is excluded rather than included, the spatial contiguity effect – in which students learn more deeply when printed words are placed near rather than far from corresponding pictures and the personalization effect – in which students learn more deeply when words are presented in conversational rather than formal style (Mayer, 2003)

ICT increases teacher efficiency and can reduce teachers' time spent performing administrative tasks (Koszalka & Wang, 2002; et al.). It is important for both students and teachers to use ICT regularly in their courses (Fig, 2000 et al.). Student's higher-order thinking skills are enhanced in learning environments where ICT is used (Allegra, Chicory, & Octavian, 2001 et al.).

To be able to use ICT in the courses effectively, teachers should;

- be aware of its potential,
- select tools and methods which are appropriate with the needs of students,
- design their teaching methods effectively,
- develop new teaching strategies,
- Know and apply classroom management rules in order to cope with problems encountered in technology-aided learning environments (Becker, 2001 et al.).

## Stereochemistry

An important branch of stereochemistry is the study of chiral molecules. (March, 1985) Stereochemistry is also known as 3D chemistry because the prefix "stereo-" means "three dimensionality". Stereochemistry with chalk and talk method is always a tedious job for teacher because it requires a lot of 3D structure of molecule and drawing 3D object on black board is not possible. There is several drawing tools available free on internet in which 3D object can easily draw and several other information viz. Bond angle, angle strain, chiral carbon etc. can easily calculate.

Software's for drawing and visualizing 3D chemistry structure, predicting NMR, IR and other spectroscopic techniques, periodic table and organic chemistry other topics. It is very unfortunate that in our country more focus on theoretical knowledge rather than experimental work and ICT can play very important role in this concern. Technology initiatives can only be successful if they are compatible with the conditions of teaching. The initiative to incorporate technology effectively into classroom instruction must begin with the curriculum objectives. This ensures a consistent goal. A mismatch between values of the teacher and the technology initiative will cause an incorporation failure. If inadequate computer access or if there is a high pupil/computer ratio, teachers will be reluctant to employ technology as an instructional tool. The technology that is available must be reliable. Computers that are outdated or frequently requiring repair will cause frustration rather than a strong commitment to change. The training of a teacher as a technical specialist is instrumental to successful integration. As the specialist provides suggestions for integration technology into the curriculum and instructional activities, teachers understand how technology can be used as an instructional tool across all disciplines. The ultimate success of ICTs for learning will be attained when we stop marveling about the ICTs and apply our minds and emotions to the wonders of learning."

Here iPod activities were demonstrated in a classroom setting. The overall objective was to use ICT procedures, including iPod apps and the use of Pasco® probe ware to collect laboratory data to further develop new personalized activities for future use of the iPod.

Global Learning Objectives:

- a) Use ICT to promote and conduct laboratory investigations on a variety of topics appropriate for introductory-level chemistry.
- b) Use ICT to collect and organize qualitative and quantitative data and make measurements with accuracy and precision using tools such as data-collecting sensors (probes).
- c) Use ICT to identify and explain the process of naming and writing ionic compounds containing main group or transition metals, covalent compounds, acids, and bases, using IUPAC nomenclature rules.
- d) Modify classroom modules for demonstration purposes.
- e) Develop classroom ready modules to be shared with workshop participants. LIMITATIONS

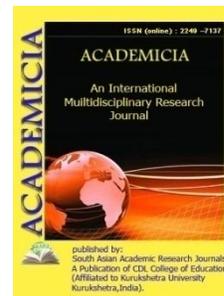

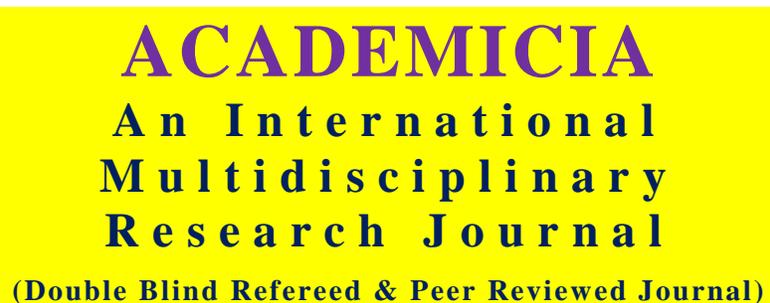

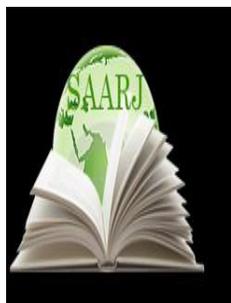

## DISCUSSION AND RESULTS

ICT tools are becoming more assessable and less expensive as supply and demand benefits increased classroom use. As compared to the updating of a static textbook, apps appropriate for teaching concepts and laboratory probe ware of sensors for collecting data have several advantages beyond cost. Yes, iPods do become outdated but even older versions can be passed down to either the lower levels or to classrooms that lack in ICT tools. Internet access with appropriate bandwidth is always problematic, but as long as the faculty is committed and willing to accept change, issues can be overcome and a positive experience provided to your students.

## LINGUOPRAGMATIC FEATURES OF SPEECH ACTS "EXPRESSION OF REFUSALS" IN ENGLISH AND RUSSIAN LANGUAGES

**Azimova Sayyora Xusanboyevna\***

\*Faculty of Foreign Languages,  
Teacher of the Department of Foreign Languages in Natural Sciences,  
Fergana State University Fergana Region,  
UZBEKISTAN

### ABSTRACT

*Scientific research in a branch of linguistics called pragmatics is plenty. This research helps them better understand the ways languages are used. It also deals with the extent to which sentences in lexical, morphological and syntactic terms are correct, but under what circumstances, in what communicative situations, with what prerequisites and intentions are these invocations pronounced and whether they will be able to meet their communication goals.*

**KEYWORDS:** *Pragmatism, Expression, Refusal, Dialect, Vernacular, Literary Language*

### INTRODUCTION

In any work of art, the author's speech (speech sphere author) takes up much more volume than the character's speech and relies on linguistic and stylistic means of the literary language (normative speech). A literary language is "an exemplary normalized language whose norms opposed to dialects and vernacular. In literary text and the author's speech and the character's speech have their own distinctive linguistic features and design features that are expressed in intonation, the relationship between word order, the nature of vocabulary and syntactic structures. " The author's speech in its varieties and the character's speech can be characterized from the point of view of communication, i.e. in the aspect of human activity, since language is not only a system of signs, but also a specific human activities. The spoken form of dialogue speech in a work of art dictates features of syntactic and lexical (linguo-stylistic) construction and the functioning of this form of speech. Oral-spoken conversational speech is built taking into account that it is understandable (publicly available) and adequately perceived. In the dialogue, strict economy of lexical and syntactic means - within the framework of dialogical speech function elliptical, unfinished, one-word, etc. sentences and very limited phrases. Despite the fact

that dialogue is inherent many (if not all) of the characteristic features of oral speech, however less dialogue in a work of fiction has its own specifics, distinguishing it from the actual oral form of spoken dialogue. Dialogue in the artistic text directly and indirectly depends on the nature and characteristics a work of art serving as aesthetically an organized complex verbal whole. Dialogue in fictional text subject to the rules of time, rhythm and tempo, outside of which does not exist artistic text. Pragmatism means “one of the plans or aspects of the study of language in their relation to that person or persons. To what extent sentences in lexical, morphological and syntactic terms are correct, but under what circumstances, in what communicative situations, with what prerequisites and intentions are these invocations pronounced and do they achieve their communication goals.

Scholars around the world have devoted their research on different areas of pragmatics with the main goal of better understanding how languages are used. We meet different forms of social behavior in different cultures around the globe that individuals categorize as mutually shared appreciation and consideration for others. Researchers in the field of Intercultural Pragmatics and Intercultural Communication have collected considerable data that illustrate how communicative behavior varies across cultures. They suggest that across societies and communities, people speak differently, and these differences in ways of speaking are profound and systematic, they reflect different cultural values, or at least different hierarchies of values. As a result, people often use different language tools and strategies, guided by their values, when performing the same speech act in a similar situation. The problem of intercultural communication is that one does not only have to understand the sentence in its semantic meaning but also have communicative competence in order to comprehend what the speaker meant; in other words to have pragmatic competence to understand and perform different speech acts in intercultural contexts. ‘Speaking a language means more than uttering a number of grammatically decent sentences’ [Ghazanfari et al 2013:], one must be aware of the pragmatic meaning of the interlocutors’ utterances. People speak different languages and therefore use them in a different way.

Refusal is a speech act that exists in all languages and is used in everyday life. It occurs as a negative response to other acts such as requests, invitations, offers, and suggestions. Searle and Vander ken (1985) define the speechact of refusal as follows: ‘The negative counterparts to acceptances and consents are rejections and refusals. Just as one can accept offers, applications, and invitations, so each of these can be refused or rejected’. The speech act of refusing is a non-preferred response and consequently it is a face-threatening act both to the Speaker and to the Hearer. In order not to risk threatening the face, speakers use various strategies to avoid offending the interlocutor but do it in a different way and with varying degrees of effort. As with other speech acts, refusal is culture-specific due to differences in such categories as face, threat, imposition, politeness and impoliteness.

The analyses show that when refusing Russian speakers, on the whole, are much more laconic and direct in comparison to English speakers. They can say a straight ‘No’ followed by gratitude or explanation and don’t often mitigate their refusal as the British do. The most typical Russian refusal consists of 2—3 moves while English speakers can go through 3—4 and sometimes even 5—6 moves.

Situation 1 (refusal to the offer to carry a heavy bag):

Russian: Нет, спасибо (No, thank you).

English: Thank you, but it's ok, don't worry. I don't have far to go.

Situation 2 (refusal to the offer to water flowers):

Russian: Не надо. Спасибо / Нет необходимости. Спасибо. (No need, thank you).

English: That's a kind offer, thank you, but I don't think they'll need watering. / Thank you, but it's all right. I'm not going to be away long.

Situation 3 (refusal to the request):

I'm really sorry, but I do not think I will have time to do it, as I have plans, is there someone else you can ask? (APOLOGY + INDIRECT REFUSAL + EXPLANATION + ALTERNATIVE).

The longest English refusal was given to an invitation :

That would be lovely, thank you, but I'm afraid I can't Saturday. My husband and I have made plans to go away. I hope you have a lovely evening though, and congratulations (POSITIVE EVALUATION + GRATITUDE + REGRET + NEGATIVE ABILITY+ EXPLANATION + WELL-WISHING + CONGRATULATIN).

As we can see the refusal here is a complex of positive politeness strategies aimed by the refuser at the inviter's positive face. Russian informants in this situation limited their refusal to 2, maximum 3 moves. They expressed gratitude and softened their refusal with a positive attitude and/or explanation:

Спасибо. Не получится / Я бы с удовольствием. Но мы с семьей уезжаем за го- род / Я бы с удовольствием. Но я уезжаюнавыходные.Спасибо.

As it has been already mentioned Russian speakers while refusing feel quite free to say a straight explicit NO. English speakers demonstrate a clear tendency to avoid it:

Situation 1 (offering help to carry a heavy bag)

Russian: Нет, спасибо (No, thank you).

English: Thank you. I'm fine.

Situation 5 (Your secretary is offering to help you)

Russian: Нет. Спасибо. Я справлюсь. (No. Thank you. I can do it myself)

English: I'm fine. Thanks. I can do it myself. It is interesting to note that in those cases, when the British informants used negative sentences, their No was focused on the refuser:

...I don't think they need watering

...I wouldn't want my colleagues to think I am getting special treatment...

...I'm not sure I'll be able to make Saturday

3. Though both Russian and British speakers while refusing expressed gratitude (for an offer or an invitation) and apology, the British performed it with more regularity and quite frequently emphasized their apology (in situations of request and invitations):

I'm really sorry, but I do not think I will have time to do it... (situation 8)

I'm so sorry, but I cannot right now... (situation 8)

I'm terribly sorry, but I'm not sure I'll be able to make Saturday... (situation 12)

Apology was sometimes expressed more than once as in the following example (refusal to a request):

I'm really sorry but I am already running late and need to hurry, so sorry (EMPHASISED APOLOGY + EXPLANATION +APOLOGY).

Giving an explanation for a refusal is also more conventional in the English context while Russian speakers find this act less necessary. In refusing an invitation some of our Russian informants softened their refusal with an expression of gratitude or an apology:

Спасибо. Не получится. / Спасибо, но не смогу / Простите, но прийти я не смогу, while the English speakers gave some specific reasons:

...I have a previous engagement for this weekend and I cannot change my plans...

...My husband and I have made plans to go away...

... I have made plans 2 weeks ago and I cannot change them...

...We are having a family reunion in NY...

...I'm meeting a client out of town...

... I'll be visiting my parents out of town...

Concerning the language differences our data have shown that the English informants use various means of modality to mitigate refusal and to make it more indirect:

I am not sure... / I don't think.../ perhaps / maybe / could etc.

Perhaps I could take it another time... (situation 4)

I'm afraid I can't make Saturday (situation 13)

Another interesting characteristic of English refusal concerns the use of positive politeness strategies. The data has shown that despite being indirect which is one of the main negative politeness strategies the British informants demonstrate, the tendency to use positive politeness strategies quite regularly:

– give communicative gifts to the hearer expressing positive emotion, evaluation and attitude: This is a kind offer... / That's very nice of you... / That's kind of you... (refusing an offer); I'd love to... / That would be great... (refusing an invitation);

– attend to the hearer and his interests: Is there someone else you can ask? / I'll ask the person next to me to help you (refusing a request); I hope you have a lovely evening though / I hope you have a nice time (refusing an invitation);

– say thank you and sorry regularly;

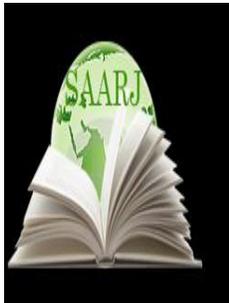

– use in-group identity markers (mate, buddy);

– are voluble.

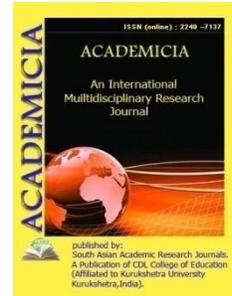

In Russian refusals positive politeness strategies are quite rare. They are limited to the use of gratitude, apology and regret.

## IMPROVING THE TECHNICAL SKILLS OF MODERN TEACHERS AND INCREASE THEIR PREPAREDNESS FOR TEACHING

**D. M. Nosirova\***

The Teacher of Bukhara State University  
 The Department of Foreign Language in Humanities,  
 UZBEKISTAN

### ABSTRACT

*Increasing the professionalism and competence was recognized as the main driving force of progress and activities leading to the goals of sustainable development. The modern education system involves the further improvement of the mechanisms for raising the competence of future specialists on the basis of a creative approach and an innovative system for putting them into practice. In order to increase the quality of current education system teachers should be armed with innovative methods and master the technical skills. The article looks into the requirements for the competent teaching staff.*

**KEYWORDS:** *Competence, Lifelong Learning, Technical Skill, Spiritual And Moral Competence.*

### INTRODUCTION

During the last decades, we in education have moved at light speed in the area of educational technology. Whether you are involved in higher ed, secondary ed, elementary, or special, all of us find it difficult to catch up, keep up, and put up with fast-moving computer-based technology. Not since the introduction of the blackboard have we seen a piece of equipment make such a difference in how we teach.

In the twenty-first century, significant changes are occurring related to new scientific discoveries, informatization, globalization, the development of astronautics, robotics, and artificial intelligence. This century is called the age of digital technologies and knowledge. Considering all the changes taking place, the question is whether the teaching staff will be able to adapt them. The theory of education, figuratively speaking, has two levels. At the macro-

level, in the “education-society” relationship, decentralization and diversification, internationalization of education, and the introduction of digital technologies occur. At the micro-level in the “teacher-learner” relationship, there is an active mix of traditional and innovative methods, combination of an activity approach with an energy-informational environment approach, cognition with constructivism and connectives.

## **MATERIALS AND METHODS**

For the formation of the readiness of future teachers of technology and entrepreneurship for the development of moral consciousness among schoolchildren, the following conditions are required: information and technological support for the stable interest of students in a new aspect of their professional training; inclusion of knowledge about morality in the content of educational disciplines of a technological profile on a successive basis; teaching students the ability to guide schoolchildren to find the moral meaning of various types of work; application of individual and collective forms of teaching students to the elements of organizing entrepreneurial activity during the period of pedagogical practices of students.

A modern day teacher is expected to approach innovatively to the teaching process. First of all, we should define the term "innovative teaching" .

Innovative Teaching Methods is a new way of teaching which includes creativity, interactive & technology in teaching. Renewing traditional teaching to provide a new method of teaching to make learning better. Innovative teaching engages the student in the classroom & develop an interest to learn.

The criteria and indicators of the readiness of the future teacher of technology and entrepreneurship for the development of moral consciousness in schoolchildren are:

- value-oriented (orientation to the moral and semantic essence of labor and its entrepreneurial version, its production in future pedagogical activity; the need to acquire moral knowledge; internal motivation of readiness for the purposeful development of the moral consciousness of schoolchildren);
- Information and competence (knowledge of the morally developing capabilities of the academic subject, the moral and semantic resources of information technologies, the methodological foundations of the pedagogically directed process of developing the moral consciousness of schoolchildren);
- activity-competence (the ability to direct schoolchildren to search for the moral meaning of various types of activity; organize training for schoolchildren in the elements of entrepreneurial activity; prepare them for moral choice in problematic situations of work, including entrepreneurial).

With that in mind, here is a comprehensive listing of the technology skills that every educator should have. Because as computer and associated technologies continue to change and evolve, educators must continue to strive for excellence in their work. Today that includes continued time and effort to maintain and improve their technology skills (as much as some educators do not want to admit).

Here are 20 basic technology skills that all educators should now have:

Word Processing Skills

Spreadsheets Skills

Database Skills  
Electronic Presentation Skills  
Web Navigation Skills  
Web Site Design Skills  
E-Mail Management Skills  
Digital Cameras  
Computer Network Knowledge Applicable to your School System  
File Management & Windows Explorer Skills  
Downloading Software From the Web (Knowledge including eBooks)  
Installing Computer Software onto a Computer System  
WebCT or Blackboard Teaching Skills  
Videoconferencing skills  
Computer-Related Storage Devices (Knowledge: disks, CDs, USB drives, zip disks, DVDs, etc.)  
Scanner Knowledge  
Knowledge of PDAs  
Deep Web Knowledge  
Educational Copyright Knowledge  
Computer Security Knowledge

In order to be a great teacher, you must display enthusiasm, leadership, commitment, and compassion. By exhibiting these key factors, you will appeal to the schools at which you are applying as someone who will work to better the lives of their students in a variety of ways. Helping others succeed is a central component to teaching, thus trust, knowledge, and commitment are invaluable traits. Teachers must also maintain current professional development standards by taking regular refresher courses and test.

Technical Skills

## **RESULTS AND CONCLUSION**

Teachers must, of course, understand the material they teach. Naturally, different positions require different types and levels of skill, but even teachers of very young children need significant expertise. It is not enough for a first-grade math teacher to know how to perform basic arithmetic, for example. He or she must have a deep understanding of numbers and numeric relationships in order to be able to explain the material in a thorough and responsive way.

Teachers must be able to perform the core responsibilities involved in the role, from comfortably using Microsoft Office to create materials to being comfortable providing disciplinary action as necessary.

Teaching in our modern world is quite demanding and requires the educators to perform successfully in several positions.

Common ground across different cultures on the nature of teaching, teacher learning and teachers' competences can be outlined in six broad paradigms, which should be seen as integrated, complementary aspects of the profession (Paquay & Wagner, 2001):

- The teacher as a reflective agent
- The teacher as a knowledgeable expert

- The teacher as a skilful expert
- The teacher as a classroom actor
- The teacher as a social agent
- The teacher as a lifelong learner.

Such a broad frame of reference can be a useful tool for analysis and dialogue, according to a systemic view of the teacher's professional development, in its tensions between person and institution, product and process, and what is desirable or possible.

In order to meet the demands of modern classrooms a teacher should always be on the way of self development. Stimulating teachers' engagement in professional learning and competence development

It is possible to stimulate teachers to engage positively in developing their competences through a competence development plan that might:

- be based upon a clear model of teacher competence with sound theoretical underpinnings, on which there can be consensus;
- promote teachers' self-reflection;
- respect individual teachers' different starting points and levels of interest by offering a mix of options, incentives and requirements; and
- leave room for school autonomy in implementing continuous professional development plans.

### ABSTRACT

*Of particular importance in the article is the research conducted in the genetic collection of cotton of the National University of Uzbekistan. Experiments have shown that in the hybrids of isogenic and introgressive lines of the genetic collection of cotton of the National University of Uzbekistan, the correlation of value-economic traits, including the positive inheritance of the fiber index.*

**KEYWORDS:** *Genetic Collection, Line, Isogenic, Introgressive, Fiber Index, Combination*

### INTRODUCTION

Cotton is one of the world's leading agricultural crops. More than 80 countries of the world are engaged in cotton growing. Of these, the 10 largest countries account for 90-95% of the world's fiber production. It is gratifying that the Republic of Uzbekistan is among these countries.

The degree to which the problem has been studied. One of the factors influencing fiber yield is the fiber index (weight of 100 seed fibers). The primary parent lines of this combination differ sharply from each other in terms of fiber index

According to the experiments of many scientists in the genetic collection of cotton, Musaev DA, Musaev DA, Zakirov SA, Kh.

a) The "high fiber index" sign completely dominates the "low fiber index" sign.

b) Lines with a "high fiber index" that have relatively similar values tend to increase in F1 relative to the parent values when mixed. [1-3].

Conditions and methods of research The experiments were conducted in the experimental field of the National University of Uzbekistan named after Mirzo Ulugbek, "Scientific Research Laboratory of Cotton Genetics" in the "Botanical Garden".

The numerical data obtained as a result of the research were statistically processed by the method of B.A. Dospekhov (1985). Classical methods of cotton genetics and selection, inter-line hybridization, field experiments, methods of genetic-selection statistical analysis were used.

The degree of dominance in G<sub>1</sub> hybrids was determined according to the formulas of Y.M.Beil, R.E.Atkins, A.Allard. The results of the applied research were statistically processed by the method of B.A. Dospekhov. In this case, the parameters obtained for each criterion were analyzed by variance, ie the reliability of the differences between the hybrids was determined by the Fisher criterion (F), the total error of the experiment S, the error of the mean differences Sd and the smallest difference (EKF) 95%. The data were analyzed statistically using the modern variance (ANOVA) program.

Research results. One of the factors influencing the percentage of fiber yield in the inheritance of the fiber index trait, as I mentioned above, is the fiber index (fiber weight per 1000 seeds). According to the statistical analysis of the results of the inheritance of the fiber parent primary line, the L-489 line reached the highest value ( $8.8 \pm 0.1$  g), and the L-4112 and L-620 lines showed the lowest value ( $6.5 \pm 0.1$  g) and  $6.7 \pm 0.1$  g), while L-39 and L-608 have average values, with a fiber index of  $7.20 \pm 0.01$  g and  $7.30 \pm 0.1$  g, respectively. did.

In the F<sub>1</sub>L-489xL-4112 and F<sub>1</sub>L-489xL-620 combinations obtained with the high-performance L-489 line and the low-performance L-4112 and L-620 lines on this mark, the mean was  $8.90 \pm 0.88$  g and 9, respectively.  $00 \pm 0.06$  g, and heterosis (hp = 1.1; hp = 1.3) was noted in the character inheritance in both combinations.

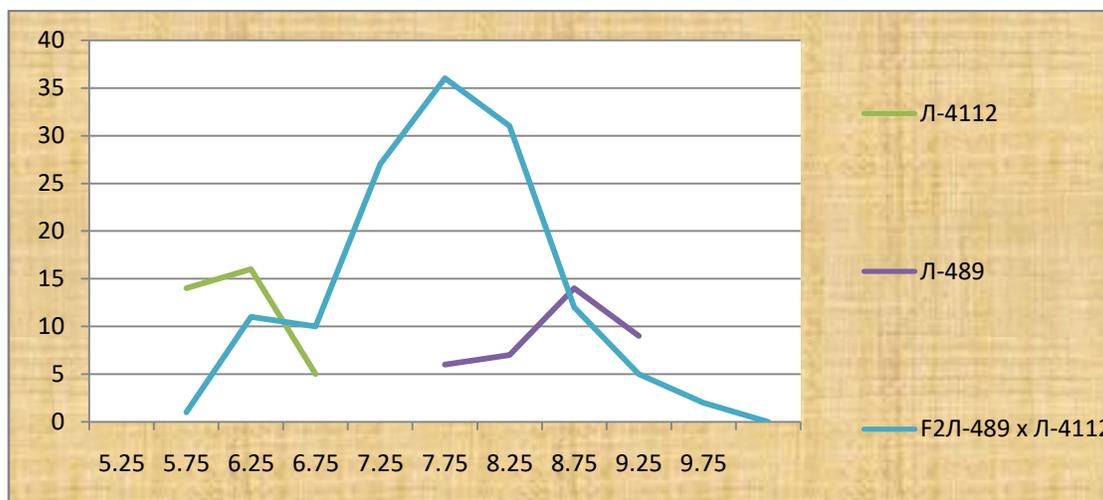

In combinations F<sub>1</sub>L-489xL-39 and F<sub>1</sub>L-489xL-608 obtained by mixing L-39 and L-608 lines with high fiber index L-489 and relatively average fiber index, the average fiber index was  $8.16 \pm 0.05$  g and respectively. At  $8.39 \pm 0.11$ g, it was observed that the trait was inherited in the intermediate state (hp = 0.2; hp = 0.5). (Table 1)

**TABLE 1 INHERITANCE OF FIBER INDEX MARK IN SIMPLE G<sub>1</sub> HYBRIDS OF COTTON GENETIC COLLECTION LINES**

№	Lines and G <sub>1</sub> hybrids	Тота индекси, г.	S	V	hp
1	Л-489	$8,79 \pm 0.11$	0,64	7,25	-
2	Л-608	$7,22 \pm 0.07$	0,41	5,62	-
3	Л-620	$6,68 \pm 0.05$	0,33	4,9	-
4	Л-4112	$6,52 \pm 0.06$	0,35	5,37	-
5	Л-39	$7,44 \pm 0.07$	0,40	5,48	-
	F <sub>1</sub> Л-489 x Л-4112	$8,86 \pm 0,88$	0,43	4,93	1,1
	F <sub>1</sub> Л-489 x Л-620	$9,00 \pm 0,06$	0,46	5,10	1,3
6	F <sub>1</sub> Л-489 x Л-39	$8,16 \pm 0,05$	0,41	5,00	0,2
7	F <sub>1</sub> Л-489 x Л-608	$8,39 \pm 0.11$	0,63	7,58	0,5

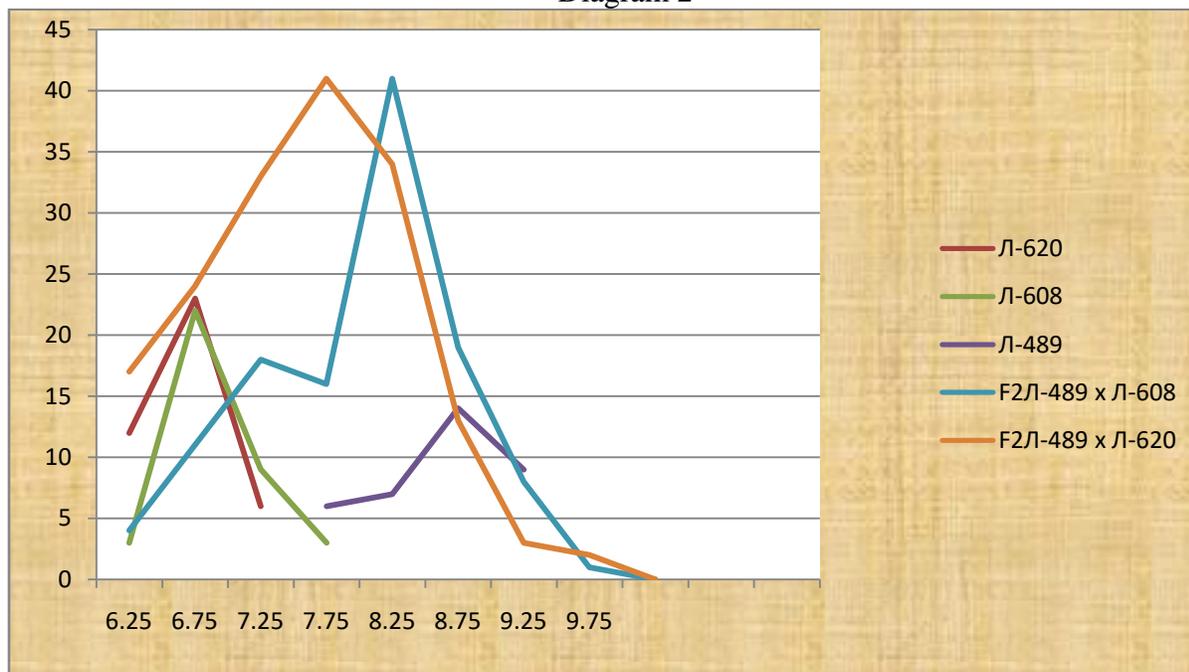

In second-generation hybrids, the variability scale of the fiber index mark was 6-9 classes depending on the combinations. Plants of the L-620, L-4112, and L-39 lines were included in 3 classes of the variability series, and 4 classes in the L-489 and L-608 lines.

Diagram1

The G'2L-489xL-4112 combination plants yielded 5.75 g of the variability range. and 10.24 g. took place in 9 classes. Most (36) plants weigh 7.75–8.24 g. placed in the indicator modal class. In this combination, right-sided transgression was observed, with plants with a high fiber index accounting for 0.74% of the total plants. Also in this combination, the fiber index variability scale plot (Table 2, Diagram 1) also had a peak appearance.

Diagram 2

### Variability of fiber index sign in G'2 hybrids of cotton genetic collection lines

TABLE 2

Lines and G'2 hybrids	n	Синфлар,г.										$\bar{x} \pm S_x$	s	v	h
		5.25-5,74	5.75-6,24	6.25-6,74	6.75-7,24	7.25-7,74	7.75-8,24	8.25-8,74	8.75-9,24	9.25-9,74	9.75-10,24				
Л-608	37			3	2	9	3					7,22 ± 0,07	0,41	5,62	-
Л-620	31			12	2	6						6,68 ± 0,05	0,33	4,91	-
Л-4112	35		1	16	5							6,52 ± 0,06	0,35	5,37	-
Л-39	32				2	2	2					7,31 ± 0,07	0,40	5,48	-
Л-489	36						6	7	14	9		8,79 ± 0,11	0,64	7,25	-
F <sub>2</sub> Л-489 x Л-4112	135		1	11	1	2	36	31	12	5	2	7,74 ± 0,06	0,79	10,33	0,40
F <sub>2</sub> Л-489 x Л-620	167			17	2	3	38	36	13	3	2	7,63 ± 0,06	0,79	10,39	0,29
F <sub>2</sub> Л-489 x Л-39	157			14	2	3	39	27	7	3	1	7,52 ± 0,06	0,73	9,73	0,34
F <sub>2</sub> Л-489 x Л-608	118			4	1	1	16	41	19	8	1	8,01 ± 0,07	0,77	9,63	0,27

In the combinations G'2L-489xL-608 and G'2L-489xL-620, the fiber index values are 6.25 g. and 10.24 g. placed in 8 classes. In this case, the maximum number of plants (41 and 38, respectively) is 8.25 g. and 8.74 g. and 7.25 g. and 8.24 g. placed in modal classes with indicators up to. In these combinations, a class shift to the right was observed, and plants with higher scores were separated from the parent forms.

Their amounts were 0.85% and 1.20% of the total vegetation. The variable scale diagram (Table 2, Diagram 2) had a peak view.

G'2L-489xL-39 plants 6.25 g. and 10.24 g. placed in 8 classes. Most (39) plants weigh 7.75–8.24 g. placed in the indicator modal class. In this combination, a shift from left to right was detected in 1 class. The proportion of low-yielding plants was 8.9% and that of high-yielding plants was 0.6%.

Conclusion: The evidence presented suggests that the additional gene is in the opinion of our scientists above

a) The “high fiber index” sign completely dominates the “low fiber index” sign.

b) Evidence has shown in our experiment that lines with a “high fiber index” with relatively similar values tend to increase in F1 relative to the parent values when mixed.

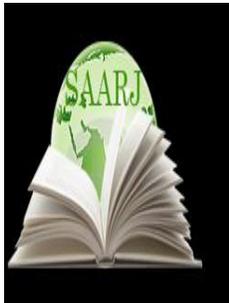

According to the evidence in the table, G'1 hybrids occupy an intermediate position relative to both parent indicators in terms of fiber index. According to the analysis of the series of variations on the fiber index, the fiber index of the G'1 hybrids showed that they form a single peak curve.

The variational curve created on the basis of the variation series formed on the fiber index is characterized by its one and two peaks. While the first peak on the left was a strong show, the 2 peaks on the right were not as strong. The many peaks of the variational curve indicate complex management of the character.

Thus, the inheritance of the fiber index is the same as in the inheritance of the fiber output.

## EXPRESSION OF LOVE FOR THE MOTHERLAND AND NATIONALISM IN THE WORKS OF ABDULLAH SHERA

**Sayyora Xaqnazarova\***

\*Lecturer at Fergana State University,  
 UZBEKISTAN

---

### ABSTRACT

*The article examines the work of Abdullah Shera and expresses his love for the Motherland, the national spirit of our people. His works are distinguished mainly by the fact that they are written in a modern spirit. In them, the spiritual world, thoughts, aspirations of the Uzbek people are expressed through their own poetic images. He finds such new means of expression in his poems and pays special attention to enriching the lines of the poem with intellectual, emotional images.*

**KEYWORDS:** *Nature Landscapes, Poetic Skill, Love For The Motherland, Nationality, Diligence, Sincerity.*

---

### INTRODUCTION

If we look at the work of Abdullah Sher, we can see that the Uzbek spirit and elegance, the spiritual perfection of the Uzbeks are in him.

His work is full of deep thoughts and philosophical observations. In his poems, he was able to capture the subtle discourses of life with deep insights and to shape man's philosophical attitude toward life.

The poet spent more than forty years of his life in productive creativity. He is one of the creators known for his poems, epics, dramatic and prose works, high artistic translations. His works are distinguished mainly by the fact that they are written in a modern spirit. In them, the spiritual world, thoughts, aspirations of the Uzbek people are expressed through their own poetic images.

The artist is one of the artists who, through his works, managed to bring to our literature the brightness, sincerity, psyche and originality of the country where he was born and grew up. In these passionate verses of his, his fervent love for the Motherland, his love, his heartbreak are lyrically expressed.

I burn: neither wild nor friendly

My darkened horizon is on the ground.  
I am the fire: I have blocked the darkness,  
I was born in the poem!

The writer expressed his love for the Motherland by singing about the nature and beautiful landscapes of our country. The heart of the reader who reads these verses is filled with some incomprehensible sweet feelings, and he imagines himself directly in the bosom of these beautiful landscapes.

In the verses skillfully described, the unique nature of our Motherland, its colorful appearance, majestic mountains and vast fields are reflected before our eyes.

Surmarang on the shores  
The sun goes down, the dawn breaks,  
The colors lie flat  
Surmarang on the shores

In the poems of the poet, the nature of our Motherland is reflected with poetic skill and colorful edges. The image of nature in the poems is in harmony with the love for the motherland, the hymn of our country.

He bowed his head and waited for the harvest.  
Dark, yellow grain in the stalks.  
Touching the horizon in the afternoon,  
Cancer comes back again.

The poet's simple but impeccable feelings were also reflected in the depiction of the image of our simple, kind people. In the poems, the virtues of innocence, diligence, humanity, which are characteristic of our people, are described in bright verses. One of the tasks set by the artist is not to lose the deep thinking in poetry, to sing the feelings of contemporaries, the feelings of the heart, the love for the Motherland.

Expressing the feelings of the poet, the expressions of his heart, we can see that in his poems, along with love for the Motherland, the Uzbek national spirit is in harmony. These verses from his poem "Ornamental Trees" are a clear proof of this:

The love of ivy is alien to them for a lifetime,  
A strange cocaine that does not grow around.  
The waters are not turbid, and a seed-free belt -  
Unbreakable mint along the concrete ditch.

In addition to delicately depicting natural landscapes, the artist has instilled in him the national spirit of our people. The main theme of the writer's poems is the nature of our Motherland, its hymns, our simple, hardworking, pure-hearted people. In his works, he approaches the spiritual world of man, the events related to life in it, with high intellectual potential and philosophical observation.

From the light of the heavens,  
It's like the snow I miss.  
From the net of the heart to the magical world  
The spring in the heart that is slowly coming down.

The writer is constantly searching for the realities of life and new layers of the hearts of his heroes, and of course, comes out on top of that. He finds such new means of expression in his poems and pays special attention to enriching the lines of the poem with intellectual, emotional images. That is why the combination of his deep experiences and dark thoughts deepens the feelings in the heart of the reader, his thoughts.

Mankind's behavior is interesting:

He lives like a gash from something.

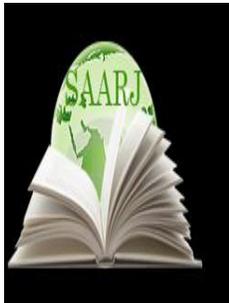

Living in one line,

He starts drawing something else.

The poems of the poet always fascinate the heart of the reader, give him aesthetic pleasure and serve to further increase the love for the Motherland in his heart.

**LEGAL BASIS OF MEDIA ACTIVITY**

**Mahmudova Maftuna Hamzaqizi\***

\*Teacher at the Faculty of International Journalism,  
 Uzbek state world Languages University,  
 UZBEKISTAN

**ABSTRACT**

*The legal basis for the development of the information industry, raising it to the level of world requirements is the primary concept. This article analyses the system of international and national law, normative documents that play an important role in ensuring the activities of the media in our country. The country has enshrined in its laws the guarantee of freedom of citizens to seek, collect and disseminate information as a constitutional principle. Today, the majority of the population uses the Internet. It is worth noting that the adoption of the European Convention for the Protection of Individuals in the Automated Processing of Personal Data in 1981 paved the way for all this.*

**KEYWORDS:** *Media Activity, Legal Democratic Basis, Communication, International Law.*

**INTRODUCTION**

It is known that in the Republic of Uzbekistan, special attention is paid to strengthening the principle of transparency in the activities of government agencies and public associations. Provision of information in the form of annual appeals and reports in the media on the information to be provided to citizens, procedures for their submission, the activities of the subjects, executive and representative bodies, the rules for providing information on the request (procedure and timing of the request, request form) , conditions of providing information, the grounds for refusal to provide information and the procedure for appealing against unreasonable refusal to provide information are clearly defined in our legal documents. As a result, a unified system of regulation of relations in the field of transparency of public administration has been formed.[1]

In this regard, special attention should be paid to the protection of personal data in a transparent manner of government agencies and public associations. The Law "On transparency of public administration" does not apply to the procedure for ensuring access to personal data of

individuals. It is clear that the protection of personal data of citizens is regulated by other laws, such as the Civil Code, network legislation.

Significant work has been done in our country to develop the information sphere, to raise it to the level of world standards. Further democratization and liberalization of the media, increasing their activity in ensuring the openness and transparency of the on-going socio-political and socio-economic reforms, the direct introduction of advanced information and communication technologies in the media space:

- “On mass media”;
- "On the principles and guarantees of freedom of information";
- "On the protection of journalistic activities";
- “On publishing activities”, “On telecommunications”;
- Laws on Informatization and more than 20 other information laws, more than 50 Decrees and Resolutions of the President of the Republic of Uzbekistan, Resolutions of the Cabinet of Ministers of the Republic of Uzbekistan and more than 300 departmental legal acts were adopted.

Regardless of the nature of such social relations, or whether they arise between subjects, such as husband and wife, employer and employee, citizen and state, doctor and patient, etc. they form their own views on each other based on the data set, its content and essence, or determine their subsequent relations and views. In general, at first glance, the fact that information about individuals and personal data are in civil circulation seems to be the norm. However, it must be acknowledged that in recent years, as a result of the rapid development of science and technology, a unique system of information technology, information exchange has emerged. Consequently, this situation has accelerated the process of entering information and data about this or that individual into a commercial transaction as a commodity. Given the fact that information about individuals and personal data is greatly expanded and at the same time their content is enriched, the process of developing, systematizing, collecting, processing and disseminating such information and personal information about a person, as well as their use is specific. It is not difficult to understand that legal regulation is becoming a necessity.

This need was first recognized in Germany, and in 1977 the Law on the Protection of Citizens from Other Citizens was adopted. By 1983, as a result of the improvement of such relations, the Law "On Disposal of Personal Information" was adopted. It should be noted that in 1995 the European Community adopted the Data Protection Directive, and in 1999 the Committee of Ministers of the Council of Europe adopted the "Recommendations on the Protection of Privacy on the Internet". It is worth noting that the adoption of the European Convention for the Protection of Individuals in the Automated Processing of Personal Data in 1981 paved the way for all this.[2]

To date, laws protecting personal data have been enacted in more than 20 European countries and have also been enacted in Independent Representations for the Protection of Personal Data. In addition, the introduction of a single, unified system of personal data protection in all EU countries since October 21, 1998, which simultaneously covers the telecommunications sector, testifies to the need for legal protection in this area.[3]

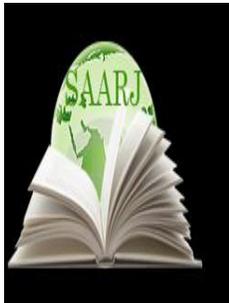

Many countries around the world, such as Estonia and Latvia, have adopted special laws to protect personal data. At the same time, the fact that the Russian Federation passed such a law in the first reading in the Parliament on July 27, 2006 shows that measures are being taken in the countries of the world community to protect personal information and data, which is becoming a powerful object of social relations.

Well, the question arises as to whether there is a certain need for the adoption of a similar law in the Republic of Uzbekistan, what is the content of such information and personal data. We will try to answer this question as follows.

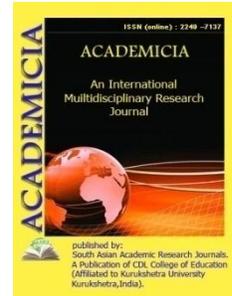

It is known that Uzbekistan has a place in the world community in terms of social, economic, scientific and technological weight. The country has enshrined in its laws the guarantee of freedom of citizens to seek, collect and disseminate information as a constitutional principle. Today, the majority of the population uses the Internet. Day by day, information and personal data are expanding their position as an object in the media and the Internet. In addition, various business entities, including financial institutions, government agencies, non-governmental non-profit organizations, are engaged in the collection and processing of various information and data in their activities, or such a task is becoming a specific way of doing business. Furthermore, it is currently not possible to keep information or personal information in a particular system or administrative-territorial framework, let alone in a particular state. In this sense, it is inevitable that the legal protection of information and personal data in the country is of particular importance.

## HUMANITY REPRESENTING ETIQUETTE WORDS OF KARAKALPAK LANGUAGE

**Naurizova Aysultan Kalbaevna\***

\*PhD Senior Teacher,  
 Department of Humanitarian Subjects,  
 Nukus branch of Tashkent State Agrarian University,  
 Nukus, Karakalpakstan, UZBEKISTAN

### ABSTRACT

*This article deals with interesting aspects of linguistics such as syntax, pragmatics, and speech culture. It is well known that language develops and in the process of language development, language norms gradually change. However, it is no less well known that the norms of the formal language are conservative in nature. If everything new that appears in speech were recognized as normative urgently and recklessly, we would not have a literary language at all, since a literary language is the result of a careful and lengthy selection of linguistic means. The language ideal, as A.M. Peshkovsky is the only one of all ideals that lies behind, that is, mastering the literary language, we strive to speak as the best writers, our teachers, parents, in a word, representatives of the older generation spoke. Moreover, the given article describes etiquette words of Karakalpak language which represents the concept "humanity". Author tries to describe peculiarities of the Karakalpak culture in greeting process; moreover all analyse materials based on Karakalpak Literature which take place as an empirical evidence of the research. It is said that all cultural dimensions represent nation's peculiarities and author focuses reader's attention on historical, religious, cultural background of greeting process and tools. These means of communications are "assalawma aleykum (formal greeting)", "salem berdik (informal)", "salem (informal)", "salam aleykum (informal)", "salawma aleykum (informal)".*

**KEYWORDS:** *Communication, Humanity, Etiquette, Gesture, Means Of Communication, Sphere*

## INTRODUCTION

Greeting is a sign of recognition of the value and dignity of a person. The variety of forms of greetings in various etiquettes is difficult to describe comprehensively and classify: nodding head, bowing, shaking hands, kiss, and also simple “good morning/afternoon”, “hello”, etc. All of them determine by a number of objective and subjective factors of ethnographic and sociocultural nature of the ethnic group.

Karakalpak Etiquette words have special ways of usage and spheres as in other languages. They can be practiced, experienced, and developed in life-long duration of the human-being, in some cases they are changed due to some factors. Nevertheless etiquette words show us the level of mannerliness in human-being, they also represent the level of intelligence as each person should know where to use, what to use and how to use them. Thus, etiquette words are the main tool of measuring morality level.

## MATERIALS AND METHODS

Analysis of the litereray texts show us that Karakalpak etiquette words are divided into two forms: verbal and non-verbal. The given types were proven from the written and oral analysis of the text; some of them were formal, semi-formal, and informal types of the text.

Greeting etiquette, welcoming, are the words that can be seen in greeting actions. Each nation has its own greetings and blessings. In Karakalpak nation greeting is similar to other nations such as in the form of shaking hands, greeting, hugging and by other verbal actions. The greetings are closely connected to the psychology of the people.

## LITERATURE REVIEW

N.I.Formanovskaya holds that etiquette words are used in “addressing and attacting”, “farewelling”, “pardoning”, “requesting”, “advising”, “congratulating”, “inviting” situations, moreover these words as the means of communication structure action etiquette words and they develop one of variants of the microsystems of the communicating etiquette group.

Pragma discourse of the literary text can be followed by etiquette action, and at the same time they fulfill each other [1, 10].

M.Saidkhanov justified in his research: “According to the history, greeting etiquette is parallel to the particular actions that is accepted by the society.” In greeting the word “Assalauma aleikum” is used by putting the right hand on the left chest and slightly turning the head down. In such cases even the word is omitted by the communicators the greeting is meant by non-verbal actions. These non-verbal expressions show nominative differences and shown through the combination of actions “putting the hand on the chest”, “nodding the head”. Non-verbal actions in the greeting can be through the process of speech [2, 37].

The greeting among people not only strengthens their relationship, but also not welcoming the greeting represents the lack of humanity in behavior. Likewise, these kinds of relationships show the lack of greeting etiquette. In some cases in which there is not opportunity for greeting or need to greet with familiar people, raising one hand, raising the chin, nodding the head are acceptable. T. Kordabaev emphasized that “The only common part of the semiotics is the gesture, the signal through the various movements of the body, the message actions” [3, 149].

## Results

Greeting is the symbol of universal humanity and most important peculiarity in verbal and non-verbal cases according to the linguistics. In accordance with the long-held traditions of the Muslim, it is pleasant when the young people greet with the old people even he or she is stranger for them.

We live in the era of large and, most importantly, rapid changes in language and speech. Changes in vocabulary are mostly noticeable: numerous borrowings, the penetration of jargonisms into our speech, etc. This is what linguists primarily describe, this is what native speakers themselves notice. Oddly enough, less noticeable are the changes in speech etiquette. There are practically no new words in this area. Apparently, the older generation considers changes in speech etiquette as a simple and random violation of it, and the younger - as the norm. Actually, the process of change remains unnoticed. However, changes in speech etiquette occur.

It is well known that language develops, and in the process of language development, language norms gradually change. However, it is no less well known that the norms of the literary language are conservative in nature. If everything new that appears in speech were recognized as normative, urgently and recklessly, we would not have a literary language at all, since a literary language is the result of a careful and lengthy selection of linguistic means. The language ideal, as A.M. Peshkovsky aptly puts it, is the only one of all ideals that lies behind, that is, mastering the literary language, we strive to speak as the best writers, our teachers, parents, in a word, representatives of the older generations

## DISCUSSIONS

As in other Turkic languages in the modern Karakalpak language it is possible to greet through various phrases and text. The most commonly used phrases are: “Assalawma aleykum/Good morning, How do you do?”, “Salem berdik, Salem/Hello”, which are frequently used. Except for these, there are the words in the style of the press, radio, television which are different from the usual greetings in everyday life of common people.

In addition to these mentioned words, shaking hands, hugging of women with each other, relatives are kept as a tradition of Karakalpak nation. Particularly, these non-verbal actions are used as the symbol of respect. One of the cases that is included in the greeting etiquette in recent time is the occurrence of the non-verbal actions: kissing, hugging among women, men and young people. According to the thoughts of people in our society the latest appeared new forms of greeting are not appropriate in social places.

In current time “Assalauma aleikum” is commonly used by both men and women. But according to the tradition of our nation men greet women as “Salem berdik” and at the same time women greet men “Salem berdik”, because the greeting between men and women should be different from the usual greeting. This tradition is changed to the modern type as both men and women use the same greeting words and non-verbal actions as shaking hands, hugging and kissing. Mainly, as in other Turkic language the forms of greeting are different according to the age, sex, social status (teacher-learner, professor-student, and employer-employee), the part of the day, formal and informal cases and up to these peculiarities the greeting words are used in an appropriate way. Probably, most of our youth do not take into account these facts that many people seem to be using the same type of greeting to all people.

One of the more unique forms of interaction between communicants is greeting from distance. It is similar to the "chesting" of military men and can be applied to all kinds of situations (as far as possible or as far away as possible, from the side of the biannuals).

Based on the literary works, we can see several variants of greeting etiquette in Karakalpak language.

1. – Aradan waqti o'tpesten-aq u'stine qasqir terisinen kelte ishik, basina g'awdiyg'an tulki malaqay kiygen aq saqalli bir g'arri kirip keldi.

- *Assalawma-a'leykum!* – H'amme og'an sa'lem brip orninan turdi...

- G'arri, qalaysan'? U'y ishin', mal-janin' amanba?

- Qoydi soyip berin', – dedi g'arri. Qonaqlar h'ayran bolip bir-birine qarasti.

- Qulagi esitpeydi, TAS geren' bolip qalg'an, – dedi kelinshek.

1. – *After a short period an old man wearing a hat and shapan came in.*

- *Assalauma aleikum!* – *Everybody in the room stood up and greeted...*

- *How are you old man?*

- *Prepare the meal, – said the old man. The guests surprisingly looked at the old man.*

- *He can not hear, he is deaf, – said the daughter-in-law.*

2. «- *Assalawma-a'leykum, bay ata!*

- *Waleykum assalam!* (K.Mombetov, «Posqan el...»).

2. «-*Assalauma aleikum, rich man!*

- *Waleykum assalam!* (K.Mambetov, «Poskan el...»).

3. «-*Assalawma-aleykum, h'urmetli Nurjan ag'a!* – dedi onin' ko'zi ku'limlewi menen ... – Jatip qaldin'iz ba? – dedi Zavmag jaqinlap kelip.

- *Kesheden berli onsha ma'nisim joq – dedi g'arri.* (T.Kaipbergenov «Ko'zdin qarashig'i»).

3. «-*Assalauma aleikum, dear Nurjan aga!* – *said with a smile...*

– *How are you? – said coming nearer to him.*

- *I have not been feeling good since yesterday– said the old man.* (T.Kaipbergenov «Ko'zdin qarashigi»).

In all three examples, the so-called “Assalauma aleikum” form which is commonly used between common people. But the peculiarity of their relation between them is visible in the second example with the help of the word “bay ata/ rich man” and “dear Nurjan aga” in the third example. Obviously, there is a significant difference in the expressiveness of the addressing words and the content of labelling. Indeed, in this context, the importance of the context, in the third textual context, is also strong. Calling their name strengthens the expressiveness and meaning of the greeting, and the third example is more expressive than the second because of the word “dear”. Moreover the description of the author “said with a smile” depicts the state

expressively. Expressiveness also provides a compelling, insightful, commentary to the actions of the characters in the literary character.

In addition to the common forms of the greeting etiquette, their determinant-epithetical conjugation is used in certain situations, in the context of communication, psychology and purposes of the language.

1. – Astraxannan kiyatirman. Atlarimiz sharshap boldirdi. Rasin aytsam, ra'smiy jumisim joq. Sizin' menen birge sa'lemlesip, pikirlesip keteyin dep edim, – dedi.

- Xosh kelipsiz, qa'dirli qonag'im, – dedi Ismayil. Bunnan keyin birden ekew'i apaq-shapaq bolip sa'lemlesti.

2. – Uyde xabarlasqanday kim bar?

Jekennen islengen jabiq birden jalt etip ashildi... Sari sinli kisinin' shoq saqali da bar eken. Saqalin taramlap uslap turip so'yledi:

- Biz bar, shiraqlarim!

- Atin' kim?

- Qobag'ash...

3. Dosim Tag'aymuratin' qupiya bir bilezik sog'ip atirg'an wag'inda keldi...

- Harma, usta!

- Bar bol, kel, dostim!

- Ne islep atirsan'?

- A'y, anaw'-minaw'... (K.Mambetov..).

1. – “I am coming from Astrakhan. Horses are tired. Honesly, I don't have any official job. I want to greet, talk with you”, he said.

"Welcome, dear guest," said Ismayil. After that, they became very close with each other.

2. – Is there anybody at home?

It was opened covered curtain from jeken (cattail)

"We're here, dears!"

- Who are you?

- Qobag'ash

3. My friend Tagaymurat came when we made of bracelet...

- "How are you doing, master!"

- "Come, come, my friend!"

- “What are you doing?”

- “Oh, just nonsense” (K.Mambetov).

So here, "xosh kelipsiz aziz qnag'im/welcome, dear guest!", question form in the second and third are the extracts of the analysed text, as well as the words on the third example can be added to the words of the "greetings". The following types of marking labels are also available in our language: Also, in our language, some of the most common forms of etiquette words are used in the form of traditional dimension labels that give the national coloring. For example:

1. – Bul gu'lla'n Qipshaqtin' qa'dirdani Shalkiyiz, biy – dedi Xalqnazar jayg'asip otirip atirip.- Yelmurat sheshen usi w'aqitta g'ana yesin jiynadi.

- Shirlap ushqan shimshiq bar, qirdan ushqan qirg'iy bar, biyiklep ushqan bu'rkit bar. Ba'ri de qus. Biraq ba'ri de bu'rkittin' bir pa'rine kelmeydi. Burqirap aqqan bulaq bar, dao'rig'ip aqqan da'r'ya bar, ten'selip aqqan ten'iz bar. Ba'ri de suw'. Biraq ten'iz benen ba'sekilese almaydi.

Barmisan' ten'selip aqqan ten'izim! Biyikke ushqan bu'rkitim! Assalawma aleykum! – dep qos qolin alip juwirdi.

Shalkiyiz Yelmurat sheshennin' sa'lemin a'lik alip soradi.

- Qay balasan', qarag'im!

- Qaraqalpaqpan.

- Qaraqalpag'in' kim?

- Nog'ayli g'oy.

- Onda tu'sinikli. O'zimiz yekense? ...

2. Qoshshaq ha'r ku'ni o'z pikirin So'yinbiykege bayan yetpekshi bolar. Biraq hesh bir ju'rek yete almastan keyinge qaytar yedi. Bu'gin qalay bolmasin og'an o'z pikirin bayan yetpekshi boldi.

Ayaqlari talip baratirg'an adamday altin taxt aldina kelip toqtadi.

- Ma'rteben'iz bunnan da ba'lent bolg'ay, ma'liykam!.

- Raxmet! «Wa'zir bunday da'bdebeli sa'zlerdi aytpaytug'in edi. Qanday jumisi bar eken?» – dep oylanip qaldi Su'yinbiyke... (K.Ma'mbetov).

1. "This is our dear Shalkiyiz for all Kipshaks, biy" said sitting comfortably Halknazar. Elmurat could just at that moment regain consciousness.

- There is a cobblestone, a crunchy bar, and a high-pitched. Anyway, all of them are birds. But none of them can be compared with eagle. There is strongly flowing streams, thunderly flowing rivers, calmly flowing seas. All of them water. But with the sea, they can't contest. Are you here calmly flowing my sea, are you here hingly flying my eagle! Good morning!" - Running to them with risen hands to greet.

Shalkiyiz greeted Elmurat Shechen and asked.

"How are you, my dear?"

- Karakalpak.

- Who is he Karakalpak?

"We are Nogay"

- So now it's clear. You are close to us...

2. Everyday Qoshshaq intended to tell his opinion to Suyinbiyke. But he couldn't have done it. However, today he is going to express his opinion surely. Just like a tired man who can't walk on his feet, he came to the golden throne and stopped in front of it.

- "Glorify, my Queen!"

- Thank you! "But, it never used to say such a luxurious word. What does he want?" - Suyinbiyke said thoughtfully... (K. Mambetov).

Greeting in these examples can be seen as the sign of respect, the sign of formality, and as the sign of addressing. In the first example, the steamy majority of the steam consciousness also described with the help of some of these expressions, and it is well-known among Nogay people, as the Shesenic style. Finally, there are some of the most remarkable examples of present-day greeting, including one of the traditional features based on national identities.

This means that the logic and functional features of the sentences are different from each other; moreover grammatical forms are not mutually exclusive and may not coincide. These language phenomena may be darker, though less sparse, and from our point of view it relates to the stylistic colors of the language.

Also, the interconnectedness of communicants are sometimes used in the form of genitive case in the context of reciprocal colorization of greeting etiquette.

- Ha, Joldas Da'wletov, men Serjanovpan! Sizdi sirqatlanip qaldi dep yesittim, hal-jag'daylarin'izdi bilw ushin zvonit etip atirman. Tezirek sawaliwin'iz ushin qanday ja'rdem kerek bolsa, aytin'iz...

- Menin' denim saw, hesh na'rse kerek emes...! (T.Qayipbergenov).

- Sha'riypa! – dep qaytaladi ol bul ushirasiwg'a tan'lang'an ha'm quwanishin ishinde bu'klep tura almay Sha'riypa basin ko'terdi. Ol tanig'an edi. Sonda-da o'zin tutip bir qaradi da:

Sultan birden tilge kirdi.

- Voevoda Mixail Petrovich! ... (K.Ma'mbetov)

- *Oh, comrade Dauletov, I am Serzhanov! I have heard you are ill, phoned you to know how you are feeling. Would you want anything?*

- *I am feling well. I do not need...! (T.Kaipbergenov).*

- *Sharipa! – he repeated. She recognized him and looked at him:*

*Sultan spontaneously spoke.*

- *Mikhail Petrovich! ... (K.Mambetov)*

Contextually, the words also mean the greeting among the characters. From our viewpoint, such kind of greeting words mean the communicants' arrogance who feels himself in upper level than others. For instance, Erjan Serzhanov represented his arrogance through his words and attitude in the work "Ko'zdin' qarashig'i".

In modern Karakalpak language the following kind of questionable greeting words can be used...

- Palwan Mamutovich, amanliq pa?
- So'ylesiwiwimiz kerek, joldas direktor! Qistawli ga'p bar... (T.Qayipbergenov...).
- O, Saltan, jag'daylar qalay?
- Jaman emes.
- Men senin alip barg'an sawashin'di a'dewir diqqat penen gu'zettim. A'neyi emessen', qilishlasiw o'nerin' mag'an unadi.
- O, Ismayil! Barmisan', dostim?! –ekewi birden qushaqlasip apaq- shapaq bolip ketti... (K.M?mbetov).
- *Palvon Mamutovich Is everything Ok?*
- *We need to talk, dear director! There is urgent... (T.Kaipbergenov...).*
- *Oh, Saltan, How are you?*
- *Not so bad.*
- *I have observed you attentively. I liked your method.*
- *Oh, Ismail! I have not seen you for ages, myfriend?! – Both of them hugged each other and began... (K.Mambetov).*

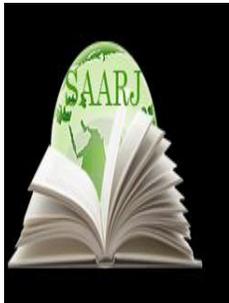

The grammatical forms, meaning and function are not the same. In practical language case is rarely appeared and it is connected to the style of the language.

## CONCLUSIONS

In particular, greeting one person to another, greeting the young to the old, minority to majority of people, woman to man in formal, literary, and publicistic style, in radio, television and press are different from one another. We consider this greeting to be the key element of ethical etiquette and need to be investigated from scientific and linguistic view.

## SPATIAL ANALYSIS OF IRRIGATION IN KARNATAKA: A GEOGRAPHICAL ANALYSIS

**Dr. M.G. Nayak\***

\* Assistant Professor  
 Dept. of Geography,  
 Karnatak University, Dharwad, INDIA

### ABSTRACT

*An attempt is made in this paper to analyse the spatial analysis of irrigation in the state of Karnataka. The State of Karnataka with its territorial content as it exists now was formed on 1<sup>st</sup> Nov 1956 under the States' Reorganization Act. However, it was known as Mysore State until 1<sup>st</sup> Nov, 1973. It is located in the western part of the Deccan Peninsular region of India and lies between 11° 35' North Latitudes to 18° 30' North latitudes and 74° 5' East longitudes to 78° 35' East longitudes. The state is bounded by Maharashtra State and the Goa State in the North and North-West respectively, by Kerala and Tamil Nadu States in the South and by the State of Andhra Pradesh in the East, while Arabian Sea in the West. The total geographical area of Karnataka is 1,91,773 squares kilometers, which shares 5.83% of the total area of India. The major finding of the study is the ultimate potential for irrigation in the Karnataka state is estimated to be 55 lakh hectares which includes 35 lakh hectares from major and medium river projects, 10 lakh hectares from minor surface projects and another 10 lakh hectares from underground water*

**KEYWORDS:** *Irrigation, Spatial Analysis and Development.*

### INTRODUCTION

The geographical area of Karnataka is 1,91,791 Sq. Km., accounting for 5.83% of the total area of the country. The cultivable command area of the State is 1,40,598 sq. Km. The net sown area is 1,07,000 sq. Km. The ultimate Irrigation Potential under Major and Medium Irrigation Projects has been estimated as 35,000 sq. Km or 35.00 Lakh Ha. For administrative purpose the state is divided into 30 districts consisting of 176 talukas, 496 towns and 29483 inhabited

villages. The state is divided into 4 divisions. Bangalore is the capital of the state. Bangalore division consists of 51 talukas followed by Belgaum with 49, Mysore 44 and Gulbarga division 31 talukas. Physiographically Karnataka State forms part of two well defined macro regions of Indian Union: the Deccan Plateau and the Coastal Plains and Islands. On the considerations of regional physiographic characteristics the State can be divided into following four regions: (1) North Maidan, (2) South Maidan, (3) Malnad, (4) Coastal region.

### Objectives of the Study

- To study the percentage wise special analysis of irrigation data by identifying ranges like very high irrigated to very low irrigated.
- To identify ranges of intensity of irrigation and make special analysis.

### Data Base

The paper is based on secondary data of the year 2003 and 2004 collected from the Director of Economics and Statistics, Bangalore. Information base is obtained through discussions made with agricultural science scientists, besides referring to books, journals and periodicals of geography.

### METHODOLOGY

Intensity of irrigation is work done by using the formula percentage data analysis through 5 class interval of mean and SD method. The spatial analysis of taluka wise percentage area under irrigation (2003-04) shows 8 taluks under very high range of irrigation i.e. more than 72%. Out of these 8 taluks 3 taluks viz., Raybag (93.69%), Gokak (86.64%) and Bilagi (74.80%) belong to Krishna river basin. Out of these 3 taluks Raybag and Bilagi taluks get irrigation water from Krishna river basin through lift water system of pumpsets, apart from Ghataprabha river canal water brought from Hidakal dam. In case of Gokak taluk the water brought from Ghataprabha river (Hidakal dam) canal is only available. Three taluks in Cauvery river basin viz., Yalandur (78.16%), K.R.Nagar (77.98%) and Mandya (75.15%) receive irrigation water from K.R.S. project as well as Kabini and Harangi river projects. The Harihar taluk (87.81%) receives irrigation water from Tunga river project while Bhadravati taluk receives water from Bhadra river project. In all these 8 taluks of very high range of irrigation, water from borewells and from small streams is also made available by the farmers and consequently these 8 taluks have made much headway in irrigation extent.

**High Range of Irrigation :** In this category 21 taluks are observed, where irrigation is available in the range of 49.8% to 71%. Three taluks i.e. Jamakhandi (69.98%), Mudhol (68.05%) and Athani (57.85%) get water from Ghataprabha project while Sorapur taluk (of Gulbarga district) gets Krishna water from Narayanapur dam. Gangavati taluk (69.27%), Bellary taluk (67.61%), Hospet taluk (62.51%) and Sindhanur taluk get water from Tungabhadra river project. Five taluks of Dakshina Kannada district i.e. Bantwal (61.05%), Puttur (53.78%), Belthangadi (53.15%), Mangalore (52.69%) and Sulya (51.55%) get irrigation water lifted from perennial streams as well as bore wells. Another 3 taluks of western ghat region i.e. Sagar (55.66%), Tirthalli (49.24%) and Honnavar (54.70%) receive irrigation water from Tunga project, Bhadra project and perennial streams respectively. Davangere taluk (55.65%) located in central part of Karnataka gets water from Tunga project for irrigation. The four taluks of Cauvery river basin

i.e. T.Narasipur (70.85%), Kollegal (63.55%), Malavalli (52.16%) and Maddur (51.89%) get water for irrigation from Cauvery river dam and its tributary dams.

**Medium Range :** In this group 44 taluks are observed. The extent of irrigation in these taluks is from 28.4% to 49.7%. These taluks are found in bunches spread in south east, south, west, central east and north west of Karnataka. These taluks belong to river systems of Krishna, Tungabhadra and Cauvery. Some taluks of the medium range irrigation also belong to high rainfall zone of Karnataka i.e. Kodagu taluk, Mulabagil taluk of Kolar district has as low as 28.08% while maximum irrigation is observed in Nargund taluk with 49.24%.

**The low range of irrigation** is observed in 87 taluks which are well distributed in most of the part of Karnataka while among 87 taluks it is found in only 4 taluks of western ghats. The maximum percentage of irrigation is found in Bangalore east taluk with 28.94% area under irrigation. Out of 87 taluks more than 70 taluks appear in the dry zone i.e. in rain shadow region of Karnataka. The lowest irrigated area being 7.11% is observed in Aland taluk of Bidar district, where due to less rainfall not only the surface water is less but also the underground water. Therefore all these 87 taluks need watershed management programmes so as to increase / recharge underground water system. **Very low range of irrigation:** In this category 15 taluks are observed where the percentage of irrigated land is below 7%. These taluks are found in Gulbarga district, Bidar district, Dharwad district, Gadag district, Haveri district, Chikkamangalore district and Kodagu district.

**Intensity of Irrigation:** The intensity of irrigation\* is work done by using the formula:

$$\frac{\text{Gross irrigated area}}{\text{Net irrigated area}} \times 100$$

Where

Gross irrigated area = Net area irrigated + area irrigated more than once since data on “area irrigated more than once is not available and therefore it is assured that area sown more than once is because of irrigation made on such land and hence in place of “area irrigated more than once” “**area sown more than once**” is taken into account.

Area sown more than once + net irrigated area = gross irrigated area.

A taluk having even less than one percentage of sown area under irrigation can appear as “very high intensity” taluk under the study of “intensity of irrigation”, mainly because of considering the “area sown more than once” as a part of irrigated area as per formula used. In such situation the annual rainfall has favoured the farmers to cultivate more than one crop and consequently as per the formula adopted, such taluks (low area under irrigation) appears as “very high under intensity of irrigation” (examples like Kundagol 0.57%, Hubli 4.12%, Dharwad 7.76%, Savanur 8.02% and Shiggaon 4.29%), contrary to this situation the taluks having very highly irrigated or more irrigated appear as “low intensity” mainly because of cropping pattern where single crop like Sugarcane/plantation agriculture crops occupy as one crop under ‘area sown more than once’. Hence such taluks do not show more area as “sown area more than once” and thus more

irrigated/high irrigated taluks/moderately irrigated taluks appear as “low intensity of irrigation medium intensity of irrigation”.

### **Development of Irrigation**

At present (during 2003-04), the Karnataka state has nearly 24.94 lakh hectares of land under irrigation. The progress could not be viewed satisfactory as: (i) it so far covers only about a fifth of the cropped area, and (ii) nearly two-thirds of the available resource potential remains undeveloped. For want of irrigation, droughts continue to take a heavy toll on crops in 80 per cent of the cropped area and a second or a third crop cannot be raised during the year in 87 per cent of it. Paucity of irrigation is mainly responsible for the low performance of the new technology in 80 per cent of the cropped area. Irrigation is essential for a successful harvest in view of the low (below 75 cm) and highly erratic rainfall in the eastern two-thirds of the Karnataka state and almost no rainfall in three-fourths of the year (from October to May) over the whole state.

### **Irrigation Potential**

The ultimate potential for **irrigation in the state is estimated at 55 lakh hectares including 35 lakh hectares from major and medium projects and 10 lakh hectares each from minor surface schemes and groundwater.** The state so far has a developed provision of only 25 lakh hectares, i.e., about 45 per cent of the total available potential. The state hopes to develop this remaining potential fully by the year 2010 A.D. of course, these estimates are based on the prevailing requirement of about 0.8 hectare-metre per hectare, which includes significant conveyance losses and excessive use, which are likely to decline in the coming years with improvement in conveyance channels and irrigation techniques. The state's irrigation resources can be significantly augmented by inter-basin transfer of water from water-surplus basins, specially from the west-flowing rivers in which water (58 per cent of the total) now simply flows as waste.

#### **1) North Maidan**

This region comprises of the districts of Belgaum, Bidar, Bagalkot, Bijapur and Gulbarga and it is largely composed of Deccan Trap. It represents a monotonous extensive plateau landscape with a general elevation of 300 to 600 meters from the mean sea level. However, the river plains of the Krishna, the Bhima, the Ghataprabha and the Malaprabha rivers with the intervening water sheds, the step like landscapes, lateritic escarpments, residual hills and ridges break the monotony of this extensive plateau. Its general slope is toward East. The region is largely covered with rich black cotton soils which are known to be retentive of moisture. Central part of Karnataka covers the districts of Bellary, Chikmangalur, Chitradurga, Dharwad, Gadag, Haveri, Raichur and Shimoga. It represents the transitional surface between the Northern Karnataka Plateau of Deccan Trap and the Southern Karnataka Plateau with relatively higher surface. By and large, this region represents the area of Tungabhadra basin. The general elevation varies between 450 and 700 meters. However, this transitional ground is broken by several sets of parallel ridges mainly made up of Dharwad system of rocks. The height of such residual hills is about 900 meters. The general slope of the region is towards East.

## 2) South Maidan

The Southern Karnataka Plateau covers the districts of Bangalore, Hassan, Kodagu, Kolar, Mandya, Mysore and Tumakur and largely represents the core of old Mysore State. Physiographically it largely covers the area of Cauvery river basin lying in Karnataka. It is bounded by 600 meters contour and is characterized by a higher degree of slope. In the West and South it is enclosed by the ranges of Western Ghat and the Northern part is an interrupted but clearly identifiable high plateau which, by and large forms the water shed between Cauvery and Tungabhadra river systems. In the East the valleys of Cauvery and its tributaries open out to form undulating plains. The general elevation of the region ranges from 600 to 900 meters. However, residual heights of 1500-1700 meters are found in Biligirirangan range of Kollegal and Brahmagiri Ghats of Kodagu.

## 3) Maland

The region covers the districts of Shimoga, Chikmangalore, Hassan, Kodagu, Uttar Kannada, and small parts of Belgaum, Dharwad, Mysore, and Dakshin Kannada districts. Its width varies from 50 to 65km. Except for the isolated ridges, the Malnad surface is not raised above the plateau level north of a line from Birur to Bhatkal. Here the Sahyadri is simply a more dissected edge of the Deccan plateau and the altitude along the crest rarely rises to over 600 m above mean sea level. South of this line, the surface has a substantial relative relief as it is highly dissected by the head-water of the Tungabhadra and Cauvery. Cauvery rise to over 900 m above mean sea-level with several peaks exceeding 1300 m (Koadachadri 1343 m, Pushpagiri 1713 m, Kudremukh 1892 m). The highest altitude in the region is attained in the west-facing crescent-shaped Bababudan hills (Mulangiri 1913 m), which lie to the east of the Sahyadris in Chikmagalur district.

## 4) Coastal Region

The Karnataka Coastal Region, which extends between the Western Ghats edge of the Karnataka Plateau in the East and the Arabian Sea in the West, covers the Dakshin Kannada, Udupi and Uttar Kannada districts of the state. This region of Western Coast is traversed by several ridges and spurs of Western Ghats. It has difficult terrain full of rivers, creeks, peaks and ranges of hills. The coastal region consists of two broad physical units, the plains and the Western Ghats. The coastal plains represent a narrow stretch of estuarine and marine plains rarely exceeding 30 Kilometers in width and at certain places the crests of adjoining Western Ghats reach the sea as close as 13 Kilometers near Karwar in Uttar Kannada. However, in South the low-land is somewhat wider with maximum width of 70 kms near Mangalore in Netravati Valley. The average height is generally 75 meters from the mean sea level. To the East of Coastal Plains the general elevation increases abruptly and this abrupt rise at the Eastern Flanks forms the Western Ghats. The Northern parts of the Ghats, which lie in Uttar Kannada district are of lower elevation (450-600 meters) as compared to Southern parts (900-1500 meters) spread over Dakshin Kannada district.

Irrigation is the key infrastructure for the agricultural development of Karnataka. Three fourth of the cultivable area in the state is dry land.

Monsoons being uncertain, the agricultural production in the rain shadow areas of the state is subject to considerable instability, which affects the economic position of the farmers. There has

been a considerable slow down in the growth of the agricultural sector in the eighties and nineties leading to stagnation in agricultural output. Recognising the situation, irrigation has been considered as one of the major inputs essential to step up the productivity. **Therefore, there is an urgent need to increase the percentage of cultivated area under irrigation by judicious tapping of available irrigation potential in the state.**

The beginning of the planning era has accorded high priority for the development of irrigation in the state. Public investment in major and medium irrigation projects and private investments in tube well irrigation have increased phenomenally in the recent years. The share of the irrigation in the total plan outlay has increased from 19.4 per cent in the eighth plan to 26.4 per cent in the Ninth plan. Though a high priority has been accorded for the development of irrigation in the state, **the irrigation potential created till the end of the 1995-96 was 23.02 lakh hectares out of which 8 lakh hectares is from well irrigation which is far below the national average of 38 lakh hectares.**

The composition of net area irrigated by different sources has undergone considerable change during the last four decades. Canal irrigation, which accounted for 27 per cent of the net area irrigated during 1960s, has registered a four-fold increase in the area during the last three decades, irrigating 41 per cent of the net area during the year 1995-96. Tank irrigation was the major source of irrigation during 1960s. It accounted for nearly 40 percent of the area under irrigation. During 1995-96 the area irrigated by tanks hardly accounted for 12 per cent of net irrigated area. The area under well irrigation, which was 15 per cent during 1960s, has increased to 26 per cent during 1990s. Thereafter, there has been a decline in area under well irrigation, irrigating only 4.27 lakh hectares, which accounted for 18 per cent of the net area irrigated during 1995-96. The decline in well irrigation is due to a phenomenal growth in tube well irrigation in the state in the recent years. Tube well irrigation, which accounted for 8 per cent of the net area, irrigated during 1990s has jumped to 16 per cent of the area irrigated during 1995-96. The net area irrigated by other sources has also declined over the years.

**TABLE: NET AREA IRRIGATED BY DIFFERENT SOURCES IN KARNATAKA**

Year	Canals	Tanks	Wells	Tube wells	Other sources	Total
1960-61	2.36 (27.51)	3.43 (39.98)	1.33 (15.50)	NA	1.46 (17.02)	8.58 (100.00)
1970-71	3.97 (34.76)	3.72 (32.57)	2.60 (22.77)	NA	1.13 (9.89)	11.42 (100.00)
1980-81	5.46 (40.12)	3.04 (22.34)	3.63 (26.67)	NA	1.48 (10.87)	13.61 (100.00)
1990-91	8.02 (39.08)	2.39 (11.65)	5.40 (26.32)	1.73 (8.43)	2.98 (14.52)	20.52 (100.00)
1993-94	9.35 (40.22)	2.72 (11.70)	4.87 (20.95)	2.90 (12.47)	3.40 (14.61)	23.25 (100.00)
1997-98	9.50 (41.26)	2.30 (10.00)	4.27 (18.55)	3.72 16.16()	3.23 (14.03)	23.02 (100.00)

Note: NA - Not Available

### Findings and Suggestions

The ultimate potential for irrigation in the Karnataka state is estimated to be 55 lakh hectares which includes 35 lakh hectares from major and medium river projects, 10 lakh hectares from minor surface projects and another 10 lakh hectares from underground water. The Karnataka state so far has developed only 25 lakh hectares of area under irrigation which is only 45% of the total available potential. The deficiency of water for the irrigation in the eastern and central parts of Karnataka can be solved through transfer of water from other surplus areas. In this regard the diversion of water from the west flowing rivers of Karnataka can be of best use. The methods like rain harvesting, watershed management, soil bunding and adoption of scientific methods in irrigation management can improve the status of irrigation in the North and South Maidan region of Karnataka, where nearly 102 taluks at present are showing only 1% to 28% area under irrigation. As a result of which the intensity of cropping, high yields of crops, quality of crops and need based agricultural production can be possible in Karnataka and thereby green revolution in Karnataka to a maximum possible extent can be achieved.

## MUNJIK'S LEGACY AND ITS LITERAL FEATURES

**Jumakulov Jamshid Panjievich\***

\*Lecturer,  
 Department of Tajik Philology and Oriental Languages,  
 Termez State University, UZBEKISTAN

### ABSTRACT

*The article examines and evaluates the artistic position of Munjik Tirmizi in the literary sphere of Chaghaniyon, the content and artistic features of his works. The research and discussion was carried out on the basis of information from exegesis, jungles, adult books, cultures, ancient and modern sources, and on the basis of the remaining quantities of the poet's works, the theme and content of the poet's poetry were identified.*

**KEYWORDS:** *Legacy, Qasida, Ghazal, Muqaot, Single Beyts, Wided Beyts, Praise, Comedy, Praise Of Love, Nature, Storm, Horse, Biography, Category, Literal, Poet, Poem Of Migrate, Soft Sound, Meaningful, Tazkira, Funs, Dictionary.*

### INTRODUCTION

On the basis of specific examinations was determined that the remaining poems of the poet consist of poems, ghazals, muqattas, single verses and scattered beyts, in total 436 bytes, of which 20 bytes belong to Munjik. In this way, the author identifies the features of hymns, hymns, satire, and in praise of love, wine and nature, and clarifies the social and moral aspects of such poems of Munjik. By means of comparative analysis it has been proved that the poet's hymns were formed under the influence of the ideological approach of the family of Oli Muhtoj and have a deep social and moral aspect. In his poems, Munjik praised the noble qualities of the Chaghan emirs, and thus conveyed his dreams and those of his contemporaries to the emirs. In the background, Munjik's poem "Lomia" is analyzed in detail and its essence is assessed.

The author of the article explains humor as the main component of the poet's work and by analyzing some examples reveals the social and moral essence of such poems of Munjik. From comparative analysis, the author concludes that in comedy, Munjik discovers good and dead meanings, subtle and pure meaning, and the influence of imagination plays an important role in the formation of his artistic thought.

At the end, the author discusses the artistic features of Munjik's poetry and clarifies the artistic position of the poet by comparison. In this approach, the use of metaphors, allegories, allusions, especially the use of detailed metaphors and emotional images, the author interprets as a factor of the poet's style and considers the influence of material elements in the formation of the poet's style. Also in the article the author describes the use of quality instead of the author as one of the refinements of the poet in the image and clarifies his skill in the use of imagery and image.

## RESULTS OF RESEARCH AND DISCUSSION

MunjikTirmizi is one of the greatest poets of the X century, who had lived and written his legacy during the Chaghaniyans' period – in kings' palace of AbuyahyoTakhir ibn FazlChaghoni. The first book, which Munjik had used was “Lubab-ul-albob” of Muhammad Avfi. The author did not mention the size of poet's legacy, but “his poems are words of sincerity”, which says: “Munjik is number of poets, whose poems full of great words of high meaning” (4, 252) and also ZabehullaSafo added to this point that “and this soft word of Avfi are the light of Munjik's legacy” (3, 101). By this improvement Munjik's poetries were popular among eleventh and twelfth century's Persian people and were used in literature and sciences of that period of his life. The selected descriptions and points which the authors of tazkirs and jungs written about him were also the proof of his powerful and famous poet. Unfortunately, the complete divan of this poet “the poetry and high writing were the best meaning of virginity” are not all reached the full form till present time.

The Iranian scholar Ehsan ShavaribiMuqaddam has collected and published Munjik's poems from tazkirah, jungs and dictionary books, which consist of 436 bytes, which 20 bytes of them belong to Munjik and more than 110 bytes published by Mahmud Mudabbiri. (5, 217). On the basis of other poet's works might be concluded that Munjik was skillfully recited poetry in various genres of Tajik-Persian poetry, including *qasida*, *ghazal*, *muqataat* and other separated verses. Among the rest poet's works were scattered verses in the form of two verses, some of which have a couplet rhyme, some may be from *masnavi*, some do not have a couplet rhyme, and may be remnants of *qit'a*, *ghazal* or *qasida*.

Munjik's poems, which have come to us, cover a wide range of topics, including praise, humiliation, humor, praise of love, wine, nature and etc. ZabihullahSafa noted that “Munjik, in addition to his power in praising and composing great hymns and rhythms, was also considered to be the forerunner of the poets of his covenant in satire, and according to Hidayat “nobody was shot by his arrows and nobody was ridiculed. “(3,101). The following verse by SuzaniSamarkandi also refers to her sense of humor:

I am the only One, who was written the jokes,  
Thousands Munjikscan not follow me by steps. (2, 216).

When we look at the rest of Munjik Tirmizi's poems in general, we see that the poet has been thinking about moral, spiritual, intellectual and passionate images. To this tendency of his thoughts in his poems are directly and strongly connected with the social issues of his life. Kh. Sharipov mentioned that “arises from the reality of human relations, reflects the conflict of desires and aspirations with the interests of individuals and members of society has a social meaning” (6,145). For this reason, the increasing of praise in Munjik's poetry and many other poets should not be attributed solely to the concentration of literary forces in the kingdoms'

court. The independence of the Chaghani dynasty required the strengthening of unity, and the use of intellectual forces was an influential tool in this process. The growth of praise during this period was one of the influential factors in maintaining a healthy social environment.

In his other remaining poems Munjik, firstly speaks about the goals and qualities of the Chaghani's Emirs, and in this way conveyed the dreams and aspirations of the people. In this context, his high-pitched poem named "Lomiya", consisting of 44 beyts, were praised Abulmuzaffar Ahmad Chaghani, and by Mahmud Mudabbiri's words: "one of the great Persian poets, who has been widely imitated by poets after him"(2, 218). This poem is not only meaningful in terms of content, but also in terms of structure.

In the poem "Lomiya" Munjik, first of all, praises his wisdom, trust, pure morals and benevolence, and then describes his qualities of war, courage, justice, justice, generosity and goodness. In its remaining form, this poem is an expression of the poet's social aspirations in recognizing "Abulmuzaffar the king of the world". Munjik's social aspirations faced emir who is – "Beloved, aimed and happy, No one as real person as him" (7, 433). Despite of the completed version of this poem, it is easy to see that Munjik, as Rudaki did in his poem "Modari Mai" ("Mother of Paradise"), did not engage in depictions of realities, including Majlisi Malik as the royal court and stage performances. These points existed in the realities of his life and were the focus of his attention and communication. In other words, in this and many other fragments of his poetry, the elements of imagination are terrestrial and often have nothing to do with the life of the aristocracy and the royal environment, but the poet is interested in things that are common both in aristocratic life and in the lives of the masses. In such poems we do not see the scenes of the royal feast, but the image of the "prosperous lights" changes with the "transfer of the sun", which has no aristocratic color, but is simple and earthy. The poet also draws the nature in such descriptive poems and examines the "mental products of praise" "with nature and the elements of nature" (8, 322), which is unique experience. There are a few verses from the poem:

Худойгоно, фархунда меҳргон омад,  
 Зи боғ гашт ба таҳвили офтоб аҳвол.  
 Саройпардаи суҳбат кашид себу турунч,  
 Ба табли рехлат барзад гулу бунафша давол.  
 Ба сони моҳии заррин кунун фуру резад  
 Зи бед барг ба як зилзила бар оби зулол... (7, 434).

*Oh God, the prosperous, the loving,  
 Under the garden became the delivery of the sun.  
 The veil of conversation drew apples and oranges,  
 Purple flowers are treated to a comfortable table.  
 The leaves fall to an earthquake on the clean water ...  
 (7, 434).*

In fact, nature is a mirror of the poet's image and reflects the past, present and future. *Mehrgan* is described in a very elegant and poetic way, and the poet says that just as the elements of nature preserve the glory of *Mehrgan*, people also need "Abulmuzaffar, the king of the world", who "... cut off the throat of question" (7, 433). ). In this poem, the sharp curse of freedom is one of the most important pillars of Munjik's social and political thought, and few poets have achieved it.

From Munjik, in addition to what has been said, there are ten imperfect verses “of which there are two twelve-beyt, one of which is in praise of Abdullah; two eleven-beyt, one of which is in praise of Abulmuzaffar Ahmad; is a nine-beyt in praise of Tohir Chaghani; three eight-byte, one of which is in praise of Abu Muhammad Abbas and we do not know him, the other is in praise of Tohir Chaghani, and the third is only a degradation; finally one deviation from one verse in seven beyts”(5, 217). It is difficult to make a general conclusion on the whole topic and issues of the poet’s flawed verses. However, one point can be made in conclusion that Munjik's articles are based on reality and free from many exaggerations, flattery and lies, and the praise in them has more real, ideal and social aspects.

Another aspect of Munjik's artistic individuality is characterized by his humorous works, which, unfortunately, have survived to a small extent. These few fragments of the poet's humorous poems testify to the fact that Munjik was one of the greatest comedians of the Tajik-Persian literature of the fourth and fifth centuries. In his chapter on comedy, Rizoqulikhon Hidayat wrote: “He was a man of eloquence, humor, eloquence, eloquence, eloquence, and eloquence. you are joking ”(9, 51). As mentioned, Suzani Samarkandi also compared herself to him in telling jokes.

From Munjik's statement that he sang a lot of humorous poems. In particular the following plot says:

Аз одам андарун зи таборат касе намонд,  
К-ӯро ҳичо накардаст Мунҷик ном ном (10, 26).

*There was no one left in the great tribe,  
Have not sould his name Munjik.*

However, from the poet’s abundant humor to the present day a few scattered verses remain. The examples of this verse also testify to his unique style of comedy. For example, in the following passage, he makes the master look like a dog and makes fun of him in a strange and artful way:

Эй хоҷа, мар маро ба ҳичо қасди ту набувад,  
Ҷуз табъи хешро ба ту бар кардам озмун.  
Ҷун теғи нек, к-аш ба саге озмун кунанд,  
В-он саг бувад ба қимати он теғ раҳнамун (7, 441).

*My lord, the serpent did not intend for you to go anywhere.  
I have put upon you no choice but to please myself.  
Like a good knife, they compete with the dog,  
The dog was a guide to the value of the tag.*

M. Mulloakhmadov and N. Nisari by this poem:  
Eyes like a house of thorns take water all year round,  
Mouth as the boots of Khoja Hasan Isi

quoted and then concluded: “Munjik's scattered satirical poems, who have a personal aspect and condemn the outward appearance and personal qualities of individuals. For example, in the following verse (the verse quoted - our commentary) a person's eyes and lips are ridiculed ”(9, 52).

Unfortunately, this idea is not correct and the poet’s humor is not taken seriously. As Zarrinkub points that, *taniz* does not have a non-serious meaning, and sometimes a serious meaning is

expressed in the color of tanz(11, 139). An example of such a comedy is Munjik's poem, including the above verse, which depicts a full face, a shameless eye, the back of an idiot's head, an eye like a dove's house, three rulers here like a thief, all thieves, etc. There is a deep social and moral aspect realizing the essence of his actions, Munjik explained in one passage:

Қалами ман-т ҳичо карду ман огоҳ наям,  
 Зи даҳан берун кардам ба сари корд забон-ш.  
 Банд бар пой ниҳодам-шу сияҳ кардам рӯй  
 В-аз дарозо бикафонида ҳама пушту миён-ш (7, 429).

*My pen is ticked and I don't know,  
 I took a knife out of my mouth.  
 I put the band on my feet and turned black  
 From long stretched all back and its middle.*

Although a small number and incomplete fragments of the poet's humorous poems remain on this basis and his comedy can be fully appreciated. In conclusion, it can be said that Munjik is undoubtedly a discoverer of good and bad meanings, subtle and pure meaning, and the power of imagination, which is a testimony to his art, is special and obvious in the rest of his comic works. Although in such works he did not refrain from insults and obscenities, but such jokes are not common among his poems and do not define his artistic face. He, like Anwari, has never threatened anyone with satire, which is one of the hallmarks of his artistic personality.

Other features of Munjik's work are the reflection of moral issues, human praise, praise of love, praise of wine, nature, sword, horse, love, fortune-telling, etc., which requires a separate consideration. At the end of this article, we will summarize a few points about the artistic features of Munjik's poetry, which are important in understanding the essence of his work and his poetic art.

Shafi'i Kadkani considers Munjik to be "an evolutionary figure in Persian poetry" (8, 434), and then adds: was his speech. Without hesitation, we should consider him the leader of the style that Abu al-Faraj Rooney and, to some extent, Mas'ud Sa'd did, and Anwari saw the same way of serving the meaning and style of allegory in Abulfaraj's divan, which ... in Anwar's century the same aspect that began in the fourth century with Munjik "(8, 435).

In fact, Munjik was a great face of poetry in his period, and Muhammad Awfi called him "one of the magicians of poets." In this assessment, first of all, the strangeness of the poem, the goodness of the language, the virginity, the eloquence and the unique metaphor of Munjik's poetry were of interest to Amnesty. Awfi also defined Munjik's style of poetry with the terms "strange poem" and "rare myth".

From a literary point of view, Munjik's poetry is very strong in terms of metaphors, especially detailed metaphors, and his emotional images and direct poetic experiences have perfected his style. The original allusions of the poet's poetry are the result of the poet's attention and attention to nature and objects, and the conscious and artistic use of metaphors has also improved the artistic aspect of his poetry. Munjik is a poet who has worked the art industry at a moderate pace and has mostly used the verbal arts industry. He had little interest in the spiritual arts industry, such as the type of ihâm or the art of analysis or execution. In Munjik's poetry, Shafi'i Kadkani

often observes the metaphors of the "sun of sleep" falling from the eyes of a lover, the "stars of imagination" and the "cup of weeping" from "friend's wine" "Such metaphors have a great deal of purity, both in terms of shortening the form of the image and in terms of placing the elements of anticipation and isolation on the material and emotional side of things," he said. and as we see in all of them, one side of the image is an expectation "(8, 436). The relationship that the poet maintained between the elements of such images has a strong artistic and aesthetic aspect and has since become the least poetic. In Munjik's imagination, the artist cuts the "flower of question" with his "curse of freedom" and when his "cloud of courage" blows, his "flower of action blossoms". In these metaphors, the poet also uses the analysis of objects, which is evidence of his master pieces.

In his research, the Iranian scholar Ehsan Shawaribi Muqaddam used examples of Munjik's art industry in his poetry, including cowardice, cowardice and tajnis, taqtazib (desire), mutazod, allegory, tasbeh, husni takhallus (adjective), which he gives an example for each of them, but does not say anything about the poet's application of the above-mentioned art industry.

Munjik uses a lot of detailed metaphors in his poems and also skillfully uses material elements in the design of the image of the imagination, the following is an example:

Неку гули дурангро ниғах кун,  
Дурр аст ба зер ақиқи сода.  
Ё ошику маъшуқ рӯзи хилват  
Рухсора ба рухсора барниҳода (7, 443).

*Look at the beautiful double flower,  
Spiritual as softly as simple.  
Or a lover on a lonely day  
Putting face to face*

Another of Munjik's innovations in the application of the art industry is his use of adjectives instead of adjectives, which not every poet has mastered. Sometimes this style of writing is combined with the most satirical satire, perfecting his humorous poetry. An example of such a poetic experience is the following passage:

Гӯгирди сурх хост зи ман сабзи ман паре,  
В-имрӯз агар наёфтаме, рӯйзардаме.  
Гуфтам, ки нек буд, ки гӯгирди сурх хост,  
Гар нони хоҷа хостӣ аз ман, чӣ кардаме? (7, 446).

*The red match asked me to green my wings,  
Today if we don't find it, let's face it.  
I said it was nice to have a red match,  
What will you do, if you ask me for bread?*

In the context of the above example, we can talk about another aspect of Munjik's art. Munjik is one of the poets who is more sensitive to the issue of color and has purposefully used the element of color in his paintings. In the first stanza of the mentioned passage the poet's attention to the color green is very precise. The poet describes and expresses his thoughts in a unique way, thus restoring his connection to reality and its outcome. In this style, the bright shadows of the images are dominated by color, in the example above, the quality of "green" instead of the beloved, and

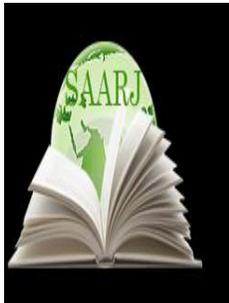

the other colors - red and yellow - in the development of the poet's idea, which is the result of morality and aesthetics.

Munjik Tirmidhi, with his new style of painting, including the choice of a metaphor instead of a metaphor, shortened the meaning of the poem and became known as a style leader who was followed by loyal followers such as Abulfaraj Rooney and Masoud Saad. The style of depiction, especially the use of metaphors in his poetic practice, is very pure and has attracted the attention of poets in the following centuries.

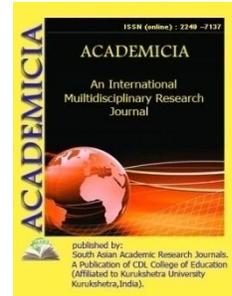

From a general review of Munjik's work and its artistic features, it can be concluded that the poet's poems that have survived to the present day consist of poems, ghazals, muqataats, single verses and scattered verses. nature, sword, horse, love, admonition, fortune-telling and other social issues. Using Munjik's verbal arts, cinema, other industries, and sensitivity to color to reinforce emotional imagery, it can be concluded that his poetry is the best example of the fourth century in terms of imagery and imagery, especially in the context of realistic imagery.

### ABSTRACT

*This article states that the study of Alisher Navoi's works and the creation of dictionaries dates back to the time of Navoi, and the perfect dictionary is the work of Mirza Muhammad Mahdikhan "Sanglokh". This work is the result of a study of more than twenty works by Navoi. In this article, Alisher Navoi states that in his work "Khamasa" he used the word "butmoq" in five senses. Based on the bytes taken from Hamsa, it is stated that the verb "butmaq" was used in its own and figurative senses. Sanglokh gives examples of the skillful use of words in Alisher Navoi's works in various senses.*

**KEYWORDS:** *Sanglokh, Alishernavoi, Hamsa, Finish, Grow, Grow Up, Heal, Built, Realized, Believe, Iyhom.*

### INTRODUCTION

The study of Alisher Navoi's works and the creation of dictionaries began in Navoi's time. Badoyiul-lug'at, compiled by the decree of Hussein Boykaro, is the first dictionary based on the works of Alisher Navoi. Iranian and Turkish philologists and lexicographers compiled dictionaries of various sizes from the time of A. Navoi to the end of the XIX century. It has become a tradition to study the works of A. Navoi and compile a dictionary explaining the words belonging to the Arabic, Persian and Turkish languages. Some of these structured dictionaries have been published.

For example, the abbreviated version of "Abushka" was first published by A. Vamberi in 1862, then in full by VV Velyaminov, Zernov in 1868, Fazlullah's Chigatoy-Persian dictionary (Calcutta 1825), Sheikh Suleyman's Chigatoycha Turkish dictionary (Istanbul 189 -93y) later reprinted by I. Kushan (Budapest, 1902) by Professor A.H. Among them are Borovkov's Badoyiul-lug'at (Moscow, 1960).

In addition to these dictionaries, in 1960 the famous English orientalist Gerard Klasson published the most complete dictionary of works by A. Navoi, "Sanglox". This dictionary was compiled by MirzaMahdikhanibn Muhammad NasirNizamiddin Muhammad Haji al-Husayni as-Safawi al-Astorobadi<sup>2</sup>. Mahdikhan was an educated, intelligent scholar of his time, and his ability to learn languages was excellent. He knew Arabic, Persian, Tajik, Hindi and Russian.<sup>3</sup> Mahdi Khan is also a well-known figure among European orientalists with his priceless historical works. That is why his name is mentioned in every play dedicated to the history and culture of Iran in Europe in the XVII-XVIII centuries. It is not clear when Mahdi Khan was born or died. But given that he served in the palace of Sultan Hussein, it is clear that he lived no less than 80 years. Mirza Mahdi was a munshi in the palaces of Sultan Hussein (1694-1722) and Takhmasp (1722-1732). "Munshi" was mainly engaged in the preparation of various government documents. In the palace of Nadirshah (1736-1747) Mirza Mahdi served as the official palace historian. Nadirshah gave him the title of "khan" with great confidence. He wrote two historical works about Mahdi Khan Nodirshah, who was always with him on military campaigns. Speaking of Mahdikhan, we must remember that he was a perfect lexicographer, turkolok, statesman, writer, historian, calligrapher and poet. He even assists Greek and Armenian believers who, by order of Nadirshah, translate the Bible into Persian.

MirzaMahdikhan finished his philological work in 1760. At the beginning of his work: From my humble youth, Bandai had an indescribable love for reading and studying the poems of Amir AlisherNavoi, the ruler of the land of puberty and eloquence, and the commander of the Sukhandans. by choosing words and interpreting their meanings. MahdikhanAlisherNavoi called this book "Sanglox" (stone) due to the grandeur and complexity of his words. MirzaMahdixon A. He composed Sangloh's work by reading 12 poems and 9 prose works of Navoi and interpreting the words in them. Mahdikhan about his work. I would like this book to include the difficult Persian and Arabic works in the above-mentioned works, so that the readers can easily understand them and enjoy the benefits of this language, "writes Mr. RavshanKhayovi, an Azerbaijan from Tabriz.

His interest in this book began in high school. Mr. RavshanKhayavi writes that I was very interested in the work "Sanglox" written in Turkish by MirzaMadikhan, the munshis of Nodirshah. This interest gradually turned into practical work. RavshanKhayavi later obtained an ancient manuscript of the Sanglox, registered in the Tehran National Library under No. 1141 "F". It starts with downloading a priceless copy. But he faces some difficulties in this work and cannot copy the work to the end. He then found another manuscript of Sanglox in the central library of Tehran University and copied it. He prepared the book for publication on the basis of these two copies and published it in Tehran in 1995. MirzaMahdikhan said in the introduction to "Canglox" that his work consists of three parts. "Maboniul-lug'at" ("Fundamentals of language") is the first part of the work "Sanglox", which describes in detail the grammatical rules of the old Uzbek language. MirzaMahdikhan'sMaboniul-lug'at is "the first grammar of the old Uzbek language, and no one has done it before me." Mr. RavshanHayobi says that "Maboniul-lug'at" is a separate work, and secondly, it has been omitted from his work due to the existence of many books on Turkish grammar today, and he will publish it separately if there is an opportunity in the future. Since the Uzbek translation of Maboniul-lugat, which is free from defects, is required by the requirements and researchers +. However, Muhiddinov's translation remains unknown to the general public.

In the second part of Sanglox, MirzaMahdikhanAtrabodi gives a Persian interpretation of Turkish root words and phrases. In the third part of his work, MirzaMahdikhan explains the Arabic and Persian words and phrases found in the work of A. Navoi. Mr. RavshanKhayavi, on the other hand, omits this part, considering that it can be easily found in many dictionaries today. The second part of RavshanKhayoviMirzaMahdikhan's work prepared and published a Persian commentary on Turkish words.

In his work, MirzaMahdikhan states that the core of words in Arabic is the second person singular. Indicates the construction of other forms of a verb using various suffixes from one form. In the book in our possession, the tenses of the verbs are omitted, and only their masdar form is sufficient to give the adjective the definite and indefinite tense and the imperative form. For example: The verb ovinmoq is given in the form of masdar and its Persian meaning is (tasallitopmoq). Then the transitive form of this verb. Rubbing is given from the (tasallibermoq). He also pointed out the command forms in the process of interpreting the meanings of some verbs.

For example: Бор - семаънидорадаввал: Бемаънийэмуўжудбошад. Дуввум: яънихаст, севвўмамрастазрафтан. The word "bor" has three meanings. The first is present, the second is present, and the third is the imperative form of the verb to go. MirzaMahdikhan pays great attention to the correct reading and spelling of every word in his work. It shows how many Turkish words are written and read with fathazammakasra movements. He compares the reading of Turkish words with words similar to Persian. Gives Turkish letters with different terms to give a clear character of Turkish words. RavshanKhayavi gives a transcription (in Latin spelling) and Azerbaijani pronunciation of each of them in order to show the pronunciation of words, phrases and terms more clearly.

М: икирма (ikirma) ададэбистрогўянд. The number twenty. In Azarbeiјанигирми (igirmi)

He solved some of the difficulties in pronunciation by giving in the Latin spelling. MirzaMahdixon; He gives his word "is" in one form or another. However, the word is written in two forms in Turkish and has four meanings. RavshanKhayavi expresses this in Latin spelling as follows:

(o`z) худ, хиш (ўзим - худам)

(İz) рўй, чехра, сурат

(İz) феъламраввалшахсмўфрад; шэнокарданасмасдарэузмакшэнокардан, The first imperative format of the word swim.

(İz) феъли-э амр-э аввалшахс-э муфрад: Бегўсэл, жудокардан. Аз-масдарэузмак, кашидан, пора кардан, жудо кардан.

The first person singular of the verb to pull, to separate. The infinitive masdar form of the verbs tartmoq. RavshanKhayavi's innovations for the use of Sanglox make it easier to use the work without changing the meanings of the words given by Mahdi Khan. "Sanglox" is reminiscent of a small encyclopedia in its structure.

In this article, we have analyzed the meanings of some of the words used in "Sanglox". In MirzaMakhdixon's book the word "butmoq"

comes in different five meanings. :the first is the growth ofcocaine and greens, germination, growth, budding ;the second is wound or wound healing ,healing, healing ; the third is a bytefrom the jeweler's story"Sa'baiSayyar ,4] "X vol., 181], which wasbuilt and completed:

حکم قیادی کیم السون و کیتسون

تخت بوتماککا جدوجهد ایتسون

Дўстлар ҳақиға ҳиммат қилибсан, Ҳар ни раҳмон диди бутунг ёри.

Butar, butadur - finished (repaired) the wound, finished it, did it, believed. Byte from AlisherNavoi to the first meaning:

کچه نی نوع یومای کیبریکینگ خیالیده کوز  
منکاکه ایکنه بوتار تا نگهنه پتکروب زار.

Кечани нав юммай кирикинг хаёлида куз,

Мангаки игна бутор то нигаҳина еткуруб зора.

The verb butor also means foil (performer of action) and masdar .In particular ,A.Navoi in the epic"SaddiIskandariy ,4] "XI vol., 240] gives a byte meaning to build . . .

که بو ایش بوتارکا تاپیلدی جحت

Ки: “бу иш бутарга топилди жиҳат,

Не навъ имди доно кўрар маслаҳат? ” ( 240p)

He gives the following example from the epic "Layli and Majnun" [4, vol. IX, 262] to the meaning of the verb butgan, butargan, butadurganungan, kokargan:

اوستیگا یاغیب غبار محنت

بوتگان ایاغیغه خار محنت

Устига ёғиб ғубор меҳнат, Бутган аёғиға хор меҳнат

Another poem in this meaning:: بوتگانگا اوقشاردیگایسین هر یان قیزیل تال اورار برگ  
дигайсин ҳар ён қизил тол урар барг

In the sense of fulfillment, the following example is given from the history of the Baburis in the description of Badiuz-Zaman: Рамазондек мутабаррук ва азиз ойға кечалик фурсат қолиб, отасидин ийманмай кўркмай, Тенгридан кўркмай, хануз иши чоғир ичмак эди. Муқаррардурким, мундоқ бутғон киши андоқ шикаст топғай. [5, 40]

It also comes in the sense of non-being. Butmagan and–butmaydurg'on(not good), butmagan(unfinished),

تبیغ عشقینگ یاره سی دور بوتمگان

Дардини ҳар кимга айтиб битмаган

هجر صحراسیدورأهیم اوتی دین آندا گل یاخود گیاهی بوتماگان

Ҳажр соҳросидур оҳим ўтидин онда гул ёхуд гиёҳи бутмаган.

Saying that the singular imperative verb *idol* and *butkil* in the second person means *ایهامبطریق* *iyhom* (a method of using two ambiguous words in a byte, one clear and one hidden), A. He gives examples from Navoi

وعدہ وصف ایلا دی او آی همانا کیلگوسی

تیغ هجریدین شکاف اولغان کونگول بو سوزگا بوت

Ваъда васф айлади у ой ҳамона келгуси

Тиғ ҳажридин шикоф улғон кунгул бу сўзга бут

In this verse, the word "idol" refers to the heart that is wounded by the sharpness of the blade It is noteworthy that the meaning of "belief" is clear, the second hidden meaning is "the end of the wound." It also comes in the form of indivisibility

دیسام کہ ترک عشقینگ ایٹای بوتما ای پری

کیم تیلبه لار حدیثیگا کوپ اعتبار یوق

Дисам ки тарки ишқинг этай бутма эй пари,

Ким телбалар ҳадисига кўп эътибор йўқ

Butmang, butmangiz. The imperative verb comes in the form of the second person singular:

نوایی ترک عشق ایئتیم دیسا بوتمانگ که بوتماسلار

کیشی هر سوز ایشیتسا اوسروک و دیوانه دین داغی .

Навоий тарк ишқ иттим диса бутманг ки бутмаслар,

Киши ҳар сўз эшитса усрук ва дивонадин доғи.

In the sense of implementation, the following example is given from the history of the Baburids in the description of Badiuz-Zaman

Рамазондек мутабаррук ва азиз ойға кечалик фурсат қолиб, отасидин ийманмай кўркмай, тенгридан кўркмай, хануз иши чоғир ичмак эди. Муқаррардурким, мундоқ бутғон киши андоқ шекаст топғай.

و بمعنی رابع در تاریخ الانبیا در ذکر حضرت اسحق // علیه السلام گویند که

عمری یوز سیکسانگا یتکاندین سونگرا تیگری تعالی حکمین بوتکاردی .

“Торих ул анбиё” асарининг ҳазрат Исҳоқ алайҳуссалом зикрида бутмоқ феълининг тўртинчи маъносига шундай мисол келтирилади: Исҳоқ алайҳуссаломнинг умри юз саксонга еткондин сўнгра тингри таола ҳукмин буткорди.

بمعنی پوشانیده در تاریخ الانبیا در ذکر تفاعل حضرت ابراهیم علیه السلام بعد از

تمام کعبه گوید که خطاب کیلدی کیم بر آچنی مو تغاریب سین یا بر یالانکاچنی مو

بوتکاریب سین کیم مباحث قیلادور سین

After the construction of the Ka'bah in the dhikr of Prophet Ibrahim (as) in the work "TarikhulAnbiya" in the sense of dressing, the following call was made:Бир очни му

چنانکه شاهد بر اول  
بمعنی رابع در تاریخ بابر می مذکور است که بقتل یار ماغیدا

اهمال قیلا دور لار ایدی بیکلارکا بویوریلدی کیم اهتمام قیلیب بوتکار کایلار

Торих Бобури мазкур аст ке беқатл ёрмоғида аҳмол қиладурлар эди бекларга буюрулди ким эҳтимом қилиб буткоргайлар.

Butmang, butmangiz, butmanglar- the imperative plural comes in the form of the second person singular:

نوایی ترک عشق ایتیم دیسا بوتمانگ که بوتماسلار

کیشی هر سوز ایشیتسا اوسروک و دیوانه دین داعی

Навоий, тарки ишқ эттим деса бутмангки бутмаслар,

Киши ҳар сўз эшитса усругу девонадин доғи. (Наводир уш-шабоб 4626

In this play, along with the Persian interpretation of the Turkic words, their Arabic, Hindi and sometimes Greek meanings are also given.

Mirza Mahdikhon paid more attention to the group of verbs in the dictionary than to other word forms and increased their number as much as possible.

In this lexicographic source, dictionaries that are actively used in the modern Uzbek literary language and are obsolete and archaic in the language dictionary, form certain lexicographic units.

Sanglox comments on more than seven hundred Uzbek verbs, indicating their correct reading and spelling. A certain part of this group of words in the work is archaic. The conclusion is that these meanings mentioned in Sanglox do not appear in some dictionaries. It would be expedient to include them in the dictionary of future classics. In this play, along with the Persian interpretation of Turkish words, their Arabic, Hindi and sometimes Greek meanings are also given. Sanglox is a work of great importance in terms of studying the names of nations, peoples, peoples and their ancient customs. The dictionary contains valuable information about the names of different regions of Asia and their cities, mountains, rivers. The work provides extensive information about the history of famous Turkish and Iranian dynasties that have left their mark on history. Китобда астрономия, астрология, тиб ва доришунослик, ўсимликлар дунёси ва гиёҳларнинг номлари ҳақида ҳам қимматли маълумотлар бор.

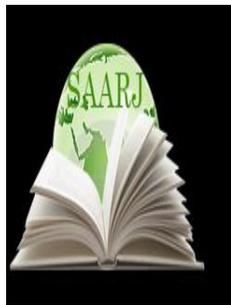

“The book also contains valuable information on astronomy, astrology, medicine and pharmacy, the plant world, and the names of plants.

Sanglox reflects the orthographic and orthoepic cases of the lexicon of the Uzbek language (mainly verbs). It gives the personality, tense, and tendencies of the verbs. Studying these will lead to a deeper study of the Uzbek language.

## POLY FUNCTIONALITY OF WORD GROUPS IN UZBEK LANGUAGE

**Nazarov Zokir Muxammad o'gli\***

\*Termiz State University 2nd course,  
 UZBEKISTAN

### ABSTRACT

*In this article, we aim to highlight one of the least studied problems in modern Uzbek linguistics - the poly functionality of word groups in the Uzbek language, its structure, linguocultural, functional features and semantic expression.*

**KEYWORDS:** *Phrases, Transpositions, Independent Words, Adverbs, Numerals, Lexemes.*

### INTRODUCTION

It is known that in the theoretical approach the noun (denotative) sema of a lexeme is understood as an action / state, object-object, quantity, sign-property of a lexeme. It is known that in the theoretical approach the noun (denotative) semantics of a lexeme is understood as the action / state, object-object, quantity, sign-property of the lexeme. Is the specific noun semantics of each word group absolute and constant, or is the phenomenon of transposition of word groups between independent word groups related to this? Transposition is the specific name of a word belonging to a certain category, weakening the function semantics to another word group. has a specific semantic and grammatical character. In Turkic languages, word groups are not strictly limited to each other, they form an integral system. Parts of this system are inextricably linked with words that are evaluated as hybrid words based on the law of "intermediate third" in the dialectical logic, retain the semantic-grammatical character of both series, and are in the process of transition from one category to another. There are several reasons for the complexity of the interpretation of the phenomenon of word migration in the Uzbek language. Third

- 1) Derived from Russian linguistics the norms of meaning, form and function specific to each word group;
- 2) In the Uzbek language, each word group is unique - the Uzbek nature is not revealed, and therefore is not taken as a unit of measurement in research.
- 3) the relative independence of each of the parties, such as meaning, form and function, the absoluteness of the absoluteness and coherence of their individuality, the absoluteness of the

proportionality of these parties in word groups due to the fact that formal grammar is based on the principles of ordinary logic; 4) consistent differentiation of verbal (accidental, temporary, occasional) valison (systemic, permanent, usual) events.

Therefore, before we talk about the transition from one word group to another, it is necessary to approach what language we are talking about, based on the norms and characteristics of word groups that are unique to that language. Because the norms and characteristics that are specific to one language do not have to be specific to another. Therefore, for many years in our linguistics, definite, definite, and indefinite constructions such as here, here, and here, in which case such diamond forms, were undoubtedly included in the category of rhymes. The only reason for their inclusion was that they corresponded to the Russian language in terms of meaning and function, and were translated into Russian as zdes, tam, tut. Just. Even more astonishing interpretations in science have been presented for decades as "absolute truth." In particular, in the saying that a good child should read, the word good is considered in the first use - because it identifies the horse - as a quality, and in the second - as it defines the verb. The interrelationships between independent words and their transition to each other occur as a result of development in the lexeme semantics, and the verbal and linguistic manifestations of migration differ. In verbal migration, verbal portable meaning is expressed. For example, in the phrase, "Think when you see one, and give thanks when you see one," the word belonging to the number group (one) is used as a temporary group of horses, and this is a transient, spoken phenomenon. In linguistic migration, the word passes completely from one category to another, a transposition phenomenon occurs. Transposition is observed in almost all independent words, even between independent and auxiliary words:

- 1) [man], [man], [man] horses (bored man (I), surprised man (I), no one (no one) who hears my pain), [one] number (one person (someone), [some] quality (some (some) say so, some say so) to replace;
- 2) The adjectives [boy], [girl], [boy], [old man, [earth], [wife], [lake, [hot and cold] (to get hot and cold), [went -come], [came-went], [came-gave], [ur-yiqit] double verbs, [read], [write], [past], [act], [search] action noun forms, [teacher], [connector], [observer] adjectives, [three], [seven], [twenty], [forty] numbers on horseback;
- 3) [Future], [future] adjectives, [gold], [silver], [board] (lilla ring, honey child) to quality;
- 4) [Without getting tired] (working), [without thinking] (speaking), [silently], [knowingly and unknowingly] adjectives, [osha], [very], [ura], [again], [put- put], [ura-sura], [early], [indin], [night], [late], [evening], [basket-basket], [navbalmanavbat] in the form of horses;
- 5) [one] number, [singular], [singular] adjectives to load;
- 6) [really], [chamasl], [meaning horses, [good, [wordless], [correct], [correct], [natural] adjectives, [where], [tin] pronouns modal sa 'zga;
- 7) [a] number, [ba 'zan] form, [both] load, [with] assistant binder;
- 8) [ost], [ust], [front], [back], [side], [tag], [top], rich, [ora], [eyebrow], [lab], [collar], [ mouth] horses, [looking], [head lip], [according to], [saying], [saying], [like] pronouns, [other], [piece], [other The adjectives], [before], [before], [before], [after], [after] have been transferred to the

auxiliary. Some of those listed are now linguistic, some are still in transition - are seen as a speech phenomenon.

For example, in existing grammars, when the classification signs of a series of numbers are numbered, the number of the subject, the order of the subject, the answer to one of the questions (how many), (how much), (how) the relationship with the word belonging to the category of horses and in the sentence, mainly as an adjective determiner. There is a deviation from the general grammatical meaning of the number in the form of a cumulative number belonging to the group of numerical lexical content.

At the same time, the forms of the compound number [-ov], [-ala], [-avlon], [-avlab], [-ovlash] are distinguished. Of the above, the forms [-ovlab], [-ovlash], in our opinion, are not the form of the cumulative number, but the relative form of the cumulative number stem: iki + ov + lash + ib. Hence, the last two forms are excluded from the list of aggregate number forms. [-Ov], [-ala], [-ovlon] can be distinguished as the main form. It is known that the form [-ov], [-ala] differs from other types of numerical meanings and is almost always used with the possessive form. The compound noun semant in the form of [-ovlon] is now considered not a quantity, but a "person of a certain quantity": [-ov], [-ovlon]

the form number does not combine with the noun, the adjective does not act as a determiner in the sentence, the questions of the number are not answered, even the pattern in which this form is formed is extremely inefficient, and the sum number form is not formed from all number roots. Vlar is adopting a more horse-specific classification character. The [-ala] form also retains some of the numerals: All three children are from a neighboring village. We show the semantic development of the number forms in the diagram as follows: [-ala] - [-ov] - [-avlan]

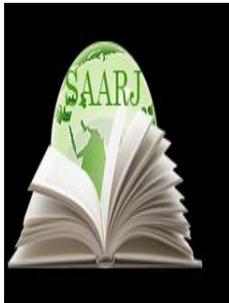

As can be seen, among these forms, the numerical symbols in the form [-ala] are somewhat preserved, the equestrian symbol in the form [-avian] is clearly preserved, and both aspects are compatible in the form [-ov], and these forms can be considered as hybrid units. possible. The [-ov] form has the status of an "intermediate third" between the compound number form, and the compound number form has the status of "intermediate third" between the noun and the noun phrase.

So, it can be said that there is a regular connection between word groups, which indicates that the communication is a living process in which the language system is constantly changing, evolving. Therefore, the affiliation of certain words should be determined on the basis of the study of their semantic, morphological and syntactic properties by appropriate research methods. This is one of the urgent tasks facing our linguistics.

### ABSTRACT

*Mutribi Samarkandi's "Tazkirat-ush-shuara" is one of the most important literary sources of the XVI century and was written in Transoxiana. In general, this work contains information about poets who were contemporaries of the poet or were related to poetry. The article describes the features of «Tazkirat-ush-shuaro» in relation to other methods. Our goal is to present, the history of the invasions of Persian literature, and the influence of Mutribi's work on later anthologies. As noted above, the formation and development, as well as the improvement of the anthology genre in Maverannahra falls on the XVI-XVII century. In this section, much attention is paid to studying influence of "Tazkirat-ush-shuara" in the anthology compiled in future periods. Previously, the stylistics and features of the Mutribi language were studied in detail using the example of "Tazkirat-ush-shuaro», written in a unique style and language. Comparative and comparative analysis, the study of common features and uniqueness of «Tazkirat-ush-shuaro» with other anthologies, which are one of the most important approaches in the study of the genre of Persian-Tajik literature, will help to determine the influence of Mutribi's work on other anthologies, as well as its role in the history of this genre.*

**KEYWORDS:** *Mutribi Samarkandi, "Tazkirat-Ush-Shuara", "Arafat-Ul-Ashikin", "Riyaz-Ush-Shuaro", "Shami Ghariban" Traditions, Comparisons, Innovation, Influence.*

### INTRODUCTION

"Tazkirat-ush-shuara" is one of the most important works of Mutribi Samarkandi. According to the author of the anthology, it was written in 1013 / 1605-1606 and contains information about 343 poets who lived with him at the same time.

Despite the fact that the study of the question of the influence of «Tazkirat-ush-shuaro» on other anthologies, in particular, on the work of individual poets, will have a long and in-depth character, we have undertaken an attempt to briefly compare the anthology of Mutribi with several other anthologies.

In addition, to determine the role of «Tazkirat-ush-shuaro» Mutribi among anthologies compiled after the 17th century and its influence on the subsequent development of the genre, we carried out a comparative analysis with three other anthologies - «Arafot-ul-oshikin» by Takiuddin Muhammad Avhadi Dakkaki Balyani, «Riyaz-ush-shuaro» by Alikulikhon Vol Dagistani and «Shomi gharibon» by Lachkhmi Narayin Shafiq and preceding the analytical study, I would like to note a few brief aspects about the mentioned anthologies and their authors: «Arafot-ul-oshikin» is one of the outstanding works of Muhammad Avkhadi and is recognized as one of the most valuable poetic anthologies of Persian-Tajik literature. The specified work was compiled in 1022/1613-1024/1615. (16, 23-23)

There is no doubt that Takiuddin Avhadi, when compiling this anthology, used the following previously compiled anthologies: «Lubob-ul-Albob» by Muhammad Avfi Bukhoroi, «Chakhor Makola» by Nizami Aruzi Samarkandi, «Tarihi Baykhaki», «Shiraznome» by Ahmad ibn Abulhair «Zamarkub -ut-tavorikh », « Khabib-us-siyar »Khondamira, « Tarihi Khumoyuni », « Tarihi Shokhruhi », « Tazkirat-ush-shuara by Davlatshah Samarkandi, «Majalis-un-nafais» by Amir Alisher Navai, « Makalat-ul -abrar by Ruknuddin Yahya Shirazi (16, 47-49) and others. Among these anthologies, the greatest and deepest influence on the work of Taki Avhadi was» Lubab-ul-albab by Avfi Bukhoroi, Tazkirat-ush-shuara by Davlatshah, «Tarihi Baykhaki» and several others.

«Riyaz-ush-shuaro» is also one of the general anthologies, which covers information about the poetry of 2594 poets and was compiled in 1167/1748 by Alikulikhan Vola Dagistani. The aforementioned work begins with the poet Abulhasan Harakani and ends with Yahyahan Yakto. Alikulikhan Vola was born in 1124/1721 in Isfahan (17, 19). His ancestors were of Arab and he is one of the famous poets of the 18th century. He died in 1170/1757 at the age of 46 (17, 36). In addition to the anthology, he penned a poetic divan, consisting of approximately seven thousand beits (14, 662).

The anthology «Shomi Garibon» by Lachkhmi Narayin Shafiq, who is one of the outstanding literary men, historians and writers of his period, is not very popular in scientific circles, however, due to the fact that the work is written about poets who migrated to the Indian Peninsula, it has a special literary value.

The full name of the compiler of the anthology is Mothar Lachkhmi Narayin, his poetic pseudonym is Shafik (15, 439). His ancestors were from the Kehtari-Kapur tribe of India (7, 1518), natives of Lahore (8, 395; 6, 235; 15, 439).

Shafik was born in the city of Avrangabad Dakan in 1158/1745 (15, 439). The year of Shafik's death in most sources is indicated in 1113/1702 (8, 400; 6, 236, 14, 48) and 1223/1808 (15, 440).

The literary heritage of Lachkhmi Narayin Shafiq encompasses many historical and literary works such as «Shomi Garibon», «Chamanistoni Shuara», «Guli Early», «Realities of India», «Tanmiki Shigarf», «Maasiri Osafi», «Maasiri Haidari», « Holoti Hyderabad »and« Bisat-ul-Ganaim », among which « Shomi Garibon »has the greatest literary and historical value (19, 28-

32). The anthology “Shomi Garibon” is one of the most important works of Lachkhmi Narayin Shafik and was written over fifteen years, in the period from 1182-1197 to 1768-1783.

Thus, the influence of Mutribi's anthology is well traced in several common features. For example, Mutribi Samarkandi in “Tazkirat-ush-shuara” cites the biography of Dai Andijani as follows: “Dai Andijani was a wise man and was skilled in poetry. In Bukhara, he had a room in the Mir Arab madrasah. In the end, through the efforts of some relatives, he got married, then, due to the troubles and quarrelsomeness of his wife, he fled to Hindustan, began to live in Gujarat ...”(18, 303-304).

However, Muhammad Avhadi Balyani in his biography of Dai also cites the following: “The fount of inner and hidden perfection, Mavlana Dai Andijani. A man of Sufi views, laconic, pensive, joyful from his condition, unmarried, prone to loneliness and seclusion. The owner of a deep mind and erudition. He spent most of his time in Kashan and he is the older brother of Malik Taifur Andijani, which we will mention later. In Isfahan several times he was honored with his meeting while he was in health and now “al-ilmu indallahi” (that is, Allah knows). (2, 1319).

Alikulikhan Vola, cites the following information from the biography of Dai: “A man of the Sufi warehouse, an excellent scribe, he lived in Kashan for a longer time. He is the older brother of Malik Taifur, a contemporary of Shah Abbas Mazi. (10, 793).

When comparing the three anthologies, it turns out that in the information given by Mutribi Samarkandi, Mukhamad Taki Avkhadi and Alikulikhan Vola, there are minor, but still visible differences. The author of «Tazkirat-ush-shuaro» begins the description by mentioning the name of the poet, then gives his nisbu, information about his studies at the Mir Arab Madrasah of Bukhara, then his trip to Hindustan in connection with the «discord and quarrelsomeness of his wife», his residence in Gujarat, which missing in the other two anthologies. Muhammad Avhadi in his anthology cites the biography of Dai Andidjani, but leaves out the important information given by Mutribi without special attention.

As already mentioned, Avhadi's acquaintance with Dai, new and unknown information about his life, Avhadi's meeting in the last years of Dai's life, he does not have any information about his youth and family indicated in Mutribi's anthology. In our opinion, if Muhammad Avhadi, after giving the name and place of residence, also provided information about the year and place of birth, the year of death, the poetic couch or his absence, the value of his information would be invaluable. As already mentioned, Avhadi's acquaintance with Dai, new and unknown information about his life, Avhadi's meeting in the last years of Dai's life, he does not have any information about his youth and family indicated in Mutribi's anthology. In our opinion, if Muhammad Avhadi, after giving the name and place of residence, also provided information about the year and place of birth, the year of death, the poetic couch or his absence, the value of his information would be invaluable. The information of Alikulikhan Vol is of secondary importance in relation to the information of Mutribi for the reason that he lived a century later and described his biography according to already existing sources.

In other cases, Mutribi's information is presented in an exquisite style, through short and beautiful phrases, describing important life periods of the poets. For example, Mutribi cites the biography of Hayati Gelani as follows: “Hayati Gelani grew up in the province of Hindustan, was close to the court of Mirzakhani, a skilled poet ...”(18, 398).

Alikulikhan Vola, after his biography, also cites 9 bayts from Hayati's poetry (9, 587-588), from which we will refrain from citing. An important fact, discovered when comparing anthologies, was that due to the lesser popularity of Mutribi's anthology, subsequent compilers of poetic anthologies did not pay attention to his information.

Lachkhmi Narayin Shafiq, relying on the information of "Tazkirai Nasrabadi" and "Khizonai Omir" about the poet Hayati Geloni, reports the following about him: "Hayati Gelani had a clear mind and was skillful in many genres of poetry. From the province he arrived in Hindustan and with the help of Hakim Abulfatk, who was also a native of Gelan, became close to the court of Akbarshah, found the mercy of the shah and his son, at the end of his life he was also close to the court of Honi Honon and in 1015/1606 gave the reins of life to the creator of the world". Then he quotes four beits from the poetry of Hayati Gelani (20, 82-83).

In the information given by Avhadi, Alikulikhan Vola and Narayin Shafik, one can find information that is absent in Mutribi's anthology. For example, about his peaceful life in Hindustan, being in the service of Akbarshah and Jahangirshah, service at the court of Khon Khonon at the end of his life, honoring the poet Jahangirshah with a measure of gold equal to his weight, about fame and authority at court, about perfection in the art of poetry, the presence of poetry sofa, possessing a unique poetic talent, etc.

However, the above facts from the biography of the poet Hayati Gelani refer to the end of his life, important information about the young era, information about his life before departure is available from Mutribi. It should also be noted that this information was used little by other compilers of anthologies.

Alikulikhan Vola, describing the biography of Anisi Iraki, cites: "He was from the Shamlu clan, was a skillful orator, a skilled rider on the field of reasoning. The garden of his thoughts is like the Garden of Eden, and his poetry deserves a thousand praises.

From the Shomlu clan, many famous figures came, especially those whose perfection was always praised, including the incomparable poet Anisi. During the reign of Akbarshah, he arrived in Hindustan, was in the service of the late Honi Honon, and died at that time. His masnevi "Mahmud and Ayaz" is known and verily, it is said very well" (9, 251). Further, after the biography of Anisi, Alikulikhan cited 32 bayts from his poetry (9, 251-253).

Lachkhmi Narayin Shafik gives the following information about Anisi: "Anisi Shomlu, his name is Yulikulibek, is a one-of-a-kind poet and a brilliant mind. He comes from Herat. For some time he was in the Jarga camp in the approach of Alikulikhan Shomlu, the ruler of those places, and since he had an attitude to poetry, he was entrusted with keeping an eye on the library. After the execution of the ruler at the hands of Abdullakhan, he left for Hindustan and his affairs went uphill at the mercy of Abdurrahim Khoni Honon. It is said that, intoxicated, he remembered that he wanted to eat fresh tobacco leaves with meat. He cooked and ate, and poison penetrated into his nature. He died in the city of Burhanpur in the thirteenth year. He started Masnevi «Mahmud and Ayaz», death did not give him the opportunity to finish it ...

Evaluation of poetic skill, a critical view of poetry is sometimes found in the anthology of Avhadi, Alikulikhan Vol and Narayin Shafik, however, in many cases, the information of the anthology of Mutribi Samarkandi is most often more detailed and more detailed, in contrast to the other three anthologies.

For example, this can be traced in the biography of Vakhshi Bafiki in comparison with the information of “Arafat-ul-ashikin” (5.4076; 18, 346-348), Vasili Marvazi (5, 4055; 18, 352-361), Mukhlisi (5.448 -4649; 18, 455-458), Likai Samarkandi (4, 3253; 18, 445-446), Sadiki Halvai (3, 2100; 18, 600-601), in comparison with the information of “Riyaz-ush-shuaro” about biographies of Abdullakhan (11, 1433; 18, 133-139), Mavlyana Mushfiki Bukhoroi (12, 2126; 18, 463-465), Figari Samarkandi (11, 1651; 18, 571-572), in comparison with the information of “Shomi Garibon ”About the biography of Jafarbak Kazvini (20, 68; 18, 279-280), Mushfiki Bukhoroi (Mervi) (20, 234; 18, 463-465), Farigi Khirawi (20, 200; 18, 578-579), etc.

Mutribi's anthology about the biographies of the above poets contains facts from the life and nature of their poetry, cited based on the works, using the research methods of great poets such as Abdurrahman Jami, Davlatshah Samarkandi, Khoja Hasan Nisari, as well as paying attention to the sacred ayats and hadiths contained in them, which is an important distinguishing feature of this anthology that does not exist in the other three anthologies under study.

For example, in Vasili's biography, Mutribi points to the pseudonym Marvazi, his friendship with a dervish named Khoja Muhammad Said, closeness with Khoja Hasan Nisari, learning the basics of poetry from him, leaving for Hindustan and serving at the court of Humayunshah (18, 352-353), about which there is no information in “Arafat-ul-ashikin” (5, 4055). Also, in sampling Vasili's poetry, the Mutribi anthology has advantages over the Avhadi anthology.

The same approach can be traced in the description of the biography of Likaya Samarkandi. Mutribi cites: “Likai Samarkandi studied, reached the theological degree, after comprehending the essence of the hadith“ al-Kanaatu kanzun lo yafna ”he chose the path of contentment and avoided self-interest and passions. This venerable person was like a pure soul dervish and prayed in an amazing way, his bowing and kneeling performed perfectly ... ”(18, 345-346).

In the course of studying the approaches of Mutribi in biography in comparison with the approaches of Muhammad Taqi Avhadi, Alikulikhan Vol Dagistani and Lachkhmi Narayin Shafik, we came to the conclusion that these authors pay more attention to the colorful and bombastic descriptions at the beginning of the biographies of poets, while Mutribi focuses on important details. Despite the fact that in some cases information from the anthologies “Arafat-ul-ashikin”, “Riyaz-ush-shuara” and “Shomi garibon” supplement the anthology “Tazkirat-ush-shuara”, the detail, accuracy, the author's approach to the description give it the greatest value.

Due to the fact that Mutribi Samarkandi in his anthology mentions 35 poets who migrated to Hindustan, we decided at the end of this section to separately compare the information from “Tazkiratu-sh-shuar” with the information from “Shomi Garibon”, since Narain Shafik are mentioned in the number of 8 poets: Anisi Iraki Yulikulibeg (20, 28). Dzhandui Bukhoroi, Jafarbak Bakhshi (20, 68), Hayati Gelani (20, 82), Mushfiki Bukhoroi (20, 234), Urfi Shirazi (20, 174), Farigi (20, 200), Razmi (20, 113).

As already noted, Mutribi is very accurate in details, short, does not allow verbosity, however, in some cases he also has many eloquent turns and deviations from the main goal. For example, when describing the life of Sadiq Halvai, he notes: “Sadiq is a noble poetic pseudonym, Qadiya Muhammad Sadiq al-Okhund, whose glorious qualities and his radiance have occurred and shines and does not need to be glorified. His noble person is adorned with good deeds and deeds, the foundations of his knowledge are such that it is impossible to describe his poetry with a pen

in two languages for many years and centuries. Many of the learned theologians have used his benefits”.

After these epithets, he describes biographical facts from the poet's life, about the place of birth, education, wanderings, service at the court of Humayunshah, pilgrimage, excellence in the sciences and death: “His blessed birth took place in the God-protected, paradise city of Samarkand, studied sciences and crafts in the same place ...

In the course of a comparative analysis of the biography of Sadik Halvai, it was found that Mutribi's “Tazkirat-ush-shuara” in comparison with the anthology of Narayin Shafiq “Shomi Garibon” has a greater scientific and historical value, since the information given by Mutribi is much more detailed than the information of Narayin Shafik for many aspects.

Firstly, information about the origin of Halvai, serving as a mentor in Medina, Halvai's activities in office in Samarkand, the presence of a poetic divan, treatises and books, information about the age of more than eighty years, the year of death (1005/1597) and the place of burial are important literary and historical significance and are absent in the anthology of Narayin Shafik. Secondly, Mutribi had the honor of personal acquaintance with Sadiki Halvai, was his interlocutor, which proves the reliability of the information of the anthology «Tazkirat-ush-shuara».

Thirdly, Mutribi masterfully presents information in the style of rhymed prose, skillfully combining it with hadiths and Quranic verses, which is a distinctive feature of the Tazkirat-ush-shuara language. This phenomenon is rarely encountered in Persian-Tajik anthologies, since Mutribi's Tazkirat-ush-shuara is a specific anthology, the Shomi Garibon anthology is general, but specialized on poets who migrated to Hindustan.

In this regard, only a few poets mentioned in «Tazkirat-ush-shuara» are mentioned in «Shomi Garibon», but in the process of research it was found that in some cases Narayin Shafik uses information from Mutribi, however, in terms of the degree of reliability and accuracy of the anthology «Tazkirat-ush-shuara» is ahead of the anthology “Shomi Garibon”. An example of this is the biographies of the poets Hayati Gelani (20, 82; 18, 398), Urfi Shirazi (20, 174; 18, 563-565), Farigi (20, 200; 18, 578-579), Razmi (20, 113; 18, 634-635) and others.

Despite this, most of the poets who lived during the life of Mutribi Samarkandi mentioned in the anthologies “Arafat-ul-ashikin”, “Riyaz-ush-shuara” and “Shomi garibon” are not mentioned in “Tazkirat-ush-shuaro”. Mutribi spoke in his anthology about two hundred contemporary poets from Moverunnakhr, for example from Samarkand, Bukhara, Tashkent, Balkh and Badakhshan, belonging to the poetic circle of the mentioned regions, but the number of poets he mentioned in the anthologies “Arafat-ul-ashikin”, “Riyaz -ush-shuara «and» Shomi garibon «is only 20-30 poets.

Another advantage of the anthology information «Tazkirat-ush-shuara» is that biographical facts and information about the poetry and stylistics of the poets, gleaned by Mutribi during the writing of his anthology, were probably not available to other compilers of the anthologies. Therefore, in the other three studied anthologies, in addition to mentioning anthologies and their compilers, no other historical, scientific, religious sources and works are mentioned.

It should be noted that «Tazkirat-ush-shuaro» by Mutribi Samarkandi, along with biographies and samples of poetry of the author's contemporary poets, also contains information about

literary and poetic circles, about the development of the Persian-Tajik language and literature of the XVI-XVII centuries, which are the only and the main sources of that period and received the same historical and literary value as “Tazkirat-ush-shuaro” by Davlatshah Samarkandi.

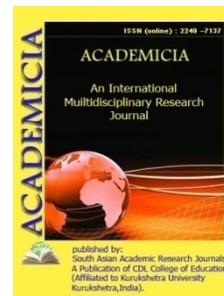

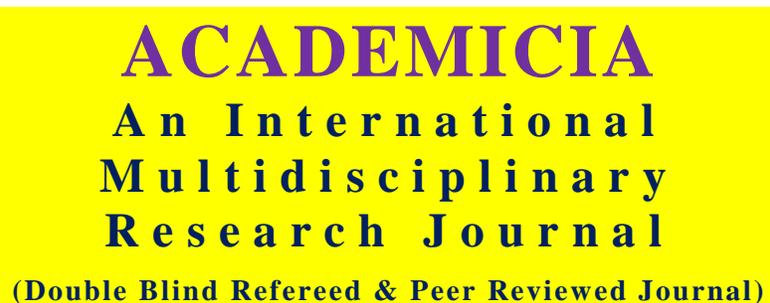

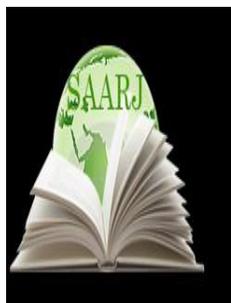

In general, the following conclusions can be drawn about the status of the anthology «Tazkirat-ush-shuara» in Persian-Tajik literature, its influence and role in the development of the traditions of the anthology genre:

1. “Tazkirat-ush-shuaro” is an anthology that plays an important role in the study of the scientific, literary and cultural situation of Maveraunnahr and India in the XVIth-XVIIth centuries.
2. In most cases and the information given by the authors of the anthologies “Arafat-ul-ashikin”, “Riyaz-ush-shuaro” and “Shomi garibon”, the information from “Tazkirat-ush-shuaro” is ahead of them, in some cases it is more detailed and detailed character.
3. The principle of composition and special stylistics used by Mutribi Samarkandi in “Tazkirat-ush-shuara” are not traced in “Arafat-ul-ashikin”, “Riyaz-ush-shuara” and “Shomi garibon”. This includes the use of parables and stories, applicable to some life situations of poets taken from the works of Saadi, Majj Hafi, Abdurrahman Jami and others, the use of hadiths and Quranic verses in presentation, if necessary, a critical view and assessment of poetic skill from the point of view of Mutribi;
4. In connection with the compilation of «Tazkirat-ush-shuara» in a short time and in the region of thoroughly developed science and literature, the anthology, due to the observance of the traditions and canons of the anthology genre, contains a relatively small amount of information, but the approaches and principles of compiling the anthology Mutribi left a tangible trace in the writing of subsequent anthologies and preserved the original nature and traditions of private anthologies contained in the anthology “Tazkirat-ush-shuara”.

### ABSTRACT

*This article presents the history of transplantation, the medical and legal aspects of transplantation of human organs and tissues, and its legal regulation, statistics of transplantation, and the basics of foreign and national experience in transplantation. At the same time, the scientific views of scholars on the subject were studied.*

**KEYWORDS:** *Transplantation, Human Organs And Tissues (Cells), Donor, Recipient, Law, Medical Law, Healthcare.*

*Today, the healthcare system is developing as fast as other sectors.*

### INTRODUCTION

Nowadays, because of the global COVID-19 pandemic, it is clear that how important this industry is, that human life and health depend on the entire health care system.

In this case, the preservation of human life is of great importance, and the right to life and a prosperous life is guaranteed by international and national documents. Organ transplantation technology has been scientifically demonstrated as a gift of life to individuals with organ failure.

At the same time, the issue of transplantation of human organs and tissues (cells) is one of the main, controversial and unresolved issues today, and transplantation is studied as an interdisciplinary field of medicine, bioethics and law.

Due to recent advances in medicine, human organs and tissues have begun to “live” their lives differently from their owners, as human organs and tissues are described as anatomical formations that do not define personality traits.

### **The main results and findings**

Human organ and tissue transplantation is a surgical procedure to replace damaged organs and tissues that is not present in the patient or in any way, based on the collection, insertion, storage, and preservation of organs and tissues from a donor or human corpse.

We agree with the above-mentioned scientists: "Transplantation of human organs and tissues is a process in which organs and tissues are transplanted from a living person or his body only with the consent and without prejudice and commercial purpose in a clinical setting with the help of surgery." we found.

Now, if we look at the history of organ transplantation in chronological order, the following doctors and surgeons-transplantologists conducted experiments in animals and humans:

In 1902 - E. Ulman makes the first experimental attempt at kidney transplantation in dogs; in 1905 The first experimental heart transplant in dogs was performed; In 1923, for the first time in the United States, a child with a burn was transplanted his mother's skin, and in 1933, Yu. Voronov was the first in the world to perform a kidney transplant.\

Interestingly, in 1954, in Boston, USA, Joseph Murray transplanted the kidneys of homozygous twins for the first time in the world, and this plastic surgery.

It was awarded the Nobel Prize in 1991 and is one of the most widely performed operations today. After that, a similar experiment was tested in the USSR, and in 1965 B. Petrovsky successfully performed the first kidney transplant in a clinical setting;

After the above operations, such test operations on different organs began to be performed one after another. For example, in London in 1966, the concept of brain death was legalized,

In 1968, Harvard Medical School set clear criteria for brain death.

In 1967, K. Bernard (South Africa) was the first person in the world to perform the first heart transplant operation, which is still relevant today, to save human life. The recipient of this surgery was a 54-year-old man with coronary heart disease and a left ventricular aneurysm after a heart attack, and the donor was a 25-year-old woman who died of brain trauma.

As all efforts have been scientifically proven, the scientific basis for organ transplantation was created in the early 19th century.

Russian scientists E.A Kapitonova, O.V Romanovskaya and G.B Romanovsky wrote in their monographs “According to Apocryphal, In the 3rd century, Saints Cosmas and Damian successfully transplanted the legs of the newly deceased Ethiopian to their patients, assisted by their angels.

In addition, if we look at the statistics, according to statistics provided by the World Health Organization, in 2015 alone, 119,873 organs were transplanted by 27,397 donors, while 79,984 kidney and 26,151 liver organs were transplanted from donor to recipient worldwide. This is only 10% of the citizens waiting in line.

The United States ranks first in the world in the number of transplants performed, with American physicians per year.

They transplant 10,000 kidneys, 4,000 livers and 2,000 hearts.

Transplantation operations were also performed in the Republic of Uzbekistan. For the first time on September 14, 1972, academician O.A Aripov performed the first kidney transplant.

If we look at the statistics of transplantation in our country, the number of kidney transplants in 1972-1975 - 348, of which 311 were from deceased donors, 1997-2006 - 42 living donors, 2011-2015 - 48 living donors, Cabinet of Ministers of October 23, 2017.

On the basis of the decision No. 859 in 2017-2019 at the Republican Specialized Surgical Center named after Academician V.Vakhidov under the leadership of Academician FG Nazirova and Academician SV Goethe performed 4 orthopedic liver transplants from a living person, a donor.

An average of 15 people die waiting for the organs in a day, but someone could have saved them—that means someone dies every 96 minutes.

"Every year, thousands of people die for preventable organ transplants in preventable cases".

The emergence of transplantology in Russia is associated with the name of the Russian surgeon NI Pirogov, who in the literature by him As early as 1835, "Plastic surgery of the nasal organ was an important part of the operation. Many religions around the world forbid harm to the body of the deceased. From a secular point of view, a person's death does not break the influence of his will in relation to what belongs to him. The expression of this will may be his written presentation (will) or his oral will.

There are ethical issues related to the procedure of organ transplantation and the lack of transplantology resources among potential recipients when performing organ transplants in corpses.

It has been suggested that organs should be taken from corpses. But who actually owns the organs taken from the corpses? This is both a moral and a legal aspect. OB Galibin and IG Belyaeva write about this in their article "Organ Transplantation: Ethical and Legal Aspects":

"There are three approaches to this issue: the principles of conscious consent (information consent), the presumption of consent, and the regular collection of organs. . In our country, the regular meeting of organs suitable for transplantation of corpses has long been the main type of solution to this problem. However, the authorities may voluntarily manage the body of the deceased. In this case, the establishment of a utilitarian ethic is made, according to which the action is morally justified if it brings the greatest benefit to the majority. However, this violates a person's right to control the body (even after death) and affects the moral values of the deceased's family, in some cases causing additional moral damage to relatives.

Apparently, the collection and storage of the bodies of the deceased is permitted by the government, but the bodies to be removed must certainly benefit, but affect the moral values of the deceased's family, in some cases causing additional moral damage to relatives, such as subsequent protests, extortion and h.

Now let's get acquainted with the views of Islamic scholars on the process of transplantation of human organs in the Republic of Uzbekistan and the fatwa board of the Muslim Board of Uzbekistan:

“Bismillahir Rohmanir Rohim. Allah has sanctified man among living beings. The Qur'an says: We have honored the children of Adam, and We have set them on land and sea, and We have provided them with good things, and We have preferred them over many of the creatures that We have created. (Surat al-Isra', 70)

This means that man and his limbs are sacred, and even the verdict of the deceased remains the same, that is, it is a great sin to desecrate the body of a dead person or to cut off a limb.

The most important point is that the member is not sold even when transferred, but is donated. Now there are a number of major sins that can be committed in the case of abducting children and sometimes selling their body parts. There is suicide here. The Qur'an states that killing one person unjustly is the same as killing all people. Moreover, selling something (human organs) that is not considered a commodity in our Shari'ah is making illicit money. Those who commit such a heinous sin will face humiliation in this world and painful torment in the Hereafter if they do not repent.

Based on this fatwa, we can conclude that. It has been concluded that donating one's organs to another person does not endanger his life, that the person donating his organ is voluntary, that it is not compulsory by anyone, that the cause of the organ transplant is the disease of a patient who really needs it. for both the organ being removed and the new member being placed, the success of the surgical procedure and the achievement of the expected result must have been observed and verified in experiments.

This means that the practice of organ transplantation in our country should be based on the rules set out in the fatwa. Otherwise, it is against the rules of Islam.

In addition, a number of measures are being taken in our country to improve and develop the regulatory framework governing the institute of transplantation in the field of medicine.

According to the current procedure, there is a resolution of the Cabinet of Ministers of the Republic of Uzbekistan "On approval of the Temporary Regulations on the procedure for transplantation of kidney and (or) liver" between relatives "№1035, which contains general provisions on transplantation. instructions and contraindications, the procedure for performing the transplant, and the closing rules. However, as it does not reflect the process, standards and interrelationships of transplantation, the World Medical Association and WHO officially regulate the transplantation of organs and tissues in accordance with international standards, which excludes the development and commercialization of human organs, tissues and It is necessary to adopt and implement the law "On cell transplantation (or) cells".

In addition, we must ratify and implement the following international instruments, which should be the basis for legislation, which almost all states have now joined and implemented into their legislation:

WHO Guidelines for Transplantation of Human Organs, Tissues and Cells in 2010;

1985 Appeal of the World Association of Physicians on the Trade in Living Organs;

Statement of the World Association of Physicians on the sale of living organisms (1985),  
 Declaration of the World Association of Physicians on Organ Transplantation, 1987;  
 Resolution of the World Association of Physicians of 1994 on "Physician Behavior in Human Organ Transplantation";  
 Resolution on the need for effective monitoring by national health authorities in 2004;  
 Resolutions "Ways to Strengthen and Encourage International Cooperation in the Field of Donor and Organ Transplantation to Effectively Address the Removal of Human Organs and Prevent and Stop Human Organ Trafficking".

## CONCLUSION

There is no doubt that transplantation is necessary to save the lives of many people. Our people turn to foreign clinics to exercise their right to life through organ and tissue transplantation to perform this valuable and very important operation. This causes great inconvenience and is very expensive. A large amount of currency will cause it to go abroad and create conditions for that.

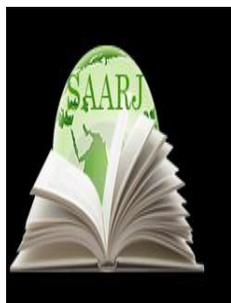

In addition, citizens of the country, like foreigners, often find themselves in a socially and legally awkward situation. Accordingly, a legislative framework is needed to regulate this operation, in which the prevention of criminal commercialization in any form of transplantation of human organs and tissues is an important condition.

It should be noted that medical legislation is not a field of law that needs to be fixed in one place, but a field of law in which health-related relationships need to change over time and be renewed when new social relationships emerge.

### ABSTRACT

*This article is devoted to the study of historical and geographical research conducted by the scientific societies operating in the Turkestan region in the second half of the XIX - early XX centuries in the Governor-General of Turkestan. In the article, L.S. Berg, I.I. Geyer, V.F. Oshanin and N.A. The data reflecting the results of Zarudniy's research are covered. Documents providing information on the results of scientific research conducted by scientific societies in Central Asia and adjacent regions are stored in the National Archives of Uzbekistan. Documents from the archives were purposefully used to disclose the content of the article.*

**KEYWORDS:** *Governor-General Of Turkestan, Turkestan, Empire, Russia, Historical-Ethnographic, Scientific Societies, Society, Expedition, Aral Sea, Cartography, Central Asia, Fund.*

### INTRODUCTION

The Turkestan branch of the Russian Geographical Society, founded in 1897 in Tashkent, made a significant contribution to the study of the nature of Central Asia. From the first period of the department's existence, scientific expeditions, research and reports of members, details of organized events, speeches at general meetings, scientific works and articles, official documents were published in the collection "Messages of the Turkestan branch of the Imperial Russian Geographical Society". These notices were of great importance not only in Russia, but also in the scientific community of foreign countries.

### **The main results and findings**

In the late 19th and early 20th centuries, many scientific expeditions were organized by the Turkestan branch of the Imperial Russian Geographical Society. During scientific expeditions from 1899 to 1903, the famous geographer, zoologist L.S. Berg's contribution is enormous. In 1899, 1900, 1901-1903 [1] L.S. Berg has organized several scientific trips to explore the Aral Sea, Lake Balkhash. In his time, L.S. Berg became the most famous expert on the study of the Aral Sea. As a result of his research, 11 issues of the scientific collection "Scientific results of the Aral Expedition" on the history and characteristics of the Aral Sea [2] were published.

The pages of the Turkestan branch of the Imperial Russian Geographical Society contain many articles of historical and ethnographic content. In particular, among the researchers covering historical and ethnographic issues, V.V. Barthold, A.V. Divaev, N.N. Pantusov, M.S. Andreev, A.A. Semyonov can be included.

Analysis of historical and geographical research conducted in the late nineteenth and early twentieth century's shows that they had a positive impact on the development of science in this period and became the basis for new research in the following period.

According to the charter of the Turkestan branch of the Imperial Russian Geographical Society, the society was under the direct control of the Governor-General of Turkestan, and the Governor-General of Turkestan and adjacent territories were to be thoroughly studied. The main researches of the society were conducted in the form of geography, history, ethnography and statistical researches of the region. In the process, the department had to organize various expeditions, collect available materials, and assist any person exploring the area. Between 1897 and 1917 alone, the society organized 42 scientific expeditions. During this time, 150 scientific reports, lectures and reports were read at the meetings of the society. The community was also to collect and store books, manuscripts, maps, and support the local museum.

Examples of some documents of the I-69 Fund:

In Protocol No. 6 of February 6, 1897, I.I. There is a report on geyser expeditions, ethnographic data on the territory of Eastern Bukhara, information on the transition of the economy of the Karshi oasis from nomadic to sedentary life.

At a meeting on March 31, 1897, estimates were made for the construction of metrological stations in southern Bukhara.

At the meeting on October 7, 1897, information was provided about the earthquake on September 5 in Jizzakh, as well as the issue of publishing the results of weather observations.

The November 13, 1897 meeting discussed the entomological study of the country, Oshani's visit to the Holy Father, the study of Issyk-Kul, and financial issues.

At the meeting of January 14, 1898, it was stated that geographical surveys were being carried out, and it was emphasized that the maps being drawn up should follow the same spelling rules.

At a meeting on August 25, 1898, organizational issues for the publication of Izvestia were considered, and the Emir of Bukhara, Said Abdullah, was admitted as a member.

At the meeting of November 28, 1898, on the election of the Emir of Bukhara as a member, the study of Sassikkol in Kazakhstan and Issyk-Kul in Kyrgyzstan, the sale of Izvestia, Bukhara, in

particular, the Zarafshan oasis, N.F. According to Sitnakovsky's study, the population of the principalities of Denau, Boysun, be in Persian has been translated as. At a meeting on January 26, 1899, Ostroumov spoke of the need to revise local geographical names. Oshanin, Ramanovich, and Karalkov commented on the report, and a commission on geographical names was set up by the council.

In addition to the above issues, the meetings focused on issues such as membership fees, expeditions, publishing, expenses, elections, organizational issues, international relations, geographical research.

Although the society in its time carried out a lot of scientific research in the study of the geography and history of the region, the historical-geographical research carried out within its history and society has not yet been studied as a holistic historical research.

In 1897, the Turkestan branch of the Imperial Russian Geographical Society established its own library to support local researchers in conducting scientific research. In the same year, 18 books and cards were donated to the library. At the meeting held on August 25, 1898, a report was given on the books donated and purchased, as well as books on the military topography of Turkestan. At the meeting of November 23, 1898, it was decided to place the library of the Turkestan branch of the Geographical Society of the Russian Empire in the public library. The department library was moved in 1898 and replenished throughout the year. *Izvestia* plays an important role in the book exchange. After the publication of the first book of *Izvestia* (13 volumes of 26 issues were published in 1898-1917), the library of the department began to exchange books. The department's library has exchanged books with the Russian Imperial Geographical Society and its departments, the Imperial Academy of Sciences, the Moscow Society of Naturalists, the Central Statistical Committee, the Orenburg Scientific Archive, the Astrakhan region, the Caucasus Museum and Library and foreign societies.

By 1900, the library had grown to 94 (from 142 to 236), while we could see that multi-volume works and periodicals were given a single number. In 1900, D.D. Placed in a new building by Gedeonov. By 1914, the total fund of the library was 4,100. On March 1, 1915, there were about 4,400 funds. The results of the analysis show that the departmental library fund was formed mainly through the exchange of books and the donation of books, to a lesser extent through the purchase of literature. Thanks to the large-scale book exchanges, we can see that the role of this library in Turkestan is growing.

The Tashkent branch of the Society of Oriental Studies has published two general maps of the period of the existence of the military-topographic department of the Turkestan military district. One of them covers the whole district with 40 versts of all the neighboring camps, and the other 10 versts cover almost all the indigenous peoples of the district, as well as Bukhara, as far as the Afghan border. The population points marked on the maps are shown, which meet the requirements for reading and viewing maps of this scale. It is clear from the document that the main task of the local representatives of that period was to create a perfect map using hand-drawn or corrected maps. It should be noted that some documents in the fund do not contain information about local settlements, but if we pay attention to the letter above, we can see that they tried to create more accurate maps using photographs. The population was also given cartographic information about the purpose of these maps.

During the study of the region, members of the Geographical Society met with V., who lived in Tashkent. F. Oshanin and N. A. The role of the Zoroastrians is important.

V. F. At the end of the 19th century, Oshanin traveled around Tashkent, Jizzakh and Khojand districts, and along the Trans-Caspian railway, collecting a rich collection of insects. From 1900 to 1905 he conducted entomological research in the Fergana Valley, Syrdarya and Transcaspiian regions.

N.A. Zarudny has been on expeditions and scientific excursions every year since 1907. Bukhara Khanate (1910), Kyzylkum (1912) and Aral expeditions collected a lot of zoogeographic data. During these expeditions, the tourist was the first to cross some inland desert areas (e.g., Kyzylkum) and describe their nature. The results of these expeditions N.A. It is described in about ten works of Zarudny, published in 1910-1916.

Community members P. K. Zalesskiy and Ya. The Gulyaevs regularly conducted topographic and geodetic surveys.

From 1907 to 1910, the Caspian part of the country, including the Mangyshlak Peninsula, was occupied by N.I. Andrusov, M.V. Bayarunas, D.A. Natskiy, B.A. Dichkov et al. Studied geographically and geologically.

The results of the research were often published in Izvestia, the Turkestan branch of the Imperial Russian Geographical Society, and became known not only in Russia but also abroad, as the Turkestan branch of the Imperial Russian Geographical Society met with dozens of Russian scientific libraries and societies, including a number of foreign countries. exchanged publications.

The attention paid to the research of members of the Turkestan branch of the Imperial Russian Geographical Society became popular after the publication of the results of the expeditions in Izvestia, especially after the publication of the scientific results of the Aral expedition.

It should be noted that the Turkestan branch of the Imperial Russian Geographical Society has had significant success in organizing expeditions.

The Council of the Turkestan Branch of the Imperial Russian Geographical Society carried out its activities with a premeditated plan, all expeditions important for the glory of the Turkestan Branch of the Imperial Russian Geographical Society were carried out on the personal initiative of talented members [9].

If the council took more initiative in organizing the expeditions and created them according to a carefully thought-out plan, then the number of expeditions and their results would be more important. Perhaps in this case there would have been no breaks in the expeditionary activities of the Turkestan branch of the Imperial Russian Geographical Society, in 1911,1913,1915 no major expedition had taken place. The reason for this is not the increased focus on processing and publishing the results of the Aral expedition, as the council did not confirm this in its reports. None of the board members wanted to continue the expedition, and the council did not even try to organize them independently because the money in the public account was dead capital.

## CONCLUSION

Despite the above-mentioned shortcomings in the work of the Council, the Turkestan branch of the Russian Geographical Society became a center of scientific thinking, around which local researchers united, supported their initiatives and provided more or less financial support to some researchers of the Turkestan branch of the Imperial Russian Geographical Society. In the Turkestan department, scientists were always able to report their discoveries to the general public and finally publish their works in the pages of Izvestia.

Among the members of the Turkestan branch of the Imperial Russian Geographical Society were many topographers who worked at the Turkestan Military Topography Department and the Tashkent Astronomical and Physics Observatory. Among them was Peter Karlovich Zalessky.

P.K. Zalessky (1850-1916) lived in Turkestan for 42 years, from 1874 to 1916. His labor and scientific activity were connected with Turkestan. He first worked as a geographer, then in 1879 moved on to astronomical work. From 1879 until the end of his life he was assistant chief of the observatory. During this time he contributed to the creation of astronomical and geodetic works.

The geographical coordinates of Turkestan and neighboring countries are of particular importance. To this end, he conducted 46 expeditions. We can see that the results of this expedition served as a solid foundation for mapping.

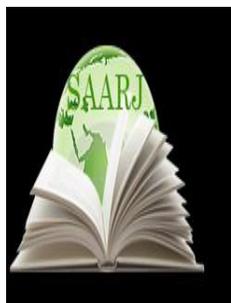

Y.P., a full member of the Turkestan branch of the Imperial Russian Geographical Society. Gulyaev worked for many years at the Tashkent Observatory and worked hard to organize meteorological observations in Turkestan and process meteorological data.

The conclusions and generalizations made by the members of the Turkestan branch of the Imperial Russian Geographical Society have not lost their relevance to this day, and have been further developed in the works of Soviet scholars.

### ABSTRACT

*This article is aimed at improving the creative competencies of working in graphic materials in the professional training of future teachers of fine arts. It also states that the student must have a good understanding and memory of the basic principles of drawing from nature, and in order to apply their knowledge in practice, he must have the technical knowledge to describe shapes in addition to scientific knowledge.*

**KEYWORDS:** *Fine Arts, Fine Skills, Graphic Materials, Teaching Technologies, Artistic Perception.*

### INTRODUCTION

At the current stage of development of the education system of our country, new requirements are set for improving its content and methodology, quality and efficiency. The Action Strategy for the further development of the Republic of Uzbekistan identifies as a priority "Further improvement of the system of continuing education, the continuation of the policy of training highly qualified personnel in accordance with the needs of quality education." Based on a competent approach, it is important for future teachers of fine arts to develop artistic comprehension, improve teaching technologies and provide pedagogical conditions and didactic opportunities for students to master the reproductive, productive, partially exploratory and creative levels of innovative activity. In the professional training of future teachers of fine arts in

the development of their knowledge and competencies will help to correctly see and understand the laws of the structure of forms in nature, to accurately describe what they see. But these are still not enough to be an artist. The student may have a good understanding and remember the basic rules of drawing from nature, but may not be able to apply the knowledge gained in practice. Therefore, in addition to student knowledge, the description of forms should also have technical competencies. Leonardo da Vinci, a famous artist and master of fine arts, said in his book "Laws of Painting":»<sup>1</sup>.

### **The main results and findings**

Technical skills are just as important to a student as they still are to know the letters when writing. Free and skillful execution, depending on the nature and memory, allows the artist to be fully committed to creativity, to realize his creative ideas and to achieve the desired result. A student who has mastered the visual techniques and technologies will not be able to feel free in future pedagogical activities and, as a result, will not be able to fully express their thoughts and feelings. This also applies to all art forms. In the ancient academies of art in Europe, great attention was paid to the technique of depiction. Even in the first acquaintance with the art of drawing (in the method of copying samples), the main focus is on the technique of execution. These can be seen in the ancient works and manuals of Julen, AT Skino, VV Pukirev, AK Savrasov.

Seeing the painting technique of the great artist OA Kiprensky, we can be amazed by his astonishing technical performance. In a number of his paintings he brought to the highest perfection of the technique of working with the Italian pen, in the style of the Italian pen he was able to use all his possibilities. He took the art of painting to great heights in the "black and white" graphic image. Kiprensky used Italian pencils and chalk in a wonderful way - in a wonderful child portrait.

Even today, we can see graphic works depicted in various genres with high technical skill. An example of this is the portrait graphic work of the American artist Vantsze Lee, which was done with great skill in painting on coal. (Fig. 1)

An artist who does not master professional techniques cannot create a perfect artistic image, which means that he cannot successfully solve a given problem. I.E. Repin wrote: "You should understand that no matter how beautiful an object may be in its shape, if its depiction is empty, it will even arouse a hatred for the perfect shape.

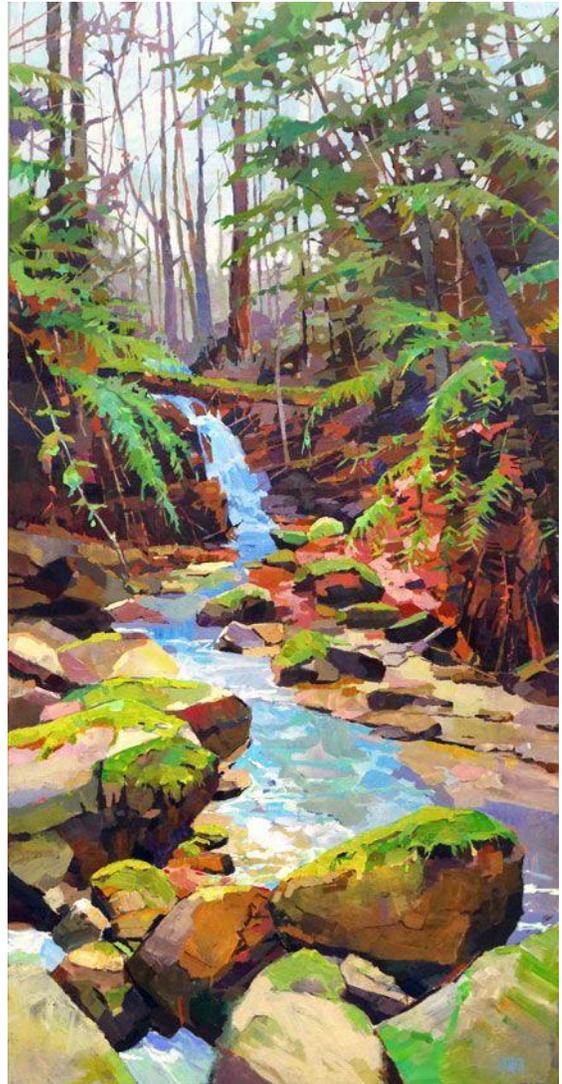

One of the ways to develop creative activity in academic classes is to involve a young artist in the study of the creative process of the skills of ancient masters. By introducing the reader to how they mastered the skills of previous great artists and showing the different interpretations of images in paintings, we are thus engaging the reader in active creative activity. Sometimes this is lacking. The educator then demonstrates how to use drawing tools to make the student's work more vivid. The teacher does not have to work much with the picture of the student, only the initial stage of the work is shown, after which the student himself continues the work. Some theorists of art see technology as an automated skill, a craft, far removed from creativity. But in reality, mastery is the result of creation. The development of technical skills has a great impact on the creative activity of a young artist.

In the past, great artists would be saddened to see such works and would say, "What a beautiful landscape it has been ruined." In all other arts, great attention is paid to the performing arts. The professionalism acquired by a person not only determines the quality of his labor activity, but also helps to show his creative abilities. "Ability to work is the foundation of any great person's talent," I.E. Repin said. Skills are automated ways and means of doing work. Skills are strengthened as you perform the exercises. Exercises should be based on a clearly designed and organized system. As a result of mastering the right exercises and methods of doing things, it is possible to acquire the necessary technical skills. In order for the hands to learn to move freely, the movements of the fingers must be brought to the level of automatic execution. Many well-known artists and scientists have come to the conclusion that the emergence and development of motor skills goes through three stages as a result of their research:

- the study of the individual elements of the movement and the unification of a number of individual details into a single whole;
- excessive movement and loss of excessive muscle tension;
- improve motor skills and achieve that actions are consistent with thinking;
- keeping the hand straight in the image;
- to acquaint the student with the technical methods of drawing from the very beginning of teaching drawing and then to achieve a good development of his creative ability.

Regardless of the methodology and individual system of teaching drawing to each educator, if the student has received the proper technical training, he or she will be able to develop successfully in the future, regardless of being a leader. Mastery is the ability of a person to perform a certain action using certain methods and techniques based on previous experience. Mastery in artistic creative activity is based on developed knowledge and skills. When working with a novice artist, it is important to keep in mind that the skill will gradually develop and improve. At first they are very loosely represented, then in the process of developing the right skills they become stronger. It is also important to remember that in order to develop a skill, you need to have a "sample of actions" to know what to achieve, to know how to correct them when mistakes are not made. Explaining the psychological nature of skills and abilities, BF Lomov wrote: "Mastery is a complex mental process. To achieve this, a person must have not only the necessary system of skills, but also the system of knowledge. At the same time, not only the knowledge of how to perform an action is taken into account, but also the knowledge of the basic features of one's work in general.

The system of knowledge, together with the system of skills, makes a person ready to solve the problems set before him independently. Mastery not only motivates but also activates mental movements. To act skillfully means to act "intelligently", to plan work processes independently, to find the most appropriate ways of action, each in a specific situation. Big differences become apparent when comparing skills and abilities. The ability is inherent in uniformity to perform an action automatically. Skill, on the other hand, is manifested in solving new problems. It involves finding the right path in new circumstances and involves creativity, not just as a return to what you have gained in your previous experience. Therefore, the process of acquiring professional skills cannot be considered as a simple mechanical work that is far from creative. Mastering the art of drawing is a creative process, but it manifests itself differently in each student. A low level of technical skill means that the creative activity of the photographer is also empty: a high level of technical skill, on the contrary, means that he has great creative potential. At the same time, it is not necessary to confuse the concepts of 'painting technique' and 'delubi'. Style is the artist's own style, which is associated with his enthusiasm and features. There are many techniques for working with pencils, sangina, and other materials. A certain technique of drawing can be achieved by a student only during a long practice. "I'm going to study technology," Kramskoy wrote. They have the equipment somewhere, like standing in a closet in front of someone, just take the key, you take the equipment, you put it: you can put it in your pocket, and when you need it, you can take it out of your pocket. Each type of technique has its own characteristics and the student should know what can be achieved from pencil, charcoal, sangina and different results can be achieved with one material. For example, when working with charcoal or drawing with sangina, a student can use a variety of techniques: in the first case, shaping is limited to shaping, in the second case, shading is done together. When drawing tiles, for example, on a mountain slope, watercolor can be painted as well as gouache. (Fig. 2) This will require the use of other techniques and special materials. The system of knowledge, together with the system of skills, makes a person ready to solve the problems set before him independently. Mastery not only motivates but also activates mental movements. To act skillfully means to act "intelligently", to plan work processes independently, to find the most appropriate ways of action, each in a specific situation. Big differences become apparent when comparing skills and abilities. The ability is inherent in uniformity to perform an action automatically. Skill, on the other hand, is manifested in solving new problems. It involves finding the right path in

new circumstances and involves creativity, not just as a return to what you have gained in your previous experience. Therefore, the process of acquiring professional skills cannot be considered as a simple mechanical work that is far from creative. Mastering the art of drawing is a creative process, but it manifests itself differently in each student. A low level of technical skill means that the creative activity of the photographer is also empty: a high level of technical skill, on the contrary, means that he has great creative potential. At the same time, it is not necessary to confuse the concepts of 'painting technique' and 'delubi'. Style is the artist's own style, which is associated with his enthusiasm and features. There are many techniques for working with pencils, sangina, and other materials. A certain technique of drawing can be achieved by a student only during a long practice. "I'm going to study technology," Kramskoy wrote. They have the equipment somewhere, like standing in a closet in front of someone, just take the key, you take the equipment, you put it: you can put it in your pocket, and when you need it, you can take it out of your pocket. Each type of technique has its own characteristics and the student should know what can be achieved from pencil, charcoal, sangina and different results can be achieved with one material. For example, when working with charcoal or drawing with sangina, a student can use a variety of techniques: in the first case, shaping is limited to shaping, in the second case, shading is done together. When drawing tiles, for example, on a mountain slope, watercolor can be painted as well as gouache. (Fig. 2) This will require the use of other techniques and special materials. Renaissance artists attached great importance to painting with feathers. Several different materials can be used in the process of performing short-term exercises (sheet, sketch). For example, the simultaneous use of coal, chalk and sangina allows to master the technical methods of working with several materials at the same time, opens up a wide range of opportunities for creative research. In general, the creative activity of the artist develops when working on the plates, and plays an important role in the formation of the artist as a teacher. Mastering the technology and techniques of fine arts, as well as its active application in their creative work is important for the student to enter the creative process.

Artistic form can be expressed in different technical ways. The task of the drawing is to show students these techniques. For example, the bar code technique of drawing for a graphite pencil is more appropriate, which we see in the artists of the old academic school: charcoal, sauce, sangina are suitable for drawing large images in color. However, it is also not possible to prioritize any method of drawing alone. On the student's own initiative, the method and technique he or she wants can also give good results, and sometimes it is even necessary to use the method suggested by the educator. In such cases, the teacher is required to have certain pedagogical skills, the ability to direct the characteristics of the student's individuality in the desired direction. A skilled educator should not try to influence the student, more precisely, he should give the student freedom without forcing him to use any method. Often, when the teacher corrects a picture, he shows the technique, not the technique: he completes a small part of the picture and instructs the student to continue in the same way. This style of work of the educator extinguishes the creative initiative of the student. To be successful, a young artist needs to ensure that the movements of his hands, eyes, and thoughts are in order, that the mind directs the movements of the hand, and that the eye checks that these movements are correct. All of the great artist educators have focused their students' attention on this. For example, KP Bryulov said: "Before becoming an artist, it is necessary to master drawing in pencil, because drawing is the basis of art: in young people the mechanism of drawing should be developed from a young

age, so that he can think and feel clearly and easily. delivers correctly. Let him follow the idea of the pen when drawing.

## CONCLUSION

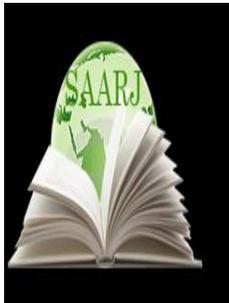

In conclusion, the technique is not magic and does not keep any secrets, but it does not come by itself, as the master artists emphasize. To help the student acquire drawing skills and abilities, special assignments should be given that will train his hand, eye and mind. For this exercise to be effective, the following is required: first, the performer's effort to improve the quality of the activity, and second. to try to work better every time, and thirdly to understand the reasons for the mistakes he made in every action, often observing it from afar in the depiction of nature. It is important that the student's self-control gradually teaches him or her to describe uncomplicated shapes, that he or she gradually progresses to the complex, and that time is correctly distributed in the description.

### ABSTRACT

*This article proposes an alternative framework of pragmatic competence in verbal communication, which addresses pragmatic comprehension and attempts to characterize what gets in the way of learners comprehending and producing pragmatic meaning and also investigated the role of listening comprehension activities as an alternative methodological approach to promote pragmatic development.*

**KEYWORDS:** *Verbal Communication, Inferences, Pragmatic Competence, Second Language, Listening Comprehension Activities.*

---

### INTRODUCTION

Pragmatics is basically concerned with inferences and investigates aspects which affect utterance meaning. In order to interpret the full meaning of utterances, listeners rely on sentence meaning aspects as well as on features which operate at utterance level.

Pragmatic development acknowledge the importance of providing pragmatic input in order to enhance learners' communicative abilities. In order to develop the ability to speak, firstly acquirers need a lot of exposure to comprehensible input. In other words, comprehension precedes production. Therefore, receptive skills play a role in the second language teaching program. Considering learners' communicative needs, listening comprehension activities offer a great source of comprehensible input and resemble real-life communication. Furthermore, listening comprehension processes include both bottom-up and top-down processing micro-skills which, when combined, enable the activation of pragmatic phenomena embedded in oral discourse. Thus, listening comprehension activities may also be used to foster pragmatic development. A person who acquires communicative competence acquires knowledge and ability for language use with respect to whether (and to what degree) something is: formally

possible; feasible in virtue of the means of implementation available; appropriate (adequate, happy, successful) in relation to a context in which it is used and evaluated; and is in fact done.

There are four types of communicative competence:

1. Linguistic or grammatical competence: consists of the knowledge of the basic elements of communication such as sentence patterns, morphological inflections, lexis and phonological or orthographic systems;
2. Sociolinguistic competence: consists of the social and cultural knowledge required to use language appropriately with reference to formality, politeness and other contextually defined choices; it refers to the degree sentences are produced and understood appropriately;
3. Discourse competence: refers to the knowledge of how to combine grammatical forms and meanings to achieve a unified spoken or written text in different genres and situations;
4. Strategic competence: includes the strategies and procedures relevant to language learning, language processing and language production. It activates knowledge of the other competencies and helps language users to overcome communication difficulties.

The descriptions of listening comprehension processes and of taxonomies of listening comprehension micro-skills aim at demonstrating how pragmatic phenomena embedded in oral discourse may be highlighted via a strategy-based approach to listening. In order to achieve listening proficiency, learners need practice in making inferences as semantic and pragmatic inferences are embedded in verbal communication.

Listening is assuming greater and greater importance in the second language classroom. In his opinion, second language acquisition has given listening a major boost by emphasising the importance of comprehensible input and the assumption that listening is fundamental to speaking since it provides input for the learner. In addition, listening extracts can be used for language work as learners are able to notice linguistic items (grammar, functions and vocabulary) in a context.

Real-life activities which involve some aural comprehension as an essential component of the communicative situation: listening to the news, weather forecast, sports report, announcements etc. on the radio; discussing work, current problems with family or colleagues; making arrangements, exchanging news etc. with acquaintances; making arrangements, exchanging news etc. over the phone; chatting at a party, other social gathering; hearing announcements over the loud speaker real-life listening activities are characterized by the following features: we listen for a purpose and with certain expectations; we make an immediate response to what we hear; we see the person we are listening to; there are some visual or environmental clues as to the meaning of what is heard; stretches of heard discourse come in short chunks; most heard discourse is spontaneous and therefore differs from formal spoken prose in the amount of redundancy, noise and colloquialisms, and in its auditory character. Although particular situations may lack one or more of these characteristics, it is rather rare for none of them to be present.

Listening comprehension exercises seem to foster the inferential sub-competency as the latter encompasses the comprehension dimension. Top-down strategies give learners the opportunity to infer hidden meanings conveyed by conversational implicates and to interpret the illocutionary force of speech acts while bottom-up strategies enable learners to decode oral speech. In

addition, the taxonomies of listening comprehension sub-skills previously presented give learners practice in noticing aspects which affect utterance meaning.

Finally, learners may do listening comprehension exercises in order to interpret cultural references and figures of speech or to raise their awareness of differences of dialect, variety, register and naturalness. On the other hand, learners may perform noticing and restructuring activities which focus on the degree of formality of speech acts or on how linguistic choices and politeness strategies affect the degree of imposition of face threatening acts.

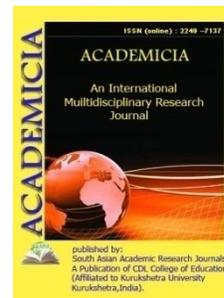

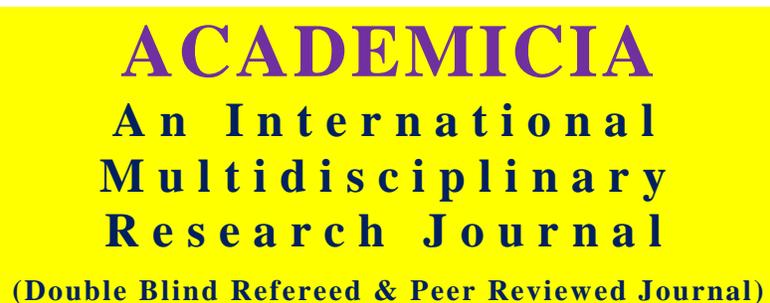

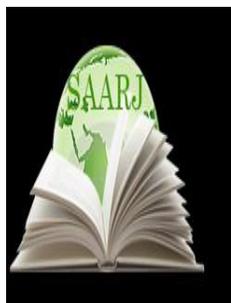

We can conclude that listening comprehension activities are potentially capable of directly enhancing the inferential pragmatic sub-competency via a strategy-based approach to listening. While pre-listening activities can activate learners' content and formal schemata, listening activities focusing on specific conversational and academic listening micro-skills can draw learners' attention to pragmatic phenomena embedded in verbal communication. However, the results of the empirical project were inconclusive as to the extent to which listening comprehension activities are potentially capable of enhancing the conversational-interactive and sociolinguistic sub-competencies. Therefore, further investigation on the effect of listening comprehension activities on these sub-competencies seems to be required as well as more specific assessment instruments.

### ABSTRACT

*The article attempts to disclose information about the history of statehood of the Hephthalites, in particular, about the system of government of the Hephthalites in India. The campaigns to northern India in the 5th century and the form of government established by the Hephthalites in this region are analyzed.*

**KEYWORDS:** *System Of Government, Government, Nomads, Dynasty, Copper Coins, Buddhism, Taxes,*

### INTRODUCTION

The history of the early Middle Ages is characterized by the history of states founded by several closely related nomadic tribes in Central Asia and adjacent territories. The Kidarites, Chionites, and Hephthalites, whose ethnic origins were not yet fully resolved, invaded the region and established a state that could compete with the great empires of their time such as the Sassanids, China (Tang Empire), and Byzantium. Among them, the Hephthalite state played an important role in the history of our statehood, and their system of government is one of the unresolved issues. The nomadic way of life also influenced the system of government of these peoples. The tribalism system has been preserved in the government. The previous system of government of the conquered indigenous peoples remained, and only influential representatives of the victorious nomads were appointed governors. They were instructed to collect taxes and, if necessary, participate in marches with the existing army. Such small khokimiyats were unconditionally subordinate to the central government. This is because power in them often passed from father to son, and not from the most powerful representative of the family. Therefore, the representative of the royal family, who was the governor of the region, honestly disposed of the property given to him, and they were sure that one day he would become king. In this study, we attempted to shed

light on the Hephthalite governance system in Gandhar (now part of the state of Pakistan) and northern India.

### Research methods

The research was carried out using objectivity, analysis, synthesis, comparative analysis, generalization, historical analysis, chronological methods.

In the 5th-6th centuries AD, the Hephthalites founded a huge state that occupied a vast territory. During the heyday of the Hephthalite state, state borders stretched from east to west - from Khotan (East Turkestan) to the border with Iran, from north to south - from the present deserts of Kazakhstan to northwestern India, most of Central Asia, Afghanistan, Pakistan, India and China. ... Information about Hephthalites can also be found in Indian sources, and they are called "dietary". Information about military operations against the Hephthalites can be found on stone pillars in Bkhitara, Kura, Mandasora and Gwalior. The Indian epics "Mahabharata" and "Ramayana" and the work of the 6th century Indian astronomer Varahamihira "Brihat Samhita" contain information about white and black blood. Information about the Hephthalite kings is contained in the Kashmir historical chronicle "Rajatarangini", compiled by Kalhana, and in the works of Prakriti "Kulavayamala" and "Puranas" of the 4th-6th centuries.[1]

The expeditions to Gandhara and India were originally carried out by the Kidarites (descendants of the Kushans)[2] who retreated to India after being defeated by the Hephthalites in Central Asia. As for the Kidari, Zion and Hephthalites, K.V. Trever claims that they appear in Armenian sources in the form of "heptal" and that the name "haft" means "seven" in Iranian, and that they were part of the Massagetae tribes of seven families. ... He points out that at the beginning of the 5th century, the Kidarites left the Massagetae Union and occupied Tokharistan, and then clashed with the Sassanids of Iran. After the death of their leader Kidara, they go to Gandhara (Peshawar) through the Hindu Kush, led by his son Kunhas Kidari. They subdued the Gupta state and ruled for 75 years. Some of the Kidarites remained in Central Asia and later joined the Hephthalite state.[3]

Attention should be paid to the efforts of the Hephthalites to build a great state. The Hephthalites, who defeated the Sassanids, at the beginning of the 5th century continued their military campaigns to the south in order to expand the borders of their state. Indian sources claim that the rulers of the Gupta dynasty waged wars with the Hephthalites (they are called "Huns"). V.M. Masson points out that in the 460s the Hephthalites occupied the lands in the middle reaches of the Indus - Gandhara River (part of modern Pakistan).[4] S.P. According to Tolstoy, at the end of the 5th century, the leader of the Hephthalites Toramana in 490-515. Defeated the resistance of the Gupta Empire and conquered the Sindh, Rajasthan and Jambh-Ganga valleys. Unlike the coins of the Hephthalites in Central Asia, Indian inscriptions appear on the coins of the Hephthalites in India.[5]

After the death of Toramana in 515-544, his son Mihirakula ascended the throne. He chose Sialkot (now Sialkot) as the capital of his state. According to the 7th century Chinese traveler Xuan Xian, Mihirakula conquered all of India. In the historical chronicle of Kashmir, called Rajatarangini, Kalhana equates Mirakula with the god of corruption and writes that he ascended the throne. Mihirakula expands the borders of his state from Jambh-Ganga in the north-west of India to Gwalior, where he builds the city of Mihirapur in his name. It was during this period that the rulers of the Hephthalites in India rose to the highest peak of their kingdom. But in 533 he was

defeated and taken prisoner by Yashodharman, the ruler of the Aulikar dynasty. It was at this moment that the brother of Mihirakul rebelled against him, and in this case the king had to leave the capital Sakalu. Although Mihirakul is defeated, he manages to keep Gandhara and a number of neighboring territories in his hands.[6]

The descendants of Mihirakul could not get more power in the future, so their power in India was weakened. Nevertheless, artistic and epigraphic sources report that they still fought against Indian rulers in the 7th century. The borders of the Hephthalite state also reached the territory of East Turkestan. Eastern Turkestan was captured by the Hephthalites in 479, Urumqi in 490-497. In 495 the lands of the southern Teleuts were conquered and in 496 the lands of the northern Teleuts. Thus, at the beginning of the 6th century, East Turkestan fell into the hands of the Hephthalites. Also known are the coins of Badgis Nizak Tarkhan, one of the Hephthalite-Turkish rulers of this period. The rulers of the Hephthalites Toraman and Mihirakul minted mainly silver and copper coins. Toraman silver coins are minted in three versions. One of them is inscribed in Brahmi with the inscription "Sri Toraman Deva - Invincible Conqueror". Copper coins were in two versions, they were both Kushan and Sassanid coins. Mihirakul coins include "Shahi Mihirakul" or "Jaytu Mihirakul" inscriptions. When Pravarasen II ascended the throne after Mihirakul, his coins bore the inscription "Sri Pravarasen" on the reverse in the Brahmi language and "Kidar" on the reverse.[7] In different parts of the Hephthalite state, along with the Hephthalite language, they also spoke different languages. In particular, the Sogdian language is widely spoken, and related documents have been found in East Turkestan. In addition to the Sogdian language, the Khorezm script is widely used. In Tokharistan and north-west India, in Kharoshti, as well as in areas bordering the Sassanids, the Pahlavi script was used. Buddhism, one of the secular religions, also existed during the Hephthalite era. While some experts say that the Hephthalite rulers supported Buddhism, another group of scholars argue that the Hephthalites, on the contrary, destroyed Buddhist temples during the invasion. Scientists' studies show that the conquest of northern India by the Hephthalites allowed them to get to know Buddhism better. This is reflected in the depiction of the purna-ghata, the Buddhist symbol of fertility, on Hephthalite coins. Archaeological excavations in Uzbekistan have also found a number of valuable materials on the art of the Hephthalite era. Among them is a silver bowl found in the village of Chelak in Samarkand. This find, on the one hand, is distinguished by the uniqueness of the decoration, and on the other hand, it testifies to the fact that the Hephthalite era was marked by a high level of metal carving (toreutics). At the bottom of this vessel is an image of a man holding a lotus (lily) on the left in his hand. Dancing women are depicted on a plate in the central part of the image. This discovery suggests that B.I. Judging by the image of a person at the bottom of the vessel by Marshak, it has been established that it belongs to the Hephthalite era.[8] Because this image is very close to the images on the coins minted by the Hephthalite rulers Toraman and Kingila in 430-490. They portrayed the image of the rulers large, differing in the size of noses and a high, elongated hat. This find was made by art critic G.A. Sufficiently interpreted by Pugachenkova.[9] B.I. Marshak acknowledged that the images in this find are close in style to Indian art.[10]

It should be noted that the unification of a significant part of Central Asia and North India into a single state during the Hephthalite era also had a great impact on the harmony of cultural ties. In particular, during the reign of Toraman, the ruler of Gefthal, and his successor Mihirakula, Buddhist traditions came into the possession of the Hephthalites. In fact, this religion was not

new for the Hephthalites, since Buddhism was widespread in Central Asia even in the Kushan period, and its unique traditions have been preserved in the archeology of cities founded by the Kushans. Numismatic data for northern India suggest that the depiction of Hindu deities, along with the depiction of horns on eptal coins, also indicates the general development of the traditions of the two peoples. However, historical sources claim that many Buddhist monasteries were destroyed as a result of the Hephthalite wars in northern India and Gandhara. During the reign of Budhagupta in the Gupta in the last quarter of the 5th century, central authority was weakened.[11]

In the late 5th and early 6th centuries, the Hephthalites conquered northern India (Punjab, Uttar Pradesh, Rajputan and Kashmir) under the leadership of Toraman (in Indian scriptures found in Punjab, he is referred to as the "famous Toraman"). We can also find out from numismatic materials.[12]By this time, the territory of the Hephthalite state expanded, and the Hephthalites of Central Asia and the Hephthalites of Northern India began to be governed separately, but the connection between them was not interrupted. During the Mihrakula period, all of northern India was conquered. About the monk Suan Siang Mihirakul, who lived in the following centuries and traveled around India: "He was very talented and brave ... He easily conquered the neighboring provinces.[13] In the inscriptions of Gvalior, he is referred to as Mihirakula, and in Jain sources as Calciria.[14]

Many wars and religious intolerance towards the local population led to a decline in the status of the Hephthalites in these areas in later periods. Moreover, the defeat of the Hephthalites in their wars with the Turks and Sassanids in Central Asia deprived them of their main support. By the beginning of the seventh century, the rule of the Hephthalites in North India and Gandhara came to an end, although several small branches of the Hephthalites survived here, but they no longer had any influence.

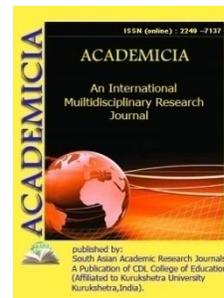

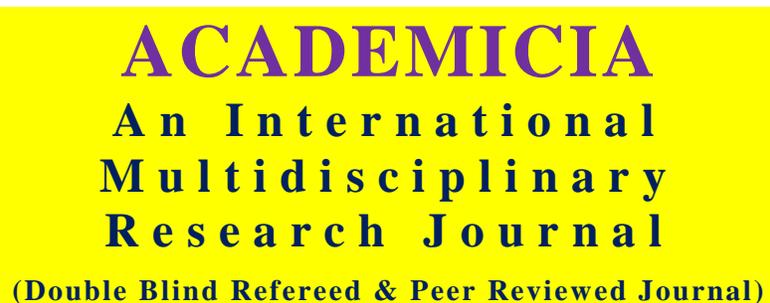

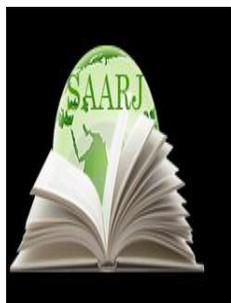

## CONCLUSION

Above, we tried to briefly describe the political system of government of the Hephthalites, in particular their system of government in India. Although the Hephthalite state, which occupies a special place in the history of our statehood, was not such a strong centralized state as the Kushan state, it was larger in territory. As a result of the conquest of neighboring territories by hephthalites, its territories in the southeast expanded to central India. During this period, the cultures of Central Asia and India merged, and its influence spread to the regions of modern Uzbekistan based on Buddhism. This was the second time after the Kushans when Buddhism in Central Asia, along with local religions, played an important role in the social life of society. The Hephthalites preserved the traditions of the Kushan Empire and became its direct successors. Therefore, in some numismatic materials, along with the name of the king of the Hephthalites, there is an inscription "Kushanshah". During their reign in India, the Hephthalites got acquainted with Indian culture, which we transmitted through information in the above Indian sources. In short, the hephthalite system of government in India has preserved the traditions of government in Central Asia. Their system of political and military government occupies a special place in the history of our statehood.

### ABSTRACT

*This article examines interethnic relations, peaceful coexistence with them, as well as the fact that Uzbeks have always had friendly, fraternal, cooperative and good-neighborly relations with the representatives of the nations and peoples living around them.*

**KEYWORDS:** *Politics, Nation, Tolerance, Peace, Friendship, Value*

### INTRODUCTION

There are a number of factors that contribute to the improvement of interethnic relations, one of the most important of which is the socio-political factor. Without taking into account the socio-political factors and improving it, the goals of interethnic relations cannot be achieved.

There is no country that has made great strides without paying attention to the socio-political sphere and overcoming the problems facing this sphere. By overcoming the problems in the socio-political sphere in a timely manner and achieving success, success will be achieved in the life of the society, trust and hope will appear in every member of the society.

### LITERATURE REVIEW

The works of thinkers and scientists who have contributed to the development of research and theories on the subject, scientific research can be conditionally divided into two groups.

The first group contained the first ideas about human existence and the relationship between people. The countries of the Ancient East, in particular. Created by the peoples of India, China, Iran, Turan, legends, fairy tales, epics, songs can be included. the first fkr-considerations about the first relationship between people can be found. However, it should be noted that the expression of the views on man expressed in the Hindu Vedas was in the form of religious

mythology. [1] According to Confucianism, which is widespread in China, people are far apart from each other in their behavior and habits. [2]

The idea of tolerance can be found in the religious-mystical, religious-philosophical teachings that were widespread in the Middle East in the VII-VI centuries BC, especially in Iran and Turan. One of them is described in the book "Avesto" created in our country. The possessor of good thoughts is not given to ignorance, ignorance deprives a person of good intentions, forgets duty and justice, and acts thoughtfully. [3]

Scientific and methodological issues of the problem from the point of view of philosophy, sociology and ethics Uzbek scientists Sh. Abdullaev, A. Begmatov, M. Abdullaev, I. Saifnazarov, B. Kuchkarov, V. Alimasov, S. Juraev, T. Juraev, A. Choriev, F. Musaev, O. .Atamirzaev, K.Xonazarov.G Xidoyatov E.YusupovErgashev, I learned, etc.

## RESEARCH METHODOLOGY

The research was carried out using objectivity, analysis, synthesis, comparative analysis, generalization, historical analysis, chronological methods.

In its foreign policy, Uzbekistan seeks to improve relations with its neighbors. For centuries, the Uzbek people have strived for good neighborliness, comprehensive support for their neighbors, and have done a lot in this area.

Strengthening friendly fraternal relations of independent Uzbekistan with the Central Asian republics and Kazakhstan, deepening and further development of deep socio-economic relations with them, expanding scientific and material cooperation is a very important priority of Uzbekistan's foreign policy. The pursuit of cooperation is historically unique to the countries of the region. This is determined not only by common boundaries, but, above all, by the closeness of national cultures, languages, customs and traditions. In our republic, living in peace, friendship and brotherhood with people of all nationalities, respecting each other's values , gives peace and tranquility to our people . [ 4 ]

The importance of interethnic equality and harmony in preserving our hard-won independence, which is sacred to us, and preserving the territorial integrity of our state is enormous.

As our country pursues the path of building a democratic society, one of the main issues to be addressed is to further expand the opportunities for the active participation of all nationalities in the socio-political life of society.

According to statistics, more than 130 nationalities and ethnic groups live in our country. Together, they make up the people of Uzbekistan. As we move towards building a free and prosperous homeland, a free and prosperous life, we must establish peace among nations.

The rapid growth of national identity is characterized by the absence of interethnic and civil strife in Uzbekistan, the prevention of interethnic and civil strife in Uzbekistan, despite the efforts of forces seeking to create and strengthen interethnic majors, peace, tolerance and respect for other nationalities. features.

At the end of the twentieth century, the mistakes of the former Soviet regime's policy on national issues, the fragmentation caused by injustices in the national interest, were happening in Uzbekistan, as well as in other republics.

However, as a result of the prudent policy pursued by the leadership of the Republic, the events that took place in such regions as Nagorno-Karabakh and Georgia did not escalate in Uzbekistan.

The qualities that have been formed over the centuries and permeated the way of life of our people, that have become an integral part of its national nature, have proved their importance on the eve of independence and in the first years of our independence. Uzbeks have always had friendly, fraternal, cooperative and good-neighborly relations with the peoples and nations living around them. The fact that this nation has been able to retain its unique sense of compassion is a unique feature of its own. It is no secret that in some of the newly independent republics, the representatives of the nation, who lived in the vicinity of independence and pretended to be brothers, were treated with disrespect. The fact that this has not happened in Uzbekistan shows the high morale of our people.

Mankind is now constantly pondering the question of "what the world we live in should be like," "how to put an end to bloodshed, extremism, and enmity between people." It is democratic not to misinterpret each individual and society in general, and to be tolerant of the opinions of others. The question of how to educate in the spirit of understanding that it is one of the most fundamental features of a legal society is also of great importance. Tolerance, that is, tolerance, is gaining priority in the conscious life of man and in the mentality of society, creating a new consciousness. The modern concept of tolerance has only recently emerged, and UNESCO has put a lot of effort into shaping this concept. In particular, the Declaration of Principles of Tolerance, adopted by the organization in 1995, defined tolerance as a value and social norm of civil society .[ 5]

In our national ideology, the main goal of which is to create a free and prosperous homeland, to further liberalize the life of society, it is emphasized the importance of ensuring interethnic harmony in the implementation of this main idea. At the same time, it is emphasized that evil, destructive ideas such as nationalism and chauvinism are the main threats to the life of society. Every member of society must always be aware of the consequences of such evil, destructive ideas and the need to avoid them.

Evil ideas such as aggressive nationalism and chauvinism have always been one of the main threats to interethnic harmony in human history, and they have not disappeared today.

The first part of this says a resident of the Republic of Uzbekistan '**... until the power chauvinism and aggressive nationalism inertsiyasiningzalvarliki faced him this power, for others it is paid for not knowing how dangerous that can be.**

Representatives of many nationalities and ethnic groups have lived in Uzbekistan since ancient times. The fact that there have been no national conflicts between them for centuries shows the eternal tolerance of our people.

Every citizen of Uzbekistan, who is a supporter of independence and prosperity of the Uzbek nation, must be faithful to the rules of interethnic harmony and friendship. Because the future of our independent state depends, first of all, on the realization of the national identity of the Uzbek people and on the territory of our country, regardless of nationality, religion, language and beliefs of everyone living side by side with Uzbeks and other nationalities. to know, depends on the establishment of friendly relations between them.

It is known from historical sources that the great statesmen Amir Temur, Ulugbek, Babur devoted their lives to strengthening inter-religious and inter-ethnic harmony and achieved certain successes in this field. The Jadids, the national progressive intellectuals of Turkestan in the late 19th and early 20th centuries, also articulated the ideas of religious tolerance. Their well-known representatives - MahmudhojaBehbudi, AbduraufFitrat, MunavvarkoriAbdurashidkhonov and others in their works and practical activities promoted the ideas of tolerance. In particular, the theme of religious and national tolerance occupies an important place in the works of A. Fitrat "Discussion" and "Stories of the Indian traveler". [6]

## CONCLUSION

Today, many nationalities and ethnic groups in Uzbekistan live a peaceful and prosperous life with equal rights and freedoms. They are working together to bring Uzbekistan to the ranks of developed countries.

In today's world, where great attention is paid to the development of the homeland and ensuring peace in the country, it is very important for multinational states to pursue a national policy based on the right, clearly defined goal. This will help accelerate development.

Improving relations between different nations, its harmonization is of particular importance in the period of the abolition of the former Soviet state, the establishment and development of new independent nation-states on the territory of this state.

This is a delicate issue that requires a careful and sensitive approach. In a multi-ethnic state, trying to resolve a national issue without taking into account the interests of all nations and peoples at the same time can lead to bad, negative consequences. It is necessary to avoid such mistakes, drawing conclusions from the consequences of mistakes made in the process of interethnic relations.

During the years of independence, it can be said that in all spheres of life in our country, including democracy and political reforms, the issue of interethnic relations in Uzbekistan is approached with special care.

From the first days of independence, attention was paid to the mistakes, shortcomings and shortcomings of interethnic relations during the former regime, which were gradually eliminated.

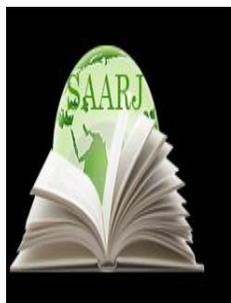

Drawing conclusions from the national conflicts in a number of regions, measures have been taken to ensure peaceful coexistence of all nations and peoples living in our country.

In our society, which consists of the unity of different peoples in terms of its composition and content, our legal framework is closely helping to maintain interethnic harmony.

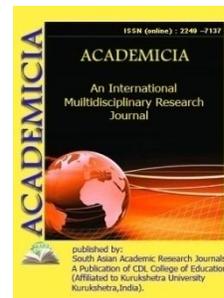

In Uzbekistan, there are public organizations, national cultural centers that serve the national cultural needs of certain nationalities living in the country. National cultural centers operate on the basis of the Constitution of the Republic of Uzbekistan and current laws on public organizations of the Republic of Uzbekistan. National cultural centers voluntarily unite citizens of Uzbekistan who are interested in the study, preservation and development of national culture, language, customs and traditions of a particular nation.

### ABSTRACT

*South Uzbekistan zone is separated with richness in orographic objects. The population of oasis were engaged in cattle-breeding and agriculture. In their occupation and mode of life the forms of land relief –the Mountains, hills, soils, different, heights, gorges, ravines, fields, steppes and others were of great importance. In the result of local population's relation with such objects during long period in their speech were created the words, terms, word-combinations which expressed different forms of these objects and they played an important role in appearance of country's oronymics. In the article the question of participation of local geographic terms in building the names of orographic objects formed in speech of population lived in the South Uzbekistan oasis.*

**KEYWORDS:** *Orographic Object, Mountain Range, Passage, Peak, Hill, Height, Gorge, Ravine, Steppe, Desert, Pasture.*

### I. INTRODUCTION

Oronyms as one type of toponimics is closely connected with people's history and reflects social-economic life of people, characteristic features of cultural and spiritual relations and it is a linguistic layer and treasury. Oronyms are the first source in decision some problems, which belongs to the development and history of formation of language and dialects. As well, the people, who has lived or living in definite zone, their ideological-political, economic-cultural, ethnic structure and origin migration and integration and occurrences concerning to other events are found its reflections. Even some of them may give important information about the dynamics of historical changes of geographical and natural conditions of above mentioned zones. Research

object of this scientific work is considered oronyms of the Uzbek language, and it is studied on the base of South Uzbekistan materials.

## II. METHODOLOGICAL BASES AND METHODS OF RESEARCH

Methodology of research is based on historical tendency obeyed in linguistics, i.e. all events in certain historical process are based on interpretation without parting from historical preconditions and occurrences.

Scientific and theoretical base of research consists of methods analyzing scientific opinions which are being used in toponimics of Modern linguistics.

As well, in linguistic research of oronyms it is worked approaching to dialectical laws combined with community and particularity, essence and event, form and content.

As the main method of research were used comparative- historical, analysing according reestablishing and dormant, structure and formation with comparing language facts.

## III. SUMMARY ABOUT OROGRAPHIC OBJECTS OF SOUTHERN UZBEKISTAN

The South Uzbekistan zone which includes Kashkadarya and Surkhandarya regions is particular separated with reflection of natural-geographic features natural to whole Uzbekistan. Because the South Uzbekistan zone is rich in vast Mountain ranges, high Mountains, high peaks, deep gorges passed through high Mountains, hills, tops, hills of different size and height, wide pastures, steppes, deserts and other orographic objects. The North border of Kashkadarya passes through Mountains of Zirabuloq-Ziyovuddin, the west border –through the heights of Jarkok, Mubarek and Dengizkul. The sands of Sandikly in the South and West separated the country from Turkmenistan. Gissar Mountains in the East of Kashkadarya, Boysun Mountains in the South-East separates region from Surkhandarya. The land is stretched from West to East about 300 km, from North to South about 200 km.

The land surface of Kashkadarya from East to West is slowly fall down, first into hills, then transited into plains. In the North-East of it the Mountains of Chaklikalon, Karatepa, Zirabuloq-Ziyovuddin which are considered as the Western continuation of Zeraphshan range.

The highest peak of these Mountains amount to 2500 metres. The Chaklikalon Mountains are stretching along the scope, the highest peak Zebonachieves 2336 metres. The Chaklikalon Mountain comes to an end at Takhtakoracha (1630 m) then Koratepa Mountain continues to the west side. The highest peak of Koratepa Mountain achieves 2195 metres. On the west part of Chaklikalon Mountain the Girqtog Mountain is situated. Particularly one of the deepest caves Keely in the Commonwealth of Independent States (1082m) is situated in this Mountain.

Gissar is considered as the highest Mountain range of Kashkadarya region. This Mountain range consists of several branches of ranges. The largest of them are considered Hazrat Sultan, Chakchar. Some peaks of these Mountains reach to 4643 metres. There are such glaciers as Seversov (2,3 km long, 1,38 sq. km in area) and Botirboy (2,2 km long, 3 sq.km in area) in these Mountains. In the East of Chaqchar Mountain Boysun range is situated. The low part of Mountains related to Kashkadarya region is adjacent to the hills. In the North the hills begin from the South foot of the Mountain Goratepa and continues till Guzar. The hills cover up the flat of the region in the East side and commonly named as Koratepa, Miraki, Yakkabog and Guzar

hills. But the parts of these hills and different pieces has their particular names. Between Zerafshan and GissarMountains low land of Kitab-Shakhrisyabz is located. Large number of orographic objects in different forms and size are met in this low land.

The great part of Kashkadarya region form flats. These flats consist of Karshi, Jom, Malik, Karnob, Nishan steppes. In general the flat part of Kashkadarya region from East to West is came down. In the East part of plain is higher from the level of ocean in 550 m, in Karshi it falls down in 378 m, in Moobarek-278m, in Sandikli sands-230m. But there are remains of Mountains in flat part of the region. The most important of them are Moymoqtog (Moymoq Mountain 500 m), Jarqoq (397 m), Dengizkol (485m).

In central part of Kashkadarya region Karshioazis is situated. In its North -West part lies Karshi Steppe. Karshi Steppe occupies a great area, its surface is not flat. Different specific orographic objects are also met in this steppe zone.

Surkhandarya region is located in the South of Uzbekistan. It includes Mountains which surround Surkhon-Sherobod valley and around it. The region from East and North-East borders with Tajikistan, through Bobotog and Gissar Mountains. Surkhandarya in North-West borders with Kashkadarya, the border passes through Chakchar and Boysun Mountains. In the West the border with Turkmenistan passes through the part Soovayirgich of the Kuhitang Mountain. In the South the border considers with the state frontier which passes through Afganistan and Amudarya. The region from the North-East to the South-West the country stretches more than 200 km long, 145 km wide.

As neighbourhood of Surkhandarya is surrounded with Mountains various orographic objects are spread in the land. The region is considered as the ancient domicile of culture. In this area famous historical memories Zarautsoy canyon and the Teshiktosh cave where ancient humans bones were found. Natural –geographic land surface of Surkhandarya zone is not identical. From the North it is surrounded with Gissar range stretched along width. The height of this range reaches 4500-4600 metres. The highest peak in Uzbekistan Khazrat Sultan (4643 m) is also located here. To the South-West Gissar Mountain range lowers and separates into several networks. Such networks as Chakchar, Boysun, Surkhontog relate to boundaries of this zone.

In frontier part of Surkhandarya with Kashkadarya Chakchar Mountain is located. The highest peak of it is Khorasan, its height reaches to 3744 metres. The Boysontog Mountain is also much high, some tops of it in the North-East reach to 3700 metres. In the South–West of Boysontog is Kuhitang Mountain located. Kuhitang spread out for 50 km to the South–West its height reaches 3137 m. In the East of Boysontog, side by side to it Surkhontog is located, it stretches in short distance, but it is high (3722m in height). In the East of this Mountain Sherabad low Mountains (1126 m) are located. In these Mountains lime rocks that are common in the mountains are melted by water and formed a large number of karst and caves.

In particular, there are comparatively many caves in Kuhitang Mountain, some of them 4 km in length.

Mountain streams and caves in Boysun, Kuhitang and Surkhan ranges were living places of ancient people. The most famous of this ancient settlements are in the Zarautsoy Gorge, on the slope of Surkhantog.

Zarautsoy historical monuments, which are of great importance in the world civilization, are protected by the state. It is ought to note that the nature of Zarautsoy is very beautiful, surroundings consist of limestones, the Mountain slope is steep. There are many caves and steep cliffs in the gorge with animals' illustrations (in 15 places). Besides, in Teshiktoshgorge in the valley of High Machay river at the outset of Sherabad river are found the bonds of ancient man. These facts indicate that there were primitive settlements in the Surkhandarya valley, and that the signs of life date back to ancient times.

To the east of Surkhandarya natural –geographical region is Babatag. The Mountain is much destroyed and fell, the highest peak Zarkosa is 2292 metres in length. Babatag in the direction of Surkhandarya valley and in the direction to the South is slowly falls down.

In the region, between mentioned Mountains Surhan-Sherabad valley is located in the country, among the above mentioned mountains.

Surkhandarya valley is flat with a height of 550 m in the North-East, and it falls down towards the South-West and on the Amudarya coast it makes up 270 metres. On the South-West of Surkhandarya valley some obstacles are situated (located). The most important of them are an old, Termiz, Uchqizil, Zang, Hovtog are in the right bank of Surkhandarya, Jayrophona, Kokaydi, Lalmikor... are on the left bank. Their height are about 400-700 metres, the upper layer is flattened and hollowed with steams.

There are also sands in the southern part of Surkhan-Sherabad valley. The biggest of them is Kattakum which is situated on the East part of Khovtog and Uchkizil borders. These informations<sup>1</sup> about natural-geographic features of the South Uzbekistan zone which include Kashkadarya and Surkhandarya regions shows its extremely richness in orographic objects. Many of these objects have peculiar names<sup>1</sup>.

#### IV. LINGUISTIC BASIS FOR NAMING OROGRAPHIC OBJECTS

Historical-linguistic study of these names, called oronyms in linguistics is of great importance. Since ancient times, the main part of the population of this region organize the representatives of population who talk in South dialects of Uzbek as well as in South-East dialects of Tadjic language.

Analysing the oronyms of Southern Uzbekistan one fact draws attention not the names of mountains, peaks, glaciers, hills and similar to them any orographic objects are named but the objects, which have special importance for local population. The name is related not to the whole mountain range but a separate part. The name applies not only to a whole mountain system, but to a particular part of it. The names are given to peaks, rocks, mountains which are separated with some respects, ravines, stones pastures and passages. In the examples of oronyms we can determine several laws which are common in formation of toponyms. In particular, the shape of the mountains, rocks, peaks, their nature, and location of mountains, can be the basis for the formation of oronyms.

As is generally known from investigations nouns, orographic terms (mostly their dialectal form) plays the main role in formation of oronyms. These peculiarities we can see in the following examples which take part in formation of South Uzbekistan oronyms: *tog'*, *tosh*, *qoya*, *qiya*, *cho'qqi*, *qir*, *tepa*, *dovon*, *bel*, *sirt*, *adir*, *ort*, *do'ng*, *cho'l*, *gaza*, *dara*, *tangi*, *zov*, *jar*, *ko'h*, *kamar*, *to'da*, *sang*, *dala//tala*, *dasht*, *mo'la*, *nura*, *o'r*, *o'ra*, *maydon*, *aydar*, *mas//mos*,

*taxta, karta//qarta, alang, qo'l, shoti, ayri, suyri, aqba//ag'ba, yaylov, yayloq, chovra, bitov//pitov, xuchchi, tubak, qaloq, dum, bo'ktar, hayot, qashqa, qatov, qoboq, singir, to'qay, joy, paykal, chag'il//chag'al, chag'at, supa, yona, shiram, handak, g'urum, qum, chamber, qaqir, taqir, dagar, jol, to'la, yer, bayir, mozor, sho'r, bet, hvol, g'or, poya, qo'ruq, gul//kul, tuz, chalqa, ota, shayit, tumshuq, kapug', darvoza, darband, qiz//quz, ti//tig'//teg, baroz//barzu, shirdon, bo'z, jira, qayir, bo'yin, bo'ynoq, bolder, changal//jangal, angar, pushta, qasova//qasag'a, orqa, orqavul, burun, oshuv, o'y, toqcha, qapchigay, ham, yovon, yoz, xovar, jovuz, o'lang, zarang, sahro, uz, chartoq, sangir, bodiya, mag'ora, dapsan, jo'sha, tarma, tirsak, chosh//shosh, chek, ungur, chordara, chig'anaq, ang'iz, qo'riq, qo'riqxon, oston, jo'lg'a.*

## V. PARTICIPATION OF OROGRAPHIC WORDS AND TERMS IN FORMATION OF SOUTH UZBEKISTAN ORONIMS

Orographic terms are inseparable part of any language. Because in the structure of vocabulary the positive forms of relief (mountain range, peak, height, hills, of different forms and size, we can't imagine a language which doesn't have the words which express negative forms, such as (lowlands, depth, gully, valleys, steppes, plains, ravines and others). Besides this, it can not be found any local dialects which has no local geographic terms connected with reflection of different details of relief [1].

In general the relationship between scientific and popular geographic vocabulary is considered as analogous relation between literary (public) and dialectal words. It should be noted that dialectal words can also be localized forms of literary words. In its turn spreading of local geographical terms is also limited.

The Southern Uzbekistan region according to its ethnic composition is of karluk and kipchak dialect demonstrate many dialectal, mixed dialectal, bilingual (Uzbek-Tajic, Tajic-Uzbek) features.

These features are reflected in language of the people of the area, in all relations which are carried out in the sphere of this language, particular in its oronymics. It is known that some of the inhabitants of the area in the past have been engaged in cattle breeding and partly in agriculture. In their occupation, lifestyle, the forms of relief-mountains, hills, dry lands, different heights, ravines, gullies, steppes and others were of great importance. As a result of relations of local population with such objects during long time were formed the words, terms word-combinations which expressed different forms of these objects, they played an important role in appearance of the country oronymics. For example dapsan//dapsan- "flat height, swelled hillock", -qovoq- "the surface is flat, stretched and the hill with slope around", tahta- "flat area on the plane surface of mountains, mountain ranges"; khovar- "level place", chovra//chobra- "hill, steppe, pasture", shiram- "the place one side of which is a steep jar, the second side place adjoined with the foot of the mountain or hill", qaloq- "an obstacle wall formed with stones or done naturally or artificially", qat- "stone layer", qatov- "a little peak, stonely rock", khoochy- "stone, peak, upper point of the hills, the top part"; sina- slope, the upper part of slopes"; the words zov, jobiz//joviz, ora, or, kotal, jorma, qaznoq, chak are among them. Many oronymes of the Southern Uzbekistan are created with these words. They are usually the second component in the structure of oronyms. They represent the indicative nature of the type of orographic object. These words may be also attributive component in the structure of oronyms. In this case, the name represents any of characteristics of an orographic indicator that comes as a second component. Below, we'll

stop on some words which have local character in possibilities and features formation of oronyms.

**Chovra//chobra.** Mainly the word is typical to speech of the population of Chirakchi region expresses the meaning of the place, consisting of low-height hill. Chovra is such type of the hill which can be only used as pasture. This word, which has an orographic meaning, has served as an indicator in formation of some oronyms: Kizilchovra (first it was the name of the hill, later transformed to the name of the nearest village), Kattachovra, Bolakchovra, Toshchovra (the names of hills). The first component of the names kizilin words expressed the different signs and features of the soil (colour of the soil), "large size", piece "place", stone (the structure of the soil).

**Qaloq.** This word is typical to speech of cattle-breeders Dehkanabad, Boysun, Sherobod, Kokaboloq. In other areas, the word is not used. That's why oronyms formed from this word are not met in other areas. In lands showed above there are some names of places formed from this word. In addition, the word qaloq is also actively used in speech of the population of these regions as appelyativ. This word according to historical formation was in the form qala+k (after adding affix q to the base happened exchange of the voice a>o, it means natural and artificial obstacles which represent the movement associated with the concept of the core. The population engaged with cattle –breeding used to build stone walls and walls for livestock used it as a place for keeping livestock. Also, in the mountainous areas, as a result of erosion, displacement and erosion of rocks as picked with hand the heap of stones are also named with the term qaloq.

This indicator on the base of this meanings serves in the formation of oronyms. Chavliqaloq (Dehkanabad, pasture), Qaloqlidara (Dehkanabad, ravine), Qoşqaloq (Dehkanabad, hill). Oronyms made with the help of this indicator will later be renamed to another object: Qaloqlidara (Dehkanabad, village). This word may also be a definite component of other type of the name of object: Qaloqjilga (Dehkanabad, small river)

**Zov** is considered as one of terms of orographic character typical to speech of the population of Mountain zone. Zov is also an orographic object that resembles a jar but differs according to its specific shape. A man who doesn't know the conditions of Mountain region may not be able to distinguish it from ravine. Ravine is appeared in the result of water collection, washing and land moving. Zov may be on the slopes of the hills, mountains and hills. One or two sites of zov are like the ravine may be as precipice. Therefore, such places are considered dangerous for human and livestock movement. The word zov, as an orographic indicator, served in formation of a number of oronyms. It is mainly the second component of oronyms, and expresses the type of the object. The words that are the first component to it shows the different features of the object. For example, Oqzov (Chirakchi) – a large zov (there is a big meaning of the word oq in oronymics), zov (ravine) soil of which looks white; Sarizov (Dehkanabad) – a yellow zov (the word sariq – yellow expresses the meaning similar to white) zov which soil looks yellow. Kattazov (Chirakchi) Kichikzov (Chirakchi), Qorazov (Dehkanabad) – zov, the depth of which is of large measure (*qora* – shows various meanings in oronymics, as well as, shows that a size of the mark is large as compared with objects expressed the negative forms of relief), Toshlizov (Sherabad) – it is a zov stones of which comes off from walls.

This word as the first component of places names, expresses sign – feature of named object: Zovqoton (Dehkanabad) – the stall built in ravine place (may express the meaning of natural

stall). Joined with the word expressing hydrographic object formhydronym: Zovariq (Baysoon)- is a ditch with steep and deepedges.

One more local term typical in formation of the South Uzbekistan oronyms ishovar. According to its origin, the word concerns to the Persian-Tajik language is widely used in speech of local population. In kipchakdialects of Kashadarya it expresses the meaning of little flat place in hills and on the foot of Mountains, flat land in hills and area. This word is mostly used in speech of population who is busy in agriculture. Oronyms formed with this word are dependent with agricultural profession. They created the name of places on the base of meaning which explain the object: Kattakhoval, Kichikkhoval (Chirakchi, pasture), Uriklikkhoval (Dehkanabad, place), Pastakhoval, (Altinsay, place), Ariqlikhoval (Dehkanabad, place), Toshkhoval (Qamashi, place) and others.

In Uzbekistan oronyms are met the names of places which had formed from the word kotal. Most of them correspond to borders of Kashadarya region. For example oronyms Kattakotal, Kichikkotal (Chirakchi), Archalikotal, Toshkotal, Ayrikotal (Dehkanabad), Qoshkotal (Qamashi) Kotaltog, Kokkotal (Yakkabag), are formed from oronym Kotal, (Chirakchi) including the names of villages.

In Tojikistan and Kirgizistan oronyms with lexem kotal are widely spread. In work "Zafarnoma" only oronym Oqkotal formed from indicator kotal is met [2]. In "Baburnama" about 30 oronyms formed from this word are brought: Bobur used this word in the meaning of mountain road and a mountain pass". The way rises higher. They say it Kotaly Zarrin" [3]. S. Qorayev noted this word in mongolian "passage", the way across the Mountain [4]. The word Kotal according to the origin is an ancient lexeme similar to period of the Altay language related to Turkish-Mongol language. In Mongolian khotal means "hill, not so high slope height" [5]. According to its historical structure the word is composed of two morphemes (kota+l). Here kota is a root morpheme (according to the meaning it fits to the verb), -l is considered as supplementary morpheme (noun formed affix from verb). Based on this it may be said that it expresses the road which may be an instrument for rising to the height. So, kotal means "Mountain road". Oronyms made of the word kotal find its explanation on these bases.

Research of the Southern Uzbekistan oronyms has also showed that some of them are based on the meaning of orographic terms used in dialects of common people's speech. The linguistic features of oronyms formed with the words in this group are opened on the base of properties of terms in dialects which are the base of nominations.

It is known that some words related to literary language have new meanings in the local dialects and in the speech of rural population. Oronyms may be formed on the base of meanings in dialects. In determining and analyzing the linguistic properties of such oronyms it is important to take into account their such aspects.

We considered to pay attention to some words related to this group met in the structure of oronyms.

One of such words which have such properties is *qovoq*. The main meaning of the word *qovoq* is a part of human's body, the place between eyes and eyebrow. The word with the help of metaphor represents the type of orographic object. *Qovoq* is a type of height, that is a height similar to pumpkin. This type of height is flat, and can be used as pasture. The term is used in

formation of oronymson the base of notion which express itself: Khusanqovoq (Dehkanabad) Kattaqovoq, Toshqovoq, Archaliqovoq (Dehkanabad), Mungqovoq (Baysoon), Yakkaqovoq (Altinsay) and others. The word qovoq may be the second component of names and denotes the type of the object. The words which are the first component express different features of the named object, to whom it corresponds, its size, form, structure of the soil, what plants grow. For example Khusanqovoq – is the height related to man by the nameKhusan, Kattaqovoq- is the height with large measure, Toshqovoq- is the height with a lot of stones, Archaliqovoq –is the height place, where the tree (archa)has grown, Mungqovoq is the height related to the family Mung, Yakkaqovoq is a lonely height in a separate place.

Also the word tuvak//tubakwhich is used in the literary language to mean flower pots which is used as a term in local conditions. Here with the way of metaphorhappenedturning the meaning and it turned to the term expressing the type of object similar to negative form of relief. Tuvak//tubakis a type of depth similar to the pot dependent to the main meaning of form.Its beginning is wider and narrows down to the depth. The term expressed this meaningserved to form the names of objects of such type: Qoshtubak, Kamartubak, Chuqurtubak, Uzuntubak, Yakkatubak, Yolgiztubak, Teshiktubak (Dehkanabad, Baysoon,Qamashi). The word *tubak* which expressed the name of the object was the second component. The first components of the names were the words*sqosh, kamar, chuqur, uzun, yakka, yolgiz,teshik* expressed different features and marks of the name of the object.

In literary language the duplicate of the word laddershotilexem in local conditions acquires its own meaning. *Shoti*is a local name of the device for climbing up anddown. The word with this meaning in Dekhkanabad, Kokabuloq, Boysoon districtsby metaphoric way with changing the meaning turned to term expressing orographic idea. So, shoti as an orographicterm means path on the slope of the hill and high places. This term served in formation of oronyms on the base of notion expressed itself: shoti (Dehkanabad, kamar; Qamashi, hill), Qoshshoti, Ayrishoti (Dehkanabad,hill), Yolshoti (Qamashi)Balandshoti (Baysoon). If the name of the second component indicate the object type what the semantic property is in the name, then the meaning of the first component of the name will also be clear. It appears an opportunity to note them on this way. For example, in the nameshoti the indicator has directly turned to the noun, Qushshoti – is a hill with two pathes, Ayrishoti is a place devided into two pathes, Yulshoti is an easy path range, Balandshoti is a range with path on the upper part.

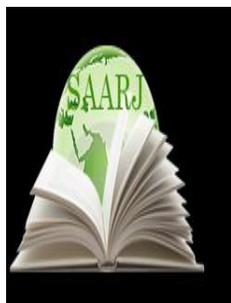

## VII. CONCLUSION

In summary, oronyms are created within a particular region, so they are dialectal according to their creation. Orographic objects may initially be named by a group of people (of nearest villages, stock-breeders, farmers) who interact with the object. In the process of naming the vocabulary units that are typical to these people are involved. In addition to the words that are specific to the literary language, names appear from words of local character. In the process of naming, words belonging to the national language may also reveal new meanings in the context of the local language. In its turn dialectical words that are used within a particular area may also extend out of their shells to different regions, and have their own specific but common meaning. Such words which have local character, in the Southern Uzbekistan oronymics, make up considerable amount. They have gone through the formation phase as an orographic term and

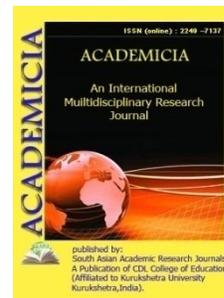

have become terminology. Some of them are used only as a term, some of them serve as oronymic indicators in the formation of names of orographic objects.

### ABSTRACT

*The word "formation" has been chosen for a reason: the root of this word suggests that the integral sense formation is a cognitive unit, a form of some reality. On the theme of restrictions on posed by the linguistic reality on the objective reality which it reflects, we should not forget about those types of ISF which have a super structural character. These superstructures are various, ranging from the metric/rhythmic to the narrative. It is quite natural for scientists to attempt to find the integral of all these socio-cultural variables related to LP. To this end, they try to establish the national type of LP, with the average level of its knowledge. The future is visualized as being behind us because it cannot be seen" (ibid.: 144). The same can be said of the systems of values and attitudes, of such axiological oppositions as "good-bad", "positive-negative», etc. Thus, LP is a schematic subject (an integral formation itself) making use in its verbal activity of many types of ISF; otherwise, interpersonal and cross-cultural communication would be impossible.*

**KEYWORDS:** *Socio-Cultural, Visualized, Metric/Rhythmic*

### INTRODUCTION

Consider LP (language personality) as a person capable of performing verbal activity - constructing and comprehending utterances and texts making use of ISF (integral sense formations). We must differentiate between the collective LP in whose mind exists the general

picture of reality as a variety of meanings, and the concrete LP, performing verbal activity which has a sense (communicative) character per se. Thought is the subject of this verbal activity: it is not the meanings, but the sense which is conveyed in the process of verbal activity. Sense is not simply the total sum of meanings, but the formation of a new quality - the integral.

Having assigned the notion of meaning to the units of language and the notion of sense to verbal utterances and texts, let us move on, remove the boundary which exists between semantics and pragmatics, considering that the sense of the utterance contains all information related to the correct interpretation of this utterance.

The word "formation" has been chosen for a reason: the root of this word suggests that the integral sense formation is a cognitive unit, a form of some reality. If one takes the view that in verbal activity a person, with the help of linguistic signs, forms a picture of the reality around him, then one can take ISF as being the form of all these components - the objective reality, the subjective reality and the linguistic reality (this distinction, naturally, is made purely for scientific purposes).

The basic type of ISF is proposition as the structured form of objective reality at the sentential level of discourse. In this way the whole text can be seen as a sequence of propositions, or a hierarchy of predicates. ISF can have more complex forms such as frames and scripts which are structured formations with a number of variables (Berger 1996, 38). Proposition is only a semantic-syntactical invariant which is the basis of other types of ISP, for example, theme and rhyme (topic-comment) which give form to the elements of the proposition.

Including in our analysis the subjective attitude of a person to the objective reality reflected by linguistic signs in the form of the proposition, we should note the existence of modal ideological and cognitive-axiological types of ISP. Modal types of ISF are traditional components of the modal frame which restricts the proposition as far as reality/unreality of the facts reflected is concerned. Teleological types of ISP are illocutionary types of speech acts. Cognitive-axiological types of ISP arise when utterances are embedded in a broad socio-cultural context.

Defining sense as the common part of the two sentences which are mutually translatable is reducing the sense to the semantic-syntactical invariant (proposition). However, moving away from the logical basis of ISP to their real psychological basis, scientists talk about propositional beliefs, values and attitudes (Tyler 1978, 244; van Dijk Kintsch 1983, 118). We cannot really understand the sense of many utterances without realizing the cognitive-axiological character of ISP. For example, even such a universal dimension of objective reality as Time may give rise to a variety of different types of ISP depending on different socio-cultural context. For instance, unlike most Western cultures, "the Hopi Indians pay very little attention to time as we know it. They believe that each thing, whether a person, plant, or animal, has its own time system" (Samovar et al 1981, 53), and "the Quechua language of Peru uses orientations to past and future that are the opposite of those found in the English language. In Quechua, the past is visualized as being in front or ahead of us because it can be seen. The future is visualized as being behind us because it cannot be seen" (ibid.: 144). The same can be said of the systems of values and attitudes, of such axiological oppositions as "good-bad", "positive-negative», etc. Of course all these types of ISF are interwoven in the language and are formed on the basis of the propositions of facts.

While propositional-factual types of ISF are invariants, independent of language and person, cognitive-axiological types of ISP loosen this frame due to the action of subjective factors which ultimately form the socio-cultural context.

Another type of ISP in which the subjective attitude of the person to the objective reality is seen through the choice of words is style. That is to say, style as an integral of various features characterizing the peculiarities of verbal activity of both a single person and a whole literary movement (Szabo 1985).

Having looked at the linguistic reality, it should be noted that rhetorical figures are one more type of ISF which have a linguistic origin. These figures which can be found on all linguistic levels, are characteristics of literary texts in the first place. As a rule, linguistic structures are quickly forgotten, since intellect processes them into cognitive structures: this process is known as "semantic integration". But sometimes the rhetorical figures get in the way of semantic integration and take on the features of ISF themselves. For example, when Demetrius, one of the characters of Shakespeare's comedy "A Midsummer-Night's Dream", says to Helen, "I love thee not: therefore, pursue me not", the syntactic parallelism acts in this way as a type of ISP.

On the theme of restrictions on posed by the linguistic reality on the objective reality which it reflects, we should not forget about those types of ISF which have a super structural character. These superstructures are various, ranging from the metric/rhythmic to the narrative. For instance, rhyme is one such type of ISP which cannot be overlooked in language processing (cf. the prose translation of Pushkin's "Evgenii Onegin" done by Uzbek poet Oibek).

Thus, the types of ISF are built upon the propositional textual basis, organizing but at the same time restricting it. A person with no knowledge of the range and uses of ISF is unable to perform verbal activity and cannot, therefore, be considered a language personality.

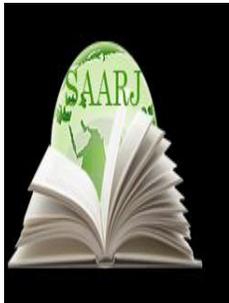

It should be noted that linguistic signs take on the features of ISF only in a broad socio-cultural context of communication. Thus, we may talk of the contextual determinants of ISP. Their objective-contextual determinants are historical, social and national variables, while the subjective ones are various psychological features of personality (age, individuality, sex etc.). It is quite natural for scientists to attempt to find the integral of all these socio-cultural variables related to LP. To this end, they try to establish the national type of LP, with the average level of its knowledge. The average personality is interpreted through the thesaurus of cultural knowledge which may be taken as a set of propositions having the same sense for all members of the nation.

Thus, LP is a schematic subject (an integral formation itself) making use in its verbal activity of many types of ISF; otherwise, interpersonal and cross-cultural communication would be impossible. The success of communication depends on the distance between the different types of ISP of two LP. Communication is made possible by the reflection of the objective reality as specific cognitive structures of universal character, which are unaffected by the differences between languages and different people. As these semantic-syntactical skeletons are being filled out with concrete psychological flesh, the distance between two LP may become greater. This is because communication gives rise to a certain cognitive shift, the nucleus of which are cognitive-axiological types of ISP.

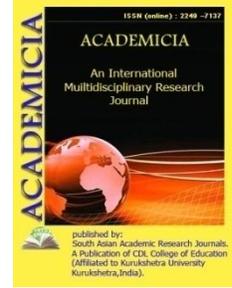

The integral units under discussion are, in our view, the units of sense analysis of utterances. The main tasks of this analysis are to look for the different ways in which all the information can be integrated into various types of ISF and categorize them, eventually aiming at building up a hierarchy of ISP as predicates of different orders.

## INTRODUCTION

Education is one of the most important social benefits. The education system plays an important role in a person's life, and one spends a lot of time for acquiring it (especially a child, teenager, young man). The quality of educational results and the quality of life of students, both in the learning process and in subsequent years, depend on the conditions in which the educational process is carried out.

Assessment of the quality of education is a scientific task that requires the development of methodology, verified methods, and an unambiguous research problem with a deep understanding. It is proposed to consider the quality of education as a multidimensional phenomenon: in the philosophical and socio-cultural, content-technological, value-worldview, communicative, structural and organizational directions. The combination of these areas allows us to designate an integral system for assessing the quality of education.

Defining the quality of education is an unambiguous research problem that requires deep understanding. The solution to this problem is of a practical nature, since the existing system for assessing the quality of education in secondary schools is fragmented and is based on quantitative, often formal indicators, such as the number of teachers with the highest qualification category, student performance, availability and correctness of paperwork, compliance with safety regulations, and others. In fact, assessing the quality of education is a scientific task that requires the development of one's own scientifically grounded methodology, and verified methods.

The quality of education is a phrase, the meaning of which is defined by two terms: education and quality. Education can be considered in several aspects: philosophical and socio-cultural, content-technological, value-world outlook, communicative, structural and organizational. Consequently, the quality of education can also be considered in all the listed aspects. The quality of education is a multifaceted phenomenon that requires measurement in the direction of several vectors.

In the philosophical and socio-cultural aspects, education is viewed as a phenomenon of an epoch-making historical scale, at the level of extreme values, it is thought of as matrices that form the image of civilization and society [1]. Education is seen as the transmission of culture in the broadest sense. Accordingly, quality education is an education that is inextricably linked with culture, conveys knowledge, values, relationships that help to form society. To answer the question about the quality of education, it is necessary to make measurements in the following directions:

1. To what extent education reflects the culture of society, in what relationship culture and education are: does education correspond to culture? Does education a part of culture, or do education and culture contradict each other?
2. What is the place of the institution of education in the socialization of the individual? Can it compete with other institutions of socialization, with the exception of the family?

Let's try to analyze the quality of education in the proposed areas. The modern education system is in crisis. If we talk about the relationship between the socio-cultural development of society and education, then at present there is a gap between education and culture associated with global changes. Firstly, we can include the globalization of the world community, the integration

of knowledge, and national economies. Secondly, the spread of information technologies, as a result of which the interaction of cultures, values, knowledge becomes more dynamic. The student is required to be able not only to assimilate knowledge, but to understand their huge flow, the ability to think critically, the ability to cognize, and others. Accordingly, the main task of quality education is not just to form certain knowledge, but to teach one to navigate in modern information. In accordance with this task, in teaching technologies should be changed: not just mastering knowledge, but the ability to filter out the necessary information, process it in the right way, and develop creative thinking in general. And modern education is aimed at a simple transfer of knowledge, and memorization. The crisis in this direction is aggravated by the fact that new values and worldview are adopted by the new generation, and the generation of teachers brought up within the framework of the value system that has existed for a long time that adheres to the old worldview.

If we talk about the place of education in the socialization of the individual, then there is also a certain weakening of the role of education. It is connected with the fact that new social institutions have appeared that claim to transmit knowledge and cultural experience. Traditionally, socialization has taken place within the family and school.

#### **Several volunteer groups act as stakeholders:**

**1. Students and teaching staff as direct participants in the educational process.** Students' needs are related to education, personal and social development. The needs of the teaching staff are associated with the self-realization of teachers, as well as with their development as professionals.

**2. Family, parents of students.** The family is one of the main consumers of the educational services provided by the school. The social order of parents is expressed in what parents generally expect from a child attending school, what, in their opinion, should be the content of education, the content of upbringing, in what form it can be implemented, what additional services may be in demand, and others.

**3. Institutions of primary, secondary, and higher professional education.** The social order of vocational education institutions is expressed in the requirements for school graduates as potential applicants and as future students.

**4. Economy represented by potential employers.** The social order of institutions from employers is expressed in the requirements for school graduates as potential employees.

**5. State.** The social order of the state is expressed in the requirements for school graduates as citizens of the country, and members of society.

In a situation where education is focused on fulfilling a social order, i.e. exists within the framework of the socio-centric model, quality education is education that maximally satisfies the social order of each of the groups - participants in the educational process, while not contradicting the interests of any of the named groups. Accordingly, the main vector for measuring quality is the satisfaction of each of the groups of social customers. The content of this vector for measuring the quality of education depends on the content of the social order.

The quality of education in secondary school is a whole complex of parameters and includes several areas. Each direction corresponds to a certain aspect of education:

**The first direction** is the parameters related to the understanding of education in a broad philosophical and socio-cultural context. This group includes, firstly, the ability of education to broadcast the existing culture, and secondly, the ability of education to occupy a leading position (following such a social institution as the family) in the socialization of the individual. From this position, education is experiencing a deep crisis associated with the gap between culture and education, as well as the weakening of the role of education in the transmission of cultural values.

**The second direction** is associated with the understanding of education in the content-technological aspect. This group includes parameters that reflect the correspondence between the type of personality that is formed by education and the model that is characteristic of education. Currently, the prevailing socio-centric model of education, focused on the social order. Therefore, here it is possible to single out as a quality standard the formation of a personality that most closely matches the social order of each of the groups of participants in the educational process.

**The third direction** is associated with the understanding of education in the value-worldview aspect. The parameters that characterize the quality of education are the presence and quality of upbringing, the formation of values, worldview in the learning process. At present, the resumption of education within the school is taking place; the question of the content of education has been raised.

**The fourth direction** is related to the understanding of education in the communicative aspect. The parameters for measuring the quality of education are related to the parameters of communication. The modern school seeks to establish feedback between the participants in communications, to the open nature of relations.

**The fifth direction** is associated with the understanding of education as a specific organizational structure. The parameter for measuring the quality of education will be the effectiveness of education as an organization from the standpoint of management. In the modern school, there is an attempt to decentralize management by involving participants in the educational process in management.

The state system for assessing the quality of education which currently exists affects only on some aspects of the quality of education: the structural and organizational aspect, as well as the implementation of the state social order (the presence of certain knowledge, skills and abilities among schoolchildren, academic performance, compliance of educational programs with the state standard, and others.) Accordingly, in these areas, quality measurement techniques are the most developed. Measurement of the quality of education in other areas is often absent. Therefore, the task of creating an integral methodologically verified system for assessing the quality of education remains urgent.

Apparently, the intensity of discussions on this issue has reached a stage today when it becomes necessary to “clear up” the terminology and disclose those contexts that arise in connection with the implementation of certain approaches to assessing the quality of education, and we are trying to solve this problem in this article.

1. We do not discussing here the question of what is the content of the criteria for assessing the quality of education, just we will analyze what to consider as a good quality and what is bad. We

will be interested in procedures and approaches to measuring the quality of the results of the work of the education system, and not in the question, for example, which results are more important. From this position, it does not matter whether we are talking about obtaining certain knowledge, abilities and skills or about the formation of abilities as the goals of education. This approach significantly distinguishes the proposed angle of view from recent discussions, which have focused mainly on the discussion of criteria for assessing quality. Our attention to forms and procedures is explained not so much by the fact that we are indifferent to quality criteria, but by the fact that, from our point of view, the procedures and approaches to quality assessment set the most important institutional context of the reform, to a large extent form the very results that then are evaluated.

2. We distinguish between a possible quality assessment system (quality management) and a system that ensures certification of individual students. From this point of view, all kinds of testing services (uniform examinations) should not be equated with quality assessment services. Their data, of course, should be used in assessing quality, but the direct identification of the totality of individual educational results, measured by standardized procedures, with the quality of the education system seems to us inappropriate.

3. We discuss the assessment of the quality of education in relation to a decentralized and variable education system. In a homogeneous centralized system, quality assessment tasks are posed in a completely different way, since the process is strictly regulated there.

What is the purpose of quality assessment? All above are about quality assessment, and it is a good desire to improve the quality of education. However, as often happens in social systems, the implementation of a tool designed to achieve a good goal leads to very contradictory results. Therefore, it is increasingly common to hear that quality assessment is needed so that (especially in a decentralized system) government can receive timely and reliable information about how the system works, how effectively budget funds allocated to education.

Let's pay attention on the problem of improving the quality that is being discussed, as the problem of providing higher authorities with information, the problem of monitoring the activities of educational institutions. This is clearly a substitution of goals. This substitution is extremely remarkable, since it reflects the difference in approaches. Recognizing the independent importance of the task of providing governing bodies with control information, we implicitly identify the quality of the work of educational institutions with the degree of administrative control. The solution becomes itself in the end.

We emphasize that we do not argue with the need to move information flows from the bottom up, but the task of ensuring this movement is subordinate secondary. It makes sense only in the context of the general task of improving the quality of the work of real teachers and school principals.

Thus, we emphasize that, from our point of view, the goal of creating a quality assessment system is to create conditions for improving the quality of education through increasing the flow of information about educational outcomes and relevant factors.

We also emphasize that for all the indisputability and even triviality of this statement, many projects for creating quality assessment systems are not really oriented towards the above goal as verifiable and achievable.

The modern history of education provides two fundamentally different approaches for assessing the quality of education in decentralized educational systems, and let's consider them below.

**Assessment as a test.** In one case, a quality assessment is needed by higher authorities to assess how the subordinate schools are performing. In this approach, a set of indicators and assessment procedures are developed at the top and applied in a standard and "inevitable" way to schools. In fact, this scheme implements not the idea of responsibility, but the idea of controllability.

**Assessment as a mechanism for dialogue and self-development.** An alternative is the approach in which the main consumers of information about educational results are the direct participants in the educational process - teachers, students and their parents. In this case, responsibility arises not from accountability, but from openness and transparency. At the same time, the procedures for assessing educational results become the weapon of the teachers themselves. In this approach, the core of the quality assessment system is the methodological work to provide schools and teachers with new means of assessing the achievement of educational goals, new means of dialogue with the extracurricular community. The undoubted advantage of the second approach is that the process of collecting information about the quality of education is at the same time a process of development of the teacher and the school institution itself. Thus, the modern idea of management as learning is realized.

It is argued that decentralization already gives schools a lot of freedom, so in order to maintain a balance freedom must be limited through quality assessment procedures. Although, here formal considerations lead to a logical error: it is overlooked that the goal of decentralization is to strengthen independence at the level of educational institutions, therefore, the main task of assessing quality in a decentralized system is to strengthen this level at which really effective decisions are made.

**Finding a balance between control and dialogue.** Comparing these approaches, we consider complete administrative control or complete abandonment of administrative control. We emphasize the need for a balance in which it is clear that the most important driving forces for high quality education are independent and competent teachers, independent and self-governing schools, dialogue between parents and schools, dialogue between schools and the educational policy department. At the same time, one must understand that behind these approaches lie two different educational philosophies:

**In the first case,** general education is understood as the sphere of investment of state funds for the implementation of state priorities.

**In the second case,** on the one hand, general education is rather viewed as a service sector; on the other hand, as a sphere of free creative action by teachers and school collectives.

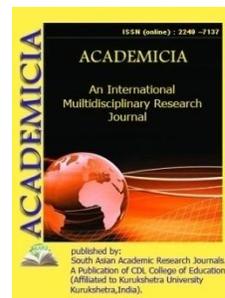

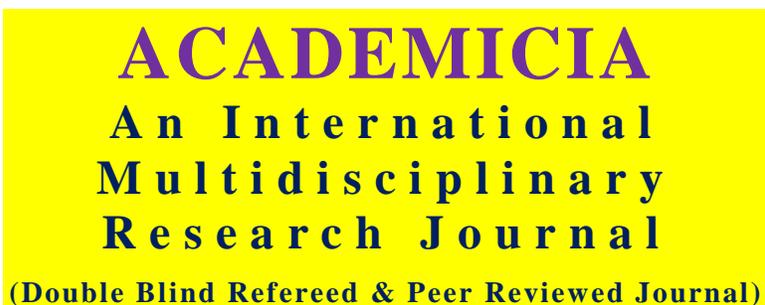

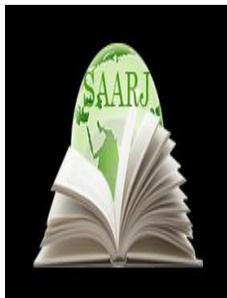

In the first case, the tool for maintaining the system is accounting, control, and direct management. In the second case, such tools are open communication channels and professional development.

The question of the scope of quality assessment also includes the question of the number and structure of a set of indicators by which an educational institution or system is assessed. Too many of them make assessment procedures extremely costly and does not leave schools the opportunity to assess those indicators that are especially significant for a given locality or

culture. On the other hand, random selection of indicators reduces the heuristic value of information. Apparently, the principle of compiling such sets should be reasonable minimum.

## HYGIENE ISSUES WHEN USING INSECTICIDE SELLER IN AGRICULTURE

**A.A. Jumaeva\***

\*Bukhara State Medical Institute,  
UZBEKISTAN

### ABSTRACT

*Based on the conducted research, the safety of the use of the new insecticide Seller in agriculture was established. Scientifically substantiated the maximum permissible concentration of insecticide in atmospheric air, air of the working area, in the soil. Approximately permissible concentration of the drug in products of plant origin, in the water of water bodies has been developed. At the same time, the skin-irritating and allergenic effects of the drug in white rats were studied by applying it to the clipped skin areas, introducing the native drug into the conjunctival sac.*

**KEYWORDS:** *Seller, Toxicity, Hygiene Regulations*

### INTRODUCTION

The environment of activities that contribute to increasing the productivity of agricultural crops, the chemical method of combating weeds, pests and plant diseases has acquired great importance.

The increasing chemicalization of agriculture, contributing to an increase in productivity and obtaining a huge economic effect, simultaneously leads to the introduction of new biological active factors into the environment, which increasingly complicates the problem of protecting it from possible adverse consequences. Now our republic knows more than 100 chemical compounds used in agriculture for these purposes [1,2].

In order to improve measures for environmental protection, hygienists and sanitary doctors of our Republic pay special attention to the need for further development of the theoretical and practical foundations of the hygiene of the use of pesticides [8,9,10,11,17].

Hygienic substantiation of the standards for the permissible level of pesticide residues in food products, the near-limit permissible level (MPC) in the air of the working area and in the

atmospheric air, soil and also in the water of reservoirs, regulation of the conditions for their use, taking into account the whole variety of factors that determine the duration of the preservation of these chemicals in nature, are the basis of the system for the prevention of all kinds of adverse effects on humans [3,7,8,9,10,11].

According to the sanitary legislation, no chemical substance can be allowed for use in the national economy without a deep toxicological and hygienic assessment (Law of the Republic of Uzbekistan, on the sanitary and epidemiological well-being of the population, 2015).

The environment of pesticides used in agriculture, insecticides occupy a special place. Of these, synthetic pyrethroids are widely recognized. These insecticides, for the most part, are relatively low-toxic to warm-blooded organisms. With a single exposure, however, they are noted for high resistance in the environment. The latter feature determines the possibility of their accumulation in the soil, food products, mixing in ecological and food chains, the final link of which is a person [4,5,7,8].

In this regard, and also considering that embryotoxicity, mutagenicity, and other manifestations of biological activity are inherent in individual groups of substances of this class, the introduction of pesticides from the group of synthetic pyrethroids into agricultural practice should be accompanied by their versatile study and strict regulation. High insecticidal and economic efficiency stimulates the search for new pesticides from the class of synthetic pyrethroids.

As a result of such searches, a new, promising insecticide was created - Seller 20% cc. To resolve the issue of the possibility of using them in large areas intended for food crops (wheat), and the development of appropriate preventive regulations, it became necessary for a toxicological and hygienic assessment of this drug, which is included in the plans of the problem commission of the Ministry of Health of the Republic of Uzbekistan.

Our goal was to assess the danger of Seller to humans and develop, taking into account the specific features of farming in Central Asia, regulations that guarantee safety for the environment (soil, air, water bodies) and consumers of plant products grown in hot climates.

Purpose of the study. Our goal was to assess the danger of Seller to humans and develop, taking into account the specific features of farming in Central Asia, regulations that guarantee safety for the environment (soil, air, water bodies) and consumers of plant products grown in hot climates.

### **Research objectives.**

1. To study the persistence, migration and translocation of Seller in the soil-plant system in the soil and climatic conditions of Uzbekistan, depending on the type of soil, the type of irrigation, the rate of consumption of the drug and the season of their growing season.
2. Determine the main parameters of Seller's toxicity for warm-blooded animals with single and multiple administrations, evaluate the cumulative properties of the drug, long-term consequences with repeated administrations necessary for the development of hygienic regulations.
3. To give a comparative characterization of the studied insecticides and those already used, taking into account their chemical structure and biological activity, determining the place of the new pesticide in the series of synthetic pyrethroids with flowing down into the waters.

4. Develop hygienic regulations that ensure safety for the environment (air, soil, water bodies) and consumers of food products of plant origin grown on soil treated by Seller

#### **Scientific novelty of the work.**

Consists in the fact that in the first, multifaceted studies were carried out on the toxicological and hygienic assessment of a new, promising Seller insecticide and a set of hygienic regulations was developed to ensure the safety of its use in agriculture, taking into account factors characteristic of the soil and climatic conditions of Uzbekistan and other Central Asian republics ( type of soil, conditions of irrigation, etc.).

#### **Objects and research methods**

The object of the study was Seller insecticide 20% c.c. produced by "Euro-Team" LLC, Uzbekistan-Germany. The name of the active ingredient is alpha-cyano-3-phenoxytenzyl (2,2-dichlorovinyl) -2,2-dimethylcyclopropane-carboxylot. Chemical class - synthetic drugs, purpose - insecticide.

Scope of application - on wheat against the harmful turtle, piyavitsy.

Seller 20% h.c. - non-systemic insecticide of contact and abdominal action with a pronounced residual effect on treated plants. - non-systemic insecticide of contact and abdominal action with a pronounced residual effect on treated plants.

Preparative form of the drug. Physical state - suspension concentrate, white (light cream) color with a weak chemical odor. The drug is not volatile, not explosive, does not possess corrosive properties.

The toxic effect of Seller 20% xc was studied in sexually mature animals of both sexes (white mice and rats) rabbits. Pre-conditioned in a laboratory mode, when it is introduced into the stomach in the form of an aqueous emulsion by a probe under conditions of acute, subacute and chronic experiments. At the same time, the skin-irritating and allergenic effects of the drug in white rats were studied by applying it to the clipped skin areas, introducing the native drug into the conjunctival sac. When studying the toxic effect and toxicity of Seller 20% xc, the following indicators were taken into account: animal survival, behavior, general condition, body weight, time on symptoms of intoxication and death of animals.

Thus, the study of the toxicity of the drug was carried out in accordance with the methodological manual "Methodology of complex and accelerated rationing of pesticides in environmental objects." Approved by the Ministry of Health of the Republic of Uzbekistan on April 10, 2014 for No. 8N-P / 193

## **MATERIALS AND THEIR DISCUSSIONS**

### **Drug toxicity parameters**

#### **(Own research)**

The study of the acute toxicity of the drug was carried out on laboratory animals - rats. The experiment involved rats of both sexes, which were injected with the drug in doses of 50.0 - 500.0 mg / kg. As a result of the research, the average lethal dose was established at the level of 300.0 (204.0 ± 395.0) mg / kg of body weight, LD16 - 120.0 mg / kg; LD84 - 440.0 mg / kg

(table 1). The clinic of poisoning manifested itself in the following way: the animals became lethargic, nasal discharge, increased salivation, difficulty breathing were noted, the animals assumed a lateral position, after which clonic convulsions were noted.

**TABLE 1 CALCULATION AND ESTABLISHMENT OF SELLER ACUTE TOXICITY PARAMETERS**

Dose mg / kg Heh	Mortality ,% Yx	Place of doses,X	PiercedY	Libra Coeff-tB	X B	X2B	YB	XY
50,0	0	0,5	3,27	1,6	0,8	0,4	5,23	2,9
100,0	16,6	1	4,01	3,5	3,5	3,5	14,04	14,04
200,0	33,3	2	4,56	4,5	9,0	18,0	20,52	41,0
300,0	50	3	5,0	5,0	15,0	45,0	25,0	75,0
400,0	66,6	4	5,41	4,6	18,4	73,6	24,89	99,3
500,0	100	5	6,73	1,6	8,0	40,0	10,77	53,3
		Σ		20,8	54,7	180,5	100,45	286,3

Thus, according to the parameters of acute toxicity, the drug belongs to the III hazard class, according to SanPiN RUz No. 0321-15 "Hygienic classification of pesticides by toxicity and hazard".

#### Irritant effect of the drug

**EYES.** The experiment was carried out on white rats. The drug was introduced in its native form into the conjunctival sac of the animal's eye in the amount of 2 - 3 drops, the second eye served as a control. In 1 hour after application, redness and lacrimation were noted in the experimental eye of the animal. 4 hours after application, there was a slight suppuration, blepharospasm. On the 3rd day, the observed signs of irritation (conjunctivitis) tended to decrease and disappeared on the 4th-5th day of the experiment. Based on the studies carried out, it can be concluded that the drug has an irritating effect on the mucous membranes of the eyes.

**LEATHER.** The experiment was carried out on experimental animals - white rats. On the clipped skin areas, the preparation was applied in its native form, after a 4-hour exposure, the preparation was washed off, and the experimental skin areas were observed. Redness, swelling and occasional cracks were noted on the test sites immediately after application. The observed signs of irritation were noted for 3-4 days, by the 5th day of the experiment, there were no signs of irritation.

Thus, the drug has an irritating effect on the skin. Study of the cumulative properties of Seller's preparation 20% c.c.

The cumulative properties of the drug were studied in a subchronic (4 month) experiment on white rats, which were divided into 2 groups. The first group received the drug at a dose of 1/10 LD50 (30 mg / kg). The second group served as a control. Due to the absence of animal deaths, it was not possible to calculate the cumulation coefficient. However, according to the manifestation of some signs of intoxication (agitation after drug administration), it can be concluded that the drug has a weak functional cumulation.

Study of chronic toxicity of a 20% c.s. seller

The study of the chronic toxicity of the Drug using mathematical modeling made it possible to establish the threshold and inactive dose at the level of 3.0 and 0.6 mg / kg, respectively. The permissible daily dose of the drug was calculated and scientifically substantiated at the level of 0.72 mg / person / day.

Study of the long-term effects of the drug's effect on the organism of experimental animals.

The long-term effects of the drug were studied during a two-year experiment in rats. Experimental animals were divided into 5 groups

I gr control

II was administered 1mg / kg

III was administered 10mg / kg

IV injected 100mg / kg

V was injected with 1000mg / kg

During the experiment for 2 years, the carcinogenic effect of the drug was not revealed. The number of neoplasms in the experimental groups of animals did not exceed the spontaneous level of control. Signs of therotogenicity, embryotoxicity and mutagenicity were also not observed. Thus, Seller insecticide 20% c.w. has no carcinogenic, terratogenic, embryotoxic and mutagenic effects. The toxic effect of Seller 20% xc was studied on sexually mature animals of both sexes (white mice and kris) rabbits. Pre-conditioned in a laboratory mode, when it is introduced into the stomach in the form of an aqueous emulsion by a probe under conditions of acute, subacute and chronic experiments. At the same time, the skin-irritating and allergenic effects of the drug in white rats were studied by applying it to the clipped skin areas, introducing the native drug into the conjunctival sac. When studying the toxic effect and toxicity of Seller 20% xc, the following indicators were taken into account: animal survival, behavior, general condition, body weight, time of symptoms of intoxication and death of animals.

Thus, the study of the toxicity of the drug was carried out in accordance with the methodological manual "Methodology for complex and accelerated rationing of pesticides in environmental objects."

Materials and their discussions. Seller 20% h.c. - non-systemic insecticide of contact and abdominal action with a pronounced residual effect on treated plants. - non-systemic insecticide of contact and abdominal action with a pronounced residual effect on treated plants. Preparative form of the drug. Physical state - suspension concentrate, white (light cream) color with a weak chemical odor. The drug is not volatile, not explosive, does not possess corrosive properties.

### **Drug toxicity parameters**

#### **(Own research)**

The study of acute toxicity was carried out on laboratory animals - rats. The experiment involved rats of both sexes, which were injected with the drug in doses of 50.0 - 500.0 mg / kg. As a result of the research, the average lethal dose was established at the level of 300.0 (204.0 ± 395.0) mg / kg of body weight, LD16 - 120.0 mg / kg; LD84 - 440.0 mg / kg. The clinic of poisoning manifested itself in the following way: the animals became lethargic, nasal discharge, increased

salivation, difficulty breathing, the animals took a lateral position, after which clonic convulsions were noted. Thus, according to the parameters of acute toxicity, the drug belongs to the III hazard class, according to SanPiN RUz No. 0321-15 "Hygienic classification of pesticides by toxicity and hazard".

### **Irritant effect of the drug**

**EYES.** The experimental animals were studied in white rats. The drug was introduced in its native form into the conjunctival sac of the animal's eye in the amount of 2 - 3 drops, the second eye served as a control. In 1 hour after application, redness and lacrimation were noted in the experimental eye of the animal. 4 hours after application, there was a slight suppuration, blepharospasm. On the 3rd day, the observed signs of irritation (conjunctivitis) tended to decrease and disappeared on the 4th-5th day of the experiment. Based on the studies carried out, it can be concluded that the drug has an irritating effect on the mucous membranes of the eyes.

**LEATHER.** The experiment was carried out on experimental animals - white rats. On the clipped skin areas, the preparation was applied in its native form, after a 4-hour exposure, the preparation was washed off, and the experimental skin areas were observed. Immediately after removing the application, redness, swelling and single cracks were noted in the test areas. The observed signs of irritation were noted for 3-4 days, by the 5th day of the experiment, there were no signs of irritation. Thus, the drug has an irritating effect on the skin.

Study of the cumulative properties of Seller's preparation 20% c.c.

The cumulative properties of the drug were studied in a subchronic (4 month) experiment on white rats, which were divided into 2 groups. The first group received the drug at a dose of 1/10 LD50 (30 mg / kg). The second group served as a control. Due to the absence of animal deaths, it was not possible to calculate the cumulation coefficient. However, according to the manifestation of some signs of intoxication (agitation after drug administration), it can be concluded that the drug has a weak functional cumulation.

Substantiation of MPC of the preparation in water of reservoirs

In order to establish the maximum concentration limit of the drug in the water of reservoirs, studies were carried out to study the effect of the drug on the organoleptic properties of water and the sanitary regime of water in reservoirs. According to the influence on the organoleptic properties of water (odor), the threshold concentration is set at 0.04 mg / l. The drug in this concentration did not foam, did not change the color of the water. According to the sanitary and toxicological experience, the threshold concentration was set at 0.72 mg / l.

The complex of the studies carried out, taking into account the data of the sanitary-toxicological experiment, made it possible to recommend the MPC of the drug in the water of reservoirs at the level of 0.04 mg / l, the limiting sign of harmfulness is organoleptic.

Rationale for the MDU of the drug in food

Based on the data on the stability of the drug, the parameters of toxicometry, guided by the generally accepted in hygienic practice approaches to the rationing of pesticides in food, the MRL of the drug is recommended: in wheat - 0.18 mg / kg. However, taking into account the minimum consumption rate of the drug - 0.05 l / ha, there should be no residual amounts of the drug in wheat.

Substantiation of PDK Seller's drug 20% c.s. in the ambient air and the air of the working area

On the basis of methodological approaches to the regulation of harmful substances in the air (methodology-2014, SanPiN of the Republic of Uzbekistan No. 0293-11), taking into account the toxicological parameters and its physical and chemical properties, by calculation, the MPC of the drug in the atmospheric air at the level of 0.002 mg is justified and recommended / m<sup>3</sup>, in the air of the working area - 0.24 mg / m<sup>3</sup>.

Substantiation of the approximate permissible concentration (ode) of the seller preparation of 20% c.s. in the soil

When calculating the approximate permissible concentration (APC) of the drug in the soil, we were guided by the methodological manual "Method for complex and accelerated rationing of pesticides in environmental objects -2014"

The calculation was based on the data of the MRL of the drug in food of plant origin. The recommended OEC of the drug in the soil at a level of 0.2 mg / kg.

## CONCLUSION

Based on the experimental studies and examination of the provided documentation, it was established: Seller 20% c.s. - non-systemic insecticide of contact and abdominal action with a pronounced residual effect on treated plants. The drug exhibits an anti-ingestion action. Scope of application - on wheat against the harmful turtle, piyavitsy. The insecticide affects the intestinal tract and the nervous system of insects. The effect is manifested immediately after treatment within the first hour. The period of protective action is one full season. Spraying during the growing season. The last processing time before harvest is 15 days. According to the parameters of acute toxicity, the drug belongs to the III hazard class (SanPiN RUz No. 0321-15). The study of the effect of the drug on the mucous membranes of the eyes of experimental animals made it possible to establish that the drug has an irritating effect on the mucous membranes of the eyes and skin. The study of the cumulative properties of the drug made it possible to establish that the drug has functional cumulation. The permissible daily dose at the level of 0.72 mg / person / day has been scientifically substantiated. Insecticide Seller 20% k.s does not have carcinogenic, mutagenic, embryotoxic effects.

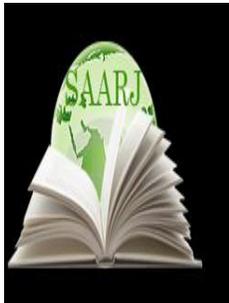

On the basis of the complex of the studies carried out, the hygienic standards Seller 20% k.a were developed and recommended: MPC in the water of reservoirs at the level of 0.04 mg / l (the limiting sign of harmfulness is organoleptic); MPC in the air of the working area - 0.24 mg / m<sup>3</sup>; MPC in atmospheric air - 0.002 mg / m<sup>3</sup>; The MRL in wheat is 0.18 mg / kg, the APC in soil is 0.2 mg / kg. Sanitary protection zone (SPZ) - 200 meters; terms of going to work - 7 days.

Thus, on the basis of the above, Seller insecticide 20% c.w. can be recommended for use in agricultural practice, subject to the mandatory use of personal protective equipment for the eyes, skin, respiratory system (irritates the eyes and skin) and compliance with the drug use regulations, recommended consumption rates and safety measures when working with pesticides.

## THE COMMONALITY OF MUSIC PSYCHOLOGY AND SOPHISTICATED EDUCATION IN MUSIC TEACHING METHODS

**Azizov Orifjon\*; Zoirov Zarif\*\***

<sup>1,2</sup>Senior Teachers of TerSU,  
 UZBEKISTAN

### ABSTRACT

*The article examines the problems of upbringing the younger generation, the comprehensive harmonious development and formation of the worldview, as well as in the field of integration of the direction of the musical profession, in connection with the methodology of musical education, the psychology of music, aesthetic interpersonal communication and the formation of youth culture.*

**KEYWORDS:** *Music Psychology, Education In Music Teaching Methods, Music Culture, Psychological Influence Of Music, Music Education, National Melody, Music Literacy.*

### INTRODUCTION

One of the most important tasks of music culture teachers is to teach the younger generation in good faith, to bring them up in the spirit of devotion to the Motherland, to bring them up as mature people and to contribute to their stability in the spirit of sincerity and justice. Because people who are engaged in the art of music are generous and elegant people, and their spiritual world is more abandoned than other intelligent people. They are especially attentive in expressing their sense of persuasion with their spiritual abilities, opinions, professional, moral dealings, and spiritual insights. When you listen to a good piece of music, the melodies in it touch your heart and arouse your delicate and elegant feelings. So, the subtlety and the psychology of music have in common. Music itself is a world, and the world is filled with art, beauty and pleasure. there is a great need for learning psychological aspects of music.

In the field of music psychology, the characteristics of the mental states of the performer in the process of performing a piece of music are used to study the possibilities of psychological influence of music. The main goal of nurturing elegance is to teach our youth to love beauty and enjoy it. Beauty and sophistication are present in every melody - in the song, in the process of work. Therefore, it is important to be able to understand it and enjoy it. Especially in today's

world, where technology is evolving with active imagery, professionals are faced with the important task of instilling the positive qualities of music in the hearts of young generations. At present, experts are developing preventive measures, realizing that many of our young people can have a negative impact on the future of our young generation by listening to cluttered, meaningless music from the West. Based on the above, we believe that the education of sophistication through music education should begin with the correct formation of the young generation's sense of sophistication, albeit primarily through the improvement of pre-school education. Because listening to music and enjoying it is an art.

The songs of every nation, but our upbringing is an important factor in the dreams and aspirations of our people, their life experiences, our folklore - ethnographic and traditional melodies - songs that reflect their spiritual world. In the process of educating young people through music education, we must take our national heritage as a basis. We music teachers need to feel very responsibly what a great opportunity music and sophistication are in the upbringing of the younger generation. We, the teachers, must work to raise the musical culture of our youth, to expand their spiritual world, without tones. Of course, it is necessary not only to turn to the national melody, but also to consciously listen to the works of mature composers: Beethoven, Mozart, Chopin, Schumann, Khachaturian, Tchaikovsky, Shostokovich and other musicians. Today, the implementation of a number of decisions on the development of music education and upbringing of young people, as well as the organization of international activities play an important role in the development of aesthetic education and national spirituality in young people. The more musical knowledge young people have, the more they receive spiritual nourishment from the art of music, and perfection, honesty, kindness, and goodness reign in their hearts.

In the development of socio-economic relations in the XXI century, it is becoming increasingly clear that the human mind and spirituality are the main coordinating, developing factor and tool. Therefore, today, as the process of understanding the national identity of our people is becoming more active, the spiritual and moral significance of young people is becoming increasingly important. Therefore, the formation of a new national-minded person is important for the development of our society. Since gaining independence, our society has opened a wide range for the development of music in our country. Taking into account these facts, the science of music psychology is one of the important directions of modern demand in increasing the interest and interest of students in the art of music, musical literacy. Due to the great changes in the field of art, developed on the basis of the "National Program of Personnel Training" adopted by the state, the attention and need for music is growing significantly, and the interest in it is growing. Music performance is a complex psychological and physiological process, and the most active form of teaching is the moral and sophisticated education of young students in music lessons on the basis of various songs, theoretical concepts. Therefore, in music, human perfection and the spirit of the nation live.

By further developing students' competencies, it is of great importance in cultivating their knowledge of the environment, aesthetic appreciation, artistic taste and love for music. The teacher's ability to engage students in music lessons helps them to understand the piece of music, to compare it with this or that process. In order to feel music emotionally, you need to know how to listen to it. Because this skill teaches children to feel a unique musical language by analyzing simple musical works, focusing their attention on musical instruments. We can say that the

preservation and promotion of national values through music education, especially the teaching of our youth to feel and love the independence of our country, plays an important role in the further development of sophistication among young people. The art of music is one of the most ancient and deeply ingrained in the life of the Uzbek people. Classes conducted in music lessons in accordance with the rules of music psychology, increase the spiritual and moral qualities of students, develop speech, form a voice, musical ability. It is possible to teach any child to sing directly, but it is a complex process because it requires great professional skill, patience and research from the teacher. If the song being studied is of interest to the children, the work on their performance skills will not be boring for the students. Because it is the means of psychological communication that can lead to the world of sophistication. In the process of teacher's teaching a music to sing correctly, children's singing skills become a skill-slowly methodical achievement.

Music is able to stir up a person's delicate feelings and rich emotional relationships in the mind. Today, based on the experience of speech techniques, it is planned to work on complexes such as speech breathing, sound. While breathing provides life to the body, it makes sounds, speaks, and sings with the help of sound-producing organs. So, the basis of song performance is the rhythm of breathing. Therefore, proper breathing and exhalation techniques are among the most important elements.

It is known that there is a certain difference between breathing in singing and physiological breathing. Physiological respiration begins to follow the child naturally and occurs from a certain rhythm, over a period of time. When singing, air intake occurs quickly, in a short period of time. Inhaling and exhaling, on the other hand, depend on the length, tempo, and description of the song. Because young children's chests are still narrow, they breathe through their breasts, so it's natural for them to lift their shoulders as they sing, rush in, and breathe in the song's sentence, word. Therefore, children should be taught to breathe calmly and calmly and to convey it to the end of the song, especially not to breathe in words. In the process of working on breathing skills, children are taught to breathe calmly and without noise, drawing attention to the melodious, smooth, pleasant sound of sounds. In the implementation of these skills are formed in practical classes, such as singing vocal and choral exercises recommended in textbooks and manuals, listening to songs performed in children's choirs. As children sing exercises and songs, they become accustomed to breathing according to the teacher's hand gestures and delivering it to the end of the sentence, saving it. It is especially important to teach the conductor to sing according to the rules of "attention", "auf", "start the performance", "finish the performance". Breathing areas are pre-determined in exercises and songs that take into account the capacity of children's breathing volume and are carried out during the training process. Students will enjoy performing songs learned with the help of fine arts and music psychology skills, while singing will enhance creative collaboration, and friendly sympathy will enable the community to explore life through the content of the song, with a deeper understanding of the song's meaning and melody. To achieve the results described above, it is possible to achieve a pleasant and melodious, pure song performance based on the psychology of music and the upbringing of sophistication.

The formation of preparatory skills for the formation and development of children's voices is done through special exercises. Experience has shown that vocal-choral exercises can be a great help in developing students' singing skills. Exercises are used for a variety of purposes, such as balancing the airways, achieving pure pronunciation, leveling sound registers, and other tasks,

resulting in vocal-technical exercises gradually becoming more complex. It is known that there is a certain difference between breathing in singing and physiological breathing. Physiological respiration begins to follow the child naturally and occurs from a certain rhythm, over a period of time. When singing, air intake occurs quickly, in a short period of time. Inhaling and exhaling, on the other hand, depend on the length, tempo, and description of the song. Because young children's chests are still narrow, they breathe through their breasts, so it's natural for them to lift their shoulders as they sing, rush in, and breathe in the song's sentence, word. Therefore, children should be taught to breathe calmly and calmly and to convey it to the end of the song, especially not to breathe in words. In the process of working on breathing skills, children are taught to breathe calmly and without noise, drawing attention to the melodious, smooth, pleasant sound of sounds. In the implementation of these skills are formed in practical classes, such as singing vocal and choral exercises recommended in textbooks and manuals, listening to songs performed in children's choirs. As children practice and sing songs, they become accustomed to breathing according to the teacher's hand gestures and saving it to the end of the sentence. It is especially important to teach the conductor to sing according to the rules of "attention", "auf", "start the performance", "finish the performance". Breathing areas are pre-determined in exercises and songs that take into account the capacity of children's breathing volume and are carried out during the training process.

The process of singing is based on sounds. The quality of the vocal sound depends on how the vowels are formed. Sounds come naturally when we speak. The production of vocal sounds depends on the condition of the vocal articulation apparatus (lower jaw, lips, tongue). The free position of the lower jaw while singing is a necessary condition for the correct pronunciation of the vowels. Language also plays an important role in the formation of vowels. Vowel sounds in speech are less than consonant sounds. If we look at the use of vowels in a song, they are divided into open and insidious closed sounds, for example: a, e, i, o, u, we can call the letters open vowels. Each song learned is a new step on the way to mastering work skills. It should be noted that the exercises are not intended to pronounce only the vowels correctly. In exercises, consonants come in the same order, and vowels come in the same order: a, u, o, i, e or i, e, a, o, u. These exercises should change the position of the lips correctly while singing and at the same time make sure that the lip is in a folded position. The skill of the teacher is that he should, with his subtle feelings and psychological attitudes, encourage them to strive for heights.

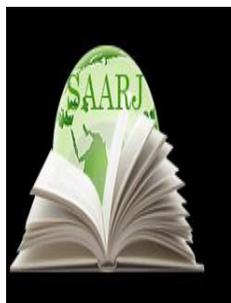

The instrument of professional music art is the note, which is performed on the basis of melodies and songs. Therefore, it is the main task of every music teacher to teach students the notation signs step by step. Based on the above considerations, it would be expedient if all music lessons and extracurricular activities in the field of music art of educational institutions were conducted on the basis of notes.

The work on music literacy is a set of general knowledge, concepts (performance, folk and compositional music, their differences, local styles of national music, classical music) that make up the general level of musical knowledge of students. Music literacy develops students' conscious attitude to music and its means of expression, helps them to understand the true meaning of music, develops the skills of singing and chanting, as well as the development of harmonic abilities. At the same time, it facilitates the accurate pronunciation of sounds and increases the quality and efficiency of singing as a group.

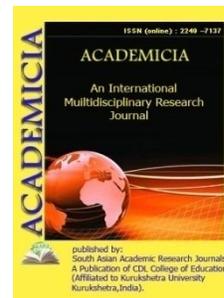

In conclusion, there are specific features of the implementation of music education, which are carried out through the implementation of several activities, namely, artistic performance, listening and analysis of music, knowledge of music literacy. It should be noted that in order to ensure the effectiveness of all musical activities, it is necessary to organize the work with an individual approach to them. It depends on the professional potential and pedagogical skills of the teacher.

**ABSTRACT**

*In experimental animals on the model of acute tetra chloromethane hepatitis, a high choleric activity of Rutan was established, which is not inferior in its effectiveness to Legalon. It is considered possible to further develop the drug as an effective choleric agent in the prevention and treatment of pathologies of the hepatopancreatobiliary system. The animals were fed with natural and briquetted feed, in accordance with the approved standards. Experimental groups of animals were formed of 6 animals each, taking into account body weight. Moreover, in the latter, the duration of the hypnotic effect of sodium etaminal does not statistically significantly differ from the values of healthy rats.*

**KEYWORDS:** *Acute Toxic Hepatitis, Bile Formation, Polyphenols, Rutan.*

**INTRODUCTION**

Diseases of the liver and biliary system occupy a significant place in the general structure of the incidence of the population. In recent years, there has been a tendency towards a steady increase in this pathology. According to the WHO, in 2015, viral hepatitis was the cause of 1.34 million deaths worldwide. The death rate due to viral hepatitis is increasing year after year. The preservation of the functional activity of the liver allows adequately to a high degree to ensure the vital activity of the internal organs, since, along with the synthetic processes in the liver, the processes of detoxification of exogenous and endogenous toxic substances, perverted metabolism in various pathological conditions. At the same time, as the central organ of detoxification and energy supply of other organs, the liver is the main one in reducing the level of endogenous intoxication and glycogen storage [1]. In this connection, in extreme conditions,

the supply of energy resources and detoxification of xenobiotics that require urgent switching on can be realized only under conditions of normal liver functioning.

Hepatoprotectors are one of the most important drugs designed to prevent lesions of hepatocytes when exposed to factors of infectious and non-infectious origin. An objective criterion for the pharmacological activity of this group of drugs, as you know, is their stimulating effect on the process of bile formation and bile secretion. Clinical observations show insufficient pharmacotherapeutic. the activity of drugs used in modern medical practice for the prevention and treatment of liver pathologies [3,4]. Despite the large number of pharmacological agents used. in the complex treatment of diseases of the hepato-pancreatobiliary system, which have a selective effect on the liver, is a relatively small group [4].

One of the ways to correct violations of the functional state of the liver in case of toxic damage is the use of hepatoprotectors, and especially of plant origin [2,3,6], the bulk of them are supplied from abroad. However, the huge raw material base of the Republic allows the creation of effective hepatoprotective agents. In this regard, we were interested in Rutan, which is a polyphenolic compound isolated from the tannin-bearing plant *Rhus coriaria* L. with high antiviral activity [7,8]. This choice was based on the fact that polyphenolic compounds are antioxidants [10,11] and therefore have positive influence on the course of pathological processes in the pathogenesis of which an important role is given to free-radical oxidation of membrane lipids [6,9,11,12]. However, there are no studies to establish the effectiveness of Rutan in the correction of violations of the biliary function of the liver in acute toxic hepatitis induced by carbon tetrachloride.

**The aim of this work** was an experimental study in a comparative aspect of the choleric activity of Rutan and Legalon in rats with acute toxic hepatitis.

## **MATERIALS AND RESEARCH METHODS**

Experimental studies were carried out on sexually mature male rats with an initial weight of 185-210 g, kept under standard conditions of biological clinics. The animals were fed with natural and briquetted feed, in accordance with the approved standards. Experimental groups of animals were formed of 6 animals each, taking into account body weight. The experiments were carried out in accordance with the quality laboratory rules (GLP) for preclinical research, as well as the rules and International Recommendations of the European Convention for the Protection of Vertebrate Animals used in Experimental Research (1986). Acute toxic hepatitis (AHT) was reproduced by subcutaneous injection of a 50% oily solution of carbon tetrachloride. A 50% oily solution of carbon tetrachloride in olive oil was prepared and injected subcutaneously at the rate of 0.5 ml / 100 g. body weight for 4 days. 24 hours after the last injection of hepatotoxin, the animals of one group were injected intragastrically with a freshly prepared aqueous suspension of Rutan at a dose of 25 mg / kg, another group of animals received Legalon at a dose of 100 mg / kg intragastrically. The control group of rats during this period of the experiment received aliquot volume of water inside. The next after the last administration of drugs under general anesthesia induced by sodium etaminal (intraperitoneal, at a dose of 50 mg / kg), the intensity of bile secretion and the chemical composition of bile were studied. The choleric activity of the drug was judged by the total amount of excreted bile for 4 hours of the experiment, as well as by the concentration and amount of its components (bilirubin, cholesterol and bile acids). In hourly portions of bile, the concentration (mg%) and the total amount (mg per 100 g of body weight) of

bile acids, cholesterol and bilirubin were determined [5]. In the second series of experiments in similar groups of animals, the effect of Legalon and Rutan on the duration of etaminal sleep was investigated. For this purpose, a freshly prepared sodium etaminal solution was injected intraperitoneally at a dose of 50 mg / kg and the time spent by the animals in the lateral position and the absence of the rolling reflex was taken into account.

The obtained digital material was statistically processed using the standard Biostat 2009 software package according to the well-known methods of variation statistics with an assessment of the significance of indicators ( $M \pm m$ ) and differences in the samples under consideration using the Student's t-test. Differences in the compared groups were considered significant at a significance level of 95% ( $p < 0.05$ ).

## RESEARCH RESULTS AND THEIR DISCUSSION

Hepatoprotectors are complex preparations, mainly of plant origin, designed to increase the liver's resistance to toxic effects, help restore its functions, normalize or enhance the activity of enzymes of the antioxidant system of hepatocytes [2,3]. Carbon tetrachloride is used in experimental works as a model of acute toxic liver damage [1,5,6,9,10]. Developing liver failure associated with intensification of peroxidation processes, production and accumulation of highly toxic metabolites, leads to necrosis of hepatocytes and liver fibrosis [12]. According to modern concepts, free radical reactions play a significant role in the development of pathology with toxic liver lesions. Reactive oxygen species cause an increase in the intensity of lipid peroxidation of cell membranes and, as a consequence, a violation of its function.

It was noted that carbon tetrachloride causes significant structural changes in hepatocytes, which ultimately leads to metabolic disorders, and especially, such that occur exclusively in the liver [5,9,12].

**TABLE 1 EFFECT OF LEGALON AND RUTAN ON THE BILIARY FUNCTION OF THE LIVER IN RATS WITH ACUTE HEPATITIS INDUCED BY CARBON TETRACHLORIDE (FOR 4 HOURS OF EXPERIMENT PER 100 G OF BODY WEIGHT)**

Groups	Bile ml	Bile acids mg	Cholesterol mg	Bilirubin, mcg
Intact	1,118 + 0,0332	7,19 + 0,39	0,201 + 0,011	138,6 + 7,17
Hepatitis	0,742 + 0,0298*	4,35 + 0,13*	0,148 + 0,007*	67,45 + 5,74*

Note: \* statistically significant difference compared to intact animals

# - statistically significant difference in comparison and hepatitis.

As can be seen from the data in Table 1, rats with acute toxic hepatitis have a statistically significant decrease in bile secretion by 33.6% compared to healthy animals. Considering the fact that bile is a product synthesized exclusively by hepatocytes [5,12], it can be assumed that the functional state of the liver is inhibited. This effect in acute toxic hepatitis induced by carbon tetrachloride is reflected in the results of the study of the content of the main components of bile.

In animals with hepatitis, the total content of bile acids in bile decreases by 39.5%, cholesterol - by 26.4% and bilirubin - by 51.3%. Consequently, in acute toxic hepatitis caused by carbon tetrachloride, there is a significant inhibition of the functional state of the liver, which manifests itself not only in the inhibition of the amount of secreted bile, but also in a decrease in the content of its main components in it. Since the synthesis of bile acids from cholesterol is carried out in the endoplasmic reticulum of hepatocytes, where the monooxygenase enzyme system is located, which also carries out the biotransformation of xenobiotics [1,5,12,13], it can be assumed that tetrachloromethane causes significant damage to the membranes of this organoid.

This assumption is based on the fact that the formation of toxic free radicals during the metabolism of carbon tetrachloride leads to degradation of the membranes of the endoplasmic reticulum of hepatocytes, causing the suppression of the activity of membrane-bound enzyme complexes that carry out the biosynthesis of the main components of bile [5,12,13].

Bilirubin is known to be excreted in bile exclusively in the form of glucuronides and therefore a decrease in its level in the bile of rats with acute toxic hepatitis indicates inhibition of UDP-glucuronyltransferase activity, which is also localized in the endoplasmic reticulum [5,12,13].

In animals with acute toxic hepatitis, after treatment with Legalon and Rutan, there is a clear restoration of the functional state of the liver. Thus, the volume of excreted bile in 4 hours of experience in rats treated with Legalon increases by 22.5%, and by Rutan - by 40%. At the same time, the value of the studied indicator does not differ statistically significantly from the level of healthy animals. Along with this, in animals treated with Legalon, bile in comparison with the untreated group increases the content of bile acids by 35.2%, cholesterol by 18.2% and bilirubin by 42.9%, and in those treated with Rutan, the increase in these substances was 57 , 5%, 30.4% and 93%. It can be seen that the effectiveness of Rutan in the correction of disorders of the biliary function of the liver in acute toxic hepatitis induced by carbon tetrachloride was somewhat high in comparison with Legalon. Thus, the presented results indicate the high pharmacological activity of Rutan as a choleric agent.

As noted above, violations of the bile-forming function of the liver are based on a violation of the functional activity of the monooxygenase enzyme system localized in the endoplasmic reticulum of hepatocytes. Based on this, it can be assumed that the investigated pharmacological agents have a restorative effect on this enzyme system of hepatocytes. To assess the intensity of the processes of bio-transformation of xenobiotics in the liver by the monooxygenase system in vivo, experimental studies with the use of test drugs such as sodium etaminal are widely used, the duration of sleep caused by it fully depends on the intensity of its metabolism [1,14 ,fifteen]. Considering this circumstance, in a separate series of experiments, in a comparative aspect, we studied the effect of Legalon and Rutan, during their therapeutic use, on the duration of sleep caused by sodium etaminal. The results of this series of experiments showed that in the group of rats with acute toxic hepatoma, the duration of barbituric sleep is  $178.2 \pm 15.23$  min versus  $82.4 \pm 3.74$  min in healthy rats, that is, compared with the latter in acute hepatitis, the duration of the hypnotic effect of sodium etaminal is extended by 116.3% (more than twice). Therefore, it can be assumed that in acute toxic hepatitis, the intensity of biotransformation of this barbiturate is significantly slowed down. This fact is in line with the results of other researchers [1,14,15]. In contrast to this, after experimental therapy, the duration of sleep is shortened: in the group of rats treated with Legalon by 33.2%, and in the group treated by Rutan - by 45.8%. Moreover, in the

latter, the duration of the hypnotic effect of sodium etaminal does not statistically significantly differ from the values of healthy rats. These data allow us to conclude that the hepatoprotector Legalon, and especially Rutan in rats with acute toxic hepatitis, clearly restore the functional activity of the monooxygenase system, which is manifested in the shortening of barbituric sleep due to the acceleration of the biotransformation of the drug.

These results fully confirm the assumption that it is the restoration of the functional activity of the monooxygenase enzyme systems of hepatocytes that underlies the beneficial effect of Legalon and Rutan on the bile-forming function of the liver in acute toxic hepatitis induced by tetrachloromethane.

Since the pathogenetic link in the harmful effect of carbon tetrachloride is associated with the formation of free radicals, the results of this work allow us to assume that Rutan has antioxidant activity, because flavonoids have the greatest ability to quench free radical activity [7,8,9,10,11] and have important pathogenetic importance in the restoration of damaged cell-cell structures of hepatocytes, ensuring the full functioning of membrane-bound enzymes involved in various metabolic processes. Considering the given data, it can be stated that Rutan has a high antioxidant activity, which does not differ in its strength from Legalon. The results of this work can serve as the basis for further research on the creation of drugs with a selective effect on the liver. It is relevant not only to search for new effective and safe hepatoprotective drugs, but also to further experimental and clinical studies in a comparative aspect of the pharmacodynamic features and intimate mechanisms of action of already known hepatoprotective agents.

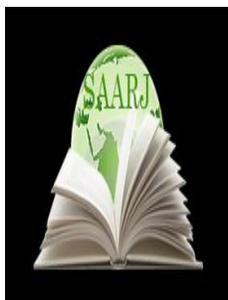

## CONCLUSIONS

1. An increase in the secretion of bile and the restoration of the content of its main components in it after the experimental pharmacotherapy with Rutan in rats with acute toxic hepatitis suggests that the drug has a pronounced choleric activity.
2. Rutan in its choleric activity is not inferior to the well-known hepatoprotector Legalon .
3. The basis of the beneficial effect of Rutan on the biliary function of the liver in its acute toxic lesion is the restoration of the functional activity of the monooxygenase enzyme system of hepatocytes.

 UZBEKISTAN

### ABSTRACT

*This article briefly describes the confusion within the subject of semantics and lexicology, dysphemism and cocophemism, dysphemism and vulgar words, dysphemism and slang, slang and neologisms, slang and jargon, slang relations as one of the current problems in world linguistics. The concept of slang is defined, different from other units. In this regard, the views of world linguists are compared, and attitudes to them are expressed.*

**KEYWORDS:** *Semantics, Lexicology, Trop, Dysphemism, Cocofemism, Vulgarism, Neologism, Slang, Slang, Kant, Official Status, Standard And Nostandard Words;*

### INTRODUCTION

As the subject of semantics, dysphemism is a manifestation of the trop, and the trop is the expression of a concept, the derivative meaning of a particular word. O.S.Akhmanova evaluates dysphemism and cocofemism as a mutual lexical doublet. It should be noted that dysphemisms have, first of all, an expression based on the derivative meaning of the word, as well as a crude, crude meaning.

In the part of M.N. Kozhina's book on russian stylistics entitled "Literary and colloquial lexicon" he discusses "barbarism" and gives it a commentary in the form of "colloquial lexicon used in written-biblical communication, albeit unpleasant" [1,117]. This comment is also consistent with the commentary for vulgarisms in O.S. Akhmanova's "Dictionary of linguistic terms" [2,92]. Thus, barbarism has nothing to do with semantics, especially dysphemism, and it is the object of lexicon. O.S.Akhmanova puzo/`belly`, rylo /`pig's, harya /`face`, sterva /`raven` and others cites the barbarisms spoken of in relation to man, and emphasizes that they express a rough, crude expression only in the sense of a product [1,117]. Professor M. Mirtojiev does not agree with O.S.Akhmanova's opinion, he considers that these words belong to the trop, ie dysphemism, and not to barbarism [3,129].

There is almost no information about dysphemism in English linguistics. Instead, the concept of slang has been extensively analyzed. This should not lead to the conclusion that the duplication of the terms dysphemism with slang gives the same meaning of language. The concept of slang is much broader than the concept of dysphemism. According to I.V. Arnold, important features of slang are their rudeness and rudeness, rudeness and emotionality, lack of compliments and lively humor. These signs attributed to slangism are almost identical to the sign of dysphemisms. Only the sign of live humor is absent in dysphemisms. The breadth of slang from dysphemism is not limited to this, that is, it is expressed in the form of a trop, the lexical unit is also common within the phraseology [4,90]

For this reason, the study of slang has been of interest to many linguists. Of particular note is the existence of a bibliography of articles and scientific works, a dictionary, and even a literature on the study of slang, written by I.V. Arnold [5,269].

Some English linguists are in favor of a sharp struggle against it, claiming that slang corrupts and defiles the literary language [5,266]. This claim is unfounded. Every event and every fact in language cannot and will not be created outside the general law. As long as he is wounded at certain stages of the laws of language, the very declaration of a struggle against it is in vain, a utterly contrary to the laws of the nature of language.

Sources include sailors, soldiers, athletes, actors, lawyers, students, and other types of slang, according to the coverage of slang [5,267]. They are the unique slang of each industry. But slang is not associated with dysphemism. The distinction of slangs from dysphemisms on certain grounds has been noted in the literature [3].

Jargon and slang come from the French, and the term slang comes from the English word slang. These three terms are often used as synonyms. Jargon is a set of words and phrases used by members of a social group to differentiate themselves from others, but slang, unlike jargon, is a more or less artificial language that is deliberately misunderstood by any social group. They are more common in the speech of criminals, thieves, drug addicts who are considered the lower strata of society.

Slang is an emotionally-expressive word or phrase used in the oral discourse of certain professionals or social groups. Slang is more common in the speech of young people [9,366].

I.V. Arnold considers some neologisms as slang. It is well known that neologisms cannot be either jargon or dysphemism. Because for dysphemism and slang it is necessary to express a subjective attitude to the referent. There is no such condition in neologism.

Today, the study of slang is one of the current problems of linguistics. Every linguist has his or her own views in this area, and a number of conflicting opinions have emerged as a result of the debate and discussion on this issue.

So, "What is slang?". There are also words in the lexicon of world languages that are difficult to understand and not universal. At first glance, they seem to have their own meaning, but they are not the same for everyone.

This term has been variously defined by linguists. Linguists distinguish slang from other words or dialects, colloquial speech, popular phrases, gestures, or jargon. Because slang, unlike other words, can mean (concisely) easily.

According to “Wonderopolis” (Wonder of the Day), the term slang first appeared as a dialect word in North America, and for some time they were used by people selling products and advertising their products in certain areas. Gradually, the slangs became the most brilliant, unconventional sociologists for the “advertising” of merchants selling their products [10, 2130].

Linguist I.R.Galperin, on the other hand, describes the origin of the term slang more according to Western American linguistic traditions [11,6].

It is known that the newly emerging slangs in the language is gaining popularity very quickly. They begin to appear as words that give new meaning instead of existing words, or in the form of shortening words. So what is the source of so many slang? Language is constantly evolving. People are looking for new creative ways to express their thoughts and attitudes, and as a result, new words are starting to appear instead of old words and expressions.

Well-known linguist I.R. Galperin notes in his 1971 book, “Stylistics”, that many linguists have expressed their views on “slang”, but have not been able to fully elucidate its essence. What amazes him and other linguists is that there is no special layer called “slang” in any European language, but they are all studied in the context of slang, and similar words.

I.R.Galperin why it became necessary to create a special term for something that was not clear, such as jargon and kant; this phenomenon is unique to English; a special feature that is not present in nonverbal words is sought on questions such as whether it is present in slang, and a definite conclusion is drawn.

While acknowledging that “the difference between slangs and non-traditional words is not noticeable, but a little complicated to understand”, I.R. Galperin denies its existence in language altogether, noting in his scientific article “About termin slang” that the concept of slang is ambiguous. Based on the research findings of English lexicographers, that is, each word (term, dictionary, lexeme) should have its own different linguistic interpretation, the linguist does not include slang as a group of words with independent meanings, but recommends their use as a synonym for slang [12, 96].

Despite the above considerations, while another group of linguists recognizes the existence of slang as a separate social dialect, another group considers them to be in the context of “separate” (private) use. In particular, A.V. Ovchinnikova in her article suggests that the Norwegian term slang means “slengenamn”, “nickname”. Explains that slang was first used in English in the mid-18th century (1756) in a dictionary of thieves and swindlers. In colloquial language, slang with modern expressions begins to appear in the 1818 year [13,59].

The slang is defined in the Great Oxford dictionary of modern English “Oxford dictionary” as “separate informal words and phrases widely used in speech by members of a particular group (children, criminals, the military, etc.)” [14].

According to another linguist V.V.Khimikov, slang is a non-normative lexical-phraseologically simple colloquial language unit under a practically open system, whose stylistic appearance or distinctive feature can be seen only in the enhancement of expressiveness (negative meanings) and emphasizes that it belongs to people, young people to the elderly, and at the same time to those who have a social affinity for a stranger (ours) [15].

English linguist Mariam Webster notes that slang is a means of communication, they are among the most informal and non-standard dictionaries, and slang serves as a means of social signals. In his book, “New world dictionary of the American language”, he explains the term *slang* as: in fact, criminals, a special dictionary of idioms, and colloquial expressions whose purpose is to mask the opinions of others (now they “cant” in English); special (specialized) dictionaries and phrases for people with the same job (field) and the same way of life (now they are commonly referred to as “argot”); colloquial language has two meanings in addition to the standard and ordinary language used in sketch speech: new and expanded meanings. They develop in search of new, powerful, sharp, or humorous phrases, from a database of unused words, or from words that have official status [12,96].

In The book “The New Oxford English Dictionary, slang is defined as follows: a special dictionary which is used by lower-class or unscrupulous individuals, i.e., “rude” words (1); cant or jargon belonging to a particular class (class) or period (2); the use of new words or current everyday words in specific meanings, which do not belong to the standard literary language, belong to the type of high-spoken speech (3) [12,96].

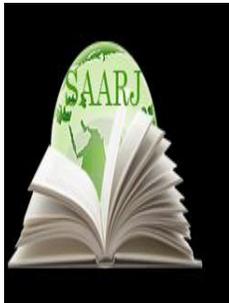

Conflicts between standard and non-standard words are eliminated in the language, leading to the creation of a single universal dictionary system. However, it should also be borne in mind that such sociolects play an important linguistic role in determining the non-standard words in a language as a social lexical unit, the speaker’s worldview, the possibility of discourse, and which social group they belong to.

From the above considerations, it is clear that there is some confusion in world linguistics within the subject of semantics and lexicology. For example, dysphemism and cocofemism, dysphemism and vulgar words, dysphemism and slang, slang and neologisms, slang and jargon, slang and so on. Based on the analysis, it can be said that slang is a broader concept than dysphemism. So, if so, what other units does its coverage include? The question naturally arises. It is natural that the equating of the term slang to dysphemism, neologism in the sources further complicates the problem. To this end, the study of the nature of slang is becoming more relevant and necessary than ever.

### ABSTRACT

*The article focuses on the analysis of articles involving antonyms. Theoretical information about antonyms is based on examples. The role of this phenomenon in the lexical level, in particular in the structure of proverbs from paremiological units, is of particular importance. The use of stable combinations, especially proverbs, is important in artistic discourse. One can see contextual antonymic units such as lubrication // thorn bonding in the parema of someone who speaks on the basis of a proverb, someone who speaks on the basis of a proverb. The antonyms are based on the smooth, thorny semantics of the lexeme of lubrication, such as bitterness and pain.*

**KEYWORDS:** *Lexoantonyms, Paremiological Unity, Connotation, Oppositional Attitude, Contextual Antonymy, Aesthetic Function.*

### INTRODUCTION

There are a lot of descriptive means and special lexical possibilities of language. These include synonyms and antonyms, archaism and neologisms, jargon and professionalism, barbarism. Contradictory words play an important lingvopoetic role in expressing the effectiveness and expressiveness of a work of art. In the classical literature of the East, the possibility of this expression in language has been widely used since time immemorial. Linguist A. Rustamov writes about it: "One of the most important arts for a poet is valid. In the art of hazard, art critics say the opposite is true. " The fact that this art is called "antithesis" in the European philological tradition is emphasized in the linguistic literature. Antithesis - (Greek. Antithesis - contrast) is a stylistic figure consisting of contrasting ideas, concepts and images. S.Karimov describes this method as follows: "The method of antithesis in the language of fiction (in classical literature, this method is called tazod) is based on

The antonym is Greek for "anti", onoma - "name". Contradictory words, phrases and additional antonyms. Lexical units in the language of a work of art, such as synonyms, antonyms, homonyms, and polysemous words, are a convenient and productive tool for expressing the artistic and aesthetic purpose of the artist. "Antonyms play an important role in the language of a work of art: they reveal the object of the image with its internal contradictions, exaggerate and brighten the event."

In order to increase the expressiveness of the speech, the content is contrasted with the contradictory concepts, and logically with the contradictory ideas. The phenomenon of antithesis is observed at all levels of language. The role of this phenomenon in the lexical level, in particular in the structure of proverbs from paremiological units, is of particular importance. The use of stable combinations, especially proverbs, is important in artistic discourse. Abdullah Qahhor, a master of words, also used proverbs with antonyms in his works.

The use of proverbs in the speech process enhances the per location expressed in context. In this sense, we believe that the place of proverbs in the literary text is individual. The artist uses proverbs creatively to describe the inner world of his characters and to describe them verbally. This is especially true of Abdullah Qahhor's stories. The following is an analysis of articles with antonyms:

In the story, "Hypocrite" Nizomiddinov is portrayed as a clumsy, lazy, greedy character. The participants of the meeting are bored with his speech and often demand that he come to clear conclusions without repeating the views expressed. *"I will, of course, go to the concrete facts,"* said Nizomiddinov, turning the pages frequently. *"Be patient, and the meat will not be without bones."*

The last sentence of the character's speech seems out of place. . In this way, Nizomiddinov exposes himself and admits that his words are baseless. The proverb that the meat used in the speech is not boneless has a hidden meaning and indicates the existence of good/bad people in life. In this case, the semantics of the meat lexeme, such as softness, edible, bone lexeme, hardness, inedible, create a contextual antonym.

From the story of the "tailed people": "After dinner, the guest went to bed. I went to the office to pour all my poison on my nephew. My nephew laughed when he heard the story, and he made me angry. "Besides, this man is a trust to you, and you should not betray the trust, but hand it over to me in good health." I lost my temper. The protagonist entrusts an unnatural foreign visitor to his uncle to turn the city into a deposit. The lexemes of deposit betrayal in the article on treason can be taken as an antonym unit.

The proverb is one of the most ancient forms of folklore, in which the various means of artistic expression - the repetition of melodic sounds. The immortal lines and wise sayings of great masters of words with a great life and creative experience often resemble folk sayings. For example, a number of wise sayings of Alisher Navoi in his book "**Mahbub ul-qulub**" include: "Little by little one becomes wise, one gathers little by little and becomes a river", "You have no choice but to speak." ignore. " A similar situation can be seen in the work of Abdullah Qahhor.

When a writer uses folklore samples, he does not copy them in this way, but creatively reworks and designs them. Creates a number of new proverbs by analogy based on existing article

templates: listen a lot, buy a sentence based on a few words, sell tons by sentence. This proverb is found in the speech of Kalandarov in the story "**Sinchalak**".

"I know, Comrade Suleymanov, that I came to you only because it was difficult. You are humbled now that it is difficult. If you hide the donkey, will be embarrassed. Don't think about it again, for example, because I'm a little bit If you bury the hood of a cart in the ground, God damn it, the cucumber will sprout. " In the speech of the protagonist of the story "Two halves and one whole", the writer uses the parema of Laghanbardor Kamolkhanov, who hides the sick, reveals the fever, hides the donkey in the form of a proverb. The proverb serves to make the reader laugh at the protagonist, and the hidden // reveal antonyms in it serve to reinforce the meaning. The title of the story also consists of a proverb. But the words half-and-half // whole antonyms here did not serve the meaning of contradiction, but the meaning of commonality, solidarity.

The popular saying, "The woman who makes the earth a woman, and the woman who makes the earth black," is slightly modified in the story of Sinchak. Finally, Kalandarov laughed to hide his frustration.

*"Sir, shall we promise the guest, shall we?" -Huriniso took the advice:*

-Speak from the back! I'm not telling you to be bad. At this point, the metaphorical meanings of the lexeme to kill, such as to elevate, and the lexeme to kill, to discredit, are the basis for antonyms.

"Someone knows how to behave," Saida said with extreme coldness, "someone doesn't know; someone speaks in a greasy way, someone speaks with a thorn in his side... so it would be correct to look at what the person who came to work said, not how he said the word. One can see contextual antonymic units such as lubrication // thorn bonding in the parema of someone who speaks on the basis of a proverb, someone who speaks on the basis of a proverb. The antonyms are based on the smooth, thorny semantics of the lexeme of lubrication, such as bitterness and pain.

*Let's look at the next example.*

Then Tillabuvam came and said, "The value is not foolishness, it is not cheap beillat, there is a flaw under it, let's be patient." Here, too, a modified version of the proverb "cheap soup does not taste" is used, and the lexemes of value // cheap, wisdom // vowel create a mutual antonym.

*"If I tell you, the one who doesn't see the big sees the small, the one who doesn't see the big sees the big, and when they look at each other, nothing is overlooked,"* people say. I wanted to say. The exemplary idea given in the text corresponds to the content of the article in the beginning, not in the age of reason. creates a contextual antonym. From our observations, it is clear that the author used this article effectively in several places:

Qambarali jumped up and stood up. Don't get me wrong, Botaboy, it's not about age, it's about age.

*Zakir shook his head.*

-Blessings of the past... I'm not against science anymore, but I want to be against this Ibragimov... Yes, he has the knowledge, he has good knowledge! Sometimes he says

unimaginable things, but he's young! He's bigger than he is, and Allanechuk doesn't seem to agree. If this knowledge is old if these words come from the mouth of an old man...

*Botaboy laughed and froze.*

"It's not the age of the mind, it's the head," he said, wiping away tears of laughter.

Well-known literary scholar O.Sharafiddinov noted that the stories "The Thief", "The Sick", "Pomegranate", "The Old Women Wired" created by A. Qahhor in the 30s and 40s of the XX century, the story "Sinchalak" and other works have been read with great interest by readers. One of the factors that ensured the international spirit in the author's works was his skilful use of folk proverbs and sayings. The same can be said of The Lights of the Cross. Literary critic Tokhta Boboyev says: "The skilful use of folk proverbs, sayings, aphorisms and phrases increases the popularity of the language of the work."

*Let's focus on the text.*

His mother would sniff from time to time, and his father would yell at him! "Don't teach me wisdom! I've come to my senses, and I will continue to do so. I didn't find it in my wealth, I didn't find it in my water, I found it in my mind. True, but what do you say if the time is like this? They set foot on your chest yesterday, they set foot on your chest today, they set foot on your throat tomorrow. You're going to die, do you need John? Seek death, if you must. If time does not look at you, you look at the time! "

This proverb, used in Zunnunhoja's speech, serves to express the life philosophy of the protagonist. She does not want to give up her poor son-in-law "now is the time" to keep her land and water, but she wants to seduce him with a sweet word. But if time does not look at you, then the lexemes in the proverb are not antonyms, but only two different forms of the same lexeme. While describing the character of Zunnunhoja, the writer also evaluates his goodness through folk proverbs:

Aunt Khadija, Sidiqjon's mother, is an old woman who grows old as fast as anyone who has lived a life of humiliation, but who, like all village elders, does not promise old age. He lived with his youngest son, Abidjan, in his native village of Bakhrabad. While the lexoantonyms of gratitude in the proverb enter into an oppositional relationship in a denotative way (in which the affixes that make up the lexeme are mutually antonyms), such an attitude of the lexoantonyms // punch occurs through connotation.

*We refer to the next text.*

But now, even though he had come in to see Aunt Khadija on the way, he saw Siddiqjon and sat for a while, as if annoyed for some reason, and asked him sarcastically, " You don't have an axe to be rich, you don't have a bag to be a beggar. "

The rich // simple antonymic units in the proverb give a clear idea of the current social situation of the protagonist Sidiqjon.

"Look at me, Tolagan aka," Safarov said politely. It's called a seven-dimensional cut. The next regret will not help. The seven lexemes in a proverb form a quantitative contextual antonym with one lexeme, with more than one semantics. The same situation is observed in the following text:

Abidjan: *Tell Captain Navruz everything you know!*

Hojar: *Wow.*

Obidjon: *Yes.*

Hagar said, "*Greet the place where you drank salt one day for forty days.*"

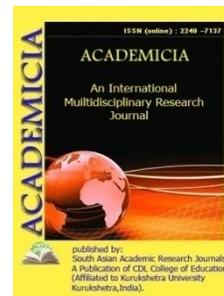

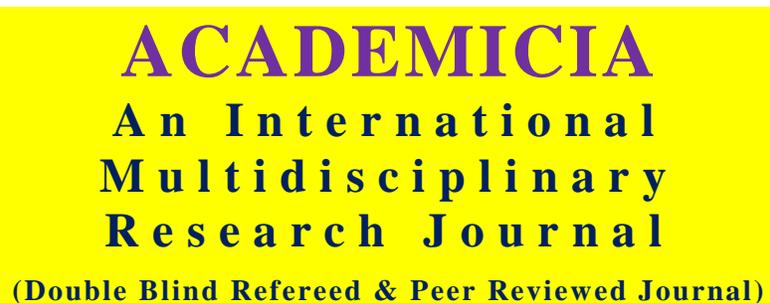

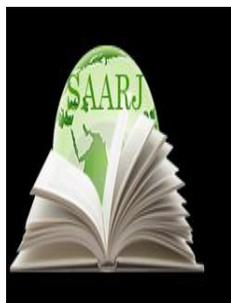

"Let me tell you," said Ruzimat with a smile. "I'm surprised my brother Butaboy didn't have a cold on his lips. If the wind blows a camel, look at a goat in the sky. What will we say to others if the person in charge of us sits like that?" The kolkhoz was not built by outsiders who thought it would be "destroyed," but by people who hoped to fix it. They say, "I need to explain," but it's true, "say the word to the one who reads it, to the one who hurts it;" You don't say a word, your mother gave birth prematurely! " Two folk proverbs are used in this text. The proverb "A camel and a goat are used figuratively here" means that if a camel is blown by the wind, the person who supports the goat in the sky will be harmed even more when he is punished. is the basis for expressive contextual antonyms.

The units in the next proverb that read // the mother gave birth prematurely are the product of the shooting event. Given that the lexeme she reads represents a context-sensitive semaphore, it can be said that her mother creates a contextual antonym with the beta semaphore represented by the unit of the speech she was born with. Because lexical usage does not create an antonym. When there is a contradiction between linguistic meaning and the verbal meaning, it is called contextual antonymy. Antonyms occur between language units. In a literary text, the author's goal is to make an aesthetic impression on the reader or reader, while in a non-literary text, the author's main goal is to have a communicative effect on the reader or reader. Thus, in a non-literary text, the communicative function is to convey information, while the primary function of the literary text is to increase the aesthetic value of the information conveyed.

In conclusion, the art of using proverbs in artistic speech has a special artistic and aesthetic significance. Creating such works requires strong skills from the creator. The analysis of proverbs used in the semantic expression of an expression, especially in artistic speech, is an aspect of linguopoetic research.

## ANALYSIS OF CONTINUOUS IN LITERARY EDUCATION PROGRAMS AND SOME ISSUES

**Fayzullaeva Gulchekhra Sharipboevna\***

\*Doctor of Philosophy in Pedagogy (PhD),  
Samarkand Regional Center for Retraining and Advanced Training of Public Educators,  
UZBEKISTAN

### ABSTRACT

*The article highlights the importance of improving the quality and effectiveness of teaching literature by ensuring the continuity of literary education, the important factors that ensure continuity. Literary education programs, the characteristics of students in the educational stages, the attitude to literary education, the factors of organizing literature lessons are also studied.*

**KEYWORDS:** *Stage Continuous, Non-Stop, Literary Education, Quality And Efficiency, Tendency, Educational System.*

### INTRODUCTION

It is well known that the system of continuing education is based on the continuity of education, which requires a certain consistency between all types of education. The implementation of this process involves not only the interdisciplinary continuity of the disciplines taught in each type of education, but also between the types of education.

State educational standards, curricula not only express the content of the educational process in general secondary schools and academic lyceums, which are the main links of continuing education, and the topics of newly created textbooks, but also It also determines the amount and level of knowledge, skills and competencies that future young professionals need to acquire, taking into account the specific characteristics of educational institutions. Therefore, in general secondary education, it is impossible to distinguish between the curricula of literature.

In our opinion, one of the most important indicators of the continuity between the curriculum of general education in primary and general secondary education is their suitability for the specialty curriculum. Thus, the integration of curricula in each type of education is considered in terms of

interdisciplinary and theoretical and practical integration, based on the continuity and continuity of the education system, the types and stages of education.

The concept of curriculum continuous is related to the concept of educational integrity and structure. In solving this problem, we have limited ourselves to giving a scientific analysis of the content of literary education in grades 5-9 and the State Education Standards and textbooks in the field of secondary special, vocational education.

From the point of view of continuity and continuity of literary education, we study the programs of 5th-9th grades and secondary special, vocational education in two groups: in the first group, we analyzed State Educational Standards, curricula, and textbooks, including literary education for grades 5-9.

The most important aspect of our research is the three main content of the literature curriculum and textbooks, which are considered to be the basis of the research and included in the second direction: 1) study of information on the history of literature, including the life and work of writers; 2) acquaintance with the basis of literary-theoretical concepts; 3) to develop students' speech and creative activity.

Concepts about the life and creative work of selected writers were approached in a study in grades 5–9 that differed from the traditional type of education. Innovative teaching technologies were used as the main teaching method. In particular, in addition to the concepts given in the textbook "Literature" in the 5th grade, in accordance with the requirements of the teacher's program and the textbook, the creative activity of the writer, his childhood (in the national literary education Navoi), interest in fiction, the study of students in accordance with their age and individual characteristics.

If in one textbook the concepts of the biographies of all writers are given, in another literature the creative activity of writers in literary education is not given in full in comparison with the above literature textbook.

The content of some subjects and textbooks has not changed much from the 5th to the 9th grade. There are some shortcomings in the education system.

In order to correct the mistakes made in ensuring the coherence of the general secondary education system, it was necessary to reconsider the scope of literary and theoretical concepts in this area. In particular, the literary-theoretical concepts in the 5th grade curriculum were analyzed. It was found that the materials of this program do not provide a clear definition of theoretical concepts. In some places, the use of terms that are difficult for a 5th grader without explanation requires the teacher to be vigilant.

In another program, the focus of the program on the coverage of theoretical material for each class is the formation of artistic word art through theoretical materials. In this research center, the concepts of the system of events, composition, general connection, introduction, introduction are considered, and the importance of teaching the structure of the work and the development of speech in relation to the above program. The general scientific approach of the work does not allow to compare and contrast the programs in this area in the process of analysis.

Another curriculum emphasizes that the teaching of each class syllabus is a basic teaching in literary education that focuses on the identification of a particular competency in the student and

---

the problems of the literary genre. In Grade 5, the genres of fiction are hardly covered, and some of the visual aids are listed as familiar concepts.

In all the analyzes discussed above, the literary-theoretical concepts presented by the authors are considered in terms of the possibilities of literary education.

In literary education, when this or that material is viewed objectively, it is found that they are not in demand. It turned out that the concepts of literature and education are the basic concepts of the scientific worldview, and the data are not sufficiently covered.

**Literary Concepts** In the curriculum and textbooks for grades 5-9, we considered it important to review and analyze a course in terms of teaching literature and innovative pedagogical technologies, and we came to the conclusion that creating an optimal teaching option.

There is little emphasis on teaching theoretical material in large-scale literature classes. In this program, some teaching methods will need to be clarified in order for students to master the subject of literature. Most importantly, the acquisition of concepts should take into account the age and individual characteristics of students.

Students in grades 5-9 have a hard time mastering the concepts of literature in the above program. Therefore, it was found that in the teaching of literature lessons in grades 5-9, enriching the minds of students with theoretical materials and ensuring that they have a basic understanding of literary education, it is important to teach by ensuring that class materials are related to 9th grade or that they are related to 9th grade and 10th - 11th grade materials. In our opinion, due to the lack of coordination or coordination in the teaching methodology in the 9th and upper grade curricula, we have set a goal to develop a consensus and continuity in the teaching of literature in education, as the curricula the concept of continuous is poorly covered. Therefore, we found it necessary to improve the teaching system in this area and provide methodological recommendations in terms of improving the level of mastery of students.

It is time to update the content of traditional education and radically change the organization of the educational process. At the same time, the introduction of pedagogical and information technologies in the education system will accelerate the training of students.

The use of elements of pedagogical technology in the classroom has its own advantages. In particular, the educational process is organized in a certain sequence, that is, in a systematic way. The following should be considered in the design:

- Defining the purpose of the subject;
- Identify the learning elements that need to be mastered according to the State Education Standards;
- Set goals for each learning element;
- Choosing the right (optimal) teaching aids;
- Identify ways to absorb the content of learning elements into the student based on didactic principles;
- Identify methods and criteria for assessing student performance;
- The result of the subject's (teacher's) activity is compared with the goal set for the student in the learning process, that is, the learning outcome is analyzed.

Ensuring continuity and continuity in the content of education alone will not achieve the effectiveness of education. Therefore, the whole education system must be restructured on the basis of the principles of continuous and system. To this end, while maintaining the continuity of existing curricula, it may be effective to address the existing disparities between the curricula created on the basis of these programs and to systematize them using new teaching methods. The use of innovative forms and methods of teaching in the organization of literary education has a positive effect.

It is known that for each stage of the system of continuing education, the approved normative documents define the minimum amount of knowledge, skills and competencies that students need to acquire. It is well known that the first stage of school literature education begins with the "Alphabet" in the primary grades and then continues with the subject of "Reading" and "Literature" in high school. In this case, students are gradually taught literacy, such as letters and sounds, their formation, syllables, words, their pronunciation and spelling, phrases, sentence construction, text creation. initial exercises and artistic-aesthetic speech, introduction to the development of creative thinking. This, of course, applies to the integration of the content of primary education in the areas of education, such as mother tongue, reading, mathematics, nature, man and society, as defined in the State Education Standards.

The field of human and social education encompasses a wide range of concepts, including morality, mental and physical education, law, and economics. By organizing the process of literary education on the principle of continuity and continuity, the spiritual maturity of students and the effectiveness of the learning process are taken into account. The following forms of continuity and continuity have a positive effect in this regard:

**1. Gradual presentation of topics.** This provides a link between the learning materials. The given training material is built on the condition that the previous ones do not duplicate each other, mainly focusing on the fact that one complements the other, there is new information that has not been studied. For example, A. Kadyri's work is presented in the form of a story "In the kid" in the 5th grade, "Scorpion from the altar" in the 7th grade, "Last days" in the 9th grade, and excerpts from these novels in academic lyceums and vocational colleges. A similar principle can be observed in the process of continuous literary education in the study of the works of writers such as Chulpon, Oybek, G. Gulom, A. Kahhor. However, in academic high schools or vocational colleges, "Literature" programs allow for the reprinting of certain works that are studied in general secondary schools, or the repetition of excerpts from other chapters of the same work. This leads to a mismatch between the curricula and programs of the continuing education phases, disruption of continuity and coherence.

For example: a) A. Kodiri's "Scorpion from the altar", Chulpon's "Night and day", M. Shaykhzoda's "Tashkentnoma", Mirtemir's "Mother", "Cloud", S. Ahmad's "Horizon", P. Kadirov's "Starry nights", "Uzbegim" by E. Vakhidov, "Genetics" by A. Oripov, "Works of the world" by O. Hashimov, "Treasure of Ulugbek" by O. Yakubov and others;

b) The complementarity of information about the work of a particular writer can be substantiated by the fact that information about the work of a poet or writer is based on the principle of simple to complex works of different genres. In particular, the biography of the writers differs in that the materials on their creative heritage are covered in more detail in the upper classes than in the

lower classes. This, of course, takes into account the age and psychological characteristics of the student.

**2. Integrate curriculum coherence.** Interdisciplinary coherence eliminates repetitive tautology-based teaching materials. For example, in elementary school, a particular season, seasonal change, or natural phenomenon is replaced by “Reading” instead of essentially similar information in “The World Around Us”, “Reading” or “Mother Tongue” textbooks. “Winter” can include text, information, pictures, or illustrations that detail the features of the subject.

In the upper grades, such a combination can be combined in Chemistry, Geography, Physics, and Biology. It is also advisable to refer to the integration between the disciplines of "Psychology", "Fine Arts" and "Literature" in the analysis of external portraits in the analysis of the inner experiences of a particular hero's psyche. For example, this process of cognition, which is characteristic of the protagonist's inner world in a work of art, is expected to be interpreted based on the concept of "fantasy" in psychology, the etymology and meaning of the word.

In psychology:

"Imagination, like thinking, is one of the processes of cognition, which is involved in the internal and external nature of human activity and research, in the emergence and solution of a problem situation with a certain degree" [6; 21-p.].

Linguistics (Explanatory Dictionary):

Imagination is thinking and imagining in Arabic; a dream, a strange desire; the ghost.

1. The process of thinking; thought. *A thousand fantasies in every head.* Proverbs.
2. Imagination. *Gulnara's eyes and face are smiling and smiling only in the thoughts of the Lonely Traveler.* Oybek, Selected works. *[Bobur's] Sick Suddenly Tanbal, who was holding a sword, appeared in the patient's mind.* P. Kadyrov, *Starry Nights.*
3. Dream, fantasy. *Buried in the sweet dreams of the future, Mahdum used to perform ablution for the Asr prayer.* A.Kodiriy, *Scorpion from the Altar. But I came back to myself and thought that what I thought and fell in love with in Shama was a sweet dream!* A.Kodiriy, *The past days.*
4. Es, memory. *At that moment, the girl came to life in the eyes of [the Memorial] like an angel, and left a sacred mark in her mind.* O. Hoshimov, *Listen to your heart* [5; 373-p.].

Curriculum harmonization focuses on the commonalities between objects in the environment, the physical and chemical properties of events, and artistic expression.

**3. Modular connection.** This connection allows for the presentation of knowledge and concepts related to related disciplines as a whole system. In particular, knowledge of specific, natural or social sciences (works that detail the life and work of al-Fargani, Beruni, al-Khwarizmi, Ibn Sino, MirzoUlugbek) is based on the purpose of the study based on a certain system. It is advisable to give the same topic in the plan once within the specified system, but in an integral whole. For example, the work of encyclopedic scholars, including Farobi's "City of Noble People", which deals with the ideal society, a just system, and just rulers, is related to Beruni's calendar, science, customs, and beliefs of different peoples. “Monuments from Ancient Peoples” is a proof of our opinion. This can be done by:

a) saves students' time, has a positive effect on the development of learning processes;

- b) prevents excessive force on materials of the same content;  
c) save public funds for education.

**4. Integrative programs.** Such programs, which combine multiple subjects or subject-specific topics, should be designed to take into account the increasing number of subjects in the curriculum. Programs of this kind are useful both in terms of pedagogical and economical hours. For example, the integration of subjects such as "Etiquette", "Sense of Homeland", "Rules of the Road" into the "Reading" program.

**5. Related topics.** Learning materials in one subject are given in sequence to closely related material in another subject. Mathematics can also be used to sharpen the mind, broaden the imagination, and develop connected speech in textbooks such as Fundamentals of Economics, Literature, or Mother Tongue. For example:

"It simply came to our notice then. A goose came and said, "Hey hundred geese, how are you?" he said. Then one of them said, "We are not a hundred geese, and if we have a goose, then we have a half goose, and if we have a half goose, then we have a hundred geese". How many geese are there in the sky?"

Answer: 36. That is  $36 + 36 + 18 + 9 + 1 = 100$ ".

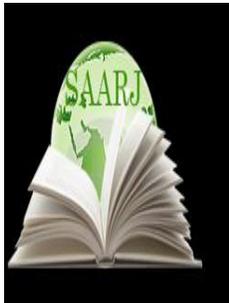

Finding the answer to the riddles of this content, of course, involves the achievement of the goal of forming logical thinking in addition to mathematical operations.

With the aim of conveying moral and aesthetic education, speech development, communicative norms, concepts of the environment through works (proverbs, sayings, poems, exercises) in the content of the native language and literature, "Fundamentals of Economic Knowledge" , "Etiquette", "Constitution lessons" will save time and reduce the workload.

In order to achieve the above goals, as Professor R.G.Safarova noted, "the development of scientific and pedagogical bases for the integration of academic disciplines in the context of education; improve the curriculum based on the requirements of the student-centered learning process; create a new generation of integrated curricula and textbooks; the content of integrated education should be selected, scientifically substantiated and put into practice" [4; 16-p.].

**AMERICAN- CHINESE ECONOMIC RELATIONS AT THE PRESENT  
 STAGE: CONTRADICTIONS OR COOPERATION?**

**Feruzha Askarova Abdullayevna\***

\*English Teacher of “English Language Department”,

**ABSTRACT**

*In today's system of international economic relations, the interaction of two economic giants, such as the United States and China, is of particular importance. In 2013, US exports to China had a positive impact on the development of many areas of America's industry, including automobile manufacturing, agriculture, computer and electronics manufacturing, the chemical industry and others. As a result of this phenomenon, the US trade deficit for these East Asian countries has decreased, and the trade deficit with China has increased. China was in second place in terms of trade with the United States after Canada, the third export market and the largest supplier of goods for the United States. In the future, it is planned to continue negotiations to overcome this situation by discussing mutual requirements. The significance of these negotiations is that in addition to the fact that the introduction of such duties will harm the economies of both countries, it will also lead to an imbalance.*

**KEYWORDS:** *Negotiations, Economic Giants, Interaction*

**INTRODUCTION**

Over the past few years, China has been one of the fastest growing US export markets, the significance of which will only increase. Over the past decade, US exports to China have grown five-fold with an average global growth of 123%.

In today's system of international economic relations, the interaction of two economic giants, such as the United States and China, is of particular importance. The future development of other economic processes in the world largely depends on how these relations will develop. Despite the rapid growth of mutual trade and the increase in foreign direct investment (FDI)

between China and the United States, relations between the two countries remain very unbalanced, and they are burdened by many contradictions. This circumstance, however, does not interfere with the active cooperation of the two countries and the expansion of the range of joint interaction.

The article also analyzes the new contradictions that complicate the development of economic relations between the two countries, such as cyber attacks performed by Chinese hackers or violation of intellectual property rights. While investigating this issue qualitative, quantitative and comparative methods of research have been applied.

Many American economists attribute the growing negative balance of America to the policy of the Chinese leadership, which deliberately understates the renminbi in order to create more favorable conditions for the export of their goods abroad, in particular to the United States. Americans at the same time blame Beijing for the fact that its policies contribute to increasing unemployment in the United States. However, in a detailed review of official materials from US government agencies, it is determined that such statements are not entirely accurate. This is just a hypothesis that has not yet been fully confirmed or even rejected by some Americans.

## **Theoretical background**

### **1. The US unemployment.**

American companies do not compete with cheaper Chinese manufacturers, which leads to their ruin. Thus, according to a study carried out by the Economic Policy Institute (EPI) in 2011, in the United States from 2001 (from the moment China joined the WTO) to 2011, about 2.7 million people lost their jobs mainly in manufacturing sector due to the inability to compete with cheap Chinese goods. Nevertheless, accusing China of dumping, there are several points to consider. First, the export of American goods to the Chinese market plays a significant role in the US economy and in the growth of employment. In 2013, US exports to China had a positive impact on the development of many areas of America's industry, including automobile manufacturing, agriculture, computer and electronics manufacturing, the chemical industry and others. Total US exports to China supported 11.3 million US jobs. In addition, the attraction of FDI from China plays an important role in increasing US employment. Over the past five years, China has significantly increased its FDI in the United States, which has led to the creation of new jobs in America and the maintenance of its employment. For example, according to the American private research company Rhodium Group, about 70,000 Americans currently work in factories or enterprises created with the help of FDI in China, which is 7 times more than in 2007.

#### **1.1 Movement of production capacities**

According to the authors of this report, the growth of the US trade deficit is the result of the objective **movement of production capacities** from East Asian countries to China, which we have witnessed in the last two decades. As a result of the increase in the cost of production, traditional suppliers of labor-intensive products for the United States from East Asia, such as Japan, Taiwan or Hong Kong, moved their production to China, where the final assembly of goods takes place and where production is cheaper. As a result of this phenomenon, the US trade deficit for these East Asian countries has decreased, and the trade deficit with China has increased. China was in second place in terms of trade with the United States after Canada, the

third export market and the largest supplier of goods for the United States. The volume of US merchandise exports to China amounted to 110.5 billion dollars (which is 6.2% more compared to 2011).

A similar point of view is expressed by American economist David Hale, who believes that mainland China is just a place for final processing of goods, but many other components and raw materials for production are imported from other countries, primarily from Asia. Such a “production chain” leads to the fact that China has a negative balance in trade with the rest of Asia and a positive balance with the United States. According to the chief economist of the Asian Development Bank, Shang Jinwei, in the production of one Apple iPhone mobile phone, the added value created in China is \$ 6, but the total cost of the phone (\$ 358) is reflected in the statistics of US customs import.

### **1.2 .Tariffs**

The trade confrontation between Washington and Beijing began in the middle of last year, when each country introduced additional import **tariffs** totaling \$ 50 billion. Since then, tension has only grown - both sides are taking new responses.

In December last year, Beijing and Washington entered into a temporary truce until March 2019. It lasted until the middle of the year, when the United States resumed the trade war, increasing tariffs from 10 percent to 25. China responded proportionally.

UNCTAD decided to study the effects of a trade war unfolding between the two largest global economies. The main conclusion is that both sides suffered. Thus, the introduction of additional tariffs on the import of Chinese goods into the United States led to a reduction in imports from China by 25 percent. Taiwan (the province of China), Mexico, the European Union, Vietnam and others took advantage of the vacant place in the American market. However, according to experts, China, which seeks to maintain its market segment, has for some time begun to reduce export prices.

In the USA, American consumers felt the confrontation and had to buy goods at higher prices. The authors of this study did not study how Chinese tariffs affected the competitiveness of American goods, but they believe that the situation is likely to develop according to a similar scenario: Chinese consumers pay a higher price and exporters to the United States incur losses.

### **1.3. Intellectual property rights IPR**

Today, innovation and intellectual property are a significant factor in US economic growth, so they perceive the protection of intellectual property rights as one of the most sensitive topics in economic relations with China. Another type of crime is related to the problem of violation of intellectual property rights - cybercrime. According to US intelligence, despite the existence of the Sino-US Cyber Security Working Group, which was created during the fifth meeting of the Sino-US Strategic and Economic Dialogue (SED) in 2013, the US is constantly being attacked by Chinese hackers. Despite a significant improvement in the enforcement of intellectual property rights in China over recent years, many U.S. companies acknowledge that the proportion of IPR infringement in China is still significantly high, and therefore suffer significant economic losses. As noted in the report of the Commission of the American Committee on theft of intellectual property, the United States incurs losses of approximately \$ 300 billion a year,

with China accounting for 50 to 80% of all losses (URL: [http:// dataweb.usitc.gov/.](http://dataweb.usitc.gov/)) This is an impressive amount, which indicates the seriousness of this issue.

In May 2014, the US Department of Justice charged cyber espionage and other offenses against five PLA members who reportedly attacked five U.S. companies for commercial gain .As noted in the report “Cyber espionage and theft of US intellectual property and technology”, today there is evidence that the PRC government not only supports cyber attacks against the United States, but also actively leads them. A report to the US Congress notes that the US Department of Defense is subjected to 50,000 cyber attacks every year, most of which are carried out by the Chinese .Thus, cyber crime remains one of the main contradictions in relations between China and the United States. Cyberattacks not only violate the trusting basis in bilateral relations and lead to economic losses in the United States.

An equally serious source for the contradictions in China's economic relations is the US accusation of Beijing's failure to fulfill its obligations under the WTO. The extraordinary behavior of the PRC and the special practice of conducting trade policy became the reason for the Americans to file 15 complaints against the actions of the PRC within the framework of the WTO ( E. Katkova ,2018) These complaints were related to a variety of Chinese trade policy practices, such as the special tax regime for domestic production of integrated circuits, access to the Chinese market for foreign audiovisual products or entertainment, restrictions on the export of raw materials, etc.

## **METHODOLOGY**

Despite the prepared plan for imposing retaliatory duties, China is not interested in waging a trade war with the United States, and expects to hold peace talks. But the opinion of Donald Trump on this issue is the opposite, he is confident that the negotiations will not bring any results.

It is important to note that from May 2 to 4, 2018, negotiations were held in Beijing, which, however, have not led to a resolution of the current situation. Among the demands made by the United States are the reduction of the trade deficit between the two countries by at least \$ 200 billion by 2020, the recall of several lawsuits from the WTO and the implementation of quarterly reports on progress in reaching joint agreements. Beijing, in turn, demanded an end to the investigation of the theft of American intellectual property by Chinese companies, the renunciation of 25 percent duties on Chinese goods and an end to discrimination against Chinese companies in the interests of national security, as well as the opening of an electronic payment market for Chinese companies and the issuance of investment company China International Capital Corp. licenses for financial activities.

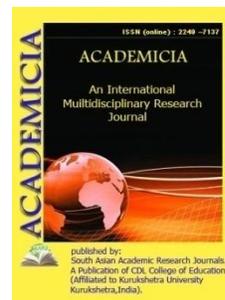

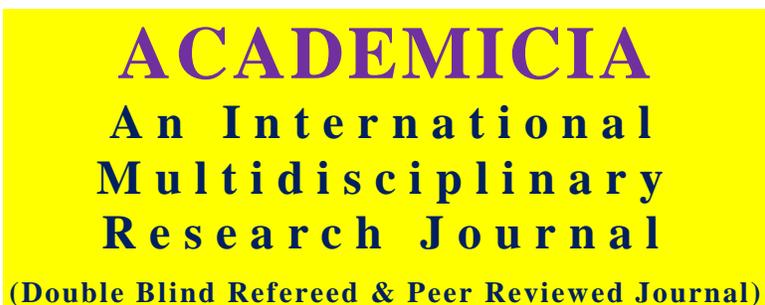

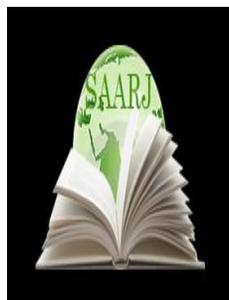

## **CONCLUSION**

Despite the fact that no agreement was reached on these requirements, each of the parties recognized the key importance of stable relations between the countries. In the future, it is planned to continue negotiations to overcome this situation by discussing mutual requirements. The significance of these negotiations is that in addition to the fact that the introduction of such duties will harm the economies of both countries, it will also lead to an imbalance. Taking into account all the given data, I would make a contribution, by offering a qualitative research method, which would survey two huge populations of both countries, suffering the most from

existing uncertainty. Opinion selection of ordinary people will possibly affect the authorities of two huge economies to make a right decision and avoid the catastrophic end.

## HYGIENIC SUBSTANTIATION OF WORKING CONDITIONS FOR WORKERS INVOLVED IN GROWING VEGETABLES IN OPEN GROUND

H.O. Kosimov\*; Z.R. Mukhamedova\*\*

<sup>1,2</sup>Bukhara State Medical Institute,  
UZBEKISTAN

### ABSTRACT

*In this article, the purpose of the study is a hygienic assessment of the working conditions of workers involved in growing vegetables in the open field. It has been established that, when growing vegetables, workers can be affected by such production factors as high load dustiness noise vibration impact of carbon monoxide insolation in summer relatively low temperature in autumn-winter period vapors and gases of mineral fertilizers and pesticides. In this regard, sanitary supervision over the working conditions of vegetable growers should be carried out taking into account the specific features of growing vegetable crops.*

**KEYWORDS:** *Hygienic Requirement, Working Conditions, Production Factors, Manual Labor.*

### INTRODUCTION

In recent years, the cultivation of vegetables in greenhouses has been widely developed. However, the main source of supply of vegetables to the population of the Republic is still open ground vegetable growing, which provides about 85-90% of the total volume of agricultural products grown in our Republic. To fully meet the needs of the population of the Republic of vegetables, to ensure an abundance of markets to increase the country's export potential and especially to improve the living standards of the population, the President of the Republic of Uzbekistan adopted the Decree on October 9, 2017 No. UP 5199 "On measures to radically improve the system of protecting the rights and legitimate interests of farms and owners of household land and the efficient use of cultivated areas. " According to this Decree, the sown area of cotton growing was reduced due to which the sowing of vegetables was increased. So, in the region, cotton fields have been reduced by 27%, the sowing of vegetables has been increased and for 2018 it is 28.5 thousand hectares. 852 farms are organized on this area. In addition to this region, there are 43,071 private vegetable farms that grow vegetable products.

Purpose of the research: To give a hygienic assessment of the working conditions of workers involved in growing vegetables in the open field.

Materials and research methods: The work was carried out in 3 vegetable farms of Gijduvan district of Bukhara region W / sq., relative humidity 32-69%, air speed 0.4-5.2 m / s. With such types of work as planting seedlings and watering, the workers' clothes are constantly wet and dirty. Manual operations are carried out in a forced bent working position with a static tension of the muscles of the back and shoulder girdle, requiring the need to lift and carry weights, the application of significant efforts to manual tools.

A qualitatively new stage in the development of the vegetable growing industry is the transition to an industrial technology for growing vegetables, which became possible due to the specialization and enlargement of farms on the basis of inter-farm cooperation and agro-industrial integration. When clearing areas from weeds, loosening and preparation of areas for sowing this agricultural technique is carried out with tractors of the Magnum, Orion brands MTZ-80, TTZ-80, PORON, T-28, T-4 and. etc. Orion magnum tractors are equipped with sealed cabins and air conditioners. The cabs of the TTZ-80 MTZ-80 tractor have technical defects in the form of leaks in places of dust formation and sun protection. In addition, in the cabins of the above equipment, the vibration noise level of carbon monoxide dust often exceeds the permissible standards. The main step in growing vegetables is sowing seeds (seedlings). This agrotechnical activity is mainly carried out manually (sowing tomatoes, cucumbers, bell peppers, eggplants, etc.) while the workers perform work in a forced position.

When caring for plants (loosening the soil, applying organic biological mineral fertilizers), dust, gases of biological organic and mineral fertilizers, is present in the air of the working area. The main sanitary and agrotechnical event at this stage of production is the mechanized farms Shukur Tukhta MK "Sarmijon" Uktam Kayum MK "Bukhtaroy" and "Gulistonobod". The total number of employees is 72 people. The study of physical activity was carried out by the method of sanitary examination and observation. Temperature and humidity were measured using an aspiration psychrometer (SanPin R Uz 0325-16), air velocity with a vane anemometer (SanPin R Uz 0324-16), noise and vibration-sound level meter VSHV-003M3 (SanPin R Uz 0325-16), dustiness air by weight method (guidelines for the determination of harmful substances in the air, 1981) carbon monoxide by the method of E. Peregud (fast method for the determination of harmful substances in the air, 1970).

**Results and discussion:** the technology of vegetable production is characterized by the complexity of multi-operation and the predominance of manual labor due to the limited possibilities of mechanization. The organization of specialized vegetable farms on large areas requires the development of new technologies and machines, as well as the creation of conditions for their early introduction into agricultural practice. In the technology for the production of vegetables in open areas, several stages are distinguished, covering operations that are interrelated in the nature and object of action: clearing areas of weeds, loosening and preparing land for sowing planting seedlings (seeds) in open ground, caring for plants (loosening and hilling, weeding, watering, pesticide treatment, etc.), harvesting, commercial processing of some vegetables, etc. The implementation of these operations is associated with the effect on the organism of vegetable growers of a complex of unequal harmful factors of the production environment.

Non-mechanized types of work are carried out in the open air under the influence of various combinations of meteorological factors, observed in summer during weeding, loosening, soil and harvesting, when the air temperature reaches 25-34 °C (degrees), radiation 697-997

Based on the analysis of the influence of indicators of production factors on working conditions of workers in the cultivation of vegetable crops, the following extremely important recreational measures are necessary to improve working conditions:

- providing mechanization and automation of the most labor-intensive and difficult types of work (planting, weeding, watering, cleaning), for which it is necessary to accelerate the improvement of the designs of serial production of new units and machines that meet hygienic requirements;
- When choosing irrigation systems, give preference to automated and then mechanized systems replacing outdated installations;
- To improve the working conditions of irrigators, watering vegetable crops by sprinkling;
- In order to prevent the impact of vapors and gases of mineral fertilizers and pesticides, it is necessary to centralized and mechanized their supply for agricultural crops;
- In order to reduce the need for auxiliary workers and ensure their labor, it is necessary to develop mechanisms and techniques for sowing and harvesting all types of vegetable crops;
- when rationing and tariffication of vegetable growers' labor, take into account the severity of tension and harmfulness of certain types of work The same data should be taken into account when deciding on the examination of the ability to work and employment of vegetable growers;
- taking into account the sharp increase in the needs of the population of the Republic and the whole world in vegetable products in order to grow high-quality and environmentally friendly vegetables, we propose the introduction of biological microfertilizers and the transition from chemical methods of pest and weed control of vegetable crops, 21 types of pesticides were used in 2016-15 names, in In 2017, 12 items, and for 6 months of 2018, 7 types of pesticides were used, of which 3 types were biostimulants.

However, the decrease in the volume and amount of pesticides used did not contribute to a decrease in the contamination of vegetable products with pesticides. These data are confirmed by laboratory data from the sanitary and hygienic laboratory of the TsGSEN. Thus, during laboratory analysis in 2000, out of 3912 samples of vegetable products, pesticides were found in 302 cases (7.75%). Exceeding the MPC has not been established. In 2016, out of 3826 vegetable products studied, 92 (2.4%) were found to contain pesticides, and no excess of the MPC norm was found. In 2017, out of 3,632 tested samples, pesticides were detected in 61 (1.6%) cases, and for 6 months of 2019, no residual amount of pesticides was found in 886 tested samples of vegetable products. At the same time, during the direct processing of vegetable crops, workers come into contact with pesticides, and if safety rules are violated, the harmful effects of chemicals on their body are possible.

Thus, when growing vegetables, workers may be affected by the following production factors such as high physical activity, dustiness, noise, vibration, exposure to carbon monoxide (for machine operators), high temperature, insolation in summer, relatively low temperatures in autumn and winter, vapors and gases when feeding mineral fertilizers and pesticides, when treating plants against weeds, pests and diseases of vegetable plants. In this regard, sanitary

supervision over the working conditions of vegetable growers should be carried out taking into account the specific features of growing vegetable crops. In this case, one should take into account the need to supply organic and mineral fertilizers centrally, i.e. through the sprinkler hose. The use of a sprinkler system solves the problem of mechanizing irrigation and saving irrigation water. However, the need for auxiliary workers remains. Due consideration should be given to the structural and operational reliability of the irrigation nozzles in order to reduce the time the installers spend in the irrigation zone.

When working under irrigation conditions, irrigators must be provided with overalls (light, non-soaking jackets and a raincoat with a hood in cold weather, additional quilted jackets) and rubber boots. Performing non-mechanized types of work is accompanied by significant physical conditions and requires a lot of energy. In the group of non-mechanized work, operations with a particularly high level of energy costs are distinguished: watering, weeding, loosening and harvesting. The manual removal of the collected products on the road requires energy costs in the amount of 327.6-359. J / s. The full implementation of comprehensive mechanization in vegetable growing will not abolish the use of manual labor, since individual processes (selective harvesting of vegetables that have ripened at different times: tomatoes, cucumbers, eggplants, peppers, etc.) will be carried out manually.

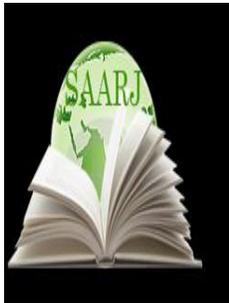

This necessitates the development of recreational activities for manual types of work. At all stages of the cultivation of vegetable crops, workers may come into contact with pesticides. Since different types of pesticides are used to control weeds, pests and diseases of vegetable crops.

It should be noted that the use of pesticides for vegetable crops decreases annually. So, in 2000, on the territory of Bukhara and diseases of vegetable crops on biological methods of plant protection.

## ISSUES OF DEVELOPMENT OF FOREIGN ECONOMIC ACTIVITY IN THE REPUBLIC OF UZBEKISTAN WITH THE HELP OF FOREIGN INVESTMENTS

**Hasanova Yulduz Murtazayevna\*; Azimova Hulkar Egamberdiyevna\*\***

<sup>1,2</sup>Karshi Engineering Economics Institute,  
 UZBEKISTAN

### ABSTRACT

*The article considers that the development of export-oriented economy in the Republic of Uzbekistan, as well as the improvement of export activities of foreign economic activity is important at the current stage of economic restructuring. At the same time, Uzbekistan is presented with issues of reducing the country's dependence on exports of raw materials, diversification of import and export markets and accelerating the export of high value-added goods, as well as the dynamics of the export situation in the regions.*

**KEYWORDS:** *Investment Policy, Infrastructure Structure, Investment Projects, Foreign Economic Activity, Financial Incentives, Modernization, Diversification.*

### INTRODUCTION

In order to ensure the stability of the economy in the Republic of Uzbekistan, increase production patterns and thereby improve the living standards of the population, reduce social problems among the population, a wide range of investment opportunities is created in a modern market economy. The Republic of Uzbekistan pays great attention to the development of multilateral relations with Central Asian countries. The proximity of our country to developing countries in the Middle East and Southeast Asia, its borders, trade routes to Europe and Asia have a positive impact on the development of foreign economic activity. In other words, large investment projects are characterized by long-term implementation, first of all, the creation of a favorable investment climate and confidence in foreign investors to do business, positive conditions in world commodity markets and favorable prices for key goods in national exports. . As a result, large national exporters are trying to expand their financial opportunities and intensify their investment projects. There are positive changes in the structure of foreign investment in the Republic of Uzbekistan. At a time when global economic competition is

intensifying, the key to stability is to expand production and gain a foothold in foreign markets. Indeed, in the Action Strategy for the five priority areas of development of the Republic of Uzbekistan for 2017-2021, the improvement of the investment climate in the new perspective, the active attraction of foreign, engaging, foreign direct investment by sectors and regions of the economy and the performance of their duties. At the same time, we can see the growing interest and confidence of foreign investors in the economy of our country through the introduction of a number of laws.

In particular, as a result of the establishment of the "Foreign Investors Support Group" to provide objective information to foreign investors on the ongoing socio-economic reforms in the Republic of Uzbekistan, the investment climate and foreign trade regime, the essence and significance of legislation, appeals from foreign investors. It is planned to ensure the timely entry into the information system "gov.uz".[4]

As the President said, "In order to further attract investors to new projects, it is necessary to hold investment forums with foreign investors at least once a year in all regions, as well as to ensure the participation of domestic entrepreneurs in major international investment forums. Most importantly, investment projects need to be placed correctly. The only requirement for investors in this regard is that the project site has the necessary infrastructure. If we have infrastructure and attract investors to places where development is convenient, we can achieve the systematic development of industry, where there is industry, there will be jobs and income, housing, social facilities, towns will be built. [5]

No matter how large-scale and targeted the measures are in line with the requirements of a market economy, there are still challenges in improving the investment climate, implementing effective investment policies, improving infrastructure in the regions and attracting foreign investment in industries. Indeed, the implementation of theoretical, methodological and organizational issues aimed at creating new jobs, especially in the regions, in order to ensure the well-being of the population and improve their quality of life is very important today.

## **ANALYSIS OF THE LITERATURE ON THE SUBJECT**

The role of foreign investment in a market economy in the works of the President of the Republic of Uzbekistan Sh.M.Mirziyoyev on ensuring the stability of the economy in the Republic of Uzbekistan, the growth of economic growth, the role of investment, in particular, foreign investment in increasing export potential the mobilization of reforms to improve the quality of life of the population, in particular the need to pay attention to social issues and their main components. Foreign experience MMNovikov, ASNeshitoy, OSSukharev, KVShvandar, AVSisoyev, VSShapran, LVShkvarya, OVXmiz, YE on the requirements of the consistency of reforms and the feasibility of implementing investment policy, the gradual implementation of the level of competition between enterprises. The structure of the investment climate, the importance of increasing the efficiency of foreign investment, the importance of state support in the improvement of mechanisms for attracting foreign investment, the analysis of economic problems and Issues of the ratio between efficiency AVVakhobov, SH.Khajibakiyev, NGMuminov, K.Djurayeva, NG.Karimov, R.Khodjayev, N.Kuziyeva, LRShayusupova's monograph, textbook, researched in scientific-methodical works and scientific articles. The research of the above-named scientists is aimed at analyzing the conceptual, theoretical and practical aspects of mechanisms for attracting foreign investment and their application in

accordance with the laws of a market economy. It should be noted that despite the scientific and practical research and theoretical research to date. Issues aimed at attracting foreign investment in the global economy, improving the comprehensive statistical analysis of guarantees and benefits, as well as the assessment of factors affecting the favorable placement of foreign investment in the regions on the basis of statistical models are not systematically covered.

## **ANALYSIS AND RESULTS**

The term "investment" is derived from the Latin word "invest", which means "to invest", "to mobilize funds", "to invest capital". In a broad sense, investment is the mobilization of capital to increase and recoup capital. "[2] In many cases, the term "investment" is defined as the tangible and intangible benefits and rights associated with economic and other activities. Investment means all kinds of national and intellectual wealth, which must be directed to the objects of entrepreneurial activity to generate income or achieve some positive results. The main purpose of investing is to earn income and achieve a positive social effect. It is also appropriate to define the concept of investment as the cost of building new capital. To fully explain the concept of investment, it is necessary to give its definitions. Investment is capital that has not yet been converted into a product, but invested in the means of production. In its financial form, they are assets invested in economic activities for profit, while in economic terms, they are associated with the construction of new enterprises, long-term maintenance of machinery and equipment, and so on. which is the cost of changing working capital. Foreign investment takes the lead in this regard, and the following rates for foreign investment can be cited. Any form of property that is transferred from one country to another for profit is completely foreign investment. If we specify the sources of their formation in the "Foreign Investment" tariff, it will be as follows. Foreign investment is all the property, financial, intellectual wealth that foreign investors mobilize in the economy, entrepreneurship and other activities of an absolutely different state in order to achieve a high level of income and efficiency. General description of foreign investment The 2nd edition of the Xenius Dictionary of Foreign Trade, published in the United States in 1947, states: "Foreign investment is an investment made from the territory of one country to the territory of another, exported." The impact of foreign investment on the economy is based on a number of approaches. There are two approaches in the economic literature to determine the impact on the economy of the host country. The first approach is based on traditional theories of foreign trade. The main condition for such an approach is that foreign investment increases the marginal product of labor and reduces the marginal product of capital. The second approach to industrial organization focuses on the indirect and external benefits of investment. Proponents of this theory try to understand why firms invest abroad without producing the same goods or services in their own country. They believe that foreign investment contributes to the economic development of the host country by increasing labor productivity and expanding exports. , it will be possible to use it more efficiently. It is desirable for the host country to create an investment climate that provides the most important criteria for the benefits to be provided by foreign investment. Creating a conducive environment for businesses and investors to provide sustainable conditions and support, promote fair competition, and prevent abuse is a prerequisite for export development and diversification and, consequently, economic growth. The measures taken over the past years to support exporting enterprises will increase the export potential of our economy, achieve positive changes in the structure of foreign trade, and increase its volume in a sustainable manner. Export diversification, ie the expansion of the range of goods and services

sold abroad, the elimination of a large share of certain goods or services (especially raw materials) in total exports, expanding the geography of countries where our products are exported will ensure stable export volumes, reduces the sensitivity of the national economy to adverse changes in foreign markets. A significant increase in the share of one or more goods in exports can put exporters in a difficult position when prices for these goods fall or external demand for them declines. As a result, the decline in exports could lead to a decrease in foreign exchange earnings, a deterioration of the foreign trade balance and a crisis in the financial condition of enterprises. It is also risky that the total volume of exports depends on a small number of countries. Diversification of exported goods, expansion of the geography of their importing countries can prevent a sharp decline in exports, even if there are problems in the economy of one or a group of countries. will give. Only in Kashkadarya region in 2016-2019, as a result of measures to diversify exports and imports, improve its structure, there have been positive changes in the commodity structure of exports of our country.

TABLE-1

Indicators	2016 year	2017 year	2018 year	2019 year
Total exports (mln. USD)	239,0	226,3	270,8	366,1
Exports total, in percent	88,6	119,6	119,2	135,2
Including (as a percentage of total):	31,3	37,9	35,4	44,4
Cotton fiber	141,8	64,7	48,5	68,2
Chemical products, plastics and plastic products	46,6	64,3	68,2	68,5
Ferrous and non-ferrous metals	0,0	0,0	0,0	0,1
Machinery and equipment	0,3	0,2	0,1	1,5
Food products	20,2	37,9	31,3	97,9
Energy resources	7,1	9,2	30,2	30,2
Services	11,2	20,5	9,4	7,0
Other	11,7	29,6	83,0	92,6

Based on the above data, we can say that in Kashkadarya region in 2016-2019 there were positive changes in the structure of exports. In particular, the export of cotton fiber in 2016 amounted to 141.8 million US dollars, and in 2019 - 68.2 million. The policy of reducing the volume of exports of cotton fiber and processing and export of finished products was also implemented. In addition, the level of food exports in 2016 amounted to 20.2 million US dollars, and by 2019 - 97 million US dollars. , \$ 9 million, an increase of \$ 77.7 million in 2019 compared to 2016. Now let's look at the composition of imported goods in Kashkadarya region.

Commodity structure of imports of Kashkadarya region. Table-1.1

Indicators	2016 year	2017 year	2018 year	2019 year
Total import (mln. USD)	525,1	370,6	495,0	458,7
Total import, in percent	78,2	133,6	133,6	92,7
Including (as a percentage of total):	68,7	62,1	64,6	55,6
Chemical products, plastics and plastic products	34,2	23,7	35,7	51,7
Ferrous and non-ferrous metals	20,6	55,5	86,0	22,0

Machinery and equipment	434,9	249,2	309,9	289,4
Food products	13,0	7,6	16,9	17,3
Energy resources	3,2	3,3	2,1	7,3
Services	1,9	16,3	2,7	1,8
Other	17,2	14,9	41,7	69,3

According to Table 1.1, positive changes are taking place in the supply of imported goods in Kashkadarya region. The volume of chemical products, plastics and plastic products in 2016 amounted to 34.2 million US dollars, and in 2019 - 51. , 7 mln. In the structure of imports of machinery and equipment, from 434.9 million US dollars in 2016 to 289.4 million US dollars in 2019.

The Government of Uzbekistan attaches great importance to the active involvement of foreign investment in this process as an important factor in the systemic reconstruction of the economy of the country and its regions. In order to achieve economic growth, it is important not only to increase the volume of investments, but also to choose the right direction and structure. In order to invest, it is necessary to choose the types of production and enterprises that can quickly pay for themselves and provide high economic and technological efficiency. In this case, the quick return on investment and how effective it is are important. This can provide an incentive to revitalize the investment process, and then allow you to choose the sectors and businesses that you prefer to invest in. The formation of a market economy in Uzbekistan requires a favorable investment climate in the regions and a sharp strengthening of a number of macroeconomic factors. The processes taking place in this area are explained by the intense exchange of events. Production investments should play a key role in creating and supporting economic growth and a favorable investment climate in the regions. Only on the basis of investments can the competitiveness of the product be increased in exchange for the renewal of fixed capital and on this basis the reduction of production costs and the improvement of quality. However, in today's highly integrated economy, the coordinating role of the state is objectively more important. In this regard, in improving the investment climate, it is important to consider the active state intervention in the activities of investors in all regions as part of macroeconomic policy in the coming years. This is a strategic goal - to ensure the economic growth of the regions, which must meet the criteria of competitiveness and sustainable economic development of the region. Achieving the strategic goal can be achieved through the creation of a favorable investment climate, where macro-government management of investment processes is one of the most important areas of such planning. The current stage of formation of the investment climate in the regions is explained by the transition to the path of economic growth. Such growth will require the development and implementation of a separate investment policy, which will be based on the experience of developed countries, the existing opportunities for the use of funds as investment resources and the attraction of foreign investment. Without attracting foreign investment, it is impossible to ensure the organization of production that meets modern requirements. One of the important tasks of investment policy is to create the economic basis for the regulation of investment processes in the regions, to create the conditions for the implementation of the developed policy, and in this way to create a favorable investment climate in the regions.

In general, in order to increase foreign investment in the economy, it is necessary to bring the investment climate up to the standards set by world practice. At the same time, it is important to

identify the factors that hinder the flow of investment, to find ways to eliminate them. Especially in a situation where the export of raw materials in practice does not hinder access to foreign markets, exports of finished goods in foreign countries faces tariff and non-tariff barriers. At the same time, high trade barriers restrict not only the import of consumer goods (goods for final use), but also the import of intermediate goods, which are necessary for the development of domestic production, both for export and for the domestic market. In addition, limiting external competition in the domestic market creates a factor for inefficient distribution of economic resources. As a result, the relative competitiveness of import-protected industries will decline in the medium and long term.

## CONCLUSIONS AND RECOMMENDATIONS

In short, the main goal of socio-economic reforms in our country is to ensure economic stability and increase the welfare of the population, thereby improving their quality of life and sustainable development of social sectors. New jobs in the Republic of Uzbekistan by attracting foreign investment. Enterprises are being equipped with modern equipment and technologies, increasing production efficiency and having a positive impact on the level of exports.

Based on the above data, it can be said that in order to increase the inflow of foreign investors into the economy, it is important to further improve the mechanisms for attracting foreign investment, in particular, based on the content of analytical materials to make the following conclusions and recommendations you can:

First of all, increasing the volume of exports, improving its structure, diversifying foreign trade turnover in general serves the purpose of achieving qualitative changes in the structure of our economy, increasing its competitiveness, economic growth and further improving the welfare of the population. is an integral part of the general economic policy of the state, aimed at ensuring, developing production, stimulating investment activity.

The geography of our foreign trade relations is changing qualitatively, primarily due to the growth of trade turnover with emerging markets in Asia.

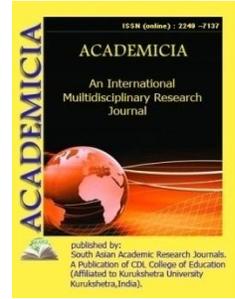

Secondly, the achievements in the field of exports in recent years, first of all, radically restructure and diversify the economy of the country, in the short term to build completely new, locomotive industries, modernize production, implement technical and technological renewal programs, is the result of timely, well-thought-out and long-term work on the formation of a modern market infrastructure.

 UZBEKISTAN

### ABSTARCT

*The authors analyzed the main stages of cotton cultivation. The data on the influence of the main factors of agricultural production on the health of cotton growers are presented. Hygienic measures have been developed based on the health protection of workers employed in cotton growing. More responsible and laborious work is the work of irrigators. The irrigators were exposed to a whole range of climatic factors: low or high temperatures, solar radiation, winds, precipitation, low or high humidity. A more effective measure for protecting the environment from chemical plant protection products is the transition to a biological and agrotechnical method of combating pests and diseases of cotton.*

**KEYWORDS:** Cotton Growing, Microclimate, Pesticides, Dustiness, Labor Protection.

### INTRODUCTION

The environment of agro-industrial workers is occupied by cotton - a valuable raw material for the textile, oil and fat and other industries. [1,3]

The technological process of growing cotton differs from the technologies of growing cereals and other industrial crops. It consists of several stages: soil preparation, seed treatment and sowing, seedling thinning, cultivation, watering of plants, chasing, weed, pest and disease control, preparation for harvesting, machine and manual harvesting. Cultivation of cotton begins with preparing the soil for sowing: macro- and micro-planning of cotton maps with the help of graders, planners and other mechanisms and plowing. Sowing of cotton is carried out in a square-nested way with special machines - seeders, which are hung on a tractor MTZ-80 "Magnum" "ORIEN". Sowing is preceded by seed dressing. After emergence, the crops are thinned out. During the growing season (May-July) 5-6 times are processed between the rows (loosening the soil). More work is done by watering the plants. It is carried out throughout the growing season and ends 2-3 weeks before harvest. [2.4]

A significant amount of work in the cultivation of cotton is devoted to the control of weeds, pests and diseases. The chemical method is widely used for this purpose. In May-August, herbicides, insecticides, acaricides are used, and in September - defoliants and desiccants. The hygienic features characterizing the use of pesticides in cotton growing are mainly the following: the use of a significant range of chemicals, simultaneous use over large areas, the combined effect of chemical and meteorological factors (high temperature, solar radiation). The single most time consuming process in cotton growing is the picking of raw cotton. [3,4]

At all stages of the production process in agriculture, physical (temperature, humidity, solar radiation), chemical (pesticides, mineral fertilizers), biological factors affect the workers' organism. In addition, agricultural labor is characterized by great physical overstrain.

All of the above urgently requires the development of hygienic regulations that guarantee the safety and health of workers employed in cotton growing. [5,6,7]

This issue became especially relevant with the release of the Decree of the President of the Republic of Uzbekistan dated November 28, 2017 No. UP-3608. "On measures to radically improve the cotton industry."

Purpose of the study: to give a hygienic assessment of the working conditions of workers in cotton-growing farms and the development of hygienic regulations for the protection of their health.

## **MATERIAL AND RESEARCH METHODS**

The objects of the study were the farms "Karvon" of the mahalla committee "Bukhtaroy", "Faiz" of the mahalla committee "Gulistonobod", Shukur-Tukhta of the mahalla committee "Sarmizhan".

The work was carried out jointly with the regional center of the State Sanitary Inspection. The study of physical activity was carried out by the method of sanitary supervision. Air temperature and humidity were measured using an aspiration psychrometer (SanPiN RUZ 0324-16), air velocity - with a wing anemometer (0324-16), noise and vibration - with a Sumer brand VShV-003 (SanPin RUZ0325-16), air dustiness - by weight by the method (guidelines for the determination of harmful substances in the air), the content of carbon dioxide - by the ANT-3 gas analyzer (MU012-3 / 0015), the determination of the residual amounts of pesticides in the air and soil - by the method of thin-layer chromatography (Kiev-1985).

## **RESEARCH RESULTS**

The leading professions in cotton growing are machine operators, irrigators, crop care workers, and cotton pickers.

The microclimate at workplaces was largely determined by the climatic conditions of the area, since almost all types of work were carried out in the open air. It is characterized by a long summer and a rather cold winter, large fluctuations in air temperature both throughout the year and during the day, a significant amount of atmospheric precipitation, which falls mainly in the winter-spring period.

The first stage of preparation for sowing cotton was the dressing of cotton seeds. For this purpose, on a specially constructed concrete site, seeds were treated with phytovac and P-4. All

workers involved in seed dressing underwent a medical examination and were provided with personal protective equipment.

When preparing the soil for sowing, workers were exposed to low and subnormal temperatures (March-April). The air temperature during the day ranged from +4 + 6C, relative humidity 70-95% and air speed - 4-6m / sec. Under these conditions, the heat-shielding properties of clothing and thermal regulation capabilities turned out to be insufficient (according to a survey of 8 workers from each farm).

During the period of cotton thinning (at the end of April, beginning of May), the air temperature in the field fluctuated 21-34 C0, and in the cab of the MTZ-80, KhTZ-80 tractor - from 28-36C0. The highest air temperature was observed during the cultivation period and summer irrigation of cotton (May - June), at 12:00 and 16:00 it was on average 36.4-38.6C and periodically reached + 41 + 45C0.

The effects of high air temperature during work in the summer period of the year were aggravated by the presence of positive thermal radiation from the heated metal parts of the tractors. The temperature in the cab of tractors during this period reached 58-59C0. The relative humidity at the workplace during these works was 50-60%, and the air velocity was 2.5-5 m / sec.

All processes related to soil preparation, cultivation and uprooting of stems were accompanied by the formation of a fairly significant amount of dust. When preparing the soil for sowing during harrowing and plowing of land in the breathing zone of tractor drivers, the dust concentration ranged from 16 to 21 mg / m<sup>3</sup>, which exceeded the permissible norm. During the cultivation period (tractor MTZ-80. KhTZ-80), the concentration of dust in the workplace was 14-17 mg / m<sup>3</sup>.

During winter plowing with the help of the "Mag Nim" brand tractor and a 4-body plow, the dust content of the air in the tractor cab was 6-9mg / m<sup>3</sup>, MTZ-80, T-4, averaged 26mg / m<sup>3</sup>, with reservations -38 mg / m<sup>3</sup>.

When manually picking raw cotton, the concentration of dust in the air of the working area, depending on the distance from the road and the agrotechnical state of the maps, averaged 3.2-13.4 mg / m<sup>3</sup>, which corresponds to the data of F.T.Dzhumaev (1987). During autumn plowing of the soil with tractors of various brands (MTZ-80, KhTZ-80, T-4) in the breathing zone of tractor drivers, the concentration of carbon monoxide during the period from the leeward side was in the range of 8.4-42 mg / m<sup>3</sup>, while booking 8.2 -36.1 mg / m<sup>3</sup>. The development of carbon monoxide poisoning in people working on modern agricultural machines is not observed, however, a number of authors have established that prolonged exposure to relatively low concentrations of carbon monoxide is not harmless. So, according to F.T. Dzhumaeva (1987), the level of carboxyhemoglobin in the blood of cotton growers of machine operators before contact with carbon monoxide averaged 2.5%, and at the end of the work in most of the surveyed, on average, increased to 7.7%.

The tractors used in the cotton cultivation of the workers were exposed to noise and general vibration. So, in the cab of the MTZ-80, KhTZ-80 tractor, the noise intensity reached 109-120 dB.

More responsible and laborious work is the work of irrigators. The irrigators were exposed to a whole range of climatic factors: low or high temperatures, solar radiation, winds, precipitation, low or high humidity. When watering in the autumn-winter period, the irrigators were exposed to pronounced cooling effects (November - January). The air temperature during these periods of the year ranged from +7 to - 9 C<sup>0</sup>. In the spring period (March), the cooling effects were less pronounced, but at this time the water temperature still did not exceed -3-6 C, and the air temperature fluctuated 4-6 C in the morning and 18-20 C in the daytime. Significant wind strength was often noted (up to 16-21 m / s). In the summer period, irrigators also worked under unfavorable meteorological conditions, in June-August the air temperature even in the early morning hours reached 30 + 35 C<sup>0</sup>, 12-16 hours - 42 + 48C<sup>0</sup>, and at 19-20 hours - 38 + 39 C. High the air temperature is combined with low humidity and low air velocity. Workers often irrigated cotton while being in the water of relatively low temperature (it ranged from 12 to 16 C in June and 18-20 C in July). At the same time, the head and body of the irrigators were exposed to high temperatures and insolation. Thus, irrigators have physiological reactions reflecting the effect of multidirectional influences: the head and body of workers are exposed to intense solar irradiation, the effect of increased and low temperatures. Polivals often complained of joint pain, burning sensation, paresthesia in the limbs, especially at night (21 workers were interviewed). A significant amount of work in the cultivation of cotton fell on the control of weeds, pests and diseases. For this purpose, starting from May to August, "Altin" "Dalate" and "Killer" preparations were used in the fields in all three studied farms. The drugs were used by ground vehicles. Tractor drivers and 2 workers were exposed to these chemicals. No residual amounts of drugs were found in the air 2 hours after treatment. The drugs were found to be unstable in the external environment.

Concluding that workers associated with the cultivation of cotton are exposed to physical (temperature, humidity, air velocity, noise, vibration, solar radiation), chemical (carbon monoxide, pesticides, mineral fertilizers).

## CONCLUSIONS

Working conditions in cotton growing depend on the level of mechanization of the cultivated crop, the technology of its cultivation, as well as on the organization of labor. To improve working conditions and protect the health of tractor drivers, it is necessary to introduce modern agricultural machinery in all cotton-growing farms, most of which meet the requirements of occupational health and ergonomics. To reduce noise, the cabins of tractors designated for cotton cultivation are sealed. Vibration reduction requires adjustment of the seat to suit the operator's body weight. To reduce environmental pollution and the harmful effects of pesticides on the body of workers, it is advisable to prepare working solutions, mixtures of pesticides and fertilizers at stationary specially equipped points. It is advisable to provide workers with overalls and personal protective equipment for the skin and organs of vision. A more effective measure for protecting the environment from chemical plant protection products is the transition to a biological and agrotechnical method of combating pests and diseases of cotton.

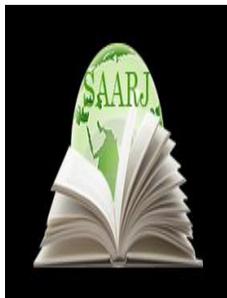

Of great importance for improving the working conditions of irrigators is the widespread use of irrigation mechanization. In the cold season, overalls should be waterproof and windproof, insulated. In the summer, it is necessary to protect the waterer from insolation and high temperatures (a hat with brim, cotton underwear and light-colored clothing), it is imperative to

use special shoes made of waterproof material. In the field camps for workers, it is necessary to organize food rich in proteins and vitamins. A prerequisite for working cotton growers is compliance with the water-salt regime and the organization of hot tea. Further improvement of working conditions in cotton growing is necessary for the organization of comprehensive mechanization of cotton cultivation, as well as automation of technological processes (control of seeding, control of the accuracy of the movement of the unit, drip and sprinkler irrigation).

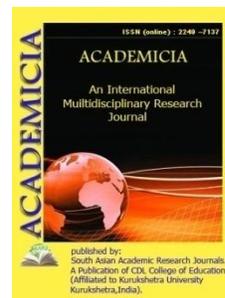

For the purpose of prevention and timely detection of diseases in persons engaged in cotton cultivation, it is advisable to carry out seasonal and periodic medical examinations.

**ABSTRACT**

*The article provides information on the effects of inoculation with nitragin and application of mineral fertilizers on plant growth, development, dry mass accumulation, NPK levels in the vegetative and generative organs, the number of root buds and grain yield before sowing the seeds of mung bean grown as a secondary crop after winter wheat. In the control variant, which was grown without the use of any mineral fertilizers, the nitrogen content of the root was 0.97%, 0.84% in the stem, 1.77% in the leaf, 1.17% in the pod, and 3.34% in the grain. in variant 5, which was inoculated with nitragin before sowing the seeds of mung bean crop, these figures were 1.00%, 0.88%, 1.85%, 1.27%, and 3.44%, respectively. The highest amounts of nutrients in the vegetative and generative parts of the plant were observed in variant 7 in which they were treated with nitragin before sowing the seeds of mung bean and also used NPK 30:90:60 kg/ha, and was 1.18%, 1.22%, 2.24%, 1.57%, 3.84%, respectively.*

**KEYWORDS:** *Nitragin, Nitrogen, Phosphorus, Potassium, Growth, Development, Dry Mass, Tuber Bacteria, Grain Yield.*

## INTRODUCTION

The basis of agricultural crops grown on irrigated lands of the Republic of Uzbekistan are cotton and winter cereals. Every year, more than one million hectares of irrigated lands of the country are planted with winter cereals. This means that once the winter wheat is harvested, there will be an opportunity to grow secondary and intermediate crops on the same amount of land. In this regard, the main focus in the areas freed from winter wheat is to grow legumes, cereals and vegetables as a secondary and intermediate crop, which will increase soil fertility, meet the needs of the population for daily food and fodder, further strengthen food security in the country. to fully meet the needs of the population in agricultural products and increase the efficiency of land use. [10].

One of such crops is mung bean, which is one of the legumes used for food, which is distinguished by the nutritional value of grain, rich in protein and vitamins, and high in calories. Mung bean is 1.5-2 times more nutritious than wheat, beans, peas, green peas and rye grains, and 1.5 times more nutritious. The digestibility of protein in mung bean reaches 86%. Mung bean contains 24-28% protein, 8% lysine and 7% arginine. Therefore, the improvement of agro-technologies for the cultivation and maintenance of mung bean as a secondary crop will serve to meet the food and nutritional needs of the population [6].

**Relevance of the problem.** After the winter harvest of cereals, the cultivation of legumes as a secondary crop yields two grains per field per year, which in turn increases soil fertility and reduces weeds in the fields [1].

The combination of nitragin with mineral fertilizers, i.e.,  $P_{90} K_{60+}$  nitragin and  $N_{30} P_{90} K_{60} +$  nitragin variants, resulted in the formation of the highest number of endogenous bacteria and an increase in yield of 3.3–5.4 center / ha. An increase in the amount of nitrogen led to a decrease in the production of tuber bacteria or no production at all. It was observed that the yield increased only due to nitrogen fertilizers [7].

The tuber bacteria that live in the roots of legumes absorb atmospheric nitrogen and enrich the soil with nitrogen. In Uzbekistan, mung bean, soybeans and peas accumulate 40 kg to 120 kg of easily assimilated nitrogen per hectare. Most of the nitrogen assimilated by legumes remains in the plant itself, and after harvesting, some of it returns to the soil through the remains of roots and stems [8].

It was found that the yield of legumes was 20.3-23.2 centner / ha when they were planted at an early stage as a repeat crop and fed with 100 kg / ha of phosphorus and 50 kg / ha of potassium [2, 3].

**Research conditions and methods.** Our research was conducted in 2015-2017 in the conditions of typical gray soils of Tashkent region, Mineral fertilizers were tested on the background of treated and not fed nitragin seeds of mung bean *Phaseolus radiatus* 148 as a secondary crop, as follows PK 90:60, NPK 30:90:60, NPK 60:90:60 and NPK 90:90:60 kg/ha.

The experiment included 8 options, each with an area of 240 m<sup>2</sup>, of which 120 m<sup>2</sup> were taken into account. Three replications were conducted and the total area of the experiment was 0.576 hectares.

The research was conducted in the field and in the laboratory, where the placement of field experiments, calculations and observations were carried out on the basis of “Dala tajribalarini utkazish uslublari” (“Methods of field experiments”), soil and plant analysis “Metodi agrohimicheskikh analizov pochv i rasteniy” (“Methods of agrochemical analysis of soil and plants”) Statistical analysis of the obtained results was carried out on the basis of Microsoft Excel and B.A. Dospekhov's handbook “Metodikapolevogoopita” (“Methodology of field experiment”) [4, 5, 9].

In the experiment, the early maturing variety of mung bean “Pobeda-104” was planted in the first ten days of July at a depth of 3-4 cm at a rate of 14 kg per hectare. Upon completion of planting, seed water was given in order to obtain full seedlings.

In the care of moss from mineral fertilizers: ammonium nitrate (N 33-34%), ammophos (N 11-12%, P<sub>2</sub>O<sub>5</sub>-46%), suprefos (N 5-6%, P<sub>2</sub>O<sub>5</sub>-32%), potassium chloride (K<sub>2</sub>O-60%) ) was applied.

**Research results.** In different soil and climatic conditions of the country, after the harvest of winter cereals, mosh is grown in large areas as a secondary crop.

In our field studies, it was found that the seedling thickness of moss was 113.4-114.8 thousand / ha at the beginning of the application period in 2016, and by the end of the application period this figure was 109.3-110.7 thousand / ha.

According to data on the growth and development of moss in 2016, on August 1, the plant height was 18.5 cm in variant 3, where the norm of mineral fertilizers NPK 60:90:60 kg / ha was applied, while the norm of NPK 90:90:60 kg / ha was found to be 20.0 cm in variant 4 used. In the control variant, where no mineral fertilizers were applied, the figure was 16.4 cm. Before sowing the seeds of mungbean were treated with nitragin, the height of the plant in the variant without any mineral fertilizers was 17.3 cm, the height of the plant in variant 7 was 18.9 cm, treated with nitragin and mineral fertilizers NPK 30:90:60 kg / ha. cm (Table 1). In the remaining years of the experiment, this regularity was maintained.

According to the data obtained at the end of the plant's application period, the plant height was 58.7 cm in Option 3 with NPK 60:90:60 kg / ha, while NPK was 90:90:60 kg / ha in Option 3 was found to be 60.4 cm in the variant. In the control variant, where no mineral fertilizers were applied, the figure was 48.0 cm. In the variant where the seeds of mosh were treated with nitragin before sowing and no mineral fertilizers were used, the plant height was 50.3 cm, the height of the plant was 59.3 in variant 7, where the norm of mineral fertilizers was NPK 30:90:60 kg / ha. 0 cm. The number of pods per plant in the fertilizer-free control variant was 18.3, while the highest rate was observed in variant 8, where the seeds of mosh were treated with nitragin before sowing and mineral fertilizers were applied at a rate of NPK 60:90:60 kg / ha. pieces.

This ensured that fertilizer-free control and moss were treated with nitragin before sowing the seeds, which was 8.2-6.5 units higher than the non-fertilized variants, respectively. While the number of grains per pod was 8.8 in the fertilizer-free control variant, the highest rate was observed in variant 7, where the NPK 30:90:60 kg / ha application rate of mineral fertilizers was

treated with nitragin before sowing mung bean seeds formed. The weight of 1000 grains in the fertilizer-free control variant is 46.3 g. The highest rate was observed in variant 7, where the NPK of mineral fertilizers was treated at 30:90:60 kg / ha, treated with nitragin before sowing the seeds of mung bean, 53.8 g formed.

According to the data obtained on the dry mass collection of mung bean, the highest value at the end of the growing season was observed in the variant where the NPK 60:90:60 kg / ha of mineral fertilizers were treated with nitragin before sowing the mung bean seeds, the dry mass of the root was 5.4 g, the dry mass of the stem is 25.0 g, the dry mass of the leaf is 26.8 g, the dry mass of the grain is 15.6 g, the dry mass of the pod is 6.0 g, the total dry mass of one plant is 78.8 g. In the fertilizer-free control variant, the dry mass of the root is 4.3 g, the dry mass of the stem is 14.4 g, the dry mass of the leaf is 16.1 g, the dry mass of the grain is 8.3 g, and the dry mass of the pod is 3.6 g. The total dry mass of one plant in total is 46.7 g. was found to be. Before sowing the seeds of mung bean were treated with nitragin and no mineral fertilizers were applied. In variant 5, the dry mass of mung bean root was 4.5 g, the dry mass of the stem was 15.8 g, the dry mass of the leaf was 17.9 g. The dry mass of the grain was 10.2 g, the dry mass of the pod peel was 3.9 g, and the total dry mass of the plant was 52.3 g compared to the fertilizer-free control option, the total dry mass of the plant was 5.6 g higher (Table 2).

According to the results of observations on the formation of tuber bacteria in the roots of the plant during the development of mung bean, the NPK 60:90:60 kg / ha of mineral fertilizers in the period of mowing was 14.1 in variant 3, while mineral fertilizers NPK 90:90:60 kg / ha norm was found to be 11.0 units in option 4. In the control variant, where no mineral fertilizers were applied, the figure was 9.8.

The highest rate of bush formation at the root of the plant was determined in Option 7, where the NPK of mineral fertilizers was 30:90:60 kg / ha, treated with nitragin before sowing of mung

bean seeds. previously treated with nitragin and treated without the use of any mineral fertilizers in option 5 amounted to 12.8 units (Table 3).

**TABLE 2 INFLUENCE OF MINERAL FERTILIZER NORMS AND NITRAGIN APPLICATION ON DRY MASS ACCUMULATION OF MUNG BEAN, G**

No var	The norm of mineral fertilizers, kg/ha (NPK)	Root	Stem	Leaf	Grain	Legumin bark	A total of 1 plant

4	N <sub>90</sub> P <sub>90</sub> K <sub>60</sub>	5,2	22,5	24,3	14,1	6,4	72,5
5	Nitragin (without fertilizer)	4,5	15,8	17,9	10,2	3,9	52,3
6	P <sub>90</sub> K <sub>60</sub> + Nitragin	4,7	17,9	19,8	12,0	5,1	59,5
7	N <sub>30</sub> P <sub>90</sub> K <sub>60</sub> + Nitragin	5,1	21,7	23,6	16,1	6,2	72,7
8	N <sub>60</sub> P <sub>90</sub> K <sub>60</sub> + Nitragin	5,4	25,0	26,8	15,6	6,0	78,8

According to the data obtained during the period of legumincultivation, the number of tubers in variant 3, where the norm of mineral fertilizers NPK 60:90:60 kg / ha was applied, was 23.8 pieces. In the control variant of mung bean cultivation, where no mineral fertilizers were applied, the figure was 18.5 pieces. Even in the period of mung bean legume production, the highest rate was observed with nitragin before sowing of mung bean seeds, and the number of tubers in variant 7, which was applied in the norm of NPK 30:90:60 kg / ha of mineral fertilizers, was 33.4, the seeds of the mung bean crop were treated with nitragin before sowing, and in Option 5, which was cared for without the use of any fertilizer, there were 25.3. Before sowing the seeds of mung bean, they were treated with nitragin, and in variant 8, where the norm of mineral fertilizers NPK 60:90:60 kg / ha was applied, it was found that the number of tubers was 25.5 pieces. It can be seen that excessive use of nitrogen fertilizers in mung bean leads to a decrease in the number of tubers formed at the root of the plant..

**TABLE 3 MINERAL FERTILIZER STANDARDS AND THE EFFECT OF NITRAGIN APPLICATION ON THE AMOUNT OF TUBERS FORMED AT THE ROOT OF THE MUNG BEAN PLANT, PIECE / PLANT (2016)**

No	The norm of mineral fertilizers, kg/ha (NPK)	Phases of development		
		honing	flowering	legumin formation
1	Without fertilizers	11,4	18,6	22,3
2	N <sub>30</sub> P <sub>90</sub> K <sub>60</sub>	14,3	22,0	26,0
3	N <sub>60</sub> P <sub>90</sub> K <sub>60</sub>	16,7	25,6	29,2
4	N <sub>90</sub> P <sub>90</sub> K <sub>60</sub>	13,2	19,4	25,4
5	Nitragin (without fertilizer)	14,6	21,3	28,0
6	P <sub>90</sub> K <sub>60</sub> + Nitragin	18,4	26,1	33,6
7	N <sub>30</sub> P <sub>90</sub> K <sub>60</sub> + Nitragin	21,2	30,0	36,7
8	N <sub>60</sub> P <sub>90</sub> K <sub>60</sub> + Nitragin	13,8	20,8	26,2

According to a 2016 study, the nitrogen content in the root of mung bean grown as a secondary crop was 0.97-1.18%, 0.84-1.22% in the stem part, 1.77-2.24% in the leaf part, and in the legume 1.17-1.57%, and the grain content was 3.34-3.84%, while the phosphorus content was 1.50-2.30%, 1.18-1.82%, 1.18-1.55%, 1.30-1.99%, 1.66-2.22%, respectively and potassium content were 2.250-2.525%, 2.625-2.925%, 2.250-2.425%, 2.400-2.670%, 2.400-2.675 % respectively (Table 4).

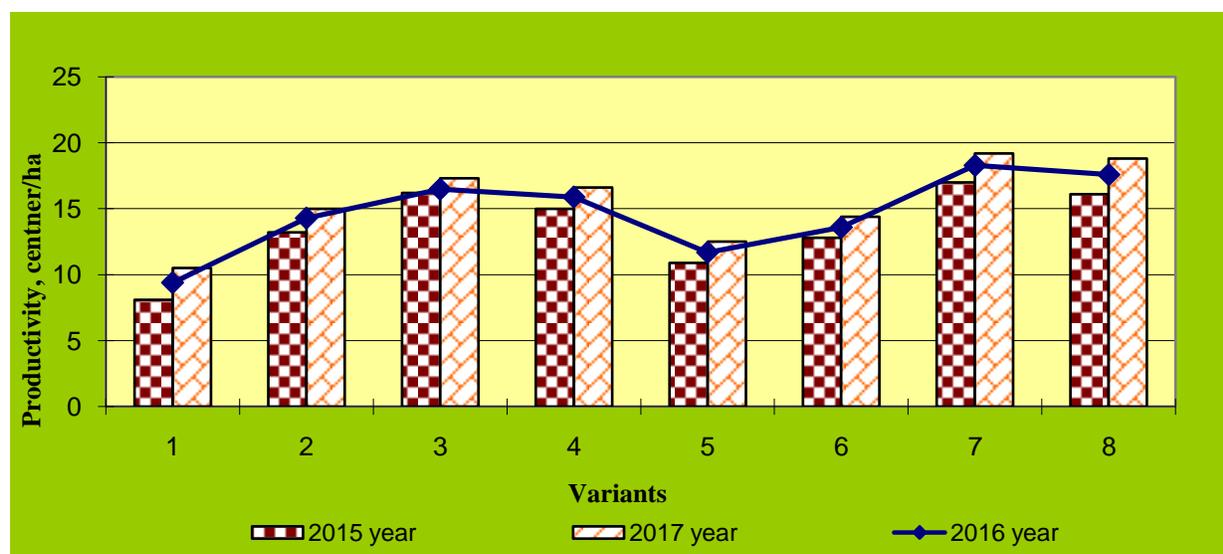

When mung bean grown without any mineral fertilizers, the nitrogen content of the root was 0.97%, 0.84% in the stem, 1.77% in the leaf, 1.17% in the legumin and 3.34% in the grain, in variant 5 without fertilizer treated with nitragin before sowing the seeds of mung bean, these figures were 1.00%, 0.88%, 1.85%, 1.27%, 3.44% respectively. The highest amounts of nutrients in the vegetative and generative organs of the plant were treated with nitragin before sowing the seeds of mung bean, and the rate of mineral fertilizers NPK 30:90:60 kg / ha was observed in option 7, which is 1.18%, 1.22%, 2.24%, 1.57%, and 3.84%, respectively. In the remaining years of the experiment, these laws were maintained.

According to the data obtained on the grain yield of mung bean grown as a secondary crop, which was treated with nitragin before sowing the seeds of mung bean after winter wheat and applied at a rate of NPK 30:90:60 kg / ha of mineral fertilizers, the highest grain yield was obtained from variant 7, which was 18.2 centner / ha in 3 years, while mineral fertilizers of NPK 90:90:60 kg / ha used in variant 4, a grain yield of 15.8 centner / ha was obtained. The lowest grain yield was 9.3 centner / ha from the control variant where the mung bean crop was grown without the use of any mineral fertilizers (Fig. 1).

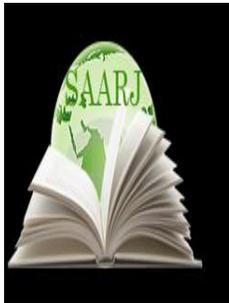

Figure 1. Grain yield of mung bean grown as a secondary crop, centner / ha

## CONCLUSION

Based on the data obtained from the research, it can be concluded that sowing of mung bean as a secondary crop after winter wheat sowing an additional grain yield of 7.4 ts / ha was obtained compared to the fertilizer-free control option when the NPK 60:90:60 kg / ha norm of mineral fertilizers was applied, the application of mineral fertilizers at the rate of NPK 30:90:60 kg / ha in the backgrounds treated with nitragin before sowing of mung bean seeds provided an additional grain yield of 8.9 ts / ha compared to the fertilizer-free control option.

### ABSTRACT

*This article provides examples of the rich cultural heritage of the city of old Urgench, the capital of the Khorezmshahs, one of the largest medieval cultural centers of Central Asia. Through this article, we will enjoy the great spiritual heritage of our monuments, which testifies to the high skill of our people.*

**KEYWORDS:** *Khorezmshahs, Urgench, Kufa, Moghuddar, Mongol, Tower, Delicacy, Ancient,*

### INTRODUCTION

Central Asia, especially Uzbekistan, is one of the oldest centers of world culture.

Even before the advent of Islam, the peoples of Central Asia had a rich tradition of architecture and craftsmanship.

Urgench planning, which began in the IX-X centuries, was completed in the XI-XII centuries.

In the memoirs of tourists of that time, large cities such as Bukhara, Samarkand, Kesh, Termez, Urgench were described as beautiful cities, rich in handicrafts and trade, with crowded markets.

Located on the Great Silk Road, these cities were the main places where trade caravans stopped and traded. The nearly 9,000-kilometer cultural and trade route stretching from west to east was of great political, economic, and cultural significance. At the same time, he made an invaluable contribution to the development of handicrafts.

One of the largest medieval cultural centers of Central Asia is the capital of Khorezmshahs, the city of old Urgench.

The rule of Khorezmshahs, which began in the second half of the 11th century, lasted until the beginning of the 13th century, before the invasion of Genghis Khan. Starting from Khorezmshah Anush, Qutbiddin Muhammad, Atsiz, Il-Arslan, Takesh, Alovuddin Muhammad and Jaloliddin Manguberdilar formed the dynasty of Khorezmshahs. One of the last representatives of the dynasty, the father of our great compatriot Jaloliddin Manguberdi, the period of Muhammad Khorezmshah (1200-1220), the state of Khorezmshahs covered a huge area. It was during this period that it finally became a powerful state. The capital, old Urgench, is flourishing.

In 1220, at the beginning of Genghis Khan's invasion of Moghuddar, after long resistance and heavy battles, the Khorezmshah state faced a crisis. Muhammad Khorezmshah died on one of the islands of the Caspian Sea.

His brave son Jaloliddin Manguberdi bravely resisted the Mongols with his brave compatriots like Najmiddin Kubro. Jaloliddin Manguberdi, who had repeatedly defeated Genghis Khan's armies in an unequal battle, was besieged by divisions and disagreements within the army. A brave warrior, a skilled commander breaks through the siege and crosses the Amu Darya with his family and relatives to India. After two years of preparation, in 1225 he ruled Azerbaijan. He remained the most formidable cousin of the Mongol invaders until 1231.

It is no coincidence that Genghis Khan did not say about our brave compatriot Jaloliddin Manguberdi, "If I had such a son, I would conquer the earth." Our people have created songs and epics, legends and myths, poems about his way of life, his unparalleled courage.

The power of the Khorezmshah state was no less than that of the Seljuk state. Old Urgench, which was ruthlessly destroyed by the Mongol invasion, was reduced to rubble. In the following centuries, the city was rebuilt. But by the second half of the fourteenth century, the capital had become a dead city. Several historical architectural monuments, which are an invaluable legacy of this ancient city, have been preserved.

The ruins of the city, the fragments of pottery, the rows of bricks on the foundations of buildings and structures, and the half-ruined buildings of four architectural monuments have survived.

Information about the ancient city of Urgench came from the literature of the early period of the era. By the 10th century, the city was one of the largest cities in Central Asia.

Ancient Urgench has been the capital of the Khorezm state since 995.

In 1220, the geographer Yakut wrote about the city: "Among the cities of Khorezm, I have never seen such a large, prosperous, rich, densely populated city." The city, destroyed by the Mongols in 1221, was rebuilt in the late thirteenth century. Fourteenth-century geographer Ion Batuta is recognized as the "largest city." In 1378, the city was last destroyed by the army of Amir Temur.

The mausoleum of Fakhriddin Razi (XII century) The mausoleum of Khorezmshah II-Arslan is so called. This miniature mausoleum has a cone-shaped dome-shaped dome on an octagonal drum on a tall square base in an elongated shape.

The monuments of such a project are traditional in Khorezmian architecture. This is a Khorezm-type mausoleum.

The structure of the main facade is executed with great taste. The carved ornament made of baked clay is a unique work of art made with great delicacy and great skill.

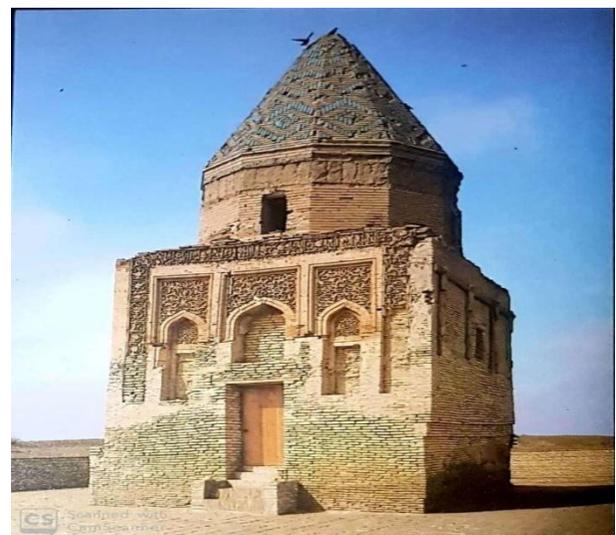

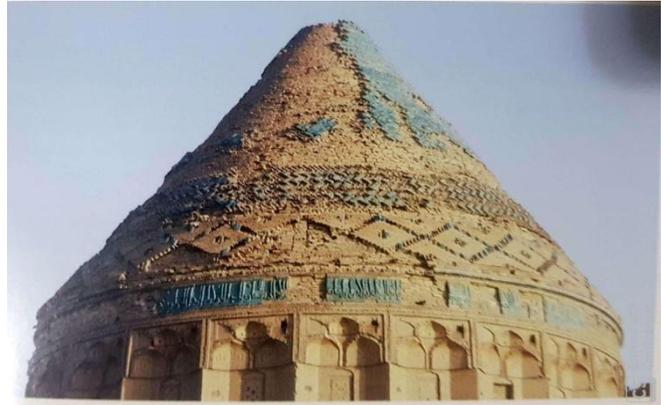

Its method of preparation is unique, with a 3 cm thick carved pattern carved on the raw brick for the main facade of the mausoleum. Then the embossed brick is baked in a jar. The finished brick pieces are then stacked on the wall surface to form a composition.

The dome of the mausoleum is decorated with geometric patterns with mysterious tiles of blue color.

The Kufa inscription and terracotta patterns on the façade of the mausoleum (12th century) are reminiscent of the roof of the Magoki Attori mosque in Bukhara and the roof of the Raboti Malik caravanserai near Karmana (12th century). The conical dome is reminiscent of the dome of the Chashmayi Ayyub mausoleum in Bukhara (XII-XVI centuries).

The mausoleum of Khorezmshah Takesh (1220) is one of the most unique monuments of this ancient city.

The mausoleum is one of the priceless monuments of the East and is a 13th century architectural masterpiece built on the royal tomb. Mausoleums of this type are made in the style common in Khorezm. The mausoleum is cube-shaped, the upper part of the drum is covered with a conical dome. The outer side of the dome is decorated with a glazed tile with a blue glaze. At the beginning of the conical dome from the drum is a blue Kufa inscription. Tiles and clay terracotta ornaments on the dome are widespread in the 12th century Khorezmian architecture.

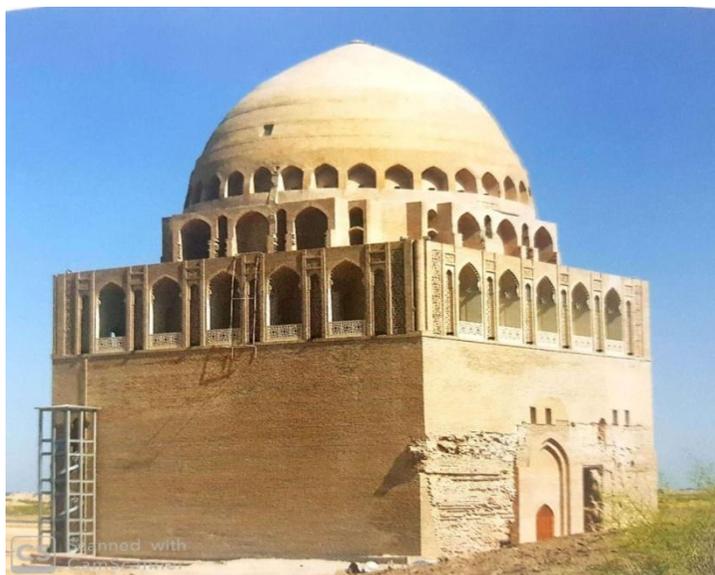

**Kutlug Timur Tower** (1321-1326). The tower is one of the tallest towers in Central Asia (62 meters), with 143 steps leading up to the top of the tower. At the top of the tower there is a wooden beacon. The tower, which narrowed sharply upwards, later served as a prototype for the Islamkhoja tower, which was built in Khiva. The date of its construction from the glazed brick fragments on the upper belt of the tower is inscribed in the ancient Arabic Kufa inscription.

The next surviving monument is the mausoleum of the Sufi dynasty, built in the second half of the fourteenth century. The mausoleum is known as the mausoleum of Turabekhanim. The mausoleum is similar in appearance to the mausoleum of Sayfiddin Bahorzi in Bukhara (XIV century).

These monuments are monuments built in Movounnahr different cities built at the same time, forming an integrity in terms of art, performance art and style. So it follows that the masters who built these monuments were representatives of the same school.

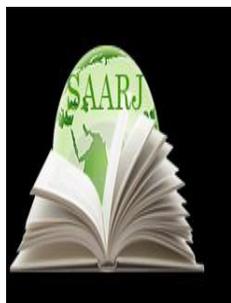

These monuments, which testify to the high skill of our people, are our great spiritual heritage.

Tourists visiting our country, which has an ancient and rich history, would be more impressed if they could see the monuments of Samarkand, Bukhara, Shakhrisabz, Khiva, as well as the monuments of Old Urgench, now located in the fraternal Republic of Turkmenistan.

### ABSTRACT

*Production of rice had gone up from around 21 million tonnes to 31 million tonnes between 1950-51 and 1965-66. In the green revolution period, production increased substantially and stood at 99 million tonnes by 2008-09. The performance of the wheat was much better than that of rice as wheat production rose from a mere 6 million tonnes to 80 million tonnes during the period from 1950-51 to 2008-09. Cereals as also foodgrains have shown better performance during the green revolution period. The period under study has been divided into four periods, viz. Pre-Green Revolution Period (1949-50 to 1965-66), Green Revolution Phase-I (1966-67 to 1980-81), Green Revolution Phase-II (1981-82 to 1990-91) and Green Revolution Phase-III (1990-91 to 2008-09). The last period is also known as economic reforms period or liberalization period. To understand the overall trend, overall period from (1949-50 to 2008-09), is also taken for the study. The worked out production compound growth rates for the overall period for crops like wheat, sugarcane, cereals, rice, food grains and groundnut were, 4.78, 3.12, 2.75, 2.59, 2.50 and 1.20 respectively.*

**KEYWORDS:** *Growth, Trend, Long-Run Modal, Rice Wheat, Cereals, Food Grains, Groundnut And Sugarcane*

### INTRODUCTION

Indian agriculture has achieved a significant break-through in production since mid-sixties with the introduction of new agricultural technology and the consequent increase in yield rates. The achievement in food production and productivity in the post-independence period, especially

since mid-sixties, is quite significant and substantial. The magnitude of technological change, as observed by Hanumantha Rao, can be assessed by estimating the increase in output attributable to modern inputs or by measuring the growth in the use of modern inputs themselves.

In the context of the success of the new technology in increasing food production, one can safely assert that there is evidence to show that a change has occurred in India's foodgrains production, the evidence does show that increase in output obtained since 1967-68 are not attributable exclusively to favorable rainfall. In fact, even if the effect of weather is held constant in statistical analysis, the effect of new technology show up quite strongly in the form of enhanced output. Thus earlier gloomy prediction has lost its validity in the context of new technology in India. Details pertaining to production of important crops, such as, rice, wheat, sugarcane, groundnut as also total cereals and foodgrains are set-out in table 1.

### Objectives

1. To study the growth rates of principal crops in India
2. Suggest suitable measures for improving area growth rates

### Data and Methodology:

Only secondary data was used for the study which was obtained from different sources such as administrative reports, Handbook of Statistics, records and reports from ministry of agriculture, government of India, and Directorate of Agriculture, crop reports, supplemented by published and unpublished articles, journals, books, newspaper etc. Besides simple averages and percentages, compound growth rates have been computed in order to study the long-run rate of growth in the production of important crops viz., rice, Wheat, cereals, food-grains, sugarcane and groundnut in India.

$$Y = AB^X \text{ or}$$

$$\text{Log } Y = \text{Log } A + X \text{ Log } B$$

$$\text{Where } Y = \text{Production of major crops}$$

$$X = \text{Time}$$

'A' and 'B' are constants

Compound Growth Rate = anti-log of  $(B-1) \times 100$  For testing the significance of Compound Growth Rate, the following test has been employed.

$$t = \frac{B}{SE(b)}$$

$$\text{Where } SE(B) = \frac{1}{n-2} \left\{ \frac{S_{yy}}{S_{xx}} - B^2 \right\}$$

$$S_{yy} = \sum \log^2 Y - \frac{(\sum \log y)^2}{n} \text{ and}$$

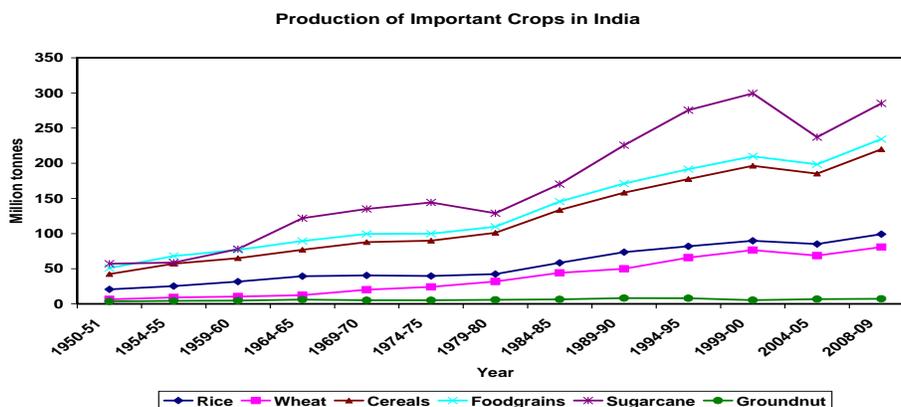

$$S_{xx} = \sum x^2 - \frac{(\sum x)^2}{n}$$

**TABLE:1. PRODUCTION OF IMPORTANT CROPS IN INDIA**  
(Million tonnes)

Year	Rice	Wheat	Cereals	Foodgrains	Sugarcane	Groundnut
1950-51	20.58	6.46	42.42	50.83	57.05	3.48

**P.G.R.P** : Pre Green Revolution Period (1950-51 to 1965-1966)

**G.R.P** : Green Revolution Period (1966-1967 to 2008-2009)

**G.R.P-I** : Green Revolution Phase-I (1966-1967 to 1980-1981)

**G.R.P-II** : Green Revolution Phase-II (1981-82 to 1989-1990)

**G.R.P-III** : Green Revolution Phase-III (1990-91 to 2008-2009)

**T.P** : Overall Period (1950-1951 to 2008-2009)

**C.G.R** : Compound Growth Rate

**Source** : using the data computed

It is clear from the table that rice production grew at a compound rate of 3.69 per cent in the pre-green revolution period. The rice production during different phases of green revolution, with the exception of phase-II grew at a lower rate as compared to pre-green revolution period. Production rose at a compound rate of 2.71 per cent in phase-I and 1.38 per cent phase-III. During phase-II production grew at a compound rate of 4.19 per cent. During the entire green revolution period, it went up at the rate of 2.53 per cent and during the overall period at 2.59 per cent. The growth rates for all the periods were highly significant at 1 per cent level.

Wheat production has shown an impressive trend during the phase-I of green revolution period when compared to pre-green revolution period. Prior to green revolution it grew at 3.80 per cent. The production of wheat has grown at a compound rate of 6.58 per cent during phase-I. However wheat production registered lower growth during the subsequent phases. It rose at the rate of 3.39 per cent during phase-II and 1.74 per cent in phase-III. During the entire green revolution period, production has grown at a compound rate of around 3.87 per cent and for the overall period covering pre-green revolution and green revolution periods, the growth was 4.78 per cent. All the growth rates are significant at 1 per cent level.

Production of cereals grew at a compound rate of 3.20 per cent before the on-set of green revolution, 3.11 per cent in phase-I, 3.12 per cent in phase-II and 1.45 per cent in phase-III of green revolution. As a result, for the entire green revolution period the growth rate was 2.49 per cent and for the overall period 2.75 per cent, which are below the rate of growth recorded during the pre-green revolution period. The growth during all the periods was highly significant.

With regard to foodgrains, production, a similar trend is noticed as pre-green revolution period seems to be better than the green revolution period. The production of foodgrains had grown at a compound rate of 2.96 per cent during the pre-green revolution period, 2.82 per cent during phase-I, 2.99 per cent during the phase-II, and 1.38 per cent during phase-III. The compound growth rates are 2.34 per cent and 2.5 per cent during the entire green revolution period and the overall period respectively. All the growth rates are found to be statistically significant at 1 per cent level.

As for as sugarcane is concerned, an impressive growth in production was recorded during the pre-green revolution period (6.42 per cent) as compared to different phases of green revolution. The compound growth rates registered in three phases of green revolution were 3.10 per cent, 2.97 per cent and 1.26 per cent respectively. During the entire green revolution period it was 2.74 per cent and during the overall period 3.12 per cent. The growth rates in all the phases are highly significant at 1 per cent level.

The growth of groundnut production was 3.54 per cent in pre-green revolution period and the growth rate was significant at 1 per cent level. During the three phases of green revolution period, the growth rates recorded were 1.09 per cent, 2.19 per cent and -0.95 per cent respectively and the growth rates are not significant. The growth rates during green revolution period and entire period are 0.88 and 1.21 per cent respectively and significant at 1 per cent level.

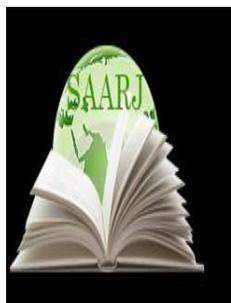

## CONCLUSION

Production of rice had gone up from around 21 million tonnes to 31 million tonnes between 1950-51 and 1965-66. In the green revolution period, production increased substantially and stood at a little over 99 million tonnes by 2008-09. The performance of the wheat was much better than that of rice as wheat production rose from a more 6 million tonnes to 80 million tonnes during the period from 1950-51 to 2008-09. Cereals as also foodgrains had shown better performance during the green revolution period. We find a similar situation in the case of sugarcane and groundnut. In terms of compound growth, with the exception of wheat, the growth achieved during pre-green revolution period was higher than that registered during green revolution period. Only wheat crop could perform well during green revolution period as compared to pre-green revolution period, corroborating the finding of Keith Griffin that in the case of wheat there is a dramatic break-through. As such, there is green revolution in respect of this crop. In the case of rice the growth was moderate during green revolution period. The rice production grew at a compound rate of 3.69 per cent in the pre-green revolution period. The rice production during different phases of green revolution, with the exception of phase-II grew at a lower rate as compared to pre-green revolution period. The production growth rates of crops for all the periods were highly significant at 1 per cent level. Wheat production had shown an impressive trend during the phase-I of green revolution period when compared to pre-green revolution period. Prior to green revolution it grew at 3.80 per cent. The production of wheat had grown at a compound rate of 6.58 per cent during phase-I. Production of cereals grew at a compound rate of as a result, for the entire green revolution period the growth rate was 2.49 per cent and for the overall period 2.75 per cent, which were below the rate of growth recorded during the pre-green revolution period. The growth during all the periods was highly significant. With regard to foodgrains production, a similar trend was noticed as pre-green revolution period

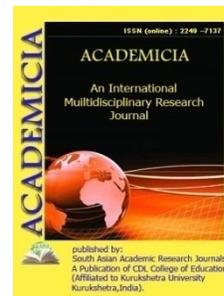

seems to be better than the green revolution period. As for as sugarcane is concerned, an impressive growth in production was recorded during the pre-green revolution period (6.42 per cent) as compared to different phases of green revolution. The growth of groundnut production during green revolution period and entire period are 0.88 and 1.21 per cent respectively and significant at 1 per cent level.

### ABSTRACT

*In this article, it is presented an analysis of data obtained on the impact of growth, development, stem height, spike parameters, grain yield and mineral fertilizer application norms on its quality indicators in soft wheat varieties. In the experiment, the increase in the rate of mineral fertilizers did not affect the increase in grain size, but rather its decrease. In particular, the highest yield was achieved when the feeding norm NPK 200:150:100 kg/ha was applied, but when determining the amount of grain formed at the expense of 1 kg NPK, it was 13.62-15.33-14.15 kg by varieties. Grain quality indicators are the highest in the variants applied NPK 200:150: 100 kg / ha, protein (15.0%), gluten (28.6%) and vitreous (63.9%) of the variety "Shavkat", control "Hosildor" (13.5%; 26.3%; 60.6%) and "Turon" (14.0%; 27.8%; 59.7%).*

### INTRODUCTION

Wheat is a grass widely cultivated for its seed, a cereal grain which is a worldwide staple food [2][3][4]. The many species of wheat together make up the genus *Triticum*; the most widely grown is common wheat (*Triticum aestivum*). The archaeological record suggests that wheat was first cultivated in the regions of the Fertile Crescent around 9600 BCE. Botanically, the wheat kernel is a type of fruit called a caryopsis.

Wheat is grown on more land area than any other food crop (220.4 million hectares, 2014).[5] World trade in wheat is greater than for all other crops combined.[6] In 2017, world production of wheat was 772 million tonnes, with a forecast of 2019 production at 766 million tonnes,[7] making it the second most-produced cereal after maize.[7][8] Since 1960, world production of wheat and other grain crops has tripled and is expected to grow further through the middle of the 21<sup>st</sup> century [9]. Global demand for wheat is increasing due to the unique viscoelastic and adhesive properties of gluten proteins, which facilitate the production of processed foods, whose consumption is increasing as a result of the worldwide industrialization process and the westernization of the diet [10] [11].

Mineral fertilizers are materials, either natural or manufactured, containing nutrients essential for the normal growth and development of plants. Three plant nutrients have to be applied in large quantities, nitrogen, phosphorus and potassium. Sulphur, calcium and magnesium also are required in substantial amounts. These nutrients are constituents of many plant components such as proteins, nucleic acids and chlorophyll, and are essential for processes such as energy transfer, maintenance of internal pressure and enzyme action [13].

Nitrogen (N) is often the most deficient of all the plant nutrients. Wheat is very sensitive to insufficient nitrogen and very responsive to nitrogen fertilization. The most important role of N in the plant is its presence in the structure of protein, the most important building substances from which the living material or protoplasm of every cell is made. In addition, nitrogen is also found in chlorophyll, the green colouring matter of leaves. Chlorophyll enables the plant to transfer energy from sunlight by photosynthesis. Therefore, the nitrogen supply to the plant will influence the amount of protein, protoplasm and chlorophyll formed. In turn, this influences cell size and leaf area, and photosynthetic activity [12].

The Republic of Uzbekistan gained grain independence in 2003 and produced 5 million tons of grain. More than 100,000 tons of grain were grown. This was achieved due to the expansion of irrigated areas from 24.0 thousand to 1356.1 thousand hectares over the years. By 2020, productivity will be even higher, at 6 million tons and the average grain yield in the Republic was 55 c / ha.

Agro-climatic zoning of agricultural crops is an urgent problem in Uzbekistan. In particular, in order to ensure sustainable grain independence, our grain growers face important and responsible tasks, such as the selection and introduction into production of varieties that are adapted to each climate and have a high yield [1].

**Purpose and functions of scientific work.** The purpose of the research is to determine the optimal standards of mineral fertilizers that will ensure the production of high quality grain from soft wheat varieties in the conditions of typical irrigated sierozem soils of Tashkent region.

To achieve this purpose, the following tasks are set:

- Germination, wintering rate and number of stem accumulation of wheat varieties;
- Development periods and biometric indicators of wheat varieties;
- agro physical, agrochemical properties of typical sierozem soil of the studied factors in the cultivation of winter wheat;
- The effect of wheat varieties on the leaf area;

- To determine the effect of mineral fertilizers on the yield and quality of wheat varieties, as well as the optimal feeding rate.

### MATERIALS AND METHODS

Field studies were carried out at the experimental station of Tashkent State Agrarian University. The experimental station is located near Tashkent, in the upper part of the Chirchik river, Kibray district of the Tashkent region, at an altitude of 481 m above sea level,  $41^{\circ}11''$  northern latitude and  $38^{\circ}31''$  east longitude. The terrain of the site is uneven, slightly wavy, with a general slope to the Salar canal. Irrigation water was pumped from the Bozsu channel.

The soil of the experimental site is long-irrigated sierozem, non-saline, with a low content of humus 0,9-0,7%, nitrogen 0,082-0,066%, phosphorus 0,153-0,139%, potassium 1,33-1,30%.

**TABLE 1 THE SOIL CHARACTERISTICS OF THE EXPERIMENTAL AREA**

№	Depth (sm)	Gross content, %				Mobile forms, mg/kg		
		humus	nitrogen	phosphorus	potassium	N-NO <sub>3</sub>	P <sub>2</sub> O <sub>5</sub>	K <sub>2</sub> O
1	0-30	0,925	0,083	0,152	1,33	4,8	47,1	180,7
2	30-50	0,715	0,070	0,134	1,30	3,2	40,3	162,0

Field and laboratory methods of research, developed by the Uzbek Research Institute of Plant Production, were used. Phonological observations were conducted according to the Methodology of the State Variety Testing of Agricultural Crops. Statistical processing of data was carried out according to B.Dospekhov [6]. Application of organic and mineral fertilizers and necessary agro techniques on these soils, enable to obtain the high yields of field crops.

### CLIMATIC CONDATIONS

The climate of Tashkent region, as well as of Uzbekistan in general, has a sharply continental character. Spring comes early: at the beginning of March, the air temperature rises noticeably, although sometimes a sharp cooling occurs. During this period a significant part of the annual precipitation falls. Summer is long, hot and dry.

**TABLE 2 THE CLIMATIC CONDITIONS DURING THE GROWING SEASON AND LONG YEARS MEAN (LEM=1960-2019)**

Months	Mean temperature (°C)				Total rainfall (mm)			
	Long years mean	2017	2018	2019	Long years mean	2017	2018	2019

Average	<b>13,9</b>	<b>13,9</b>	<b>15,6</b>	<b>15,9</b>	<b>518,5</b>	<b>498,3</b>	<b>746,4</b>	<b>511,3</b>

Sometimes precipitation falls in the month of June in the form of rains, but then comes hot and dry weather, usually continuing until late autumn. The maximum air temperature reaches 43 °C in July, sometimes in August.

The following phenological observations, calculations, laboratory analyzes were carried out in the experiment:

1. The degree of germination of grain.
2. The number of grasses, seedling thickness per 1 m<sup>2</sup> was determined at 3 points of all options.
3. Phenological observations were made on the stages of development.
4. The height of the stem of winter wheat according to the options (during the periods of booting and full ripening); spike length (during full ripening); the number of grains per spike; grain weight per grain; Weight of 1000 grains.
5. At the time of harvesting, 1 m<sup>2</sup> of wheat was harvested from 3 points of repetition of all variants in the experiment, the grains in it were milled and the yield of grain and straw was calculated by weighing.
6. Agrochemical analysis of soil was carried out during the experiment. In order to determine the agrochemical composition of the soil, before the experiment put and before the harvest, samples were taken from the topsoil (0-30 cm) and subsoil (30-50 cm) layers of soil: a) the amount of humus (by the method of I.V. Tyurin); b) total amounts of nitrogen and phosphorus in the soil (by the method of LP Gritsenko, IM Maltseva); c) Calorimeter of the mobile form of nitrate nitrogen; phosphorus B.P. Machigin, exchangeable potassium P.V. Determined by the Protasov method.
7. Technological quality indicators of grain (samples were delivered to a special laboratory) were determined.
8. In the mathematical analysis of the yield of winter wheat grain and straw, B.A. Dospikhov's (1985) multiple factory field experiments used the method of variance analysis based on randomized returns.

## EXPERIMENTAL RESULTS

Grain crops go through several developmental stages during development, namely from germination to the formation of new seeds. During the developmental stages, morphological changes occur in plants and new organs are formed. The winter wheat crop, like other cereals, goes through the following stages: seed germination (seedling), stem accumulation, booting, heading, flowering and ripening (milk, dough and full ripening).

The rate of development of wheat sown in autumn depends to some extent on growing conditions, biological characteristics of species and varieties, bush thickness, soil moisture, air temperature, sowing depth of seeds, sowing times, standards, fertilization and irrigation standards and other factors.

Phenological observations were performed continuously every two days from the beginning of each development period (10%) until 75% were manifested in the plant. The grassing period was observed in "Hosildor" and "Turon" varieties on November 4-6, and in "Shavkat" variety on November 6-8. After the germination of winter wheat seeds, the next stage of development of the

plant gradually enters the stem accumulation phase. The experiment showed that the studied varieties entered the stem accumulation phase during the onset of cold winter days.

Booting (stem formation) period: During this period, the plant grows rapidly, its mass increases rapidly. Therefore, during this period, the demand of plants for nutrients and moisture increases. During this period of development, the second feeding of the plant with the remaining 50% of nitrogen fertilizers led to the rapid development of wheat varieties. Booting wrapping period March 26-28 in “Hosildor” variety; The Turon variety was observed on March 14-16 and the Shavkat variety on March 20-22. During this period, the differences in varieties were significant, and the development of the variety "Turon" was accelerated.

The results of observations between the varieties show that the Turon variety passed 111-114 days, the Shavkat variety 113-116 days, and the Hosildor variety 117-121 days later.

The heading period was observed on April 26-28 in “Hosildor” variety, on April 18-22 in “Turon” variety, and on April 22-24 in “Shavkat” variety. By this time, there was a rapid development of the variety "Turon". Data on the impact of fertilizer standards on the development periods of prospective wheat varieties are given in Table 3.

**TABLE 3 DEVELOPMENT PERIODS OF WINTER WHEAT VARIETIES, 2018-2019**

9	N <sub>200</sub> P <sub>150</sub> K <sub>100</sub>	24.X	22.III	24.IV	2.V	14.VI

Ripening: In the winter wheat plant, the ripening period is divided into three periods: milk, dough and full ripening. During these periods, a decrease in the amount of moisture in the grain is observed (55-60%; 25-30%; 13-14%). According to Table 3, full ripening of grain in the variety «Turon» 10-12.VI.; «Shavkat» variety 12-14.VI. and 13-18. VI days in the “Hosildor” variety.

It is known that the high yield of agricultural crops means that the crop structure is well formed. The main indicators that determine the weight of winter wheat are: the length of the spike, the number of grains in the spike, the weight of the grain in the spike, and the weight of 1000 grains, almost all of which depend on the biological characteristics of the variety.

Feeding the wheat plant with mineral fertilizers has a major impact on the number of grains. Especially if nitrogen is not enough for the formation and formed spikes, the number and weight of grains in the spike decreases (Shatilov 1990, Turaev, Khojakulov, 1999).

In the experiment, the effect of the norm of mineral fertilizers on the biometric indicators of prospective wheat varieties was observed. According to Table 5, in variants 1,4 and 7 mineral fertilizers NPK 100:75:50 kg / ha were applied, while in the first variant the average spike length was 8.0 cm, in Turon variety 8.7 cm and in Shavkat 8.7. On the sequence of varieties when applied NPK 150:110:75 kg per hectare, while the variety was 8.5 cm; 9.4 and 9.3 cm; mineral fertilizers high NPK 200:150:100 kg / ha when applied norm 1; 4 and 7 - 1.7 cm compared to options; caused an increase of 0.3 cm and, 1.7 cm.

Another yield element of winter wheat is the number of grains per spike, with NPK applied at 100:75:50 kg / ha per hectare; 4 and 7 - 40.0 in options; 41.5 and 41.6 piece, respectively.

**TABLE 4 SPIKE ANALYSIS OF WHEAT VARIETIES**

№	The rate of mineral fertilizers, kg/ha	Spike length, cm	Number of grain per spike, piece	Grain weight per spike, gr	Grain weight of 1000 pieces, gr
Hosildor					
1	N <sub>100</sub> P <sub>75</sub> K <sub>50</sub>	8,0	40,0	1,58	40,1
2	N <sub>150</sub> P <sub>110</sub> K <sub>75</sub>	8,7	41,9	1,70	41,2
3	N <sub>200</sub> P <sub>150</sub> K <sub>100</sub>	9,7	43,9	1,76	42,2
Turon					
4	N <sub>100</sub> P <sub>75</sub> K <sub>50</sub>	8,7	41,5	1,59	38,8
5	N <sub>150</sub> P <sub>110</sub> K <sub>75</sub>	9,4	44,3	1,80	41,4
6	N <sub>200</sub> P <sub>150</sub> K <sub>100</sub>	9,0	43,1	1,69	40,1
Shavkat					
7	N <sub>100</sub> P <sub>75</sub> K <sub>50</sub>	8,5	41,6	1,63	40,8
8	N <sub>150</sub> P <sub>110</sub> K <sub>75</sub>	9,3	43,6	1,71	42,5
9	N <sub>200</sub> P <sub>150</sub> K <sub>100</sub>	10,2	44,7	1,80	43,4

In options 2, 5 and 8, the grain weight per grain applied to mineral fertilizers N<sub>150</sub>P<sub>110</sub>K<sub>75</sub> kg / ha was 1.70, 1.80 and 1.71 grams, respectively. It can be seen that the feeding norms with mineral fertilizers affected the length of the spike, the number and weight of grains per spike.

Affecting factors to the yield of cereals include: first of all, the biological characteristics of the variety, natural climatic conditions, optimal planting method, duration time and norm, nutrient content and duration of application, moisture supply, disease and pest infestation, timely harvest (Atabaeva, Khudaykulov 2018, Amanov 2019).

When the analysis of grain yield, the average yield of Hosildor variety was reached to 49.2-61.3 c / ha, Turon variety is 53.9-69.0 c / ha, Shavkat variety is 51.7-63.7 c/ha.

The main problem in grain production remains quality indicators. The reason for the fact that the quality of grain grown in Uzbekistan does not fully meet the requirements for the closure of bakery bread: the average vitreous content is 63% (15-90%), gluten content is 26.7% (23.6-

33.2%), IDK - 95 (65-120) In Kazakhstan, the figures are relatively high: 81 (41-95%), 32.6 (24.0-37.6%), and IDK 80 (60-95).

According to the experimental data, the quality of winter wheat was affected by the amount of mineral fertilizers.

One of the indicators of grain quality is the amount of protein. The protein content of winter wheat varies depending on varietal characteristics, soil climatic conditions, fertilization, moisture content, plant disease and pest infestation, and a number of other factors (Kodanev 1976; Corbellini 1996, Amanov 2001, Anderson 2001). The importance of protein is that it is easily digested in the human body, increasing its physical and mental capacity.

In the experiment, it was found that the values of protein, gluten, vitreousness in the studied varieties were different in terms of the biology of the varieties. The data obtained are presented in Table 5.

In the experiment, the amount of grain (in kg) formed at the expense of 1 kg of NRK fertilizers in the formation of grain yield was determined.

In the experiment, when calculating the amount of grain formed per 1 kg of NPK, NPK in the variants used 100:75:50 kg / ha was 21.87 - 24.06 - 22.98 kg by varieties.

The increase in the rate of mineral fertilizers did not affect the increase in grain content, but rather its decrease. In particular, the highest yield was achieved when the feeding rate NPK 200:150:100 kg / ha, but when determining the amount of grain formed at the expense of 1 kg of NPK was 13.62-15.33-14.15 kg for varieties.

## CONCLUSION

In the conditions of typical sierozem soils of Tashkent region, the effect of mineral fertilizers used in the cultivation of high and high-quality crops from soft wheat varieties was observed.

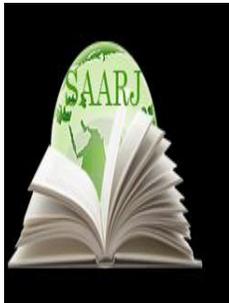

In the experiment, the increase in the rate of mineral fertilizers did not affect the increase in grain size, but rather its decrease. In particular, the highest yield was achieved when the feeding norm NPK 200: 150: 100 kg / ha was applied, but when determining the amount of grain formed at the expense of 1 kg of NPK, it was 13.62-15.33-14.15 kg by varieties.

Grain quality indicators NPK 200:150:100 kg / ha are the highest in the applied variants, protein (15.0%), gluten (28.6%) and vitreous (63.9%) of the variety "Shavkat" compared to control "Hosildor" (13.5%; 26.3%; 60.6%) and Turon (14.0%; 27.8%; 59.7%).

### ABSTRACT

*The article analyzes the geographical and ethnographic features of the Jizzakh oasis based on a number of historical sources, archival documents and field records, and also discusses the Uzbek tribes living in the oasis, their branches and main types of economic activities.*

**KEYWORDS:** *Jizzakh Oasis, Turkestan And Morguzar Mountain Ranges, 92 Uzbek Tribes, Dashti Kipchak Uzbeks, Yuz, Qirq, Uzbek-Turkmen, Kangli, Mangit, Nomadic Cattle Breeding, Sedentary Agriculture.*

### INTRODUCTION

The Jizzakh oasis has a long history and is a micro-ethnographic region located in the central part of Uzbekistan. Geographically, it is located between Nurata, an offshoot of the Turkestan ridge, the Morguzar, Koytash and Mirzachul ranges in the east, it borders on Samarkand in the west, Syr Darya in the east and the Republic of Tajikistan in the south [1. 95]. From the north-east of the oasis it is connected to Haydarkul (Aydarkol) through Pakhtakor, Dustlik, Zafarabad districts, from the north-west to the Kyzylkum deserts, from the south-west to the Zaamin and Oykar ridges [2. 593].

To the southeast, the Ilonotti mountain pass on the Sangzor River separates the Nurata Range from the Morguzar Range [1]. The western part of both mountain ranges is a plain, and the eastern part is connected to the Aktag, Karatag, and thus the Koytash mountains through the Nurata oasis.

While a part of the oasis is occupied by deserts and steppes, the connection of the region with the mountains, foothills and deserts defines its uniqueness. From the north and northeast, the stair-shaped plains rise towards the mountains. Most of the area is occupied by Mirzachul, which consists of plains [3. 24-25]. The terrain of the oasis is not uniform it descends from south-east to

north-west. The part of the plain is sloping to the north-west, with an average height of 250-300 meters. In the southern foothills, the height reaches 450-530 meters [4. 14].

### **The Main Findings and Results**

The average height of Morguzar Mountain, which is the northern branch of the Turkestan ridge, is 1500-2000 meters, the height of some peaks is up to 2621 meters. It is separated from Mount Nurata by a valley of the Sangzor River to the north. The largest river in the oasis, the Sangzor (123 km long), is saturated with snow and ice from the Turkestan, Koytash and Morguzar ridges, increasing in summer and decreasing in winter. The average monthly water consumption is 6.1 cubic meters per second [3. 27]. At the same time, such rivers as Zominsuv, Ravotsay, Khojamushkentsay, Saykhansay, Turkmansay, Achchisay, Koshchisay, Jaloyirsay start from the northern slope of the Turkestan ridge and supply the oasis with water.[5]

In general, the location of the oasis, favorable geographical features have created all the natural conditions for the economy of the ancient settled and semi-settled population. This has led to the constant and seasonal development of agriculture and animal husbandry in the region. The all-round convenience of the oasis's pasture opportunities (meadows) has led to the co-development of nomadic pastoralism with sedentary farming here and the settlement of many ethnic groups.

The population of the oasis has an ethnically complex composition. Today, 89.0% of Uzbeks, 3.1% of Kyrgyz, 3.0% of Tajiks, 2.1% of Kazakhs, 0.7% of Russians and 2.1% of other nationalities live in the Jizzakh region. 4.1% of the population of the Republic of Uzbekistan live there. In particular, Uzbeks - 1208.7 thousand people, Kyrgyz - 41.6 thousand people, Kazakhs - 28.4 thousand people, Tajiks - 31.6 thousand people, Russians - 14.9 thousand people, Tatars - 6.4 thousand people, Koreans - 2.7 thousand people, Turkmens - 0.4 thousand people, Karakalpaks - 0.2 thousand people of other nationalities and ethnic groups - 17.3 thousand people [6].

An analysis of surviving written sources shows that in the late 15th and early 16th centuries, the people of Dashti Kipchak began to migrate en masse to Central Asia, especially between the two rivers, under the leadership of Shaibanikhan, and most of them settled in convenient oases. By this time, the influx of Dashti Kipchak Uzbeks into the oasis had a unique impact on the local ethnic system. However, the Uzbek tribes began to mingle with the local settlers and slowly began to forget their tribal traditions. As a result of their assimilation of the high cultural achievements and traditions of the local population, the process of formation of the majority of the population between the two rivers as a single Uzbek people throughout the sixteenth century entered a decisive phase. Now an entire nation has begun to develop as the Uzbek people. Although we see the Uzbeks as a whole nation, it is divided into several tribes.

As in other nations, the Uzbeks have preserved their tribal division until recently. Indigenous people call themselves "92 bovli (connected) Uzbeks." This means that the Uzbeks consist of 92 bov (connected) sections. There is a lot of historical evidence that the Uzbek people are made up of 92 parts (tribes)[7. 3]. In particular, Turdi Farogi, a democratic poet of the Uzbek people who lived in the 17th century and came from the Yuz tribe, wrote in his ghazal "Tor kongillik bekalar" that the Uzbek people consisted of 92 tribes[8. 282]. In addition, Abdullah II's correspondence with the 16th century Indian king Akbarshah contains information about the division of Uzbek tribes[9. 76].

Written data on the ethnic composition and lifestyle of the population living in the Jizzakh oasis and adjacent areas, mainly some statistical materials for the 60-90s of the XIX century and 20s of the XX century[10. 75].Chapter V of the book “Ancient Earth” by Y.F. Buryakov and A.A. Gritsina, published by “Fan” in 1994, describes the historical and ethnographic description of the country in the late Middle Ages, albeit in short lines.Chapter IV of this book, written by T.U. Salimov, is devoted to the ethnic formation of the population of the region in the late Middle Ages. The author reveals the ethno-historical roots of the population of the Jizzakh oasis on the example of Zaamin district.In it, the author studies the Turkic, yuz, kirk, Kipchak tribes, their subdivisions on the basis of historical written sources and ethnographic sources[11. 86-102] .

In the Jizzakh oasis we can meet representatives of almost all 92 Uzbek tribes. In the early days, large groups of forty came and settled in Jizzakh. As a result of the settlement of Uzbeks in the eastern, northern and northwestern regions of the oasis, the ethnic composition of the population of the oasis will thicken.

If we pay attention to the history of the formation of ethnic and ethnographic groups mentioned above and the composition of their way of life, we can witness the formation of a unique ethnic landscape in the oasis from time immemorial. In particular, one of the many ethnic groups among these ethnic components is the yuzs, kirks, va qangils.The yuzs are mainly in Zaamin, Yangiabad, Zarbdor districts, Jizzakh city and its environs, Qangils in Takali, Chayonli, Sayfinota, Chuvillak villages of Gallaorol district, in Zaamin district, in Kangli, Sherkongli, Karangul villages of Gallaorol district and in Jizzakh city of Jizzakh. along with animal husbandry and agriculture[5].In his research, K. Shoniyazov emphasizes that Gallaorol ganglia are yellow ganglia[12. 123-128].

A number of expeditions were organized to study the ethnic composition of the oasis. In particular, an ethnographic expedition led by T.U. Salimov in 1988-1989 to study the ethnic history of Zaamin district provided an opportunity to study in depth the ethnic units in the oasis.As a result of this research, the names of Uzbek tribes and settlements in the oasis, their habitats were studied.In addition, the well-known ethnographer V.Radlov in his work “On the settled Turkic tribes of Central Asia” gives a detailed description of the faces of Zaamin, based on the work of General A.Maksheev.According to Maksheev, the composition of the Yuz Tribes, Piece yuz (Boymoqli, Biran sadoq, Olmachi, Mirza uch tamgali, Sergeli yuz, Uyuvli, Karakalpak, Puchugoy, Ak kigiz, Kuyonkulokli, Bolgali four tamgali, Eshquli, Tokboy),Chinese yuz (Khan Khoja, Norin, Chunkan, Sirboyinlik, Kokani, Double logo, Ochamayli, Mangit), Solin (Shodmon topi, Nauferash, Togayi balli, Kavrak, Davlat, Qirq sadoq, Boyovut, Kenayuz), Uyas (Oq chakmon, Norin, Chunkan, Sirboyinlik), Qarapchi (Burjigen, Kongirboy, Sakkiz sari, Naiman, Qoqoni, Kushtamgali, Ochamay , Mangit), Naiman Erganakli (Chiljuvut), Besh yuz (Koshtamgali) and Soloqli (Kultepalik, Beshkal, Gafur, Chirkirovuq, Mirza, Ariq, Beklar topi) [11. 86-102].

Forty people, who make up the majority of the population of the oasis, now live in the area adjacent to Morguzar Mountain in the village of Pishagor in the Zaamin district, and in several villages in the Sharof Rashidov district, Ethnic and ethnographic groups such as Kipchak, Sarai, Chuvillak, Iranian, Turkish, Turkmen, and Yuz live in and around Jizzakh.

During this period, the above-mentioned representatives of the above-mentioned clan also established intensive economic and trade relations with the Uzbek-Turkmen of the Nurata oasis.

Livestock districts brought cattle, camels, and yearlings to the oasis hunters to start or sell for cash, and bought fresh fruit, tobacco, and handicrafts from local markets. According to sources, in the “Sarbozor” in the Gallaorol district until the 30s and 40s of the XX century there was a constant trade in cattle, horses and camels[13. 66].

In the late 19th and early 20th centuries, traditional steppe cattle-breeding played an important role in the Kangli economy, but in the foothills of the Morguzar and Koytash mountains, along springs and reservoirs, the population was engaged in irrigated agriculture by planting sesame, maxsar, wheat, millet, watermelon. As a result of the complementarity of the two types of economy, irrigated agriculture and steppe pastoralism of the oasis, ethnocultural ties were established between the Turkmen, Sarai, Nayman, Qirq, and Mangits. This led to the formation of a unique economic and cultural type in the oasis. After all, economic and cultural types are a historical set of farms and cultures that exist in certain natural and geographical conditions and at the same level of socio-economic development[14.13].

Mangits are scattered in Ilonchi, Osmonsay, Deristan, Yomchi, Sayyod, Osmon villages of Forish district of Jizzakh region, especially in the villages from Ustukhan desert to Ogzikent[15. 13-14]. Later, the process of settlement, which is typical for all ethnic groups, also affects the way of life of the Mangits, and a large part of the population settles near rivers and springs. The Forish mangits are basically divided into two large tribes. These are called “kyrlik” and “soylik”. The steppes consisted of tribes such as Odinasariq, Shotolib, Oqaat and Soylik-Khojakorson, Mansur, Jalmat, Qurbonaji, Chuli[5].

As a result of the settlement processes that began to end in all regions in the early twentieth century, the main groups of mangits, including the Kirghiz, were engaged in animal husbandry as well as handicrafts and agriculture, while the valleys were engaged in agriculture, growing grapes and cereals. The Mangits sold their products mainly in Forish, Sintob, Josh, and Juma markets. The Turks settled in the villages near the northern ridge of Mount Nurata, most of them in the Forish and Morguzar mountain oases, mainly in Balandosmon and Ajrim[5].

The natural-geographical location and climatic conditions of the oasis have affected the family and economic life of the population. On the vast hills and irrigated oases on both sides of the Nurata and Koytash Mountains, three main types of farming were formed, consisting of oasis irrigated agriculture, steppe cattle-breeding, and mountain-pastoral cattle-breeding. Part of the population was also engaged in driving livestock during this period. By the middle of the twentieth century, these ethnic groups, which had become fully settled, had ethnocultural ties with other ethnic groups and ethnic groups in the oasis who had been engaged in these types of farming. Indeed, the fact that these peoples lived in the same area for many years and interacted with each other was an important factor for them to fully adapt to the ethno-cultural environment of the oasis.

As for the Uzbek-Turkmen of the oasis, in the 1920s, their range was not only Mount Nurata, the villages adjacent to Nurata in the upper Zarafshan oasis, but also villages in the foothills of the Koytash Mountains. By the 1920s, the number of Nurata Turkmen in the Jizzakh and Nurata oases was 30,000-35,000. At the end of the 19th century and the first half of the 20th century, Uzbek-Turkmen lived in most villages without guj (compact), they are divided into two major seed-community associations “Olti ota g’oz oyoqli” “beshota mantiglov”. Olti ota g’oz oyoqli divided “oytamg’ali, qo’shtamg’ali”, “qon-jig’ali”, “bo’gajli” (bo’gajli, bekjig’ali) “g’oz-

oyoqli".VG Moshkova divides each of them into 6 smaller tribes and calls them "yigirma to'rt ota turkmanlar"(twenty-four Turkmen fathers)[16. 155-159].

Currently, ethnologist F. Tolipov records a number of small ethnic groups of Uzbek-Turkmen scattered along the Nurata oasis adjacent to the Jizzakh oasis on the basis of available ethnographic data. According to the author, their settlement in the Nurata oasis is the result of long-term ethnogenetic processes, as a separate ethnic component, fully absorbed into the Uzbeks and became part of it[15. 12-13].However, the Forish and Gallaorol districts adjacent to the Nurata mountain range are administratively part of the Jizzakh region, and the ethnic composition and lifestyle of the population in these regions are also covered in a number of historical and ethnographic materials[17. 125-128] .

## CONCLUSION

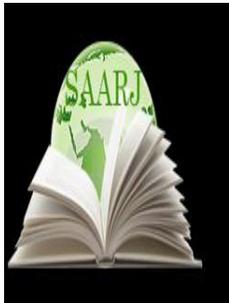

The Uzbek-Turkmen of the second ethnic group, the "olti ota g'oz oyoqli" Turkmen, lived in the villages of Garasha, Karaabdol, Narvon, Eshmoksak, Gulchambar, Bolgali, Jarbulak, Kosa, Shohusmon, and several others in the northeastern part of the Jizzakh oasis.Although the Uzbek-Turkmen Juz tribe's life and customs are similar to those of other Uzbek tribes, they combined irrigated agriculture with traditional steppe farming. The formation and development of such an economic style contributed to the development of economic and cultural relations between ethnic groups.

In short,the peculiar geographical features of the oasis are a unique area of ethno-communication in the migration of ancient and semi-settled population along the Jizzakh oasis,that ispeculiar "contact space" that contributed to the constant and seasonal development of specific economic sectors in the region, in particular, agriculture and animal husbandry.

### ABSTRACT

*In today's world individuals struggle the most with mental health and healing. It is a known fact that mental wellness begins from self-realization, which is considered to be the main goal of Sufi perspective. This article defines Sufism and explains the integration between Sufi practices and emotional healing, and its application in real life.*

**KEYWORDS:** *Sufism, Islamic Spirituality, Spiritual Healing, Sufi Practices, Self-Actualization*

---

### INTRODUCTION

From time immemorial there is a curiosity in human being to search for the selfhood. Selfhood is a place of order and enlightenment and at the same time it is also inclined towards the Evil commanding self. If it is tempted it loses its purity. Self-purification and self-realization are the main teachings of the Sufi order in Islam.

Sufism is one of the Islamic fields that focuses on cleansing aspects of human spirituality, which in turn raises the virtues of noble character (Frager, 2013). Cleansing the spiritual aspect of a man is then known as the esoteric dimension of the human self (Muhaimin, 2006). Through Sufism, a person can learn about the ways of self-cleaning and apply them in real life. This enables him to maintain self-control, honesty of his heart, sincerity, and responsibility.

Sufi Spiritual Healing is not a mysterious process but is in fact very natural instinct with which every human being is born but fail to realize this potential power. It is an instinctive ability within all individuals as it is a Divine quality which human being possesses. However this skill just like any other talent among humans varies in degrees. Some are gifted with healing ability that

people recognize them as natural healer while others are given the ability of healing in transmission and others through their inner calling take upon this or perform healing out of compassion. Some healers are unaware of their healing ability yet they help others to heal, thus they are saved from their ego-based claim since behind all healing is as-Shafi (the One Healer).

The role of Sufi Spiritual Healing is not only to cure the suffering humanity but to teach them the ways to awaken the God gifted hidden treasure. The goal of the Sufi is awakening and realization. Each and every one of us possesses the energy field or an aura that surrounds and penetrates the physical body and hence associated with the health of the human being. The more we are optimist the more we generate positive energy while more we a pessimist the more we generate negative energy which ultimately affect not only our social circle but also the health.

### **The Sufi approach of Therapy**

Sufis have called the act of zikr "the recognition of flawlessness and the flawlessness of recognition." Chanted, moved, inhaled, in silence and in tone, zikr welcomes us to a complete attention to the living potentials inside our spirit. Reflection in the hush and with different expressions of internal focuses is likewise central for Sufis and will structure a piece of the day's practices and investigating the realm of zikr, breath, heart and insightful moving. The modification and nature of environment produced through such development and a sound practice empowers one to wind up all the more rapidly responsive to the internal planes of awareness.

Therapy and Sufism oblige one to courageously stand up to reality of oneself, and assume liability for the majority of one's encounters - considerations and feelings; decisions and circumstances. Through striving and exertion, one can recuperate from the past, and work to create a blissful present self which is liquid yet grounded, astute, and proper to every circumstance. Sufi experts encounter this procedure as a trip through perpetually developing levels of the profound heart.

Eventually, Sufism as a mystical control goes further than usual remedial objectives: the Sufi search for association with the deepest levels of truth and the most significant aspects of experience - the Sufi search to know the heavenly power . One most likely acquainted with the sonnets of the most famous mystic Moulānā Rumī , whose lyrical interpretations of affection, magnificence and transcendence are broadly utilized as touchstones by specialists, healers, craftsmen, and the profoundly slanted all through the world. Tenderness, trustworthiness, and uniformity of people around the globe are the focal principles of Sufism. So are peace, leniency, opportunity, equity, and truth.

### **Healing Methods and Techniques practice by the Sufi**

It is a known fact now that energy undertakes numerous structures from the unseen to the seen, so does the act of Sufi healing. Certain setting must be met possess by the healer and in the recuperating environment so mending can happen. There are three categories for health practices:

- 1) For the body;
- 2) For the mind or emotions;
- 3) For the soul.

The most ideal amongst these are the one related to the Soul. The practices involved for the soul are highly divine in nature and have blessings above.

### **Spiritual healing**

#### **1) Suras and Verses from the Quran.**

Allah ordained in the Quran that His Book of Wisdom is healing and mercy for those who believe. The Words of Allah in the Quran show a divine energy having spiritual powers that affects and heal the minds, heart and bodies as well as the some specific Surahs and Verses are prescribed for different ailments.

#### **2) Allah's Most Beautiful Names/Attributes**

Allah portrays Himself regarding qualities, called Allah's Most Beautiful Names. There are ninety-nine Names of Allah specified in the Holy Quran. It is mentioned in Hadith (sayings of the Prophet Muhammad (SAW)) that each name/attribute has a significant quality as well as a particular energy connected with it and can be utilized to influence a longing result.

### **Material healing**

#### **1) Diet and Physical Exercise.**

The purpose of the Sufi healing is to seek the simplest and most persistent form of therapy. The key factors to maintain the health are nourishing food and healthy drinks as well as the appropriate amount of physical exercises. For this purpose the medicinal herbs are often prescribed.

#### **2) Environment.**

The need of clean and pleasant environment is the requirement of the human being in which they flourishes. Adding to that purity and calmness provide an atmosphere negative energy and negative forces cannot hit upon a comfortable corner to rest or settle.

The ultimate aim of the Sufi is communion with God through spiritual realization, which is achieved through the knowledge revealed by Quran (*ilm*) and the practice of Islam (*amal*). Since its inception the Sufi philosophy has revolved around the concept of God and the ways and nature of communion with him. The early Sufis adhered strictly to the Quran in their interpretation of the concept of the God as infinite, eternal, unchangeable, creator, all-powerful, merciful and the cause of all existence. With the growth of Sufi philosophy, the concept of God changed from the one as the cause of all existence to the idea of God as the only real existence. This philosophy reached its ultimate in the concept of the *wahdat-ul-wujood*. Sufis regards the soul as the agency for communication with God. It is the higher soul, as Sufis believe, created before any human being came into existence, consisting of heart (*qalb*), spirit (*ruh*), and conscience (*sirr*) that has the ability to know God. The *sirr* is regarded by many Sufis to represent the "secret shrine of God himself, wherein he knows man and man can know him." The heart (*qalb*) has an important place in Sufism and is considered to contain the divine spark that leads to spiritual realization. Sufis cherish the revelation by God that "I, who cannot fit into all the heavens and earths, fit in the heart of the sincere believer." For the heart (*qalb*) to reflect the truth as it is, it has to be cleansed of the rust of worldly influences.

Muhammad, has a special place in Sufism. The spiritual enlightenment or the ascendance of the higher soul for communion with God is believed to go through a chain of transmissions to Muhammad as through him only can the communion be achieved. Sufis refer to the saying of Muhammad “the first thing that Allah created was my light, which originated from his light and derived from the majesty of his greatness” as a basis for this belief. Sufis believe that the ascendance is possible only through the process of purification of the soul – the way (tareeqa).

Spiritual and religious beliefs form an important means of coping with stress for a large number of people but unfortunately this has received little attention by the mental health professionals. Recently, however, religion and spirituality have been incorporated into the therapeutic process and have shown promising results.[46,54] The assimilation of spirituality into the psychotherapeutic processes has been either in the form of an augmentation of an already existing therapeutic technique – spiritually augmented cognitive behavior therapy or the development of new techniques where spirituality itself forms the core – transpersonal psychotherapy. Though Sufi beliefs and practices have been incorporated into the transpersonal psychotherapy but there exists no literature about the incorporation of these into the cognitive behavior therapy models.

A vast number of the mentally ill people in the community go untreated or seeks the help of spiritual healers in most of the developing countries. The reasons lie in the belief systems of the people which foster a spiritually oriented explanation of the mental illnesses and the practically non-existent mental health care services in most of the rural settings. The large number of mentally ill people thronging the shrines (*dargah*) of Sufi saints to seek cure is a testimony to this. The incorporation of spiritual/Sufi elements into the mental health care services needs to be a two-fold process:

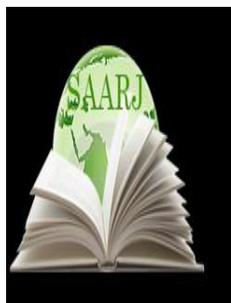

1. Incorporation of the spiritual/Sufi healers into the mental health care delivery system which may include basic training in identification of mental illnesses and appropriate referrals when needed.
2. Incorporation of the spiritual/Sufi beliefs and practices into the therapeutic process which may increase the utilization of mental health services by a largely spiritually oriented population.

The integration of spiritual beliefs and practices into the mental health care delivery system needs efforts both at the organizational and individual level. Sensitization of the trainees in the mental health profession to spiritual issues needs to be given an impetus. The focus of the training should be on understanding of spirituality as an important part of the individual seeking help and a thorough understanding of the belief systems of the people in the practice area.

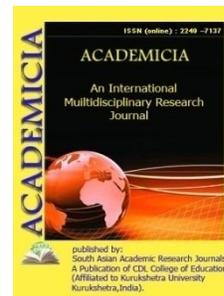

Sufism provides a vital link to the understanding of revelation – the source of religious knowledge in Islam as well as other Semitic religions, and influences the mental health of its believers and practitioners in a significant way. Unfortunately, there is little in terms of research based evidence to draw any conclusions in both these directions. There is a need for research to evolve scientifically sound means of incorporation of Sufi beliefs and practices into the mental health care system before any dogmas strike their roots. At the same time, mental health professionals should not slide into the role of preachers and start promoting the Sufi beliefs and practices; the role should rather be restricted to utilizing these beliefs and practices where it forms a part of the belief system.

**INTRODUCTION**

The highest product of family-human thinking. After all, this small place not only gives meaning and benefit to our lives, but also plays an important role in the development of society and the development of the country. At the same time, harmony and harmony in the family form in the human mind such high human qualities as love of life, devotion to the profession, respect and attention to others. A healthy environment is one of the most important factors in the upbringing and development of children who are able to work for the country and be able to serve the people. Therefore, to ensure the strength of families in our country, to support it materially and spiritually identified as one of the priorities of public policy. As President Sh. Mirziyoyev said, "It should be to further strengthen the foundations of the family, which are sacred to us, to create an atmosphere of peace, harmony and mutual respect in homes, to fill spiritual and educational work with concrete content. It is related to the bitter and unpleasant issues that are not specific to our people, such as crime among women, the increase in family divorces, the exposure of young people to various religious extremist movements and terrorist organizations. The complex and multifaceted interactions between family members have led many scholars, including Uzbek

scholars, to believe that V.M.Karimova, M.Davletshin, G.Shoumarov, E.Goziev, B.Qodirov, H.Karimov, N.Soginov, F.Akramova, G.Yadgarova, M.Salaeva, D.Khalikov, Ruzikulov F.V. studied by. They study the ethno psychological aspects of family relations in terms of customs, traditions and traditions specific to the Uzbek family. But while analyzing the institution of the family as a social reality, its laws have been put forward here in many studies that have focused on the psychological nature, origins, and dynamics of family-specific relationships.

The most important methodological principle in research is that the person studying the family should not forget that there is a complex and multifaceted system of relationships between all family members, rather than as a sum of ordinary family members, which are reflected in the responses of each member. That is, the family and the relationship within it are always in a coma of external psychological influences. Looking at it as a small social group requires taking into account the fact that there are almost all the socio-psychological laws inherent in a small group and that they determine the status of each family member. In fact, the family as a whole, some scientists (GMAndreeva, AIZakharov, VSTorokhtiy, N.Ya.Soloveva and others) according to the rightful confession of, this is the primary group<sup>1</sup>. That is, the emotionality inherent in the primary group, the combination of formality and informality in relationships, the dependence of the socio-psychological environment on human relationships, and h-zones are also inherent in family relationships. In the Republic of Uzbekistan, the Cabinet of Ministers adopted Resolution No. 422 of 06.07.2020 "On measures for the gradual implementation of the subject" Education "in general secondary education<sup>1</sup>.

The requirements for the complex include "Students in this subject to provide quality knowledge, to direct them to the right path of upbringing, the necessary knowledge

It is rich in ethically modern, interesting and psychological-pedagogical materials aimed at providing quality knowledge, directing them to the right path of education, helping them to acquire the necessary knowledge and skills, to adapt to independent life, to form decision-making skills based on legal and moral criteria in different situations. requires the following complex of educational and methodical complexes." - is marked<sup>2</sup>.

At present, public councils "Family-neighborhood-educational institution" have been established in the citizens' self-government bodies of the country, which are taking the necessary measures to strengthen the responsibility of parents in the upbringing of children, to study student attendance.

The concept of cooperation "Family-neighborhood-educational institution", developed in our country in 1994, today is important for the protection of the younger generation from various crimes, extremism, drug addiction, "popular culture", meaningful leisure, career guidance. factor. However, in recent years, the emergence of individuals with different types of destructive behavior in society requires the strengthening of special pedagogical and psychological measures in this regard<sup>3</sup>.

In addition, the types of interpersonal relationships in Uzbek families, their impact on personal development, psychological characteristics, especially the impact of divorce on the formation of a child of different ages in the family, the development of conflict in the family in recent years. the causes of the cases are markedly different from those in other years. This requires an in-depth and comprehensive study of these problems, the development of effective practical measures to address them, the introduction of family psychological services in practice. [1]

The term destruction is derived from the Latin word *detructio*, which means to destroy something, to destroy. In psychology, destruction refers to a person's destructive attitude toward oneself, others, and the outside world. Destruction in a <sup>3</sup>National Database of Legislation, 07.07.2020, No. 09/20/422/1033 person as a personality trait, the inability to express oneself, the use of one's own opportunities limited capacity, lack of communication technique, develops when its internal energy is unable to go out due to an environment of mutual intolerance. Destructiveness in a person can be assessed as a result of barriers to his self-expression.

The problem of destruction has been studied in various directions. In particular, Z. Freud, N.A. Berdyaev, K.G. Jung, Yu.M. Lotman and others studied the causes of personality destruction and ways to overcome it. Well-known psychologist Z. Freud acknowledged the importance of studying the problem of destruction. [4. S. 26 - 80]. Z. Freud explained the concept of "destruction" as a tendency to death, a mysterious, incomprehensible force sealed in human nature. Also, in the teachings of Z. Freud, the term "aggression" is used, which is a negative form of the psyche, focused on the object, subject or self. Thus, destruction is a process that moves from a complex structure to a simple one, from diversity to homogeneity, from life to death.

A destructive person is a person whose activity is aimed at violating social norms and laws. The activity will also focus on creating an alternative identity that is different from the model one seeks to disrupt. Such a person cannot live outside of society because he can only find ways to express himself, affirm himself, and develop himself by entering into relationships with other people. A destructive person is an aggressive type who runs away from freedom. With the help of debauchery, he tries to get rid of the feeling of inadequacy caused by his inability to show the possibility of self-improvement. By its destructive actions it destroys the moral, physical capabilities of others. A person with this trait is not able to adequately evaluate his actions, he is biased towards the world.

Man and society, the role of man in nature and society, the role of education in the formation of the perfect man, the issues of improving the moral culture in the family are widely interpreted not only in scientific and theoretical teachings, but also in philosophical, didactic and artistic works. In particular, Yusuf Khos Hajib in his book "Qutadg'u bilig" gives a series of advice to the son of Aitoldy Ogdilmush: My only concern, he says, is your next life. When a father's work is absorbed in his son, his behavior becomes irritating. Selective control of the child provides light to the parent's face. An uncontrolled child tends to be naughty and naughty. The behavior of sons and daughters who have grown up as husbands brings sorrow and pain to parents. [Yusuf Khas Hajib] This view recognizes the responsibility of parents and children to the upbringing of children and the health of relationships.

In our study, a survey on the factors of the destruction of family relationships conducted a comparative study of the situation in young and middle-aged families on 8 factors. (Table 1) In the results, young (1-5 years of marriage) as factors of destructive attitudes in families: Factor 1 - "Unpreparedness for marriage" 21%; Factor 2 - "Misconceptions about family and marriage" 38%; "Defects in personal psychological characteristics" 27%; "Low level of communication culture 36%; Low tolerance" was 54% higher. This is 0.9% in the destruction of family relations in young families "Socially harmful habits (alcoholism, adultery)"; Dissatisfaction with marriage 14%; Problems with child rearing accounted for 12%, indicating that the share of these factors in the destruction of family relationships is low.

While everyone aims to start a family, to get married, it is based primarily on the perceptions formed among the people about the family and marriage. A married couple always lives in a world of strict circles and norms that are related to the concept of marriage, but the life of each couple is a unique, mysterious world that is unique to them. (V. Karimova Family Psychology)

**TABLE-1 A STUDY OF THE FACTORS OF DESTRUCTIVE ATTITUDES IN FAMILIES**

№	Factors of destructive attitudes in young and middle-aged families	In young families	In middle-aged families
1	Not ready for marriage	21%	0,8 %
2	Misconceptions about family and marriage	38%	17%
3	Defects in personal psychological characteristics	27%	31%
4	Dissatisfaction with marriage	14%	29%
5	Low communication culture	36%	27%
6	Low tolerance	54%	48%
	Socially harmful habits (alcoholism, adultery)	0,9%	32%
8	Problems with child rearing	12%	43%

The results of the study show that the figure in middle-aged families differed slightly on the same factors. "Personal psychological defects" 31%; Dissatisfaction with marriage 29%; Problems with child rearing 43% "Low communication culture 27%; Low tolerance "48%; Socially harmful habits (alcoholism, adultery of a husband or wife) were reported to be 32% higher. Thus, in the breakdown of relations in middle-aged families - "Unpreparedness for marriage" - 0.8%; "Misconceptions about family and marriage" 17%; showed a relatively small share.

In practice, when a husband and wife decide to divorce, if there are no children between them, they apply to the FXDY offices and their marriage is annulled. If there is a child in the middle, the case is decided by the courts, but in most cases, the mahalla, a self-governing body, and activists who are members of the conciliation commission in it intervene, with little public outcry. Because, In the Uzbek national mentality, it is a great sin to orphan a child alive, so there is a long-standing tradition that adults are involved in the future of a young family and a decision is made after the causes of family conflict are investigated. If a family conflict poses a serious threat to the health, peace, and coexistence of young people, primarily women and In children cases (such as infidelity, husband's constant torture of a woman due to alcohol consumption, domestic violence, non-participation of men in the family budget), the public protects women's rights, and the neighborhood itself determines the fate of women and their children, their social protection. interferes in this work in order to do. Interviews with members of the conciliation commissions in the neighborhood revealed that in most cases they are concerned with protecting the interests of women, but due to the woman's guilt and her unpreparedness for family affairs, her inability to establish proper relations with her husband and relatives, the neighborhood counselors and conducts educational work. (V. Karimova Family Psychology, pages 104-108)

In the current process of globalization, changes in society that lead to radical changes in people's lives, shortcomings in the educational process, the spiritual and moral depravity that spreads around the world under the guise of "popular culture" also seriously threatens the formation of

worldviews and behavior of our youth. To protect the younger generation from their effects and prevent destruction, families and educational institutions should work together to develop and implement special psychoprophylactic programs. Therefore, it is necessary to organize training hours and various events for young people in the family, educational institutions and neighborhoods with the involvement of specialists who can thoroughly analyze today's complex ideological processes. It is necessary to strengthen the foundations of national thinking and a healthy outlook in the hearts of our youth by revealing the essence of such negative attitudes that contradict our national interests, our way of life, the tragic consequences of human behavior for themselves, their families and society.

Every parent raises their child to see his or her maturity, a process that doesn't happen on its own. There is a saying among our people: "What you sow, you reap". In fact, what a person achieves in life is the result of his hard work and relationships. However, because the present age requires a conscious attitude to life, "sow what you want to reap!" requires a change. Parents can give their children property, housing, cars, and other valuable material possessions, but upbringing cannot find happiness. This is achieved by the degree to which they are brought up. In order for adults to be attentive to the upbringing of young people, they must first address the shortcomings in their behavior. "As the father was leading his son, and he said, 'Think of your step,' the son replied, 'Father, I will walk as you walk, for I am following you.' This narration is a proof of our opinion. Upbringing is one of the most complex, wide-ranging issues, and it is important that such a responsible and honorable work is carried out jointly by the family, the educational institution. Psychologically healthy formation of youth, social health such as respect, support, assistance, tolerance in relationships The discipline and discipline established in educational institutions, the quality of education, a healthy spiritual environment have a comprehensive impact on the formation of relationships and prevent the formation of destruction in young people.

Psychoprophylaxis is a field of activity of a practicing psychologist, which consists of measures aimed at preventing factors that negatively affect the mental formation of the individual. The organization of psychoprophylactic measures aimed at preventing the destruction of the individual in educational institutions serves to eliminate such problems. Psychological prevention-every age At the stage of formation of the child as a person, the creation of reasonable conditions for ensuring mental maturity is a factor in the timely prevention of psychological disorders and deficiencies in personality development and education.

Psychoprophylactic work carried out in educational institutions includes:

- The participation of a psychologist in the admission of children to the 1st grade, specialized classes, to determine the level of their psychological readiness for school education;
- participation in the admission of children to specialized classes; -Explain to parents the reasons for their children's lack of learning materials, provide special guidance;
- prevention of psychological stress in children;
- work with children with special needs (acquaintance with family conditions, conversation with parents);
- to give the necessary advice on how to solve problems in the relationship between student and teacher;-

prevention of psychological stress of members of the pedagogical team (conducting psychotrainings);

- Psychological approach to the planning of spiritual and educational work plans, activities of the school;-

to provide psychological assistance to young people in acquiring the qualities of a perfect person, a well-rounded person;

- creating an atmosphere of friendship between students;

- one-on-one conversations with students who are addicted to drugs, alcohol, prone to easy living;

- Teaching young people to think logically. Take measures to prevent the minds of young people from being damaged by various alien ideas;

- to make recommendations on how to stimulate the psyche of depressed students and teachers.  
[2]

Conducting psychological training is especially effective in preventing personality destruction. The following psychological training exercises can be organized for psychoprophylactic purposes in a group of students of different ages. Through these psychoprophylactic exercises, students improve interpersonal relationships, increase their perception of others, and engage in discussions and debates about improving behaviors.

### **Exercise "I like"**

The psychologist asks the children to continue and write the sentences given on the paper:

"I like ..... in our family ..."

"Our class would be great if my friends. . . ».

"It would be nice ..... for me to solve my personal problems myself. . . ».

The children's written responses are collected and analyzed. But it is not said who wrote what answer. The expected result of the exercise is to form positive attitudes of children towards each other, to create friendly relations and mutual support, to analyze the positive and negative aspects of their behavior.

### **Exercise "A gift to my loved ones."**

Before the lesson, the psychologist prepares a card for each participant to write the names of those they know close to them and distributes one to the children. Children need to express in one word the best human qualities that are manifested when they communicate because of the closeness of those they know to be close to them.

The psychologist collects the answers written by the students and assigns them to give the cards as a gift to their loved ones and the attributes belonging to them. Children should roughly describe the attitude their loved ones expressed when they received the gifts they were given.

### **Exercise "Building a positive relationship with others."**

In the lesson, children will be told about the lives of heroes in fiction, the positive aspects of their communication with others, will be given examples. Some aspects of communicating with people are written on the blackboard (e.g., smiling, smiling, sweet talking, kindness, attentiveness, politeness). There is a debate about how to treat people the way they want to be treated.

### **Exercise "Self-assessment"**

The children asked, "How do you rate yourself? Do you like praise? What kind of words do you want your relatives to say to you?" answer the questions. The psychologist draws conclusions and concludes, gives examples.

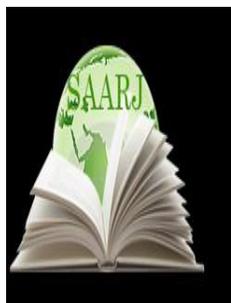

Each student is given a sheet of paper.

Children write down their human qualities (For example: humble, hardworking, industrious, polite, generous, courageous, diligent, enterprising, kind, hospitable, conscientious, cheerful, etc.). After writing, all the answers are analyzed, the psychologist gives the necessary advice. [3] Practical psychologists can creatively add to psychoprophylactic exercises like the one above, based on their own experience.

### ABSTRACT

*This article studies the composition of food products. The negative impact of low-quality goods on human health and the country's economy has been substantiated. Modern methods for determining the amount of alpha-tocopherol in chicken meat using the liquid chromatography gas method have been developed and introduced into the customs system. For the first time, established and recommended for implementation in customs practice to determine the code numbers of different types of food products based on their physical and chemical indicators. The problems of food shortages and the production of quality goods are analyzed, and practical recommendations are given for improving the classification of goods. ## INTRODUCTION

The production of new types of goods and the demand for consumer goods are growing every year. The creation of the necessary conditions for the free movement of goods around the world determines the standard of living of the population. The development of international trade is based on international standards or standards of national legislation. Large-scale developments in this area, including the introduction of modern information and communication technologies, the introduction of new products and the simplification of international trade. Today, ensuring the protection of intellectual property rights, combating the distribution of low-quality products has become one of the most difficult economic problems of the world community. Each country, to the best of its capabilities, is fighting in this area. Taking into account the direct inflow of these goods to Uzbekistan, serious damage to the health of the population and the reduction of tax and customs duties to the budget and other negative consequences, it is necessary to increase the effectiveness of the fight against it [1].

Based on the research results, we have developed effective methods of customs examination and characteristics of food products, and they are also implemented in practice. In everyday life, for various events, we buy alcoholic (beer, vodka, cognac, wine) and non-alcoholic (carbonated, natural vegetable, fruit drinks and juices) drinks, as well as various food products. It cannot be concluded that all these products are of guaranteed quality and are suitable for consumption. The process of identifying goods occupies a special place in the further improvement of the activities of customs authorities. Today, the level of technical equipment and the existing methods of customs identification of goods require constant improvement. In this regard, the use of more advanced mechanisms and methods for identifying goods is required. In this aspect, customs expertise is gaining more and more importance as a means of determining the consumer characteristics of goods and methods of their use.

An important task for the customs authorities is to improve the mechanisms for conducting customs examination in identification of goods. Based on Article 197 of the Customs Code of the Republic of Uzbekistan, the process of identifying goods is considered one of the forms of customs control. Based on the above concept, it is possible to draw up a scheme for determining customs identification through customs examination. Figure 1 shows a scheme for identifying goods by their classification.

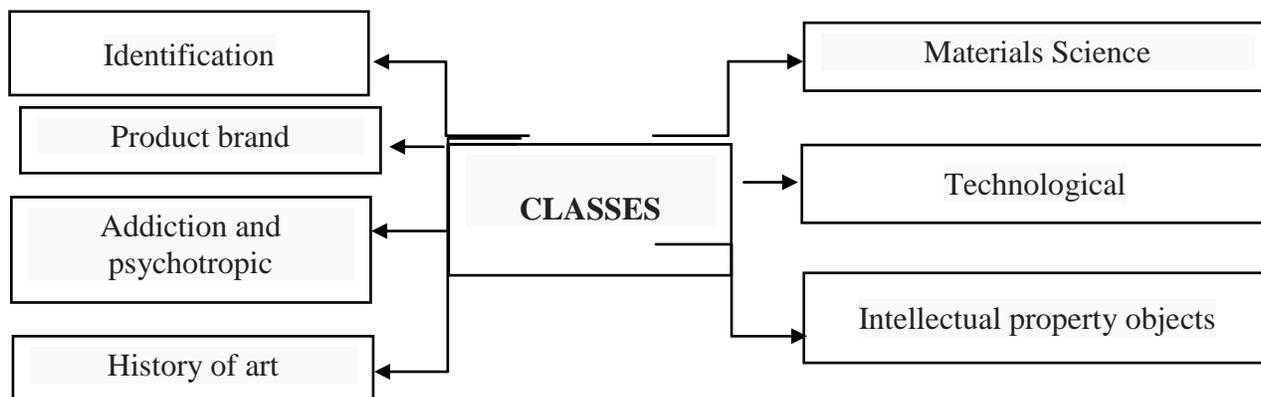

Fig. 1. Scheme for the study of the identification of goods by their classification.

The identification of goods for customs purposes is inextricably linked to the problems of classification of goods. Carrying out identification operations (production materials, functional purpose, country of origin, chemical composition, degree of processing, etc.) Includes the definition of key characteristics indicating that the Commodity Nomenclature of Foreign Economic Activity (TN VED) belongs to a specific group of commodity nomenclature. However, not all means of identification are effective in conducting a customs examination. For example, meat products. The process of recognizing information on the label of meat products is very complex. Often, after freezing, a mark is applied to the meat, causing the ink to wash out when the meat is partially thawed. In addition, it is difficult to discern a brand outline and it is impossible to verify the quantities of goods transported. In our opinion, the use of the following tools when identifying meat products, it will increase the efficiency of customs examination:

- Introduction of electronic or ultraviolet marking systems. A special sticker in the form of a strip will be used and will be placed on all carcasses after inspection. To identify the brand, special devices are used, like a scanner, using ultraviolet and other radiation;
- Use of special protective paper with the necessary protective equipment on the principle of oil paint. The use of special materials containing information about the product, which is capable of preventing harm to participants in foreign economic activity;
- The use of special ink that uses the necessary information that protects the contents of the trademark from threats of reposition or alteration.

Speaking about food security, it should be noted that the composition of arable lands has completely changed. In non-cotton arable lands, first of all, vegetables and potatoes, fodder crops, oilseeds and other crops will be planted, orchards and vineyards will be laid out. Due to the optimization of sown areas and the introduction of modern agricultural technologies in 2020, it is planned to increase the production of grain crops by 16.4%, the volume of which will be increased to 8 million 500 thousand, the production of potatoes up to 35%, vegetables up to 30%, fruits and grapes up to 21 , 5%, meat production up to 26.2%, milk up to 47.3%, eggs up to 47.3%, and an increase in fish production up to 2.5% is envisaged [2].

In the republic, the volume of imports and exports of goods is growing from year to year. In 2018, imports of goods amounted to USD 17.3 billion. In 2018, compared to 2017, the volume of imports increased by 43%. Out of 84 groups of goods, the largest indicator is occupied by

household appliances. Imports of these goods in 2017 amounted to 2.7 billion, and in 2018, 4.5 billion USA. Food products rank 10th. Of these 17 product groups, sugar and confectionery amounted to US \$ 0.33 billion in 2017 and US \$ 0.35 billion in 2018. Out of 1701 commodity items, the cost of sugar in 2017 was \$ 0.33 billion, and in 2018 - \$ 0.34 billion. USA. In 2017-2018, food accounted for 9-12% of all imported goods. In 2017, the export of goods from the Republic of Uzbekistan amounted to \$ 10.07 billion, and in 2018 it amounted to \$ 10.91 billion. In 2017, the largest volume of exported agricultural products from group 07 amounted to USD 3.5 billion. In 2018, this figure was \$ 3.2 billion. From the above, it follows that the lion's share of exports and imports from the Republic of Uzbekistan is food products [3].

It is known that the examination of goods imported from the customs border is carried out in order to determine the quality of goods, check compliance with national and international standards, and the correct application of the commodity code of the TN VED. The expertise of food products that is carried out plays an important role in maintaining the health of the population. Consumers and manufacturers are the main obstacles to international trade in substandard and non-guaranteed products.

According to the World Health Organization (WHO), a number of dietary supplements pose a serious threat to human health. There is also a list of food additives that are more toxic, and their data is shown in Table 1.

## Legend:

D! - Dangerous; VD !! - very dangerous; P - prohibited; CAID - causative agent of intestinal disease; BD - blood pressure destroyer; R - rash, fever; C - causing cancer, forming a tumor; CD - causing stomach disease; Ch-cholesterol; S - suspicious, HS - harmful to the skin. According to the above table and the results of research by researchers A.V. Alekseenko, U.K. Ibragimov, tocopherols are widely used as food additives in food, including meat and meat products. Tocopherols (vitamin E) E307, E308, E309, butylhydroxyanisole (BGA, BHA) E320, butylhydroxytoluene (ionol, BOT) E321, citric acid E330 and antioxidants E310 to E341 high levels of antioxidants can lead to benign tumors in the body in malignant [4]. Table 2 shows the amount of alpha-tocopherol in chicken meat produced in the republic and abroad table 2

No.	Samples of chicken meat, 100 g	Amount of Alpha-tocopherol, mg	Difference relative to controlmg
1.	Sample of local product (control)	0,62	-
2.	Samples of products from Kazakhstan	3,98	3,36
3.	Samples of US products	14,50	13,88
4.	Product samples from Brazil	2,55	1,93

From this table. 2 shows that the content of alpha-tocopherol in chicken meat produced in Uzbekistan was 0.62 mg, and the content of alpha-tocopherol in chicken samples from Kazakhstan, the USA and Brazil was 3.98, 14.50 and 2.55 mg, respectively ... In addition, the table above shows that the amount of the antioxidant alpha-tocopherol in chicken samples imported to Uzbekistan from the United States, Kazakhstan, and Brazil was 13.88, 3.36, and 1.93 mg, respectively, higher than the control samples. homemade chicken. The amount of antioxidants in chicken meat can be harmful to human health [5].

Thus, any food, especially chicken, has a small proportion of macro- and micro-nutrients such as water, total protein, fat, carbohydrates, calcium, phosphorus, iron, using traditional methods. Determination of the amount of antioxidants, antibiotics and other synthetic compounds using highly sensitive methods, such as modern high-performance gas chromatography-mass spectrometry, is an important and urgent problem.

Figure 2 shows the results of a spectro-chromatogram of a standard sample of fat-soluble vitamins, and Figure 3 shows a chromatogram of chicken meat vitamins obtained by liquid chromatography gas.

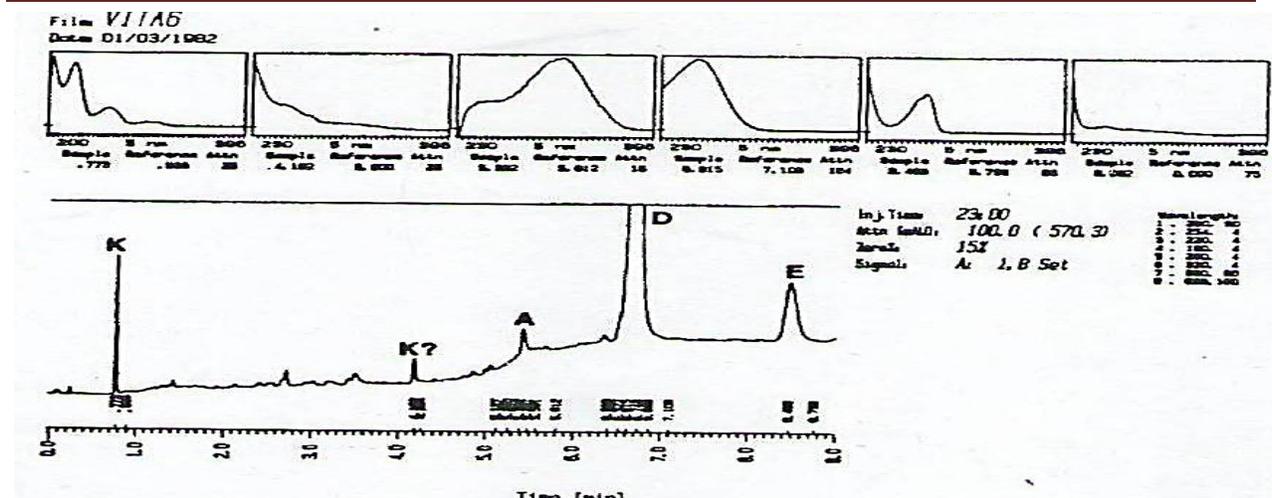

Figure: 2. Results of spectro-chromatogram of a standard sample of fat-soluble vitamins.

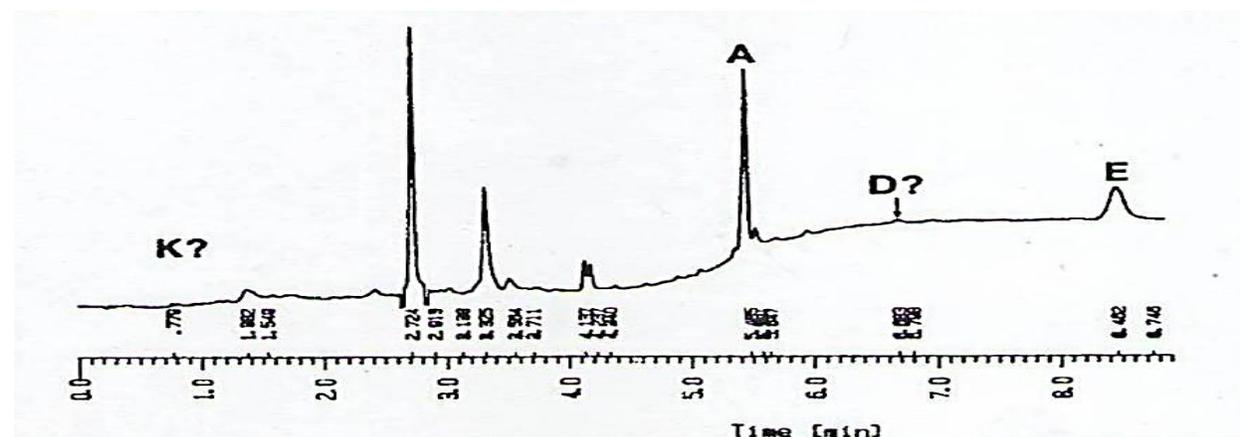

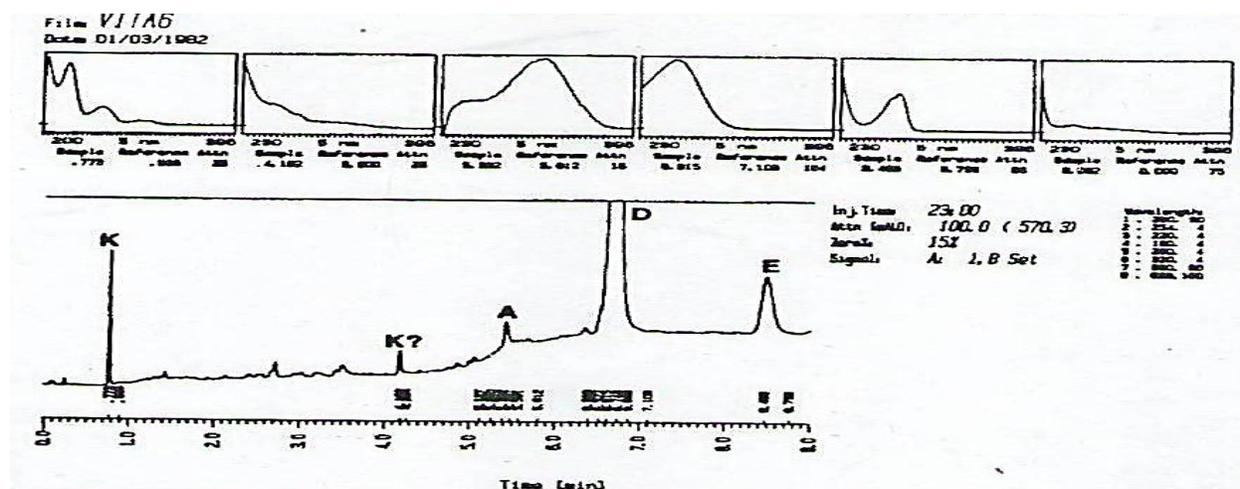

Figure: 3. HP 1090- Chromato-gram of chicken meat vitamins obtained by liquid chromatography gas method

From the data in Fig. 3 HP 1090 it can be seen that if liquid chromatography is focused on the chromatogram of vitamins in chicken meat, then it can be seen that the content of retinol

(vitamin A) and alpha-tocopherol (vitamin E) in the composition of this investigated chicken meat is also high [6] ...

Customs examination methods

The examination of food products is carried out by the following methods:

1. Organoleptic method.
2. Laboratory (experimental) method.

The organoleptic method plays an important role in food quality control. Using this method, their taste, smell, color, and appearance are determined using the organs of touch. The advantages of the organoleptic method are that it does not require large expenditures for chemicals, tools, and also allows you to quickly draw conclusions about the quality of the product. The disadvantage of this method is that the sense of touch is developed differently in all people. Therefore, the quality of the goods will be assessed in different ways. When checking the quality of goods by the organoleptic method, their quality indicators cannot be expressed in numbers, or it becomes difficult to obtain complete detailed information about the quality of products. For example, using this method it is very difficult to say about the biological value of a product or about its harmlessness. However, if the assessment of product quality by the organoleptic method is carried out with the participation of highly qualified, experienced tasters, there will be even fewer errors. However, it should be borne in mind that our senses can quickly pick up specific aromatic qualities of a product that are difficult to detect or cannot be detected by other testing methods. For example, the organoleptic method is the only way to determine their quality and type, since it is very difficult to identify the aromatic complex substances that make up tea, coffee and wine products. In the organoleptic assessment of food products, taste characteristics are one of the main indicators that determine their quality. The main organ of the human body that tastes is the tongue. Academician I.P. Pavlov was the first to explain how the senses work when eating food. The mucous membranes of the tongue and mouth contain taste receptors, which are acted upon by a solution of substances that stimulate taste sensations. The total number of tubercles on the tongue is estimated at more than 9000, most of which are located at the tip of the tongue, and the rest at the lateral level and at the back of the tongue. Basically, there are four types of simple flavors: sweet, salty, sour, and bitter.

Other tastes and taste sensations are formed by adding these basic taste sensations: bitter-salty, sour-sweet, sour-sweet, sweet-bitter, etc. The taste of food depends on the nature of the product, its chemical composition, the temperature at which the product is tasted ... Consequently, the assessment of the quality of food products organoleptically should be based on regulatory requirements [7].

And the smell of products greatly affects their quality. All products also have a certain smell. Depending on their smell, you can get information about what kind of product it is, whether it is spoiled or clean. A mixture of different flavors in products can give the complex the same smell, for example, the aromatic smell of wine, cognac, coffee, tea and cheese can be an example of this. When determining the quality of food products by organoleptic methods, as well as in accordance with the requirements of the standard, their taste and odor characteristics are recorded and indicated together.

In addition, the organoleptic characteristics of food products, determined by the organoleptic method, include their color and appearance. These indicators are determined using the organs of sight, hearing and sensation. With the help of the human organ of vision, the appearance, size, color, shape, arrangement of dishes, clarity, etc. are evaluated. When using the product, you can immediately draw conclusions about the hardness or softness of the products or their temperature using the tip of the tongue. Even by hitting an object on the surface of the product and hearing the sound coming from it, you can draw a certain conclusion about the quality of this product. Currently, scientific work is underway to increase and improve the accuracy of the organoleptic method. There are several methods for sensory evaluation of products, the most common of which are evaluation and comparative evaluation. Scored by point, food quality is mainly checked on a scale of 5, 10, 30 and 100 points. When assessing the quality of products by points, their total amount is divided by quality indicators. As an example, consider checking the quality of butter at 100 points. According to this method, the main indicators of butter are given as follows: taste and smell - 50, consistency - 25, color - 5, salinity - 10, packaging - 10, total - 100. If the overall assessment of butter is from 88 to 100 points - high grade, from 80 to 87 - grade 1 and finally less than 80 - will not meet the standard requirements. But in addition to the general assessment, the highest grade of oil should not be evaluated for taste and smell less than 41 points, and grade 1 - not less than 37 points. The convenience of scoring foods is that each product defect is scored accordingly. It is deducted from the total points set for this indicator. Then it is determined how many points need to be subtracted from a special table defined in the State Standard. This method simplifies the work of an expert checking the quality of the product, and to some extent increases the accuracy of assessing the quality of the product. The scale score is based on a comparison of the food product tested with that product's standards, i.e. standard samples. If the product does not have a reference sample, the characteristics of the tested product are compared with the characteristics of the relevant regulatory and technical documents to which the product belongs. In addition, there is a sociological method for assessing the quality of goods. The sociological method for determining indicators of food quality is assessed according to the opinion of buyers.

#### Physical and physicochemical control methods

These methods of testing food quality include the determination of the specific gravity of the product, viscosity, melting, solidification and boiling point, optical properties. The specific gravity and density of the product can be measured with a hydrometer, pycnometer and hydrostatic balance. By their specific gravity, we can talk about a certain degree of chemical composition and quality. Based on the melting and solidification temperature of fats, information can be obtained about their nature, purity and, to a certain extent, which fatty acids they contain.

The melting and solidification points of oils are determined by measuring the temperature of the oil during the transition from a solid state to a liquid or from a liquid to a solid state with a thermometer. The optical properties of food products are determined by the methods of polarimetry, refractometry, photo calorimetry, luminescence and chromatography.

The polarimetry method is based on the ability of some solutions of optically active substances to change the direction of light vibrations. For example, this method can be used to determine the percentage of sucrose in sugar and how much sugar it contains with a blood sugar meter. Refractometry is used to determine the percentage of fat, water, alcohol, sugar, and other solids

in food. For example, a refract meter is used to determine the presence of water in honey, the presence or absence of dry substances in juices, the purity of fats and oils by their refractive indices, and the spoilage index of products. The quality of food, compliance with national and international standards affect people's health, the country's economy, the reputation of food companies. Production and import of low-quality food products has a number of negative consequences. Therefore, the development of methods for the examination of imported food products is a requirement of the time [8].

Analyzing the reforms in the customs sphere in recent years, we see that the efficiency of the work carried out by the customs authorities in our country has increased several times due to the introduction of automated information on goods. However, it should be noted that in addition to the work done, some problems and disadvantages remain. Examples include the problem of defining the commodity code of food products under the Commodity Nomenclature of Foreign Economic Activity.

According to the results of the analysis carried out in the laboratories of the Republic of Uzbekistan over the past 3 years, in 2019 the total number of expert examinations carried out was 3794 (24121 in 2018), which is much less (-20327). The number of detected inconsistencies in the foreign economic activity nomenclature was 2,257 (905 in 2018). Here it is 1352 more than in 2018. Consequently, it can be seen that, although the number of appointments for an appointment with an expert based on the risk management system has decreased, the number of cases of non-compliance with the TN VED code has increased. The additional costs calculated as a result of the examination identified in accordance with the Commodity Nomenclature for Foreign Economic Activity also increased, respectively. This can be seen from the following data, in 2019 the surcharges calculated as a result of the revealed by the Foreign Economic Activity Commodity Classification amounted to 45 billion soums, which is 30 billion soums more than in 2018 (14 billion soums). According to [9], the following factors contributed to this:

- Cases of unlawful use of customs privileges by VET participants as a result of changes in the commodity code of the TN VED;
- The fact that goods entering the green and yellow corridors are not subject to customs inspection by the customs authorities poses a significant risk;
- when registering goods that are not subject to customs privileges through the green and yellow corridors, the customs authorities do not have complete information about the goods;
- Lack of training manuals and qualified customs officials for the examination and identification of goods;
- Insufficiently developed innovative technologies for the examination and identification of goods;

Lack of guidelines for the identification and classification of certain groups of goods based on the basic rules for interpreting the commodity nomenclature of foreign economic activity. To improve the effectiveness of the methods of examination of goods and classification of goods based on the above problems, it is necessary to first consider the following simple elements:

- -Ways to attract other expert organizations for customs purposes;
- -Training programs for specialists in the examination of goods for customs purposes;

- TN VED guidance on the use of the results of customs examination to control the reliability and classification of goods for customs purposes;
- Algorithms for making optimal management decisions by customs officials carrying out the classification of goods;
- Scientific and methodological instructions (methods, schemes, algorithms, modules for computer programs, etc.). Methodological instructions for asking questions to an expert conducting an examination;
- Sampling and development of methods for sampling goods for customs purposes. Study of the commodity codes of imported and exported food products used in international economic relations, and on this basis the development of a classification of new commodity codes for food products. To protect the economic interests of the republic, taking into account their physical and chemical characteristics, composition, their "express methods". The development and implementation of research methods is a more pressing problem.

The study on a scientific basis of the relationship between the code numbers used in international economic relations in accordance with the composition of food products, and the determination of their general laws, allows for extensive research in all areas of this specialization. The methods of customs examination of fruits and beverages in the country have not been improved.

Also, in the scientific works of some scientists there is no common view on finding solutions to the problems of product classification. In Uzbekistan, a group of experts and the Committee on the Harmonized System of the World Customs Organization conducts regular studies to clarify the rules for the classification of certain consumer goods, as well as amendments and additions to the Harmonized System [6].

The study was carried out in two stages: the classification of economically important goods in the country on the basis of the Harmonized System and additions to the nomenclature of goods, and the next - making additions to the first 6 numbers of the Harmonized System.

In the conditions of a modern market economy, special attention should be paid to the development of domestic production in the country, the production of import-substituting, export-oriented, high-quality domestic goods.

Fig. 4. Export distribution chart for 2019.

One of the largest export and import goods of the Republic of Uzbekistan is food (Fig. 4). Therefore, the correct classification of these products in the commodity nomenclature of foreign

economic activity is relevant in the tariff and non-tariff management of foreign economic activity. Full detailing of the code numbers of these export-import goods will allow accurate customs statistics and protect the economy of the republic. The main criteria for the classification of a product according to the TN VED are its composition, quantity, price and function of goods. At present, juices differ in composition, which are classified by codes belonging to the 2009 TN VED group. These goods are classified by commodity items 2009. They are classified according to composition and technology of receipt, when they are imported, an excise tax of 20% and a customs duty of 30% are set. However, in the 2009 heading, the 30% excise tax was imposed on imports of the remaining goods produced on the basis of classified goods. There is also no excise tax on natural or synthetic products which are classified in heading 2009 and are subject to a 20% import duty. However, for juices made from natural products, the customs duty is 30%. Information about what substances are contained in the product and in what quantity is available only from the manufacturer, and free access to this information is impossible, since it is a trade secret [10].

### CONCLUSION

Thus, the world practical experience shows that when determining the composition of food products in each country, the use of methods of customs examination of goods, in particular, the analysis of their chemical composition, gives effective results. In particular, GLC analysis showed that the amount of the antioxidant alpha-tocopherol in chicken meat samples imported to Uzbekistan from the USA, Kazakhstan and Brazil was 13.88, 3.36 and 1.93 mg, respectively, higher than in control samples of homemade Chicken.

The most effective way to identify low-quality food products imported into the republic is the organoleptic method. At the same time, an expert inspector of the customs post helps to speed up the clearance process by checking the documents of the country of origin of the goods, the delivery conditions under which it is transported, its appearance, the composition of the label and the expiration date. The process of processing perishable foodstuffs, documents on their quality are reviewed, and, if necessary, an examination of the impact of products on human health is carried out

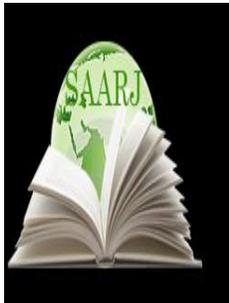

To protect the economic interests of the republic in international economic relations, on the basis of the chemical composition of food products, new commodity codes have been developed, and comments have been prepared on their classification;

The developed express methods for coding food products are recommended for use by participants in foreign economic activity and experts when determining the code of goods according to the TN VED.

### ABSTRACT

*This article explores the scientific foundation of vocational guidance for school students. Professional orientation is a system of socio-economic, medical, psychological and pedagogical activities aimed at preparing young men and women for the conscious choice of a profession.*

**KEYWORDS:** *Socio-Economic Aspect, Vocational Guidance, Psycho physiological Qualities, Human Factor, Personality.*

---

### INTRODUCTION

Professional orientation is a system of socio-economic, technological, medical, psychological and pedagogical activities aimed at preparing young people for the conscious choice of profession and specialty. The socio-economic aspect of vocational guidance determines the need for labor in the country or region, the technological aspect determines the requirements for the physical and moral-psychological qualities of the specialist; medical and psychological - to diagnose the level and characteristics of physical and mental development of the applicant for the profession, to correct and further develop the psycho physiological qualities of students who

require specialization in pedagogy. Therefore, the essence of active and effective vocational guidance lies in the psychological and pedagogical activity of education and correction. The human factor is the main object of educational influence at all levels of career guidance work in school.

The psychological system of career-oriented activity is the continuous formation of the individual qualities of the student, his needs, interests, beliefs, life experience, neurodynamic qualities and personality traits, mental processes and relationships, the basis of professional work efficiency and conscious choice of profession and reconstruction.

A systematic analysis of vocational guidance problems is especially important in polytechnic education. Each academic subject is “involved” in one way or another in professional labor activity, substantiating or revealing in its own way (mathematically, physically, biologically, etc.) the technology or economics of labor, its hygienic, aesthetic and humanistic aspects, development prospects in links with scientific, technical and social progress. Polytechnic education will contribute to the formation of students’ professional abilities and interests in the event that each academic subject equips the student with specific knowledge, reveals to him that common in professions, which, being introduced into the structure of other types of professional activity, makes the student a polytechnic educated creates the preconditions for his readiness for a number of professional activities, “jack of all trades”. This is one of the most important theoretical foundations for the formation of polyprofessionalism in boys and girls, painless switching of existing interests to the required specialty, as it happens in regions with a limited number of types of professions and specialties or in the presence of contraindications to the profession of interest.

### **The Main Findings and Results**

Human activity is always mediated by the sum of his inner qualities, knowledge, experiences views. Leading among them is the motivational attitude. Motive is an internal motivating force that forms the basis of psychological preparation for work in general and for work in a particular professional field in particular. Motive determines the conscious choice of profession. B.F. Lomov believes that activity is conditioned by one or another motive and is aimed at achieving a specific goal. The vector “motive-goal” acts as a kind of core organizing the entire system of mental processes and states that are included in this activity. At the first stages of career guidance activities, external stimuli (imitation, order, external attractiveness of activity, etc.) that do not affect the need side, which internally stimulate activity, can serve as an incentive for the implementation of professional assignments. The task of a career counselor is to switch external stimuli to internal stimuli by appropriate pedagogical influence, personal influence. To this end, professional information should be emotionally colored, evoke in students not only cognitive, but also moral and aesthetic feelings. The emotional factor in vocational guidance contacts with students excites, as is known, volitional activity. The cognitive side in professional actions, positive emotional experiences when performing them is the main components of interest, which is an important stimulus for a person’s mental and physical activity.

Every professional activity, every labor, is, as the founders of Marxism emphasized, an expenditure of human labor power. Labor activity, regardless of its type, is the expenditure of the human brain, muscles, nerves, arms, etc. To be productively spent, the human labor force must be more or less developed. Naturally, the educational and vocational consulting work of the

school should be aimed at developing some aspects and qualities of a person (physical and mental) and re-educating others. This requires a comprehensive knowledge of the student from the professional advisor.

In professional leadership and career choice, first of all, it is necessary to take into account the individual characteristics of the person - innate anatomical and physiological, and, first of all, the usual, characteristic qualities acquired in the educational process. Congenital typological features of the nervous system, manifested in labor activity in various variations of strength, mobility and balance of nervous processes, in a person's temperament, should become the subject of close attention of a vocational guidance counselor in order to rework". Psychologists – B.M. Teplova, V.D. Nebylytsyna and others - proved that on the basis of the same properties of higher nervous activity in people can be formed significantly; different characters, that similar characters can be formed based on different properties of the nervous system.

The same should be noted with respect to the introversion (directed inward, towards oneself) and extravertedness (directed outward, towards objects and phenomena of the surrounding reality) of the personality. In vocational guidance work, one should keep in mind some neuropathic and psychopathic inclinations - excessive excitability and withdrawal, suspicion, aggressiveness, etc., which to one degree or another are manifested in individual boys and girls. Observing these phenomena and planning ways and means of overcoming them, it is necessary to pay attention to their genesis (to find out what lies at their basis: functional disorders caused by unfavorable living conditions and upbringing, or some congenital pathogenic circumstances - alcoholism, nervous diseases of the parents). However, in all such cases, there should be a subtle pedagogical approach, tactfully given recommendations, educational and labor tests based on taking into account the interests of the student, aimed, along with re-education, at choosing such a labor activity that will not provoke neuropathic manifestations in behavior.

In the process of vocational information and vocational consultation, a vocational guidance counselor should, based on the professionograms, be guided by the psycho- and physiograms of the personality. It is important to take into account the general state of health of young men and women, the state of their sense organs - vision, hearing, tactile, olfactory and gustatory sensitivity, their mental activity - observation and curiosity, creative inclinations in drawing and sketching, the ability to perceive the beautiful, a sense of new, original, tendency to performing or creative design activities, features of motor reactions - speed or pregnancy, mobility or rigidity, speed, exercised in the formation of skills and abilities, stability or variability of moods, interests and other personal qualities of schoolchildren.

In all these orientations, the career counselor must be guided not by empirical, but by scientifically sound data.

As already noted, it is important for a career counselor to be aware of contraindications to certain professions. It is known that color blindness is contraindicated for the professions of drivers and cloth sellers, which is found in 5-7% of men (in women - 1-1.5%). For many professions, a decrease in visual acuity, hearing (drivers, radio operators, operators, etc.), smell and taste (food workers, chemists), disorders of the respiratory system and the cardiovascular system, etc. are contraindicated. Currently, health authorities have at their disposal sufficiently scientifically substantiated contraindications to many professions. For example, contraindications for a

radiotelegraph operator are decreased hearing, poor auditory memory, low level of performance, fatigue, etc.

In all levels of vocational guidance (vocational information, vocational consultation, drawing up characteristics and recommendations of the student), it is necessary to focus on the professionogram of the specialty, which should reflect the following.

1. General characteristics of the profession and its individual specialties; skill levels in the profession and its specialties.
2. Description of labor processes, performed types of work.
3. Working conditions (labor, mainly physical, mental; place of work - production premises, natural conditions; collective or individual; hygienic working conditions, possible occupational hazards).
4. Requirements for a person's specialty - his mental and physical sphere, load on the nervous system, emotional-volitional sphere.
5. The necessary knowledge for the successful implementation of labor processes.
6. Skills - mental, physical.
7. The dynamics of the development of the profession and specialty in connection with scientific and technological progress.
8. Possible accidents, marriage at work due to the moral and psychological qualities of a person.
9. Economy of the profession, its importance and location in the regions of the country.
10. Where can I get training for the Profession.

Today, there are about 1500 specialties. Since it is naturally impossible for a single career counselor to cover all professions and specialties, they resort to their classification according to the subjects (objects) of labor, the goals of labor, working conditions, the tools of labor used, according to the leading knowledge with which labor activity is carried out.

On the subject of labor (according to E.A. Klimov):

1. Human- nature (land, water, plants, animals, nature conservation).
2. Human - technology (machines, mechanisms, their manufacture, use in labor).
3. Human - man (work with people, collective work, relationships with people, management of the work of people).
4. Human is a sign system (mathematical, graphic, speech).
5. Human is an artistic image (literature, art).

By labor goals:

1. Gnostic activity (educational, cognitive, feature recognition).
2. Transforming (scientific work, art, visual, rationalization activities).
3. Prospecting (geology, prospecting of mineral wealth, laying routes).

By the used tools:

1. Machine labor (turner, milling machine operator, weaver, electric locomotive driver, driver, pilot, tractor driver, combine operator).
2. Manual labor (locksmith, carpenter, carpenter, equipment regulator, mechanical assembly work, drawing work).
3. Hardware labor (refinery operator, steelmaker, thermist, physicist, chemist).
4. Operator (control panel, tracking, work with computers)

According to the leading knowledge:

1. Physical and mathematical knowledge (engineering and technical work astronomy, astronautics).
2. Biological and chemical knowledge (medicine, agronomy, pharmacology, chemical production).
3. Humanities (history, literature, art, linguistics, pedagogy).

By working conditions:

1. Labor in different geographic latitudes (north, southern regions, surface reliefs, water areas).
2. Hygienic conditions (work in conditions of occupational health, day and night work, work of drivers, long-term stay on the road, in various conditions of food and rest).
3. Labor in enclosed spaces, in nature (factory production labor, agricultural labor).

The given data on the classification of types of labor should be supplemented and changed in connection with scientific and technological progress, with changes in working conditions.

Aiming in professional orientation at the given classifications of types of activity, it is necessary to single out in progressions and specialties what is common for them, which makes it possible both in vocational consulting work, and in the propaedeutic determination of the professional aptitude of students, and when they “try on” professions to judge a wider range professional capabilities of each boy and girl and a conscious choice of professional direction.

As an example, we give a professional analysis of individual professions, which can be used in all vocational guidance students, in particular, in determining the requirements of a profession to a specialist.

The professions listed below have the following requirements for a specialist:

Profession, activity	Requirements
1	2
Pedagogical (teacher, educator)	Consciousness and conviction. High literacy, knowledge of their subject, erudition, the desire to constantly learn, intellectual and emotional activity. A high level of culture of mind and behavior, tact, humanity and optimism, contact

Engineering and technical specialties	Physical and mathematical knowledge. Spatial representation and imagination; spatial orientation. Constructive and technical ingenuity, thinking; analytical mind; tendency to design; a penchant for technical activity; interest in a specific engineering and technical specialty; observation (visual, auditory, etc.), Ability to anticipate results
Driving professions	Good visual acuity, hearing; good color perception; speed of reaction; constructive and technical thinking, quick wits, stability of attention, ability to distribute attention; spatial orientation; knowledge in the field of physics; high culture of communication.
Medical specialties (doctor, paramedic, nurse), veterinary medicine	Good knowledge of biology, anatomy and physiology; good orientation in the psychology of a person, especially a patient, humanity; auditory and visual observation; the ability to manipulate. Good orientation in electrical engineering, physics and chemistry; patience in dealing with patients, optimism; a tendency to communicate with patients; good memory for types of diseases and their symptoms, for remedies; orientation in the behavior of animals.
Economic professions (planner, economist, materials scientist, accountant, etc.)	Good knowledge of the basics of science, especially computing; a tendency towards economy and frugality; good presentation of the development of industries; economic thinking; the ability to take into account development prospects in planning; accuracy in calculations; knowledge of the country's economy; courtesy and culture of communication.

The specified requirements for professions are general and should be clarified when drawing up a specialist's profессиogram, for example: teacher-mathematician or primary school teacher; civil engineer or mechanical engineer; general practitioner or surgeon, etc.

The career paths are numerous: cinema, television programs, excursions, reading fiction, scientific and technical literature, conversations with specialists, etc. But the main ones are technical and labor training, classes in special circles.

All the subjects of the general education school provide opportunities for the disclosure of a certain side of the labor professions of human activity. Studying academic subjects, the student comprehends the role of science in the technological process, in creating working conditions, the aesthetics of labor activity, the process of overcoming difficulties in their specificity and requirements for a specialist. It is difficult to overestimate the role of polytechnic teaching by means of academic subjects, therefore, a career counselor, carrying out labor education of young people, must constantly contact subject teachers and educators.

In career guidance work, a significant place should be devoted to identifying the interests, inclinations and abilities of boys and girls.

There are many ways to identify the qualities of a person and his suitability for a certain job. These are medical, physiological, pedagogical and psychological research. In special laboratories, institutes they are engaged in the theory and practice of professional selection. The most accessible ways to identify personality traits are as follows:

a). Observing students in the process of their general and labor education and fixing the level of development of diligence, attention, discipline, consciousness, interest in academic subjects, the

speed of mastering skills, etc. The conclusions from these observations will be reliable if they are carried out purposefully, over a long time and not by one person, but by all teachers, labor instructors and other competent persons. Based on the results of observations, the characteristics of students are compiled, which should reflect the essential in the personality, especially what relates to her work interests and goals;

b). Conversations with students about their interests and inclinations, successes and difficulties in assimilating educational knowledge, abilities and skills, success in labor training. In order for students to be able to judge their successes and qualities, it is necessary to teach them self-observation, the ability to monitor the development of their abilities and their compliance with the requirements of their chosen profession, realistically assess the sustainability of their interests and opportunities and in mastering a specialty;

c). Medical indicators of the state of health, organs of vision and hearing, nervous system, organs of movement. When determining professional suitability for more responsible professions, for example, a pilot, an electric locomotive driver, a car, an operator, etc., one should inquire about deeper psycho-physiological characteristics and possible psychopathies of a person.

## CONCLUSION

Patient and calm observation of students is the best way to identify their individual capabilities.

In all cases, it is significant for a career counselor to get advice from their teachers and especially a labor instructor (teacher), from a competent representative of the production that the student is interested in, and only after that professional reorientation can be carried out. Decisive in all cases should be a test of the student's strength and verification of the stability of his interests in the specialty in difficult and less favorable conditions of activity.

The role of young men and women in career guidance should not be passive. Self-observation is the path to self-recognition. It is recommended that you answer such questions.

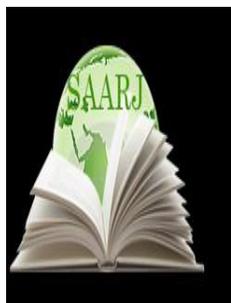

1. What is the greatest interest? What kind of work is done willingly, without much fatigue, and does not get boring?
2. In what activity (labor, educational) the best successes are achieved? What type of work, what educational subjects are given easily, quickly, mastering which brings satisfaction?
3. For which activity (profession) there is the best (theoretical and practical) knowledge and skills
4. Where and in what jobs (easy, difficult) did you try your hand at the vice activity of interest?
5. How did those who watched your work assess your tests of strength?
6. Why do you think that you can achieve good results in the profession that interests you?
7. What are the pros and cons of choosing your profession?

Based on the results of the vocational guidance work, characteristics-recommendations are compiled, which reflect the individual psychophysical characteristics of the personality of a student who graduates from school.

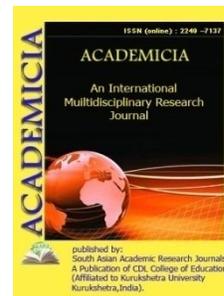

The characteristic should be optimistically orienting towards the further formation of the moral-psychological and physical qualities of a specialist in the professional field where the applicant will come (production, institution, special educational institution) after graduation.

### ABSTRACT

*This article describes in detail the essence of the application of elements of pedagogical technology in the lessons of “Music Culture” in secondary schools, the ways of its application. In music education, the teacher teaches a beautiful profession, although this is not easy from an early age, like parents who have given birth to a child. He opens the way to the world of music for his students, gives them a piece of his soul and becomes their teacher and friend. At a certain time, after the students have completed this task, the teacher checks their cards. One of the two students at the desk who completed the task correctly goes to the board and writes the correct answer to the task on the board with chalk.*

**KEYWORDS:** *Music Culture, Technology, Pedagogy, Interactive Method, Teacher, Student, Method, Application.*

### INTRODUCTION

The basic task of the discipline of musical pedagogy is to provide pedagogical knowledge to future specialists in the field of music education and upbringing. Providing the necessary pedagogical knowledge and skills in all areas of music pedagogy is the main goal of the pedagogical disciplines of music education. The quality of professional training of students, and hence the future of musical art and musical culture, largely depends on the level of pedagogical

training of music teachers. In music education, the teacher teaches a beautiful profession, although this is not easy from an early age, like parents who have given birth to a child. He opens the way to the world of music for his students, gives them a piece of his soul and becomes their teacher and friend. The basic tasks facing the music teacher are to identify the unique characteristics of the student, to determine his character and abilities, to interest him, to find the most reasonable ways to develop his musical abilities. However, not every teacher will be able to accomplish this set of tasks, will not have sufficient pedagogical skills, and will not be able to train good musicians. With this in mind, the effective use of interactive methods of pedagogical technology allows to naturalize the communication between teacher and students in music lessons, to provide students with a thorough knowledge of music, free thinking, full expression of their abilities, increase the effectiveness of music education.

### **The Main Findings and Results**

We will focus below on some interactive methods and their application to the teaching process.

**Brainstorming method.** To use this method, students are taught to think broadly and logically about the problem, each student is given the opportunity to express and substantiate their personal opinion.

Voluntary feedback from students is only encouraged and they are not evaluated, which leads them to express new ideas on the problem. At the same time, it is important to create a wide range of opportunities for students on the problem under analysis.

To apply this method, each student is given a worksheet on which he writes down his opinion on the problem and justifies his opinion.

After a certain time, the papers are collected and the main points are written on the board. Students are given the opportunity to add new ideas to the ideas expressed. The process only ends when you stop saying new ideas. In this way, a solution to the problem is achieved with the help of the teacher.

Here are some examples from our experimental work on this method.

**Course Title:** Uzbek modern music (6th grade).

**The purpose of the lesson:** to acquaint students with the ideas of modern music.

The following tasks are performed during the course.

1. Genres typical of world music.
2. Classical works by Uzbek composers based on world music.
3. Awakening respect for Uzbek classical music.

**Classroom equipment:** pictures, tape recorder, video cassettes, table.

**Lesson plan:**

1. World composers and musical genres created by them.
2. Introduction of new genres by Uzbek composers.
3. Newly created works.

4. Diversity of genres is a great achievement of Uzbek music.

### 1. Conversation method.

In the first interview, the teacher introduces the world-famous composers and their works and engages the students in questions and answers.

### 2. Question-answer method:

1. Who do you know of Uzbek composers?
2. What works do they know?
3. Which of the works in the opera genre do you know?
4. What do you know about the symphony genre?
5. How do you feel about pop music?

### 3. The method of “mental attack”.

To apply this method, each student is given a piece of paper and examples of composers they know and their work are given. Students are taught to write their first and last names on the sheet and their answers are not marked, so each student must write the answer on the sheets as he or she knows. Within ten minutes, all students write down the information they know on their sheets. Importantly, in this work, each student is engaged in independent thinking, that is, the solution of the problem is carried out not only by the teacher, but also by the efforts of students. This method is called “Mental Attack” because everyone started attacking to solve the problem.

To complete the results of the last ten minutes, the teacher collects the handouts. The names of the composers who create modern music are written on the right side of the board and the names of the works they create are written in the middle of the board, and the genre of these works is written on the left side of the board. To do this, the teacher pays special attention to each sheet and writes the facts on the board. It is natural for students to pay attention to the importance of the information written on their leaflets. The repetition of the same facts is also emphasized. If it is written on the board, it will not be rewritten. Some facts are corrected by the teacher, briefly explained and supplemented. As a result of the use of the method of “mental attack”, the following information was reflected on the board.

Names of composers	Name of works	Which genre it belongs to
Mutal Burkhonov	National Anthem of the Republic of Uzbekistan	Psalm
Sulaymon Yudakov	“Maysara’s work”	Opera
Mukhtar Ashrafiy	“Dilorom”	Opera
Sulaymon Yudakov	“My Homeland”	Kontata
Sulaymon Yudakov	“Mirzachol ”	Sonata
Sharif Ramazonov	“Uzbekistan ”	Choral work
Dilorom Omonullaeva	“It’s raining”, “Nisholda”	Children’s song
Shermat Yormatov	“Maysa”, “Islam Bobo”	Children’s choir, children’s song
Rustam Abdullaev	“ children of independence”	Children’s song

Avaz Mansurov	“Who is clever, who is agile”	Children’s song
Sobir Boboev	“Yoriltosh”	Children’s team
Farid Olimov	“Fatima and Zuhra”	Musical drama
Mustafo Vafoev	Workers of Uzbekistan	Symphonic records
Mutal Burkhonov	“Alisher Navoi”	Opera

Students write this information on their board in their notebooks. At the same time, they will have access to modern Uzbek music and a wide range of information.

At the end of the lesson, the teacher teaches that this information should be enriched and assigns them the task of remembering the composer of each piece, the name of the piece and to which genre they belong.

Another such method of pedagogical technology is the “**fifth plus**” method. Depending on the content of the topic, this method can also be considered. Below we will consider the use of the “**Fifth Plus**” method.

**Course Title:** Intervals.

**The aim of the lesson** is to reinforce the knowledge that students have gained about different intervals and their types.

In the course of the lesson the concept of **interval** is given, that is: pure, small and large intervals.

Initially, the teacher gives students an idea of the placement of intervals in an octave range. In doing so, he points out that there are three main types of intervals: That is,

- 1. Pure intervals:** pure prama (p1), pure quartet (p4), pure quintet (p5) and pure octaves (p8).
- 2. Small intervals:** small second (small2), small third ((small3), small sex (small6), small septimo (small 7).
- 3. Large intervals:** large second (large2), large third (large 3), large sexta (large 6), large septema (large 7)

The teacher should focus the students’ attention on the fact that the number of intervals for each type is four. This makes it easier for them to set the exact system of intervals in front of them. Then proceed to the use of the interactive method “Fifth Plus”. The following visual aids will be hung on the board:

Pure intervals		Small		Large	
1	Pure 8	1	Small 2	1	Large 2
2	Pure 5	2	Small 3	2	Large 3
3	Pure 1	3	Small 4	3	Large 5
4	Pure 2	4	Small 6	4	Large 6
5	Pure 4	5	Small 7	5	Large 7

Students are given the task of determining which interval is redundant in the forms provided and proving it.

Answers: In Figure 1, the number of pure intervals should be four. It is well known that the pure second (p2) is not common, that the seconds are usually small or large, and that the second interval is unpleasant to the ear, and that the pure intervals are pleasant to the ear.

In Figure 2, however, he acknowledges that the small quartet (small4) is incorrectly listed and that there is no large fifth interval in Figure 3. It is reported that there are currently gained quarters and reduced quarters, and this interval is called “triton”.

The use of such a method allows students to place their knowledge of intervals in their thinking based on a clear scheme. Now let’s look at our next interactive method.

This “**black box**” method is useful for further strengthening the knowledge acquired by students. At the same time, it allows students to work collaboratively and improve their self-management skills.

When using each method, special attention should be paid to the origin of the topic corresponding to this method.

This method can be used effectively to strengthen the knowledge of students. In particular, in the 6th grade, the lesson on the life and work of composer V.A. Mozart is aimed at instilling international feelings in students, strengthening their interest in classical music.

## CONCLUSION

The course provides information about the composer’s childhood and creative achievements, analysis of his life and work, increasing students' interest in studying the work of foreign musicians, educating students in the national and international spirit.

To use the **Black Box** method, first: two students at each desk are allowed to work together. They record key dates related to the life and work of V.A. Mozart on handouts. At a certain time, after the students have completed this task, the teacher checks their cards. One of the two students at the desk who completed the task correctly goes to the board and writes the correct answer to the task on the board with chalk. The following numbers are written on the board: 1756, 1762, 1786, 1788, 1791. The teacher then discusses the importance of these questions. The student who correctly interprets the meaning of the dates performs the reading task and the lesson is conducted in a self-directed manner.

The acting class will hand out 6 cards to each class and the students will be asked to write down the most important celebrities in the life of V.A. Mozart.

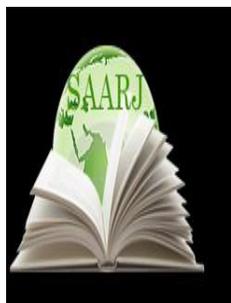

The following entries will appear on the board.

- 1.1756 is the year of birth of V.A. Mozart.
2. 1762 - 1 concert performance by 6-year-old Mozart.
3. 1786 - The opera “The Wedding of Figaro”.
- 4.1788 - The opera Donjuan is staged.
- 5.1791 - Writes the opera The Magic Flute and Peckville.
- 6.1792 y. - V.A. Mozart died at the age of 36.

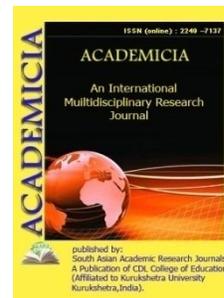

Experiments show that the use of these methods allows you to update the traditional methods used in the classroom, the active participation of students in the use of these methods to provide an interesting lesson, deepening knowledge and information in the minds of students. It is important that every music teacher who uses these methods effectively has the opportunity to improve the effectiveness of their lessons.

## PRAGMATIC FEATURES OF SEGMENTED CONSTRUCTIONS

**Marhabo Egamberdiyevna Umurzakova\***

\*Doctor of Philosophy in Philological Sciences,  
 Language and Literature named after Alisher Navai,  
 Tashkent State University of the Uzbek,  
 UZBEKISTAN

### ABSTRACT

*The article is devoted to the pragmatic features of segmented constructions in the Uzbek language. In recent years, a number of studies on linguopragmatics have been carried out in world linguistics. Some of their important tasks are to highlight the relationship in the process of communication of the authors of speech to linguistic units, the role of linguistic units in depicting reality, the objective world. The main problems of this industry are the illumination of the relationship of the addressee to the addressee in the process of speech, the syntactic structures formed as a result of the restructuring of sentences, the dependence on the importance of the transmitted information, the pragmatic intention of the speaker in them, the reflection of the evaluative attitude, the role of such syntactic structures in the poetic text and the provision of emotionality.*

**KEYWORDS:** *Segmentation, Segmented Constructions, Correlate, Emotionality, Expressive Syntax, Pragmatic Intentions.*

### INTRODUCTION

Segmented constructions are a means of ensuring the emotionality of the text, in which the speaker draws attention to the expression of pragmatic intentions, the problem of actual division. Emotions are one of the forms of reflection of the world.

Emotions reflect not objects and phenomena of the real world, but the relationship of a person to objects and phenomena, that is, not the properties of objects and phenomena, but their meanings for human life [1:106].

I.V. Shcherbakova, in whose work the gender characteristics of the expression of emotionality in the speech process are analyzed, argues that male and female speech depends on social status,

behavior, on the basis of examples, proves that the typical male way of expressing negative emotions is the use of harsh vocabulary [2:56-57]

In artistic speech, emotionality is not transmitted directly, but with the help of specific linguistic means [3:15]

G.N. Baryshnikova notes the peculiar role of segmented constructions in the transmission of emotionality, different transmission of emotionality by segmented constructions in the form of reprise and anticipation.

The author, examining the features of the use of such constructions in male and female speech, notes that despite the tendency of women to emotionality, segmented constructions that convey emotionality are more often found in male speech, which, in addition to joy and sadness, serve to convey hatred, contempt [4]

N.A. Medvedeva considers a special intonation and the presence of a correlate to be specific features of such constructions. The presence of a correlate, which, like any repetition, gives a bright expressive coloring to the entire utterance [5.182]

Observations have shown that segmented words are more often abstract nouns, which, along with depicting reality, also express the meaning of underlining.

Segmented constructs are of great importance in text shaping:

*Ayniqsa, xazonrez...*

*Oh, bu xazonrez!..*

*Barglarga ko'chirib, uchirar ziyoni.*

*Shundan – chiday olmay – ketasanmi tez,*

*Yolg'iz menga*

*Tashlab dunyoni (U.Azim)*

In the above text, the word *khazonrez* is highlighted as a result of segmentation.

In the following lines of the verse, events connected with it are expressed. The repetition of a member highlighted as a segmented construct serves to reinforce the value of the underline.

In the passage below, the word *mukhabbat* is highlighted as a segment. With the help of sentences complementary to them, the text is constructed:

*Muhabbat, bu – yalt etgan nigoh*

*Va halovat abas degani,*

*Muhabbat, bu – o'zingni sevmoq*

*Va o'zgaga havas degani (Iqbol Mirzo).*

A word highlighted as a segmented member can easily fit into the sentence it is associated with.

*This poetic passage can be restructured as follows:*

*Muhabbat – yalt etgan nigoh*

*Va halovat abas degani,*

*Muhabbat – o‘zingni sevmoq*

*Va o‘zgaga havas degani*

In such a text, the thought of love *mukhabbat* is not violated, however, the loss of the member selected by the poet for isolation and its absence lead to the leveling of the meaning of the underscore.

The communicative-expressive function of segmented constructions is more clearly manifested in their comparison with non-segmented, ordinary sentences.

The segmented term can be put in place of its correlate in the following sentence:

*Tintuv ...U qanaqa bo‘ladi o‘zi, nimani axtarisharkin? (X.Tohtabaev)*

*Tintuv qanaqa bo‘ladi o‘zi, nimani axtarisharkin?*

*O‘sh suvchi Nizom... undagi halollik, poklik, beg‘arazlik, fidoyilik bizning hech birimizda yo‘q (P. Kodirov) O‘sh suvchi Nizomdagi halollik, poklik, beg‘arazlik, fidoyilik bizning hech birimizda yo‘q*

In sentences with segmented constructions, several words are given to define the word selected as a segment.

Naturally, in such cases, the text-generating ability of segmented members increases several times.

Sometimes one concept can be designated by several names, evaluated in different ways.

In such cases, each segmented member receives a kind of strong emphatic stress and stands out from other units:

*Qizlar... Ota-onalari hisobiga yashaydigan boqibeg‘am, sip-silliq, olifta yigitchalarni yoqtiradigan qizginalar! Bir qarashdayoq narxingizni aytib beradi (E.A‘zam)*

In the given example, the first segmented member is the word *qizlar*, then it is spread by the connected definition and expressed by the word *qizginalar*.

The next sentence does not express its correlate, but nevertheless its place in the composition of the sentence is felt.

The concept of intention, which originally appeared as a philosophical concept (intention from latin intentio - goal, intention, strong desire, stimulus, striving) denotes intention, goal, orientation of consciousness, thinking on some object [11]

The term intention in linguistics was first used by J. Austin, in pragmatics it is called a communicative (illocutionary) act.

When the addressee cites the name of an object as a segmented construction, he does not just highlight one object, but pursues a specific goal.

By highlighting a certain subject for the realization of this goal, it activates the addressee's associative knowledge about this subject, encourages him to analyze information about this subject.

As a result of the fact that segmented structures are mainly formed from the name of the object (in a broad sense), associations based on the attribute of the object and their attributes appear in the listener's mind in the speech process.

Such an association arises on the basis of the connection between an object and its characteristic feature and, conversely, a feature and its carrier" [6]

The segmented member is also formed to express the speaker's sympathy towards a person, his empathy.

This can be seen in the following example: *Komila! Qiynalayotgandir bechora! Tog'a-ku uncha qattiq gapirmaydi qiziga, aksincha, tilida bo'Imasa ham dilida qizi taraf. Ammo anavi yosuman onasi turtkilab qo'ymayotgandir* ( A.Ibodinov)

I. Rasulov evaluates such units as a kind of evaluative, unpredictable sentences [7.209]

In the example below, the segmented construction is used as a stylistic means to convey the sender's regret about the past life, abandoned friends:

*O'shavoqealargaqanchabo'ldiekan? Yorabbiy, yigirma yettiyil! Qarchig'aydekbiryigitumri! O'shandayonidahamrohuhamkorbo'lganlardankimlarbor? Uturli-tumannomlarnieslashgaurinarkan, ularningbaribarmoqorasidanshuvillabto'kilganqumsingarixotirasiqatlaridanbir-birsirg'alibtushayotgannisezdi. No'yonko'kaldosh, G'uldaQosimbek, Xoldor, Mirshohqavchin. Ko'chbek... Evoh, qaydaular? Qayerlarda? Barchasiendi «rahmatli» Ba'zilarishiddatlijanglardaboshidanayrildi, ba'zilarig'animnayrangagaduchorbo'ldi, ayrimlariningumriqisqaekan, ayrimlariesa... xiyonatqildi. Oqibat, o'shakunlardanbukunfaqatachchiq, mahzunxotiralaryodgor, xolos* (X.Sultonov).

In the semantic structure of sentences with segmented constructions lies the transmission of a communicative goal

At first glance, it seems as if the addressee just singles out a certain event and phenomenon, while realizing the meaning hidden in it, the communicative goal is correctly realized.

The example below reflects the speaker's communicative intention:

*Shunchakiyozmoq-chi, ko'ngilto'lmaydi,*

*Shunchakiyozmoqqabormaydiqo'lim.*

*Shunchakiyozgangachidabbo'lmaydi,*

*Shunchakiyozmoq, bu – shoirgao'lim* (H. Khudoyberdieva).

In the given example, the segmented member is *shunchaki yozmoq*, thanks to which one can catch the poetess's goal "I do not write just like that."

And in the following examples, the affirmative conclusion on the subject, highlighted as a segmented member, is remarkable in terms of novelty and originality:

*Bo'Isaaytareidotang*

*Urush – buyo'qnarsao'g'lim* (R. Parfi).

As it turns out, despite the fact that the segmented members are simple in structure, they participate in the implementation of various speech acts, expressing the hidden meaning.

Pragmatics are interesting not for direct intentions, but for veiled, hidden intentions [8.172]

In terms of the actual division, the segmented constructions are divided into themes and remes.

Rema, in turn, consists of two members - theme and rema.

A segment as a topic not only expresses the transmitted message, but also encourages the listener to think, reason [9.83]

T.N. Safronova, in whose work segmented constructions are studied on the material of the English language, the originality of such constructions in the communicative structure is explained by the actualization of the subject and the addition, since the members of such sentences are expressed in words of a substantive nature [10.3]

The location of the actualized substantive component ensures the division of thought into two parts: a theme and a bump.

Rema, in turn, is divided into sub-theme and sub-theme. A pronoun in rheme is considered a subtheme, and the remainder of a subreme in relation to it.

*She'riyat – buaslijununkamoli,*

*Mayligakimuninimademasin* (E.Vokhidov).

In the given example, *she'riyat* is a theme, and *bu asli junun kamoli* is rema, the demonstrative pronoun *bu* in rem is a subthema, and the rest is a subrem in relation to it.

Thus, when updating a thematic element as part of a segment, highlighting it, it is underlined twice:

- 1) The segmented construct acts as a theme;
- 2) The main part is the topic in the rem.

The segment that follows the basic part, as well as the segment that precedes it, prove that in the main part there is a self-comprehended phenomenon.

This can be illustrated with the word *paxta*, which in the example below is a segmented member:

*Paxta...*

*Usevgidekmavzudiro 'lmas,*

*Uilhomchashmasi, mangubuloqdir* (E. Vokhidov).

For the rhematic essence, it does not matter what position the segmented element occupies in relation to the main part, in any position it performs the function of a topic, this is used to attract the attention of the recipient to a new message. A body pronoun associated with a topic segment is a subtopic. It expresses new information, which is a subreme

*Tepaliklar... Bularhamg'alatiodamlar. Tinchginabug'doylarinio'rib, xirmonlarinisovurib, qo'ylariniboqib, qorinlarinito'qlab, dimog'larinichog'labyurishavermaydimi?* (Sh.Bo'taev)

Here *tepaliklar* is the topic and the next sentence is the rema. Rhema itself is divided into two

parts: the pronoun *bular* - subthema, *g'alati odamlar* - subrema.

Based on the judgments of T.N. Safronova, the proposal can be modeled as follows: T1.P1 (T2-P2). Segmentation makes it possible to turn any part of a sentence into a topic. This is due to the intention and communicative purpose of the addressee.

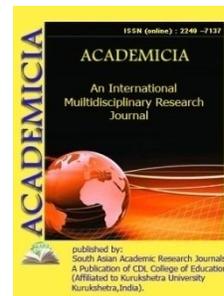

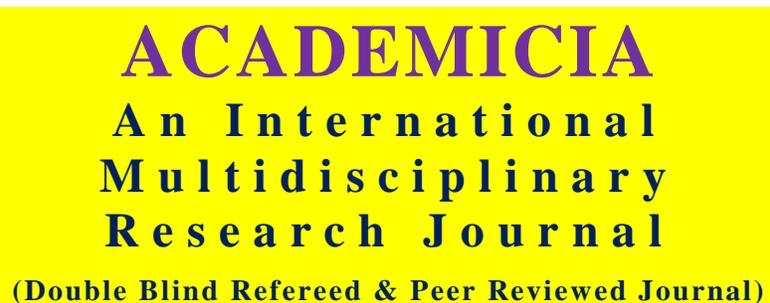

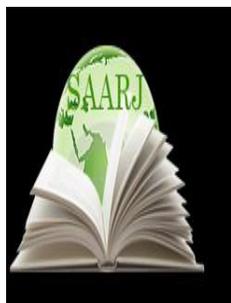

## CONCLUSION

Segmented constructs are built on the basis of substantive narrative correlation. In the subsequent part, they are replaced by a word of a substantive nature or a pronoun. The value of a segmented member can be refined using one or more clauses. In this regard, segmented members are considered a text builder.

Significative and denotative functions of sentences with segmented constructions and complex sentences are the same, they differ in pragmatic meaning and structural form. In both cases, the same message is conveyed, however, in sentences with segmented constructions, in contrast to syntactic units formed by the method of a compositional connection, the expressiveness and attitude of the speaker are conveyed. The meaning of a pronoun acting as a correlate of a segmented member is more concretized due to the speech situation; for the concrete transfer of this meaning from the participants of speech, pragmatic knowledge is required.

### ABSTRACT

*Conducting a comprehensive clinical and allergic examination of sick children with allergies, identify the criteria for the state of allergy and apply specific therapy. Among children suffering*

*respiratory by allergic diseases frequently there is a latent bronchial spasmodic stricture and absence of topical characteristic for the bronchial asthma. All main criteria typical of an allergy are observed for want of the patients: a high level of the contents common IgE, hypersensitivity of the bronchias, allergic hereditary predisposition and allergic diathesis, positive allergic skin tests. The complex therapy patients before bronchial asthma, including the specific therapy gives good and excellent results. Materials and methods. 30 practically healthy children (control) and 230 sick children with various clinical forms of allergy, including non-infectious-allergic (atopic) etiology - 107 (46.5%) and infectious-allergic etiology - 123 (53.5%) were under observation. Boys - 130 (56.5%), and girls - 100 (43.5%). The age of children is 3-15 years old. Disease duration up to 5 years, including: up to 1 year - 14 (6.0%), 1-3 years - 85 (37.0%), 4-5 years-131 (57.0%). Specific diagnostics of allergies in children was carried out on the basis of complex clinical-allergological, immunological, functional and laboratory research methods. The patients were treated in a complex: non-specific and specific ways. The digital data were processed statistically. Results. The main criteria characterizing the state of allergy in children were established, the causes of sensitization (allergens) responsible for the development of sensitization of the body were determined, and complex non-specific and specific therapy was carried out with good and excellent results, which is of great importance in preventing the transformation of mild clinical forms of allergy into more severe ones.*

**KEYWORDS:** Allergy, Pediatrics, Bronchial Asthma, Children's Population, Clinic, Specific Diagnostics, Therapy

## INTRODUCTION

### RELEVANCE OF THE STUDY

The urgency of the problem of allergy in pediatrics is explained by the widespread prevalence of this disease among children. It is believed that only 10% of the child population of our planet suffers from bronchial asthma [2,3] - The problem of bronchial asthma is also relevant for the region of Uzbekistan, where over the past 5 years the growth of this disease has been observed almost 20 times [4, 6, 7]. In the development of bronchial asthma, at least two stages are distinguished: 1) the state of pre-illness and 2) clinically formed bronchial asthma [7]. The concept of pre-asthma means a condition that poses a threat of bronchial asthma. At this stage, sick children have inflammatory processes in the airways with elements of bronchospasm, combined with various allergic reactions and diseases, but there are no typical asthma attacks characteristic of bronchial asthma. Subsequently, in the vast majority of sick children, this condition is transformed into typical bronchial asthma.

In this regard, there is an urgent need for early specific diagnosis and timely effective therapy of sick children at the stage of pre-illness, which is of great importance for preventing its transformation into bronchial asthma not only in children but also in adults.

### MATERIALS AND METHODS

Under the supervision were 30 practically healthy children (control): boys - 15, girls - 15 and 230 sick children with various clinical forms of allergies, including; with non-infectious-allergic

(atopic) etiology - 107 (46.5%) and infectious-allergic etiology - 123 (53.5%): boys - 130 (56.5%), and girls - 100 (43.5%). The age of children is 3-15 years old. Disease duration - up to 5 years, including: up to 1 year - 14 (6.0%), 1-3 years - 85 (37.0%). Specific diagnostics of allergies in children was carried out on the basis of complex clinical and allergic, immunological, functional (determination of forced expiration with a pneumotachometer) and laboratory research methods (1,5). Sick children were treated with a non-specific conventional therapy. Specific therapy, that is, vaccination with allergens, was carried out in a combined way: injection of an allergen + its inhalation according to an individual scheme. The digital data were processed by the method of variation statistics with the calculation of the reliability of numerical differences. The differences were considered significant under the condition  $t > t_{\alpha}$ , and  $p < 0.05$ .

## RESULTS AND DISCUSSION

Analysis of the clinical forms of manifestations of allergic diseases showed that children suffered from typical allergic diseases. Clinical manifestations of allergies were as follows: allergic conjunctivitis, rhinitis and sinusitis - in 54 (24.4%), allergic recurrent obstructive bronchitis - in 78 (33.9%), chronic pneumonia - in 98 (42.6%).

Elements of bronchospasm were observed in all patients. The patients did not have typical asthma attacks characteristic of bronchial asthma. The underlying disease was often combined with other allergic reactions and diseases: urticaria, neurodermatitis, migraine, drug and food allergies, etc. Eosinophils were detected in swabs from the nasal mucosa and sputum. Eosinophil was also noted in the peripheral blood.

According to our data, cases with moderate and severe clinical course prevailed. Regardless of the reason for the sensitization of the body, the specific frequency of such forms of asthma was: with atopic form -  $82 (35.6 \pm 3.1\%)$ , and with infectious-allergic -  $99 (43.0 \pm 3.2\%)$  ...

In general, the specific frequency of moderate and severe forms of pre-asthma was in  $181 (78.6 \pm 2.7\%)$  patients (Table 1).

**TABLE 1 THE SEVERITY OF THE CLINICAL COURSE AND THE CAUSES OF SENSITIZATION OF THE BODY IN PRE-ASTHMA IN CHILDREN (N = 230)**

Severity	Sensitization by allergens:		Total
	Non-infectious	Infectious	
Easy	25(10,9 ± 2,0)	24(10,4 ± 2,1)	49(21,3 ± 2,6)
Medium-heavy	30(13,0 ± 2,2)	36(15,7 ± 2,3)	66(28,6 ± 2,9)
Heavy	52 (22,6 ± 2,7)	63(27,4 ± 2,9)	115(50 ± 3,2)
Total	107(46,5 ± 3,2)	123(53,5 ± 3,2)	230(100)

Note: percentages (%) are shown in parentheses

In the onset and development of allergies, risk factors are of great importance: predisposing, causal, contributing to and exacerbating the symptoms of the disease (triggers).

Among the predisposing factors, an increase in the total IgE content in the blood serum of sick children, hyper reactivity of bronchial receptors and hereditary allergic burden were of great importance (Table 2).

The content of total IgE in the blood serum of sick children ( $M \pm m$ ), compared with the control ( $228.8 \pm 19.8$  IU / ml), was significantly increased: with atopic allergy up to  $803.4 \pm 46.6$  IU /

ml, and in the infectious-allergic form - up to  $676.5 \pm 56.5$  IU / ml ( $p < 0.05$ ). The hyper reactivity of bronchial receptors was detected by determining the threshold dose of biologically active substances. Bronchospasm (according to pneumotachometry data) developed in comparison with the control at minimal concentrations of histamine (100-2000  $\mu$ g) and acetylcholine (50-3000  $\mu$ g) ( $p < 0.05$ ). Hereditary allergic burden was observed in general in 121 (52.6%) sick children. However, the frequency of hereditary predisposition was relatively dependent on the cause of sensitization. So, out of the total number of children with atopic form of allergy (107), an allergic hereditary predisposition was observed in 84 (78.5%) children, while with infectious allergic forms (123) only in 37 (30.0%), then there is 2.6 times less often ( $p < 0.05$ ), which is consistent with the literature data (2,3). The vast majority of children with atopic allergies - 86 (80.3%) suffered from allergic diathesis in early childhood. Among children with infectious-allergic forms of allergy, the frequency of allergic diathesis was 2.2 times less frequent - 44 (35.7%) ( $p < 0.05$ ).

The reason for the sensitization of the body was: in atopic form of allergy, non-infectious allergens: house dust - 71 (66.3%), pollen (wormwood, quinoa, scrub, etc.) - in 58 (54.2%), insecticide (house dust, mosquitoes, moths, etc.) - in 48 (44.8%), epidermal (animal hair, horse dander, etc.) - in 32 (29.9%), food (cow's milk, chocolate, etc.) - in 11 (10.2%). In infectious-allergic forms of allergy, the cause of sensitization was bacterial allergens: pneumococci-55 (44.7%), streptococci - 45 (36.5%), staphylococci - 33 (26, 8%), etc.

In exacerbation of the symptoms of the underlying disease, physical activity, stressful situations, and sudden changes in theological weather conditions are of great importance. In almost all of these children, these factors worsened overall empathy. In some sick children, mostly with severe clinical course, mental disorders were observed, which is consistent with temperature data [7].

**TABLE 2 RISK FACTORS FOR DEVELOPING PRE-ASTHMA IN CHILDREN**

Risk factors	Atopic	Infectious-allergic
Predisposing: JgE content in the blood bronchial hyperreactivity allergic hereditary burden allergic diathesis	803,446,6 ME/MLI 100% 78,5%	676,556,5 ME/MLI 100% 30,0%
Reasons for sensitization, allergens	Non-infectious 10,2- 66,3%	Infectious 26,8 44,7%
Contributing: Toxicosis of pregnancy	66,3%	71,5%
Induced labor	38,3%	29,2%
Operative delivery (caesarean section, application of obstetric forceps, etc.)	26,1%	31,7%
Artificial (or) previously mixed	68,2%	57,7%
feeding combination with allergic dermatitis	59,8%	47,9%

Some features of the clinical course of allergy in children have been clarified. In allergy to pollen etiology, exacerbation of symptoms of the main and concomitant diseases was noted mainly in the spring-summer season and coincided with the period of flowering of those or x plants, for which pollen was observed. Hypersensitivity of the body. Symptoms of dust allergy could develop throughout the year, that is, the seasonality was noted. However, the frequency of referrals increased in the autumn-winter period, since during this period children spent most of

their time at home in closed rooms. On auscultation of the lungs, wheezing was heard. Patients complained of cough, dyspnea of the expiratory type, but did not indicate the onset of asthma attacks characteristic of bronchial asthma.

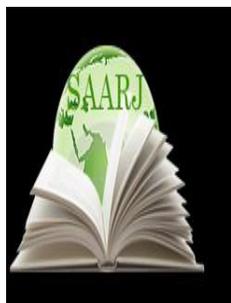

Patients were treated with traditional complex application of non-specific and specific treatment methods. As a basic therapy, anti-inflammatory, antihistamines, restorative and symptomatic drugs were prescribed, taking into account the age of children and the timing of giving the drug: antihistamines (diphenhydramine, suprastin, claritin, etc.). Specific therapy, that is, vaccination with non-infectious allergens, was carried out in a combined way: injection of the allergen + its inhalation. The treatment was carried out in the phase of remission of the disease after preliminary sanitation of the foci of chronic infection. Each sick child received at least 2-3 courses of treatment. Specific therapy was given to children with mild and moderate clinical course of the disease. Out of the total number of treated patients (55), excellent and good treatment results were observed in 52 (94.5%), the effect was satisfactory in 3 (5.5%) patients.

## CONCLUSIONS

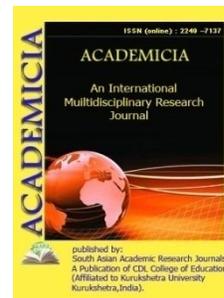

1. Among children suffering from respiratory allergic diseases, there is often a state of allergy, which is characterized by the presence of latent bronchospasm and the absence of typical asthma attacks, characteristic of bronchial asthma.
2. All the main criteria typical for allergies are observed in sick children: a high level of total IgE content, bronchial hyperreactivity to the action of biologically active substances, the presence of an allergic hereditary predisposition and allergic diathesis, positive allergic skin tests for specific allergens.
3. Complex therapy of children with allergies, including specific vaccination with allergens, gives good and excellent results, helps prevent the transformation of mild forms of allergy into more severe clinical forms.

### ABSTRACT

*This article describes the physico-mechanical properties of summer costume fabrics of 4 different fiber compositions: 64.7% cotton fibers + 35.23% polyester fibers, 50% cotton fibers + 50% dacron fibers, 100% dacron fibers 25.5 % cotton fibers + 75.5% dacron fibers.*

**KEYWORDS:** *Density, Surface Density, Tensile Load, Elongation At Break, Breathability, Crease Resistance, Shrinkage, Color Fastness.*

### INTRODUCTION

One of the current issues in the development of the textile industry is the production of a new range of suiting fabrics from local raw materials, using the range of modern weaving equipment.

New high-tech jobs will be created in the textile and garment industry of the Republic due to high and stable growth rates, attraction and development of foreign direct investment, production and export of competitive products, implementation of strategically important modernization projects. Systematic work is being carried out to further deepen the structural reorganization, aimed at the creation, technical and technological modernization of enterprises, the introduction of an advanced “cluster model” [1].

The aim of the research is to create a technology for the production of a new range of suiting fabrics from local raw materials, using the range of modern weaving equipment in the

development of the textile industry. Study of factors influencing the structure of the fabric in scientific work; selection of raw materials and preparation for weaving; tasks to determine and study the consumer properties of new fabrics [2-3].

Samples of summer suiting fabrics of different assortment, ie 64.7% cotton + 35.23% polyester fiber, 50% cotton + 50% lavsan fiber, 100% lavsan and 24.5% cotton + 75.5% lavsan fiber for research work were taken. , their physical and mechanical properties were determined using modern equipment.

Based on the test results, the following symbols were used to construct the graphs: 1-64.7% cotton + 35.23% polyester fiber suit fabric; 2- 50% cotton + 50% lavsan fiber suit fabric; 3-100% lavsan fiber suit fabric and 4-24.5% cotton + 75.5% lavsan fiber suit fabric.

### THE MAIN FINDINGS AND RESULTS

Costume fabrics differ from each other in structure, fiber composition and properties. In addition, these fabrics are produced depending on the season. Seasonal suit fabrics are made from yarns obtained by snow and re-combing [4].

Suit fabrics produced for the summer season should be light, high air permeability, durable, suits fabrics produced for the winter season should be high and thick, and have high heat retention properties.

The structure of the fabric is determined by the intertwining and connection of the body and back yarns. The appearance, properties and use of textile fabrics depend on its structure [5, p. 286].

One of the indicators that characterize the structure of suit fabrics is their density, the other is their weaving. If the density of the fabric on the body and back differs from each other, the density of such fabrics will be uneven gauzes.

The density of suit fabrics varies widely. The thinner the yarns of fabrics of the same density, the thinner the fabric, i.e. the less it is filled with yarns.

The main parameters of suit fabrics include such indicators as density, tensile strength, elongation at break.

Research work was carried out on the study of the size and physical and mechanical properties of costume fabrics. For this purpose, samples of suit fabrics with different fiber content were taken and their physical and mechanical properties were studied.

The test results are presented in Table 1.

**TABLE 1 INFLUENCE OF DIFFERENT FIBER CONTENT ON THE QUALITY INDICATORS OF SUIT FABRICS**

Types	Gauze content of the fabric	Linear density of yarn, tex		Surface density, g / m <sup>2</sup>	The tensile strength of the fabric, N		Elongation at break of fabric,%	
		on the body	on the back		on the body	on the back	on the body	on the back
1.	64.7% cotton + 35.23% polyester	30	30	219,8	813	332	15,5	13,8

2.	50% cotton + 50% lavsan	42	42	217,2	1015,1	560,0	24,0	12,0
3.	100% lavsan	38	37	207,0	1015,0	1015,0	26,0	32,0
4.	24,5% cotton+75,5% lavsan	31	28	201,6	920,0	430,0	20,0	18,0

If we compare the results of the study with the quality of 64.7% cotton + 35.23% polyester fiber suit fabrics, the surface density of 50% cotton + 50% lavsan fiber suit fabric is reduced by 1.1%, the tensile strength on the body is reduced by 19.9%. , the tensile strength on the back increases by 40.8%, the elongation at the waist increases by 35.5%, the elongation at the back decreases by 13.1%, the surface density of 100% lavsan fiber suit fabric decreases by 5.5%, on the body the tensile strength increases by 19.9%, the tensile strength at the back increases by 67.3%, the tensile strength at the waist increases by 40.4%, the tensile strength at the back increases by 56.9% and 24.5% cotton + 75.5% lavsan fiber. The surface density of the summer suit fabric is reduced by 8.3%, the tensile strength of the trunk by 11.6%, the tensile strength of the back by 22.8%, the elongation of the trunk by 22.5%, the elongation at the back of the trunk by 23.3% increases.

The textile fabrics produced differ in structure, purpose of use, fiber composition and properties.

One of the main characteristics of suit fabrics produced in the textile industry is air permeability, tensile strength, abrasion resistance, color fastness and so on.

Costume fabrics have the ability to transmit air, water, gas, steam, dust, smoke liquids, radioactive pomegranates. Air permeability is the air permeability of the sample itself, which is measured by the air permeability coefficient. The air permeability coefficient indicates the amount of air passing through 1 square meter of surface in one second under conditions of known difference in air pressures on both sides of the sample.

The higher the density of the suit fabrics in the body and back direction, the lower the air permeability coefficient. Therefore, in the production of any suit fabric is produced with attention to the season. In addition, fabrics under the influence of bending and compression deformations under the influence of various technological processes in the textile industry, wrinkles, that is, they form folds and creases. Wrinkles and creases can be removed only by wet ironing. The shrinkage of fabrics depends on their fiber content, the thickness of the yarns used in their structure, the type of weaving and finishing, the density.

One of their negative features is the non-wrinkle performance of suit fabrics. It spoils the look of the item. Fabrics that are easily creased will wear out quickly because they will rub more in bent and twisted areas.

It is understood that costume fabrics do not wrinkle — they resist wrinkling and return to their original state after wrinkling.

One of the main indicators of suit fabrics is its abrasion resistance. The abrasion resistance of fabrics depends on the fiber content, density, thinness or thickness of the yarns, thickness and other parameters. For example, the more the fabric is rubbed, the more the structure is damaged, the yarns in it are broken, and the strength decreases.

The abrasion of suit fabrics is mainly due to the effect of friction. The abrasion resistance of fabrics depends on their fiber content, surface texture. First of all, the fiber ends protruding from the surface of the fabric are subject to friction. The fibers protruding from the bends of the threads in the suit fabric begin to break down. Some areas of the fiber surface are damaged and the fibers break. The yarns are also broken as some fibers or pieces of fiber come out of the yarn. The bent areas of the threads protruding from the surface of the fabric are the first to be eroded by friction. These areas are the base surface of the fabric, i.e. the larger the base surface of the fabric, the better its abrasion resistance. By strengthening the base surface of the fabric, its abrasion resistance can be increased. For this purpose, long-coated wraps (satin, satin), abrasion-resistant fibers (kapron, lavsan) or finishing processes (appreting) are used.

The abrasion resistance of knitted fabric also depends on the amount of base surface. At the same time, when the yarns that make up the knitwear are rubbed off, the loops on the hoop columns or rows come out of each other depending on the weave of the fabric, and the structure of the fabric is disrupted.

The abrasion of the nomato fabrics obtained by the weaving method also occurs mainly as a result of friction. During the friction process, the fibers in the fiber bundle of the fabric come out of the fabric structure because they are not well bonded to each other, and the threads that hold the fibers together are rubbed and torn.

The frictional abrasion of suit fabrics containing short fibers, especially synthetic fibers, usually begins with the appearance of peeling. First, the ends of the fibers protrude to the surface of the fabric. Then, they get confused. When tangled, some of the fibers come out of the fabric structure. Later, the fibers in the pillars break off from the surface of the fabric. As a result, the thickness of the fabric is reduced and it is easily absorbed.

Research has been conducted to determine the crease, air permeability, dye resistance and penetration of suit fabrics. The test results are presented in Table 2.

**TABLE 2 CHANGES IN THE QUALITY OF FIBER CONTENT OF SUITING FABRICS**

Т/р	Gauze content of the fabric	No wrinkles,%		Air permeability of the fabric, dm <sup>3</sup> / cm <sup>2</sup> sec	Бўёқнинг чидамлилиги, балда		Киришиши,%	
		on the body	on the back		dry	wet	on the body	on the back
1.	64.7% cotton + 35.23% polyester	50,0	58,3	91,4	4/4	3/3	-1,5	0
2.	50% cotton + 50% lavsan	67,4	68,1	39,8	4,5/4,5	3,5/3,5	+1,0	+0,5
3.	100% lavsan	76,4	77,2	215,7	4,5/4,5	4,0/4,0	-1,5	-0,5
4.	24.5% cotton + 75.5% lavsan	81,1	82,2	137,7	4,5/4,5	4,0/4,0	0	-0,5

If we compare the results of the study with the quality of 64.7% cotton + 35.23% polyester fiber suit fabrics, the air permeability of 50% cotton + 50% lavsan fiber suit fabric is reduced by 56.5%, non-crease on the body by 25.8%, non-wrinkle on the back increases by 14.4%, air permeability of 100% lavsan fiber suit fabric increases by 37.6%, no wrinkle on the body

increases by 63.4%, no wrinkle on the back increases by 24.5% and 24.5% cotton + 75 , 5% lavsan fiber summer suit fabric air permeability increases by 33.3%, non-wrinkle on the body by 38.3%, non-wrinkle on the back by 29.1%. The results of the study showed that due to the fact that the suit is a fabric designed for the summer season, the air permeability of the fabric is higher than other composite fabrics in 100% lavsan and 64.7% cotton + 35.23% polyester fiber suit fabrics.

In addition, 64.7% cotton + 35.23% polyester fiber suit fabric has 4/4 of the paint resistance in dry friction, 3/3 of the paint resistance in wet friction, -1.5 in the body, 50% in the back, 50%. cotton + 50% lavsan fiber suit fabric dye resistance in dry friction 4.5 / 4.5, dye resistance in wet friction 3.5 / 3.5, penetration on the body +1.0, penetration on the back +0.5 Dry resistance of 100% lavsan fiber suit fabric in dry friction is 4.5 / 4.5, dye resistance in wet friction is 4.0 / 4.0, penetration on body is -1.5, penetration on back is -0.5 24.5% cotton + 75.5% lavsan fiber summer suit fabric dye resistance in dry friction 4.5 / 4.5, dye resistance in wet friction 4.0 / 4.0, non-penetration on the body, penetration on the back -0.5.

The analysis of the test results showed that the air permeability of 64.7% cotton + 35.23% polyester fiber and 100% lavsan fiber suit fabrics, 24.5% cotton + 75.5% lavsan fiber summer suit fabric is higher than other fabrics.

An important aspect of the research work is to determine the virginity of materials in the textile industry and present them to the seamstress. In the garment industry, the level of virginity of the purchased raw material is specified for which part of the garment or product to be used, and the role of virginity in the purchase of fabrics and in determining the quality based on customer demand. It can also be observed that the differential equations of yarns with linear deformation laws of holonomic and nogolonomic bonds remain nonlinear [6, pp. 82-85].

## CONCLUSION

1. The quality indicators of suit fabrics with different fiber content were studied. The test results show that if we compare the quality of 64.7% cotton + 35.23% polyester fiber suit fabrics, the surface density of 50% cotton + 50% lavsan fiber suit fabric is reduced by 1.1%, the tensile strength on the body is 19, 9%, tensile strength on the back increases by 40.8%, elongation at the waist increases by 35.5%, elongation at the back decreases by 13.1%, surface density of 100% lavsan fiber suit fabric decreases by 5.5% , the tensile strength of the trunk increases by 19.9%, the tensile strength of the trunk increases by 67.3%, the tensile strength of the trunk increases by 40.4%, the tensile strength of the trunk increases by 56.9% and 24.5% cotton + 75.5% % The surface density of lavsan fiber summer suit fabric is reduced by 8.3%, the tensile strength of the body is reduced by 11.6%, the tensile strength of the back is reduced by 22.8%, the tensile strength of the body is reduced by 22.5%, the tensile strength of the back is reduced by 23%. , Increases by 3%.

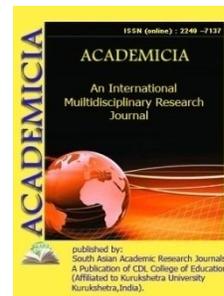

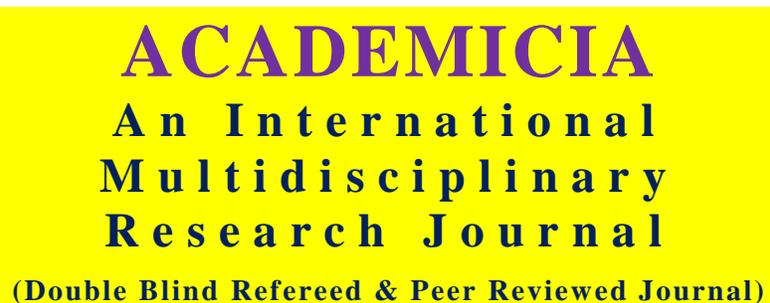

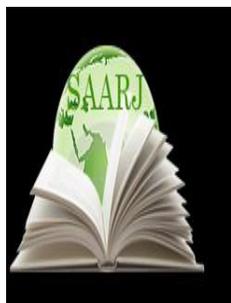

2. The results of the study showed that due to the fact that the suit is a fabric designed for the summer season, the air permeability of the fabric is found to be higher in 100% lavsan and 64.7% cotton + 35.23% polyester fiber suit fabrics than other blended fabrics.

3. 64.7% cotton + 35.23% polyester fiber suit fabric of different assortment has 4/4 of the paint resistance in dry friction, 3/3 of the paint resistance in wet friction, -1.5 on the body, 50 on the back. % cotton + 50% lavsan fiber suit fabric dye resistance in dry friction 4.5 / 4.5, dye

resistance in wet friction 3.5 / 3.5, penetration on the body +1.0, penetration on the back +0, 5, 100% lamsan fiber suit fabric with dry friction dye resistance 4.5 / 4.5, wet friction dye resistance 4.0 / 4.0, body penetration -1.5, back penetration -0, 5, 24.5% cotton + 75.5% lamsan fiber summer suit fabric, dry friction dye resistance 4.5 / 4.5, wet friction dye resistance 4.0 / 4.0, does not penetrate the body, on the back input was -0.5.

## MULTILATERAL CULTURAL AND HUMANITARIAN COOPERATION OF UZBEKISTAN WITHIN THE SCO: ACHIEVEMENTS AND OPPORTUNITIES

**Muhayyo Soliyeva\***

\*PhD Student,  
Tashkent State University of Oriental Studies,  
UZBEKISTAN

---

### ABSTRACT

*This article is devoted to the multifaceted cooperation, achievements, and opportunities of Uzbekistan in the cultural and humanitarian spheres within the Shanghai Cooperation Organization, which is characterized by initiative and pragmatism. The author has sufficiently analyzed the fact that Uzbekistan, together with member states, is working to expand cultural and humanitarian cooperation within the SCO, improve coordination, strengthen the role of the organization in the international arena. The contribution of Uzbekistan to the strengthening of good-neighborly, friendly, and cooperative relations between the peoples living in the SCO, the intensification of intercultural dialogue in their interests was emphasized. The multifaceted cultural and humanitarian cooperation between Uzbekistan and each of the member states has been studied in detail, and their potential has been highlighted.*

---

### INTRODUCTION

In modern international relations, regional international organizations play an equally important role, which is a reflection of the growing trend of the interdependence of states and the solution of problems of security and economic development in different regions of the world. One of these associations is the *Shanghai Cooperation Organization (SCO)*. In today's rapidly changing world, the role and influence of the SCO is growing in addressing pressing issues,

ensuring security, stability, and development, and expanding economic, cultural and humanitarian spheres. Uzbekistan is one of the founders of the organization and plays a special role in its activities as a country with huge economic and geopolitical potential. Uzbekistan's efforts have always been aimed at expanding multilateral cooperation and implementing the basic principles of mutual trust, mutual consultation, respect for cultural diversity, and common development.

The SCO was established as an informal forum to resolve border issues between China and neighboring countries in the framework of the 1996 Shanghai Agreement on Measures to Strengthen Military Confidence in the Border Areas. The sub regional international organization has six members - Kazakhstan, China, Kyrgyzstan, Russia, Tajikistan, and Uzbekistan. Following the expansion of the organization in 2017, with the accession of Asia's largest countries, India and Pakistan, the SCO has become the world's largest regional organization with a universal agenda. Today, the total area of the SCO member states is more than 60% of the territory of Eurasia, in terms of total demographics (population), about half of the world's population, 4 to 2 part (more than 3 billion 40 million people)[1][2]. According to the results of 2019, the total GDP of the SCO countries amounted to 20% of world GDP[3].

Today, within the SCO, Uzbekistan is working on a number of issues. In many countries, not only economic, political, and military issues are important, but also cultural and humanitarian spheres. Cultural and humanitarian cooperation has also been established within the SCO, which has been showing practical results for several years. It is known that a meeting of the Ministers of Culture of the SCO member states will be held. This, in turn, identifies promising areas of multilateral cooperation in the cultural and humanitarian spheres. For example, on June 21-22, 2016, Tashkent hosted *the thirteenth meeting of the Ministers of Culture* of the SCO member states, which included Kyrgyzstan, Kazakhstan, Russia, Tajikistan, China and The heads of relevant ministries of Uzbekistan discussed important issues in the cultural and humanitarian sphere.

The jubilee summit held in Tashkent during the presidency of the Republic of Uzbekistan in the SCO is the result of the ongoing reforms in our country. Uzbekistan during its chairmanship in the SCO, following the existing tradition strictly adheres to and abides by the principles of consistent expansion and development meets the interests of the Member States of constructive and lasting cooperation, to ensure the steady growth of the authority of the organization in the international arena[4]. It is worth noting that during the presidency of Uzbekistan in the organization, more than 380 events of various levels and directions were organized, and as a result, *the Tashkent summit* was held.

As a result of Tashkent's new active policy in the organization, since 2017, Uzbekistan has implemented more than 10 initiatives aimed at further strengthening cooperation in the SCO insecurity, economy, transport, science, tourism, and cultural and humanitarian spheres. Uzbekistan has become an initiator of creating new platforms in the SCO.

Currently, under the far-sighted and wise leadership of the President of the Republic of Uzbekistan Shavkat Mirziyoyev, it is reaching a qualitatively new stage in its development and is bearing fruit in all areas. *The Action Strategy* for the five priority areas of development of the Republic of Uzbekistan, proposed by the President of Uzbekistan provides for topical issues of

sociopolitical, socioeconomic, and cultural-humanitarian development of the country in 2017-2021 and a number of important initiatives have been considered. Of course, all this will affect the activities of our country within the SCO. The main goals of the action strategy are to develop multilateral cooperation with the SCO. The specific functional load of the organization is realized through the interdependence of three important areas - security, economic, and cultural-humanitarian cooperation, but they do not have to develop simultaneously. Economic, cultural, and humanitarian ties are also the basis of interstate cooperation.

In recent years, Uzbekistan's initiative to further develop multifaceted practical cooperation has become clear. President Shavkat Mirziyoyev addressed the summits of the heads of state in *Astana (2017)*, *Qingdao (2018)*, and *Bishkek (2019)* in the areas of security, trade and economic, science, education and cultural and humanitarian spheres, as well as He outlined a number of practical proposals, such as strengthening cooperation in the field of tourism, innovative development, support for the younger generation, promoting public diplomacy as an effective tool in strengthening friendship and mutual understanding between the peoples of the SCO. Joint Address of the SCO Heads of State to the Youth and Action Plan for its Implementation, Cooperation *"Roadmap"* of the SCO Member States for 2019-2020, *Interregional Cooperation program*, the concept of cooperation in the field of digitalization and information and communication technologies and other important documents were adopted.

The establishment of *the SCO Center for Public Diplomacy* in Uzbekistan has become a key step in multilateral cultural and humanitarian cooperation. Currently, a number of state and public organizations of Uzbekistan contribute to the effective operation of the center. This is confirmed by the fact that the center's founders are the Committee on Interethnic Relations and Friendly Ties with Foreign Countries under the Cabinet of Ministers, the Ministry of Foreign Affairs, Culture, Higher and Secondary Special Education, Physical Culture and Sports, the State Committee for Tourism Development, the Academy of Sciences, the Academy of Arts, Youth Union, Creative Union of Journalists, Writers Union. In its activities, *the Public Diplomacy Center* will focus on expanding cultural-humanitarian ties with the SCO member states, mutual visits of delegations, creating necessary conditions for the development of friendly ties between civil society institutions, including youth and women's organizations. The center will closely cooperate with the mass media in the issues of formation of information resources aimed at preserving the rich history, cultural heritage, traditions of people, prepare information-analytical materials in various areas and regularly publish them[5]. There is no doubt that the work in these areas will help bring the SCO countries and their peoples closer to each other, strengthen the spirit of trust and good neighborliness.

With the help of the Shanghai Cooperation Organization (SCO), President Mirziyoev signed the Resolution on the Establishment of *"Silk Road" International The University of Tourism* on June 28, 2018. This resolution aims to organize a system to train professional personnel and carry out research and creative work in the field of international tourism. A secondary purpose is to further the development of historical and cultural-humanitarian ties of member states of the SCO[6].

The ceaseless development of various relations between *Uzbekistan and China within the SCO* has brought the two countries to a new stage, namely long-term strategic partnership and comprehensive cooperation. China is willing to continue to help the country fight the pandemic

according to its needs and called for more efforts to construct Chinese-Uzbek center for *traditional medicine* to safeguard people's health[7].

It is known that in recent years, Uzbekistan's strategic partnership and cooperation with Russia within the SCO has been significantly strengthened. As a result of joint efforts based on openness and mutual trust, the scope of cooperation in trade and economic, investment, energy, transport, agro-industrial, scientific-technical and cultural-humanitarian spheres has been significantly expanded. When it comes to cultural and humanitarian cooperation, which has become one of the important areas of *Uzbek-Russian relations*, it is worth noting that Uzbekistan has opened branches of dozens of leading Russian universities. These include *the National Technological Research University, the National Nuclear Research University*, and the first foreign branch of *the Moscow State Institute of International Relations*. All this shows that the partnership between Uzbekistan and Russia has a solid foundation and is focused on the future.

Despite the fact that India has been a member of the SCO for just over three years, the stage of cultural and humanitarian cooperation with Uzbekistan occupies a special position. There is a close affinity between the cultures of the two countries, and the following evidence of their multifaceted cultural and humanitarian cooperation:

- India affirmed its commitment to develop a state-of-the-art Information Technology (IT) complex in *Armed Forces Academy of Uzbekistan* for the benefit of the soldiers.
- Indian films, actors and songs are extremely popular across Uzbekistan.
- After the first major co-production of *Alibaba aur Chalis Chor* in 1980, *Indo-Uzbek* jointly produced film "*Hoichoi Unlimited*" premiered in Uzbekistan on 31st March 2019.
- *The Lal Bahadur Shastri Centre* for Indian Culture teaches Hindi, Yoga and Kathak and holds cultural performances across Uzbekistan[8].

The multilateral cooperation between *Uzbekistan and Pakistan* within the SCO is also developing today. The unique position of Uzbekistan in cultural and humanitarian cooperation has not escaped the attention of the Islamic Republic of Pakistan. Student exchanges between the two countries in the field of education have been established and cultural ties have been expanded. Thus, the trade turnover between Uzbekistan and Pakistan increased 5 times, and at the end of 2019 made up US\$123 million. At the same time, in the period from 2016 to 2019, the number of tourists from Pakistan to Uzbekistan has grown from 400 to over 4 thousand[9].

It is known that many enlightenment meetings, various festivals and creative evenings, events in the field of tourism and cultural and humanitarian spheres are organized between *Kazakhstan and Uzbekistan* within the SCO. Currently, over 50 cooperation agreements are in force in higher education system of the two countries. The Kazakh language is studied almost in 400 schools of our country, pedagogical personnel are trained in higher education institutions in the Kazakh language, mathematics and other subjects. In Shymkent, in May 2018[10], a Memorandum of Cooperation was signed between *the Committee on Interethnic Relations and Friendly Ties* with Foreign Countries under the Cabinet of Ministers of the Republic of Uzbekistan and the Assembly of People of Kazakhstan.

Special attention is paid to strengthening and expanding close cooperation in cultural and humanitarian sphere, friendship and good neighborly relations between *Uzbekistan and Kyrgyzstan* within the SCO. In this regard, it is worth noting the successful tour of the Osh State

Academic Uzbek Music and Drama Theater named after Zahiriddin Muhammad Babur in Fergana Valley in February, and in June – the collective of the Uzbek State Music Theater named after Mukimi in Osh, Uzgen, Aravan, Navkat, Karasu, Jalalabad. Representatives of Kyrgyzstan took the second place at the recently held *“Sharq taronalari” International Music Festival* in Samarkand. Today there are about 300 thousand of our compatriots of Kyrgyz nationality in Uzbekistan. All conditions have been created for the development of their culture, language, traditions and customs. There are 6 Kyrgyz national cultural centers, education in 56 schools is conducted in the Kyrgyz language[11].

Also, within the SCO, Uzbekistan’s cooperation with Tajikistan is developing in the cultural sphere. Of particular importance is the fact that the governments of *Uzbekistan and Tajikistan* have signed an agreement on cooperation in the field of culture and arts[12], and an action plan for 2018-2020. The commonness of history and traditions, the neighborhood of our nations predetermined close Tajik-Uzbek interaction in the cultural and humanitarian sphere. The Tajik and Uzbek diasporas living in our countries is a sign special importance to our relations. In this regard, the creation of favorable conditions for the self-realization of members of the Tajik and Uzbek diasporas in our countries is an important aspect of interaction in *the humanitarian sphere*[13].

Uzbekistan’s initiatives to adopt a special resolution of *the UN General Assembly “Enlightenment and Religious Tolerance”* and a joint statement of the SCO leaders on youth have been widely welcomed in international political and analytical circles. Their support for the SCO means that the member states are trying to strengthen the unity of the organization, increase its influence in the world arena and work together on topical issues of the regional and international situation.

Cooperation between *the SCO and UNESCO* is aimed at the development and strengthening of cultural and humanitarian ties, cooperation in science and education, in-depth study of the cultural heritage of the SCO peoples and the promotion of tourism to the world community. Uzbekistan will undoubtedly play a key role in this process. According to the Prime Minister of India Narendra Modi, the SCO space has inspired the scientific, philosophical, spiritual, and cultural development of the world for thousands of years. It is natural that this document will help the SCO member states to integrate into the world tourism market and thus increase their tourism potential. It should be noted that 15% of *the UNESCO World Heritage Sites* are located on the territory of the organization. Uzbekistan alone has about 7,000 unique historical and cultural sites that attract tourists from all over the world. The establishment of practical cooperation between the SCO and the *World Tourism Organization*, as well as the opening of the Silk Road International University of Tourism in Samarkand at the crossroads of civilizations as a manifestation of the initiative of the President of Uzbekistan Shavkat Mirziyoyev contributing is one of the most important aspects. A region is a place of great spiritual and cultural richness. It is important not only to preserve and reproduce it but also to use it effectively for the benefit of present and future generations.

Nowadays, the SCO, like many other international structures, faces some threats. Among them is the SCO’s ability to adapt to radical changes in the geographical area and the world in general, and, of course, *the coronavirus pandemic* will have a certain impact on shaping its future agenda. There is no doubt that a number of programs and projects planned to be implemented in the context of a pandemic will be postponed, as the whole world is currently fighting an invisible

enemy. Nevertheless, it is noteworthy that the reforms carried out by Uzbekistan are bearing fruit and cultural and humanitarian ties within the SCO are developing significantly.

In this context, the SCO's activities will be enriched with new content, its agenda will include the creation of transport and transit corridors, innovative and digital development, the search for new points of economic growth, the integration of member states' efforts to combat climate change and environmental risks, remote online exchange of ideas, search for solutions to important issues on the agenda, demonstration of cultural harmony, etc.

In conclusion, as a multidisciplinary intergovernmental organization, the SCO is based on the principles of dialogue and cooperation between different cultures and civilizations. This, in turn, depends on the cultural and humanitarian cooperation of Uzbekistan within the organization. On the basis of several analyzes, it is expedient to list important aspects of Uzbekistan's multilateral cultural and humanitarian cooperation within the SCO.

**First**, the cultural and humanitarian direction of the SCO may play a key role in the future, and it should be noted that the position of Uzbekistan in these areas has a special place.

**Second**, in a multi-ethnic, multi-confessional Central Asian, it is precisely the factors of cultural and civilizational order that may be the key to unification or division in a regional context. In this regard, the multifaceted cultural and humanitarian cooperation of Uzbekistan within the SCO will undoubtedly serve as a key tool for further integration of the SCO member states.

**Third**, although the cultures of the SCO member states are different, there are many similarities. Uzbekistan, which plays a geopolitically important role in strengthening cultural harmony and mutual trust, can serve as a bridge.

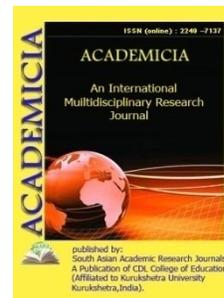

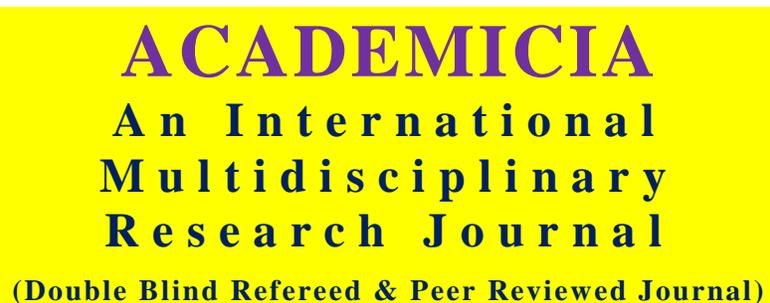

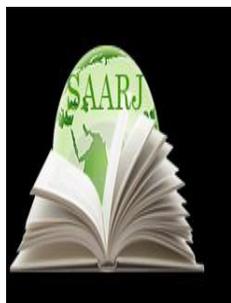

**Fourth**, the multilateral cultural and humanitarian cooperation carried out by Uzbekistan within the SCO will have a significant impact on other areas. Not every industry can develop at the same level at the same time, but regardless of which industry develops, it is done on the basis of the industries in the organization, that is, all are inextricably linked.

**Fifth**, it is no exaggeration to say that due to the coronavirus pandemic on the planet, multilateral humanitarian cooperation within the SCO has reached a key stage, and the Republic of Uzbekistan is one of the activists.

## EXPRESSION OF THE PRAGMATIC BARRIER IN UZBEK COMMUNICATION TEXT (IN THE EXAMPLE OF CHILDREN'S SPEECH)

**Munavvara Abdujabbarovna Kurbanova\***

\*Associate Professor,

Doctor of Philological Sciences,

Tashkent State University of the Uzbek Language and Literature named after Alisher Navoi,  
UZBEKISTAN

Email id: munavvara2013@yandex.ru

### ABSTRACT

*The article focuses on the nature of a pragmatic barrier. It reflects the issues of communicative-pragmatic barriers in the framework of the world linguistics. The reasons for the emergence of a pragmatic barrier specific to adult and children's speech have been identified, differentiated and explained. The pragmatic barrier in the communicative act of children appears in the forms of incorrect pronunciation, inappropriate use of words, lack of knowledge on the object and incorrect interpretation, social relationships between the child and the addressee and the uniqueness of their regional variations.*

**KEYWORDS:** *Ontogenesis, Linguistic Unit, Verbal Communication, Children's Speech, Imitation, Analogy, Speech Interference, Dialog, Pragmatic Barrier, Pragma-Linguistics, Context, Proposition, Communicative Situation.*

### INTRODUCTION

Some linguistic units copied from the speech of the adults serve as a phenomenological model for children in the developmental stage of verbal communication ontogenesis. Because most of the specific features of their speech arise under the influence of customary usage of speech units created by the method of imitation, repetition and analogy. A child starting the process of linguistic socialization may also make minor error in the use of language systems and norms. This situation has a certain negative effect on the effectiveness of verbal communication.

Research on this topic uses the terms *communicative error* and *communicative failure* to express the concept of *ineffective communication*. If the *success of the dialogue* and the mutual agreement of the interlocutors is a *successful dialogue*, then the negative consequences of the *speech (communicative)* are the inability of the speaker to achieve his goal, the unplanned negative emotional effect of the conversation, confrontation, conflict, collision). Communicative error means ineffective or inappropriate translation of the ideas or communicative uncertainty. [1]

Sometimes, communicative error results in the major difficulties for adults to understand a child's speech. Overcoming misunderstandings in the conversation process requires a thorough exploration of causes over a period of time. Because the means of expression present in the addressee's speech play an important role in the emergence of a pragmatic barrier in the first place.

A pragmatic barrier is an interference with the proposition to be mentioned, obscurities of the content and issues related to the thinking and pronunciation of the speaker. [2, 155] The phenomenon of the communicative-pragmatic barrier has a special place in the interpretation of issues related to the creation and perception of the speech.

R.R.Gelgard, L.A.Kiseleva, I.V.Chernigova, Yu.V.Sadovskaya and other researchers have contribute a lot to the exploration of the problem of pragmatic barrier in pragmalinguistics. [3, 3-9; 4, 135-136; 5; 6]

M. Hakimov was the first to explore the issue in Uzbek linguistics. He assessed the pragmatic barrier as non-pragmatic information that was inconsistent with the communicative purpose of the speaker. [121-134]

The pragmatic barrier in speech occurs under the influence of certain factors. M. Hakimov notes that the pragmatic barrier arises as a result of abnormal pronunciation, inappropriate word choice, incorrect connection of grammatical forms and syntactic devices and functional style divergences. [2, 121-134] L.A. Kiseleva points out following factors that contribute in the formation of a pragmatic barrier:

1. Signs of a planned pragmatic effect.
2. The social relationship between speaker and listener.
3. Thesaurus (intellectual capacity) fund and character.
4. Linguistic material feature. [4]

The communicative-pragmatic barrier is also observed in children's speech. The pragmatic barrier in adult speech which obscures the content of speech often arises in the form of violation of orthoepic norms of language, improper use of lexical units and etc. The use of lexical units in speech without understanding their meaning, as well as non-compliance with pronunciation norms, leads to the emergence of a pragmatic barrier in children.

## **MATERIALS AND METHODS**

A "linguistic discovery" aimed at word creation by children, as well as some of the functionally misused language units, are used to express a referential act. However, some forms of expression formed in this way have lingual-pragmatic significance in adult interpretation. This in turn leads

to a communicative barrier. "Although communicative barriers, inconsistencies, errors (confusion in the statement, lack of consistency, a lot of redundant words) slow down the process of achieving the result, they can never completely hinder it." [1]

Explorations indicate that the pragmatic barrier that emerges under the influence of extra-linguistic factors in the process of thought expression is clearly traceable in preschool children's speech. Although children's vocabulary is rapidly enriched at this age, it is natural that they will not be able to fully master most of the linguistic tools that are actively used in daily life. An expression that reflects this feature is common in common speech.

It is expedient to study the pragmatic barrier that occurs in connection with children's communicative activities in two ways: 1. The occurrence of a pragmatic barrier in children's speech. 2. The perception of a part of speech of other people as a pragmatic barrier by a child.

Various factors can emerge a pragmatic barrier for the listener in children's speech. These are: 1) the mispronunciation of words by children violating the norms of orthoepy; 2) inappropriate use of words by children; 3) individual occasionalisms created by children; 4) having not enough knowledge about the object of speech and misinterpreting it; 5) social relations between the child and the addressee, their territorial variations.

The pragmatic barrier that results from a violation of the orthoepic norm in children's speech makes it difficult to understand the speech. Preschoolers learn some sounds late or have difficulty pronouncing them. This can result in children's mispronouncing the sounds and as a result creating pragmatic barriers in speech. For example:

*Bolakay ming so'mlikning u yog'ini aylantirib ko'rди, bu yog'ini aylantirib ko'rди. O'ng cho'ntagiga qo'l suqqan edi, bir dasta ming so'mliklar ilashib chiqdi. Chap cho'ntagidan besh yuz so'mlik, yuz so'mliklar oldi. Barmog'iga tuflab, chaqqonlik bilan beshta yuz so'mlikni sanab, qo'limga tutqazdi.*

– *Bakalashkani bo'shatib beying, – dedi dona-dona qilib. Magazinga topshiyaman. "Spyayt" keyakmasmi? Ming so'm. (O'.Hoshimov. "Daftar hoshiyasidagi bitiklar")*

### Meaning:

*The boy watched the one-thousand sum currency thoroughly. He had a hand in his right pocket and got a bundle of thousand sum currency. He took five hundred sums and a hundred sums from his left pocket. He spat on his finger, quickly counted five hundred sums, and held it in my hand.*

*- Empty the bottle, - he said. I'll sell it to the shop. Do you want a bottle of "Sprite?" One-thousand sums. (O. Hoshimov. "Inscriptions on the margins")*

In children's speech, the abnormal expression of pronunciation is also manifested on the basis of the fact that the word undergoes through sound change. For example, the mispronunciation of the Russian word "nachalnik" in the following line: "Ijroqom bobo, **nachaynik bobo**, militsiya amakilar kelgan emish" (H.Tukhtaboev. "People of Paradise") created a pragmatic barrier. However, although the phonetic change observed in a child's speech utilization is considered a speech error, it plays a pragma stylistic function in that it serves to attract the attention of the adult addressee in the play.

The type of pragmatic barrier that occurs in connection with the misuse of the word in the speech of preschool children is often observed. Misuse of a word often occurs as a result of not knowing the meaning of the word. The word *corpse*, used in a child's speech in the following text, created a pragmatic barrier:

*Dadamning qo'shtig'ini ko'tarib, hovliqib chiqib ketayotgan edim, buvijonim:*

– *Miltiqni nima qilasan? – deb jerkib berdi.*

– *Biz qori pochcham bilan murda ovlagani ketyapmiz, – dedim achchig'im chiqib. Buvijonim qotib-qotib kuldi-da:*

*Murda emas, murid degin, bolam, murid, – deb tushuntirdi. Keyin murda bilan muridning farqini ham gapirib berdi. Shoshilib turganim uchun, bari bir, hech narsa anglamay, miltiqni tashlab qori pochchamnikiga qarab yugurdim. (X. To'xtaboev. "Sariq devni minib").*

### Meaning:

*As I was walking out of the house carrying my father's gun, my grandmother said:*

*"Why would you be doing with a gun?"*

*"We're going hunting for "murda"(a dead body) with my brother-in-law" I said angrily. My grandmother laughed heartily:*

*You mean "a murid" (a disciple), not a murda (a dead body), my child. Then she even explained the difference between those. As I was in a hurry, I dropped my gun and ran towards my brother-in-law, not realizing anything. (H. Tukhtaboev. "Riding the Yellow Giant")*

It becomes clear that the child has heard the word "murid" from his brother-in-law, but he has no idea about the meaning of this word. So, in his speech, he automatically replaces it with another word that sounds alike but has a completely different meaning.

Sometimes a pragmatic barrier in children's speech is caused by their misuse of assimilated words or false terms. In particular, a pragmatic barrier arises when children hear unfamiliar terms, inadvertently use their meanings, or mispronounce them, or use words that are similar in pronunciation to the term. For example:

*Meni ko'rishi bilan bo'lim boshlig'i:*

– *O'rtoq agronom, sizdan bir iltimosim bor, – deb qoldi.*

– *Marhamat, – mototsikldan asta tushdim.*

– *Agar malol kelmasa, mana bu Rahimjonga, uning a'zolariga kompost to'g'risida bir gapirib bersangiz. Bular haligacha hech narsa tushunishmas ekan.*

– *Marhamat, – dedim-da, u yoq-bu yoqqa qarab olgach, leksiya o'qishga tushib ketdim, – o'rtoqlar, kompost juda foydali ichimlik, uni asosan meবাদan tayyorlashadi. Mevalarning xili qancha ko'p bo'lsa, u shuncha shirin bo'ladi. Bizning Farg'ona tomonlarda kompostni o'rik, shaftoli qoqi va olchanning qurug'idan tayyorlashadi. Xullas, kompost ichmabsiz, dunyoga kelmabsiz. (X.To'xtaboev. "Sariq devni minib")*

*As soon as he saw me, the head of the department said:*

*“Comrade agronomist, I have a request”.*

*“I am all ears,” I said, slowly getting off the motorcycle.*

*“If you don't mind, tell Rahimjon and his members about compost.” They still don't understand anything.*

*“Sure,” I said, looking around, and went on with a lecture. “Comrades, compost is a very useful drink, it is made mainly from fruit. The more variety of fruit, the sweeter it will be. In Fergana, compost is made of dried apricots, peaches and cherries. Those weren't born, who have never tried it. (H. Tukhtaboev. “Riding the Yellow Giant”)*

It is understood that such communicative errors in the use of words in children's speech occur as a result of their inability to comprehend the word.

Sometimes individual occasionalisms created by children can also create a pragmatic barrier. *Hadjimurod Erkinov* (4 years and 10 months), speaking in Tashkent city dialect, said to his friend: - ***Do you fancy playing drsh – drsh?***[7, 82] When the child is asked what kind of game *Drsh-drsh* is, he explains that the idea of the game is hitting the heads against each other. Such individual occasionalisms used in speech also create a pragmatic barrier for adults.

The following hybrid, created by telescopic method on the basis of contamination caused by a pragmatic barrier, can be considered as an excellent example of child-specific occasionalism:

*Yulduz. Uch yashar.*

*– Nima eysan, Yulduz, nokmi, shokoladmi?*

*– Nokolad! (O'.Hoshimov. “Daftar hoshiyasidagi bitiklar”)*

### **Meaning:**

*Yulduz. A-three-year old girl.*

*“What would you like to eat Yulduz, pear or chocolate?”*

*“**Pearcholate!**” (O. Hoshimov. “Inscriptions on the margins”)*

The word *nokolad* (*pearcholate*) used in a child's speech may refer to pear and chocolate, or the word may have been formed involuntarily. In the first interpretation, the child formed an occasional word using the components of the words *pear* and *chocolate* in order to name two types of product in one word, and it can be assumed that by this artificiality she expressed the wish to eat both pear and chocolate. In the second interpretation, it can be said that the child formed the word *nokolad* occasionally. In either case, understanding the word is difficult for the addressee. In this situation, the only way to clarify the illocutive goal envisaged by the child is to ask him or her *“What is a nokolad?”*. If *nokolad* is an occasionally expressed form known as a product of spontaneous speech, it will be difficult for the child to explain meaning of the word.

Children tend to misinterpret the meanings of the words if they do not have enough knowledge about the object. This situation also leads to the emergence of a pragmatic barrier in speech and

consequently difficulty in the comprehension of speech. For example, in one of the episodes of the film “Magic Hat” based on the script of R. Muhammadjanov, the teacher asks the student, who was not paying attention to the lesson, what topic was covered in the previous lesson. When the student can't think of an answer, one of his classmates decides to help him and whispers “Events of Diffusion”. Then, with the help of a classmate, the student, aiming to get out of a difficult situation, hastily repeats “*Events of Dilfuza*”. Of course, such a funny situation occurred, first of all, by the fact that the pupil did not know what topic was covered in the previous lesson. As a result, he was had to say the combination that was phonetically close to the subject spoken in a low voice by his friend.

A striking example of the pragmatic barrier that arises as a result of the fact that not only the speaker but also the addressees have no knowledge of the object of speech can be observed in the following text:

*...Sizda qofiyadan bormi? – deb so‘radim kitob sotib o‘tirgan ayoldan. U shapaloqdek oynaga tikilib, labiga qizil surtish bilan ovora edi. Gapimni eshitmadi shekilli. Qofiya bormi? – deb so‘radim yana.*

– Nima? – Yuzimga qaramasdan so‘radi ayol.

– Qofiya, she‘rga ishlatiladigan qofiya, – tushuntirdim, – jon opa, bo‘lsa yuz gramm topib bering. Juda zarur bo‘lib qoldi.

– Unaqa narsa yo‘q bizda.

– Bo‘masa besh-o‘nta vazn topib bering.

– Vazn ham yo‘q.

– Turoq-chi? Turoq ham bo‘lmasa kerak? – dedim kesatib.

– Yo‘q dedim-ku. Qanaqa ezma bolasan o‘zing. Sen so‘ragan narsalar kultmagda bo‘ladi.

*Kultmagga borgan edim, xozmagdan so‘rab ko‘ring, deyishdi.*

*O‘sha kuni men bormagan magazin qolmadi. Hatto bir oz qimmatga bo‘lsa ham ola qolay deb chayqov bozoriga ham birrov tushib chiqdim. Yo‘q, anqoning urug‘i bo‘lib ketgan ekan bu narsalar, topilmadi. Alamimdan kechasi qofiya, vazn, turog‘i bo‘lmasa ham, she‘rni shunaqangi ko‘p yozdimki, ko‘rsangiz, yuragingiz vahm oladi. (X.To‘xtaboev. “Sariq devni minib”)*

### Meaning:

... Do you have a rhyme? I asked the woman who was selling books. She stared at the mirror, that was as big as a hand ready for a like a slap. She was busy rubbing red color on her lips. She didn't seem to hear me. Is there a rhyme? I asked again.

- What? “She asked even without looking at my face.”

“Rhyme, the rhyme used in poetry,” I explained. It is very necessary.

“We don't have that.”

“If not, give me, at least a few meters.”

“No meters, as well.”

“What about stanzas?” You ought not to have any of them for sure? I said sarcastically.

“I did say no.” What a mess you are. Everything you ask might be found in a kultmag (a shop that sells items related to culture).

I went to kultmag and was told to go to khozmag (hardware store).

There was no store I didn't go to that day. I even went to the market to buy it, even if it was a little expensive. No, they were not to be found because as if they had never even existed in the world. I wrote so many poems that night, even though I didn't have the rhyme, the meter or the stanza to use. I composed so many of them that you would be horrified if you saw it. (H. Tokhtaboev. "Riding the Yellow Giant")

Apparently, not only the child, but also the sellers of “kultmag” and “khozmag” do not have knowledge about rhyme, meter or stanza. This situation made communication difficult. Such a pragmatic barrier created in the play has pragmatic stylistic purposes of defining the characters of the heroes and enhancing the humorous situation.

Sometimes the social relationship between children and the addressee also affects speech, leading to the emergence of a pragmatic barrier. As A. Ulugov noted, “Children want to know a lot about the environment they exist. In their hearts there is a desire to comprehend the mysteries of the world. That is why children always question and bother their parents. Adults, on the other hand, never want to admit their weakness. They say, “Shut up!”, “Shush!”, “Be quiet!”. The growing body is really terrified of this threat. They desperately try to stop the flow of strange emotions in the murky nature so as not to face the siege of fear again. They spend all the energy they need to cultivate their mind, to restrain their tongue, to stop their desires. This, of course, paves the way for ugly consequences”. [8, 1] Indeed, some children feeling anxiety, fear, and embarrassment in front of adults can have a serious impact on their speech. In such situations, children are less likely to pronounce words and stutter. This situation also leads to the emergence of a pragmatic barrier in children's speech. For example:

– *Men bu yerda sening muallimangman, shuni unutma!* – dedi Muhabbat opa Akramga.

– *Xo 'p, endi unutmayman, mu...*

*Akram oyisini “muallima opa” desa ham kulgi bo'lishini sezdi-yu, “mu” deganicha tili tutilib, to'xtadi. (P.Qodirov. “Akramning sarguzashtlari”)*

– *Bizga nima qilg'i yoqmaganini aytdik. Akram, gapimizga Tushundingmi?*

– *Tush... Tushundim. (P.Qodirov. “Akramning sarguzashtlari”)*

### Meaning:

- *I'm your teacher here, you do keep it in your mind!* – said Muhabbat opa to Akram.

- *Yes, I won't forget it, teach...*

*Akram felt that everybody will make fun of him if he called his mother “teacher”, so he stuttered saying “teach”. (P.Qodirov. “Adventures of Akram”)*

- *We told you what we didn't like. Akram have you understood us?*

- *I did .. I did. (P.Qodirov. “Adventures of Akram”)*

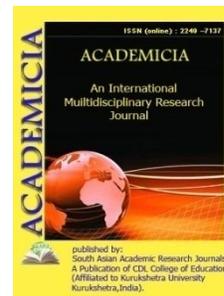

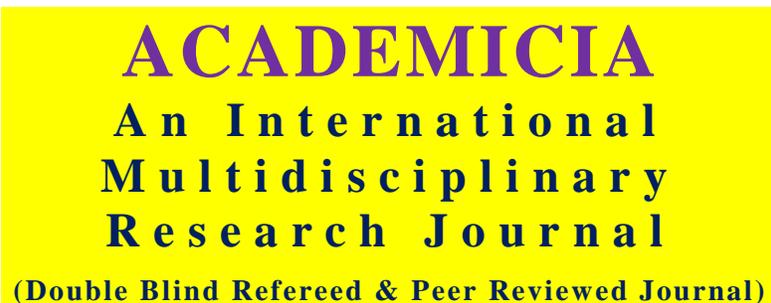

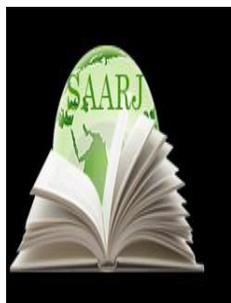

The fact that the child and the addressee are representatives of different dialects also causes a pragmatic barrier in speech. Because the pragmatic barrier is related to the regional adaptation of communication participants, differences in this regard may interfere with children's understanding of speech. For example, in the dialect of children from Tashkent city there is a word "jiz" that refers to the meaning of "hot". Since this word is incomprehensible to other dialects, it creates a pragmatic barrier when used in speech.

## CONCLUSION

In conclusion, it can be said that the expression of the communicative-pragmatic barrier in the speech of adults and children differs to some extent. In the speech of the children this emerges in the forms of mispronunciation of words, inappropriate use of the words, lack of knowledge about the object of speech and incorrect interpretation of the meaning that rise as the result of social relationships between the child and the addressee. Factors such as the age, territorial affiliation, and ethnicity of the communicators play an important role in the formation of a pragmatic barrier in speech activity. The results of research in this area are also extremely important for the solution of existing linguopragmatic problems in comparative linguistics and translation studies.

### ABSTRACT

*Human being tangibly has obtained this fact that thoughtfulness, intelligence and wit play a major role in bliss and improving the material and spiritual life. Swift development in social and behavioral sciences re-identified this role in different life aspect. This research under the title of “analyzing the effect of organizational factors or creativity in Jihad Daneshgahi Urmia branch” with statistical population of 132 people is written based on these goals: recognizing the effect of organizational factors on creativity, the study of leadership approach and its effect on creativity, the study of organizational structure and its effect on creativity, investigating training and education and its effect on creativity. Research hypotheses include: 1. Organizational factors*

*have a positive effect on creativity 2. Leadership approach has a positive effect on creativity 3. Organizational structure has a positive effect on creativity 4. Rewarding system has a positive effect on creativity 5. Required resource supply has a positive effect on creativity 5. Training and education have a positive effect on creativity. Field method and questionnaire were used to collect data and SPSS software was used to analyze data. All hypotheses were approved.*

**KEYWORDS:** *Creativity, Leadership Approach, Organizational Structure, Reward, Resource Supply, Education.*

## INTRODUCTION

Economical efforts of human being have already focused on obtaining the most result from the least amenities and efforts. This tendency can be named as an enthusiasm to reach an increased efficiency. All inventions and originalities of human being from the most initial ancient tools to the most complicated contemporary electronic and mechanic equipments are influenced by this enthusiasm.

In spite of the long presidency of creativity in human being life, organizations have discovered recently that because of the swift technological revolutions, global competition and economical unreliability, creativity is the key and constant resource of competitive and viability privilege. This constant competitive privilege is appeared based on opinions, goods and services. Those organizations that paid less attention to the effective factors on organizational success will face some difficulties in their viability.

## SIGNIFICANCE OF STUDY

Always this question is raised that why a country has developed while another country with better utilities and resources is left behind. Which important factor in the same situations can lead to development and success (organizational - group- individual) or lead to malfunction and dropping behind of some others. The answer of this question should be sought in direct relationship and positive correlation between creativity and innovation of human force and the level of organizational efficiency.

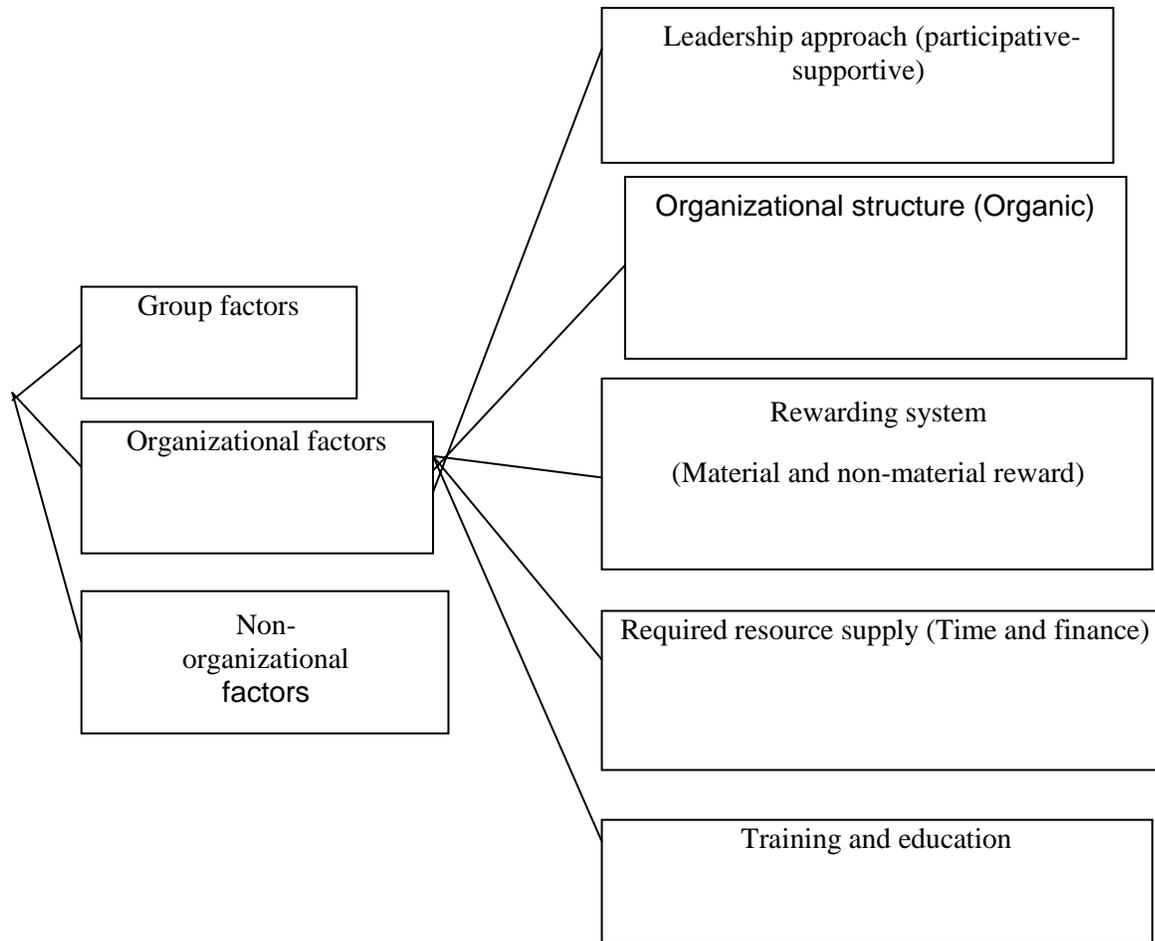

## STATEMENT OF THE PROBLEM

Human being tangibly has obtained this fact that thoughtfulness, intelligence and wit play a major role in bliss and improving the material and spiritual life. Swift development in social and behavioral sciences re-identified this role in different life aspect. Nowadays fundamental indexes of intellection in creation and innovation play the basic role in the magnificence of material civilization of the world. Today those companies and organizations that are pioneer in creativity and innovation can achieve success. Viability and development are the most important principles for organizations. In recent decades these viability and development were naturally feasible through the simple responsiveness to environmental changes, but nowadays conditions are different. Innovation and creativity are the most valuable assets of organization and also they are equipments that enable organizations to precede their rivals which are involved in revolutions. Companies and organizations that go toward the innovation and encourage their human resources in this way are successful. (Robins 1376: 26). Therefore according to the important role of creativity in viability and ascendancy of organizations especially Jahad Daneshgahi which is an

educational and investigational entity, creativity plays a fundamental role in achieving organizational goals in Iranian Academic Center for Education, Culture & Research. In this study first of all we will discuss about organizational factors and then the effect of some organizational factors variables including structure, leadership approach, rewarding, education and resource supply on creativity as empowerment output is going to be investigated.

### **THEORETICAL BASIS OF RESEARCH**

Creativity is an essence for the viability of any organization (Griffin W.Ricky. 1993, PP.295-297). Amabil in 1983 investigated about 7000 articles about creativity and found out that only 138 articles have discussed about creativity variables. Of these 138 cases just a few numbers spoke about the role of organization's environmental variables in creativity. Amabil et al (2003) after more than two decades research about the relationship between working environment and creativity and investigating numerous organizations and hundreds of individuals and groups concluded that creativity is intensely influenced by working environment. These findings state that environment has a more significant role in comparisons with other factors like individual features and talents in creativity. According to Amabil organizational factors are absolutely more manipulative and changeable than individual features and talents. Peter Draker (1999) confirms Amabil's idea about the difficulty of changes in innate talents and suggest never try to change yourself, this is not practical. Fiddler also declares that it's difficult to change people and it's better to change their position (organizational environment) rather than changing people. Amabil (1998), Andriopoulos (2001) Cardinalo and Hotfild (2001) demonstrate in their research that creativity is affected by organizational variables. The most important organizational variables effecting creativity include "leadership approach", "organizational structure", "rewarding system", "and organizational atmosphere", "resources". This research aims to study the effect of organizational factors and variables on creativity; thus it investigate the relationship of organizational factors like leadership approach, organizational structure, rewarding system, required resources supply and education with creativity.

## LEADERSHIP APPROACH

Conducted researches in organizations environment demonstrate that leadership approach is one of the organizational aspects that significantly affects creativity (Amabil and Graigzoikz, 1987, King and Anderson, 1990). Herad believes that the basic challenge of organizations interested in creative trading solutions is to provide a “leader” who provokes creativity in an organizational field (Ford and Gioia, 1995). “Effective leadership” is the proper leadership for encouraging creativity in organizations which is a fairly extensive idea. Leadership behaviors that lead creativity include setting clear expectations about what should be done and supporting the choices and options of staff in achieving these goals. Researches show that management effort to dictate working procedures are completely inappropriate. Understanding the fact that liberty of act and supportive behaviors can lead to creativity is related to participative- supportive leadership, while dictatorship does not produce creativity. Bernard M. Boss is the first person who declares between successful and effective leadership (Blanchard, 1380: 71). If the leadership approach was not adjusted with staff expectations and people do their job because the leader is in authority, we can say that the leader was successful, but not effective. This is because of the fact that people obey the leader just because he controls rewards and punishments. In contrast if the leader’s affairs lead to a successful response from staff and they do their job because they wanted it themselves, in this case the leadership is effective. In such a condition the leader not only is in authority, but also has a personal power that staff respects him and want to

cooperate with him (Blanchard, 1380:92). Dignity is given to the leader by organization while personal power is something that is given to the leader by staff acceptance. Hardy and Schwartz (1996) believe that a leader is effective only in a condition that his behavior was adjusted with his orders. Therefore, regardless the fact that leader's orders are coordinated with his behavior or not, his behavior creates group or organizational culture. (Sadeghi 1376:172). Management efforts in order to dictate working procedures are completely inappropriate. Understanding the fact that liberty of act and supportive behaviors can lead to creativity is related to cooperative-supportive leadership, while dictatorship does not produce creativity. In other words, creativity is a result of liberty of act in supportive environments not following dictatorial orders. Oldham and Kamingz (1997, 1996) investigated the effect of leadership approaches on creativity in their studies and found out that supportive and non-control approach is the most effective factor on creativity and innovation. Vizberg (1992), Scot and Broos (2004) demonstrated that leaders are able to affect staff creativity through creating self-confidence in them. King and Anderson (1995) explain that specialists considerably agree upon the fact that the leadership approach required for creation and innovation is participative or democratic approach, i.e. staff should be active participants in decision-making process and it should be possible for them to convey their ideas to organization leaders. Alton Mayo believes that participative approach is a democratic approach which reduces working tension and increases creativity. In such a situation, we can expect people to utilize whole their capabilities (Parkinson et al, 1987). Faris (1982) showed in his studies that participative leadership approach leads to the most thriving creations and encourages innovations rather than appointive system. (King and Anderson, 1995, PP.96-100)

### **ORGANIZATIONAL STRUCTURE**

Considering the structure goes back to Hasoren's studies in electronic company of western electric (Joe Mary, 1387:387). Organizational structure is one of the organization's dimensions which aim to divide jobs among organization members and coordinate them. (Moghimi, 1385: 196). Organizational structure's function is to remove ambiguities in a way that is a solution for environmental unbeknownst and emerges from correlated behaviors in connected processes. Structure is produced considering strategy and most of the organizations design their strategy according to innovation and creation, expense reduction and imitation (Robinz , 1376:313). Experts believe that structure has different types and they studied them in two general groups of mechanic and organic. According to Bronz and Scatter (1962) there were two environments and each of them results in special structure formation of itself. "Mechanistic structure" was appropriate for the organizations that act in consistent and safe environments and "organic structure" is suitable for organizations operating in dynamic and inconsistent ones. They determined that mechanistic and organic structures are the most ideal organizational structures that are coherent and no organization exists with mere organic or mere mechanistic structure (Sadeghi, 1386:180). These two researchers found out that using organic structure is more practical whenever the organization needs more creativity. These kinds of organizations expect more of their staff so that they can maintain their competition privilege with new plans. Mintzberg (1989) with a systematic point of view concluded that each organization includes five divisions and each of these divisions has a strategic and dominant in the organization. Structure is formed based on that division. These structures involve "simple", "mechanic bureaucracy", "professional bureaucracy", "partial bureaucracy" and "bureaucracy". Bronz and Stoker (1962) and Mintzberg (1989) believe that organizational structures are effective on creativity and

declare that organic structures (bureaucracy, simple, connected and matrix structures) simplify creativity and mechanistic structures prevent the appearance and emerge of creativity. Martin and Troblanch (2003) believe that “flexibility”, “liberty” and “co-operated team work” are the most important characteristics or values of organic structures that result in the development of creativity and innovation. In contrast, features like “inflexibility”, “controlling”, “predictability” and “discipline related to hierarchy” hinder creativity. Taro (2000) states that whenever affairs are organized precisely, there would be no gap and no weed may grow out of it, and on the other hand it means that excessive sticking to structures won’t allow the emerge of any gap so that new flowers can flourish. Organizations with low adjustment have a high level of control through concentrated decision making. Mere obedience of rules has a negative effect on creativity. Ford and Gioya (1995) based on an ultra-analyze of researches, kind of emphasize on bureaucracy structure features and declare that structure in creative organizations tend to flexibility, low level of rules, little explanation of career, and high level of independency since these mechanistic, traditional and hierarchical structures hinder creativity. Some of the other features of organic structure which resemble mostly to the structure of freelance organizations (Robinz, 1376:312) and lead to creativity include: lack of concentration in decision making and low formality, flexibility due to low level of rules and lack of their effectiveness, general explanation of job, granting high level of liberty and appointing authority to individuals in any levels to represent their new opinions and thoughts. Most of the restricting factors of creativity regarding bureaucratic organizations include: hierarchical structure, concentration in decision making, insufficient and inappropriate resources, reduction of budget, tendency to do things in traditional ways and a high level of rules and disciplines. Most of the researchers believe that high formality, hierarchical structure and management supervision of creative behavior are not suitable and mechanistic and inflexible structures prohibit the creativity (Ford and Gioya, 1995).

### **REWARDING SYSTEM**

The reason people do something is that they want to meet their own requirements. They always think about the result and rewards they would get before starting to do it. Organizations control most of the rewards and in most cases these rewards are the way of motivation (Robinz, 1377: 363) and the answer of this question that how it is possible to make staff do some significant creative jobs and special operations. Staff rewarding system is consist of organization’s cohesive policies, processes and approaches according to staff’s role, proficiency and competence which are an effective assist in organizational efficiency (Abbas Pour 1384:230). Creative decision makers and others expect the organization to recognize their hard work and creativity and appreciate and reward them (through tipping or increasing their wages). Amabil (1997) studied the effect of internal and external motivation on creativity and believes that internal motivation has a more significant and determinant effect on creativity rather than external motivation. He declares that one of the features of creative organizations is rewarding the creativity, but it should avoid external rewarding like money to make their staff creative. Monetary rewarding makes the person to feel that he is under observation. In contrast lack of rewarding to creativity produces negative feeling in organizations. People may think that they are being manipulated or they are not appreciated because of creative functions. Consequently providing a rewarding system and encouraging creative people in this field can be efficient and effective (Alvani, 1372:217). Amabil suggests some rewarding of internal motivation in order to increase creativity including: allowing people to join those projects that they are interested in, generous and

enthusiastic appreciation of individuals and groups creative works, allowing people to work on their desirable ideas, although they are not sure about its success. Rewarding system permits taking risks that has a significant effect on creativity. Researchers like Izenburger and Armeli (1977) believe that external rewarding is utilized with two different controlling and informing purposes. If we use them with controlling purpose, Amabil precisely confirms that external rewarding causes the control of individual's behavior and finally leads to the reduction in internal motivation and creation of staff. If we use rewarding with informing purpose i.e. rewarding convey information that reflects competence and creative function of individuals, it leads to internal motivation and creation. Therefore external rewarding should be observed as those things that demonstrate individuals' competence and endeavors to undertake creative functions. If rewarding distribute through these informing approaches, they can have a positive effect on staff creativity ( Sadeghi, 1386:205). Martin and Trablanch (2003) suggest that staff should be rewarded to encourage them to creativity, taking risks, producing, experiencing and executing in their work. As Craft (2001) believes any creative working or behavior should be rewarded to reinforce creativity. According to Strat's idea rewarding should involve flexibility, uniqueness and be special and adjusted with individual or individuals who receive it tyo reinforce creativity through rewarding system. Amabile (Amabile, 1979, PP.221-223) found out that inaccurate evaluation and granting external rewarding results in individuals' creativity repression. Amabile (Amabile 1998, PP.77-80) suggest that the organizations who attempt to encourage creativity, at the same time have to appreciate creativity constantly and avoid monetary rewarding since internal motivations of individuals increases whenever they feel what they do is important for others. In other words, allocating rewards in organizations should provide the most output. At the first step, organization should be planned in a way that rewards were allocated to effective functions (by effective function we mean a function that is along the lines of organizations goals). Just in this case, utilizing rewarding is an effective solution to encourage and motivate staff (Saadat 1375:254-265)

## **EDUCATION**

Education is considered as a tool by which organization determine a range in which their human asset is being considered as a sustainable asset (Abbas Pour 1384: 166)

In order to have creativity we require two kinds of knowledge (not any kinds of knowledge) which are both acquisitive. One is factual knowledge and the other is experimental knowledge. Factual knowledge is the basis of everything, to learn a language w should learn its vocabulary and their meanings, otherwise speaking in that language is not practical (saadeghi,1386: 128). Creative people have the required knowledge in the related field of function. The related knowledge includes "education", "training" and "experience" that a person in contact with the related function (Gardener, 1993). Education exposes the person with a variety of experiences, viewpoints and knowledge basis to reinforce using experiments and divergent problem solving proficiencies and preparing people to utilize different and numerous viewpoint and create more intricate plans (Perkins, 1986). Creativity as other human talents is fairly acquisitive and is not peculiar to special people. Creativity development requires special conditions and educating and guiding organization staff are others facilitators of encouraging and emerging creativity and innovation in an organization. Creativity can be found in all people with various strength and weakness and can be flourished and extended through education (Aghaieefisahani, 1377:157).

Study shows that the feasibility of achieving an invention among those who have academic education is lower than other people and this means that explorations and inventions don't necessarily require academic education (Ojen K. wan fanjeh, 1364:240). People who didn't have academic education, in most cases showed some creations while people with higher education didn't have any creations. Creative characteristic doesn't form intrinsically, however it flourishes in social environment and through education. A teacher who emphasizes on a question leads his students to a creative thinking (Aghayi Fishani, 1377:219). Assiduity and perseverance make creative people use their intellectual and knowledge processes (Esternburg, 1998). Most people fail because they only spend 9 minutes on solving a problem, while solving it requires 10 minutes. Creativity needs hard work and enthusiastic energy and time consumption since nothing valuable including creativity can be obtained simply and swiftly. It only achieves by studying, researching and knowledge educating. Simonten, the magnificent researcher of creativity, on the strength of the results of numerous studies demonstrates that creativity emerges from lots of efforts. Creative people like Edison, Picasso and Einstein and etc. had lots of inventions which means that they faced lots of failures and successes (Sadeghi, 1386:137) since merits are flourished based on experience and education.

### **RECOURSE SUPPLY**

Amabile (1998) believes that money and time are two major resources influencing the creativity. Managers should be aware of allocating these resources. Making decisions about the amount of allocating time and money to a group or project as well as appointing people to a suitable job is an intricate judgment which concludes to encouraging or repressing creativity. Unfortunately, organizations usually suppress creativity through determining unreal urgencies which lead to uncertainty or unreasonable time pressure that causes disenchantment. It's obvious that creativity is most often time consuming. Managers who don't allocate enough time to exploration and doesn't have any special plan for waiting period, hinder creativity inadvertently.

Shali and Gilson (2004) emphasize on time resource and believe that time is an important resource to monitor and manage creativity and managers must ensure that their staffs have access to it. The research conducted by Amabile, Moler, Simson, Hadlei, Kramer and Fleming (2003) demonstrate that people under time pressure are significantly less committed to creativity. Creativity requires time consumption and Basedore (1987) in his research found this fact that time restriction in doing creative jobs is one of the most prominent limitations of creative behavior. Katz and Alen (1988), in agreement with Amabile, express financial resources as one of the important resources of creativity in an organization. However some other scientists like Sikezentemi Hali (1997) believe that managers encounter a big challenge about various resources such as financial resources in association with creativity. In another way, while the material resources are important for creativity, in some cases the restriction or availability of material resources may have a negative effect on creativity. In other words, lack of material resources could really cause encouraging creativity. Managers should assure that required resources for working are reasonably available for staff.

Managers, who empower staff and make them more creative, act as the backup defenders of a football team rather than forward players. They are mostly resource providers and problem solvers and don't act as a guide or leader that much. Therefore, empowerment and assisting staff in their way to reach their goals are one of the fundamental missions of managers. Managers,

who try to provide required resources to enhance staff abilities, attempt to assure that their staff receives the sufficient and consistent education and experience of professional development (Nave Ebrahim, 1386:75)

### **REPRESENTING CONCEPTUAL MODEL**

A valuable thought is neither developed in a vacuum condition nor will it. Thus, existence of a desirable organizational environment is of the essence to develop new ideas and thoughts. Nowadays, creativity and innovation is not considered as a feature that is better to have it rather than lack it and also it cannot just be found in some peculiar people. But, creativity and originality are vital and prominent discussions in the leader organizations of business that try to survive in competition with others and remain pioneer. This is because of the fact that creativity is of paramount importance as structure flexibility base and originality and innovation ability. Organizations that fail in noting the effective factors of organizational success will encounter some difficulties in their viability (cook, 1998, p 24) Staff creativity would lead to organizational survival (Amabile,1996) just in the case that they were innovative in their works and represent and also utilize new and beneficial ideas about productions, function, service or organizational procedures (Oldham,2002; Shali and Gilson, 2004). The results of this study show that there is a relationship between organizational factors and the amount of creativity. In the form of conceptual model of study which is obtained by investigating creativity literatures and some factors of organization field, the model consists of five variables of creativity, organizational structure, rewarding system, required resources, leadership approach and education.

### **RESEARCH QUESTIONS MAJOR QUESTION**

Which variables of organizational factors have positive effect on creativity?

### **MINOR QUESTIONS**

1. What is the effect of leadership approach on creativity?
2. What is the effect of organizational structure on creativity?
3. What is the effect of rewarding system on creativity?
4. What is the effect of required resources supply on creativity?
5. What is the effect of education on creativity?

### **RESEARCH PURPOSES**

1. Recognizing the effect of organizational factors on creativity
2. Studying the approach of leadership and its effect on creativity
3. Studying organizational structure and its effect on creativity
4. Recognizing rewarding system and its effect on creativity
5. Investigating the required resource supply and its effect on creativity
6. Investigating education and its effect on creativity

### **RESEARCH HYPOTHESES**

Research hypotheses are represented in two major and minor groups.

**MAJOR HYPOTHESIS**

Organizational factors have positive effect on creativity.

**MINOR HYPOTHESES**

1. Leadership approach has positive effect on creativity.
2. Organizational structure has positive effect on creativity.
3. Rewarding system has positive effect on creativity.
4. Required resource supply has positive effect on creativity.
5. Education has positive effect on creativity.

**METHODOLOGY****TYPE AND METHOD OF RESEARCH**

According to the subject and purpose of this study, it is an applied research with a descriptive method.

**DATA COLLECTION METHOD**

In order to gather data in this study a questionnaire and for theoretical basis and review of literature the library method of study were applied.

**DATA ANALYSIS METHOD**

After gathering data by using a questionnaire, it was analyzed by SPSS 18. Statistical methods like descriptive and inferential were applied as follows:

**DESCRIPTIVE STATISTIC:** it's like the calculating the abundance averages, standard deviation, percentages, tables and diagrams.

Inferential statistics: Freedman ranking test, Pearson correlation test (based on normal data condition).

**STATISTICAL POPULATION**

Statistical population of this study is consist of 132 people of Urmia Jahad Daneshgahi staff of back up, educational, cultural, and research department.

**STATISTICAL SAMPLE**

Since statistical sample is limited and confined, questionnaires were distributed among all members.

**SUBJECTIVE SCOPE OF STUDY**

An important thing in this study is to investigate the effect of organizational factors on creativity of Jahad Daneshgahi and expressing the solutions and suggestions. Therefore, issues related to organizational factors effective on creativity have formed the subjective scope of the study.

**LOCATION SCOPE OF STUDY**

Urmia Jahad Daneshgahi is the location scope of this study.

**TIME ZONE OF THE STUDY**

The collected data is related to the first half of 1391.

- 1) Responders' sensitivity and the possibility of insincere responding to the questions.
- 2) Low amount of motivation and tendency of some people to answer the questions.
- 3) Determining the extent of research scope.

**DEFINING KEY WORDS CONCEPTS AND EXPRESSIONS CONCEPTUAL WORDS DEFINITION**

- 1) **CREATIVITY:** creativity includes utilizing subjective capabilities to develop an idea or concept ( Kizer, 1968)
- 2) **LEADERSHIP:** leadership includes any measurements to tempt people for enthusiastic working in order to reach determined goals (Kate Davis 1981).
- 3) **ORGANIZATIONAL STRUCTURE:** organizational structure is one of the organization's dimensions which aim at sharing jobs among organizations' members and coordinating them. ( Moghimi, 1385:196)
- 4) **REWARDING:** people do some jobs because they want to meet their needs. People think about the result and reward that they will achieve. Most of the rewards are considered as the most effective motivational tools (Robins, 1377:363) and these rewards are the answer to this question that how is it possible to make staff do creative and special jobs.
- 5) **RESOURCE SUPPLY:** Amabile (1998) believes that time and money are two major effective resources on creativity. Managers must act precisely in allocating resources. Decision making about the amount of time and money allocated to a group or project as well as appointing people to suitable jobs is a complicated judgment that can conclude to encouraging or suppressing creativity.
- 6) **EDUCATION:** Education is equipment through which organizations determine a range and in that their human asset considers as their sustainable asset (Abbaspour, 1384:166). To have creativity, we need two types of acquisitive knowledge entitled experimental and factual knowledge and are obtained through education. Creativity development requires some conditions and special educations. Educating and guiding organization personnel are assisting factors of creativity and innovation in organization.

**DATA ANALYSIS OF STUDY****DEMOGRAPHIC CHARACTERISTICS OF STUDY POPULATION AGE GROUP OF STUDY POPULATION**

As it is demonstrated in the table, statistical population of study are classified in three age groups of 20-35, 36-50, and 51-higher. 99 people of 132 statistical populations are in 20-35, 29 people are among 36-50 and 2 people are in the last age group. Most of staff and statistical population of study are in 20-35 age range and we can say that they are rather young.

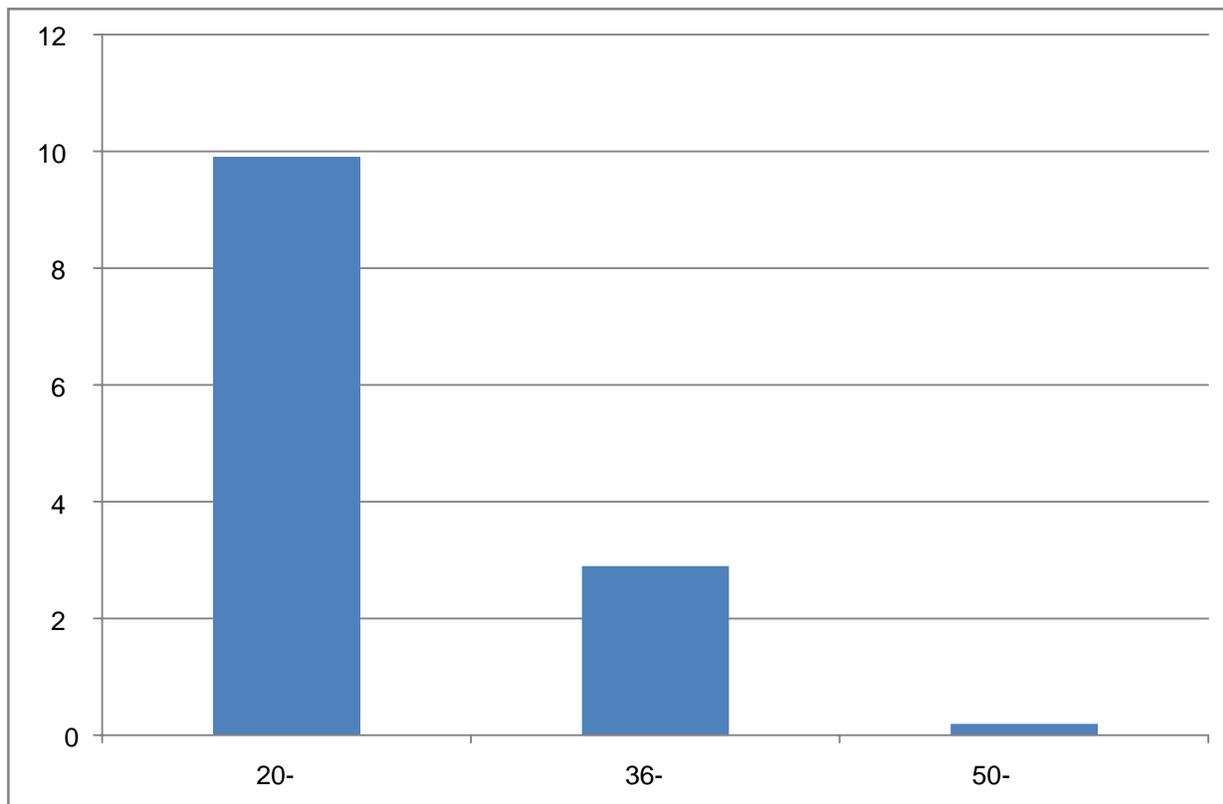

**TABLE 6: AGE GROUP OF STUDY POPULATION**

Number	Age range	Frequency	Frequency percentage
1	20-35	99	76

2	36-50	29	22
3	51-higher	2	1
Total		130	100

Resource: research data

**DIAGRAM 1: AGE GROUP COMPOSITION OF STATISTICAL POPULATION**

Resource: research data

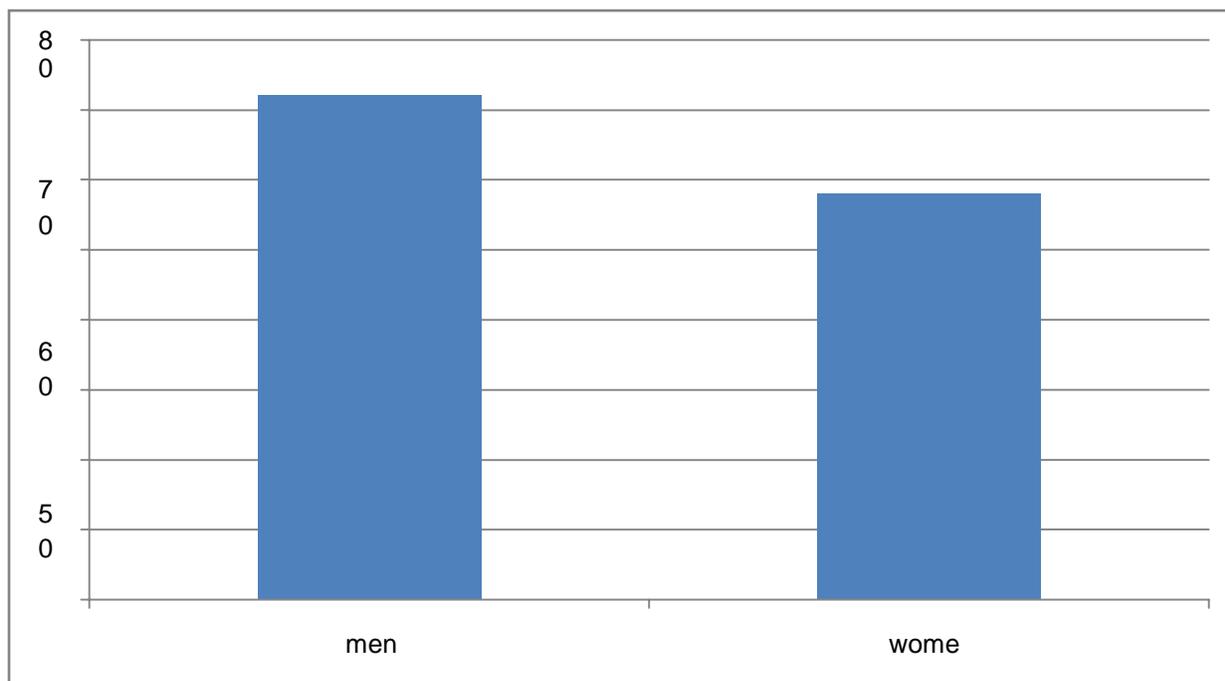

### THE NUMBER OF STATISTICAL POPULATION OF STUDY

The total number of statistical population was 132 consisting of 72 men and 58 women that shows the number of men was more than women and 2 people didn't give back the questionnaire.

**TABLE 7: THE NUMBER OF STATISTICAL POPULATION OF STUDY**

Number	Population	Frequency	Frequency percentage
1	Men	72	55
2	Women	58	45
Total		130	100

Resource: research data

**DIAGRAM 2: GENDER COMPOSITION OF STATISTICAL POPULATION**

Resource: research data

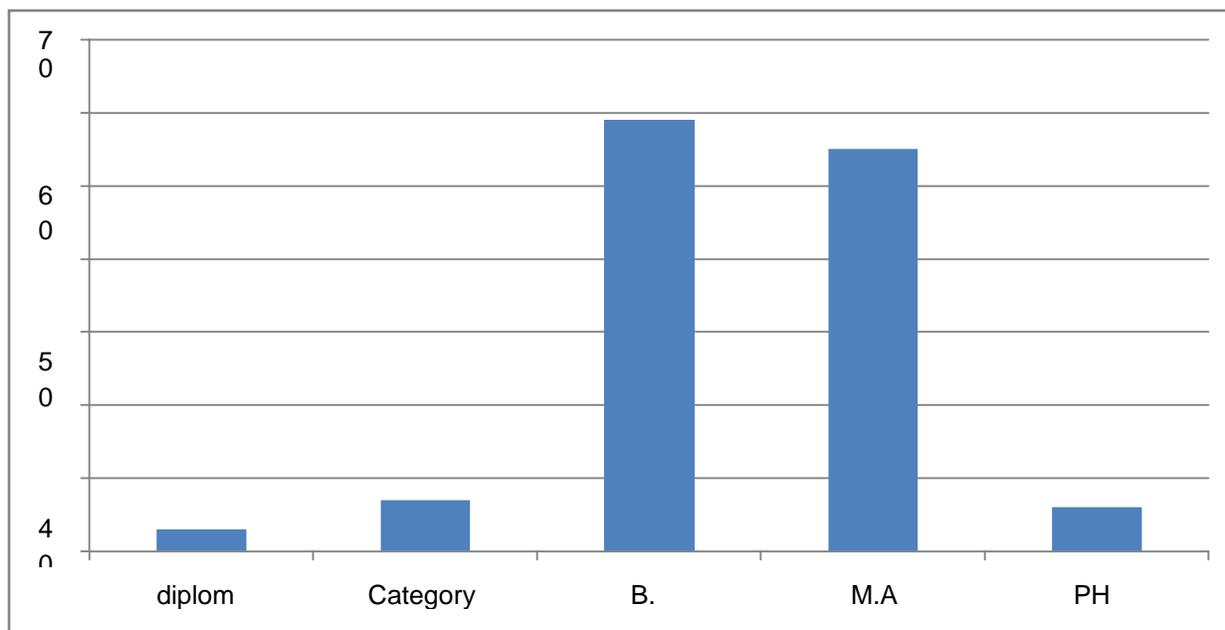

The composition of education of statistical population

Table 3 demonstrates the composition of education of statistical population. As it is observed, the population consists of 132 people who hold five levels of education including diploma, collegiate, B.A, M.A, and PHD. According to table's data most of the population i.e. 59 people hold B.A and 55 of them have M.A. 2 people didn't give back the questionnaire.

**TABLE 8: LEVEL OF EDUCATION OF STATISTICAL POPULATION**

Number	Level of education	Frequency	Frequency percentage
1	Diploma	3	2.5
2	collegiate	7	5
3	B.A	59	45
4	M.A	55	42
5	PHD	6	5

Resource: research data

**DIAGRAM 3: LEVEL OF EDUCATION OF STATISTICAL POPULATION**

Resource: research data

**PRECEDENT INDEX OF RESEARCH POPULATION**

Table 4 demonstrates the composition of staff precedent in statistical population. They are classified in groups of 1-10, 11-20, and 21 or more according to their precedent. 97 people have 1-10 years, 17 people 11-20 and 16 people 21 or more years of experience. By investigating data in the mentioned table it is understood that most of the statistical population in the first group has the working experience of less than 10 years.

**HYPOTHESES TESTING**

Hypothesis 1(H1): leadership approach has positive effect on creativity

The opposite hypothesis (H0): leadership approach doesn't have positive effect on creativity.

Table 9: the effect of leadership approach on creativity (correlation)

Creativity	Leadership approach		
0.725	1	Pearson correlation	Leadership approach
0.000	0	Sig (1-tailed)	
130	130	N	

SPSS result is an output since Sig is less than 5%. Thus, H0 is disapproved and H1 is approved. Accordingly, it can be 95% said that leadership approach affects positively on creativity and has a significant relation with it.

**HYPOTHESIS 2 TESTING**

Research hypothesis: organizational structure has a positive effect on creativity. H1:  $p \neq 0$

Opposite hypothesis: organizational structure doesn't have a positive effect on creativity.

H0:  $p = 0$

**CORRELATION****TABLE 10: THE EFFECT OF ORGANIZATIONAL STRUCTURE ON CREATIVITY (CORRELATION)**

Creativity	Organizational structure		
0.936	1	Pearson correlation	Organizational structure
0.000	0	Sig (1-tailed)	
130	130	N	

Resource: research data

According to Sig that is less than 5%, H<sub>0</sub> is disapproved and H<sub>1</sub> is approved. Therefore with 95% confidence we can say that Organizational structure has a positive effect on creativity and has a significant relationship with it.

**HYPOTHESIS 3 TESTING**

**RESEARCH HYPOTHESIS:** rewarding system has a positive effect on creativity. H<sub>1</sub>: p#0

**OPPOSITE HYPOTHESIS:** rewarding system doesn't have a positive effect on creativity. H<sub>0</sub>: p=0

**CORRELATION****TABLE 11: THE EFFECT OF REWARDING SYSTEM ON CREATIVITY (CORRELATION)**

Creativity	rewarding system		
0.721	1	Pearson correlation	rewarding system
0.000	0	Sig (1-tailed)	
130	130	N	

According to Sig that is less than 5%, H<sub>0</sub> is disapproved and H<sub>1</sub> is approved. Therefore with 95% confidence we can say that rewarding system has a positive effect on creativity and has a significant relationship with it.

**HYPOTHESIS 4 TESTING**

**RESEARCH HYPOTHESIS:** required resource supply has a positive effect on creativity. H<sub>1</sub>: p#0

**OPPOSITE HYPOTHESIS:** required resource supply doesn't have a positive effect on creativity. H<sub>0</sub>: p=0

**CORRELATION****TABLE 12: THE EFFECT OF REQUIRED RESOURCE SUPPLY ON CREATIVITY (CORRELATION)**

Creativity	required resource supply		
0.645	1	Pearson correlation	required resource supply
0.000	0	Sig (1-tailed)	
130	130	N	

Resource: research data

According to table 12 the amount of Sig is less than 5%, H0 is disapproved and H1 is approved. Therefore with 95% confidence we can say that required resource supply has a positive effect on creativity and has a significant relationship with it.

#### HYPOTHESIS 5 TESTING

**RESEARCH HYPOTHESIS:** education has a positive effect on creativity. H1:  $p \neq 0$

**OPPOSITE HYPOTHESIS:** education doesn't have a positive effect on creativity. H0:  $p = 0$

#### CORRELATION

**TABLE 13: THE EFFECT OF EDUCATION ON CREATIVITY (CORRELATION)**

Creativity	Education		
0.599	1	Pearson correlation	education
0.000	0	Sig (1-tailed)	
130	130	Sig (1-tailed)	

According to table 12 the amount of Sig is less than 5%, H0 is disapproved and H1 is approved. Therefore with 95% confidence we can say that education has a positive effect on creativity and has a significant relationship with it.

#### MAJOR HYPOTHESIS OF STUDY

Organizational factors have positive effects on creativity.

**RESEARCH HYPOTHESIS:** organizational factors have positive effects on creativity. H1:  $p \neq 0$

**OPPOSITE HYPOTHESIS:** organizational factors don't have positive effects on creativity. H0:  $p = 0$

**TABLE 14: THE EFFECT OF ORGANIZATIONAL FACTORS ON CREATIVITY (CORRELATION)**

Creativity	Organizational Factors		
0.639	1	Pearson correlation Sig (1-tailed) N	organizational factors

**TABLE 15: THE EFFECT OF ORGANIZATIONAL FACTORS ON CREATIVITY (CORRELATION)**

Creativity	Organizational Factors		
0.639	1	Pearson correlation	organizational factors
0.001	0	Sig (1-tailed)	
130	130	Sig (1-tailed)	
1	0.639	Pearson correlation	Creativity
0	0.001	Sig (1-tailed)	
130	130	N	

According to the amount of Sig which is less than 5%, H0 is disapproved and H1 is approved. Therefore with 95% confidence we can say that organizational factors have positive effects on creativity and have a significant relationship with it.

### FRIEDMAN TEST

This testing is used to investigate the significance of variables' ranking. The average rank of independent variables in study is the same: H0 The average rank of independent variables in study is not the same: H1 Test statistic (a)

**TABLE 16: FRIEDMAN TEST**

N	130
Chi-square	320.114
DF( degree of freedom) Asymp.sig	4
	0.000

### A. FRIEDMAN TEST

By 95% certainty and because of the fact that the level of significance (0.000) is less than error degree (0.05), it is said that H1, which expresses the average rank of independent variables is not the same, is approved.

Next table demonstrates ranking according to the level of importance and the effect of independent variables in research population.

### RANKS

**TABLE 13: RANKING ORGANIZATIONAL FACTORS**

	Man rank
Leadership approach	3.75
Organizational structure	4.10
Rewarding system	1.60
Resource supply	2.25
Education	3.40

Resource: research data

### DISCUSSION AND CONCLUSION

In analyzing data at the first step, research population was demographically investigated briefly and in the second step a pre-test was applied to examine research hypotheses. Then all of the hypotheses or the correlation test was evaluated and according to the results all research hypotheses (both major and minor) were approved. Finally a Friedman test was used to rank all organizational components.

- Based on the first hypothesis test leadership approach has a positive effect on creativity which correlation coefficient in SPSS software between the approach of leadership and creativity in West Azerbaijan Jahad Daneshgahi is 0.725. Since this number is positive and near 1, therefore, the range of correlation is high and direct which means that as the leadership approach improves (cooperative method), the range of creativity in organization improves too.

- A Conclusion based on the second hypothesis test which shows that organizational structure has a positive and meaningful effect on creativity, expresses 0.936 ranges between organizational correlation and creativity. This means that as the organizational structure is organic and appropriate, the level of creativity in organization increases.
- Based on the analysis of the third hypothesis test, which tells that “rewarding system has a positive effect on creativity”, it is revealed that the range of correlation between rewarding system and creativity is 0.721 that is a positive number and near to 1; and shows a positive correlation between two parameters. As the amount of reward corresponding with a function elevates, creativity on that organization increases too.
- Based on the analysis of the fourth hypothesis test, which tells:” required resources have positive effects on creativity” correlation coefficient is 0.645. Since this coefficient is positive and near 1, it means that there is a positive and meaningful relation between required supplies and creativity. It is concluded that, if supplies are prepared sufficiently and on time (finance, time, etc) it will provide and boost creativity in organization.
- The analysis of fifth hypothesis shows that, education has a positive effect on creativity. Aas correlation coefficient shows (0.559), by rendering training and providing education it could be possible to create and elevate creativity in Jahad Daneshgahi.
- Based on the main hypothesis which was about analyzing the organizational factors on creativity, the relation and its effect was positive, and it is concluded that if organizational factors in Urmia Jahad Daneshgahi is provided sufficiently and on time. It will bring creativity in organization. Based on ranking test, the effect of organizational factors on creativity was ranked as follows:

Rewarding system <supply < education and training < leadership approach < organizational structure

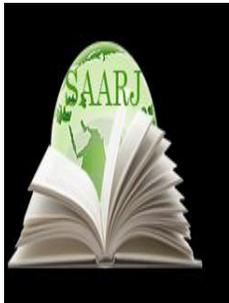

Modeling based on these results is possible. Utilizing these factors according to their rank and importance in organization elevates creativity in organization and causes problem solving and increased development. Therefore the structure of organization is in priority.

### **PRACTICAL SUGGESTIONS**

According to one by one data analysis of research hypotheses as well as the major hypothesis, if the honorable Jahad Daneshgahi managers tend to develop creativity and increasing it, they should reinforce all of the organizational factors specially based on their rank and priority to increase the amount of organizational creativity in Urmia Jahad Daneshgahi.

### **FURTHER SUGGESTIONS**

1. It is recommended to researchers to study other effective factors of creativity like interpersonal factors, and environmental factors that include other group and out of organization factors.
2. It is recommended to executive managers and non- governmental company managers to study the factors other than organizational factors in their managing scope in order to develop creativity and increasing it in organization.

### ABSTRACT

*A teacher needs to understand a student's needs and bring each one to awareness of this need. When he brings this awareness to the student then he can guide the student and hold his interest in the subject he is teaching. Most teens are very talented at one thing or another, take your time to get to know them and discover what these talents are. May be some of your students are good at drawing. The student needs to have his own desire to learn and not an outside pressure wanting him to learn. He will be eager to learn if his interest is positive. The use of real-life objects is also a great way to motivate students of all ages. Choose places that teens frequently visit like supermarkets, concert halls, or sports stadiums. Use anything from real city maps to brochures of these locations to practice giving directions.*

**KEYWORDS:** *Frequently, Supermarkets, Directions, Pressure*

### INTRODUCTION

A person, especially a student in school, needs to become interested and needs a purpose or a motive to learn effectively. The teacher has a responsibility to every student in his class to motivate each one to learn. This can be very difficult and yet the teacher has a wonderful opportunity to motivate and promote learning.

For a person to learn there has to be a need to learn and sometimes the student does not appreciate this need as it needs to be a conscious need. A teacher needs to understand a student's needs and bring each one to an awareness of this need. When he brings this awareness to the student then he can guide the student and hold his interest in the subject he is teaching. There has to be a recognition of need from the student.

Attention from a student is necessary and essential for learning and this gives a student a feeling of self-worth and he wants to put out effort. If a teacher can secure the interest of his pupil and he will do the work assigned and it holds his attention then interest is maintained.

There are two kinds of interest, the positive and the negative. When a student has positive interest in learning he is getting value because it is something he wants to obtain. If he has only negative interest, he may still learn a small portion of what is being taught but not to the extent of positive interest. The student needs to have his own desire to learn and not an outside pressure wanting him to learn. He will be eager to learn if his interest is positive.

If the student already has an interest in the subject a wise teacher can make use of these interests. He can work towards achieving holding this motivation for learning. Before a teacher can hold his student's interest, he needs to have an understanding-of how interests are obtained, and how purposes develop in individuals that cause an interest for learning. A person's daily life, his character and his personality determine his drive for learning. This interest can lead him to move to action and want to acquire knowledge. He needs a desire or an urge. He also needs an inner drive for the power of knowledge and learning. He also needs the desire to be active, if he is lazy, he will not have a desire and an urge. He needs to desire new experiences and to learn. The desire to achieve needs to be in connection with the desire to be active.

A student also needs to have the desire for approval from his parents, from his teachers and his peers. He needs to have the desire for a feeling of accomplishment as this causes him to seek more and more.

Young learners are so energetic that most activities you propose are met with great enthusiasm. Adult learners are focused on meeting their language goals and have a wealth of skills and knowledge to contribute to the class. However, things are not as simple with teens. Most of them are very clever and insightful, but this is not exactly the most talkative age group. Have you ever felt frustrated by the lack of interest among students and their responses like "Yes", "No", or "It depends"? To motivate ESL students, first of all consider their interests. Most teens are very talented at one thing or another, take your time to get to know them and discover what these talents are. May be some of your students are good at drawing. Ask them to draw pictures or cartoons of a story you read out loud to the class. Do you have students who play the musical instruments? Ask them to play a song while the class sings the lyrics in English.

If your students are not enthusiastic about writing assignments, use pen friends to motivate writing, Give them pen friends to write to. Writing to their friends is a great introduction to what they may have to master later in life: business emails.

Give them a little friendly competition, because children like to compete. Why not introduce some games into the ESL classroom? Games motivate any learner whether they are 5 or 50 years old. But with teens it is essential to choose games that will challenge them, give them opportunity to compete with each other, and help them effectively practice an ESL item. A

guessing game or any type of quiz show game should get them motivated. You can practice Wh-Questions Grammar Game with your students. This game intends to practice question words + Past Simple, but it can be used to practice questions with present simple or any other verb tense. The students should be divided in groups of 4 or 5 people. Each group gets a set of Wh-question words. Place a chair in front of the board. The teacher reads an answer; the groups send someone to sit on the chair carrying the right question word. The student who sits there first has a chance to produce the whole question and score 5 points. If the question is wrong, another group can give it a shot, but till time it is worth 10 points. But you can also have them compete in any activity, 'fell them that whoever finishes a written exercise first or has the most correct answer has a chance to choose a song to listen to in class.

To get students excited about a reading assignment, make sure you choose material that will raise their interest and which is age appropriate. You can include celebrity biographies, anything sports-related, or any topic that may interest them, but is also up to their reading level.

The best way to improve their listening comprehension and to motivate them to listen is by playing songs. But you should also choose songs they like, or can relate to.

Videos also have great potential in the ESL class. Thanks to recent advances in technology, we no longer need to have a TV and DVD player in the classroom to teach a video lesson. A lap top will do for a small class, and a speedy Internet connection is great, but not entirely necessary, as you can have video files already downloaded to your computer. To keep teens focused on the task, choose short interviews, movie trailers, music videos.

You can integrate technology in any other ways. Most teens have excellent Web surfing skills. You can assign them a Web Quest. A Web Quest is an online, inquiry-based activity where students are required to search for specific information within links provided by the teacher, and then produce a report or a Power-Point presentation.

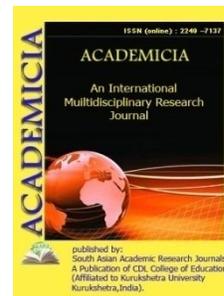

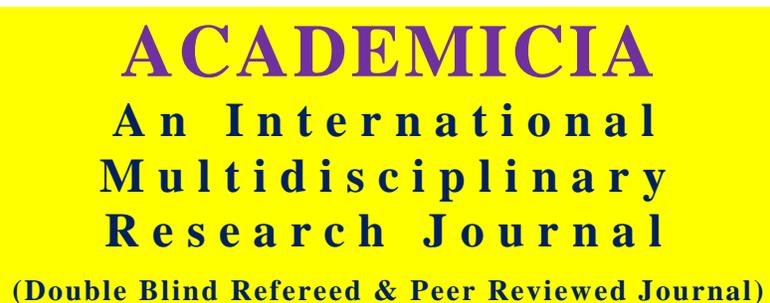

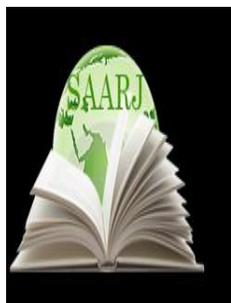

The use of real-life objects is also a great way to motivate students of all ages. Choose places that teens frequently visit like supermarkets, concert halls, or sports stadiums. Use anything from real city maps to brochures of these locations to practice giving directions. Instead of telling the class about themselves, ask your teens to bring photos, as well as some of their favorite books, CDs, or anything that represents them.

They need English to surf the Internet, understand their favorite band's songs, or chat with foreign friends. And talking about the things that interest teens is a great way to establish mutual understanding between the teacher and students.

**“WHEN TERMS MOVE INTO OUR EVERYDAY LIVES: AN OVERVIEW OF DETERMINOLOGIZATION (UZBEK LANGUAGE)”**

**Ortiqova Iroda Shuhratovna\***

\*UZSWLU,  
UZBEKISTAN

**ABSTRACT**

*This article illustrates the components of vocabulary related to science, technology and manufactures the terminology of science and technology is active and changeable layer of current Uzbek lexis. As author mentioned in her article science and technology is developing intensively because of scientific and technical revolution of our age. And determinologization is one of the main ways of enriching language vocabulary which is considered to be the effect of terminologization as well as in Uzbek language. The fields of science are increasing, new branches of technology are appearing and as a result, significant changes occurring in language.*

**KEYWORDS:** *Determinologization, Terminology, Derivations, International Words, Components of Vocabulary, Uzbek language.*

**INTRODUCTION**

The strong socialization of terms in general discourse reflects the importance of the process. Systematization and analysis of terms show how important they are in terminology and in everyday speech. Recently, the lexical discovery of common language has been enriched to a large extent as a result of the rapid merging of terminological vocabulary. Terms in the fields of computer technology, economics and finance, medicine, politics, law, communications, military affairs, psychology, sports, astrology, space production, art and culture are clear examples of this.

As for philosophical ideas, initially the concepts (about language) were different. From the point of view of changes in language, it is now said that terms enter into everyday speech on a large scale. According to SV Grinyov: the number of terms in different fields exceeds the number of commonly used words in the language.<sup>1</sup>

In the sciences of language, the study of the nature of terms and the system of individual terms has always been a problem. From this it can be understood that the views, opinions and problems associated with the study of terms and their application have never lost their relevance. In this regard, it is important to work on a sufficiently clear, semantic aspect of the concept of 'term'. Full and adequate coverage of the essence of the terms V.V. Vinogradov, G.O. Vinokur, S.V. Grinyov, V.P. Danilenko, N.P. Kuzkin and a number of other linguists have found expression in their research. Based on scientific views, the structure of terms is divided on the basis of the sign of more or less formal and spiritual aspects. In particular, VM Leichik writes in his book "The subject, method and structure of terminology": A term is a lexical unit used for the specific purposes of a particular language, based on an understanding of the theory of activity and the definition of a specific field of knowledge.<sup>2</sup> Linguist Leychik suggests another clear approach to the definition of terms.

Philosophical-genoseological approach (based on the signs of knowledge of terms), terms defined using terms in material form that reinforce the results of knowledge; such terms summarize learning outcomes in specific areas, including: science, manufacturing, economics, culture, sports, and more.

According to V.O. Vinokur: terms are not important words, but words that perform important functions.<sup>3</sup>

S.V. Greenev introduced a system of basic requirements for terms. They are:

- 1. Meaning:** contradiction of meaning, unambiguousness, whole meaning, absence of synonyms.
- 2. Form:** compliance with vertical rules, brevity, no alternative, systematic.
- 3. Function:** practicality, general acceptance, ability to apply in an international and modern way, relevance. It can be seen from the sum of the signs of the terms that a term is a lexical unit (word or phrase) that serves to clearly name an accepted concept in a particular language.

Problems with words and terms used in general are one of the important aspects of terminology. In modern linguistics, terms are studied in two ways: normative and descriptive. In the normative method, terms are studied as a specific type of lexical unit, according to the important syntactic and grammatical structure that distinguishes them from the general literary language. The opposite is explored by describing the meaning of terms in a descriptive way.

According to VM Leichik, "Terminology" is a chaotic sum of terms, and "**termsystem**" is a conscious sum of terms.

The process of introduction of terms into the commonly used language includes the processes of determinologization in terminology, which are closely related to the development of the modern Uzbek language and its current state. On the one hand, terminological lexicon is a word that has undergone historical semantic changes and is strengthened in the system of terms used in general. On the other hand, terminological vocabulary is a word that affects a solid, independent, commonly used vocabulary.

In the process of using terms, one can sometimes encounter the process of their non-specialization, i.e. the introduction of terms into the general literary language in several stages. One is the introduction of terms based on a non-specific text while retaining their meaning, in

which only the functional area of the term changes, the term adapts to the new text, and this only affects the initial semantic capacity of the term.

For example: *Тадбиркорларга ўз капиталларини ошириб, қудратли саноатга эга бўлишлари учун йўл очиб бериш керак.*

In this sentence, the term “*капитал*(capital)” is used in its own sense, i.e., value added, a security. As an example, the word “*импорт* (import)” means the import of a foreign product with financial support. Initially, imports included not only products, but also culture, customs and traditions in general.

But by the second half of the twentieth century, the word had retained its different meanings, retaining its meaning of “inclusion in the state,” i.e., “ideological value, an example of common culture,” such as “strangers”.

For example: *Лотин Америкаси филмларининг импорти Ўзбек киномотографиясида савия жиҳатидан паст филмлар яратилишига олиб келди.*

In each language, the terminological process takes place in two ways. They are: definition by translating meaning from metaphorical units or using phraseological units. In general, 86% of the terminological words currently analyzed are formed using metaphorical and 14% using phraseological units. The use of terms can also be in different ways. For example, you can capitalize terms or put them in lower case in parentheses. The main purpose of both is to engage the reader and express the basic concept “*Бозор иқтисодиёти*” да “*қора бозор*” муҳим омиллардан биридир.

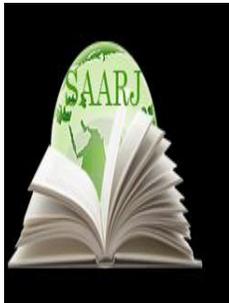

Describing the term through explanation: “*Соф бозор иқтисодиётида ҳар доим “рақобат” бўлади.*” This means that for the population, the product is not produced by a single manufacturer. This gives customers a choice at all times.

In conclusion, when terminological units are used in a non-specific text, they can take on a new meaning and create an additional image that is not specific to a particular subject or action, or to express realities that occur in the environment.

**ABSTRACT**

*One of the main items of this sphere is the history of the people to whom this language belongs. This aspect of the problem is becoming topical now due to the fact that the English language is pretending to be a global language. This article covers two main aspects of the influence of the Great Migration of Peoples to the formation and further development of Germanic and Turkic languages. They are as follows:- Problems related to the language situation in Europe after the Great Migration of Peoples.- Problems related to the role and importance of religious factors in the history of Germanic languages.- Influence of the social factors to the changes in the phonetic structure of Germanic and Turkic languages during the great migration.*

**KEYWORDS:** *Language Situation, Migration, Language Island, Political Boundary Factors Of Change, Social, Geographical, Temporal, Christianity, Church, Bible, Rhotacism, Missionary, Differentiation, Integration.*

**INTRODUCTION**

Not only linguists of different spheres of interests but also language teachers and serious academic learners are interested in knowing more and more information about the problems related to the development of the language they are learning or the language they are speaking. These moments and features became visible in the era of anthropological paradigm, when the

speaker of a language, his culture, his psychology, anthropological, ethnocultural features, social anthropology, the features of the discourse where this speech act was produced, etc.

It is well-known that any language lives in a particular area, or rather, it serves as a means of communication. The boundaries of the territories are also the boundaries of language or dialect. This is determined by how clear and clear the properties of a particular area are. For hundreds of years, if the size of a region has remained unchanged and remained relatively independent, the level of originality of the language in that region is so high. Usually, the boundaries of strong territories are not as precise as they are spread across adjacent areas of language, culture, and socio-economic development, and the language, culture, and other areas of life are strongly influenced by that region. The strength and accuracy of the border lines are determined by how long and steadily the political boundary exists in the area where that language exists. In many respects they are explained by the influence of internal and external factors in the region.

### **MAIN BODY**

The data of history, archeology and ethnography indicate that since ancient times, the Germanic linguistic community and the Turkic linguistic community coexisted in Eastern Europe and there was a long connection between them. It cannot be said that this was a peaceful coexistence of two different nationalities. Between them was war, alliance, trade, cultural ties. Since the Germanic and Turkic peoples were on the same step of the ladder of historical development, their general level of social thinking and the sociopsychological foundations of behavioral stereotypes were similar and therefore they could quickly find a common language among themselves in the struggle against a common enemy, in solving various territorial disputes.

In this case, we are interested in such questions: "How is this reflected in the linguistic structure of the contacting languages". Comparative studies of phonetics, morphology, syntax, word formation, as well as the lexical composition of the ancient Germanic and Turkic languages should give answers to all questions regarding the presence or absence of mutual influence. The analysis of linguistic facts is intended to answer the question: Are existing systems of coincidence between the ancient Germanic and Turkic languages random in the field of sound composition, as well as in the composition of phonetic processes, word-building elements, as well as at other levels of the linguistic structure.

The goal: To investigate the nature of the language situation in Europe after the Great Migration of Peoples.

The tasks are the following:

- To analyse the language situation in Europe after the Great Migration of Peoples.
- To analyse the role and importance of religious factors to the development of Germanic languages after the Great Migration of Peoples.
- To analyse the influence of the Great Migration of Peoples to the phonetic structure of Germanic languages (the case of Rhotacism).

Methods of Investigation. Historical-comparative, Diachronic method and Sociolinguistics in its historical aspect.

Results and achievements of the investigation. Having analysed the problems related to the effects of the Great Migration of Peoples to the language situation in Europe we have come some very interesting conclusions which might have been considered impossible earlier by the linguists who worked with this problem.

- Language situation in Europe after the Great Migration of Peoples which was caused by the misbalance of forces which appeared to the end of the migration.
- Role and significance of religious factors in the social history of the language were greater than we had expected before writing this article.
- Many phonetic processes which had taken place in the phonetic structure of Germanic and Turkic languages which earlier were explained by quite other factors or remained unexplained, found their scientific explanation from the point of view of language contacts and influence of one language to another in the situation of multicultural and multilingual contacts.
- The investigation proved the thesis that any linguistic problem can be given a scientifically proved, correct solution if the linguists apply the principle of historizm with all methods, approaches and procedures.

If we analyze the situation of the language in the VIIth-IXth centuries in Europe, we can see that only Latin and Greek languages had a status in Europe at the time. The history of these languages is quite ancient, and in the VI-VII centuries was the basis for the emergence of new languages, with variation in Latin. Of course, the Greek variation did not develop, and the language was able to maintain relative integrity.

When we analyze the linguistic map of the VIIth-XIth century Europe, we see that the two languages groups, mainly Roman and German, are in central and western Europe and are in the final stages of the formation of Slavic languages in Eastern Europe. While all languages are still underdeveloped, the literary language exists in a primitive, primitive form, for example the language norm was still a relatively relative concept. The future of both German and novel languages, their literary norms, stable phonetic and grammatical structure and their vocabulary depend on the socio-political development of the regions where they exist.

When we analyze the linguistic map of the VIIth –XIth century Europe, we see that the two languages groups, mainly Roman and German, are in central and Western Europe and are in the final stages of the formation of Slavic languages in Eastern Europe. While all languages are still underdeveloped, the literary language exists in a primitive, primitive form, for example the language norm was still a relatively relative concept. The future of both German and novel languages, their literary norms, stable phonetic and grammatical structure and their vocabulary depend on the socio-political development of the regions where they exist.

In this period, the upper boundaries of the dialects of the language are marked by large territories and margins of cultural districts. The smaller territorial units attached to or attached to them (the administrative district, the larger church subdivisions) represent the specific structural scheme of the group of inner dialects. The analysis showed that in such a “small world,” political boundaries would be more important than the church boundaries for the spread or expansion of language. This also applies to small independent territories, prerogatives, khanates, and so on. In these small areas, the survival rates of the dialects or languages are minimal, and the languages of the regions with the highest tendency for development are the same.

The linguistic fate of the two larger regions, which is retained in the competition between the two major regions, is determined by the superiority of the two major regions, and the language of the two major regions has the characteristics of the language. Their ultimate fate depends on which region is the leading dialect. The dialect or language that exists within a political region or cultural center has a special place in the language situation. There is a tendency for these language forms to develop into a compulsory language for its subordinate lands. When political boundaries arise, the power and influence of the cultural center is also lost on language.

As an example of this, if two adjacent villages with the same language of culture are for different reasons included in different state, state, county, prince, khanate or similar political state and these two political state centers are connected to two different languages or cultures. The process of differentiation begins in the language, culture. This differentiation comes from different languages into different languages from one side. As a result, language differentiation occurs because the speakers and the speakers themselves follow different languages and cultures that are present in the administrative center.

On the other hand, the representatives of the two villages may voluntarily or involuntarily adopt language features that they did not previously have, as a result of maintaining interactions with one another.

In such complex, multi-component language situations observed in the VII-XI centuries, which language or language is the leading dialect or language depends on a number of factors.

- 1) A dialect or language is a dialect or language of a politically dominated nation.
- 2) It is a sign that the language or language belongs to those layers that are socially or politically superior.
- 3) This dialect or language is accepted as the language of a particular civilized culture.
- 4) This dialect or language indicates that a particular tribe or nation belongs to a larger whole.

In these situations, as the language units that are integrated are commonly used words in everyday communication and expressing elementary things and actions. Words that are less commonly used or express more abstract concepts are preserved in their original form in different dialects or languages.

In the center, the distribution of dominant language symbols to remote villages is achieved through small towns, districts, and areas of local significance. While this is the first way of spreading linguistic characters, there is also a second way of dispersion. According to him, it is possible for the center's learners to come directly to the village and distribute centralized language signs there.

A number of linguists, studying the regularities of the formation of German languages, have differed in this regard.

The most prevalent view in this area is that the boundaries of Germanic dialects in Europe coincide with the boundaries of ancient Germanic dialects.

This view was later misunderstood by the results of a dialectological analysis of linguistic evidence. The reason for this is the great migration of those nations. If we were to remove the factor of great migration of peoples from European history, the above statement would be

correct. However, as a result of the great migration of peoples, the tendency of tribes, peoples and nations to settle in the same territory was disrupted, and a great movement, such as a great mechanism, began to emerge, and Europe became a boiling pot of different languages and dialects. In this cauldron there were new, naturally, new language structures that absorbed the signs of different, unparalleled languages.

Territorial structures of the early middle Ages and the middle Ages, that is, the language boundaries of the 11th and 11th centuries, are no longer compatible with the oldest language boundaries.

Only in some areas are the cases where the oldest boundaries correspond to the present dialect boundaries. These areas are usually marginal areas that have not been involved in or are part of the great migration process.

On the other hand, the term “**tribal boundary**” is more appropriate than the term “tribal alliance”. It is hardly possible to say that since ancient times the tribes of Germanic languages existed in ethnic and linguistic areas.

In the Middle Ages, when there were no centers for spreading secular knowledge, secular knowledge, often with religious knowledge, was often created by the monks in their shells or in the form of their interpretations. As in ancient Greece, “*lyceum*” and “*academies*” were completely abolished in those regions, where political life, unrestricted wars, stagnant economies, and prosperity only through wars and occupations. Therefore, the words that entered the cultural life were entered through the church's chronicles, geographical and other works (Gumilev, 2007; Müsse, 2008; Abdurasulov, 2009).

Words began to enter the European languages. The Germans and the Romans, who had begun to become converts, abandoned many religions and embraced various denominations of the Christian religion that was based on the single God. It was then that Latin and Greek began to penetrate into German. An effort has been made to better understand religious literature and to read it in its own language. The leader and the driving force of this movement were also religious leaders. When Bishop Wolfila realized the failure of the runic inscription used by the ancient Germans to accomplish this great task, he developed a new alphabet based on special Greek, runic, and Latin letters and translated the Gothic translation of the Bible. This indicates the strong influence of the Church on language development.

The religious movement is developing through the missionaries' mission. So in this article, we will talk about some missions. The Anglo-Saxon mission was formed around 700 AD. The best example of this layer is the word *Oster* (Easter). This word represents gall-German and English-Saxon-German communication. In England and South Germany, the term “*Easter - Oster*” is used in the Mainz church. This word in its original meaning refers to the ancient German spring god and the ancient German spring holiday. This word was introduced into the church circulation by 748 years by the Anglo-Saxon missionaries in the Baptist residency in Mainz. In the churchyard of Cologne, the word ‘*paschen*’ is used, as in Roman Gallia. This is evidenced by the fact that here the beginning of the year was marked by the Passover, (*Pascua = paschen*), and in Tyrus and Mainz the Easter was not merely a religious holiday, but the beginning of the calendar year. In Mainz, the year begins at Christmas, and begins in Tryr on March 25 (Adji M., 2004).

In this context, we will again focus on March 25, the purpose of the *Easter/Oster* Festival in Easter/Oster - the beginning and celebration of Easter. East means East (and Ost) means to belong. In other words, the "Eastern holiday". It signifies the arrival of spring, the beginning of the new year. It comes to mind as a holiday of *Navruz*. Although the word "Navruz" comes from the Persian-language word, it is a translation that was later translated into Turkish. The essence is that the Turks celebrated the beginning of the New Year as a special holiday even during the Great Altai. That is, the spring equinox, the new seasons, and the coming of the New Year would mean this holiday to the people. The feast of the Turkic peoples, who took part in the Great Migration of the People, led this ceremony to the west, to the vicinity of Türe to Europe (M. Adji, 2004).

Whether it was more or less inconvenient to pronounce the name of the feast in Turkish, or to put it more closely in their own words, they called it Easter/Oster. Everything was clear with this. Aryan religion, strong army, fair politics, brave men who have done justice, advanced weapons, unparalleled martial arts, all of which are the holidays, customs and traditions of the Turkic peoples from Central Asia and Altai. which led to the acceptance by the European peoples of things. This holiday, after five or six centuries after the name was lost, became itself a religious holiday.

This is another indication of the deep connection between medieval Turkic nations and European nations.

The mission of Frank belongs to the V-VII centuries AD. The Christianization of the francs in the northern regions of Gallia was made by the southern gall churches and monasteries. Fathers and mothers, therefore, who were immersed in the Lower Rhine and the Netherlands, were called gallo-romans: patrinus-French parrain: Peter in Dutch: matrina French-marraine Dutch-meter (Dybo, 2007).

Around 700 the Rhine came to fruition in 700 AD with the German mission and the Anglo-Saxon mission from England. Therefore, the word peter is used in the Kyo region of the same period as gode. The word Gode comes from the English word Godmother. The Anglo-Saxon missionaries invaded southern Rhine Germany through the Rhine. Through southern Germany and Switzerland, this word has reached the lobbards in northern Italy. The arrival of this word coincides with the complete victory of the Catholic to the gangsters in Boniface (722-754) in the beginning of the eighth century.

During the Germanization of the terms and concepts associated with the Christian religion, the Anglo-Saxon stratum of 700 AD and 700 AD collided with other layers during the Germanization. For example, the term "*humilitas*" is subordinate to the word "*ootmoed*" in German, for example, in the northern linguistic areas of the English-Saxon influence of the continent. In South Germany the word "*Demut*" appeared, which is now spread throughout Germany. The existing difference between the northern (English-Saxon) and the southern (upper German) layers has now become the confrontation between the Dutch and German language spaces.

In this case, the language material of the compared languages is analyzed in sufficient quantity, which allows the reliability of the data obtained by statistical processing. Gothic, Old German, Old English, Old Turkic, Hunnic, Scythian texts and dictionaries on the one hand and data of modern languages on the other hand served as the material.

The analysis procedure is simple, as it is traditional and has stood the test of time. Phonetic, grammatical and other phenomena are compared and used from the compared languages to confirm or refute the hypothesis put forward. We start from the lowest level of the language hierarchy, with a phonetic structure.

The ancient Germanic languages had a phonetic process called rhotacism. Rhotacism except Germanic languages is observed in such strict form only in Turkic languages. Neither in another Indo-European linguistic community, nor in other languages of the world, rhotacism is observed as a feature of one or another language. Since the same phonetic process is observed only in two linguistic communities, and these two linguistic communities have been in contact for a long time, we can confidently say that there is a case of mutual influence or the influence of one language on another. It is clearer to say if rhotacism is observed only in the Germanic and Turkic languages, then several conclusions can be drawn from this:

- a. Turkic rhotacism arose under the influence of German rhotacism;
- b. German rhotacism arose under the influence of Turkic rhotacism;
- c. German and Turkic rhotacism arose autochthonously simultaneously or at different times.

In this case, our task is to prove the correctness of one of these conclusions. To solve this problem, it is first necessary to clarify what Rhotacism in general is. Rhotacism is the phonetic process in which there is a transition of **S** to **Z** and then to **R** (**s** > **z** > **r**). There is a fairly extensive literature on the nature of rhotacism in Germanic languages. Therefore, we will not go into the details of German rhotacism, and here the data on rhotacism will serve us as a starting point in the description of Turkic rhotacism, since this phonetic process has been studied fragmentarily and is not systemic in terms of modern Turkic languages in general and the Uzbek language in particular. To begin with, in which Turkic languages rhotacism is observed. The list of languages where rhotacism is small: *Altai* (Linguistic Encyclopedic Dictionary (hereinafter LES p. 28); *Bulgarian language* (LES p. 77); *Gagauz language* (LES p. 212); *Karakalpak language* (LES p. 121); *Karachaevo - Balkar* (LES p. 212); *Khalaj language* (LES p. 569); *Shor language* (LES p. 588); *Yakut language* (LES p. 623); and some other Turkic languages.

Without going into details, we analyzed the entire vocabulary of the Uzbek-Russian Dictionary (Tashkent 1959, 40,000 words) and found the following cases of rhotacism: *ko'z* (eye), *ko'rmoq* (see), the transition **z** > **r** (or **z** > **r**), the basis for this is the fact that the verb "*ko'rmoq*" is formed from the noun "*ko'z*" by conversion. With the addition of formative affixes, **z** changes in **r** since the principle of the greatest effort saving requires this.

In colloquial speech there is a form *-mardim*, in place of the form of *-masdim* in the formation of negative forms of the past subjunctive Uzbek verb. The obviously hyper-correct use of the sound **r** in place **s**, since the norm requires the use of **s**, is a use by analogy, the ancient forms of the transition **s** > **z** > **r** serve as an analog. For example, in place of *aytmasdim* (I would not say) they say *aytmardim* (**s** > **r**), *bormasdim* (**s** > **r**), *o'qimasdim* (I would not study), *o'qimardim* (**s** > **r**).

A very frequent case is the fixed end of the compulsory pledge **-gir**, which arose from **-giz**. For example, "*aytgiz*" (make him say) "*ayttir*". With the disappearance of "**g**", the sound "**t**" is megenized, **s** changes into **r**. "*Aigiz*" type of willow > "*aigirqiyoq*" (grate of a giant ifiform). The transition **z** > **k** is beyond doubt. "*Bitkazmoq*" (end, end) > "*bitkarmoq*" (with the same value) **z** > **r**. "*Pokiza*" (pure, unspoiled) > "*bokira*" (virgin) **z** > **r**. Accompanied with **p** > **b**. "*Bo'g'izlamoq*"

(slaughter, cut), “*bo’g’irsoq*” (bun). This refers to how the bun is prepared i.e. Gingerbread man, as you know, is made from dough by cutting different pieces of dough, forming balls from them. The transition **z>r** requires no explanation. “*Degizmoq*” (ponud. From the demo say, that is, force to say) - “*dedirmoq*” (with the same meaning). “*Yegizmoq*” (there is a causative from “*yemoq*”) - “*yedirmoq*” (makes you eat) **z>r**, “*kesik*” (cut, notch) - “*kertik*” (with the same meaning) **z>r**, “*kesmoq*” (cut, trim) - “*kertmoq*”; “*kiygizmoq*” - *kiydirmoq* (put on a causative from “*kiymoq*”); “*lohas*” (relaxed, lethargic) - “*logar*” (weak, thin); “*muqaddas*” - “*muqaddar*” (sacred, holy duty, destiny) “*oqar suv*” (flowing water) - “*oqizoq*” (name of a children's game in which some floating object starts to float with the flow) “*peshvoz*” (meeting); “*semiz*” (full, fat) - *semirmoq* (plump, getting fat); “*suvsizlik*” (lack of water) - *suvsiramoq* (to thirst, languish with thirst) *so’z* (word) *so’ramoq* (ask); “*tus*” (type, variety) - *turlamoq* (bow, select according to shade); *chiqazmoq* - *chiqarmoq* (force or allow to come out); “*o’lasi qilib urmoq*” - *o’lar holatga kelmoq* (beat to death) - (bring to death).

If in the Uzbek language *khur* - means a bird of paradise, or a fairy-tale girl, then in some Turkic languages this word means an ordinary girl. In the Gothic language, the word “*gor*” means “girl”. As you know, the sounds [g, h, q] are on the same line and are often interchangeable due to the proximity of articulation. Based on this, we can assume that *got* is the same as *hor*, as *hur* as *hir* and *qiz*. This happened apparently so, at first there was the word *got/gor* > *gor* > *hor* > *hur* > *hir* > *hiz* > *qiz*.

Then we can order that the Germanic languages borrowed the words *khur/qiz* from the Turkic languages. Other authors also came to the same opinion, but on the other hand (Terentyev, 1990). This borrowing dates back to the Hunnic period of the history of Turkic languages, i.e. this happened as early as 1<sup>st</sup> millennium BC. The fact that the *khur* form has been preserved in the Chuvash language confirms the current view that the Chuvash language, due to the relative frequency of the presence of Old Turkic (or rather Prototurkic) elements, is closer to the Hunnic language than other Turkic languages. In connection with the word under discussion, another version arises, according to which ethnic and linguistic contacts between the ancient Germanic and Turkic languages and the most ancient periods of history were closer than it seems at first glance.

Based on the foregoing, we can draw the following conclusions:

The translation of the Bible into Gothic language was a major step forward in the history of European languages. This is because the language of the Gospels ensures that they can become holy, immortal languages.

The difference between the Goths and the Franks is that one of the two German tribes, which had almost the same function in European history, translated the Bible into their own language when the peak of their occupation, and the Gothic language left an indelible mark in history. The other tribes, the Franks, did not care about the future of their own language, and began to forget their language while admiring their own culture and lost it as a language. If the Franks had also translated the Bible into their own language, we would have known more about the French language than it is now, and the French was not a dead language, but the French, or Dutch, or German. It was.

This process, that is, the policy of importing religion through the language or importing religion through the language, is very old but very tried and effective. Latin and Greek have been

declared sacred to the Christian religion. Christianity entered the Latin area, and Latin was "stuck" in the areas where Christianity entered. These two geolinguistic, geopolitical phenomena were the two sides of a common process.

"The piety of other nations is much stronger than the beliefs of the people of a particular religion," said one scholar. Therefore, the Goths, who later became Christians in the Aryan denomination of Christianity, quickly translated the Bible into their own language and were able to read it in their own language. The Romans, who were more cultured, more confident, and more righteous, were greatly influenced by the barbarians' work, and they quickly realized the need to translate the Bible into their own language without reading the Greek language. During the century, the vulgar translated into Latin.

Religion is one of the forms of social consciousness, and it is closely related to language. Language and consciousness, language and thinking are inextricably linked. No matter how decisive a scientific idea can be from each speaker, religious thought is also present. This will not affect the speaker's speech language more clearly.

A quick look at the examples cited here, from the Uzbek language, even without a deep multi-stage, indicates that here the language process has rhotacism in its pure form and all that prof. Smirnitsky A. I. Talks about rhotacism, its nature and how it occurs in the Germanic languages, completely coincides, or rather, explains the nature of Turkic rhotacism.

Rhotacism as a phonetic process of transition  $s > z > r$  is observed only in Germanic and Turkic languages.

Direct language contacts that began V-I in BC, as well as I-X in BC were the cause of many language transformations in the culture of contacting languages. The Uzbek language is one of the oldest Turkic languages and, over the course of centuries of historical development, the Uzbek language has chosen the features of three groups of the Turkic language family (Kipchak, Karluk and Oguz groups). This explains the preservation and flowering of such an ancient phonetic process as rhotacism in the modern Uzbek language.

## CONCLUSION

Summarizing the above, we can summarize the following.

1. The translation of the Bible into Gothic language was a major step forward in the history of European languages. This is because the language of the Gospels ensures that they can become holy, immortal languages.
2. The difference between the Goths and the Franks is that one of the two German tribes, which had almost the same function in European history, translated the Bible into their own language when the peak of their occupation, and the Gothic language left an indelible mark in history. The other tribes, the Franks, did not care about the future of their own language, and began to forget their language while admiring their own culture and lost it as a language. If the Franks had also translated the Bible into their own language, we would have known more about the French language than it is now, and the French was not a dead language, but the French, or Dutch, or German. It was.
- 3) The process, that is, the policy of importing religion through the language, is very old but very tried and effective. Latin and Greek have been declared sacred to the Christian religion.

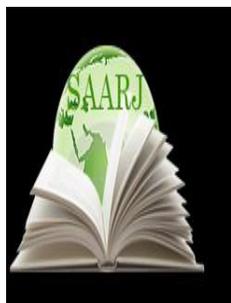

Christianity entered the Latin area, and Latin was “stuck” in the areas where Christianity entered. These two geolinguistic, geopolitical phenomena were the two sides of a common process.

4) “The piety of nations is much stronger than the beliefs of the people of a particular religion,” said one scholar. Therefore, the Goths, who later became Christians in the Aryan denomination of Christianity, quickly translated the Bible into their own language and were able to read it in their own language. The Romans, who considered themselves as more cultured, more convincing, and more pious, were greatly influenced by the barbarians’ work, and they quickly realized the need to translate the Bible into their own language without reading the Greek language and in the Vth century of our Era, they translated the Bible into the vulgar Latin language.

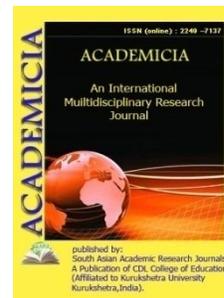

5) Religion is one of the forms of social consciousness, and it is closely related to language. Language and consciousness, language and thinking are inextricably linked. No matter how decisive a scientific idea can be from each speaker, religious thought is also present. This will not affect the speaker’s speech language more clearly.

### ABSTRACT

*This article suggests three effective ways to translate biotechnological texts, namely in DNA profiling into English fruitfully. The suggestions are solely based on the ideas of prominent linguists and researches in this field. The author explores basic transformations to be made in the process of translation which are needed to reach adequacy and equivalence. In addition to this, the article attempts to draw attention on some of biotechnological language traps, words which direct meaning can mislead the non-specialists into interpreting in a wrong way.*

**KEYWORDS:** *Biotechnological Translation, Biotechnological Terminology, Equivalence, DNA Profiling, DNA Biology, Deoxyribonucleic Acid (DNA), Mitochondrial DNA, DNA Samples, Genetic Information.*

### INTRODUCTION

Worldwide biotechnological industry has shown excellent growth for many years. Due to a burst of development and incredible breakthrough in science, particularly in DNA Biology, there is much demand for professional service of translators and interpreters in Uzbekistan. Most of researchers and biotech companies are turning more and more to translation providers for professional translation of their study materials. Since the accuracy of the translations is linked to the accuracy of the study results, researchers frequently turn to companies and translators that have biological translation certification, which in turn has led to an increase in work for language professionals.

The government of Uzbekistan has committed to reforming in biotechnology studies and making biological industry is a development priority in Uzbekistan. The need for translation touches

nearly every field, and DNA Biology and Genetics research is no exception. There is no doubt that the translation activity of biotechnological terms into many different languages of the world has become one of the most essential and vital issues. Therefore, these days nearly 80 per cent of translators work with scientific and technical texts. Translation of such kind of literature is highly demanded. Consequently, theoretical study of the specific features of scientific translation is an urgent problem of translation theory.

### **MAIN BODY**

The work on the study of biological terminology has a worldwide scale. The significance of this work is very essential, since the terminology that serves Molecular biology and Genetics is one of the richest terminological systems. According to various sources, there are nearly 100,000 terms in it, which is much more than in any other scientific discipline. Allocate up to 10 main areas of biology, such as biotechnology, DNA-related literature, biochemistry, biology, zoology, botany, geology, biodiversity, environment, health issues, food, virology, medicine and research studies related to understanding the interactions between the various systems of a cell, including the interrelationship of DNA, RNA and protein synthesis each of which has its own particular system of terms.

It is obvious that translator's job is to convert the text in the source language to its equivalent in the target language. All translators' skills, knowledge should be in high level. Many of biological documents are written by specialists and are meant to be read by specialists; subsequently, the translator has to be an excellent subject matter expert.

Vast majority of challenges that the translator faces in the world of DNA Biology is that it is much specialised field. And with it comes much in the way of expert language that not everyone knows the specific biotechnological terms. Therefore, it is more advisable to call on DNA experts from a range of different biological institutions to help when it comes to translating molecular and cellular biotechnological documents. Since the translation process should be interpreted with the highest level of accuracy and DNA expert knowledge.

Molecular and cellular biotechnological terminology is one of the most complicated and challenging. The qualitative translation of DNA-related documents have a number of features, such as translating specific vocabulary, ambiguous abbreviations, formulas, clinical trial, scientific findings, specific data, facts, research and investigations on biotechnology industry.

The most difficult part of the translation work has been to render the terminology specific to this field. As for general terminology as a discipline, Pozzi states that "the ancient process of naming concepts and objects belonging to a special subject or field constitutes an essential part of what is now known as the discipline of terminology". The terms should be appropriate translation equivalents adapted in spelling and should be found in up-to-date parallel texts that are representative of the field. Cabré insists that it is essential to keep to the standardization of terms to exclude the risk of naming the same concepts with variants of terms. The ultimate goal is the achievement of accurate, modern and unambiguous professional communication".(Pozzi, 2001; Cabre Teresa,2010)

For others, translation is to substitute a piece of writing in one language by its corresponding piece of writing in another language. As for Ghazzala, translation is any process that results in transferring the meaning from one language into another. For him the main goal is to deliver

meaning of the source language by using the equivalents available in the target language.(Ghazalla,2004) According to Hatim and Mundaydefine translation from two different perspectives. First as a process, translation is an act of taking a text from one language and transforming it into another. In this sense, the above mentioned researchers focus on the part of the translator. Second as a product, translation focuses on the results achieved by the translator, the concrete product of translation.(Jeremy Munday, 2001)

Biotechnological translations have a zero policy for errors. Mistakes can inevitably lead to serious catastrophe. Because translation in this field is a sensitive and confidential process that must comply with laws, regulations and guidelines. Biotechnological translations must be carried out by professionals who understand the required translation procedures and protocols for a wide variety of DNA-related documentation. Accuracy is paramount, which is why all of biotechnological translations go through a double review process.

Biotechnology is a field of life science that is truly vital. Remarkable advances in biotechnology can benefit every person across the globe. Simply defined, biotechnology is the process of harnessing biomolecular processes to boost and develop products that improve our lives. These days biotechnology is a major part of the medical industry, and it has also expanded to reach a global audience. For such an expansion to happen and continue, the translation of documents related to the biotechnological industry is essential.

The biotechnological translation of is one of the scrupulous and time-taking translations that require extreme attention and concentration. A large number of abbreviations, chemical substances and compounds, formulas, figures, complex operations, tables and diagrams as well as the abundance of specific terms - these are only a part of the problems the translator has to face with. The following items cover Molecular and Genetics biotechnological terms:

- Scientific articles and technical documents on Molecular and Cellular Biotechnology
- New studies on the interactions between the various systems of a cell, including the interrelationship of DNA, RNA and protein synthesis
- Scientific findings on forensic DNA typing, DNA extraction
- History of DNA typing
- Scientific findings on Y Chromosome and mtDNA testing
- Scientific findings on genetic fingerprinting and mapping of the human genome
- Test protocols and laboratory and clinical testing
- Product launch presentations and conferences
- Glossaries of Medical and Molecular Genetics

Recently, it has become evident that the increased interest of linguists and scientists of various fields of science and technology to problems of branch terminological systems, due to the growing flow of scientific and technical information, increasing processes of term creation. It is often discussed problems of terminology and due to the increasing use of computer technology to create terminological data banks, electronic industry dictionary.

Observation of the development of science, creation and replenishment of different branch terminological dictionaries is one of the main tasks of linguistics and lexicography in terminology.

Biotechnological terminology is a young terminological system which is under stage of formation. Formation of terminological systems of biotechnology is closely connected with the formation of Biotechnology as a scientific field. Despite of the fact that biotechnology began at the end of the twentieth century its terminological system is the formation associated with all course development of genetic and biological issues beginning from ancient times.

Today, vast majority of influential scientific and Molecular and Genetics biotechnological journals are written in English, and English has become the language of international scientific conferences. Hence, we have entered the era of **biotechnological English**, which resembles the era of medical Latin; outstanding biologists and medical doctors have chosen a single language for international communication. Whereas in former times new medical and biological terms were derived from classical Greek or Latin roots, now they are often, partly or wholly, composed of words borrowed from ordinary English. For example, *DNA typing* - *ДНКтипирование*, *DNA profiling* - *ДНКпрофилирование*.

Scientists from non-English-speaking countries now have the choice between importing these English terms directly and translating them into their own language. For instance, Russians use *шунтирование*, which is just another anglicism, being derived from English verb *shunt*.

The main task of the biotechnological translator is a logically meaningful, taking into account all the specifics of terminology and the style of the document. Biotechnological text cannot be paraphrased, even while maintaining the meaning of the translated document. It should not contain any emotional statements and subjective assessments.

The Russian famous translator and linguist V.N. Komissarov claims that translation is an important auxiliary tool for ensuring that the language fulfils its communicative function when people express their thoughts in different languages. (V.N. Komissarov, 2000) It also plays a large part in the exchanging of thoughts between different people and serves the cause of spreading knowledge and culture. The need for communication in various spheres of human activity, such as science, culture, trade, constantly increases in the world. In connection with the development of scientific and technical cooperation, trade with foreign countries and the increase in the volume of information exchange, the ability to translate scientific and technical literature acquires special significance. It is noteworthy that the style of the original document must be maintained with a high-quality technical translation. Vast majority of all documents of a biotechnological sort have the main features, such as: a clear and concise nature of the presentation, strict adherence to technical terminology, a clear logical sequence of information. All requirements for the original text are automatically transferred to the translated document.

Firstly, main feature of scientific style, which makes it distinguishable from other styles, is the logical coherence of ideas expressed by the author. Biotechnological style has a lack of emotiveness.

Secondly, the translation of biotechnological texts is the fact that there appear new technologies, products, terms, s and interpretations in the world almost every day. In order to retain the skills, it is necessary, to be in the topic of new scientific discoveries and developments within the framework of the subjects of translation in which you work. For example, in order to keep yourself in a good shape, you can study numerous foreign publications on quite different subjects, which allows not only to retain the skill, but also to multiply it over time.(A. Pumpyansky, 2015)

Thirdly, in biotechnological technology, as well as in all other spheres, we can find many abbreviations, which at first glance may cause confusion.

Translation is a complicated task, involving a great deal of skill, preparation, knowledge and intuitive feeling for the text. The process of translation between two different written languages involves the translator changing an original written text (the source text or ST) in the original verbal language (the source language or SL) into a written text (the target text or TT) in a different verbal language (the target language or TL) .

Translation as a procedure or a method has its own rules and ways how to progress. There is seven main translation procedures that translator should follow.

Knittlova supports the idea that even though there are a variety of procedures, ways and methods used for translation, all of them should lead to the same target – to achieve the most appropriate form of a translation. (D. Knittlova, 2005). She operates with seven main translation procedures that solve the lack of equivalence:

1. Transcription – more or less adapted transcription to the utterance of TL.
2. Calque – literal translation
3. Substitution – substituting one linguistic means with another equivalent one (e.g. substitution of nouns by personal pronouns and vice versa).
4. Transposition – i.e. necessary grammatical changes resulting from the differences in SL and TL systems.
5. Modulation – the change of aspect.
6. Equivalence – Knittlova does not consider this one as a suitable term for using of stylistic and structural means different from the source text.
7. Adaptation – substitution of a situation described in ST with different adequate situation, e.g. when there is no equivalent of saying in TL.

The target text is the product of the translation process, and is an interesting object of study in itself, but another important part of translation is the translation process itself.

There are three primary ways of translation of terms and in the practice of translation of the biotechnological publications.

### **1. by direct borrowing (transliteration or transcription):**

The most frequent transformation of biotechnological terms is a transliteration. The vast majority of terms are taken from the Latin and Greek, they are international, so it is often passed down from one language to another via transliteration. *Deoxyribonucleic acid (DNA), found in virtually every cell in the body, contains genetic information that helps determine physical characteristics* - *Обнаруживаемая практически в каждой клетке тела, дезоксирибонуклеиновая кислота содержит генетическую информацию, выявляющую физические характеристики; DNA profiling examines discrete parts of an individual's DNA that vary greatly from one person to another* - *ДНК-профилирование проверяет отдельные части ДНК человека, которые значительно отличаются от человека к человеку; DNA profiles are derived from*

*samples such as semen, saliva and blood. ДНК-профили получают из образцов, таких как семя, слюна и кровь; One of the four bases in DNA that make up the letters ATGC, adenine is the "A". The others are "G" for guanine, "C" for cytosine, and "T" for thymine - Одним из четырех оснований ДНК, которые составляют буквы ATGC аденин является «А». Другие - «Г» для гуанина, «С» для цитозина и «Т» для тимина.*

**2. by translation loans:** *chelating agent- хелатирующий агент, photophobia-светобоязнь; intravenous – внутривенный*

**3. by descriptive or interpreting translation:**

This technique is used for verbalizing new objects, not existing in the target language; for example, *reacclimatization – введение в среду ранее обитавших в ней организмов; Following a series of legislative changes; DNA samples can be taken by the police from anyone arrested and detained in police custody in connection with a recordable offence - Теперь, после введения ряда законодательных изменений, полиция может получить образцы ДНК каждого лица, арестованного или задержанного в связи с совершением регистрируемого преступления; DNA samples (from which the profile is derived) are retained primarily to enable profiles to be upgraded as new technology becomes available. They are also used for quality assurance purposes and in case of disputes regarding sample processing - Образцы ДНК (из которых получают профили) хранятся, прежде всего, для обновления профилей с внедрением новой технологии. Они также используются в целях гарантии качества и в случае возникновения споров относительно обработки образцов.*

## CONCLUSION

As a result of the investigation the following conclusion has been drawn:

It is noteworthy that there are certain requirements to biotechnological translator. Translator needs to understand:

1. Greek and Latin roots, prefixes and suffixes used in biotechnological terminology;
2. basic DNA Biology and Genetics notions;
3. Molecular and Cellular Biotechnology notions

Translator needs to be familiar with:

1. scientific findings on human DNA testing, DNA profiling; Y Chromosome and mtDNA testing, Forensic DNA Typing,
2. scientific findings on DNA extraction;
3. glossaries of key terms on DNA Biology and Genetics
4. specific data, facts, research and investigations on biotechnology industry

Material for the study was selected from articles of famous periodical British scientific journal "Postnote" on National DNA database (Postpone, February 2006) written in English language as SL and translated into Russian as TL. The text is designed primarily for the students of Molecular Biology and Genetics at universities offering Biology as main studying program. The style of the language is scientific, with a lot of special terminology.

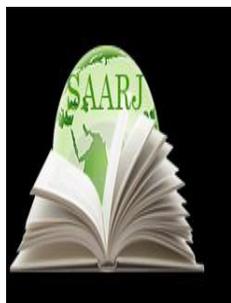

The present paper attempts to draw attention on some of these biotechnological language traps, words which direct meaning can mislead the non-specialists into interpreting in a wrong way.

Having translated documents related to DNA profiling, we came to conclusion that vast majority of all documents of a biotechnological sort have the main features, such as:

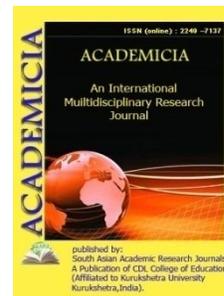

1. a clear and concise nature of the presentation
2. a clear logical sequence of information
3. a strict syntax and sentence ordering
4. an accurate information, real data, proved assertions

## EXPLORING COMPETENCES IN TEACHING FOREIGN LANGUAGES

**Mirzoidova Nigora AvazQizi\***

\*Senior Lecturer,  
 Uzbekistan State World Languages University,  
 UZBEKISTAN  
 Email id: nishofe@gmail.com

---

### ABSTRACT

*This article investigates the role of pragmatic, socio-cultural, and translation competence in teaching languages in universities. The author cites many abstract studies and notations of scientists and, studying them, declares the importance of implementing competences into practical exercises. The paper also provides an explanation of translation competence based on research by linguistic scholars. As an example to this research is taken the short story of Oscar Wilde, "The Nightingale and the Rose" and expanded research and explanation in the field of translation with the participation of students, based on practical lessons and their mistakes.*

**KEYWORDS:** *Competence, Translation Competence, Socio-Cultural Competence Pragmatic Competence, Translation.*

---

### INTRODUCTION

Targeting at adequate translation in teaching the translation of any text, the teacher should be mindful of social and cultural differences between languages. Students should not only be able to find suitable equivalents and properly convey terms, but also analyze the communicative situation and cultural characteristics of the source text. This avoids serious shortcomings in translation when a translator is faced with images and concepts of another language culture.

Modern Uzbek society is going through a period of complex sociocultural transformations that affect all aspects of its life. Deep changes in social, political, economic life have a great impact on the development of the education system. New social needs caused a change in the educational paradigm, due to the tendency of its humanization, which required the development of the creative potential of the individual, the active implementation of modern innovative

technologies in higher education, and the training of specialists to work in a world without borders.

The conditions for the constant expansion and deepening of the spheres of intercultural communication in the modern world in general and in Uzbekistan, in particular, have led to the reform of language education, it is content based on UNESCO recommendations on education in the spirit of peace, respect for human rights, orientation towards the dialogue of cultures. The ideas of humanization of education require the solution of the main tasks: the formation of a student's conscious attitude towards himself as a cultural and historical subject; enrichment of his worldview; formation of social responsibility; learn to independently analyze your actions. The successful implementation of these tasks is possible in the process of vocational education based on a sociocultural approach.

Culture is studied by almost all social sciences, but the “mediator” and “consumer” of culture is, first of all, the sphere of education, the purpose of which is to familiarize a person with cultural values that provide the development of special opportunities.

Thus, the role of culture in the educational paradigm, including in linguistic education, is growing. Communication in a foreign language involves knowledge of the cultural characteristics and specifics of the country of the target language in unity with the culture of the native country. Many studies note that intercultural communication and, as a consequence, the formation of translation competence are necessary conditions for achieving a new quality of vocational education. The expansion of opportunities for representing our country at the international level has created a need for specialists with knowledge of foreign languages to carry out translation activities. Thus, the requirements for the quality of teaching students - future translators are increasing, which implies the selection and development of a professional context, in the content of which professional terminology and information about the socio-cultural characteristics of communication are integrated.

## **MAIN BODY**

The translator itself is very skeptical, for all the fact that even if all the words find their equivalent, not everyone is able to convey the atmosphere. The fact is that the main translation is not to translate words, but to open the plot of the text. During translation, students encounter not only terminological difficulties but also cultural illiteracy. In many cases, the translation fails due to the translator's sociocultural perceptions.

Based on this, at present, specialized universities have introduced competencies as the basis for translation. Short stories are a favorite with many students, they start translating with these interesting texts. In their opinion, they are doing a great job, but when you ask them the essence of the story, they themselves find it difficult and begin to reread the translation and eventually return to the original. In fact, the translation of short stories is both deeply meaningful and, because of this, are the most difficult translations.

Many linguists generalize the meaning of competence or even go deeper into the explanation. This is why it is very difficult to navigate one or the other research as fact. But if you grasp the essence, then the competence itself is a skill that can and should be acquired. In translation, there should be taken into account several competences: pragmatic, socio-cultural, and translational competences.

Under the socio-cultural competence of a number of researchers understand the knowledge of the sociocultural context of the language and the experience of using this knowledge in the process of communication. (I. L. BIM, P. V. Sysoev).

In linguistics, pragmatic competence is the ability to use language effectively in a contextually appropriate fashion. Pragmatic competence is a fundamental aspect of a more general communicative competence.

"Intrinsic to this decision-making process [in using language to communicate] are several principles that concur to define the nature of pragmatic competence. In particular, individuals make choices and build strategies based on some of the unique properties of pragmatic/communicative competence, such as:

- variability: the property of communication that defines the range of communicative possibilities, among which is formulating communicative choices;
- negotiability: the possibility of making choices based on flexible strategies;
- adaptability: the ability to modulate and regulate communicative choices in relation to the communicative context;
- salience: the degree of awareness reached by communicative choices;
- indeterminacy: the possibility to re-negotiate pragmatic choices as the interaction unfolds in order to fulfill communicative intentions;
- Dynamicity: development of the communicative interaction in time."

For instance, PACTE argues that the concept of translation competence is borrowed "from the idea of linguistic competence", but they define translation competence as including a set of knowledge, skills and abilities that differ from person to person and that will never find their way into the concept of language competence.

According to PACTE, there are six subcomponents of translation competence, which I list briefly here with just a smattering of what PACTE includes under each (PACTE, 2000, 101-102):

1. Communicative Competence in two languages, including linguistic, discourse and sociolinguistic competence.
2. Extra-Linguistic Competence composed of general world knowledge and specialist knowledge.
3. Instrumental-Professional Competence composed of knowledge and skills related to the tools of the trade and the profession.
4. Psycho-Physiological Competence, "defined as the ability to use all kinds of psychomotor, cognitive and attitudinal resources" including "psychomotor skills for reading and writing; cognitive skills (e.g. memory, attention span, creativity and logical reasoning); psychological attitudes (e.g. intellectual curiosity, perseverance, rigour, a critical spirit, and self-confidence)".
5. Transfer Competence, which is "the ability to complete the transfer process from the ST (source text) to the TT (target text), i.e. to understand the ST and re-express it in the TL (target language), taking into account the translation's function and the characteristics of the receptor".

6. Strategic Competence, which includes “all the individual procedures, conscious and unconscious, verbal and non-verbal, used to solve the problems found during the translation process”.

In particular, students often face translation problems precisely with socio-cultural competence, they lack knowledge of the subculture of other countries. They are not able to perceive certain information data through text. As an example, we take the fairy story of **Oscar Wilde**, "*The Nightingale and the Rose*" that story is translated word by word (which strategy is used by most of the students) into the Uzbek language, then the semantic context will be that the young man was rejected by the beautiful girl.

However, he tried to explain the deep sense of value and devaluation of the precious feelings of the whole world, a poor student falls in love with a rich girl, the daughter of his professor, and invites him to a ball, the girl refuses and mockingly suggests that she would go with him to the ball if he brings the most beautiful rosebud. A guy comes home near the window sits and cries, his soul hurts, he wants this flower and he falls asleep, but during this heartbreaking drama, we will see a character for several lines, a little nightingale bird. It looks at all this, and it feels sorry for the boy and wants to help him with all its heart sincerely sympathize with him. The nightingale with no hesitation sacrifices itself sings until morning, exhausted, but the long-awaited rose will open at the expense of her life. The guy wakes up and takes a rose and being glad that he found rose, he perceives it as a heavenly gift. Goes to that girl, to her amazement, the girl still chooses not him, but another wealthier young man. The guy with the rosebud stands and he just throws out this rose and goes on, that's the whole story.

But if there will be the comprehension of the essence of this particular story, then the interpretation turns out to be a completely different story about not about a boy, but about a nightingale, not even about a nightingale, but about people's feelings about human relationships. What are the values of people or what are the values in the whole world? There, from one nightingale, such deepest value is shown that not everyone will deduce. In translation not only culture has a very important role, but also the age of the mind, the age of perception of this world. Often, many turn to an experienced candidate for translations, and the fact is that the older a person is, the broader the horizons and subtle perception of the world and feelings. How and what does the writer feel? What does he want to convey?

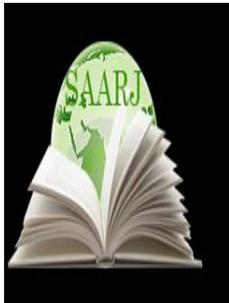

Students need to expand not only their vocabulary, but they must also have a developed sense of perception, the ability to feel the cultures of other peoples, including. This feeling gives them absolutely detailed uncover a particular story. Returning to the story of **Oscar Wilde**, often students who translate it with word by word translations, after consultation and explanation of the essence of the story, they radically change their view of it, and they translate the same story in other words, they do not look for single words, they look for the meaning of that story and they try to reveal the whole color of sense of the story.

## CONCLUSION

Making a conclusion on the basis of the above factors when teaching students in specialized language universities in translation lessons, one should pay attention not only to increasing the vocabulary but also to develop and introduce socio-cultural and translation competence at the same time. It is a specialized language university that students must acquire this skill and improve in this sphere of education.

## CUNNING BEHAVIOR OF DIFFERENT STYLISTIC DEVICES IN TRANSLATION

**Rashidova Aziza Farkhadovna\***

\*Senior Lecturer,  
 Uzbekistan State World Languages University,  
 UZBEKISTAN

Email id: azizarashidova99@gmail.com aziza-r@mail.ru

### ABSTRACT

*One of the main items of translation is the history, traditions, habits and lifestyle of two nations who the source and target languages belong to. Due to the rapid changes in the entire world in all spheres, different linguistic aspects and their translation are becoming more and more challenging nowadays. The following article is dedicated to the translation of different stylistic devices, the problems in their translation and cunning behavior of lexical and phonetic stylistic devices that make the work of language learners and translators more complex and substantive. The cases when translation changes a lot or little or when translation does not work at all are described and discussed in this article.*

**KEYWORDS:** *Translation, Stylistic Devices, Linguistic Phenomenon, Source Language, Target Language, Training Translators, Translation Techniques, Literary Styles.*

### INTRODUCTION

Words or expressions in figurative or metaphorical meaning are the subject matter of stylistics. They are mainly used in the literary style (prose, poetry and drama), and also in Publicistic and Newspaper styles (essays, articles, brief news items, editorials, oratory, announcements), in advertising and everyday conversation.

When we deal with translation of stylistic devices, we have to come across all of the above-mentioned styles. While translating stylistic devices, a translator must be fully aware of their sense and the emotive effect they produce through their image. Both sense and image should be preserved as much as possible. Peter New mark, an outstanding British theorist of translation, suggests several procedures for translating stylistic devices. To convey the author's intent, the

translator must be very careful in selecting words with the same denotative and connotative meanings. Translation of epithets, metaphors, similes, periphrases, hyperbole can be good examples to our topic. 'Her brain is the size of a pea' is equivalent to Uzbek 'miyasitovuqnikidek' (some insulting).

The crucial strategy of a translator in rendering all these types of trope is to make a similar impact upon the reader/listener of the target text as did a source text on its receptor.

### MAIN PART

As a philologist and instructor of translation sciences, first and foremost, I should mention that translation (be it written or oral) is a process so complicated. It is, actually, one of my professional features to delve deeply into meanings of words. On top of that, over a span of the years I dedicate myself to language learning and translating, I do comprehend that translation is not merely a replacement of one language with another. It is, in fact, a somewhat demanding and fairly responsible work. This is why, by and large, translation requires not only a profound understanding and knowledge of a particular field, but also a creative approach, genuine willingness and sparkling zest. Ergo, one should be utterly meticulous and vigilant to encapsulate various cultures, traditions, personalities, and attitudes in translation. This is the only way to convey a spectrum of ideas as explicitly as possible. So, this, in turn, will lead us into the next area of my investigation — *cunning behavior of stylistic devices in translation*.

One of the acute concerns of translation is transmitting stylistic devices into a target language. This being said, commanding a massive lexical resource will not suffice to express all the colors unless one recognizes expressions in the target language and utilizes stylistic techniques. Therefore, translators put methods in use to convey expressiveness and brightness of the original source.

Leaning on the given situation, they copy the technique of the original or create their own stylistic tools with the equal emotional and artistic effect for the target language audience.

Learning stylistic devices is interesting, but translating them into another language keeping the color and deep insight is quite engaging. Because the more one goes deeper with their behavior, the more enthralled he/she becomes. Moreover, one gets familiar with the importance of studying the translation of expressive means, the parameters of the adequacy of the translation means in terms of content, etc. When it comes to the translation of various lexical stylistic devices, among the transformations "compensation" (the transfer of semantic meaning or stylistic color which it is expressed in the original) is the most sophisticated one. Naturally, we can find some elements that cannot be separately transmitted by means of another language. Nevertheless, it is a top priority for any translator to preserve the expressive meaning of a word or phrase.

Furthermore, the methods of transmitting lexical figures of speech during translation depend primarily on nationwide or individual. For the record, it is logical to find a figurative equivalent/analogue to translate. Here, we can present a classic example for this: *a hotbed of disease* — *kasalliko'chog'i*. However, some metaphors or comparisons might be built on a different image: *to hit the nail on the head* — *nishongaurmoqor work like a horse - eshakdekishlamoq*. From the aforementioned examples, we can deduce that preserving the imagery is as equally important as replacing the neutral image. It is also of paramount

importance to keep in mind that if there is no figurative unit in target language, translators should create a literal equivalent. Let us look at this example of simile: *as dead as a doornail – o'likdekjonsiz*.

In our fast-paced world, there is a tendency to a style, which is plainer and more simplistic. This is why, it is highly unlikely to encounter stylistic means, namely hyperbole, metaphor, metonymy, pun, zeugma etc. Yet we do have epithet in our case. As a matter of fact, it is quite difficult for translators with epithets. The reason is- English adjectives are far ambiguous. Let me present the following examples: plain, tough, strong (and the adverb strongly), deep, mean. There are, of course, legions of meanings and we can only understand it leaning on the given context or situation.

The cunning behavior of Stylistic devices in translation can be vividly observed in many riddles and brain teasers for language learners. *'You are crossing the bridge and in the water you see a boat full of people, but there isn't any single person in it, how?'* this is a word-play, pun, that the translation of it would put the guesser in challenging situation, so the solution is to think in the language of origin! Here, the word 'single' is easily accepted as 'lonely, one' from the context (full of), but in fact it is 'not married' and the answer to the riddle is- 'All of them are married'. Another example is hidden in the alliteration of the letter 't' in the following riddle: 'Name four days of the week that start with the letter 't''- translated into Russian or Uzbek languages (the ones we usually deal with in translation), the riddle will lose its charm- so, again, we have to think of the answer in English. The answer is- Tuesday, Thursday, today and tomorrow.

Of course, when we speak about stylistic devices and their translation the first thing that should be covered is- belles-lettres in all its forms, be it a drama, prose or poetry. But in our article we decided to deal with a slighter topic- interesting cases we experienced during our regular classes, that are both easy to understand and challenging for learners of the language. This type of translation should be included in literal translation, an opposition to those who were eager to preserve the inner essence of the original text. For instance, famous and respectable poet A.Fet was the apologist of literalism. He writes, "The translator is happy when he manages, at least partially, to achieve the beauty of form that is inseparable from the original text. The main task of translation is to be literal. No matter it can sound heavy and uneven; the reader with an artistic flair will feel the power of the original text".

Last but not least, despite the challenges and tricks of stylistic devices, translators should attempt to use multitude of expressive means to make the text more vivid and have a considerable bearing on readers. This is the combination of translator's knowledge, ability, competence and talent.

## CONCLUSION

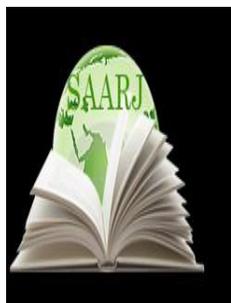

I would dearly love to conclude my piece of writing with the words of K.I. Chukovsky about the principle of stylistic compensation: "It is not a metaphor that needs to be conveyed by metaphor, not comparison conveyed by comparison, but a smile - by a smile, a tear - by a tear, etc. This means a certain freedom of action." Is not this fantabulous?! Resoundingly yes! I cannot get enough of the wonders of translation!

Summing up all analyzed ideas and phenomena we should bear in mind that techniques acceptable for the Informative Translation are inadmissible for the Literary one. Beauty does not

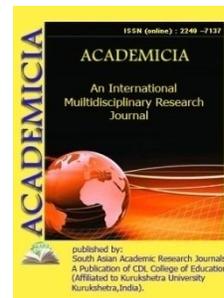

exclude the accuracy. What is more, it should not be interpreted as prettiness and accuracy as literalism.

When the role-play began the students felt 'armed' with the appropriate language.*

**KEYWORDS:** *Imaginary, Drilling, Millionaire*

---

### INTRODUCTION

Incorporating role-play into the classroom adds variety, a change of pace *m* & opportunities for a lot of language production and also a lot of fun! It can be an integral pass of the class and not a 'one-off event. If the teacher believes that the activity will work and the necessary support is provided, it can be very successful. However, if the teacher is not convinced about the validity of using role-play the activity "will fall flat on its face just as you expected it to" (Gillian Porter Ladousse 1987). Therefore, if you think positive and have a go you may be pleasantly surprised! Role-play is any speaking activity when you either put yourself into somebody else's shoes, or when you stay in your own shoes but put yourself into an imaginary situation.

*Imaginary people* - The joy of role-play is that students can 'become' anyone they like for a short time! The President, the Queen, a millionaire, a pop star..... the choice is endless! Students can also take on the opinions of someone else. 'For and Against' debates can be used and the class can be split into those who are expressing views in favour and those who are against the theme.

*Imaginary situations* - Functional language for a multitude of scenarios can be activated and practiced through role-play. 'At the restaurant', 'Checking in at the airport', 'Looking for lost property' are all possible role-plays. It is widely agreed that learning takes place when activities are engaging and memorable. Jeremy Harmer advocates the use of role-play for the following reasons:

- It's fun and motivating.
- Quieter students get the chance to express themselves in a more forthright way.
- The world of the classroom is broadened to include the outside world - thus offering a much wider range of language opportunities.

In addition to these reasons, students who will at some point travel to an English-speaking country are given a chance to rehearse their English in a safe environment. Real situations can be created and students can benefit from the practice. Mistakes can be made with no drastic consequences.

Role-play is possible at elementary levels providing the students have been thoroughly prepared, 'try to think through the language the students will need and make sure this language has been presented. Students may need the extra support of having the language on the board. I recently did a 'lost property office' role-play with elementary adults and we spent time beforehand drilling the structures the students would need to use. When the role-play began the students felt 'armed' with the appropriate language. At higher levels the students will not need so much support with the language but they will need time to 'get into' the role. The role of the teacher

- Facilitator - students may need new language to be 'fed' in by the teacher if rehearsal time is appropriate the feeding in of new language should take place at this stage.
- Spectator - The teacher watches the role-play and offers comments and advice at the end.
- Participant - It is sometimes appropriate to get involved and take part in the role-play yourself.

Realia and props can really bring a role-play to life. A group of my young learners recently played the roles of pizza chef and customer. A simple cone of white card with CHEF written on it took a minute to make and I believe it made the whole process more fun and memorable for the class. As soon as it was placed on their heads they 'became' the pizza chef and acted accordingly.

We have to mention 3 stages of performing the Role-play during the lesson;

1. Pre-Role-play
2. While-Role-play
3. Post-Role-play

- Pre-Role-play. We actually give students some guessing exercises or multiple choice questions to involve them into topic.

While-Role-Play. They perform their roles with their dialogues with the help of their abilities.

- Post-Role-play. After performing their stage, they are given extra task to evaluate their roles by themselves.

Rearranging the furniture can also help. If you are imagining you are at the tourist information office or at the doctor's surgery try to make it as real as you can. Students can even leave the room and make an entrance by knocking on the door, try to keep the roles you ask students to play as real to life as possible.

There are many ways to correct mistakes when using role-play, it is rarely appropriate for the teacher to jump in and correct every mistake. This could be incredibly demotivating! Some students do like to be corrected straight after a role-play activity, while the language is still fresh in their minds. Sentences with errors can be written on the board for the group to correct together.

- Self-correction - If you have the equipment to record the role-plays either on audiocassette or on video, students can be given the opportunity to listen to the dialogue again and reflect on the language used. They may find it easy to spot their own mistakes.

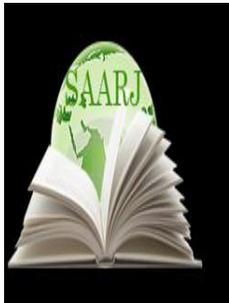

Peer-correction - Fellow students may be able to correct some mistakes made by their peers. Students could be asked to listen out for both great bits of language they'd like to use themselves, and some mistakes they hear. Be careful to keep peer-correction a positive and profitable experience for all involved.

- Making a note of common mistakes yourself and dealing with them in future classes ensures that the students don't lose motivation by being corrected on the spot or straight after the role-play. Negotiate with students and ask them how they would like to be corrected.

Role-play can be a lot of fun. If you still feel reluctant to use it in the class I suggest you begin to integrate it slowly. Why not extend an appropriate reading or a listening from a course book and turn it into a role-play? You may be pleasantly surprised by the results.

## THE BENEFITS OF USING POETRY IN TEACHING ENGLISH

### ABSTRACT

*It is known that linguists have developed a lot of theoretical and practical methods of teaching a foreign language. The most effective of these methods are used by teachers in classroom education. One of the fruitful ways of teaching language that we would like to analyze in our article is to teach this language through poetry. Poetry may not obey the grammatical, syntactic rules of language, but the metaphorical images expressed in the poem, rhyming synonyms serve not to bore the student during the lesson and, conversely, to increase interest in language learning. The article also details a number of practical activities on how to apply the research topic in the classroom.*

**KEYWORDS:** *Poetry, New Ideas, Metaphorical Meanings, Stylistic Effect, Key Words, Images.*

### INTRODUCTION

Once British author Minette Walter said, "As a reader, I love to escape into somebody else's world. As a writer, I love to create that other world for my readers. There's nothing so adventurous as going on a journey to an unknown destination. Reading expands our imagination and gives us the confidence to explore new ideas". We would like to emphasize that reading expands not only our imagination but also our understanding of another country's life style. We know that during last period our people did not have confidence to explore new ideas, to explore new world, to explore something new which could change our life, our thoughts, and our style.

Due to our Independence we have an opportunity to explore new things and our teachers can be acquainted with a number of new methods in teaching second language.

This article is intended to show the thrill and meaning of poetry through the author's key elements of his craft. We express the faith that good literature best reflects the human condition, for better to worse, for greater extent than films or television. Even these media, so easy to absorb if not delight, could not exist without the written word. Perhaps the oldest kind of literature known to humanity, poetry in its earliest stages was told or sung, but during its long and continuing evolution it has become part of the written tradition and has been used for several purposes. Poetry encourages students not only to understand and appreciate some facts of the life, but also to use the skills essential for critical thinking - to develop and refine abilities to analyze, compare, classify and define concepts and to defend critical positions. "Poetry", wrote Ralph Waldo Emerson, "teaches us the enormous force of a few words". The careful selection, compression, and arrangement of language by the artist gives poetry the power to project experience vividly and memorably for the reader.

Why poetry is should be used with the language learner? One of the greatest enemies of successful teaching is student boredom. If student spend all of the time reading or writing, they will probably get bored. But if, during the lesson, there are different tasks with a selection of different texts, the students are much more likely to remain interested. We suggest using poetry in teaching English once a week. Students enjoy line-by-line analysis, jotting down many new vocabulary words along the way. They can write about the poems in their journals, choose a poem to memorize and perform for the rest of the class. Teachers should integrate the poetry as fully as possible into the syllabus, find poems with a variety of themes and styles, give plenty of time for in-class practice, and give plenty of encouragement. Poetry has been characterized as deviating from the norms of language. It has been argued that poetry frequently breaks the 'rules' of language, but by so doing it communicates with us in a fresh, original way. If a poem contains unusual syntax then students can be asked to pinpoint in what way it is unusual and to contrast this with more commonly accepted uses. In so doing, they would be reaching some kind of conclusion about the stylistic effect conveyed with language, and hence the meaning of the poem. Using poetry is not then seen simply as an activity done for its own sake, but as way of improving language knowledge. The occasional use of a poem linked linguistically to a lexical or grammatical area being taught in a particular lesson is often an enjoyable way of reinforcing or revising that area.

Let's see some practical ideas for helping students to unravel the often complicated metaphorical or figurative meanings in poems. Metaphor denotes expressive renaming on the basis of similarity of two objects: the real object of speech and the one whose name is actually used. Metaphor is not only an effective stylistic device, but also a common lingual means of occasional denomination. Whenever a speaker does not know the name of a thing he has not seen before, he generally resorts to a metaphor, using a word or expression which denotes a similar thing, a thing familiar to him. There are plenty of metaphors in the poetry, that's why students might find it difficult to understand and interpret a metaphor in a poem for a number of reasons. To begin with, it may not be very clear to students that' a metaphor is being used, or rather that a metaphorical reading of a poem is required. Secondly, students may find it difficult to unravel the connections between apparently dissimilar objects or concepts. For example, the metaphor is used in the poem "The gull's flight". In this poem the sun is described as the 'the day's fire' lit at

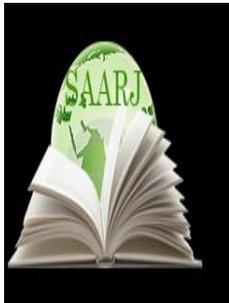

the edge of the sea. To be able to understand this metaphor, students need to infer that one object (the sun) is being implicitly compared to another (the day's fire) so that the fire 'stands for' the sun.

Below are some suggestions how to work with metaphorical words in the poem. Teacher divides students into two groups and asks one group to look at the following lines from a poem, from which two words have been removed. Teacher asks students to predict what words could go in the blanks. Then the teacher asks; the other group to look at the same lines from the poem but with different words removed, and to do the same as the other group.

Another activity is to ask students to write down any associations they have for the key words from the poem. Then they read the poem and underline any of the words mentioned in cluster. With younger learners you can use pictures which represent metaphorical words or ask students to draw their own pictures. Student will get a lot of fun with working on different poems and the teacher can consider that his lesson succeeded. Teacher should take notes on what works to improve the unit the next time he teaches it. If possible, the teacher can pair up with another teacher to teach the same poems and compare students' reactions. Teacher should believe in the power of poetry, most of the students already do that. All they need is a little prompting from the teacher.

## THE ROLE OF GRAMMAR IN IMPROVING STUDENTS' WRITING SKILLS

**Jumaev Sanjar Jurakulovich\***

\*Senior Teacher,  
 Karshi Engineering Economic Institute,  
 UZBEKISTAN

Email id: sanjarjumayev8866@gmail.com

---

### ABSTRACT

*The variety of methodological approaches can contribute to improving students' writing in educational institutions and there has always been a demand for predominant strategies. However, the role of grammar is essential not only in improving students' writing abilities but also in other language skills, such as listening, reading and speaking. The question of making the way students write better has been significantly researched over the last few years. The current research paper investigates the urgency and actuality of grammar (in our case the English Grammar) in improving students' writing. In the era of globalization, English is a very important tool in communication, especially when it is in a written form. Therefore, it is an essential prerequisite for students to master grammar to put their ideas and thoughts on paper. Consequently, teaching grammar in harmony with writing should be adapted to achieve proficiency in students' writing abilities.*

---

### INTRODUCTION

#### **The most effective methods and activities in teaching grammar in context**

As it is known, approaches and methods play a great role in teaching foreign language acquisition. Therefore, we must implement different approaches and methods in language learning classes. There are various types of methods which we can widely use in language learning classes:

### *The communicative approach*

The communicative approach is based on the idea that learning language successfully comes through having to communicate real meaning. When learners are involved in real communication, their natural strategies for language acquisition will be used, and this will allow them to learn to use the language. The communicative approach could be said to be the product of educators and linguists who had grown dissatisfied with the audiolingual and grammar-translation methods of foreign language instruction. They felt that students were not learning enough realistic, whole language. They did not know how to communicate using appropriate social language, gestures, or expressions; in brief, they were at a loss to communicate in the culture of the language studied. In the intervening years, the communicative approach has been adapted to the elementary, middle, secondary, and post-secondary levels, and the underlying philosophy has spawned different teaching methods known under a variety of names, including notional-functional, teaching for proficiency, proficiency-based instruction, and communicative language teaching.

Communicative language teaching makes use of real-life situations that necessitate communication. The teacher sets up a situation that students are likely to encounter in real life. Unlike the audiolingual method of language teaching, which relies on repetition and drills, the communicative approach can leave students in suspense as to the outcome of a class exercise, which will vary according to their reactions and responses. The real-life simulations change from day to day. Students' motivation to learn comes from their desire to communicate in meaningful ways about meaningful topics.

Margie S. Berns, an expert in the field of communicative language teaching, writes in explaining Firth's view that "language is interaction; it is interpersonal activity and has a clear relationship with society. In this light, language study has to look at the use (function) of language in context, both its linguistic context (what is uttered before and after a given piece of discourse) and its social, or situational, context (who is speaking, what their social roles are, why they have come together to speak)" (Berns, 2004, p. 5)

The exercise puts students in a real-world listening situation where they must report information overheard. Most likely they have an opinion of the topic, and a class discussion could follow, in the target language, about their experiences and viewpoints. Communicative exercises such as this motivate the students by treating topics of their choice, at an appropriately challenging level. (The announcement can be read by the teacher or played on tape.) Then ask students to circle the letter of the most appropriate answer on their copy, which consists of the following multiple-choice options:

- |  |
|--|
| a taxi service<br>b. a hotel<br>c. an airport<br>d. a restaurant |
|--|

Teachers in communicative classrooms will find themselves talking less and listening more becoming active facilitators of their students' learning (Larsen-Freeman, 2003, p. 19). The teacher sets up the exercise, but because the students' performance is the goal, the teacher must step back and observe, sometimes acting as referee or monitor. A classroom during a communicative activity is far from quiet, however. The students do most of the speaking, and

frequently the scene of a classroom during a communicative exercise is active, with students leaving their seats to complete a task. Because of the increased responsibility to participate, students may find they gain confidence in using the target language in general. Students are more responsible managers of their own learning (Larsen-Freeman, 2003, p. 34).

### ***Teaching Grammar Using the Inductive Approach***

Inductive learning is the process of 'discovering' general principles from facts. In a language classroom, an inductive approach involves getting learners to discover rules and how they are applied by looking at examples. The role of the teacher is to provide the language the learners need to discover the rules, to guide them in discovery if necessary, and then to provide more opportunities to practise. The inductive approach is often thought of as a more modern way of teaching: it involves discovery techniques; it seeks in some ways to duplicate the acquisition process; it often exploits authentic material; it has learners at the centre of the lesson; and the focus is on usage rather than rules. Over the years, different teaching approaches and methods have been developed for use by teachers of English language development and the merits of teaching grammar in language lessons has long been a hot topic. Despite this, some distinct approaches have formed. In general teaching terms, Prince M.J. and Felder (2006. – P. 75) looked at different methods under the rubric of the inductive approach, endorsing constructivist problem-based learning activities. Conversely, Bilash (2006.-PP. 35-37) looked at both approaches but concluded that students understand and retain content more effectively through inductive learning. According to Howard Community College (2012,-pp. 58-59), the constructivists' approach to teaching grammar involves teaching it in context and not as a separate entity. It is taught using methods such as mini-lessons, grammar journals and peer group activities. This simply means that grammar is taught using the students' own work as models. These methods help students understand that evaluating grammar in their writing is a part of the revision process.

The inductive approach is especially useful for the development of critical thinking and fluency via a range of instructional methods including inquiry learning, problem-based learning, project-based learning, and discovery learning (Prince, 2006. – P. 12). Simply put, the teacher provides examples of the target grammar but it is the task of the learner to figure out the rules from these examples and it is the students' job to notice the differences and similarities.

Overall, regarding best practices for teaching grammar, research does not prove either way which approach is most effective. Some teachers are better at teaching one method than the other whilst at the same time, students vary in their ability to perform under one approach or the other. To decide upon the best approach, the teacher's ability, academic level of the students and their learning styles are all important factors which need to be considered when deciding upon which classroom methods to use

### ***Content-Based Teaching***

In the early days of the TESOL profession, most teachers pulled their students out of mainstream classes or offered English instruction in a self-contained, language-focused classroom. Teachers often focused on learning about language in these settings. It wasn't unusual to see explicit grammar explanations and drills in these ESL classrooms. In the last twenty years, however, things have changed. Due in large part to the underwhelming results of these early models, programs began shifting to push-in, co-teaching, and sheltered models. These models are thought

---

to offer a form of content-based language instruction (CBI), a research-backed (Grabe, Stoller, 2002. -PP. 1-21) approach to language teaching in which language and content are taught concurrently. A central idea of CBI is that language is best learned when used to make meaning, and academic language is best learned when heard and used in academic settings (Brinton, 2010, -P. 63). As more ESL teachers push into content classes, their focus has shifted from teaching about language to scaffolding the content so that it is accessible to the multilingual students in the class. However, to be most effective, teachers must balance the emphasis on language and on content in a content-based class (Cammarata, Tedick, Osborn, 2016. -P. 38). As to the correct balance, Nation (2007) suggests that approximately 25% of class time should consist of language-focused learning in which students are attending to, processing, and discussing language features that they will use in the other 75% of the course time. In their teacher education programs, most ESL teachers are taught to achieve this balance by identifying two kinds of learning objectives: content objectives and language objectives. This practice is directly connected to a content-based approach to language instruction and the need to focus on both content and language. If we are to teach language through content, it is important to articulate both the content that is to be taught (the content objectives), and the language to be taught (the language objectives). Language identified in the language objectives is related to the content and will help students better understand and interact with the big ideas of the content.

### *Task-based language teaching*

Over the past two decades, task-based language teaching (TBLT) has been introduced quite successfully into foreign language teaching methodology in wide parts of the world and a sizable number of current and especially future foreign language teachers have become acquainted with this approach during their studies as well as during diverse internships and trainings-on-the-job. However, task-based teaching has not yet found a solid way into foreign language classrooms. Textbooks do not integrate this approach, nor do curricula, as task-based teaching is seen as being partly incompatible with current views on didactic progression. This situation is understandable insofar as task-based language teaching does not – and does not want to – follow the rigid routine of a traditional foreign language textbook. This may be seen as a disadvantage by those teachers who have learned to rely exclusively on a text book series, but for teachers with a more creative mindset the integration of task-based teaching bears many advantages, which outweigh the disadvantage just mentioned, as it allows the teachers (as well as their learners) a lot more freedom to deal with everyday situations and current issues, which is usually perceived as immensely motivating by both teachers and learners alike. Yet, how can grammar be seen as fun or even as interesting when not even the teachers like it? Such a view of grammar is presumably still heavily influenced by the grammar drills and/or PPP methods (“presentation, practice, production”) that the teachers have encountered in their own school, university or internship days, where grammar was presented as a set of abstract structures with rules and exceptions which had to be learned by heart, and where grammar was not necessarily related to meaning. As Ellis, N. C. (2017. -pp. 113-124) correctly claims, “grammar can no longer be viewed as a central, autonomous system to be taught and learned independent of meaning, social function and discourse structure”. This book even goes a step further because it argues that grammar is as meaningful as lexis (just in a more abstract way) and that teaching grammar is therefore at the same time teaching meaning. According to Nassaji, H., Fotos, S. (2011. – P. 76)., applied cognitive grammar is a good starting point for grammar instruction, “because the kinds

of generalizations it posits to describe linguistic organization can easily be made explicit, and thus incorporated into classroom practices”. As grammar will definitely be an ever-present ingredient in any foreign language classroom, grammar teaching will always be a necessity. Using language creatively will also benefit an outside-of-the-classroom use of the foreign language, as a creative use of language is exactly what happens in ‘real’ communication, which is quite different from the pseudo-communication that can be found in the majority of more conventional foreign language classrooms. According to Schmidt, R. (2001. -PP. 3-32), task-based language teaching “puts learners in an unconventional and perhaps unusually proactive relationship to their classroom learning. They have more room to show seriousness of purpose, some capacity for decision-making and space to be unique”, an important quote which already mentions several crucial aspects of this approach. Task-based language teaching can be seen as an action-oriented approach, which can be enhanced by integrating grammar teaching in a non-explicit way, i. e., “by the backdoor”, while the learners may not even notice that what they are learning IS indeed grammar. They will be involved in situations that they may, at least to a certain extent, also encounter outside their classrooms and they are given communicative tasks they are to work on and solve, usually with a partner or in small groups. These situations and tasks have to be carefully chosen and developed by the teacher so that in order to fulfill a task the learners need to use a specific grammatical phenomenon. In this way, not only the communicative topic is for grounded in the lesson, as is usual in task-based classrooms, but the lesson focus is instead two-pronged, as a grammatical topic goes hand-in hand with the communicative topic. What teachers need to invest for preparing such lessons is especially their creativity, as they have to come up with communicative situations which more or less force the learners to use a specific grammatical structure and which additionally cater to different learner types. The connection between task-based teaching and cognitive grammar definitely seems to be a fruitful one, although this can only be claimed with caution, as there is still a lack of studies.

During the class we can suggest to provide the following communicative activities in language learning classes

### ***Information-Gap Activities***

An important aspect of communication in CLT is the notion of information gap. This refers to the fact that in real communication, people normally communicate in order to get information they do not possess. This is known as an information gap. More authentic communication is likely to occur in the classroom if students go beyond practice of language forms for their own sake and use their linguistic and communicative resources in order to obtain information. In so doing, they will draw available vocabulary, grammar, and communication strategies to complete a task. The following exercises make use of the information-gap principle: Students are divided into A-B pairs. The teacher has copied two sets of pictures. One set (for A students) contains a picture of a group of people. The other set (for B students) contains a similar picture but it contains a number of slight differences from the A-picture. Students must sit back to back and ask questions to try to find out how many differences there are between the two pictures. Students practice a role play in pairs. One student is given the information she/he needs to play the part of a clerk in the railway station information booth and has information on train departures, prices, etc. The other needs to obtain information on departure times, prices, etc. They role-play the interaction without looking at each other’s cue cards.

### **Jigsaw activities**

These are also based on the information-gap principle. Typically, the class is divided into groups and each group has part of the information needed to complete an activity. The class must fit the pieces together to complete the whole. In so doing, they must use their language resources to communicate meaningfully and so take part in meaningful communication practice. The following are examples of jigsaw activities:

The teacher plays a recording in which three people with different points of view discuss their opinions on a topic of interest. The teacher prepares three different listening tasks, one focusing on each of the three speaker's points of view. Students are divided into three groups and each group listens and takes notes on one of the three speaker's opinions. Students are then rearranged into groups containing a student from groups A, B, and C. They now role-play the discussion using the information they obtained. The teacher takes a narrative and divides it into twenty sections (or as many sections as there are students in the class). Each student gets one section of the story. Students must then move around the class, and by listening to each section read aloud, decide where in the story their section belongs. Eventually the students have to put the entire story together in the correct sequence.

### **Other Activity Types in CLT**

Many other activity types have been used in CLT, including the following: ***Task-completion activities***: puzzles, games, map-reading, and other kinds of classroom tasks in which the focus is on using one's language resources to complete a task.

***Information-gathering activities***: student-conducted surveys, interviews, and searches in which students are required to use their linguistic resources to collect information.

***Opinion-sharing activities***: activities in which students compare values, opinions, or beliefs, such as a ranking task in which students list six qualities in order of importance that they might consider in choosing a date or spouse.

***Information-transfer activities***: These require learners to take information that is presented in one form, and represent it in a different form. For example, they may read instructions on how to get from A to B, and then draw a map showing the sequence, or they may read information about a subject and then represent it as a graph.

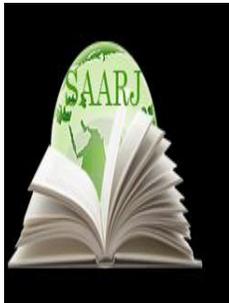

***Reasoning-gap activities***: These involve deriving some new information from given information through the process of inference, practical reasoning, etc. For example, working out a teacher's timetable on the basis of given class timetables.

***Role plays***: activities in which students are assigned roles and improvise a scene or exchange based on given information or clues.

Relying on collected facts and arguments, one can definitely infer that, teachers need to display a range of roles such as being: role models, motivators, supporters, facilitators, and relation managers. The common understanding is established in the guidelines and we asked learners to follow them. In addition, clarity is very important for us all. They will get better grades if the ideas are clearly stated and when the writing has a beginning and a conclusion or an appropriate end. Organization is everything, and the more organized the arguments are, the higher the grade in case it meets the requirements set for the content, of course.

## PROBLEMS OF THE DEVELOPMENT OF WORD FORMATION IN MODERN LINGUISTICS

**Saliyeva Surayyo\***

\*Senior Teacher of UzSWLU,  
 UZBEKISTAN

---

### ABSTRACT

*This article is devoted to some theoretical problems of word formation. This term is understood as the formation of new words, due to the needs of the communication through various word-formation means, acting in a given language in a given period of its development. As you know, the creation of new words to meet the demands of the communicative intention is the main function of word formation. On the one hand, it is closely connected with vocabulary, on the other with grammar and thus, it allows including a section of word formation in the description of the vocabulary of the language and its grammatical structure.*

**KEYWORDS:** *Word Formation, Word- Derivation, Productivity, Referent, Affixation, Grammar, Prefixation, Suffixation, Synchrony, Diachrony, Compounding Vocabulary, Grammatical Structure.*

---

### INTRODUCTION

Linguists agree that the language is a social phenomenon, associated with different areas of human activity; therefore, the vocabulary of any language directly reflects all the changes that have taken place and are taking place in social production, cultural, and other fields of human activity.

Vocabulary of any language is replenished with vocabulary units, in various ways. Like other languages, modern English is replenished mainly in two ways: word -formation or borrowing.

In the linguistic literature related to the issue of formation words, the terms word-formation are used. This term is understood as the formation of new words, with the help of various word-formation means, and acting in a given language in a given period of its development.

Certainly, the creation of new words is the main function of word formation. This function is well characterized, for example, by P.A. Soboleva: “language without its actual formation could not have a derivational composition that would correspond to the development of society”.

Indeed, the endless process of cognition of the world, the emergence of new concepts and the modernization of existing ones, the discovery and creation of more and more new objects of reality require the language to provide the speaking team with the necessary number of words, object names, characteristics, etc. this is evidenced by A.I. Gelyaeva: “..... man has to talk about more and more new things that he discovers in nature or produced by man’s own labor. This, by the way, requires the construction of such a language model, in which not only the set of phrases is infinite, but the vocabulary is also infinite: As we see it, word formation is one of the most important linguistic mechanisms that ensure the infinity of the vocabulary”. However, word formation, obviously, does not in the full sense of the word “infinity” of the dictionary, i.e. to the extent that the grammar provides for the construction of an infinite number of phrases. The lexical content of phrases is not limited by anything (in the grammatical sense), but the peculiarity of word-formation is that the possibility of spreading word-formation process (acts) to lexical principles is subject to various restrictions. In other words, word formation creates potencies for an infinite vocabulary, potencies that are never fully realized. In particular, it depends on the linguistic traditions of the collective.

However, the lack of development of the theory of word formation, in particular, due to the fact that this aspect of the teaching of language is only beginning to gain autonomy, does not yet give an opportunity to talk about certain rules of word formation. Moreover, it is still completely unclear what concept in a general sense should be invested in the expression “rules of word formation,” “principles of word formation,” etc. For example, Fowler, speaking of “principles of word formation,” refers to recommendations on the compatibility and incompatibility of certain English and non-English, as well as living and non-living foundations and word-formation elements. He gives the following examples of “mis formed” words: amoral, automation, backwardation, bi-weekly, bureaucracy, cablegram, climatic, coastal, coloration, dandiacal, floatation, gullible, impedance, pacifist, speedometer, breat-halyser and triphibious.

Citing this list, Fowler writes further: “word-making, like other manufactures, should be done by those who know how to do it. Others should neither attempt it for themselves, nor assist the deplorable activities of amateurs by giving currency to fresh coinages before there has been time to test them”. As can be seen from this quote, by “principles of word formation” is meant here, what can be called the recommendations of purists and “good” and “bad” words.

Word formation is closely connected with vocabulary on one side, and grammar on the other. The connection between word formation and vocabulary is that each newly formed word becomes a unit of vocabulary. At the same time, however, the process of creating new words is carried out according to the models, forms that are peculiar to this language. In addition, each newly created word includes one or another lexica-grammatical category of words, called a part of speech. This is the close connection of word formation with grammar. Close connection of word formation with vocabulary and grammar allows including a section of word formation in the description of the vocabulary of the language and its grammatical structure.

Language is a product of a number of epochs, therefore, the vocabulary of a language can be found as words created using such methods of word formation, which acted in the early period of

the development of the language and have now become productive and words created using word formation methods. Among the first, i.e. unproductive with respect to the English language should note the alternation of sounds, stress changes, substance, lexicalization. The second group of methods of word formation, along with collocation, conversion, abbreviations, also includes affixation and, in particular, one of its subtypes, prefixation, which in the linguistic literature is considered as a method of word formation involving prefixes with roots and stems.

Prefixation as a method of education appeared in the Indo-European languages rather late. Therefore, the prefix origins are more or less clear compared to the origins of other derivational morphemes.

One of the sources of prefixation is prepositive particles, which over time receive word-formation functions. Each language prefix can be classified according to certain criteria. For example: by their origin, by their purpose and by their function.

Before turning to the question of how the system of word formation is arranged and what it is made of, it becomes important, if only in general terms, on the question of how this system functions. Word formation, less than any other system, can be represented as a statistical aggregate of once and for all these models, frozen in flawless regular correlations and implemented in more or less voluminous word-formation series. The mere fact that many of these series are not closed and closed gives the whole system the character of a mobile system, differing more in development possibilities than in the realization of all the possibilities incorporated in the system in the form of ready-made derivatives- their formulas. Open character of the word-formation system distinguishes word-formation among other formalized systems with their more stable configuration.

It is not only a matter of much greater potential for changes within a single word-forming series or in the relationship between various word-formation series. Greater mobility and distinguishes a word-formation from a paradigmatic series: the completion of a word-formation series, on the one hand, and its separate components falling out of it, on the other, is generally more frequent and simpler than redistribution within paradigmatic series. It's, therefore, not the fact of the transformation of various parts of the system, but the speed with which these transformations occur.

It is the rapid rate of change that leads to the fact that the system as a whole is characterized only by relative stability, and its boundaries at any given moment are definable only conditionally. What is the measure of this convention?

How to determine the boundaries of word formation? Solving these questions means answering a whole series of questions about the essence of understanding language phenomena in their statistics and in their dynamics, in synchronous terms and in terms of diachrony. With regard to word formation, these questions can be formulated as follows; how to carry out the description of the system of word formation in a purely synchronous plan, if this system acts simultaneously both as a result of development and as a kind of language creation process; whether it is possible to describe this process without restoring to clarifying the framework of its temporal assignment or abstracting from the time factor; can, finally, be called "synchronous" such a description of the system, which inevitably includes the concept of the evolution of its individual elements? And what, actually, the length of time is a decade, several decades, half a century, a century, etc.

– can be considered sufficient and accessible so that in relation to it we can use the term “synchronous”?

Of course, the known instability of the system and, in particular, the uneven rate of transformation of individual links of the system complicate the answers to all these questions. It is not possible to exclude descriptions of word-formation in the synchronous plan, however. Moreover, precisely because of the mobility of word formation, the principle of strict separation of synchrony and diachrony becomes especially important here.

With the change of various links of the word-formation system, not only the quantitative and qualitative characteristics of individual word-formation series, but also the ratio of its constituent units –models of the derivative –change in it. In this respect, the interpretation of the same units from the synchronous and diachronic points of view is completely different.

From a historical point of view, for example, formation such as English Childhood ‘детство’, boyhood ‘отрочество’ etc. represented complex words (in Old English, the word had ‘состояние’, ‘образ’, ‘положение’). From the synchronous point of view, we have before us ordinary suffixal derivatives parallel to other abstract denominative formations.

Naturally, when transformations occur before our eyes, synchronous and diachronic descriptions can come into direct contradiction (see, eg., the formation of new affixes, when any morpheme, which is not yet completely independent, begins to be used as a derivational particle, i.e. functionally changes its purpose). The ambiguity of the phenomenon in itself, and no metaphysical distinctions, against which our most prominent linguists so rightly speak, here cannot.

In contrast to the purely synchronous analysis aimed at establishing correlative pairs, historical parallels and excursions contribute to discovering the cause of the connection between various phenomena and allow revealing some regularities of the functioning of the word formation system. Thus, referring to the history of the period before the studied one can help to explain the reasons for the sudden spread of one of the methods of word formation due to the disappearance of another method or by contacting the given language with any other language and borrowing. Nominal word formation in Germanic languages is in the book “Comparative Grammar of Germanic Languages”. As a result, knowledge of a broader historical perspective for the development of a given language or group of languages is not only desirable, but also necessary. And in detail about this can be found in the work of H. Marchand “The categories and types of present-day English word-formation”. It would be important to highlight the range of problems in word formation, the coverage of which, due to their specificity, requires taking into account diachronic data.

But which models should be considered as forming a word formation system?

On this the opinions of many linguists differ. So, according to academician L.V.Scherba, the rules of word formation, first of all, the rules of active word formation, this is “how to make new words”. The question of how ready words are made is a matter of vocabulary. Moreover, it is possible to learn in more detail in his works “The Next Problems of Linguistics”. There is no doubt that in describing the word-formation system of a particular language, we will give preference to the most used common and productive models and try to distinguish between models by which even now new words are created, and word-building types are less common,

unproductive, disappearing. In our description, perhaps, it will not be given at all a place for unproductive models. Yet, consciously or unconsciously, we will be guided by the selection of material to be considered, one rather simple rule: take into account those models “that are perceived by native speakers as a living construct within the framework of a particular semantic category.”

This does not mean, however, that only living languages can be studied in synchronous terms. This only indicates that, in the study of modern languages, their carriers can provide us with invaluable assistance, which we often underestimate and which it is so difficult for us to replace with other criteria in the study of so-called dead languages. In principle, the basis for the selection of the material remains the same; only such correlative pairs are included in the synchronous system of word formation, whose existence is easily verified by repeatability under the same conditions. The moment of the structural-semantic correlation of the original and derived units plays a crucial role in this. On it builds relations of production. The latter are central to the whole system of word formation.

English vocabulary continues to be updated and replenished with new units.

According to some data, on average about 800 new words appear in English in a year – more than in many other languages. This vocabulary replenishment is not only due to various borrowings, including neologisms, i.e. create new words using models of another language by translating morphemes (such a word, for example, is chain smoking, калькированнонемецкое "kettel-rauchen"), but also at the expense of the “internal resources” of the language system – word-building processes and rethinking existing values (secondary nomination). To persist, according to the expression B.A. Serebrennikov, “in a state of communicative fitness”, the language must constantly be rebuilt and developed without losing the originality of the system.

Not every new word created by a speaker is fixed in the language. Initially, this word is occasionalism, the meaning of which is rigidly connected with this context and is not perceived outside of it. Later, if there is a whole complex of prerequisites for this, the word may gradually be fixed in the language (lexicalized); at this stage it is already a neologism, which can either finally enter the lexical system, or stop its existence.

A new word can be new, either in form, or in content, or in form, and in content. Based on this, it is customary to distinguish:

1. neologisms (new form and new content) - bio-computer, telecommuter, audio taper;
2. rename (new form – already known content) - sudser (soap opera), big C (cancer);
3. rethinking (already existing in the language of the form – new content) - acid (narcotics), bread (money), box (TV-set).

The first two groups assume the use of the internal resources of the English word-formation system. So-called phonological neologisms can also be added to them, i.e. artificially created sound configurations. Most often these are terms or trademarks, often associated with morphemes of Greek or Latin origin (acryl, perlon). The third group relates to the sphere of the secondary nomination of the value change.

1. **Borrowing** from other languages is one of the most common ways to form words. Such an original word as “paparazzi” was borrowed from Italian language and “tsunami” from Japanese.

2. The next type of word formation is **transliteration**: the words are different in pronunciation, but in fact they are the same. Often transliteration is used colloquially: gonna – going to, pix – pictures.

3. In English, words appear with the help of **conversion** – the transition of one part of speech to another; the form of the word does not change. A noun can turn into a verb, in English you can often hear words text, skype, email, denoting action.

4. **Contamination** is often observed when two or more bases are mixed for example: global + localization = globalization – глобализация; net + etiquette = netiquette – правилаповедениявИнтернете.

Short words are often used colloquially, they have become common. The word “gossip” is gradually being replaced by “goss”, in order not to pronounce the long word “demonstration”, you can simply say demo.

5. In English, new words are formed by **affixation**. Word formation suffixes are added to the existing word, among them -athon, -busting, -fest, -gate, -impaired, -ista, -meister, -ville. For example, an entertainment-master – экспертвразвлечениилюдей. There are many prefixes that are necessary for word formation, among them there are those by which it is clear that the word has a negative connotation: un- (unbelievable), im- (impossible), in- (incapable), non-(non-essential). Common prefixes include the following: over- (overpay), pre- (prehistoric), de- (decontrol), re- (reconstruct), sub- (subdivision), co- (co-operation), inter- (international) and others.

6. Another method of word formation in the English language is the **merging of two words**, sometimes you can see a combination of three words. For a word to have a complete logical meaning, there is a definite connection between its components, for example, basketball – баскетбол, mother-in-law (матьвзаконе) свекровь.

7. New words can be formed using particles [a type of affixal way], a clear example is the derivation of phrasal verbs: find out – узнавать, weed out – удалять, talk up – хвалить.

Word formation in English also occurs with the participation of the Greek – Latin components. You can often find words with these elements cur orcour: excursion – экскурсия, course – курс, currency – валюта.

English is unusually rich. Sometimes new words are thought out very quickly, which is why they do not have time to get into the dictionary. Most English words have more than one meaning; sometimes there are difficulties when translating them separately. To correctly translate a sentence, it is important to consider the context. If you know the basic ways of word formation, you can learn vocabulary more easily.

The factors causing the development and replenishment of the vocabulary of the English language can be divided into:

1. linguistic,
2. non- linguistic,
3. mixed.

Allocate quantitative and qualitative enrichment of vocabulary. Quantitative completion – creating new words. It is divided into internal and external methods. Qualitative vocabulary replenishment is a change in the semantic structure of a word.

A large role in the development of the vocabulary of the English language played borrowings from the Latin and French languages. Scandinavian languages also had some influence on the English dictionary. Borrowing Latin vocabulary: I –V centuries AD –Roman domination: kettle, wine, cheese, butter, cheap VI-VII centuries – the Introduction of Christianity in England: angel, candle, priest, school, church XV-XVI centuries- the development of culture in the era of Renaissance: animal, formula, maximum. Borrowing French vocabulary: XI – XI centuries – 1066 – the Norman Conquest: French supremacy in the country, French is the official language in England, there was bilingualism in the country (ability, accompany, beauty, coin, plate). Borrowing Scandinavian vocabulary: IX c. – Scandinavian conquest, England enters the power of the Danish king. From the Scandinavian dialects in the English language entered common words of broad semantics: they, their, take, give, call, get, raise, want. It is believed that the Scandinavian influence contributed to the falling away of the endings in English words, and, ultimately, to the establishment of an analytical structure of the English language. The periods of the history of English. Old English – 5-11 centuries (from the moment of the resettlement of the Germanic tribes of the Angels, Saxons, and others to the British Isles and until the beginning of the intensive influence of the French language and the establishment of bilingualism in the country). Middle English – 11-15 centuries. (until the cessation of bilingualism and the formation of the national English language) Modern English – 15 century. Borrowing vocabulary can occur: orally and in writing. In the case of borrowing verbally, words are quickly fully assimilated into the language. In the case of borrowing by writing, words retain their phonetic and grammatical features longer. Borrowing can be direct and through intermediary language. For example, many borrowings from Latin came to English from French, or many words from Greek fell into English from Latin. The main methods of borrowing: - Transcription (phonetic method) – borrowing a vocabulary unit, which preserves its sound form. From Fr. to Eng.: ballet, bouquet, from English: футбол, трейлер. - Transliteration is a borrowing method in which the way of writing a foreign word is borrowed, the letters of the borrowed word are replaced with the letters of the native language. When transliterating the word is read according to the rules of the native language audio (лат. "слушать") - audience, audible demos (греч. "народ") - demography, democracy – Tracing is a borrowing method in which the components of a borrowed word or phrases are translated separately and combined according to the pattern of a foreign word or phrases. Many words based on Latin and French are created using the tracing method in English: masterpiece - фр. шедевр blue stocking - фр. ученаяженщина under consideration - лат. на рассмотрение Примеры заимствований Латинские: kettle, wine, cheese, butter, circus, angel, candle, priest, church, school Греческие: alphabet, character, psychology, Christmas, sympathy, physics Скандинавские: take, give, want, get, their, them, they, leg, egg Французские: - правительство: government, parliament, treaty, majesty; - еда: peach, lemon, beef, bacon, cream, biscuit; - церковные: baptism, sermon; - игры и развлечения: dance, chess, music, restaurant, pleasure, leisure; - литература: romance, poet, literary, story; - другие: treasure, memoirs, bouquet, ballet, fiancée, cartoon, engineer, cigarette, machine.

High-quality vocabulary replenishment – changing the semantic structure of the word. Many linguists consider changing the meaning of words and the appearance of new meanings in words as one of the ways to form new words.

## EFFECTIVE WAYS AND TECHNIQUES OF TEACHING A FOREIGN (RUSSIAN) LANGUAGE

**Shadmanova Nigora Ergashevna\***

\*Russian Teacher in Karshi Engineering Economic Institute,  
UZBEKISTAN

### ABSTRACT

*Teaching foreign languages is considered to be a complex system of actions which demands that both a teacher and learners should follow particular principles and methods to achieve their target in the process. Generally speaking, while teaching language skills to learners a teacher searches all sources and means for appropriate tasks and materials to make his or her lessons as much interesting for learners.*

**KEYWORDS:** *Methodology, Russian Language, Techniques, Method, Approach, Classroom, Student Centered.*

### INTRODUCTION

Principles of teaching are understood as starting statements which determine the purposes, the contents, methods and the organization of teaching and are shown in interrelation. In our case principles are used to define strategy and tactics of teaching Russian language at all stages practically in each point of educational process.

As far as the result of teaching of students' foreign language is formation their skills of using language as means of intercourse, the leading principle is the principle of a communicative orientation.

Its main function is in creation of all conditions of communications: motives, purposes and problems of intercourse. The communicative orientation defines selection and the organization of language material, its situational conditionality, communicative value both speech and training exercises, communicative formulation of educational problems, organization and structure of the lesson. This principle assumes creation of conditions for speaking and intellectual activity of pupils during each moment of teaching<sup>1</sup>.

Proceeding from the aforesaid teacher should follow the rules:

**1) Principle of communicative orientation**

- Selection of situations.
- Recurrence and novelty.
- Participation of everyone in intercourse.
- Favorable conditions for intercourse.
- Communicativeness of tasks.

As far as juniors have still insignificant experience of collective intercourse and they are taught not only to associate in Russian, but also to associate in general, teacher should provide the support on pupils' realizing the models of intercourse in native language, realizing the communicative function of this or that language unit. Realization of this principle is carried out through system of cognitive problems, solving which children "open" laws of the native language.

On the basis of this realizing there is children's acquaintance with the form and functions of corresponding units of Russian language.

Proceeding from this, it is possible to plan some rules - following which allows realizing this principle in teaching and educational process.

**2) Principle of support on the native language:**

- Display of generality between Uzbek and Russian languages.
- Formation of the common educational skills.
- Use of similarity and distinctions in the script.
- Use of similarity and distinctions in pronunciation.
- Uses of carry and avoidance of interference in teaching vocabulary and grammar.

It is established, that for each kind of speaking activity "set" of actions and even the lexical and grammatical registration<sup>2</sup>. It has allowed formulating methodical principle of the differentiated approach in teaching a foreign language.

Thus the differentiation is carried out as though at different levels of generalization - precise differentiation is conducted in teaching:

- oral and written speech;
- speaking and listening;
- reading aloud and reading silently;
- script and spelling.

In teaching Russian language process of integration is realized, it shows, first of all, that mastering of various aspects of language, its phonetics, grammar, lexicon occurs not separately as certain discrete components of language, but is also integrated. Pupils seize and acquire them during carrying out of speech actions which realization can demand the use of a word, word forms, a word-combination, super phrase unity and, at last, the text, caused by situations of intercourse.

Considering the given specific principle of teaching the Russian language it is possible to formulate rules, their observance will help the teacher to realize this principle.

### **3) Principle of differentiation and integration:**

- The account of specificity of each kind of speaking activity.
- Use of teacher's speech and sound recording for listening.
- Teaching monologed speech, proceeding from features of each form.
- Teaching reading aloud and silently in view of features of each form.
- Mastering of aspects of language in speech units.
- Use semi-typed font in teaching writing.

In a basis of teaching any subject at school including foreign language, there are general didactic principles. Such principles are: scientific character, availability, presentation in teaching, an individual approach in conditions of collective work and others.

Specific and general didactic principles express typical, main, essential, that should characterize teaching a foreign language at school and, first of all at the beginning stage where bases of mastering are pawned by this subject. The understanding of action of principles of teaching and direct use of rules will allow the teacher to carry out teaching effectively<sup>3</sup>.

The learning is the active process which is carried out through involving pupils in a various activities, thus making it active participant in reception of education. In this bilateral process it is possible to allocate the basic functions which are carried out by each the parts. The teacher carries out organizational, teaching and supervising functions. Functions of the pupil include acquaintance with a teaching material, the training which is necessary for formation of language skills and speaking skills, and application of investigated language in the solving of communicative problems<sup>4</sup>.

We distinguish three basic functions which are carried out by the pupil, and the teacher is to organize and direct the doctrine of the pupil. Then it is necessary to attribute acquaintance, training and application to the basic methods. Control including correction and an estimation is accompanying, as it is in each of the basic methods.

The organization of acquaintance with "portion" of a teaching material includes:

First, I. L. Bim marks, that display is addressed to sensual perception of pupils - acoustical, visual, motor<sup>5</sup>. The teacher can accompany display by some explanatory's;

Second, an explanation inducing pupil to reflection is necessary and enough for understanding and realizing of a perceived material with a view of the subsequent intelligent training and application. The teacher can involve various means of presentation.

Due to training memory of the pupil is enriched with new units of language and automatism in their use is developed. At application of new vocabulary organizing function of the teacher is shown most precisely. He should create favorable conditions, benevolent atmosphere for normal course of the speech act. He should make such conditions in which each pupil would like to participate in work of group, in which children aspired to understand the contents and sense of the text, they have read or listened to, and were not afraid to make a mistake. At application of

new vocabulary it is supervised formulation of speaking skills, it is established, how the pupil can use each of them in the practical purposes.

The considered methods reflect essence of pedagogical process in which the teacher and pupils cooperate. These methods are used in teaching a foreign language at school, open specificity of a subject and are directed on achievement of the practical, educational and developing purposes.

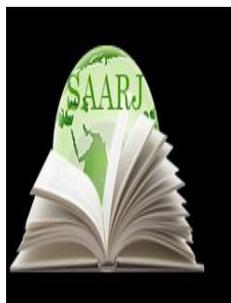

Each of the considered methods is realized in system of the modes used by the teacher in the organization of teaching pupils, carried out by the latter through the decision of set of the specific targets which are bound up with cogitative operations and perception by sense organs. Modes as well as methods are structural-functional components of mutual action of teacher and pupil. But if the method names the basic, dominating activity mode is bound up with the concrete action making essence of formed speech activity<sup>6</sup>.

It is very important, that modes which are applied by the teacher, let pupils solve tasks, and not just demand simple storing. And it is also necessary, that the pupil not only reproduces speech unit, but also creates his own «speech product », i.e. he can construct the statement in connection with a communicative problem facing to him, using units of language.

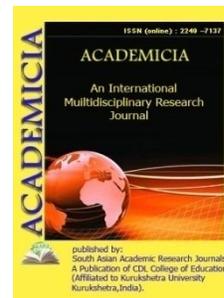

In conclusion, there is no key to future without learning any foreign language. It is very important and necessary to learn any kind of needed foreign-language in order to achieve success in a broaden area. Especially, in this integrated world it is significant to be capable of speaking in more than two foreign languages. Thus, there is always a certain question – how is it effective and possible to learn faster, effortlessly and automatically. Current tendency in national education make it necessary to state the fact that for most people the level of this education itself is not enough to become successful. Naturally, school knowledge is considered as a basis for the growth of many useful skills in life. The main purpose of learning foreign languages is the formation and development of the communicative skills and enhancement cultural capabilities of students, learning a practical mastery of a foreign language.

## THE ROLE OF HOME READING OF FICTION IN LITERARY TRANSLATION TRAINING

**Sultanova Said\***

\*Uzbekistan State World Languages University,  
 UZBEKISTAN

### ABSTRACT

*Today the translation activity covers the whole world. These days it is difficult to imagine any area of social, scientific, and cultural life without translation. Literary translation plays an important role in intercultural communication. Literary translation should consider how to develop in future translators a sense of language, understanding its clarity, correctness and expressiveness. In terms of lingua didactic principles set of exercises are useful in literary translation training. One of them is based on home reading of fiction. Reading, discussion, translation and comparison of different translated versions (by students) of authentic texts (fiction) give good results in students' training for literary translation.*

**KEYWORDS:** *Literary Translation, Translation Competence, Communicative Competence, General Educational Competence, Technical Competence, Text-Forming Competence, Linguistic And Didactic Principles, Authentic Texts, Home Reading, Fiction, Criteria.*

### INTRODUCTION

With the development of civilization, the role of translation in the life of mankind steadily increased, and in the second half of the 20th century there was a real explosion of translation activity, which covered more and more new areas of activity and, especially areas related to production, scientific and technological progress and international communication. Translation activity today covers the whole world. We cannot imagine any area of social, scientific, cultural life today without translation. That is why a significant place in the modern field of professional education is occupied by specialties related to foreign language and the study of translation.

The study of literary translation is a creative process; it is connected with the development of languages in their historical perspective. Language and speech in translation practice are tools of

cognition, thinking, have rich opportunities for creative enrichment of students. Mastery of language and speech is a necessary condition for the formation of a socially active person.

Teaching literary translation should consider how to develop in future translators a sense of language, understanding its clarity, correctness and expressiveness. And in this regard, the role of linguistic and didactic principles is important. The formation of translation competence takes place in exercises, which are understood as structural units of the methodological organization of educational material and as units of teaching foreign language speech activity, and, consequently, translation as an activity.

Translation schools consider the issue of teaching literary translation study in close connection with the development of creative thinking of a translator. Mastering a language creates the prerequisites for developing thinking, so the sooner the language is learned, the easier and more complete the knowledge of literary translation will be absorbed by senior students.

The main methodological approaches in the study of translation have developed within the framework of linguistics, while the time requirement is to shift the key vector of translation studies towards the cultural component. Experience of literary translation shows that the methods developed in its process such as periphrasis, translation by adaptation, imitating translations require careful selection and appropriate application in order to obtain an adequate result. This choice is determined not only by the language systems encountered, but also, above all, by the peculiarities of interacting cultures and the translator's mentality.

With the help of reading and translation of fiction it is possible to improve the interaction of cultures, i.e. the dialogue of cultures. It is not the cultures themselves that engage in dialogue, but people for whom the respective cultures draw specific semantic and symbolic boundaries. A good translator can find a way of dialogue between different cultures.

In literary translation training, the process can be divided into three stages with the help of exercises. At the first stage of training exercises for improvement of communicative competence and general educational competence are carried out, at the second stage - exercises for formation of technical competence, at the third stage - exercises for formation of text-forming competence. Step-by-step exercises to improve communicative competence and to form translation competences are closely linked to the method of teaching translation with the help of linguistic and didactic exercises. The translator must constantly maintain a high level of knowledge of the language he or she works with. This requires regular reading in this language, fiction and periodicals, watching programs to improve the understanding of speech and vocabulary.

In the process of fiction translation knowledge of the meanings of words and grammar rules is obviously not enough to carry out effective intercultural communication in the translation process. A translator needs to have a good knowledge of both the cultural peculiarities of the author of the text being translated and a good understanding of the culture of the audience for which the text is being translated. Translation practically serves to interpret the content of the text generated by one culture in terms of the culture for which the translation is being translated. At the same time, there may be situations in which fully adequate translation is impossible.

It should also be taken into account that the perception, understanding and interpretation of the texts to be translated are influenced by a third culture - the personality of the translator himself, his cultural characteristics, level of professional training and experience. Therefore, when

translating a text, methodologists recommend analyzing it in terms of cultural content. The purpose of this procedure is to develop the translator's ability to analyze cultural differences, to develop a special "sensitivity" to the cultural content of the texts being translated. And in this term the role of home reading and translation is significant. Home reading assists in clarifying the issues such as cultural characteristics of the potential text translation audience, characteristics of the possibility of taking into account cultural peculiarities of the text when translating and features of translation strategies used when translating a text.[1]

Home reading assists in ability to communicate with native speakers of a foreign language, using a variety of styles of communication; in ability to read authentic texts of English using different types of reading; in mastering of written speech skills; in ability to use the acquired knowledge and acquired skills in life. In our opinion, using fiction texts as texts for home extracurricular reading for students is more helpful in improving the quality of literary translation training.

Home-reading should be compulsory for all future translators. The use of home reading in the process of teaching literary translation in the classroom has several advantages:

- 1) Using texts for home reading in parallel with reading fiction texts leads to full mastery of the language. "It is reasonable to speak about home reading only in the middle and advanced stages of education, when students already have the necessary amount of words, grammatical knowledge and practical skills. [3] In the process of home reading, grammar and vocabulary skills become part of the skills of students. Thus the vocabulary of students is expanded and fixed.
- 2) With the help of home reading skills and independent reading and, above all, understanding the content of literary texts is improved.
- 3) Reading of literary works plays an important role in the process of fiction translation training, because on the one hand is a means of familiarizing students with the country, life and culture and on the other hand, enriching lexical and grammatical competencies, helps them develop other types of speech activity, i.e. listening, writing and speaking.

The quality of training in translation activity implies that future translators should have the following knowledge, skills and abilities: - knowledge of vocabulary; - knowledge of grammar; - knowledge of country and cultural information obtained from authentic texts. In translators' training, achieving a result in the reading process is very important because "reading is a speech activity aimed at extracting information contained in a written text. The purpose of reading is to reveal the semantic connections, to make sense of a visually perceived speech message" [2]

It is necessary to develop the professional orientation of translator training for intercultural mediation within the framework of "Home Reading" and analysis on the stylistic and lexical features of literary works. "Home reading" will become more effective if it is: a) aimed at the formation of the intercultural component of translation competence; b) is aimed at the formation of adequate and creative levels of the cultural and linguistic personality of the translator.

Obviously, when working with future translators it is very important to introduce students to the best works of the world. Home reading gives us the opportunity to acquaint future translators not only with these works, but also with the life and culture of the peoples of the world. When working on fiction texts, especially in discussions about fiction extracurricular texts, lexical and grammatical materials are actively used by students. At the same time, their knowledge is

transferred into skills and abilities. In the training of literary translation it is very important, because this is an indicator of quality training.

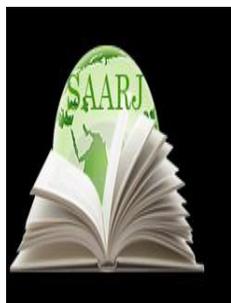

What criteria do we have to meet when selecting texts for my home reading? When selecting texts, the home-reading topics should be similar to those used in the classroom. For pretext work we can use questions about the content of home texts, it increases interest and confidence of students. In the selection of texts for home reading it is important that the classroom and home texts should be relatively the same in terms of lexical and grammatical difficulties. Students can be offered to translate texts at home and in the classroom, to discuss and compare translations with each other. Translation, along with the above tasks, will also help students to actively master the language.

Using fiction texts as texts for home reading increases the quality of literary translation training. Both the criteria for selecting fiction texts for home-reading and the methods of working on these texts are extremely important. More attention should be paid to the work on texts for home reading. Methodologists are convinced that the fiction texts themselves are not outdated, but methods of work on these texts are outdated.

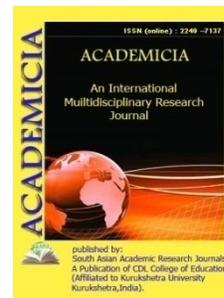

In our opinion, if teachers take into account the criteria for selecting fiction texts for home reading and the norms for working on these rich texts, the use of such texts in the process of literary translation training helps to improve the quality of training. It should be noted that home reading is one of the effective means of teaching literary translation and improving its quality.

## LEXICAL PROBLEMS OF TRANSLATING NEW PHENOMENA IN SOCIO-POLITICAL LIFE OF THE SOCIETY

**Badalova Luiza Kholmamatovna\***

\*Senior Teacher,  
 Karshi Engineering Economic Institute  
 Email id: luiza.badalova.01@mail.ru

### ABSTRACT

*Many translators believe that a socio-political translation does not require certain knowledge from them comparing to a special translation, for example, where it is necessary to have information in the specific field of translated area. However, background information plays an important role in socio-political translation, and the more extensive this information, the more adequate the final variant. The implementation of the socio-political translation involves considering and analyzing specific areal features and, of course, a high lexical level, since the vocabulary of the socio-political sphere is most susceptible to semantic changes. The equivalence of the translation means that the translator must create speech works in the target language that are amounting to the translated speech works according to the criteria.*

**KEYWORDS:** *Translation Process, Equivalence, Socio-Political Terminology, Transliteration and Transcription*

### INTRODUCTION

The socio-political sphere remains one of the most innovative. It is marked by a tendency towards civil progress, political and social advances, values and orientations.

The most typical ways of the formation of socio-political terms are: rethinking of individual words, stable combinations of non-phrase logical nature, as well as phrase logical units that do not have a prototype in the form of a variable phrase. It is also known that the terminological apparatus of sciences studying certain social phenomena has the ability to be popularized easily.<sup>1</sup> The presence of these attributes makes socio-political terminology an object of the study of linguo-culturology.

“Socio-political terminology” means a thematic combination of commonly used words and phrases of a stable and phrase logical nature, that are understandable by most native speakers, and which from a semantic point of view can be considered as socio-evaluative nominations. The informative component of socio-political terminology is implemented through explication in the meaning of social position or values. This layer of vocabulary is delimited from political science terminology, which is utilized only by specialists in special, politics-oriented sciences.<sup>2</sup>

Since the nominative units of socio-political terminology act as mental models for the perception of the world, designed to serve as a socio-political conceptualization of reality, this layer of vocabulary is a special channel for creating a corresponding picture of the world in the mass consciousness. It is proved that there are conceptual constructs familiar to native speakers, which influence any nomination formed on the basis of a trope.<sup>3</sup> This means that images that served as basis for the representation of knowledge about various fragments of the political picture of the world are in constant correlation with the living environment, life experience and culture of the people. Such representations carry traces of everything that is known by man - from visual and acoustic impressions to the ones of conceptual nature, which are formed under the influence of heard, seen or read.

For instance, the nomination ‘*stalking horse*’ (заслонная лошадь) in the sentence ‘*a candidate put forward in an election to conceal an anonymous person’s potential candidacy*’ (кандидат «для отвода глаз», кандидат-прикрытие) is associated with the natural-geographical and national features of the United States.<sup>4</sup> Originally it was used among hunters who lived on the Great Plains, where, due to scarce vegetation, hunters had to use their horses to hide while hunting a bison. The nomination ‘*flip-flop*’ (сальто-мортале) means ‘a sudden reversal of opinion or policy by a politician, usually running for office’ is based on the image of an acrobat performing dexterous and unexpected tricks. The feature of the ‘*dog-whistle*’ (свист-сигнал, который отзывается собака), ‘a type of political speech using code words that appear to mean one thing to the general population but have a different meaning for a targeted part of the audience’ (политическая речь, в которую заложены скрытые от широкой публики, но понятные целевой аудитории, значения и смыслы), is explained by acoustic impressions. These and many other examples confirm how important the role of “mental pictures” in reflection of the fragments of political picture of the world and in conveying the main features of these phenomena and their essential characteristics.

The English-language terminological apparatus of the political sphere is a dynamic linguistic phenomenon that is under active development. The nineteenth century is considered to be the golden age of the English political dictionary. It gave birth to the majority of nominations that are still actively used up to this day. Among them are: *left, right, center, spoils system, lobbyist, split ticket, party ticket, dyed-in-the-wool, office seeker, dark horse, lame duck, slate, standard-bearer, gag rule, straw vote, party machine, filibuster, to whitewash, to keep the ball rolling*, and others.

The origin of the phrase ‘to keep the ball rolling’ (вести длинную и широко масштабную предвыборную агитацию) dates back to 1840. During the election campaign in support of presidential candidate William Francis Harrison, an ingenious propaganda decision took place: a huge leather ball was rolled across the streets of American cities with the slogan “Keep the ball rolling!” on it.<sup>5</sup>

Some terms were borrowed from other linguistic cultures. So, 'left', 'right', 'center' (левые, правые, центристы) came to American political language in about 1840 from Great Britain, where, in turn, they were borrowed from France. These terms were used to indicate the location of the deputies of the French National Assembly, where traditionally representatives with more radical political views took seats to the left of the president, and representatives of the conservative clergy were located to the right.

Great Britain gave the terms like 'dark horse' (тёмная лошадка) 'a little-known politician who emerges to win a primary election and capture his party's nomination'<sup>6</sup> and 'lame duck' (хромяютка) 'a public official still in office after the election but before the inauguration of his or her successor' (непереизбранный государственный деятель). The author of the expression 'dark horse' is B. Disraeli, who utilized it in his novel 'The Young Duke' in the context of horse racing meaning 'a person who is not expected to succeed in or unexpectedly wins'.

The term 'lame duck' came from the London Stock Exchange, where it was used in the meaning of 'exchange bankrupt'. For some time, the original nomination remained, however, by the middle of the XIX century the term has entered the realm of politics. It is interesting to note that the nomination in the UK already has an additional negative connotation 'one that is weak or that falls behind in ability or achievement' (weak opponent).

Nominations as *smoke-filled room*, *grass roots*, *pork barrel*, *square deal*, *new deal*, *keynote speech*, *off the record*, *egghead*, *brain trust*, as well as words formed with the suffix - *gate* (Koreagate, Quakergate, Irangate, Watergate) entered political discourse by the beginning of the XX century. The word 'pork' was included in the vocabulary of politicians as a slang term for abundance (of any kind) with a suspicious origin. At the beginning of the XX century in the process of further phraseologization of the meaning of the word *pork*, the phrase '*pork barrel*' assigned the meaning 'a bill or project requiring significant government spending in a locality to the benefit of the legislator's constituents who live there'

(legislative approval of programs of state financing of individual regions in order to increase the popularity of the politician, whose voters live in the given region). The second half of the XX century is marked by a new surge in term-creation. The unstable political situation on the world's scene and the need to resolve emerging conflicts led to the birth of a number of terms based on military and diplomatic metaphors, like: *guerilla strategy*, *offensive strategy*, *defensive strategy*, *push strategy*, *pull strategy*, *strategic withdrawal*, *search-and-destroy mission*, *clean bombing*, *dollar diplomacy*, *give-and-take policy*, *good-neighbor policy*, *kid-glove diplomacy*, *big-tent policy*.<sup>7</sup>

A lot of nominations and phrases of phraseological character appeared at that time. For example, '*long hot summer*' arose in 1966 during an unprecedented upsurge of the struggle of African Americans for their civil rights and began to be used as a euphemism for the word '*riots*'. '*Straw man*' outside political terminology means 'imaginary power'. The political meaning of the term is as follows: 'a dummy candidate nominated for election in order to divert attention from another candidate and thereby split the political opposition.'

A lot of new words with metaphorical context and precedent have appeared in the political vocabulary recently. This feature of political terms is determined by the specificity of political communication. Imagery, an abundance of metaphors, orientation to word games and an

emotional influence on the addressee are the most essential characteristics of modern political communication.<sup>8</sup>

Real situation is a frequent source for new nominations these days. For instance, the phrase '*full Ginsburg*' – 'an appearance by one person on all five major Sunday-morning interview shows on the same day:

This Week on ABC, Face the Nation on CBS, Meet the Press on NBC, State of the Union on CNN and Fox News Sunday' (the appearance of a public person is one and the same day on the five main Sunday shows).

This term is associated with the name of William Ginzburg, the lawyer of Monica Lewinsky, who became the first person to find himself in such situation on February 1, 1998.

New nominations often force out generally accepted political vocabulary. For example, the phrase 'agonizing reappraisal' appeared in political discourse instead of a usual 'change of mind'; the word 'fringe' or the phrase 'lunatic fringe' (безумствующиекрайние) in the political language is used more often than traditional 'extremists'.<sup>9</sup>

The considered examples allow us to conclude that the role of extra-linguistic factors in the process of formation of the names of new phenomena is really great. The desire for novelty, the deliberate attempt of politicians to 'hide' their thoughts, euphemistic tendencies and, finally, the provocative style of political speeches - all this gives a rise to an abundance of neoplasm in the sphere of political vocabulary. Election campaigns, foreign policy, political traditions and socio-political practice of people is reflected in the socio-political translation.

The lexical layer of any language is recognized to be quite flexible and very sensitive to changes. Lexical field represents the interrelation of various spheres of public life (political, socio-economical, for example) with the language system. That is why transformations in this sphere occur continuously, making it unstable.

This fact creates a number of translation problems for a novice specialist of this direction. One of them is the inability to see translation problems. Replacing the words of the original with the words of the target language is a translation fault called literalism. L.S. Barkhudarov defined a literal translation as the one carried out at a level lower than it is necessary. If a thought can be expressed in the same way as it is expressed in the original, in this case there is a correspondence at both formal and semantic levels.

Each language is an original and specific phenomenon, and frequent coincidences are quite rare when comparing languages in translation. The meaning of the original is conveyed using translation correspondences. This creates the need for all kinds of translation transformations.

Describing the subject situation in English, one can use different predicate or configuration of attributes. "The predominant use of verb forms is distinctive to English. The Russian language, on the contrary, is characterized by a wider use of objectified actions and signs, which come out more frequently than in English. Interlinguistic factors can also lead to translation transformations, such as compatibility and change in communicative structure of the sentence."<sup>10</sup>

Lexical units of English and Russian here show various types of semantic correspondences between each other:

About one-third of the total vocabulary of the English language constitute words and phrases that are equal in meaning of its Russian adequation (i.e. fully correspond). Regardless of context, they are always transmitted constantly with the same equivalent.<sup>11</sup>

Most of these words are terms:

*agenda* - 'новостка дня'

*indictment* - 'обвинительный акт'

2) Second group includes English words, which have different correspondences in the Russian language. So, let us take the English adjective 'definite'. It can be translated as 'определенный', 'точный', 'ясный', 'конкретный' into Russian. All these nominations have something in common:

*definite opinion* – 'определенное мнение';

*definite statement* – 'не двусмысленное заявление';

*definite dimensions* – 'точные размеры'

Context plays an important role, when choosing the right match for the words of this type.

3) The English lexicon is polysemantic in general. It means that such kind of words has several interpretations, when translated into Russian. Quite often they have nothing in common.

A huge amount of English words (like football, manager, antenna), are just like Russian ones both in form and sound. The size of this vocabulary increases over time because of globalization. International words are often confused with "pseudo-international", which can have different meanings in Russian and English, despite its external similarity:

'*progress*' is not only '*прогресс*', but '*успехи, достижения, развитие*';

'*leader*' is not only '*лидер*', but also '*руководитель, глава (делегации)*'.

There are so-called "false friends", i.e. words similar to Russian ones in phonetic and graphic form, but with absolutely another denotation. These groups belong to the layer of hardly translated vocabulary we discussed above:

*prospect* – '*перспектива*' (а не '*проспект*');

*decade* – '*десятилетие*' (а не '*декада*');

*momentous* – '*важный*' (а не '*моментальный*').

The context helps to translate this lexical units adequately:

He was careless about his personal *prospects*.

Он не заботился о *своем будущем*.

The English socio-political dictionary is constantly updated with neologisms. These are new words and new meanings of already existing words that arise as a result of socio-political changes, the advances in technology and science. Neologisms arise when a word is used in a different, new context, when existing words can acquire new shades of meaning or new meanings. For example, the word '*confrontation*' at first carried the meaning of '*очная ставка*,

*сличение, сопоставление*’, but later transformed into *‘столкновение, противостояние, противоборство’*.<sup>13</sup>

Affixation is another productive method to form neologisms: reintroduce *‘повторновноситьнарасмотрение’*; decentralize *‘децентрализовать’*. Some neologisms were formed as a result of the expansion of the meaning of the old word. For example, the word *‘trash’* has the meaning *разрушать*, *громить*, *портить* in the American English: *to go out trashing* equals *to go out for things to destroy* - *‘заниматьсяпорчейимущества’*. When translating neologisms into Russian, the translator must, understand its implicit meaning by analyzing its structure.

A number of political terms appeared as neologisms: *political drudge* - *‘работяга’* (about a hardworking person); *straw man* - *‘подставнойкандидат’* and others.

The large amount of terms determines English socio-political. Most of the them are unambiguous: they assigned a specific meaning. Ambiguous terms create some obstacles in translation:

*engine* – *машина, двигатель, паровоз’*;

*device* – *‘устройство, аппарат, машина, эмблема, символ’*;

*attorney* – *‘прокурор; поверенный’*.

The literacy of the translation of terminological vocabulary depends on the competence of a specialist, which requires knowledge of the conceptual content of the terms, as well as the ability to distinguish the denotation from the surrounding reality. Here are a few examples of military terms:

*navy* – *‘военно-морскойфлот’*

*company* – *‘рота’*

*intelligence* – *‘разведка’*

If the first term is unambiguous, the rest may reveal their terminological meaning only in context.

But many lexical units do not have correspondences in the vocabulary of the target language. Such lexical units belong to “non-equivalent vocabulary” and are transmitted using the following methods:

**1) Transliteration and transcription.** The method of transliteration is the transfer of an English word into Russian using the reproduction of its graphic form – letter composition:

*Baltimore* – *‘Балтимор’*;

*Washington Post* – *‘ВашингтонПост’*.

Transcription conveys the sound image of the lexical unit, not its literal composition:

*General Motors* – *‘Дженералмоторс’*;

*Guardian* – *‘Гардиан’*;

*know-how* – *‘ноу-хау’*

The transfer of non-equivalent vocabulary into the Russian language is imprinted with the difference between the phonetic systems of both languages:

*Yehuda Avner* – ‘Иезуда Авнер’

*Elisabeth* – ‘Элизабет’.

Transliteration and transcription are usually used in combination: ‘Herald Tribune’ - ‘ГеральдТрибюн’ (the first word is transmitted by transliteration, the second – by transcription).

## 2) *tracing*

It translates the parts of an English lexical unit with the subsequent combination of the translated parts:

*backbencher* – ‘заднескамеечник’

*shuttle diplomacy* – ‘челночная дипломатия’

*White House* – ‘Белый дом’

3) **Descriptive translation** is a detailed explanation of a word or phrase translated. The need for this type of translation arises when target language does not possess the indicated realia (*maverick* – ‘государственный деятель, занимающий отличную от других позицию’). Another case is the peculiarities of combinability of words in English (*better-late-than-never admission* – ‘признание, сделанное по принципу «лучше поздно, чем никогда»).

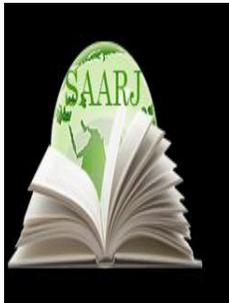

Some *politically correct* words do have an equivalent, however, the amount of them is relatively small. For example, ‘*indigenous people*’ (instead of natives) have the equivalent ‘*исконное население*’. In some cases, the translation uses partial correspondences, which are not a stable fact of translation, i.e. they are not a constant dictionary correspondence.

In conclusion, the general pattern of socio-political translation corresponds to the following words by L.N. Soboleva: “... the measure of accuracy varies depending on the purpose of the translation, the nature of the text to be translated and the reader to whom the translation is intended”. To conclude, this type of translation is one of the most popular directions due to the increasing intensity of international contacts and the amount of socio-political texts published annually. That is why conveying the original intent is of a great importance.

### ABSTRACT

*Cash may no longer be king. Cashless economy is an economy system in which there is little or very low cash flow in a society and goods and services are bought and paid through electronic media. It includes e-banking (Mobile banking) debit and credits card swipe or point of sale machines and digital wallets. Digital transaction or cashless transactions brings in better transparency, Scalability and accountability. This paper focuses on concept of cashless economy, pros and cons and knows the modes of cashless transactions. The digital India is a leading programme of the government of India with a vision to convert India into a digitally authorized Society and knowledge economy. "Faceless, Paperless, Cashless" is one of the declared rule of digital India. Cashless economies, as the name suggests are those that run frequently on plastic or digital money.*

**KEYWORDS:** *Cashless Economy, E-Banking, Digital Money, Demonetization.*

### **1. INTRODUCTION:-**

India is an enthusiastic effort to move towards a cashless transaction economy by minimizing the use of corporal cash. Digitalization is a process which help the economy towards a cashless Society. The trend towards use of non-cash transaction an settlement began in daily life during the 1990's , when electronic banking became popular. By the 2010's digital payment method where widespread in many countries with examples including intermediaries such as Paypal, digital wallet systems operated by companies like apple, contract less and NFC payments by electronic card or smart phone and electronic bills and banking, all in wide spread use

TABLE -1 TOP CASHLESS COUNTRIES

WE WANT TO HAVE ONE MISSION AND TARGET: TAKE THE NATION FORWARD DIGITALLY AND ECONOMICALLY

-SHRI NARENDRA MODI

Prime minister, Mr. Narendra Modi Launched the programme “**Digital India**” with a vision to transform India into a digitally empowered nation and creating a cashless, paperless economy. As per the current status of India, only 7% or 8% of all the payments are taking place electronically. Narendra Modi’s government Scrapped currency notes of INR 500 and INR 1000 Demonetization, Which is seen as an unprecedented measure, through a giant leap towards curbing corruption and forged currency. Even the RBI has also revealed a document “**Payments and settlement schemes in India: Vision 2018**” Setting out a plan to inspire electronic payments and to permit India to move to a cashless society or economy in the medium and long term. Digitalization is a process may help the economy towards a cashless society.

### **CASHLESS ECONOMY?**

A Cashless Economy is an economy in which all types of transaction are carried out through digital means.

### **2. Statement of the Problem:-**

As continuation of demonetization process, the cashless transaction activities are implemented and has impacted significant changes in country. In India most they are heavily dependent only on the cash economy, now everyone have to switch from cash to cashless transactions. Even government has restricted for cash transaction and pushed the people to adopt and implement cashless transaction.

### **3. Objectives of the Paper:-**

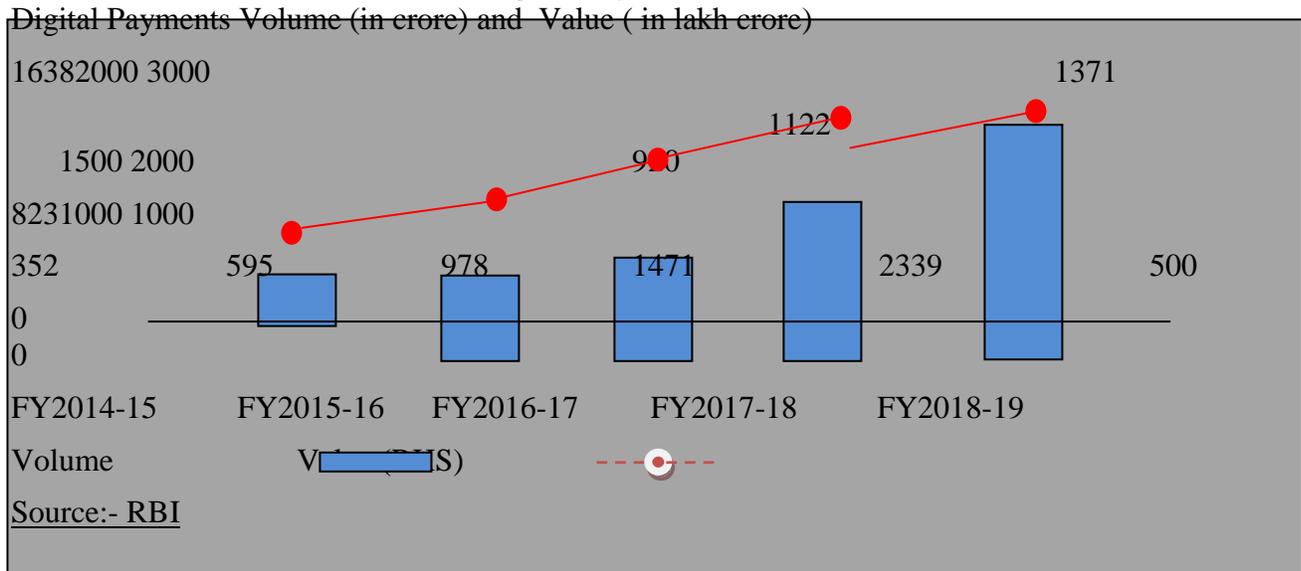

1. To study the concept of cashless economy
2. To know the benefit and challenges of cashless economy
3. To know the modes of cashless transactions

### **4. Research methodology:-**

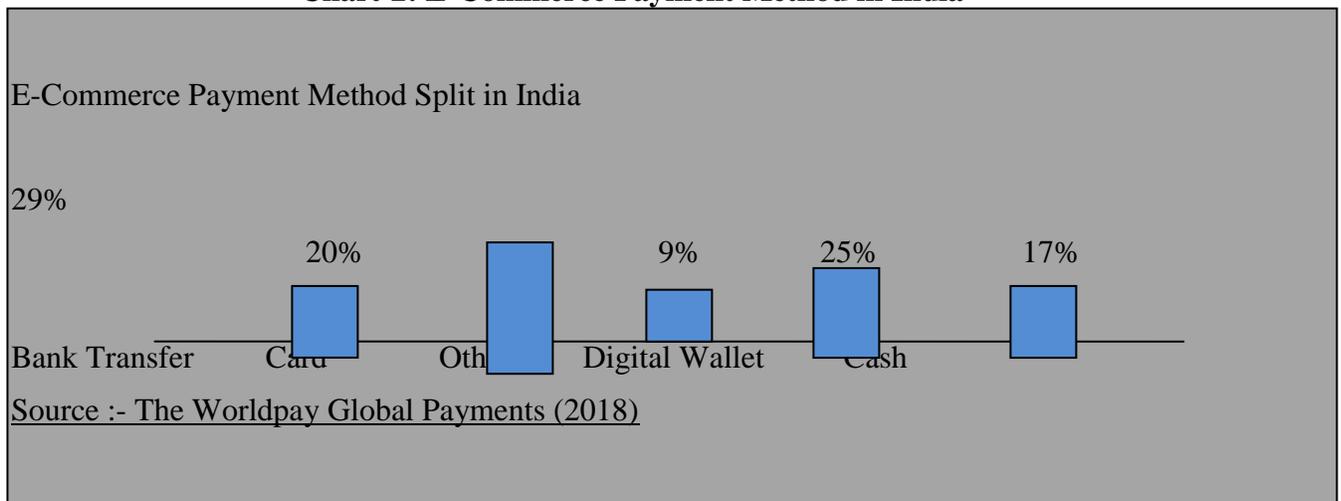

The study is based on secondary sources of data. Different books, journals, local news- papers and relevant websites have been consulted in order to make the study an effective one.

## 5. Cashless Indian Economy current Scenario

**Chart-1: Digital Payment Trend in India**

**Chart-2: E-Commerce Payment Method in India**

## 6. Modes of cashless transactions:-

1. Credit Card and Debit Card
2. Cheque
3. Demand Draft
4. Online Transfer- NEFT or RTGS
5. Mobile Wallets
6. E-Wallets
7. UPI Apps

8. Unstructured Supplementary Service data
9. Aadhaar Enabled payment system
10. Gift card

**TABLE -2 : TOTAL DIGITAL PAYMENTS (2020)**

System	Value ( Rs.Crore)	
	Apr	May
Credit Transfer – RTGS	64,43,653	70,41,869
Credit Transfer – Retail		
i) NEFT	13,06,406	14,81,750
ii) UPI	1,51,141	2,18,391
BHIM Aadhar pay	217	159
Wallets	8,693	11,080
CTS (NPCI Managed)	1,63,487	2,60,012
Total Payments	84,10,535	94,64,151
Total Digital Payments	82,46,850	92,03,924

Source: RBI Data

### **7. Benefits of cashless Economy:-**

**7.1 Transparency in transaction** – Needless to say, electronic dealings or plastics money always leaves a digital impermeable valuable for both the tax payer, consumer and the tax collector. It will curb generation of black money.

**7.2 Financial inclusion** - The will to have a cashless economy will promote financial attachment of the people. It will require the government to connect all the households with a bank and plastic economy.

**7.3 Higher revenue** - Unoriginal advantage of transparent transactions is collections of tax will increase.

**7.4 Lower transaction costs** – Digital business is born in turns of handling cost and waiting time. If fulfilled appropriately it will increase the fasting and production rates and there by cultivating the economy.

**7.5 Taxation** - With lesser availability of hard cash at homes and more in banks, there is lesser scope of hiding income and evading taxation and when there are more tax payers are ultimately lends to a lesser rate of taxation for the whole country.

**7.6 Less availability for illegal activities** – When people are encourage to go cashless, there is lesser cash available with the people and there won't be a means to invest in other activities to use the ideal cash. Channels like HAVALA [ illegal remittance] will ultimately suffer the brunt of a cashless economy.

**7.7 Hygiene** – Soiled tobacco stained notes full of germs are an average in India. There are many such happenings in our lives where we significantly or innocently notes, NO Risk.

### **8. Challenges of cashless Economy:-**

**8.1 Digital Literacy** – More than half of the nation still does not know how to use a Computer. People in rural areas still don't know about smart phones. Besides there is lack of internet facilities and without it a country cannot become cashless.

**8.2 Few Banks in villages** – The capital city New Delhi alone has about 20 HDFC bank branches. There are several villages and Tehsils that don't even have one. Banks in villages should be helpful in teaching the residents the process, usage and benefits of plastic cards.

**8.3 Low Literacy Rate** – Low literacy hinders the accessibility of banking services. Citizens should not only know how to read and write but also possess basic ICT literacy to fully enjoy the benefits of e-payments.

**8.4 Transactions are mainly in cash** – Nearly 95% of transactions takes place in cash. Large size of informal [ unorganized ] sector entities and worker prefer cash based transactions.

**8.5 Not enough smart phone and credit or debit card** – In India large number of people without a smart phones and other side 24 million Credit cards and over 660 million debit cards, now interesting bit about this number is that most of the people who have a multiple cards. This means the actual number of people who have the debit or credit card is less.

**8.6.** No law on data security

**8.7.** Sorry state of cyber security

**8.8.** Language barrier

**8.9.** Costly Swipe machines etc.

### **9. CONCLUSION:-**

A large informal group which is major constituent of India's population still runs on cash. Growth in government incentives has yet not proved fruitful and cash is still king in the market. To incline digital payments better internet connectivity and security against hackers should be provided to people along with this, uneducated and people living in remote areas should be trained to use digital means. The transparency in the economy will increase through the e-commerce transactions and the digital payment gateways which will increase the GDP of the economy.

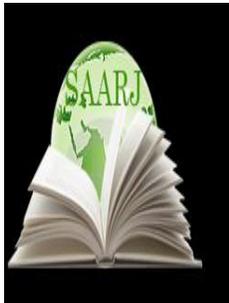

Current COVID-19 pandemic also effect digital payment transactions. This time increase digital payment. Last government all step of cashless is truly going to create ripples of big success and it will help to attain vision of prime minister Modi's vision of Digital India.

### ABSTRACT

*The world practice of laying asphalt concrete mixtures plays a very important role in the stability and durability of asphalt concrete pavements. Therefore, professionally executed asphalt paving allows not only creating a reliable road surface but also ensuring its long-term service, ease of repair in case of mechanical damage to the road surface. The quality of the paving of the asphalt mixture is critically dependent on the viscosity of the bitumen and therefore on the temperature. So, if the temperature of bitumen is too high, it becomes fluid, prone to mixing, and sometimes plays the role of a lubricant. In the process of paving, in addition to the temperature of the asphalt concrete mixture, the temperature climatic conditions in the work area are also of great importance.*

**KEYWORDS:** *Laying, Asphalt Mixes, Bitumen Viscosities, Mix Temperature, Temperature Segregation, Cold Spots, Protective Tarpaulin*

## INTRODUCTION

Over the past decade, the number of cars has increased several times. The volume of traffic is growing rapidly, and the intensity of traffic is increasing. Accordingly, the load on the roads increases every year.

Many roads fall into disrepair almost before our eyes, in a couple of months. The matter may be in the not very high-quality material used for paving the road, or in heavy loads that are not comparable with the norms. In any of these cases, the roads are covered with cracks and potholes. And in order to provide the necessary safety for vehicles, the road has to be repaired or re-laid[2, 1p].

Asphalt paving includes a whole range of works and is one of the most effective ways to build roads. Professionally executed asphalt paving allows not only to create a reliable road surface but also to ensure its long-term service, ease of repair in case of mechanical damage to the road surface.

## MATERIALS AND METHODS

The article uses a comparative analysis, study and nationalization of foreign experience, study and career guidance of technologies, methods of logic and generalization.

During the construction of highways, hot asphalt concrete mixtures are used as a material for road surfaces. From the analysis of scientific research, a feature of the use of mixtures is the need to lay and compact them at certain temperatures, depending on the type of mixture and the brand of bitumen. Also, a certain temperature must be maintained during the preparation, processing and transportation of the asphalt concrete mixture.

The quality of the paving of the asphalt mixture is critically dependent on the viscosity of the bitumen and therefore on the temperature. So, if the bitumen temperature is too high, it becomes fluid, prone to mixing, and sometimes plays the role of a lubricant (which is favourable for laying)[1, 3p]. When cooled, the mixture becomes harder. The cold mixture is distinguished by its viscosity, stiffness, elastic-plasticity, ensuring the connection of its fillers with each other. In accordance with GOST 9128–97, the temperature of hot and cold mixtures during shipment to the consumer and to the warehouse, depending on the bitumen parameters, must correspond to that specified in Table 1.

**TABLE 1. THE TEMPERATURE OF HOT AND COLD MIXTURES**

Mix type	Mix temperature, °C, depending on bitumen index						
	The needle penetration depth of 0.1 mm at +25 °C, mm					Nominal viscosity according to the viscometer with a hole of 5 mm, at +60 °C	
	40-60	61-90	91-130	131-200	201-300	70-130	131-200

Hot	from 150 to 160	from 145 to 155	from 140 to 150	from 130 to 140	from 120 to 130		from 110 to 120
Cold						from 80 to 100	from 100 to 120

In accordance with GOST 31015-2002 "Asphalt-concrete mixtures and crushed stone-mastic asphalt concrete", the temperature of the mixtures, depending on the bitumen binder used, when shipped to the consumer and when laying, must correspond to the values indicated in Table 2.

**TABLE 2. THE TEMPERATURE OF THE MIXTURES**

Depth of needle penetration, 0.1 mm, at a temperature of + 250C	Temperature, °C	
	On shipment	When laying, not less
from 40 to 60 inclusive	from 160 to 175	150
from 60 to 90 inclusive	from 155 to 170	145
from 90 to 130 inclusive	from 150 to 165	140
from 130 to 200	from 140 to 160	135

The time for transportation of hot asphalt from the place of its production to the place of laying depends on the remoteness of the asphalt mixing plants, and in urban conditions, in addition, on the intensity of traffic flows, the number of traffic jams on the way of the dump truck[9, 2p].

## DECISION

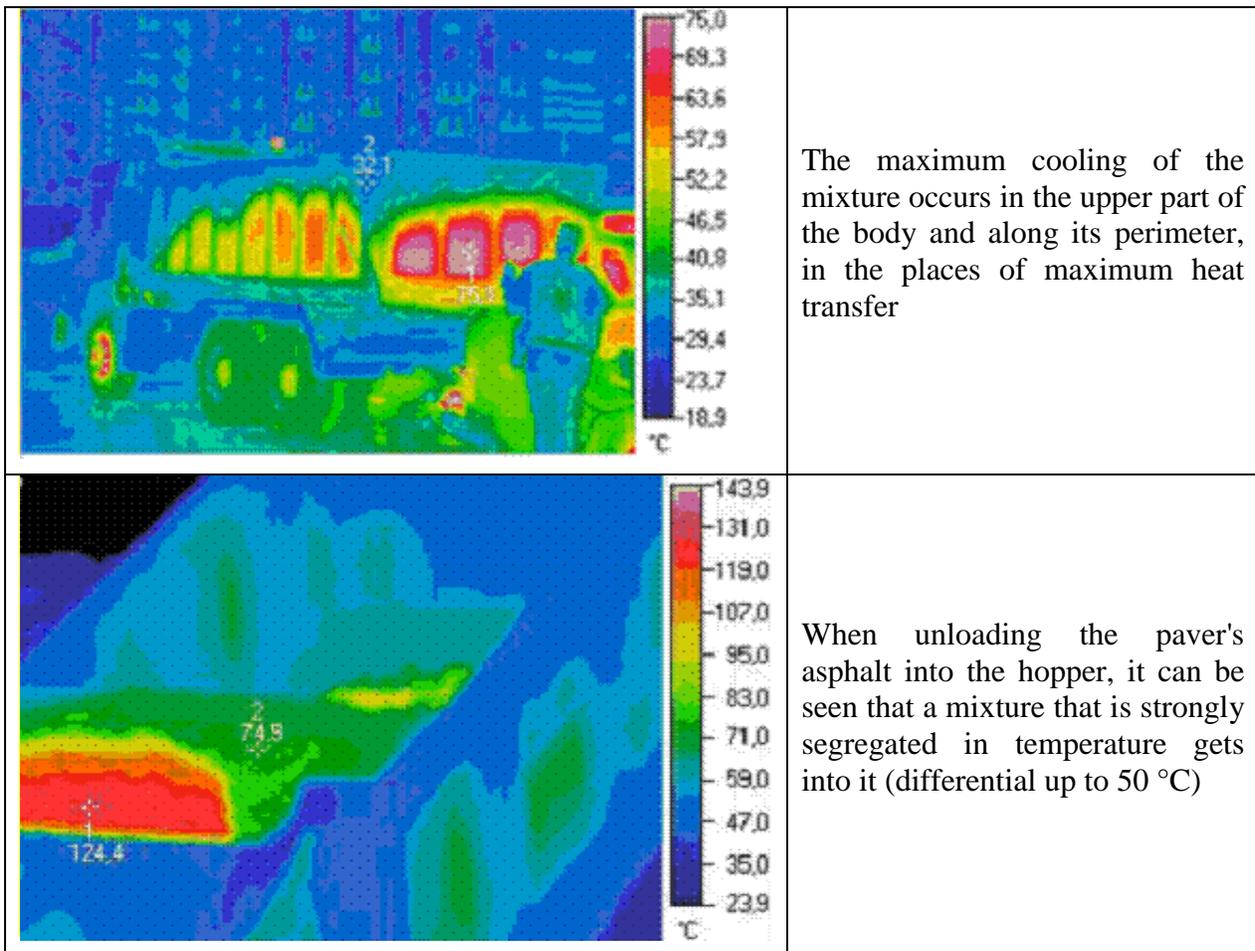

This leads to the cooling of the surface layer of hot asphalt in the places of its contact with the air by the dump truck body. During transportation, heavy fractions of asphalt settle to the bottom of the dump truck, this defect of the mixture is especially pronounced when transporting crushed stone-mastic asphalt, characterized by an excess of bitumen[6, 3p]. Also, the transportation of asphalt from asphalt mixing plants to the place of laying leads to the formation of temperature and fractional segregation (stratification) of the hot asphalt concrete mixture. Fractional segregation in a number of cases can be determined visually - in the form of bands of different roughness.

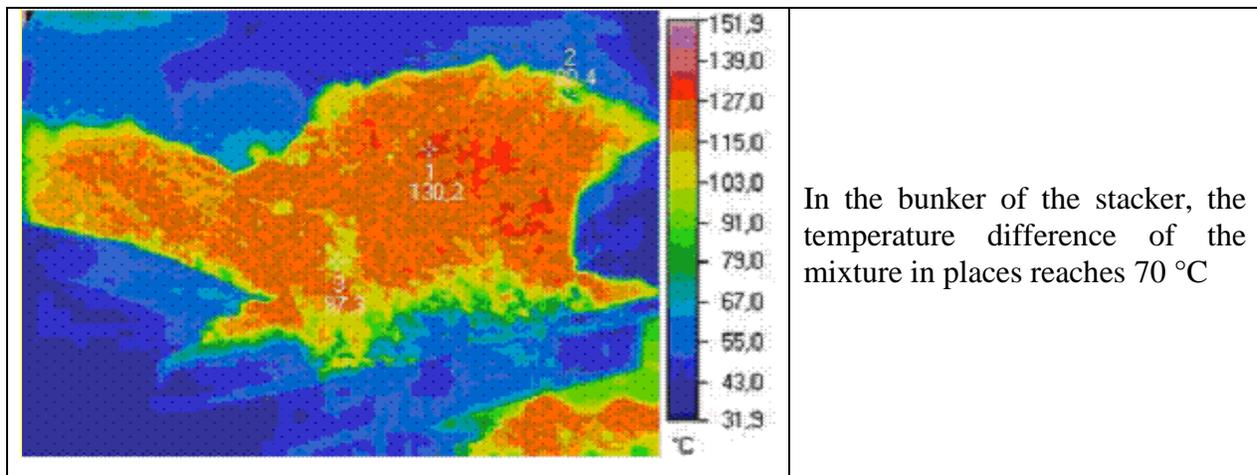

Temperature segregation is not detected visually, it can only be detected with a thermal imager (infrared camera), but its consequences have no less, and maybe even greater consequences for the durability of the road surface[10, 1p]. The low thermal conductivity of the asphalt mixture leads to the fact that pieces of the crust formed during transportation cooled to 70-80 °C, falling from the body of the dump truck into the bunker of the paver's asphalt and then under its slab, do not heat up to the temperature of the bulk of the asphalt, i.e. to 130-140 °C. These comparatively cold pieces form "cold spots" with a temperature of 15-30 °C lower than the temperature of the main area of the coating[3, 2p].

When the ambient air temperature passes through 0 °C, such areas are destroyed much faster than the main part of the pavement, since the moisture in the asphalt layer turns into a solid-state

– ice[8, 1p]. The transition from a liquid to a solid-state is accompanied by an increase in the occupied volume and destroys the coating from the inside. With heavy traffic of vehicles, under the influence of loads from its wheels, these areas are destroyed faster. Hence, potholes and local cracks in the coating, which significantly reduce its overall durability and often appear after 1–2 years of operation.

The photographs with an infrared camera, made at one of the objects, where work was carried out to replace the top layer of asphalt concrete pavement, are presented.

Therefore, a protective awning is offered - the awning protects the mixture from wind and rain, preventing its hardening and large heat loss. A double tarpaulin is especially effective in this sense. It should be removed only immediately before dumping by mixing the stacker hopper. The closed heat-insulated body keeps the mixture ready for laying for several hours, thereby facilitating the implementation of minor repairs[7, 3p].

As well as body closures. The best thermal protection is provided by a two-wall thermally insulated body. It is used in special cases, for example, to maintain the temperature of small amounts of the mixture for several hours when patching roads.

In the process of paving, in addition to the temperature of the asphalt concrete mixture, the temperature climatic conditions in the work area are also of great importance. Road construction is carried out by the device of roads, guided by regulatory documents (SNiP 2.05.02-85, as well as SNiP 3.06.03-85, etc.), prescribing the laying of asphalt concrete is clearly regulated temperature conditions (at least + 10 °C in the fall and + 5 °C in spring). This is due to the fact that the rapid cooling of the asphalt layer at lower temperatures sharply limits the time for its high-quality compaction, which leads to premature destruction of road surfaces and necessitates road works to repair highways[5, 3p].

Road construction, in general, has two “problematic” operations, which are especially sensitive to low temperature and wind that amplifies its influence - placing asphalt in the pavement and compaction. The thickness of the paving layer to be laid has an extremely strong effect on the cooling rate of the asphalt mixture. With fairly thin layers, negative temperatures from -5 to -10 °C reduce the rolling time to 10-15 minutes, which makes it impossible to perform compaction even with the minimum required quality.

Each period of structure formation affects the complex properties of the asphalt concrete pavement. To obtain a coating with the required properties, it is necessary to be able to control the technological process.

During the main period, when the asphalt-concrete mixture is prepared, stored in a storage hopper, and then transported to the place of laying and compaction, microstructural bonds are formed against the background of the intensive ageing process of bitumen. During this period, the main task of the technology is to destroy the primary point contacts between the particles,

evenly distribute all the components of the mixture and envelop the mineral grains with bitumen, and reduce the rate of its ageing.

The necessary condition for the favourable course of the process of structure formation is created primarily by the complete wetting of the mineral material with bitumen[3, 1p]. Wetting is impaired by the presence on the surface of the material of moisture adsorbed from the air, insufficient drying, contamination with dust and clay. During storage of the mixture in a storage bin and transportation, further distribution of its structural elements occurs under the influence of its own weight and the dynamic effect of dump trucks, as well as the ageing of bitumen. During overloading and long-term transportation of a mixture with certain structural and mechanical properties, its segregation (separation) is possible.

The final period of the technological process includes the operations of laying and compaction of the asphalt concrete layer, during which further formation of micro structural bonds takes place, and as a result of the convergence of mineral grains, the microstructure of the material is formed. The ageing of bitumen's slows down.

When the mixture is compacted, bitumen is squeezed out of the zones of increased tension. In this case, free bitumen fills the intergranular space, a film of adsorbed bitumen remains on the grains, and the strength of asphalt concrete increases[4, 5p]. The compaction operation can be controlled by adjusting the temperature regime of the asphalt concrete layer. An increase in mixture temperature slows down compaction. However, the lack of adhesive capacity of bitumen at high temperatures leads to a decrease in the ability of the mixture to compact. Compaction of the asphalt concrete layer must be carried out not at its maximum temperature, but at a rational one, which does the viscosity of the bitumen, the type of mixture and the type of compaction agent determine. The use of pneumatic and vibratory rollers allows the layer to be compacted at lower mixture temperatures. The compaction of the mixture is related to the nature of the stone material, bitumen and the shape of the particles. Asphalt concrete mix on limestone material is compacted better than on sandstone material, since bitumen is evenly distributed on limestone, and the adsorbed layer is more pronounced than on sandstone. The presence of natural rolled sand in the mixture reduces the work of compaction since the grains of sand serves as a kind of hinges along which larger rough and angular particles roll[5, 6p]. During the operation of the asphalt concrete pavement, the further formation of the structure of the asphalt concrete occurs. With a rationally selected composition of the mixture and effective parameters of technological operations, the asphalt concrete pavement is strengthened.

#### **ACKNOWLEDGEMENTS**

We thank the research director A.Inamov and N.Ergasheva for their help to translate into English.

#### **CONCLUSION**

The work on the construction of the main asphalt concrete pavement includes the following technological processes:

- cleaning the base from dust and dirt with sweeping machines, if necessary, drying and fine filling;
- verification of the geometric parameters of the base (width, elevations, slopes). Measurements are made by theodolites, levels and tape measures. Particular attention is paid to the presence of

irregularities when using machines with an automatic tracking system of the drive of the working bodies (irregularities should not exceed 2 mm). If the unevenness exceeds the permissible values, then in advance arrange a levelling layer on uneven places from the same material as the base, or from an asphalt concrete mixture;

- detailed alignment work of pavement edges, layers, working marks along the axis of the road, installation of the tracking system base. When using asphalt pavers without a tracking system, in order to comply with the required profile and marks, immediately before laying, control beacons made of asphalt concrete are set, the thickness of which should be equal to the thickness of the layer being laid in a loose state;

- device for bitumen emulsion priming. For a strong adhesion of the asphalt layer to the base, a day before laying, an auto-asphalt sprayer is sprayed with a bitumen emulsion (emulsion consumption is 0.6..0.9 l / m<sup>2</sup>);

- laying of asphalt concrete mixture. ABS is placed on a solid, clean and dry base at an outside temperature of at least 5 °C (for hot and warm mixtures). At low temperatures, special laying technologies are being developed;

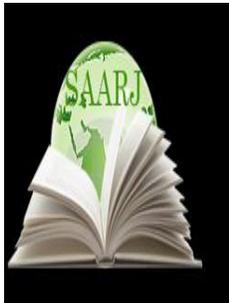

- seal ABZ. The supply of material (asphalt concrete mixture) is carried out by dump trucks continuously until the end of the work on the grab. For small amounts of work, the ABS is poured onto the base manually, smoothed and rolled. This technology is unproductive and requires a lot of workers. Modern construction involves the use of high-performance asphalt pavers.

Technological properties characterize the behaviour of mixtures in the process of performing technological operations: shipment, storage, transportation and unloading, stacking and compaction. The most important properties of asphalt concrete mixtures are homogeneity, degradability (separability), workability (mobility), workability (formability). By regulating these properties, it is possible to rationalize the parameters of the technological process in the direction of ensuring the quality of the asphalt concrete pavement with minimal energy consumption and the cost of work.

**ABSTRACT**

*The article deals with the issues of artistic creativity and innovation of products from his artistic form "artistic mood". Also considered the issue of a common product, which serve as an object of artistic thinking of the artist-designer. Further, the article analyzes the "artistic mood", the thought process of products, the essence of which lies in the close connection of factors "man-machine - environment". Thus, it must be recognized that product design should be a bridge between technology and human culture. The product design commitment should be sustainable and humane, and it should be beautiful, cheerful and warm.*

**KEYWORDS:** *Suit, Shoes, Shape, Nature, Symmetry, Function, Landscape, Line, Colour, Product Design, Ornament.*

**INTRODUCTION**

The composition of the costume as a volumetric-spatial structure is determined by a natural given - a figure. To a certain extent, the compositional method of grouping elements can be called a schematic diagram that determines the placement of the masses of a suit, a kind of skeleton on which forms are built up. This scheme is constant for various functional divisions of the suit. Functionality determines the nature of the forms. The character of the suit's forms, from which its harmonious integrity is created, is in turn determined by the plastic pattern of the form, which depends on the material, its plasticity. Thus, a chain arises the function of the suit, the material, the plasticity of the form, the plastic pattern, conditioned by the functionality of the

suit, its suitability for which this suit is intended. A costume is a shell and artistic and semantic entourage. Clothes, shoes, as well as the entire costume as a whole, combining useful and beautiful, are transformed into artistic products when they are endowed by the creator with some figurative, ideological, emotional, poetic meaning when they are expressive.

## **MATERIALS AND METHODS**

In the costume, as in all works of architectonic creativity, the category of form is central to the design system. The form and the process of shaping itself appear here in a pure form, without pictorial techniques. However, it should be noted at the same time that the appeal to figurativeness in works of architectonic arts occurs under the condition of complete subordination of pictorial logic, architectonic logic. This principle is especially clearly illustrated by pictorial ornament, i.e. extreme convention, stylized and schematic representation, the free connection of objects (elements or details), connected not according to the rules of their natural interconnection, but according to the rules of ornamental rhythm and symmetry. This means that in this case, we are not dealing with a pictorial language, but with an architectonic one. The artistic image of mass-produced items (including clothing and footwear) appears only when the man-thing system functions.

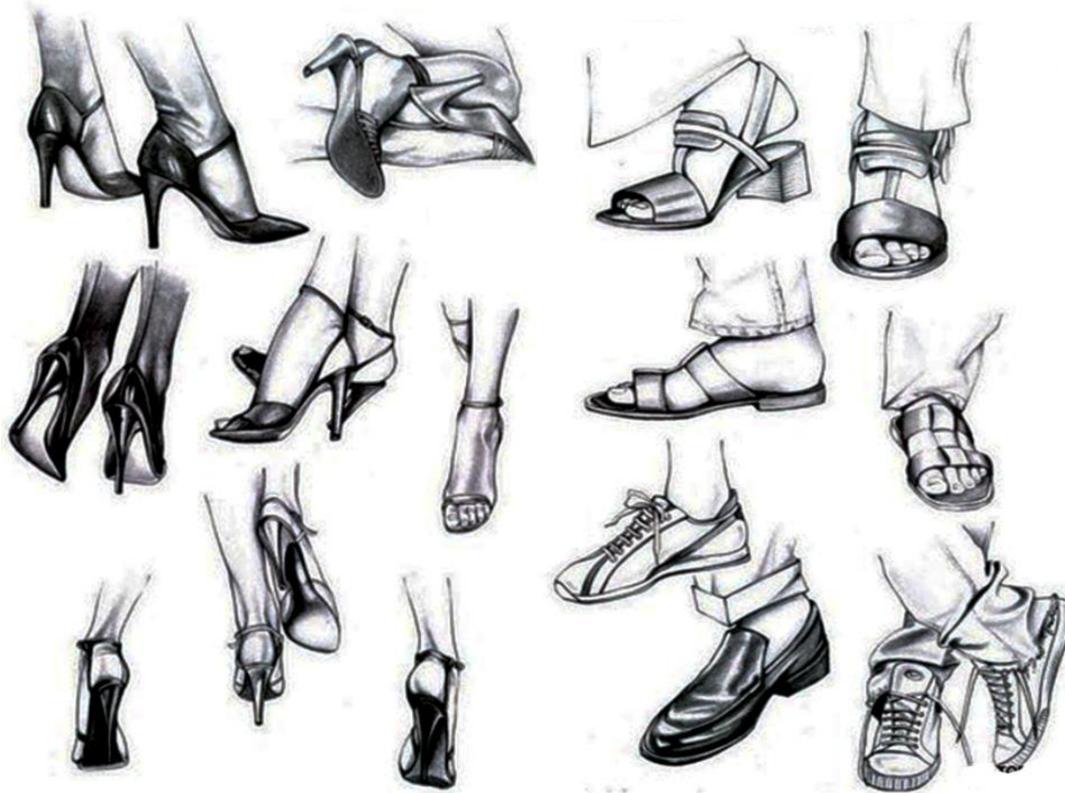

An artist, a promoter of great ideas, should act as a director who gives direction in the development of the image, leaving it to the actor, the person who will wear clothes, shoes, the right to deepen and improve it.

Creation of uniforms and shoes, clothes, etc. is inextricably linked with the concept of plastic. Plastic is the continuity of the movement of the form, smooth transitions from one element to another, creating the impression of the integrity of the form. Speaking about the plasticity of shoes, clothes, they mean at the same time the plasticity of the whole human body. Objects of the external world, which a person encounters, affect directly the sense organ, and above all on the vision. These sensations are the starting point for analysis, comprehension, processing into ideas and concepts.

On the path of living contemplation to abstract thinking, every mental process includes a moment of emotional reaction to man's perception of nature. Looking at a spring or autumn landscape, a person sees a collection of certain forms; colour ratios, which, as a result of repetition of perception, develop a certain emotional mood, are associated with various ideas of a person about life, flourishing, fading. In this regard, emotional-figurative expressions arise, for example, "colors of spring", "colors of autumn", "cold", "warm", "light", "heavy" colors, etc.

As a result of repeated repetition of perception, a person develops conditioned reflexes, which, thanks to associations, representations, can cause a certain emotional image, a certain mood. The words "heavy", "light", "soft", "hard", "fluffy", etc. have not only visual, physical but also figurative meaning. The spatial relations of forms perceived by us, the form itself, its lines, details have an equally definite character. The images that arise in this case are explained by the fact that the shapes of objects, their colour, outlines and other qualities are associated with the idea of rest, movement, takeoff, fall, etc., that is, with those mechanical properties that characterize their state in space. When creating any work of art, including a costume, the designer uses different lines. These are straight horizontal, straight vertical, oblique lines, curves, broken lines, mixed, parallel, intersecting, etc.

Horizontal lines create an idea of the width of the product, they create the illusion of completeness, tranquillity, stability. The wide toe part of the shoe, for example, reinforces the static, completes the plastic developed forms.

**Figure1. Plastics of shoes.**

Vertical lines create an idea of the length of the product, the impression of strength, solidity. These lines emphasize the growth, give a majestic appearance. Curved lines are the main structural and compositional lines in shoes. It is thanks to curved lines that, for example, we can create a three-dimensional Shoe shape from a two-dimensional blank that corresponds to the shape of a person's foot. Curved lines are diverse. When designing shoes, breaking lines are most often used in the design of certain parts – the beret, lining, etc.

Mixed lines are found in the design of shaped parts and shapes. The slanted lines emphasize the movement. Being transitional, they have the properties of both horizontal and vertical lines, can visually reduce or increase the shape and volume, depending on the degree of inclination and the nature of the direction. They are often used in cutting details, pinches, folds of clothing, shoes, bags, etc. parallel and intersecting lines are mainly finishing and decorative lines. All the infinite variety of lines can be reduced to three emotionally different groups: straight lines, lines with a constant radius of curvature-arcs, lines with a variable radius of curvature-parabolas, hyperbolas, spirals. Straight lines and lines with a constant radius of curvature cause a sense of static, calm, balanced, lines with a variable radius of curvature-a sense of variability, dynamics, anxiety, elegance. Parabolas and hyperboles cause an active emotional reaction, so they tire the psyche faster. Consequently, their use in shoes and everyday clothing is limited.

Practical needs do not allow a man to be indifferent to nature. Moreover, the more active a person is, the immeasurably more complex is his emotional apparatus. The variability of human emotions depends on the historical conditions of the life of society, the national characteristics of the people, the social status of various classes, the nature of the professional activity, and the experience of the cultural level.

So, in the perception of different peoples, the same colours can have completely different emotional and semantic meaning, for example, the colour of mourning is black for some peoples, white for others, and pigeons for others. An emotional attitude was formed, formed in a person for a particular object in the process of its creation. For example, a potter shapes a jug.

Experience confirms that a vessel expanding downward and a vessel narrowing at the bottom will evoke different emotional impressions, like melodies built on different emotional impressions, like melodies built on different sound ratios. Different steepness of lines in the form of a jug, in its transition to the neck of the vessel, different texture and colour of the material, ornamentation (degree and character) - all this emotionally affects the person looking at the jug in different ways.

Thus, not only a vessel is created, but also its certain appearance - solemn, festive, strict, amusing, pleasant, intimate, etc.

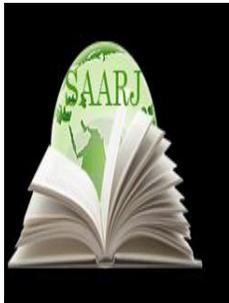

An artistic image is born here from the poetization of a prosaic everyday thing. The same phenomena are observed in the costume and its elements. Depending on the purpose, constructive basis, material, the costume, created at different times in different countries, figuratively embodies the most diverse ideological and emotional content. The beauty of a utilitarian thing lies in the proportionality of the elements of its form, which in turn is determined by the relationship between form and content.

## CONCLUSION

The concept of the beauty of shoes and clothes is not something permanent, unchanging. With the emergence and establishment of new forms, the former lose their beauty. The constant search for new forms, figuratively revealing the contents of clothing, shoes, accessories, the desire to date the modern solution of the form, the revelation of the beauty of the plastic texture, colour in new solutions is the task facing the designers.

### ABSTRACT

*The article presents data on the amount of waste yield obtained during processing at carding machines units of various companies and the possibility of using the fibres contained in them. According to the results of experiments conducted under production conditions, and concluded that the amount of waste produced is much less compared to the total mass.*

**KEYWORDS:** *Cleaning, Carding, Combing, Nutlet, Fluff.*

### INTRODUCTION

At the initiative of President Shavkat Mirziyoyev in the state policy for the modernization and diversification of light industry, as noted in the Action Strategy for the last 5 years of independence (2017-2021), "The cotton-textile cluster is a priority project for economic development" [1]. On the basis of this project, an excellent system of additional sources of income in the textile industry has been created. The consumption of raw materials in the

manufacture of textiles is the main factor determining the cost of production, and its share is about 85-90%. Therefore, it is important and relevant to find all the possibilities for the full and effective use of raw materials in the industry, their scientific justification and correct use [2]. Most of the raw material supplied for yarn production in cotton mills is separated into fibre waste. In particular, according to the spinning system, the average amount of waste is about 20% of the mixture, in the snow spinning system - from 12 to 18%, in the recycling system - up to 32% [3].

In textile mills, the carding process is one of the main processes affecting product quality. This is because, as a result of the carding process, the short fibres in the fibrous products are separated, and the fibres in the product are straightened and placed parallel to each other. Also, the carding process in yarn production has a huge impact on product quality. The roughness of the coarse product from carding machines is flat compared to the coarse product obtained from other processes, and the roughness is less [4].

### **MATERIALS AND METHODS**

Modern carding machines provide for the improvement of product quality and the implementation of measures for the final cleaning of fibrous products from debris. To do this, it is equipped with fixed carding to transfer parts of the product from one surface to another in order to increase the level of scraping.

The number of drums for cleaning the fibre product has been increased to 3, and the cleaning level of the machine has been increased. These parameters directly affect the quality of the product, leading to an improvement in the strength and purity of the finished yarn [5].

Defects in the fibre and the amount of foreign matter affect the spinning of the yarn, i.e. the yarn from the fibre and the efficiency of the technological process.

If the cleaning intensity is increased in the technological process, the amount of spinning fibre that can be released into the waste, along with the contaminated mixture and foreign bodies, can also increase [6].

Experiments have shown that fibres with elastic properties are also added to the waste separated as a result of the process of scraping fibrous products [2].

In recent years, a large amount of research has been conducted on the improvement and modernization of grinding and cleaning machines. A clear example of this is the fact that the efficiency of grinding and carding machines produced by the world's leading companies is recommended, especially the capacity of the carding machine to 200 - 270 kg/h. The speed of the current carding machines is more than three times higher than the previous combing machines, i.e. the main drum from 200 min<sup>-1</sup> to 900 min<sup>-1</sup>, the receiving drum from 700 min<sup>-1</sup> to 2700 min<sup>-1</sup>, and the speed of the hats from 100 mm/min to 400 mm/min resulting in a sharp increase in the productivity of the scraper. For example, it is suggested that the kinematic performance of Truszscher (Germany) TS-11, TS-15 carding machines can reach up to 260 kg/h [7].

The Swiss company Rieter claims that the C70 carding machines have a main drum diameter of 814 mm and a rotational speed of 600-900 rpm, with a capacity of up to 240 kg/h [8].

In a spinning system, a simple carding machine is a final process in cleaning the fibres from contaminants and defects, but as has been pointed out to some extent, debris, foreign bodies, and

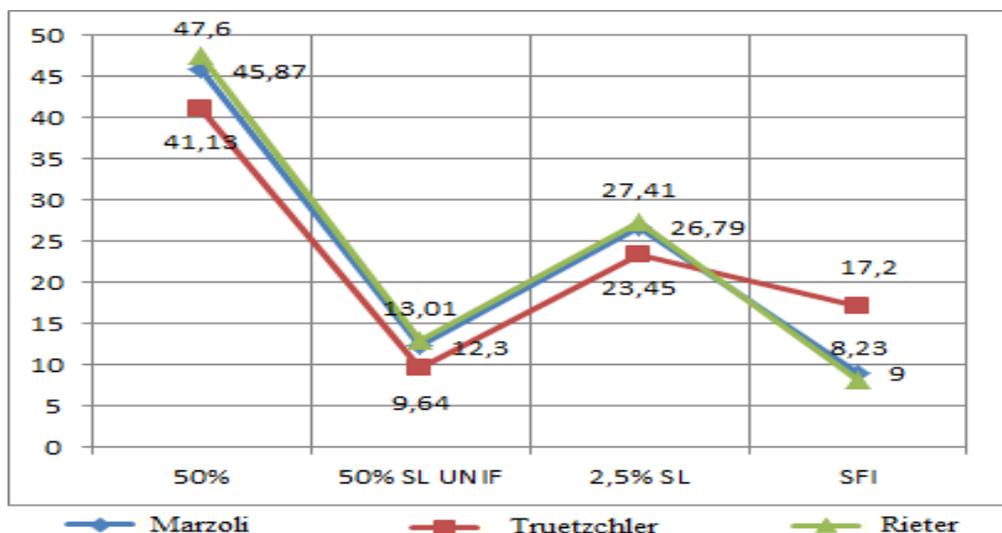

short fibres remain in the spinning system. Simultaneously with the removal of debris and defects in the fibre, a certain amount of waste and spinning fibres are also separated in the process of scraping [9].

Using the results of the study in production, the yarn breakage was reduced by 12-13%, the properties of the yarn were improved by 8-10% and the amount of waste was reduced by 3-4% [10].

In this research paper, the properties of the waste from different types of carding machines were determined and the results obtained were analyzed. To do this, *fibres were separated from the C60 1SN*, developed by the Italian company Marzoli, Model TC-03, developed by the German company Truetzschler and fibre waste from C-4 carding machines of the Swiss company Rieter was cleaned with the help of Shirley Amalayzer MK-2 equipment. The properties of the isolated fibres were determined experimentally on USTER system equipment and their average values were calculated. The results obtained from the experiments are presented in Table 1.

**1 - TABLE. PROPERTIES OF ISOLATED FIBRES**

Indicators	50%	50% SL UNIF	2,5% SL	SFI	AMOUNT	MICRONER
Standard 7						
Marzoli	45,87	12,30	26,79	9	445	4,67
Truetzschler	41,13	9,64	23,45	17,2	411,33	4,83
Rieter	47,60	13,01	27,41	8,23	367,67	4,77

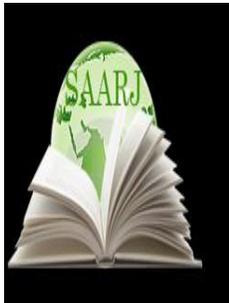

From the analysis of the figures given in the table, it is known that the micron air index of fibre in carding machines (ST-7) ranges from 4.67 to 4.83, with almost no significant difference in all types of carding machines. The share of spinning fibres in the composition of ST-7 waste from C60 1SN and S-4 carding machines was 26.79% and 27.41%, respectively. On the TS-03 carding machine, 23.45% of the yarn is spun.

## CONCLUSION

In conclusion, it is recommended to use the carding machine of the German company Truetzschler TS-03, since the amount of fibre spinning in the poultry is minimal, the performance is higher than in other models of carving machines, and the quality of the tape fully meets the requirements of the standard. Analysis of the results of the study showed that the efficient use of raw materials at the plant can be achieved by using spinning fibres in separable waste. Accordingly, it is recommended to use usable fibres from the wastes of the carding machine as raw materials.

### ABSTRACT

*This article explains the essence of the concept of linguistic expertise. The tasks of linguistic expertise are divided into general and special functions, and the specific tasks of linguistic expertise are defined in Uzbek written texts. The "principle" of language is based on the fact that language is related to law and plays a practical role in this process. Expands the main tasks of linguistic expertise and focuses on the leading factors in determining the object and subject of linguistic expertise.*

**KEYWORDS:** *Lawmaking, Language And Law, Law Enforcement, Judicial Rhetoric, Legal Linguistics, Integration, Linguistic Expertise, Expertise, Legal Texts, Authorization, Speech Act.*

### INTRODUCTION

The growth of interdisciplinary integration in recent years has led to the emergence of interactions, problems and cooperation in science. As a result of the development of science, linguistics, like other areas, began to be considered from a new point of view. A new approach to linguistics has created a need for the creation and implementation of language corporations. Now a number of areas of modern linguistics have appeared, and this process continues. The practical function of the language began to work actively in various fields of science. This, in turn, led to the creation of a number of studies [1].

Focusing on the interdependence and interdependence of sciences is more important than ever. In particular, the interdependence of language and law, the need to study legal materials from a linguistic point of view, led to the formation of a new field linguistic expertise. One of the areas of legal linguistics is forensic linguistic expertise. There is a need for the participation of linguists in various litigations. The reason is that the study of legal texts, the linguistic analysis of the speeches of the accused, the suspect is a factor in the objective consideration of the case.

Linguistic expertise requires in-depth knowledge of a specialist. There are certain contradictions in litigation that require joint work of psychologists, political scientists and linguists, as well as lawyers. It is at the crossroads of this cooperation that a new branch of linguistics emerges - linguistic expertise. Linguistic expertise in Russian linguistics has created a number of studies on the forms and foundations of its implementation [2].

It is difficult to substantiate the question of exactly when the linguistic examination was carried out with specific facts and evidence. Each term that is included in science has its own history, stage of formation and period of development. In the same way, it cannot be said that linguistic expertise emerged and developed simultaneously. The need to generalize the various attributes of words and phrases used in speech, such as length, timbre, etc., which, in turn, allows the author of the speech to be a psychologist, while simultaneously "diagnosing" him. In the nineteenth century, mathematicians argued that the attributes of speech should be generalized. In particular, they emphasize the need to measure word length, sentence length, and check sentence structure. However, it is difficult to substantiate these ideas and generalize them in relation to linguistic materials. The term "forensic linguistics" was first used in 1968. A Swedish linguist who worked at the University of London this year heard about the scandalous incident that occurred at 10 Rington Place (Kensington, London) several decades ago. Then the Swedish linguistics professor Jan Svartvik used it in his lecture. Based on this information, we can say that in the early 90s of the last century a new area of linguistics emerged - legal linguistics, the subject of which began to be considered at the junction of language and law. The emergence of new forms of production, economic and socio-political relations stimulated the study of specific problems of interdisciplinary research. These problems, as a rule, arose in connection with the philological support of various forms of professional legal activity (lawmaking, law enforcement, forensic science, forensic medicine).

### **Main part**

Linguistics has acquired a new and very wide field in the field of jurisprudence and legal activity, and the importance of theoretical linguistics for jurisprudence has already been recognized in world linguistics and jurisprudence (E. Berg, E. I. Galyashina, E. I. Goroshko, Gubaeva T. V., Ivanenko G.S., Neflyasheva I.A.). In this regard, linguistics faces a practical task: linguistic knowledge makes it possible to solve current social problems (in particular, linguistic expertise is one of the ways to obtain evidence-based information). But the question of the importance of jurisprudence for fundamental theoretical linguistics has not yet been worked out. This value is assessed as secondary and is consistent with the general opinion that the practical aspects of linguistics are a peripheral field of science (ND Golev, N. Matveeva).

The relationship between language and law was first defined by N. D. Golev:

- Language works as an object of legal regulation
- Language acts as a means of regulation. [3.B.7], [3].

ND Golev emphasizes the legal nature of language in the process of expressing his views. In this case, the theoretical aspect seems to prevail over the practical. Without denying the views of ND Golev, we can add that the language makes a single conclusion that defines and substantiates the inner essence of the desired texts (written advertising texts, newspaper and magazine articles, tablets; advertisements, court texts, etc.). acts as a motivation tool. Let's try to substantiate our

opinion, for example, when analyzing literary texts from a linguistic point of view, the author's psyche, goal, idea are clarified. In the process of analysis, the researcher and the person familiar with this study have a general idea of the author of the literary text, a certain conclusion. The linguistic exam examines the oral and written acts of speech. Theoretical knowledge is directly applied in practice. During the trial, the available evidence, the testimony of witnesses, the testimony of the accused will be examined. Summarizing all the collected materials and studying the facts, oral and written presentations will help solve the problem[4].

## RESULTS AND DISCUSSION

Linguistic expertise is the legal aspect of the language, in other words, the implementation of the practical function of the language in the legal field. There are a number of aspects that need to be addressed in the linguistic examination process. This allows the specialist to set a primary goal for himself. Special:

Explore the semantic nature of a given oral or written text;

Determination of compliance (or, conversely, inconsistency) with verbal words;

Examine the facts in the text to determine if they have a negative connotation;

Identification of the linguistic properties of extremist materials;

Determine if there is word processing;

In the process of linguistic examination of the text, prepare the ground for a conclusion, taking into account the aspects of author's authorization;

Study the text based on linguistic and legal laws and draw general conclusions;

In world linguistics, in particular in Russian linguistics, there are tasks of linguistic expertise: Interpret and explain the meaning and origin of words, phrases, stable phraseological combinations (phrases); interpretation of the main and additional meanings of a linguistic unit or a unit of speech (for example, oral or written texts); interpret the rules of the text of the document to determine what opportunities exist in modern speech to understand these rules; to study the similarity of trademarks, word designations, slogans, advertising texts, trademarks, trademark names to the extent of confusion with their originality or other characteristics; study the text in order to determine its semantic orientation, modality of sentences, expressiveness and sensitivity of speech units, their formal grammatical features and semantics, features of the methodological tools and methods used [5].

The above tasks cannot be limited to the process of linguistic examination of Uzbek written texts. Because every nation has its own ethnic characteristics. Some laws determined by linguistic expertise cannot be applied to all rights as "iron law". Therefore, when setting the listed tasks, the expert should pay attention to the ethnic side of the issue. From this point of view, a deeper approach to defining the tasks of linguistic examination of Uzbek written texts is required, which we considered expedient to define as general. Linguistic examination of some folk texts also requires special attention. In particular, the following tasks of the linguistic examination of Uzbek written materials should be added: Identification of territorial divisions when studying written texts (in the case of regions and specific regions, differences in speech, psychology, and temperament of representatives of this region are also taken into account).

Estimate the frequency of use of slang, slang units used in the text, and the level of coloration;

Focus on the use of non-verbal means in oral texts and justify their relevance;

The specific tasks of linguistic expertise mentioned above make it possible to gain a deeper understanding of the essence of the text and an objective approach to the issue. At the same time, the question arises about the foundations of linguistic expertise. The basics of linguistic expertise in Russian science are divided into three main types:

1. Analysis of the features of the text as a carrier of information about the author (author's research);
2. Analyze the text (semantic, or semantic, research) in order to determine the meanings expressed in it and the nature of the impact of the text on the addressee or audience;
3. Analysis of names (names, trademarks, domain names, etc.) As a means of identifying the "products" of human activity (study of names). [4.B.58]

From the above considerations, we can say that linguists study everything that is represented by letters. Letters, phrases, sentences, texts, ie. Linguistic units and speech presented on a material medium are the subject of research as an object of linguistic expertise in the language[6]. This means that in the process of linguistic expertise, the objects are different types of texts. Such materials can be divided into the following types: phonograms, texts in the form of video and audio recordings; texts in newspapers and magazines, in the media, including speeches on the Internet;

Names, texts, campaign materials, letters audio recordings;

Oral or written oral works, material evidence, documents, samples for comparative research, case materials for forensic medical examination[7].

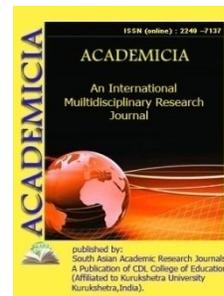

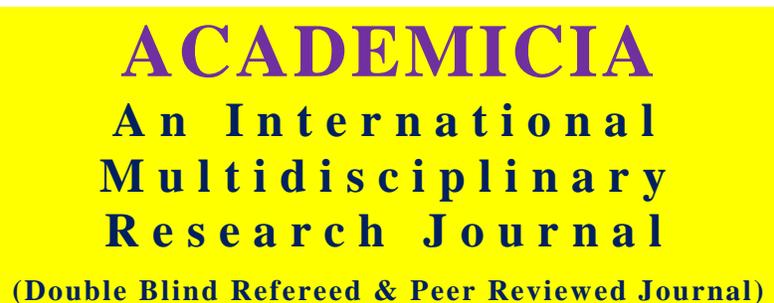

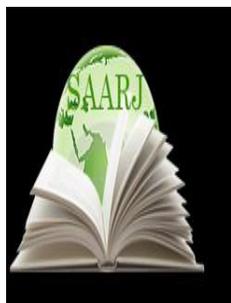

## CONCLUSION

Thus, taking into account the above information, we can conclude that the subject of linguistic expertise is the facts and circumstances revealed on the basis of studying the existence and functioning of the language. Linguistic expertise can also be seen as a tool to support the procedural regulation of speech, both oral and written. In turn, procedural research requires in-depth knowledge of forensic speech and general linguistics. For example, a language is a system with a large structure. The possibilities and features of the language are enormous and multifaceted. Therefore, not everyone can understand and correctly interpret this. There are many subtleties in the language [8]. By analyzing a speech act, a specialist can draw a general conclusion that forms an understanding of the author and his psychological state. Linguistic expertise is designed to bring the conflicting parties to a common opinion. With the help of linguistic expertise, real cases are identified that need to be proven in a specific case. The final conclusion by analyzing its linguistic component in determining the real circumstances of a particular case is made by a linguistic examination.

### ABSTRACT

*The article is devoted to the study of innovative technologies in the production of textiles and clothing from natural fibres. The analysis of the studied material showed that today on the modern market there is a wide range of innovative fabrics that meet the needs of consumers, allowing to obtain materials of various structures, which are the result of innovative scientific and technological progress. Modern scientific achievements of the textile industry allow the transition of science to a new level of development, requiring the introduction of scientific developments into the production process, which contributes to the opening of new opportunities in the production of high-quality clothing that meets modern consumer requirements.*

**KEYWORDS:** *Innovation, Market, Hygienic Properties, Innovative Fabrics, Textile Materials, Natural Fibres, Development Of The Innovation Sphere.*

### INTRODUCTION

The global trend in the production of consumer goods is the formation of modern principles for the development of eco-fashion. This trend comes into conflict with the direction of "fast fashion" ("fast fashion"), which allows manufacturers of mass clothing to provide a large selection of inexpensive clothing made from cheap artificial and synthetic materials. Eco-fashion is based mainly on the use of natural raw materials obtained based on a careful attitude to natural resources [1, 2].

It is this foundation that is laid in the development of marketing strategies for manufacturers of goods that receive the "organic" label. This characteristic of the properties of the product is attractive to the consumer. Consumer appeal is determined by the high indicators of tactile and hygienic properties of materials that provide comfortable physiological operating conditions. In addition, many of them have unique medicinal properties and are preferable for people with allergies, dermatological diseases, nervous and mental disorders, diseases of cold and humidity, diseases of the respiratory tract, and the cardiovascular system [3].

Manufacturers of natural fabrics assure that they are able to suppress the growth of pathogenic bacteria and do not lose their beneficial properties after numerous washes. Innovation activity at the present stage of development is one of the most important systemic factors of economic growth and increasing the competitiveness of innovative products, which is necessary to ensure high-quality goods with a lower consumer price that satisfy the needs of the consumer. Innovation activities are aimed at creating, implementing and implementing innovation, i.e. to achieve a result.

## **MATERIALS AND METHODS**

Sustainable fashion involves a harmonious combination of ethics and aesthetics.

One of the founders of eco-fashion in the 21st century is designer Linda Lauder milk, who in 2002 presented models dressed in eco-clothes on the catwalk.

Today, the eco-collection show is a mandatory program for many Western fashion shows. This determines the development of new approaches to creating clothing collections. Designers began to create collections according to new rules, actively promoting a healthy lifestyle and urging to save natural resources [1].

This study is devoted to defining the principles of choosing modern types and methods of finishing clothing models when designing ethical collections. To achieve this goal, in the first stage, aspects of the ethical design and production of ethical clothing collections are determined. The category of ecological or ethical clothing includes a product that is made from natural environmentally friendly raw materials without the use of harmful chemicals and emissions that pollute the environment, in harmony with nature, in full compliance with the balance of interests of humans and animals [2]. Since one of the leading aspects of ethics is natural raw materials, it is important that in the process of finishing materials for clothing and finishing the garments themselves, the unique positive properties of the materials do not "suffer", and the production processes do not harm nature. In this regard, the analysis of innovative methods of finishing materials [4,5] and garments [6, 7] was carried out. Finishing significantly affects the properties of fabrics. The finishing processes for fabrics that differ in their fibrous composition are different, but there are general finishing operations that all fabrics are subjected to. The purpose of finishing is to improve the appearance of the fabric and its consumer properties: softness, density, heat resistance and others. So, in the process of finishing cotton fabrics, they are subjected to singeing, resizing, boiling and bleaching (removing fibre impurities and destroying its natural colour), washing, drying, dyeing or printing, and finishing. In the process of this finishing, wash-off (starch) and indelible (based on synthetic resins, etc.) dressings are applied to the fabrics, which give them the necessary density, softness or rigidity. Some cotton fabrics are subjected to special types of finishing, such as anti-shrink, crease-resistant, water-repellent, etc.

Most cotton fabrics are mercerized, some are subjected to naping (bike, flannel, bumazeye, suede, cloth, etc.).

The finishing of linen fabrics is done according to the scheme of cotton production, but more carefully. The operations are repeated several times so as not to destroy the technical fibre to elementary fibres and thus not to deteriorate the properties of the fabric. Unlike others, woollen fabrics are washed, decatized, rolled and carbonized. The purpose of the first two operations is to stabilize the wool fibres and the fabric in general. Carbonization (treatment with a 4-5% solution of sulfuric acid) is carried out to cleanse fabrics from vegetable impurities (burdock, straw, etc.). Natural silk fabrics, unlike woollen fabrics, are boiled in hot soapy solutions.

This increases their softness and shine. To correct the deficiencies inherent in fabrics made of certain fibres (threads), to give them new, special properties, various types of special finishing are used. For example, to improve the dimensional stability of cellulose fabrics, finishes are used that promote low creasing, "easy ironing", which are based on the impregnation of fabrics with solutions of various drugs (carbamol, methazine, etc.).

In addition to the above, other types of special finishes are used - antistatic (usually stearox-6, alkamones OS-2, OS20 preparations are used), anti-rot (based on copper compounds). To give the effects of durable embossing, polishing, silvering, corrugation in order to improve the appearance, the fabrics are impregnated with pre-condensates of synthetic resins, dried, processed on an appropriate calendar to obtain one or another effect and fixed by heat treatment. For cotton fabrics, such finishes as persistent dressing based on low-washable dressings are widely used, which are emulsions or latexes of various polymers (polyvinyl chloride, polyvinyl acetate, etc.) [4].

The hygienic properties of fabrics with such finishes are reduced and may cause allergic reactions during use. For example, to obtain indigo colour, formaldehyde is used, which, when released into the atmosphere, cause a decrease in immunity and intoxication of the body. In addition, industrial chemical processes consume huge volumes of natural water resources and are associated with the need to dispose of spent chemical solutions. According to the definition of ethical apparel, the use of such materials for designing ethical apparel collections is unacceptable.

This creates special specific requirements for the choice of materials for the design and production of ethical collections. Research and development of methods for dyeing fabrics with natural dyes testifies to the relevance of the task of careful attitude to preserving the natural properties of natural materials during the finishing process [5].

However, even the proposed methods involve the use of alum (crystalline metal hydrates) or low-toxic garden preparations, such as copper, aluminium and iron vitriol for fixing the dye on the fabric. These chemical compositions are more environmentally friendly for waste disposal, but not preferable in the manufacture of clothing, especially for people with dermatological diseases.

The ideological and semantic content of the eco-fashion direction contributes to the formation of the corresponding trends. So, at the peak of popularity, natural fabrics made from natural fibres, dyed in natural colours, but at the same time completely in harmony with modern life. The fashionable trend towards naturalness plays on the imperfection of natural fabrics. For example,

the Italian company LoroPiana deliberately emphasizes imperfections in its collections of silk costume fabrics “wild silk”, demonstrating the imperfection of natural fibres. To identify possible approaches to the selection of preferred types of finishing materials and products from natural materials in the development of ethical collections, a questionnaire was developed and marketing research was conducted. The information and communication platform Google Forms was used as a toolkit. The results of the survey showed that the majority of consumers prefer to buy clothes made from natural materials, despite some difficulties in their use (wrinkling, delicate care, shrinkage, rapid wear (Figure 1).

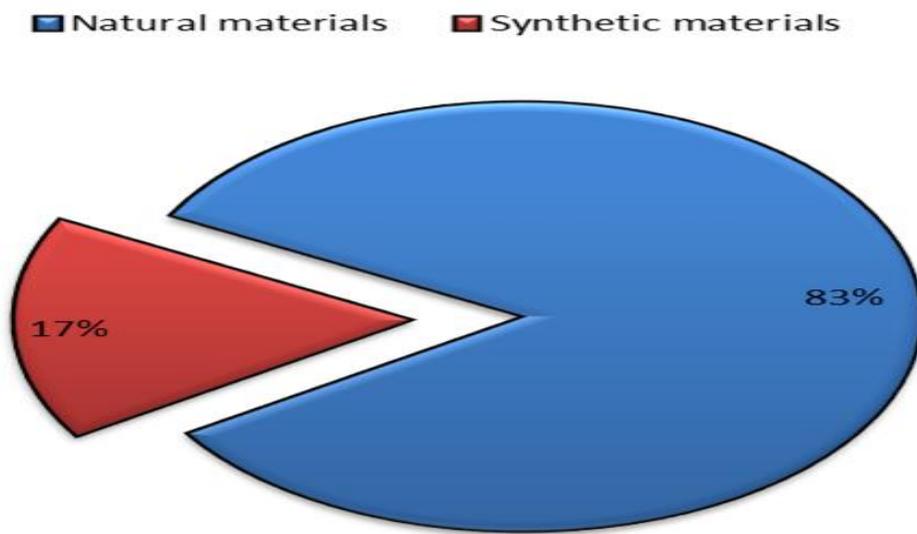

Figure 1. Diagram of feedstock preferences

And when choosing the option of finishing materials, most of the respondents spoke in favour of painting methods without fixing the colour (Figure 2). This preference can be justified by the desire to create a stylistic effect of natural primordiality, transmitted by the heterogeneity of colour.

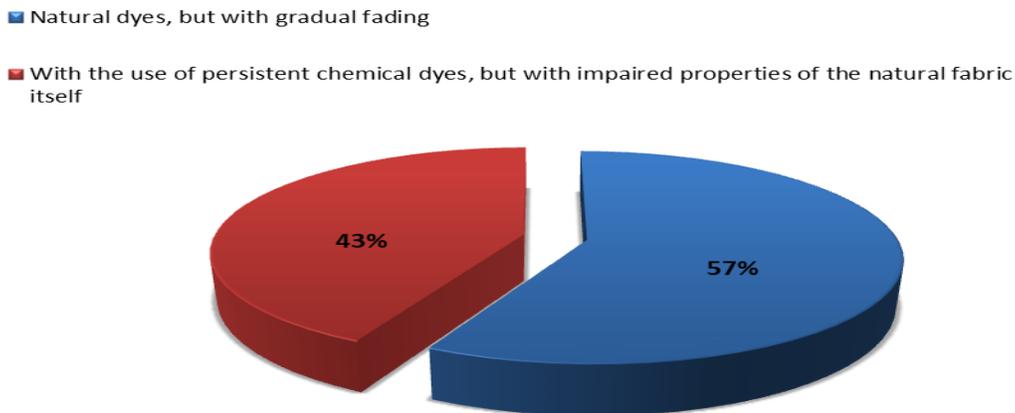

Figure 2. Diagram of preferences for the method of dyeing natural fabrics

To select the types of finishes that ideologically and stylistically coincide with the philosophy of ethical clothing collections, an analysis of innovative methods and methods of finishing garments was carried out [8]. Modern technologies for finishing clothes are a means of increasing the artistic level of garments and are able to provide individualization of products [6]. They can be used in the development of the general concept of collections and projects of individual models. Traditional types of finishes, which are the forerunners of innovative types, can now be called luxury, since the predominant way of their execution is manual [7], which is quite ethical, labour-intensive and costly for use in mass and serial production. Innovative high-tech finishing equipment is capable of providing rational economic indicators of products. Therefore, when choosing finishing methods for ethical clothing models, not only the aesthetic result and compliance with ethical aspects were assessed, but also the economic aspect of using one or another type of finishing. Traditional finishes include appliqué; drawing on fabric (batik, art painting); needle embroidery using various techniques and materials; Luniville crochet embroidery; fringe; drapery, folds, ruffles, flounces, pleating, puffs; finishing with fittings.

And the innovative types of finishes include: 3D printing methods; LED trim; laser technologies (laser cutting); thermal and laser welding; printing on fabric, which can be performed using direct digital printing, sublimation printing, thermal transfer, silk screen printing [9]. However, a critical analysis of these methods has shown that certain types of popular finishes have a negative impact on the original hygienic properties of natural materials.

For example, all types of currently widespread such type of finishing as printing on fabrics change the original properties of the material due to the use of chemical dyes, which form a film on the surface that impairs the natural unique hygienic properties of clothing made from natural materials.

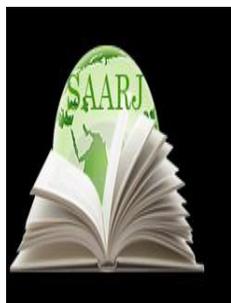

## CONCLUSION

Thus, it was determined that the important stages in the design of ethical collections are the choice of materials, the choice of types of finishing products that do not contradict the aspects of ethics. Recommendations for the choice of finishing methods for models of ethical collections have been developed.

**ABSTRACT**

*This study presents the results of studies on the study of rheological characteristics (density and viscosity) of both non-one stripped off and one stripped off ammo phosphate slurries obtained by decomposition of the phosphorus-containing mineralized mass of the Central Kyzyl-Kum deposit with phosphoric acid, followed by separation of the calcium phosphate pulp into solid and liquid phases and pre-ammoniation pH 4.0-4.5. The effect of the rate of extraction phosphoric acid, pH of the medium and temperature on the density and viscosity of one stripped off and not one stripped off ammo phosphate pulps was established. The obtained values of rheological characteristics substantiate the mobility of ammo phosphate slurries, which will ensure their pumping without any particular difficulties on the technological equipment.*

## INTRODUCTION

The traced global trend of a natural decrease in the average content of  $P_2O_5$  in phosphate raw materials leads to the need for more and more use of the poor phosphate raw material base. The problem of efficient processing of low-grade phosphate raw materials into concentrated phosphorus-containing fertilizers remains relevant and becomes more complicated with the growth of production of phosphorus-containing mineral fertilizers. At present, the main industrially significant source of phosphate raw materials in Uzbekistan remains phosphorite ore of the Djeroi-Sardara deposit, the concentrate obtained from it contains about 26%  $P_2O_5$  [3,4].

By its composition, this is a poor raw material, and its processing presents serious difficulties.

This is associated with: low content of the target component in the raw material, a high amount of various impurity rocks: carbonates, clay minerals, insoluble residue, often closely intergrown with the phosphate mineral. Such raw materials are difficult or not at all enriched by existing methods, and there are no effective methods for its direct processing. In this regard, the search for unconventional methods of technological processing of low-grade phosphate raw materials is a task that requires special attention. Based on the literature on improving the quality and range of phosphorus-containing mineral fertilizers based on low-grade phosphorites and establishing the rheological properties of pulps, we investigated the production of ammo phosphate with a high content of nutrient components. The initial raw material was a phosphorus-containing mineralized mass, which is a waste generated during the processing of phosphorite ores of the Central Kyzylkum deposit and extraction phosphoric acid produced by Ammophos-Maxam JSC [3,4].

At the next stage of research, a technological approach was taken, due to the fact that in one technological cycle two types of products can be obtained at once, both one-sided phosphorus and complex mineral fertilizers. The process of obtaining them consists of the following main technological stages:

- a) Decomposition of phosphate raw materials by extraction phosphoric acid;
- b) Separation of acidic phosphate pulp into liquid and solid phases;
- c) Granulation and drying of the solid phase by the method of intensive rounding to obtain a single phosphorus fertilizer;
- d) Ammonization of the liquid phase with ammonia to pH = 4.0-4.5, followed by granulation and drying of the product to obtain an NPCa-fertilizer [5].

## MATERIALS AND METHODS

The purpose of this study was to determine the rheological properties (density and viscosity) of unbleached and one stripped off ammo phosphate slurries at temperatures of 30-80 °C, obtained from the liquid phase of calcium phosphate slurry. The objects of study were the phosphorus-containing mineralized mass of the Central Kyzylkum deposit (wt.%): 14,33%  $P_2O_5$ ; 43,66 CaO; 1,19 MgO; 1,38  $Fe_2O_3$ ; 1,18  $Al_2O_3$ ; 1,75 F; 2,22  $SO_3$ ; 14,70  $CO_2$  and EPA of Ammophos-Maxam JSC composition, (wt.%): 14.32  $P_2O_5$ ; 0.86 CaO; 0.29 MgO; 1.32  $Fe_2O_3$ ; 0.32  $Al_2O_3$ ; 1.31 F; 0.38  $SO_3$ . The activation of the phosphorus-containing mineralized mass with extraction phosphoric acid was carried out in the range of weight ratios of  $P_2O_5$  in acid to  $P_2O_5$  in the feed from 1: 0.38 to 1: 0.165, i.e. in the limit of phosphoric acid norms from 35 to 78% of the stoichiometric norm for the formation of monocalcium phosphate.

The laboratory experiments were carried out as follows: a calculated amount of phosphorus-containing raw material was slowly dosed into a thermostated glass beaker, in which a sample of EPA was located, for 10-15 minutes with vigorous stirring (stirrer rotation speed 250-300 rpm) and an acid temperature of 60 °C. The duration of contacting the components was 30 min. After the specified time elapsed, the reactor was removed from the thermostat, and the contents of the reactor were filtered under a vacuum of 650-700 mm Hg on a Buchner funnel using one layer of filter paper. The liquid phase, consisting of monocalcium phosphate and phosphoric acid, was neutralized with gaseous ammonia to pH 4.0 and 4.5. The total content of nutrient components in ammophosphate pulps before and after evaporation was determined according to [1].

The assimilable form of P<sub>2</sub>O<sub>5</sub> was determined both in a solution of 2% citric acid and in a 0.2 M solution of Trilon B. The assimilable form of CaO was determined only by 2% citric acid. Kjeldahl nitrogen. The measurement of the pH value of ammonized pulps was carried out using an I-130 M (И-130 M) laboratory ionometer with an electrode system of ESL 63-07, EVL - 1M3.1 and TKA electrodes with an accuracy of 0.05 pH units.

The pulp density was determined by the pycnometric method with a measurement accuracy of 0.05 rel. %, and kinematic viscosity - using a glass capillary viscometer VPJ-1 (ВПЖ-1) with an error of 0.2 rel. % in the temperature range 30-80 °C.

## RESULTS AND DISCUSSION

Результаты проведенных научно-исследовательских работ показали, что значения плотности и вязкости неупаренных аммофосфатных пульп в зависимости от нормы ЭФК и pH при одинаковой температуре возрастают (таблица 1).

As can be seen from Table 1, at a temperature of 30 °C, the pulp density ranges from 1.0946 to 1.1693 kg/cm<sup>3</sup> and the viscosity from 1.48 to 5.85 cP. However, with an increase in temperature from 30 to 80 °C, these values decrease from 1.1693 to 1.0582 kg/cm<sup>3</sup> and from 5.85 to 0.74 cP, respectively. In the case of using one stripped off ammo phosphate pulp with a moisture content of 45 and 50% at temperatures of 30 and 40 °C, thickening of the pulps obtained at EPC rates of 35, 75 and 78% is observed (Table 2).

**TABLE 2. INDICATORS OF RHEOLOGICAL CHARACTERISTICS OF EVAPORATED AMMOPHOSPHATE PULP (BASED ON AMMONIATION OF THE LIQUID PHASE OF PRODUCTS OF MINERALIZED PHOSPHORITE MASS ACTIVATION AT CENTRAL KYZYLKUM)**

Norm EPC, %	pH	Density, g/cm <sup>3</sup>						Dynamic viscosity, cP

	4.5	**	**	1.240	1.236	1.228	1.220	**	**	279.24	229.83	188.36	162.43
78	4.0	**	**	1.270	1.263	1.255	1.249	**	**	363.74	295.69	241.48	198.79
	4.5	**	**	1.291	1.284	1.278	1.272	**	**	302.25	244.77	207.67	185.05

Despite this tendency to decrease density and viscosity with increasing temperature leads to a sharp decrease in these values from 1.5591 to 1.2203 kg/cm<sup>3</sup> and from 92.89 to 4.43 cps, respectively. While with an increase in the EFA norm from 35 to 78% of the stoichiometry and the pH value, the density and viscosity are oscillatory. For example, at a temperature of 40 °C, the density increases from 1.3599 to 1.5438 kg/cm<sup>3</sup> and from 18.85 to 28.38 cps, respectively, at

stoichiometry from 35 to 61%, and stoichiometry from 65 to 78% decreases from 1.3134 to 1.2916 kg/cm<sup>3</sup>, the viscosity increases from 25.22 to 363.64 cps. This can be explained by the behaviour of the component components in the pulp. Since before ammoniation, the liquid phase consisted of Ca(H<sub>2</sub>PO<sub>4</sub>)<sub>2</sub>, (Fe, Al)PO<sub>4</sub>, etc.

However, prior to the ammoniation of pH 4.0 and 4.5 according to [5], a salt (Fe,Al)<sub>3</sub>NH<sub>4</sub>H<sub>8</sub>(PO<sub>4</sub>)<sub>6</sub>•6H<sub>2</sub>O is formed at a pH of 1 to 1.6, which is well crystallized, easily filtered and separated. In the course of neutralization at increase pH approximately to 2.5 water-soluble NH<sub>4</sub>H<sub>2</sub>PO<sub>4</sub> and also the amorphous and colloidal not defended and badly filtered precipitation - (Fe,Al)NH<sub>4</sub>HPO<sub>4</sub>F<sub>2</sub>. When neutralizing magnesium-containing acid, Mg(Fe,Al)NH<sub>4</sub>(HPO<sub>4</sub>)<sub>2</sub>F<sub>2</sub> is also formed. The salt (Fe,Al)<sub>3</sub>NH<sub>4</sub>H<sub>8</sub>(PO<sub>4</sub>)<sub>6</sub>•6H<sub>2</sub>O is well crystallized, easily filtered and separated [6].

At increase pH to 5.5 education of NH<sub>4</sub>H<sub>2</sub>PO<sub>4</sub> is continued, complex phosphates of iron and aluminium will be transformed to Mg(Fe,Al)(NH<sub>4</sub>)<sub>2</sub>(HPO<sub>4</sub>)<sub>2</sub>F<sub>3</sub>, (Fe,Al)NH<sub>4</sub>(PO<sub>4</sub>)<sub>2</sub>•0,5H<sub>2</sub>O, (Fe,Al)NH<sub>4</sub>HPO<sub>4</sub>F<sub>2</sub>, disubstituted phosphates of calcium and magnesium drop out, the magnesium fluoride-phosphate besieged hydroksilapatit, unstable intermediate phosphate of Mg<sub>3</sub>(NH<sub>4</sub>)<sub>2</sub>(HPO<sub>4</sub>)<sub>4</sub>•8H<sub>2</sub>O unstable in aqueous solution is formed, which decomposes to form MgNH<sub>4</sub>PO<sub>4</sub>•H<sub>2</sub>O. All phosphates except hydroxylapatite are citrate soluble. All these compounds, with varying pH and temperature, inevitably affect the rheological characteristics of the ammoniated pulp to varying degrees.

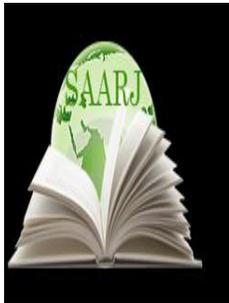

## CONCLUSION

The results of the studies carried out indicate the fundamental possibility of obtaining concentrated phosphorus-containing fertilizers on the basis of man-made waste, and the values of the rheological characteristics of unbleached and one stripped off ammophosphate pulps indicate their manufacturability and that they will be pumped from one apparatus to another without any particular difficulties.

### ABSTRACT

*The need for translation in society is growing day by day. With the development of technology and the creation of computer programs, teachers are using a variety of new innovative ideas and methods to train translators. A modern professional translator should know not only his native language but also other foreign languages. Translators need to know the equivalents of the words themselves so that they do not have to spend time looking up translations of words in dictionaries, and they also need to be able to translate the text given to them in writing. It is very important for translators to have a computer, they can translate the text electronically, they can even find the translation of words on the computer that they can't find on the Internet. In the future, when training skilled translators, we need to prepare them for professional translation activities, to form in them information-technological competence and to explain to them ready-made electronic translation programs. Because students are not well versed in the computer field, there are several shortcomings in the field of translation, in addition to knowledge of the language, translators must also know how to use a computer and various programs. Therefore, we need to educate students based on modular technology using information technology.*

## INTRODUCTION

New programs in science, technology and the humanities need to be developed to provide primary education in module technology. The concept of an educational unit is currently being developed. According to him, the module technology will be implemented in Chinese on the basis of methodological and methodological projects. In the teaching of foreign languages, the didactic system has evolved as a process of self-directed learning. Module technology has a didactic structure in which a person reads with a reflexive approach to teaching methods and develops them step by step. Module technology was first used in the United States and Southern Europe. Later, this technology was used in Russia and the People's Republic of China, and finally, this type of technology was introduced in the Republic of Uzbekistan. Modul technology in the world consists of

1. The study and analysis of scientific and technical words in the text, in-depth study of psychology, sociology, cultural studies and the formation of professional competence in students.
2. A review of the typology of texts is an excellent analysis of texts in the field of science.
3. Teach students to choose the right textbook and adapt to it in the work of translators.
4. Use of the textbook at the level of linguistic, extralinguistic modules.
5. Explain the process of translation with PPT programs based on modular technology in students depending on the allocated hours.
6. Adapt and teach according to each student's worldview.
7. When working on module technology, do the translation correctly and choose a dictionary for a specific purpose.
8. Demonstrate your knowledge of individual rankings step by step.

New programs in science, technology and the humanities need to be developed to provide primary education in module technology. The concept of an educational unit is currently being developed. According to him, the module technology is based on methodological and methodological projects in Chinese. In the teaching of foreign languages, the didactic system has evolved as a process of self-directed learning. Modular technology has a didactic structure in which a person reads with a reflexive approach to teaching methods and develops them step by step. Module technology was first used in the United States and Southern Europe. Later, this technology was used in Russia and the People's Republic of China, and finally, this type of technology was introduced in the Republic of Uzbekistan. Special module technology is also used in schools, colleges, lyceums and universities to train translators. The word module is derived from a Latin word that translates into Uzbek as "quantity" or "method". The developers of the module technology have expressed their views on the teaching of translation methods with didactic descriptive methods in the teaching of foreign languages. A module is a special quantitative method that reflects the demands of a high level of self-management and the conditions for self-improvement. Scientists say that a module is a way of teaching students in which a person has to be self-directed. Each module has a specific purpose. The textbook must be appropriate for each module.

Module technology includes the following functions:

- The completeness of the information in the textbook;
- This manual is explained;
- Data access requirements are defined;
- Theoretical tasks and recommendations in the textbook;
- Practical tasks are also given;
- controls itself and from the outside.

In the practice of modular technology, the practice manual should correspond to 80% to 20% of the textbook.

There are three different types of modules depending on the target function:

- Cognitive (for the study of specific sciences);
- Operational (revealing human mental and intellectual knowledge);
- Mixed.

The module technology curriculum should be divided into 10 or 12 modules, the optimal size of the curriculum is measured by its completed plan, ie the number of modules can be from 10 to 20. Module technology can be used in a variety of learning areas. The number of malls in the lecture halls of universities and institutes in Beijing, People's Republic of China, is divided into 10 or 12. The basis of module technology in translation competence is this module program.

Modular learning technology. The term "modular training" is an international concept -module ("module", lat. modulus), the only meaning of which is activity denotes a node that is composed of closely related elements that can represent. In this sense, it is understood as the main tool of modular learning, as a complete block of information.

A module is a logically complete learning material based on developed principles that are designed to help students master one or more concepts.

In 1982, at the UNESCO conference, the module was entitled "A separate training package (package) designed to acquire one or more skills in individual or group training through careful study and sequential study of exercises at a specific speed." was described as.

Modular learning is one of the most promising learning systems because

the human brain is best adapted to the assimilation system. Modular learning is based on the modular structure of the human brain tissue.

The human brain tissue is about 15 billion years old. neurons (nerve cells) or conditioned modules. Tissue cells are involved in many collisions with each other. The number of collisions between one cell and its tumour with another cell and its tumour can reach up to 6,000. This means that the number of collisions (contacts) in the brain tissue is an astronomical number (15000000000x6000). In this sense, the module is seen as a cell of the learning process.

This cell is made up of elements that have the same specificity and structure of information as a whole.

The modular system of education was first officially discussed in 1972 at the UNESCO World Conference in Tokyo.

Provides an opportunity to comprehensively address the following modern issues of vocational education:

- Ensuring the flexibility and flexibility of programs to optimize and systematize the content of training on the basis of a modular-functional approach;
- Individualization of teaching;
- At the level of practical training and evaluation of the observed actions monitoring the effectiveness of teaching;
- Activation of the teaching process on the basis of professional motivation, the full realization of independence and learning opportunities.

There are two approaches to modern theory and practice of modular teaching: science-based learning and system-based learning technologies.

Within the framework of these approaches, a number of concepts of modular training have been developed. At the heart of all concepts is an activity approach, and in this context, the teaching process as a whole or within a particular subject is focused on the student's sequential mastery of elements of professional activity in accordance with the content of the modular curriculum. Under different concepts, modular curricula consist of different content and structure, presented in different forms of documentation, but all of them must include the following three main components:

- targeted content application; a database of various forms;
- Guidelines for students.

A module system is a collection of several modules based on a didactic purpose. It is a system created by the teacher depending on the course. Each science teacher creates independently. Researchers suggest that each module is implemented as follows:

1. With basic knowledge and skills (preparing students for independent work;
2. Analyze the data according to their individual knowledge. For example, he can analyze an essay based on his knowledge, tests tests, independent work and questions in this way.

The results of the module technology analysis are always based on written work. Students can be tested on their knowledge based on one or more modules to verify this. Therefore, the current and final control work is taken from students. Then they work on the mistakes made in the last module based on their writing. The basis of the module system is formed depending on the structure, acceptance, comprehension, analysis, memory and application of the level of knowledge of students.

## **MATERIALS AND METHODS**

The functions of the module system are:

1. The task of developing students in their intellectual activity (this is the degree to which the student masters his knowledge)

2. The task of students to realize their abilities and potential;
3. On the basis of students' psychological views, it is stated that the student reads as independently as possible, and in this case, a person can perform physiological exercises.

The program "Training of translators in the field of professional communication" was developed using modular technology in teaching Chinese to students. New projects and proposals are being introduced in higher education institutions of the country on the basis of this program. Based on this module technology, the following suggestions for the Chinese language are included:

- Strengthening professional translation in students in translation;
- Development of knowledge and bases of information-technological competence;
- Formation and translation of students' translation into modular technology;
- Development of electronic translation programs on modular technology.

According to the requirements of higher education institutions in our country today, Chinese language classes are held using scientific, technical and information projects to develop students' translation skills. The purpose of developing students' translation competence in modular technology is to help them translate scientific and technical texts and develop oral communication. In order to solve professional problems for students in modular technology, translators perform step-by-step text translation. The object, the subject, and the goal all come together in a modular learning environment that develops students' ability to work independently.

### **The structure of modular technology**

Programmed learning  
Gradual development of mental activity  
Formation of independent learning.  
Student's specific actions in mental activity  
Performing correct actions  
Formation of personal activity.

In the process of working between students and the teacher on the module technology, they translate the text based on specific goals in the translation work and at the end of the work discuss how the translation of this text was done.

The standardized actions, including the module of translation competence, consist of the structure of the textbook, database, methodical activity on the basis of didactic purposes, use of intellectual potential in practical activity, checking of written works on the basis of the set purposes. Under the module system, teachers explain to students what literature and dictionaries they can use to build translation competence. At the beginning of the work, the teacher gives the students a referral, and the students begin to work independently, using their intellectual abilities and translation skills in the process of translating the text or while doing an oral translation.

Using modular technology shows that we can achieve great success in training translators in accordance with the plan of the state educational standard of higher education institutions, as well as in the creation of translation programs. It can also help high school teachers teach their students the skills of translating texts. It is said that the results of this module are excellent. The goal of developing translation competencies in students using this technology is to train and deliver to our society modern, professionally trained translators. The basic professional translation skills of any translator depend on their professional competence. Students can also

use a variety of online translation sites to gain additional knowledge. Students also use dictionaries to translate.

## **RESULTS AND DISCUSSIONS**

Based on their integrative knowledge, students will be able to exchange ideas, think strategically, be active, classify and analyze information in the translation process, and students will be able to self-manage and find solutions to problems in this situation. Usually, in the process of developing translation competencies, of course, a great deal of attention is paid to their level of knowledge of the Chinese language.

### **Students' level of language proficiency in translation competence**

1 Primary education is the level of language proficiency of a student in his / her work. Communicate independently to talk about psychology and work. Being able to organize a conversation in a work environment in different contexts is to identify the goals and results of collaboration in the work process.

2 Secondary education is the student's ability to speak and translate a language at an intermediate level. It is about being able to take into account the interests of other states in the process of communication and to communicate with them on various topics.

3 Higher education - the degree to which a student is able to communicate with representatives of other languages as a workhorse. That is, the student does not face any obstacles in the process of communication with them and tries to work with the team.

There are 3 types of translation competencies in the translation process:

1. Conceptual translation competence.
2. Technological translation competence.
3. Basic translation process.

There are several proposals for the formation of translation competencies in higher education institutions in the Republic of Uzbekistan on modular technology.

1. To teach and develop communicative activities for students to engage in communication.
2. The textbook should be based on the module syllabus.
3. To use their knowledge of computer programming language level.
4. The textbook consists of the volume, structure and organization of information.
5. On the basis of the module program consists of substantiation of linguistic and electro linguistic knowledge with the level of language proficiency of students.
6. Students develop their intellectual skills so that they can learn independently.
7. The pedagogical process takes into account the results of current, intermediate and final control of students.
8. Individual requirements rating also plays a key role.

A competent approach by the teacher as we shape our students' translation competencies using modular technology and helps students to excel in their own speech or written translations of the text as they use their knowledge and translation skills. In this way, in a competent approach, our translators will be able to improve their knowledge and translations. A competent approach - the level of knowledge, skills and language skills will help our students to develop their professional careers in the future. With the development of international relations in the modern age, there are many types of translations. This means that you can not only translate with the help of books and dictionaries, but also with translation programs and online translation dictionaries. Computer technology and software are also being used today due to the growing demand for written and interpreting. This will help us to take the necessary information for future abstracts, reports and dissertations. In their future professional careers, students will be able to translate their knowledge and skills from Chinese to excellent written and oral translation. Currently, there are also lectures on translation competence and practical conferences on the problem of translation, as well as presentations on modern methods of teaching Chinese. In higher education, in addition to the profession of Chinese philologist, he is also trained as a professional translator.

### CONCLUSION

Translators develop translation skills with a competent approach so that they can grow professionally in the future. Students should be active in engaging in social and international cultural interactions during the translation process. High-level translators need to have different competencies in the communication process and be able to communicate and communicate in different areas. The works of Chinese scholars such as Rosa Ye and Jun Wang on translation competence, Russian scholars I.S. Alekseeva, L.S. Barxuradov, N.K. Barkovskiy, L.K.Latishev, R.K. Minyar-Belouchev, A.D. Swiss and similar scholars have written dissertations. But V.N. Komissarov's dissertation is devoted to the competence of translation, and his writings are very important. According to him, the main emphasis of his dissertation is on training and educating qualified translators. The field of translation is very broad and can be divided into several types: interpreting, text translation, communicative translation, and professional simultaneous translation. The types of translation of this type of translation competence are explained:

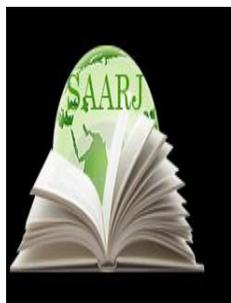

Translators develop translation skills with a competitive approach so that they can grow professionally in the future. Students should be active in engaging in social and international cultural interactions during the translation process. High-level translators need to have different competencies in the communication process and be able to communicate and communicate in different areas. The works of Chinese scholars such as Rosa Ye and Jun Wang on translation competition, Russian scholars I.S. Alekseeva, L.S. Barxuradov, N.K. Barkovskiy, L.K.Latishev, R.K. Minyar-Belouchev, A.D. Swiss and similar scholars have written dissertations. But V.N. Komissarov's dissertation is devoted to the competence of translation, and his writings are very important. According to him, the main emphasis of his dissertation is on training and educating qualified translators. The field of translation is very broad and can be divided into several types: interpreting, text translation, communicative translation, and professional simultaneous translation. The types of translation of this type of translation competence are explained:

The language must be translated quickly. In such circumstances, the formation of translation competencies in the requirements serves for active participation based on a modular system and helps to develop in the translation skills during practice. The development of translation

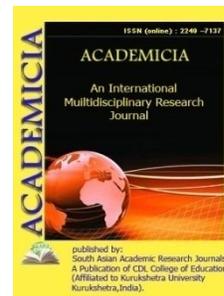

competence in a modular system takes place over years and in stages, which is the amount of information collected in the textbook and they also change over the years. The same is true for our Chinese language students, as the information, text size, and grammar rules in the textbooks change over the years. This indicates a growing demand and interest in learning Chinese. The translation process covers learning aspects of the language, such as oral, written, listening, and speaking skills. If the requirements have these four aspects, then the translation skills will develop on their own. Therefore, when we teach students translation competence, the key is to translate the text based on their knowledge.

## THE TERM “TASK”: THE KEY CONCEPT IN TASK-BASED LEARNING

**Tojiboyeva Mushtariybonu Tojiboyqizi\***

\*Teacher,  
 Uzbek State World Language University,  
 UZBEKISTAN

### ABSTRACT

*The article represents the practical application of Task-based approach (TBA) and its role in teaching English as a foreign language. In addition, the information regarding the implementation of TBA, the term “task” and its methodology are researched.*

**KEYWORDS:** *Task-Based Approach, Task, Student-Centred Approach, Communicative Competence, Target Language.*

### INTRODUCTION

Task-based approach (TBA) is regarded as an alternative method to traditional language teaching methods because it favours a methodology in which functional communicative language use is aimed at and strived for. Also, TBA is considered to be an effective approach that fosters a learning environment in which learners are free to choose and use the target language forms which they think are most likely to achieve the aim of accomplishing defined communicative goals<sup>1</sup>. In the literature, two early programs applying task-based instruction within a communicative framework for language teaching were implemented.

### MATERIALS AND METHODS

The term ‘task’, which is one of the key concepts in task-based learning and teaching, is defined in different ways in the literature and instructional tasks are used for different purposes. In everyday usage, tasks are seen as the commonplace goal-directed activities of everyday life such as cooking dinner, writing a letter, building a model<sup>2</sup>. Tasks became more formalized as part of various kinds of vocational training in the 1950s and came into widespread use in school education in the 1970s. Major programmatic proposals for Task-Based education in language teaching appeared in the 1980s and 1990s.

TABLE 1.DEFINITIONS TO THE TERM “TASK”;

Author	Year	Definition
Long	1985	A task is a piece of work undertaken for oneself or for others, freely or for some reward. Thus, examples of tasks include painting a fence, dressing a child, filling out a form, buying a pair of shoes, making an airline reservation, borrowing a library book, taking a driving test, typing a letter, weighing a patient, sorting letters, taking a hotel reservation, writing an invitation card, finding a street destination, and helping someone across a road. In other words, by ‘task’ is meant the hundred and one things people do in everyday life, at work, and in between. ‘Tasks’ are the things people will tell you they do if you ask them and they are not applied, linguists.
Richard,PiattandWeber	1986	An activity or action which is carried out as the result of processing or understanding language (i.e. as a response). For example, drawing a map while listening to a tape, listening to an instruction and performing a command, may be referred to as tasks. Tasks may or may not involve the production of language.
Prabhu	1987	A task is an activity which required learners to arrive at an outcome from given information through some process of thought, and which allowed teachers to control and regulate that process.
Breen	1987	Any structured language learning endeavour which has a particular objective, appropriate content, a specified working procedure, and a range of outcomes for those who undertake the task. ‘Task’ is therefore assumed to refer to a range of work plans which have the overall purposes of facilitating language learning-from the simple and brief exercise type, to more complex and lengthy activities such as group problem solving or simulations and decision-making.
Nunan	1989	Task as a piece of classroom work which involves learners in comprehending, manipulating, producing or interacting in the target language while their attention is principally focused on meaning rather than form.
Willis	1996	Tasks are always activities where the target

		language is used by the learner for a communicative purpose (goal) in order to achieve an outcome.
Skehan	1996	A task requires personal information to be exchanged, or a problem to be solved, or a collective judgment to be made bears a relationship to things that happen outside the classroom in a way that separates these activities from doing.
Richards and Rodgers	2001	Tasks foster learners' motivation because tasks require learners to draw on their past experiences and involve themselves in variously designed interactions, e.g., tasks requiring physical involvement or cooperative work.
Ellis	2003	A task is a work plan that requires learners to process language pragmatically in order to achieve an outcome that can be evaluated in terms of whether the correct or appropriate propositional content has been conveyed. To this end, it requires them to give primary attention to meaning and to make use of their own linguistic resources, although the design of the task may predispose them to choose particular forms. A task is intended to result in language use that bears a resemblance, direct or indirect, to the way language is used in the real world. Like other language activities, a task can engage productive or receptive, and oral or written skills, and also various cognitive processes.
Branden	2006	A task is an activity in which a person engages in order to attain an objective, and which necessitates the use of language.

Currently, tasks are also viewed as important research tools as well as the basis for language instructional approaches. In second language education, a task is defined as an activity that focuses on the meaning which the learners undertake using the target language in order to reach a specific goal at the end of the task<sup>3</sup>. Nunan (1989) claims that tasks should encourage learners to feel the need and strive to complete the activity communicatively. Through tasks, students are provided with a “purpose” to use the target language. In this purposeful learning process, learners are not instructed to use certain language forms. Instead, they are encouraged to build and use the target language on their own, with teacher support but without immediate teacher correction. The role of the teacher is to observe and facilitate the process of task-based communication<sup>4</sup>. In order to promote the meaning-focused and communicative nature of tasks, Skehan (1996) proposes that tasks should be designed to have a relation to the real world. This

relation to real-life creates a more meaningful and authentic focus. According to Ellis (2003), authentic tasks are those tasks whose interactional patterns are similar to those in real-life situations.

In EFL, the terms “exercise”, “activity”, and “task” confuse a lot of language teachers.

## RESULTS

Thus in this research, the differences are studied and shown in the following table.

**TABLE 2. THE DIFFERENCES BETWEEN THE TERMS “ACTIVITY”, “EXERCISE”, “TASK”**

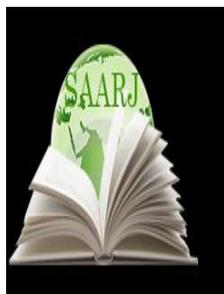

<b>Activity</b>	<b>Exercise</b>	<b>Task</b>
More general;	Specific;	Interpreted specific;
Restrictive, focus on one or two language items;	Restrictive, focus on a single language element;	Not usually restricted;
Communicative outcome	Linguistic outcome	Non- linguistic outcome
The physical, active form	Written form	Any form
Focuses mainly on fluency and communication;	Used mainly to practice correct production of the lesson target;	Undergone by students using pre-existing or scaffolded language resources;
A primary focus on communication;	The focus is upon form;	A primary focus on meaning;
	Not authentic	Authentic

Tasks as organized sets of activities play essential roles in classroom learning processes. A task-based approach is an approach that emphasizes the significance of the role of tasks in these processes. As learners in EFL contexts have fewer opportunities to practice the language outside school, classroom activities become more important<sup>5</sup>. Teachers and syllabus designers turn to the role of tasks and task-based approach in order to have a more effective teaching-learning environment. Some important studies are examining the use of task-based instruction and its focus on communicative competence.

**ABSTRACT**

*High-speed and power readiness is the major factor determining the high level of the special working capacity, influencing on the efficiency of the game actions at the strongest young handball players. Jumps, along with fast run, make the main content of motor activity of the young athletes. In the main experiment made among the contingent of the young handball players aged 14-15 years the problem have been solved covering the scientific reasonable design of the motor tasks modeling the competitive hopping activity for the young handball players and providing the exact reproduction of the volume of basic effort under the certain quantitative parameters of the training load.*

**INTRODUCTION**

The high level of special working capacity and the effectiveness of playing actions among the strongest young handball players are largely determined by speed-strength readiness [ 6]. Many authors, studying the nature of competitive activity in youth handball, note that multiple jumps in combination with running constitute the main content of the motor activity of young athletes. Jumping, along with fast running, become an effective method of attack and defense, and their number in competitive activity with age and qualification is steadily increasing both in absolute and relative indicators [5].

It was revealed that the greatest number of running jumps are made by the attackers; In the game, more jumps are performed from a standing position than from a running start, as well as jumps from two legs than from one leg, and the greatest playing efficiency was revealed in techniques with take-off in jumps with maximum height and minimum execution time. It was established that young handball players of 14 years old make  $82 \div 87$  jumps during the game, 15 years old -  $100 \div 117$  jumps per game, 16 years old -  $135 \div 157$  jumps, 17 years old -  $153 \div 167$  jumps. In terms of net playing time (for one minute of the game), these values are, respectively, at 14 years old - 3.5 jumps, 15 years old - 3.7 jumps, 16 years old - 3.8 and at 17 years old - 4.0 jump per minute for each player. It was noted that the centers make  $3.3 \pm 0.18$  jumps per minute, forwards -  $3.5 \pm 0.13$  jumps, defenders -  $3.7 \pm 0.15$ . The specificity of handball players' game actions is manifested in the fact that athletes perform jumping movements in various technical options (to the maximum height or speed, deviation of the body or turn, with a pause or hovering, etc.), when most of them are performed with the ball in direct contact with the enemy. Long-term playing load manifests itself in increasing fatigue, when handball players spend more effort for a lower jump height. At the same time, as handball players participate in the game, the absolute jump height significantly decreases by 5 cm after 10 minutes of the game, both in the first and second halves. It should be recognized that jumping movements are an important element of individual attacking and defensive actions of handball players.

Thus, the analysis of scientific research shows that the growth of sportsmanship against the background of improving the basic aspects of the athlete's motor skills, and primarily the speed-strength readiness of handball players, should be associated with the ability to repeatedly perform various competitive jumps, which ultimately leads to more effective game activity.

However, in the existing program materials and practical recommendations, the gross mechanical build-up of training loads in jumping exercises is preserved. Recommended loads of speed-power orientation among young handball players are not related to the nature of the jumping activity of young athletes. And, most importantly, the quantitative indicators of loads in jumping tasks do not take into account the peculiarity and specificity of the functional stresses of the musculoskeletal system of handball players of different roles. Thus, one of the prerequisites for young handball players to achieve a high level of readiness is the development and implementation of motor tasks in the training process, aimed at the upbringing of speed-strength abilities and special jumping endurance [4, 5, 6].

## RESEARCH METHODS AND RESULTS

All studies were carried out in the research laboratory of the Voronezh State Institute of Physical Culture using the multifunctional system MuscleLab 2040e [13].

This system provides information on the basic kinematic and dynamic characteristics of jumping exercises. The MuscleLab software provides for the calculation of the following parameters: the duration of the jump tests in seconds, the number of jumps, the average power of the jumps, the average height of the jumps, the rigidity of the locomotor system of the lower extremities.

In the ascertaining experiment, the determination of anaerobic power indices was carried out using the Rebound Jump test - repeated jumps, and the determination of jumping endurance - using the Series Jump SJ tests - serial jumps. The study used a modified Bosco test, the essence of which is to perform a series of jumps for 60 seconds. Subsequently, the index of speed-strength endurance was calculated (Bosco S., 1999), presented as "the ratio of the average height

in the last three jumps to the average height in the first three jumps", the body length was taken into account. Index indicators less than 80 ÷ 90%, indicate a low level of development of speed-strength endurance, indicators of 100% and above are high.

**Table Jumping parameters in the "Repeated jumps" test ( $\bar{X} \pm \delta$ )**

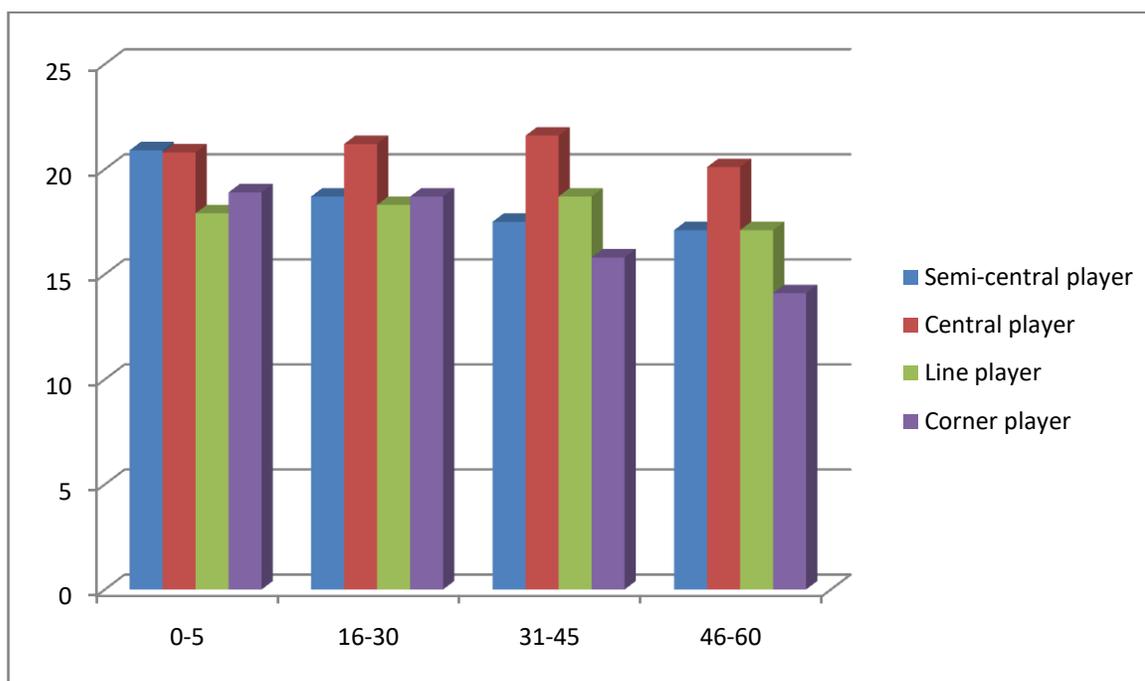

Number of jumps, units	Average jump height, cm	Average power jumps, W / kg	Stiffness of the motor apparatus
94,8±6,4	19,0±3,6	24,3±4,8	81,1±14,8
99.0	21.1	30.4	105.4

Note: The bottom column shows the data of the best attempts in testing.

It can be seen from Table 1 that an average of  $94.8 \pm 6.4$  jumps are made in 60 seconds, an average jump height of  $19.0 \pm 3.6$  cm, and an average power of  $24.3 \pm 4.8$  W / kg. The speed-endurance index was 82% for semi-center players, 97% for center players, 78% for line players, and 75% for corner players, which to a certain extent affected young athletes. characterizes its resistance to jumping.

To reveal the dynamics of jump endurance, a change in jump height was observed in a series of exercises lasting 60 s over a 15-second interval. The dynamics of the players' jump heights had a different configuration; the tendencies of the player's ability to jump were identified among the tasks performed by the player in the game (Figure 1).

Jump height

**Figure: 1.** Indicators of the average height of the jump in 15-second time intervals

The semi-central players showed a downward trend in their jump performance, resulting in a gradual decrease in jump height over a 15-second time interval in the "successive jumps" test. Tests for central players revealed a tendency to increase the jump height from one time interval to another, which showed that the players had a high endurance of speed and force. In the 60-

second test, the line player's jump height varied to a non-maximum level and had a tendency to rise like corner players.

In the main experiment conducted in the contingent of young handball players aged 14-15, the problem of scientifically based design of motor tasks that simulates the competitive jumping activity of young handball players and provides accurate repetition of the value of support movements with certain quantitative parameters of training load is solved. done. As a result, studies have shown that an increase in the volume of exercise to increase speed at the age of 14-15 years has a beneficial effect on the functional state of the nervous and muscular apparatus of adolescents, develops the ability to jump.

**Figure 1** Depth jumping test rates in young handball players 14-15 years old ( $\bar{X} \pm \delta$ )

Jumping height (cm)	Age	Height jumping out (cm)	Jump duration (ms)	Flight time	Power repulsion (watt / kg)

	15	52.2	303	652	47.8
Girls					
30	14	35.7	306.1	539.3	37.2
	15	40.1	196.1	572.3	58.1
40	14	36.2	303.3	543.1	35.6
	15	42.0	249.4	585.2	47.6

An analysis of the results of mathematical data processing showed that the increase in the number of repetitions in jumping exercises used in the speed-strength training methodology of 14-year-old young midfielders makes jump training endurance more appropriate. The number of repetitions in motor functions is also more important than the factors of intensity (altitude, distance), which can be estimated by regression coefficients for the factors in the given mathematical equations, as well as at higher values of support force than at rest intervals. As the jump height increases, the jump strength parameters gradually decrease.

### Figure 3.

The regression equation for the repulsive power in individual jumping tasks among 14-year-old young defenders and the nature of the influence of the influencing variable factors

Type of motor task	Regression equation
Jumping off the dais	$R = 37.6 + 16.4x_1 + 8.6x_3$
Jumping over hurdles	$R = 32 + 9.3x_1$
Throw in a jump after jumping-jumping	$R = 26.5 + 9x_1$
Jumps up by pushing off two, hands up	$R = 20.4 + 11.9x_1 + 6.4x_3$
Catching and passing the ball in a jump in pairs in place	$R = 18.5 + 9.5x_1 + 15.5x_1 x_2$
Jump upwards by pushing off two after moving in a defensive stance	$R = 18.5 + 11x_1 + 9.5x_1 x_2$

So, when analyzing the manifestations of the power of efforts in jumps and exercises of a jumping character, characteristic of the specifics of the game activity of defenders, it was revealed that the greatest value of the power of the supporting effort is observed in the exercise "jumping from a dais". The parameters of the load that cause the proper, comparable to the competitive, functional tension of the musculoskeletal system in this training task are the following: the number of jumps 35 times, the height of the elevation 35 cm, the rest intervals 20 s. These data were obtained by methods of mathematical analysis of "steep ascent along the response surface". It was found that among the attackers, among the influencing variable factors of the motor task, the intensity of the exercises fulfillment acquires the greatest importance (table 4).

It is characteristic that in most of the studied exercises the parameters of the support force power are determined by the elevation height. In general, we would like to note that exercises of a striking character in jumps acquire a significant value in improving the speed-strength abilities of young athletes. The optimal parameters of the load in the training task "jumping from a dais" for

attackers of 14 years old are 25 jumps performed from a pedestal 50 cm high, with a rest interval of 15 seconds.

**Table 4** The regression equation of the repulsive power in individual jumping tasks in young attackers of 14 years old and the nature of the influence of the influencing variable factors

Type of motor task	Regression equation
Jumping off the dais	$R = 43.6 + 11.9x_2$
Jumping over hurdles	$R = 38.4 + 18.6x_2$
Throw in a jump after jumping-jumping from a dais	$R = 28.0 + 11.5x_2$
Jump by pushing off one from two steps after the take-off run with reaching the highest mark on the gate	$R = 29.3 + 9.3x_1 x_2$
Leap in place by pushing off two with reaching the mark on the goal	$R = 27.0 + 10.3x_2$
Throw in a jump in various technical variations with a change in distance hitting the target	$R = 25.8 + 10.3 x_1 x_2$
Jumps up by pushing off two, hands up.	$R = 17.1 + 7.3x_1 + 11.5x_3$

The specificity of the functional stresses of the musculoskeletal system of the center players of 14 years old is associated with multiple repetitions of jumps of a different nature in motion and on the spot, while the greatest power of the support force among the center players was found in the group of jumping exercises performed in motion. The leading factors influencing the manifestation of power in jumps in motion are the number of jumps, as well as the number of series with constant rest intervals of 35 seconds. In the center, the display of the power of the support force is activated with an increase in the number of jumps not only in one move, but also an increase in the number series.

**Table 5** The regression equation for the repulsive power in individual jumping tasks in young center 14 years old and the nature of the influence of influencing variable factors

Type of motor task	Regression equation
Stream jumps upward by pushing off one after a run in 2.4 steps	$R = 25.1 + 13.9x_1 + 8.9x_4$
Multiple jumps from foot to foot over 10 push-offs	$R = 26.0 + 8.5x_1 + 13.3x_4$
Jump by pushing off two after the run with reaching the highest mark on the gate	$R = 33.2 + 9.5x_1$
Leap in place by pushing off two with reaching the mark on the goal	$R = 24.4 + 11.6x_1$
Jumps up and forward by pushing off two on "cut legs", hands above	$R = 19.5 + 8x_1 + 16.3x_4$
Jumps up by pushing off two, hands up	$R = 18.3 + 10.3x_1 + 9.3x_4$
Stream jumps (three) in place by pushing off two with reaching the mark on the goal, hands on top	$R = 18.0 + 11x_1$
Jumping with a ball on the backboard or against the wall	$R = 17.4 + 6.6x_1 + 11.4x_4$
Note: $x_1$ - number of repetitions, $x_2$ - intensity (height, distance), $x_3$ - rest intervals, $x_4$ - number of series.	

## CONCLUSIONS

If we take into account that the training task is the initial element of the training micro-structure, then it can be argued that the quality and effectiveness of the training process largely depends on the choice and construction of the most optimal training tasks corresponding to the load of the competitive exercise [4,5,6].

Scientifically grounded construction of training tasks in the structure of a separate lesson and a micro cycle will lead to the implementation of purposeful and effective management of the current state of an athlete, and in the complex both physical and sports-technical readiness [9].

**ABSTRACT**

*This article reveals the relationship between ecological, zoological knowledge and field practice, and the role of practice in the development of students' knowledge. The practical importance of the organization of field practices in the formation of scientific understanding of students is also analyzed. The article describes the relations between science and practice in the study of the benefits and harms of animals, plants, which given in the subject of zoology and ecology.*

**KEYWORDS:** *Ecology, Case Study, Zoology, Knowledge, Skills, Qualifications, Nature, Field Practice, Training Practice, Learning Process, Fauna, Species, Plant.*

---

**INTRODUCTION**

Field practice is of great importance in the training of highly qualified specialists in the field of biology. The main goal is to develop students' skills and competencies to conduct biological research independently through fieldwork and training. Field practice is a direct continuation of classroom training and it is a key link in the whole learning process [1]. The purpose of the field practice is to strengthen the theoretical knowledge of schoolchildren in biology, to teach them to apply this knowledge in practice, to develop the ability to observe and to accurately describe its causes through independent observation of natural phenomena.

Field practice is one of the forms of teaching biology and it is no exaggeration to say that it is an open lesson. Therefore, the requirements for this form of the course should also be high. The

peculiarity of outdoor biology classes is that they are studied simultaneously with the living conditions of the object. When students fully understand the relationship between organisms and the environment, the purpose of the fieldwork session will be fully achieved. To achieve this, of course, future biology teachers need to improve their ability to combine theoretical knowledge with practice. Conducting field practices in biology is an active form of knowing that the plant and animal world is one with the living environment and the practical activities of man. Infield practice, the interdependence of events is described clearly, and once students observe this connection, it is much easier to master it than in the classroom [1,2].

The organization of field practice in higher education is the most relevant for future biology teachers. Because the future biology teacher plays a key role in giving a natural geographical description of the place of field practice, in the formation of concepts about the geographical location, topography, climate, soil and vegetation, fauna. During the year, in order to strengthen the knowledge of students in the field of zoology, in-depth study of the diversity of fauna of Uzbekistan, lifestyle, habitat, distribution laws, biology, summer fieldwork is held. During the field practice in zoology, students are acquainted with the fauna of the natural area. They also make sure that wild and domesticated animals have a certain economic value, and that their use can be done on a scientific basis. They fully master the ways of using the identifier in determining the name of an animal to which species, generation, family and category it belongs [1.3]. This plays an important role in the formation of future biology teachers' skills and abilities to work with students in their pedagogical activities.

## **DISCUSSION AND RESULTS**

The science of zoology, like other sciences, it is inextricably linked with teaching and field practice. Without highlighting the interrelationship between field practice and zoology teaching, it is important to give students a clear understanding of the diversity of the animal kingdom, its laws of development, the role of animals in human life and nature, and to use it as a subject. Zoology is also of great importance for medicine by studying the pathogens of various diseases and their carriers. Zoological objects are also used in space research; at present, space biology is developing successfully. Materials of practical importance on the diversity of animals are found in almost every subject. The main directions devoted to the application of knowledge about animals in the practical activity of man can be considered in a generalized way. As mentioned above, the school zoology course explored the secrets of their effective use based on the reproduction and protection of wildlife, which is conveyed to students through the following concepts. "Importance of earthworms in soil formation", "Importance of insects in nature and human life", "Economic importance of fish and protection of fish wealth" and others. The importance of wildlife resources for the food industry are clearly showed and the issues of efficient use of fishing grounds are studied.

The rules of efficient use of natural resources and the need to protect them, the role of animals in human life can be explained by the example of fishing. At present, in order to increase the number of fish species of high importance in the food industry in the country, fish farms are being established and quality fish is being introduced from one reservoir to another. In the Zoology course, students learn about fish and how to protect them; restriction of hunting time and places, temporary ban on hunting, restriction of the size of nets, ban on the use of poisons, anti-poaching get acquainted.

Students gain knowledge about bird conservation and attraction when studying the topic of birds. In addition, the topic "Class of Birds" introduces students to the importance of insectivorous birds in reducing the number of pests of cultivated and wild plants, the role of birds of prey in the eradication of

small rodents - field pests and vectors of infectious diseases. It also explains the importance of birds of prey and the system of bird conservation measures. At the end of the zoology course, the study of mammals, the origin of cattle, their different breeds, sheep and sheep breeds, the importance of horse and horse breeds in human life and their use are completed. In the first lesson, students learn the silkworm in a zoology course. Being acquainted with the silkworm and its reproduction will allow you to learn about its origins and differences from its wild ancestors, the need to have a clear understanding of the biology of silkworms in its care, and more. It allows to students to explore directly the changes that take place in them during the process of feeding silkworms. Students will be introduced to another domesticated insect bee in direct practice by exploring the role of bees in nature and human life. Many pets are considered in the study of vertebrates. The topic of "fish" is the study of carp breeding as a domesticated animal and the breeding of fish close to it in a pond farm. The biological characteristics of this highly heat-loving fish have been determined, taking into account that it spawns in shallow, well-heated shallow, non-freezing pools. Students increase their chances to deal with fishing in the future with this knowledge.

In the study of birds and mammals, great attention should be paid to poultry and pets. Students will be acquainted with domestic birds, their origin, nature and their methods of reproduction and care. To study the biology of domestic mammals, a series of double-hoofed and single-hoofed has been introduced into zoology. Students learn about these wild and domestic breeds through the study of these mazes, their unique species and conservation measures, and their breeding issues.

During the study of the class of insects and their most important categories, students explore both beneficial and harmful insects, the damage that pests inflict on agricultural crops. For example, in the study of a group of straight-winged such as the genus of locusts, it is said that the locust is a pest of dangerous agricultural plants. In the study of other categories, the damage of parasites and pests is also considered.

In addition to insects, various rodents also cause great damage to agriculture, and special attention is paid to their study. In determining the practical significance of zoology for medicine as well, information on pathogens is used. Students when studying simple animals and parasitic worms (ascaris, liver worms, tapeworms, cattle tapeworms, echinococcus, pig tapeworms, roundworms, and baby nematodes) encounter them. Knowing the biology of these animals, their reproduction and development is very convenient for the prevention of diseases.

The school zoology course includes ticks that transmit malaria, houseflies, spiders, encephalitis and other diseases from various animal-carrying insects. The transport of pathogens by these animals is highly related to their biology. Linking zoological teaching with field practice and the application of zoological knowledge in various sectors of the economy (agriculture, food and light industry) in connection with the vocational guidance of students, it is of great importance, along with other subjects, in teaching.

In the higher educational institutions, we can use case study tasks, brain storming, modular learning technologies to develop viewpoints of students for sustainable development, because one of the most promising learning systems is that it is best adapted to the system for developing students' cognitive and creative abilities. In traditional education, the learning objectives are expressed through pedagogical activity, that is, education, while the modular learning, case study, brain storming are expressed through the activities of the learners and

focuses on professional activities [4].

Assessment of students' knowledge, skills and abilities are obtained on the basis of case study test tasks in ecology and nature protection. Some case study tasks are given in the followings. *In the following, there are theoretical materials, you should read it and describe your viewpoints on the case study tasks into tables:*

There are about 4500 species of wild higher plants and over 2000 species of fungi in the territory of Uzbekistan. About 400 of them are rare, endemic and relict species (10-12% of flora). Effective measures are necessary for their protection. Although the status of flora protected in the reserves is rather good, natural stocks of wild species have sharply reduced. The current state of coenotic (cenotic) populations of 5 plant species were listed in the Red Book of the Republic of Uzbekistan from the territories of the Kashkadarya region, such as: *Dianthus uzbekistanicus Lincz.*, *Eremurus robustus (Regel) Regel*, *Salvia lilacinocoerulea Nevski.*, *Iris magnifica Vved.*, *Tulipa fosteriana W. Irving*. So their reproduction are not available [4].

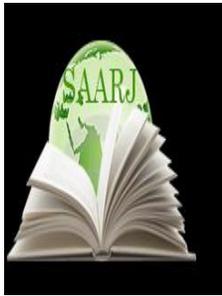

<b>Case study tasks</b>		
<b>Types of problems</b>	<b>Origin of the problems</b>	<b>To inhibit the problems</b>
Desertification of pasture ecosystems		
Sand movement		
Some threatened species	Ways that species become endangered	What can you do to help endangered species?

## CONCLUSION

We have analyzed the relationship between ecological, zoological knowledge and field practice, and the role of practice in the development of students' knowledge. The practical importance of the organization of field practices in the formation of scientific understanding of students is also studied. The relations between science and practice in the study of the benefits and harms of animals, plants are strengthened by practical knowledge of students. Practical knowledge involves *assessment* of students' knowledge, skills and abilities and these are obtained because of case study test tasks in ecology, zoology and nature protection.

### ABSTRACT

*The article discusses the problems of psychological advisory by a psychologist in the organization of preschool education, reveals the main aspects of organizing and conducting psychological counseling in a preschool institution.*

**KEYWORDS:** *Psychologist Of The Organization Of Preschool Education, Preschool Children, Psychological Advisory, Pedagogical Methods, Role-Playing And Didactic Games, Educational Activities, Thematic Advisory Functions.*

### INTRODUCTION

Thematic advisory (consultation) plays an important role in the activities of the psychological service and performs *informational, preventive, and propaganda* functions. Psychological consultations by child psychologists are the most "popular" in preschool education. Psychologists themselves consider it important, giving them professional satisfaction and the opportunity to participate in the educational process of the institution. This type of activity, according to their estimates, allows not only to help pupils, but also to develop technologies for teaching children, to form their own positions on preserving the specifics of the educational process in different age groups.

**LITERATURE REVIEW:** An analysis of the questions addressed by educators to psychologists (psychological counseling of 20 psychologists with at least three years of experience) showed that this is first a group of questions about the psychological conditions of the educational process, then a question about the discipline of children in the classroom, expressing the specifics of raising children. Summarizing questions are a tool of choice for children interested in the lesson.

Thus, educators often seek advice from a psychologist on how to organize the learning process, how to best use the thematic learning environment, and how didactically select and present learning content. However, unfortunately, educators do not consult with a psychologist from a professional point of view when raising children. This indicates that the activity of pupils does not have a sufficiently developed reflexive side, and most psychologists do not have the competence to give advice.

Therefore, in the process of conducting psychological advisory on raising children, the psychologist develops the reflexive qualities of pupils, their sensitivity to the situations being taught, solving the questions posed to him.

The work of psychological advisory is not limited to the implementation of the educational function of a psychologist, but also largely includes a propaganda function, because a person asking a question to a psychologist is now ready to learn and understand something, change himself.

We will try to give an example of these rules in the scenario of a psychologist's work on the issue of child discipline in the classroom and the informational order of answers to some questions from teachers to psychologists.

**Analysis:** Discipline (from the Latin disciplina - order, ordered structure; sequence) - a strict order, a rule that a team or members of a particular team must follow [1].

Usually, teachers think about discipline for two reasons: firstly, in the absence of it, the impact on effective learning decreases, and secondly, the violation of the daily routine of children in the classroom interferes with the teacher, reduces his learning opportunities, and leads to disruption of his activities.

The work of a disciplinary psychologist in kindergarten can be multidimensional and multi-stage.

The first stage is diagnostic, which consists in examining the causes of indiscipline in the educational activities of children. For this, the psychologist monitors the progress of the classes in groups, records the facts of disciplinary violations and analyzes the reasons that lead to them. For example, this could include:

- nervousness of the educator, excessive tone of communication, dissatisfaction with children and the emergence of negative experiences in the group as a result of their actions;
- alienation of children from group goal setting, independence in the choice of methods of action, separation from the assessment of results, stereotypes of educational tasks, insufficient intellectual and emotional saturation of the content of classes, lack of regularity and stereotypes, reproductive capacity, creativity;
- inability of the educator to use the means of communicative development (mediation, support of initiatives, acceptance, approval of the processes of teaching children, etc.);
- the use of authoritarian techniques and techniques of the teacher to interact with children in the classroom (direct instructions, strict orders, prohibitions, strikes, criticism, etc.);

- lack of clarity and consistency in the organization of classes, irregular rhythm, violation of the requirements for the time of classes, lack of adequate and complete teaching materials and equipment for each child;
- environmental problems from a hygienic point of view (training in cramped, semi-dark, cramped rooms, uncomfortable furniture, exposure to distracting noise);
- children are not interested in lessons because of the complexity and incomprehensibility of the lessons;
- the level of development of the skills of intellectual activity due to a violation, absence or weakness of the motivational basis of children's cognitive and educational activities, lack of interest in new information, the child's lack of confidence in thinking about activities, lack of self-control skills, lack of independence in general (attention, memory, contemplation, imagination ) lead to underdevelopment;
- manifestation of certain formal dynamic features of temperament in the form of behavior and activity (imbalance, increased physical activity, decreased mobility, inertia, fatigue, stiffness, etc.);
- poor development of communicative components of interaction with peers and teachers (conflict, inability to coordinate their actions with others, lack of adequate speech, lack of understanding of "role" positions in the lesson, lack of reflective abilities).

The second stage is informational, preventive and propaganda work that a psychologist conducts with teachers in a group to prevent and eliminate factors leading to disciplinary violations.

These can be individual and group psychological consultations, master classes, discussion of the problems of organizing classes in order to improve their developing impact. The method of verbal interaction on how to learn to communicate with children in the classroom, the use of teaching methods to "remove" negative emotions in order to overcome the emotional stress of children in the learning process. These are the types and forms of work of a psychologist with all participants in training to improve the professionalism of teachers and their personal growth.

It is especially important for educational psychologists to form a rational attitude towards the manifestations of high reflexivity in the analysis of children's indiscipline and its causes. (Often children are accused of hooliganism in the group, rather than looking for flaws in the content and didactics of teaching). It is important to understand that educators need to master polite forms of commenting on child abuse.

The psychologist can use role play to achieve this goal. For example, a group of educators should be given a "lesson" in teaching a new technology for developing game reality for narrative role-playing games. It also simulates special situations (lack of necessary tools, lack of suitable places to work, distractions, vague instructions, "poor" content materials, explanations of individual abilities, etc.) that cause difficulties and "failed" actions.

Then all these negative moments are eliminated, and "education" is created in a new way on a positive emotional "background" and a convenient "didactic" basis. The experience is discussed by teachers. Thinking professionally helps raise awareness among pupils by waiting for minutes to disrupt the group schedule. Their experience helps pupils develop a sensitivity to finding suitable, humane means to tidy up the group.

After the role play and discussion, the participants can be asked to answer the questionnaire.

The third step is the work of the psychologist on solving disciplinary problems in the classroom, helping children when they have difficulties with self-regulation in their behavior and activities. The forms of his work can be different. Special classes to develop children's voluntary attention, "lessons" to develop the ability to listen, accept, store and complete teacher assignments, trainings to develop children's confidence, communication skills and relationships with others in the group, psycho-gymnastic work such as resistance to failure, exercises in development and many other types of work with children to develop mechanisms for self-regulation of behavior and activity.

Therefore, in conclusion, since the discipline function in teaching has three variables, they are as follows:

1. The teacher's subordination to a well-established, meaningful and didactic order in the group;
2. Specific possibilities, skills and habits of children that are objectively necessary in the learning process, i.e self-regulation and self-control of children in the group;
3. Awareness of the interaction of all subjects of the educational process. Maintaining a certain order of reason, consciousness, and freedom (freedom is a recognized choice).

It is difficult for teachers to distinguish an educational task in the educational process from a practical one. Psychological propaganda on this issue primarily involves familiarizing teachers with the views of leading psychologists.

There are also changes in the topic of solving practical problems. However, these changes are not the main goal of the movement and the main result of activity, but an addition. For example, a child makes a vegetable salad. The main result is cooking, an additional result (using a knife) is the formation of cutting skills, knowledge of the properties of vegetables, emotional experience, changes in motivation and much more.

The main result in the educational task is the change of the subject (knowledge, skills, abilities, thinking processes, personal development, awareness, different competencies, etc.). The purpose of the educational and practical task is distinguished by the main and additional final result.

Nevertheless, it is conditional to differentiate these tasks according to this indicator. There is no change in the subject itself outside the process of changing the objective reality of the subject. Therefore, a child's learning activity must be a subject activity that makes a difference in the subjects.

For a kindergarten psychologist, the end product of a study assignment and the fundamental importance of the problem of a practical assignment is that in educational practice, a practical assignment is often a solution to the problem when replacing an educational assignment in a group. For example, a teacher focuses only on the results of production activities (drawings, manuscripts, sketches, etc.). The child's experiences, methods of action, volitional tension, attitude to activity, motives and other manifestations of personal experiences and changes in them remain "strangers".

This requires a different solution to diagnose the child's development in the learning process. A psychologist must explain to educators that the specifics of an educational task is not a specific

object that needs to be learned, in which the child acts in solving it and makes changes by his actions.

When conducting classes in kindergartens, when the entire group of children simultaneously performs certain educational activities, the teacher will inevitably not see ways to solve the educational problems of most children. The only thing that seems to him is changes in these objects (traces on a blank sheet of paper, modifications of pieces of plasticine, etc.). That is, the final result of completing subject tasks, teachers indirectly assess the development of the child, his cognitive abilities and changes in his competence.

Thus, the definition of the concept of "educational task" in the learning process in kindergartens and a clear understanding of its final result confirms the need for educational activities with young children.

Distinguishing between practical and educational tasks in the group requires a psychological analysis of the results of children's learning activities, as well as goal setting in the lessons and a comprehensive analysis of all its didactics in this context.

What is the role of exercises, repetitions, that is, what are sometimes called "hand training" in the upbringing of young children? This question is often asked by educators to the psychologist in connection with poor memory of the material by the children in the group.

There are two limits to the answer to this question. Some consider "hand training" to be the main way of raising a child, since his consciousness is not yet sufficiently developed. Secondly, in order to properly criticize the mechanical nature of repetition, exercises in educational practice sometimes lead to a denial of the value of consolidating other knowledge, skills and competencies. People have two important conditions for correct behavior: the strength of habit and the strength of thinking. While the former is sufficient to operate under normal stereotyped conditions, the latter is necessary in changing conditions. Both are necessary and conditional. In the development of the child, the value of habits and new ways of acting does not differ. Both are the essence of life, the usual patterns of behavior created in the process of thought, and the replenishment of new ones.

Since the first days of life, the child is in a relatively stable environment of life, when he needs familiar ways to act in any thoughtless and changing environment, to give up energy-intensive habits to find a new way of acting, i.e. creative solutions to evolving problem situations, exercise role, i.e. Adapts to "hand training". Exercise is very important in teaching. They allow the child to have prior experience in solving life problems, or to use this reinforced experience to re-integrate it into new situations based on new information.

Thus, teaching is important both in stereotypical contexts and in the development of creative processes. Some educators, who firmly deny the incorrect traditional methods of identifying another teaching material through practice and repetition, may consider it a novelty. The child's hands will only be able to take on the control function by repeating the movement over and over again. Surveillance cannot be avoided without hands-on training.

**Discussion:** *What pedagogical methods are effective in education?* Pedagogical methods should not adversely affect a child's personal development. This question arises in the analysis of the work of a particular educator for kindergarten stylists. The psychologist should approach this issue with great responsibility and discuss it in detail with the educators.

There are many ways to master the material and remember it in the classroom. There are methods that increase the effectiveness of education, but collide with the conditions for the full development of the child's personality. Among them are two groups, which are coercion under the threat of punishment and the second, techniques of a competitive nature, comparing the successes and failures of one child with others. The first group of compulsory pedagogical methods has been comprehensively analyzed and discussed not only in terms of harm to personal development, but also as a didactogenic risk factor for the physical health of the child.

Very little is said and written about the negative consequences of constant competition in educational activities for the personal development of children. At the same time, competition as a didactic device that activates children's activities is gaining popularity in the work of pupils. (For example, in a kindergarten educator's speech, always say, "Look, Madina's did well", "Put the best things at the top and put the things of the kids who didn't succeed today", "Choose the funniest thing", "Whose story did you like?", "Who is the fastest ... " and so on).

How should a psychologist relate to this competitive environment in groups? In such cases, the recognition of the level of activity of some children and discrimination of others by some indicator, the exact outcome of the activity, is often discussed by solving a simple topic task rather than a learning task. In fact, assessing the success or failure of educational activities, or, conversely, self - esteem, some children 's objections are insufficient, there is a risk of uncertainty or an increase in self - confidence. All of these personality traits can occur at a pre-school age, or at least can be the basis for a child's impaired development of self-awareness.

The psychologist of the preschool organization should pay special attention to the procedure for evaluating the results of children's activities in the group. It leads the educator to understand the harmfulness of competition in the learning process, to use very carefully the elements of comparing the activities of one child with another. The principle of "personal achievement" should always be kept in mind when evaluating learning activities. L.S.Vigotskiy wrote about the importance of the concept of "relative success" in pedagogy. Relative success does not mean absolute success [2].

Thus, it is not correct to compare a child with another on the success of educational activities, and even more so to organize a team struggle (competition) in the learning process. A child's success today can only be compared to his or her own achievements yesterday, the assessment is relative, not absolute, in scientific activity. Only with this approach to the evaluation of the results of children's activities in the educational process will be the basis for talking about the humanization and individualization of education in preschool organizations. The use of common methods of comparing a child to other and constant competition to achieve good results can negatively affect children's self-awareness and self-esteem.

There are a number of issues related to child rearing in small rural kindergartens. In addition, very often the living conditions of urban and rural children are assessed in terms of their education. What is unique about the work of urban and rural kindergarten psychologists on issues of person-centered education? The benefits of urban children's personal development are compounded by their alienation from the creative work of adults.

There are limited opportunities to imitate creativity because of the behavior of loved ones at home, in which children often interact with adults they have witnessed, mainly related to communication at home "What does a person have to do to have bread at home? When asked,

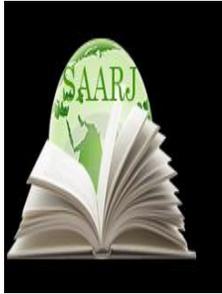

---

72% of six-year-olds in the city said they had to go to the store, and 28% said they had to make money. The children of the village said, “We must plant and cultivate wheat”. The children in the city are alienated from the whole movement (to the question “What should I do to have water in the house?”, The child says “I turn on the tap”, “If he needs hot water” – “I don't know”. “What do you do if the food comes?” He says, “I ask my mother,” “I get it from the refrigerator”). In order for children to avoid domestic dependence, the preschool child should be involved in creative activities (growing plants, caring for animals, cooking, working with fabric and wood, etc.). The curriculum content of an urban children’s education program should contain more materials that can be involved in creating a child.

**CONCLUSION:** Rural children, unlike urban children, have the opportunity to experience natural information, to develop thinking, a unique emotional experience. But mental development is not determined only by personal experience. Personal development education involves the development of a child’s unique experience and the mandatory inclusion and recognition of the value of other people’s experiences (various social associations) and universal experience.

**ABSTRACT**

*The article presents the types and characteristics of the professional competencies of the preschool teacher, identified on the basis of the functions and professional and pedagogical skills of the teacher.*

**KEYWORDS:** *Competencies, Competence, Preschool Educator, Types Of Competencies.*

**INTRODUCTION**

A widely researched issue of theory and practice is the training of a specialist within the framework of the competence paradigm, which is characterized by the possession of not only knowledge, skills and abilities, but also the ability to implement and implement them in professional activities. However, there is no consensus regarding the definition and composition of the professional competence of a preschool teacher.

What is competency for?

For successful work with children today, you need a teacher with already established professional experience, the ability to think creatively, analyze and plan activities, and be responsible for the result. In these conditions, it becomes necessary to develop special professional competencies in the educator.

The concept of "competence". Educational result, expressed in real possession of methods, means of activity, in the ability to cope with assigned tasks both in traditional and non-standard situations;

A predetermined social requirement for the educational result necessary for effective activity in a particular area (A. V. Khutorskoy);

The educational result, represented by the integration of its skill and intellectual components and its application in activities (E. F. Zeer);

Integrated quality, which characterizes a person's ability to realize his potential for solving professional problems (Yu. G. Tatur);

“Content” of competence: knowledge, skills, experience, thanks to which a person shows competence in activities. (D. G. Arsentiev).

Competence is understood by us as the ability of a person to responsibly, effectively implement activities. Competence is based on competencies - internal potentials, hidden psychological neoplasms (I.A.Zimnyaya).

Singling out the types of competencies of a preschool teacher, we relied on the integration of models for defining competencies based on personality parameters and on the performance of tasks and activities [1].

J. Delors. The French politician has formed the following personality competencies:

- learn to know
- make
- to live together
- live
- Necessary for the full life of the individual, we single out:
- cognitive competence, involving the use of theory and concepts, as well as hidden knowledge;
- functional competence (skills), namely, what an individual must be able to do in the labor sphere, in the field of education or in social activities;
- personal competence, which involves behavioral skills in a specific situation;
- ethnic competence, which presupposes the presence of certain personal and professional values.

The classification of competencies presented by I.A.Zimnyaya summarizes different areas of human activity and consists of several blocks:

Competencies related to the person himself as a person, a subject of activity, communication (health saving, citizenship, value orientations, etc.);

Competencies related to social interaction of a person and the social sphere (all types of communication and social interaction);

Competences related to human activities (different types of activities - play, learning, work, cognitive activity, information technology competencies, etc.).

V.I.Baydenko proposes to classify competencies in connection with the orientation of the individual to the readiness and ability to perform efficiently:

General competences (social interaction, systemic activity, self-organization and self-government, value-semantic and political-legal, independent cognitive activity);

Professional competencies (economic, including the ability for entrepreneurial behavior; general scientific, expressing readiness for the constructive use of knowledge, methods and technologies; general professional, which make up the range of the individual's abilities to use the theoretical foundations of professional activity; special, expressing the professional profile of the individual);

Academic competence (knowledge of terminology and methodology in a particular field of knowledge).

A. V. Khutorskoy assumes the following classification of educational competencies, the formation of which guarantees the self-development of an individual throughout his life:

- value-semantic competencies in the field of worldview associated with value guidelines;
- general cultural;
- educational and cognitive;
- informational, providing the skills of the student's activity in relation to information;
- communicative, which include knowledge of ways of interacting with others, skills of working in a group;
- social and labor, denoting the possession of knowledge and experience in the field of civil social activities;
- impotence of personal self-improvement, aimed at mastering the methods of physical, spiritual and intellectual self-development.
- Classification of the teacher's competencies corresponding to the types of his activities as a person and a professional:
  - personal block - competencies aimed at self-improvement, health preservation both in the physical and spiritual sense, value-semantic competencies in the field of worldview associated with value orientations, general cultural competencies;
  - cognitive block - educational and cognitive competencies, information competencies that provide the skills of an individual's activity in relation to information, readiness for learning throughout life;
  - social and communicative block - competencies related to knowledge of ways of interacting with others, knowledge of written and oral speech, teamwork skills, the ability to lead and obey, find solutions in non-standard situations, social adaptation in society;
  - professional block - competencies that make it possible to achieve success in the professional sphere, ensuring the adequacy of the performance of professional activities (divided into general professional competencies, special and organizational).

Classification of the teacher's competencies corresponding to the types of his activities as a person and a professional: personal block - competencies aimed at self-improvement, health preservation both in the physical and spiritual sense, value-semantic competencies in the field of worldview associated with value orientations, general cultural competencies; cognitive block - educational and cognitive competencies, information competencies that provide the skills of an individual's activity in relation to information, readiness for learning throughout life; social and communicative block - competencies related to knowledge of ways of interacting with others, knowledge of written and oral speech, teamwork skills, the ability to lead and obey, find solutions in non-standard situations, social adaptation in society; professional block - competencies that make it possible to achieve success in the professional sphere, ensuring the adequacy of the performance of professional activities (divided into general professional competencies, special and organizational).

Distinctive features of the teacher's activities:

The main task of pedagogical work with children of early and preschool age is the development (not teaching) of the child;

The educational process and the interaction of the teacher with the child takes place throughout the day, so the results largely depend on the level of professional training and the integrity of the teacher's personality;

One of the main directions in the work of a teacher in preschool education is the organization and management of various types of children's activities: play, work, motor - which requires special skills.

Based on the analysis of the content of pedagogical activity, we highlight its main functions:

Protection of life and health of children;

Planning educational work;

The implementation of the educational process;

Organizational and economic function;

Pedagogical education of parents;

Self-education.

It is very important to independently spontaneous activity of communication, the organization of the subject-spatial environment is necessary for the development of the child, taking into account his individual characteristics, this can be organized by a teacher who has formed a special special competence.

We highlight the following professional competencies:

- Communicative competence- pedagogical communication skills, as well as general ability to understand other children, teachers and parents;
- Informative competence- the ability and skills to work with various sources of information, the ability to adapt them to learning objectives;
- Methodological competence - selection of the most effective ways of professional activity, possession of analytical, predictive and design methods of activity;
- Developing competence - theoretical and practical ideas about ways to develop a child's subjective position, ways to maintain attention, control and correct the course of children's activities;
- Orientation competences- aimed at the formation of moral and value attitudes of pupils;
- Mobilization competence- theoretical and practical ideas about ways to enhance the activities of children.

Competencies can be divided into several groups:

- Competences related to communication and communication skills;
- Selfdevelopment competence, readiness to use adequate methods and technologies in working with preschool children;
- Competence of readiness to act in unexpected situations, use of experience in new conditions;

- Competence of readiness for planning and forecasting the results of work with preschool children;
- Competencies related to the teacher's readiness to diagnose and analyze performance results;
- Competence of readiness to use information technologies for self-development, work with children and communication with parents and colleagues.

The content of professional competencies necessary for a preschool teacher

Competence	Content
Communicative	Willingness to compile psychological and pedagogical support for families on the upbringing and education of preschool children
Cognitive	<p>Towards personal developmental interaction with adults and children from a position of cooperation. Willingness to work on the formation of a general culture of the personality of children, the development of their social, moral, aesthetic, intellectual and physical qualities, initiative, independence and responsibility.</p> <p>To the implementation of social and communicative speech development of children.</p> <p>To work on the formation of the prerequisites for educational activities in preschool children.</p> <p>To work in a team with other employees of the educational organization.</p> <p>To continuous self-development.</p>
Mobilization	<p>Readiness to support the child's initiative and independence.</p> <p>Projective-prognostic</p> <p>Work with children with different educational needs, health opportunities, including in inclusive groups.</p> <p>Readiness to work on the creation of individual routes for the development of children, taking into account the zone of proximal development of each child.</p> <p>The ability to plan the activities of children, taking into account the creation of conditions for a free choice of activities, the development of the educational environment.</p> <p>Use non-directive methods to help a child in a difficult situation.</p> <p>To carry out professional activities in accordance with the State Educational Institution of Higher Education in the context of education renewal,</p>

	non-standard pedagogical situations, etc.
Diagnostic and analytical	The ability to regularly monitor the development of the child, collect and analyze his actions and deeds.
Information	Willingness to diagnose child development using feedback from their own pedagogical actions to plan further work with children. Willingness to use the skills of working with information sources, including ICT for self-development, organizing educational activities of children, interactive communication with families of pupils, staff of preschool educational institutions.

## THE STUDY OF MANPOWER DEVELOPMENT THROUGH RELEVANT TECHNOLOGY EDUCATION CURRICULUM FOR SUSTAINABLE POVERTY ALLEVIATION

S. T. Puyate\*

\*Faculty of Technical and Science Education,  
Department of Science and Technical Education,  
Rivers State University of Science and Technology,  
Port Harcourt, Rivers State,  
NIGERIA

### ABSTRACT

*The purpose of this study was to investigate whether the present curriculum being used to the development of technological manpower in our technical colleges is relevant, adequate in content, effective and enough to make the recipients self-employed for sustainable poverty alleviation. A total of 50 respondent comprising 20 technical teachers and 30 final year students from technical colleges formed the sample of the study. A set of questionnaire was used for data collection while the target population was all teachers and students. A total of three research questions were and simple percentage was used to analyze the data collected. The findings revealed that, the currently used curriculum in technical colleges is inadequate, not very relevant, no enough time for practical and cannot earn the products self-employment for sustainable poverty alleviation.*

**KEYWORDS:** *Self-Employment, Alleviation, Comprising*

### INTRODUCTION

No meaningful progress can be made by any aspiring nation to become a technological giant without the initial step of developing an efficient and reliable labour force. During the colonial era when Nigeria was in the hands of her colonial master, a lot of notable establishments were put in place for the training of able-bodied Nigerians for manpower development in special trade areas. Such private sectors include among others, the then Electricity Corporation of Nigeria (ECN) which metamorphosed into National Electric Power Authority (NEPA), the Post and

Telegraph now Nigeria Telecommunications Limited (NITEL) just to mention but a few (Akaninwor, 1992).

It is also worthy of note that in 1895, the Hope Waddel Training Institute in Calabar, Nigeria was established primarily for the training of men for employment in the society. In addition, the Yaba Trade Centre, which is now Yaba College of Technology, was established in 1984 including several others in Nigeria for the development of middle-level manpower for the world of work.

As a follow up, the Federal Government of Nigeria through Decree No.47 established the Industrial Training Funds (ITF) as an organ of government for the purpose of training students on the job-training and re-training of both students and staff of various training Institutions. In 1977, the Federal Government established the National Board for Technical Education (NBTE) through Decree 9 for the purpose of co-ordinating technology education programmes in Nigeria.

Nigeria as a developing country with over 100 million people, one cannot definitely ascertain the number of unemployed graduates or school leavers. As the growing uncertainty in the labour market continues, unabated with more and more graduates without the necessary employable skills being turned out yearly, one then tends to ask the question, where and when would these graduates be employed?

It is a fact that, the now so-called developed nations in the world today did pass through this hectic situation for some decades before arriving at a reasonable lasting solution but when will that of Nigeria come (Puyate, 2002)?

According to Agbionu (1991), education being a social service is prone to modifications and constant review if it is to bring about the desired change.

Manpower development generally is a factor, which no serious nation can afford to ignore. A sound skilled manpower based development is the bedrock for sustainable poverty alleviation. Both Federal and State governments at different times made serious efforts to engender the development of manpower necessary to enhance the nation's industrial aspirations.

According to Tudunwada (1984), Nigeria is naturally endowed with tremendous human and material resources, but there is no gainsaying of the fact that the country has not yet got all that is necessary to make her fully developed industrially".

Technology education covers the process of producing skilled manpower, craftsmen, technologists and scientists. The International Labour Organization (ILO), defined technology education as that which involves all activities which essentially aims at providing the skills, knowledge and attitudes required for employment in a particular occupation, group of related occupations or a function in any field of economic activity including agriculture, industry, commerce, catering, tourism, engineering, public or private services etc.

According to Ukaha (1986), for technological education; manpower development, and self-reliance, Nigeria requires essential skills for survival in the 21<sup>st</sup> Century. For Nigeria as a developing nation to survive in the light of the above, she needs to develop a strong employable, skilled manpower development programme different from the present orientation for sustainable poverty alleviation. Poverty can only be alleviated when there is a means to sustain it. Thus, the only means is to empower the citizenry is through employable skills' acquisition programme in the formal way through the proposed suggested skills acquisition innovation.

In his opinion Puyate (2002), stated that for any nation to develop technological and industrially, she must have well trained and capable manpower and that this training ranges from craftsmen to engineers.

Curriculum has been defined as the total learning experiences presented to the learner as a deliberate, systematic and planned attempts by the school to change his behaviour (Onwuka, 1981).

In this paper, curriculum is specially limited to the area of technology education. As earlier stated, it is an area of education in which the recipients acquire a level of applied and manipulative skills, and basic scientific knowledge that will enable them understand the world of technology and the society better.

According to Aremu (1986), the effectiveness of any curriculum can be evaluated in terms of its suitability, relevance and adequacy. A technology education curriculum is ascertained useful and relevant if it meets the needs and aspiration of the trainer and trainee. Hence, the relevance of the technology education according to Aremu (1986), is that of practicability, applicability and functionality if manpower development through relevant technology education for sustainable poverty alleviation is to be achieved.

### **PURPOSE OF THE STUDY**

The purposes of the study are to:

1. Ascertain the degree of relevance of the present technology education curriculum for manpower development and sustainable poverty alleviation.
2. Investigate the adequacy of the present technology education curriculum for employment and sustainable poverty alleviation.
3. Determine the effectiveness of the products of the present technology education curriculum in employment for sustainable poverty alleviation.

### **RESEARCH QUESTIONS**

For the purpose of this study, answers to the following research questions were sought.

1. What degree of relevance exists in the present technology education curriculum for manpower development and sustainable poverty alleviation?
2. What level of adequacy exists in the present technology education curriculum for manpower development and sustainable poverty alleviation?
3. What level of effectiveness exists in the products of the present technology education curriculum for employment and poverty alleviation?

### **RESEARCH METHODOLOGY**

#### **POPULATION OF THE STUDY**

In this research study, two groups of respondents formed the target population;

- i) Teachers of technology education in Technical Colleges, in Rivers State.
- ii) All final year students of technical colleges in Rivers State

### SAMPLE OF THE STUDY

From the target population a total of 20 technology teachers and 30 final year students were sampled for the study.

### INSTRUMENT OF THE STUDY

The instrument used for the study was a simple questionnaire, which comprises four sections. The first section requested for the personal data of the respondents while the second section comprised items, which sought to find out the degree of relevance of the present technology education curriculum. The third section also consisted of items that deal on the adequacy of the curriculum while the fourth section dealt on the effectiveness of the curriculum as it relates to employment.

### TECHNIQUE FOR DATA COLLECTION AND ANALYSIS

The questionnaire was administered personally to the respondents.' A total of 50 copies of the instrument were filled and returned which represents 100 percent return. Simple percentages were used to analyze the data collected.

### RESULTS AND FINDINGS

**TABLE 1: DEGREE OF RELEVANCE OF CURRICULUM FOR MANPOWER DEVELOPMENT**

Response Options	Number of Respondents		Total Respondents	Development Percentage %
	Teachers	Students		
Very relevant	6	4	10	20
Relevant	2	6	8	16
Not relevant	0	8	8	16
Enough practical	4	2	6	12
Little practical	8	2	10	20
No practical	-	8	3	16
<b>Total</b>	<b>20</b>	<b>30</b>	<b>50</b>	<b>100</b>

Source: Field Report, 2012

The above figures in Table I show that 12(20%) of the 50 respondents indicated their opinion that, the present curriculum is very relevant, 8(16%) indicated relevant, 8(16%) indicated not relevant, 6(12%) indicated that there is enough practice, 10(20%) indicated little practical work is done while 8(16%) finally indicated that no practical is conducted. This means that, the present curriculum is relevant for manpower development but enough time is not given for practical. Thus, the implication of this is that, students do not gain enough employment skills for sustainable poverty alleviation.

**TABLE 2: LEVEL OF ADEQUACY OF TECHNOLOGY EDUCATION CURRICULUM**

Response Options	Number of Respondents		Total Respondents	Development Percentage %
	Teachers	Students		
Very adequate	4	-	4	8
Adequate	10	2	12	24

Inadequate	6	28	34	68
<b>Total</b>	<b>20</b>	<b>30</b>	<b>50</b>	<b>100</b>

Source: Field Report, 2012

Results from Table 2 above indicate that 4(8%) out of 50(100%) indicated that the curriculum is very adequate, 12(24%) indicated adequate while 34(68%) indicated inadequate. The above findings therefore suggest that, the presently being used technology education curriculum is inadequate in content and cannot meet the demands in manpower development for sustainable poverty alleviation.

**TABLE 3: EFFECTIVENESS OF THE CURRICULUM PRODUCTS AND SELF-EMPLOYMENT**

Response Options	Number of Respondents		Total Respondents	Development Percentage %
	Teachers	Students		
Very adequate	2	-	2	4
Adequate	9	4	12	24
Inadequate	10	26	36	72
<b>Total</b>	<b>20</b>	<b>30</b>	<b>50</b>	<b>100</b>

Source: Field Report, 2012

Results from Table 3 above indicate that 2(4%) out of 50(100%) respondents strongly accepted that the current curriculum being used for instruction is very effective while 12(24%) indicated effective and 36(72%) vehemently opined that the curriculum is ineffective thus not for self-employment.

## CONCLUSION

From the study, it is evident that, the presently used curriculum for the production of technical manpower for the nation is relevant as indicated by the overall result in Table 1 but that there is little or no time for effective practical. The results also indicated that, the content of the present curriculum is inadequate in content as regards practical or skills acquisition aspect with 34, (68%) out of 50(100%) response while in Table 3 the respondents strongly affirmed that the curriculum is ineffective as 36(72%) indicated their response. Manpower development is a very important aspect, which any meaningful administration cannot overlook or ignore. It is the wheel that moves the progress of the nation. The problem associated with the present curriculum is lack of enough time for practical, which is the bedrock for self-employable skills in manpower production for sustainable poverty alleviation.

## RECOMMENDATIONS

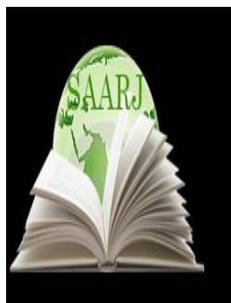

Based on the findings of the study, the following recommendations are made:

1. As a matter of urgency, the time for practical work should be increased weekly as to enable students acquire more practical skills.
2. Government should enact a policy called College — Industry Link Policy which will enable each student each day to spend half of his/her time in the school for theoretical work while the remain half time should be utilized in the students' proposed employment environment for enough practical skills acquisition.

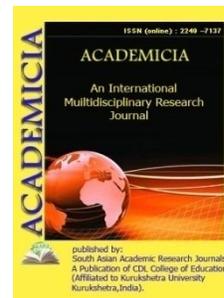

3. Federal Government should urgently urge ITF to carry out its functions for both teachers and students alike.
4. Colleges should adopt students' projects teaching method in instruction for more skilled manpower development.
5. Government should provide more equipment, materials, and funds to schools for practical as obtainable in the industry so that the learning environment will look the same as the working environment.

**ABSTRACT**

*On the basis of the conducted hygienic experiments, the dependence of persistence (resistance), migration and translocation processes, mixing, on the type of soil (serozemic) and the type of irrigation (borodzokovy, dozhedevalnoy) is substantiated. When zencora is used in serozem soil, its responsibility remains for a longer time. When using the drug in sprinkler irrigation accelerators, the level of its residues in the soil was 6.5-13.3% higher than in furrow irrigation.*

**KEYWORDS:** *Herbicide, Zenkor, Persistence, Migration, Translocation, Soil Irrigation.*

---

**INTRODUCTION**

One of the bathroom issues from a hygienic point of view is the study of the behavior of herbicides in various environmental objects. Numerous researchers have proved that the resistance of herbicides from a number of triazines in soils depends on temperature, humidity, and the content of organic substances [1]. Therefore, in some types of soil, these herbicides accumulate, while in others they decompose quickly. So, in chernozem soils, with prolonged use of simazine, its accumulation and migration occurs. In dark gray loamy soils containing 5.8% of humus, simazyn at a rate of consumption of 3.0 and 10.0 kg / ha remains in the 0-10 cm horizon [8].

In sandy loam soils containing 3.2% humus, the preparations penetrate to a depth of 30 cm [9]. In light loamy soils with a consumption rate of simazine equal to 20 kg / ha, it can persist for up to 6 months, and at higher consumption rates, it can be found from traces to 0.6 mg / kg [4]. In irrigated soils, herbicides are highly stable. Thus, the half-life of simazine under irrigation conditions is -180 days [4]; catofora - 171 days [6,7]. Prometrine and atrazine in overburden

chernozems, at a consumption rate of 3.0 kg / ha, after 75 days is found at a level of 0.1-0.15 mg / kg [11].

Thus, the analysis of the literature allows us to conclude about the persistence of herbicides from the group of triazines in the environment. Triazines can persist in the soil from 6 months to 1.5 years, as a result of which there is a risk of contamination of agricultural crops [12].

Based on the foregoing, we set the goal on the basis of our own experimental research and generalization of literature materials to study the resistance in the soil, the degree of migration and translocation in the soil-plant system of herbicide zenkora in different types of soil (gray soil, shank), and different irrigation conditions (furrow, sprinkler).

Zenkor-produced by Bayer (Germany) in the form of 70% wettable powder. The average lethal dose is 2200-2345 mg / kg for rats, 698-711 mg / kg for mice, and 500 mg / kg for rabbits [7]. The drug is intended for combating weeds on crops of potatoes, tomatoes and watermelon.

## MATERIALS AND METHODS OF RESEARCH

Field trials of the zenkar were carried out on sierozem and pinion soils, under conditions of furrow and sprinkler irrigation. The characteristic features of these types of irrigation are as follows: With furrow irrigation, water is supplied from the irrigation ditch network and directed into the furrows of the irrigated field. To the end of the field, a discharge ditch is diverted, where water is discharged after irrigation. The duration of irrigation is 5-6 hours.

With sprinkler irrigation, water is supplied through special pipes and falls on the irrigated surface in the form of rain. There is no water runoff. Watering is done within 2-3 hours.

## DISCUSSIONS OF MATERIALS

The processes of migration, the persistence of zenkora in different soils (loamy-sierozem, shank) on plantings of different crops, with different types of irrigation were studied. We studied the residual amounts of zenkora in three horizons (0-10 cm, 10-20 cm, 20-30 cm) of loamy-sierozem soil sampled in areas under the spring summer plantings of potatoes.

It has been established that when using the drug from the calculation of 0.5-2.0 kg / ha under the conditions of furrow and sprinkler irrigation, soil contamination is observed with residual amounts of the drug. The greatest accumulation of herbicide residues is found in the soil horizon of 0-10 cm ( $0.195 \pm 0.004$ - $0.610 \pm 0.130$  mg / kg). At the same time, penetration of zencora to a depth of 30 cm is observed, where its content was  $0.03 \pm 0.004$ - $0.170 \pm 0.004$  mg / kg. Percentage distribution of zencora in different soil horizons is: 0-10 cm - 56.6 - 60.1%, 10-20 cm - 27.7 - 30%, 20-30 cm - 9.8-15.7%. Zenkor is mixed from the soil into the plant's terrestrial organs. The residual amount of the drug in the tops of potatoes, depending on the rate, was spent 110 days after planting the potatoes, ranged from  $0.11 \pm 0.02$  to  $0.39 \pm 0.03$  mg / kg, in tubers - from  $0.08 \pm 0.01$  to  $0.31 \pm 0.04$  mg / kg. When using zenkora on summer plantings of potatoes at the same consumption rates (0.5-2.0 kg / ha), 10 days after planting, it was found in soil horizons from 0-10 cm to 20-30 cm in quantities equal to  $0.180 \pm 0.02$ - $0.590 \pm 0.05$  to  $0.02 \pm 0.002$ - $0.150 \pm 0.22$  mg / kg. As a result of translocation from the soil, Zencor accumulates in the tops of  $0.08 \pm 0.01$ - $0.30 \pm 0.04$  mg / kg and in tubers -  $0.05 \pm 0.01$ - $0.21 \pm 0.02$  mg / kg.

We studied the processes of migration and translocation of zenkora on plantings of tomatoes grown in the same soil and climatic conditions as potatoes. When the drug was introduced into

the soil at the rate of 0.5-2.0 kg / ha after 85 days, it was found in horizons from 0-10 cm to 20-30 cm at the level of  $0.230 \pm 0.023$ - $0.950 \pm 0.320$  mg / kg. The content of herbicide residues in the tops of tomatoes was  $0.07 \pm 0.011$ - $0.28 \pm 0.05$  mg / kg and in fruits  $0.04 \pm 0.01$ - $0.18 \pm 0.05$  mg / kg.

When using zenkora on planting tomatoes in shaken soil, the herbicide migrated in greater quantities into the depths of this soil than loamy-gray soil. So, at rates of consumption of 1.0-1.5 kg / ha in shaken soil at a depth of 20-30 cm, its residues amounted to  $0.130 \pm 0.020$ - $0.230 \pm 0.040$  mg / kg, and in loamy - serozem soil  $0.090 \pm 0.010$ - $0.135 \pm 0.04$ mg / kg ( $p < 0.05$ ). The highest degree of zenkora translocation was observed in conditions of shaken soil ( $0.11 \pm 0.03$  -  $0.19 \pm 0.04$  mg / kg), significantly less in loamy-serozemic soil ( $0.07 \pm 0.001$  -  $0.14 \pm 0.03$  mg / kg,  $p < 0.05$ ).

Based on the study of the processes of migration and translocation of zencora, it can be said that the content of the drug in the soil under different crops is not the same. So, under equal conditions (type of soil, temperature and humidity, consumption rates of the drug) the greatest amount of zencora was contained in the soil in areas occupied by tomatoes. This is probably due to the difference in the microflora of the rhizosphere of these crops, various agrotechnical measures carried out in the areas of vegetable crops and potatoes. We noticed a difference in the degree of translocation of zencora in plants at different periods of its introduction. So, when using zenkora on spring plantings of potatoes, its content in the tops was 30.0-37.8%, and in tubers - 47.6-60.0% higher than in the tops and tubers of summer-planted potatoes. This fact is apparently associated with the peculiarities of the course of physiological and biochemical processes in potato plants of different vegetation periods. It should also be noted that the level of residual amounts of zenkora in the soil and the degree of its translocation into cultivated plants depended on the conventional irrigation. So, when the soil was cultivated with a zenchrock under spring plantings of potatoes, its concentration during furrow irrigation in the 0-10 cm horizon was  $0.195 \pm 0.041$ - $0.560 \pm 0.110$  mg / kg, and under conditions of sprinkling irrigation -  $0.210 \pm 0.060$ - $0.610 \pm 0.130$  mg / kg, about 5-10% more ( $p < 0.05$ ). The type of soil also played a certain role in the degree of migration of the zencora deeper along its profile. So, the use of the herbicide for the treatment of loamy-gray soil, its residues in the horizon of 20-30 cm was by 29.2-38.0% ( $p < 0.05$ ) less than in the same horizon of the shaken soil.

## DIDACTIC CONDITIONS FOR THE USE OF INFORMATION TECHNOLOGY IN THE ORGANIZATION OF EDUCATIONAL LESSONS IN PRIMARY SCHOOL

**Khazratkulova Shoira Noralieвна\***

\*Teacher of the Department "Methods of Primary Education",  
Termez branch of Tashkent State Pedagogical University named after Nizami,  
UZBEKISTAN

### ABSTRACT

*We all know that today the information and communication system is developing at a high level in the world, and this, among other things, penetrates into the educational process and contributes to its better organization. In such conditions, it is natural that the theoretical and practical aspects of human activity are constantly updated. Pedagogical activity is also no exception as a separate and complex type of work. Educators are trying to achieve guaranteed results in their work.*

**KEYWORDS:** *Didactic Games, Methods And Tools, A Pedagogical Process, Informational Teaching, New Pedagogical Technologies.*

### 1. INTRODUCTION

Today, with the development of science and technology, human activity is expanding and new technologies are entering. Qualitative changes indicate that there are new technical, informational, audiovisual, tools that require new methods and are becoming an integral part of the educational process, introducing certain features into it, which are modern pedagogical made technology a reality.

Pedagogical technology is essentially on a par with other technologies because they, like others, have their own field, methods and tools. However, pedagogical technology differs from production and information technology in that it represents a complex and incomprehensible pedagogical process as a field of knowledge related to the human mind. Its unique feature is that it combines the components of education.

Pedagogical technology is constantly enriched with technological processes in other fields and takes on new opportunities to influence the traditional learning process and increase its effectiveness.

The use of pedagogical technologies in the educational process requires, first of all, the development and democratization of pedagogical relations, because any pedagogical technology used without their implementation does not give the expected effect.

Pedagogical technology, based on the development and democratization of pedagogical relations, is the opposite of authoritarian technology, which in the pedagogical process is based on cooperation, care, respect and esteem for the individual, education, creativity and learning. creates a favourable social and psychological environment for self-development. In this process, the pupil is the subject of his own learning activities, and in collaboration with the teacher solves the subject of a single educational process - educational tasks.

Pedagogical technologies increase the efficiency of the educational process, form the process of independent thinking of pupils, increase pupils' enthusiasm and interest in knowledge, develop skills and abilities to master the knowledge and use it in practice.

The traditional teaching system is described as "informational teaching" because it relies on written and spoken words because the teacher's activity is not limited to the organizer of the learning process; rather, it is being evaluated with an emphasis on becoming an authoritative source of knowledge.

✚ First, pedagogical technology is designed for the educational process. Therefore, each society determines the purpose of the formation of the individual, and accordingly, there is a certain pedagogical system. This system is constantly influenced by social order and determines the content of education in general. The "goal" is to update the remaining elements of the pedagogical system.

✚ Secondly, at the developing stage of scientific and technological development, with the rapid increase of information, the development of science and technology, the boundaries of human activity are expanding and new technologies with great learning opportunities are entering the field of education. limited requirements, as well as the requirements for the perfect preparation of young people for life, require the introduction of new technologies in the education system. There are new technical, informational, audiovisual tools that require new methods and become an integral part of the educational process and introduce certain features into it, which have made new pedagogical technologies a reality.

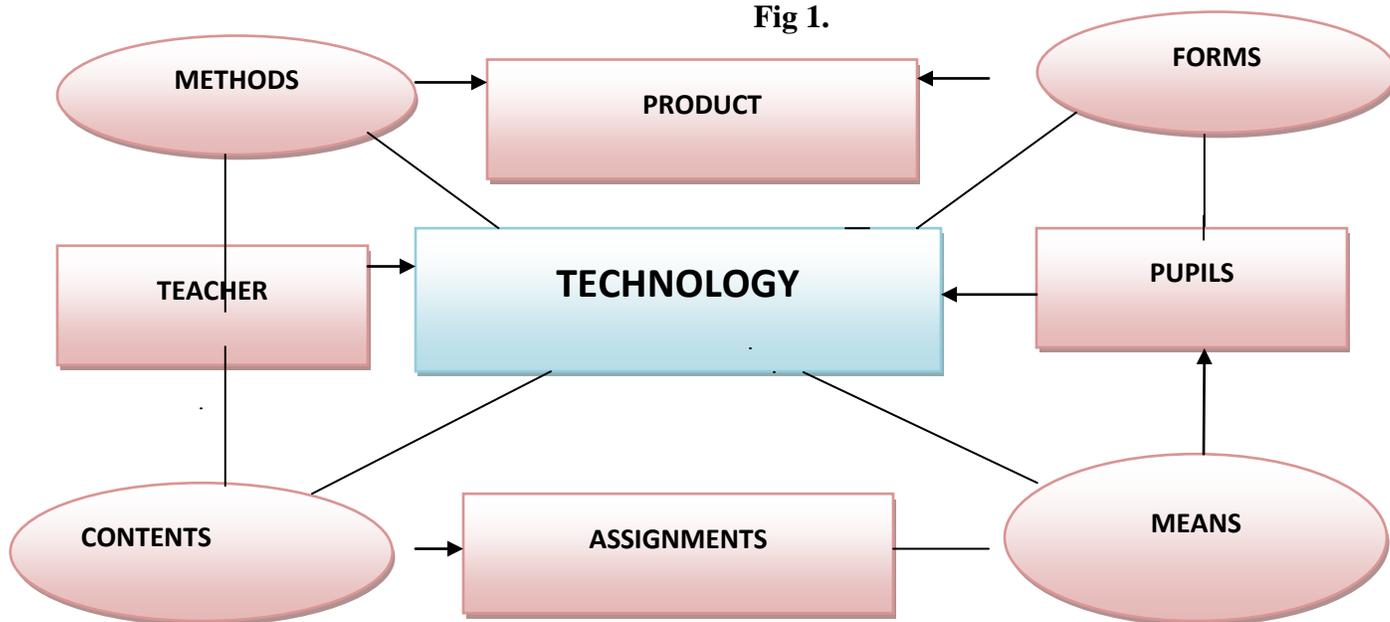

✚ Thirdly, the continuous influx of industry and other technologies into the classroom and their transformation into live learning objects makes it necessary for the teacher to go beyond the traditional methodology and, naturally, to apply technological approaches.

## 2. Main part

Didactic games allow you to infinitely repeat and change game modes, adding different things to the game. For example, we repeated 5-7 types of the game "Silence" more than 10 times with the whole class and with some children; "What has changed?" type game was held with 5 different visual aids and so on. As a result, the game skills were uniform and strong, as well as the ability to listen to and follow every rule of the game. Didactic games are very different in form from

creative games that are mainly played in kindergarten, as well as games that are explained by the teacher through storytelling and reinforced by asking pupils one by one.

**Fig 1.**

**Figure 1. The structure of teaching technology.**

Didactic games serve a teaching function and are conducted in a fun, engaging, understandable way. Children practice hard to win, they become accustomed to doing every task, and as a result, they become more interested in didactic tasks. Didactic games help to better understand the purpose of each lesson, the goals and objectives of each exercise. Didactic games involve the demonstration of learning, the teacher's speech, and the children's movement, resulting in unity in perception (visual, auditory, skin sensory cues). This allows the children to think about and express what the teacher says, that is, the pupils follow the rules of the didactic games themselves.

The richly structured features of didactic games allow for the analysis of pupil performance. That is why all children act with interest during play. Didactic games affect a child's emotions, instilling in him or her a positive attitude and interest in reading. The kids play the game with great pleasure. and they wait impatiently for the game to begin, and in their minds involuntarily the joyful scene of tomorrow's school day is embodied. Did Each didactic game involves most children or a whole class of pupils?

For example, in the game "Circular Examples" all children solve problems, in "Chain" 10 children, in "Shop" 8-12 children, and in "Ladder" almost all pupils solve problems and so on. In addition, even if some of the children are not directly involved in the game, they participate in the game through gestures. For example, they close their eyes and listen to how many times someone knocks, and in games like "The Best Accountant," "Who's More Accurate and Faster," they watch how well their peers solve the example.

Achieving positive results in education is determined, first of all, by the effective organization of educational work on the thorough teaching of the basics of scientific knowledge to the younger

generation, the expansion of their worldview and thinking, the formation of spiritual and moral qualities. In this regard, many changes are being made in the educational process, new approaches are being introduced. One of them is to use information and communication technologies to increase the effectiveness of teaching.

Based on this, information and communication to the educational process the introduction of technology is a requirement of the times. Enhancing pupils' interest in science, their intellectual and creative potential development of thinking, intellectual abilities, the interdisciplinary connection is one of the important tasks of today's pedagogy. The priority is to organize lessons on the basis of advanced pedagogical technologies, to teach pupils to work independently, to use information technology wisely, to improve the quality of learning the subject. There are many different methods used in primary education. One of them is the use of modern information technology.

The rapid development of modern information technologies and their rapid penetration into the field of education, which are becoming increasingly important in our lives, requires the formation of our knowledge and skills in this area. Therefore, it is recommended to use computers in primary school.

One of the important achievements of the course process is computer technology was the creation of software that allows the use of components. These software tools are especially important in the organization of the learning process. E-books are created using software tools such as Macromedia Flash, GIF Animation, Microsoft Front Page, Adobe Photoshop, 3D Max, and Microsoft PowerPoint. Because they allow you to create moving, colorful, sound images. This will help elementary school pupils to better understand the topic and improve the quality of learning. An e-textbook for primary school pupils and presentations are widely used in the learning process.

A variety of visual slides can be used in the teaching process to teach reading, mother tongue, mathematics, and science. For example:

- ✚ Letters and words on the big screen in reading and mother tongue sciences read aloud, then read short stories, correct letters and beautiful writing;
- ✚ Using simple operations in mathematics, using slides problem solving, organization of various calculation games;
- ✚ It is possible to give concepts from natural science with the help of simple slides about phenomena in nature.

The use of these methods promotes the development of oral and computational skills, creativity, research and thinking skills of young and knowledge-hungry pupils.

Using e-presentations as demonstrations and visual aids in the classroom can be a great help to the teacher. The presentation of educational material in the form of animations in the electronic presentation facilitates the understanding of the topic and increases visibility. Demonstration slides can also be given to pupils as handouts. An example of this is the e-learning "Agreements" designed for use in 4th-grade mother tongue lessons the presentation can be said.

Independent study of e-textbooks and study materials can be used for effective assimilation. The e-textbook uses science materials in an interactive way, using psychological and pedagogical aspects, modern information technologies, audio and video animations.

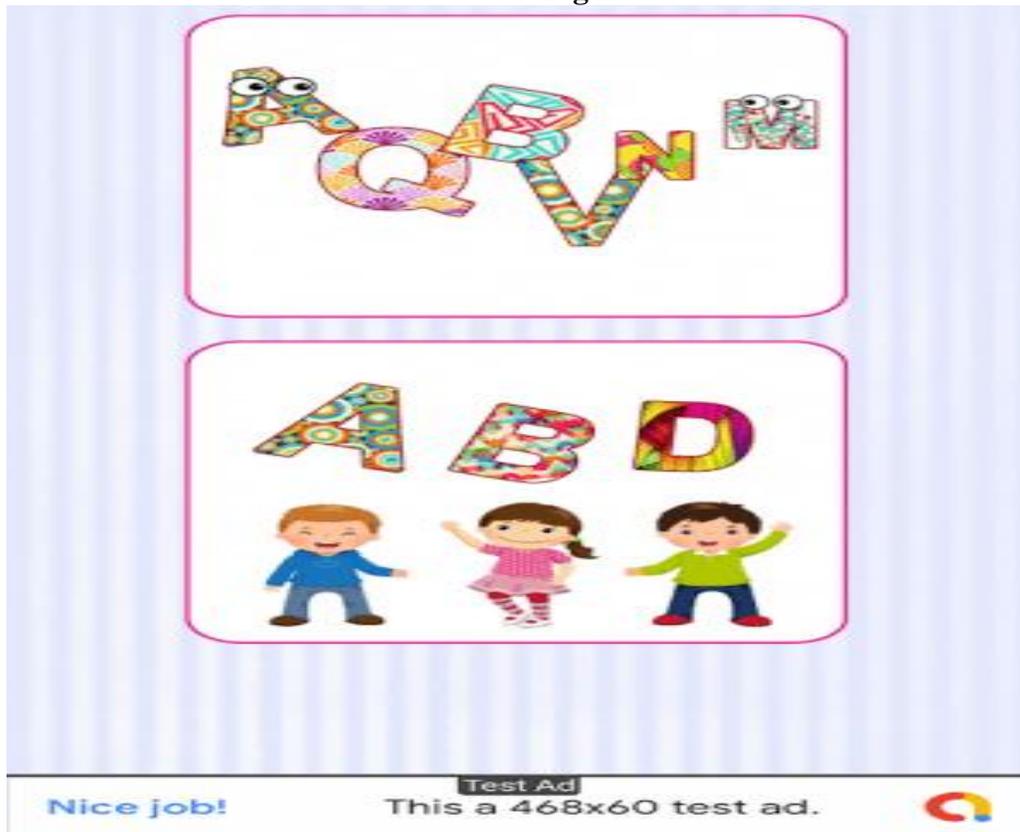

[Kitob.uz](http://Kitob.uz) for almost all subjects for pupils in grades 1-4 electronic textbooks are available. But they are not presented in text and audio form. It is advisable to provide e-textbooks in the form of text and audio, in the form of slide shows. The combined use of audio and video information dramatically increases the effectiveness of teaching.

Electronic programs created by RTM for primary school pupils, such as “*Sanashnio‘rganamiz*”, “*Alifbosaboqlari*”, “*Aljabr*”, “*5x5*”, are interesting, age-appropriate, easy to use, intellectual. capacity building is important as it encourages logical observation.

Learning to Count is an e-learning tool for elementary school math pupils. Through the development of this e-learning course, elementary school pupils will be able to perform 4 operations, as well as the ability to use a computer "mouse" device.

Alphabet Lessons is a program for first graders to learn the alphabet. The advantage of the program is that it helps pupils to develop oral and written speech (pronouncing and writing a letter, learning the names of things that start with that letter). Also, after the letters are studied, a picture is given to reinforce it. The given cell is filled with the name of the object in the picture. Here pupils' computer skills are developed and they are taught to work with tests.

Fig 2.

**Electronic programs created by RTM for primary school pupils called “*Alifbosaboqlari*”** Algebra is for use in 1st-grade math classes program. Through the program, pupils learn to number, sort, add and subtract in 10, and compare. The program allows the pupil to automatically master the solution of oral examples. It also helps develop independent work skills. 5x5 is a multiplication table program designed for use in 2nd-grade math classes. In the

repetition part of the program, the computer itself teaches tables from 2 to 9, respectively. In the exam section, the pupil develops the schedule independently. It is important to note that not moving from one room to other forces the pupil to work on himself. The program is a real help to the teacher.

This is because 30-40% of the pupils in the class have difficulty learning the multiplication table. The program automatically generates multiple tables for those pupils ensures that they learn at a high level. Today's teacher needs to be able to use information technology in the classroom, to give pupils free access to computers, to acquire modern knowledge, to become spiritually mature consists of teaching.

We try to use a variety of visual aids in the educational process. So, let's try to find answers to the question of the importance of the method of visual transmission and reception of this educational information, what types of demonstrations are available. The importance of the visual method is to motivate the student to emotionally perceive the studied objects and events, to observe them, to convince them of the unity of logical and theoretical elements, and finally to teach them to apply theoretical knowledge in practice.

Demonstration method in education is carried out in the form of demonstrations, illustrations and excursions. The use of the demonstration method in the educational process depends on the nature of the main material - the content, shape and size.

### **3. CONCLUSIONS AND SUGGESTIONS**

The system of continuing education is being radically reformed to achieve this goal. A differentiated approach to the educational process, ensuring that pupils study in various professional colleges, academic lecterns, sets high goals for modern pedagogy. For example, the development of curricula and textbooks for these educational institutions in accordance with state educational standards must meet today's requirements. The literature on pedagogy shows that in modern times the concept of pedagogical technology has taken a strong place in the science of educational practice and theory, but its place in the perfect dictionaries of pedagogy still remains unknown.

There have been different views in the history of the formation and development of the concept of pedagogical technology: it has been interpreted as a doctrine of technical means, as well as a coherent and systematic organization of the teaching process by design.

It is necessary to fully understand the theory of complexes in order to know the true meaning of pedagogical technologies and to create a type that suits our region. Because pedagogical technology is 160% based on the laws of complex theory, it expresses new philosophical thinking, a new worldview.

If we translate these concepts into the learning process, we can see that as a result of the systematic influence of the teacher on the pupils with the help of teaching aids to certain conditions, they are a necessary and predetermined social phenomenon for society. According to the theory of definitions, such a social phenomenon can be called pedagogical technology.

The basis of technological nation of education is the idea of complete management of the educational process in order to increase its efficiency and ensure that learners achieve the projected learning outcomes in the given conditions and time.

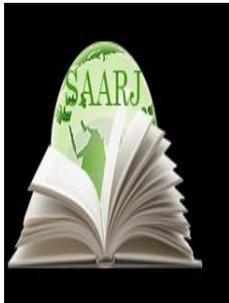

Defining the content of education in the use of pedagogical technologies, preparation of forms and means of education, development of a system of tasks aimed at the acquisition of knowledge and spiritual qualities of students, determining the results of education and the level of mastering them. preparation of test tasks for objective assessment.

Primary school students develop the ability to think freely and independently in the process of reading lessons organized on the basis of pedagogical technologies. As a result of the formation of independent thinking skills, students develop the ability to understand the laws of the environment, society, as well as human qualities through the positive and negative characters in the work, to study knowledge in depth, to think broadly, to make appropriate decisions.

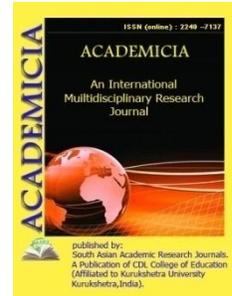

Effective and high-quality organization of lessons requires the development of teaching aids that provide organizational and methodological training of teachers and the organization of the educational process. It is important to have access to modern information technology in the educational process on the basis of support.

## OCCUPATIONAL HYGIENE IN THE CULTIVATION OF GRAIN AND GRAIN PRODUCTS

**Kosimov HO\*; Mukhamedova ZR\*\***

<sup>1,2</sup>Bukhara State Medical Institute,  
 UZBEKISTAN

---

### ABSTRACT

*The process of growing grain and grain products is the most difficult and responsible agro-technical stage, in which the body of the participating workers is affected by complex factors: high temperatures, noise, dust, mineral fertilizers, pesticide residues. Therefore, it is important to develop measures to protect workers involved in the production of grain and grain products from the effects of such factors.*

**KEYWORDS:** *Agriculture, Pesticides, Mineral Fertilizers.*

### INTRODUCTION

**Validity:** especially the production of grain and cereals is characterized by the following characteristics of field labor:

**The first feature:** seasonality, the intensity of a particular season of the year. This feature is more typical of the southern republics.

**The second feature** is that the work is carried out mainly in the field (in the open air), and the work begins in early spring and lasts until the end of autumn, even in winter. This situation depends on the impact of complex meteorological factors on agricultural workers, the climatic conditions in which it is located, the season of the year and the weather.

**The third feature** is the frequent change of types of labor in agricultural production (preparation of grain lands, sowing of grain, irrigation of grain lands, feeding, pest control), which is more related to manual labor.

**The fourth feature** is that the workplace is located far from the place of residence. The hygienic value of this is that the worker spends more energy to get to work.

**Fifth feature:** More chemicals (mineral fertilizers, pesticides) are used in the cultivation of agricultural crops (grain and grain products). In return, not only the workplaces, but the whole biosphere is irreparably polluted by them [1,2,3,9,10].

Today, more biologically active substances, bio-fertilizers, chemicals that ensure the growth of grain seedlings, and mineral supplements are used in the production of additional grain and grain products. [1,2,3,10,13].

Based on the above evidence, hygienic assessment of the factors of production that occur in agro-technical and technological conditions in the cultivation of grain and grain products in agriculture (field) and their negative impact on the body of field workers will reduce the negative impact on the body.

### **Object and methods of inspection**

The main object of this research was the scientific substantiation of measures to protect workers involved in the cultivation of grain and grain products from the adverse factors that arise in the process of agricultural machinery. The basis of the inspection is the chemical and physical factors that occur in the workplace in the production of grain and grain products, the severity and intensity of the work process, as well as their impact on the ability and health of workers.

### **MATERIALS AND THEIR DISCUSSION**

Grain and grain production is one of the most mechanized sectors of agriculture. In the cultivation of these products, the processes of land preparation, sowing and harvesting are carried out with the help of machinery. Taking into account the natural climatic conditions, the cultivation of cereals in all regions consists of the following agro-technical technological processes: tillage, organic fertilization (ammorph, superphosphate), land leveling, tillage, sowing, sowing, sowing, sowing, sowing, sowing, sowing, sowing, sowing, sowing, sowing, sowing cleaning. Land reclamation is carried out mainly with the help of magnum, maxum, orion630, orion850, MH techniques. In some farms, leveling and compaction is carried out with the help of tractors MT380, MT-85, HTZ-80. In most cases, SZ-3.6, SZU-3.6, Agromaster sowers are used for sowing grain crops. However, along with the improvement of sowing techniques, the technology of sowing seeds and mineral fertilizers is lagging behind. Fertilizer application is mainly done by hand. This leads to physical exhaustion of workers, the formation of dust in the workplace soil, plant and mineral fertilizers.

Grain products are less demanding to heat and moisture than other crops (potatoes, tomatoes, cucumbers, etc.) in accordance with its agro-techniques. Therefore, they are grown in all natural and climatic conditions. In the conditions of the Republic of Uzbekistan in August-September the lands are prepared for sowing grain crops. During these months, the temperature is  $35^{\circ} + 30^{\circ}$  C. One of the main factors of grain production during sowing is high temperature ( $35^{\circ} + 38^{\circ}$  C), noise (95-120 dB), vibration energy (80-90 dB) in the cabins of equipment (MTZ, HTZ), which are not equipped with air exchangers.  $-50\text{mg} / \text{m}^3$ ) [5,6,9,12].

At the same time, workers involved in the application of seeds and fertilizers are exposed to heavy physical pressure and dust from the soil, plant and mineral fertilizers.

Feeding of grain and cereals is carried out mainly on the basis of manual labor. Feeding of grain and grain products with mineral fertilizers (November, December, February) is carried out on the

basis of NRU-0.5, NRU-0.6. In such technologies, the application of fertilizers to the equipment is carried out manually, and the amount of mineral fertilizers dust around the respiratory organs of workers is recorded at a high level. (40-45mg / m<sup>3</sup>) [6,7,8,9,12].

Grain and grain products are harvested with the help of combines. For this purpose, in our country, grain harvesters "Case", "Case-5580", "Don-1500", "Sampo", "Klaas-mega-204", "Yenisei-1200" are used.

## THE ROLE OF TEACHING VOCABULARY IN THE EFL CLASSROOM

**Munajat Sultonova Yunusovna\***

\*Fergana State University and ISMA University Lecturer in Fergana,  
 UZBEKISTAN

### ABSTRACT

*Vocabulary is the main part of teaching second language to understand the reading, listening, speaking and writing. Investigations show that the average adult native speaker of English possesses knowledge of from 17,000 to over 40,000 base words. Furthermore, an L2 learner of English must acquire a minimum of 3,000 base words to be capable of reading unsimplified text with some degree of comprehension. However, Nation (1990) said that there are 54,000 word families in English. Many studies confirm the connection between vocabulary size and reading comprehension. Some even argue that increase in vocabulary improves quality of reading comprehension and learning. Schmitt (2000) mentions that a person needs to know between 95- 98 % of the words in a text in order to understand it successfully. Most researchers found an interest in vocabulary teaching by analyzing in two factors such as the language corpora and lexical method for teaching vocabulary in the last 20 years. In this article, firstly it will be discussed about what kind of lexical coverage and size L2 students need to learn to understand the reading text or written passage. Secondly, the discussion is continued with one of the benefits of teaching vocabulary through lexical and corpus approach. Finally, it will be suggested that techniques involving incidental learning are successful at improving vocabulary.*

### INTRODUCTION

It is known that learning lexis was less important than grammar learning in language instruction, because some researchers thought (Larsen-Freeman, 2000; Zimmerman, 1997) that students were taught grammatical structures, but lexical items only according to their needs. Recently this view has changed dramatically, and more and more researchers claimed that students should be instructed lexical competence to use the language into practice by utilizing certain number of words through improving the communicational skill. As Wilkins (1976) said, "Without grammar

very little can be conveyed, without vocabulary nothing can be conveyed.” Vocabulary, as one of the knowledge areas in language, plays a great role for learners in acquiring a language (Cameron, 2001). Learners’ vocabulary development is an important aspect of their language development. It is interesting that even very skilled speakers will not know all of these words, and also there is a concern that second language learners could be taught the great number of words through reading materials and texts. One of the example of Goulden’s research on New Zealand university undergraduates had an English vocabulary size of about 17,000 word families. It is found that second language learners do not need to learn 100% coverage, although people know a few unfamiliar words, they can understand speaking and writing. However, if they do not know too many words, their comprehension of listening and reading becomes unpleasant and boring. So, in this case, what percentage of words should be taught to L2 learners? Recent research proposes that coverage in the range of 95–98% is adequate for acceptable comprehension, or in other words, that acceptable comprehension can be achieved with 2–5% of the words unknown (Hu & Nation, 2000). For example, Nation (2006) found that a typical finding is that 98% coverage in written texts corresponds to knowledge of about 8,000 word families.

### **Lexical Coverage in L2**

There are many researches on lexical coverage which is relevant to L2 comprehension conducted by reading, and it is known that learners know the percentage of vocabulary to allow them to understand a written text. It is considered 95% lexical coverage was needed including 5% unfamiliar vocabulary may equal to one unfamiliar word in all two lines of text, as a result it is seen that unknown words on every page are 15%. In this way, Hu & Nation (2000) recommended a higher coverage figure closer to 98%. Nowadays, Schmitt, Jiang & Grabe (2011) tried to show the connection percentage of coverage between 90 and 100% including coverage and comprehension. According to their data, if 60% comprehension is the purpose, 98 % lexical coverage is necessary. Second language learners read the authentic reading materials, textbooks for several purposes, for example it might be for learning vocabulary or just reading for pleasure. If learners read a novel for pleasure, then they do not need to understand 100% as Laufer & Ravenhorst-Kalovski (2010) thought the idea of basing the required coverage level on the reading comprehension wanted to. According to their research, they found two lexical coverage levels, such as ‘adequate’ comprehension which depends on the definition, 98% as the sufficient and 95% as the minimal.

Recent researches show that learning vocabulary in native speakers is being formed and continued development from the early childhood and also expanded vocabulary year by year. Children can learn vocabulary from the social life and importantly from their parents. In adulthood period, they can improve their vocabulary through reading novels, school books and other activities. If we see this in statistical figures it seems to us very challenging to know the measurement of vocabulary. According to Watts (1944), elementary school children may know 2000 words, at the seven of their age they may enrich it to 7000 words and until the age of 14 the child may know 14000 words. In addition, Mackey found that, college students can understand 60,000 to 100,000 words (Mackey 1965: 173). Nation (2006) also suggested using 1,000 word – family listed by British National Corpus which is useful for teachers and L2 learners to know what vocabulary size is needed to understand the written and spoken English. From his research “98% coverage of a text is needed for unassisted comprehension, then a 8,000 to 9,000 word-

family vocabulary is needed for comprehension of written text and a vocabulary of 6,000 to 7,000 for spoken text” (2006). If ESL teachers know how large vocabulary is necessary for their non-native students, their students can use the language easily to read newspapers, novels, watching movies and participate in conversations. Firstly, we need to know how many word families are there in English. According to some facts, English has 54,000 word families (Goulden, Nation & Read, 1990). However, native speakers know 20,000-25000 word families. It is clear that, even native speakers do not know all words in English and also this is too large for L2 learners. So every L2 learners confuse that how much vocabulary they need to learn to read novels or converse with others. To know about most used text for native speakers, Hirsh and Nation (1992) investigated on teenagers how many words a reader would need to know to read the novel and they found that 5,000 words are the most accessible to read. Moreover, Hu and Nation (2000) also found the connection between text coverage and reading comprehension for L2 learners. According to research students are given the text which is known the words in it. Then, some unknown words are replaced to check students’ comprehension of the text. Consequently, it is known that 98% text coverage is vital for learners to understand well.

Most teachers in second language classrooms face with how to teach learners vocabulary and how to involve them to the main vocabularies which they can put into practice or understand the main meaning of the text. In this case, many researchers investigate about frequency vocabulary size in L2 vocabulary teaching. According to Norbert Schmitt, the high-frequency vocabulary of English has traditionally been considered that to consist of the 2000 most frequent word families, and low –frequency vocabulary as that beyond the 10.000 frequency level. The collaboration of students, teachers, material writers and researchers learning vocabulary plays a vital role of mastering a second language.

Furthermore, it is important to have good estimates of the vocabulary sizes necessary to use the language in specific communicative contexts, because these estimates form learning targets for language students. According to Nation’s calculation, a learner would be required to know about 4,000 of the most frequent word families plus proper nouns to reach 95% lexical coverage, and around 8,000–9,000 families plus proper nouns to reach 98% coverage. He found similar figures for a corpus of newspapers. He found that about 3,000 word families plus proper nouns provided more than 95% coverage, but that it took 6,000–7,000 word families to reach 98% coverage. Since the number of words that can be taught explicitly in language classes is limited, studies would do well to include an empirical consideration of learners’ capacity to acquire new vocabulary incidentally, through exposure to reading and listening input.

There have been researching on second language vocabulary learning which concludes that a large vocabulary is necessary to function in English: 8000–9000 word families for reading, and perhaps as many as 5000–7000 families for oral discourse. Furthermore, most learners need learn several word knowledge aspects about each lexical item. Naturally, such amounts of lexical learning challenge which most learners find difficulty about it.

In order to give the main facts about vocabulary learning goals, it would be better to determine the percentage of lexical groups in written or spoken discourse to help the learners must know to understand it. It was previously thought that around 95% coverage was sufficient but more recent research suggests that the figure is closer to 98–99% , at least for written discourse. 98% coverage would mean that one word in 50 is unknown, which still does not make comprehension

easy and so this is probably a reasonable minimum coverage figure (Hu & Nation, 2000). If it is used for spoken discourse, and also accept that the proper nouns in the discourse are known, it can be estimated the number of word families it takes to be able to engage in informal daily conversation. Nation (2006) analyzed about 200,000 words of the Wellington Corpus of Spoken English, which included talk-back radio, interviews, and friendly conversation between family members and friends.

From my point of view, knowledge of more vocabulary is always better to understand the language. Bonk (2000) found no absolute lexical percentage 'threshold', but learners who knew less than 80% of the lexical words tested in the target passages almost always had poor comprehension, 43% of those who knew 80–89% achieved good comprehension, while 60% of those who knew more than 90% of the lexical words had good comprehension. From classroom backgrounds, learners must know about each item in order to use it well with a large number of lexical items which is referred as a depth of vocabulary knowledge. It is as essential as vocabulary size. Teachers should teach vocabulary in different contexts in order to enrich students' different word knowledge types such as the form, meaning and usage of the vocabulary. Chang and Read (2006) found that vocabulary instruction before a listening comprehension task helped less than hearing the input twice or reading and discussing the topic beforehand. During the investigation, students told that they did not learn the target vocabulary adequately to use it in the on-line listening task, and for higher proficiency students, a focus on this inadequately learned vocabulary seemed to distract their attention away from a more general understanding of the listening passages. There is no doubt from the research that the L1 exerts a considerable influence on the learning and use of L2 vocabulary in a number of ways. According to learners' productive skills, Hemchua and Schmitt (2006) researched the lexical mistakes in Thai university EFL compositions, and found that nearly one-quarter were judged to be attributable to L1 influence. Learners also typically employ their L1 in learning an L2, most noticeably in the consistently high usage of bilingual dictionaries. They also strongly believe that translating helps them to acquire English language skills, such as reading, writing, and particularly vocabulary words, idioms, and phrases (Liao, 2006). Frequency has long informed the principled selection of vocabulary in L2 teaching pedagogy. Paul Nation, breaks vocabulary into four categories: high-frequency words, academic words, technical words and low-frequency words (2001 a: 11–12). High-frequency vocabulary is extremely useful for learners, so should be explicitly addressed. Academic vocabulary is worth focusing on for learners wishing to study in English, and the same goes for technical vocabulary for learners focusing on specific-purpose domains. Conversely, in Nation's view, low-frequency vocabulary occurs so infrequently that it is not worth spending classroom time on. Rather, teachers should teach vocabulary learning strategies to learners, so they can learn these rarer words on their own. For estimates of written vocabulary, we are on firmer ground. Nation (2006) went on to calculate that 8000–9000 word families are necessary to read a range of authentic texts (e.g. novels or newspapers), based on British National Corpus (BNC) data and 98% coverage. Inevitably, other indicators point to somewhat lower figures. For example, Milton and Hopkins (2006) report that both the highest level (C2) of the Common European Framework and the CPE require only about 4500–5000 word families. However, careful scrutiny of the C2 level suggests that 4500–5000 word families would not be sufficient to achieve many/most of the descriptors. Therefore, while learners may be able to cope with a smaller vocabulary, 8000–9000 word families seems to be a more realistic target if they wish to read a wide variety of texts without unknown vocabulary being a problem.

### Teaching Vocabulary through using CLT approach

The CLT (Communicative Language Teaching) approach is regarded as important way to help the learners in SLA classrooms. As this approach is very useful, it requires the second language learners to speak and not to translate the text as Grammar Translation method. Although, Schmitt (2000) says that “grammar and vocabulary are fundamentally linked”, more importantly in CLT, language and certain vocabulary are taught according to learners’ needs, interests and ages as well. In this case, for speaking and understanding other people’s ideas, ESL teachers are using and developing classroom materials and various effective classroom activities. However, CLT focuses on more conversation and fluency, that is reason this approach might not give enough and clear guidance for effective methods to teach vocabulary, “the idea that vocabulary acquisition would just find its own way through students’ transaction of information using functional language (Coady, 1993). For example, rote memorization method, learners can enjoy and succeed in learning materials through memorization. However, reading novels or texts in context, L2 learners can guess and learn the semantic knowledge such as developing knowledge of usage, collocations and other grammar rules that students meet them in context. Naturally, it is useful to provide them with word meaning through texts and reading materials, as Kintsch said “words become meaningful because of their relation to other words” (Kintsch, 1998: 43). However, Nation (1990) says that knowing a word also implies knowing its spelling, pronunciation, collocation and appropriateness. Seal (1991) agrees with Nation regarding considering that word knowledge is an essential component of communicative competence, and it is important to develop receptive (listening, reading) and productive (writing and speaking) skills in a foreign language.

New words should be presented in context to help the students to learn and memorize the words in the context. In explicit vocabulary learning, students are encouraged in activities that take their attention on words and their link with other words in the text. As Nattinger (1988, p. 69) states, “the meaning of a word has a great deal to do with the words with which it commonly associates.” Therefore, students are involved more the knowledge of words that collocate with it. Furthermore, there are many advantages to use incidental approach in the classroom. One of the important merits of incidental approach is to involve the students to read the extensive reading texts and learn the new words by guessing the words from the context. While the teachers give the extensive reading materials, they should give a chance to learners to choose their favorite reading material as Nation (2001) mentioned that a teacher inspire the students to read according to their interest and comprehension level. For example, Horst (2005) measured vocabulary knowledge scale and found that from graded reading materials including 35 new words, only 51 % of words gained, namely 18 words were learned. In this case, L2 learners can learn new words fast from the context when they meet unknown words in context. O’ Harra (2004) said that “context is the setting and surrounding of a word. Therefore when we listen to someone's talk, the context of a word is the statement that includes the word”. “When we read new words in a written context one or two nearby words may explain the meaning of new words or sometimes the paragraph may tell us what the new words mean”. From my experience, incidental learning helped me to teach the meaning of words with grammatical patterns, common lexical sets and the combination words in context, because in this method students think and rethink new words which help the students to memorize the words for a long time, and improves their fluency through extensive reading. Teaching prefixes and suffixes is also

effective to guess the words from the context and very helpful to differ the speech patterns in language.

### **Corpus Approach**

Another useful tool in teaching vocabulary is analysis of corpus data. It provides valuable information for both students and teachers about how language is used in real-life situations. A corpus is a collection of authentic texts (written or spoken transcripts) that are stored in an electronic form (Partridge, 2006: 1). Its size can range from a few sentences to millions of words. Linguistic information is typically presented in the form of concordances (Tribble and Jones, 1997). A concordance is a list of all the occurrences of a particular word or phrase in a corpus, presented within the context (usually a few words to the left and right of this word). Concordances are obtained using the software called a concordance. One of the first teachers who used a concordance was Tim Johns, who was the author of the Data Driven Learning (DDL) (Johns, 1991). Teachers may use corpus tools in two different ways to develop and adapt materials and also to help students explore academic vocabulary through classroom. A variety of activities can be created using output from a concordance program. A major advantage of these activities is that students are interacting with the authentic texts that they are reading. These activities can be carried out either by the teacher bringing concordance printouts into the classroom or by having students use concordance software during class. Frequency lists, concordance lines, and extended concordance displays are excellent tools for examining academic vocabulary as it occurs throughout course texts. For supporting students' learning academic vocabulary, teachers can use the corpus techniques with authentic texts as resources for academic vocabulary instruction. One of the corpus-based exercises is to create concordance lines, the students create the wordlist which showed the frequency of occurrence of all the words occurring in the text. By creating a frequency list before analyzing concordances for certain key words, it is possible to see which lexical items are most common in the texts in a particular domain. From the key word displayed in medicine as an example, the students could list the words that collocate with "patients", notice that prepositions, such as with, in, on are used in these combinations, and see which adjectives precede this word. In order to check which word is more often used as the subject of sentences describing research procedures: the first person pronoun "we" in active-voice sentences, or the noun "study" in passive-voice sentences, the students created concordances for the key words "we" and "study". They can make their own concordance lines by writing out all the sentences or parts of sentences that include the examined words, however, making concordance lines manually is not as quick as with the use of a concordance. Another possibility, which the use of a corpus and a concordance gives to a teacher, is editing (printing) concordances. This gives teachers the possibility of designing exercises consisting of the concordances in which the key word was blanked out, and the students' task is to guess what the missing word is.

### **CONCLUSION**

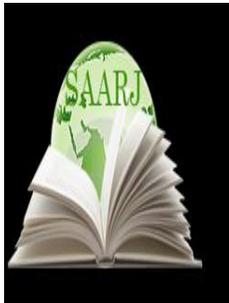

To conclude, learning vocabulary is a vital process in ESL learners to gain proficiency and competence in English. Word power facilitates effective writing and fluent speaking and which is really important for L2 learners to understand the written texts and newspaper or to take part in conversations. It is clear now, although we do know a few words in English, so we can understand the speech and use the language to talk. In contrast, if our lexical size and coverage is

too low, it causes misunderstand the language. For ESL classrooms, we should know the frequent and useful words to help the learners how large words learners can utilize through reading or watching, talking. As mentioned above, we can identify these words by word families (54,000) and native speakers' vocabulary knowledge using by lexical and corpus approaches. Finally, it is suggested to teach L2 learners according to their level in language and their need and interest for using incidental approach to enrich their integrated skills such as listening, reading, writing and speaking based on vocabulary.

### ABSTRACT

*This article analyzes some of the poems of Hamza Hakimzoda, a leading figure in the literature of the National Renaissance, and discusses their ideas and significance. A poet with such creative power manages to express his experiences and feelings in simple, understandable expressions. In this way, he shows the real picture of the colonial situation in Turkestan. In the first line of the above paragraph, the artist predicts that "one day will be great." In short, the ideas of enlightenment, which play a key role in Hamza Hakimzoda's poetry, are combined with feelings of concern for the development of the nation. The effectiveness of Hamza's poems is also seen, first of all, in the vitality of his thoughts and feelings, as well as in the fact that he conveys the reality to the students as it is.*

**KEYWORDS:** *Harmony Of Ideas, Ideas For Enlightenment, Artistic Prophecy, A Sense Of Belonging To The Future Of The Nation.*

---

### INTRODUCTION

The main issue in the effectiveness of any work of art is the harmony and commonality of thoughts and feelings. He also said, "An image created by an artist, unlike ordinary perceptions, is an artistic and emotional representation of reality. And artistic emotion can only be created by an artistic idea." Hamza Hakimzoda's poems are also made up of a chain of ideas, the value of which, both ideological and artistic, has captured the hearts of readers for centuries.

It is known that the main reason for the emotional turmoil of the poet's inner world is the influence of the being around him. We can see in many of his poems that the period of the poet's

life, social environment and this environment is skillfully absorbed into every line of Hamza Hakimzoda's poems.

Many of them reflect the poet's anguish and anxious thoughts. In particular, we analyze the poem "Do not look for us in the ball." The poem is written in the weight of a finger, and the poet proves his views (perhaps dreams) on science, society and man, the nation and its development. As we look at each verse of the poem, we see the endless anguish embedded in it, we involuntarily witness the past of millions of people, including the poet, and we feel a sense of pity. From the very first band:

*Bizni to'pdan izlama, o'z yo'liga achingon  
Bir kishi yo'qdur.  
Boriguna qorinni to'yg'azuvdan boshqaga  
Hech ishi yo'qdur.  
Mayli uxlasun, to'qtur hali.*

He writes. The poet begins with an appeal from the first line. He does not address his appeal to anyone in particular. As a result, he reads the verses and feels that the appeal is written for him. This ensures that the bitter words are addressed to the whole nation. As we have witnessed in the band, the poet is in anguish: he does not feel sorry for his beloved among his compatriots, knowing that his path will lead to the swamp, but only his own belly (past, present, future). suffers from a plethora of people who don't think. His grief is exacerbated by the fact that he cannot find the enlightened man he dreams of among his countrymen. At the end of the band, "Let him sleep!" he concludes. The riot escalated into a second riot:

*Qorin och qolib turadur o'zi istashub, kerishub  
Butun sel olursa mijasini qoqmas,  
Ko'ngli o'kunmas.  
Erinmog'i shuncha har bir ish, gapda  
Erta-bugunmas,  
Qiyinalmoqg'a yo'q tobi hali.*

One of the reasons which angered the poet, and compelled him to look with hatred, was that the slaves of their own lusts were growing up among their own countrymen. If the whole nation is worried, the brain will melt, and the eyes of such people will be so beautiful that they will not regret it. They look at every job with laziness. Neither early nor today - in general, there is never a cure. The poet writes the verses in such a way that his suffering, his inability to change his countrymen, who are becoming slaves to lust, and his hatred for such people are clearly reflected. She moves her emotions from one point to another. It is so skillfully copied that it is absorbed into the heart of the reader.

*Bir kun zo'r kelur ko'rur kuchonib, tirishub  
Bilishiga ishi yo'q, kelishini peshi yo'q,  
Dunyo o'ylamas  
Sotub harna borin to'y qilishdan boshqa  
Ishni o'ylamas.  
Burni isni bo'ylamas hali.*

There is a concept in our literature called artistic divination. In this case, the poet tells an event or reality before it happens. This is a rare case that can only be achieved by real creators. A poet with such creative power manages to express his experiences and feelings in simple,

understandable expressions. In this way, he shows the real picture of the colonial situation in Turkestan. In the first line of the above paragraph, the artist predicts that "one day will be great." Who or what was the BEST thing that was said? You can see that it refers to the Russians. Indeed, if we look at our history, from the day the Russians entered our country, the course of life in our country has changed radically. In the eyes of our compatriots, there is no confidence in the future, not hope, but fear.

Unlike the educated nationalists who felt this long ago, the fact that a large part of the population does not realize this tortures the artist. Hamza is worried about the situation of his compatriots, who do not want to spend what they earn (sell only if necessary) on their children's education, but only on his wedding, and on the situation of their compatriots who do not feel the smell under their noses. In the following verses, the question of knowledge and enlightenment, which has been on his mind all his life and covers his whole body, is raised:

*O'quv, yozuv nimadir? Yo'ldan ozuv nimada?*

*Ibrata olmas.*

*Qoriguncha bolasi ota-ona tangrini*

*O'rgata olmas.*

*Yo'lni ko'rsata olmas hali.*

The poet writes. At this point, the poet encourages the reader to think about science and enlightenment, which are the basis of the development of society. For those who are referring to it, the concepts of reading and writing that enlighten people's hearts are foreign. He raises the question, "What is the real reason for the loss?" As a result, each reader tries to find the answer to it on his own, and as he finds the answer, he feels that he is being purified from the inside and formed as a person. Unfortunately, among our compatriots, the presence of those who forgive also saddens the lyrical protagonist. Science refers to both secular and religious science.

It is well known that one of the duties of a parent in a Muslim family is to introduce Allah to the child from infancy. These people did not enlighten themselves or their children with the light of knowledge, nor did they understand Allah. The poet condemns them in the last verses: They do not deserve to be a guide for future generations!

*Mana shul uchun oqishub ketar har yona erishub,*

*Bir birini ko'rolmay yeng ostida otushar,*

*Birlashuv qayda.*

*Yo'qlar boyga yopushar, boylar yo'qni chopushar.*

*Chirmashuv qayda.*

*Suqni tashlashuv qayda hali!*

The poet gives the reasons for ignorance in the following lines. Since the fire of enlightenment is not lit in his heart, he lives only for his own benefit, rejoicing in the little he has achieved and believing that this is his only goal in life. The main thing that worries Hamza is the deplorable state of the country. He understands that only unity can save the country from this situation.

Realizing this, he propagates it to his countrymen. He is determined to change the fate of his compatriots, who have been in a state of ignorance and oppression for years. To do this, he calls them to unity, to work towards a common goal. He hopes that people will not succumb to the scourge of lust and that the rich will approach the poor and the poor will approach the rich. The poet concludes the verse with a direct question for all: when will the suk be abandoned?

*Bitmay qolarmi? Bo'yla yursalar urushib,  
Oa'zgalarga hammasi yemak uchun berilib  
Tangridan kechdi.  
Yuz garanglik ustiga chiroyiga aldanub,  
Chog'iridan ichdi.  
Endi... bichdi hali.*

There is a human being who is trapped by lust at least once in his life. And for some, as a baby gets older, he or she will outgrow this. They think that in the eyes of the poet, the prosperous life that follows their desires will never end. To them, the purpose of living seems to be food.

That is, they obey God and forget God. In the fourth verse of the band, the poet uses the word *Garang* and adds a hundred words to further enhance its meaning. In this way, we see that the influence of the poem is greatly expanded. So, in the days of the poet, most people, as they say, were ignorant. We need to focus on the word *chogir* used in the next verse. Alisher Navoi described the harm and sinfulness of this in one of his works as "**Ummul habois**" or "**Mother of the Wicked**". By saying this, the poet emphasizes the greatness of his sin and the loss of those who taste it.

*Tufroq o'g'uncha emdi sosushib, chirishub,  
Achchiq-achchiq so'zlaridin Nixoniyini, biman  
Ko'nglungiz og'rub  
Zora betingizga qattiqgina qadalub,  
Botsa bir bog'irub,  
Har biringizni chog'irub hali  
O'zingizg'a bir boqsangiz edi ko'zingiz yirishub.*

The poet concludes his words in the last verse of the poem. His words are a clear reflection of the anger of those who live for themselves and do not care for others. They walk in the same way until they turn to dust, and do not change. The poet's direct appeal to them continues.

Wouldn't it be nice if you could just look at yourself?" In the course of analyzing the poem, we witness that the poet's anguish to change the past of those in the care of his compatriots has shifted from point to point. He is ready to do anything along the way: to sacrifice himself and, if necessary, to say bitter things that will hurt them. It is important that the country is completely free, that the eyes of its compatriots are opened and they realize themselves!

Hamza lived a conflicted life throughout his life. But wherever and in whatever situation he lived, he cared for the spiritual development of the nation, as he put it:

*My nation is a human race, my homeland is a nation,  
The service of both is obligatory, and the life of both is indebted  
He called on his countrymen to unite and unite in this way.*

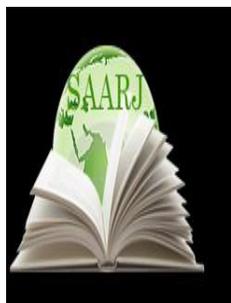

Most of the poet's poems have the same theme. In particular, both the poem "**Dardiga darmon istamas**" and the ghazal "**O'zbek xotin qizlariga**" are in harmony with the above poem in terms of theme and idea. In a word, Hamza Hakimzoda was "a poet who was asleep for centuries, determined to deliver the message of freedom to his oppressed compatriots, determined to awaken him."

In short, the ideas of enlightenment, which play a key role in Hamza Hakimzoda's poetry, are combined with feelings of concern for the development of the nation. The effectiveness of

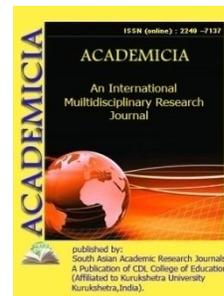

Hamza's poems is also seen, first of all, in the vitality of his thoughts and feelings, as well as in the fact that he conveys the reality to the students as it is. In short, in Hamza's work, the ideas of the Enlightenment found expression as a topical issue of the time, as an expression of feelings about the future of the nation.

## HYGIENIC ASSESSMENT OF WORKING CONDITIONS OF EMPLOYEES POULTRY FARMS

**Kh.O. Kosimov\***; **A.A. Ortikov\*\***

<sup>1,2</sup>Bukhara State Medical Institute named after Abu Ali Ibn Sina,  
 UZBEKISTAN

### ABSTRACT

*In this case, the operations associated with walking make up 35-55% of the time, and during the shift, the worker walks a distance of up to 10-12 km. (materials of time-keeping research). A significant amount of physical labor is characteristic of work in the workshops for raising young animals. The production process at the enterprises is organized according to the flow method, taking into account the biological characteristics of the bird's body and consisted of a number of technological stages. The above urgently requires a qualifying scientific analysis and the development of scientifically grounded and effective health-improving measures to improve the working conditions of workers and the protection of atmospheric air around poultry complexes and farms.*

**KEYWORDS:** *Hygienic Requirement, Working Conditions, Production Factors, Manual Labor.*

### INTRODUCTION

The aim of the study is the hygienic assessment of the influence of production factors on the health of workers in poultry farms and the development of measures to improve working conditions. It has been established that the unfavorable factors of the working environment of poultry farms are intense physical labor, neuropsychic stress, exposure of the human body to chemicals of bacterial and dust aerosols, fungal microflora, excrement and other waste products.

Poultry farming is the most industrially developed branch of animal husbandry. Working conditions at poultry enterprises have a pronounced specificity, which determines the specifics of sanitary supervision at each stage of the technological process. The leading organizational forms of industrial poultry farming are their specialization in the production of eggs and meat. Industrial poultry farms are built mainly according to standard projects designed for the maintenance of 250-500 thousand hens - carriers, 3-10 million broilers, 1-1.5 million ducklings,

0.25-0.50 million turkeys or ducklings a year. According to the State Policy, in order to provide the population of the Republic with meat products and eggs, at the initiative and support of President Sh.M. Mirziyoyev, starting from 2017, the organization of poultry complexes and poultry farms began to develop rapidly. At present, in the Bukhara region alone, there are more than 60 poultry complexes and about 250 poultry farms.

Purpose of the study: hygienic assessment of the impact of production factors on the health of workers in poultry farms and the development of measures to improve working conditions.

**MATERIALS AND METHODS:** The work was carried out on the basis of JSC "Bukhara parranda" of the Kagan region. The study of working conditions at each stage of production was carried out by the method of sanitary inspection and observation. Measurement of the temperature and humidity of the premises at each stage of production was carried out using an aspiration psychrometer (San.PiN Republic of Uzb 0324-16), the content of ammonia, hydrogen sulfide, carbon dioxide - by the aspiration method (MU-1981) using the ANT-3 analyzer (GOST 12.1.005.88), dust - by the aspiration method (MU 1981).

## RESULTS AND DISCUSSION

The production process at the enterprises is organized according to the flow method, taking into account the biological characteristics of the bird's body and consisted of a number of technological stages. These include obtaining hatching eggs from the parent (brood) herd; incubation and withdrawal of day-old chicks; their cultivation and acquisition of replacement and industrial herds; maintenance of an industrial herd that provides the main products; primary processing of birds; preparation and distribution of feed; recycling.

In the workshops of the parent flock, intended for obtaining fertilized eggs, birds are kept in groups (4-5 roosters and 30-40 chickens) in two - three-tier automated cage batteries such as KEMP, KBR-3, or on the floor on a deep non-replaceable bedding, mesh floors.

In the workshops of an industrial herd, laying hens were housed in mechanized and automated cage batteries. The main operations in the batteries (feeding, drinking, cleaning manure) are mechanized and automated, the collection of eggs in automated sections was carried out by belt conveyors with feeding to a storage table, from where the eggs were collected, packed in cardboard boxes, or immediately fed by conveyors to the egg storage ...

For the cage keeping of the parent and industrial herd, pavilion-type premises were built, for the floor, as a rule, one-story. The size of poultry houses and their number are determined by the capacity of the farm. One poultry house accommodates 12-80 thousand laying hens, 10-20 thousand broilers and 4.5-6.4 thousand head of parent flock. Buildings for keeping poultry, especially laying hens, were provided mainly for windowless ones with extended daylight hours to 17-18 hours due to artificial lighting.

The microclimatic conditions of keeping the adult livestock of productive poultry in the workshops of the parent and industrial flocks corresponded to 12-18 ° C in the cold and 18-20 ° C in the warm periods of the year with a relative humidity of 60-75%. At the same time, the maximum permissible concentration of ammonia is 10 mg / m<sup>3</sup> of hydrogen sulfide -1 mg / m<sup>3</sup> for broilers and 5 mg / m<sup>3</sup> for other bird species, and carbon dioxide is 0.2% by volume. To ensure the required parameters of the air environment in the premises for keeping poultry, ventilation and heating systems of the "Climate" type are equipped, capable of operating in

automatic mode according to a given program.

In hatchery shops, hatching eggs are sorted and stored in a warehouse at a temperature of 4-12 ° C. According to a certain schedule, batches of eggs in an amount of up to 14-15 thousand pieces are most often disinfected with formaldehyde vapors, placed in trays and placed in incubators. During incubation, the operating mode of the equipment is monitored with the help of instruments and biological control is carried out on the 6th, 12th and 18th days (translucent eggs on mirage tables and weighing trays with embryos). Tilted egg trays are transferred on days 19-20 to hatchers. At the end of incubation, young animals are selected from trays into boxes, subjecting them to zootechnical sorting, and, if necessary, additional sorting by gender, and transferred to other workshops. Hatchers, equipment and workplaces are thoroughly cleaned and disinfected. Incubation waste is sent for recycling.

The hatcheries were located in detached one-story buildings, where incubation and hatching zones for the installation of incubators, rooms for sorting and storing eggs, a disinfection chamber, a washing room, utility and auxiliary rooms, including a sanitary inspection room, were provided. The most widespread are incubators with external servicing of the "Universal" type, the work of which is fully automated. and the temperature in the chamber is maintained at 37.2-38.3 ° C at a relative humidity of 49-64 / 0.

In the workshops for growing young animals, the livestock were housed in age cage batteries (KBE-1DSBA-4, BKB) with transplants on the 30th, 60th and 120th days or in universal cage batteries designed for one-stage non-stop poultry rearing (KBU -3). The cage batteries are equipped with devices for mechanized distribution of feed and manure removal, groove, nipple micro-bowl shelves and removable electric heating devices. When kept on the floor on a deep, permanent bedding, the birds were planted on the floor covered with a layer of wood shavings cut with straw 20-25 cm thick. \_

The air temperature in the places where the birds are located should be maintained at 25-26 C in the first 10 days and 26-20 ° C thereafter at a temperature in the hall of 28-18 C, a relative humidity of 55-70% and an air velocity of 0.5-0, 6 m / s. The content of gases, according to zoo technical requirements, should not exceed 10 mg / m<sup>3</sup> for ammonia, 5 mg / m<sup>3</sup> for hydrogen sulfide and 0.2% for carbon dioxide by volume.

Slaughterhouses of the poultry farm were equipped with flow-mechanized conveyors with spatially suspended conveyors with a capacity of 500-3000 heads per hour.

According to the technological stages, the division of labor of workers of poultry farms is carried out. To care for poultry in the workshops of the parent and industrial herd, teams and teams are organized as part of poultry operators, mechanic operators. night and ancillary poultry houses, electricians. Work in these workshops with the cages of birds was characterized by moderate physical exertion and a certain neuro-emotional stress when performing operator functions. In workshops with floor keeping of poultry, the low productivity of manual labor increases.

The poultry-house operator in the workshops of the parent and industrial herd from 15-20% of the time was busy with the culling of poultry, 10-15% - watching the distribution of feed. 30-30% - collecting and laying eggs in containers and up to 20% - washing the trough-type drinkers with a brush.

In this case, the operations associated with walking make up 35-55% of the time, and during the

---

shift, the worker walks a distance of up to 10-12 km. (materials of time-keeping research). A significant amount of physical labor is characteristic of work in the workshops for raising young animals. especially in the first 10-15 days of caring for a bird, a pronounced dynamic component and the need to maintain a forced working posture for a long time: with cage keeping - bending low or standing with arms raised high near the low upper tiers of cage batteries, with floor keeping birds - low bent state. In the majority of poultry farms, in the first 10-20 days, especially with floor keeping, the young were handled manually, which creates great physical activity.

In the first 15-30 days, the poultry operator spends up to 40% of the time on distributing feed manually at least 4 times in a 6-hour shift, 15-20 - on washing drinkers, feeders and equipment with hot (90 ° C) disinfectant solutions funds. At this stage of the technology, the operator is exposed to physical exertion, high humidity of 60-90% and the influence of disinfectants. Work in hatcheries was characterized by a certain cyclical nature, a clear regulation of labor processes for day and night shifts, associated with significant physical exertion and accompanied by pronounced neuro-emotional stress.

Slaughter workshops were served by personnel with a narrow specialization in individual technological operations (slaughter, evisceration, sorting, etc.). The main production operations in the slaughterhouses were carried out manually with intense physical activity. Numerous and monotonous working movements at a high speed of execution of the technological process cause a high monotony of labor against a background of significant eye strain and concentration of attention (established by interviewing personnel).

The service personnel of poultry farms, when caring for poultry livestock, had to stay for a long time (6-8 hours) directly in the premises for keeping poultry, where, according to zootechnical requirements, a certain microclimate is maintained (temperature 30-35 ° C, humidity 70-80 %).

In the studied poultry farm in the workshops and in some areas, the microclimate parameters did not always correspond to the sanitary and hygienic standards: in the cold period of the year, the air temperature in the buildings for young animals was 28-35 ° C. in housings for keeping parent stock and industrial meat breeds of poultry, on the contrary, the temperature is kept at a relatively low level (2.5-12 ° C), the relative air humidity during this period ranges from 49 to 90%, depending on the particular heating and ventilation at an air speed of up to 2.5 m / s. The air environment of poultry houses is polluted with gaseous products, in particular ammonia, hydrogen sulfide, intestinal gases, carbon dioxide, which are formed during the life of the bird and as a result of the decomposition of the organic substrate (feed, litter, droppings, fluff, feathers) The number of continuously formed gases are determined by the age of the bird, the way it is kept, the condition and organization of forced air exchange.

When chickens are kept from 1 m<sup>2</sup> of litter, ammonia 10-25 mg / h, hydrogen sulfide 4-5 mg / h, carbon dioxide 4-5 mg / h are released. With a cage keeping of 50 thousand laying hens, 127.5 m<sup>3</sup> of carbon dioxide are produced every hour. According to our data in the premises for the content of laying hens, the content of ammonia was 15-35m<sup>3</sup>, hydrogen sulfide 10-15m<sup>3</sup> and carbon dioxide 5-8 mb The above factors are not indifferent for the body of those working in poultry farms.

The most unfavorable factor on poultry farms is dust. The concentration of dust in the air of poultry houses fluctuates within a very wide range of 10-18 mg / m<sup>3</sup> (research continues in this direction \* The largest amount of dust is found in the breathing zone of workers during the

distribution of dry feed, culling and catching poultry, cleaning the premises 14-18 mg / m<sup>3</sup>. The dust of poultry houses is mainly organic, animal (down, feathers, dandruff, droppings, etc.), vegetable (feed, litter) origin, which are strong allergens. Intensification of production and rapid development of poultry farms in conditions of industrial technology are accompanied by a rapid accumulation in the environment of various kinds of microorganisms, including pathogenic for humans. With a specific feature of poultry production, bacterial contamination of the air reaches significant values. According to the literature, in 1 m<sup>3</sup> of air in poultry houses, 7.5- 22 thousand microorganisms. When kept in single-tier cell bacteria – up to 509 thousand, with floor the content of poultry per 1 m<sup>3</sup> - 1 million microbes. Microbial contamination of the open atmosphere on the territory of poultry farms is 20-45 thousand colonies in 1 m<sup>3</sup>. The microflora of poultry farms consists of opportunistic microorganisms (Staphylococcus aureus and white, hemolytic streptococcus, intestinal sticks, etc.). along with them, pathogenic microorganisms of the intestinal group are also found, especially salmonella, the causative agents of psittacosis and toxoplasmosis. fungal microflora. This is the material for further research.

Thus, the unfavorable factors of the production environment of poultry farms are intense physical labor, neuropsychic stress, the impact on the human body of chemicals, bacterial and dust aerosols, fungal microflora, excrement and other poultry waste products.

The above urgently requires a qualifying scientific analysis and the development of scientifically grounded and effective health-improving measures to improve the working conditions of workers and the protection of atmospheric air around poultry complexes and farms. Among the important recreational activities is the planning solution for the placement of poultry complexes and farms in relation to settlements. Poultry houses, auxiliary buildings and structures of poultry farms.

According to the sanitary standards and rules for the protection of atmospheric air SanPin No. 0350-17. should be located in the territory separated from residential buildings by a sanitary protection zone from 300 to 1500 meters, which is subject to their adjustment.

The planning and organization of the territory, the placement of individual production facilities on it is carried out taking into account the zoohygienic and veterinary and sanitary requirements aimed at preventing the introduction of infection from the outside, preventing the spread of infectious diseases among the population, preventing air pollution by emissions from poultry farms ... In order to radically improve working conditions and reduce the incidence of disease in poultry farmers, the pace of transition from private mechanization to continuous automated technology based on multi-tier cage batteries with full automation of the processes of feed distribution, drinking, dropping, collecting eggs, management and control of the microclimate and others should be accelerated. technological operations (disinfection of premises, eggs, washing equipment, inventory, etc.).

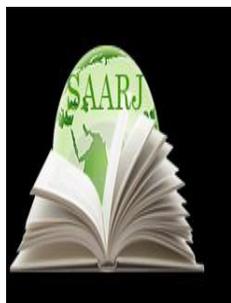

For the transportation of manure, it is necessary to use more widely pneumatic removal systems, which allows to reduce the number of maintenance personnel and vehicles, as well as improve the sanitary working conditions of workers in poultry farms. A prerequisite for the protection of atmospheric air when cleaning poultry houses, hatcheries, feed shops and other production areas from dust and bacterial aerosols is the installation of mechanical filters of various designs on the inflow and discharge into the atmosphere

In incubator shops, it is recommended to use not only light, but also sound alarms at the control and automatic control panels, in places of intense dust formation, local exhaust ventilation. Ovoscopy, candling of eggs and sorting of chicks should be performed in dark clothes on a dark background. In slaughter shops, it is necessary to mechanize and automate production operations. The epidemiological well-being of poultry farms is ensured by the admission of service personnel and visitors to the production areas through sanitary and veterinary checkpoints with a change of everyday clothes for special clothes, clothes and footwear.

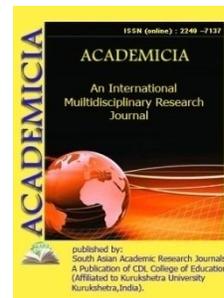

Preliminary and periodic medical examinations are important for the prevention of occupational diseases in poultry farmers, according to order No. 200 M3 of the Republic of Uzbekistan of 2000.

**ABSTRACT**

*This work describes of the effect of pulsation drying on the kinetics of drying and analyzes the experimental results for some problems. Vibration is realized with the help of an air flow interruption, which allows obtaining the front of the wave pulse with a pronounced leading edge.*

## INTRODUCTION

It is known that the study of drying kinetics allows drying with the least energy loss and obtaining high-quality products. Since drying is a heat exchange process, its kinetics will be determined by the form of moisture binding to the material. Depending on the binding energy of moisture with dry matter, the following classifications are distinguished:

1. Chemical bond water is not removed during the drying process. Note that pulsation also does not speed up or help to break these connections. The ionic and molecular bond is water, in this case in stoichiometric ratios.
2. the Physical and chemical (adsorption and osmotic) bond includes moisture absorbed in the form of steam from the environment and retained on the surface of the substance under the action of its molecular force field (adsorbed water), as well as moisture that is part of plant and animal cells.
3. Physical and mechanical water located in the pores and macrocapillaries of the material, as well as wetting moisture.

Macropillaries include those that do not have capillary properties, they do not show changes in vapor pressure compared to its value for a free liquid.

It is assumed that the radius of the macrocapillary  $R=10^{-4}$  mm.

When studying the drying process, we deal with physical-mechanical and physical-chemical forms of communication. The quantitative content in the material is estimated by humidity. Distinguish between relative humidity, i.e. the mass of moisture contained in the material referred to the total mass  $m$ .

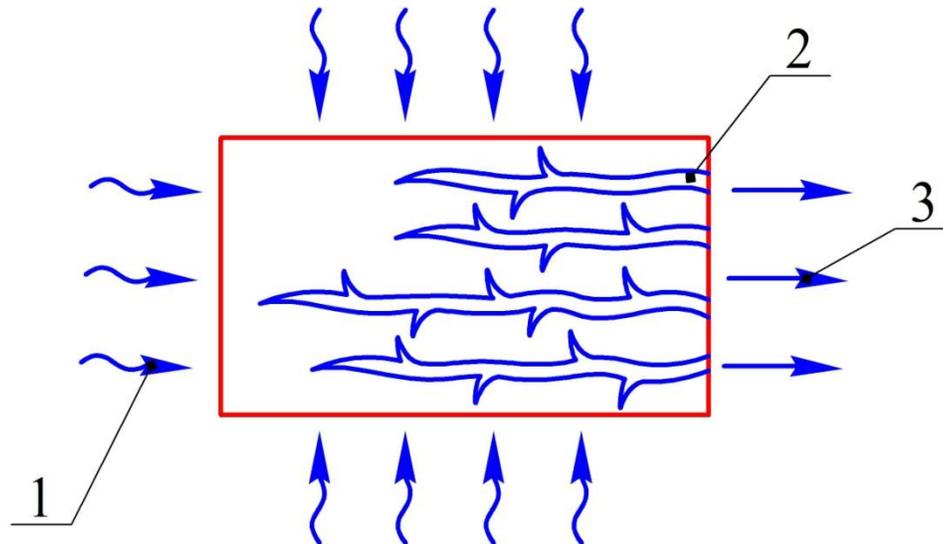

$$n = \frac{W}{M_m + W} \quad (1)$$

$$\text{Absolute humidity} \quad n^{a\delta c} = \frac{W}{M_m} \quad (2)$$

When studying the drying kinetics, it is necessary to determine the influence of various external and internal factors on the drying rate.

$$\text{In particular} \quad \vartheta = \frac{dn^{a\delta c}}{dt} = \vartheta(A, \omega, p, A) \quad (3)$$

The dependence of the rate of change in moisture content and especially the rate of its change depends on the vibration amplitude, and, on the pulsation frequency  $\omega$ , on the second parallel low-frequency pulsation  $p$  on the rate of change of the wave front relative to time - i.e., on  $\frac{dA}{dt}$  [1,5]

The mechanism of moisture transfer inside the solid phase is complex because part of the moisture evaporates inside the material per unit time and as a result, movement to the surface of the material occurs in the form of a liquid and in the form of steam simultaneously due to the action of various forces. In particular, the pulsation accelerates the process of breaking moisture from the body. [1] its influence can be shown schematically using the following image (Fig. 1).

1-pulsation of the heating air having a frequency of  $\omega$  and  $p$ , the amplitudes of wave vibrations  $A$ , as well as from  $\frac{dA}{dt}$

2-macrocappillaries

3-exit to remove moisture from the surface of the material.

In this scheme, usually the ripple is harmonic i.e.

$$A = A_0 \left( \omega t - \frac{\omega}{c} x \right)$$

where  $A_0$  is the amplitude

$t$ -time

$x$  - coordinate

$c$  - is the speed of the pulse.

In our experiments,  $A_0$ =from  $10^{(-2)}$  cm-to 1 cm

$$\omega = 2\pi \frac{rad}{sec}$$

$$P = 2\pi 0,01 \frac{rad}{sec}$$

The main thing is to get an additional acceleration of moisture, which is equal to

$$a_1 = \omega_1^2 A_0 \cong 0,4 \frac{M}{c^2}$$

If, the ripple frequency  $\omega_2 = 20\pi \frac{\text{rad}}{\text{sec}}$

$$a_2 = \omega_2^2 A_0 = 40 \text{ M}/c^2$$

That is, much more than the acceleration of gravity.

As you can see from the picture, the drying time with the interval [q, b] is less than the time [q, B]. This means the influence of pulsations in the stabilization period. The shortening of the drying time is due to these interactions, i.e. in the region of temperature stabilization during drying [2,3].

and  $A=1.6$  cm. additional vibration P was absent in this experiment. Drying material-pumpkin slices, with the size (3x3x4) cm<sup>3</sup>.

The obtained data allow designers of drying systems to introduce a pulsation device to increase the drying efficiency, as it reduces the drying time and increases the quality. [4]

To observe the ripple effect, consider using the drying curve for the above pumpkin slices.

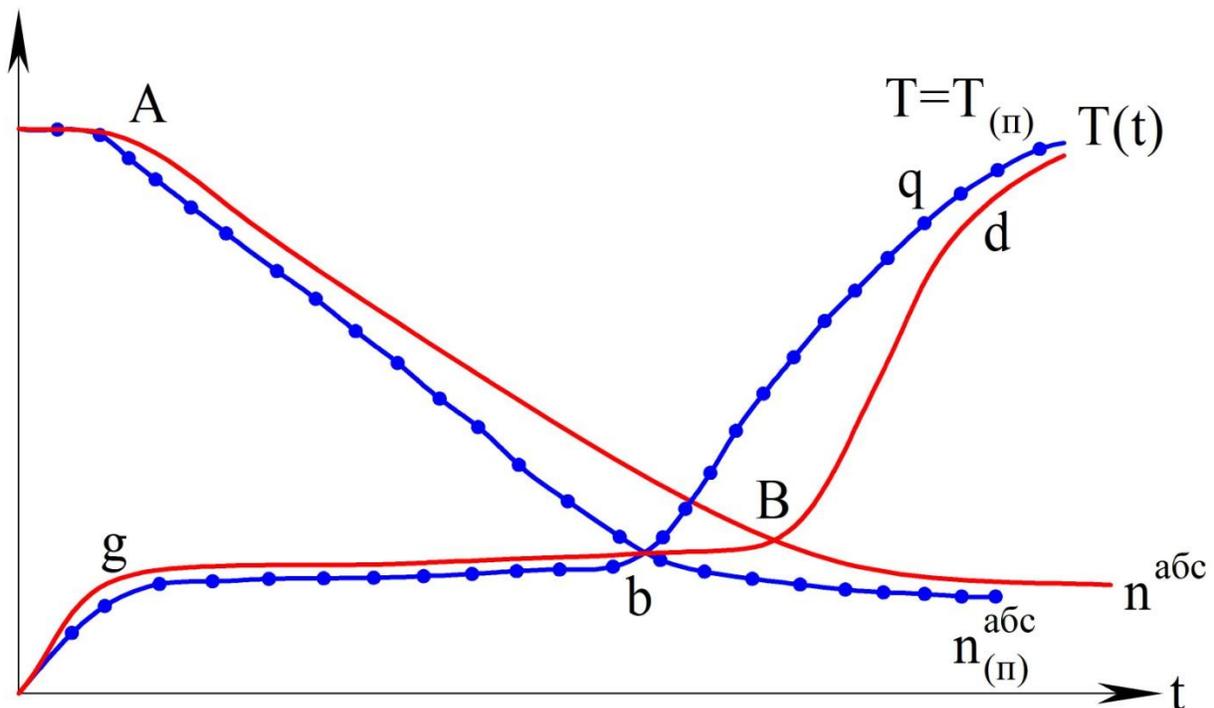

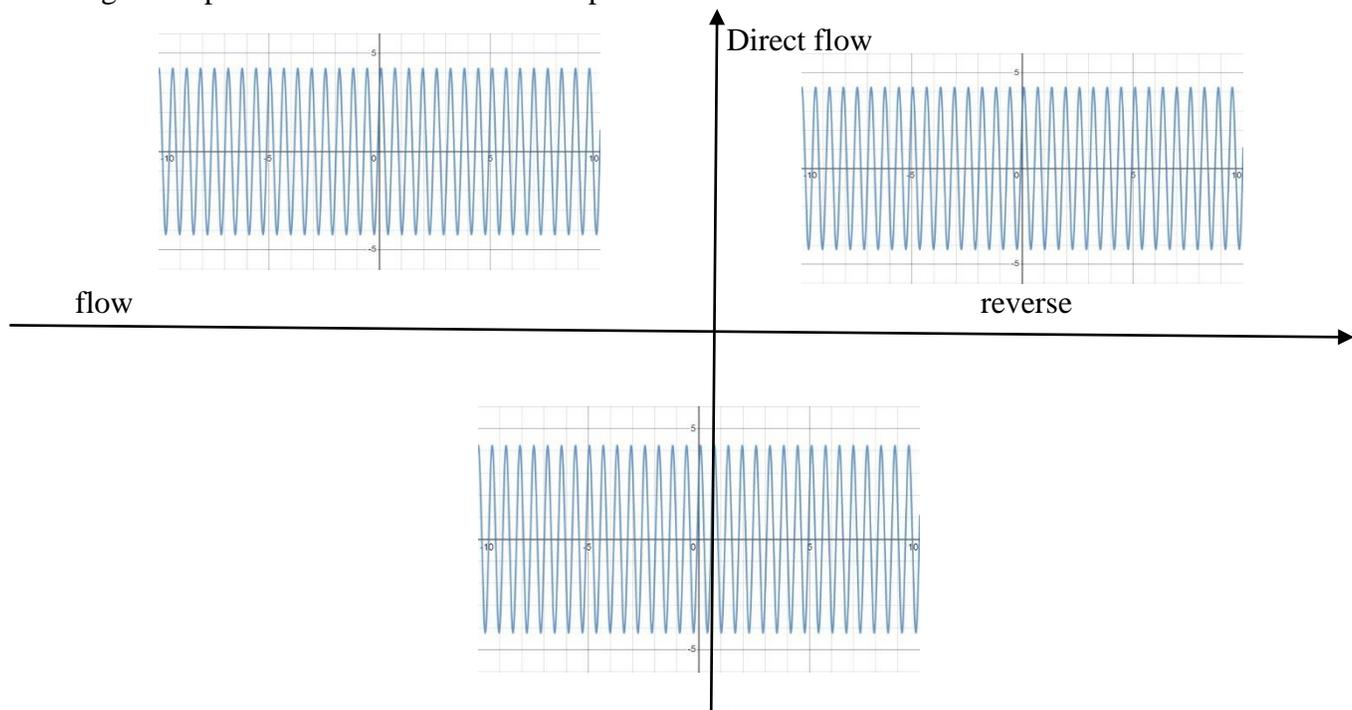

Figure 2 Effect of ripples on the drying curve.

- 1) The curve in the presence of ripples
- 2) Curve in the absence of ripples

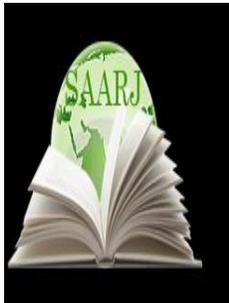

Fig. 3 Graph of movement of heated air particles

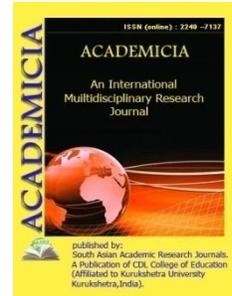

As a result of studies of similar drying curves for other homogeneous materials, we conclude that the pulsation of the heater with a relatively high frequency affects the drying process mainly during the stabilization period. Pulsation of the flow direction of the heat carrier (Fig.3) improves the quality of products, preventing one-way overheating of materials during horizontal gas supplies.

 Bukhara State University, UZBEKISTAN

### ABSTRACT

*This article discusses the difficulties of translating the gluttony vocabulary and some effective tips or translating culinary lexemes. Attention is also paid to the French national gastronomic culture, which is recognized as the king of world cuisine.*

**KEYWORDS:** *Recipe, Text, Textual Criticism, Speech, Gastronomic Speech, Linguistics, Gluttonous Dictionary, Linguistic Landscape Of The World, Reality, Methods Of Translation, Methods Of Adaptation.*

### 1. INTRODUCTION

Food is an integral part of national life. This is why lexical units related to the subject of "Gastronomy" are common in all languages of the world, and some of them are considered very old lexical units. These lexical units affect the language at the stage of lexical and grammatical construction. They reflect the culture of each nation, its people, their national identity and values. Therefore, we tried to turn to the lexical layer of the national cuisine and its culinary terminology in order to correctly interpret the French and Uzbek culture.

### 2. Main part

On November 17, 2010, the French cuisine was recognized by UNESCO as an Intangible Cultural Heritage of Inconvenience. The history of French cuisine ranges from ancient Gaul dishes to the present day. It is well known that France has the status of a "trendy" in the culinary field all over the world. Each language uses the vocabulary of French cuisine to one degree or another. In this direction it is important to remember that the gastronomic dictionary will help all chefs and translators in the hard work. But our Uzbek cuisine is not far behind.

The gastronomic speech, which includes the gastronomic (culinary) dictionary, also reflects important aspects of world cultural, linguistic, religious-ethnic and ideological indicators, and is also very important for cultural linguistics. Among the problems the translator faces: translation of dish names; names of ingredients; the amount and parts of ingredients can be found in the culinary dictionary. However, we do not have such a “French-Uzbek dictionary”.

As one research suggests, the following features of the French gluttony of word combinations in Russian were revealed: 1) phonetic-graphic correspondence (preservation of the original language, replacement of sounds with close Russian sounds, simplification of double consonants; 2) adaptation of grammatical leveling; 3) the formation of national values (change in lexical values when switching to Russian).

When studying the article, the following tips for translating the French gastronomic dictionary into Russian were used:

1. Transcription method: squid - squid; caramel-caramel; margarine-margarine; gelatin - gelatin.
2. Method of transliteration: champignons - champignons; coupling - cup (forks); chocolate - chocolate.
3. Mode of interpretation: abaissé - abec (pie crust).

We can also use these methods to form a gastronomic vocabulary and study texts. We hope that the use of transcription and transliteration when translating menus and recipes into Uzbek will give good results.

At the same time, international electronic methods are increasingly used in the translation of literary texts. To a lesser extent, they resort to transcription or transliteration with the help of translators and dictionaries. However, this method does not give the desired result.

The problem of gastronomic debates has always been relevant and remains one of the most urgent. It is currently attracting the attention of local and foreign linguists. Because as tourism develops in our country, special attention is paid to it. When translating gastronomic units and gastronomic texts, translators do not have enough translation method, so they also face certain problems.

The gluttony discourse, as a separate type of media discourse, has a wide range of abnormal properties. It reflects the cultural, linguistic, ethnic and ideological worldview and is a system that embodies the intercultural values of the national culture and has social characteristics. The gluttony speech is presented in oral and written form in mass media discourse.

In France at different times there were different prevailing cooking recipes. Initially, they were passed from mouth to mouth, from cook to student, from mother to daughter, so that the main recipe went from oral to written form. From the end of the 14th century, written "collections of recipes" began to appear. Currently, oral and written commitments (graphic presentations next to the menu) are performed in various forms. Oral form is done on the radio and television: from magistrate (professional cook) to a student, from more experienced housewives to less experienced, while written form is done in newspapers, magazines, websites for chefs of various types.

The cooking recipe is text in small format. Small size is a type of text that contains a large amount of transmitted information. Structurally, small format text is characterized by simplicity and stereotype of construction:

- a) the input part (name and components)
- b) special part (algorithm of actions)
- c) The final part.

A culinary recipe is an author's speech containing written and oriented in monological way, "cumulative" information for "long-term" use, also it is a certain area in which the author can possess the necessary knowledge and skills [2].

The cooking recipe is considered as a necessary speech in the works of N.P. Golovnitskaya and P.P. Burkova.

N.P. Golovnitskaya considered the text of a culinary recipe in the spotlight as a work with a certain pragmatic position and proposed a form of a written document for this type. P.P. Burkova considers the recipe of a cook as "a written collection of monologues of the text." The genre of the recipe for homemade activity was analyzed by A.M. Kanturov based on seven methods: 1. Recipe is a multipurpose genre that combines cognitive and imperative genres. 2. The author of the cooking recipe has more information than the recipient. 3. A recipe for cooking is the execution of the information provided to the customer. 4. The recipe is usually the first step as it introduces new information to the customer. 5. A cooking recipe usually does not mean a communicative future (it is just a way of choosing a cooking order). 6. The eventual meaning of the content of the recipe is a map that defines the perspective future. 7. The recipe for cooking differs from the dictionary of generalized individual sentences, thematic and lexico-semantic groups associated with the cooking process.

Given the socio-cultural context, this type of discussion can be defined as "communication + kitchen recipe text + context". In the works A.Yu. Zemtskaya discourse peculiarities of the culinary recipe were put forward as a separate type of gastronomic discussion.

By their composition, they are distinguished:

1. Participants in the gastronomic discussion: "author" - a person with extensive experience, skills, abilities, knowledge in the field of cooking, "client" - a person ordering the preparation of some meal. The authors can be professional chefs, and celebrities who talk about the culinary preferences and skills of a particular cook, people who share their experiences, and young housewives.
2. The chronotope of a clearly defined speech is the time that corresponds to the daily mealtime of a person: breakfast, lunch, afternoon tea, dinner. A common place for gastronomic speech is in the kitchen (dining room) and restaurant.
3. As a subject of a gastronomic discussion A.Yu. Zemtskova highlights the following: a) informational feature: transmission of significant information by the author, reception of information by the recipient; b) training (exchange of experience), acquaintance with the culinary culture and traditions of other peoples; c) incentive: to induce the recipient to take action; g) evaluation of the recipe on the basis of experience. Evaluation is usually about

expressing personal opinions and can be related with sense, taste, aesthetic and emotional character.

4. National values, firstly, are associated with the cooking process: pragmatic (every day), celebration (light breakfast, festive breakfast, separate dinner, festive dinner), aesthetic; secondly, the processes of food consumption. Eating habits, service tips, table manners; third, the moral and aesthetic preferences of consumers.

5. Strategies. Gastronomical discourse strategies - explain and contribute. An explanation is an algorithm that must be performed to achieve the desired result, a certain sequence of actions, these are experiences and traditions accumulated by previous generations and other peoples.

6. Working texts. Includes previous texts of the gastronomic discussion, the texts of culinary recipes from different nations, presented in newspapers, magazines, on websites, etc.

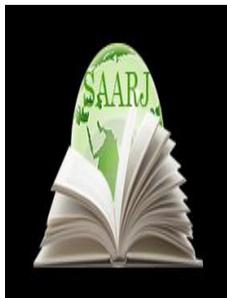

7. Formulas of discourse. Discourse formulas are the norms of behavioral speech that belong to the corresponding social institution.

### 3. CONCLUSION

The textual features of the concept of “recipe” are found in the works of A. V. Olyanish, P. P. Burkova, A. M. Kanturova. Their works explain special discourse properties of gluttony texts, their culinary recipes include properties of the compositional, syntactic and lexical texts, and peculiarities and uniqueness in the context of culinary publications. Among them, it is worth studying the lexico-semiotic functions of gluttony speech and the most important communicative functions of gluttony vocabulary: iconic, directive, qualification-evaluative and presentation functions, developed earlier by A.V. Olyanish.

#### ABSTRACT

*Data on research on the growth and development of irrigation standards, irrigation procedures of varieties of soybeans (Arzu, Arleta), sunflower oil (Jakhongir, Navruz) in the conditions of typical burlap soils of Tashkent region are presented. As a control in the experiment, the sunflower variety "Jaxongir" was late compared to the varieties "Navruz", and the vegetation period lasted on average in 3 years to 92 days, or late ripening was observed in 7 days.*

**KEYWORDS:** *Typical Burlap Soils, Growth, Development, Soil Moisture, Accounting Layer, Irrigation Norms.*

#### INTRODUCTION

According to the Bureau of Food Agriculture the average crop capacity of soybeans is 2.7 tons per hectare? And in 2020 soybean production will be 1.62 mln tons World of wide, soybean

production is expected to grow by 2.2 % to reach 371.3 mln tons by 2030. Due to the positive biological characteristics of the soybean in the republic, there is a lack of irrigation water and their deficiency in the development and improvement of agrotechnology for recultivation of soybeans as a secondary crop.

The Decree of the President of the Republic of Uzbekistan dated March 14, 2017, PK 2832 On measures to increase sowing and soybean cultivation in the country for the period of 2017-2021 is intended for 92.266 ha of the main crop and 40.557 ha of secondary crops.

Soybean crop occupies 4 hectares in terms of sown area after wheat, rice and maize.

With a total grain yield of 220,64 million tons, Brazil, the United States of America and Argentina are the leading producers of soybeans, the buyer countries are our neighbor, China, Korea and their countries.

In the country in 2018, the main crop was sown on a total of 1.100.000 hectares and as a secondary crop at 19.150 hectares.

### RESEARCH METHOD

The scientific research institute of agrotechnologies of cotton selection, seed growing and cultivation was held in the fields of the Tashkent region Aghkovak experimental area. Experimental fields were carried out in the conditions of typical Burrow soils irrigated by Tashkent region, in conditions of heavy sand of mechanical composition, deep underground soils (>15 m). It was studied by comparing the soybean to the variety "Arleta", the variety "dream", which is perceived as control. And sunflower was studied by comparing the variety "Jakhongir" to the variety "Navruz". In the care of soybeans and sunflower crops, irrigation was carried out in the order of 65-65-60% and 75-75-65% in relation to the limited field moisture capacity (LFMC) in the soil accounting layers. In this, the layers of soil 0-50 CM and 0-70 CM were watered in the order in which the crops were taken into account. The experiment consisted of 10 variants, placed in three repetitions, in three hemispheres by the method of randomization. All observational measurements and analyses in the studies were taken in Psueaiti according to "methodology polevixopitov s khlopchatnikom" (1981), "methods of conducting field experiments" (2007) and statistical analysis of data on productivity B. A. Dospekhov's methodology polevogoopita " (1979; 1985) was carried out on the basis of methodologies.

### RESEARCH RESULTS

When the dynamics of the germination of repeatedly cultivated soybean seeds in the conditions of typical burlap soils of the Tashkent region was observed, it became known that the "Atleta" variety sprouted 100% in the same period, if 12 days after the sowing of the "Arzu" variety made up 99% of the full germination of the seed. The beginning of the flowering period was 6 August, respectively, 95,6 and 98,9%. The average development duration of repeatedly planted soybeans for 2018-2020 years. The period of validity was 99 days in the form of "desire" and 85.6 days in the form of "Arleta", on average in three years. It was observed that the soybean ripened 65-65-60 days earlier than the control used in the development, when watering in the order of 0-50 CM of the soil in 13,5% of the Arleta variety compared to LFMC.

The height of the stem of the soybeans changed during the season, and when four maple leaves were extracted, the flowering and flowering of the first controlled "dream" varieties of the

experiment before ripening and harvesting were correspondingly equal to 10.1, 11.9, 78.4, and 81.1 CM, the branches of the harvest were 2,88 - 3,84 grains. The lowest plant height and number of harvested branches were observed in the order of 65-65-60% irrigation compared to the Arleta varieties LFMC, respectively 10,2 and 64,4 CM, and the harvested branches were around 2,0 pieces. In this method soybean variety "Arleta" has a high index, 65-65-60% of the experiment was observed in the order (2-variant) when irrigation was conducted on the 0-50cm account layer of soil in thriftiness. In the other 3, 5-variant areas of the experiment, cases of soybean growth and development took an intermediate place.

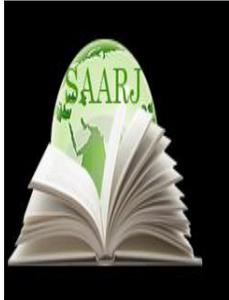

According to field experiments, observations and calculations conducted in the conditions of typical burlap soils of Tashkent region, the growth period of sunflower varieties was 80-100 days. As a result of the research conducted, the "Navruz" variety of sunflower manifested itself quite early. In this made 65-65-60% of this variety in the order of LFMC, the earliest ripening in irrigation according to the accounting layer of soil 0-50 cm was 85 days. As a control in the experiment, the sunflower variety "Jaxongir" was late compared to the varieties "Navruz", and the vegetation period lasted on average in 3 years to 92 days, or late ripening was observed in 7 days. The growth and development of varieties of sunflower grown in Tashkent region was different during the season. On average, the plant height went to the vegetation barn, the highest indicator was 176,6-184,4 cm on average in three years in the "Jakhongir" variety, while the lowest indicator was 65-65-60% in the "Navruz" variety and the average was 159,6-174 cm. In the order of 75-75-65% of this variety compared to LFMC, the soil was 172,7, -181,6 CM in the calculation layer of 0-70 cm in irrigation, according to the results of the measurements, in the highest "Navruz" variety according to the diameter of the basket, 65-65-60% in irrigation compared to LFMC, and the soil wetting was/

## CONCLUSION

As a result of research conducted in the conditions of typical burlap soils of the Tashkent region, the "Arleta" variety of the shade, the "Navruz" variety of the Sunflower, manifested itself quite early. Bunda is the earliest ripening of this variety in irrigation on an account layer of soil 65-65 cm in the order of 60-50% compared to LFMC, and the shade was 85,6 days, while the Sunflower was 85 days. The growth and development of these varieties and high yields have been achieved.

UZBEKISTAN

### ABSTRACT

*This article discusses the organization of experimental work in order to implement proposals and recommendations for the development of professional and creative abilities of students of higher educational institutions, based on the purpose of the study. One of the features of the education system is to ensure the "external" socio-pedagogical conditions for the development of a person-centered education system and the "internal" pedagogical conditions of his life. The use of cognitive-informational, personal, cultural, competence paradigms in the development of professional and creative abilities of students, diagnostics of teaching quality, design of critical thinking and developmental educational technologies, synergetic integration in higher education and production play an important role.*

**KEYWORDS:** Vocational Education, Definition, Formation, Preparation, Basic, Graduation, Stages, Creativity, Levels, Innovative Technologies.

### INTRODUCTION

It is important to conduct research on the development of professional and creative abilities of students of higher education institutions in the world, the organization of the educational process on the basis of media technologies, the development of pedagogical opportunities for the development of professional and creative abilities. In this regard, professional problems, research of scientific hypotheses, identification of professional problems, definition of independent thinking educational strategies, creation of mechanisms of continuous renewal and development of professional and creative abilities, organization of differential approach, cooperative,

educational and mediation (impartial service environment) priority) explains the need for the formation of education, the organization of corporate learning based on e-learning and m-learning technologies and the development of corporate databases .

The legal and regulatory framework for increasing the creative potential of students of higher education institutions of the country, the development of professional and creative abilities, the formation of independent thinking skills, the further development of curricula, programs and literature, the material and technical base of the education system has been developed . Tasks such as "Increasing the level of coverage with higher education, training highly qualified, creative and systematic thinking, independent decision-making personnel on the basis of international standards, creating the necessary conditions for their intellectual abilities and spiritual development". The use of cognitive-informational, personal, cultural, competence paradigms in the development of professional and creative abilities of students, diagnostics of teaching quality, design of critical thinking and developmental educational technologies, synergetic integration in higher education and production play an important role.

One of the features of the education system is to ensure the "external" socio-pedagogical conditions for the development of a person-centered education system and the "internal" pedagogical conditions of his life. They are manifested in the humane nature of education, the primacy of universal values, the free development of the individual, the universal use of education, openness, comprehensive protection of the consumer of education.

Professional and creative abilities of students are those qualities that characterize their level of compliance with the requirements of a particular type of professional activity and depend on the level of its effectiveness, allowing them to master current theoretical developments and innovative practical solutions in a purposeful and consistent manner. and a set of properties is understood [5]. Based on the research purpose of the development of professional and creative abilities of students, experimental work was organized in order to implement in practice the proposals and recommendations developed for the development of professional and creative abilities of students of higher education institutions.

Experimental work was carried out in 2018-2020 with a total of 448 students of 2-3-4 courses of the bachelor's degree in Andijan Institute of Mechanical Engineering, Tashkent State Technical University, Jizzakh Polytechnic Institute 5111000 - Vocational Education (Ground Transport Systems and Their Operation). Two groups were selected from each stage of the selected educational institutions, one of which was divided into an experimental group and the other into a control group, and the number of participants in each stage was determined (see Table 1).

The experimental work was carried out in two stages, such as identification and shaping. In order to develop students' professional activity, first of all, it is necessary to plan, analyze and determine the level of professional and creative abilities of students in the conduct of lessons. In the clarifying phase, the impact of the ideas put forward during the research on the students' practical activities is studied.

Cases of misunderstanding of the ideas put forward on the development of professional and creative skills will be identified, and it is planned to create tools and developments to overcome it. At the formative stage, targeted activities are organized to improve the educational process of professional disciplines, conduct and analyze spiritual and educational activities, develop methods and tools for the development of professional and creative abilities of students based on extracurricular activities and the implementation of these tasks.

At both stages, attention was paid to the levels of assessment in determining the professional and creative abilities of students of higher education institutions. This was done by dividing the knowledge, skills, and competencies to be acquired through the blocks in the structure of the critical competencies and professional-creative components at the assessment levels. The manifestation of personality traits and characteristics that allow students to master the current theoretical developments of professional and creative activities and innovative practical solutions in a purposeful and consistent manner, encourages them to seek their unconventional direction in the chosen field of pedagogical activity.

Levels of knowledge were determined according to the assessment criteria for the development of professional and creative abilities of students of higher education institutions. "High", "medium" and "low" indicators were used to determine such levels of knowledge (see Table 2)

**TABLE 2 ASSIMILATION RATE INDICATORS**

Levels	Evaluation criteria
High	Students who have the knowledge to be assessed on the basis of criteria, have the skills and abilities to apply this knowledge in practice
Medium	Students who have knowledge that is assessed on the basis of criteria, who have errors in the skills and abilities to apply this knowledge in practice
Lower	Students whose knowledge to be assessed on the basis of criteria is scattered, who have difficulties in applying this knowledge in practice, and who make mistakes

The average value of the results obtained from these criteria and the indicators that determine the level of knowledge of the assessment were taken as the main indicators of the level of development of professional and creative abilities of students. The experimental work was organized in three stages of development of the recommended professional and creative skills on the above criteria and levels of knowledge

**1. Preparation.**

**2. Basic.**

**3. Closing.**

**1. Preparatory stage.** 2 courses - the period of adaptation, during which the initial tests on the proposed criteria and levels of knowledge (mastery) of students were conducted and the level of formation of their professional and creative abilities was determined. After that, seminars and roundtables on the development of professional and creative abilities of students were organized during this period. Organized seminars and roundtables were held using innovative technologies. Tests were conducted to find out to what extent the lessons were changed by the students. This resulted in a significant increase in knowledge levels in the experimental groups compared to the knowledge levels in the control groups.

**2. The main stage.** 3 courses - the stage of mastering psychological and pedagogical disciplines. At the same time, the development of professional and creative abilities of students on the proposed criteria and levels of knowledge (mastery) was examined in the field of psychological and pedagogical disciplines. Preliminary and final results were obtained at this stage as well. This led to a significant increase in the levels of knowledge in the experimental groups compared to the levels of knowledge in the control groups, leading to the effectiveness of the research conducted in the experimental groups.

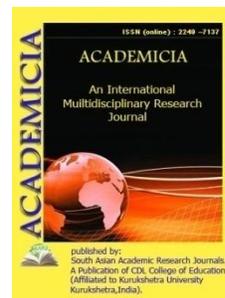

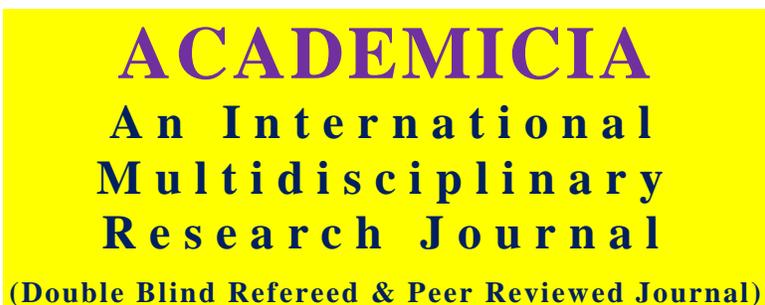

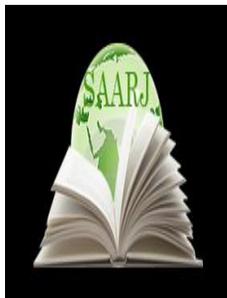

**3. The final stage.** 4th year - many new products of professional disciplines in the structure of professional-positive abilities of future teachers of vocational education were integrated and tested in practice in the process of testing their professional-creative abilities, i.e. students' real pedagogical reality. The results were obtained on the basis of the level of mastery of professional disciplines, pedagogical practice and observation and analysis of future scientific and creative activities. This showed that the knowledge levels in the experimental groups were significantly higher than the knowledge levels in the control groups, indicating that the research conducted in the experimental groups was effective.

From the results obtained, it can be seen that the criterion for assessing the effectiveness of professional and creative abilities is suddenly large, and the criterion for assessing the level of development is greater than zero. This means that experiments on the effectiveness of the educational process through the development of professional and creative skills in students are effective.

## ANALYSIS OF WORKING CONDITIONS BY PARAMETERS OF THE PHYSIOLOGICAL STATE OF WORKERS COTTON PLANT

**Zokirov V.Z\***; **Manasova I.S\*\***

<sup>1,2</sup>Bukhara State Medical Institute,  
UZBEKISTAN

### ABSTRACT

*In a cotton mill with difficult working conditions, the work of sorters, carders and spinners is carried out. Adverse effects on the body are: noise, meteorological factors, air velocity, waste of cleaning machines and harmful factors in violation of the technological process of the technical equipment used in the spinning shop. It is known that in recent years, measures have been taken to improve technical equipment, improving the working conditions of persons whose work is associated with harmful factors. However, these measures do not exclude the tension of the physiological functions of the workers' organism, which are an important factor in the efficiency and, ultimately, the state of human health. The work of sorters, carders and spinners noticeably differs from the nature of the work of engineers and technicians, primarily in terms of physical stress, as well as dustiness, noise and vibration.*

**KEYWORDS:** *Cotton Mill, Sorters, Carders, Spinners, Physical Labor, Strenuous Physical Activity.*

### INTRODUCTION

Protecting the health of workers at a cotton mill and developing measures aimed at improving working conditions is the most important task of hygiene and occupational pathologies. Work of workers associated with the impact of intense noise and vibration, high dust content and heavy physical labor, leading to a decrease in working capacity, and in the future to disability and occupational diseases [1,3.] At all stages of the production process in the organism of workers of the cotton mill has an effect physical (temperature, humidity, noise, vibration), chemical (pesticides, chemicals), biological factors. {2,4,5} In addition, the work of a cotton mill is characterized by high physical overstrain. All of the above urgently requires the development of hygienic regulations that guarantee the safety and health of workers employed in. cotton mill [5,6,7] This issue has become especially relevant with the release of the Decree of the President

of the Republic of Uzbekistan dated November 28, 2017 No. UP-3608. "On measures to radically improve the cotton industry." [6, 7, 8]

**The purpose of our research.** For this purpose, the organization of working conditions of workers and engineering and technical services of a cotton mill and a hygienic assessment of working conditions of carders, sorters of engineering and technical personnel were studied. It is known that in recent years, measures have been taken to improve technical equipment, improving the working conditions of persons whose work is associated with harmful factors. However, these measures do not exclude the tension of the physiological functions of the workers' organism, which are an important factor in the efficiency and, ultimately, the state of human health.

In a cotton mill with difficult working conditions, the work of sorters, carders and spinners is carried out. Adverse effects on the body are: noise, meteorological factors, air velocity, waste of cleaning machines and harmful factors in violation of the technological process of the technical equipment used in the spinning shop. The equipment and mechanism are complex in design and operation, associated with the physical effort of the muscles of the arms, static stress and constantly repetitive monotonous movements, which cause an increased load on the organs of the central nervous system, cardiovascular system, pulmonary ventilation and, ultimately account, leading to overwork.

#### MATERIALS AND METHODS

The studies were carried out using physiological and hygienic methods: dynamometry, spirometry, tonometry, heart rate determination in 90 workers with various working conditions: 30 shop workers, 30 sorters, carding workers and 30 engineering and technical workers (control). A contingent of workers aged 25 to 35 was selected, with work experience of 5-15 years.

The main group of workers, sorters, spinning shop and spinners had direct contact with harmful factors (noise, vibration, dustiness and intense work). Of the total sampled, 28% were women and 72% were men. The study criterion was: dynamometry, VC, pulse rate and indicators of maximum blood pressure, arm muscle strength before starting work, at the end of work and one hour after the work shift.

Results. The labor of sorters, carders and spinners was assessed as heavy stressful (3rd category of tension), for engineering and technical workers - as moderate (2nd category of tension) according to the following results of physiological and hygienic research methods:

**TABLE 1 INDICATORS OF MUSCLE STRENGTH OF THE RIGHT AND LEFT ARM IN WORKERS OF THE MAIN GROUP AND ENGINEERS**

Professions	At the beginning of work M + m	In the end work M + m	After work (in an hour)
cardmen	34,3+4,1 29,5+3,5	30,5+3,7 28,1+3,2	32,3+2,5 26,1+2,3
sorters	36,5++4,0 29,5+3,5	30,7+3,8 28,3+3,2	34,7+2,5 29,4+3,4
I.T.R.	34,5+4,2 34,3+3,3	33,5+4,0 32,5+3,2	34,4+4,1 29,9+3,2

(Note: the numerator is the muscle strength of the right arm, the denominator is the muscle strength of the left arm).

The results showed that the respiration rate and VC of workers in the main group and ITR with an increase in tension, working time is accompanied by an increase in respiration rate and, accordingly, a decrease in VC, but there is a significant difference in indicators among the main and control groups.

Indicators of vital capacity of the lungs and respiratory rate among workers of the main group and ITR # 2

Professions	At the beginning of work M + m	At the beginning of work M + m	After work (in an hour)
cardmen	39,+1,2 20,0+0,6	2,7+0,8 24,4+1,3	3,6+1,2 2,23+0,8
sorters	4,1+1,4 20,1+1,0	3,5+1,03 26+1,1	3,8+1,2 22+1,1
I.T.R.	34+1,2 20,1+0,6	3,2+1,1 22,1+0,1	3,3+1,2 20,4+0,3

(Note: the numerator is the heart rate, and the denominator is the maximum A / D).

It is known that the indicators of gas exchange are interrelated with the hemodynamic states of the body, in particular, in the process of increasing the intensity of physical activity, the heart rate increases, and the blood pressure rises.

**TABLE 3 INDICATORS OF PULSE RATE AND BLOOD PRESSURE IN WORKERS OF THE MAIN GROUP AND ENGINEERING AND TECHNICAL PERSONNEL.**

Professions	At the beginning of work M + m	In the end work M + m	After work (in an hour)
cardmen	74,9+1,3 120,0+1,3	92+1,4 127,5+2	89,2+1,3 121,1+2,2
sorters	77,1+0,8 118,9+1,8	96,7+1,1 127,5+2,6	80,2+2,0 123,4+2,2
I.T.R.	76,9+1,3 1201+1,3	80,8+1,7 123,6+1,8	78,0+1,6 120+1.4

The physiological and hygienic studies of the working zone of the workers of the cotton mill showed that there are a number of significant shortcomings in the design of machines and workplaces of sorters, carders and spinners.

Workers are forced to be in an uncomfortable working position for a long time during work, make unnecessary movements, perform monotonous repetitive actions with constant intense physical exertion. The static load of the arm muscles is also great, which is the cause of fatigue and even overwork of workers in this profession.

The muscular strength of the right arm in the main group at the beginning of work averaged 34.3, at the end of work - 30.5, an hour after the shift - 32, 3, while in the engineering services (control

group) it was at the beginning of work 34.5, at the end of work - 33.5, and an hour after the shift - 34.4.

The muscle strength of the left arm in the main group was 29.5-28.0-26.1, respectively, and among the engineering and technical workers - 34.5 at the beginning of work, 30.5 - at the end of work and 29.9 - an hour after work. These data show that the decrease in arm muscle strength increases with the increase in working hours in both groups. At the same time, the decrease in strength in I.T.R. the right hand averages 4.2 percent, while in the main group it is about 10-17 percent.

The decrease in the muscle strength of the left hand was insignificant in both groups. The recovery of muscle strength in the main group lasted longer than that of I.T.R.

The ventilation function of the lungs was studied using a respiration analyzer (AD - 01), combined with the PVEM "Neuron", which registers the frequency and vital capacity of the lungs (flow - volume).

It follows from the table that VC and NPV in the main group have shifts by 1.2 times, and in ITR by 0.7 times. Respiratory gas exchange in the main group is reduced by 15-20%, while in ITR by 5-6%. The indices of respiratory functions in an hour after work in both groups did not have a significant difference, they were equal to 28 minutes both for the main group, as well as for ITR. These data confirm that the indicators of external respiration are closely interconnected with the nature of the intensity of labor processes and physical activity.

The increase in heart rate at the end of work, compared to the beginning of work, for the main group was 12-35%, and for engineers and technicians only by 5-6%. The stroke volume of the heart increased by 14-20% in the main group, and in the ITR only by 8-10%. At the same time, it was found that the change in the rhythm of heart contractions is closely interrelated with the nature of physical stress, the increase in A / D in the main group was 4-8%, and in ITR - 2-3%

## RESULTS AND DISCUSSION

The results showed that the respiration rate and VC of workers in the main group and ITR with an increase in tension, working time is accompanied by an increase in respiration rate and, accordingly, a decrease in VC, but there is a significant difference in indicators among the main and control groups.

It is known that the indicators of gas exchange are interrelated with the hemodynamic states of the body, in particular, in the process of increasing the intensity of physical activity, the heart rate increases, and blood pressure rises.

The conducted physiological and hygienic studies of the working zone of the workers of the cotton mill showed that there are a number of significant shortcomings in the design of lathes and workplaces of sorters, carders and spinners.

Workers are forced to be in an uncomfortable working position for a long time during work, to make unnecessary movements, to perform monotonous repetitive actions with constant intense physical exertion. The static load of the arm muscles is also great, which is the cause of fatigue and even overwork of workers in this profession.

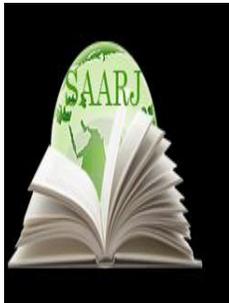

## CONCLUSIONS

The nature of the work of the workers of the cotton mill can be attributed in terms of severity and stress to 2 - medium and 3 - tension categories.

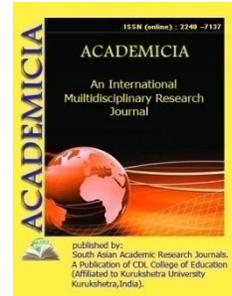

The work of sorters, carders and spinners noticeably differs from the nature of the work of engineers and technicians, primarily in terms of physical stress, as well as dustiness, noise and vibration. Improvement of working conditions, technological processes, optimal organization of the workplace, compliance with technical equipment, compliance with sanitary and hygienic requirements for occupational hygiene and rest determine the efficiency of the production process while maintaining the health of workers and maintaining high efficiency of labor resources. The results obtained can serve as the optimal point for the development of rational tactics of sanitary-hygienic and preventive health-improving measures among workers of a cotton mill.

## PROSODIC FEATURES OF SPEECH FORMS OF ADDRESS IN ENGLISH DISCOURSE IN COMPARISON WITH RUSSIAN

**Artikova Shahnoza\***

\*Lecturer,

Department of Foreign Languages of Fergana State University,  
 Fergana Region, UZBEKISTAN

---

### ABSTRACT

*Prosodic Features and Prosodic Structure presents an overall view of the nature of prosodic features of language - accent, stress, rhythm, tone, pitch, and intonation - and shows how these connect to sound systems and meaning. It is a work of great scholarship and learning, expressed in way that will be accessible to all linguists from advanced undergraduates to postdoctoral researchers. The last substantial overview was published over 20 years ago. Since then the subject has been transformed by linked advances in phonological and phonetic theory and acoustic technology. The article explores the prosodic features of Russian in comparison with English.*

**KEYWORDS:** *Prosody, Prosodic Features, Intonation, Tempo, Rising Tone, Falling Tone, Accent.*

---

### INTRODUCTION

Prosody, the study of all the elements of language that contribute toward acoustic and rhythmic effects, chiefly in poetry but also in prose. The term derived from an ancient Greek word that originally meant a song accompanied by music or the particular tone or accent given to an individual syllable. Greek and Latin literary critics generally regarded prosody as part of grammar; it concerned itself with the rules determining the length or shortness of a syllable, with syllabic quantity, and with how the various combinations of short and long syllables formed the meters (i.e., the rhythmic patterns) of Greek and Latin poetry. Prosody was the study of meter and its uses in lyric, epic, and dramatic verse. In sophisticated modern criticism, however, the scope of prosodic study has been expanded until it now concerns itself with what the 20th-century poet Ezra Pound called “the articulation of the total sound of a poem.”

Intonation is referred to as a prosodic feature of English. This is the collective term used to describe variations in pitch, loudness, tempo, and rhythm. These features are all involved in intonation, stress, and rhythm.

Loudness has already been mentioned in relation to weak and strong syllables in English and in the extra prominence given to nuclear syllables. In more extended speech, loudness can be used for other effects. It is associated with anger (though anger can also be indicated by very quiet, tense speech). In public speaking, orators produce powerful effects by varying the loudness of their speech.

The juxtaposition of very loud and very quiet utterances is a device often used by those trying to arouse strong emotions in their audience. It is also used to heighten effectiveness when reading children's stories. In Stan and Jan Berenstain's book *Bears in the Night*, the naughty little bears creep out of bed and go up Spook Hill until an owl calls WHOOOO! whereupon they rush down the hill and back into bed.

The pace of speech is called tempo. This too can be varied. Fast speech can convey urgency, whereas slower speech can be used for emphasis. Varying the tempo can also be used for effect in public speaking, often accompanying changes in loudness. When reading stories to children, we can vary the tempo and loudness to reinforce the meaning of the words.

The varieties that are spoken by a socially limited number of people and used only in certain localities are called dialects. An accent is a variety of a language which is distinguished from others exclusively in terms of pronunciation. Accent variation may be geographical, social and situational. Geographically native English accents are divided into British-oriented (U.K., Australia, New Zealand, South Africa) and North-America-oriented (U.S.A., Canada). Within each country national standards, regional standards and local accents reflect both geographical and social diversity. The orthoepic norm of a language is the standard pronunciation adopted by native speakers as the right and proper way of speaking. It comprises the variants of pronunciation of vocabulary units and prosodic patterns which reflect the main tendencies in pronunciation that exist in the language. It is used by the most educated parts of the population. National standards: RP, GA, Gen Aus, Gen Can. Regional standards in U.K.: Southern, Northern, Scottish, Northern Irish. Regional standards in U.S.A.: Northern, Northern Midland, Southern Midland, Southern, Western. National standards are associated with radio and TV newsreaders, certain professional groups and public figures. Regional standards are spoken by most educated people and they show regional deviation from the standard. In U.K. people in the South-East of the country are closest to RP, in the U.S.A. it is people from the North, North Midland and the West who show the least differences from the unofficial standard of American Network. Local accents are numerous, they can be urban and rural. Urban centres are leading in accent diversity today. The major accent-classifying feature is the presence of r in 'rhotic' (r-full) accents and its vocalization in post-vocalic position in 'non-rhotic' (r-less) accents. Most of the American accents (except southern and eastern) are rhotic, most of the British accents are non-rhotic (except northern, Scottish, Irish). Current changes in RP are grouped according to the degree of process completion: processes almost complete, changes well-established, recent innovations and innovations on the verge of RP. A more subtle realizational feature is /r/ pronounced as a post-alveolar approximant in all positions and not, as formerly, as a tap in intervocalic positions following an accented syllable, e.g. very, error.

Comparing the sound systems of RP and GA we note differences in vowel systems (20 vs. 15), in consonant systems (r-vocalization, t-voicing, etc.), in accent placement, rhythm and intonation. The major differences in vowels are: [ɒ/ɑ:/ɔ:] in dog, stop, long, orange, [æ]-distribution in ask, dance, [oo]-quality in go, home; less contrast in length between American tense and lax vowels; retroflexion quality of American vowels before r, nasalization before nasals, loss of contrast in cot/caught, Merry Mary married. In consonants, besides r-retroflexion and vocalization, there is American flap in better, letter, t-omission before n in twenty, weakened [j] in news, Tuesday, dark [l] in little, less. There are also non-systemic, lexical occurrences which create differences in pronunciation of words and their accentuation, as [ɑ:/eɪ] in tomato, vase, [f/sk] in schedule, accent patterns of [' - - / - -'] in address, adult, detail, ballet, café, garage. Secondary (tertiary) stress occurrence, as in dictionary, ceremony, strawberry. American rhythm is more smooth, not clipped as the British one due to an additional number of stresses and to lower contrast between accented and unaccented syllables in length and pitch (1.5 vs. 1.7). The monotony of American intonation is due to recurrence of mid-level wavy, rise-falling and level-rise pitch patterns. On the whole American men's speech, especially, is specific for its narrow pitch range with rise-fall termination.

How Russian Intonation Contours Differ from English

If a Russian L1 speaker of English uses Russian information question intonation when uttering a wh-question in English, it may sound like a statement. This is because the pitch accent is near the start of the utterance in Russian intonation questions. In contrast, information questions in English have a pitch accent on a focal word often near the end of the utterance. Figures 9 and 10 show the idealized, unmarked version of a Russian intonation contour (dotted line) superimposed over an actual, unmarked intonation contour by a native speaker of English. If the Russian intonation pattern influences the L2 English, the intent behind questions or commands could be misconstrued, or utterances could seem monotonic in pitch compared to native speech.

## CONCLUSION

To summarize, both information and yes-no questions have low boundary tones as unmarked intonation contours in Russian. Yes-no questions in English end in a high rise boundary tone. The main difference in the Russian information questions and the equivalent in English wh-questions is the placement of the high pitch accent, which falls near the beginning or mid sentence in Russian, but closer to the end, on the focus word, in English. When analyzing the data I use these descriptions of unmarked question intonation. Potential L1 Intonation Influence on Learners of English

When examining the phonological differences in question intonation between the two languages and the possibility of how this affects L2 speech, we are considering the possibility of L1 intonation influence and how this may affect speech. L1 intonation influence is a possibility because as literature has shown, there is a difference between the intonation contours in English and Russian. Before looking at influence between Russian and English, we will look at some other research on intonation transfer.

One study explained that German speakers of English conveyed uncertainty with their rising intonation in declarative sentences when speaking English (Edmondson et al., as cited by Chun, 2002). Another study described Indian and Pakistani food servers in Britain being perceived as

irritating or impolite for using a falling intonation rather than a rising intonation when saying “Gravy” and offering it to the customers (Gumperz, as cited by Chun, p.87). Swertz and Zerbian (2010) researched L2 intonation transfer in Zulu speakers of English with perceptual and acoustic analysis.

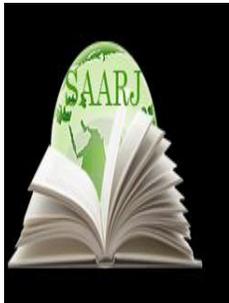

Perceptions of and Attitudes Toward Russian Intonation in English L2. The intonation patterns of Russian speakers of English tend to have a subtle but complex effect on language. They do not cause a lack of intelligibility so much as they set up a possible misunderstanding of attitude or intention from the perspective of the native English speaker. When considering the phonological differences in question intonation between the two languages and the possibility of how this affects L2 speech, it is relevant to consider how English language learners are perceived. Studies have shown

Russian speaking English Language learners among others to be perceived negatively at times due to their non target-like intonation. Misunderstanding due to non target-like intonation can have undesirable consequences such as a negative effect on employability. This is an important area to understand where negative perceptions happen in order to better help L2 learners. Research has shown Russian accents to be preferred less than other accents. A study by Hyman (2001) shows reactions to Chinese and Russian accents where the Chinese accents were preferred over the Russian accents when considering the participants for manager level job positions. Hyman conducted a study on perceptions of adult ESL learners on a pre- and post-instruction basis. As an example of misunderstanding of emotion behind suprasegmental features, Hyman cited Jones and Evans (1995) who found that the “staccato pronunciation characteristics of some Cantonese speakers’ interlanguage...has been mistakenly perceived as expressing anger or irritation” (Hyman, 2001). This makes the point that although a Cantonese accent is not desirable, it is still preferable to a Russian accent. Hyman’s data was reviewed by business managers looking at employability qualifications and research results showed that Chinese accents are preferred to Russian accents. In another study the general complaint by tourists about Russian tour guides speaking English was that they found the guides to be rude. Dorodnych conducted a study on requests in English and Russian based on feedback received from English and American travelers. This study documented differences in the use of lexical, morphological and syntactic items, but stated that there were differences in intonation whose “importance can hardly be overestimated”. Hyman and Dorodnych’s results combined with the fact that intonation is a considerable part of the pronunciation problem for Russians, such as with yes-no questions, indicate that further study on acquiring intonation patterns can be valuable. In addition to those studies, Holden and Hogan researched the emotive impact of foreign international “accent” in L2 Russian (in Moscow) and L2 English (in Edmonton, Canada). They aimed to make a preliminary assessment “of the emotional and attitudinal ‘confusion’ that may arise in the use of foreign intonation in L2”. The study showed that for positive emotions, English native speaking subjects rated their own intonation higher than the intonation of Russian L1 speakers of English in yes-no questions. Both English and Russian speakers “reacted more negatively to the greater pitch range of Russian intonation in exclamations and yes-no questions”. The authors also explained: English speakers were found to be much more sensitive to Russian intonation than Russian speakers were to English (1993). According to Holden and Hogan, when considering sensitivity to intonation patterns between the two languages, there is more concern with the negative transfer of Russian L1 intonation to English L2. After

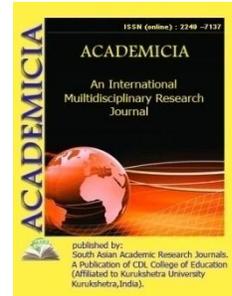

conducting their study, Holden and Hogan cautioned Russian speakers on retaining their Russian intonation when using English, “even if they are otherwise fluent segmentally and grammatically,” because their evidence suggested that Russian speakers of English “will be judged negatively on most simple syntactic constructions” . The idea that Russian speakers of English who transfer their native intonation patterns can so commonly be perceived negatively provides good reason to investigate this further.

## ACADEMIC AUDIT- A BENCHMARK FOR QUALITY ENHANCEMENT IN HIGHER EDUCATION

**Deekshith Yogesh\***

\*Asst. Prof. Department of Commerce,  
 A.P.S Evening college of Arts and Commerce,  
 N.R Colony, Bengaluru, INDIA  
 Email id: Dheeee08@gmail.com

### ABSTRACT

*Academic Audit plays a significant role in bringing quality in higher education. Academic audit is a system to control and maintain high standards in the field of Higher education. It is a continuous process of self introspection for the better growth of the institution. Higher education includes all types of studies and research at UG, PG and higher level, provided by universities and other educational organizations which are approved government higher education institutes. Currently vast research is undergoing in the field of higher education mainly because of the support both Financial and Technical from the government. The purpose of an academic audit is to encourage the departments or programs to evaluate their “education quality processes” and regularly improve and upgrade the quality of teaching and learning. An audit asks how the faculty can approach to their decision making and how well they can organize their work with the available resources to them and to provide a quality education in the best interests of the discipline and student learning.*

**KEYWORDS:** *Academic Audit, Higher Education, Quality Process.*

### INTRODUCTION

Changes have been witnessed in all the fields and education is not an exception of it. Developing country like India has huge challenges in the field of education. Problems like unwieldy affiliated system, inflexible and inappropriate academic structure, low relevance on various subjects have been observed over a period of time and Considering the fact, the government has been working on various methods and measures to enhance the quality of higher education at university levels. On this light, the National Assessment And Accrediation Council (NAAC)

which is an autonomous body established by the University Grants Commission (UGC) of India to assess and accredit institutions of higher education in the country. Assessment and Accreditation is significant for understanding the Quality of an institution.

### **What is Academic Audit?**

Academic Audit is a system to examine, evaluate and enhance the quality of academic process in the institution. It is related with quality assurance and enhancing the quality of academic activities in the institutions.

B.L Gupta defines it as, “it is a systematic and scientific process of designing, implementing, monitoring and reviewing the quality of academic systems, i.e. inputs, processes and outputs. It emphasizes on reviewing the performance of the academic inputs with respect to quality assurance”.

### **Objectives of Academic Audit:**

1. Enhancing Quality in Academic Standards,
2. To ensure the practices are in accordance with standards.
3. Quality of students’ learning opportunities.

### **Quality learning**

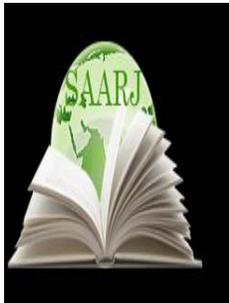

The academic audit provides an opportunity for a regular strategic overview of a college’s teaching and learning process. Quality enhancement is an inclusive concept and a collective enterprise. It involves everyone who teaches, supports and guides the students of higher education institution. The main focus of the institutes should be on the policies and practices to enhance the quality of students learning. It will also examine all institutions ability to manage the standards of academics and the quality of the learning opportunities it provides for its students.

Quality assurance mechanism requires an integrated approach of all the aspects of educational activities of the institution. It includes mission and objective of the institution, faculty strengths, input-output level of student, infrastructure evaluation, curricular teaching, learning process, feedback system, cultural and social activities etc.

### **Academic Audit: Its Necessity:**

The Academic Audit is necessary for the following:-

- [1] To confirm that the arrangements for quality assurance are fit for the purpose and conform to the institutions’ objectives, mission and vision.
- [2] To assure that the standards compile the expectations.
- [3] To ensure that students have access to appropriate learning opportunities through private study and supported learning.
- [4] To promote, evaluate and enhance quality teaching and learning.
- [5] To guide decision making about academic standards like knowledge, skills, attitude and achievements expected of students in their subject discipline.

### INTRODUCTION

According to experts, traffic jams on the roads strongly affect the social life of modern cities. This leads to a decrease in labor productivity, most importantly, transport logistics deteriorates. Multiple traffic jams lead to large loss of income. In idle time, the time of car owners is wasted, fuel is wasted, the emission of harmful substances into the atmosphere increases.

According to the estimates of the American Carnegie Mellon University, due to traffic jams, the US economy alone loses more than \$ 120 billion annually. These losses are associated with inefficient use of labor resources and additional emissions of about 25 billion kg of harmful substances into the atmosphere [1]. University scientists have calculated that the implementation of the "Smart Traffic Light" system can reduce drivers' travel time by almost 25%, and the time spent in traffic jams - by more than 40%. As a result, motorists are able to spend more time on useful things, instead of wasted in traffic jams. According to researchers, smart traffic lights can also reduce the amount of harmful substances emitted into the atmosphere by almost 21%.

Our cities are already experiencing traffic jams due to unjustified downtime of cars at intersections. Where the installed traffic lights are not synchronized with the traffic flows. Here, the solution to the problem is also the installation of smart traffic lights. But smart traffic light systems have been developed and applied in developed countries. The use of ready-made systems requires sufficient foreign exchange costs. Therefore, the development of a system of smart traffic lights in our republic is relevant.

Development. The Smart Traffic Light system works on the following principles:

Sensors or video cameras are installed at a certain height or sensors on the road to specific sections of the route. The signal from them enters the microprocessor-based information processing module in real time. Then, in this module, data on mobile vehicles is processed and various integral estimates are determined. These results are fed to a central server. Communication with the central server can be carried out through a radio environment or via optical communication lines. The server instructs the traffic light controllers to turn on the red or green light and for how long.

First of all, transport oriented data reception systems provide three types of data:

First, this is traffic information for statistical processing:

- The total number of vehicles by destination;
- Average flow rate;
- Traffic flow acceleration;
- Flux density;
- Traffic lanes congestion.

Second, information about accidents on the road:

- High speed, flux density or occupancy of lanes;
- The presence of congestion or movement in the oncoming lane;
- The number of stopped or slow moving cars.

Thirdly, information about the presence / absence of cars:

- The presence of approaching cars;
- The presence of cars stopped at the intersection;
- The number of vehicles passing through the detection zones;
- measuring the length of the queue.

The system is integrated into the traffic light control module, which makes it possible to coordinate the work of absolutely all traffic lights at an intersection in any busy transport hub.

The "smart traffic light" system is able to predict the traffic situation 15-30 minutes ahead and develop an effective traffic management plan in advance. The control command is generated based on the collection of data for a certain time interval. In the event of a failure of the dynamic control system, the traffic lights switch to autonomous mode.

The widely used scheme for collecting the smart traffic light system is as follows:

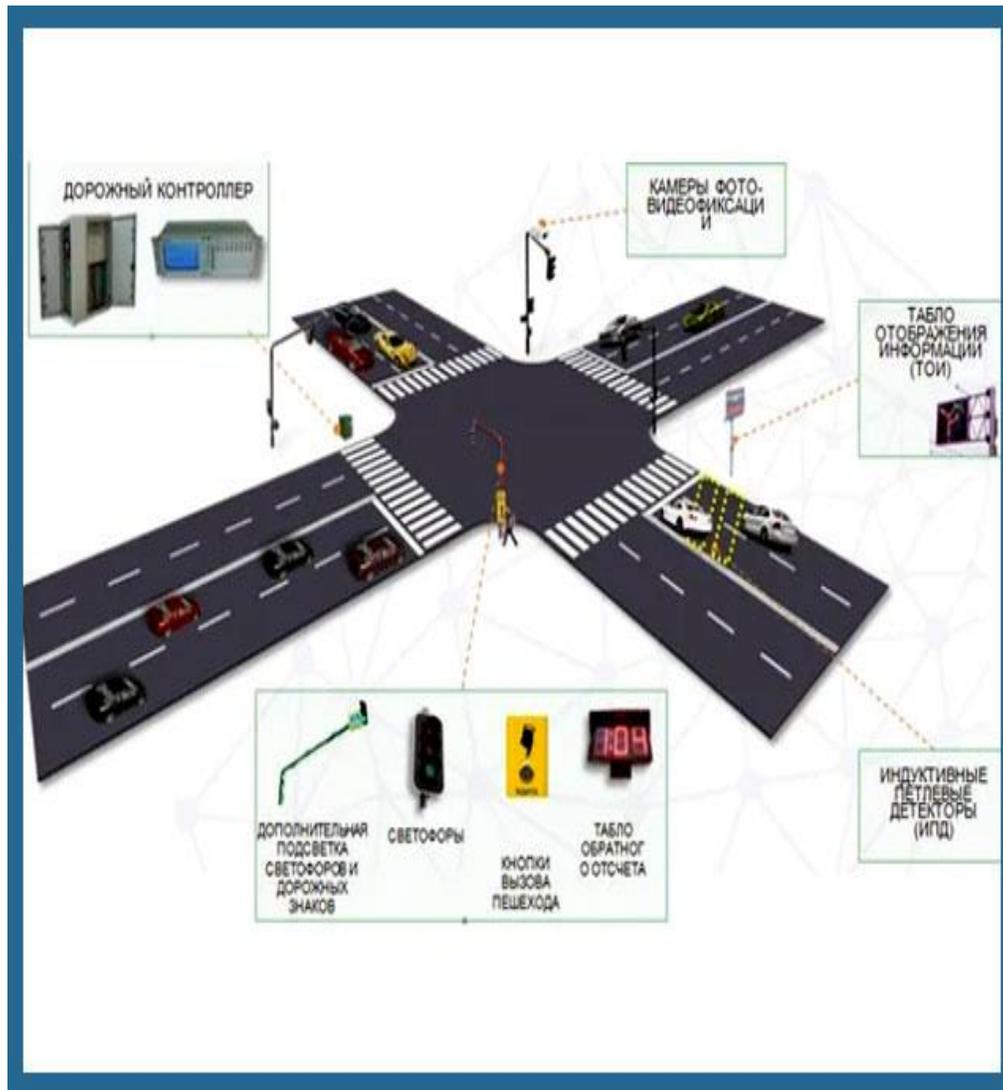

Fig. 1. Organization diagram of the "smart traffic light" system

We have developed a project for the "smart traffic light" system, created on infrared motion sensors, has the following advantages:

- Downtime diagram;
- Each system works autonomously;
- A scheme is provided for combining groups of intersections or city traffic lights;
- The cost of the system is much lower than that of the installed systems.

The scheme for the installation of primary sensors and their symbols are shown in Figure 2.

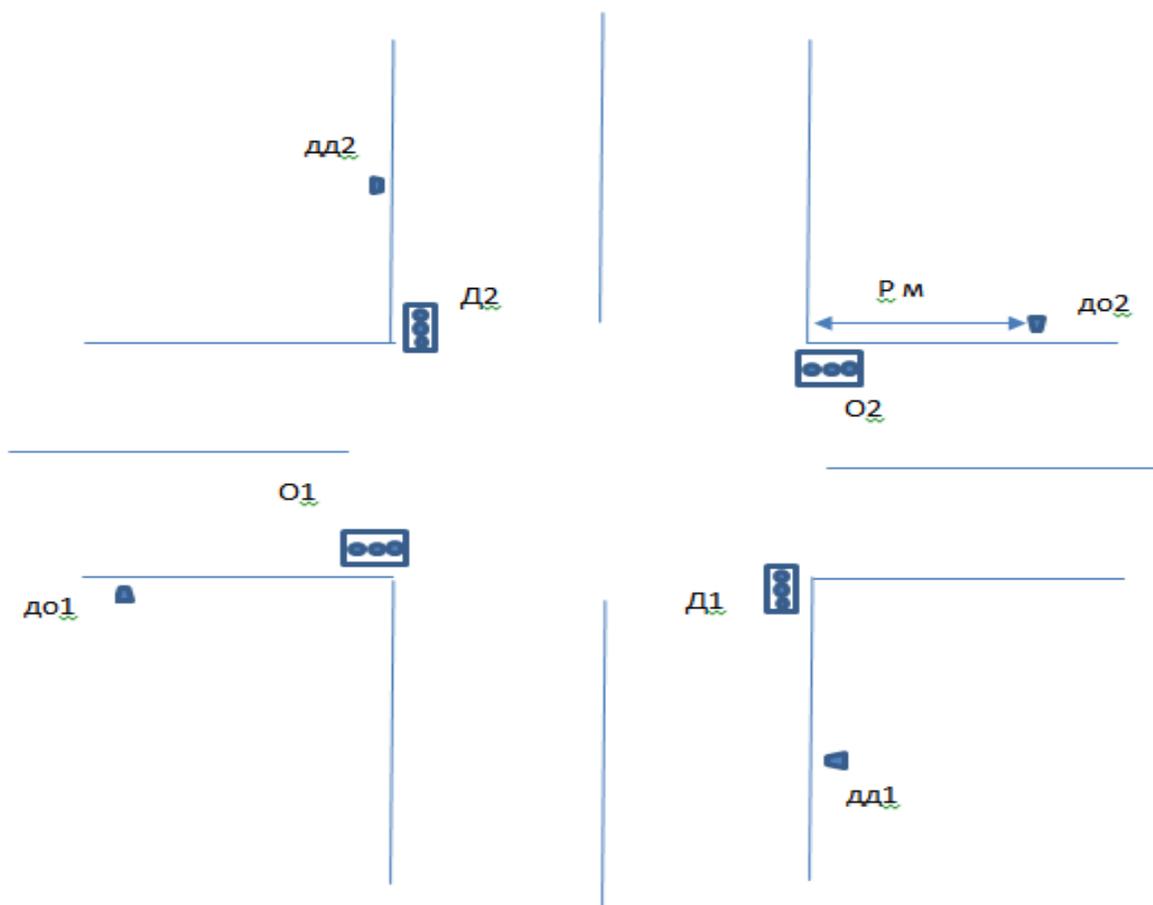

Fig. 2. Installation diagram of motion sensors.

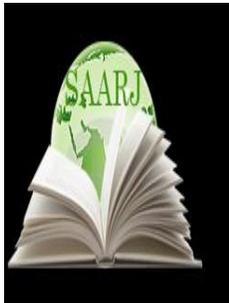

The system uses infrared motion sensors, in which the sensitivity zone is adjusted. The sensitivity range of different roads may be different. The zone is defined by a wide strip of roads. In addition, the distance of the sensor installation (in the pm. Scheme) from the intersection is also different in different roads. It depends on the intensity of traffic. Usually in the range from 30 to 50 meters.

In our project, a logic controller PLC 110-30 (MO2) programmed in the CodeSys language is used to control the processes. The logic programmable controller has 18 digital inputs and 12 digital outputs. The controller provides for the reception of information transmission to other controllers at the upper control levels, which allows the unification of groups of traffic lights or the organization of a control system of a single center. The applied controller also covers the operation of traffic lights, so a separate controller is not required to control the sequence of turning on and off traffic lights.

## PROSPECTS FOR THE USE OF MICRO HYDRO POWER STATIONS

**Yusupova Feruza Turdalievna\***

\*Senior Lecturer,  
 Fergana Polytechnic Institute,  
 UZBEKISTAN

---

### ABSTRACT

*The use of hydropower, which is a type of alternative energy sources, is important in the production of electricity around the world. Small hydropower is the cleanest type of electricity generation, does not pollute the atmosphere with harmful wastes, and does not require the construction of large reservoirs. They require a small amount of construction materials, there is no risk of flooding nearby areas in case of an emergency, and the cost of large hydropower plants is lower. Therefore, this article discusses the prospects for the use of micro-hydro power plants. It provides a brief analysis of the small hydropower potential of the Central Asian states.*

**KEYWORDS:** *Hydroelectric Power Station, Micro Hydroelectric Power Station, Water Flows, Electricity, Small Hydropower Potential, States, Reservoirs.*

---

### INTRODUCTION

Today, hydropower plants (HPPs) account for about 20% of the world's total electricity generation [1]. Currently, Iceland is in the lead, with 98% in Norway and Canada and Sweden[2]. It should be noted that China is the largest consumer of electricity in the world[3]. In recent years, the construction of hydropower plants in this country is growing rapidly, and special attention is paid to the construction of small hydropower plants, ie micro-hydro power plants.

#### Main part

Depending on their capacity, hydropower plants are divided into the following classes [3]:

- micro hydroelectric power station (micro hydroelectric power station) - capacity up to 100 kW;
- mini hydro power station - from 100 kW to 500 kW;
- small hydro power station - from 500 kW to 10 MW;

- medium hydropower plant - from 10 MW to 1000 MW;
- Large hydroelectric power station - with a capacity of more than 1000 MW.

The main advantages of using micro HPPs are:

- the possibility of network or autonomous local power supply in remote areas, difficult to reach;
- low time and simplicity of construction and operation (disassembly and assembly);
- low cost of construction;
- The main thing is to cover the expenses in a short time.
- not directly dependent on weather conditions like other renewable energy sources.

We will consider the hydropower potential for the use of alternative energy in Kazakhstan, Tajikistan, Kyrgyzstan, Turkmenistan and Uzbekistan.

Kazakhstan ranks third in terms of hydropower resources after the Commonwealth of Independent States [4]. It has a hydropower potential of 170 billion kWh [4], of which 30 billion is economically viable [4]. Hydropower resources are located mainly in the eastern and southeastern regions of Kazakhstan and distributed by regions [4]. The hydropower resources of northern and central Kazakhstan account for only 1.7% [4].

Shardarin in the Syrdarya, Kapchigai on the Ili River, Shulbin in the Irtysh and Ust-Kamenogorsk, and Bukhtarmin, which belong to several large and medium-sized stations, are used as hydroresources [4].

The Republic of Kazakhstan has a small hydropower potential. There are 2174 rivers with a total length of more than 10 km [4], the total length of which exceeds 83.2 thousand km [4]. The number of rivers with a length of 10 to 50 km is 1889 (86.9%), from 50 to 100 km - 130 (6%), more than 100 km - 155 (7.1%) [4]. Thus, almost 90% of rivers fall into the category of small rivers, which determines the economic feasibility of using them for small hydropower needs [4].

The mountainous regions of Tajikistan have great potential for renewable energy sources, including hydropower, solar, wind, and geometric water [5]. For the state of Tajikistan, hydropower potential is the most convenient and cheapest source of renewable energy [5].

93% of Tajikistan's country is mountainous, [5] and 10% of the population, or more than 750,000 people, live far from the centralized power supply system. In addition, there are agricultural and other facilities that are geographically separated, portable and consume small amounts of electricity, with an electrical load density of 0.3–50 kW per km<sup>2</sup> [5].

The hydropower potential of small hydropower plants in Tajikistan is 184.46 billion kWh [6], including 11.28 billion kWh in the Judiciary, 140 billion kWh in the regions and 32.53 billion kWh in the Gorno-Badakhshan Autonomous Region. . kW \* hours [6].

The Kyrgyz Republic is one of the countries with great potential for the development of hydropower [4]. It is the third largest source of water resources in the country among the Commonwealth of Independent States [4]. There are 252 large and medium-sized rivers in the country, with a potential estimated at 18.5 million kWh and more than 140-160 billion kWh of electricity [4], of which less than 10% is used [4].

In Kyrgyzstan, hydropower potential is economically much higher than other renewable energy sources [4]. The capacity of small rivers and streams is 1.6 million kWh and can produce 5-8 billion kWh per year [4].

It should be noted that about 90% of small water flows occur at the level of the upper and middle canals [4], the population is located in rural and mountainous areas, where there is a shortage of electricity [4].

The largest rivers flowing through the Amu Darya in the territory of Turkmenistan include 20 small rivers flowing from the northern slopes of the Murgab, Tedjen, Etrek and Kopetdag [7]. The largest river is the Amudarya, which provides 95% of the country's water supply. It is advisable to use small hydroturbines to supply electricity to consumers with a capacity of 0.5-2.0 kW using fast-flowing small rivers of the mountainous area [7].

There are 650 rivers, irrigation canals and reservoirs flowing through the territory of Uzbekistan, and opportunities for the construction of small hydropower plants are being created [7]. The total hydropower potential of the river in Uzbekistan is estimated at 88.5 billion kWh per year [7]. Technical hydropower potential is estimated at 27.4 billion kWh per year, with 6.28 billion kWh or about 23% currently used [7].

## CONCLUSION

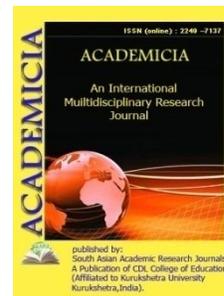

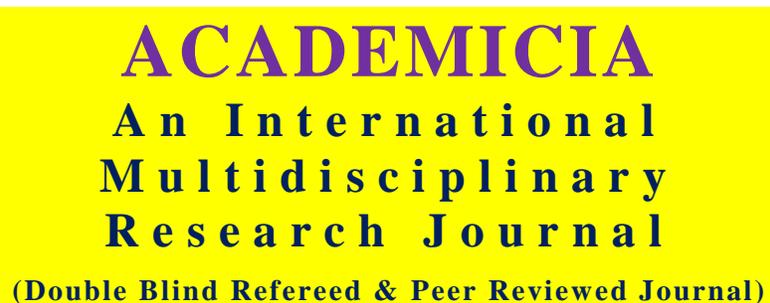

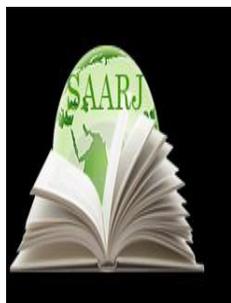

One of the most efficient ways to develop electricity is to get efficient electricity from small and medium HPPs. The purpose of building small hydropower plants is to develop business, especially in mountainous areas in agriculture, industry, tourism, improve the social conditions of the population engaged in farming in remote pastures, provide seasonal processing of agricultural raw materials, organize the production of building materials. provides electricity to the population.

Hydropower potential, which is a type of alternative energy sources, is the most efficient, harmless and free in providing electricity to the population around the world. Scientists have conducted research in this area. To further develop the hydropower potential, it would be expedient to build microHPPs and use them more efficiently.

### ABSTRACT

*Questions connected automatic control system technological process introduced the design are in-process considered. The production engineering of management and observation of manufacture with the help intellectual sensing transducers is presented. Modern methods of the analysis of composition of substance, the production technology of oil products, production engineering of modernisation of manufacture on the basis of modern means of automation.*

**KEYWORDS:** *Automatic Control System, A Process, The Analysis Of Composition Of Substance, Intellectual Оптоэлектронные Devices, Concentration Of A Mix, Gas The Analysis.*

### INTRODUCTION

Now from crude oil it is possible to gain various aspects of fuel, oil oils, paraffins, bitumens, kerosene, solvents, black, greasings and other oil products gained by rehash of raw materials.

Hydrocarbonic oil joints share on easy and heavy, petronew, paraffin and aromatic, and so on.

Chemical properties of oil products if to observe them from the point of view of elementary composition, are in many respects similar, as all these substances contain carbon and hydrogen. These two elements form joints of a various structure.

From the physical point of view oil is observed as a solution of gaseous and firm hydrocarbons in a liquid. The natural oil extracted from bowels of the Earth, always contains a quantity of the gases dissolved in it (passing rock gases), mainly methane and its homologues.

The analysis oil with allocation of individual joints demands a lot of time. In technological calculations at definition of quality of raw materials, oil refining and petrochemistry products often use the data of proximate analysis which consists in definition of some physical, chemical and operational properties of oil products. With that end in view use following methods, in a complex giving the chance to characteristic commodity properties of oil products in various service conditions, to connect them with composition of analysed products, to make recommendations for their most rational application:

- Physical - definition of density, viscosity, temperatures of fusion, a solidification and boiling, a heat of combustion, molecular weight, and also some conditional parametres (a penetration, ductility);

- Chemical, using classic methods of an analytical chemistry;

Physical and chemical - colorimetry, potentiometric titration, nephelometry, refractometry, spectroscopy, a chromatography;

- Special - definition octane and cetane numbers motor fuels, chemical stability топлив and oils, corrosivity, flash point and ignition and other [1].

Last decade demands to accuracy of modern devices and methods of the analysis of physical and chemical properties (FCP) oil, oil products and chemical substances raised. So, in accordance with GOST 8.615-2005 operative control of charge Q is required, to concentration of water W, gas G and density  $\rho$  extracted downhole to a liquid (DL) in the flowing regime (on holes, in pipelines).

Devices used on oil fields and methods of definition of physical and chemical properties of parametres of oil, oil products and chemical substances.

Rapid development of optoelectronics and its element baseline, creation of new highly effective semi-conductor radiation sources in short-range IR - spectrum areas create preconditions for working out of high-sensitivity and exact, reliable devices for control of concentration of gaseous substances.

On the other hand optoelectronics as one of microelectronics directions, develops sweeping rates. Highly effective light-emitting diodes for average IR of the range, working at the room temperature, created on the basis of fourfold solid solutions of joints  $A_3B_5$  are perspective for a gas analysis, moisture measurement and medical diagnostic.

It is known that characteristic absorption bands of variety of important chemical compounds lie in average IR spectrum areas. Among them water and its steams (1.94 microns, 2.75-2.85 microns), methane (1.65 microns, 2.3 microns, 3.3 microns), carbonic gas (2.65 microns, 4.27 microns), carbonic oxide (2.34 microns, 4.67 microns), acetone (3.4 microns), ammonia (2.25 microns, 2.94 microns) both many other anorganic and organic matters [2,3]. Despite certain progress in development chemical and adsorption gas sensor controls, optical sensor controls possess indisputable advantages, first of all in selectivity, reliability and service life. Now a row of firms (Perkin Elmer, Texas Instruments, City Technology, Ion Optics, Comag IR etc.) [2] is made by the infra-red optical sensor controls on the basis of thermal sources IR of radiation. Such source radiates in very wide spectral range under Planck's law. Special optical filters cut out the necessary spectral range.

In laboratory of the Infra-red optics IRO of A.F.Ioffe highly effective light-emitting diodes on the basis of GaInAsSb [5] are developed, they much more surpass thermal sources IR of radiation in all key parametres:

- The width of a spectrum of light-emitting diodes is comparable with width of absorption bands of gases, therefore there is no necessity for use of additional filters.
- Speed on 3 order above, than at thermal sources.
- Essentially lower consumed electric power.
- Time of life of 80000-100000 hours of a continuous work (more than on an order exceeds life time of thermal sources).
- The small size light-emitting diode and photodiode chips (0.3 x 0.3 mm) allows to create exclusively compact sensor controls.

By us are developed intellectual optoelectronic devices with application of these highly effective light-emitting diodes for average IR areas:

- 1) Intellectual optoelectronic devices of carbonic gas. Obligatory installation of such devices in inhabited and industrial premises, and also in streets of big cities is already legislatively regulated in a number of the countries. Control over emissions CO<sub>2</sub> is the basic means of struggle against global climate change.
- 2) Intellectual optoelectronic methane devices are necessary for control of leaks of methane in dwellings where rock gas, along gas pipelines, in pits is used.
- 3) Intellectual optoelectronic devices of humidity and the water maintenance are necessary in many processes (measurement of the maintenance of water in oil and oil products, moistures in a paper, in grain, etc.)
- 4) Medical diagnostic. The optical spectroscopy is applied to the analysis of concentration of carbonic gas, acetone, etc. in exhaled air.
- 5) System of noninvasive control of the maintenance of glucose and other organic matters in blood, a lymph and cloths.

The principle optoelectronic a method consists the following:

The controllable installation irradiates with two antiphase right-angled sequences pulses with lengths of the waves lying in a maximum of sorbtion by a controllable component (measuring) and in not a maximum of sorbtion by this component (basic). In optoelectronic, devices with functional development amplitude of one of quantities of radiant energy (for example, measuring) are supported constantly, and the amplitude of other stream is modulated in a time on exponential to the law.

The past through installation quantities of radiant energy gets on a photodetector photosensitive surface on which occurs their comparisons. A measured controllable component judge pulse-number from the beginning exponential modulated syrup till the moment of change of a phase of a photo-electric signal from both streams.

Controllable installation irradiate with two quantities of radiant energy  $\Phi_{0\lambda 1}$  and  $\Phi_{0\lambda 2}$  on basic  $\lambda_1$  and the worker  $\lambda_2$  lengths of waves accordingly. The past through installation quantities of radiant energy will be equal accordingly:

$$\begin{aligned}\Phi_{\lambda 1} &= \Phi_{0\lambda 1} e^{-kLN_1} \\ \Phi_{\lambda 2} &= \Phi_{0\lambda 2} e^{-kLN_1} \cdot e^{-k_2LN_2}\end{aligned}\quad (1)$$

Where:  $\Phi_{0\lambda 1}$  and  $\Phi_{0\lambda 2}$  - quantities of radiant energy submitting on installation on lengths of waves  $\lambda_1$  and  $\lambda_2$  accordingly,  $\Phi_{\lambda 1}$ ,  $\Phi_{\lambda 2}$  - quantities of radiant energy after passage through the ambassador of passage through installation on lengths of waves  $\lambda_1$  and  $\lambda_2$  accordingly,

$N_1$  - Concentration of a mix of gaseous substances,

$L$  - length of an optical way, i.e. length gas the chamber,

$N_2$  - Concentration of a defined gaseous substance,

$K_1$  - Dissipation coefficient of a mix of gaseous substances,

$K_2$  - An absorptance defined gaseous substances.

Stream  $\Phi_{0\lambda 1}$  changes in a time (t) on exponential to the law:

$$\Phi_{\lambda 1} = Ae^{-\frac{t}{\tau}} \cdot e^{-k_1LN_1} \quad (2)$$

Where  $A$  - the constant factor matching to initial value of amplitude exponential of a pulse. At the moment of equality of streams  $\Phi_{\lambda 1}$  and  $\Phi_{\lambda 2}$

$$\Phi_{0\lambda 2} e^{-k_2LN_2} = Ae^{-\frac{t_c}{\tau}} \quad (3)$$

$$N_2 = \frac{1}{K_2 L_\lambda} \cdot t_c \quad (4)$$

Where  $t_c$  - a time matching to the moment of comparison,

$\tau$  - time constant exhibitors.

### ABSTRACT

*Questions connected the automatic control system introduced the design are in-process considered by Processes, management of processes. The production engineering of modernization of manufacture on the basis of production engineering of modernization of manufacture on the basis of modern means of automation is presented.*

**KEYWORDS:** *Processes, Modernization*

### INTRODUCTION

Modernization of processes is one of the priority directions of updating of industrial systems. The basic driving bases of the given approach are following [3]:

- Working out of modern intellectual systems of automation of manufactures;
- Requirements to raise of productivity of manufacture;
- Demands to качествум products;
- Necessity of the account and monitoring of manufactures for real systems of a time;

- Change of the approach of production management irrespective of a location of controlling systems;
- Interest of specialists to new modern technicians and production engineering.

The automated industrial lines have advantages in following properties from traditionally applied systems:

- Rather low consumption of power resources;
- Raised accuracy of production cycles;
- Economy raw materials and man powers in manufacture;
- Continuous control over a condition of the industrial equipment.

Automatic control systems technological processes develop many firms and the companies. Some of them work in the field of the software of automatic control system technological processes and some in area hardware. But some world famous firms develop to the hardware the software.

Structurally, automatic control system TECHNOLOGICAL PROCESSES consists of three levels. At the bottom level there should be primary sensing transducers and power units, at a following level - the converter (semiconductor device) which is accepting and processing information from sensing transducers, level above - the computer, being the operator of the machinist automated by a work station, giving the chance to the operator on graphical mnemonic diagrams on the monitor to control and operate process parametres.

Technological assemblies it is rigged by an automatic-control system and the control measurements, allowing remotely to operate mechanisms, to control and control technological parametres, a quality of product and productivity of the assembly, a condition of separate mechanisms.

The block diagramme of a control system of assemblies is organised in the following form:

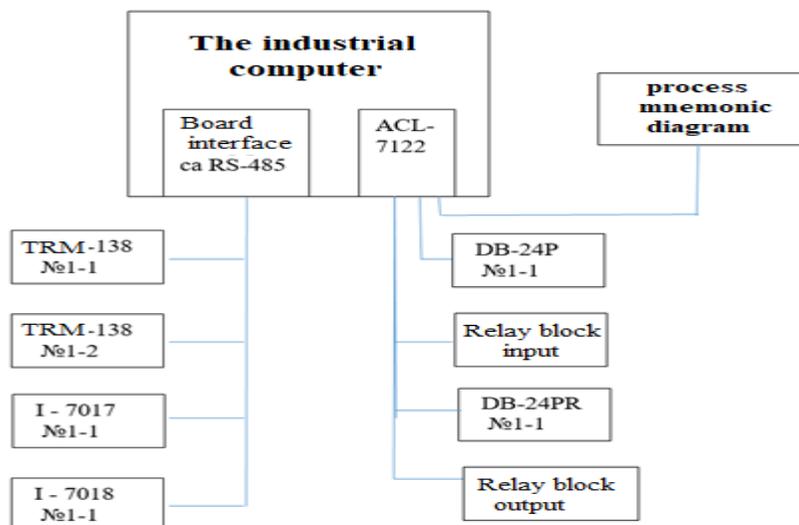

Fig. 1. Block diagram of the control system.

The offered system of automatic control system technological processes embraces all managerial process of a process.

In the industrial computer are installed pay ACL-7122 of interface RS-485 for transformation of analogue digital signals on the computer. Connection to a pay is carried out by a two-wire system. The reception extreme range makes no more than 1200 m.[4,5].

The computer pay ACL-7122 developed by firm ADLINK has 144 discrete channels of input-output. Portable pays of firm ISP DAS DB-24P are connected to it (24 channels a discrete entry), DB-24PR (24 channels a discrete exit) for definition of a condition of the equipment in system of a column and for management of a process.

Secondary microprocessor devices TRM-138 have 8 channels of measurement and 8 output equipment. In the given design these devices were used for the forestalling before an emergency condition and interlock of physical parametres. These devices are installed to panels operational and represent the measured values of technological parametres of temperature, pressure and rarefaction. Each channel of measurement is adjusted separately on the basis of real boundary, initial technological parametres.

The control algorithm is defined on the basis of a production schedules and experience of machinists of the crumber.

Given automatic control system technological processesis system of the centralised management with sections of the distributed management. Where the basic systems of the forestalling and interlock of technological parametres are organised on microprocessor devices TRM - 138. To them "tasks" are installed by the central control system.

In this control system the new technique of automatic steering of congestion of assemblies for the first time is used. After long researches of work of the apparatus, we offer a control system on the basis of change current main drive loadings on congestion. At filling of the assembly above installed on those to the order current loading increases, if congestion of the apparatus less installed current loading decreases. The automated system watches congestion of the apparatus on measurement of loading of a current of the main drive the Circuit design of connection of system it is possible to present in the following form:

Management is organised under law PID (Proportional-integral-differential) regulating in the programm alternative, installed on the industrial computer. In control algorithms parameters of each composed law are considered. Regulator appointment is in preset value maintenance  $x_0$  some magnitude  $x$  by means of change of other magnitude  $u$ . Value  $x_0$  is called as a preset value, and a difference  $e = (x_0 - x)$ , an error signal or a deviation of magnitude from a preset value. The regulator starting signalis presented by following expression [6]:

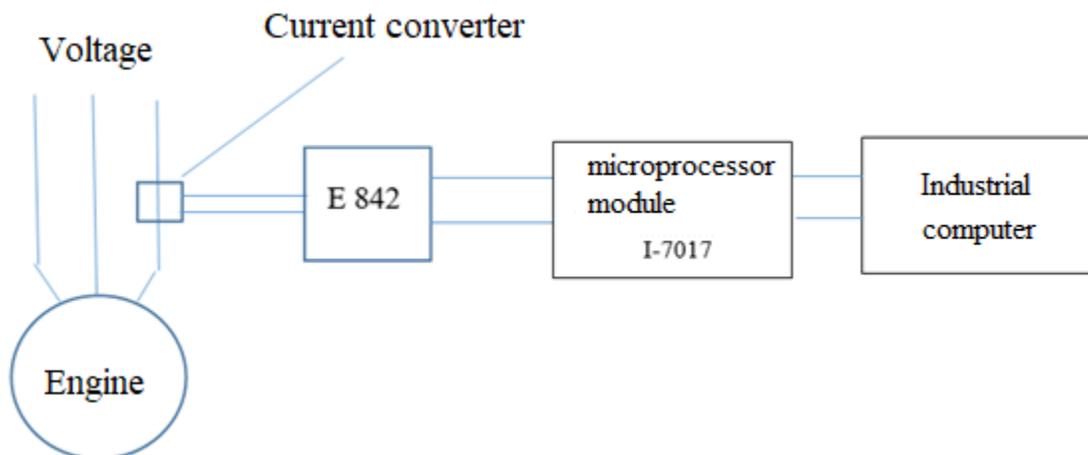

Fig. 2. Current converter.

$$u(t) = P + I + D = K_p e(t) + K_i \int_0^t e(\tau) d\tau + K_d \frac{de}{dt} \quad (1)$$

Where  $K_p$ ,  $K_i$ ,  $K_d$  - coefficients of amplification of proportional, integrated and differential components of a regulator, accordingly.

Working out of the design of automatic control system technological processes is carried out on standard instrumental package Trace Mode. This package includes many algebraic, logic, statistical and administrative functions. The designer at design construction in a control system in the core uses the function data. Functions as subroutines, in them are organised blocks with the entrance and target knots. In designs these knots contact the real measured values of technological parametres. Function of law PID of regulating is represented in a following aspect:

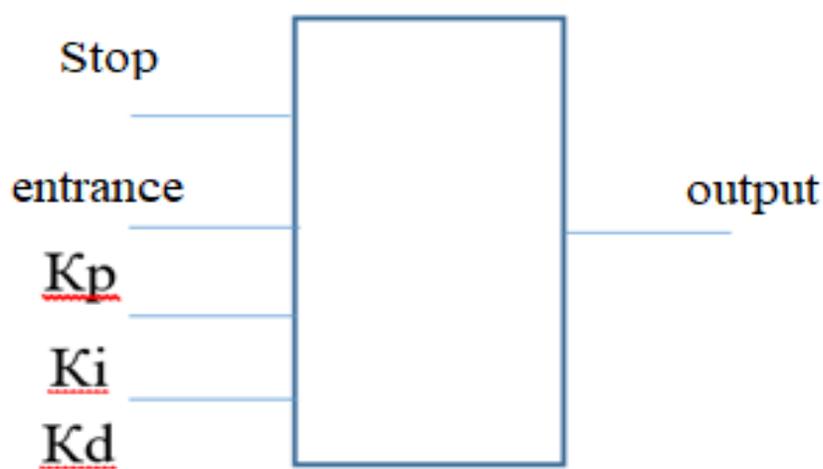

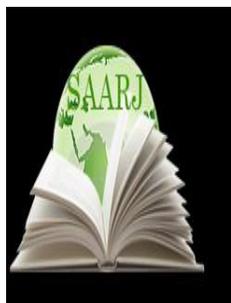

Fig. 3. Microcontroller block diagram.

Factors Kp, Ki, Kd were selected on the basis of experiments. On "entry" the measured value of a consumed current moves, the starting signal moves to the reciprocating plate feeder.

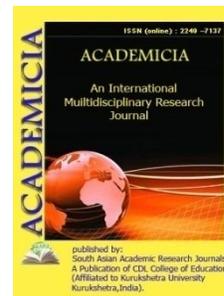

The presented system except management of crumbers leads to certain power savings in a production cycle as the system provides an optimum operating mode of crumbers.

### ABSTRACT

*The actual problem of controlling the concentration of hydrocarbons in the air is highlighted. Structural diagrams and timing diagrams are given that explain the principle of operation of an optoelectronic device for monitoring the concentration of hydrocarbons in the air. The principle of operation of an optoelectronic device for monitoring the concentration of hydrocarbons in air with an exponential sweep is stated. A technique for calculating the optimal LED current for optoelectronic gas analysis methods is presented. It has been established that the use of a pulsed mode with an intermittent exponential sweep period in optoelectronic devices for monitoring the concentration of hydrocarbons in the air makes it possible to increase the sensitivity of gas analysis.*

**KEYWORDS:** *Gas Analysis, Optoelectronics, LED, Pulse Mode, Exponential Sweep, Sensitivity, Photo Detector, Optical Path Length, Pulse Current Amplitude, Duty Cycle, Concentration, Hydrocarbon.*

### INTRODUCTION

An analysis of the operation of optoelectronic devices for monitoring the concentration of hydrocarbons in the air showed that the most promising are optoelectronic devices based on a two-wave control method.

The main advantages of an optoelectronic two-wave device in comparison with single-wave devices are high control accuracy due to the exclusion of non-informative parameters, such as air dustiness, humidity and the content of aerosol particles on the control result [3-6].

### Main part.

A block diagram of an optoelectronic device for monitoring the concentration of hydrocarbons in air with a continuous repetition period by exponential sweep is shown in Figure 1. where: DG - driving generator; T - trigger; FD - frequency dividers;

ME - modulator exponent; EF - emitter follower; PA - pulse amplifier; ED1 - reference emitting diode RD1; ED2 - measuring emitting diode; GC - gas camera; PD - photodetector; LNA - low noise amplifier; TD - threshold device; DD1 - first differentiate devices; DD2 - second differentiate devices; SC - schema coincidences; CU - counter; DC - decoder; IN - indicator.

Timing diagrams explaining the principle of operation of an optoelectronic device for monitoring the concentration of hydrocarbons in air with a continuous repetition period of an exponential sweep is shown in Figure 2 and Figure 3.

The optoelectronic device operates in the following way: The driving generator of the DG generates a sequence of rectangular pulses (Fig. 2.a).

Rectangular pulses from the output of the driving generator DG, acts on the counting input of the trigger T, as a result of which symmetrical rectangular pulses are formed at the output of the latter (Fig. 3.b).

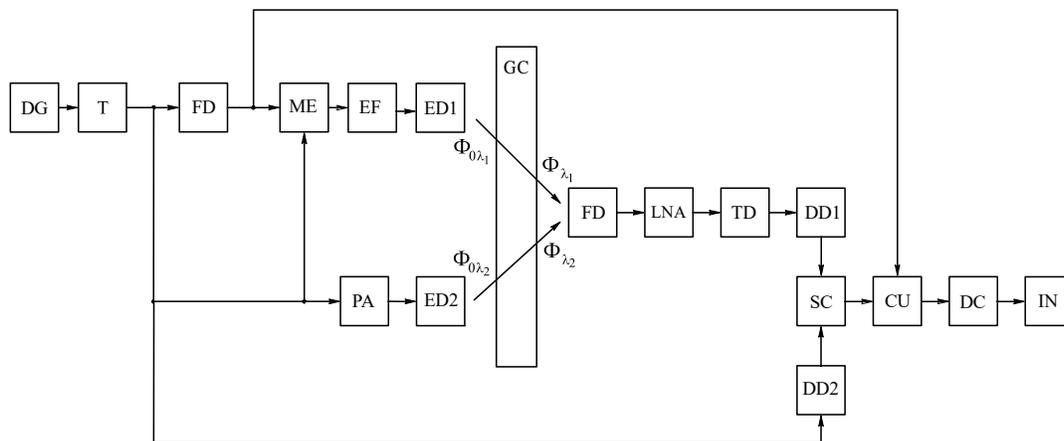

Fig.1. Block diagram of an optoelectronic device for monitoring the concentration of hydrocarbons in air with a continuous exponential sweep.

The generated pulses from the output of the trigger T, are fed to the input of the second differentiate devices DD2, to the input of the pulse amplifier of the PA, and to the control input of the modulator of the exponent of the ME, and through the frequency divider of the FD, to the triggering input of the modulator of the exponent of the ME (Fig. 1).

From the output of the modulator exponential ME, exponentially modulated rectangular pulses in the form shown in Fig.2.e, through the emitter follower are fed to the reference emitting diode ED1.

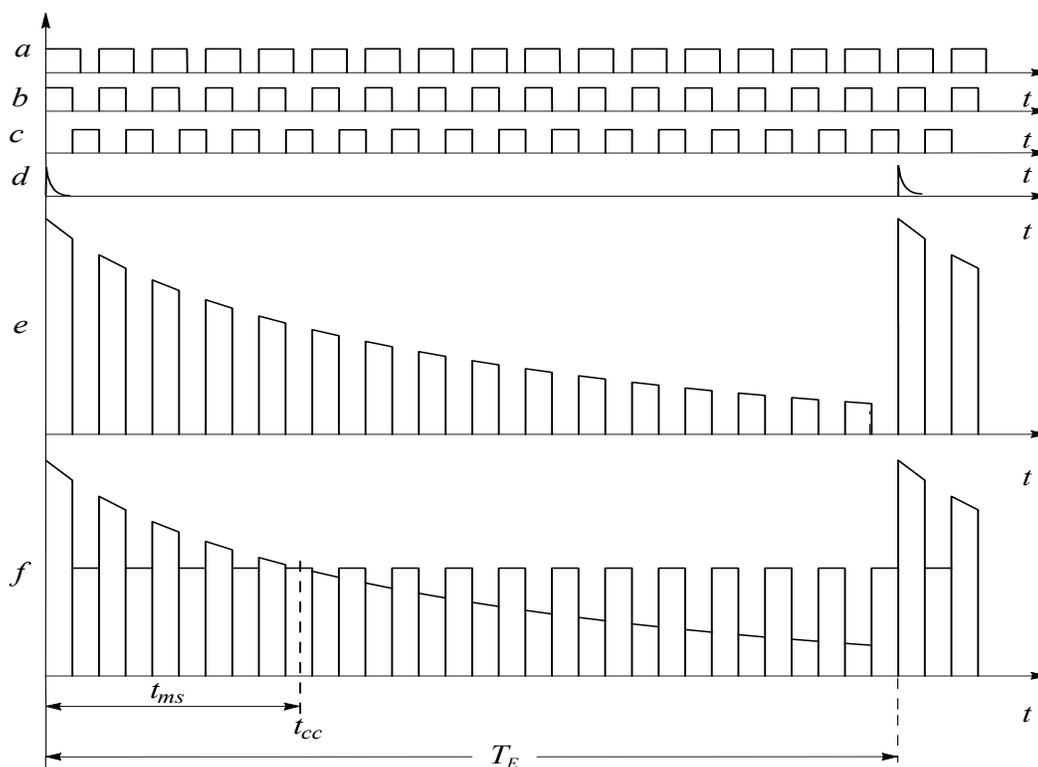

Figure 2. Timing diagrams explaining the principle of operation of an optoelectronic device for monitoring the concentration of hydrocarbons in air with a continuous exponential sweep period.

Antiphase exponential pulse, rectangular pulses from the output of the PA pulse amplifier are fed to the measuring emitting diode ED2 (Figure 2.c).

As a result, the reference emitting diode ED1 emits pulsed radiation fluxes at a wavelength  $\lambda_1 = 3.12 \mu\text{m}$ , the amplitude of which changes with time according to a decreasing exponential law (Fig. 2.e).

Measuring emitting diode ED2, emits pulsed radiation fluxes at a wavelength of  $\lambda_2 = 3.39 \mu\text{m}$ , in which the amplitude is constant over time.

Thus, the gas chamber of the GC is irradiated with two antiphase radiation fluxes (Figure.2.f).

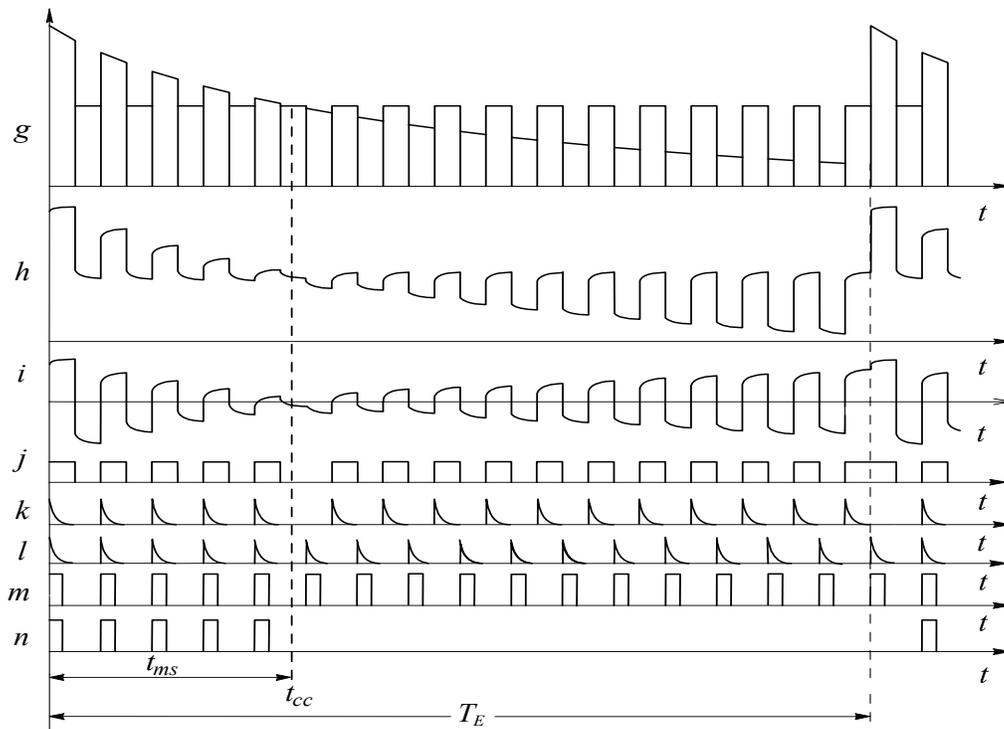

Figure 3. Continued timing diagrams explaining the principle of operation of an optoelectronic device for monitoring the concentration of hydrocarbons in air with a continuous exponential sweep repetition period.

In this case, the radiation fluxes passed through the gas chamber at reference and measuring wavelengths based on the optoelectronic two-wave method with functional sweep are described as:

$$\Phi_{\lambda_1} = A e^{-\frac{t}{\tau}} e^{-k_1 N_1 L} \quad (1)$$

$$\Phi_{\lambda_2} = \Phi_{0\lambda_2} e^{-k_1 N_1 L} e^{-k_2 N_2 L}$$

where:  $N_1$  - is the concentration of the gas mixture,  $N_2$  - is the concentration of the gas to be determined,  $L$  - is the optical path length in the gas mixture,  $K_1$  - is the scattering coefficient of the radiation flux at wavelengths  $\lambda_1$ ,  $K_2$  - is the absorption coefficient of the radiation flux at wavelengths  $\lambda_2$ ,  $\tau$  - is the time constant exhibitors.

Then the voltage at the output of the photodetector according to [1,6] is determined as:

$$U_{\lambda_1} = k_{PD} A e^{-\frac{t}{\tau}} e^{-k_1 N_1 L} \quad (2)$$

$$U_{\lambda_2} = k_{PD} \Phi_{0\lambda_2} e^{-k_1 N_1 L} e^{-k_2 N_2 L}$$

where:  $k_{PD}$  is the conversion factor of the photo detector.

The nature of the change in the voltage of the photoelectric signal at the output of the photo detector is shown in Fig.2. h. The photoelectric signal from the output of the photo detector is amplified by the low-noise AC amplifier LNA, (Figure3.i) and fed to the input of the threshold device TD.

The photoelectric signal converted into rectangular pulses (Fig. 3.j) is differentiated on the first differentiating device (Fig.3.k) and fed to one of the inputs of the CC coincidence circuit, and a short rectangular pulse from the output of the second differentiating device DU2 is fed to the other input of the latter (fig. 3.m). In this case, at the time of comparisons  $t_{cc}$  of stresses  $U_{\lambda_1} = U_{\lambda_2}$  we have;

$$A e^{-\frac{t_{cc}}{\tau}} e^{-k_1 N_1 L} = \Phi_{0\lambda_2} e^{-k_1 N_1 L} e^{-k_2 N_2 L} \quad (3)$$

or

$$A e^{-\frac{t_{cc}}{\tau}} = \Phi_{0\lambda_2} e^{-k_2 N_2 L} \quad (4)$$

If you choose  $A = \Phi_{0\lambda_2}$  we have:

$$N_2 = \frac{1}{\tau k_2 L} t_{cc} \quad (5)$$

or

$$N_2 = C t_{cc} \quad (6)$$

where:  $C = \frac{1}{\tau k_2 L}$  - constant.

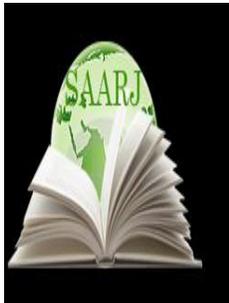

Therefore, according to expression (6), in the time interval from the beginning of the exponent to the moment of comparisons  $t_{ms}$  (Fig.3) on the exhalation of the SC coincidence scheme, a series of rectangular pulses is formed, the number of which is proportional to the concentration of hydrocarbons (Fig.3n). Formed at the output of the circuit, the SC coincidence, the pulse signals are read, by the counter CU and then through the decoder DC to the indicator IN.

The IN indicator readings correspond to the concentration of hydrocarbons in the air.

### ABSTRACT

*In this paper, transient photoelectric processes in a hyperfine gas-discharge cell were investigated. The issues of delay of the gas discharge breakdown in the pulsed mode of the cell operation and the electrostatic phenomena of the transient processes are considered. It is established that the breakdown delay time depends on the semiconductor illumination intensity, the duration and magnitude of the voltage pulse, and also the state of the surface charge, that is, the field strength of the surface charges.*

**KEYWORDS:** *Gas-Discharge Cell, Photo Detector, Breakdown Delay, Surface Charge, Watt Ampere Characteristic, Kinetics Of Pulse Current, Intensity Of Glow Discharge*

### INTRODUCTION

An ultrathin gas discharge cell (20–100  $\mu\text{m}$ ), consisting of a photosensitive semiconductor electrode and located through a gas discharge gap of a fiber-optic washer with a conductive transparent coating of  $\text{SnO}_2$ , is the main element of a semiconductor photographic ionization chamber (PFIC) [1-4]. The kinetics of the current in such a cell and the kinetics of the glow of the discharge have already been partially investigated in [5]. It was found that the statistical spread of the breakdown delay at a negligible resistance of the electrodes corresponds to a distribution function of exponential type, while the spread at a sufficiently large value of the resistance of the semiconductor electrode is described by a function close to the random error function [6].

Indeed, the semiconductor electrode is the highest resistance element of the electric circuit of an ultrathin gas discharge cell, and therefore it will determine the value of the passing stationary current of the PFIC, which is equal to the photocurrent in the semiconductor [7]. In the case of transients, for example, when an external voltage is connected or an “instantaneous” change in the conductivity of the semiconductor, the surface charge may be in complete discrepancy with the conductivity current, which causes electrostatic phenomena. A significant role in the current transmission is played by the surface electric charge, which is localized at the semiconductor – gas discharge interface, self-consistent in magnitude with the current density and largely determines the stationary current-voltage characteristic of the PFIC.

However, until now transient photoelectric processes in an ultrathin gas discharge cell have not been sufficiently studied. Data on the effect after breakdown of statistical spread and breakdown delay time, as well as the magnitude of the surface charge on the photoelectric characteristics of an ultrathin gas discharge cell, are not available in a wide scientific publication.

The aim of this work is to identify patterns of transient processes occurring in an ultra-thin PFIC gas discharge cell, taking into account the delay in the breakdown of a gas discharge and the distribution of the surface charge on a semiconductor photo detector.

This report presents the results of a study of a gas discharge cell with a thickness of 40  $\mu\text{m}$  and 100  $\mu\text{m}$  at an air pressure of 0.2 atm with electrodes of chromium-compensated gallium arsenide at room temperature with a dark specific resistance of  $\sim 10^8 \text{ Ohm} \cdot \text{cm}$  and silicon doped with platinum at  $T = 80 \text{ K}$  with a dark resistivity of  $\sim 10^9 \text{ Ohm} \cdot \text{cm}$  in conditions of very small through currents or their absence, when the effects of an electrostatic nature are most pronounced.

The experiment was performed at a residual pressure of gas (air) 0.2 bar. At the peak between the photo detector and the counter electrode was applied DC voltage 1200V Intensity mattered  $10^{-4} \text{ W} / \text{cm}^2$  in the wavelength  $\nu = 2,4 \text{ m}$ .

The experimental results seem to be explained as follows; field emission dark current form at equilibrium carriers. The concentration at low temperatures much lower temperature with the increase in their number and thus the current increases. However, the energy equilibrium electrons torn from the surface of semiconductor field emission is not sufficient for the formation of avalanches Townsend. The beginning of the concentration of non-equilibrium carriers, field emission always torn more only their intensity is not enough to Townsend avalanches. When the temperature equilibrium media play the role of supplying additional energy for breeding ions. And from that moment it begins with a jump Townsend discharge. It should be noted that this phenomenon occurs in uncooled form, i.e. at room, temperature was observed.

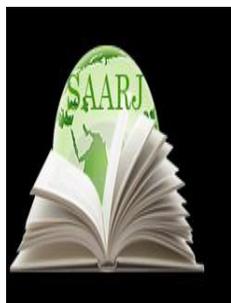

Note that the abrupt decrease of the dark current and an abrupt increase in the photocurrent - has a positive effect, influencing the increase in contrast, that is, the sensitivity of the semiconductor ionization chamber.

Thus, the presence of field emission has a positive effect on the stabilization of the gas discharge space. The flow of electrons ejected from the photocathode field, leads to an intense neutralization of space charge of positive ions in the discharge gap, and thus separates the terms of such distortions of the electric field distribution in the gap, which corresponds to the transition from Townsend to the glow discharge. The experimental data obtained in [4], with a small value

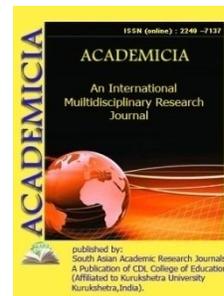

of discharge gaps is confirmed. Field emission when gas filling plays the role of the electron supplier for Townsend avalanches in the gas discharge. Note that the observed field-emission current is controlled by the photoresistor semiconductor, ie the radiation intensity.

**INTRODUCTION**

Metrological properties optoelectronic devices as can be reflected gauges by means of metrological characteristics (MCh.). The information on metrological properties of meters is necessary for the solution of a complex of the problems usually originating in metrological practice.

First of all, it is an estimation of a lapse of measurements, in optoelectronic the device for control of humidity of installations. This estimation frequently is necessary for spending before conducting of measurements.

Other important problem - comparison and sampling optoelectronic devices for concrete applications. At the solution of this problem also it is necessary to know metrological

characteristics optoelectronic devices which attribute to the given device and which must be determined experimentally.

The third problem is interfaced to use optoelectronic devices in composition is informational - measuring systems (IMS). It is a question, first of all, of calculation MCh of system on MCh components making it. On the other hand, at system engineering there is a problem of its "synthesis", i.e. structure sampling, proceeding from demands to MCh systems as a whole and demands to compound components.

To operate with data on metrological characteristics optoelectronic devices, it is necessary to regulate norms on metrological characteristics.

At rationing MCh optoelectronic devices it is necessary to observe a row of demands to which the following refers to:

- A lapse estimation in actual practice measurements taking into account all factors influencing a lapse of measurement;
- Comparison and sampling optoelectronic devices;
- Sampling of components IMS on the basis of demands to MCh systems;
- Calculation MCh of system according to MCh components;

Besides, it is necessary to provide possibility of definition MCh with almost implemented and most simple methods of an estimation of metrological properties both for concrete optoelectronic devices, and for set optoelectronic devices of the given type.

According to a technique of definition of metrological characteristics it is informational - measuring converters expediently separately to define the instrumental and methodical lapses. We define the lapses occurring at conducting of experiments. The total lapse of experimental installation will be

$$\sum \delta = \delta_{u\delta_{1-8}} + \delta_N + \delta_{\phi_{n_{1-8}}} + \delta_{y_{1-8}} + \delta_{ocy}; \quad (1)$$

$\delta_{u\delta}$  - a lapse caused by a deviation of radiated power during experiment;  $\delta_N$  - a lapse caused by inaccuracy of definition injected in the chamber of concentration of hydrocarbonic gases;  $\delta_{phd}$  - a lapse which is brought in by a photodetector;  $\delta_a$  - a lapse which is brought in by the amplifier;  $\delta_{lwo}$  - a lapse which is brought in by the oscilloscope.

The maximum lapse of a deviation of radiated power is defined as follows:

$$\begin{aligned} \delta_{u\delta} &= \frac{\Phi_{t_1} - \Phi_{t_2}}{\Phi_{\max}} 100\% = \frac{U_{u\delta t_1} - U_{u\delta t_2}}{U_{u\delta \max}} 100\%; \\ \delta_{u\delta} &= \frac{\Phi_{t_1} - \Phi_{t_2}}{\Phi_{\max}} 100\% = \frac{U_{u\delta t_1} - U_{u\delta t_2}}{U_{u\delta \max}} 100\%; \end{aligned} \quad (2)$$

where  $U_{u\delta t_1}$  - voltage on a photo detector exit in the experiment beginning;  $U_{u\delta t_2}$  - voltage on an exit of a photo detector in the end of experiment. To determine the error of the photo detector, the emitting diode is placed in a thermostat and the radiation intensity of the ID is

stabilized. The Photo detector is in usual conditions. Indication in the beginning and the experiment end is made. The lapse which is brought in by a photo detector, is defined by formula

$$\delta_{\phi n} = \frac{U_{\phi nt_1} - U_{\phi nt_2}}{U_{\phi n \max}} 100\%; \delta_{\phi n} = \frac{U_{\phi nt_1} - U_{\phi nt_2}}{U_{\phi n \max}} 100\%;$$

(3)

where,  $U_{\phi nt_1}, U_{\phi nt_2}$  – voltage on exit  $\Phi\Pi$  in the beginning and in the end of experiment;  $U_{\phi n \max}$  – the maximum voltage. The lapse which is brought in by the amplifier, for circuit designs of standard operational amplifiers makes 1,5 %. The lapse which is brought in by the oscilloscope, under characteristics sheet does not exceed 2 %. In this connection developed installation for gauging and definition of metrological characteristics optoelectronic sensing transducers of humidity several magnitudes samples of humidity of air which diagrammatic representation is resulted in drawing 1.

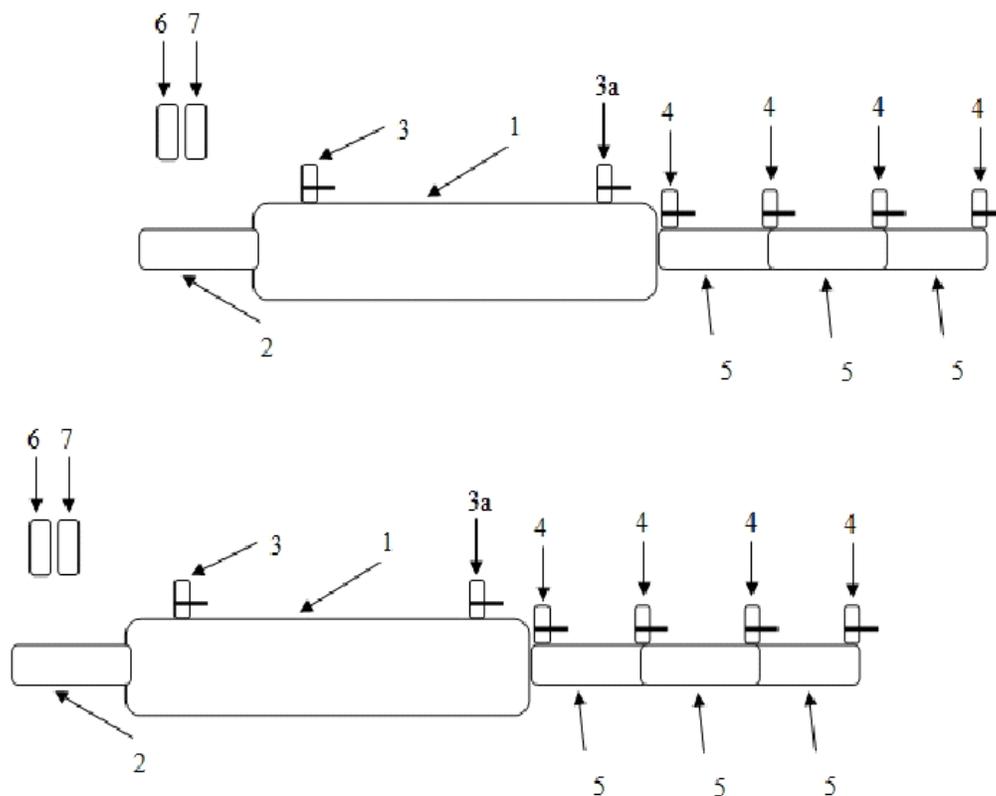

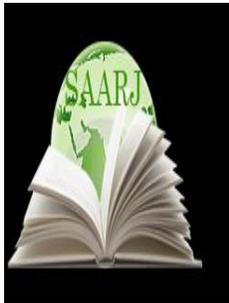

Fig. 1. Installation for generation of various magnitudes of a relative humidity of air. 1 - a tube, which volume it is counted for an upper limit of a relative humidity of air. 2 - a quartz tube (ditch); 3 - 3a - tubes and coincidence gates for a filling of system a moist air; 4 - краники for the connection, the following volume; 5 - the calibrated volumes filled with dry air; 6 - the temperature transmitter, 7 - the sensing transducer of humidity of air.

This installation are used as follows. By means of a tube with the coincidence gate 3 in system it is started *нагретый* water vapors, at the open coincidence gate 3a, the others of the coincidence gate are closed, behind that we close the coincidence gate 3a. Thus, in the first compartment and in a ditch from a quartz tube connected to it is had 100 % relative humidity of air. We spend measurement and it is written down the first point of a standard curve by means of 6 and 7. We open the coincidence gate 4 following compartments filled with air. To occur formation new concentration of humidity. We spend measurement and it is written down the second point of a standard curve. We open the coincidence gate 4 following compartments filled with air. To occur formation of the following concentration of humidity. We spend measurement and it is written down the following point of a standard curve. Thus, we write down all possible points of a standard curve. For raise of accuracy of formation of reference quantities of concentration, it is possible applies preliminary gauging of reference volumes by means of water and калибровочных screws. The given installation allows to gain repeatedly reference quantities of humidity of air with sufficient accuracy and reproducibility and should be maintained in the open or fanned premises for definition of metrological characteristics of devices. It is intended for joint maintenance by laboratory-scale plants allowing measurement and humidity control in the restricted spaces.

## FERDOWSI AND UZBEK LITERATURE: HOUSEHOLD AND SOCIAL ISSUES

**Islam Jurayev\***

\*Teacher,  
 Department of Foreign Languages by Natural Directions,  
 FarSU, UZBEKISTAN

### ABSTRACT

*The article discusses the influence of the great Persian-Tajik poet Ferdowsi on Uzbek literature. Emphasis is placed on the harmony of the family environment with society. In particular, the family environment and relations, the processes that take place in it, are artistically studied by word artists, philosophical and aesthetic conclusions are drawn. The relationship between the individual and society is harmonized through the depiction of events in everyday life. In the time of Parviz, there was a slave to lust named Firuz Hurmuz, who was commander-in-chief, expressed his love for Ozarmidokht with obscenity. Ozarmidokht used a trick and invited him to come at night.*

**KEYWORDS:** *Tradition, Originality, Nationality, Universality, Historical Figure, Artistic Image, Universal Ideas.*

### INTRODUCTION

Every nation is formed in the process of long historical development. Its formation takes place in its own natural socio-economic conditions. The formation of a person representing society is influenced not only by the economic activities, life, socio-cultural environment of the nation to which he belongs, but also by the whole complex of social relations. And the spiritual image of a person is determined by these social relations. The degree to which a work of art can accurately express the spirit, aspirations, national mentality of a particular people is determined by the artist's spiritual closeness to that nation.

Literature is a mirror of public life as well as anthropology. Every event that takes place in social life is reflected in the fiction in a positive or negative way. In particular, the family environment and relations, the processes that take place in it, are artistically studied by word artists,

philosophical and aesthetic conclusions are drawn. The relationship between the individual and society is harmonized through the depiction of events in everyday life. In many sources, the social crisis finds its artistic expression in harmony with the processes of family and domestic decline, the degradation of the individual. Thus, certain spiritual and enlightenment ideas are promoted by learning from history.

Abul-Qasem Ferdowsi's "Shahnameh", which combines such features and qualities, is one of the rare examples of world literature. This work, which is a heroic epic, consists of dozens of independent epics. Along with heroic epics, which are the leading genre, it contains romantic plates, moral-educational places, exhortations, lyrical poems and others. Each of the epics has an independent plot and composition. Nevertheless, "Shahnameh" is a work with a whole plot, a complex composition.

The image of the struggle between the good forces and the symbols of evil in the "Shahnameh", the ideas of humanity, patriotism and heroism unite in a single plot and a single composition in the life and struggle of such heroes as Rustam. Abul-Qasem Ferdowsi in his work "Shahnameh" gave information about dozens of historical figures, rulers in the style of historiography of his time and processed them in a literary and artistic way. Many of these historical figures have acquired a legendary appearance due to some of their characteristics, their place in socio-political reality, their services to humanity. Such myths and legends are still known and popular among the people.

The word artists belonging to the peoples of the East who lived after Ferdowsi have widely used the example of such historical and legendary figures in the expression of their lyrical experiences, attitude to reality, ideological and philosophical views. Every historical figure or literary hero in the "Shahnameh", while leaving a deep mark on the life of society, is remembered by the reader for his personal life, specific behavior in everyday life, positive or negative qualities, shortcomings.

Historical legends and myths speak of Suleiman, who subdued the giants with a magic ring, and Jamshid, the owner of the drum, who reflected the world like a mirror. Alisher Navoi, who effectively used such ideas and concepts among the people, emphasizes the transience of life, ephemeral world through their destiny:

*Тутай жаҳонда Сулаймон сени ва ё Жамшид,  
Не мунга жом вафо айлади, не анга узук.*[3. 231]

Life passes like the wind.

That is why Navoi in his short life made an artistic and philosophical judgment on the accumulation of wealth and indulgence in the following verses:

*Скандар кўзгусию жоми Жам ичра кўр, эй шаҳким,  
Сени гўр оғзига тортар каманди сайд Баҳроми.*[3. 630]

Abul-Qasem Ferdowsi explained the meaning of what do not do to others what you do not like to yourself:

*Марон чиз, к-онат наояд писанд,  
Мақун ҳеч касро бадон дардманд.*

*(Content: Don't bother others with what you don't like)*

Apparently, the great Ferdowsi also focused his conclusions on the life of historical figures and the events of the past on the expression of his spiritual and moral ideas. As a result, history lessons have become a unique aesthetic and educational tool that encourages the next generation to awareness. The thinker and poet AlisherNavoi expressed the same meaning in one of his poems:

***Эрурчуноламичражоҳфоний, яшии от боқий,  
Бас, эл коминравойлаўзунгникомронқўргач. [ 2.230]***

That is, the poet says that in this world the position, rank is temporary, and a good name is eternal. So, if you think you are capable of great things, lighten the burden of the people, help them reach their goal.

Unfortunately, there are children in life who do not follow these rules. Navoi points out that the root of some children's disabilities lies in a family and social environment that is not based on improper upbringing, cleanliness and integrity. Indeed, children who grow up in an environment with such deficiencies develop negative traits such as selfishness, greed for possessions and careers, superiority over others, and indifference to self-interest. As a result, such children will not refrain from harming not only others, but even their own parents. Navoi also provided arguments for this.

For example, for such a bad behavior, Sheruya even reached the level of killing his father Khisrav, Abdullatif his father MirzoUlugbek. Although Navoi, in his epic Farhod and Shirin, contrasts Khisrav with Farhod and strongly condemns his misconduct, he did not approve of his being killed by his own son Sheruya. For this reason, Navoi paid great attention to spiritual education based on historical realities.

In AlisherNavoi's "TariximulukiAjam" the information about Khisrav and Sheruya was expressed as follows:

“ Khisrav had a lover like Shirin.No one in the world could match her beauty, and I found two words from historians.She was lucky, she was better than all the other girls. One of them was Shirin, the only one in the world, and the other was Farhod, the wonderful lover of the world. King Khisraw, who was united around love and need, also showed mercy to Farhod.Upon learning of his condition, Khisrav, out of jealousy, plotted to kill Farhod...” [3. 235]

These events are reflected in detail in the epic "Farhod and Shirin" in "Khamsa", created before the “TariximulukiAjam” (“History of Iranian kings”). The poet interprets Khisrav's death at the hands of his son Sheruya as revenge for Farhod's blood:

***...Ўғул қатл этгали оҳанг қилди,  
Ато қонига тигин ранг қилди.  
Ўғул қилмади онинг қасди жони  
Ки, даврон истади Фарҳод қони.  
Агар Фарҳодга зулм этти Хисрав,  
Иваз бот айлади чархи сабукрав.[2.320]***

In the epic Farhod and Shirin, AlisherNavoi gave free rein to his imagination to show that Sheruya was not only a parricide, but also a spiritual inferiority, selfish person, and quoted the following verses as part of the "confession of the heart" uttered by Sheruya to Shirin:

*...Манга андоқки ул ўт солди партав,  
Не Фарҳод ул сифат куйди, не Хисрав.  
Далил истар эсанг, даъво сурубмен,  
Ки ишқингда атомни ўлтурубмен... [1.321]*

In the work "TariximulukiAjam" there are also scenes reminiscent of the events of Khisrav-Sheruya-Shirin about parent-child relationship, love conflicts, the actions of lustful slaves. These historical events, although different in content, could be an example of Navoi's closeness to historical events in his epics. Speaking about Ozarmidokht, one of the last female rulers of Iran, the author emphasizes that she was unmatched in beauty, resolute and enterprising. This beautiful girl runs the country without ministers, with her own programs and events.

In the time of Parviz, there was a slave to lust named Firuz Hurmuz, who was commander-in-chief, expressed his love for Ozarmidokht with obscenity. Ozarmidokht used a trick and invited him to come at night. When he arrived, they grabbed him, cut off his head, and hung his head on the door of the castle. His son Rustam, who was in Khurasan at that time, came with an army and fought with Ozarmidokht. As a result, he captured Ozarmidokht, "...both accomplished his father's goal and took revenge." [3.235]

As mentioned above, the events described in historical works end with poetry. The poem at the end of the stories summarizes the details of the events. It is clear from the poem that Khisrav was the owner of immense property and was distinguished from other kings by his immense wealth and powerful potential. But Alisher Navoi also drew attention to other aspects of Khisrav.

He had a lover like Shirin. But the heaven has also created an alternative person like Farhod who stands higher than him in terms of love and affection.

Khisrav, as the poet said, using his superiority in power and might, killed Farhod. But the unfaithful world behaves differently in his death as well. He was executed by his own son Sheruya.

Even in the events dedicated to Sheruya, the author did not stray far from the historical truth. Sheruya also died soon after. Here, Navoi developed and confirmed the phrase "Parricide cannot be a king, even if it does not exceed six months," which was predicted in the Ferdowsi's "Shahnameh" and in Nizami Ganjavi's "Panjganj."

*Ҳанузайламайтахтузрамақом,  
Юрудифалактахтасорихиром*

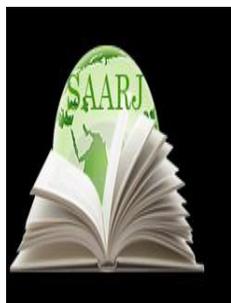

we can see this clearly in his verses. The events of Ulugbek and Abdullatif had not been forgotten yet, it was natural that AlisherNavoi tried to influence them through his works at a time when the crown disputes between fathers and sons in the palace of Hussein Baykara were being carried out, sometimes secretly and sometimes openly. Therefore, in the part of the "Tariximuluki Ajam" devoted to the history of ShapurbinniShapur, Shirvin, who was sent to

Rome by Shapur to rule Rome on behalf of his youngest son at the request of the Roman emperor, said that when the heir to the throne reaches puberty, he would hand over the throne to him, “ if that is indeed the case, it is to be admired ” inadvertently wrote author.

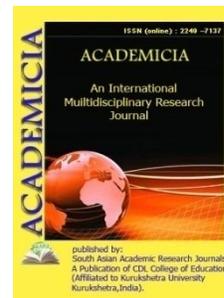

The author of the "Shahnameh" set himself the task not to cover the private lives of kings, but to show their attitude to society, the people and the country. This positive fact shows the tendency to try to understand the history of Ferdowsi objectively. So, rather than the author giving new material about the kings of Iran in the “ Shahnameh”, it is more important how he covered their social activities and what issues he interpreted from their point of view. Ferdowsi's "Shahnameh" is not only a description of battles, but also covers the fate of the individual, life issues, problems of the history of society, and in later periods it was able to give a powerful impetus to the consistent traditions in Eastern literature.

### ABSTRACT

*This article highlights the role and powers of the Institution of elders in the management of makhallas in Uzbekistan. The makhalla is governed by a leader who is used in the sense of an elder or chairman. The elder is granted administrative, legal, social, economic and cultural powers in the manner prescribed by law. His activities have become an important part of the self-government system in Uzbekistan.*

**KEYWORDS:** *Makhalla, Elder, Chairman, Social, Economic, "Prosperous Makhalla" ("Obod Makhalla"), "Prosperous Village" ("Obod Kishlok"), Peace, Civil Society, Social Protection, Citizen, Values, Traditions.*

### INTRODUCTION

From time immemorial, the makhalla institution has made a significant contribution to the preservation of interethnic friendship and solidarity, the education of national and universal values among young people - good-neighborliness and mutual respect, compassion, care for the needy and patriotism, a peaceful life in Uzbekistan[1]. Its role and importance in preserving the national values, way of life and thinking of our people, passed down from generation to generation, are invaluable[2]. Makhalla is a unique institution of civil society in Uzbekistan. According to media reports, today in Uzbekistan, about 10 thousand gatherings of citizens successfully solve more than 30 socio-economic problems that were previously in the competence of local authorities[3].

In Uzbekistan, the role of the institution of elders in the management of makhallas is great. Because the elder has been in the management of the makhalla for centuries. The concept of

elders is used in relation to an elderly, enlightened, educated person among the peoples of Central Asia and the Caucasus, who has won special respect in the region in which he lives. The opinions, advice and recommendations of the elder were taken into account in local government. The elder is an institution of historical statehood in Uzbekistan, as well as in other countries of Central Asia. The role of elders is increasing in all changes taking place in the makhalla system. The elder was part of the national public administration. Reforms in each locality were carried out in accordance with the advice of the elders of that locality. That is why today the elders are actively involved in the process of ongoing social, economic and cultural reforms.

The powers of the elder are determined by the Law of the Republic of Uzbekistan dated April 22, 2013 "On self-government bodies of citizens". According to article 14 of this law, the chairman of the gathering of citizens - the elder has several powers: convenes a gathering of citizens (a meeting of citizens' representatives); submits to a gathering of citizens for approval the candidacy of the executive secretary, chairmen and members of the commissions for the main areas of activity and the audit commission of the gathering of citizens, to the kengash of the gathering of citizens - the candidacy of an employee for maintaining military records; organizes work on the implementation by the gathering of citizens and its bodies of their powers, as well as the execution of decisions; represents the interests of the gathering of citizens in state bodies, including the court, in relations with legal entities and individuals, concludes contracts on behalf of the gathering of citizens, including labor contracts; disposes of the means of gathering of citizens in accordance with the legislation; organizes the work of advisory centers in the relevant territory; takes measures to preserve ownerless property, property transferred to the self-government of citizens by inheritance, as well as property of lonely persons temporarily absent due to being in medical institutions, property of orphans, children left without parental care, who are in specialized educational - in educational institutions or under the guardianship and guardianship, transferred to a family for foster care; submits to the court an application for recognizing a citizen as having limited legal capacity due to abuse of alcoholic beverages, narcotic drugs and psychotropic substances, or recognizing a citizen as incompetent due to mental disorder (mental illness or dementia); submits proposals to the relevant state bodies on improving the material and living conditions of low-income families, orphans, children left without parental care, as well as citizens affected by natural disasters and man-made emergencies; makes proposals to local government bodies on the creation of new and reconstruction of existing burial places; organizes public work to protect the rights of minors, provides the guardianship and guardianship authorities with information about orphans, children left without parental care, and also promotes the placement of such children in the relevant state institutions; together with the assistants of preventive inspectors for the protection of public order of the internal affairs bodies, exercises control over the activities of members of the public formation "Mahalla Posboni"; organizes in the relevant territory the holding of mass events related to holidays and significant dates; organizes work to suppress the activities of unregistered religious organizations, cases of forced inculcation of religious views, resolves other issues related to compliance with the legislation on freedom of conscience and religious organizations; coordinates the activities of the executive secretary, an employee for keeping military records; receives citizens, considers their applications, proposals and complaints; ensures the issuance to citizens of certificates and documents on their family and property status, other documents provided for by law; in accordance with the procedure established by law, submits to the relevant state bodies and other enterprises, institutions and organizations submissions on bringing

officials to responsibility for non-execution or improper execution by them of decisions of citizens' self-government bodies and their officials, adopted within their competence; ensures the issuance to citizens of certificates and documents on their family and property status, other documents provided for by law; in accordance with the procedure established by law, submits to the relevant state bodies and other enterprises, institutions and organizations submissions on bringing officials to responsibility for non-execution or improper execution by them of decisions of citizens' self-government bodies and their officials, adopted within their competence; requests and receives from the relevant state bodies information on protected natural areas, objects of material cultural heritage.

The chairman (aksakal) of a gathering of citizens may exercise other powers in accordance with the legislation.

The chairman (aksakal) of the gathering of citizens has a certificate of the established form. A sample certificate of the chairman (aksakal) of a gathering of citizens is established by the Cabinet of Ministers of the Republic of Uzbekistan[4].

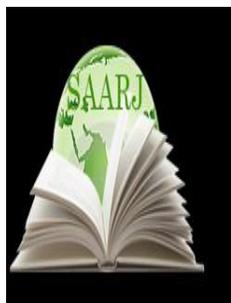

The elders also contribute to any changes in the makhalla system of Uzbekistan. In recent years, the state has adopted many social assistance measures through makhallas. In 2017, 24,536 citizens were allocated financial and material assistance in the amount of 7,424.9 million soums to support and rehabilitate the low-income, socially vulnerable, orphans, families with minor children, lonely elderly people, people with disabilities and victims of natural disasters[5]. In 2018, the Obod Kishlok and Obod Makhalla ("Prosperous village" and "Prosperous makhalla") programs were launched[6]. In 2018, funds worth 3 trillion soums were allocated for construction and improvement under both programs. As a result, 416 villages received a new look[7]. In 2018, within the framework of the Obod Kishlok and Obod Makhalla programs, construction and improvement works were carried out in 416 villages in 159 districts. 142 thousand individual and more than 1000 apartment buildings, 3 thousand kilometers of roads, 2.5 thousand kilometers of power lines, 2 thousand kilometers of water supply networks, 2,400 markets and other infrastructure facilities have been built and repaired in these villages. In addition, construction and repair work was completed in 388 secondary schools, 313 preschool educational institutions, 168 medical institutions, 38 makhallas and 55 other social facilities. In 2019, within the framework of the Obod kishlok and Obod makhalla programs, large-scale construction and improvement works were carried out in 479 villages and auls, 116 urban makhallas[8]. For these purposes were spent 6.1 trillion soums, which is 1.5 trillion soums more than in 2018. In 2018, the appearance of the village "Manas" of the Dustlik district of the Jizzakh region, the center of the Mirzachul district, the village "Karakalpakstan" of the Kungrad district, the village "Chuya", located 110 km from the Navoi city and 38 km from the center of Nurata district, the village "Utemurat", located about 400 km from the Navoi city and 140 km from the center of the Tomdi district, the village "Kulkuduk" of the Uchkuduk district, located 355 km from the center of the Navoi region, the village "Jom" of Nurabad district of the Samarkand region, the "Mustakillik" makhalla of Andijan city, the "Ashgabat" makhalla of Urgench city, the "Bunyodkor" makhalla of the Kagan city[9].

In general, the institution of elders performs an important function in the makhalla. This is a unique means of self-government and spiritual and educational propaganda. Through the elders in the makhalla, not only spiritual and educational work is carried out, but also unique cultural

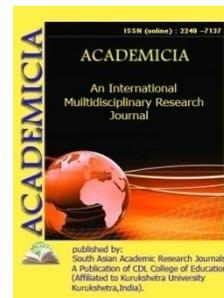

values, spiritual qualities, customs and traditions of our people are passed on from generation to generation. Today, large-scale changes are being made to preserve and further develop values in the makhalla. The state is building up the material and technical capabilities of local self-government bodies. The most important thing is that the makhalla performs an important function related to targeted social protection of low-income families to improve the well-being of the population, the development of household plots and the improvement of the self-employment system, obtaining preferential loans from banks for citizens who want to open their own business. The role of the makhalla and the elders leading it in solving the problems of citizens through the study of appeals from the population is significantly increasing.

### ABSTRACT

*High quality and not expensive infrared drying of agricultural products will increase the circulation of food products to a new level of development and turnover of funds. Reducing the drying cycle of products will allow you to quickly send products to the consumer. The quality of infrared products can be attributed to high-tech product processing processes. By introducing this drying process, it is possible to preserve the composition of the products, increase the caloric value and the healing power of food products.*

**KEYWORDS:** *Infrared Drying, Contact, Moisture, Dryer, Storage Technology, Penetration Depth, Convective Method, Is Actively Absorbed By Water, Micro Flora, Vitamins, Biologically Active Substances*

### 1. INTRODUCTION

The infra-red drying in an aerosphere of deep vacuum of the most actual, perspective at present, an industrial processing method of vegetables and fruit with caloric radiation application. Creation of the equipment of machining of agricultural products the thin and specific process consisting of assemblage of cycles.

It is for this purpose necessary: drying, as well as evaporation is a process of removal of a moisture of a material with thermal energy use. However thanks to presence of a firm phase transition of a moisture from a material in a circumambient is made at superficial transpiration of a moisture and its diffusion from inside layers to a material surface. Thus, drying is diffuzionno-desorbtsionnym process. Because of presence at the chamber of a firm phase in which there is a denudation of molecules of dissolvent and their diffusion, designs of the drying apparatus

considerably differ from designs) kettles. Existing methods of drying can be divided on two groups. To the first group refer to drying by contact of a wet material with the warmed-up air or top internal gases. Thus the moisture from a material is carried away by air which leaves a dryer more moisture-laden than at an entry in a dryer.

The basic features, advantages and possible scopes of application of vacuum drying are illustrated and proved by following factors:

High level of preservation in the exsiccated installations органолептических параметров - forms, sizes, taste, colour, odour. (New consumer properties and new solutions in production engineering of storage and implementation of perishable foodstuff).

### TECHNICS OF THE INFRA-RED DRYING

High level of preservation of thermo labile components - vitamins, enzymes, amino acids, live microorganisms. (Manufacture of products of baby food and functional purpose products, pharmaceutical industry, applied biotechnology, conservation of a genofund of seeds of plants, manufacture of high-grade forages for aquarian fishes and pets, and birds).

High porosity and hygroscopicity. (Manufacture of effective catalysts, sorbents).

Sweeping dehydration of the "piece" installations, full solubility мелкодисперсных and powdered materials. (Convenience of application of foodstuff, drinks and medical products.)

Small relative density. (Abbreviation of expenses for transport, effective utilisation possibility in situations when the weight and volume play an important role - space, underwater fleet, tourism).

Low final humidity of the exsiccated materials. (Possibility of long storage in leak proof packing in the conditions of noncontrollable temperatures).

Possibility to provide in the exsiccated materials the same distribution of components, as well as in difficult on composition initial solutions. (Krio special purpose chemical engineering's).

Possibility of creation of new consumer properties in a course регидратации the exsiccated products. (Restoration of mincemeat by milk, fruit - liquor).

New production engineering of traditional foodstuff. (Sublimirovannoe ice cream for those to whom in a cold aspect its use is counter-indicative).

New production engineering of original directivity. (Conservation for many long years bunches of flowers, for example, from weddings; drying of the moistened valuable ancient books; таксидермия).

**2. An experimental part.** Starting with above the told reasons, from technical advantages of use of the infra-red сушильной chambers it is possible to note its low power consumption, tightness in conditions of completely closed system, absence of environmental contamination and possibility to control drying process.

In offered сушильной to the chamber the method of drying by means of caloric radiation is applied. Caloric radiation of solids is caused by excitation of molecules and atoms of a body owing to their thermal traffic. In the capacity of an emitter the metal pipes which have been had in the chamber in regular intervals on certain distance from the irradiated product are chosen. The surface of pipes is covered by a ceramic covering in this connection нагревая the ceramic

surface radiates the infra-red beams of certain length and intensity. At caloric radiation sorption by an irradiated body in it thermal traffic of atoms and molecules that calls its heating increases. Transfer of energy occurs from a body to high potential of carrying over of heat to a body with smaller potential. For foodstuff the depth of penetration of the infra-red beams reaches 6-12 mm. On this depth the small part of energy of radiation, but temperature of the layer lying on distance of 6-7 mm from a surface of a material penetrates, grows much more intensively, than at heating by the convective way.

The infra-red drying of foodstuff as a process, it is based that caloric radiation defined waves actively are long is absorbed by the water containing in a product, but moisture removal was possibly is not absorbed by a cloth of an exsiccated product, therefore at low temperature (40-60 Celsius degrees) that allows to keep almost completely vitamins, biologically the active materials, natural colour, taste and aroma of products exposed to drying. The equipment for drying of vegetables and fruit, meat and fish, grain, groats and other food and not food materials based on caloric radiation use is the most perspective now.

Drying of products offered on the given production engineering allows to keep the maintenance of vitamins and others biologically active materials in a dry product at level of 80-90 % from initial raw materials. At short retting (10-20 minutes) the product which has passed drying rebuilds all natural органолептические, physical and chemical properties and can be used in a fresh aspect or be exposed to any kinds of culinary machining. Drying of products (drying of vegetables and fruit.) In such a way gives the chance manufactures vegetable and fruit powders. In comparison with traditional drying, the vegetables processed by the infra-red drying after restoration possess the flavouring qualities as much as possible approached to the fresh. Besides, the powders which have passed the infra-red drying, possess anti-inflammatory, детоксирующими and антиоксидантными properties. The infra-red drying gives the products which are not containing preservatives and other foreign matters, these products is not exposed to affecting of harmful electromagnetic fields and radiations. Caloric radiation is harmless to a circumambient and the person, as well as the equipment using it for drying of fruit, the equipment for drying of vegetables, etc.

## THE CONCLUSION

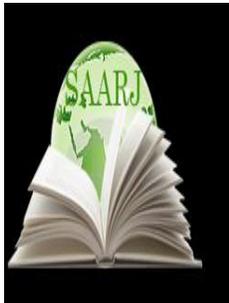

The product which has passed drying is not critical to storage conditions and racks to microflora development. About one year products can chilly be stored without special container, thus losses of vitamins make 5-15 %. The product can chilly be stored In the hermetically sealed container till two years. Drying of products gives their decrease in volume in 3-4 times, and in weight in 4-8 times in comparison with initial raw materials. Rebuilt by retting in water the product can chilly be exposed to any traditional culinary machining: to cook, жарке, to suppression, etc., and also it can be used in food in a crude or dry aspect.

### INTRODUCTION

From the formation of philosophical thinking in man to the present day, various opinions have been put forward about the laws of nature and society, the achievements of science, the essence of the content of events and processes, their specific features. This in turn is a process in which the human mind is in a state of constant development and depends on the levels of its worldview. By understanding and reacting to the real state of events and phenomena in nature, the importance of the laws of society in determining social and spiritual stability can be determined by man himself and directed towards stability and, conversely, can destabilize the existing state of stability. Because man always strives to know and understand the truth, fighting between truth and error, truth and falsehood, right and wrong. In order to understand the truth, to know the real state of a particular event and phenomenon, a person must have formed certain knowledge. Knowledge is recognized as a belief that corresponds to and is based on truth, and truth is

recognized as a philosophical concept that represents the correct, true reflection of reality in the human mind.

Another important point to keep in mind here is that no knowledge can be truth, but every truth arises as a product of certain knowledge and experience. For example, the myths of antiquity are truth, the rules of the holy books for religion are truth, the truth in philosophy is something that corresponds to objective reality, and the knowledge, which accurately reflects the real content, quality and characteristics of events and tested in practice, the truth for science tested, reliable, logically coherent knowledge is understood. Every scientist perceives truth as the highest value of science and accepts the search for truth as one of the main tasks of scientific activity.

### **The main part.**

From antiquity to the present day, truth has been one of the most interesting and fundamental problems of philosophy, and the views of thinkers on this subject have caused controversy, and new doctrines, views, and theories have emerged at the heart of these debates. Because the focus on the issue of truth and its importance in human life, society, the development of science has never been lost.

Stabilization of human life is, of course, achieved through a correct understanding and comprehension of the truth. "The truth is sometimes hard to find, and when it's found, it's easy to lose it," he said. If it is difficult to find, if it is found, if it is easily lost, will the human heart find peace and satisfaction in such a truth? " said K. Popper. This raises a natural question. So how is the truth achieved? Different views and attitudes have been expressed on this question in a given period. acknowledging the place of philosophy in knowing the essence of truth, according to many thinkers and philosophers, philosophy is to know the truth, not any truth, but the source of all truths, the truth that belongs to the first foundation of all things, such truth is the basis of any truth , asserts that the order of things in existence is as it really is. For example, the ancient Greek philosophers Socrates and Plato were able to reach the truth by exposing the contradictions in human thought through debate. "Man," writes Farabi, "can attain truth or philosophy only through dialectical debate." The idea that "truth is born of controversy" has been recognized as an important wisdom since ancient times and is often followed. The fact that the goal of knowledge is to determine the truth, the need to create the means to achieve it in different cognitive situations, suggests that scientific debate is a pressing problem for all periods. If we strive for the truth, we must resolutely expose our mistakes and misguidance through rational criticism and self-criticism.

Philosophy uses knowledge (scientific and non-scientific) to get to the bottom of truths that are important to all people. That is, philosophy studies the world in relation to man, defines the system of principles, approaches, values and ideals that guide human activity, his attitude to the world and to himself. Truth, on the other hand, does not limit or narrow the above-mentioned powers and abilities of man, but relies on the principles and values that expand and develop them. Therefore, a person with a philosophical mind will have the courage to look straight at life and knowledge about the place and role of man in the world, and the ability to understand and comprehend the realities of life.

At different periods in the history of philosophy, attitudes and approaches to truth have varied, and if someone has linked truth to materialism, some doctrines have argued that it should be viewed with suspicion, that the absence of absolute truth is relative to all truths. The diversity of

---

opinions, based on the existence of different approaches, is divided into the following forms of knowledge of truth in philosophical sources.

Objective truth is such a content of our knowledge that it does not depend on one person or on all of humanity. That is, the essence of things and events in the universe exists independently of human consciousness and desires. Man's perceptions form a reflection of the objective world beyond his consciousness. By acknowledging the existence of the objective world, the formation of its correct perception consists of objective reality. For example, the laws of nature and society are objective truths. Because these laws do not depend on man, they exist outside of him, man cannot repeal these laws, he cannot change them at will. The notion of objective reality cannot be equated with the notion of objective reality. Because objective reality is a correct reflection in our minds of the objective reality that exists outside our consciousness. Objective reality develops and is divided into forms of relative and absolute truth.

Relative truth is knowledge that represents the limitations of human knowledge, characterized by the fact that the image is largely accurate, but the image is not very suitable for the object, that is, inaccurate, hypothetical, limited by certain historical conditions of time and place. Relative truth develops and leads to absolute truth. In every relative truth there is an element, a particle of absolute truth, and the absolute and relative truths are in a dialectical relationship. The fact that human thought, by its very nature, has the ability to reveal absolute truth, implies that absolute truth is composed of sets of relative truths. New discoveries in every field of science contribute to the absolute truth, and these discoveries can expand and develop with a relative limit. That is, in the development of practice and science, this truth becomes more and more perfect, scientific knowledge (rules, concepts, and theories) that relatively accurately reflects the objective world, becoming more and more complete in the subsequent development of complete and inaccurate human knowledge.

Absolute truth is the complete reflection of the essence of an object or event in the human mind, the perfect knowledge of an object in such a way that it cannot be supplemented or clarified in the future. Due to the infinity of time and space, such knowledge is practically impossible to achieve. However, the real stage of development of science has shown that science develops because it is able to know the truth, which is understood as a unit of relative and absolute knowledge. In other words, objective truth is absolute truth in a complete and perfect view.

Recognition of relative truth is not denial of absolute truth. For our knowledge is not ready or rigid knowledge, but the knowledge of absolute truth is known by the knowledge of relative truths, by the knowledge of incomplete conjectural truths.

Man is always approaching the end of his knowledge of nature, but he cannot reach the level of complete knowledge of the laws and phenomena of the material world. The reason for this is that nature is infinite, it is in constant motion, evolving, changing. Human knowledge, on the other hand, can never completely cover the material world. Therefore, the approximation of human knowledge to absolute truth is relative. From this we must not conclude that all our knowledge is relative, that it has no objective content. Regardless of the relativity of any truth, elements of absolute truth are preserved in it. It is necessary not to contradict the absolute and relative truths, but to study them as an integral whole. Because knowing the dialectical relationship of absolute and relative truths is of great importance in the struggle against dogmatism, agnosticism, relativism.

Dogmatism and relativism are doctrines that unilaterally decide the truth and its essence, trying to separate its absolute and relative aspects. Dogmatism denies the relative aspect of human knowledge in relation to the specific time, conditions, and possibilities of cognition, and is understood as the ultimate truth that does not change, develop, improve, or supplement every knowledge. On this basis, they completely deny the existence of relative aspects in human knowledge. Representatives of dogmatism emphasize that there is no need to supplement and develop the acquired knowledge. It is not always possible to apply any knowledge in practice without taking into account the specific conditions. Because dogmatists deny that concrete historical conditions and situations are ever-changing, they sometimes blindly memorize theoretical rules and believe that they can be easily applied in any situation.

Representatives of relativism, on the other hand, recognize only the relative aspects of human knowledge and deny the absolute truth altogether. In their view, relativity is inherent in all aspects of human knowledge, not just one. This doctrine also denies the existence of a truth in it that accurately reflects a reality that does not depend on the human mind, by treating all our knowledge as relative.

Eternal truth, on the other hand, is the accurate reflection of objective reality, things and events in the human mind without absolute change. The conclusions that emerge as a result of scientific knowledge in eternal truth will not be refuted in the future development of scientific knowledge, but will be further clarified. Eternal truth is synonymous with absolute truth. Eternal truth is not subject to absolute change and criticism. On the contrary, he may encounter knowing and learning the eternal truth. For example, according to Islamic theologians and scholars, religious pillars are an eternal truth. That is, the undeniable truth in the process of the development of knowledge is the eternal truth. In some cases, if the truth does not change over time, that is, does not depend on the conditions of time, it is also called eternal truth.

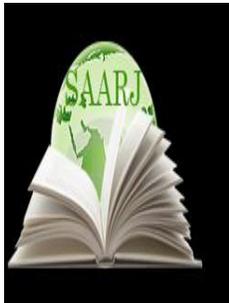

It is also a concrete and abstract form of reality, in which concrete reality is the reflection in the human mind of the fact that an object or event is always present in a specific place and condition. If we look at reality as a process and approach it from the point of view of its development, then abstract truth is contrasted with concrete reality. Abstract reality is an incomplete, undeveloped, one-sided reality, while concrete reality, on the contrary, is a fully developed multi-faceted reality under certain conditions. Any truth includes both abstraction and concreteness as it develops in the process of knowing. Reality is abstract in relation to the next stage of its development and concrete in relation to the previous stage of development.

In conclusion, we can see how difficult and complex the process of understanding and achieving the truth is at different stages of historical development. Because no one has ever been able to create truth from nothing, on the contrary, the process of striving for truth involves the use of scientific research, scientific research, various methods, memory, will, imagination, intuition, and the full power of the mind. The study of nature and being on the basis of scientific and philosophical knowledge, the development of natural and scientific knowledge, the belief in the power of the mind, the focus on knowing the truth, the knowledge that truth is the basis of human knowledge, the pursuit of this goal is important.

### Abstract

*Mental Health Is The Main Factor That Determines The Quality Of Our Life. Personal Happiness Of A Person, Professional Success, The Level Of Emotional Well-Being, Memory, Perception, Dreams, Thoughts, Beliefs Depend On It. The Level Of Mental Health Varies In Very Wide Ranges From Serious Disorders To High Emotional Well-Being: A Well-Developed Sense Of Individuality, Activity, The Ability To Communicate And Get Closer To People, To Adequately Perceive Difficulties And Be Able To Overcome Them.*

**KEYWORDS:** *stress, emotion, sadness, fear, anger, satisfaction, interest, joy, loneliness, emotional well-being, psychoanalysis, id, ego, superego, self-esteem, self-esteem, behavior.*

### INTRODUCTION

An important component of human health is the optimal ratio of material and spiritual in his life, its physical and mental components. A spiritually rich, cultured person is distinguished by a high demand for himself, for society, for nature, the ability to survive failures and effectively deal with stress; independence, care for other people, the quality of relationships with other people.

The whole life of a person, any of his activities are emotionally colored. All actions have the goal of adapting the body to the external and internal conditions of existence and satisfying the needs of a person - both vital (nutrition, movement, sleep, procreation, etc.) and the needs of a higher order (in labor activity, creativity, communication, etc.).

Emotions reflect the mental functions of a person: joy, sadness, fear, anger and others. Each emotion affects the physiological functions of the human body: a state of nervousness causes a change in breathing and cardiac activity, a feeling of shame - reddening of the face, etc. A state

of emotional peace and tranquility manifests itself in relaxation of the whole body and restoration of energy.

When the existing system of satisfying needs is disrupted or the likelihood of this violation increases, a person has a feeling of anxiety, neuropsychic tension, that is, a state of emotional stress is formed.

Human emotions are very diverse. Here are just a few of them: anger, anxiety, boredom, contempt, longing, disgust, irritation, excitement, fear, guilt, hostility, interest, joy, loneliness, love, sadness, shame, surprise, anxiety, rage, and many others. Emotions make us human, they decorate our life, bringing interest and variety to it.

One of the most important points that determine the emotional well-being of a person is the formation of a person as a person. Each person has a unique combination of traits inherent only to him, i.e. each of us is a unique personality. This concept includes thoughts and feelings of a person, his relationship to people and situations. It used to be thought that a person's personality is formed only in the first 5 years of development. However, it has been proven that a person retains the ability to learn from experience, learn and change as long as he lives. Many mental health professionals have tried to explain personality development for a long time. The most famous is the theory of psychoanalysis by Sigmund Freud. According to this theory, subconscious forces have a significant influence on people's behavior. The key idea of Freud's theory of personality is that a person has an energy called libido, aimed at obtaining maximum pleasure. Freud's concept of personality and psyche includes three main components: id, ego and superego.

**Id** is the main and most primitive part of the psyche, localized in the subconscious and consists of libido and aggression. To satisfy the libido, the id strives for the complete possession of everything that it desires. Man only learns to control the requirements of the id.

**The ego** is a conscious part of the psyche, develops as we grow up and deals with the requirements of the id. When id requests are reasonable, the ego permits them to be satisfied. When the demands of the id are asocial, the ego uses suppression, by which unacceptable thoughts, memories, desires, and motives are excluded from consciousness.

**The superego** is our conscience, or the feeling of right and wrong. The superego tells us what we "should" do.

The theory of Z. Freud was seriously criticized. It is impossible to prove the existence of id, ego and superego. However, almost no one now denies the significant influence of the subconscious part of the psyche on emotions and human behavior.

John Watson, Eric Erickson, Abraham Maslow, Karl Roger and many other scientists have made their contributions to the modern concept of personality, but there is still no single concept of personality formation.

It is known that the level of human mental health varies in a very wide range - from serious mental disorders to high emotional well-being.

One of the characteristics of emotional well-being is self-esteem. Self-respect is an integral part of self-awareness. Emotionally healthy people relate to themselves well, adequately perceive the difficulties of life and have a developed sense of their own worth. Self-esteem is developed when

a person tries to do everything well. Success breeds success - each of your successes gives you confidence, which leads to further success.

Emotionally healthy people, passing from one age group to another during their lives, face certain psychological difficulties, but overcome them successfully.

Human needs are diverse and are realized by him as he grows up. The person masters the ways of satisfying these needs in the course of life. Not understanding or denying one's needs makes a person unhappy. For example, some people deny that they need love and warmth from others. In fact, they feel this need, but they are afraid of being rejected. Fear makes them reject others, a person is afraid of being humiliated, and as a result, such an important human need for mental health remains unmet.

Disappointments are inevitable in the life of any person. The ability to deal with failures develops as they grow up, mature people understand that they cannot count on the fulfillment of all desires, therefore, in case of failures, they retain a positive outlook on life, and in order to get rid of the feeling of disappointment, they do not resort to alcohol, but prefer to act.

An emotionally healthy person knows how to adapt to a constantly changing external environment. A familiar, familiar environment gives us a sense of security, and meeting something new sometimes causes excitement and anxiety. When we feel secure enough and look into the future with interest and confidence rather than fear, we can say that we have achieved a high level of emotional well-being.

Emotionally successful people are independent. They are able to make decisions on their own, plan their lives to follow their own plans. Emotionally immature people find it difficult to make decisions, are afraid to make mistakes and therefore simply "go with the flow." Meanwhile, mistakes in the life of every person are inevitable, in fact, they are our life experience.

Emotional well-being implies a person's confidence that he is "the master of life", ie. he himself largely controls his life.

One who feels helpless and insecure cannot be happy.

Modern life can be a source of intense stress. People who do not know how to effectively deal with stress, over time, acquire physical and mental illness, a tendency to abuse alcohol.

A hallmark of a person's emotional well-being is their ability to care for others. People whose own needs are not satisfied are not inclined to think about the problems of another person. But a selfish person is usually unhappy.

An important characteristic of emotional well-being is the quality of our relationships with others. Emotionally healthy people love other people, believe them and expect the same attitude towards themselves. All this gives them a sense of self-confidence and allows them to recognize themselves as part of society.

Before a person learns to love others, he must respect and love himself. Failure to love and express your feelings for others is often based on low self-esteem and can lead to dire consequences. You need to learn to accept the favor, respect and love of others.

The ability to work effectively is an important indicator of emotional health. Lack of self-confidence and self-respect can reduce our productivity in the same way as emotional conflicts

that distract our attention and energy. People who are not confident that they can get a good job and cope with it very often work below their level of ability all their lives.

People are not born emotionally happy. They go to this state, overcoming life difficulties. A prerequisite for emotional well-being is a well-developed sense of individuality, ability to communicate, build close relationships, and be proactive.

Effective communication enriches a person, improves the quality of meeting our own needs. Effective communication requires two active participants when the possibility of misinterpretation of our words is minimized in the conversation. A person should be able not only to speak and express his thoughts correctly, but also to listen, use and understand gestures correctly. People often misunderstand each other. If you have any doubt about the meaning of what you have just been told, immediately ask for an explanation.

Close relationships are friendships that are held together by close emotional, intellectual, social, and spiritual ties. Close people care about each other, trust intimate thoughts and experiences. Close relationships develop between friends, spouses, lovers, relatives, neighbors, and workmates. Intimate relationships are essential to emotional well-being, as they support us during difficult times. The lack of close relationships leads to emotional isolation, and the inability to enter into them is a symptom of serious emotional disturbance.

Through activity, our desires and goals become known to other people. Almost all of us have had to experience a feeling of annoyance that someone took over us in a certain situation. You should be more active and not allow this.

There are three types of behavior:

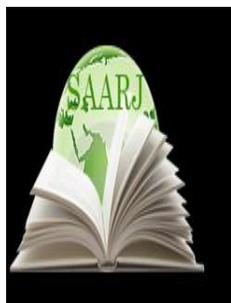

- Passive behavior. We do not declare our goals and rights, as a result of this, our desires remain unfulfilled, and our dreams unfulfilled. As a result, we begin to despise ourselves for this, and relationships with other people become strained.
- Active behavior. We openly declare our goals and rights and strive to ensure that our needs are met.
- Aggressive behavior implies achieving a goal at the expense of infringing on the rights of others, and therefore ultimately destroys our relationships with others.

Thus, emotions are a mental state characterized by subjective experiences, physiological activation, and certain modes of expression. Emotions are real, meaningful, and an important part of the human personality. Since every emotion affects bodily functions, emotional well-being has a lot to do with physical health.

## SEMANTIC ANALYSIS OF LITOTES IN THE ENGLISH LANGUAGE LITERARY TEXT

**Rasulova Zukhra\***

\*Jizzakh State Pedagogical Institute,  
 UZBEKISTAN

### ABSTRACT

*The semantic analysis of litotes in the descriptions of natural disasters in the English-language media text is given. The language material made it possible to reveal that the most productive conceptual sphere in litotes models is “scale”. Litotes is a form of understatement, more specifically meiosis, and is always deliberate with the intention of emphasis. However, the interpretation of negation may depend on context, including cultural context. Understatement of a certain feature of the described object in the media text indicates the activity of the process of reflection of the surrounding world, the desire to penetrate into its most significant properties.*

**KEYWORDS:** *Litotes, Semantic Analysis, Media Text, Natural Disaster, Information, Aid Agency, Stylistic, Literary.*

### INTRODUCTION

Modern language researchers are showing increasing interest in rethinking well-known stylistic techniques from the point of view of cognitive science and pragmalinguistics. In particular, we were interested in such a stylistic device, like litota. Many Western and Russian linguists of the XX-XXI centuries (I.R. Galperin, I.V. Arnold, F. Johson, N. Knox, D. R. Smith et al.) Expressing an opinion about the versatility of the trail being explored, which allows him to act as a structural component of lexical and syntactic stylistic devices such as antithesis, irony, metaphor, comparison, ellipsis, anadiplosis, epiphora, inversion, a rhetorical question. the purpose of litotes to cause doubts in the listener by discrepancies between the asserted and implied concepts.

In rhetoric, litotes is a figure of speech and form of verbal irony in which understatement is used to emphasize a point by stating a negative to further affirm a positive, often incorporating double negatives for effect. Litotes is a form of understatement, more specifically meiosis, and is always deliberate with the intention of emphasis. However, the interpretation of negation may depend on

context, including cultural context. In speech, it may also depend on intonation and emphasis; for example, the phrase "not bad" can be intonated differently so as to mean either "mediocre" or "excellent". Along the same lines, litotes can be used as a euphemism to diminish the harshness of an observation; "He isn't the cleanest person I know" could be used as a means of indicating that someone is a messy person.[6]

Litotes is a figure of speech in which a negative statement is used to affirm a positive sentiment. For example, when asked how someone is doing, that person might respond, "I'm not bad." In fact, this means that the person is doing fine or even quite well. The extent to which the litotes means the opposite is dependent on context. For example, the person saying "I'm not bad" may have recently gone through a divorce and is trying to reassure a friend that things are okay. On the other hand, this person may have just won the lottery and says, "I'm not bad" with a grin on his face, implying that things are, in fact, incredible.

The word litotes comes from the Greek for "plainness" or "simplicity" and is derived from the Greek word litos, meaning "plain," "small," or "meager." Note that litotes is not a plural word. [8]

Litotes is a form of ironic understatement. An understatement can be any expression that minimizes the importance of something. Understatement and litotes both invoke a certain restraint or stoicism when describing something. However, the definition of litotes is much more specific than that of understatement. Litotes only refers to the negation of one quality to emphasize its opposite. If a person is "not unimaginative," this negation of the negative quality "unimaginative" implies that the person is, in fact, imaginative. It is quite common to hear examples of litotes in everyday speech in English. Perhaps you have heard or even used some of the following expressions:

He's not the friendliest person.

It wasn't a terrible trip.

She's not unkind.

They aren't unhappy with the presentation.

Not too shabby!

The two concepts are not unlike each other.

She's no spring chicken.

It's not exactly a walk in the park.

## THE MAIN PART

The purpose of this study is a semantic analysis of the features of an object that can be understated in litotes models of the English-language media eco-text. The range of environmental texts is wide, but our research focuses on information messages describing natural disasters. The relevance of the research is determined not only by the growing interest in the analysis of modern discourse practices, but also by the cognitive and pragmatic focus in studying the semantics of stylistic means in media texts.

Within the framework of the pragmatic approach, any “text is considered as a complex speech act that is carried out with specific intentions and goals and which uses a complex of language means and methods of influencing the addressee ” [1, p. 20].

Trails are actively used in journalism, not only increasing the informative value with the help of associations (images), but also participating in the most important functions of newspaper texts - persuasion and emotional impact. A.P. Skovorodnikov noted that for modern newspaper texts characterized by an increased frequency and variety of semantic figures, in which he includes figures of the so-called "Peripheral-euphemistic type". [6, p. 74–75].

Litotes traditionally refers to the figures quantity and is a technique based on comparing two dissimilar objects (phenomena) or their characteristics with a quantitative feature common to them. According to P. Fontagnier, in the most general sense litotes, “more or less reduces a thing” [6, p. 133].

In the interpenetration of positive meanings of truth and subjectivity, the dialectic of the subjective and the objective is manifested in litotes, where both sides of the reflection process act as interacting sides of one and the same phenomenon: the real measure - an objective assessment - is rethought taking into account the litotes measure - a subjective assessment. It is especially clearly manifested the creative nature of the subject is constant transformation of reality in the use of this stylistic device. The influence of subjective psychological factors while understatement is clearly visible (emotionality of the naming object) on language form.

Understanding the measure as a mean between two opposites plays an important role in the perception of the individual and regulation his behavior. Each element of reality exists within certain quantities. However, “excessive stereotyping of actions and forms tires” [7, p. 117], therefore, any deviation from the measure not only creates a certain tension, but also leads to the emergence of the necessary emotions.

Based on the material reviewed, we presented the opportunity itself to highlight such traits that are most often understated in cast designs when describing natural phenomena: scale; quantity / weight; strength; time.

The semantic group "scale" is the most productive in the composition of litotes models. In a broad sense, the scale is size, scope, coverage of the phenomenon or object.

It seems quite logical that that litotes is used in media texts in its direct purpose - to indicate the small size of the object. Remarkably, that these cast structures characterize such inhabited objects as islands, villages, settlements. British reporters hardly ever use "dimensional" litotes to describe the natural phenomenon itself: “They had been swept off a tiny island and survived the storm by clinging to planks and lifebuoys (They were washed off the tiny island, and they survived the storm by holding onto boards and life buoys) (BBC news. 2007. 6 Sept.); The devastation caused by the Asian tsunami in the tiny Indonesian province of Aceh has been well documented; (The Guardian. 2006.1 Jan.); Authorities in Ile-à-Vache, a tiny island off Haiti’s south-west coast, said, an elderly woman died when huge waves crashed on her house (The Guardian. 2006. 29 Aug.)

In second place in terms of productivity, two semantic groups - "quantity" and "mass". The understatement of quantity is used as a dimensional characteristic by English-speaking journalists when referring to the insufficient amount of assistance for victims of a natural

disaster: A government allocation of £ 2.1m to flood-ravaged Hull is only “a drop in the ocean,” according to the council the amount allocated by the government of 2.1 million dollars for the devastated flood Halla is just a drop in the ocean) (BBC news. 2007.13 July); An estimated 3,3 million people were made homeless by the earthquake. Aid officials estimate that up to 540, 000 tents are required, but only 122, 000 have been delivered. Aid agency plans to send another 83,000 aids and just a ‘drop in the ocean’, said UN official Jesper Lund (It is estimated that the earthquake left 3.3 million people are homeless.

It is believed that about 540 thousand tents are required, but they brought only 122 thousand. Plans for the humanitarian organization to send more than 83 thousand aids is just a drop in the ocean, said UN spokesman Jesper Lund) (The Guardian. 2005.23 Oct.)

The underestimation of the mass of an object finds linguistic expression in the descriptions of the natural disaster itself, when, under the influence of external forces, heavy material objects experience shaking, move and move in space at different distances: He said: “The roof started shaking in the wind, like it was a tent, and the timbers were being thrown about like matchsticks” (He said: “The roof began to shake in the wind like an awning, and logs scattered like matches) (The Telegraph. 2000.30 Oct.); We were swept inland and got to high lands. People were being plucked up like toy soldiers (We were washed inland and we got to the hill. People were thrown like toy soldiers) (The Independent. 2005. 2 Jan.)

To a lesser extent, the linguistic material presents the representation of the semantic group "strength". Strength is the ability of objects to "resist destruction, as well as irreversible change in shape (plastic deformation) under the action of external loads, in a narrow sense - only resistance to destruction" [2, p. 216], for example: Tornadoes “bent pylons like tooth picks” (Tornado “bent the lamp poles like toothpicks”) (BBC news. 2003. 6 May); Juan Jose Daboub, the President’s chief of staff, pointed out how Tuesday’s big tremor knocked out much of the national water and power system. He said, main highways had crumbled "Like a loaf of bread" (The Independent. 2001. 19 Feb.)

According to the data obtained, the conceptual sphere "time" is the least productive in cast models. The understatement in cast models follows the line of time during which a natural phenomenon occurred: “It was in a split second that we sat down and started to cover ourselves before the storm hit”, said Kira Simpson, 17 (The Independent. 2009. 21 Aug.). So, in the informational descriptions of natural disasters, British journalists use the understatement of various attributes of the object. In epistemological terms the desire to measure an object in order to know its true physical characteristics of the bearer of any linguistic culture. Therefore, it is not surprising that the most common feature understated in texts is physical property of the described object. While describing a material object, the logical action of the author will be the desire to characterize the described object by means of specific measuring quantities. The quantitative characteristic of the measured value is its scale, therefore it is this parameter that is most productively subjected to rethinking on the scale of understatement. Journalist strives for completeness and the accuracy of the narrative, its purpose in the media eco-text is to offer the reader the most concrete idea of the realities of the environment.

Along the way, he must solve the problem - as the most attractively "pack" the presented information to them. Consequently, the understatement of the described property of the object of

reality in the press usually implies not only the acuity of his perception, but also the evaluative attitude to the object, as well as the desire impress and convinces the reader.

Understatement of a certain feature of the described object in the media text indicates the activity of the process of reflection of the surrounding world, the desire to penetrate into its most significant properties. This is especially evident in the cases where a journalist embodies of his idea turns to litotes, which is based on mental operations on comparison and differentiation of two plans - real and unreal, - contributing to penetration into the true essence of life, its laws. The choice of understated properties in media text relies on mental prerequisites such as desire to draw attention to the statement, the desire to impress the reader and elicit an emotional reaction.

A. Potebnya [9,56] proposed to distinguish between transitive and reflexive litotes. If the speaker (narrator, lyric subject, character) talks about another person, belittling him, we can talk about a transitive, transitional litotes. A transitive litotes is an effective means of conveying a contemptuous attitude towards someone or something. If the subject is engaged in self-deprecation, underestimates any of his features, we are talking about a reflexive (introspection) litotes.

Negation of a logical character should not be confused with litota as a fact of linguistics. Let us cite Shakespeare's sonnet for illustration:

My mistress' eyes are nothing like the sun;  
 Coral is far more red than her lips' red;  
 If snow be white, why then her breasts are dun;  
 If hairs be wires, black wires grow on her head.  
 I have seen roses damask'd, red and white,  
 But no such roses see I in her cheeks;  
 And in some perfumes is there more delight  
 Than in the breath that from my mistress reeks.  
 I love to hear her speak, yet well I know  
 That music hath a far more pleasant sound:  
 I grant I never saw a goddess go,  
 My mistress, when she walks, treads on the ground;  
 And yet, by heaven, I think my love as rare  
 As any she belied with false compare.

(Shakespeare. SonnetCXXX.)[3]

This sonnet is built on the denial of a number of positive qualities of the beloved, and the denial is carried out on the removal of the usual comparisons, in which the extremely high degree of a positive sign is affirmed (eyes are like stars; lips are like corals; chest is whiter than snow; cheeks are roses; breath is the scent of perfume; voice - music, etc.).

In the epigrammatic lines, it turns out that all negative sentences carry praise. However, there is no litotes in this sonnet. Litota is a linguistic means. Logical means are used in this sonnet. The denial of the qualities listed in the sonnet does not carry the statement about the presence of these signs like the litotes; in other words, negations remain negations. The last lines only make the conclusion that the absence of these qualities does not diminish the charm of the beloved.

Litotes is a technique opposite, that is, a deliberate understatement of the qualitative or quantitative characteristics of an object or its properties. Usually this technique is expressed by the negation of the opposite (not bad = very good).

## CONCLUSION

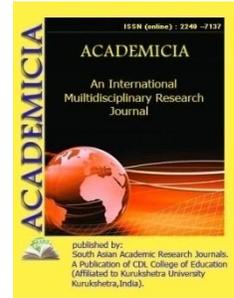

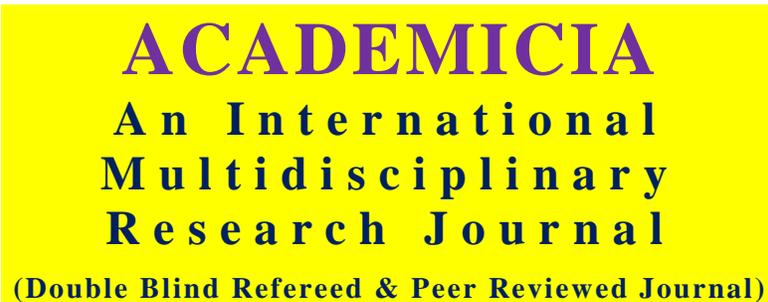

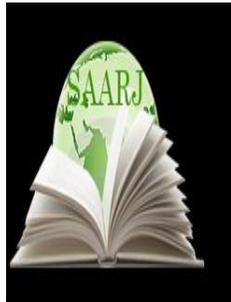

Litotes is euphemistic, distinct from exaggeration. In particular, litotes is taken in a transitive sense and is an expression of a look at the third person, among other things, contempt for him; meanwhile, humiliation and belittling (litotes) is taken in a reflective sense when a person speaks about himself.

In the process of understatement, various kinds of images are involved that are present in the human mind, which are expressed in language, i.e. litotes acts as a product of the linguistic picture of the world. Moreover, in sustainable literary models, certain stereotypes of thinking inherent in that or other linguacultural community and passed down from generation to generation. However, when choosing a linguistic form to designate a litotes measure, the naming subject is guided not so much by information that leads to the correct reference as communicative and pragmatic functions, as well as their own psychological inclinations.

### ABSTRACT

*The stress of a patient's cancer can easily be felt by her partner so that the cancer becomes a shared stress or a "we-disease." In this article, we look at how couples experience the cancer diagnosis and treatment and the ways they cope together with the illness. As practitioners, we are particularly interested in understanding the process of mutual support and the characteristics associated with a couple's coping that lead to a positive adjustment to cancer. A total of 187 spouses of cancer patients attending oncology clinics of two hospitals in Tehran, Iran, participated in the research program. Data collection was done using the Zung Self-Rating Anxiety Scale, Thought Control Questionnaire and Beck Depression Inventory. The research sample consisted of 29 married spouses of cancer patients. The prevalence of probable mixed anxiety depression disorder (MADD) among the spouses was 15.5 %. In the present study, we examined changes in thought control strategies for MADD patients who underwent couples-based coping training. The couples-based coping training sessions extended for 45 minutes and were held once weekly. All of the thought control strategies were positively associated with MADD. Mutual support for couples with cancer can substantially benefit family and patient functioning and caregiver burden.*

**KEYWORDS:** *Couples-Based Coping Training, Cancer, Mixed Anxiety Depression Disorder (MADD), Thought Control Strategies.*

## INTRODUCTION

There is an interaction between individual coping and mutual support processes among couples. For example, healthy partners' appraisals of both their own coping and the coping of the diagnosed partner influences the types of support they report offering to their partner (Kuijer et al., 2000). The type of support partners provide, in turn, affects the coping behaviors employed by patients (Manne & Glassman, 2000).

Moreover, patients' coping behaviors may signal the type of support they need and serve to mobilize or discourage support from partners. In fact, individual coping and support processes appear so intertwined that some coping researchers have concluded that the ability to mobilize the desired type and amount of support from significant others is a coping skill in itself (Bodenmann, 2005; Kennedy-Moore & Watson, 2001; Stanton et al., 2000). As an illustration, a partner interprets the other partner's not talking about the cancer as coping well and therefore, offers little support to the other. In contrast, a partner who openly expresses fears about the cancer may be offered a lot of support from the partner, who interprets the concerns as not coping well with the cancer. Thus, couples who are satisfied with the support they give and receive may be skilled in communicating their support needs to each other (Duck, 2002). They mutually shape the nature of their support processes in a way that positively enhances both partners' adjustment to cancer.

Support, then, should be viewed as a mutual activity rather than an individual one. When a partner has cancer, she not only is the recipient of support but provides support to her partner. Typically the value of support is assessed from the perspective of only the recipient and not the provider. Many patients show concern about the effects of their cancer on loved ones and attempt to support those loved ones, while also seeking support from them (D'Errico, Galassi, Schanberg, & Ware, 1999). There is much evidence to suggest that, for a person in a committed relationship who is coping with a severe illness, a major influence on their adjustment is mutual support between partners. It is widely accepted that partner interaction is so crucial in coping with a major crisis that, for the best outcome, the couple should conjointly cope with the stress. Thus, the two partners should interact in ways that positively influence each other's mood and methods of coping. To illustrate the importance of this couple or dyadic focus, consider the following two studies of couples coping with breast cancer. First, Skerrett (1998) interviewed 20 couples about their coping, focusing on their communication, beliefs regarding illness and health, problem-solving techniques, feelings of loss and disfigurement, and other topics. Based on the interview data, the couples were categorized as either resilient or problematic. Most of the 20 couples were viewed as resilient: They had a philosophy of coping that was mutual and served as a basis for dealing with the ongoing demands of the illness. They strongly believed that they were "in it together" and served as each other's confidante, advisor, and sounding board. Most talked openly about cancer but did not allow the talk of the illness to dominate their daily living. In contrast, there was a small cluster of "problematic" couples for whom breast cancer had a devastating impact on their lives. The illness seemed to color every aspect of their interaction. The "problematic" couples were unable to formulate a common coping philosophy. Their communication took the form of one of the two patterns: individual retreat into withdrawal

and silence or, conversely, reactive, anxiety-driven, tell-all communication. They struggled to find ways to understand and make meaning of the experience.

In the second qualitative study, Zunkel (2002) identified four relational or dyadic processes in which each partner contributed to coping with breast cancer. These were: (1) sharing in the patient's recovery, (2) helping her, (3) normalizing the household, and (4) moderating or minimizing the intrusion of the cancer. Zunkel (2002) concluded that there were two distinct types of processes: an acknowledging type and a moderating or minimizing type. The acknowledging process attempted to incorporate the illness into family life; couples openly expressed their feelings about its presence and acknowledged their partners' responses to the cancer and recovery. In contrast, the moderating or minimizing process attempted to limit the cancer's impact on the family.

Although both patients and their partners are affected by the stress of breast cancer, there has been little systematic study of the effectiveness of psychosocial interventions targeted at the couple. Neither has there been much study of psychological outcomes for both partners or for the marriage. Given the frequency and intensity of interaction that a patient has with her spouse or partner, psychosocial interventions designed for couples may be more effective than peer groups or cognitive behavioral interventions (Radojevic, Nicassio, & Weisman, 1992). Furthermore, recent changes in medical care have transferred greater responsibility from health care professionals to the spouse and couple, making it all the more important to work with a couple as a unit and include the partner in treatment plans.

In reviewing outcome studies on psychosocial interventions for cancer patients, we could find only seven studies that evaluated interventions that included a spouse or family member (Kayser, 2005). Most of the studies were of interventions using behavioral training, educational groups, individual counseling, and support groups for patients. While support groups appear to be the most common type of intervention offered to cancer patients, recent studies have questioned their efficacy (Bordeleau et al., 2003; Goodwin et al., 2001). Some researchers have found not just minimal psychosocial benefits of peer support groups for early-stage breast cancer patients, but even adverse effects of peer discussion for some subgroups of women (Helgeson, Cohen, Schulz, and Yasko, 2001). There have been three randomized controlled trials evaluating couple-based interventions. Christensen's (1983) intervention involved four counseling sessions with 20 post-mastectomy couples and emphasized communication and problem-solving techniques. Patients who had received the treatment had significantly lower levels of depression than patients in the control group. Also, the husbands who received the treatment had significantly lower levels of discomfort than the husbands who did not receive the treatment. The author noted that with the small sample it was difficult to obtain statistically significant results, but these preliminary results provide some promising findings for couple-based interventions.

The Couples-Based Coping Training (Can-COPE) was evaluated in a randomized controlled trial with 94 married women who were recently diagnosed with early stage breast or gynecological cancers (Scott, Halford, & Ward, 2004). Women in CanCOPE compared to the other two conditions experienced less psychological distress, less avoidance of intrusive negative cognitions, and improved sexual adjustment. There was also a large increase in observed couple-coping, and supportive communication, and a large reduction in couples' coping effort or burden (Scott et al., 2004). Partners in coping, a couple-based intervention for breast cancer patients and

their partners, was evaluated in a randomized control trial with 50 couples (Kayser, 2005). Patients in the Partners in coping intervention arm reported higher overall well-being and common dyadic coping than the patients in the standard services arm at Time 2 (6 months post-baseline). Partners in the intervention arm reported higher stress communication coping and lower avoidance and hostile coping than partners in the standard services at Time 2. A recent meta-analysis of 70 randomized studies on people with chronic illnesses found positive benefits for both patients and family members when including a family member in psychosocial interventions (Martire, Lustig, Schulz, Miller, & Helgeson, 2004). The studies compared interventions using traditional methods to interventions targeting patients' closest family member or both patient and family member. For patients, interventions that involved spouses had positive effects on depression and, in some cases, on mortality. For family members, these interventions had positive effects on caregiving burden, depression, and anxiety. Only 5 of the 70 studies had samples of cancer patients—the illnesses were most frequently cardiac, dementia or Alzheimer's, or chronic pain. The aim of this study is to measure thought control strategies among spouses with mixed anxiety-depression symptoms and reduction of cancer-specific thought intrusions and MAD symptoms with couple-based coping training.

## METHODOLOGY

### SAMPLE

We asked 214 consecutive patients with a diagnosis of breast, lung and colorectal cancer ranging in age from 20 to 70 years, who had a spouse, for permission to contact their spouses. We selected patients in wide range of age, because cancer can occur at any age. Spouses could participate in the study if they were legal husband, age between 20 and 70 years.

All 214 patients who were approached gave consent to contact their partners. Of the 214 spouses 196 agreed to participate, and of these 187 returned the questionnaire. Of the 187 spouses 29 were diagnosed as patients with mixed anxiety-depression symptoms. The mean age of spouses were ( $M=42.9$ , Range, 24 - 61,  $SD= 8.61$ ,  $N=29$ ). *Average number of children was ( $M= 2.5$ , Range, issueless to more than 5,  $SD= .881$ ,  $N=29$ ).*

The research sample consisted of 29 married spouses of patients with breast, colorectal and lung cancers in *Imam Khomeini Hospital and Resalat Hospital*, Tehran-Iran. Spouses with previous history of psychiatric illness or spouses with medical/health problems were excluded from the study.

**TABLE 1 - THE LEVEL OF MIXED ANXIETY DEPRESSION DISORDER, MAD WITH OTHER HEALTH PROBLEMS AMONG SPOUSES OF CANCER PATIENTS**

Level	Frequency	Percentage
Mixed Anxiety Depression Disorder	<b>29</b>	<b>15.5</b>
MAD with other Health Problems	4	2.1
Depression	27	14.43
Anxiety	36	19.25
Normal	91	48.6
Total	<b>187</b>	100

## TOOLS

Data concerning spouse age, education, occupation, number of children, length of marriage, type of the cancer, stage, time of diagnosis and actual treatment were collected from medical files and demographic variables sheet.

### **ZUNG SELF-RATING ANXIETY SCALE**

The Zung Self-Rating Anxiety Scale (SAS) was designed by Zung (1971) to quantify the level of anxiety for patients experiencing anxiety related symptoms. The self-administered test has 20 questions. Each question is scored on a scale of 1-4 (none or a little of the time, some of the time, good part of the time, most of the time). There are fifteen questions worded towards increasing anxiety levels and five questions worded towards decreasing anxiety levels.

### **BECK DEPRESSION INVENTORY**

BDI (Beck & Beamesderfer, 1974). A measure of depressive symptoms was provided by the BDI. The Beck Depression Inventory is a 21-question multiple-choice self-report inventory that is one of the most widely used instruments for measuring the severity of depression. The BDI is a self-administered depressive scale measuring the extent of depressive symptoms such as hopelessness and irritability, cognitions such as guilt or feelings of being punished, as well as physical symptoms such as fatigue, weight loss, and lack of interest in sex.

### **THOUGHT CONTROL QUESTIONNAIRE**

The Thought Control Questionnaire (TCQ) (Wells & Davies, 1994) developed and validated on a normal sample, was administered to a clinical sample in order to investigate the consistency of the original factor structure and its psychometric properties. The sensitivity of the scale to change associated with recovery was also examined.

### **COUPLE-BASED COPING TRAINING**

This couple-based intervention aims to help couples develop satisfactory reallocation of family tasks/roles, foster effective cognitive coping, learn new thought control strategies, facilitate couple communication, promote supportive and intimate behaviors, deal with children's responses to cancer, and build a social support network. The intervention sessions can be implemented over 8–10 sessions during the first year after the cancer diagnosis. Later sessions are also likely to be useful for couples who are well beyond their first anniversary after cancer. The interventions were derived from two programs: Partners in Coping Program (PICP) and Can-COPE. Both programs have been empirically evaluated in randomized clinical trials with samples of 50 couples in the PICP (Kayser, 2005) and 94 couples in Can-COPE (Scott et al., 2004).

### **PROCEDURES**

Twenty nine spouses of cancer patients fulfilled the inclusion criteria and were recruited for the study after providing informed consent. Their wives were in treatment for cancer or visiting the surgeon for check-up. All spouses completed the following self-report questionnaires: Demographic Variables Sheet, Beck Depression Inventory (BDI), Zung Self-Rating Anxiety Scale (SAS) and Thought Control Questionnaire (TCQ). As couple-based coping training and program of mutual support was provided solely by the first author, there was a mean delay of approximately 2 months before spouses could start training. At commencement of couple-based coping, all participants were required to repeat the self-report questionnaires to confirm the

stability of the symptoms. All questionnaires were completed weekly by the participants to assess their response to the intervention. For the purpose of this study, only the data from the last session were used for analysis.

## RESULTS

Demographics of the spouses are given in Table 2. Among 29 (15.5%) spouses of the patients mixed anxiety depression disorder was found beyond the cut-off point of 45 on Zung Self-Rating Anxiety Scale and 9 on Beck depression Inventory. Anxiety and depression were more common among the spouses having schooling for grade eleven (44.8%) than those who were illiterate (6.8%) and post-graduated (6.8%). Second number of spouses (31%) was found exhibiting anxiety and depression beyond cut-off point among those who had diploma and pre-university level of education.

**TABLE 2 - MIXED ANXIETY DEPRESSION DISORDER IN SPOUSES AND THEIR AGE, NUMBER OF CHILDREN AND EDUCATION STATUS OF PATIENT. (VALUES ARE NUMBERS, PERCENTAGES)**

Age (mean=42.9)		(n=29)
	Below 25	1 (3.4%)
	26 – 30	1 (3.4%)
	31 – 40	7 (24.1%)
	41 – 50	17 (58.6%)
	51 – 60	2 (6.8%)
	Above 60	1 (3.4%)
Number of children (m=2.5)		
	Issueless	3 (10.3%)
	Single	11 (37.9%)
	Two to four	10 (34.4%)
	Four and above	5 (17.2%)
Education		
	Illiterate	2 (6.8%)
	Till Grade 11	13 (44.8%)

	Diploma & PU	9 (31%)
	Graduation	3 (10.3%)
	Post-Graduation	2 (6.8%)

## FOOTNOTE TABLE 2

Table 2 is showing no significant interdependence between MAD in spouses and age, number of children, and education status of patient.

No significant interdependence was observed among the observed anxiety-depression and age, number of children, length of marriage already administered and non-illness related concerns. Among spouses with mixed anxiety-depression disorder, 24.1% of them were belonging to the age group of 31 – 40 years whereas 58.6% were falling in age range of 41 – 50 years. But overall we observed no significant interdependence between mixed anxiety- depression in spouses and their age (Table: 2).

The research sample consisted of 29 married spouses of cancer patients in *two groups (n=14 Experimental group) and (n=15 Control group)*. The mean level of anxiety in spouses of breast cancer patients in experimental group before intervention was 58.13, SD=10.15 and depression was 22.75, SD=5.06, and the mean level of anxiety in spouses of lung cancer patients was 63.33, SD= 5.68 and depression was 22, SD=6.08, also the mean level of anxiety in spouses of colorectal cancer was 6.33, SD= 10.59 and depression was 24.33, SD=5.68. The total mean level of anxiety was 59.86, SD=9.05 and depression was 22.93, SD=5.01.

The steps to building adaptive couple-based coping training and broadening coping repertoires are taught over several sessions. This is necessary because learning new ways to view the self or the world or to manage challenging situations takes time and practice. The couple-based coping training sessions extended for 45 minutes and were held once weekly. The steps are to help each partner better understand their own responses to cancer. Their physical, behavioral, emotional, and cognitive responses to cancer are reviewed and discussed. This affords them a deeper understanding of how their thoughts, feelings, and coping behaviors are linked. Ultimately, it also gives them insight into how their own cognitions and behaviors can enhance or hinder their partner's coping.

The mean of the Zung scores at the beginning and end of the study was as follows : Experimental group 59.86, SD= 9.05 versus 37.57, SD= 15.85 and control group 59.67, SD= 8.05 versus 58.80, SD=8.47, the decrease in the experimental group was significantly more than control group. Also, the mean of the Beck depression scores at the beginning and end of the study was respectively: Experimental group 22.93, SD=5.01 versus 11, SD=7.66 and control group 21.40, SD=4.42 versus 21.07, SD=5.02, the decrease in the experimental group was significantly more than control group. So, the couple-based coping training decreased significantly the mean of the anxiety and depression symptoms scores more than the control group.

**TABLE 3 – EFFECTS OF COGNITIVE BEHAVIOR COPING TRAINING ON THOUGHT CONTROL STRATEGIES OF SPOUSES OF CANCER PATIENTS BEFORE AND AFTER INTERVENTION**

Thought Control Strategies	Intervention Group				Control Group			
	Pre test		Post test		Pre test		Post test	
	Mean	SD	Mean	SD	Mean	SD	Mean	SD
<b>Distraction</b>	16.79	2.19	12.21	3.60	16.93	2.31	16.73	2.65
<b>Social Control</b>	18.14	2.31	11.79	3.21	17.53	2.47	16.93	2.34
<b>Worry</b>	17.86	2.14	11.79	3.37	17.53	2.23	17.13	2.50
<b>Punishment</b>	16.36	2.53	11.14	2.21	15.27	2.34	14.93	2.68
<b>Reappraisal</b>	15.29	1.85	10.86	1.87	14.47	1.99	14.27	2.25

Spouses with MAD had more intrusive thoughts (not necessarily at bedtime) and more difficulty coping with them. Spouses with MAD in both experimental and control groups display elevated levels of punishment, worry, and social control and distraction strategies (Table: 3). The mean of the Thought Control scores at the beginning and end of the study was as follows: Experimental group, distraction, mean = 16.79 versus 12.21, worry, mean = 17.86 versus 11.79, social control, mean = 18.14 versus 11.79, and distraction mean = 16.79 versus 12.21 and control group, distraction, mean = 16.93 versus 16.73, worry, mean = 17.53 versus 7.13, social control, mean = 17.53 versus 16.93, and distraction mean = 16.93 versus 16.73, the decrease in the experimental group was significantly more than control group. Also, one-way ANOVA was utilized to compare the groups on reported levels of each thought control method. Results of the one way repeated measure ANOVA indicated that participants receiving couple-based coping training had significantly more reduction in anxiety scores than the controls,  $\Lambda = .336$ ,  $F(1,27)$ ,  $p < .000$ ,  $\eta^2 = .664$  and depression scores than the controls,  $\Lambda = .351$ ,  $F(1,27)$ ,  $p < .000$ ,  $\eta^2 = .649$ . Effect size indicated that the model explained 66.4 of the variance in Anxiety and 64.9 in depression.

## DISCUSSION

A series of studies have found what most clinicians have already observed among couples coping with cancer: many times the mood of one partner can affect the mood of the other partner, producing a strong correlation between their levels of adjustment. Feelings of hopelessness and emotional distress are easily transferred from one partner to the other. Husbands and wives report similar levels of stress in trying to carry out their usual roles at home and work. This similarity in adjustment to the cancer not only occurs at diagnosis, but also continues over time. For example, when measuring their adjustment at three times (time of diagnosis, 60 days later, and 1 year later) moderately high correlations between patients and husbands were found on each of the adjustment measures (Northouse, Templin, & Mood, 2001). How well husbands adjusted after 1 year had a direct effect on how well their wives adjusted 1 year after the diagnosis. Furthermore, 2–3 years after diagnosis and treatment, wives and their husbands were still showing similar levels of emotional adjustment (Carter & Carter, 1993).

The downside of the strong correlation between partners' adjustment is that when both partners experience similar high levels of distress, they are most at risk for long-term adjustment difficulties. What is the mechanism by which partners' moods and adjustment influence each other? A simple explanation may be that the listening and empathizing with a partner's plight and mood may lead to a transfer of mood and emotions to the other partner. Even without

empathizing with the person's feelings, just observing a spouse's negative mood can alter the partner's mood. While this spillover of mood may occur, we view the process as more complicated.

The results of this study are in agreement with previous studies. Just as there is a reciprocal effect of mood between partners, the ways in which each individual manages stress also affect the other. Indeed, studies find that the coping strategies used by one partner affect the other partner's adjustment to the stress of the illness. There is a reciprocal influence between individuals in how they react to stress. They shape each other's coping, and their coping responses, in turn, shape the quality of the support they provide each other. Here are some examples from research. Wives' positive adjustment to breast cancer has been associated with:

- \_ Husbands' use of more problem-focused coping (Ptacek, Ptacek, & Dodge, 1994)
- \_ Husbands' use of external control-resignation coping (Hannum, Giese-Davis, Harding, & Hatfield, 1991)
- \_ Husbands' use of active engagement coping strategies (Kuijer et al., 2000)

Women with cancer are more likely to feel distressed when:

- \_ Husbands use wishful thinking to cope (Ptacek et al., 1994)
- \_ Husbands use denial or optimism (Hannum et al., 1991)
- \_ Husbands are overprotective toward them (Kuijer et al., 2000)

In a similar vein, breast cancer patients' coping strategies also impact their husbands' adjustment. Husbands adjust better when:

- \_ Wives use optimism as a way to cope (Hannum et al., 1991)
- \_ Wives use more problem-focused coping and less avoidance (Ptacek et al., 1994)
- \_ Wives do not use wishful thinking (Ptacek et al., 1994)

Emotional support provided by cancer patients' play a critical role in their partners' adjustment. Marital support was a significant predictor of both emotional and physical adjustments for spouses of cancer patients. Spouses who were dissatisfied with the emotional support they received experienced significantly more negative emotions, such as worry, tension, and uneasiness.

## CONCLUSION

These findings illustrate the significant relationship between the coping of one spouse and the adjustment of the other spouse. But we also know from research that how a couple copes together influences an individual partner's well-being. Partners engaged together in coping tend to be communal in their approach to coping; that is, each partner sees that it is in his/her self-interest to approach and manage the stress together. Their communication of support is sophisticated in that they not only acknowledge and validate each others' feelings, but also tend to view a stressful situation as "our" problem, and share the burden and responsibility for managing the problem in a way that balances both individual and relationship needs.

Future research should investigate the impact of developing adaptive thought control strategies based on the presence of—and discomfort associated with—intrusive thoughts. Repetitive questionnaire administration or use of daily self-monitoring reports could help assess if individuals are consistent in the choice of the thought control strategies they use.

### ABSTRACT

*Manifestation of annular Richardson effect for two-phase flow with variable phase concentrations taking into consideration changes in transverse gradient pressure were studied in the article. Numerical calculations were performed over wide range of Womersley parameter and Reynolds number*

**KEYWORDS:** *Pulsating Flow, Richardson Effect, Womersley Parameter, Reynolds Number, Marching Method, Two-Phase Mixture, Pressure Gradient, Adhesion Conditions.*

### INTRODUCTION

E.G. Richardson and E. Tyler experimentally discovered characteristic features of profile of longitudinal velocity during periodic fluid motion in the pipe. Using heat-loss anemometer they have measured the time average quadratic value of velocity in various sections of pipe with oscillating flow. It was determined that the maximum velocity during flow oscillation is located not on axis of the pipe, but closer to the wall. This phenomenon in the literature is known as “annular” Richardson effect [1, 3]. Let us consider the “annular” Richardson effect for a two-phase flow with variable phase concentrations taking into consideration changes in transverse gradient of the pressure.

It is generally acknowledged that the most promising for the study of multiphase flows is the use of theory of interpenetrating continua [1]. According to this theory, the system of dimensionless equations for viscous two-phase mixtures taking into consideration the conversion of physical area into unit square has the form [1, 2]:

$$\begin{aligned}
& x_1^\xi f_i \frac{\partial u_i^j}{\partial t} + \sum_{k=1}^2 x_1^\xi f_i u_i^k \frac{1}{(L)^{\delta_k^2}} \frac{\partial u_i^j}{\partial x_k} = -\frac{M}{a_i} x_1^\xi f_i \frac{1}{(L)^{\delta_k^2}} \frac{\partial P}{\partial x_j} + \\
& + \frac{1}{a_i} \sum_{k=1}^2 \left(1 + \frac{\delta_j^k}{3}\right) \frac{1}{(L^2)^{\delta_k^2}} \frac{\partial}{\partial x_k} \left( x_1^\xi f_i \frac{\partial u_i^j}{\partial x_k} \right) + \\
& + \frac{1}{a_i} \sum_{k=1}^2 \left(1 - \frac{5}{3} \delta_j^k\right) \cdot \frac{\partial}{L \partial x_k} \left( x_1^\xi f_i \frac{\partial u_i^{3-j}}{\partial x_{3-k}} \right) + \\
& \cdot + \frac{1}{a_i} \xi \psi_i^j + \frac{M}{\text{Re}_i} x_1^\xi K (u_{3-i}^j - u_i^j) + Fr_2 x_1^\xi f_i; \tag{1}
\end{aligned}$$

$$\frac{\partial f_i}{\partial t} + \sum_{k=1}^2 \frac{1}{(L)^{\delta_k^2}} \frac{\partial (f_i u_i^k)}{\partial x_k} + \xi \frac{f_1 u_i^1}{x_1} = 0; \tag{2}$$

$$f_1 + f_2 = 1; \quad i, j = 1, 2. \tag{3}$$

where:

$$\vec{\Psi}_i = \left\{ \begin{array}{l} -\frac{2}{3} \sum_{k=1}^2 x_1 u_i^k \frac{1}{(L)^{\delta_k^2}} \frac{\partial}{\partial x_k} \left( \frac{f_i}{x_1} \right) + \frac{2}{3} \frac{\partial}{L \partial x_2} (f_i u_i^2) - 2 \frac{f_i u_i^2}{x_1} \\ -\frac{2}{3} \frac{\partial}{L \partial x_2} (f_i u_i^1) \end{array} \right\}$$

$\alpha_i = R\sqrt{\omega/v_i}$  - Womersley oscillating parameter of  $i^{\text{th}}$  phase;

$\text{Re}_i = RU_{cp}/v_i$  - Reynolds number of  $i^{\text{th}}$  phase;

$Fr_2^{-1} = gR/U_{cp}$  - Froude number of 2<sup>nd</sup> phase

$M = \mu_1/\mu_i$  - dimensionless number;

$X_1, X_2$  – transverse and longitudinal coordinates;

$K$  – coefficient of interaction between phases;

$u_i^j$  –  $j^{\text{th}}$  velocity component of  $i^{\text{th}}$  phase;

$f_i$  - concentration of  $i^{\text{th}}$  phase;

P - pressure;

t - time;

$\mu_i$  - coefficient of dynamic viscosity of  $i^{\text{th}}$  phase;

$\delta_i^k$  - Kronecker symbol;

$\omega$  - oscillation cyclic frequency;

$\psi_i^j$  -  $j^{\text{th}}$  component of  $\vec{\psi}_i$  vector;

L – dimensionless quantity leading the physical area of flow to unit square;

$\xi = 0$  corresponds to a flat task,  $\xi = 1$  axisymmetric.

$X_1 = r$ ,  $X_2 = Z$ ,  $u_1^{(2)} = u_1$ ,  $u_2^{(2)} = u_2$ ,  $u_1^{(1)} = v_1$ ,  $u_2^{(1)} = v_2$

We formulate the initial and boundary conditions for the system of equations (1)-(3).

Suppose that at the initial moment the two-phase flow is at rest. Starting from  $t > 0$  pressure gradient of periodic form arises, which causes the occurrence of unsteady flow. If to this, we add the sticking conditions on the wall, as well as the symmetry conditions on the pipe axis, the initial and boundary conditions will take the following form:

at  $t=0$ :  $u_i^j = 0$ .  $f_i = f_i^0$  for  $0 < x_1 < 1$ .  $0 < x_2 < 1$ ;

at  $t > 0$ :  $x_2 = 0$ :  $P = A_0 + A_1 \cos \omega t$ ,  $u_i^1 = 0$ . ,  $f_i = f_i^0$  for  $0 < x_1 < 1$ ;

at  $x_2 = 1$ :  $\frac{\partial u_i^2}{\partial x_2} = 0$ .  $U_i^1 = 0$ ; for  $0 < x_1 < 1$ ;

at  $x_2 = 0$ :  $u_i^1 = 0$ .  $\frac{\partial u_i^2}{\partial x_2} = 0$ .  $U_i^1 = 0$ ; for  $0 < x_2 < 1$ ;

at  $x_1 = 1$ :  $U_i^j = 0$ ; for  $0 < x_2 < 1$ ;

Taking into consideration the fact that at the inlet pipe section the pressure gradient is periodic function of time, the boundary conditions at  $x_2 = 0$  for the longitudinal velocity of the carrier phase are determined from the average consumption rate in the form:

$$u_1^2 = u_{10} (A(\alpha) \cos \omega t - B(\alpha) \sin \omega t)$$

The physical-mechanical parameters of mixture of type water + solid particles are accepted as two-phase flow. The system of equations (1)-(3) is solved by the marching method, taking into account the initial and boundary conditions. The individual members of system of equations (1)-(3) are approximated as follows:

$$A \frac{\partial F}{\partial t} \Big|_{i,j} = A_{i,j}^S \frac{F_{i,j}^{S-1} - F_{i,j}^S}{\Delta t}$$

$$A \frac{\partial F}{\partial \xi} \Big|_{i,j} = A_{i,j}^S \frac{F_{i,j}^{S+1} - F_{i-1,j}^{S+1}}{\Delta \xi}$$

$$A \frac{\partial F}{\partial \eta} \Big|_{i,j} = A_{i,j}^S \frac{F_{i,j+1}^{S+1} - F_{i,j-1}^{S+1}}{2\Delta \eta}$$

$$\frac{\partial}{\partial \eta} \left( A \frac{\partial F}{\partial \eta} \right) \Big|_{i,j} = \frac{A_{i,j+1}^S (F_{i,j+\frac{1}{2}}^{S+1} - F_{i,j}^{S+1}) - A_{i,j-\frac{1}{2}}^S (F_{i,j}^{S+1} - F_{j,j-1}^{S+1})}{\Delta \eta^2}$$

$$\frac{\partial}{\partial \eta} \left( A \frac{\partial F}{\partial \xi} \right) \Big|_{i,j} = \frac{A_{i,j+1}^S (F_{i+1,j+1}^S - F_{i-1,j+1}^{S+1}) - A_{i,j+1}^S (F_{i+1,j-1}^S - F_{i-1,j+1}^{S+1})}{4\Delta \eta \Delta \xi}$$

$$\frac{\partial}{\partial \xi} \left( A \frac{\partial F}{\partial \eta} \right) \Big|_{i,j} = \frac{A_{i+1,j+1}^S (F_{i+1,j+1}^S - F_{i+1,j-1}^S) - A_{i-1,j}^S (F_{i-1,j+1}^{S+1} - F_{i-1,j-1}^{S+1})}{4\Delta \xi \Delta \eta}$$

$$\frac{\partial}{\partial \xi} \left( A \frac{\partial F}{\partial \xi} \right) \Big|_{i,j} = \frac{A_{i+\frac{1}{2},j}^S (F_{i+1,j}^S - F_{i,j}^{S+1}) - A_{i-\frac{1}{2},j}^S (F_{i,j}^{S+1} - F_{i-1,j}^{S+1})}{\Delta \xi^2}$$

Where A and F – various combinations of volumetric concentration, phase velocity components, pressure gradient and some constants.

Numerical calculations were carried out over a wide range of the Womersley frequency parameter and Reynolds number. As example of manifestation of Richardson effect for a two-phase flow, in Fig. 1 shown profiles of phase longitudinal velocities for  $\alpha_1=5$ .  $\alpha_2=1.9$ .  $Re_1=174$ .  $Re_2=25$ , as well as  $\alpha_1=10$ .  $\alpha_2=3.8$   $Re_1=155.8$ .  $Re_2=22.4$  at  $\omega t=0$ .  $\pi/2$ .  $K=50$ .  $\mu_1/\mu_2=0.062$ .

From the figure it can be seen that at moderate numbers of Womersley oscillating parameter of carrier phase ( $\alpha_1=5$ ) at the time moment  $\omega t=0$  ( $\alpha_1 = 5$ ) (curve 1), those features that are specific for oscillating flows begin to appear on the phase velocities profiles. The maximum velocity is located at distance  $x_1=0.2-0.3$  from the pipe wall, and at  $\omega t=\pi/2$  (curve 3) it moves to the core of flow. The layer-by-layer change in the  $u_1-u_2$  phase velocity difference uniformly increases in the direction of axis.

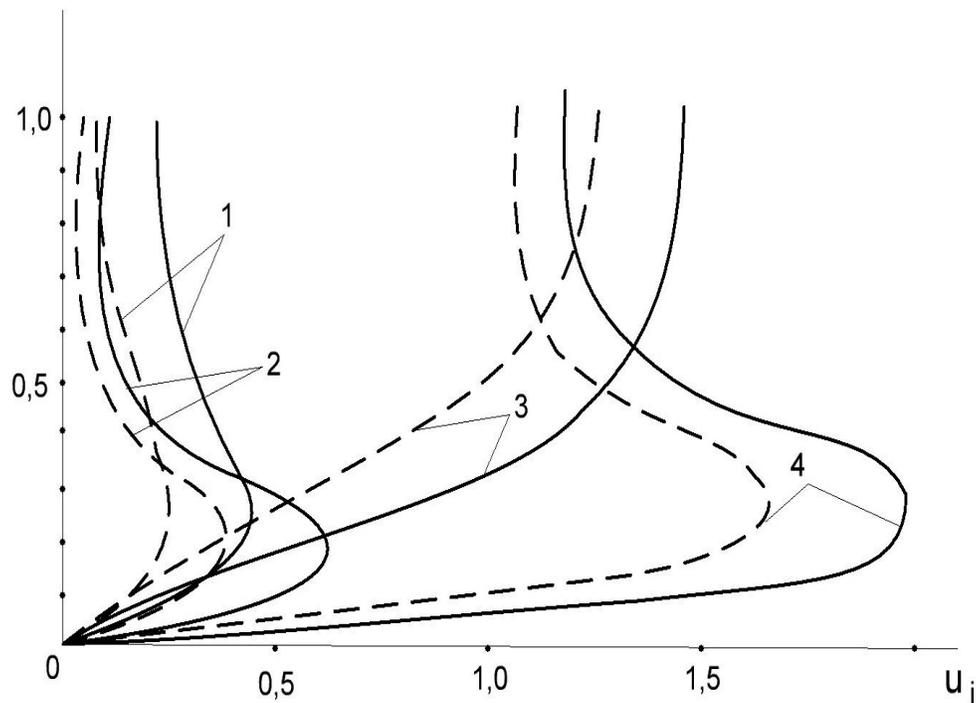

Fig. 1. Manifestation of Richardson effect for a two-phase mixture

Curves 2 and 4 obtained at  $\alpha_1=10$  and  $a_2=3.8$  clearly demonstrate the manifestation of “annular” Richardson effect for a viscous two-phase flow. The maximum values of axial components of phase velocities are moved closer to the wall. The relative difference  $u_1-u_2$  is unevenly distributed over the section of pipe; it increases in the area of maximum values. Distribution diagrams of longitudinal velocities of phase obtained at time moment  $\omega t=0$  differ from the profile taken at  $\pi/2$ . This is because the shape of the profile obtained at any time moment is certainly influenced by the velocity profiles that take place in the previous moments.

Results suggest that in the range of Womersley parameter  $\alpha_1= 6\dots 10$  the particle transfer velocity is enhanced near the wall. Particles of the second solid phase migrate from the wall in the direction of the axis.

Table 1 shows the change in longitudinal velocity of the first phase along the axis of pipe depending on Womersley parameter and phase angle. With distance from the input, the change in axial velocity becomes smoother. It gradually grows to  $x_2 =0.5$ , after which it practically remains constant. Similar picture is observed for longitudinal component of velocity of the second phase on axis of the pipe (Table 2).

Studies have shown that Richardson effect increases with increasing oscillation amplitude, and phase correspondence between shearing stress and velocity change in different layers of the flow is a function of the frequency parameter. With an increase in the frequency parameter, when an M-shaped profile of the longitudinal velocities of the phases is formed, the value  $f_2$  begins to decrease in the wall layers of the flow. Moreover, the process of particle transfer from the wall layers increases with a decrease in the boundary layer. The strongly Richardson effect is pronounced, the lower the volume content of the second phase in the parietal layers. Thus, an increase in the Richardson effect decreases  $f_2$  near the wall and increases the parietal peak of concentration of transported medium.

By virtue of Newton's law of viscous friction, the restructuring of the velocity profile during unsteady motion of the mixture should be accompanied by a change in the distribution law of shearing stresses in the flow. Due to the fact that during a pulsating flow near the pipe wall, a

deviation of the velocity distribution from the quasistationary law increases with increasing Womersley parameter, the shearing stresses on the wall must also differ from their quasistationary values. In this regard, the study showed that when the phase velocity profiles have an M-shaped distribution, the shearing stress on the wall increases several times in comparison with the laminar flow. Moreover, the larger the boundary layer, the greater the shear stress on the wall and less in layers located closer to the axis. Taking into consideration the fact that with M-shaped distribution of velocities with pronounced Richardson effect, the predominant amount of fluid is near the wall and the shearing stress increases; then the fluid with a large volume concentration in the wall layers enhances the flushing properties of the flow and prevents particles from settling, and also reduces wear.

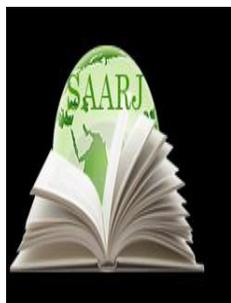

Therefore, decisive role of frequency parameter  $\alpha_i$  in changing the distribution of velocities and volume concentration of phases and, as a consequence, in changing the shearing stress, allows considering parameter  $\alpha_i$  as one of the main criteria for an unsteady pulsating flow. The ratios  $\alpha_i$  in this case are considered as the product of the Reynolds and Strouhal numbers, in the calculation of which the values of the flow parameters are taken at the same time moments.

Consequently, it is possible to control the hydrodynamic parameters of the flow from the point of view of its efficient transportation by modulating pressure gradient over wide ranges of the parameter  $\alpha$ .

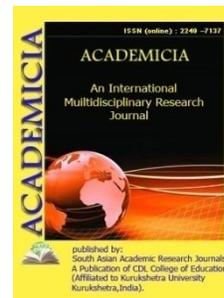

Studies carried out regarding manifestation of Richardson effect have great practical importance in transportation of small-grained materials, coal-water mixtures, as well as in washing pipes from chemicals and fuels.

## COMPARATIVE TENDER CHARACTERISTICS OF STUDENT DENTAL HEALTH INDEXES

**Farrukh Aslidinovich Ismatov\***

\*Assistant,  
 Department of facial surgery and Pediatric Surgery,  
 Samarkand State Medical Institute,  
 UZBEKISTAN

### ABSTRACT

*Students of higher education institutions constitute a special social stratum of population united by a certain age, specific conditions of education and lifestyle. Mastering the sciences requires from young people a huge amount of energy, psycho-emotional tension, physical effort, mobilization of body reserves.*

**KEYWORDS:** *Lifestyle, Students, Statistical Methods, "Health Survey" Questionnaire, Samarkand City.*

### INTRODUCTION

The analysis of the studied indicators in the dynamics of study at the university indicates that the adaptation of students to the learning process is proceeding with a different degree of intensity of adaptation shifts, which depends on a set of factors, among which an important role belongs to social factors: lifestyle and quality of life. In a comparative analysis of the incidence of teenagers noted higher rates of disease classes of the nervous system and digestive organs. The majority of authors of researches have revealed deterioration of a state of health of students from the first to senior courses, mainly due to increase in number of persons having chronic diseases. On average, the frequency of chronic pathology increases from 49% to 69% for students of higher educational institutions, the index of general pathological affection increases by 38%. Statistical methods of revealing the dependence of the state of health of the population allow to establish that risk factors are living and nutrition conditions, adverse environmental factors, genetic factors and the state of health services.

**Research objective.** To evaluate the comparative tender characteristics of dental health indices of students of Samarkand higher education institutions.

### Research materials and methods

The subject of the study was the sociological methods of studying the relationship of dental health with the general health of students.

The study was conducted in Samarkand universities:

1. Samarkand State Medical Institute:
  - a) faculty of dentistry
  - b) pediatric faculty
  - c) faculty of medicine
2. Samarkand State Institute of Economics and Service (SamISI)
3. Samarkand State University (SamDU)
- 4 Samarkand Veterinary Institute (SamVMI)
5. Samarkand State Institute of Information Technologies (SamGIT)

Our study involved 1024 students' (513 men (50.1%), and 511 women (49.9%) aged 18-25. The age-sex composition of the subjects is presented in Table .1. The average age of students was  $19.3 \pm 1.5$  years (men  $19.2 \pm 1.4$ , women  $19.4 \pm 1.6$ ).

To achieve the goal of the study, a student survey was organized using the Health Survey questionnaire, for which a Russian version was created and its cultural and linguistic adaptation was carried out.

The survey was conducted in classrooms of higher educational institutions. The interviewees were explained the purpose and objectives of the survey (on average, within 3 minutes). All

students (healthy and chronically ill) took part in the research; the survey lasted 3-4 minutes. Participation in the research was voluntary.

The research consisted of three parts.

The first part included a survey of students on questions (18), which allowed to determine the prevalence of symptoms of major dental diseases, behavioral stereotypes of students, the attitude of students to go to the dentist, to identify the presence of dentistophobia and to calculate the dental health index of students. The data were analyzed based on determining the frequency distributions of student responses. Dental health index was defined in points.

The second part included 15 questions, which were related to the study of changes in general health due to the presence of problems in the oral cavity. This part of the study was analyzed based on frequency distributions of answers.

The third part included 20 questions which provided for studying various functions of general health of students, they were united into 6 groups characterizing various functions of an organism and self-assessment of health: physical function (6 questions), mental function (5 questions), role function (2 questions), social function (1 question), perception of health (5 questions), perception of pain (1 question). Answers for each group of questions were evaluated in points. The analysis of the data from the third part of the study included comparison of the results with the data from the first part of the study and determination of correlation between the dental health index and students' general health indicators.

## **RESEARCH RESULTS AND THEIR DISCUSSION**

The results of all the studies were analyzed with a tender approach in mind.

For this part of the research, the NB questionnaire was adapted, which included a regrouping of questions, depending on the research focus. The first group of questions was aimed at studying the signs (symptoms) of major dental diseases (5 questions). The second group of questions was aimed at studying behavioral stereotypes of young people that influence the state of the oral cavity and characterize their life position (8 questions). The third group of questions (5) was aimed at studying the experience of students in various situations related to dental reception, which allowed to reveal the prevalence of stomatophobia among young people. The survey results were used to determine the frequency distribution of student responses.

The Student Dental Health Index was determined in accordance with the 8020 program's methodology, which provided a score on the answers to questions that characterize oral health and lifestyle of students. The assessment criteria for the Dental Health Index were as follows:

The 20 Score Index is an ideal value that shows a high level of oral health and the focus of students' lifestyle on achieving good dental health.

The index of 16 to 19 points indicates that a person's oral health is good and that their current lifestyle is appropriate for achieving a higher level of dental health. However, despite this, it was recommended that the current situation be improved by trying to eliminate the zero score responses (Table 2).

**TABLE2. DENTAL HEALTH INDEX SCORE FOR THE PROGRAM "8020".**

№	Answers	Questions	
		Yes scores	No scores
1.	Do you have / Have you had gum swelling?	0	4
2.	Do you have / Have you had pain in your teeth?	0	3
3.	Do you often eat / snack between meals?	0	3
4.	Do you have a hobby?	3	0
5.	Do you have a family dentist?	2	0
	Do you go to the dentist as soon as you start dentisting?	1	0
6.	siapain?		
7.	Do you have / did you have bleeding gums?	0	1
8.	Do you brush your teeth twice a day?	1	0
9.	Do you have your own toothbrush?	1	0
10.	Do you smoke cigarettes or tobacco?	0	1
	Totalpoints	20	

The index of 11-15 points showed that the current state of health of the oral cavity is not very good, and behavioral stereotypes are aimed at worsening dental health. To save teeth under the «8020» program, you need to revise your lifestyle and eliminate zero grade responses.

The index of 10 or less points indicates poor oral health and shows that existing habits are unsuitable for health. It was strongly recommended to visit the dentist, to revise the lifestyle and try to improve this situation, trying to reduce the number of responses with zero score.

The total index of dental health of students was compared with similar data from a survey of foreign students. In addition, based on the results obtained, they conducted a comparative analysis of dental health indexes of students of different universities of Samarkand and ranked the data obtained in accordance with the average score of each university.

For all parameters of this part of the study, differences between the results of the survey of men and women were For the first time, a new method of studying the relationship between the dental and general health of students was used using the Russian-language version of the questionnaire «Health Survey» (HS)

For the first time it was found that the majority (62.9%) of university students had a high prevalence of symptoms of major dental diseases, and 46.8% experienced acute toothache. The lack of need in dental treatment was reported by 17.5% of students.

Students had changes in their general health due to oral problems more often than male students: 77.3% and 70.3% respectively (74% on average). For the first time, oral problems were found to be more likely to manifest in various types of mental discomfort (68.6% of students) than in somatic disorders (31.8% of students).

For the first time it was determined that behavioral stereotypes of the majority of students, especially men, are aimed at deterioration of oral health: irrational nutrition (54.6%) and oral hygiene (20.0%), smoking (25.1%), irregular visits (90.6%) and avoidance of dentist in case of pain (50.6%). For the first time a high prevalence (80.9%>) of dentistophobia was established among university students, which was more typical for women than for men.

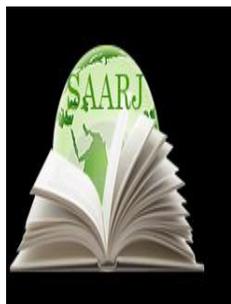

## CONCLUSIONS

For the first time determined the index of dental health of students, held a comparative tender characteristics of dental health indexes of students, which in most higher education institutions of the city, were higher for women than for men. For the first time determined the compliance of dental health index to the social image of general health of students of higher education institutions in Samarkand.

### ABSTRACT

*Among cerebrovascular diseases, the most common is discirculatory encephalopathy, which develops as a result of a slowly progressing lack of blood supply to the brain against the background of atherosclerosis, arterial hypertension or their combination. In modern functional diagnostics, besides ultrasound methods, it is widely used for vascular examination. Although it is more expensive, it is one of the non-invasive, safe and highly informative methods of examination for patients.*

**KEYWORDS:** *Discirculatory Encephalopathy, Arterial Hypertension, Noninvasive Research Methods, Magnetic Resonance Imaging, Medicine*

### INTRODUCTION

Vascular brain diseases in clinical neurology are rightly considered the number one problem, which is explained by high morbidity and mortality rates, long-term disability. Prevention and treatment of vascular brain disease remains one of the most pressing and unresolved issues in clinical neurology. First of all, it concerns discirculatory encephalopathy, the relevance of which is due to the wide prevalence of the disease and polymorphic clinical manifestations. Dizziness, headache, memory loss, rapid fatigue, sleep disorder - this is not a complete list of initial

symptoms that reduce the quality of life, make it difficult to adapt to increased psycho-emotional and physical stress, making it impossible or difficult to continue professional activity. Over the last decade, there has been a significant increase in the number of vascular brain diseases in young and middle-aged people, which are difficult to objectify in the early stages and difficult to treat in later stages. It is believed that the frequency of discirculatory disorders in the vertebral-basilar system is 25-30% of all cerebral circulatory disorders and about 70% of transient disorders. Not so long ago, the only diagnostic tool of a neurologist was a neurological hammer, supplementing the ability to analyze and compare symptoms of the disease, carefully collect anamnesis. In recent decades, the diagnostic capabilities of such imaging methods as X-ray and complex ultrasound have increased significantly. Nowadays, great importance is attached to modern methods of neuroimaging, primarily X-ray computer tomography and magnetic resonance imaging, in the diagnostics of discirculatory encephalopathy. In more than half of the observations, CT and especially MRI studies reveal changes in brain tissue that usually correspond to the existing clinical symptomatology. A timely correct diagnosis significantly contributes to adequate treatment of the disease and provides a favorable prognosis. The use of magnetic resonance imaging in clinical practice has a relatively short history - since the 80s of last century. But nowadays, it is magnetic resonance imaging that is developing rapidly and offers the widest range of opportunities to diagnose various aspects of cerebrovascular pathology. MRI diagnostic capabilities are determined by the set of performed modes of investigation, which is largely due to the magnetic field strength of the tomograph and its software. Slow modes of scanning were used at the first stages of MRI development. However, in the 90's the arsenal of possible MRI modes was significantly expanded by development of methods to control tissue contrast by suppressing the signal from certain tissue components, such as water or fat, and introduction of rapid pulse sequences, which allowed, in particular, to obtain high-resolution MRI images within a short time.

**Research objective.** Evaluate the role of magnetic resonance imaging in the complex diagnosis of brain lesions in patients with different stages of discirculatory encephalopathy.

### **Research materials and methods**

The material will serve more than 60 patients with discirculatory encephalopathy of both sexes, the control group of 30 people. All examined by clinical and neurological, magnetic resonance imaging... Particular attention was paid to the analysis of the possibilities of clinical, instrumental and radial methods of investigation in diagnostics of stages of discirculatory encephalopathy. We specified the peculiarities of the clinical course of discirculatory encephalopathy taking into account the stages of the disease and the nature of organic changes in the brain revealed by magnetic resonance imaging. The technique of qualitative and quantitative analysis of magnetic resonance imaging results in patients with discirculatory encephalopathy has been developed.

### **RESEARCH RESULTS AND THEIR DISCUSSION**

On sufficient clinical material to study in detail the clinical picture of chronic cerebrovascular diseases caused by arterial hypotension at a young age, to determine the severity of symptoms, to identify the leading clinical syndromes: asthenic and neurotic in DE I stage, caused by arterial hypotension, in DE II stage, caused by arterial hypotension cephalgia, vestibular, cognitive disorders, insomnia and disordinator. The results of the conducted research clarify and

supplement the idea about structural changes of the brain in patients with discirculatory encephalopathy, dynamics of these changes in the course of disease progression, interrelation of the revealed changes and clinical manifestations of the disease. Analysis of the results of clinical, instrumental and magnetic resonance studies made it possible to determine the criteria of differential diagnostics of stages of discirculatory encephalopathy.

The use of the proposed technique of magnetic resonance imaging analysis allows to determine quantitative parameters of structural changes in the brain, to objectify the data of clinical studies and to conduct adequate dynamic monitoring of patients with discirculatory encephalopathy during treatment. They promote reliable diagnosis of stages of discirculatory encephalopathy, which provides an individual optimized treatment approach to patients, increases treatment efficiency and reduces labor losses.

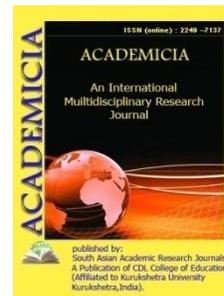

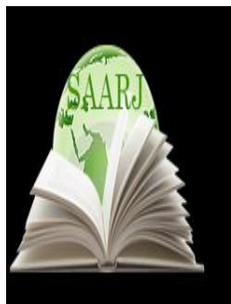

## CONCLUSION

Thus, the generalizing scientific research devoted to the purposeful study and improvement of the complex diagnostics of the stages of discirculatory encephalopathy using magnetic resonance imaging was performed. For the first time, the generalizing scientific research devoted to the purposeful study and improvement of the complex diagnostics of the stages of discirculatory encephalopathy using magnetic resonance imaging was carried out. Dynamic MRI study is recommended for patients with discirculatory encephalopathy: at stage I - 1 time per year, at stage II - 1 time in 8-12 months, at stage III DE - 1 time per six months, with the mandatory study of intravenous arteries.

## WAYS TO DETERMINE TALENTED CHILDREN IN PRESCHOOL EDUCATION

**Rakhmonova Dilfuza Mahmudovna\***

\*Teacher of Pedagogy Department,  
Pedagogy Faculty, Bukhara State University,  
UZBEKISTAN

### ABSTRACT

*The article provides detailed information about talented children and ways to identify them. In the modern world, it is very difficult for teachers to immediately identify a truly talented child because it requires a series of tests. Gifted children require special attention from parents, teachers, peers, and other members of society. It depends on the child's talent being taken into account and its full disclosure.*

**KEYWORDS:** *Talented Children, Members Of Society, Psychologists, Creative Approach, Ability.*

### INTRODUCTION

A talented child is a child who is bright, transparent, and sometimes famous (or has an inner basis for such achievements) in this or that activity. Today, most psychologists recognize that the level of qualitative specificity and developmental characteristics of talent is a complex of the social environment, which is always associated with heredity and the child's activities (play, education, work). is the result of a continuous effect. In this case, the child's personal activity, as well as the psychological mechanisms of self-development of the individual, based on the formation and implementation of individual talent, are important. The use of information and communication technology (ICT) helps students to find answers to questions that interest them, to think about events that are not clear to them, but are interesting. In the process of thinking about the problem, there are debates, different opinions.

### LITERATURE REVIEW

Talented children- these children are young people who have developed their mental abilities more than their peers and are distinguished by their intellectual, physical, creative or other abilities. A gifted child can be identified by careful observation using a variety of methods:

- Guilford's children's creativity tests reveal a variety of abilities;
- Tests designed to assess verbal creative thinking and skills in children over 5 years of age;
- Creative ability to evaluate the test group proposed by S. Rimm to identify talents, interests and hobbies;
- The Pennsylvania test, developed by T. Ruki to determine creative direction;
- Creativity test developed by J. Hemenvey and R. Hoffner.

Psychologists and educators can also use other tests and questionnaires, as well as create their own methods to determine children's abilities. Talented children have some characteristics that distinguish them: great vocabulary, they begin to speak at a very young age; remembers all the information quickly, asks a lot of questions; solid memory, ease of use of existing knowledge; very curious, easily concentrates on objects for a long time; broadened horizons, an interest in everything that happens in the world; interest in problem solving, often with no transition from question to direct solution, intermediate steps are ignored; has an unusual imagination; early onset of reading ability; has strong emotions, has a unique idea, can have a unique sense of humor; requires people and processes, but doesn't like to do the same actions for long periods of time. The appearance of one of the features presented does not make the child capable, but forces you to look at him carefully. Talented children have several of the above characteristics.

### **Analysis**

Proper upbringing of gifted children reveals their talents as much as possible and thus opens up opportunities for further development of skills and knowledge. A child's talent is manifested from the moment the child achieves his or her first achievements in painting, music, or anything else. Also, one of the signs of talent is that the child pays attention to the details of the world and is able to focus on a single topic or lesson for a long time. It is necessary to assist the child in all aspects of development, giving him the opportunity to independently obtain the information and topics necessary for reading.

However, do not praise the child, tell him that he is not like everyone else, because it can cause a number of problems, especially when it comes to the baby: often it causes difficulties in society, especially in relationships with peers, because such a child very different; constant praise can lead a child to a lack of criticism; they often ridicule others, putting themselves above others and not joking in their addresses. You may also face other problems that afflict talented children: hostility to school - the reason is that the school curriculum seems boring and uninteresting to such children, as well as very easy; play hobbies - talented children love complex games, while their peers prefer light and fun games, which in turn lead to the child being isolated and locked up; inconsistency - the rejection of any standards, especially those that contradict what interests them; manifestation of the difference between physical, intellectual and social development; a desire for imperfection that transforms itself into a sense of inferiority and resentment.

Talented children are preschoolers and teachers in need of a sensitive approach from parents and child care providers. To make it easier for a child to adapt to future developmental characteristics, they need to lay the foundations for social behavior from an early age. A number of other characteristics that such children have should also be taken into account: a special

curiosity, a desire to prove and manifest themselves in everything; early development mental ability, seriousness, openness and honesty; the desire to achieve greatness, will, perseverance in behavior; zeal in his work, excellent memory, and growing energy; manifestation of independence, independent work; self-confidence and peace of mind in any situation. Particular attention should be paid to gifted 5-year-olds who need to go to school soon. The teaching staff needs to choose the right educational institution by choosing a lyceum or gymnasium that is more prepared to work with such children. Another way to contribute to the development of such a child is through various clubs, courses and development centers, where you will have the opportunity to get everything you need to develop their talents.

There are different types of talent, and before contributing to the development of a particular talent, it is necessary to correctly determine the preferences of the child. Based on this, it can be attributed to one of the types of gifted children. A talented child may have general developmental indicators or special abilities in a particular area. Depending on this, the type of ability is determined: General ability - the development of all general skills at a high level. It is characterized by a wide range of activities in which the child can achieve significant results in any field in the future.

## **DISCUSSION**

The basis for the development of special skills, but also a completely independent factor. Artistic talent can be musical, visual or stage. Distinguished by high skill in music, fine arts, theater, sculpture and other activities. Creative ability is manifested in a creative approach to problem solving. Creatively talented children have unconventional thinking that allows them to find unique solutions to problems. Such children tend to learn new things and often this becomes their main motivation. Intellectual ability is the ability to analyze quickly, accurately, and correctly, and to compare facts, think, and even find ways to solve complex problems. Usually in school such children are excellent students. However, very good results are often achieved in one or two topics that interest the child, while the remaining topics are moderate. Smart talented children can easily process information, remember it and actively use it in the future, as well as be able to evaluate or perceive certain information. Academic ability is a clear achievement in reading, high activity and efficiency in reading and cognitive activity. Even if the specialized school curriculum is easily digested, in the future - excellent professionals. Mental and academic symbiosis refers to a child's special abilities to remember and understand basic concepts, to retain information well in memory for a long time, and to process knowledge effectively. Such children easily overcome knowledge in various fields.

Psychomotor or sports ability. It stands out among those who have special indicators in terms of speed, accuracy of movements, reaction speed and other sports skills. Social or leadership skills include a number of qualities that a person should have. Among other things, it is important to emphasize such characteristics of children - moderate intelligence, quick and independent decision-making, planning business and time constraints, self-knowledge and self-confidence, perseverance and zeal. Each direction requires a different approach. It is important to remember that talent discovered in a timely manner by parents, teachers, and educators will help the child become as open as possible and take a worthy place in society in the future. The modern world is ready to offer a range of courses that allow talented children to develop their abilities in a variety of fields. In addition, in most cases there is no need for a simple memorization of materials, an

independent long-term search. Now talented children can actively participate in technology classes using the most modern techniques and elements, which allow them to better reveal their abilities. Extracurricular activities for children allow them to discover more through a non-individual approach to each other. In this case, classes with talented children are not only useful, but also fun, because the child can often use topics and equipment that are not in school. Another advantage of such lessons is that they are conducted in a free form, sometimes in play, with the participation of experienced professionals who are ready to help and assist with all questions. From childhood, modern children become interested in computer technology, and later many will have the opportunity to acquire and discover real talents in the field of computer technology and information technology. Especially for those who are very interested in new devices, there are now a variety of computer science courses to work with talented children.

This will allow the child to better understand the computer device, its working principle and learn how to use it quickly and correctly. And that's just a small part of what you can learn by visiting our courses. In addition to learning computer hardware, a gifted child in a classroom in central Aitland will have a wonderful world of programming, which will open up an understanding of the software components of computer performance and create many opportunities for development. Talented children, regardless of their talents, require additional education. Creative children can easily take courses in animation, computer graphics, photography and other artistic activities. Each of them is carried out with the help of modern technologies, which help the child to adapt to modern conditions of modern computerization and the world of information. The use of the acquired skills will not only allow you to better reveal your creative potential, but also significantly expand your skills in the future. Talented children with different talents can visit, where everyone can find interesting moments for themselves. A similar course will allow you to demonstrate your potential in creativity, math, computer science and other sciences and fields, which is important for every child and their parents. These courses will be especially useful for technically talented children.

Classes are available for every child and will be fun even for gifted children ages 5-6. The ability to choose one or more of the courses allows a child interested in a particular direction to get the maximum amount of useful information. The development of gifted children in such courses is greatly accelerated due to the flow of important and useful knowledge acquired by students. It stimulates existing abilities and allows not only to reveal them, but also to significantly expand the child's worldview, opening up a world of unknown possibilities in front of him. Talented children are born in all corners of the world. Usually, parents are the first to notice the manifestation of certain abilities, depending on the development of the talent in the future or ignoring it. Of course, it is better when adults choose the first option and do everything for the child to develop in their areas. Throughout history, there have been many cases where people in their childhood became famous because of their genius in a particular field. Here are a few bright examples: These are just a small fraction of the children who have gained popularity and achieved great success despite their young age. Talented children are sometimes referred to as the children of the future because they can bring new and unique things to develop all the basic technologies, arts and other aspects of life. In Belarus, gifted children always test their talents and develop them by participating in our classes.

## CONCLUSION

Involve students in tasks that require elements of creative activity and independent decision-making, from simple tasks related to memorizing and narrating a task or text, to solving standard tasks, and so on. Also, for example, the Russian Working Concept on Talent focuses on the ability of gifted children to access various sources of information in the educational process, including access to information through computer networks. Depending on how quickly the student receives information and needs feedback on their actions, it is important to follow the rules of using computerized learning tools. Visual aids (videos, DVDs, etc.) can be helpful.

## BASIC PRINCIPLES OF PSYCHOLOGICAL AND PEDAGOGICAL SUPPORT OF TALENTED CHILDREN

**Dilfuza Sadulloyevna Fayozova\***

\*Teacher of Foreign Languages Department,  
 Bukhara Engineering and Technological Institute,  
 UZBEKISTAN

### ABSTRACT

*The article provides information on ways to identify talented children, methods of their psychological and pedagogical support, tools and methods that we can use in the process of teaching and developing the abilities of talented children.*

**KEYWORDS:** *Talented Children, Members Of Society, Psychologists, Creative Approach, Ability, Psychological And Pedagogical Support.*

### INTRODUCTION

The process of identifying, teaching and developing talented children is one of the most important tasks of modern national education. The urgency of working with gifted children is determined by several factors: society's understanding of "human potential" as the most important condition and main source of its development; acceleration of life dynamics, increase of information and emotional stress in a person, various problems, the solution of which requires huge intellectual efforts; society's requirements for the professional activity of a person who must be creative, active, socially responsible, have a developed intellect, higher education, etc. Psychological and pedagogical work with talented children plays a special role in the formation of such a person.

### LITERATURE REVIEW

An appropriate scientific framework is required for the effective operation of additional education institutions with gifted children and adolescents. There are already certain achievements of psychological and pedagogical science in this area. Thus, the nature of talent has been studied to date (V. Alexander, V. Bastendorf, G. Webb, D. Wexler, E. Galanter, T. Gasser, J. Miller, D. Molfese, K. Pribram, D. Hendrixon, R. Hattel, E. Shafer, J. Ertle, etc.), the essence of the concepts of "talent", "children's talent" is defined, the peculiarities of the talented

child are revealed (K. Abrams, D.B. Bogoyavlenskaya, Y.Z. Gilbux, E.A. Golubeva, E.N. Zadorina, A. Karne, N.S. Leyts, A.M. Matyushkina, F. Monks, V.I. Panov, K. Perlet, A. Savenkov, V. Siervald, K. Tekes, K.A. Heller, L. Hollingvort, E.I. Sheblanova, V.S. Yurkevich and others). In addition, the main problems of the structure and nature of abilities, the conditions of their development (B.G. Ananiev, V.A. Krutetsky, A.N. Leont'ev, K.K. Platonov, S.L. Rubinshtein, B.M. Teplov, V.D. Shadrikov, etc.), the value of general abilities, the development of special skills are considered. (B.G. Ananiev, S.L. Rubinstein). The structure of specific abilities has been studied (V.A. Krutetskiy, B.M. Teplov et al.), General laws of talent development (A.V. Brushlinsky, L.S. Vygotsky, V.N. Druzhinin, I.S. Leites, R. Stenberg, J. Freeman, etc.), methods of studying talent (A. Binet, J. Gildford, L. Terman, P. Torrens, et al.), Attempts have been made to classify talent types and create talent models (F. Monks, J. Renzulli, K. Haller, et al.). The works that reveal the practical solution of the problem (Y.D. Babaeva, G.L. Bardgor, L.M. Dolgoplova, A.V. Jigailov, V.P. Lebedeva, A.M. Matyushkin) are of great interest for our work. M. Nikolskaya, V. Orlov V. I. Panov, L. V. Popova, N. N. Ponarina, T. A. Poyarova, A. I. Savenkov, D. A. Sisk, T. V. Khromova, G.T. Shpareva, V.S. Yurkevich, E.L. Yakovleva, V.A. Yasvin and others).

### Analysis

According to our data, 62.3% of teachers and 68.6% of parents believe that “the school is in a deep crisis” and that it needs radical change. 71.5% of parents believe that the school needs to change its attitude towards the student in the first place. Only 16.2 percent of teachers point out that the processes that have taken place in school in recent years are related to the optimization of child development.

In such an environment, it is difficult to talk about a special system of school work with a category of gifted children. The situation is aggravated by the contradictions that have accumulated so far: between the growing demands on the formation of an educated, intellectually advanced, creative personality and the reluctance of the education system to solve this problem; Between the collective nature of the organization of the learning process in school and the specific individual nature of teaching; Between the purposeful influence of “adult” culture and the spontaneous emergence of child development, its individuality; Between parental expectations and real teaching practices. Resolving these and other conflicts is not just a matter of school effort. A comprehensive approach to problem solving is required. An important role in this process can be played by additional general education, in which the implementation of a model of creative development of a gifted child, systematic work with gifted children within a particular area is the most realistic.

To date, many issues related to the teaching and development of talented children in the context of additional education have not been well explored. This applies to the psychological-pedagogical diagnosis of children's talent, the influence of certain socio-psychological factors on the manifestation and development of mental ability. Specific issues of pedagogical work with talented children in the context of additional education, content, forms and methods of their development, identification of the most effective pedagogical technologies, etc. In addition, the practice of working with talented children is constant due to the diversity of talent, different theoretical approaches and methods of its study, the variability of modern education, as well as very few professionals who are professionally and personally ready to work with gifted people,

indicates the pedagogical and psychological difficulties that arise. Psychological and pedagogical support for the learning and development of talented children in the context of additional education, if the following results can be achieved:

- Children's talentedness is considered from the standpoint of a comprehensive approach to the interrelationship of three components;
- Identification, learning and development;
- Based on the scientific criteria of talent;
- Objective diagnosis of children's talent has been developed and is widely used;
- The basic principles of the organization of education for gifted school students, including the structure of additional general education, are revealed;
- Structures in the purposeful and functional form of additional general education provide the necessary conditions for the continuous development of a gifted child;
- The psychological, pedagogical and didactic bases of the processes of teaching and development of a gifted child in an additional general education institution were identified;
- A leading condition for the development of a gifted child is a person-centered learning process that implements individual-oriented pedagogical technologies.

## **DISCUSSION**

Relying on the opinions of A. Maslow, N. A. Bernstein, and other famous scientists, psychologist V.S. Yurkevich distinguished three laws of development of high abilities:

1. The development of abilities occurs only in the activity in which the positive emotions of the child occur.
2. For the development of skills it is necessary to constantly increase the level of complexity of the main activities of the child (educational and extracurricular activities).
3. For the activity to be developmental (both ability and personality of the child) it must be important for the child (in terms of internal motivation). The mission of the school is to create conditions for the development of abilities and personal qualities of students, which prepares students for lifelong learning in a market economy, ensures the competitiveness of future graduates in the labor market. The purpose of joint research work of teachers and students is to increase ICT competence, study the achievements of pedagogical science and test it in innovative activities, adaptation to society, the use of ICT in the creative self-development of the individual. Research activities are a means of teacher-student interaction.

In traditional education programs, the development of creativity and communication skills is usually not considered important. It only gives you the opportunity to acquire the necessary knowledge, skills and competencies. New approaches to the education of gifted children, computer-based educational and developmental programs, methods and forms of work using ICT are needed. In the process of working with students, a group of students is formed who compete with each other, trying to do the task as well as possible and earn the praise of the teacher. School teachers have three main tasks:

1. Develop a theoretical, practical-oriented system of working with gifted children.
2. Carrying out diagnostics and monitoring of students' abilities at school and creating an electronic database.

3. Career guidance of the obtained information by class teachers and its application in the daily work of a psychologist.

The achievement of the set goals and objectives can be achieved only in the context of the integrity of the educational process, the greater use of students' classroom and extracurricular activities. Taking into account the age characteristics of students, as well as tasks for each stage of the content of education and upbringing of students, tasks are set: The first stage of education: identification and development of creative potential of primary school students; develop a sustainable interest in learning activities; formation of interest in research activities; formation of elements of independent activity; development of elements of figurative perception and imagination as a basis of creative activity; to form a positive attitude towards oneself and people; the world, life, the formation of a valuable attitude to society.

In the second stage of education: development of intellectual and creative potential of students; to form a stable motivation for learning and creative activity; mastering the elements of research activities; formation of the basis of independent activity; develop imagination; to form a valuable attitude to oneself as a person, to the person of people; formation of a valuable attitude to the world, life, society.

Objectives of the third stage of education: development of intellectual and creative activity of senior students; formation of sustainable motivation for learning and creative activity; formation of the need for independent education; mastering the methods of research activities; development of independent intellectual and creative activity; realization of figurative and imaginative abilities; to exercise a value attitude towards oneself and the individual as a person; the ability to understand life situations and their solutions. Work with talented students is carried out in the following areas: maximizing the intellectual, material and technical potential of the school in the organization of extracurricular and extracurricular creative activities of students: science clubs and hobby clubs; sports sections, computer art clubs; creative groups; theater studios; research work; preparation of Olympiad participants; individual lessons; Diagnosis of Talents in Children and Adolescents; Early awakening of students' interest and aptitude for research activities, serious preparation for this process; Fostering an active civic position, high moral qualities and spiritual culture.

## CONCLUSION

The implementation of this work includes:

1. Development of the content of educational methods aimed at the student's experience of creative activity, which includes the following elements: comprehension, understanding of the hidden mechanisms of events, their causal relationship, the ability to predict the development of these events as; the ability to identify and pose a problem in understanding and analyzing evidence; be able to effectively transfer the acquired knowledge to research and development tasks; solve research and design problems on the basis of figurative, symbolic, meaningful analogies; change of images and ideas, their interpretation.

2. Strengthening the methodology and subject matter and its methods in students' learning activities.

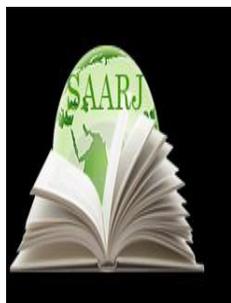

3. The use of technical modeling as a basis for the creative application of scientific knowledge and the development of creative activity of students. The end result in education is determined

not only by the level of complexity of the textual tasks, but also by the volume of the subject content, the duration of the creative activity.

## DEVELOPMENT OF COMMUNICATIVE CULTURE OF ESP STUDENTS IN THE PROCESS OF TEACHING ENGLISH LANGUAGE

**Mukhamedjanova Sitorabegim\***

\*Teacher of the Department of Foreign Languages,  
 Bukhara Engineering-Technological Institute,  
 UZBEKISTAN  
 Email id: setora087@rambler.ru

### ABSTRACT

*The article discusses some features and role of the functioning of the English language in the higher education system. Professional training of future specialists should be based on the formation of a communicative culture. Analysis training future specialists for professional activity leads to an understanding special relevance and importance of the problem of the formation of communicative culture future specialists in the process of teaching English.*

**KEYWORDS:** *Communicative Culture, Pedagogy, Method, Decree, Teaching English, Communication, Non-Language, Specialist, Foreign Language.*

### INTRODUCTION

It is well known that language has always been important. Especially in the current age of science and education, the development of the digital economy, information and innovative technologies, its importance is growing. Particular attention is paid to awareness of scientific achievements, mastering modern techniques and technologies used in various fields, exchange of experience with foreign partners, the ability of specialists in various fields to communicate freely in foreign languages in their professional fields.

The integration of our country into the world community, the development of science and technology require young people with higher education to learn and teach several foreign languages perfectly.

As a result of reforms in the education system, an effective system of teaching foreign languages in continuing education has been introduced. In addition to the work done, there is a need today to improve the quality of effective and systematic teaching of English. Consequently, the rapid growth of the scope of international educational programs also requires students to be able to use

English not only professionally, but also as an academic field of communication in modern conditions.

This requires us to form and develop a communicative culture in English related to the professional activities of future higher education personnel studying in the field of non-philological education.

### **Result**

Decree of the President of Republic of Uzbekistan number PD-1875 on the topic of "Developing the systems of learning foreign languages" in the year of 2012 on 10 December, Cabinet of Ministers dated August 11, 2017 No-610 "On measures to further improve the quality of foreign language teaching in educational institutions" in accordance with the decisions of the Ministry of Education and Science of the Republic of Uzbekistan, higher education institutions began to pay more attention to teaching English in non-philological education, strengthening language skills of students in their specialties, improving the quality of education.

Based on the decisions of the government, the search for effective ways to improve the quality of the process of teaching English in non-philological higher education institutions is carried out simultaneously in different directions. The main goal of non-philological higher education institutions in English language classes is to prepare students for speech-oriented activities in connection with the professional and social spheres of communication.

### **Method**

The possibilities of English lessons in developing the communicative culture of future professionals are very wide. Especially in English lessons, the use of interactive methods aimed at developing a communicative culture in English related to the professional activities of future highly educated professionals gives high results.

Questions of communicative teaching of a foreign language in the system vocational education have acquired particular importance in the conditions the increase in the functional significance of foreign languages caused by trends of globalization and internationalization in recent decades.

The main goal of teaching a foreign language in all its forms is development of a foreign language communicative culture of a future specialist in professional communication in a foreign language in the scientific and technical, industrial and educational spheres. Communicative culture is indicated by the main goal of learning foreign languages in the system of higher professional education and interpreted as a set of sub-competencies: linguistic competence, sociolinguistic competence, debatable competence, strategic competence and socio-cultural competence.

One of the most socially significant problems of modern pedagogy is - the formation of a foreign language communicative culture future specialist.

### **Analysis**

Proficiency in English allows you to realize such aspects of professional activity as timely acquaintance with the latest technologies, discoveries and trends in the development of science and technology, establishing professional contacts with foreign partners. It provides an increase in the level of not only communicative, but also professional competence.

Teaching a foreign language at non-language universities implies teaching professionally oriented communication between specialists different countries - both in writing and in the form of oral communication (with internship, at conferences, while giving lectures, etc.).

For the successful formation of a foreign language communicative culture the future specialist, it is necessary to take into account, in our opinion, the following pedagogical conditions:

- definition as one of the target components of activities foreign language teacher formation of foreign language communicative culture of the future specialist;
- communication-oriented nature of the learning process foreign languages based on the ideas of intercultural communication and productive joint activities;
- use of implementation-based interactive learning methods sociocultural, communicative-cognitive and project approaches.

Therefore, under the professional skills of the teacher foreign languages skills are understood pedagogically, psychologically correctly carry out professional activities aimed at the development in students of the traits of a secondary linguistic personality that predetermine ability to participate in intercultural communication.

In other words, the teacher must master the art of communication, and also be tolerant, open in the manifestations of their own interests and emotions. Moreover, a necessary condition for professional activity, according to G.V. Saprykina's opinion is that the teacher's communicative culture is elements of which include:

- ✚ The presence of an attitude towards the realization of the abilities of each student to creating a comfortable microclimate in the process of learning a foreign language;
- ✚ Degree of willingness to cooperate with colleagues;
- ✚ Speech culture.

Foreign language communicative culture in relation to educational the situation of a non-language university is considered as acquired in the process organized learning the ability of an individual to realize communicatively appropriate models of foreign language speech behavior in stereotyped communication situations. It is necessary to distinguish between theoretical and applied description of communicative culture. Theoretical and practical development of this problem is aimed at identifying external and internal communicative factors that have a direct effective influence on the process of formation and improvement organization and communication skills.

Teaching a foreign language in a non-language university provides consolidation and further improvement of basic general education the level of language proficiency in combination with an in-depth profile language training focused on the use of acquired knowledge in the field future professional activities. Acquisition by students communicative culture and is focused on the formation of such a level knowledge of a foreign language, which will allow you to use it for professional needs, the implementation of personal and business contacts and further self-education.

The formation of a foreign language communicative culture is an urgent task of scientific and practical importance. In theoretical aspect, communicative culture is presented as a multi-component phenomenon in which the level of its formation components determines the

effectiveness of development work communicative culture of the future specialist. It means that, despite the various interpretations of the component composition of the studied phenomena, such basic elements as language, speech and socio cultural competence most fully reflect the content and goals teaching a foreign language at a non-language university. Theoretical aspect communication culture is based on the most important concepts

terminological apparatus describing the communication process, including concepts of communication strategy, communicative behavior as conventions for the selection of linguistic material and the organization of communication in a set of socio-psychological and linguistic proper factors, receptive behavior as an adequate understanding of verbal actions of the interlocutor.

Applied description of foreign language communicative competence focused on the search for new methods of educational work, appropriate the goals of the formation of a competence specialist. Productive aspects learning a foreign language can be effectively explicated in such forms of methodical work as a multidimensional teaching of monologue (retelling by profile, abstracting, annotating, translation of texts in a foreign language) and dialogical speech as part of the implementation of the project methodology, gaming technologies, interactive and modular learning technologies. The listed ways of forming a foreign language communicative cultures as part of professional competence, having a practice-oriented nature, can help to form the ability trainees to action, solving professional problems.

## CONCLUSION

Use in professional training of interactive methods allows you to create an authentic virtual language environment, to include students in real situations of intercultural communication, gain individual experience of communication with another culture, which, in the end account, affects the effectiveness of the formation of a foreign language communicative culture of the future specialist.

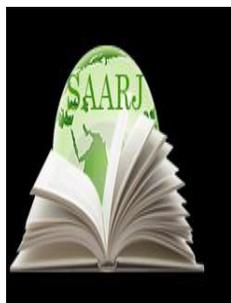

In the process of developing and improving the foreign language communicative culture in educational situations of a non-language institution of particular relevance acquires the study of social and professional context, combination collective, socially significant and personal variables. In this way, foreign language communicative culture despite the constant mobility and variability is perceived as the sum of knowledge, serving kind of guide to subsequent speech behavior and communication, necessary for students in their future professional activities.

### ABSTRACT

*The article provides information about the linguistic features of the journalistic style, its importance in Uzbek linguistics. The types of journalistic methods and their uses are analyzed. In the study of the history of the feuilleton genre, its formation and development in the Uzbek press, it is evaluated under the terms "press genre", "satirical genre", "satirical-journalistic genre". In the existing literature on Uzbek linguistics and journalism, they are listed in general in varying amounts. The division of newspaper articles into genres is still neglected. The phenomenon is that they are undoubtedly convenient for the writer and the student class: it is easy to repeat ready-made speech formulas, automate the reproduction process and facilitate communication.*

**KEYWORDS:** *Linguistic Features, Journalistic Style, Journalistic Methods, Newspapers, Magazines, Radio, Television Materials.*

### INTRODUCTION

The journalistic method in Uzbek linguistics was specially studied by T. Kurbanov. This style is the style of media, especially newspapers, magazines, radio, television materials. In linguistics and journalism, the terms "journalistic genres" and "newspaper genres" are rarely used today. The use of the term "genres of journalism" has a strong place in literary criticism. However, in Uzbek linguistics, the term "newspaper genres" has not yet found its exact expression, its object, it is used in parallel with the term "journalistic genres". Another problem is that newspaper articles do not have a clear classification by genre. In the existing literature on Uzbek linguistics and journalism, they are listed in general in varying amounts. The division of newspaper articles into genres is still neglected. In Russian linguistics, newspaper materials have a clear classification by genre. Genres have also appeared in the Uzbek periodical press since the

beginning of the 20th century. With the development of the periodical press, the peculiarities of genres, their differences, new types appeared and developed. When thinking about genres, the lack of a clear classification of Uzbek linguistics, whether it is called a "journalistic genre" or a "newspaper genre", has complicated the work in this area. The program of special courses "Language of the newspaper", "Methodology of newspaper genres" and the program of the course "Theory and practice of journalistic creativity (genres)" contain newspaper genres and their classification. It should be noted that they define "newspaper genres" in Uzbek linguistics, and despite some differences in the classification of genres, some clarifications have been made in this area.

## LITERATURE REVIEW

T. Kurbanov's researches distinguish genres of journalistic style. He noted the following genres of journalistic style: news, reportage, correspondence, article, political article, political, economic and scientific article, essay, column, pamphlet, sheet, party and government directives and decisions, information, various comments, reviews, socio-political essay, open letter, international news, call.

S. Muhamedov as a network of newspaper journalism - a genre of newspaper journalism: report, report, interview, correspondence, article, commentary, review, review, press review, essay, column, pamphlet, sheet.

O. Togayev, who created a number of studies on the features of Uzbek art journalism, assessed letters, essays, and feuilletons as genres of art journalism. In its classification, it distinguishes between genres of fiction (letter, essay, column), as well as genres of socio-analytical or information-analytical (correlation-pondensia, article, reportage). It is especially noteworthy that the scientist divided the genres into groups according to their individual characteristics.

## Analysis

In the study of the history of the feuilleton genre, its formation and development in the Uzbek press, it is evaluated under the terms "press genre", "satirical genre", "satirical-journalistic genre". The term "genres of literary and artistic journalism" is also used. "Press genres" also include information genres, correspondence, simple critical articles, main articles, general political theoretical articles, and reports. Although the researcher used various terms in a mixed way, he described the features of the feuilleton genre, mainly as a press genre, on the basis of newspaper and magazine materials. This shows that it is possible to think about the genre of the press, in particular, the genre of the newspaper, in contrast to fiction.

A. Boboyeva, recognizing the existence of "newspaper genres", distinguishes the information genre. Also noteworthy are the terms used by the scholar in relation to feuilletons and essays ("socio-publicist", "artistic-publicist"). Recently, the concepts of "newspaper language", "newspaper style", "newspaper genres" are gaining ground in Uzbek linguistics.

I. Toshaliyev defines "classification and grouping of newspaper genres" as follows: "Information genres. Analytical genres. Descriptive (artistic-publicist) genres". It includes news, reports, interviews, reports, sheets (information genres), correspondence, articles, journalism, correspondence, international reviews, press reviews, reviews (analytical genres), essays, columns, pamphlets (fiction)-publicist genres) in his classification.

G. Gafurov notes the meaning of the terms "journalistic genres" and "journalistic genres" and classifies the genres as follows:

- 1) Information genres: news, conversation, interview, report.
- 2) Information-analytical genres: correspondence, article, review, commentary, observation, letter, press commentary.
- 3) Fiction-publicist genres: essay, column, satirical genres, and sheet.

Due to the nature of the press, including the newspaper, its main function is to provide information and figurative influence through artistic and journalistic means, and so on. Researchers have used the terms "informational" genres, "art-publicist genre", and "analytical genre" when talking about genres, based on the function and methods and forms of expression of the press.

In the researches of A. Abdusaidov the language of the newspaper is studied on the basis of the following classification:

### **INFORMATION GENRE**

1. Message: chronicle-message, news-message, critical or satirical message, short messages under special headings, extended messages.
2. Reportage: reportage on current events, thematic reportage, problematic reportage.
3. Report: simple report, analytical report, thematic report, problem report, scientific report, court report, report on official events. Interview: interview-monologue, interview-dialogue, interview-sheet, portrait-interview, round-conversation, press conference.

### **ANALYTICAL GENRE:**

1. Correspondence: information correspondence, analytical correspondence, problematic correspondence, positive correspondence, critical correspondence, portrait correspondence, feedback correspondence.
2. Article: main article, theoretical article, problem article, critical article, propaganda article, scientific-educational article.
3. Review.
4. Commentary: general review, thematic review, news review, press review.
5. Image: thematic review, general review, information review.
6. Letter: newspaper letter, open letter, appeal, congratulation, letter from the writer.
7. Observation: general observation, thematic observation.

### **ARTISTIC-PUBLICISTIC GENREES**

1. Sheet.
2. Essay: essay-portrait, travelogue (travel essay), problem-essay, essay-sheet.
3. Feuilleton: documentary feuilleton.

Among the sources of journalistic style, especially the press, i.e. newspapers and magazines, have a special place. A number of studies on the study of the language of newspapers in Uzbek linguistics have been created.

A.Abdusaidov's monograph "Journalist's language skills" provides a review of the literature on the study of newspaper language. It shows the newspaper vocabulary in Uzbek linguistics, the use of international words and terms in the periodicals, semantic and stylistic features of the lexicon and phraseology of the magazine "Mushtum", newspaper speech, newspaper headlines, lexical doublets based on newspaper materials, lexical and Syntactic variants, statistics of newspaper language, the role of newspaper language in journalistic style, genres, grammar of newspaper language, some syntactic features of "Turkistan region newspaper", ancient Turkic words on the basis of rich facts from periodicals of the first half of XX century, there is important research on lexical stratification, polysemy, newspaper language, and literary norms.

## DISCUSSION

The language of the newspaper has a special place and features in the journalistic style. K.Yusupov, A.Boboyeva, A.Abdusaidov indicated the following as characteristic features of the language of the newspaper:

1. The language of the newspaper is the written literary language. It has its own linguistic features.
2. The newspaper publishes materials on all functional methods. In some materials they come in a mixture. This is one of the peculiarities of the language of the newspaper. Materials on other functional methods (e.g., poems, stories, excerpts from works of art, decrees, decisions, etc.) should be studied within the framework of their own methods, if they are not embedded in the materials of the newspaper, i.e. it is related to the language of the newspaper.
3. Newspaper materials differ in style and expression. If the message, main article, correspondence, report, commentary, etc. are written in pure literary language, elements of artistic style are widely used, such as plates, essays, open letters, reports, critical articles, feuilletons. In these genres, elements of dialect are sometimes used in their place.
4. The language of the newspaper is close to the language of artistic, colloquial styles, differs from the language of scientific, formal styles.
5. It is typical for the language of the newspaper to use standards (templates) and stamps (templates).
6. The peculiarity of the language of the newspaper stems from its functions such as informativeness, organization, propaganda and effectiveness. These features of the language of the newspaper are taken into account when using language tools.
7. Expressiveness is expressed in the language of the newspaper. Publicity, imagery, emotionality and expressiveness, clarity and concreteness, conciseness, and debate are taken into account in ensuring effectiveness.
8. The situation with the use of language in newspaper genres is different. The use of expressive and methodological possibilities of lexical, phraseological, grammatical means in information,

analytical and artistic-publicist genres has similarities and differences. Different methods are used when using the methodological features of language tools.

9. The language of the newspaper strictly follows the spelling, lexical, grammatical, punctuation and methodological norms of the literary language. Deviations from the literary norm (for a specific methodological purpose) occur in the language of plates, essays, critical articles, feuilletons. If the general norm is followed in the artistic style, the work in the language of the newspaper is carried out within the literary norm.

10. The language of the newspaper contributes to the enrichment of the literary language, in particular its vocabulary. Changes in socio-political, economic, spiritual and domestic life are first reflected in the newspaper. As a result, new words or words from other languages are widely used in newspapers. The newspaper acts as a "creative laboratory" in the use of lexical units, especially terms.

11. The newspaper is a written source that keeps pace with the times, neologisms and occasionalisms are often used due to the skill of journalists. Newspaper language has more opportunities to reflect changes in the lexicon of our language than artistic style.

12. The language of the newspaper as a written literary language is also a source of high literacy due to the fact that it is based on certain rules, norms and existing spelling rules.

13. The language of the newspaper as a model language serves as a kind of mirror in the development of speech culture, the promotion of literary norms. Some of its shortcomings are identified and the state of the newspaper's language and changes in language development are assessed accordingly.

## CONCLUSION

In newspaper language, various speech stereotypes are as common as elsewhere. The phenomenon is that they are undoubtedly convenient for the writer and the student class: it is easy to repeat ready-made speech formulas, automate the reproduction process and facilitate communication. In particular, one of the laws of language development and one of the principles of speech, "speech effort" and "time saving" - is not only "material economy", but also the use of complex words, formal business style abbreviations, speech style elliptical sentences), but in "saving mental reserve". However, this only applies to the language of the newspaper. Many speak and write through ready - made formulas.

### ABSTRACT

*This article focuses on the development and improvement of methods for measuring the speed of asynchronous electric motors without sensors, as well as the mathematical representation of this system model. Since it is accepted to write the magnitudes corresponding to the rotor with index 2, we define the angle between the real number axis  $d$  of the rotor coordinate system and the fixed axis in the stator coordinate system as  $th\theta_2$ .*

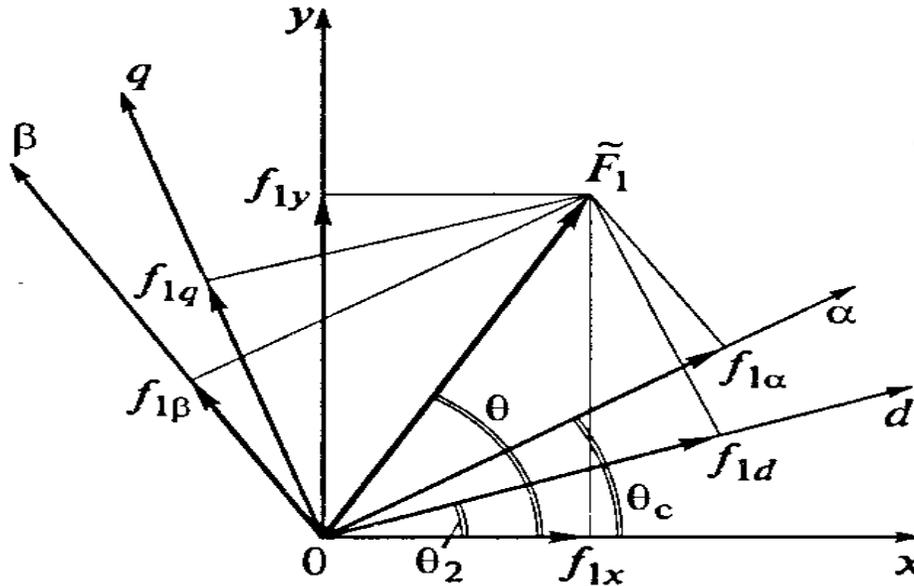

**KEYWORDS:** *Stator, Rotor, The Number Of Pairs Of Poles, Angular Frequency, Electric Drive, Angular Velocity.*

---

### INTRODUCTION

In addition to the stator coordinate system, we can also use the  $d - q$  rotor coordinate system, which is connected to the motor rotor shaft and is stationary with respect to it. This system rotates with the rotor in electric space. In this coordinate system, we denote the spatial vectors considered by the index  $d - q$ , respectively, by such indices we also denote the projections of the spatial vectors  $d$  and the vertices. Since it is accepted to write the magnitudes corresponding to the rotor with index 2, we define the angle between the real number axis  $d$  of the rotor coordinate system and the fixed axis in the stator coordinate system as  $th\theta_2$ . The difference between the

rotation of the rotor in physical space and the rotation in electrical space should not be overlooked. The unit of measurement for all angles shown in Figure 1 is el.rad. The positions of the axes in the physical space depicted in the figure only correspond to the fact that the number of pairs of poles of the motor is  $r_p = 1$ .

**Figure 1. Location of a spatial vector in different coordinate systems**

The figure also shows another general a-b coordinate system that is arbitrarily oriented relative to the x - y and d - q coordinate systems. In our subsequent descriptions, we consider this coordinate system as a system that rotates at a synchronous angular velocity equal to the angular frequency of the supply source voltage in the electric space. With respect to the stator coordinate system, the instantaneous value of the angle of rotation of this system is defined as  $\theta_c$  [1].

Continuing to look at the MYUK vector in the example of a spatial vector, we can write the following expression for a rotating vector with respect to a fixed x - y coordinate system:

$$\tilde{F}_{1x-y} = F_{1max} e^{j\theta}$$

Or

$$\tilde{F}_{1x-y} = F_{1max} (\cos \theta + j \sin \theta = f_x + j f_y ,$$

where  $F_{1max}$  is the amplitude value of MYUK.

The angle is a function of time  $\theta$ , if the value of MYUK changes when the operating mode of the electric drive changes, the value of  $F_{1max}$  can also change.

Similarly, we can write a spatial vector expression for a rotor coordinate system. To do this, we must take into account that the d - q coordinate system itself shifts at an angle  $\theta_2$  with respect to the stator coordinate system:

$$\tilde{F}_{1d-q} = F_{1max} e^{j(\theta-\theta_2)}$$

Writing an expression in the d - q coordinate system using a spatial vector projection is as follows [2]

$$\tilde{F}_{1d-q} = F_{1\max} \{\cos(\theta - \theta_2) + j\sin(\theta - \theta_2)\} = f_d - jf_q$$

Comparing the expressions (1) and (2), we obtain the formulas for the transition from the stator system to the rotor system and vice versa from the rotor system to the stator system:

$$\begin{aligned}\tilde{F}_{1d-q} &= F_{1\max} e^{j\theta} e^{j-\theta_2} = \tilde{F}_{1x-y} e^{-j\theta_2} \\ \tilde{F}_{1x-y} &= F_{1d-q} e^{j\theta_2}\end{aligned}$$

In the general coordinate system, the spatial vector is written as follows

$$\tilde{F}_{1\alpha-\beta} = F_{1\max} e^{j(\theta-\theta_c)}$$

Or

$$\tilde{F}_{1\alpha-\beta} = F_{1\max} \{\cos(\theta - \theta_c) + j\sin(\theta - \theta_c)\} = f_\alpha - jf_\beta$$

The relationship between writing a space vector in a general coordinate system and writing in a stator or rotor system is defined as follows:

$$\begin{aligned}\tilde{F}_{1\alpha-\beta} &= F_{1\max} e^{j\theta} e^{-j\theta_c} = \tilde{F}_{1x-y} e^{-j\theta_c}; \\ \tilde{F}_{1x-y} &= \tilde{F}_{1\alpha-\beta} e^{j\theta_c}; \quad (6) \\ \tilde{F}_{1\alpha-\beta} &= F_{1\max} e^{j(\theta-\theta_c)} e^{j\theta_2} e^{-j\theta_2} = \tilde{F}_{1d-q} e^{-j(\theta_c-\theta_2)}; \\ \tilde{F}_{1d-q} &= \tilde{F}_{\alpha-\beta} e^{j(\theta_c-\theta_2)}\end{aligned}$$

From our subsequent statements, it is clear that in the mathematical representation of an asynchronous motor electric drive, there are both quantities in the stator coordinate system and quantities in the rotor coordinate system. All these sizes must be brought into some kind of common system. The above formulas allow you to do this.

In asynchronous motors, the angular frequency supply  $\omega_{0\beta 1}$  of the supply voltage and the rotor speed  $r_p \omega$  electric in the electric space vary in all modes except the ideal salt operating mode. The difference between the angular frequency of the voltage in the stator and the speed of the motor in the electric space  $\omega_{0\beta 1} - r_p \omega$  determines the angular frequency of the rotor EYUK, and this difference must be taken into account in the process of mathematical expression of the electric drive.

We can say the specificity of the spatial vector in conclusion: the projection of the spatial vector on the axis of the sphere at each moment of time is equal to the instantaneous values of these magnitudes [2].

The design of a synchronous motor stator is no different from the design of an asynchronous motor stator. It will have a three-phase coil, just like an asynchronous motor. When the coil is supplied from a three-phase voltage source, the current flowing through them creates a rotating magnetic field at a synchronous speed. The design of a synchronous motor rotor is drastically different from the design of an asynchronous motor rotor. The rotor of a synchronous motor will have a single-phase (exciter) coil supplied from an alternating current source. The presence of an

alternating excitation current causes the rotor to generate its own magnetic field. This field binds to the rotating magnetic field of the stator and forces the rotor to rotate synchronously along the speed of the stator field. Therefore, in steady state, the motor speed is always equal to the synchronous speed  $\omega_0$ , which value is determined by the supply voltage frequency and the number of pairs of poles of the stator coil  $\omega_{061}/r_p$ . An instantaneous deviation of the motor speed from synchronization can occur only in transient processes, for example as a result of a change in the load on the motor shaft. At the end of the transient process and if the loading torque does not exceed the maximum allowable value, the speed returns to  $\omega_0$ , again.

Synchronous motors are divided into open-pole and non-polar motors, regardless of their design. In the first case, the rotor poles are made separately from the rotor itself. In the core made of electro technical steel, the excitation coil windings are installed and the finished winding poles are fastened to the rotor. In the second case, there are special radial grooves in the electro technical plates on which the magnetic conductor of the rotor is assembled. After the rotor is assembled, the excitation coil windings are placed in the longitudinal grooves formed on its surface. In special grooves arranged along the length of the rotor, the cores of the damper (starting) coil are installed. These cores are connected to the rotor teeth by short-circuit segments, the segments of the individual poles are interconnected, resulting in a short-circuit coil reminiscent of an asynchronous motor. This coil serves to start the synchronous motor. During start-up, it receives the same acceleration as an asynchronous motor, but when switching to synchronous speed, the excitation voltage is applied to the rotor shaft and the motor moves in synchronization. In order to prevent the formation of large EYUK in the engine parts at start-up time, the drive coil is short-circuited or an additional resistor is connected. The damping coil also causes the rotor to vibrate, which is generated in the transient process. In stabilized synchronous mode, i.e. when the speed of the stator field and the speed of the rotor are equal to each other, there is no current in the damper coil.

The design difference between an open-pole rotor motor and a non-polar rotor motor is primarily due to the inductance of the stator coil directed along a straight axis, which is compatible with the rotor poles and is defined as a threat. It is assumed that the inductance of the stator coil directed along the quadratic axis denoted by  $q$  is not the same. Second, these inductances are equal to each other.

Typically synchronous motors are synchronous speeds of 100 to 3,000 rpm used in high-power non-adjustable electric drives. is a huge motor with a range of tens of kilowatts to several tens of thousands of kilowatts. However, adjusting the speed of the synchronous motor supplied from the adjustable source can be done by changing the frequency of the stator voltage.

Let us consider the electromagnetic processes that take place in a synchronous motor for the simplest case, i.e., when the damper coil is not in the rotor. To do this, we consider only a rotor motor with an open pole, but it should be borne in mind that in the transition from an open pole to a non-polar motor, only the mathematical expression of the motor assumes that the inductance of the stator coil is equal on both axes.

As done in the process of mathematical representation of an induction motor, we introduce a  $d - q$  coordinate system connected to the rotor and rotating with it for the case under consideration. However, there is a significant difference between the  $d - q$  coordinate system in asynchronous and synchronous motors, which differs from the synchronous speed in all modes except the ideal

slip operating mode, where in the first case this coordinate system converts to rotor speed in electric space  $r_p \omega = \omega_{0bl} - \omega_r$ . In the second case, its velocity in the electric space is always equal to the synchronous velocity  $r_p \omega_0 = \omega_{0bl}$ . Thus, in the mathematical representation of a synchronous motor, the d-q coordinate system plays the same role as the  $\alpha - \beta$  coordinate system, which rotates at the same synchronous speed, used in the mathematical representation of an induction motor.

Since the stator winding of a synchronous motor is almost indistinguishable from the stator winding of an asynchronous motor, the equilibrium equation of the stator voltage can be applied directly to the mathematical expression of the synchronous motor. To do this, it is necessary to describe the spatial vectors belonging to it through their projections on the coordinate axes: [3]

$$\tilde{U}_1 = u_{1d} + ju_{1q}; \tilde{I}_1 = i_d + ji_{1q}; \tilde{\Psi}_1 = \psi_{1d} + j\psi_{1q}$$

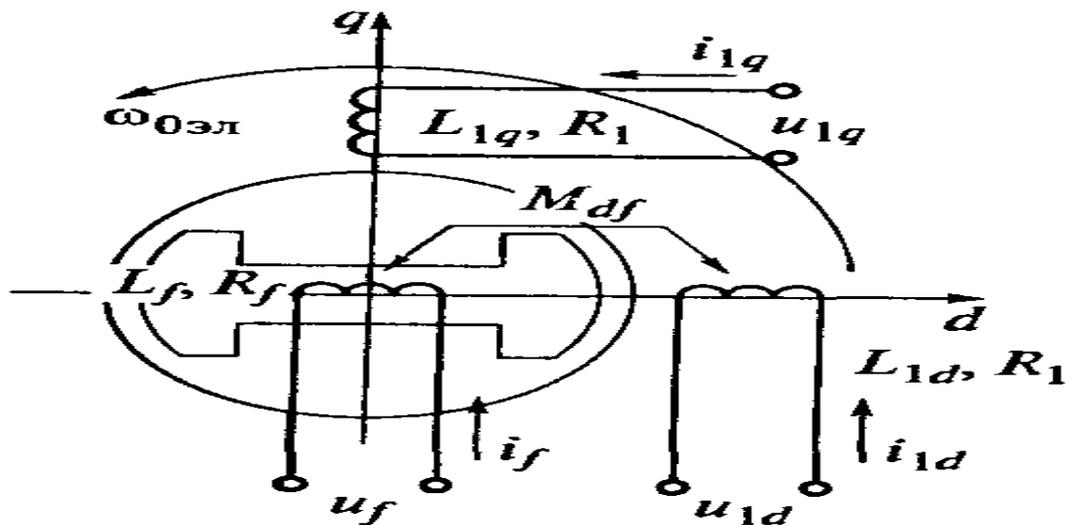

Unlike an induction motor in which the rotor coil is affected by a three-phase alternating current with an angular frequency equal to  $\omega_r$ , an alternating current flows through the synchronous motor drive coil. The voltage  $U_f$ , the current  $i_f$  and the rotor current junction  $\psi_f$  in the excitation coil are stationary with respect to the rotor and can be represented by rotating spatial vectors along it and respectively with the d - q coordinate system. In this assumption, they do not differ from the spatial vectors formed as a result of considering the stator voltage, current, and current junctions in a three-phase system. Therefore, the actual axes of the d - q coordinate system are directed in the direction d along the axis of the excitation coil axis, i.e., the vector of the coupling of the rotor current and by directing it along the corresponding excitation voltage and current vectors, the magnitudes of the rotor connected by the equation  $u_f = R_f i_f + p\psi_f$  can be considered as the projection of the spatial vectors on the d-coordinate axis .

It is more convenient to use the motor model described in Figure 2 to analyze the connections between currents and current junctions. In the model, the three-phase winding of the stator is replaced by two phases, which are stationary with respect to the rotating coordinate system d - q and are characterized by active inductors  $R_1$  and  $L_{1d}$  and  $L_{1q}$ . These axis axes are oriented along the d and q coordinate axes. They are subjected to a constant voltage along the  $u_{1d}$  and  $u_{1q}$  axes, and as a result currents  $i_{1d}$  and  $i_{1q}$  flow through the coils. The excitation voltage  $u_f$  watt current  $i_f$  is applied to the rotor coil with resistance  $R_f$  and inductance  $L_f$ . As can be seen from Figure 2, the stator current junction on the selected coordinate axes is determined by the currents  $i_{1d}$  and  $i_f$  at the junction, and only by the current  $i_{1q}$  at the junction [3].

Taking into account the above, the mathematical model of electromagnetic processes in a synchronous motor without a damper can be described in the form of a system of equations written for the projection of generalized vectors on the axis of the rotating coordinate system:

$$u_{1d} = R_1 i_{1d} + p\psi_{1d} - \omega_{0bl} \psi_{1q};$$

$$u_{1q} = R_1 i_{1q} + p\psi_{1q} + \omega_{0bl} \psi_{1d};$$

**Figure 2. Model of a synchronous motor in a rotating coordinate system**

$$u_f = R_f i_f + p\psi_f;$$

$$\psi_{1d} = L_{1d} i_{1d} + M_{df} i_f ;$$

$$\psi_{1q} = L_{1q} i_{1q};$$

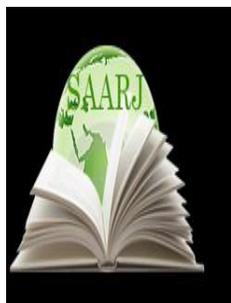

$$\psi_f = L_f i_f + M_{fd} i_{1d}.$$

where  $R_1$ ,  $R_f$  are the resistances of the stator coil and excitation coil phases, respectively;  $L_{1d}$ ,  $L_{1q}$  and  $L_f$  are the total inductance of the stator coil and the total inductance of the excitation coil along the d and q coordinate axes, respectively;  $M_{df}$ -d is the mutual induction coefficient between the excitation coil and the stator coil along the coordinate axis,  $M_{df} = M_{fd}$ .

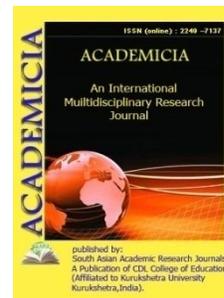

Usually in references the parameters of synchronous motors are given in relative units. Therefore, when considering the problem of mathematical representation of electromagnetic processes in a synchronous motor, it would be expedient to move to relative units, that is, to normalize the equations that are part of its mathematical expression. The base values required for normalization should be selected in such a way as to allow the maximum reduction of the primary equations representing the physical processes in the engine from yesterday. ### INTRODUCTION

Image modes that are new to yesterday are considered a common occurrence for today. Today's Uzbek literature follows the path of depicting the human psyche in all its complexity. Our writers use new ways and methods to describe real events in the plot of the work, to reveal the character of the heroes, their psychology. It is widely observed that, in order to increase the reality of the events described in the work, the author uses the events of people's lives to increase its artistic value, the use of folklore traditions in the process of reflecting customs and traditions, national features, myths, legends and fairy tales.

As we read the stories of the talented writer Isajon Sultan, we can often come across such features. His works are led by devotion to the motherland, courage, holiness of the family, love for the mother and relatives. As we look at the writer's work in recent times, we see that a subtle aspect of it has centrifuged the past, history, and the future through mythological methods. This method, embedded in the writer's stories, ensured that the stories were educated and popular.

Our acquaintance with dozens of his stories, such as "Garden of Era", "Windy Night", "Fate", "The Hut in the Forest", "The Secret of the Blackbird Star", "Me, My Mother and the Mediterranean" led us to this conclusion. The language of the writer's stories is also very close to the vernacular, as it is simple and fluent.

One such story of Isajon Sultan is the story of Bibi Salima. The protagonist of the story is a kind-hearted Uzbek woman, full of pure sincere feelings.

The story begins: "Bibi Salima lives in a green village. The village is not large, but the scenery in each yard is similar. The streets are dirt, the water in the ditch in front of the houses. The dense oak leaves rustle along the stream. In front of some, the brooms stretched out like a green storm. In fact, it is a type of flea, which people use as a broom. When you enter Bibi Salima's house, you will see a dark building with a porch on the left. It is a newly built tandoor (oven). " Although the writer begins the story with a landscape, he focuses on the tandoor detail in conveying the course of events and unites all his thoughts around that detail.

The story begins with Bibi Salima's oven-building process. The tandoor is actually represented in the play as a symbol of sustenance. This populism in the work, a reference to our traditions and customs, begins with the tandoor builder finishing his work and asking Bibi Salima to bless.

"Do I pray when a man is standing?" said Bibi Salima, uneasily.

'You will bake the bread,' said the baker. 'I will bless the clay I have made and the work I have done. Ask for blessings.' [1, 26]. The play focuses on prayer, one of the ancient traditions of our people. In fact, Bibi Salima believes that women do not pray where there are men. "No, do I pray when a man is standing? On the one hand, it refers to the beginning of the domination of the patriarchy, and on the other hand, it is based on our international views on the supremacy of the man in the family, his greatness.

Bibi Salima in the story also says that the prayer should be started by a man in a way that is typical for Uzbek women. Quoted from Bibi Salima. In the author's work, Bibi Salima depicts not only a simple, sincere Uzbek woman, but also a beautiful Muslim woman.

The author said to the tandoor, "We have made you so that we may find food for our children." Your liver burns, but for us they bake red bread" [1, 26]. But the tandoor, which is the main detail in the story, is a reference to their religious beliefs as a symbol of sustenance, food, life, which is considered sacred among the people. The beliefs of our ancient ancestors regarding bread and wheat are embedded in the speech and actions of Salima mother. The motive for addressing the tandoor in order to glorify it is originally derived from the life of the people and is a product of mythological views associated with the glorification of bread. This motif used by the author should be regarded as ethnofolklorism. This motif used by the author should be regarded as ethnofolklorism. In order to brighten up the character of the protagonist in the story, he used ethno-folklore appropriately: "May God provide us with abundant food, serve us for many years" [1, 26]. Interestingly, Isajon Sultan broke the tradition formed on the basis of an ancient religious view in the essence of the applause in the speech of the protagonist. This is a testament to the writer's artistic skill.

Bibi Salima's husband becomes ill, and a helpless woman relies on Allah alone at such a time. "O God, heal my husband and bless my livelihood. It's all up to you, isn't it?" [1, 29]

More applause is addressed to God. The story mentions another tradition that is common among our people. Our ancestors get up early in the morning and open the doors and windows of the house because in their eyes angels enter the house in the morning. They teach their children and grandchildren that an angelic home will be blessed and prosperous. The writer infuses this tradition into the actions and thoughts of the protagonist in order to show the spirit of the people in the story. Bibi Salima also gets up in the morning and opens the doors as if an angel enters the house. He thinks that if the doors are closed, he should be reluctant to enter. The folk tradition used in this story of the writer is the character of the protagonist of the work, which serves to reveal the psyche and to show the vitality of the traditions used in our people. The skill of the writer lies in the use of folklorisms in the plot of the work with towels and covers. Bibi Salima's opening of the doors in the morning and the entrance of blessings into the house is a secretly expressed ethno-folklore, which is embedded in the actions of the protagonist. The use of curses in the speech of the characters, the place of applause is the use of towels.

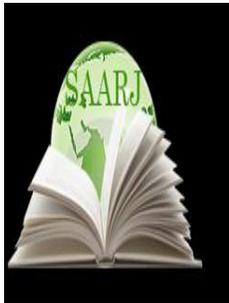

The second story, "Manzil (Address)", which we want to analyze, is also based on ideas that discuss human life and its essence. In most of his works, the spirit of self-discovery and understanding of the meaning of life leads. The protagonists of the story "Manzil" Muslim, Muhammad and Abdullah also set out in search of the treasure of their lives. On the way to the destination, they come across mountains, oases and deserts. These scenes involuntarily remind us of the birds that set out in search of Semurg in A. Navoi's epic "Lison ut-tayr" and the valleys they passed through, or Santiago, the protagonist of "The Alchemist". All of these heroes set out in search of the treasure and meaning they needed. However, not all the heroes of the work were able to reach this address. Except for the protagonists of our story, Muslim, Muhammad and Abdullah, their companions were not fortunate enough to reach this address. This is also a matter of fate. Their friends became victims of the promised wealth, pleasure along the way. In a word, they forgot the purpose for which they set out by indulging in the lusts of the world. In the language of mysticism, they could not rise from the Shari'ah to the sect, from the sect to the enlightenment. The main protagonists of the story, due to the strong faith, patience and faith in their hearts, reached their goals and destinations. In this way, they overcame lust, which was their greatest enemy.

Look, they did what they were looking for, but they came across an unexpected, unthinkable situation. They went and saw that there were a number of talisman gates. But there is not a single gate in them that mentions the names of their partners left on the road. There is no name for them among the gates of Mount Tilsim in the Tilsim Valley, which have been sought for almost a lifetime. There is wisdom here too, that is, their destiny has come here. It is no coincidence that the name of this lifelong mountain and valley is Tilsim. The spell will have a solution to a puzzle that is unknown to everyone. They were eager to know the meaning and solution of their lives, and this magic was found. It read: "This treasure is enchanted in the name of one of the servants of God. I swear by the attributes of the Creator that I, the possessor of this magic, will deliver my demon-possessed Palbos horse owner to his husband in the blink of an eye. I will pour out the riches of the world under my feet. I will make you king over whomever you want. I teach the language of worms, birds and animals. I am weak only in the presence of my Lord and in the face of the judgment which he has decreed" [2, 44]. As they read these words, they will see their reflections on the outside of the ring. They realize that what they have been searching for all their

lives is only in themselves, and at the end of their lives, they have achieved the truth they are looking for.

## MANAGEMENT OF THE TEACHING STAFF AND IMPROVING THE QUALITY OF EDUCATION

**Kurbanov Muzaffar Ummatovich\*; Toshpulatova Nozima Sadullayevna\*\***

<sup>1,2</sup>Kokand State Pedagogical Institute,  
 Kokand, UZBEKISTAN

### ABSTRACT

*The idea of quality and quality management of education is one of the most relevant at the present stage of development for the Uzbek school. Improving the quality of education in secondary schools is, first of all, the correct formation of the teaching staff of the school, the definition of specific goals and objectives for the teaching staff and monitoring their implementation. The positive component of this approach is that during its implementation, both the continuity of the Uzbek traditions of education is preserved, and the set of positions that best meet the modern needs of society and standards is expanded. The quality of education is understood as its compliance with the existing requirements, norms and standards, the needs of society and production. In the course of the study, a complex of theoretical and empirical methods was used: analysis of scientific literature, generalization, systematization, modeling, observation, study of pedagogical experience, pedagogical expertise.*

**KEYWORDS:** *Teaching Staff, Quality, Quality Management Of Education, General Quality, Total Quality Management, Quality Of Education, Education Quality Management System, Consumer, Team, Monitoring.*

### INTRODUCTION

Quality management in a general education institution affects all its constituent structures: target, functional, technological, organizational, informational, normative and criteria. In a school environment, education quality management can follow two sides: quality management of the educational process and management of its development. The overall goal of quality management at school is to achieve a higher quality of teaching staff, curricula and programs, the quality of teaching, teaching methods, pedagogical control. To do this, it is necessary to have reliable and informative quality indicators, peer review mechanisms, a quality monitoring system, rating scales and standards.

The effectiveness of management activities is largely determined by how the school leaders master the method of pedagogical analysis, how deeply they can investigate the established facts, and identify the most characteristic dependencies. An untimely or unprofessional analysis in the activities of the school administration leads, at the stage of developing goals and forming tasks, to ambiguity, vagueness, and sometimes to groundlessness of decisions [1]. Ignorance of the true state of affairs in the pedagogical or student collective creates difficulties in establishing the correct system of relationships in the process of regulating and adjusting the pedagogical process. The main purpose of pedagogical analysis as a management function is to study the state and development trends of the pedagogical process, in an objective assessment of its results, with the subsequent development on this basis of recommendations for streamlining the controlled system. This function is one of the most labor-intensive in the structure of the management cycle, since the analysis involves the allocation of parts in the studied object into a single whole, the establishment of links between system-forming factors.

The management process of any pedagogical system involves goal-setting and planning (decision making). The improvement of goal-setting and planning of management work is dictated by the need for constant development, movement of the pedagogical system. The goal of management activity is the beginning, which determines the general direction, content, forms and methods of work. When determining the "tree" of management goals, it is necessary to present a general, or, as they say, "general" goal to be presented in the form of a number of specific private goals, that is, to decompose the general goal. Thus, the achievement of a general, general goal is carried out through the fulfillment of its constituent goals. Implementation of the planning function in a single management cycle increases the efficiency of the school [2].

A special document can be developed at the school in accordance with the existing development priorities and the readiness of the administration and the teaching staff to strive to meet the needs of consumers of educational services as a priority area of their work. The objectives of this document are formulated based on the desire:

- To increase consumer satisfaction with the educational services provided,
- To give the implemented educational programs a greater social orientation,
- To increase the competitiveness of the school in the educational services market of the region.

Effective work of staff is the most important condition for the success of educational institutions, which is determined by the specifics of pedagogical work and the state of the organization [3]. Human resources are the main potential of an educational institution and activities for its development are one of the leading tasks of management, since:

- Teachers create a microclimate that directly and indirectly contributes to the full development of the child,
- The unity of efforts of the teaching staff, combined with the activity of children, ultimately lead to the achievement of the key goals of education.

The school must formulate the basic principles of personnel policy and ensure that they are strictly followed.

The activities of the heads of educational institutions related to the management of the teaching staff are today becoming the subject of numerous discussions. The study of this topic from the

standpoint of psychological support has been carried out relatively recently. In modern domestic educational psychology and management psychology, there is an objective need to study this definition in the context of the transition to market relations of the mentality of both the younger generation and many pedagogical workers, especially young ones, have a changed approach to the system of school teaching and upbringing [1].

It is not enough just to build the organizational structure of an educational organization; it is necessary to ensure the effectiveness of joint activities of people. To do this, it is necessary, firstly, that the performers understand well what results and when are expected of them, secondly, that they are interested in receiving them, thirdly, that they feel satisfaction from their work, fourthly, that socially- the psychological climate in the team was favorable for productive work. The totality of actions taken by the subject of management to ensure all these conditions is called leadership [4].

Tasks in implementing the leadership function:

- 1) Selection, placement and evaluation of personnel, setting tasks for performers;
- 2) Analysis and regulation of the socio-psychological climate in the team;
- 3) Stimulation of the productive activity of subordinates and their self-development;
- 4) Creating conditions for the professional growth of subordinates.

The peculiarity of intraschool control is its evaluative function of focusing on the teacher's personality. If the teacher is young, then this affects his professional development; if it is a teacher with experience - on strengthening or weakening his professional position and authority in school. Therefore, in the implementation of control, the professionalism and competence of the inspector is so important. The person performing the controlling function must be a person. Its task is not to "catch" and whip up fear, but to objectively assess the state of affairs, provide methodological assistance, support, and stimulate pedagogical activity. The existing practice of intra-school control is not without some drawbacks. Firstly, this is the absence of a control system, when there is no distribution of objects of control among the director and his deputies, when control is organized in the name of reporting and recruiting the number of lessons or classes attended. Secondly, this is the formalism in the organization of control, when there is no clearly defined purpose of the control, there are no objective evaluation criteria or are not used. Third, the one-sidedness of intraschool control, understood as the control of one side, one direction of the pedagogical process. For example, only the educational process is controlled, or only the lessons of the Russian language and mathematics, etc. Fourth, only officials participate in the control, without the involvement of experienced teachers, methodologists, or, conversely, a small participation of representatives of the administration.

Management of the teaching staff ensures the achievement of the goals of improving the quality of education and includes:

- setting clear goals for educational purposes
- creation of conditions conducive to self-realization of teachers and their satisfaction with their work;
- effective use of professional skills and capabilities of teachers;

- creating and maintaining a favorable moral and psychological climate;
- meeting the professional needs of teaching staff;
- Evaluation of results.

Each teacher is a unique and inimitable person, in this regard a manager can hardly expect that the application of the same approach, the same management actions and techniques to different employees will be equally effective. At the same time, it should be taken into account that, from the point of view of psychologists, the behavior of an employee manifests itself not only rational, but also intuitive-emotional qualities of his character. Thus, his decisions and behavior are determined not only by rational (conscious), but also by emotional factors, most often acting together [5]. A person acts, on the one hand, according to his inner inclinations and decisions, and on the other, according to the external environment. The decisions and actions of any person are influenced by:

- personal professional skills
- material and spiritual stimulus
- family circumstances
- features of his personality;
- opportunities given to him by nature or developed in the course of training;
- existing or prevailing views and tastes;
- Motivation of activity inherent in him from birth or developed.

An experienced leader recognizes that human nature is a critical business variable and is essential to the effective operation of an organization.

If we consider organizational behavior, first of all, as a managerial process, then in this case it is necessary to find out the role that belongs to the leaders in it, in essence and who are its organizers.

Distinctive features of modern management in education:

A systematic approach, implemented through a unified system of pedagogical requirements, a unified system of value orientations.

A situational approach based on the fact that management decisions are made taking into account the current situation.

Continuous improvement of organizational culture, implemented by attracting specialists of a high professional and general cultural level to the educational institution, by inviting managers, scientists to improve their qualifications, conducting lectures, consultations and seminars with management and teaching staff.

Personality-oriented and individual approach, which consists in maximizing the identification and use of the abilities of each member of the team, observing freedom of choice for all participants in the educational process, creating a favorable moral and psychological climate, conducting research by the psychological service of the educational institution, individual

conversations between the head and employees on issues personal participation in improving the activities of the educational organization.

A democratic approach, which consists in delegating authority and responsibility to heads of departments and teaching staff, providing opportunities for discussing important issues, taking into account the opinions of employees when making decisions.

It should be noted that the level of sociability is the most important quality that determines the professional competence of teachers.

Thus, on the basis of the above, it can be stated that the psychological support of the work of the leadership of an educational organization is one of the most important tasks of organizing the management of pedagogical collectives.

The most effective ways of psychological support for the work of the head of an educational organization in managing the teaching staff, in our opinion, are as follows: the interaction of the psychologist and the school management should be aimed at improving the style and methods of managing the teaching staff, corresponding to the characteristics of the stage of development of the teaching staff, the formation of the atmosphere in the team benevolence, respect and trust in employees, the use of collegial decision-making methods, democratization of management [6].

Thus, the head of the educational organization needs to create psychological and pedagogical conditions under which each member of the teaching staff could feel like an organizer at their workplace, which is achieved through the implementation of productive management models and leadership styles in the process of business communication with employees and students:

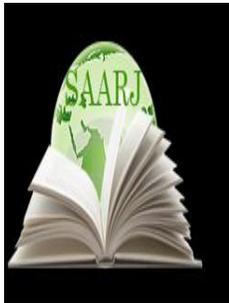

- Formation of optimal conditions for the activities of teaching staff;
- Improving the structure of relationships, personal contacts, etc.;
- Provision of a recruiting procedure for primary school collectives, taking into account the psychological compatibility of people;
- The use of active socio-psychological methods to develop skills of effective interaction among team members.

Management functions of the teaching staff include a set of tasks: personnel policy, selection of employees; assessment and certification; training; placement of management personnel. Creation of a team of like-minded people capable of setting strategic goals and solving complex problems, motivating employees to the changing conditions of activity due to the modernization of education, the merger of educational organizations, etc. subject only to leaders who have mastered the art of combination.

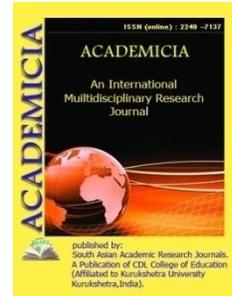

Management of the pedagogical team is a complex process, on the basis of which ensuring the quality of education is a key issue. Therefore, in the formation of the pedagogical team, it is necessary to set clear goals in the management of the educational process, taking into account various factors.

## THE INFLUENCE OF ALIEN IDEAS AND IDEOLOGIES ON HUMAN THINKING AND CONSCIOUSNESS

**Yuldasheva Matluba Minavarovna\***

\*PhD. Kokand State Pedagogical Institute,  
 Kokand, UZBEKISTAN

### ABSTRACT

*The article focuses on the role of religion in the life of society, the threat of destructive, alien ideas to human life and various manifestations of ideological threats, their danger to the development of society and the impact of various destructive actions on the human mind and psyche.*

**KEYWORDS:** *Society, Man, Consciousness, Foreign Idea, Ideology, Threat, Religion, Nation, Spirituality, History, Cosmopolitanism, Homeland, Popular Culture, Freedom, Democracy, World, Psyche.*

### INTRODUCTION

It is well known that religion performs important functions in society. Therefore, the influence on religious beliefs has become one of the main directions of spiritual and ideological threats. At the same time, the most harmful manifestation of the destructive idea, the threat of the idea of cosmopolitanism, aimed at extinguishing the love of young people for their homeland, is also manifested in the context of globalization. Undoubtedly, this ideological current that promotes statelessness is one of the most serious threats to our national spirituality.

In turn, cosmopolitanism (Greek word "cosmopolites" - "citizen of the world") is a movement that pollinates the whole earth as a single homeland, a person's love and devotion to his homeland, people and state. Harmful ideas such as statelessness, indifference to the present and future of the homeland, disrespect for independence rely on and feed on cosmopolitanism.

Cosmopolitanism, which emerged as a reflection and denial of patriotism, has historically manifested itself in various forms. Where life is easy and where the stomach is full, to keep the homeland, to love the homeland if it is rich, to leave it when disaster strikes, to stay in one's homeland and to look at other places, these are manifestations of statelessness.

The idea of statelessness is considered one of the most dangerous weapons in the arsenal of ideological struggle. Categories and individuals who are dissatisfied with life in their own country are found in every society. A little propaganda, the advertisement of a "prosperous life" abroad, could instill in such people, who were not brought up in the spirit of the national idea, at first indifference to the motherland, and gradually hatred.

If a person consciously, intentionally condemns his country and throws a stone of blame, such a person is considered a traitor in the eyes of the people. But there is another group of people who condemn and do not appreciate their country, the work being done in their country.

At the same time, Islam Karimov has sharply criticized those who are afraid to tell the truth in the conditions of independence, who are afraid to reveal shortcomings, and who say that the ongoing reforms do not concern me. In his speech "Man, his rights and freedoms and interests - the highest value", the head of state said that the remnants and complications of the former regime, the old approaches and views are still in the minds of many. "If we acknowledge our achievements, critically evaluate our shortcomings and mistakes, and tell ourselves the bitter truth in the first place, we will never be short, but we will be able to prevent such shortcomings in our lives in a timely manner" [1] says the first President of Uzbekistan I.A.Karimov.

Indeed, the spectrum of attitude to the Motherland is very wide: on the one hand, there is boundless love and unconditional devotion to it, while people of pure conscience and faith love the Motherland. As it is said in the hadiths, "Loving one's country is a matter of faith." [2]

The second pole of the attitude to the Motherland, the opposite side - is patriotism, betrayal of the Motherland. Terrorist groups and their leaders who shed the blood of innocent people in Uzbekistan fall into the category of such patriots.

It is known that there are great forces behind the subversive activities in Uzbekistan. Undoubtedly, their goal is to disturb the peace of our people, to intimidate them, to frighten them, to undermine their confidence in our policies, to strike at the great deeds they are carrying out.

From this point of view, the impact of ideas and ideologies alien to our nation on the minds and psyche of people is characterized by "theoretical" and "pragmatic". This is because the natural difficulties of the transition period, the alternative "theoretical foundations" and "methodological means" of trying to take over the human mind and heart from the outside in situations where ideological immunity is unstable, are natural. These different theories are trying to influence people's minds and spirits through their own means.

In general, along with love for the motherland, national pride and national pride are among the highest feelings. The national pride of our people is based, first of all, on our rich cultural heritage, our centuries-old traditions and values. We have another wealth to be proud of, which is our culture and unique mentality. After all, "the main task of all our parents and educators is to bring up our children in accordance with the traditions, beautiful values and modern methods of upbringing, to acquaint them with the wonders of the world before their eyes" [3]. Due to this, the concepts of family, lineage, dynasty, neighborhood, nation have become a source of pride for us. It is the sacred duty of each of us to regularly propagate the ideas of statelessness in order to prevent them.

Another ideological threat, called the "promotion of democracy", which is currently developing in a specific ideological direction and aimed at increasing its influence in the socio-political, spiritual and cultural spheres, is one of the key elements of the system of destructive ideas.

It is also no secret to an honest and conscientious person that the slogan of the spread of democracy is, in fact, what goals and interests are hidden under the plan to export it in opposition to democracy. In other words, our ideological opponents are trying to spread obscenity by promoting "immorality" under the guise of democracy. As the first President of the Republic of Uzbekistan I.A. Karimov noted, it is important to timely understand the essence and goals of the long-term policy pursued under the guise of "promoting freedom and democracy."

Naturally, under the guise of "popular culture", the spread of ideas of moral depravity and violence, individualism, egocentrism, and, if necessary, enrichment, disregard for thousands of years of traditions and values of other peoples, the spiritual foundations of life, dangerous threats to destroy them not to worry.

Today, the perception of immorality as a culture and, conversely, a disregard for original spiritual values, poses a serious threat to today's progress, human life, family sanctity and the upbringing of young people, and how to combat such attacks understands the importance of" [4].

In general, the conveniences created by globalization are emerging as an effective tool for self-serving forces. They use such tools extensively in the field of economic potential, engineering and technology, as well as in the field of spirituality, and artificially raise their philosophy, norms and criteria of social development to the level of "world standard".

It should be noted that today there is a great opportunity to use the advanced achievements of information technology, the significant results of integration processes for noble purposes, to penetrate into the spirituality of a people or a social stratum, to use truly noble, humane ideas, to promote high values. .

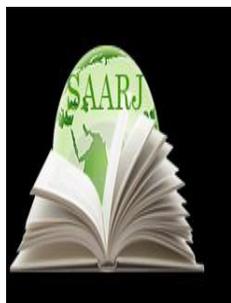

Of course, some forces that aspire to hegemony in the ideological and political spheres are not interested in such behavior. Therefore, they seek to reduce spirituality, to use methods that lead to spiritual decline. Today, our ideological rivals promote immorality as "individual freedom" and obscenity as a "celebration of democracy." The natural desire to preserve one's identity, spirituality and national pride is interpreted as a return to antiquity, a suppression of freedom, a lack of democracy.

In response to the growing spiritual attacks during the years of independence, the first President I.A. Karimov created the concept of "high spirituality" in the framework of the theory of "Uzbek model" of development. The content of this ancient concept has been further enriched, the role, place and significance of spirituality has been re-evaluated.

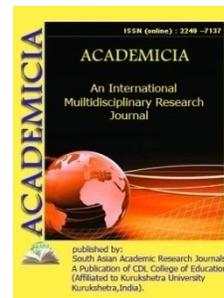

In particular, for a comprehensive scientific and practical analysis and evaluation of complex ideological processes, to identify their priorities, to study their impact on different segments of the population, to reveal the essence of harmful ideas that contradict our national interests and way of life, to strengthen national thinking the effective performance of tasks of special importance is an objective necessity.

**ABSTRACT**

*In this article, the author describes the historical aspect of the development of handicrafts in the Kokand Khanate and the special role of paper production. This aspect of the issue serves as additional material for the works published so far in the international arena. Thus, the production of paper in Samarkand workshops stopped, and gradually Kokand workshops began to have a supply of paper throughout Central Asia, ie in Turkestan - from the Aral Sea to the Chinese border.*

**KEYWORDS:** *Paper, Handicrafts, Kokand Paper, Objuvoz, Paper Making, Paper Varieties, Paper, Cover.*

---

**INTRODUCTION**

The largest center of paper production in Central Asia after Samarkand was the city of Kokand, where the emergence of production had its own historical conditions.

It is well known that in the eighteenth century, due to the political crisis in the Central Asian states, cultural life throughout Central Asia and the production of paper, which is a part of it, faced a crisis. In particular, various wars, uprisings, conflicts between khanates led to the collapse of the Samarkand School of Paperwork. On the contrary, during this period, paperwork began to flourish in Kokand, which was becoming politically stable. Masters from Samarkand moved here. Thus, the production of paper in Samarkand workshops stopped, and gradually Kokand workshops began to have a supply of paper throughout Central Asia, ie in Turkestan - from the Aral Sea to the Chinese border. Even when studying the list of Oriental manuscripts at the Institute of Oriental Studies of the Academy of Sciences of the Republic of Uzbekistan, among the manuscripts of the XVIII and XIX centuries there are no sources written on

Samarkand paper. On the contrary, it turned out that most of the manuscripts and records of the second half of the XVIII century and the XIX century were written on Kokand paper. By the 19th century, the workshops in Kokand had become the largest paper production center in Central Asia. Because paper production is integrated into a single neighborhood. Persons responsible for the quality, quantity and price of the paper have been appointed. As a result, Samarkand and Khorasan papers soon began to be phased out in Central Asia.

Kokand has always been a major center of handicrafts and trade in the Fergana Valley. The city has developed a variety of handicrafts, including the paper industry, which is a rare branch of handicrafts in Central Asia. To date, the craft of making Kokand paper is one of the most widely studied scientific topics, and the study of this issue can provide new information about the history of the city, the history of handicrafts.

Indeed, the paper craft in Kokand has a long history. Researcher Ahmadali Madaminov, based on local historical sources, says that in the XVIII century in Kokand there was a craft of paper production. This means that when the Kokand khanate became independent from the Bukhara khanate, many new crafts, especially paper-making, appeared in Kokand. V.K.Razvodovsky, who studied Turkestan handicrafts in the 19th century, said that the Chorsu paper handicraft workshop in Kokand had a 200-year history.

The first information about the production of paper in Kokand can be found in the works of Russian tourists who traveled to Turkestan in the second half of the XIX century. In particular, P.I.Pashchenko in his work "Turkestanskiy Kray 1866" tells about the local production of paper in Kokand [1].

A.P. Fedchenko, who traveled to the valley in 1871, wrote that the paper in Kokand was mainly in two workshops, one near the city's Moi Mubarak Gate and the other in Chorcu near the city. (A.P.Fedchenko "In Kokand Khanate") [2].

He also gives information about masters Saib Nazar, Master Muhammad Musa Fozilov, Muhammad Sodiq Muhammadimov, who made paper in their personal shops [3].

In particular, the well-known Russian scientist V.Grigorev came to Kokand in 1931 and visited the Paper Village and witnessed the method of production of this product, which has been polished for centuries, confirms our opinion.

Thus, it can be said that the paper handicraft in Kokand as a rare handicraft based on its several hundred years of experience has long satisfied the khanate's need for paper. As a result of subsequent historical processes, the industry fell into disrepair, and artisans dispersed. But the industry has not completely stopped in the country. The once famous Muy Mubarak paper shop has been preserved as a toponym (place name) today.

**Kokand paper was able to compete with Chinese paper.** Kokand paper can easily compete with Chinese paper in terms of quality, durability and elegance. Because paper as transparent and elegant as Kokand paper is considered to be non-existent in the world. Many countries around the world have long had the technology of making paper. Papyrus papers were made in Egypt, Chinese and Japanese papers in the east, and silk papers in Samarkand. In particular, the ancient Kokand paper has a special place in Central Asia due to its smoothness, the fact that it can be written on both sides and does not soak in water. Even Afghanistan, Khorasan and Badakhshan used this paper. By the 20-30s of the XVII century, paper production was developed in

Samarkand, Bukhara and Kokand. What else! The highest grade, a paper money that makes a rattling sound. Later, Kokand became the largest center for the production of paper. Kokand paper, it could easily blend with Chinese paper in terms of quality, durability, and elegance. The rapid development of paperwork in our city is associated with the ruler of Kokand Tangriyor. At the beginning of the seventeenth century, he invited his brothers, masters Nurmuhammad and Ahmad Akhun, from the city of Khotan in East Turkestan, to improve this important profession. They set up a paper-making workshop in the village of Muyimuborak, on the banks of a wet river, on the outskirts of Kokand. The local youth, on the other hand, are hired as apprentices and later rise to the level of skilled paperworkers. At that time, the paperwork workshop was no different from the objuvoz, which justifies rice in terms of the appearance and work process. That is why his name was called "Objuvoz" among the people [4].

What was the technology of making paper? Initially, the paper was mainly made of old rags. These were supplied by the old-timers. The color of the raw material is divided into varieties depending on what the fabric is made of. The homogeneous is soaked in large pools, placed in an iron-clad keel on the inside, and crushed with a hammer. After this process was repeated six to seven times, the semi-finished product in the dough state was thoroughly mixed in the pits. The mixture was then taken by means of raw or woven netting and the water was soaked. The finished product is spread evenly on a special board. On top of it is laid a chna board, and heavy stones are pressed. The next day the mixture was glued to the ganj wormwood wall. The dried paper is slowly poured from the ganchi soil and, when dropped, is sorted. The next task was to polish, polish, and flatten the paper. They applied wheat flour or lilac glue to both sides of the paper, dried it in the shade, and polished it with an agate or kiudung sharpener. That is why polishing and polishing paper is called 'kudungkash', and the owners of this profession are called 'kudungkash'. Thus, 300 to 500 sheets of paper are produced per day. For this, a batman, i.e. 17 kilograms of rags, was used.

From the second half of the 19th century, Egyptian and American cotton were used as paper raw materials. To this end, paperworkers set up cotton stalks around the city. However, in the 1870s, all the masters were relocated to the Sokh Valley, 70-80 kilometers from the city. While some attribute this to the controversial situation at the time, others say that the paperworkers were angered by Khudoyorkhan, the last khan of Kokand. It is known that in the early 70s of the last century Khudoyorkhan built a luxurious palace Horde. When it was finished, the chief architect - master Abdullah from Rishtan was invited to the residence. According to one of the popular legends, during the construction of the new Horde of Khudoyorkhan, the city's paperworkers were moved far from Kokand. The reason for this was due to the conclusion of the artisans that the strong underground blows given by the paper-making shops during the paper-making process had a negative effect on the longevity of the palace [5].

We built this building by the will of Allah Almighty. But how many centuries will he be a master on earth as a symbol of our kingdom? Asked the khan. Master Abdullah silently led Khudoyorkhan to the roof of the building and placed a bowl full of millet in the upper part of the mezzanine. However, the air was clear and there was no strong wind. After a while, the container becomes empty. When the khan asks the secret of this, he points to the master Abdullah Muyimuborak. The sound of the objuvos could be heard in the Horde. Then the khan felt that the ground was trembling uncontrollably from the blow of the rags.

If the paper towers are moved three to four miles from the city, the building could last up to a thousand years, the master said.

For Khudoyorkhan, the preservation of the Horde, the symbol of the arch state, the kingdom, was paramount.

Khudoyorkhan will take the last but fair measure to protect the city buildings, a unique monument of our architecture - the Horde. According to his decree, the Kokand paperworkers will move the paperworkers with their tools and equipment to the villages of Qalacha and Tul in the Sokh region, which is 70-80 km away from the city. According to Ehsionali Tursunov, an elderly teacher living in the village of Mui Muborak, Mamadali built a paper factory on the riverbank, first in Qalacha and then in the village of Faznov, and taught his children. His company has been producing since the turbulent political times in Turkestan.

Master Yodgorboy and his son Kadyrali went to Shafirkan district of Bukhara oasis at the invitation of the Emir of Bukhara and started paperwork. The paper he produced pleased the emir. There is even information that Amir Yodgorboy married one of his concubines to his son Kadyrali. After the dissolution of the Bukhara Emirate in 1920, the master Yodgorboy returned to Kokand with his son Kadyrali and spent his life as a farmer.

The memoirs of local elders about the life and work of the paperworkers in the village of Qalacha also provide some information. In particular, the stories of Mirzali, Sharifjon, Bobojon ota, grandchildren of Qalacha paper masters, are of great importance. According to Bobojon ota Latipov, in the 1930s, when he was still young, objuvoz worked day and night on the banks of the Sokh River. Well-known poets Charkhi and Chusti, who came to the village, also wrote about this in their impressions.

Bobojon told his father that Salihboyvachcha, Karimchaboy, Madaliboy had seen these objuvoz from the masters from Kokand. Despite his young age, Bobojon has a good memory of these masters who condemned the 80-90s. They were mainly engaged in paperwork. Running objuvoz, washing raw materials required a large amount of clean running water. This is probably the reason why Qalacha, which is located in the wetlands along the river, was chosen. Paper production in the village continued until the early 1930s. Paperwork has been replaced by cotton fields. Many of the workshop owners were sent into exile as earwigs, some were repressed, objuvos were demolished, and pools were filled with stone. Russian papers, which were much cheaper for the need, began to be used [6].

According to the villagers, Qalacha paper was sold on camels to towns and villages in Afghanistan, Badakhshan, Khorasan and Turkestan. In conclusion, the art of paper making in Kokand has a long history. According to some sources, this network was formed in Kokand in the XVII century and developed in the XIX century. Paper centers such as Mui Mubarak and Chorku were established. Kokand papermakers, who are famous for their paper in Central Asia, have also started making various types of paper. Kokand paper is known for its high quality and is known to have been exported to Kashgar, northern Afghanistan and Egypt. According to some sources, a good scientific article was published in the Afghan magazine "Farhangi Mardum" about the use of this paper by the Emirate of Bukhara in money circulation.

But in our opinion, the main reason why papermakers moved to a new place during this period was the influx of cheap paper products from Russia into the country, which squeezed out the

products of local papermakers. It is also possible that artisans have moved to areas where there is always an abundant supply of water and less access to factory products.

Victim of years of repression. Running the objuvos, washing the raw materials required a large amount of running water. This is probably the reason why Qalacha, which is located on the river, in the wetland, was chosen. Later, when the kolkhozes were formed, the cotton fields of the paperworkers were confiscated. Most of the owners were sent into exile as listeners, some were repressed. The objuvs were demolished, the pools filled with stone, and in life a much cheaper Russian paper was used. Thus, the Kokand paper, which became famous all over Central Asia, also fell victim to the years of repression. Until the 1940s, paper was sometimes made for the needs of the kolkhoz.

Have you looked at the pages of old books?

Kokand paper can easily compete with Chinese paper in terms of quality, durability and elegance. Because transparent and elegant paper like Kokand paper is considered to have never existed in the world. The elegance is that if a text was written on it, it could be easily read from the back of the paper as well. The parchment paper does not soak quickly in water, stretching instead of tearing when pulled. When it was made into a rope, it could carry a lot of weight. It was also used for dope ornaments. Experts say there were about a dozen types of Kokand paper. In particular, there were high-grade paper types such as abribahor, abrishem, haftrang, which were separate shops of different khans, and abribahor was the most expensive type of paper in their store. Calligrapher Roji Khokandi was an incomparable master in the colorful processing of abri paper types. Mirzo Khairullo Mirzo Hoqandi Mirzo Nosir oglu (poet, master of Askarali Charkhi in poetry), a skilled calligrapher from Kokand, was also very good at making such magnificent writing papers.

The production of khafrang paper required special skills from the master. The pages of the manuscripts were made of brown paper, and each sheet was shiny in a different color. As a result, this quality did not tire the reader, but added to his enjoyment. For example, one of the calligraphers, Muhammad Tohir Hoqandi, copied a 48-page bayaz of Mirzo Bedil's selected ghazals, poems by Furkat, Almai, Zavqi and others. This bayoz is currently kept in the Fergana Regional Museum of Literature and Art in Kokand. In general, in the research work devoted to the production of paper from silk in Kokand, there is no mention of whether paperworkers worked with paper or not, but a scientist familiar with local paper production methods, A.A. Semyonov writes: "Kokand masters knew how to make silk paper, they went to Bukhara and showed it to local masters." Master Yodgor confirmed that he used to buy silk paper from Kokand long ago. This opinion is confirmed by the orientalist Ibrokhim Adilov.

In Kokand, abrishem paper is also made from waste silk and silk fabrics. Sacred books copied by Kokand calligraphers, textbooks on Arabic grammar, and works by famous poets are mostly written on this paper. In particular, in 1873 in Kokand, a common textbook on Arabic morphology "At-tarif al Izzi" was copied in black ink on such silk paper. This idea is also confirmed by the fact that in 1875 in Kokand one of the most popular textbooks on Arabic grammar called "Al-kofiya" was copied on silk paper in black ink. From this it is clear that in the past, bibliography and paperwork were considered not only a profession, but also an art.

Silk paper made by Kokand craftsmen was expensive and in demand due to the weight of life. Often this type of paper is made to order by a wealthy man. High-grade papers were also used for khanate correspondence, decrees, documents and letters.

Among the young specialists, the miniature artist Shomahmud Muhammadjanov and the painter Maruf Salimov to some extent revived the method of making Kokand cloud paper (about 1980). In the manufacture of paper, mulberry bark served as a raw material.

It should be noted that each manuscript is a work of art by different masters - sahhof (cover), artist (decorator), tablecloth (master who decorates the text of the work in different lines), lavvax (master who frames the text), paper (paper) cutting master), abroz (abri paper making master) is the result of joint creative work. The word abru means cloud in Persian and means spring rain water. This work of art, adorned with marble flowers, served to decorate works of high artistic value, letters and some miniatures.

Each of them is a different color, weekly, that is, seven shades of paper are made in the same Kokand. We only have books printed on white paper. Our ancestors, on the other hand, ensured that its leaves shone with color. When this is done, the reader does not get tired, but adds to the pleasure. From this it is clear that bibliography is not only a profession, but also an art.

During the years of repression, when people were exiled to Siberia and buried in graves, those books, made of Kokand's original paper, were lying on the ground for 30-40 years, rotting under the ground, as if they had just come out of the rubble. I read compliments.

According to experts .....

According to experts, there are about ten types of Kokand paper: abrebahor, abrishem, haftrang. These are considered to be of high quality. In particular, the abrebahor was made of Egyptian cotton and was mainly used for covers. They are decorated with egg yolk to make them beautiful. In the city there were sahhofs, i.e. separate shops of binders, and Abrishem was made from scraps of silk and silk fabrics. The production of haftrang paper, on the other hand, required special skill from the master. In general, in the research work devoted to the production of silk paper in Kokand, there is no mention of whether the paperworkers worked on paper or not, but a scientist familiar with local paper production methods, A.A. Semyonov writes: "Kokand masters knew how to make silk paper, they went to Bukhara and showed it to local masters." Master Yodgor confirmed that he used to buy silk paper from Kokand long ago. This opinion is confirmed by the orientalist Ibrokhim Adilov [6].

In Kokand, abrishem paper is also made from waste silk and silk fabrics. Sacred books copied by Kokand calligraphers, textbooks on Arabic grammar, and works by famous poets are mostly written on this paper. In particular, in 1873 in Kokand, a popular textbook on Arabic morphology "At-tasrif al Izzi" was copied in black ink on such silk paper. This idea is also confirmed by the fact that in 1875 in Kokand one of the most popular textbooks on Arabic grammar called "Al-kofiya" was copied on silk paper in black ink. From this it is clear that in the past, bibliography and paperwork were considered not only a profession, but also an art.

Silk paper made by Kokand craftsmen was expensive and in low demand due to the weight of life. Often this type of paper is made to order by a wealthy man. High-grade papers were also used for khanate correspondence, decrees, documents and letters.

Among the young specialists, the miniature artist Shomahmud Muhammadjanov and the painter Maruf Salimov to some extent revived the method of making Kokand cloud paper (about 1980s). In the manufacture of paper, mulberry bark served as a raw material.

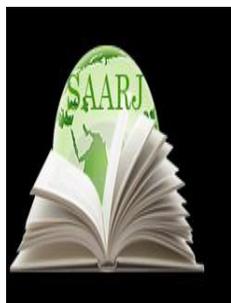

It should be noted that each manuscript is a work of art by different masters - sahhof (cover), artist (decorator), tablecloth (master who decorates the text of the work in different lines), lavvax (master who frames the text), paper (paper) is the result of the joint creative work of abroz (master of abri paper). The word abru means Persian cloud and means spring rain water. This work of art, comparable to marble flowers, served to decorate works of high artistic value, letters and some miniatures.

Each of them is a different color, weekly, that is, seven shades of paper are made in the same Kokand. We only have books printed on white paper. Our ancestors, on the other hand, ensured that its leaves shone with color. When this is done, the reader does not get tired, but adds to the pleasure. From this it is clear that bibliography is not only a profession, but also an art.

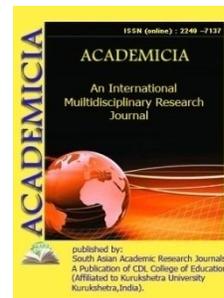

During the years of repression, when people were buried in graves for fear of being exiled to Siberia, those books, made of Koka's original paper, lay in the ground for 30-40 years, rotting under the ground, as if they had just come out of a stone, remembering that our ancestors praises can be read.

## ON THE USE OF METAFORA IN MUKIMIY'S WORKS

**Jurayeva Ramziya Abdurahimovna\***

Kokand State Pedagogical Institute,  
 Kokand, UZBEKISTAN

### ABSTRACT

*The article is devoted to the study of metaphors used in the works of Muhammad Aminkhoja Mirzakhoja oglu Mukimiy, a representative of Kokand literary environment. It is analyzed that the use of metaphors in the poet's lyricism and humor served to a full understanding of the author's artistic intention.*

**KEYWORDS:** *Kokand Literary Environment, Mukimiy, Metaphor, Constant Metaphor, Horse-Metaphor, Adjective-Metaphor.*

### INTRODUCTION

The study of the works of Muhammad Aminkhoja Mirzakhoja oglu Mukimi, a great representative of Kokand literary environment, began in the poet's lifetime. The popularity of the lexicon of the poet's works, the richness of artistic means has a special place in the literary environment of Kokand. Doctor of Philology A.Pardaev comments on the study of Mukimi's work: "Considerable work has been done to study the literary heritage of enlightened artists who lived and worked in the Kokand literary environment, but it is true that there are many topics in the literature of this period. Through it, "... First of all, a comprehensive study of the unique heritage of our people, created by the creative genius, a comprehensive understanding of the life and scientific and creative activities of great scientists and thinkers, educating the younger generation in the spirit of humanistic ideas, national pride. noble goals are envisaged "[1]. One of such artists, Muhammad Aminkhoja Mirzakhoja oglu Mukimi's life and creative legacy have not been studied objectively and completely in the conditions of communist ideology, nor have they been re-studied in a monograph during the period of independence "[2]. Therefore, the study of the linguistic features of the lexicon of the poet's works is one of the important tasks before us.

Mukimi's lyrics, humorous works, language are a worthy contribution to the development of Uzbek literature and lexicon of the literary language of that time, and its linguistic study can be a valuable and worthy material in determining the sources of development and enrichment of the Uzbek literary language in the late XIX and early XX centuries.

The most widely used metaphor in Mukimi's work is the metaphor, which the poet skillfully used in both lyrical poems and humorous works. "Metaphors differ from other means of artistic expression in that they require the most creativity. Creating a metaphor requires the creator to have a broad outlook, to think deeply about the universe and man, and to have a good knowledge of spirit and nature. The metaphor opens the way not only to the appearance of the image, but also to the depiction or expression of events in its spiritual world on the basis of an extraordinary artistic judgment that the listener or reader does not expect" [3]. Mukimi uses metaphors to describe the qualities of a lover in his lyrical works, and to exaggerate humor in his satirical works. In particular, in the poet's lyrics the word "arrow" is widely used in a metaphorical way. The word means "a long, slender stick with a spearhead, which is thrown into a bow" in the "Explanatory Dictionary of the Uzbek language". The poet uses the lexical-semantic semantics of the word "arrow" to create metaphors such as "arrow of grief", "arrows of flirtation", "arrow of pilgrimage".

My body is always the target of flirting

Turn my love affair around until the exam [4]

In the ghazal "Khayriyat" metaphors serve to convey the feelings of the lyrical hero to the reader:

I would say that the bud of dreams will never open

The chill of hijran (exile) has finished, the spring has come, goodness [5]

In the verse, the arrival of the mistress is likened to the opening of a "bud of dreams." The bud was the state before the opening of the flower, and the semaphore of "the beginning of an event," [6] also referred to the lover's emerging love. The word "hijran" (exile) in the second verse is associated with "chilla" and serves to express the suffering of winter as the coldest days.

I drowned in the mountains and did not fall

The blue building has two fountains of tears, charity [7]

In this verse, metaphor is skillfully used in the art of rhetoric.

The flood of the lover's tears ("the flood of tears") spilled so much that it drowned the mountains. Now the lyrical protagonist worries that these tears will drown the sky (the "blue building") as well. The metaphors "flood" and "blue building" were a means to enhance the exaggeration.

You hit the bottle of hope mercilessly

You hastened, O oppressor, to send an army of grief

You exaggerated the title stranger without giving an acquaintance

Well, you hid your fast in the mirror

Blessed is the glory of the moon.

The metaphorical combination of "glass of hope" in the band is formed by activating the semantics of the word "glass" "break", "crack". The desperate hero's situation is explained in the next verse by the metaphor of "army of grief." Here the semantic "oppression" of the word "army" is activated.

I'm sick tonight

I'm dying for you now  
 I wonder if I can reach the beach  
 I cross the river of tears [9]

This metaphor used the metaphorical combinations "coastal goal", "river of tears". That is, his illness without a bodhichitta (meaning the love of Allah) emphasizes that he wants to die with the thought of his lips. He says that water is flowing in the river of tears to reach his goal ("coastal goal"). The inner state of the lyrical protagonist is exaggerated through metaphors.

Mukimi's comedies are full of irony, sarcasm and jokes. Metaphors further enhanced the artistic value of satirical works.

Lof raxshin pushes the field of size,  
 Manually turn the clouds higher every time [10]

Giving a speech (reception) was a tradition in Kokand. In the above verses, the poet mocks those who did not make the "debt soup", and at the banquet they ride the "lof rakhshi", that is, the false horse, in the "square of greatness", and emphasizes that it is ruined by his wife when he comes. The poet used metaphors such as "lof raxshi", "field of greatness", which allows to clearly imagine the character of the people being ridiculed.

The burden of old age falls on me, my subject is twisted,  
 My beard is a messenger of death, my memory sinks again,  
 My nickname is bad, I can get away with it,  
 Until I die alive, all my hair will fall out,  
 Like the ankles of the Tajik people, my liver was choked.

In this verse of the satire, written in the language of a man who was no longer needed when he was fifty years old, metaphors such as "ambassador of death" and "liver shock" were used. In this case, the whitening of the beard, the curvature of the waist, the loss of memory are likened to the "ambassador of death." The fact that the official could not get rid of the nickname "dog" was likened to a "liver shock".

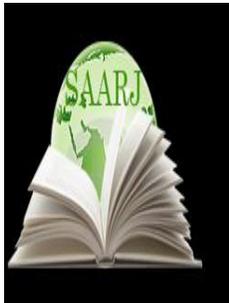

Laziness is great in the field of ignorance,  
 At the beginning of the indictment is a correct child.

In this verse, taken from the ghazal (poem) "Bachchagar", the poet mocks false, hypocritical people with the metaphors "lazy, the field of ignorance", "the book of accusations".

In conclusion, it can be said that in Mukimi's work mainly constant metaphors were used. The use of horse and quality metaphors allows the reader to fully understand the author's artistic intent.

## ANALYSIS OF THE EXPERIENCE OF GLOBAL DEVELOPMENT OF THE "GREEN" ECONOMY

**Shayusupova Lobar Rixsievna\*; Djumashev Alisher Nishanbayevich\*\***

<sup>1,2</sup>Military-Technical Institute of the National Guard,  
 Republic of UZBEKISTAN

### ABSTRACT

*This article is devoted to the actual problem of ensuring environmental safety by introducing a "green" economy on the example of the experience of leading foreign countries and the CIS countries in this aspect. The analysis of the development of "green" technologies, the results achieved to improve the environmental situation in countries where this area is a priority, has been done. It also describes the development policy of the "green" economy in Uzbekistan, based on the Action Strategy for the five priority areas of development of the Republic of Uzbekistan in 2017-2021.*

**KEYWORDS:** *Environmental Safety, "Green" Economy, "Green" Business, "Green" Technologies, "Green" Sector, Transformational Impact On The Environment, Natural Resources, Energy Efficiency, Environmental Friendliness.*

### INTRODUCTION

Today's society, taking care of the improvement of its life, shifted the issue of nature protection and ensuring its protection to the second, or even to the last plan. Among the acute problems of our time, the issues of ensuring environmental safety are in the first place.

In this article, we will try to describe a small experience in the implementation and development of a "green" economy, its specifics and some of the results that have been achieved by the countries under consideration.

The concept of environmental safety as a whole is the state of protection of the biosphere and human society, and at the state level - the state from threats arising from anthropogenic and natural impacts on the environment.

Environmental safety is implemented at the global, regional and local levels.

The global level implies prognostication and tracking the processes in the state of the biosphere as a whole and its constituent spheres.

In the second half of the twentieth century these processes are reflected in global climate changes, the emergence of the "greenhouse effect", demolition of the ozone screen, desertification of the planet and pollution of the World Ocean. The essence of global control and management is in preserving and restoring the natural mechanism of reproduction of the environment by the biosphere, which is guided by the totality of living organisms that make up the biosphere. [1]

Global environmental security management is the prerogative of interstate relations at the level of the United Nations, UNESCO, UNEP and other international organizations.

The concept of environmental safety includes a regulation and management system that allows predicting, preventing, and, if it occurs, eliminating the development of emergencies, which in turn explains the increased interest in the problem of creating a "green" economy among specialists in different fields of knowledge.

Many modern sources provide a number of definitions of the concepts of "green jobs", "green sector of the economy", "green business", "green" technologies, "green" goods.

The idea of a green economy as the United Nations Environment Program (UnEp) was adopted in 2008. [2]

A green economy, in accordance with the definition of the United Nations Environment Program (UnEp), is an economy that enhances human well-being and provides social justice, while significantly reducing environmental risks. It is a circular economy with no waste, low greenhouse gas emissions, resource efficient and responsive.

Green growth is characterized by the growing use of green technologies in all sectors of the economy, the increase in green jobs, and the production and use of environmental-friendly products and services. It aims to support economic development while ensuring the sustainable use of natural capital, minimizing environmental pollution and other forms of negative environmental impacts.

The "green sector" of the economy includes areas in which activities are aimed at transforming resources without causing damage, as much as possible, to the environment and climate - "green energy", transport, recycling and disposal of waste, etc.

The concept of a "green" economy is a relatively new concept that has entered our lives due to the negative consequences of the irrational use of natural resources and an irresponsible attitude towards environmental protection.

During the transition to a "green" economy, special attention is paid to the formation of modern infrastructure, which is of key importance for ensuring sustainable development and the modernization of which is an essential element of the analyzed structural reforms.

Let's consider some of the ways to form a "green" economy in countries that consider this area a priority.

One of the world leaders is South Korea. This country has 3% of GDP or \$ 60 billion. The United States was directed to the development of "green" sectors, due to which 1.8 million jobs were created.

South Korea, which has adopted green growth as a national strategy, focuses its attention on industry, energy and investment, green modes of transport, alternative sources of fresh water, waste recycling technologies, park development, and urban river development.

The various projects that the ministries carried out independently were combined into a single package to avoid budgetary expenditures for secondary purposes.

Since 2011, South Korea has launched a "green payment card" system to stimulate green consumption of goods produced with sustainable innovation. These maps take into account the consumption of "green" goods and services, the use of public transport, the use of public transport instead of personal, and the use of energy efficient goods.

In the USA, the development of alternative energy has been chosen as the main directions for the development of the "green" economy. By 2030, usingsolar installations will be generated 65% of the country's energy consumption, 35% heat.

Almost all EU countries have developed "green" measures in the field of energy, development of public transport, infrastructure, construction of eco-settlements, as well as recycling systems.

The EU has adopted standards in the field of energy, development of public transport, construction of eco-settlements, as well as recycling systems. To prevent the degree of air pollution from exhaust gases, multi-million dollar subsidies are allocated to buyers for the purchase of electric vehicles.

The UK has adopted a green tech economy as its national development strategy and has unveiled its "green", which aims to create 100,000 new workplaces.

China's economic growth has already amazed the world with its meteoric speed. This is not the first time China has received the UN's highest environmental honor for its outstanding contribution in terms of positive transformational environmental impact. This country has also distinguished itself by the accelerated introduction of "green" technologies.

Today, China accounts for 40% of world exports of solar panels and 20% of wind turbines. Here I would like to emphasize China's aspiration to become a world leader in the field of "green" technologies, based on the work done, in particular, the open Global Innovation Center for nanofibers Global Innovation GICNA.

Among the countries of the near abroad, the leading positions in the development of the "green" economy are occupied by Russia, Kazakhstan, Belarus.

And here, of course, I would like to note the regional specifics, where special attention is paid to the geographical location, climatic conditions, natural resource potential, which are directly related to the approach in adopting the strategy of each country, because environmental problems to one degree or another exacerbate the vulnerability of the economies of countries.

According to experts, the demand for a green economy came to Russia together with Western companies that have long integrated sustainable development into business strategies, where the environmental aspect is the most important criterion in assessing efficiency. First of all, green

technologies are relevant in the manufacturing sector, and Russian business strives to apply the best world practices.

Among the priority areas are the reduction of the company's carbon footprint and the development of closed-cycle technologies, when waste is viewed as a valuable resource and is reused in production.

In some industries, Russia is one of the world leaders in the implementation of green, more environmentally friendly technologies, experts say, - for example, in hydro and nuclear energy, district heating, urban public and rail transport.

In Russia, there are enough problem areas in the field of accumulated pollution, negative impact in large industrial agglomerations, river pollution, handling hazardous and municipal waste. The investments of enterprises and regions in solving these problems are significant - only direct investments, accounted for in national statistics, amounted to 158 billion rubles in 2018. [3]

Water scarcity is a global threat. Water resources in Kazakhstan are considered as a living, unique and vulnerable system, which is subject to high external risks associated with the geographic, ecological and hydrological characteristics of the country, the transboundary nature of most rivers and the impact of global climate change.

In the future, Kazakhstan is expected to increase consumption and, as a result, reduce the availability of water resources, which threatens six of the eight water basins in Kazakhstan in 2020. Given that 45% of the water resources in the Republic of Kazakhstan are replenished from external sources, transboundary cooperation is vital for water security, which requires a comprehensive, integrated and strategic approach.

The concept of transition to a green economy, adopted by Kazakhstan in 2013, laid the foundation for an entirely new development paradigm. Over the past decade, a reform of the national water legislation and water management system in Kazakhstan has been carried out. The reform continues and to reduce the risk of water scarcity formation, steps have been taken in Kazakhstan to improve water resources management by moving to the basin management principle in accordance with the best international practices. Funding has been increased for water resources management, support for irrigation and drainage infrastructure, thereby reducing water losses and improving infrastructure security. In 2012, with the support of the EU, OECD and UNECE, a National Water Policy Dialogue (NPD) was launched in Kazakhstan. [4]

In the Republic of Belarus, more and more attention is paid to environmental issues: state programs are being implemented, legislation is being improved, fundamental documents in the field of environmental protection and rational nature management are being developed.

The National Strategy for Sustainable Socio-Economic Development of Belarus until 2030, approved by the Government in February 2015, developed with the participation of the Ministry of Economy, is aimed at implementing the principles of the "green economy" in practice.

Currently, a number of such projects are already being implemented in the country, among which are:

“Development of the forestry sector in the Republic of Belarus” - implemented with a loan from the World Bank (US \$ 40.7 million) and a related grant from the Global Environment Facility (US \$ 2.7 million).

“Facilitating the Transition of the Republic of Belarus to a Green Economy” - funded by the European Union and implemented by the United Nations Development Program. The total project budget is 5 million euros. The project started in 2015.

The development of electric transport promotes the principles of a green economy. The first Belarusian electric car, created by employees of the National Academy of Sciences of Belarus on the basis of Geely, was presented in August 2017, now the sample is being finalized. The Belarusian-British enterprise Unison and the Chinese company Zotye International Automobile Trading last year signed an agreement on the organization in Belarus of the assembly production of 30 thousand Zotye electric vehicles with a high degree of localization until 2022 for the subsequent exclusive supply of products to the markets of the CIS countries.

In addition, the number of electric charging stations is growing in Belarus. Green building, organic farming and ecotourism are also important for the development of a green economy. [5]

The transition of Uzbekistan to a "green" economy, as well as in other countries, is caused by environmental problems, which seriously forced us to think and take measures to reduce the degree of environmental problems, thereby increasing the provision of environmental protection and rational use of natural resources.

On October 4, 2019, the President of the Republic of Uzbekistan Sh. Mirziyoyev approved the Strategy for the transition of Uzbekistan to a "green" economy for 2019-2030.

Among the target indicators for the implementation of the strategy is to reduce the specific greenhouse gas emissions per unit of gross domestic product by 10% from the 2010 level, to bring the share of renewable energy sources to more than 25% of the total electricity generation, to ensure access to modern, inexpensive and reliable energy supply to 100% of the population and sectors of the economy, expanding the production and use of motor fuel and vehicles with improved energy efficiency and environmental friendliness, as well as the development of electric transport, the introduction of drip irrigation technologies on an area of up to 1 million hectares and an increase in yields up to 20-40% of cultivated on them cultures.

“The implementation of the strategy will contribute to improving governance in the field of increasing energy efficiency of the economy, rational consumption and conservation of natural resources, reducing greenhouse gas emissions, ensuring access to green energy, creating green jobs and ensuring climate resilience,” – noted in document.

At present, a high rate of transformation in the field of public policy has already been set. Action strategy for five priority areas of development of the Republic of Uzbekistan in 2017-2021 adopted.

Sustainable Development Goals (SDGs) and other strategic program documents set objectives:

-by 2030, significantly increase the share of renewable energy in the energy mix. To bring their share in the structure of generating capacity to 19.7% by 2025;

-double the rate of improvement in energy efficiency by 2030 and halve the carbon intensity of GDP;

-by 2030, ensure universal access to affordable, reliable and modern energy supply;

- modernize infrastructure and re-equip industrial plants to make them sustainable through improved resource efficiency and increased use of clean and environmentally friendly technologies and industrial processes;
  - by 2030, substantially improve the efficiency of water use in all sectors of the economy and ensure universal access to safe drinking water;
  - achieve land degradation neutrality by 2030;
  - increase by 2030 average productivity of agricultural food production and income of producers.
- [6]

And finally, in conclusion, I would like to separately note the fact that we are all responsible for the future generation, who will breathe air, use the natural resources that will remain after us, use water that we must use carefully. If we want to keep progress in living standards, we need to find new ways of producing and consuming and even rethinking our understanding of progress and how to measure it.

The growth of the world economy with the existing model of production and consumption can inevitably lead to the moment when the damage from pollution and destruction of the natural environment around us begins to exceed the benefits obtained through economic development. It is possible to overcome this situation only through the introduction of innovations for the reproduction of natural resources.

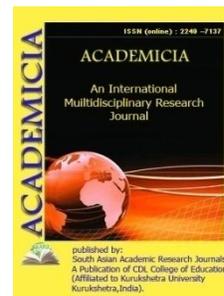

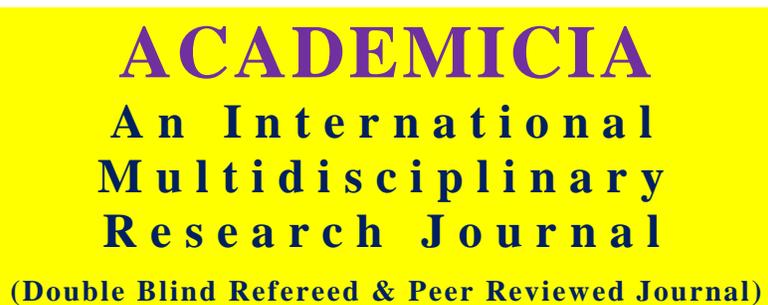

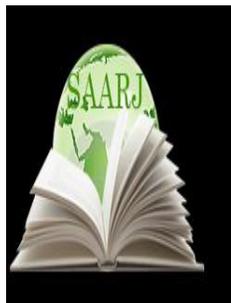

Appropriate changes in tax, competition and trade policies, financial incentives for “green” innovations, and control over the use of natural resources can serve to stimulate innovation activity in this direction. It is necessary to achieve a situation so that production associated with environmental pollution or excessive consumption of energy, water and other resources become unprofitable. Then companies that invest heavily in green technologies will be able to receive real dividends from this due to the advantage over competitors in the cost of the final product.

Without a doubt, the transition of the global economy to a green growth model will require significant efforts to expand international cooperation.

### ABSTRACT

*Increasing the thermal resistance of the enclosing structures is one of the main reserves of energy saving during the operation of the building. However, with a limited thickness (300 mm), single-layer panels made of lightweight concrete  $\rho = 1100-1200 \text{ kg / m}^3$  have low heat transfer resistance and, as a result, insufficient heat-shielding qualities. An increase in the heat-shielding qualities of the panels under consideration is possible either by reducing the volumetric mass of lightweight concrete, or by improving the design solution, for example, by using wall shielding.*

**KEYWORDS:** *Resistance, Fluctuations, Amplitude, Temperature.*

### INTRODUCTION

The effectiveness of the air gap of the walls under study is evidenced, for example, by a comparison of specific heat gains for walls of different types under identical external influences.

We make theoretical studies, calculations of heat resistance of expanded clay concrete shielded wall with a ventilated air gap (example) for Bukhara city.

The thermal resistance of the building envelope must comply with the requirements of SNiP II-3-79 \*\*: to do this, define: the required amplitude of fluctuations in the temperature of the inner surface of the enclosing structure  $AT_{wtr}$ , ° C, the amount of attenuation, the calculated amplitude of fluctuations in the outside air temperature  $v$  in the enclosing structure; the estimated amplitude of fluctuations in the outside air temperature  $At_{nresch}$ , ° C; amplitude of temperature fluctuations of the inner surface of the enclosing structure  $AT_{TB}$ .

If  $A_{TB} \leq A_{TB}^{TP}$ , then the enclosing structure meets the requirements of heat resistance standards.

**Example.** Determine whether a shielded wall with a ventilated air gap in Bukhara city meets the heat resistance requirement.

### A. Baseline data

1. The panel consists of the following layers, counting from its inner surface: a textured layer of cement-sand mortar with a density of 1800 kg / m<sup>3</sup>, 20 mm thick, expanded clay concrete on quartz sand with porosity with a density of 1100 kg / m<sup>3</sup>, 250 mm thick, the wall has a on the outside there is an air gap of 70 mm, limited by a concrete screen of 80 mm, Fig. 1.

2. Average monthly temperature of the hottest month (July)  $t_H = 28.2$  ° C.

3. The maximum amplitude of daily fluctuations in the outside air temperature  $A_{\Delta t} = 25,9$  ° C.

4. Maximum and average values of total (direct and scattered) solar radiation for vertical surfaces of western orientation  $I_{max} = 740$  W / m<sup>2</sup> and  $I_{av} = 169$  W / m<sup>2</sup>.

5. Estimated wind speed  $V = 3.04$  m / s. Parameter values p. 2-5 are determined according to SNiP 2.01.01-82.

6. Thermal characteristics of panel materials are selected according to operating conditions A from app. 3 \*: для фактурных слоев цементно-песчаного раствора

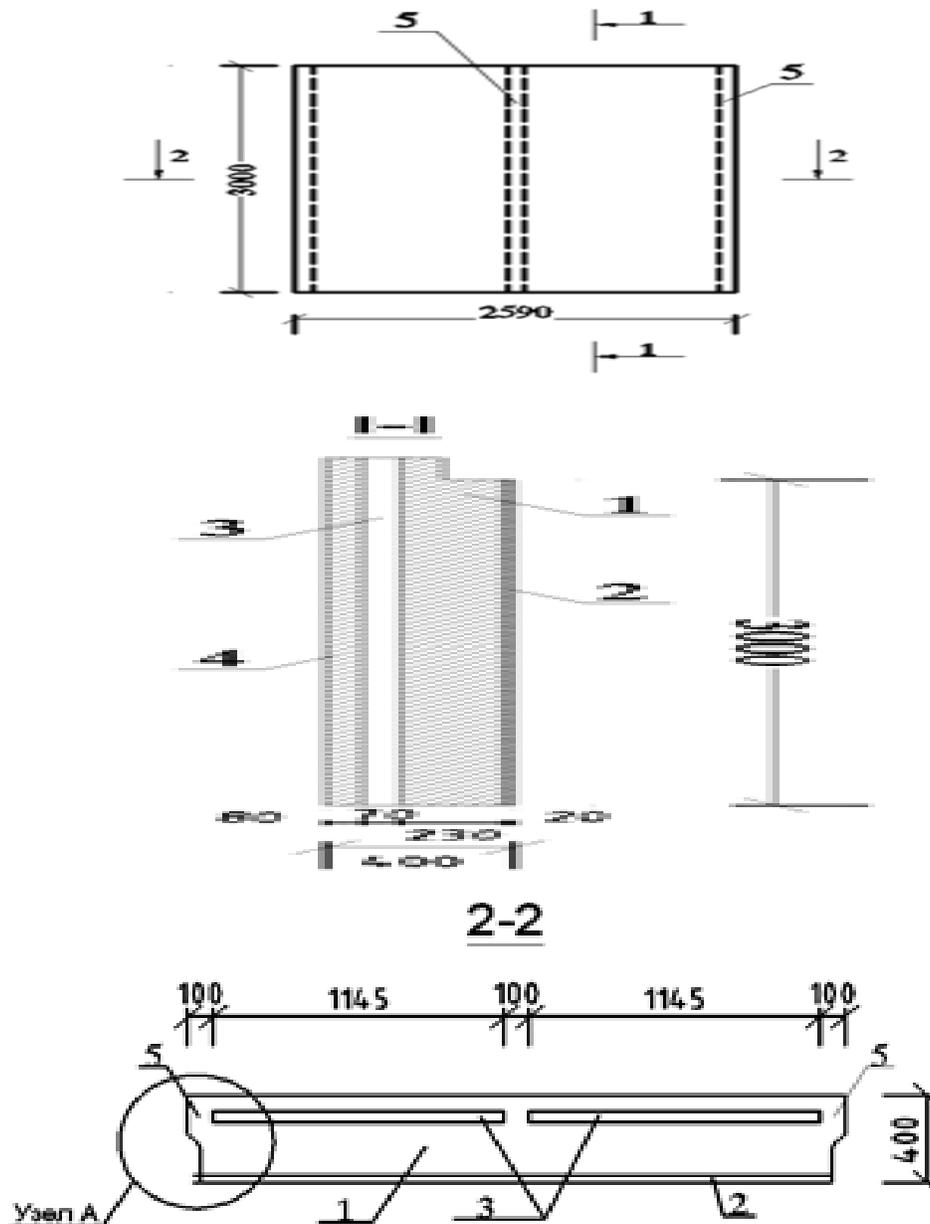

$$\alpha_1 = \alpha_3 = 0,76 \text{ Вт}/(\text{м} \cdot \text{°C}); s_1 = s_3 = 9,60 \text{ Вт}/(\text{м}^2 \cdot \text{°C});$$

for expanded clay concrete on quartz sand with porization

$$\alpha_2 = 0,41 \text{ Вт}/(\text{м} \cdot \text{°C}); s_2 = 5,49 \text{ Вт}/(\text{м}^2 \cdot \text{°C}).$$

7. Coefficient of absorption of solar radiation by the material of the outer surface of the enclosing structure for concrete = 0.7.

8. Thermal characteristics and climatic data for summer conditions are accepted as in the previous example. The coefficient of heat assimilation of the air layer  $s_4 = 0$ , of the concrete screen  $s_5 = 9,60 \text{ Вт}/(\text{м}^2 \cdot \text{°C})$ .

**Figure: 1 Design of the experimental panel: 1-main part of the wall; 2-inner finishing layer; 3-air gap; 4-screen; 5-connecting ribs.**

### B. Calculation procedure

1. Thermal resistance of wall layers: textured  $R_1=R_3=0,0263\text{m}^2 \cdot \square \text{C/BT}$ ; expanded clay concrete  $R_2=0,63 \text{m}^2 \cdot \square \text{C/BT}$ ; air gap  $R_4=0,14 \text{m}^2 \cdot \square \text{C/BT}$ ; concrete screen  $R_5=0,08/0,76=0,11 \text{m}^2 \cdot \square \text{C/BT}$ .

2. Thermal inertia of wall layers: textured  $D1 = D3 = 0.0263 \cdot 9.60 = 0.252 < 1$ ; expanded clay concrete  $D2 = 0.63 \cdot 5.49 = 3.46$  air gap  $D4 = 0$ ; concrete screen  $D5 = 1.06$ ; walls  $= \square D_i=0,252 \cdot 2+3.46+1.06=5.02 < 4$ , i.e. no heat test required.

3. The values of the required amplitude of fluctuations in the temperature of the inner surface of the wall  $A_{\tau_B}^{TP}$  and the calculated amplitude of fluctuations in the temperature of the outside air are the same as in the previous example,

$$A_{\tau_B}^{TP}=1,78, A_{\tau_H}^{pacq}=28,33 \square C$$

4. Coefficient of heat assimilation of the outer surfaces of the layers: inner textured layer, middle layer of expanded clay concrete and outer textured layer Y1, Y2 and Y3, as in example 1;

airgap ( $s_4 = 0$ )

$$Y_4 = \frac{(R_4 S_4^2 + Y_3)}{(1 + R_4 S_5)} = \frac{Y_3}{(1 + R_4 S_5)} = \frac{6,92}{(1 + 0,14 \cdot 9,60)} = \frac{6,92}{2,34} = 2,96 \text{ Bm}/(M^2 \cdot ^\circ C)$$

Re in forced concrete screen ( $S_5 = 9.60$ )

$$Y_5 = \frac{(R_5 \cdot S_5^2 + Y_4)}{(1 + R_5 \cdot S_4)} = \frac{(0,11 \cdot 9,60^2 + 2,96)}{1} = 13,09 \text{ Bm}/(M^2 \cdot ^\circ C)$$

5. The value of attenuation of the estimated amplitude of fluctuations in the temperature of the outside air for a ventilated enclosing structure is determined by the formula 21 [4]:

$$\begin{aligned} \nu &= 0,9e^{5,02/\sqrt{2}} \cdot \frac{(9,6 + 8,7)(5,49 + 9,05)(9,60 + 5,49) \cdot 6,92}{(9,6 + 9,05)(5,49 + 5,49)(9,60 + 6,92) \cdot 2,96} \\ &\times \frac{(9,60 + 2,96)(25,98 + 13,09)}{(9,60 + 13,09)25,98} = 0,9 \cdot 2,718^{3,56} \cdot \frac{27785,03}{10013,43} \cdot \frac{490,72}{589,49} \\ &= 0,9 \cdot 35,15 \cdot 2,77 \cdot 0,83 = 72,73 \end{aligned}$$

The amplitude of temperature fluctuations of the inner surface of the wall panel is determined by the formula 19 [4]:

$$A_{\tau_B} = \frac{A_{\tau_P}^{pacq}}{\nu} = \frac{28,33}{72,73} = 0,39 < A_{\tau_H}^{mp} = 1,78^\circ C$$

which meets the requirements of SNiP II-3-79 \*\*.

Thus, the results of theoretical and experimental studies allow us to draw the following conclusions with a sufficiently high heat resistance and heat-shielding efficiency of the outer walls:

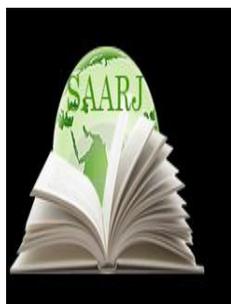

The use of screens with a ventilated layer allows:

- To reduce the thickness of the wall in comparison with a wall without a screen when the same temperature conditions in the premises are reached;
- To reduce the amplitude of temperature fluctuations on the inner surface of the wall, twice as compared to a wall without a screen;
- to reduce the daily specific heat input by 30-40%.
- the presence of an air gap in the structure of the fence increases the thermal stability of the structure.

-the thermal stability of the structure depends on the material of the structure and the order of the layers of materials;

#### ABSTRACT

*Owing to large potential of clayey soil in agriculture sector leading to better yield of crops, analysis for micro and macronutrients of soil has been done eg.phosphorous, nitrogen, potassium, zinc, boron, iron, manganese, copper ranges from 0.05 ppm to .09 ppm, iron from 8.5 to 9.7 ppm, manganese from 2.3 to 3.3 ppm and zinc from 0.32 to 0.49 ppm. All these elements are essential for plant growth and decide the particular crop for specific soil profile. Clayey minerals, useful in water treatment and other industrial purposes are in abundance in Rajmahal Hills and some part of Hazaribagh district also contain clays useful for industry. Organic clays have found extensive use in plants, inks, greases and decolouring of oils. Clays over the years*

*weather to the formation of soils rich in clay which impact colloidal character, plasticity and swelling character to the soil.*

**KEYWORDS:** *Hazaribagh, Clay, Heavy Metals, Bentonite, Cation Exchange*

## INTRODUCTION

Soil acts like a sink for all type of contaminants and several chemical reactions take place in and around soil<sup>1</sup>. Hydrolysis causes weathering of the rocks leading to the formation of clayey soils. Hydrolysis of orthoclase feldspar produces clay mineral kaolinite. The weathering is important in humid tropics due to rainfall and high temperature and takes years in the formation of red soil and clayey soils. Weathering process also takes place by oxidation reduction. When primary minerals are exposed to the atmosphere, oxidation occurs and many clay minerals eg. Vermiculite, montmorillonite and illite are formed. The behavior of hydrous oxide is responsible for several types of changes in minerals. Intensive use of fertilizers and ground water resources for better crop yield makes the soil nutrient deficient. Plants need macro nutrient species like potassium, calcium and magnesium. The clayey soils have cation exchange capacity which prevent leaching and hold cations<sup>2</sup>. Cation exchange capacity may be expressed as

$BH + M^+ = BM + H^+$ , where  $M^+$  and  $H^+$  are the cations and  $M^+$  exchanges  $H^+$  cation. BH is an exchanger.<sup>3-4</sup>

Generally montmorillonites have cation exchange capacity of 70 to 110 meq/100 g of clay. Thus clayey composition of soils give it the properties of swelling power, plasticity, water holding capacity and bleaching. These properties make clay suitable for industrial applications. Bentonite-water mixtures find its use in bonding, suspending and binder for asbestos fiber. Thus suspension of Bentonite in water has got wide application in industry. The presence of ferrous and ferric oxide imparts brownish appearance of the clay. It has been known from experimental finding that collected samples of Bentonite clay from Hazaribagh have acidic nature. Thus the montmorillonite mineral series occur as clay mineral constituent of acid clays. The montmorillonite minerals exhibit gray to black in daylight and finally turns brown within a few weeks due to the presence of 9.2% Fe in the collected samples.<sup>5-6</sup> upon chemical analysis the chemical formula of the primary state is obtained as

If the material is an iron bearing montmorillonite, the chemical formula is as follows due to the presence of iron<sup>7-8</sup>.

Small spots of native copper occur in the pale green colored clay<sup>9</sup>. Thus the chemical constituents  $SiO_2, Al_2O_3, Fe_2O_3, FeO, MnO, CaO, MgO, Na_2O, K_2O$  and  $CuO$ <sup>10</sup>.

The clay mineral deposits of Hazaribagh especially montmorillonite need to be exploited for local use as well as industrial applications. It has been established that pure montmorillonite finds application in pesticide and fertilizer applications, softening of hard water due to cation exchange, decolorisation of oil and grease and adsorption of toxic elements from aqueous medium.<sup>11-13</sup>

**Overview of place of field study:**

Our study area was Hazaribagh which is a city and municipality in Hazaribagh district of Jharkhand. It is the divisional headquarter of North Chatanagpur division. It has a longitude and latitude of  $23.9933^{\circ}\text{N}$

,  $85.3620^{\circ}\text{E}$ .

**Sample Collection:** Nine soil samples were collected from different mouzas of Hazaribagh districts mainly located at lat.  $23.99^{\circ}\text{N}$  and long.  $85.37^{\circ}\text{E}$ . the places are Barhi(Kundba), Barkagaon(Debgarh),Chauparan(Chandpur),Chalkusha(Sudan),Barkatha(Shiladhi),Keredari(Masuria),Churchu(Sandi),Karbekla(Kesu) and Oriya(Rolagaon). Soil and clay for N, P, and K are done at the office of the agricultural chemists soil testing laboratory, Malda, West Bengal where soil samples were coded as U-186,U-187,U-188,U-189,U-190,U-191,U-192,U-193,U-194.All the soil samples were collected during 7<sup>th</sup> to 25<sup>th</sup> August,2017.

**Experimental:** Nitrogen, Phosphorus and potassium are the main components of any soil sample. When chemically isolated from soil, nutrients has been detected by using chemical reagents which are used to color each sample with an increasing colour intensity indicating increase in concentration. Nitrogen and phosphorus are typically found in the form of nitrates and phosphates. In the high and medium range, nitrate tests, cadmium metal is used to reduce nitrates to nitrites which then react with sulfanilic acid to form intermediate diazonium salt. Then it is coupled with gentisic acid to form an amber color solution. The color intensity is directly proportional to the nitrate concentration (in mg/l). For phosphorus, sodium molybdate and potassium pyrosulphate in the PhosVer 3 reagent powder reacts with the soluble reactive phosphate to form a phosphate molybdate complex. Then the complex is reduced by ascorbic acid to form molybdenum blue color. Colour comparison is made using phosphate colour comparator (colour intensity b/w 0-150 mg/l). For potassium tests,  $\text{K}^{+1}$  ion combine with sodium tetraphenylborate contained in Potassium 3 reagent to form white ppt of potassium tetra phenyl borate which will remain in suspension. Potassium measuring dip stick is used to measure the quantity of potassium concentration. The concentration of iron /zinc/manganese/copper in the soil and clay samples has been detected by U.V.Visible spectrophotometer Paro300 available in the laboratory. The percentage of carbon has been detected by using carbon analyzer. The electrical conductivity of the soil and clay samples under investigation has been done by conductivity meter (model no 304). The PH measurement is done by PH electrode available in the laboratory of P.G.Chemistry, T.M.B.U.

**RESULT AND DISCUSSION**

Elemental analysis of C and N shows that the collected samples have very low concentration of carbon varying from (0.45 to 0.75) %. The results indicate that the soil is not humus. The elemental analysis carried out by U.V.Double beam spectrophotometer show a considerable percentage iron up to 9.7% which clearly reflects that the clayey soil is rich in ferrous and ferric oxide imparting brown color to the sample. Manganese is also present in the samples up to 3.3% showing the presence of oxide of Mn in the sample. The presence of copper up to 0.33 mg/Kg is very less in comparison to the concentration of Fe and Mn and thus a faint tint on the surface of the clay minerals appear due to copper. Zinc oxide is also present in small proportions which indicate that zinc oxide is also a chemical constituent of the clay mineral. The presence of sulphur, small amount of boron has come into the composition during course of weathering and

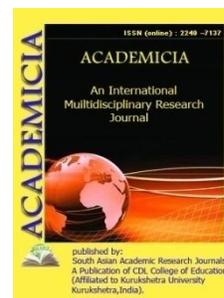

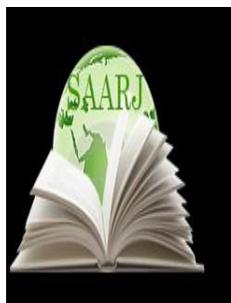

local factors along with climatic conditions. Some of the physical properties show that these samples have good swelling power, plasticity and expansion. Studies show that the expansion of the lattice has taken place along X axis in 2:1 structure of montmorillonite.

**CONCLUSION AND ACKNOWLEDGEMENT:** The authors do hereby acknowledge the agricultural chemist Dr.P.C.Das of soil testing laboratory, Malda for analyzing the soil sample at free of cost for the research work.

Through this short paper the author aims to have exact idea of the soil constituent of different mouzas of Hazaribagh districts which helps to set up a platform of his research based on the studies on characterization and chemical kinetics for the removal of arsenic, cancer causing hexavalent chromium, Manganese, fluorine by Bentonite mineral and its derivatives.

## PECULIARITIES OF INTERCULTURAL UNDERSTANDING IN UZBEK AND JAPANESE VERBAL COMMUNICATION

**Nadira Tashmurzaevna Khalmurzaeva\***

\*PhD, Associate Professor,  
Department of Theory and Practice of the Japanese Language,  
Uzbekistan State University of World Languages,  
Tashkent city, UZBEKISTAN

### ABSTRACT

*The article is devoted to a contrasting description of the features of intercultural understanding in Uzbek and Japanese verbal communication. The linguoculturo logical approach to the problem of understanding in intercultural communication, based on the provisions of social philosophy and using the achievements of other sciences of the humanitarian cycle seems to be the most complex. In the research of this problem, the process and the result of understanding are considered to establish a dialogue of cultures. The verbal communication of the Japanese has a number of striking features that distinguish it from the Uzbek verbal communicative behavior. The analysis allows us to talk about the difference and similarities of understanding in the intercultural aspect. The “dialogue of cultures” is achieved by knowing another culture through one’s own and one through another’s cultural interpretation and adaptation of cultures to each other under conditions of semantic discrepancy. The discrepancies between the Japanese and Uzbek language pictures of the world are one of the forms of contradiction that allows the space of two cultures to develop. The result of this development is mutual understanding between*

*cultures and representatives of Japanese and Uzbek verbal communication. Therefore, the contrasting description shows that the Japanese and Uzbek languages are not only a means of communication or the transfer of information, but the most important mechanism of cultural communication. In this research, the task is to consider the phenomenon of understanding in the modern convergence of Japanese and Uzbek cultures. The phenomenon of understanding was analyzed by the established criteria of the semantic range and the range of knowledge, that is, the space of meaning and knowledge arising from the development of Japanese and Uzbek verbal communication, which is very extensive, reveals the tendency of multisense unity. In such conditions, the study of understanding as a phenomenon of intercultural communication seems to be very relevant. The following leading factors were identified as characterizing special features of understanding during intercultural communication between Japanese and Uzbeks: mismatch of national and cultural-specific pictures of the world, varying degrees of verbalization of the underlying content, inconsistency of the lexical-semantic system, as well as the cultural situations used, characteristic of Japanese and Uzbek languages .*

**KEYWORDS:** *Understanding Phenomenon, Intercultural Communication, Semantic Range, Knowledge Space, Japanese, Uzbeks, Dialogue Of Cultures*

## INTRODUCTION

Culture - creates special forms of behavior, it modifies the activity of human mental functions. Ignoring them makes communication difficult and breeds big stereotypes.

Modern research in the field of interpersonal and intercultural communication, psychology, social philosophy considers understanding as the key to successful communication. Lack of mutual understanding in the process of communication leads to complication or destruction of relationships between people, to conflicts, and in intercultural communication - to rejection of foreign culture, ethnophobia and cultural shock.

This study aims to examine the phenomenon of understanding in the modern convergence of culture. The space of meanings and knowledge, great in the development of culture, is vast, there is a tendency for polysemantic unity. All social and individual life of a person takes place in a linguistic environment. Language and speech, as its practical embodiment, is the environment in which it is found. Language reflects the universal conditions of human life, which allow him to constantly orient himself and act intelligently in the constantly changing world of interpersonal communication. The quality of intercultural communication, like communication within one culture, depends on the quality of the understanding achieved.

Linguoculturology is associated with the work of the famous American linguist B. Whorf, who, together with E. Sapir, formulated the hypothesis of linguistic relativity. Linguistic relativity as a scientific concept originates from the worker of ethno linguistics, the American anthropologist F.Boas. The most important stage in the study of language as a systematization of cultural experience is associated with the works of E. Sapir. Understanding the linguistic relativity, how impossible it is to establish component wise correspondences between the systems of different languages, Sapir introduced the term “incommensurability” of languages. The linguistic systems of individual languages not only record the content of cultural experience in different ways, but

also provide their speakers with the same ways of understanding reality and the ways of its perception. The most radical views on the "speaker's worldview" as a result of the action of linguistic mechanisms of conceptualization were expressed by B. Whorf. The tool of conceptualization, according to Whorf, is not only the formal units highlighted in the text, but also the selectivity of linguistic rules and compatibility in each specific language.

M.M. Bakhtin devoted his works to the study of the phenomenon of understanding. He put forward the linguoculturological concept of the dialogue of cultures, considering dialogue as the basis of dialectics, and understanding as a space of meanings and knowledge arising in the development of culture.

At present, the idea of the existence of a certain meta-cultural meaning, a certain common conceptual background, differently represented in different cultures, but guaranteeing the general significance of the content that representatives of different cultures understand, grasping the meaning, is being actively developed. In such conditions, the study of understanding as a phenomenon of intercultural communication seems to be very relevant.

“Dialogue of cultures” is the cognition of another culture through one's own, and one's own through another through cultural interpretation and adaptation of cultures to each other in conditions of semantic discrepancy and even conflict. But conflict is one of the forms of contradiction that allows the system (in this case, the space of two cultures) to develop. The result of this development is mutual understanding between cultures (and their individual representatives). Therefore, language is not just a means of communication or the transfer of information, but the most important mechanism of cultural communication. Dialogue of cultures is not a homogeneous superposition of meanings on top of each other, but a kind of pulsating symbiosis of meanings that get used to each other, sometimes passing directly into one another at the linguistic level.

Thus, if we semiotically interpret the dialogue of cultures, then it is realized, according to the apt designation of Yu.M. Lotman, within the semiosphere as a special semiotic space, which includes not only the sum of individual languages, but also the sociocultural field of their functioning. “Any single language turns out to be immersed in some semiotic space, and only because of its interaction with this space it is able to function. The semiosphere is both a result and a condition for the development of culture. ” As a result, culture appears before us in the form of a text, and the dialogue between cultures - in the form of a collision of two texts. Moreover, part of the text is a relatively simple coincidence, if not direct, then associated with an elementary translation of words from one language to another. But the mismatching part is the one that is most interesting to the representatives of cultures, which requires not direct translation, but semantic adaptation. As noted by M.M. Bakhtin, one can easily translate individual words of one language into another (which is reflected in dictionaries), but it is impossible to translate even one sentence. A sentence is not just a mechanical set of words, but a system of meanings rooted in the entire culture. The overlapping part is the intercultural primary vocabulary, the beginning of communication. And the non-coinciding part of cultures is the system of sentences, i.e. systems of meanings rooted in their own culture and not directly translatable, but associated with semantic interpretation and adaptation.

**Methods:** Consequently, the dialogue of cultures is their semantic adaptation to each other. The communicative culture of Uzbekistan is a kind of fusion of the most diverse traditions of many

peoples, which are reflected in folk music, dances, painting, applied arts, national cuisine and clothing. The Uzbek folk culture has been forming for centuries and is distinguished by an extraordinary, original and vibrant character among other cultures of the East. The ancient Iranian peoples, later the nomadic Turkic tribes, then the Arabs, Chinese and Russians made their contribution to it. Many residents of the republic, especially in rural areas, still adhere to many traditions that have their roots in the distant past. Ethical principles of Uzbeks, according to which a wise person should live according to rituals and rules, live with dignity, be balanced, restrain the expression of emotions, know his place, not violate the established order, not show off his dignity and be hospitable. These ethical principles still play a significant role in the life of Uzbeks.

1. For example, in everyday life, Uzbeks often point out treats in a hospitality situation if the following expression is used in Uzbek:

**【例文】** -*Marhamat, qani olinglar*

**【直訳】** どうぞ、どことってください。

**【意味】** *Қани олинглар.*- expression in Uzbek is used in the sense- どうぞ、召し上がってください。 which is translated into Uzbek. “*Marhamattannavul qilinglar* “after which it can be perceived by the Japanese.

Then you can see that you can easily translate words, but the meaning rooted in Uzbek culture is impossible. The matching part is どうぞ -*Marhamat* is an intercultural word and the beginning of communication. And the non-coinciding part of the cultures is *Qani olinglar*- 召し上がってください part of the meanings rooted in Uzbek and Japanese culture. This expression is not directly translated; semantic interpretation and adaptation are needed to establish an understanding of the dialogue of cultures.

2. For example, also in a situation of hospitality, Uzbeks often use the following expression in the Uzbek language:

**【例文】** -*Osh keldi*

**【直訳】** -ピラフが来た。

**【意味】** -*Osh keldi* - an expression in Uzbek language is used in the sense - ピラフを持ってきた。 which is translated into Uzbek. “*Osh olib kelindi*” is perceived by the Japanese.

**【解説】** Then you can see that you can easily translate words, but the meaning rooted in Uzbek culture is impossible. Since pilaf by itself cannot carry out an action. It is necessary to understand what this truly means here and it means that the pilaf was brought and put on the table. Consequently, semantic interpretation and adaptation is necessary to establish for the establishment of intercultural communication.

3. For example, also in a situation of hospitality, The Uzbek often use the following expression in Uzbek language:

**【例文】** -*Oshga qaranglar*

**【直訳】** -ピラフを見てください。

【意味】 The expression “*Oshga qaranglar*” is conveyed through the expression どおぞ、ピラフを召し上がってください -*Marhamat oshni tannavul qilinglar*。

【解説】 Then you can see that you can easily translate words, but the meaning rooted in Uzbek culture is impossible. A foreigner who does not know Uzbek culture can sit and watch, thinking that he should look at pilaf. But the Uzbek mean and want to say help yourself please. To convey the meaning of this expression and intercultural understanding by the Japanese, semantic interpretation and adaptation are necessary.

4. The following types of phraseology are distinguished: a) phraseological suppression - the meaning of a phraseme does not depend on the meaning of the words contained in it, the phraseme in the transitional sense is not explained by the meaning of the words it contains:

For example, Uzbeks use the following expression in Uzbek:

【例文】 -*Oyog'ini qo'liga olib chopdi*

【直訳】 -足を手で持って走った。

【解説】 То можно увидеть, что можно легко перевести слова, а смысл фраземы в переходном смысле не объясняется значением слов. Незнающий узбекскую культуру иностранец может понять данное выражение думая что надо бежать ногу держа руками.

【意味】 Но узбеки имеют ввиду и употребляют в значении поспешно уходит, убежать, спастись бегством, удирать от ответственности. Необходимо понимать это выражение японцами うまく逃げる、尻に帆かけて逃げ出す。

Следовательно, необходимо смысловая интерпретация и адаптация для установления понимания диалога культур.

5. In Uzbek language, the following phraseological expression is used; the meaning of a phraseme does not depend on the meaning of the words contained in it. For example:

【例文】 - *Qo'li pishib qoldi*

【直訳】 - 手を炒める

【意味】 The Uzbek mean and use in the meaning of prioritize experience, skill in any business. You must understand this expression in Japanese 腕を上げる、熟練する

【解説】 Then you can see that you can easily translate words, and the meaning of the phraseme in the transitional sense is not explained by the meaning of the words. A Japanese person who does not know Uzbek culture may think the meaning of this expression is how to fry a hand. To convey the meaning of this expression and intercultural understanding by the Japanese, semantic interpretation and adaptation are necessary.

6. For example, if we consider the expression:

【例文】 - *To'nini teskari kiyib oldi*

【直訳】 - トン<sup>1</sup>を裏面にして着た

**意味】** Uzbeks mean and use in the meaning will change in relation to someone in a bad way. You must understand this expression in Japanese 気が変わった

**【解説】** Then you can see that you can easily translate words, and the meaning of a phrase in the transitional sense cannot be explained by the meaning of words. A foreigner who does not know Uzbek culture may think that it is necessary to put on the national robe inside out. To convey the meaning of this expression and intercultural understanding by the Japanese, semantic interpretation and adaptation are necessary.

7. When learning about Japanese culture and the Japanese language, we often come across the expression いただきます. This expression is rooted in history, and pronouncing it before meals is a relatively new custom in Japan. Saying the phrase いただきます before a meal is an important part of Japanese etiquette.

**【例文】** - いただきます

**【直訳】** - *Men qabul qilaman*

**【意味】** Literally it translates as “*Men qabul qilaman*”, but when it is pronounced at the table, it rather means “*Kelinglar ovqat yeylik!*” or “*Yoqimli ishtaha!*” However, some, translating this phrase literally, liken it to a prayer before meals, an expression of gratitude to God for the food sent.

**【解説】** There are many nuances in using the verb いただく, it is used not only at the table, it has many more areas of application.

The verb いただく is most often translated in dictionaries as “qabul qilmoq”, “olmoq”. But these words do not fully reveal its meaning and can, on the contrary, confuse if you do not know Japanese culture. The verb いただきます (and its vocabulary form 頂く (いただく *itadaku*) are rooted in Buddhism, which teaches respect for all living things. Similar thinking extends to food, in the form of gratitude to plants, animals, farmers, hunters, cooks, etc. This is a manifestation of one of the basic principles of the cultural behavior of the Japanese.<sup>2</sup>

There is a saying in Japan: お米一粒一粒には、七人の神様が住んでいる。(おこめひとつぶひとつぶには、しちにんのかみさまがすんでいる, *okome hitotsubu hitotsubu niwa shichinin no kamisama ga sundeiru*)

- *Bitta guruch donasida ettita xudo yashaydi* (Seven gods live in one grain of rice.)

Intercultural understanding requires the transmission of meaning that gratitude and reflection are at the heart of the custom of pronouncing the phrase いただきます before food, through semantic interpretation and adaptation. There is also a sense of gratitude in Uzbek culture

God for providing food to us. In this case, intercultural communication can start with similar feelings of gratitude.

8. Intercultural understanding requires the transmission of meaning that gratitude and reflection are at the heart of the custom of pronouncing the phrase いただきます before food, through semantic interpretation and adaptation. There is also a sense of gratitude in Uzbek culture

God for providing food to us. In this case, intercultural communication can start with similar feelings of gratitude.

For example, if we consider the expression:

【例文】－ お客様をおもてなしの心でお迎えしましょう。

【直訳】－ *Mehmonlarni chin qo 'ngildan kutib olaylik!*

【意味】 Literally it translates as “‘*Mehmonlarni chin qo 'ngildan kutib olaylik!*’”, but in this case, you can easily translate the words, and the meaning of the expression “omotenashi” as it is used in a broad sense cannot be explained by the meaning of words.

【解説】 *Mezbonlikis* a neutral-polite word. It is used to express courtesy and attention to guests, customers, etc. A foreigner who does not know Japanese culture may perceive this expression simply as hospitality. To convey the full meaning of this expression and intercultural understanding by Uzbeks, semantic interpretation and adaptation are necessary, since the word “omotenashi” can express not only hospitality, but includes the meaning of kind treatment and special attention. Respect for someone else is a characteristic feature of Uzbek culture. If for Europeans old age is something that you can hardly be proud of, then in the East, old age is associated with ideas of experience and wisdom. Old age is revered in the same way as kinship. A high degree of politeness, attention to the interlocutor, lack of pressure and categoricalness are becoming effective means of communicative influence for Uzbeks. Just as Uzbeks are famous for their hospitality, through this expression Uzbeks can understand the warm heart of the Japanese and feel the unique spirit of Japan and establish a dialogue of cultures.

9. In Japanese culture, sayings are often used in everyday life. For example one of them:

【例文】－ お客様は神様です。

【直訳】－ *Mehmon xudodir*

【意味】 - If you look at the dictionary, the expression in Japanese お客様 is used in the sense of guest, client, which is translated into Uzbek. “*Mehmon, haridor, mizoz*” according to the context, Uzbeks can easily choose the meaning of “*меҳмон, харидор*”.

【解説】 *In this case, it might seem like the saying was easily translated. However, the adage has a transitional meaning, the meaning associated with roots in Japanese culture is impossible. The matching part is “神様です-Xaridor xudodir” is an intercultural word and the beginning of communication. And the non-matching part of the cultures is the お客様は mehmon. part of the expression that has different meanings, rooted in Japanese culture. This proverb in Japanese is used in a transitional meaning and in order to establish an understanding of the dialogue of cultures in the Uzbek language, it must be adapted and interpreted. In this case, the proverb お客様は神様です must be conveyed by making a semantic interpretation as follows “Hamma narsa haridorlar uchun” yoki “Xaridor har doim haq”.*

This expression “Fans and listeners are god” spoken by Haruo Minami was first used as an address by a performer on stage. Nowadays, this expression has fallen out of use in relation to the audience of the concert hall.

The current situation お客様は神様です – “Tomoshabinlar xudodir “ the saying is used only by employees as an expression for the training from the company:

"Mijoz xudo, shuning uchun siz har qanday narsani tinglashingiz kerak!" - The customer is God, so you have to listen to anything."

Thus, it spread as a meaning, far from the idea that Haruo Minami originally thought.

**Conclusion:** Thus, the following conclusions can be drawn regarding the intercultural understanding of the Japanese and Uzbeks. In general, the Japanese and Uzbeks demonstrate a fairly high speech culture. Their culture differs from European culture and is based on a centuries-old tradition. Similar characteristics of the intercultural understanding of the Japanese and Uzbeks are a high degree of politeness, kind treatment, special attention, lack of categoricity, hospitality. Their desire to establish a dialogue of cultures is subordinated to the task of providing maximum attention to the interlocutor, showing courtesy to him, creating a good mood in him. They are also characterized by moderation in everything, including in speech behavior.

When analyzing the semantic range and space of knowledge, the national peculiarity of intercultural understanding was determined. A distinctive national feature of the intercultural understanding of Uzbeks is the need to take into account their mentality and not demand from them, for example, a dispute on an equal footing with an elder in age or social status, not only demand a story about work problems. But it is necessary to be able to listen to their personal problems and feelings, not to seek a direct answer where Uzbeks prefer indirect answers.

A distinctive national feature of the intercultural understanding of the Japanese is respect for the individual culture, language, faith and even the culture of foreigners.

We believe that intercultural understanding is a very important value, both for the Japanese and the Uzbeks. The analysis of intercultural communication between the Japanese and Uzbeks from the point of view of cultural linguistics made it possible to substantiate understanding as a phenomenon that arises and functions simultaneously at two levels: linguistic (the result of adequate perception in the space of knowledge and semantic space) and cultural (the result of adequate perception of other cultural ideas). The phenomenon of understanding the Japanese and Uzbeks is specific due to the difference in nationally-specific pictures of the world, the degree of verbalization of the deep content of speech and text, which is characteristic of the Japanese and Uzbek languages.

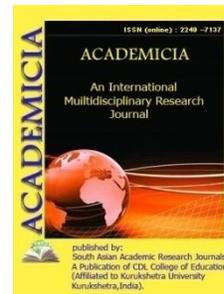

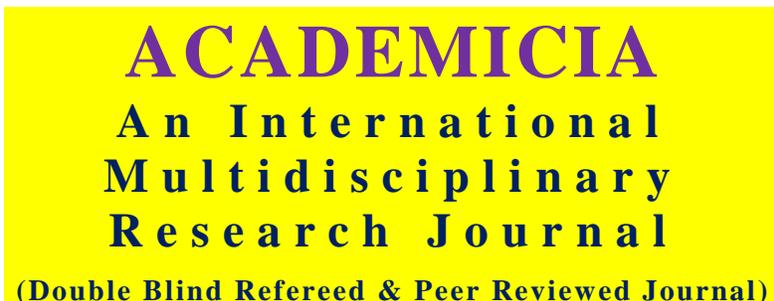

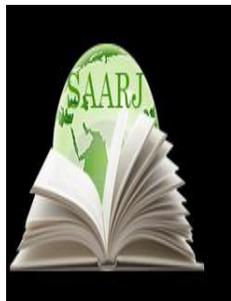

In the intercultural verbal communication of the Japanese and Uzbeks, a distinctive feature is the lexico-semantic structure, cultural situations used by communicants, the space of knowledge and perception, as well as the semantic range of expressions and sayings they use.

In the course of the analysis, it was found that the Japanese and Uzbek dialogue of cultures is not a homogeneous superposition of meanings on each other, but a kind of pulsating symbiosis of meanings that get used through adaptation and interpretation at the linguistic level.

**ON PATIENCE ETIQUETTE OF KHWARESMIAN SCHOLAR  
MAHMUD ZAMAKHSHARIY**

**Nigora Sulaymonova\***

\*Associate Professor,  
Candidate of Philological Sciences,  
Tashkent State University of Uzbek language and literature named after Alisher Navoi,  
UZBEKISTAN

**ABSTRACT**

*The article analyzes separated views wisdoms and edifications of Mahmud Zamakhshariy from his didactic works of “Navobighu-l-kalim” (Delicate expressions) and “Atvoqu-z-zahab” (“Golden necklet”) on the etiquette of conversation, limits of a language, patience and satisfaction that are humane features.*

**KEYWORDS:** Mahmud Zamakhshariy, “Navobighu-L-Kalim” (“Delicate Expressions”), “Atvoqu-Z-Zahab” (“Golden Necklet”), Ethical Views, Wisdom And Edification, Quote, Language, Language Restriction, The Etiquette Of Conversation, Patience And Satisfaction.

**INTRODUCTION**

Indeed, the main indication of a nation, which puts it among other nations, is its language. Uzbek literary language has been recognized as one of the wealthiest languages in the world in this regard. The colorfulness in Uzbek dialects guarantee a unique appeal and beauty to the language. Sir Alisher Navoi proved the prestige of the literary Uzbek language among other Turkic languages and “at the global stage” through his works written in this language. However, there is also a metaphoric use of a language where a part of an object is regarded as a part of a human body which has also been used to imply for the etiquette of conversation among people.

In the history of our national literary language, there are rare sources for expressing speech in a meaningful and beautiful way, for patience and satisfaction in general. Khwarezmian scholar Mahmud Zamakhshariy also expressed a number of exemplary ideas in his works in this regard. In particular, he noted on speaking when necessary and on time response as “*Whosoever cannot restrain the muscle between his two teeth lives his whole life in regret. He lives through sleepless nights for not restraining his tongue when necessary. If his tongue had been sad (silent), his heart would not have been sad. It is difficult to keep a person alive when he cannot keep his tongue still*” [3,72]. When considered from the perspective of modern society, it is important to know how and what to say to whom and when. Because as the networks of speech expand (media, Internet, mobile, other channels of the virtual world), firstly, adherence to the rules of language, and secondly, the etiquette of speech, the attention to culture should increase day by day. However, we cannot confidently acknowledge that these requirements are being met. On the contrary, we can see that a gross violation of language norms leads to a violation of our national literary language, resulting in incomprehensible speech practices as a result of the interference of dialects. Therefore, it is recommended to pay serious attention to this factor in the education of a harmoniously developed person, especially in the education of students' speech etiquette and culture, the appropriate use of our historical values, including the teachings of Mahmud Zamakhshariy on language.

Speaking about restraining the tongue, Mahmud Zamakhshariy interprets the consequences of not being able to control it as follows: “*If you cannot control your tongue, then you have given the reins to the devil*” [1, 52]. That is why our people have an exemplary saying in which it is said that “a person should little and only necessary words”. Furthermore, in the words of Zamakhshariy, “*Too much talk hurts the listener*” [1; 70]. The Chinese philosopher Lao Tzu interprets Zamakhshariy's view as “*one who speaks too much fails too much.*”

In Zamakhshariy's teachings on language, an understanding of the meaning and essence of each word acknowledges the need to pay attention to how similar its meaning is to the subject of speech before speaking. Because some words in the Uzbek language have several meanings, their meaning and essence can be interpreted differently depending on the context of the speech (conversation). In this sense, Zamakhshariy's words “*There are many sayings that, although they may seem eloquent to people, they are unacceptable in the sight of Allah, and these words make both the speaker and the hearer upset*” [1, 58]. Indeed, it is possible to hurt others because of a word that is used improperly. This pain, the complication of a spiritual injury, can persist for years, and in some cases may stay forgotten for a lifetime. In this regard, Zamakhshariy says: “*Often a wound inflicted on the tongue is more severe than a wound inflicted by a sword*” [1, 58].

These thoughts of Mahmud Zamakhshariy are also exemplary in Uzbek folk proverbs, that is, it says, “*Even if the poison of the sword goes away, the poison of the word does not go away.*” That is why there are calls in our people to refrain from language, not to hurt the hearts of others with bad words, to bite the core of words. This situation did not escape Zamakhshariy's attention. In other words, the scholar warns people to be careful with their language, saying, “*There are many words that will make you fight and destroy you, or even if you turn them away, they will turn your shoulder pads red like a flower (that is, after many hardships)*” [1, 58] which urges to be careful.

Language is such a powerful weapon that people "carry it on their shoulders" throughout their lives. How to use it depends on the manners, culture and spirituality of the owner. Zamakhshariy says, "*How many weapons are there in the world which requires to be taken down (if you can't use me, what are you going to do with me?) There are also so many words that says to those who say them leave me alone (what are you going to do with me if you cannot use properly)*" (3; 109).

There is a norm, a measure in everything. Accordingly, Zamakhshariy figuratively describes the etiquette of speech as being patient: "***The good tongue is the one which is restricted from use of improper words, the good saying is the one which is weighed on a scale***" [3:102]. Although it is not actually a word to be weighed, Zamakhshariy put forward such an idea by pointing out how weighty it is. There are also exhortations in Zamakhshariy's works, such as "***Think first, then speak***" "***O my son, protect your tongue from evil words***" which call to restrain the tongue [1; 79]. In his works, the scholar strongly condemns the practice of lying. As a sign of this, Zamakhshariy's statement, "***Do not utter a word until you have taken action on what and why you are talking about***" [3, 109], can be seen as a "recipe" for refraining from lying or misrepresenting.

Zamakhshariy's ideas on the use of language in its place, in accordance with the established order, have served as a program for the most advanced strata of the Uzbek people, scholars, writers and poets for centuries. Abdullah Qadiri, the founder of Uzbek novelism, developed Zamakhshariy's ideas by giving a jeweler's description of the proper use of language (words). Abdullah Qadiri says, "*It is not a virtue to weave sentences from every word that comes to mind improperly. Let the word be the mold and the thought be the brick in it.*" It can be said that these ideas have doubled in importance to this day. Because today, when the type and network of media is growing rapidly, we cannot say that all our work on the use of language instead of adherence to the norms of language, as noted by Abdullah Qadiri, is as perfect as it should have been.

At different times, our scholars have pointed out in their works that it is not polite to talk too much. Speaking in circles, in particular, requires a certain norm and etiquette. In this sense, the following thoughts of Mahmud Zamakhshariy are exemplary: "***Speak if your speech is better than silence***" [3, 102]. Otherwise, silence is preferable to that statement. Continuing this idea, Zamakhshariy logically continued the instructive words of Aristotle. In other words, Zamakhshariy paraphrases Aristotle's saying, "*A short-sighted person usually has a very long tongue.*" as "***The sign of light weight word usage is the sign of a person with only little knowledge***" [3, 102]

Zamakhshariy considers those who speak patiently and calmly to be intelligent and knowledgeable, and "***nothing can adorn a speaker like calmness and patience***" [3, 102], that is, the scholar values calmness as the adornment of a person.

Analysis of historical sources shows that Zamakhshariy's views on language and its rational use are also recorded in other sources. In particular, it is repeated in many of the hadiths (the instructions of Muhammad PBUH) that the quality of "speaking kindly or keeping silent" is the most important of the deeds. In fact, the more a person talks, the more mistakes he makes. A person who talks too much can turn to gossip, lies, and even slander. Therefore, the idea expressed in the hadith can be understood as that a person should think of every word and find it good, then put it into his mouth, and vice versa, and remain silent.

The following narration can be cited as a continuation of the scholar Zamakhshariy's views on keeping silence. When Luqman Hakim entered the presence of David the Prophet, he was sewing armor. Luqman Hakim had never seen an armor before. He was amazed at what he saw. He wanted to ask about it, but his wisdom prevented him from doing so, and he refrained from asking what it was. When David had finished his work, he put on his armor and said to Luqman Hakim, "The armor is for war." Then Hakim said to himself, "Silence is wisdom."

The wise Mawliq Ajli said: "There is a work, I have been in demand for it for twenty years. But I cannot. But I will not give up this demand." "What is it?" They asked. "To be silent about something that doesn't matter to me," he replied.

Zamakhshari's opinion on the proper use of language is also exemplary: "***It is better for a wise person to remain silent, than the apology of an ignorant and careless person***" [1, 55]. There is also a very beautiful description by Zamakhshariy of meaningful and pleasant words coming out of the tongue: "***Almsgiving that comes from your tongue (i.e., your advice and sermon and service) is sometimes better than the alms that comes from your hands (wealth)***" [1, 57].

As we have seen, patience and contentment have always been revered as the most precious of human qualities. This quality, first of all, requires a person to use the language beautifully and appropriately, with a certain amount of patience. That is why many scholars have created works of classical status about this quality that is nurtured in human beings. Mahmud Zamakhshariy's views on patience and contentment have not lost their spiritual and enlightenment significance even today. After all, in his words, "***the higher the rank, the better.***"

Indeed, Uzbek folk proverbs such as "The root of patience is pure gold", "If you are patient, honey will grow out of a fruit" have been formed over the centuries as the historical value of patience and contentment not only for one person or another but for the whole humanity. That is why Mahmud Zamakhshariy in his didactic work "Atvoqu-z-zahab" ("Golden necklet") states that "***Satisfaction is the reason for ascending to the highest peak***" [3, 104].

Regardless of a person's financial situation, Mahmud Zamakhshariy says, "***The contentment of the poor, even if his (the poor's) face is covered with dust and in a torn garment, shows it to your eyes in a royal robe. And the greed of the rich man, even though he is standing in front of you in a golden robe, shows it to you in the form of a poor, worn-out man***" [3, 104]. With these thoughts, Zamakhshariy, first of all, put forward the idea of valuing labor, the working man, and secondly, urging people to be patient, pointing out that the "gold clothes" of the rich man seem to be "torn" due to impure actions towards wealth.

In his didactic views, Zamakhshariy argues that the defects that exist in the human psyche and "control" his activities, directing him to various behaviors, can occur only in those who have a weak patience. One of such vices is his statement to those who live a simple life that "***he who enjoys entertainment will never be like one who endures hardships***" [3, 91].

Commenting on patience, Mahmud Zamakhshariy pays special attention to the content, essence and quality of this quality. For patience alone does not make a person's life prosperous, and patience alone does not make him perfect. Mahmud Zamakhshariy rightly states that "***a prudent, sensible, patient person will never stop working for the benefit of this world and the hereafter***" [3, 91].

Mahmud Zamakhshariy's views on patience and contentment are exemplary, especially for those who are stupid and impatient. The scholar says, "*A wise man who is pure and upright in nature, high in value and gentle, endures calamity in any situation, and a fool seeks to justify his intolerance of calamity under various pretexts*" [3, 76]. In other words, he acknowledges that the exemplary behavior of high-minded people in terms of patience and contentment is an example to the impatient.

Some people think that patience and contentment are needed only in times of poverty, helplessness and anxiety. On the surface, it seems so. But patience and contentment are qualities that are necessary for all strata of humanity. There are many real-life examples of this. For example, not all children raised in a wealthy family are wise. This is due, first of all, to the ingenuity of parents, their low pedagogical competence, in general, lack of perseverance and patience in trying to increase their knowledge in this area, and they children grow to be the individuals who lack important qualities, such as content and satisfaction, of a good man. As a result they lack patience and gratitude which lead them to the path of greed and jealousy in which cases they mistakenly cross the road of evil. So, "*patience is always needed. Whether a person is in good or in bad situation, whether s/he is surrounded with loss and disadvantage or surrounded with profit and advantage. It is easy to endure poverty. But not everyone can tolerate to be wealthy. In fact, the human being should be patient in difficult times, and when s/he is blessed, s/he should be patient with gratitude and kindness*" [4, 284].

Analyzing Mahmud Zamakhshariy's views on patience and contentment, we see that the scholar put forward such a content in his ideas. In this sense, it is appropriate to recognize the scientific heritage of Mahmud Zamakhshariy as one of the components of the conceptual basis of the system that leads to perfection. In addition, this framework is a credible approach that should be followed in this direction.

It is known from history that Mahmud Zamakhshari was one of the three commentators who perfectly interpreted the Qur'an and left a rich scientific and spiritual heritage in this area. Therefore, his views are in line with the ideas put forward in Islamic teaching. "The call to patience is repeated many times in the Qur'an. For Allah needs patience in obedience, in avoiding sin, in overcoming obstacles, in the face of weakness, and in controlling lust" [4, 286]. Islamic teaching is not obsolete, it is important as a value that has not lost its educational value at all times, including today, in the existence of humanity and society.

In addition to the calls in the Qur'an, the hadiths also set out exemplary ideas about patience and contentment, saying, "*Patience is the greatest and most generous gift bestowed on a servant by Allah. The patient endures both the scarcity of food and poverty, and does not despise himself, but keeps his head upright. A slave who is deprived of the blessing of patience, even if he has half of the world, will be humiliated and greedy. If a Muslim perseveres and is content with the sufficient sustenance given to him by Allah, he will become one of the few who have achieved the greatest salvation in the world. The real wealth is not in the abundance of the world, but in the satiety of the self*" [14, 286].

Based on the analysis of the above points, the following conclusions can be made.

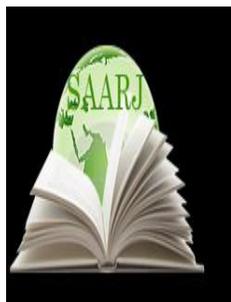

One of the important norms of etiquette is that patience and contentment are respected in all periods of human society and are unique to real people.

Since patience and contentment are a unique quality that characterizes the personality of people with high spirituality and introduces them as beautiful people, our historical ancestors, including the great scholar Mahmud Zamakhshariy, encouraged people to be patient and content in their works. His observation in this regard, based on his life experience, has left an immortal scientific and spiritual legacy of teachings that have not lost their didactic significance even today. Their rational use serves to strengthen the historical and national basis of the upbringing of a harmoniously developed generation.

The concepts of patience and contentment should be seen as a source of nurturing important human qualities based on both religious and secular sciences. Indeed, following the ideas that encourage people to be patient and content in the Qur'an, the hadiths, and the works of Mahmud Zamakhshariy, along with other historical sources, is a historically proven way to bring people to perfection.

## TYPES OF HOMONYMS IN THE KARAKALPAK LANGUAGE

**Nurjamal Rustemovna Karamatdinova\***

\*A Research Intern of Karakalpak branch of the Academy of Sciences of Uzbekistan,  
Nukus, Karakalpakstan, UZBEKISTAN  
Email id: nkaramadinova@mail.ru

### ABSTRACT

*The article discusses the types of homonyms in the Karakalpak language and their characteristics. Lexical homonyms, lexical-grammatical homonyms and mixed homonyms are briefly explained with the help of examples. Our language has the same sound structure and pronunciation, but also completely different types in terms of meaning and form. Such a group of words serves only a certain norm of homonymy, but in the second form it does not have a homonymous function. Finally, in our language we call such homonymous phenomena grammatical homonyms.*

**KEYWORDS:** *Karakalpak Language, Homonyms, Lexical Homonyms, Lexical-Grammatical Homonyms, Mixed Homonyms.*

### INTRODUCTION

Homonyms in the Karakalpak language are divided into several types, similar to homonyms in other Turkic languages. Homonymous words are made up of one word and several words, and are semantically unrelated and indistinguishable from each other.

### Main part

Professor E.Berdimuratov in his works called word-related homonyms lexical homonyms, homonymous phenomena among grammatical terms as grammatical homonyms. “Words that

have a common form in all cases are called lexical homonyms, as the structure of the sound is the same as the pronunciation, but the meaning is completely different [1, p. 146].

In his work, the scientist recognized lexicological homonymy as one of the most important phenomena of lexicology and divided them such that: homoforms, homographs, homophones.

Scientist A. Bekbergenov in his work divides homonyms into homoforms, homographs, homophones, depending on how they are made of any word [2, p. 23].

But, as E. Berdimuratov points out in his last work: "We see that in the growing lexical homonymy there are two groups of words called homonyms and homoforms" [3, p. 38].

Lexical, lexical-grammatical homonyms and mixed homonyms are divided into three parts depending on the forms of meanings of homonyms in the Kazakh language [4].

As you can see, we call a group of words homonyms, which are the same in terms of pronunciation and consonant, but differ in meaning, and always have the same grammatical forms.

There are also controversial views on the classification of homonyms. We see this in the examples above. Based on the above comments of scientists, we consider it appropriate to consider the homonyms in the Karakalpak language as follows:

1. Lexical homonyms or complete homonyms;
2. Lexical-grammatical homonyms are incomplete homonyms;
3. Mixed homonyms.

This is because the properties of homophones, homographs, and homoforms are also evident in the work of the three types of homonyms mentioned above.

**Complete homonyms.** Complete homonyms are formed from a single word and are considered to be words that have the same affixes and the same form in all cases. For example:

1. *Hámel* degen ózi dım qızıq,

Bir jeri basqalardan dım parıq qıladı (I.Yusupov)

2. Bazar talapları bolsa da qattı,

Bas awırtıp oğan *hámel* qılmaymız (I.Yusupov)

1. Shayırman dep shirengennen ne *qayır*,

Házir sonı sonı oylap túrman Kegeyli. (I.Yusupov)

2. Keshe tolqıp jatqan *qayırdı* qara,

Qanlı urıs bolǵanday qıp-qızıl sora (I.Yusupov)

1. *Hámel* (atlıq) *basqarıwshı jumıs, lawazım, dáreje, ataq.*

2. *Hámel* (atlıq) *tásil, ádis,*

3. *Qayır* (atlıq) *payda, saqawat, úmit.*

4. *Qayır* (atlıq) *suw qayıw nátiyjesinde ashılǵan jer.*

There are many such examples:

1. Shejirege altınqabaq baylap at,  
Bilgishlerge jiberme óz haqıńdı (I.Yusupov)

2. Qabaq shıtıp júrme hasla,  
Úyge miyman kelgen waqta (I.Yusupov)

1. Basqa is túskende sır berme hasla,  
Joqarı tut beglik inabatıńdı. (I.Yusupov)

2. Sını ketpes deydi sirli tabaqtıń,  
Qızlarǵa bergisiz badamqabaqlım. (I.Yusupov)

In these examples: “qabaq” – the desired product from the palm plant used in everyday life, “qabaq” – human body, “sır” – secret, unknowable sense, “sır” – paint.

True dialectal lexical homonymous trains are a group of dialectal words that, in any case, are related to a single word, differ in lexical terms, and are not so different in grammatical order.

We are looking for the following words that appeared in the Karakalpak language in the Moynak dialect.

**KergiI**a certain part of a fishing boat (n);

**KergiII**a bowl for putting dishes. (n);

**ArqalıqI**fishing net (n);

**Arqalıq II**whollen thing in cart (n);

**Incomplete homonyms.** Words that are included in lexical-grammatical homonyms are related to each part of speech and are homonymous only in the root form, and in the rest of the time each word is transformed into its own form. For example: **Qorǵan I** n. a fence, a wall, a high wall that turns something upside down. Hár úydiń úzin-úzin **qorǵanı** bar (S.Baqbergenov). **Qorǵan II** v. Búl - biziń sırtqı jawlarımızdan **qorǵanatuǵın** jalǵız gana qúralımız (Á.Sh).

Our language has the same sound structure and pronunciation, but also completely different types in terms of meaning and form. Such a group of words serves only a certain norm of homonymy, but in the second form it does not have a homonymous function. Finally, in our language we call such homonymous phenomena grammatical homonyms. Such homonymous words can be from any part of speech and they can be homonymous only in the form of a root word, otherwise each of them has the property of changing with its own affixes. For example:

1. Qulama say shıqqanday keń jazıqqa,  
Bir ańqaw pil únilgendey qazıqqa. (I.Yusupov)

2. Say kelmestey aqılına adamnıń,  
Bir ájayıp gilem toqıp taslayıq. (I. Yusupov)

In the first example, the word “say” refers to a noun, which means “valley”, and in the second example, the word “say” refers to a noun, which means “appropriate”.

A group of words that retain only one center and have different grammatical features in other situations, the meanings of which are separated from each other, are called homofoms, and they are made up of all kinds of words. For example:

1. *Qaqtıń* suwın ańsap kelgen kiyiktey,  
Biz kelgenbiz bilim izlep aw'ldan. (I.Yusupov)
2. Sóytip ol óziniń xan sarayına,  
Patshalıq taqtınıń*qaq* mańlayına,  
Qazıqqa qıstrip qoydı ol búgin,  
Shopan waqta kiygen jaman sharıǵın (I.Yusupov)
3. Titretpey *qaq* tarińdı janım "Tánawar" gózzal,  
Bunshelli titretip meni jazıǵ'm bar ma deymen. (I.Yusupov)

The word "qaq" in the examples is used as noun-adjective-verb and has different meanings.

Although it is pronounced the same in the Karakalpak language, there are some words that differ in the way they are pronounced, even if they are spelled the same way. For example: *azshılıq-ashshılıq, duzshılıq-dushshılıq, jaza aladı-jazaladı.Sosúrme* (n), *súrme* (v), *shıǵarma* (n), *shıǵarma* (v), *tuwrama* (n), *tuwrama* (v) and etc. Words that have the same pronunciation and spelling are called homophones. Omographs are words that are spelled differently instead of the same spelling[5, p. 256]. Now let's give them examples from the poet's works:

1. Bir túkten *shash* bolmas, bir gúrishten as,  
Bir túp baǵ bolmas, taw bolmas bir tas. (I.Yusupov)
2. Sol topıraqtı *shash* ústime kómerde,  
Hám anańniń tumarı bar sol jerde. (I.Yusupov)

Here, words that are homonymous with each other come in the service of homofoms.

1. Ata-baba bir jaylawda mal baqtı,  
Muwsa, Súyew bir duwtarda *tar* qaqtı.
2. Toparlasıp júrgen sıymas *tar* jerge,  
Hár kim shópler napaqasın hár jerde. (I.Yusupov)

In the first example, "tar" (n) means the string of a musical instrument, while in the second example, tar (adj) is used in the sense of a small, dimensionless space. These words have nothing in common with each other, and in the end they are homonymous words. We can include such words in the list of lexical homonyms.

1. Awır miynetine kónip,  
Islep qarater bolǵanbiz. (I.Yusupov)
2. Jas jigittey ashıq qılıp ómirge,  
Sóz marjanınter dep ilham bereseń. (I.Yusupov)

1. Qızıl qumǵaqoy jayıp, qozı tergen,  
Men súemen elimniń shopan xalqın. (I.Yusupov)
2. Qoy, endi sen maǵan úlpet bolǵandı,  
Atańniń qarızı bolmasa mende. (I.Yusupov)

The words "ter" (n), "ter" (v), "qoy" (n), and "qoy" (v) in these examples are made up of different part of speech and have different meanings. It is difficult to distinguish these words from one another unless they are uttered with a special intonation. These words are written in the same way in writing, but they are spoken in different ways. Such words were called homographs [6].

Dialectal lexical-grammatical homonyms were also found in our language. This type of dialectal homonyms is mainly related to each part of speech, and in the former form corresponds to each other, and in the rest of the time to some extent differs from each other. Their specificity is as follows:

If lexical homonyms consist of a single root word, and the dialectal lexical-grammatical homonymy series adds affixes to the word root with the affixes of the verb, homonymous series will appear. For example:

**Mata I** **Motocikl**, actively uses in the lexical structure of the Southern dialect of the Karakalpak language.

**Mata II** in the Kegeyli dialect of the Northern dialect it is pronounced in the sense of commodity.

**Mata III** in the Moynak dialect of the Northern dialect, a special type of fabric (plate) is woven from reeds to suppress the roof and place it on the walls.

**Mata IV** tie something up (v). This word is characteristic of most regions of the Northern dialects.

The difference of this type of homonymous series can be considered as its separation from other groups on lexical and grammatical features. Such properties are taken into account not in all forms, but in one form, and they are also called semi-homonyms [5, pp. 29-31].

**Mixed homonyms.** Words that are included in mixed homonyms have many part of speech, and the above two types (lexical and lexical-grammatical) are used. For example: **Quw I** n. Iyilgen uzın moyınlı suw qusı, aqquw. Jırshı qúslar hawada qosıq aytıp, qıyqıw salar kóldegi ǵaz benen quwlar (A.). **Quw II** adv. Qurǵap ketken, quwraǵan, qurǵaq. Quw shópten basqa nárese joq dalada bir. (Q.B.). **Quw III** adj. Hiyleker. Ámel tapqısh, epshil. Aysulıw da bir qubılıp shıqtı, keliwimenen-aq Qasimbek quw onı jawlap aldı (Z.A.)- **Quw IV** v. Qashqan náresege jetiw ushın sońına túsıw, juwırıw. Atlan! Usła, alıp ketti! Quw! Jet! (J.R.)

Аралас омонимдерде лексикалық және лексикалық-грамматикалық омонимдер бар. Бұл сөздер бір немесе екі емес, бірнеше бөліктерге арналған. Мысалға:

- Shappat penen *júz* qızartıp *júr*genler,  
Bul bazarǵa kire almas jigitler. (I.Yusupov).  
“Tuwılasań” dese maǵan *júz* ret,  
Tek te usı jerde tuwılar edim.

Jáhángir shah, qayt iraydan,  
 Arǵı júzge sıymaysañba? (I.Yusupov).  
 Házir nelerjúz bermeydi dúnyada,  
 Bir jaqlardıń suwı sıymas dáryaǵa.  
 Bul mısallarda “júz” sózi:  
 1.Júz (n) –the face of man.  
 2.Júz (num) - numeral.  
 3.Arǵı júz - on the other side of the river (adv).  
 4.Júz beriw - (v) appearance.

Homophones and homographs were also used in our language to differentiate the types of homonyms.

Many words in our language are pronounced in the same way, keeping the spelling norm, but there are many words that are spelled differently according to the spelling norm.

For example, the words "asshy" (the person who cooks) and "ashshy" (antonym of the word unleavened); The words "qara ala" (appearance) and "qarala" (verb) are pronounced in the same way, the spelling is marked differently. Homographs have the same pronunciation, but different spellings.

Although many words in our language are written together, they are pronounced differently depending on the meaning of the word patty, and there are also words that have meaning in front of them. For example, the words "alma" (v), "alma" (golden apple) belong to omographs.

### **Dialectical-literary homonyms**

It can be seen that this group of homonyms consists of both literary and dialectal words. Example: "maydan" 1. In literary language, 1) maydan, 2) field 3) battlefield. “Maydan“II is pronounced in the Northern dialect in the sense of time, epoch, epoch.

Mat I. The word in literary language is 1) a defeat in a chess game; 2) defeat in the aitys;

Matt II. means to press underfoot (In Northern and Southern dialects).

### **CONCLUSION**

The above examples show that homonyms in a literary language can be used alongside dialectal homonyms, and that there is a certain range of meanings between them.

Depending on the changes in the system of change of words included in dialectal homonyms:

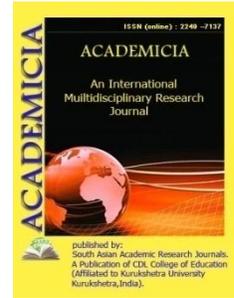

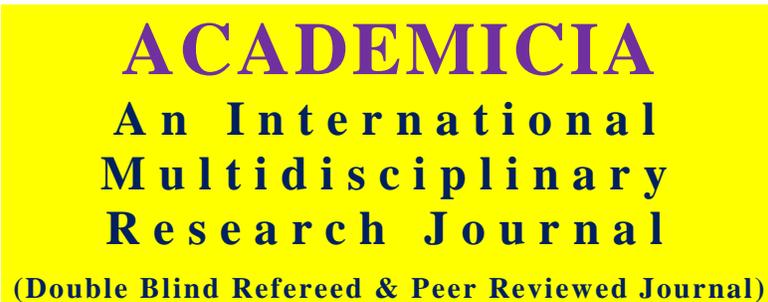

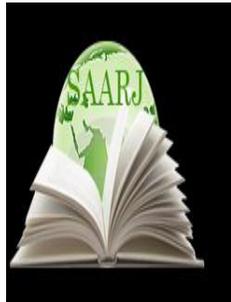

- a) true dialectal-lexical homonyms;
- b) dialectal lexical-grammatical (patch half) homonyms;
- c) can be considered as dialectal homonyms.

Homonyms in our language are used in the form of roots and derivatives. In the Karakalpak language, root homonyms are used more often than derivative homonyms, and in the lexicon of

the Russian language, according to academician V. Vinogradov[7], derivative homonyms are more common than root homonyms.

## SHARAF RASHIDOV: OUTSTANDING STATE AND PUBLIC FIGURE

Nurkulova R.R\*

\*Associate Professor,  
Department of “Methodology of History Teaching”,  
Jizzakh State Pedagogical Institute named after Abdulla Kadyri,  
Honored Pedagogue of Public Education of the Republic of UZBEKISTAN

### ABSTRACT

*In this article, the difficult situation that arose in the Republic of Uzbekistan during the former Soviet period, a prominent state and public figure, a well-known writer Sh.R.Rashidov was formed as a person and his leadership activity was shown, and his service in the development of agriculture, industry and culture of the Republic was covered.*

**KEYWORDS:** “Center”, Uzbekistan, Sh.R.Rashidov, Mirzachul, Jizzakh, Karshi, Gulistan, Boston, Marjanbulak, Istiqlol Palace, 1966 Earthquake, New Tashkent, Sh.Rashidov Diplomat, “Rashidovchilik”, “Cotton Business”, “Uzbeks Work”, Independence.

### INTRODUCTION

The name and activity of SharofRashidov, a well-known statesman and public figure, a well-known writer and a man of many talents, are inextricably linked with the life and history of the Uzbek people and cannot be imagined.

SharofRashidov has taken a worthy place in the hearts of our people with his great leadership skills, vast knowledge, rich memory, unique talent, wide-ranging culture, nobility and honesty, zeal, kindness, humility.

During his 66 years of short life, he worked in leading positions in Uzbekistan for 33 years, devoting his leadership skills, knowledge and full potential to the welfare of the people, the cure for their ailments, the development of our republic.

At the age of thirty-three, SharofRashidov was appointed Chairman of the Presidium of the Supreme Soviet of the Uzbek SSR.

It should be noted that in the history of the former USSR at this age no one had yet held the highest authority. In 1959, SharofRashidov was elected the first secretary of the Central Committee of the Communist Party of Uzbekistan, which was the highest position at that time. SharofRashidov served in this high position with perseverance and perseverance until the last day of his life and made a great contribution to the economic, political, social and spiritual development of Uzbekistan. Despite the persecution of the center, he took every opportunity along the way. He bravely overcame the difficulties of that difficult period and spared not even the dear life of the people, the path of development of the republic. Therefore, the honored son of the Uzbek people SharofRashidov with his great services will live forever in the hearts of our people, and his great name has taken a worthy place among the historical jewels of Uzbekistan.

SharofRashidov lived with great hope and confidence in the independence and bright future of Uzbekistan. As the First President of the Republic of Uzbekistan Islam Karimov said: "SharofRashidov was one of the figures who laid a worthy foundation for independence" [1, p. 89].

In this article, we will focus on the role of the famous statesman and public figure and well-known writer Sh.R. Rashidov in the history of Uzbekistan. We must not forget that Uzbekistan was one of the allied republics of the former USSR, and the socio-economic development of our country depends on the "Center", the Central Committee of the Communist Party of the Soviet Union.

### **THE MAIN FINDINGS AND RESULTS**

The formation, development and activity of Sh.R. Rashidov as a statesman and public figure took place at a difficult time during the former Soviet era. Sh. Rashidov led the republic for almost a quarter of a century. He served faithfully to the existing system. However, even in the most difficult conditions, SharofRashidov honestly fulfilled his duty to the Motherland as a child of the people. He tried to soften the orders from the center as much as possible, to raise money and resources for the welfare of our people and the development of our republic. He was forced to think of national interests on the one hand, and to implement the orders of the Center on the other.

It is known from history that if the state is not independent, it is natural for such insults and injustices to occur. As the President of the Republic of Uzbekistan Sh.M.Mirziyoev said: "If every nation, every state is not independent, others can insult not only the farmer, not only the worker, but also the poet, scientist and statesman" [2, p. 34].

Indeed, before the independence of Uzbekistan, the Center pursued such a policy towards Uzbekistan. Many selfless children of our people have been humiliated and their human dignity has been trampled.

SharofRashidov led the republic for almost a quarter of a century in very difficult and difficult years. During his presidency, he sacrificed his life to glorify the Uzbek name, to demonstrate its highest qualities, and, as the First President of the Republic of Uzbekistan Islam Karimov said, for "He planted his life, his whole being, for the people who brought him up" [1, p. 89] took a worthy place in the hearts of our people and won his love. As the President of the Republic of Uzbekistan Sh.M.Mirziyoev noted: "The name of SharofRashidov is inseparable from the history of the Uzbek people. SharofRashidov was a devoted son of his people and homeland" [2, p. 345].

SharofRashidov was an example to all, big and small, with his wonderful qualities - purity, sincerity, humanity, kindness, zeal, devotion and devotion to the Motherland. AskarAzimov from Jizzakh, who worked with the Central Committee for almost four years, recalls his leadership hours and skills as “his rich memory, art and skill, leadership ability and ingenuity were evident from the first conversation ... In every action, the lightness, kindness, and attention of the elders quickly captivated us” [5, p. 3].

As noted, SharafRashidov was an incredibly talented and talented person in all spheres. With deep thought and deep knowledge, he would surprise not only the public figures, but also politicians, diplomats, economic workers.

It is known that despite the difficult and difficult period in the history of our republic in nearly quarter century Sh. Rashidov headed Uzbekistan, the agricultural, industrial and scientific potential of the country developed due to the wise policy and natural wisdom of his father, and became one of the prominent republics of Central Asia. Indeed, during 1976-1981 years, industrial production grew by almost 30 percent, the plants of mineral fertilizers Almalik and Samarkand... and in general, about 100 industrial enterprises have been launched [4, p. 270].

During these years, Khiva carpet factory, Kuvasoy porcelain factory, Andijan, Bukhara, Margilan textile plants, Urgench, Gulistan oil plants were built and put into operation. Rashidov also made a significant contribution to the development of non-ferrous metallurgy in the country. At his direct initiative, the Almalyk copper concentrator was commissioned in 1962, and the Muruntau gold mine in 1967. This proved that Uzbekistan was a “white gold treasure”, but now it is a real gold mine.

“Muruntau processes 18 million tons of ore a year, initially 50 tons of gold a year, then this figure was 70 tons ... Uzbekistan is one of the largest gold producers in the world ... Then Almalyk plant, Angren, Chodak , Marjanbulak gold sorting factories have been built ” [4, p. 272]. Unfortunately, the gift of this great wealth of Uzbekistan was in the hands of the Center. And they were all taken to Moscow. This was a natural state of affairs in the Soviet system at that time.

The construction of many important facilities in the country is personally associated with the name of SharofRashidov. He was a skilled and wise statesman who cared not only for his time, but also for the future of the nation and the motherland.

As a result of the development of the Mirzachul, Karshi, Yazyovan, Surkhan-Sherabad and Jizzakh deserts, millions of hectares of protected lands have been opened, cotton fields, wheat fields, gardens and new cities have been built. Today, these regions serve the well-being of our people, the prosperity of our Motherland. During his leadership, dozens of cities such as Navoi, Zarafshan, Yangier, Gulistan, Boston, Shirin, Marjanbulak, Uchkuduk were built, which are of great importance for the development of our country and the life of our people. Rashidov has contributed to the creation of these cities, from the preparation of city projects to giving them a beautiful name.

Sh.Rashidov worked tirelessly to carry out construction and beautification works in all regions of the country, to develop the productive forces.

For the selfless leader of the Uzbek people, all the cities of Uzbekistan were dear and honorable. However, the center of the republic - Tashkent - was a city that deserved his special love.

Rashidov's contribution to the construction of a new Tashkent after the 1966 earthquake is invaluable. Academician AkilSalimov, an Uzbek scientist who worked side by side with him for many years, writes: "Housing, administrative buildings, and businesses destroyed by the 1966 earthquake were not the same as providing housing for people who were left homeless and relocated from distant lands. Today, everyone who uses the metro service in the capital, in theaters, museums, palaces of art or parks, pays homage to the bright memory of SharofRashidov ... Sh. Rashidov tried to make Tashkent one of the most beautiful cities in the East. It is no coincidence that our people call SharofRashidov the chief architect of the new post-earthquake Tashkent" [4, p. 8].

As a statesman and public figure, SharofRashidov has rendered invaluable services in introducing the Uzbek people to the world. The concept known in the world as the "Spirit of Tashkent" is directly related to the name of SharofRashidov. During his years as head of the republic, he said, "Uzbekistan has become a venue for various international forums. In particular, the International Film Festival of Asia, Africa and Latin America and the Conference of Asian and African Writers have been held in Tashkent. On October 7-13, 1958, Tashkent hosted the International Tashkent Conference of Asian and African Writers. The first film forum in Tashkent in 1968 was of a traditional nature, celebrated every two years, and from 1968 to 1988, 10 film festivals were held" [5].

As a result of such film festivals and forums, the status of the city of Tashkent has risen throughout the East, and the term Tashkent spirit has played an important role in the history of political relations.

Uzbekistan has hosted important international forums, socio-political summits, festivals and major sports competitions. Tashkent has become a city that regularly hosts regional summits and forums, attracting many heads of state and representatives of special international institutions. Creative evenings of Asian, African and Latin American scientists and cultural figures have started in Uzbekistan. "Tashkent has become a symbolic capital of Central Asia. It is no coincidence that the United Nations has awarded Tashkent the special status of "Ambassador of Peace" [5].

The skillful diplomatic activity of the well-known statesman and public figure, well-known writer Sh. Rashidov in foreign policy is also commendable. One of the most acute crises of the Cold War, the Caribbean Crisis of 1962, was an event in the relations between the USSR, Cuba and the United States that threatened the world with a new world war.

USSR President Nikita Khrushchev chose SharofRashidov as the head of the delegation to hold talks with Cuban leader Fidel Castro.

In fact, Khrushchev visited India in 1957 with Sh. Rashidov, was aware of his skillful diplomacy, and was confident in carrying out this complex diplomatic mission. Sh. Rashidov used all his diplomatic skills and successfully completed the task.

It is obvious that the honorable son of the Uzbek people Sh. Rashidov also made an important contribution to the development of Cuba, which has chosen its independent path in Central America. R. Gaziev, a veteran of the Uzbek aviation industry who now lives in the United States, writes in his memoirs: "Almost all publications on Cuba in Central America provide information about Rashidov, his role in bringing the two countries closer, his journalistic and writing

activities, and his contribution to the development of the deserts of Central Asia. Castro also devoted a few pages to Rashidov in his book "My Life", which was published in many countries around the world" [5, p. 390].

The first secretary of the Central Committee of the Communist Party of Uzbekistan Sh. Rashidov also played an important role in the cessation of hostilities between India and Pakistan and the signing of a peace agreement between the two countries.

On January 4-10, 1966, a peace treaty between India and Pakistan was signed in Tashkent. The first major major conflict between India and Pakistan over Kashmir in 1965 threatened to turn into a world war. The Prime Minister of India Lal Bahadur Shastri and the President of Pakistan General Muhammad Ayubkhan arrived in Tashkent for talks. After negotiations between the two, it was announced that an end to the war and a peace agreement would be established between them. This document went down in history as the Tashkent Declaration. The declaration called for "the return of the two sides' forces to their pre-conflict positions, the resumption of the full functioning of diplomatic missions, and the continuation of economic and trade ties between India and Pakistan" [6].

The signing of the Tashkent Declaration became a practical basis for resolving disputes between the two neighboring states. With this initiative, the leader of Uzbekistan has made a significant contribution to peace in the world by eliminating the threat of war and reconciling the two neighboring countries.

Almost a quarter of a century of history of our country has been associated with the name of Sh. Rashidov. Sh. Rashidov became famous as a statesman and public figure, a consistent promoter of peace and friendship between peoples. In particular, he was one of the most respected figures in the circle of Asian peoples.

The President of the Republic of Uzbekistan Sh.M.Mirziyoev in his speech on November 18, 2016 at a meeting with voters in Jizzakh region described it as "SharofRashidov is a humble and wise statesman, a well-known writer who ruled Uzbekistan in very difficult and difficult years, who did not tarnish the honor of our country and his name" [4, p. 343].

During the years of Rashidov's leadership, Uzbekistan has become a land of peace and friendship. His contribution to science, culture and art is significant in dozens of areas, such as the development of the national economy, the development of protected and gray lands, the construction of new cities, industrial enterprises, and large irrigation facilities.

Despite the opposition of the Center for the development of his homeland and the well-being of his people, he took full responsibility and served selflessly until the last day of his life, giving his whole being, even his dear soul.

After the death of the selfless leader of Uzbekistan SharofRashidov, a difficult situation arose in our country. Under the guise of "fighting crime", various investigative teams were sent to Uzbekistan from the former center. Personnel from different parts of the former Soviet Union began to flow into leadership positions in the country. As in the center, they took the lead in all provinces. In addition, a nationwide investigation into the so-called "Cotton Case" and the "Uzbek Case" has begun. Gdlyan's and Ivanov's groups have launched an illegal, brutal investigation into the Uzbeks. As a result of their violence, the courts issued unjust sentences.

So, “by 1989, more than 4,500 people had been convicted in these cases ... more than a thousand of those convicted had been sent to Siberian prisons to serve their sentences. The detainees could not withstand the methods of investigation and went so far as to commit suicide” [7, p. 323].

At that time, the whole republic was in danger, and our people were in fear.

It is known that R. Nishanov was elected the first secretary of the Central Committee of the Communist Party during such tragic events in Uzbekistan. Instead of rescuing the republic and the people from slander, he did not hesitate to beg for “It is impossible to work with personnel in Uzbekistan, so send more personnel from Russia to Uzbekistan” [8, p. 191] in order to look good to those in Moscow in order to maintain his position.

At that time, at a time when the whole republic was in a difficult situation, the pride of the Uzbek people was trampled, the confidence in the future was lost, and people lived in fear and danger, I.A.Karimov came to the leadership of the Republic of Uzbekistan.

Thankfully, the terrible and evil days, the end of unjust repressions, and the bright days that the Uzbek people and its selfless son Sh. Rashidov have been waiting for have begun. The Uzbek people, under the leadership of their leader I. Karimov, have gained state independence in Uzbekistan. The age-old dream of our great ancestors and people has come true. The pride of the Uzbek people has risen. A new era has begun in the history of Uzbekistan and in the life of the Uzbek people.

In the second year of independence, the First President of the Republic of Uzbekistan I.A.Karimov, recognizing the services rendered by Sh. Rashidov to Uzbekistan and our people for nearly 40 years, restored his honest and pure name and decided to celebrate the 75th anniversary of SharofRashidov. The 75th anniversary of the great statesman Sh. Rashidov was widely celebrated in the capital and all regions of the country.

The name of Sh. Rashidov was returned to farms, districts, branches, schools. A statue of this great statesman was erected in the center of Jizzakh, where SharofRashidov was born and raised. It was a symbol of respect, esteem and affection for the famous statesman and public figure and famous writer of today’s generation. This eliminated all “accusations” against the Uzbek people. With justice, the Uzbek people fulfilled their sacred duty to their great son and his troubled soul.

In 1994 (after his death) Sh. Rashidov was awarded the State Prize of Uzbekistan named after AlisherNavoi as the author of the idea of construction for the architectural complex of the Palace of Friendship of Peoples in Tashkent.

Continuing the prudent policy initiated by the First President, President Mirziyoyev adopted a resolution “On the celebration of the 100th anniversary of the famous statesman and writer SharofRashidov”.

In November 2017, the 100th anniversary of the birth of the famous statesman and public figure, well-known writer Sh. Rashidov was widely celebrated throughout the country. In this regard, Jizzakh region, Jizzakh district was named after SharofRashidov, and a memorial complex and a monument to him were erected in the center of the district. A grand meeting was held in the building of the Jizzakh regional theater, which was attended by President of the Republic of Uzbekistan Sh.M.Mirziyoev.

The SharofRashidov Museum operates in the center of Jizzakh and at the school where he studied.

In short, during the difficult period of Sh. Rashidov, Uzbekistan led for almost a quarter of a century. As a great statesman, he devoted his entire life to glorifying the Uzbek name. He was a great statesman of his time, a wise politician, an entrepreneurial leader. Sh. Rashidov skillfully raised the problems of Uzbekistan to the level of the common interest, and in this way managed to get a permanent addition to the republic. Former First Secretary of the Central Committee of the Communist Party of Kazakhstan D. Kunaev recalls: “Amir Temur had this greatness in this gentle Kyrgyz boy with a Kyrgyz pumpkin and a plane tree”. Both the cunning and the wisdom of this mighty man were sufficient. The center said "give cotton", and Sh. Rashidov promised to give the Siberian River”. Indeed, bringing the Siberian River to Uzbekistan was a great dream of Sh. Rashidov [9, p. 203].

SharofRashidov did not like to sit in his office and live with the people's worries and anxieties. He always wanted to be among the people, to know the life of the people closely.

No matter what region they go to, no matter how busy they are, President Mirziyoev visits homes and get acquainted with the life of the population. After all, no doubt, the head of state, the leader of the people, deserves his love only if he has such a quality.

## CONCLUSION

Almost a quarter of a century of the history of our republic is connected with the period of the leader of Uzbekistan Sh. Rashidov. One of the main tasks is to cover this period, which is far from the current generation, and to explain the place of the famous statesman Sh. Rashidov in our history.

As the President of the Republic of Uzbekistan Sh.M.Mirziyoev said: “We have a history worth envying. We have great ancestors worth envying. We have incomparable riches that are worth envying. And I believe that, God willing, we will surely have a great future worth it” [2, p. 482].

Indeed, the Uzbek people should be proud of their rich history and great ancestors. SharofRashidovichRashidov, a respected and devoted son of the Uzbek people, has a worthy place in this history. Our people will never forget the selfless services of the famous statesman and public figure and writer SharofRashidov to Uzbekistan and our people, as well as his honest and pure name.

### ABSTRACT

**Objective:** the purpose of this course is to analyze the structure, content, variety of topics, the skills of the hosts, the language and style of the author's performances in the interview genre, broadcast by national TV channels in Uzbekistan. **Methods:** observation, induction, systematic analysis, comparison techniques were used in the research work. **The results:** achieved by analyzing the structure, composition, variety of topics, the level of their preparation, the skills of the hosts, the manner of interview of TV journalists, linguistic features of the show with the analysis of local TV shows. **Scientific novelty:** the expression of author's shows on modern television, the new trends observed in them, the mutual aspects of the characteristics of traditionalism and modernity have been studied. **Practical significance:** the practical significance of the achieved results is explained by the fact that it is possible to prepare textbooks and educational manuals on television in higher educational institutions.

**KEYWORDS:** Television, Dialog Genres, Author Shows, Language And Style Opportunity.

### INTRODUCTION

When viewing various public and private channels on television, you can find both a message and a report, essay or show. This period disappears in terms of time or as a result of industry progress, genres that went unnoticed on television are also increasing. This is especially true in analytical genres. Therefore, categorical division, division of journalistic materials into genres is observed mainly in theory, but in practice the phenomenon of integration of genres in their application continues. However, among all journalistic genres, in terms of their form, structure, interview, conversation genres, viewers will be able to distinguish faster than in other genres.

In this article, the author analyzed a number of interviews and conversations with the author's programs broadcast on TV channels of Uzbekistan, studying the elements of language, style and skill in their programs, the actions of the hosts in order to increase the effectiveness of the television work. Through this, the author tried to show the position of dialogical genres in the activity of interactive television.

Journalists who have a creative approach to the genre of the interview-conversation, quickly recognizable among the audience. Especially if the journalist can find a lot of interesting questions and ask them to the interlocutor, then there will also be more such interviews-those who watch the interview. As a result of the conversation, rare thoughts and comments reach the majority. Buda, of course, is of great importance due to factors such as the skill of the journalist, personal qualities, and the full use of genre opportunities.

There are general rules for all interviewers. First of all, the interviewer must be thoroughly prepared for the interview. From the actress who plays the main role in the series "What role do you play?" This question shows that the journalist is not prepared for an interview. One of the informational genres that are widely used in the media, is the interview. The purpose of the interview is to find out the essence of the question and bring it to the audience. This genre serves as a broad and deep coverage of all aspects of public life and serves to quickly and reliably convey reliable information to the audience.

### **Research result**

In the interview, first of all, the topic occupies a special place. In other words, the subject that is covered through it must be relevant to society, have social significance, and be able to arouse the interest of readers. And this requires intelligence, observation on the part of the journalist. One of the main requirements of the interview is to find the right people who can highlight the most important events and give information about them, as well as call them to communicate. "The interviewer's success depends primarily on how well prepared they are for the interview. And his preparation begins with choosing the person he wants to interview. This is one of the most important aspects of the interview. Because the success of the interview will largely depend on the respondent's personality, what knowledge they have, and how much information they can provide on the chosen topic. Particular attention should also be paid to the accuracy of interviews. To do this, you need to ask clarifying questions that will further clarify the issue. At the same time, these questions must be asked in time, as well as the necessary answers to them. During the interview process, a controversial method based on mutual distrust, an elite method based on a sense of social responsibility, and one of the methods of cooperation can be used.

In a contradictory way, there may be a competition of opinions between the interviewer and the Respondent. The intervals created in this way are most often seen in tabloid Newspapers. According to canadian John Savatsky, such competition is quite natural. But this method of collecting information prevents the journalist from getting a full interview. In fact, the conflict of thoughts is more typical of the conversation genre. Because questions are asked and answered at the interview.

On this issue, a journalist should not focus on demonstrating their knowledge to the Respondent or audience. This is an elite way of interviewing. In this case, the interview becomes a material that expresses the interests of a particular group. For this reason, this genre is not considered a

genre in which the mind teaches or the journalist looks at his knowledge. Because it should serve to deliver fast-paced and important information to the audience.

The best way to get an interview is based on collaboration. It is based on mutual trust and the truthfulness of the information provided. In fact, any interview should also be based on openness, transparency, tolerance, relevance, interest, and mutual respect. Another of the main requirements for an interview is brevity and thoroughness. Questions in materials prepared in the interview genre will have these two characteristics. Specific questions that are intended to be answered unambiguously ensure that the information is clear to everyone. According to E. Fichtelius, comprehensively perceived, short, concise and simple questions are the best questions.<sup>1</sup>

Unnecessary details are not a specific feature of the interview. X. Dustmukhammedov<sup>2</sup> commented that the task of journalists at the time of the interview is to get information – not to Express their opinion. The list of "fail-safe sins", which the canadian journalist and scientist divided into journalistic questions, is known and popular among journalists.

These are:

- **Questions that require answers in the form of "Yes" or "no".** They are also called closed questions. According to the study, 50 percent of the questions asked during the dialogue fall into this category. For this reason the interviewer should avoid such questions;
- **Use approved sentences instead of question sentences.** The audience, listening to such an interview, does not get a new idea for themselves. Only the journalist gets acquainted with his reviews and no more;
- **Ask two questions at the same time.** As a rule, when reading interviews with such questions, it is observed that the Respondent has only one answer to the question, or the last question asked is remembered, the more they strive to answer it. Therefore, in an interview, each question should be asked separately from the other.<sup>3</sup>

Although the interview is a small genre of information and volume, it is one of the most accessible genres for quickly searching, processing and transmitting the necessary information. Because "the interval between the interview taken and published should be as short as possible".<sup>4</sup>It is easier and more convenient for the audience to watch and understand the material prepared in the interview genre and the novelty put forward in it than in other genres. Any information can be transmitted either in a new message or in the reportage genre. But if it is prepared and broadcast as a question-and-answer with a source of information, the journalist will be able to hear among the questions a question that interests or torments him, and get an answer to these questions even without viewing the show in the entire interview genre.

The interview also consists of three components, like other genres: introduction (lid) - it is usually short; the main part-it consists of questions and answers; conclusion-today this part is often called by journalists sounds like this: "Tell us about your plans for the future", "What other projects are you planning to implement?»But among the TV shows, you can also see interviews that are prepared in an unusual style.

In particular, the host and author SaodatUrmonova tries to get an unusual interview from the characters of her show in the program "peace of Mind", which is broadcast on the TV channel

"Uzbekistan". Heroes can sometimes be seen in places where we see them among the tulips, sometimes associated with their sphere. In one of the shows on 19.02.2018<sup>5</sup>, a conversation was broadcast with ErkinSadikov, who worked as a mechanical assistant in many popular Uzbek films. The author does not introduce his character at the beginning of the program. In neutral words, she says that a person who shares spiritual kindness, introduces their hero and tells about their way of life. After that, a short interview will be given about what films the hero worked on. Then the name and surname of the hero appears on the screen with his pictures. In some broadcasts, the author himself delivers the opening words on "Stand-up". And in the main part of the show, the author tries not to be seen. But in order to show her participation and presence in the process, she herself addresses questions to her hero, remaining unnoticed. - Are you now someone who also went through acting face-to-face? You also have experience as an operator. Which one is more difficult? Be an actor or a cameraman? she asks her first question. When asking questions, you will notice that the author uses a more conversational style. Therefore, in the first question asked, you can observe the repeated use of the word "also". In the next question, we also see the use of dialects: "what countries have you been to?"

Entering into communication with the interlocutor in this conversational style, on the one hand, serves as a natural and easy course of communication, but when the prepared text, written in a dialect, is rich in artistic elements that correspond to the norms of the literary language, the questions posed in a conversational style, in our opinion, are not purposeful.

The journalist's questions take an important place in the manifestation of the features of any interview and conversation. Questions are the main factor in determining these aspects. "The question should be based on logic and contain accessible information and direct the movement of thoughts. As the main weapon of the journalist in obtaining information, the question may unexpectedly object to the Respondent. A correctly asked question from the interlocutor does not allow you to get away from the question forcing him to talk in a dump. The journalist's questions are formed in advance depending on the topic of conversation, the environment, the problem being discussed, or are born during the dialogue.<sup>6</sup>

- «*Do you find any flaws in the films that you made yourself?*» in subsequent inquiries, the author begins to succumb even to a certain awkwardness. After the interviewee has stated that he finds disadvantages, the next question is: "*For example, what disadvantages have you found?*» - based on his answer, the journalist again refers to this question to clarify the answer. In an interview with word is available to a larger number of respondents. This is why the skill of a journalist can be seen in the way she manages this process. In addition, it is especially important to be able to ask the necessary questions. "Whatever the question is, the answer will also be the same," they say. Good, complete answers come from a good question, not good, and incomplete answers from content come from weak and ill-considered questions.<sup>7</sup>

The author's show "Theme and essence", which is broadcast on the TV channel "Culture and education", is also prepared in the interview genre. It will be brought to the attention of viewers live. At the second demonstration,<sup>8</sup> an interview was given on the 1st initiative of five important initiatives put forward by the President of the Republic of Uzbekistan. 1-the initiative was aimed at broad involvement of young people in the activities of cultural and art institutions, 4 representatives of the Ministry of culture were represented as respondents to the show. The host and author of the program, MahmudaTojiboeva, addressed various questions to the respondents.

The President of our country paid special attention to attracting young people to music, art and culture, and asked why. In the process of raising this issue, the word sport also sent support. "I'm sorry, but sport is not the 1st initiative, but the 2nd initiative," the journalist stressed. When asked about the reason, it was obvious that the host was agitated. And arousal distracts dreams, it is much more important not to get aroused, especially when you ask questions, not to distract the imagination with other things. Since the subject is at the political level, this can be judged by the correctness of the gross mistake made. There were a lot of extra sentences, words, and comments in the questions. In particular, "Let's now talk about our shortcomings. We have enough shortcomings in the field of culture. What is being done to eliminate shortcomings, where are our pain points? In this sentence, 2 questions are asked in a row. This, first of all, distracts the interlocutor, as you would expect, the Respondent answered only one question, that is, how things are if there are shortcomings in the field of culture.

Researcher M. Lukin distinguishes between direct and indirect types of questions. Indirect questions are often used for the purpose of obtaining information relevant to the respondent's personal life, or directly using examples that should be applied in cases where imposing a specific question is somewhat inconvenient.<sup>9</sup> Direct and open questions serve to give the Respondent a clear and concise answer to them. It will be as if the viewers who watched this interval were introduced to the material in the genre of small news. Only here can you clarify the basic information as a result of questions and listen to it from the language of the relevant person to know its authenticity. It's easier to see an interview like this than a simple message, let's see. Because it provides accurate information in a simple language that everyone understands.
